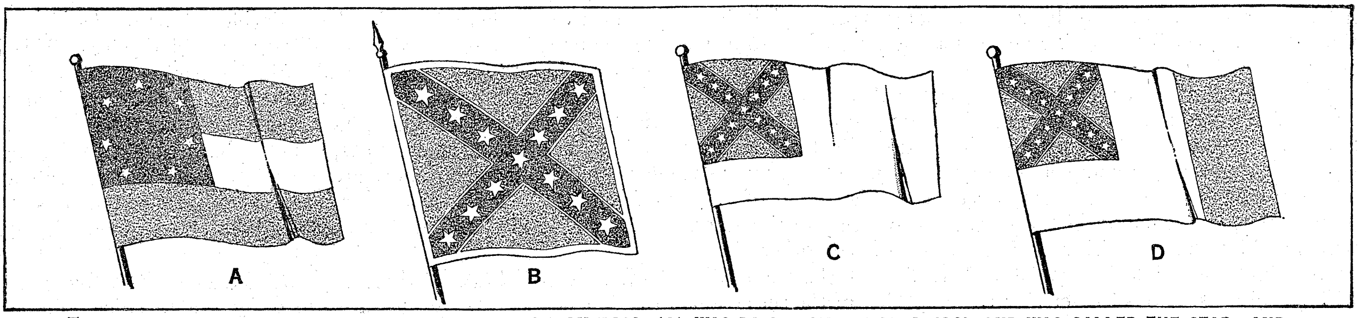
CONFEDERATE STATES OF AMERICA, the title of the independent Government formed by the seceding Southern States—Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas and Virginia—in the early part of 1861. The causes leading to the secession had grown out of social and economic conditions, chiefly dependent upon slavery, which had been a subject of compromise for 40 years. Important among the movements toward the separation of the North and South were: the struggle over Missouri; the nullification pronouncement of South Carolina; the activities of abolitionists which caused the Southern leaders to make impossible demands on Congress for the protection of slavery; the passage of a fugitive slave law which public opinion in the North would not enforce; and finally the struggle between the representatives of the North and South over the constitutional right to exclude slavery from the Territories. The slave States, in proportion to their population, had played a more important part in the previous political history of the United States than was their share. In the election of Lincoln the Southern leaders saw the end of their preponderance of power in the Union, as well as a threat to the institution of slavery.

Secession.—South Carolina took the position that secession should not be dependent on the joint agreement of the slave States, but rather on the voluntary action of each separate State. In accordance with this policy, it adopted an ordinance of secession on Dec. 20, 1860. Its action was followed by Mississippi, Florida, Alabama, Georgia and Louisiana on Jan. 9, 10, 11, 19 and 26, 1861, respectively, and by Texas on Feb. 1. On Feb. 4, 1861, the delegates of the first six States met at Montgomery, Ala., for the purpose of framing a Government, and after the lapse of four days the convention reported a constitution for the provisional Government of the Confederate States of America, which was to last until a permanent constitution should be put into operation. All laws of the United States in force on Nov. 1, 1860, which were not inconsistent with the provisional constitution, were continued. The next day (Feb. 9), the provisional Congress elected Jefferson Davis of Mississippi president and Alexander H. Stephens of Georgia vice president. Further work of the Congress was to appoint all principal committees, including one of two representatives from each State to draw up a permanent constitution for the Confederate States as a whole.

Davis Inaugurated President.—Jefferson Davis, at the formal ceremony of his inauguration at Montgomery, Ala., on Feb. 18, delivered an address in defence of the seceded States. It was, he asserted, "wanton aggression on the part of others that justified the action of the Southern people. We have vainly endeavoured to secure tranquillity and obtain respect for the rights to which we are entitled. As a necessity, not a choice, we have resorted to the remedy of separation." The president's cabinet, as then constituted, contained Robert Toombs, of Georgia, as secretary of State; C. G. Memminger, of South Carolina, secretary of treasury; L. P. Walker, of Alabama, secretary of war; S. R. Mallory, of Florida, secretary of navy; J. H. Reagan, of Texas, postmaster-general; and Judah P. Benjamin, of Louisiana, attorney-general. Of these Benjamin was distinctly the most powerful intellectually, occupying subsequently the positions of secretary of war and secretary of State. Memminger, with little training or aptitude for his difficult position, did not distinguish himself as a financier, and was succeeded in the summer of 1864 by Trenholm, a Charleston banker of high intelligence and good training, who, however, found it impossible to save the Confederacy from financial ruin.



THE FIRST FLAG OF THE CONFEDERATE STATES OF AMERICA (A) WAS RAISED ON MARCH 4, 1861, AND WAS CALLED THE STARS AND BARS. IT CONSISTED OF ONE HORIZONTAL WHITE BETWEEN TWO RED BARS; THE FIELD WAS BLUE WITH SEVEN WHITE STARS. AT THE BATTLE OF MANASSAS, JULY 1861, THE CONFEDERATE FORCES HAD GREAT DIFFICULTY IN DISTINGUISHING THEIR OWN REINFORCEMENTS FROM THOSE OF THE ENEMY BECAUSE OF THE SIMILARITY, IN THE DUST AND HEAT OF BATTLE, BETWEEN THE STARS AND BARS AND THE STARS AND STRIPES. TO PREVENT A REPETITION OF THIS A NEW DESIGN (B) THE "BATTLE FLAG," WAS CHOSEN, HAVING A RED FIELD CROSSED DIAGONALLY BY A CROSS OF BLUE WITH THIRTEEN WHITE STARS. IN MAY 1863, THE CONFEDERATE CONGRESS ADOPTED A SECOND NATIONAL FLAG (C) KNOWN AS THE "STAINLESS BANNER," WHICH WAS PURE WHITE WITH THE "BATTLE FLAG" IN THE LEFT CORNER. THIS FLAG, HOWEVER, WHEN HANGING LIMP LOOKED LIKE A FLAG OF TRUCE, SO, ON MARCH 4, 1865, THE CONFEDERATE CONGRESS CHANGED THE NATIONAL FLAG BY PLACING A BROAD RED BAR ACROSS THE END OF IT (D). THIS WAS THE FOURTH AND LAST FLAG OF THE CONFEDERACY

The Permanent Constitution.—The provisional congress, on March 11, 1861, adopted and submitted to the several States for ratification the permanent Constitution of the Confederate States of America. It was subsequently ratified by the 11 seceded States and such portions as were adaptable to war conditions were put into operation in 1862. The document followed closely the fundamental law of the United States, but where opportunity offered the "States rights" view of the sovereign and independent position of the individual States was emphasized. It even went so far as to allow a State legislature to impeach a Confederate official acting wholly within that State; it was specifically stated that legislative powers were "delegated" rather than "granted" and that each State was accordingly acting in its "sovereign and independent character."

The Confederate constitution used the words "slave" and "slavery" in provisions regarding that institution, and forbade all legislation which might impair right of property in negro slaves. The African slave trade, however, was prohibited. The Southern attitude toward a protective tariff was emphasized by the constitutional provision that no bounty should be paid nor any protective duties levied on foreign importations for the benefit of any branch of industry; it forbade the expenditure of public money for internal improvements except for aids to navigation and these were to bear their own cost. The expenses of the post office, after the first year, were not allowed to exceed its receipts. The constitution increased the powers of the executive as against the prerogatives of Congress; it gave him the power to veto separate items in appropriation bills; and the Congress could appropriate money for particular purposes only by a two-thirds majority, unless it were asked for by the head of that department. The president's term of office was lengthened to six years, but he was declared ineligible for reëlection; members of the cabinet were recognized on the floor of Congress.

These changes all had reference to times of peace. The war powers of the Government were left unchanged from those provided for by the Federal Constitution. Provisions of that document as to suspending the writ of habeas corpus and the provisions regarding conscription were left equally vague in the new Confederate constitution. These led to acrimonious discussion and much bitter feeling against the centralized war powers of the Government at Richmond. As the war progressed, the Richmond authorities, through force of necessity, became more and more oppressive, and this aroused the "States rights" feeling of many of the outstanding leaders. Governors of States resisted the acts of Congress for the conscription of men, the control of food, the suspension of civil procedure, and the regulation of their imports and exports, as an invasion of their sphere of authority. Such conditions made it evident that a confederated form of government, such as was planned by the Southerners, was unsuited to the stringent requirements of war times and contributed doubtless somewhat to the final cataclysm.

Movements for Conciliation.—With the assemblage of the thirty-sixth U.S. Congress for its second session on Dec. 3, 1860, the question uppermost in the minds of many political leaders was, how could a compromise of sectional grievances be effected. To attain this end a special committee was appointed by each the House and the Senate, but after prolonged debate it became evident that extremists of neither side favoured compromise and as a consequence these efforts were of no avail. The public, however, had not given up hopes of an agreement. Petitions poured in upon Congress for a reconsideration of the Crittenden compromise. Virginia came forth as the champion of a "peace convention" and on Feb. 4, 1861—the same day that delegates from the seceding States met at Montgomery to form a Southern Confederacy—representatives from 14 States (later increased to 21) assembled at Washington to settle peaceably the sectional quarrel. After the selection of ex-president Tyler as chairman, the convention heard reports from various State delegations and finally gave serious consideration to the Crittenden compromise which it thought "would be acceptable by the people of this commonwealth," but after labouring for nearly a month with diminishing harmony, the conference came to naught. The Confederacy, taking no part in conciliatory movements, sent to Washington three commissioners—A. B. Roman, Martin J. Crawford and John Forsyth—to seek recognition as an independent nation and to effect a peaceable agreement regarding public property situated within the seceding States. They, although not officially received, carried on with secretary of State Seward, chiefly through the mediation of justices Campbell and Nelson of the Supreme Court, negotiations in accordance with their instructions, and, also, for the evacuation of Ft. Sumter. However, when it became known that President Lincoln intended to provision the fort rather than evacuate it, as Seward had intimated, the Southern commissioners charged the president with a breach of faith and withdrew, thus bringing to a close the last attempt at a peaceable settlement.

Preparation for War.—In the meantime the Confederate Congress had authorized an army of 100,000 men; had seized practically all the coast fortifications and arsenals within the seceded territory; had adopted a national flag; had given sanction to loans amounting to $15,000,000 for which an export duty of $\frac{1}{8}$ of a cent a pound on cotton was pledged; and had sent commissioners to Europe to enlist the sympathy of foreign Governments in the Southern cause.

On April 12 the Confederate forces opened fire on Ft. Sumter and thus was begun the terrible civil conflict which was to last for four years. (*See* AMERICAN CIVIL WAR.) President Lincoln's call for volunteers to suppress the rebellion, brought to an end the hesitant policy of the remaining slave States. Most of the border States had shown a strong Union sentiment due chiefly to a more diversified economy, closer business relations with their neighbours to the North and a greater non-slave holding population. When Virginia left the Union, on April 17, 1861, the Unionist faction of the north-west managed to tear away several disaffected counties, organized them into the State of West Virginia, and later entered the Union as a separate commonwealth. The withdrawal of Virginia was followed by Arkansas and North Carolina on May 6 and 20, 1861, respectively, and by Tennessee on June 24, 1861. Four other slave States—Delaware, Maryland, Kentucky and Missouri—remained in the Union.

Comparative Military Strength.—The final grouping of the States for the great conflict showed 11 in the Confederacy as opposed to 23 loyal to the Union; in population there was a similar inequality, approximately 9,000,000 (including about 3,500,000 slaves) confronting 23,000,000. No official records exist to show the exact military strength of the Confederacy; however, it has been estimated by competent authorities that it possibly equalled, as compared with the Federal, a ratio of two to three. It was largely owing to the strategic skill of their military leaders that the Southern armies, smaller and more poorly equipped than their opponents, maintained the unequal contest for four years. In the naval operations the North had an overwhelming advantage, which was promptly and effectively used. The blockade of the Southern ports, beginning in the spring of 1861, was much less spectacular than the operations of the army, but was quite as effective in breaking down the Confederacy. It cut off the South from foreign war supplies, and reduced it to dependence upon its own products, which were almost exclusively agricultural. Manufacturing industries hardly existed in the slave-holding States. Of the few iron works only that of the Tredegar at Richmond was capable of turning out ordnance of the larger type. The output of these plants was supplemented by arms obtained from the Federal arsenals in 1861, by capture and to some extent by eluding the blockade. Powder factories were established and vigorously operated. The scarcity and high price of clothing put a premium on the establishment of textile factories, but their product was far below the demand. As compared with those of the North, the South's railways were inadequately equipped and did not form connected systems. During the war, the inroads of the Federal troops, and the natural deterioration of the lines and rolling stock greatly reduced their value as a military factor. To offset this inequality in numbers and resources, the South had certain definite advantages. Their soldiers would fight a defensive war on familiar soil, for the protection of their homes and property; the vastness of the territory—an area slightly larger than that of the United Kingdom, the Irish Free State, Spain, France, Germany, Belgium, the Netherlands and Denmark, combined—would make a speedy subjugation of the Confederacy impossible; and with the slaves to till the soil, they felt reasonably sure of a food supply. There was also a firm conviction in the South that England would aid them rather than allow the Federal blockade to ruin her cotton-milling industry.

The harvests in the South during the war were fairly abundant, as far as they were not destroyed by the advancing Northern armies. Maize was raised in large quantities, and, in general, the raising of food products instead of tobacco and cotton was encouraged by legislation and otherwise. The scarcity of food in the armies and cities was due chiefly to the breaking down of the means of transport, and to the paper money policy with its attendant evils.

The War Administration.—The second session of the provisional Congress, which met on April 29 at Montgomery, voted to accept an invitation from the Virginia convention to make Richmond the capital of the new Government. The transfer was effected by July 20, 1861. In the November following, the Confederacy, for the first time, was to choose a president and vice president in accordance with the provisions of its permanent constitution. Personal differences (there were no parties) were forgotten, and Davis and Stephens were elected without opposition. The Provisional Government gave way to the new when the first Congress elected under the permanent Constitution met on Feb. 18, 1862. Four days later Jefferson Davis was inaugurated for a term of six years, but this was brought to an untimely close by the collapse of the Confederacy. The personnel of the new Congress and administration was materially weakened by many of the most brilliant leaders answering the call of military duty. Petty jealousies and an abhorrence of centralized Government did much to lower the effectiveness of the war administration. The first Congress, after holding four sessions, gave way to the second in Feb. 1864. The latter was able to hold two sessions before taking final adjournment, on March 18, 1865.

Financial Problems.—The Confederacy was hampered throughout its existence by an inadequate system of public finance. The effectiveness of the Federal blockade reduced the proceeds from import duties almost to nothing. A small export duty on cotton was expected to produce a large revenue sufficient to base a loan upon, but the small amount of cotton exports reduced this source to an insignificant figure. There being, besides, no manufactures to tax under an internal revenue system such as the North adopted, the Confederacy was cut off from deriving any considerable revenue from indirect taxation. The first Confederate tax law levied a direct tax of $20,000,000, which was apportioned among the States. These, with the exception of Texas, contributed their apportioned shares to the central Government by issuing bonds or notes, so that the tax was in reality but a disguised form of loan. The specie holdings of the Southern banks largely found their way into the Confederate treasury in payment for the $15,000,000 loan effected early in 1861. Other specie was secured from the various Federal offices and the mint at New Orleans. These sums were soon sent to Europe in payment for foreign war supplies. Also the gold and silver in general circulation soon left the country almost entirely, driven out by the rising flood of paper money. The first notes were issued in March 1861, and bore interest. They were soon followed by others, bearing no interest but redeemable at a stated time after the restoration of peace. New issues were continually provided so that from an initial $1,000,000 in circulation in July 1861, the amount rose to $700,000,000 by the autumn of 1863; and to no less than $1,000,000,000 by the end of the war. This policy of issuing irredeemable paper money was copied by the individual States and other public bodies. Even corporations and other business concerns issued promissory notes intended to circulate from hand to hand. As a result of this redundancy of the currency the price of gold rose to great heights. By the end of 1861 a paper dollar was quoted at 90 cents in gold; during 1863, at 6 cents; and still lower during the last months of the war. In the spring of 1865 potatoes sold in Richmond for $100 a bushel and coffee at $40 a pound in Confederate currency, but in gold this was less than the price demanded in New York. This rise of prices reflecting the inflation of the currency was no advantage to the producer. Prices were often fixed by legislative action, and supplies for the army were obtained by impressment, the price to be paid for them being arbitrarily fixed at a low figure.

The bonds of the Confederacy rapidly fell in value, and were quoted during the war at approximately the value of paper money, in which medium they were paid by the subscribers. An effort to avoid the falling price of bonds was the inauguration of a system of produce loans whereby the bonds were subscribed for in cotton, tobacco and food products. This policy enabled the Government to secure at least a part of the armies' food supplies. The South, in its monopoly of cotton, held a pawn of value in negotiating for foreign loans. In the spring of 1863, the French banking house of Erlanger and Company undertook to float a loan of $15,000,000, redeemable, six months after the conclusion of peace, in New Orleans cotton at the rate of 12 cents a pound. The placing of the bonds in Europe was mismanaged by the Confederate agents, but notwithstanding about $6,250,000 was realized from the loan.

Foreign Relations.—The foreign relations of the Confederate Government were one of its chief disappointments. Early in 1861 W. L. Yancey headed a commission sent to Europe to enlist the sympathy of foreign Governments in the Southern cause. J. M. Mason and John Slidell followed later in the same year, after a short detention by the Federal Government, which had removed them from the British vessel "Trent" while en route to Europe. They received considerable unofficial sympathy; were allowed to float Confederate loans; buy military supplies; and, in violation of neutrality, ships were built in both France and England and delivered to the Confederacy (*see* "ALABAMA" ARBITRATION). Great Britain's recognition of the Confederacy as a belligerent power on May 13, 1861, gave encouragement to the Confederate Commissioners who were seeking political recognition, but, largely due to the skill and persistence of the Federal minister in London, Charles Francis Adams, this never came.

Collapse of the Confederacy.—When it was apparent that the Southern cause was tottering, Vice-President Stephens, R. M. T. Hunter and former justice Campbell of the U.S. Supreme Court opened communications with the Federal military authorities for permission to go to Washington to confer with the Federal Government. A conference of the representatives of the two Governments was arranged for Feb. 3, 1865, at Hampton Roads. President Lincoln would consider no terms which did not include a restoration of the union, and as this point exceeded the instructions of the Confederate Commissioners, the conference failed. The surrender (April 9) of Lee and the Army of Northern Virginia marked the end of the Confederate States of America. In making its struggle for independence, the South sacrificed everything, and emerged from the war a financial and industrial wreck. (*See* article SOUTH, THE.)

(J. A. DU.)

CONFEDERATION, primarily any league or union of people or bodies of people. The term in modern political use is generally confined to a permanent union of sovereign states, for certain common purposes, *e.g.,* the German Confederation (*Bund*), established by the Congress of Vienna in 1815. The distinction between confederation and federation (*see* FEDERAL GOVERNMENT), terms synonymous in their origin, has been developed in the political terminology of the United States. Up to 1789 these were a confederation; then the word federation, or federal republic, was introduced as implying closer union. This distinction was emphasized during the Civil War between North and South, the seceding states forming a confederation (Confederate States of America) in opposition to the Federal Union. Confederation thus comes to mean a union of sovereign states in which the stress is laid on the sovereign independence of each constituent body (*cf.* the German *Staatenbund*); Federation implies a union of states in which the stress is laid on the supremacy of the common government (Ger. *Bundesstaat*). The distinction is, however, by no means universally observed. The variant "confederacy," derived through the Anglo-French *confederacie,* and meaning generally a league or union, whether of states or individuals, was applied in America in the sense of confederation to the seceding Southern States. In its political sense, however, confederacy has generally come to mean rather a temporary league of independent states for certain purposes: as applied to individuals "confederacy" is often used to describe a secret combination, probably for illicit purposes. In trade union terminology a federation (*e.g.,* The Miners' Federation of Great Britain) is an alliance of autonomous unions; whereas a confederation (*e.g.,* the Iron and Steel Trades Confederation) is a body to which the constituent unions have handed over the majority of their powers—in other words, a disguised form of amalgamation, made necessary by the provisions of British law.

CONFERENCE, a bringing together for the purpose of discussion, particularly a meeting of members of one or more societies, of representatives of legislative or other bodies, or of different States (Lat. *conferre*). Such are the meetings between members of the upper and lower chambers of the British parliament, or of the U.S. Congress, to adjust matters of difference, and the assemblies of the prime ministers of the various British colonies, held at stated intervals to consult with the imperial government. The title of Colonial Conference was changed to that of Imperial Conference in 1907, but the proposal to change conference to council was dropped; it was felt that the administrative functions usually connoted by the word "council" made that title less suitable to an assembly with purely deliberative and consultative powers, which were more fitly expressed by "conference." In diplomacy the word "conference" is used of a meeting of the representatives of States of greater or less importance for the purpose of settling particular points, as distinguished from a "congress," which is properly a meeting of the great Powers for the settlement of questions of general interest. In practice the distinction is not consistently maintained. The meetings preliminary to a congress and the sessions of the congress are also styled "conferences" (*see* CONGRESS). The word is also applied to the annual assemblies for transacting church business in the Wesleyan Methodist Church of Great Britain and to various similar assemblies in the Methodist Episcopal Church of America (*see* METHODISM).

CONFESSION. In the Roman Catholic Church confession is regarded as one of the essential elements of the sacrament of Penance, although the term is frequently used for the whole penitential procedure of which confession forms but a part. (*See* PENANCE.) According to the teaching of the same church, a specific avowal of all serious post-baptismal sins, motivated by true sorrow of heart and a sincere purpose of amendment, is of divine precept. The scriptural foundations of this doctrine are seen in the statements of Jesus bestowing on His Apostles authority to bind and to loose (Matt. xvi, 19; Matt. xviii, 18), and, more specifically, authority to forgive and to retain sins (John xx, 23); the form of these statements implies that the power so entrusted is discretionary and judicial in character; for this reason its valid exercise demands a judicial knowledge of the case, which is supplied by the penitent's "confession."

In treating the sacrament of penance (session xiv, chaps. 1–9), the council of Trent gave a full statement of Catholic doctrine on confession: "From the institution of the sacrament of penance as already explained, the universal Church has always understood that the complete confession of sins was also instituted by the Lord, and is by divine law necessary for all who have fallen after baptism; for our Lord Jesus Christ, when about to ascend from earth to heaven, left behind Him priests, His own vicars, as rulers and judges, to whom all the mortal sins into which the faithful of Christ may have fallen should be submitted, in order that they, in virtue of the power of the keys, may pronounce sentence of remission or retention of sins. Evidently, it would be impossible for priests to exercise this judgment without a knowledge of the case, nor could they observe justice in imposing penalties, if the faithful were to declare their sins only in general, and not in particular and one by one (chap. 5)." The necessity of confession, therefore, is intimately related to the institution of the sacrament of penance as a judicial process; and this latter in turn is related to the Church's possession of the power of the keys (*see* ECCLESIASTICAL JURISDICTION). A special canon asserts the divine origin of the practice of confession: "If anyone denies that sacramental confession was instituted by divine law, or is necessary for salvation, or says that the manner of confessing secretly to a priest alone, which the Catholic Church has always observed from the beginning, and still observes, is at variance with the institutions and command of Christ and is a human invention, let him be anathema" (sess. xiv, can. 6).

Irremissible Sins.—There is historical evidence enough that the early church was persuaded of her competence to administer divine pardon; the problem concerned rather the extent of this power. On this point, the teaching of the New Testament presents an exegetical difficulty. St. John speaks of a "sin unto death" for which Christians are not asked to pray (I John v, 16), and St. Paul states that it is impossible to renew unto penance those who have apostatized from the faith (Heb. vi, 4–6); on the other hand, Christ's commission to forgive sins is expressed without limitation, and St. John (I John i, 9) assures his followers that if they confess their sins God will deliver them from every iniquity (*cf.* d'Alès, *L'Édit de Calliste,* p. 21 *ff.*). Moreover, early in the history of the church two tendencies manifested themselves. Hermas of Rome (*c.* 140) states that certain teachers of his day admitted no other remission for capital sins than the remission granted in baptism. While agreeing in principle that a Christian should have no need of a second remission, Hermas himself preached a second penance even for the adulterer and the apostate. And it is the more indulgent practice of the church of the 2nd century that is witnessed to by Clement of Rome, Ignatius of Antioch, Polycarp, Justin Martyr, Dionysius of Corinth, Irenaeus and Tertullian before his Montanist defection (*De Poenitentia,* vii, 9 *ff*).

Some 20 years later (*c.* 220), Tertullian adopted the more rigorous position in his Montanist work, the *De Pudicitia.* In an untempered outburst against the author of an episcopal edict (probably Pope St. Callistus) who promised pardon after due penance to the adulterer and the fornicator, Tertullian bitterly protested that the bishop, in reconciling those guilty of sins of the flesh, was usurping a power that belonged to God alone. For lesser sins the bishop might exercise his prerogative of loosing; but for the three sins of apostasy, impurity and bloodshed the bishop, in assigning a penance, could exercise only the prerogative of binding. The Catholic reply, as furnished by Tertullian, is reminiscent of Tertullian's earlier teaching: all sinners are admitted to penance; all sinners are therefore entitled to pardon, the fruit of penance (*De Pud.* iii, 1–2).

The same question of irremissible sins was occasioned by the Decian persecution (250–252), in which the number of those who had apostatized created a serious problem of discipline. A cursory reading of the correspondence that passed between St. Cyprian of Carthage and the Roman clergy during the papal interregnum would lead to the belief that at Rome and at Carthage there was no precedent for reconciling apostates. There is, however, good reason to believe that the question that vexed Cyprian and the Roman clergy was not whether the lapsed should be reconciled (there was ample precedent for this), but whether the normal discipline of penance should be maintained despite the threat of schism, the angry entreaties of the lapsed themselves, and the insistent intercession of the martyrs.

Exomologesis.—What this "normal" discipline of penance was may be gathered from the *De Poenitentia* of Tertullian and the letters of St. Cyprian. The procedure is called by Tertullian "exomologesis," the Greek term for confession. As used by Tertullian and later authors, the term seems to include the whole apparatus of public penance. The sinner was admitted to exomologesis by an imposition of hands; as a public penitent he wore sackcloth and was sprinkled with ashes; he restricted himself to "simple things for meat and drink," and at the celebration of the Liturgy he prostrated himself at the feet of the bishop and the clergy and knelt before the faithful. In this way the sinner was reminded that his sin affected the whole body and that reconciliation would normally follow upon the intercession of the whole Church. However, the final act in the great drama of reconciliation was reserved to the bishop, to whom had been entrusted the "power of the keys."

It is not easy to determine whether a particular confession of sins was made openly before the congregation or whether the term exomologesis is sufficiently explained by the public exposure of generic guilt inherent in the discipline itself. The Anglican authority, O. D. Watkins is persuaded "that the whole subsequent evidence of Church practice goes to show that the verbal particularization of offense before the congregation at no time formed part of the exomologesis which was required by the Church." (*Hist. of Penance,* I, p. 470.) An example of this "subsequent evidence" may be found in the celebrated letter of Pope St. Leo I (*Epistle* clxviii, A.D. 459) in which the pontiff strongly condemns a local custom of divulging secret transgressions in open assembly as an innovation and contrary to apostolic rule. It might be noted in this connection that Pope Leo is the first who plainly and unequivocally demands strict silence on the part of the confessor, and in so doing, offers the first clear evidence for what shall later be referred to as the "seal of confession."

The public penance or exomologesis as described by Tertullian and St. Cyprian was probably representative of the penitential discipline of the whole Church up to the close of the 3rd century. The discipline itself could be received but once, and during the period in question public penance was ordinarily denied to those who first sought it as danger of death approached. This last practice, however, appears to have been a temporary measure, introduced to strengthen the constancy of those who contemplated apostasy during the period of persecution, and was revoked when universal peace was restored to the church (*cf.* St. Innocent I, *Epistle* vi).

In the east, the graded penitential discipline was introduced shortly after the Decian persecution by St. Gregory Thaumaturgus, the bishop of Pontus in Neo-Caesarea, and spread rapidly to the neighbouring provinces of Cappadocia and Galatia. The grades were four in number: the Mourners, the Hearers, the Kneelers and the Bystanders. Those guilty of serious sins were obliged to pass through some or all of these grades according to the nature of their guilt. It would appear that reconciliation and forgiveness took place at the close of the third grade when the penitent was permitted to remain as a "bystander" for the Mass of the Faithful, although the further privilege of receiving the Eucharist was denied for a short time. The graded discipline did not long survive the action of Nectarius, the patriarch of Constantinople, in abolishing the office of priest-penitentiary and with that office the whole discipline of public penance. A relic of the graded discipline did survive in the eastern practice of postponing the reception of the Eucharist for those guilty of public crimes.

In the west, the public penance continued, with this change, that toward the close of the 4th century the liturgical ceremonies connected with the discipline were restricted to the season of Lent. Perhaps to compensate for this abbreviated discipline, certain disabilities were introduced which served to remind the sinner of his former penitential status; for instance, those who had been public penitents were obliged to abstain from marriage, or the use of marriage, to forego military service and other secular pursuits.

In the Celtic discipline, which is representative of Ireland and England from the 6th century on, there is little evidence of a liturgical discipline even during the Lenten period—a fact that has led many authors to conclude that the public penance did not exist in those countries. The practice was rather to commit those guilty of grave crimes to a monastery or to a penitential station such as that connected with the monastery of Iona—a bit of Celtic realism which to all intents and purposes gave to the public penitent the status of a professed religious.

Lest the public penance strike the modern spirit as oversevere and somewhat inhuman, it should be noted that the discipline was not applied indiscriminately nor without regard for the dispositions of the penitent. Exomologesis, with all its attendant severity, was never regarded as so essential an element in sacramental remission that it could not be dispensed with. We know that the public penance was waived in favour of a private, milder discipline in the case of sickbed penitents. Again, there is some evidence that the public penance was restricted to the more heinous crimes of apostasy, adultery and murder; and even in these cases the more awesome features of the public penance could, at the discretion of the bishop, be dispensed with. Even in the Celtic discipline, which became more stereotyped through the widespread use of the penitentials or handbooks for confessors, provision was made for the granting of commutations. Finally, with the growing practice of granting indulgences (*q.v.*), the public penance gave way altogether to the strictly private discipline which now finds place in the Roman Catholic Church.

Obligatory Confession.—In the early church, the penitential discipline was frequently referred to as a "second baptism," and serious doubt was entertained about the salvation of those who departed this life either unregenerated or unreconciled to the church (*cf.* St. Augustine, *Epistle* ccxxviii). The stringent character of the public penance, however, led many to postpone the reception of the sacrament until death approached. Beginning with the 5th century, the evidence for yearly confession becomes more cogent in the frequent exhortations that sinners should come to confession in the beginning of Lent and return for reconciliation on Holy Thursday. Finally, at the Fourth Lateran council in 1215, the obligation to confess one's sins at least once a year and to receive the Eucharist during the paschal season was imposed on all Latin Christians who had reached the age of discretion. This precept, colloquially known as the Easter Duty, is still in force in the Roman Catholic Church.

During the early Scholastic period the question was frequently asked, whether the intention of confessing one's sins would reconcile the sinner to God even before actual confession to a priest. The solution arrived at by the early Scholastics was the same as the later official teaching of the council of Trent: the sacrament of penance, of which confession to a priest is an essential part, is of divine precept; but where this precept is incapable of fulfillment, sorrow for sin perfected by charity will reconcile the sinner, provided he has the intention of receiving the sacrament when the opportunity presents itself (Trent, *sess.* xiv, 4).

In the separated churches of the east, the doctrinal position on the necessity of sacramental confession agrees substantially with that of the Roman Catholic Church. Among the Lutherans, obligatory confession to a minister of the Word survived the Reformation, although its sacramental character was denied in consequence of the Protestant concept of justification by faith alone. In time, however, the Lutherans followed the practice of the Calvinists, who substituted for private confession a general confession followed by a general absolution.

The Church of England resisted to some extent the attempts of the non-Conformists to have all reference to private confession expunged from the Prayer Book. It would, however, be difficult to formulate a doctrinal statement to which all Anglicans and Episcopalians would subscribe. The Oxford Movement in the middle of the 19th century fostered a revival of auricular or private confession, and the practice has received wide acceptance among Anglo-Catholics. Liberal churchmen, however, are opposed not only to the practice but more particularly to its doctrinal implications.

Public confession of a generic nature plays an important role in the revivalist meetings of Fundamentalists and certain Evangelical sects; and the year 1921 witnessed the rise of a new religious group, the Buchmanites, among whom a public and detailed confession is regarded as the first step toward a sincere conversion. The strictly psychological and therapeutic value of confession has not been overlooked by the psychiatrist, whose demands upon the sincerity and frankness of his patient are no less exacting than those made on the penitent in the early church.

CONFESSIONAL. A box, cabinet or stall, in which the priest in Roman Catholic churches sits to hear the confessions of penitents. The confessional is usually a wooden structure, with a centre compartment (entered through a door or curtain) in which the priest sits, and on each side a latticed opening for the penitents to speak through, and a step on which they kneel. By this arrangement the priest is hidden, and the penitent may or may not be visible to the public. Confessionals sometimes form part of the architectural scheme of the church, but, more usually, they are movable pieces of furniture. The confessional in its modern form dates no farther back than the 16th century, and Du Cange cites the year 1563 for an early use of the word *confessionale* in this sense. Originally the term was applied to the place where a martyr or "confessor" (in the sense of one who confesses Christ) had been buried. Confessional boxes were devised to guard against scandals by securing at once essential publicity and a reasonable privacy, and by separating priest and penitent. In the middle ages stringent rules were laid down, in this latter respect, by the canon law in the case of confessions by women and especially nuns. In England, before the Reformation, publicity was reckoned the best safeguard, the priest usually hearing confessions at the chancel opening or at a bench end in the nave near the chancel. With the revival of auricular confession in the English Church, confessionals were introduced into some Anglican churches. The question of their legality was raised in 1900 in the case of *Davey* v. *Hinde* (vicar of the church of the Annunciation, Brighton), tried before Dr. Tristram in the consistory court of Chichester. They are condemned as illegal.

CONFESSION AND AVOIDANCE. A plea in confession and avoidance neither simply admits nor denies alleged facts; it admits that the facts alleged by the opposite party make out a good *prima facie* claim or defense, but it proceeds to destroy the effect of these allegations either by showing some justification or excuse of the matter charged, or some discharge or release from it. (*See* PRACTICE AND PROCEDURE.)

CONFESSOR, a word used in the Christian Church to denote (1) a male saint who is not included in any of the categories martyr, apostle, evangelist; (2) a priest empowered to hear confessions.

(1) In the early church the title was restricted to those who had suffered persecution and torture, though not actual death, for the faith, but after the ages of persecution it came to be applied to those who had lived a holy life and died in peace. From about the 4th century persons so honoured became objects of cultus. As in the case of "saint," the right of declaring the holy dead to be "confessors" was ultimately reserved to the Holy See; King Edward of England thus was made a "Confessor" on his canonization by Alexander III in 1161. (2) For the functions of the confessor in the second sense, *see* the article CONFESSION.

CONFIRMATION in the Christian sense is one of the three sacraments of initiation into the church, the other two being baptism and the Eucharist. In the primitive church, confirmation followed baptism as its complement, and confirmation in turn was followed by the Eucharist. If baptism made of its recipients children of God and members of the church on earth, confirmation gave to the newly baptized the gift of the Holy Ghost in His fullness, in order to strengthen them in the faith.

In the New Testament there are clear indications that Christ promised to give the Holy Ghost to His followers: "You shall receive the power of the Holy Ghost coming upon you, and you shall be witnesses unto me . . . even to the uttermost parts of the earth" (Acts i, 8). This promise was strikingly fulfilled on Pentecost when the Holy Spirit descended in visible form upon the apostles and disciples (Acts ii). What this descent of the Holy Spirit was for the apostles and disciples on Pentecost, the sacrament of confirmation has been for the members of the church in succeeding ages.

In the primitive church the coming of the Holy Spirit was sometimes accompanied by certain extraordinary gifts (*charismata*), such as the gift of speaking strange tongues. There was no necessary connection between the two, however, for often the Holy Spirit was given without the *charismata*, and vice versa. When Philip the deacon had baptized the Samaritans, the apostles Peter and John "laid their hands upon them and they received the Holy Ghost" (Acts viii, 17). No mention is made of any extraordinary manifestations accompanying this gift of the Holy Spirit.

Confirmation in the New Testament is represented as a distinct rite and not merely as part of the baptismal ceremony. The Samaritans (Acts viii) and the Ephesians (Acts xix) were first baptized and then, after a lapse of time, they received the gift of the Spirit through the imposition of hands. Prayer and the imposition of hands are the regular means of conferring this gift in the Scriptures. It is possible, but by no means certain, that in apostolic times an anointing with oil was also part of the rite (*cf.* II Cor. i, 21–22; I John ii, 20, 27). The Gospels do not record the actual institution of the sacrament of confirmation by Christ. The presumption is, however, that He did institute it, since He not only promised to send the Holy Spirit upon His followers but meant this to be a normal process in His Church.

Outside the New Testament explicit references to confirmation begin as early as the 3rd century. Tertullian (d. *cir.*, 240), describing the rite of Christian initiation, says that, after baptism and an anointing, "the hand is laid upon us through the blessing, calling and inviting the Holy Spirit" (*De Baptismo*, viii). The name confirmation goes back at least to St. Leo the Great (pope from 440–461). Before this time the rite was more commonly known as the "imposition of hands," "unction," "chrism," "sealing" and "strengthening." The imposition of hands seems to be the only rite for the first three centuries; in the fourth, an anointing with chrism (a mixture of olive oil and balsam blessed by a bishop) came into use especially in the east, where it supplanted the imposition of hands altogether. In the west the older imposition of hands was retained but it became more and more closely associated with the chrismation.

In the east confirmation is conferred as a rule upon infants immediately after their baptism. The priest, however, uses chrism blessed by the bishop for this purpose. Among the Greeks the form of words said during the anointing is: "The seal of the gift of the Holy Ghost. Amen." In the Latin Church it is customary to wait until the seventh year before conferring this sacrament. It is normally administered by the bishop, who simultaneously imposes his hand and anoints with chrism the forehead of the candidate (*see* Canon 780 of the *Code of Canon Law*). Only in exceptional cases may a priest administer this sacrament, and then only with proper authorization.

The Latin form is the following: "I sign thee with the sign of the cross, and I confirm thee with the chrism of salvation, in the name of the Father and of the Son and of the Holy Ghost. Amen."

At the Reformation, confirmation ceased to be regarded as a sacrament on a par with baptism and the Eucharist by those who separated from the Church of Rome. Where it was retained, it came to mean not so much a rite whereby one was confirmed as a means of confirming one's baptismal vows, as among the Lutherans.

Because of their emphasis upon the importance of personal faith and conviction, the Reformers laid it down as a rule that confirmation should be put off until the candidate could learn the catechism and the fundamentals of the faith. In the Anglican Church confirmation is classed among the "five commonly called Sacraments" which "are not to be counted for Sacraments of the Gospel" (art. 25 of the 39 Articles).

In 1661 a solemn renewal of baptismal vows by the candidates was added to the confirmation service in the Book of Common Prayer. In England this has often been taken as the essential feature of the rite, although the tendency today is to deny this and to see the essence of the confirmation ceremony in the laying on of hands of the bishop "after the example of the holy Apostles" (prayer in the Confirmation Service). In recent years, considerable discussion has arisen among Anglican theologians as to the nature and relation of the gifts conferred in baptism and confirmation respectively. According to Darwell Stone (*Holy Baptism*, 3rd ed., 1901, ch. v, pp. 66–85), the personal indwelling of the Holy Spirit is given in baptism; the complement of this, or a fresh gift of the same Holy Spirit, is conveyed in confirmation.

Confirmation among the Jews is a modern rite, dating from 1810. It bears a close resemblance to Bar Mizwah, with the exception that it provides for the consecration of Jewish maidens as well as boys to their religious duties (*see Jewish Encyclopedia*, "Confirmation").

CONFIRMATION OF BISHOPS. In canon law confirmation is the act by which the election of a new bishop receives the assent of the proper ecclesiastical authority. In the early centuries of the history of the Church the election or appointment of a suffragan bishop was confirmed and approved by the metropolitan and his suffragans assembled in synod. By the 4th canon of the first council of Nicaea (A.D. 325), however, it was decreed that the right of confirmation should belong to the metropolitan bishop of each province, a rule confirmed by the 12th canon of the council of Laodicaea. For the appointment of a metropolitan no papal confirmation was required either in the West or East; but the practice which grew up, from the 6th century onwards, of the popes presenting the pallium (*q.v.*) at first *honoris causa*, to newly appointed metropolitans gradually came to symbolize the licence to exercise metropolitan jurisdiction. By the 8th and 9th centuries the papal right of confirmation by this means was strenuously asserted; yet as late as the 13th century there were instances of metropolitans exercising their functions without receiving the pallium, and it was not till after this date that the present rule and practice of the Roman Catholic Church was definitively established. (*See* Hinschius, *Kirchenrecht*, ii. p. 28 and notes.) The canonical right of the metropolitan to confirm the election of his suffragans was still affirmed by Gratian; but from the time of Pope Alexander III. (1159–81) the canon lawyers, under the influence of the False Decretals, began to claim this right for the pope (Febronius, *De statu ecclesiae*, 2nd ed., 1765, cap. iv. § 3, 2). From the 13th century onwards it was effectively exercised, though the all but universal practice of the popes of reserving and providing to vacant bishoprics, initiated by Clement V., obscured the issue, since in the case of papal nominations no confirmation was required. The question, however, was raised, in connection with that of the papal reservations and provisions, at the councils of Constance and Basel. The former shelved it in the interests of peace; but the latter once more formulated the principle that elections in the churches were to be free and their result confirmed according to the provisions of the common law (*juxta juris communis dispositionem*), *i.e.*, by "the immediate superior" to whom the right of confirmation belonged (Febronius, *op. cit.* Appendix, p. 784).

In England, where the abuse of provisors had been most acutely felt, the matter was dealt with during the vacancy of the Holy See between the deposition of John XXIII. at Constance (May 1415) and the election of Martin V. (Nov. 1417). During the interval the only possible way of appointing a bishop was by the ancient method of canonical election and confirmation. Shortly after the deposition of John XXIII., Henry V. assented to an ordinance that during the voidance of the Holy See bishops-elect should be confirmed by their metropolitans (*Rotuli Parliamentorum*, iv. p. 71); but the ordinance was not recorded on the Statute Roll. Three bishops only, namely, John Chaundeler of Salisbury, Edmund de Lacey of Hereford and John Wakering of Norwich, were confirmed by the archbishop of Canterbury during the papal vacancy. When Martin V. was elected pope in 1417 he resumed the practice of providing bishops, and from this time until the Reformation the canonical election and confirmation of a bishop in England was a rare exception.

In Roman Catholic countries the complete control of the papacy over the election and appointment of bishops has since the Reformation become firmly established, in spite of the efforts of Gallicans and "Febronians" to assert what they held to be the more Catholic usage (*see* GALLICANISM; FEBRONIANISM; BISHOP).

In England at the Reformation the share of the papacy in appointing bishops was abolished, but the confirmation became almost formal in character. By 25 Hen. VIII. c. 20, s. 4, it is provided that after an episcopal election a royal mandate shall issue to the archbishop of the province "requiring him to confirm the said election," or, in case of an archbishop-elect, to one archbishop and two bishops, or to four bishops, "requiring and commanding" them "with all speed and celerity to confirm" it. This practice still prevails in the case of dioceses which have chapters to elect. The confirmation has usually been performed by the archbishop's vicar-general, and, in the southern province, at the church of St. Mary-le-Bow, London; but after 1901 it was performed, in part, at the Church House, Westminster. All objectors are cited to appear on pain of contumacy after the old form; but although the knowledge that opposition might be offered has been a safeguard against improper nominations, *e.g.*, in the case of Dr. Clarke the Arian, confirmation has never been refused since the Reformation. *See* also BENEFICE; PROVISION.

CONFISCATION, in Roman law the seizure and transfer of private property to the *fiscus* by the emperor; hence the appropriation, under legal authority, of private property to the State. In common law the term embraces forfeiture (*q.v.*) in the case of goods, and escheat (*q.v.*) in the case of lands, for crime or in default of heirs. Goods may also be confiscated for breaches of statutes relating to customs, excise or explosives. The word is used, popularly, of spoliation under legal forms, or of any seizure of property without adequate compensation. (*See* COMPENSATION.)

CONFOLENS, a town of south-western France, capital of an arrondissement in the department of Charente, 44 mi. N.E. of Angoulême by rail. Pop. (1936) 2,118. The ancient town, with steep narrow streets occupies a fine situation on the Vienne, which is crossed by a 15th century bridge. On the left bank is the 11th century church of St. Barthélemy. The ruined castle and the church of St. Maxime (15th century) are on the right bank. Confolens possesses a subprefecture and a tribunal of first instance: laces and paper are made.

CONFORMAL REPRESENTATION. Conformal geometry had its origin in the practical problem of so mapping the earth's curved surface upon a flat leaf of paper that differences of directions at any point of the surface shall be indicated by equal differences of direction at the corresponding point on the map. By the term *conformal representation* (also called isogonal, orthomorphic) is understood any continuous mapping of one surface or region upon another, with a one-to-one correspondence of their points, and in such manner that corresponding angles in the two surfaces or regions are equal. The term *conform* is due to Gauss, who referred thereby to the equivalent property that corresponding infinitesimally small triangles on the two surfaces tend to *conform, i.e.*, approach similarity, when their dimensions are indefinitely diminished. Thus suppose ABC to be a small triangle on one surface formed by three intersecting curves, and $A'B'C'$ the corresponding triangle on a second surface. As B and C approach

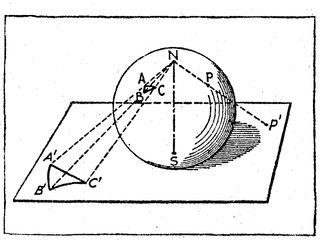

FIG. 1

A along BA and CA, correspondingly B' and C' will approach A' along $B'A'$ and $C'A'$. When the transformation is conformal, the sides of the rectilinear triangles ABC and $A'B'C'$ tend to become proportional, and the three angles of the two triangles to be respectively equal. Consequently the angle between the two curves meeting at A must be equal to the angle between the two corresponding curves at A'. A net of infinitesimal triangles closing around A so as to make up a curvilinear polygon enclosing A, is transformed into a similar polygon around A'. The ratio of magnification in passing from the triangles at A to those at A' varies in general with the position of A.

The earliest known conformal representation is the stereographic projection of Hipparchus (*c.* 140 B.C.) and Ptolemy (*c.* A.D. 150). Another early conformal representation was afforded by the familiar Mercator's projection (1568). (*See* MAP: *Map Projections.*)

Lambert (1772) was the first to seek the general conformal representation of the earth's surface on a plane, and Lagrange first noted its connection with functions of the complex variable. In 1822 the Society of Sciences at Copenhagen proposed as prize subject "the general solution of the problem to so build the parts of one given surface upon another given surface that the image shall be similar in its smallest parts to the (surface) imaged." The solution of this problem was obtained by Gauss and published in 1825 in a memoir (*Collected works*, vol. 4) which marks the beginning of a general theory of conformal representation. The next great step was due to Riemann (1859), and among the important contributors in the last 50 years Schwarz and Klein should be particularly mentioned.

Conformal Representation in a Plane.—If the points of the ordinary plane are represented by $z=x+iy$ where $i=\sqrt{-1}$, the bilinear transformation $z'=(az+b)/(cz+b)$ with real or complex coefficients, transforms the plane conformally upon itself, changing circles (inclusive of straight lines) into circles. This transformation may be resolved into a proper succession of simpler elementary transformations, viz., translations, rotations, magnifications, inversions and reflections on the axis of reals. The totality of these transformations and their combinations form a *group*, any succession of them resulting in a single bilinear transformation, or the same with z replaced by its conjugate. In an inversion, and likewise in a reflection, the *sense* of the angle is reversed; *i.e.*, clockwise angles are changed into anti-clockwise angles and vice versa. Correspondingly two classes of conformal transformations are distinguished—those with and those without change of angle-sense.

In his famous *Erlanger Program*, Klein revealed how the different kinds of geometry are associated each with a different collection or group of transformations. Each particular geometry is a study of the properties and theorems invariant under application of all transformations of the group. Ordinary Euclidean geometry rests on the so-called *principal group*, which results in combining in all possible ways translations, rotations, magnifications and reflections, and contains the theorems which are unaltered by these transformations. If with this group we combine all inversions of the plane with respect to its circles, we obtain a special conformal group, known as the *group of reciprocal radii.*

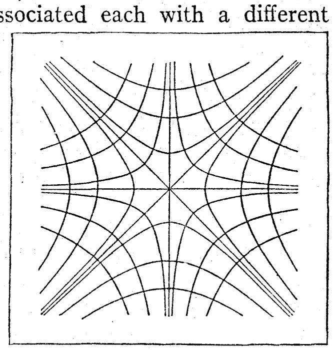

FIG. 2.—DIAGRAM ILLUSTRATING ORTHOGONAL SYSTEM OF HYPERBOLAS

The *general* conformal group of a plane or plane region comprises all conformal transformations into itself. Properties which are unaltered under this group constitute a *conformal geometry*, which has been only fragmentarily developed.

Consider a continuous reversible point-to-point transformation of the interior of a region of the ordinary (x,y)-plane into the interior of a region of the (u,v)-plane, by means of the functions $u=u(x,y)$, $v=v(x,y)$ provided with continuous first derivatives.

It is easily established (*see* W. F. Osgood, *Lehrbuch der Funktionentheorie*) that the necessary and sufficient condition that the two regions shall thereby be built conformally one on the other, without change of angle-sense, is that u and v shall satisfy the Cauchy-Riemann differential equations, $\frac{\partial u}{\partial x}=\frac{\partial v}{\partial y}$, $\frac{\partial u}{\partial y}=-\frac{\partial v}{\partial x}$, the conformality ceasing only in the points where these derivatives are all zero. In other words, $w=u(x,y)+iv(x,y)$ must be an *analytic* function of $z=x+iy$ in the region considered. Conformal geometry enters, therefore, into the very warp and woof of the theory of analytic functions. To obtain a conformal transformation we have only to select any analytic function, $w=f(z)$—for instance, z^n, e^z, or $\sin z$,—with restricted or unrestricted domain, and split the function into its real and imaginary parts, $f(z)=u(x,y)+iv(x,y)$. The equations $u=u(x,y)$, $v=v(x,y)$ then map any portion of the z-domain, in which $f(z)$ is analytic, into a corresponding domain of the w-plane. The conformality ceases only at the isolated points for which $f'(z)=0$. The w-region may overlap itself if too large a portion of the z-plane is taken, giving rise then to an overlapping *Riemann surface*.

By the analytic transformation $w=f(z)$ just indicated, families of orthogonal straight lines $x=c_1$, $y=c_2$ are mapped into orthogonal families of curves in the (u,v)-plane, and likewise the curves $u=c_1$, $v=c_2$ into an orthogonal system in the (x,y)-plane. For example, if $f(z)=(x+iy)^2$, we get $u=x^2-y^2$, $v=2xy$, and the orthogonal system $u=c_1$, $v=c_2$ consisting of straight lines parallel to the axes of the (u,v)-plane, is mapped into an orthogonal system of equilateral hyperbolas, $x^2-y^2=c_1$, $2xy=c_2$. This is perhaps the simplest method of securing orthogonal systems of curves, which are of fundamental importance in hydrodynamics, electricity and potential theory where the curves of one system are interpreted as lines of force or stream lines, and those of the orthogonal system as equipotential or level lines.

Riemann's Problem.—In his inaugural dissertation (1851) Riemann proposed the problem whether any simply connected region of a plane can be built conformally upon any other such region. This is undoubtedly the central problem in the conformal geometry of the plane. To answer the question affirmatively it is obviously sufficient to show that each of the regions can be mapped conformally upon a circle. Riemann's proof of this fact was vitiated by the famous Dirichlet principle, later recognized to be true only under limitations, and he failed to distinguish between the problem of merely building their interiors conformally upon each other and the more complicated problem arising when their boundaries are also brought under consideration. The first complete proof that the interior (R) of any simply connected region, no matter how intricate its boundary, can be built conformally upon the interior of a circle, was given by Osgood in 1900. If its boundary is a Jordan curve, it will simultaneously be mapped continuously point-to-point on the perimeter of the circle (C. Carathéodory, article in *Math. Ann.*, Leipzig, 1913). Satisfactory results regarding the conformal mapping of doubly connected regions, etc., have been obtained by Koebe (1915–18).

The uniqueness of the conformal transformation of the region (R) into the circle or its equivalent, the half-plane, can be secured in various ways, for instance, by requiring that three boundary points of (R) shall pass over into three preassigned perimeter points of the circle or half-plane. The analytic function $w=f(z)$ which effects the transformation is thereby uniquely defined. For example, the requirement that a rectangle $E_1E_2E_3E_4$ shall be built upon the half-plane of z above its real axis defines the analytic function

$$(wz)\equiv\int_{e_1}^{z}\frac{dz}{\sqrt{(z-e_1)\,(z-e_2)\,(z-e_3)\,(z-e_4)}},$$

in which e_1, e_2, e_3, e_4, are the points on the real z-axis (three of them arbitrarily selected) which correspond to the vertices E_1, E_2, E_3, E_4 of the rectangle and at which the conformality of the representation breaks down. Properties of the function $w=f(z)$ manifest themselves in the shape of the region (R), and accordingly conformal representation can be used for their study. In particular, it has been an invaluable aid in the development of the theory of hypergeometric, elliptic modular, and automorphic functions.

Conformal Representation of One Surface upon Another.—It is easily established that any ordinary surface can be built conformally upon any other with, of course, the admission of points where the conformality ceases. For suppose the position of the points on one of these surfaces to be fixed by $x_1=f_1(u,v)$, $x_2=f_2(u,v)$, $x_3=f_3(u,v)$; then the formula for the length of arc on the surface has the form $ds^2=dx^2+dy^2+dz^2=Edu^2+2Fdu\,dv+Gdv^2$, in which E, F, G are functions of u and v. Let ds^2 be resolved into its factors $\frac{Edu+Fdv\pm i\sqrt{EG-F^2}\cdot dv}{\sqrt{E}}$, in which the quantity under each radical is necessarily positive, inasmuch as ds^2 is positive irrespective of the relative values of du and dv. Let $\mu(u,v)\pm i\lambda(u,v)$ be the integrating factors by which we must multiply these two factors to make them complete differentials, and denote these differentials by $d\phi(u,v)\pm i\psi(u,v)$; then ds^2 takes the form $\frac{d\phi^2+d\psi^2}{\lambda^2+\mu^2}$. If ϕ,ψ are plotted as ordinary rectangular co-ordinates in a plane, the corresponding arc in the plane is $ds_1=\sqrt{d\phi^2+d\psi^2}$. Since ds and ds_1 are proportional, it follows that the surface is built conformally upon the plane. Similarly, the other surface can be built upon the plane. Then, since by Riemann's theorem any two simply connected pieces of the plane can be built conformally the one on the other, it follows that the two surfaces can be mapped conformally on each other, as stated above. When *isothermic* co-ordinates ϕ,ψ are used to fix the position of a point on one surface and likewise isothermic co-ordinates ϕ_1, ψ_1 on the other, $\phi+i\psi$ is an analytic function of $\phi_1+i\psi_1$.

A special case of note is that in which corresponding infinitesimal arcs ds, ds_1 on the two surfaces are not merely proportional but equal. The two surfaces are then *applicable* one to the other; *i.e.*, they can be applied one to the other without stretching, somewhat as we would roll a leaf of paper into a cylinder. Another important case is that in which a minimal surface is built conformally on a sphere. This is accomplished very simply by drawing the normal at each point P of the minimal surface, and then taking, as the corresponding point P' on the sphere, the point in which it is cut by a ray drawn through the centre of the sphere, parallel to the normal and like directed. In this and other cases the conformal representation is of value in studying the surface.

Conformal Representation for a Space of Three or More Dimensions.—Quite contrary to what might be naturally expected, the conclusions for two dimensions cannot be carried over bodily to a space of three or more dimensions. According to a notable theorem of Liouville the group of all conformal transformations for $n\geqq 3$ is identical with the group of reciprocal radii, that is, with the group resulting from combination of the principal group of rigid transformations (translations, rotations, magnifications and reflections) with inversions with respect to hyperspheres $\Sigma\,(x_i-a_i)^2=a^2$, $(i=1,2\cdot\cdot\cdot,n)$. Accordingly there is nothing analogous to the conformal representation of a region of the z-plane upon a w-region by means of an arbitrarily selected analytic function $w=f(z)$.

Klein has pointed out a second noteworthy fact which is also without analogue in two dimensions, viz., for $n>2$ the conformal geometry of an Euclidean space of n-dimensions is identical with the projective geometry of a hypersphere in $n+1$ dimensions which is transformed into itself projectively in the most general manner. Various topics have been treated in conformal geometry of n-dimensions such as the possibility of referring non-Euclidean to Euclidean space conformally, but the development must be regarded as fragmentary.

CONFUCIANISM, a misleading general term for the teachings of the Chinese classics upon cosmology, the social order, government, morals and ethics. Confucius is not the founder of the system, but is the transmitter of the teachings of antiquity and the editor of some of the classics. Mencius (372–289 B.C.) interpreted the work of Confucius. Confucianism was formulated in the Han dynasty (206 B.C.–A.D. 221). In the first century of our era the system came into contact with Buddhism and underwent certain changes which were interpreted by Chu Hsi (1130–1200) and by Wang Yang Ming (1472–1528). Though the government of the Manchu dynasty (1644–1912) made Chu Hsi's commentaries the standard, scholars attempted to restore the primitive teaching of Confucius and the ancients but were hindered by the impact of the West upon Chinese culture.

Cosmology.—In cosmology Confucianism starts out with an impersonal cosmic energy and principle which produced the *yin* and the *yang*, the negative and the positive principles. These by their interaction produced Heaven and Earth and all beings. The social order evolved from the universal order and models of government, social life and morals existed in the universal order as ideas or images. These were transmitted as symbols to the saints and the sages and interpreted and adapted by them to the needs of the people.

Government.—The government was modelled upon that of the patriarchal family, the country being regarded as a large family. The emperor was considered as appointed by Heaven to be the father and the mother of the people and ruled as a benevolent patriarch. The conception of the State as an abstract entity was never developed. The emperor was assisted by the officials recruited from the people on the basis of a civil examination in the classics. They were arranged in ranks, each possessing certain rights and duties and were bound together and to the emperor by a rigid ceremonial. The emperor and officials united all the functions of government, being the priests, executives, the law-makers and the judges. The government was one of men rather than of laws.

Moral System.—The moral system started with the axiom that all men were by nature good, formulated by Mencius. A corollary to this was the dogma that goodness is developed by the study of the classics. Society was divided into five relations: ruler-subject, father-son, husband-wife, older brother-younger brother, friend-friend. The fundamental theory underlying these relations was that of reciprocity expressed by the words, "What you do not wish done to yourself do not do to the other man," essentially the principle of the Golden Rule.

The virtues were finally grouped under five: love, the root of all the others, corresponding to our word humanity in its old meaning; justice, which assigns to each one his place and his duties and rights in that status; reverence, through which the rights are acknowledged and the duties performed; wisdom, which discriminates between good and evil; sincerity, which imparts reality to all. The outstanding virtue was filial piety, which also includes loyalty and is the outgrowth of reverence.

As Ethics.—Confucianism as an ethical system was a mixture of nature worship and ancestor worship. There were three classes of sacrifices under the last dynasty: the great sacrifices, namely, Heaven, Earth, the imperial ancestors and the gods of the grain and of the ground; the middle sacrifices, to the sun, moon, certain cultural heroes including Confucius and nature gods; the general sacrifices, performed entirely by the officials, including cultural heroes, nature gods and departmental deities. To the people were left their ancestors and gods approved by the State. The emperor as the high priest of the nation worshipped Heaven at the winter solstice and Earth at the summer solstice. The purpose of the worship was the conservation and the perpetuation of this system.

In China the establishment of the republic in 1912 brought with it far-reaching changes. The relation between Heaven and the emperor upon which the government was based was abandoned and the new idea that the people are the real rulers of China is being inculcated. Confucianism ceased to be a State system, though certain practices have survived. It has become a type of church and is slowly trying to collect and organize its heritage. The new cult is being established about Confucius. Religious toleration, however, is granted by the constitution and Confucianism after over 2,000 years as the dominant State system is taking its place as one of the cults of China. *See* CONFUCIUS.

CONFUCIUS (550 or 551–478 B.C.), the famous Sage of China. He was born, according to the historian Sze-ma Ch'ien, in the year 550 B.C.; according to Kung-yang and Kuh-liang, two earlier commentators on his *Annals of Lu*, in 551; but all three agree in the month and day assigned to his birth, which took place in winter. His clan name was K'ung, and Confucius is merely the latinized form of K'ung Fu-tze, meaning "the philosopher or master K'ung." He was a native of the state of Lu, a part of the modern Shan-tung, embracing the present department of Yen-chow and other portions of the province. Shuh-liang Heih, the father of Confucius, was commandant of the district of Tsow. Confucius was the son of Heih's old age.

Heih died in the child's third year, leaving his family in straitened circumstances. Long afterwards, when Confucius was complimented on his acquaintance with many arts, he accounted for it on the ground of the poverty of his youth. When he was five or six, people took notice of his fondness for playing with his companions at setting out sacrifices, and at postures of ceremony. He tells us himself that at fifteen his mind was set on learning; and at 19 he was married,—his wife being from his ancestral state of Sung. A son was born in the following year; and he had subsequently two daughters. Immediately after his marriage we find him employed under the chief of the Ki clan to whose jurisdiction the district of Tsow belonged, first as keeper of stores, and then as superintendent of parks and herds.

In his 22nd year Confucius established a school, not of boys to be taught the elements of learning, but of young and enquiring spirits who wished to be instructed in the principles of right conduct and government. He accepted the substantial aid of his disciples; but he rejected none who could give him even the smallest fee, and he would retain none who did not show earnestness and capacity. Thereafter, in 517 B.C. two scions of one of the principal houses in Lu joined the company of his disciples in consequence of the dying command of its chief; and with them he visited the capital of the kingdom. There he examined the treasures of the royal library, and studied the music which was found in its highest style at the court. There, too, according to Sze-ma Ch'ien, he had several interviews with Lao-tsze, the father of Taoism. It is characteristic of the two men that the latter, a transcendental dreamer, appears to have thought little of his visitor, while Confucius, an inquiring thinker, was profoundly impressed with him.

On his return to Lu, in the same year, that State fell into great disorder. The marquis was worsted in a struggle with his ministers, and fled to the neighbouring state of Ts'i. Thither also went

Confucius, for he would not countenance by his presence the men who had driven their ruler away. He was accompanied by many of his disciples. As they passed by the T'ai mountain, the attention of the travellers was arrested by a woman weeping and wailing at a grave. The sage stopped, and sent one of his followers to ask the reason of her grief. "My husband's father," said she, "was killed here by a tiger, and my husband also, and now my son has met the same fate." Being asked why she did not leave so fatal a spot, she replied that there was there no oppressive Government. "Remember this," said Confucius to his disciples, "remember this, my children, oppressive government is fiercer and more feared than a tiger."

He did not find in Ts'i a home to his liking. The marquis of the State was puzzled how to treat him. The teacher was not a man of rank, and yet the prince felt that he ought to give him more honour than rank could claim. Some counsellors of the court spoke of him as "impracticable and conceited, with a thousand peculiarities." It was proposed to assign to him a considerable revenue, but he would not accept it while his counsels were not followed. Dissatisfactions ensued, and he went back to Lu.

There for 15 more years he continued in private life, prosecuting his studies, and receiving many accessions to his disciples. He had a difficult part to play with the different parties in the State, but kept aloof from them all; and at last, in his 52nd year, he was made chief magistrate of the city of Chung-tu. A marvellous reformation, we are told, forthwith ensued in the manners of the people; and the marquis, a younger brother of the one that fled to Ts'i and died there, called him to higher office. He was finally appointed minister of crime,—and there was an end of crime. Two of his disciples at the same time obtained influential positions in the two most powerful clans of the State, and cooperated with him. He signalized his vigour by the punishment of a great officer, and in negotiations with the State of Ts'i he laboured to restore to the marquis his proper authority, and as an important step to that end, to dismantle the fortified cities where the great chiefs of clans maintained themselves like the barons of feudal Europe. "He strengthened the ruler," it is said, "and repressed the barons. A transforming Government went abroad. Dishonesty and dissoluteness hid their heads. Loyalty and good faith became the characteristics of the men, and chastity and docility those of the women. He was the idol of the people, and flew in songs through their mouths."

But the marquis of Ts'i and his advisers saw that if Confucius were allowed to prosecute his course, the influence of Lu would become supreme throughout the kingdom, and Ts'i would be the first to suffer. A large company of beautiful women, trained in music and dancing, and a troop of fine horses, were sent to Lu. The bait took; the women were welcomed, and the sage was neglected. Confucius felt that he must leave the State. The neglect of the marquis to send round, according to rule, among the ministers portions of the flesh after a great sacrifice, furnished a plausible reason for leaving the court. He withdrew, though very unwillingly and slowly, hoping that a change would come over the marquis and his counsellors, and a message of recall be sent to him. But no such message came; and he went forth in his 56th year to a weary period of wandering among various States.

His Ideas of Government.—A disciple once asked Confucius what he would consider the first thing to be done, if entrusted with the government of a State. His reply was, "The rectification of names." When told that such a thing was wide of the mark, he held to it, and indeed his whole social and political system was wrapped up in the saying. He had told the marquis of Ts'i that good government obtained when the ruler was ruler, and the minister minister; when the father was father, and the son son. Society, he considered, was an ordinance of Heaven, and was made up of five relationships—ruler and subject, husband and wife, father and son, elder brothers and younger, and friends. There was rule on the one side of the first four, and submission on the other. The rule should be in righteousness and benevolence; the submission in righteousness and sincerity. Between friends the mutual promotion of virtue should be the guiding principle. It was true that the duties of the several relations were being continually violated by the passions of men, and the social state had become an anarchy. But Confucius had confidence in the preponderating goodness of human nature, and in the power of example in superiors. "Not more surely," he said, "does the grass bend before the wind than the masses yield to the will of those above them." Given the model ruler, and the model people would forthwith appear. And he himself could make the model ruler. He could tell the princes of the States what they ought to be; and he could point them to examples of perfect virtue in former times. With his own lessons and those patterns, any ruler of his day, *who would listen to him,* might reform and renovate his own State, and his influence would break forth beyond its limits till the face of the whole kingdom should be filled with a multitudinous relation-keeping, well-fed, happy people. "If any ruler," he once said, "would submit to me as his director for 12 months, I should accomplish something considerable; and in three years I should attain the realization of my hopes."

His Disciples.—His professed disciples amounted to 3,000, and among them were between 70 and 80 whom he described as "scholars of extraordinary ability." The most attached of them were seldom long away from him. They stood or sat reverently by his side, watched the minutest particulars of his conduct, studied under his direction the ancient history, poetry and rites of their country, and treasured up every syllable which dropped from his lips. They have told us how he never shot at a bird perching nor fished with a net, the creatures not having in such a case a fair chance for their lives; how he conducted himself in court and among villagers; how he ate his food, and lay in his bed, and sat in his carriage; how he rose up before the old man and the mourner; how he changed countenance when it thundered, and when he saw a grand display of viands at a feast. He was free and unreserved in his intercourse with them, and was hurt once when they seemed to think that he kept back some of his doctrines from them. Several of them were men of mark among the statesmen of the time. It was they who set the example of speaking of him as the greatest of mortal men.

Thirteen years elapsed before Confucius returned to Lu. In this period were comprised his travels among the different States, when he hoped, and ever hoped in vain, to meet with some prince who would accept him as his counsellor, and initiate a Government that should become the centre of a universal reformation. Several of the princes were willing to entertain and support him; but for all that he could say, they would not change their ways.

It was in his 69th year, 483 B.C., that Confucius returned to Lu. One of his disciples, who had remained in the State, had been successful in the command of a military expedition, and told the prime minister that he had learned his skill in war from the master,—urging his recall, and that thereafter mean persons should not be allowed to come between the ruler and him. The State was now in the hands of the son of the marquis whose neglect had driven the sage away; but Confucius would not again take office. Only a few years remained to him, and he devoted them to the completion of his literary tasks, and the delivery of his lessons to his disciples.

His Death.—The next year was marked by the death of his son, which he bore with equanimity. But on the death of his favourite disciple, Yen Hwui, in 481 B.C., he wept and mourned beyond what seemed to his other followers the bounds of propriety, exclaiming that Heaven was destroying him. His own last year, 478 B.C., dawned on him with the tragic end of his next beloved disciple, Tze-lu. Early one morning, we are told, in the fourth month, he got up, and with his hands behind his back, dragging his staff, he moved about his door, crooning over:

> The great mountain must crumble,
> The strong beam must break,
> The wise man must wither away like a plant.

Tze-kung heard the words, and hastened to him. The master told him a dream of the previous night, which, he thought, presaged his death. "No intelligent ruler," he said, "arises to take me as his master. My time has come to die." He took to his bed, and after seven days expired. He uttered no prayer, and he betrayed no apprehension.

When their master thus died, his disciples buried him with great pomp. A multitude of them built huts near his grave, and remained there, mourning as for a father, for nearly three years; and when all the rest were gone, Tze-kung, the last of his favourite three, continued alone by the grave for another period of the same duration. The news of his death went through the States. The man who had been neglected when alive seemed to become all at once an object of unbounded admiration.

The grave of Confucius is in a large rectangle separated from the rest of the K'ung cemetery, outside the city of K'iuh-fow. A magnificent gate gives admission to a fine avenue, lined with cypress trees and conducting to the tomb, a large and lofty mound, with a marble statue in front, bearing the inscription of the title given to Confucius under the Sung dynasty: "The most sagely ancient Teacher; the all-accomplished, all-informed King." A little in front of the tomb, on the left and right, are smaller mounds over the graves of his son and grandson, from the latter of whom we have the remarkable treatise called *The Doctrine of the Mean.* All over the place are imperial tablets of different dynasties, with glowing tributes to the one man whom China delights to honour; and on the right of the grandson's mound is a small house said to mark the place of the hut where Tze-kung passed his nearly five years of loving vigil. The adjoining city is still the home of the K'ung family; and there are said to be in it some 40,000 or 50,000 of the descendants of the sage.

His Influence on China.—The dynasty of Chow finally perished two centuries and a quarter after the death of the sage at the hands of the first historic emperor of the nation,—the first of the dynasty of Ts'in, who swept away the foundations of the feudal system. State after State went down before his blows, but the name and followers of Confucius were the chief obstacles in his way. He made an effort to destroy the memory of the sage from off the earth, consigning to the flames all the ancient books from which he drew his rules and examples (save one), and burying alive hundreds of scholars who were ready to swear by his name. But Confucius could not be so extinguished. The tyranny of Ts'in was of short duration, and the next dynasty, that of Han, while entering into the new China, found its surest strength in doing honour to his name, and trying to gather up the wreck of the ancient books. It is difficult to determine what there was about Confucius to secure for him the influence which he has wielded. He left no writings in which he detailed the principles of his moral and social system. *The Doctrine of the Mean,* by his grandson Tze-sze, and *The Great Learning,* by Tsăng Sin, the most profound, perhaps, of his disciples, give us the fullest information on that subject, and contain many of his sayings. The *Lun-Yü,* or Analects, "Discourses and Dialogues," is a compilation in which many of his disciples must have taken part, and has great value as a record of his ways and utterances; but its chapters are mostly *disjecta membra,* affording faint traces of any guiding method or mind. Mencius, Hsiin K'ing and writers of the Han dynasty, whose works, however, are more or less apocryphal, tell us much about him and his opinions, but all in a loose and unconnected way.

The sage, probably, did not think it necessary to put down many of his own thoughts in writing, for he said of himself that he was "a transmitter, and not a maker." Nor did he lay claim to have any Divine revelations. He was not born, he declared, with knowledge, but was fond of antiquity, and earnest in seeking knowledge there. The rule of life for men in all their relations, he held, was to be found within themselves. The right development of that rule, in the ordering not of the individual only, but of society, was to be found in the words and institutions of the ancient sages.

China had a literature before Confucius. All the monuments of it, however, were in danger of perishing through the disorder into which the kingdom had fallen. The feudal system that had subsisted for more than 1,500 years had become old. Confucius did not see this, and it was impossible that he should.

China was, in his eyes, drifting from its ancient moorings, and the expedient that occurred to him to arrest the evil was to gather up and preserve the records of antiquity, illustrating and commending them by his own teachings. For this purpose he lectured to his disciples on the histories, poems and constitutional works of the nation. What he thus did was of inestimable value to his own countrymen, and all other men are indebted to him for what they know of China before his time, though all the contents of the ancient works have not come down to us.

He wrote, we are told, a preface to the *Shu King,* or Book of Historical Documents. The preface is, in fact, only a schedule, without any remark by Confucius himself, giving the names of 100 books, of which it consisted. Of these we now possess 59, the oldest going back to the 23rd century, and the latest dating in the 8th century B.C. The credibility of the earlier portions, and the genuineness of several of the documents, have been questioned, but the collection as a whole is exceedingly valuable.

The *Shih king,* or Ancient Poems, as existing in his time, or compiled by him (as generally stated, contrary to the evidence in the case), consisted of 311 pieces, of which we possess 305. The latest of them dates 585 years B.C., and the oldest of them ascends perhaps twelve centuries higher. It is the most interesting book of ancient poetry in the world, and many of the pieces are really fine ballads. Confucius was wont to say that he who was not acquainted with the *Shih* was not fit to be conversed with, and that the study of it would produce a mind without a single depraved thought. This is nearly all we have from him about the poems.

The *Li ki,* or Book of Rites and Ancient Ceremonies and of Institutions, chiefly of the Chow dynasty, have come down to us in a mutilated condition. They are still voluminous, but they were edited, when recovered under the Han dynasty, with so many additions, that it is hardly worth while to speak of them in connection with Confucius, though much of what was added to them is occupied with his history and sayings.

Of all the ancient books not one was more prized by him than the *Yi-king,* or "The Book of Changes," the rudiments of which are assigned to Fuh-hi about the 30th century B.C. Those rudiments, however, are merely the 8 trigrams and 64 hexagrams, composed of a whole and a broken line (——, — —), without any text or explanation of them earlier than the rise of the Chow dynasty. The leather thongs, by which the tablets of Confucius's copy were tied together, were thrice worn out by his constant handling. He said that if his life were lengthened he would give 50 years to the study of the *Yi,* and might then be without great faults. This has come down to us entire. If not intended from the first for purposes of divination, it was so used both before and after Confucius, and on that account it was exempted, through the superstition of the emperor of the Ts'in dynasty, from the flames. It is supposed to give a theory of the phenomena of the physical universe, and of moral and political principles by the trigrams and the different lines and numbers of the hexagrams of Fuh-hi. Almost every sentence in it is enigmatic. As now published, there are always subjoined to it certain appendixes, which are ascribed to Confucius himself. Pythagoras and he were contemporaries, and in the fragments of the Samian philosopher about the "elements of numbers as the elements of realities" there is a remarkable analogy with much of the *Yi.*

A greater and more serious difficulty is presented by his last literary labour, the work claimed by him as his own, and which has already been referred to more than once as the *Annals of Lu.* Its title is the *Ch'un Ch'iu,* or "Spring and Autumn," the events of every year being digested under the heads of the four seasons, two of which are used by synecdoche for the whole. Mencius held that the composition of the *Ch'un Ch'iu* was as great a work as Yu's regulation of the waters of the deluge with which the *Shu King* commences, and did for the face of society what the earlier labour did for the face of nature. This work also has been preserved nearly entire, but it is excessively meagre. The events of 242 years barely furnish an hour or two's reading. Confucius's annals do not bear a greater porportion to the events which they indicate than the headings in our Bibles bear to the contents of the chapters to which they are prefixed. Happily Tso K'iu-ming took it in hand to supply those events, incorporating also others with them, and continuing his narratives over some additional

PORTRAITS OF CONFUCIUS

1. Confucius and his favourite disciple, Yen-tse, both carrying swords, from a rubbing of an engraving on stone dated A.D. 1563, after an earlier stone engraving dated 1107. Style of Ku K'ai-chih, painter of the 4th century
2. Centre panel of "Confucius at the 'Apricot Altar,'" a painting by Kano Tanyu (1602–1674), of the Kano school
3. Confucius, after a rubbing of a stone engraving dated A.D. 1734 in the Pei lin (the Museum of Inscriptions) at Sian. This portrait is typical of those representing Confucius as a kind-hearted old gentleman. The large ears, a sign of sincerity, and the rather flat nose, curved inward, are characteristic of his appearance as usually described some centuries after his death, and these features are emphasized in most of his portraits
4. Scene with inscription relating to the visit of Confucius to the court of Ch'u, where King Chao intended to confer on him as a fief the district Shu Shieh. According to the inscription, objections were raised by one of the king's ministers, who asked the king if he had another ambassador as brilliant as Tzu Kung, a minister as learned as Yen Hui or a general as clever as Tzu Lu, all disciples of Confucius. Upon the king's admitting that he had not, the minister pointed out that the interests of Ch'u would be endangered if power were conferred on Confucius, who had these talented disciples to assist him; and the king was thus dissuaded from his purpose. The ox cart at the left is supposed to have carried Confucius in his wanderings through the provinces and is depicted in many paintings of his life

years, so that through him the history of China in all its States, from year to year, for more than two centuries and a half, lies before us. Tso never challenges the text of the master as being incorrect, yet he does not warp or modify his own narratives to make them square with it; and the astounding fact is, that when we compare the events with the summary of them, we must pronounce the latter misleading in the extreme. Men are charged with murder who were not guilty of it, and base murders are related as if they had been natural deaths. Villains, over whose fate the reader rejoices, are put down as victims of vile treason, and those who dealt with them as he would have been glad to do are subjected to horrible executions without one word of sympathy. Ignoring, concealing and misrepresenting are the characteristics of the *Spring and Autumn.*

And yet this work is the model for all historical summaries in China. The want of harmony between the facts and the statements about them is patent to all scholars, and it is the knowledge of this, unacknowledged to themselves, which has made the literati labour with an astonishing amount of fruitless ingenuity and learning to find in individual words, and the turn of every sentence, some mysterious indication of praise or blame. But the majority of them will admit no flaw in the sage or in his annals. His example in the book has been very injurious to his country. One almost wishes that critical reasons could be found for denying its authenticity. Confucius said that "by the *Spring and Autumn* men would know him and men would condemn him." It certainly obliges us to make a large deduction from our estimate of his character and of the beneficial influence which he has exerted. The examination of his literary labours does not on the whole increase our appreciation of him. We get a higher idea of the man from the accounts which his disciples have given us of his intercourse and conversations with them, and the attempts which they made to present his teachings in some systematic form. If he could not arrest the progress of disorder in his country, nor throw out principles which should be helpful in guiding it to a better state under some new constitutional system, he gave important lessons for the formation of individual character, and the manner in which the duties in the relations of society should be discharged.

The Golden Rule.—Confucius on several occasions gave his "golden rule" deduced from his study of man's mental constitution. "What you do not like when done to yourself do not do to others." It has been said that he only gave the rule in a negative form to give force to a positive statement.

Another valuable contribution to ethical and social science was the way in which he inculcated the power of example, and the necessity of benevolence and righteousness in all who were in authority. He taught emphatically that a bad man was not fit to rule. As a father or a magistrate, he might wield the instruments of authority and punish the transgressors of his laws, but no force would countervail the influence of his example.

A few of his more characteristic sayings may here be given, the pith and point of which attest his discrimination of character, and show the tendencies of his views:

"What the superior man seeks is in himself; what the small man seeks is in others."

"The superior man is dignified, but does not wrangle; social, but not a partisan. He does not promote a man simply because of his words, nor does he put good words aside because of the man."

"A poor man who does not flatter, and a rich man who is not proud, are passable characters; but they are not equal to the poor who yet are cheerful, and the rich who yet love the rules of propriety."

"Learning, undigested by thought, is labour lost; thought unassisted by learning, is perilous."

"In style all that is required is that it convey the meaning."

"Extravagance leads to insubordination, and parsimony to meanness. It is better to be mean than insubordinate."

"A man can command his principles; principles do not master the man."

"The cautious seldom err."

Sententious sayings like these have gone far to form the ordinary Chinese character. Hundreds of thousands of the literati can repeat every sentence in the classical books; the masses of the people have scores of the Confucian maxims, and little else of an ethical nature in their memories,—and with a beneficial result.

His Ethics and Philosophy.—Confucius laid no claim, it has been seen, to Divine revelations. Man as he is, and the duties belonging to him in society, were all that he concerned himself about. Man's nature was from God; the harmonious acting out of it was obedience to the will of God; and the violation of it was disobedience. But in affirming this, there was a striking difference between his language and that of his own ancient models. In the *King* the references to the Supreme Being are abundant. With Confucius the vague, impersonal term, Heaven, took the place of the Divine name.

There were, we are told in the *Analects,* four things of which he seldom spoke—extraordinary things, feats of strength, rebellious disorder and spiritual beings. Whatever the institutions of Chow prescribed about the services to be paid to the spirits of the departed, and to other spirits, he performed reverently, up to the letter; but at the same time, when one of the ministers of Lu asked him what constituted wisdom, he replied: "To give one's self earnestly to the duties due to men, and while respecting spiritual beings, to keep aloof from them,—that may be called wisdom." Again, "While you cannot serve men," he once replied to the inquiry of Tze-lu, "how can you serve spirits?" The oracle of Confucius was equally dumb on another question. "While you do not know life," he said to the same enquirer, "what can you know about death?"

His teaching was thus hardly more than a pure secularism. He had faith in man, man made for society, but he did not care to follow him out of society, nor to present to him motives of conduct derived from the consideration of a future state. Good and evil would be recompensed by the natural issues of conduct within the sphere of time,—if not in the person of the actor, yet in the persons of his descendants. Confucius never appeared to give the evils of polygamy a thought. He mourned deeply the death of his mother; but no generous word ever passed his lips about woman as woman. Nor had he the idea of any progress or regeneration of society. It was no doubt the moral element of his teaching, springing out of his view of human nature, which attracted many of his disciples, and still holds the best part of the Chinese men of learning bound to him; but the conservative tendency of his lessons—nowhere so apparent as in the *Ch'un Ch'iu*—is the chief reason why successive dynasties have delighted to do him honour. (J. Le.; X.)

CONGÉ D'ÉLIRE, a licence from the Crown in England issued under the great seal to the dean and chapter of the cathedral church of the diocese, authorizing them to elect a bishop or archbishop, as the case may be, upon the vacancy of any episcopal or archiepiscopal see in England or in Wales. According to the *Chronicle* of Ingulphus, abbot of Crowland, who wrote in the reign of William the Conqueror, the bishoprics in England had been, for many years prior to the Norman Conquest, royal donatives conferred by delivery of the ring and of the pastoral staff. Disputes arose for the first time between the Crown of England and the see of Rome in the reign of William Rufus, the pope claiming to dispose of the English bishoprics; and ultimately King John, by his charter *Ut liberae sunt electiones totius Angliae* (1214), granted that the bishops should be elected freely by the deans and chapters of the cathedral churches, provided the royal permission was first asked, and the royal assent was required after the election. This arrangement was confirmed by subsequent statutes passed in the reigns of Edward I. and Edward III. respectively, and the practice was ultimately settled in its present form by the statute Payment of Annates, etc., 1534. According to the provisions of this statute, upon the avoidance of any episcopal see, the dean and chapter of the cathedral church are to certify the vacancy of the see to the Crown, and to pray that they may be allowed to proceed to a new election. The Crown thereupon grants to the dean and chapter its licence under the great seal to elect a new bishop, accompanied by a letter missive containing the name of the person whom the dean and chapter are to elect. The dean and chapter are thereupon bound to elect the person so named by the Crown within 12 days, in default of which the Crown is empowered by the statute to nominate by letters patent such person as it may think fit, to the vacant bishopric. Upon the return of the election of the new bishop, the metropolitan is required by the Crown to examine and to confirm the election, and the metropolitan's confirmation gives to the election its canonical completeness. In case of a vacancy in a metropolitical see, an episcopal commission is appointed by the guardians of the spiritualities of the vacant see to confirm the election of the new metropolitan. (*See* CONFIRMATION OF BISHOPS.)

CONGLETON, HENRY BROOKE PARNELL, 1ST BARON (1776–1842), was the second son of Sir John Parnell. He was educated at Eton and Cambridge. From 1806–32, he was returned to parliament for Queen's county, and from 1833–37 for Dundee. He was raised to the peerage in 1841 as Baron Congleton of Congleton, but in 1842, he committed suicide. He was a liberal Whig, being commissioner of the treasury for Ireland in 1806, secretary at war in 1830–31 and paymaster of the forces and treasurer of the ordnance and navy from 1835–41. His most important treatise is that *On Financial Reform* (1830).

CONGLETON, municipal borough, east Cheshire, England, on the L.M.S.R. 8½ mi. S.S.W. of Macclesfield. Pop. (1938) 14,940. Area 8.7 sq.mi. It is in a deep valley, on the banks of the Dane, a tributary of the Weaver, with an important "gap" through the Pennines behind.

Congleton (*Congulton*) was held in Domesday by Hugh, earl of Chester. In the 13th century, the manor passed to Henry, earl of Lincoln, who by a charter dated 1282 declared the town a free borough, with a gild merchant. This charter was confirmed by successive sovereigns, with additional privileges. The governing charter, which held force until the Municipal Corporation Act of 1835, was granted by James I in 1624. Charters were also granted by Charles II and George IV. In 1272 Henry, earl of Lincoln, obtained a Saturday market and a three days' fair. This market is still held. In 1311 a Tuesday market is mentioned, and a fair at the feast of St. Martin. Henry VI granted a fair at the feast of SS. Philip and James. James I confirmed these and granted one on the Thursday before Quinquagesima Sunday. Congleton suffered severely from the plagues of 1603 and 1641. The grammar school was in existence as early as 1553. In the 16th and 17th centuries the leather laces known as "Congleton points" were in high repute. The town manufactures silk, which was introduced in 1752 by a Mr. Pattison of London. Coal is raised, and the other industries include weaving, finishing, stitching, etc., of textiles, agriculture and tobacco making. Congleton is served by the Macclesfield canal. It is in the Macclesfield parliamentary division of Cheshire.

CONGLOMERATE, in petrology, the term used for a coarsely fragmental rock consisting of rounded pebbles set in a finer grained matrix (from the Lat. *conglomerare,* to form into a ball, *glomus, glomeris;* so also the general term "conglomeration" for a miscellaneous collection of things gathered together in a mass). If the pebbles are angular, the rock is termed a *breccia* (*q.v.*). Conglomerate is thus merely consolidated gravel or shingle. The coarser constituents have attained their present rounded shapes by weathering and by attrition during transport by streams and the waves and currents of the sea. Their size varies considerably; occasionally they are 10 or 20ft. in diameter, but are usually a foot or less. Quartzites, cherts and flints, and vein-quartz being among the hardest and most durable of all rocks, are specially abundant in conglomerates; but granite, gneiss, sandstone and limestone are also of frequent occurrence. Although conglomerates occur in geological formations of all ages, they reach a considerable thickness only in the Palaeozoic rocks in Britain. In the old red sandstone of Scotland, for example, they are thousands of feet in thickness and consist largely of boulders of andesite, granite, quartzite, gneiss, etc.

The matrix in which the pebbles are embedded is usually formed of sandy material cemented by a siliceous, ferruginous, calcareous, dolomitic or clayey bond. The "Brockram" of the North of England is a well-known Permian limestone-conglomerate. The Dolomitic conglomerate of the Bristol district is a similar rock of Triassic age. The pebble-beds of the Bunter (Trias) are a valuable source of underground water-supply. For Crush-conglomerate *see* BRECCIA. (P. G. H. B.)

CONGO, formerly known as Zaire, the largest of the rivers of Africa and exceeded in size among the rivers in the world by the Amazon only. The Congo has a length of fully 3,000 m. and a drainage area estimated at 1,425,000 sq.m., with a diameter of some 1,400 m. either way. This vast area includes the equatorial basin of Central Africa and much of the surrounding plateaus. West and north the Congo basin is bounded by comparatively narrow bands of higher ground, while east and south the drainage area of the river includes considerable portions of the high plateau of east and south Central Africa. The main drainage of the Congo system is thus north and west, and these two directions dominate the great bow-like sweep of the main stream before it is deflected south on approaching the western highlands, through which it finally forces a way to the Atlantic Ocean. From the high lands of the south and east in which the headstreams of the Congo have their origin, the land falls in a succession of steps, generally marked by gorges or rapids in the upper courses of the streams. Besides the main stream most of the affluents are navigable for considerable distances; in all there are over 6,000 m. of navigable water in the Congo basin and 20,000 m. of overhanging wooded banks. On the Congo alone are over 4,000 islands, many of considerable length—some fifty of them are over ten miles long. The volume of water poured into the Atlantic is calculated at 1,200,000 cubic ft. or more per second.

Head-streams.—The easterly head-streams are regarded generally as marking the true course of the parent river. The most remote of these rivers is the Chambezi, which rises (in British territory) on the southern slope of the plateau between lakes Nyasa and Tanganyika at an elevation of about 6,000 feet. The watershed is formed by the crest of the plateau, and is perfectly distinguishable, save at a spot called Ikomba, about half-way between the lakes, where is a swamp which drains to both the Atlantic and the Indian oceans. The Chambezi source is in 9° 6′ S., 31° 20′ E. Its chief tributary, the Karungu, rises in 9° 50′ S., 33° 2′ E. After the junction of the Karungu and Chambezi the river flows in a south-westerly direction through a fairly fertile country. In its lower course it passes through papyrus marshes, and dividing into several channels, enters the vast swamp which adjoins the southern part of Lake Bangweulu (*q.v.*). The river, known as the Luapula (Great River), which issues from this swamp is a continuation of the Chambezi. The Luapula on leaving the swamp bends west and then south and approaches the watershed of the Zambezi. The source of its most southern affluent, and therefore the most southern point in the Congo basin, is approximately in 13° 30′ S. Turning north the Luapula precipitates itself down the Mumbatuta (or Mambirima) falls (12° 17′ S., 29° 15′ E.), the thunder of which can be heard on a still night for 8 or 9 miles. The river, the width of which varies from 250 to 1,200 yd., is almost unnavigable until below the Johnston falls, a series of rapids extending from 11° 10′ to 10° 30′ S. Below the falls the river is navigable by steamer all the way to Lake Mweru—a distance of 100 miles. Before entering Lake Mweru (*q.v.*), 100 m. below the Johnston falls, the Luapula again passes through a swampy region of deltaic character. The river (known now as the Luvua) makes its exit at the north-west corner of the lake, and bending westwards, passes across the zone of the Kebara and Mugila mountains, falling during this interval nearly 1,000 feet. In about 6° 45′ S., 26° 50′ E. it joins the Kamolondo (otherwise Lualaba), the main western branch of the Congo, which, as it flows in a broad level valley at a lower level than the eastern branch, is held by some to be the true head-stream.

The Kamolondo is formed by the junction of several streams having their source on the northern slope of the south-central plateau as it dips towards the equatorial basin. The streams flowing south from it belong to the Zambezi basin, but the watershed is not everywhere clearly defined. There is, however, no connection between the Zambezi and Congo systems. The Lualaba, also known as Nzilo, which is the main stream of the Kamolondo, rises at an altitude of 4,700 ft., in 26° 40′ E., just north of 12° S. East of the Lualaba—between it and the Luapula—rises the river Lufira. With many windings the Lualaba and Lufira pursue a generally northerly direction, passing through the Mitumba range in deep gorges, their course being broken by rapids for 40 or 50 miles. Below Konde rapids in 9° 20′ S. the Lualaba is, however, free from obstructions. (Just above the last of the series of rapids it is joined by the Lubudi, a considerable river and the westernmost of the Kamolondo affluents.) Between the rapids named and 7° 40′ S. its valley is studded with a chain of small lakes and backwaters. In the rainy season the whole region becomes a marsh; various grasses, especially papyrus, form floating islands, and the conditions generally recall the sudd region of the Nile. In about 8° 20′ S. the Lualaba and Lufira unite in one of these marshy lakes—Kisale—through which there is a navigable channel. The region watered by these western head-streams of the Congo includes Katanga and other districts, which are among the most valuable parts of the Belgian Congo. For practical purposes navigation down stream begins at Bukama, in about 9° 50′ N., the Lualaba there being some 300 yd. wide and 10 ft. deep. Bukama is in railway connection with Cape Town and with the lower Kasai.

The Upper Congo or Lualaba.—After the junction of the Luapula (Luvua) and the Lualaba (Kamolondo) the united stream, known as the Lualaba or Lualaba-Congo, and here over half a mile wide, pursues a north-north-west course towards the equator. The Dia rapids, some 300 m. below the Konde rapids, are the first obstruction to navigation encountered. A mile or two lower down the Lualaba passes through a narrow gorge called the Porte d'Enfer. From this point to as far north as 3° 10′ S. the course of the river is interrupted by falls and rapids. In this part of its course the Congo becomes a majestic river, often over a mile wide, with flat wooded banks. Between the junction of the two main upper branches, about 1,700 ft. above the sea, and the first of the Stanley falls (1,520 ft.), the fall of the river is less than 200 ft., in a distance of 500 m. Of the tributaries it receives in this section the Lukuga connects Lake Tanganyika with the Congo system (*see* TANGANYIKA).

Stanley Falls.—Stanley falls, which mark the termination of the upper Congo, begin a few miles south of the equator. At this point the river forsakes the northerly course it has been pursuing and sweeps westward through the great equatorial basin. The falls consist of seven cataracts extending along a curve of the river for nearly 60 miles. They are not of great height—the total fall is about 200 ft.—but they effectually prevent navigation between the waters above and those below except by canoes. The first five cataracts are near together; only 9 m. separate the first from the fifth. The sixth cataract is 22 m. lower down, and the seventh, the most formidable of all, is 26 m. below the sixth. The fall, divided into two portions by an islet, is 800 yd. wide. The channel is narrowed at the foot of the fall to some 450 yd. by an island close to the left bank; on the right bank is the island of Wane Rusari (2 m. long by $\frac{1}{4}$ m. broad), separated from the mainland by a channel 30 yd. wide. The fall is only about 10 ft.; but the enormous mass of water, and the narrow limits to which it is suddenly contracted, make it much more imposing than many a far loftier cataract.

The Middle Congo.—Below Stanley falls the Congo is unbroken by rapids for 980 m., and is navigable throughout this distance all the year round. The river here makes a bold north-westerly curve, attaining its most northerly point (2° 13′ 50″ N.) at 22° 13′ E., and reaches the equator again after a course of 630 m. from the falls—the distance in a direct line being 472 miles. For another 250 m. the river flows south-westerly, until at Stanley pool the limit of inland navigation is reached. For the greater part of this section the Congo presents a lacustrine character. Immediately below the falls the river, from $\frac{1}{2}$ to 1 m. broad, flows between low hills, which on the south give place to a swampy region, the river-bank marked by a ridge of clay and gravel. After receiving the waters of the Aruwimi—130 m. below the falls—the Congo broadens out to 4 or 5 m.; its banks, densely wooded, are uniformly low, and the surface of the water is studded with alluvial islands and innumerable sandbanks. The velocity of the current decreases as the waters spread out, though there is always a channel from $4\frac{1}{2}$ to 5 ft. deep. About 100 m. below the Aruwimi confluence the Loika or Itimbiri joins the main stream from the north, the Congo narrowing considerably here, owing, it is supposed, to the matter deposited by the Loika. At two or three other places lower down, the river is contracted to $2\frac{1}{2}$ or 2 m. as a result of a slight elevation in the ground, but for a distance of 500 m. no real hill is met with.

On the southern curve of the horseshoe bend are found the largest islands of the Congo—Esumba, 30 m. long, and Nsumba, 50 m. long, and over 5 m. across at its broadest part. At this point the river from bank to bank is 9 m. wide. Opposite Nsumba, the Mongala, a northern affluent, enters the main stream, whilst lower down (just north of the equator) the Lulanga, Ikelemba and Ruki rivers, southern tributaries, mingle their black waters with the dark current of the Congo. Thirty miles south of the equator the river is joined by the Ubangi (*q.v.*), its greatest northern affluent. Here the Congo is fully 8 m. wide. Opposite the Ubangi confluence is the mouth of a narrow channel, some 10 m. long, which connects the Congo with Lake Ntomba, a sheet of water about 23 m. long by 8 to 12 broad. In flood time the water flows from the Congo into the lake. Immediately below ferruginous conglomerate hills of slight eminence reduce the river to a width of less than 2 m., and in comparatively close succession are two or three other narrows. With these exceptions the Congo continues at a width of 5 to 6 m. until at 2° 36′ S. it abruptly contracts, being confined between steep faced hills.

This stretch of the river, known as the "Chenal," is 125 m. long and is free from islands, though long reefs jut into the stream. Its width here varies from 2 m. to less than 1 mile. About 40 m. after the Chenal is entered the Kasai (*q.v.*), coming from the south, empties its brick-coloured waters at right angles into the Congo through a chasm in the hills 700 yd. wide. The confluence is known as the Kwa mouth. The Chenal ends in the lake-like expansion of Stanley pool, 20 m. long by 14 broad. The middle of the pool is occupied by an island (Bamu) and numerous sandbanks. The banks offer considerable variety in character. On the north bank are the Dover cliffs, so named by H. M. Stanley from their white and glistening appearance, produced, however, not by chalk but by silver sand. On the south side stands the great red cliff of Kallina Point (about 50 ft. high). Round the point rushes a strong current $7\frac{1}{2}$ knots an hour, difficult to stem even for a steamer. On the northern bank of the river at the western end of the pool is Brazzaville, the capital of French Equatorial Africa. South of the pool, hills, low but steep, reappear, and 4 m. lower down begin the cataracts which cut off the middle Congo from the sea. Some 300 yd. above the first of these cataracts is Leopoldville, the capital of the Belgian Congo Colony, connected with the lower river at Matadi by railway. At Stanley pool the elevation of the river above the sea is about 800 ft., a fall of over 500 ft. in the 980 m. from Stanley falls. The velocity of the stream in the middle Congo varies considerably. At the Aruwimi confluence the rate is from 300 to 350 ft. a minute; in the broader stretches lower down the current is not more than 200 ft. a minute. Through the Chenal the pace is greatly accelerated, and as it flows out of Stanley pool the current is not less than 600 ft. a minute.

The Lower Congo.—The cataracts below Stanley pool are caused by the river forcing its way through the mountains which run parallel to the western coast of the continent. About 30 main rapids are distinguished, and in 215 m. the river falls 800 feet. The highlands (known as the Serro do Crystal) consist of two mountain zones with an intermediate zone of lower elevation. The passage of this intermediate zone is marked by a fairly navigable stretch of river extending from Manyanga to Isangila, a distance of 70 m. The last rapid is a little above Matadi, whence the river is navigable for large vessels to the sea, a distance of about 85 miles. At Matadi the river widens out into an estuary with many mangrove-bordered creeks and forest-clad islands of a deltaic character. This estuary is traversed by a deep cañon, in which soundings of 900 ft. have been obtained. The mouth of the river is in 6° S. and 12° 20′ E. The cañon or gully is continued into the open sea for over 100 m., with depths as much as 4,000 ft. below the general level of the sea floor. Just below Matadi, where the width of the river is about half a mile, depths of 276 and 360 ft. have been found, the current here running at from 4 to 8 knots, according to the season; while the difference in level between high and low water is 20–25 feet. The difference is caused by the rainy or dry seasons, of which there are two each during the year. In the middle Congo May and November are the times of greatest flood; in the lower river the floods are somewhat later. At Stanley pool the maximum rise of water is about 15 ft. The tides are felt as far as Boma, 49 m. from the mouth of the river, but the rise is there less than a foot; while at the mouth it is 6 ft. The cañon above mentioned is occupied by salt water, which is nearly motionless. Above it the fresh water runs with increasing velocity, but decreasing depth, so that just within the mouth of the river it is only a few feet deep.

The river at its mouth between Banana Point on the north and Sharks Point on the south is over 7 m. across. Banana Point (which grows no bananas) is the end of a long sandy peninsula, its highest spot not more than 6 ft. above high water; Sharks Point is bolder and shaped somewhat like a reaping-hook with the point turned inward, thus enfolding Diegos bay. The current of the river is perceptible fully 30 m. out to sea, the brown waters of the Congo being distinguishable from the blue of the ocean.

Northern Tributary Rivers.—Of the many affluents of the middle river the Ubangi on the north and the Kasai on the south, with their tributary streams, are noticed separately. Other notable affluents which join the river on its right bank include the Lindi, which enters the Congo about 15 m. below Stanley falls in 25° 4′ E. and is navigable from its mouth for over 100 m., and the great Aruwimi, which rises, as the Ituri, in close proximity to Albert Nyanza, flowing generally from east to west. The Aruwimi is formed of many branches and its upper basin extends over 2½° of latitude. The river flows almost entirely through the great equatorial forest, which here seems to reach its maximum density. Its confluence with the Congo is in 1° 12′ N., 23° 38′ E., and it is navigable for 90 m., up to the Yambuya rapids. The Loika, Itimbri or Lubi river, rises in about 26° E., and joins the Congo by two mouths, 22° 35′–46′ E. The Loika is navigable as far as the Lubi falls, a distance of 150 miles. The Mongala, which drains the country between the Loika to the east and the Ubangi to the west, rises in about 3° N., 23° 20′ E., and flows in a somewhat similar curve (on a smaller scale) to that of the Ubangi. The Mongala is navigable for over 300 m. The Mongala confluence is in 1° 53′ N., 19° 49′ E. Below the Ubangi confluence the Sanga, in 1° 12′ S., 16° 53′ E., joins the Congo. The Sanga rises in the north-west verge of the Congo basin and flows in a general north to south direction. The main northern branch rises in southern Adamawa in about 7° N., 15° E. An almost equally large western branch, the Dscha (or Ngoko), rises about 3° N., 13½° E., and in its course traverses a vast tract of dense forest. The Sanga is navigable by steamers as far as the south-east corner of the Cameroons, a distance of approximately 350 miles. The Likuala and Alima, which join the Congo within 30 m. of the mouth of the Sanga, are much smaller streams.

Southern Tributaries.—The first of the southern tributaries of the middle Congo, the Lomami, enters the main stream in 0° 46′ N., 24° 16′ E. It has a length of over 700 m., rising in nearly 9° S. It flows south to north, the greater part of its course being parallel to and from 40 to 150 m. west of the upper Congo. For the last 200 m. it is navigable by steamers. Below the mouth of the Lomami there is a long stretch with no southern tributary, as the great plain within the Congo bend is drained by streams flowing in the same direction as the middle Congo—east to west. The Lulanga (or Lulongo), about 400 m. long, enters in 0° 40′ N., 18° 16′ E. The main branch of the Ruki or Juapa, which enters a little north of the equator in 18° 21′ E., has its rise between 24° and 25° E. and about 3° S., in the swampy region traversed by the Lomami. It is about 600 m. long and has two large southern tributaries. A few miles above the Ruki confluence the Ikelemba (some 150 m. in length) joins the Congo. The Lulanga, Ikelemba and Ruki, and their sub-streams, have between them over 1,000 m. of navigable waters. No rapids intercept their course.

Exploration.—Unlike the Nile there are no classic associations with the Congo. A single mention made of the Zaire by Camoens in the *Lusiads* exhausts its connection with literature (up to the beginning of the 19th century), other than in little known and semi-fabulous accounts of the ancient kingdom of Congo. The mouth of the river was discovered by Diogo Cão or Cam either in 1482 or 1483. To mark the discovery and to claim the land for the Portuguese crown he erected a marble pillar on what is now called Sharks Point. Hence the river was first called Rio de Padrão (Pillar river). It soon, however, became known as Zaire (*q.v.*), a corruption of a native word meaning "river," and subsequently as the Congo. In the three centuries succeeding Diogo Cão's discovery strangely little was done to explore the river though various European firms established "factories" in the estuary, trading in slaves and other commodities. At length the British Admiralty took action, and in 1816 despatched Captain J. K. Tuckey, R.N., at the head of a well-equipped mission. The expedition was prompted by the suggestion that the Congo was identical with the Niger. Captain Tuckey reached the Congo on July 6, 1816, and managed to push up stream as far as Isangila, beyond the lowest series of rapids; but sickness broke out, the commander and 16 other Europeans died and the expedition had to return. Captain Tuckey and several of his companions are buried on Prince's island, just above Boma, the point where the Congo widens into an estuary. For 60 years, though two or three attempts were made no other European reached even as far as Isangila. Lieutenant W. Grandy, R.N., who was sent from England in 1872 to the relief of David Livingstone, started from Ambriz, south of the Congo estuary, and, after many vicissitudes, reached, late in 1873, a point on the Congo below the cataracts. The death of Livingstone was soon afterwards reported; and in April 1874, just as Grandy was prepared to ascend the river, letters of recall brought the expedition to a close.

It was by working down from its source that the riddle of the Congo was solved. In 1868 David Livingstone traced the course of the Chambezi to Lake Bangweulu. In March 1871 he reached the town of Nyangwe on the Lualaba, and died (1873) whilst endeavouring to trace the head-streams of that river, which he believed to be the Nile. "I have no fancy," he once said, "to be made into 'black man's pot' for the sake of the Congo." But by 1872 geographers were able to affirm, from Livingstone's own reports, that the great river system he had explored must belong to the Congo and not to the Nile. Actual proof was lacking, and of the course of the main river there was absolute ignorance. In Oct. 1876, H. M. Stanley arrived at Nyangwe from Zanzibar and from that point navigated the river over 1600 m. to Isangila—"Tuckey's Furthest"—reached in July 1877, thus demonstrating the identity of the Lualaba with the Zaire of the Portuguese. Stanley's great journey marked an epoch in the history of Africa, politically and commercially as well as geographically. Of the travellers who followed Stanley none did more to add to the exact knowledge of the main river and its greatest tributaries than the Rev. George Grenfell (1849–1906) of the Baptist Missionary Society, while the Aruwimi was partly explored by Stanley in 1887 in his last expedition in Africa. The detailed survey of the river system was mainly done by Belgian officers, notably by Captains A. Delacommune and C. Lemaire. In 1913 Captain R. Walker, R.E., showed that the Luapula did not issue from Lake Bangweulu, as had been supposed, but was a direct continuation of the Chambezi. Alongside all the non-navigable reaches of the river railways have been built (*see* BELGIAN CONGO).

CONGO FREE STATE, the name frequently used for the *État Indépendant du Congo,* a state of equatorial Africa which occupied most of the basin of the Congo river. After its annexation by Belgium in 1908, it became known as *Congo Belge* or the BELGIAN CONGO (*q.v.* for events after 1908).

The state owed its existence to the ambition and force of character of a single individual, Leopold II., king of the Belgians. Interest in Central Africa had been greatly stimulated in the middle of the 19th century by the discoveries of David Livingstone, J. H. Speke, Richard Burton and others, and in 1876 King Leopold summoned in Brussels a conference of geographical experts which resulted in the creation of "The International Association for the Exploration and Civilization of Africa." National committees were formed in various countries and an international commission was instituted with headquarters in Brussels. The Belgian committee devoted attention first to East Africa, but the arrival in Aug. 1877 of H. M. Stanley at the mouth of the Congo, which marked the end of the great journey in which he discovered the course of that magnificent river, at once turned Leopold's thoughts to the immense possibilities offered by the development of the Congo basin. Having tried in vain to interest British merchants in the development of the region, Stanley in Nov. 1878, accepted Leopold's offer to return to the Congo, build a chain of stations on the banks of the river, open a road through the cataract region separating the estuary from the navigable waters above, and to conclude agreements with the native chiefs. A separate committee of the International Association was formed in Brussels, under the name of *Comité d'études du Haut Congo;* this committee afterwards became the International Association of the Congo. Though international in name the association soon came entirely under the

ON THE CONGO RIVER AT STANLEYVILLE, BELGIAN CONGO

direction of King Leopold and his associates. Stanley, as agent of the association, spent four years in the Congo, founding stations and making friendly agreements with various chiefs. The first station was founded at Vivi in Feb. 1880.

Recognition by the Powers.—Before Stanley's return to Europe the work of the association had attracted much attention among the powers interested in Africa. A little tardily the importance of the newly-discovered regions was realized. On behalf of France M. de Brazza had reached the Congo from the north and had established various posts, including one, the present Brazzaville, on Stanley Pool (*see* FRENCH EQUATORIAL AFRICA). Portugal, on the strength of the discovery of the mouth of the Congo by her navigators in the 15th century, advanced claims to sovereignty over both banks of the estuary of the river. These claims were recognized by the British Government in a convention concluded in Feb. 1884. This convention aroused much opposition, especially in Great Britain and Germany, and was never ratified. It led directly to the summoning of the Berlin Conference of 1884–85, and to the recognition of the International Association as a sovereign state. Such recognition had been King Leopold's aim. In any case the position of the association was anomalous. On the Congo itself there was no one great native state; the region was under the rule of a vast number of petty chiefs. This made it comparatively easy for the association, locally, to assume supreme authority. The United States of America, where Leopold's aims and Stanley's work attracted much sympathy, was the first great power, in a convention signed April 22, 1884, to recognize the association as a properly constituted state. At this time King Leopold was negotiating with France not only for recognition of the association but on boundary questions. Negotiations were conducted by and in the name of the president of the association, Col. M. Strauch, a Belgian officer. By a note of April 23, 1884, Col. Strauch gave France the right of pre-emption—the first right to purchase—should the association be compelled to sell its possessions.

In 1887 it was announced by the Congo State that this preferential right granted to France in 1884 was not intended to be opposed to the rights of Belgium, and in fact Belgium ultimately acquired the Congo State. While the negotiations with France were proceeding Germany recognized the independence of the association (Nov. 8, 1884). This was followed by recognition by Great Britain (Dec. 16, 1884) and other Powers. Owing to difficulties in reaching agreement as to boundaries, French recognition was delayed until Feb. 5, 1885; that of Portugal followed on Feb. 14.

While the negotiations for recognition were going on the Berlin congress on African affairs met. Some of its decisions directly affected the International Association. A conventional basin of the Congo was defined, and in this conventional basin it was declared that "the trade of all nations shall enjoy complete freedom." Freedom of navigation of the Congo and all its affluents was also secured, and differential dues on vessels and merchandise were forbidden. Trade monopolies were prohibited, and provisions made for the suppression of the slave trade, and the protection of missionaries, scientists and explorers. Provision was also made for the Powers owning territory in the conventional basin to proclaim their neutrality. The International Association not having possessed, at the date of the assembling of the conference (Nov. 15, 1884) any recognized status, was not formally represented at Berlin, but the flag of the association having, before the close of the conference, been recognized as that of a sovereign state by all the powers, with the exception of Turkey, the association formally adhered to the General Act signed by the delegates to the conference on Feb. 26, 1885.

Leopold's next step was to assume his place as the sovereign of the new state. The Belgian Chamber in April 1885 authorized the king "to be the chief of the state founded in Africa by the International Association of the Congo" and declared that "the union between Belgium and the new state of the Congo shall be exclusively personal." The formal proclamation of the king's sovereignty was made on July 1, 1885, at Boma (on the north bank of the lower Congo) by Colonel (later Sir) Francis de Winton, who had succeeded Stanley as head of the local administration. This was followed by a circular letter sent to the Powers on Aug. 1 by King Leopold in which he declared the perpetual neutrality of "the Independent State of the Congo" and set out the frontiers then claimed by the state. The king had been compelled to yield to France considerable areas in the Congo basin, including the north bank of the river itself from Stanley Pool to the confluence with the Ubangi; Portugal obtained the south bank of the river from its mouth up to Noki. In a race with British agents for unappropriated regions Leopold succeeded in securing for the Congo Free State the highly mineralized region of Katanga and the only part of the Congo basin where white settlement on any scale is possible.

It was not until 1894 that an agreement was made with Great Britain defining the frontier with British possessions in Central Africa. By this agreement King Leopold also attained, for a time, an outlet on the Nile for the Congo State. This was one of his great ambitions and he had sent more than one expedition to the Upper Nile. Now by the 1894 agreement he obtained a lease from Great Britain of the Bahr-el-Ghazel province. However, in 1906 the lease was annulled, though King Leopold was permitted during his reign to hold the Lado Enclave. The whole episode was part of the struggle for supremacy in the Upper Nile and of the British efforts to obtain an "All-Red" route from the Cape to Cairo. (*See* AFRICA: *History*.)

The Arab War.—While seeking to extend the boundaries of the state the administration had many internal difficulties to overcome. Much energy was shown in establishing posts along the Congo itself and its main affluents; from the first steamers had been placed on the river and it was early determined to build a railway round the cataract region so that the produce of the upper river could be brought more easily to the markets of the world. The avowed object of the Free State was to develop the resources of the country with the aid of the natives and to the mutual benefit of blacks and whites. But it soon became apparent that the Arab slave-traders, mostly of Zanzibar origin, who had established themselves in the country between Lake Tanganyika and Stanley Falls were a serious obstacle to any progress over a large region. The state was poor—its revenues had to be supplemented from the private purse of King Leopold—and a cautious policy was enjoined on its officers who were brought into relations with the Arabs on the upper river, of whom Tippoo-Tib was the chief. In 1886 the Arabs had destroyed the state station at Stanley Falls, and it was apparent that a struggle for supremacy was inevitable. But the Free State was at that time ill prepared for a trial of strength, and at Stanley's suggestion the bold course was taken of appointing Tippoo-Tib governor of Stanley Falls, as the representative of King Leopold. This was in 1887, and for five years the *modus vivendi* thus established continued. During those years fortified camps were established by the Belgians on the Sankuru, the Lomami, and the Arumiwi, and the Arabs were quick to see that each year's delay increased the strength of the forces against which they would have to contend. In 1891 the imposition of an export duty on ivory excited much ill-will, and when it became known that, in his march towards the Nile, van Kerckhoven had defeated an Arab force, the Arabs on the upper Congo determined to precipitate the conflict. In May 1892 the murder of M. Hodister, the representative of a Belgian trading company, and of ten other Belgians on the upper Lomami, marked the beginning of the Arab war. When the news reached the lower river a Belgian expedition under the command of Commandant (afterwards Baron) Dhanis was making its way towards Katanga. This expedition was diverted to the east, and, after a campaign lasting several months, during which the Arab strongholds of Nyangwe and Kasongo were captured, the Arab power was broken and many of the leading Arabs were killed. The political and commercial results of the victory of the Free State troops were of great importance; henceforth the Free State was master of its own house. Rather it was master over the greater part. In 1895 there was a revolt of the Batetelas in the Lulua and Lomami districts. The mutineers were defeated; but in 1897 the Batetelas again revolted and took possession of a large area of the eastern portion of the state. The mutineers were not finally dispersed until near the end of 1900. In other parts of the country the state had difficulties with native chiefs, several of whom preserved their autonomy. In the central Kasai region the state had been unable to make its authority good up to the time it ceased to exist.

PYGMIES OF THE BELGIAN CONGO

Although in 1885 the Belgian Parliament had declared that the union between Belgium and the Congo was purely personal it had been foreseen that the union would become closer. In 1889 King Leopold made public certain terms of his will, dated Aug. 2 of that year, in which he bequeathed to Belgium "all our sovereign rights over the Independent State of the Congo." This was a preliminary to a request for financial help, and in 1890 Belgium granted a loan, receiving in return the option of annexing the Congo state at the end of a period of ten years and six months. Further financial difficulties led to a proposal, eventually defeated, for the annexation of the state to Belgium as from Jan. 1, 1895, and this proposal led to a Franco-Belgian convention (Feb. 5, 1895) in which the Belgian Government recognized "the right of preference possessed by France over its Congolese possessions in case of their compulsory alienation in whole or in part." In 1901 the question of the annexation of the Free State again formed the subject of prolonged discussion in the Belgian Parliament. It was decided at that time not to exercise the option possessed under the terms of the 1890 loan. At that period (1901) King Leopold opposed the immediate annexation of the state.

The Charges of Maladministration.—By this time charges highly injurious to the administration of the Free State had been publicly made. It was admitted that the state, as far as it could, had suppressed cannibalism, that it had strictly enforced anti-liquor laws, and had broken the power of the Arab slavers, but it was accused of robbing the natives of their rights, of suppressing freedom of trade and even of countenancing "atrocities." The discussions in the Belgian Parliament on the affairs of the Congo State were greatly embittered by these charges. The administration of the state had indeed undergone a complete change since the early years of its existence. A decree of July 1, 1885, had, it is true, declared all "vacant lands" the property of the state (*Domaine privé de l'état*), but it was not for some time that this decree was so interpreted as to confine the lands of the natives to those they lived upon or "effectively" cultivated. Their rights in the forest were not at first disputed, and the trade of the natives and of Europeans was not interfered with. But in 1891—when the wealth in rubber and ivory of vast regions had been demonstrated—a secret decree was issued (Sept. 21) reserving to the state the monopoly of ivory and rubber in the "vacant lands" constituted by the decree of 1885, and circulars were issued making the monopoly effective in the Aruwimi-Welle, Equator and Ubangi districts. The agents of the state were enjoined to supervise their collection, and in future natives were to be obliged to sell their produce to the state. By other decrees and circulars (Oct. 30, Dec. 5, 1892, and Aug. 9, 1893) the rights of the natives and of white traders were further restricted. The effect of these later decrees was to assign to the Government an absolute proprietary right over nearly the whole country; a native could not even leave his village without a special permit. The oppressive nature of these measures drew forth a weighty remonstrance from the leading officials, and C. Janssen, the governor, resigned. Vigorous protests by the private trading companies were also made against this violation of the freedom of trade provided for by the Berlin Act, and eventually an arrangement was made by which certain areas were reserved to the state and certain areas to private traders, but the restrictions imposed on the natives were maintained. The "concession" companies were first formed in 1891. In all of the companies the state had a financial interest as shareholder or as entitled to part profits.

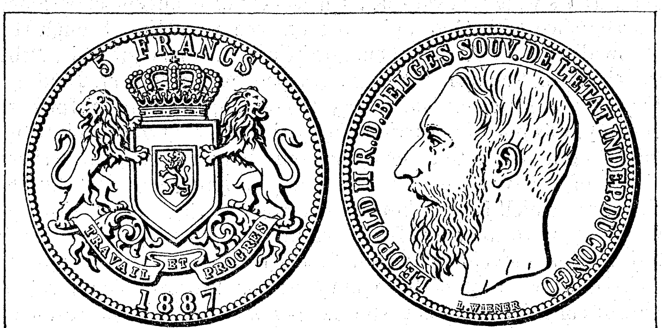
This monopolist system of exploitation was fruitful of evil. It involved, in many cases, oppressive treatment of the natives. Only in the lower Congo and a narrow strip of land on either side of the river above Stanley pool was there any freedom of trade. The situation was aggravated by the creation in 1896, by a secret decree, of the *Domaine de la couronne*, a vast territory between the Kasai and Ruki rivers, covering about 112,000 sq.m. To administer this domain, carved out of the state lands and treated as the private property of Leopold II., a *Fondation* was organized and given a civil personality. It was not until 1902 that the existence of the *Domaine de la couronne* was officially acknowledged.

The *Fondation* controlled the most valuable rubber region in the Congo, and in that region the natives appeared to be treated with great brutality. In the end of the 19th century and the early years of the 20th the charges brought against the state assumed a more and more definite character and gave rise to a strong agitation against the Congo State in the United States and elsewhere.

Action by Great Britain.—The agitation was particularly vigorous in Great Britain, and the movement entered on a new era when on May 20, 1903, the House of Commons agreed without a division to a motion requesting the Government to confer with the other signatories of the Berlin Act, "by virtue of which the Congo Free State exists, in order that measures may be adopted to abate the evils prevalent in that state."

Representations to the powers made by the British Foreign Office followed, but evoked no official response—except from Turkey. In Great Britain however the agitation was greatly strengthened by the publication of a report made by Mr. (later Sir) Roger Casement (*q.v.*), then British consul at Boma, on a journey he had made in 1903 on the Congo above Stanley Pool.[1] The Congo administration denied most of the charges made in the Casement report—in particular it adduced evidence going to show that the cases of mutilation of natives which had occurred were neither the work of nor approved by the agents of the state, but were customary punishments inflicted by the chiefs on their people; methods of barbarism which the state had not so far been able to eradicate. The efforts to disprove the charge that the state had become a monopolistic trading concern, to the detriment of the natives as well as to would-be white merchants, were not successful. Belgian public opinion was aroused and critical, and this led to the appointment by King Leopold in July 1904 of a commission of enquiry to visit the Congo.

The Commission of Enquiry.—The commission was composed of M. Edmond Janssens, advocate-general of the Belgian Cour de Cassation, who was appointed president; Baron Giacomo Nisco, president *ad interim* of the court of appeal at Boma; and Dr. E. de Schumacher, a Swiss councillor of state and chief of the department of justice in the canton of Lucerne. Its stay in the Congo State lasted from Oct. 5, 1904, to Feb. 21, 1905, and its



FROM "NUMISMATIQUE DU CONGO," BY PERMISSION OF A. MAHIEU

FIVE FRANC PIECE, REVERSE AND OBVERSE, STRUCK FOR THE CONGO FREE STATE THREE YEARS AFTER ITS ORGANIZATION

report appeared in Nov. 1905. While expressing admiration for the signs which had come under its notice of the advance of civilization in the Congo State, the commission confirmed the reports of the existence of grave abuses in the upper Congo, and recommended a series of measures which would, in its opinion, suffice to ameliorate the evil. It approved the concessions system in principle and regarded forced labour as the only possible means of turning to account the natural riches of the country, but recognized the need for a liberal interpretation of the land laws, effective application of the law limiting the amount of labour exacted from the natives to 40 hours per month, the withdrawal from the concession companies of the right to employ compulsory measures, the regulation of military expeditions, and the freedom of the courts from administrative tutelage. Simultaneously with the report of the commission of enquiry, a decree was published appointing a commission to study the recommendations contained in the report, and to formulate detailed proposals. The report of the reforms commission was not made public, but as the fruit of its deliberations King Leopold signed on June 3, 1906, decrees embodying various changes in the administration of the Congo State. By the advocates of radical reforms these measures were regarded as utterly inadequate, and even in Belgium, among those friendly to the Congo State system of administration, some uneasiness was excited by a letter which was published along with the decrees, wherein King Leopold intimated that certain conditions would attach to the inheritance he had designed for Belgium. Among the obligations which he enumerated as necessarily and justly resting on his legatee was the duty of respecting the arrangements by which he had provided for the establishment of the *Domaine de la couronne* and the *Domaine privé de l'état.*

Annexation by Belgium.—The Belgian Parliament looked with disfavour on this latest indication of King Leopold's policy and in Dec. 1906 resolved that a committee appointed in 1901 to study the conditions which should govern the Congo State when it became a Belgian possession should "hasten its labours." While the committee was sitting, further evidence was forthcoming that the system complained of on the Congo remained unaltered, and that the "reforms" of June 1906 were illusory. Not only in Great Britain and the United States did the agitation against the administration of the Congo State gain ground, but in Belgium and France reform associations enlightened public opinion. The Government of Great Britain let it be known that its patience was not inexhaustible, while the Senate of the United States declared that it would support President Roosevelt in his efforts for the amelioration of the condition of the inhabitants of the Congo.

It was clear that Belgium would have to undertake responsibility for the Free State before long, and in Nov. 1907 a treaty was signed for the cession of the state. Some of its terms revealed clearly the proprietorial attitude Leopold adopted. These terms stipulated for the maintenance of the *Fondation de la couronne.* This "government within a government" was secured in all its privileges, its profits as heretofore being appropriated to allowances to members of the royal family and the maintenance and development of "works of public utility" in Belgium and the Congo, those works including schemes for the embellishment of the royal palaces and estates in Belgium and others for making Ostend "a bathing city unique in the world." The state was to have the right of redemption on terms which, had the rubber and ivory produce alone been redeemed, would have cost Belgium about £8,500,000. These terms were preposterous and had not long been published before it was realized that the treaty would not be accepted by the Belgian Parliament unless they were modified. So negotiations were begun again. While they were in progress the British Government again expressed its views, and in very monitory language. In Feb. 1908 a British parliamentary paper was issued (*Africa No. 1,* 1908) containing consular reports on the state of affairs in the Congo. Mr. W. G. Thesiger, consul at Boma, in a memorandum on the application of the labour tax, after detailing various abuses, added, "The system which gave rise to these abuses still continues unchanged, and so long as it is unaltered the condition of the natives must remain one of veiled slavery." On the same day the British foreign secretary, Sir Edward Grey (afterwards Viscount Grey of Fallodon, *q.v.*), declared that the Congo State had "morally forfeited every right to international recognition."

This declaration by Sir Edward Grey, together with the report of W. G. Thesiger, a man whose testimony was unimpeachable, virtually ended the conflict. King Leopold hastened to make such terms as he could. On March 5, 1908, an additional act was signed in Brussels annulling the clauses in the treaty of cession concerning the *Fondation,* though the king obtained very generous compensation for the surrender of that domain. Finally the Belgian Chamber, after some four months' debate adopted, Aug. 20, 1908, the treaty of cession, the additional act and a law setting out the principles upon which the new colony should be governed.

[1]Roger Casement's association with Germany during World War I led to a legend that Germany had fomented the Congo atrocities agitation for its own purposes. There was no evidence to support this legend. Neither did Casement's treason in 1914–16 affect the truth of a report made in 1903.

These measures were voted by the senate on Sept. 9, 1908, and on Nov. 14 the "Congo Free State" ceased to exist. On Nov. 15 the Belgian government assumed authority without ceremony.

This assumption of authority by Belgium was not lightly undertaken. The legislature had the matter under consideration for 14 years and public opinion in Belgium was perturbed by the prospect of taking over the administration of a vast, distant and badly administered territory, likely to be a financial drain upon the resources of Belgium for years. But Belgium assumed its heavy task with the determination that as a colonial possession the Congo territory should be honestly governed, and in real agreement with the humanitarian principles which Leopold II had never ceased to profess.

CONGREGATION, an assembly of persons, especially a body so assembled for religious worship, or habitually attending a particular church, and hence the basis of the religious system known as Congregationalism (*q.v.*) (Lat. *congregatio*, a gathering together, from *cum*, with, *grex*, a flock). In the English versions of the Bible "congregation" is used to translate Heb. *'edāh*, the whole community of the Israelites, and *kāhāl*, the assembly of the people; but in the Revised Version "congregation" is kept for the first (LXX. συναγωγή) and "assembly" for the second (LXX. ἐκκλησία). In the Roman Church the word is used in several senses.

(1) The congregations or committees of the college of cardinals which form administrative departments, *e.g.*, the congregations of Propaganda, Rites, etc. (*see* CURIA ROMANA).

(2) The committees of bishops for the regulation of procedure at general councils.

(3) The branches of a religious order, following its general rule, but forming separate groups, each with its special constitution and observances. Thus the Trappists are a congregation of the Cistercian order, itself an offshoot of Benedictine monasticism.

(4) Communities of religious under rule, composed of persons who have taken no vows or have not taken "solemn" vows, such as the Oratorians, Oblates and Lazarists.

(5) In France, religious associations of lay persons, male or female, for some pious, charitable or educational purpose (*see* FRENCH LAW AND INSTITUTIONS).

In secular usage there are two congregations or governing bodies of the university of Oxford, viz., the "Ancient House of Congregation," which, consisting of the vice-chancellor, proctors and regent masters, grants and confers degrees, and the "Congregation of the University of Oxford," created by act of parliament in 1854, and consisting of all members of convocation who are technically resident. All statutes must be passed by this congregation before their introduction in convocation, and it alone has the power of amending statutes. In the university of Cambridge congregation is the term used of the meeting of the senate. In Scottish history, the frequent occurrence of the word, in the sense of "church," in the national covenant of 1537, gave the name of "congregation" to the reforming party, and the signatories of the covenant were generally known as "lords of the congregation."

CONGREGATIONALISM, the name given to that type of church organization in which the autonomy of the local church, or body of persons wont to assemble in Christian fellowship, is fundamental. Varied as are the forms which this idea has assumed under varying conditions of time and place, it remains distinctive enough to constitute one of the three main types of ecclesiastical polity, the others being Episcopacy and Presbyterianism. It regards church authority as inherent in each local body of believers, as a miniature realization of the whole Church, which can itself have only an ideal corporate being on earth. But while in practice it is religious democracy, in theory it claims to be the most immediate form of theocracy, God Himself being regarded as ruling His people directly through Christ as Head of the Church, whether Catholic or local. So viewed, Congregationalism is essentially a "high *church*" theory, as distinct from a high *clerical* one. It springs from the religious principle that each body of believers in actual church-fellowship must be free of all external human control, in order the more fully to obey the will of God as conveyed to conscience by His Spirit. Here responsibility and privilege are correlatives. This, the negative aspect of the congregational idea, has emerged at certain stages of its history as Independency. Its positive side, with its sense of the wider fellowship of "the Brotherhood" (1 Pet. v. 9, *cf.* ii. 17), has expressed itself in varying degrees at different times, according as conditions were favourable or the reverse. But catholicity of feeling is inherent in the congregational idea of the church, inasmuch as it knows no valid use of the term "church" intermediate between the local unit of habitual Christian fellowship and the church universal. On such a theory confusion between full catholicity and loyalty to some partial expression of it is minimized, and the feeling for Christians as such, everywhere and under whatever name, is kept pure.

Congregationalism proper, as a theory of the organized Christian life contemplated in the New Testament, emerges at the Reformation, with its wide recovery of such aspects of evangelic experience as acceptance with God and constant access to Him through the sole mediation of Christ. The practical corollary of this, "the Priesthood of Believers," though grasped by Luther (*cf.* Lindsay, *Hist. of the Reformation*, i. 435 ff.) and continental reformers generally, was not fully carried out by them in church organization. This was due partly to a sense that only here and there was there a body of believers ripe for the congregational form of church-fellowship, which Luther himself regarded as the New Testament ideal, partly to fear of Anabaptism, the radical wing of the Reformation movement, which first strove to recover primitive Christianity apart altogether from traditional forms. The development of congregational churches proper was gradual, the result of constant study of "the Word of God" in the light of experience. The process can be traced most clearly in London.[1] There, owing to measures taken in 1565–1566 to enforce clerical subscription to the authorized order of worship, especially touching vestments, certain persons of humble station began to assemble in houses "for preaching and ministering the sacraments" (Grindal's *Remains*, lxi.). This led in June 1567 to the arrest of some fifteen out of a hundred men and women assembled in Plumbers' Hall (ostensibly for a wedding), none of whom, to judge from the eight examined, was a minister. Probably they were not long kept in prison, for six of them were among a similar body of 77 persons "found together" in a private house on March 4, 1568, the leaders of whom were imprisoned, and liberated only after "one

[1]Here in 1561, appeared *A Confession of faith, made by common consent of divers reformed Churches beyond the seas; with an Exhortation to the Reformation of the Church.* It advocated "the polity that our Saviour Jesus Christ hath established," with "pastors, superintendes, deacons"; so that "all true pastors have equal power and authority . . . and for this cause, that no church ought to pretend any rule or lordship over other"; and none ought "to thrust himself into the government of the Church [as by ordination at large], but that it ought to be done by election." *See* C. Burrage, *The Church-Covenant Idea* (1904), p. 43.

whole year," early in May 1569 (*ibid.* pp. 316 ff.). Perhaps it was between 1567 and 1568 that they began to organize themselves more fully in conjunction with four or five of the suspended clergy, with elders and deacons of their own appointing (Grindal, *Zürich Letters,* lxxxii.; *Remains,* lxi.). This act of ordaining ministers, probably after the Genevan order—which they certainly used from May 1568—and their excommunication of certain deserters from their "church" (so Grindal), clearly mark the fact that this body of some 200 persons had now deliberately taken up a position outside the national church, as being themselves a "church" in a truer sense than any parish church, inasmuch as they conformed to the primitive pattern. Their ideal is embodied in a manifesto set forth about 1570 under the title *The True Marks of Christ's Church,* etc., and signed by "Richard Fytz, Minister," as being "the order of the Privy Church in London, which by the malice of Satan is falsely slandered."

"The minds of them that by the strength and working of the Almighty, our Lord Jesus Christ, have set their hands and hearts to the pure, unmingled and sincere worshipping of God, according to his blessed and glorious Word in all things, only abolishing and abhorring all traditions and inventions of man whatsoever, in the name of Religion and Service of our Lord God, knowing this always: that the true and afflicted Church of our Lord and Saviour Jesus Christ either hath, or else ever more continually under the cross striveth for to have,

"First and foremost, the Glorious word and Evangel preached, not in bondage and subjection [*i.e.,* by episcopal licence], but freely and purely.

"Secondly, to have the Sacraments ministered purely, only and altogether according to the institution and good worde of the Lord Jesus, without any tradition or invention of man.

"And last of all, to have not the filthy Canon law, but discipline only and altogether agreeable to the same heavenly and almighty worde of our good Lord, Jesus Christ."

Here we have essential Congregationalism, formulated for the first time in England as the original and genuine Christian polity, and as such binding on those loyal to the Head of the Church. All turns, as we see from the petition addressed in 1571 to the queen by twenty-seven persons (the majority women, possibly wives in some cases of men in prison), upon the duty of separation with a view to purity of Christian fellowship (2 Cor. vi. 17 f.), and upon moral discipline "by the strength and sure warrant of the Lord's good word, as in Matt. xvii. 15–18 (1 Cor. v.)" were it only in a church of "two or three gathered in the Name." Whatever may be thought of the application of these principles, there is no mistaking the deeply religious aim of these separatists for conscience' sake, viz., the realizing of the Christian ideal in personal conduct, in a fellowship of souls alike devoted to the Highest; nor can it be doubted that the "mingled" communion of the parish churches made church "fellowship" in the apostolic sense a practical impossibility. This was confessed alike by the bishops (*e.g.,* Whitgift) and by the Puritans, who maintained the paramount duty of remaining within the queen's church and there working for the further reformation which they recognized as sadly needed by English religion. But the radical "Puritans" (the above documents in the State Paper Office are endorsed "Bishop of London: Puritans") felt that this meant treason to the Headship of Christ in His Church; and that until the prince should set aside "the superstition and commandments of men," and "send forth princes and ministers (like another Josiah), and give them the Book of the Lord, that they may bring home the people of God to the purity and truth of the apostolic Church, they could do no other than themselves live after that divine ideal. They were not separated of their own choice, but by the word of God acting on their consciences."

Robert Browne.—"Reformation without tarrying for Anie" was the burden laid on the heart of these Congregational pioneers; and it continued to press heavily on many, both "Separatists" and conforming "Puritans" (to use the nicknames used by foes), before it became written theory in Robert Browne's work under that title, published at Middelburg in Holland in 1582 (*see* BROWNE, ROBERT). The story of the many attempts made in the interval by "forward" or advanced Puritans to secure vital religious fellowship within the queen's Church, and of the few cases in which these shaded off into practical Separatism, is still wrapped in some obscurity.[1] But tentative efforts within parochial limits, by accustoming the more godly sort to feel an inner bond peculiar to themselves, prepared many for the congregational idea of the church, and on the other hand made them feel more than ever dissatisfied with the "mixed" services of the parish church. It seemed to them impossible that vital religion could be inculcated, unless there were other guarantee for ministerial fitness than episcopal licensing, unless in fact the godly in each parish had a voice in deciding whether a man was called of God to minister the Word of God (*see* C. Burrage, *The True Story of Robert Browne,* pp. 7, 11 f.). But this implied the gathering of the earnest "professors" in each locality into a definite body, committed to the Gospel as their law of life. Such a "gathered church" emerges as the great desideratum with Robert Browne between 1572, when he graduated at Cambridge, and 1580–81 when he first defined his Separatist theory. It involved for him a definite "covenant" entered into by all members of the church, with God and with God's people, to abide by Christ's laws as ruling all their conduct, individually and collectively.

From Browne's idea of a holy people, covenanted to walk after Christ's mind and will, all else flowed, as is set forth in his *Book which sheweth the life and manners of all true Christians.* As it may be called the primary classic of congregational theory, its leading principles must here be summarized. Since the hearing of the word of God unto obedience is due to "the gift of His Spirit to His children," every church member is a spiritual person, with a measure of the spirit and office of king, priest and prophet, to be exercised directly under the supreme Headship of Christ. Thus mutual oversight and care are among the duties of the members of Christ's body; while their collective inspiration, enabling them to "try the gifts of godliness" of specially endowed fellow-members, is the divine warrant in election to church office. Thus the "authority and office" of "church governors" is not derived from the people, but from God, "by due consent and agreement of the church." Conference between sister churches for counsel is provided for; so that, while autonomous, they do not live as isolated units. Such were the leading features of Browne's Congregationalism, as a polity distinct from both Episcopacy and Presbyterianism. Any varieties in the congregational genus which emerge later on, keep within his general outlines. To this fact the very nickname "Brownists," usually given to early "Separatists" by accident, but Congregationalists in essence, is itself witness.

"The kingdom of God was not to be begun by whole parishes, but rather of the worthiest, were they never so few." This sentence from Browne's spiritual autobiography contains the root of the whole matter, and explains the title of his other chief work, also of 1582, *A Treatise of Reformation without tarrying for any, and of the wickedness of those Preachers which will not reform till the Magistrate command or compel them.* Here he, first of known English writers, sets forth a doctrine which, while falling short of the Anabaptist theory that the civil ruler has no standing in the affairs of the Church, in that religion is a matter of the individual conscience before God, yet marks a certain advance upon current views. Magistrates "have not that authority over the church as to be . . . spiritual Kings . . . but only to rule the commonwealth in all outward justice. . . . And therefore also because the Church is in a commonwealth, it is of their charge; that is, concerning the outward provision and outward justice, they are to look to it. But to compel religion, to plant churches by power, and to force a submission to ecclesiastical government by laws and penalties, belongeth not to them . . . neither yet to the Church" (*Treatise,* etc., p. 12). Here Browne distinguishes acceptance of the covenant relation with God (religion) and the forming or "planting" of churches on the basis of God's covenant (with its laws of government), from the enforcing of the covenant voluntarily accepted, whether by church-excommunication or by civil penalties—the latter only in cases of flagrant impiety, such as idolatry, blasphemy or Sabbath-breaking. In virtue of this distinction which implied that the nation was not actually in

[1] *See,* however, *The Presbyterian Movement in the reign of Queen Elizabeth, as illustrated by the Minute Book of the Dedham Classics 1582–1589* (Camden Society, 3rd series, vol. viii., 1905).

covenant with God, he taught a relative toleration. In this he was in advance even of most Separatists, who held with Barrow[1] "that the Prince ought to compel all their subjects to the hearing of God's Word in the public exercises of the church." As, however, the prince might approve a false type of Church, in spite of what they both *assumed* to be the *clear* teaching of Scripture, and should so far be resisted, Browne and Barrow found themselves practically in the same attitude towards the prince's religious coercion. It was part of their higher allegiance to the King of kings.

Between 1580 and 1581, when Browne formed in Norwich the first known church of this order on definite scriptural theory, and Oct. 1585, when, being convinced that the times were not yet ripe for the realization of the perfect polity, and taking a more charitable view of the established Church, he yielded to the pressure brought to bear on him by his kinsman Lord Burghley, so far as partially to conform to parochial public worship as defined by law (*see* BROWNE, ROBERT), the history of Congregationalism is mainly that of Browne and of his writings. Their effect was considerable, to judge from a royal proclamation against them and those of his friend Robert Harrison, issued in June 1583. But the repression of "sectaries" was now, and onwards until the end of the reign, so severe that the organization of churches was impossible. We can trace none in England, until we come in 1586 to Greenwood and Barrow, the men whose devotion to a cause in which they felt the imperative call of God seems to have rallied into church-fellowship the Separatists in London, whether those of Fytz's day or those later convinced by the failure of the Puritan efforts at reform and by the writings of Browne. At what exact date this London church—which had a more or less continuous history down to and beyond 1624—was actually formed, is open to doubt. It was only in Sept. 1592 that it elected officers, viz., a pastor (Francis Johnson), a teacher (Greenwood), two deacons and two elders. Yet as Barrow held that a church could exist prior to its ministry, this settles nothing. In 1589 Greenwood and Barrow composed "A true Description out of the Word of God of the visible Church," which represents the ideal entertained in their circle. It was practically identical with that set forth by Browne in 1582, though they were at pains to deny personal connection with him whom they now regarded as an apostate.

Exile in Holland.—After the execution of Greenwood, Barrow and the ex-Puritan Penry (a recent recruit to Separatism), in the spring of 1593, it seemed to some that Separatism was "in effect extinguished." This was largely true for the time as regards England, thanks to the rigour of Archbishop Whitgift, aided by the new act which left those who denied the queen's power in ecclesiastical matters no option but to leave the realm. Even this hard fate the bulk of the London church was ready to endure. Gradually they resumed church-fellowship in Amsterdam, where the learned Henry Ainsworth (*q.v.*) became their leader in place of Greenwood. More important historically is the church which was formed originally at Gainsborough (?1602), by "professors" trained under zealous Puritan clergy in the district where Nottinghamshire, Yorkshire and Lincolnshire meet, but which about 1606 reorganized itself for reasons of convenience into two distinct churches, meeting at Gainsborough and in Scrooby Manor House. Ere long these also were forced to seek refuge, in 1607 and 1608 respectively, at Amsterdam, whence the Scrooby church moved to Leiden in 1609 (Bradford's *History of Plymouth Plantation*, chs. 1–3). The permanent issues of the Gainsborough-Amsterdam church are connected with the origins of the Baptist wing of Congregationalism, through John Smyth and Thomas Helwys (*see* BAPTISTS). As for the Scrooby-Leiden church under John Robinson (*q.v.*), it was in a sense the direct parent of historical "Congregationalism" in England and America (*see* U.S. section, p. 251).

Separatism was now passing into Congregationalism,[2] both in sentiment and in language. The emphasis changes from protest to calm exposition. In the freer atmosphere of Holland the exiles lose the antithetical attitude, with its narrowing and exaggerative tendency, and gain breadth and balance in the assertion of their distinctive testimony. This comes out in the writings both of Robinson and of Henry Jacob, both of whom passed gradually from Puritanism to Separatism at a time when the silencing of some 300 Puritan clergy by the canons of 1604, and the exercise of the royal supremacy under Archbishop Bancroft, brought these "brethren of the Second Separation" into closer relations with the earlier Separatists. In a work of 1610, the sequel to his *Divine Beginning and Institution of Christ's true Visible and Ministerial Church,* Jacob describes "an entire and independent[3] body-politic," "endued with power immediately under and from Christ, as every proper church is and ought to be." But his claim for "independent" churches no longer denies that true Christianity exists within parish assemblies. Similarly Robinson wrote about 1620 a *Treatise of the Lawfulness of hearing of the Ministers of the Church of England* which shows a larger catholicity of feeling than his earlier *Justification of Separation* (1610). These semi-separatists still set great store by the church-covenant, in which they bound themselves "to walk together in all God's ways and ordinances, according as He had already revealed, or should further make them known to them." But they realized that "the Lord had more truth and light yet to break forth of his Holy Word"; and this gave them an open-minded and tolerant spirit, which continued to mark the church in Plymouth Colony, as distinct from the Puritans of Massachusetts Bay. Such, then, was the type of church formed in 1616 by Henry Jacob when he returned to London. It was founded under the tolerant Archbishop George Abbot (1562–1633), and would have been content with toleration such as the French and Dutch churches in England enjoyed. But Charles I. and Archbishop Laud would make no terms with those who denied royal supremacy in religion, and in 1632 this church was persecuted.

Independency.—Besides such regular churches in London and the provinces under the early Stuarts, there were also numerous "conventicles" composed of very humble folk, such as the eleven scattered about London which Bishop Joseph Hall (1574–1656) reports in 1631, and which he states in 1640 had grown to some eighty. In these latter the earlier Brownist or even Anabaptist spirit probably prevailed. Further there was arising a new type of "Independent," to use the term now coming into use. Conjoint repression of civil and religious liberty had made thoughtful men ponder matters of church polity. The majority, indeed, even of determined opponents of personal rule in state and church favoured Presbyterianism, particularly before 1641, when Henry Burton's *Protestation Protested* brought before educated men generally the principles of Congregationalism, as distinct from Puritanism. But besides this telling pamphlet and the controversy which ensued, the experience of New England as to the practicability of Congregationalism, at least in that modified form known as the "New England Way," produced a growing impression, especially on parliament. Hence even before the Westminster Assembly met in July 1643, Independency could reckon among its friends men of distinction in the state, like Cromwell, Sir Harry Vane, Lord Saye and Sele; while Milton powerfully pleaded the power of Truth to take care of herself on equal terms. In the assembly, too, its champions were fit, if few. They included Thomas Goodwin and Philip Nye, who had practised this polity during exile abroad and now strove to avert the substitution of Presbyterian uniformity for the Episcopacy which, as the ally of absolutism, had alienated its own children. Yet the "Five Dissenting Brethren" would have failed to secure toleration even for themselves as Congregationalists—such was the dread felt by the assembly for Anabaptists, Antinomians, and other "sectaries"—had it not been for the vaguer, but widespread Independency existing in parliament and in the army. Here, then, we meet with a distinction (*cf.* Dale, p. 374 ff.) of moment for the Commonwealth era, between "Independency" as a prin-

[1] *See* F. J. Powicke, *Henry Barrow Separatist (1550?–1593) and the Exiled Church of Amsterdam (1593–1622)* (1900), pp. 128 foll., for his views on the topic.

[2] The abstract term dates only from 18th century. But "congregational" (due to rendering of *ecclesia* by "congregation" in early English Bibles) appears about 1642, to judge from *New English Dictionary*.

[3] "Independent" is not yet used technically, as it came to be about 1640.

ciple and "Congregationalism" as an ideal of church polity. Independency, like nonconformity, is primarily a negative term. It simply affirms the right of any society of private persons to meet together for worship, without being interfered with by any external authority.[1] Such a right may be asserted on other theories than the congregational or even the Christian. Congregationalism, however, denotes a *positive* theory of the organization and powers of Christian churches, having as corollary independency of external control, whether civil or ecclesiastical. Historically the two terms have been used interchangeably during the last two hundred years. But under the Commonwealth many professed the one without fully accepting the other.

During the Civil War Congregationalism broadened out into reciprocal relations with the national life and history. Thenceforth it involves not only the story of Nonconformity and the growth of religious liberty, but also the whole development of modern England. To sketch even in outline "The Evolution of Congregationalism" in correspondence with so complex an environment is here impossible. Only salient points can be indicated.

Development After the Restoration.—During the Protectorate, with its practical establishment of Presbyterians, Independents and Baptists, the position of Congregationalism was really anomalous, in so far as any of its pastors became parish ministers,[2] and so received "public maintenance" and were expected to administer the sacraments to all and sundry. But the Restoration soon changed matters, and by forcing Presbyterians and Congregationalists alike into Nonconformity, placed the former, instead of the latter, in the anomalous position. In practice they became Independents, after trying in some cases to create voluntary presbyteries, like Baxter's associations, adopted partially in 1653–1660, in spite of repressive legislation. But though Presbyterians did not in many instances become Congregationalists also, until a later date, the two types of Puritanism were drawn closer together in the half-century after 1662. The approximation was mutual. Both had given up the strict *jure divino* theory of their polity as apostolic. The Congregationalism of the Savoy Declaration (Oct. 12, 1658), agreed on by representatives—the majority non-ministerial—from 120 churches, is one tempered by experience gained in Holland and New England, as well as in the Westminster Assembly. Hence when, after the Toleration Act of 1689, a serious attempt was made to draw the two types together on the basis of *Heads of Agreement assented to by the United Ministers in and about London, formerly called Presbyterian and Congregational,* the basis partook of both (much after the fashion of the New England Way), though on the whole it favoured Congregationalism (*see* Dale, pp. 474 ff.). In many trust-deeds of this date (which did not contain doctrinal clauses), and for long after, the phrase "Presbyterian or Independent" occurs. Yet the two gradually drifted apart again owing to doctrinal differences, emerging first on the Calvinistic doctrine of grace, and next on Christology. In both cases the Congregationalists took the "high," the Presbyterians the "moderate" view. These specific differences revealed different religious tendencies,[3] the one type being more warmly Evangelical, the other more "rational" and congenial in temper with 18th-century Deism. The theological division was accentuated by the Salters' Hall Controversy (1717–1719), which, nominally touching religious liberty *versus* subscription, really involved differences as to Trinitarian doctrine. Ere long Arianism and Socinianism were general among English Presbyterians (*see* UNITARIANISM). Congregationalists, on the other hand, whether Independents or Baptists, remained on the whole Trinitarians, largely perhaps in virtue of their very polity, with its intimate relation between the piety of the people and that of the ministry. Yet the relation of Congregational polity to its religious ideal had already become less intimate and conscious than even half a century before: the system was held simply as one traditionally associated with a serious and unworldly piety. "Church privileges" meant to many only the sacred duty of electing their own ministry and a formal right of veto on the proposals of pastor and deacons. The fusion into one office of the functions of "elders" and "deacons" (still distinguished in the Savoy Declaration of 1658) was partly at least a symptom of the decay of the church-idea in its original fulness, a decay itself connected with the general decline in spiritual intensity which marked 18th-century religion, after the overstrain of the preceding age. Yet long before the Evangelical Revival proper, partial revivals of a warmer piety occurred in certain circles; and among the Independents in particular the new type of hymnody initiated by Isaac Watts (1707) helped not a little.

The Methodist movement touched all existing types of English religion, but none more than Congregationalism. While the "rational" Presbyterians were repelled by it as "enthusiasm," the Independents had sufficient in common with its spirit to assimilate—after some distrust of its special ways and doctrines—its passion of Christlike pity for "those out of the way," and so to take their share in the wider evangelization of the people and the Christian philanthropy which flowed from the new inspiration. For underneath obvious differences, like the Arminian theology of the Wesleys and the Presbyterian type of their organization, there was latent affinity between a "methodist society" and the original congregational idea of a church; and in practice Methodism, outside the actual control of the Wesleys, in various ways worked out into Congregationalism (*see* Mackennal, *op. cit.* pp. 156 ff., Dale, pp. 583 ff.). So was it in the long run with the Countess of Huntingdon's Connection, springing from Whitefield's Calvinistic wing of the Revival, not to mention the congregational strain in some minor Methodist churches.

But whilst Congregationalism grew thereby in numbers and in a sense of mission to all sorts and conditions of men, it modified not only its Calvinism but also its old church ideal in the process. During most of the next century it inclined to an individualism untempered by a sense of mystic union with God and in Him with all men (*see* Dale, pp. 387 ff., for an estimate of these and other changes). It lost, however, its exclusive spirit. Its pulpit, which had always been the centre of power in the churches, has for a century or more taken a wider range of influence in a succession of notable preachers. Congregationalists generally have been to the fore in attempts to apply Christian principles to matters of social, municipal, national and international importance. They have been steady friends of foreign missions in the most catholic form (supporting the London Missionary Society, founded in 1795 on an inter-denominational basis), of temperance, popular education and international peace. Their weakness as a denomination has lain latterly in their very catholicity of sympathy. Thus it was left to the Oxford Revival, with its emphasis on certain aspects of the Church idea, to help to re-awaken in many Congregationalists a due feeling for specific church-fellowship, which was the main passion with their forefathers. Another influence making in the same direction, but in a different spirit, was the Broad Church ideal represented in various forms by Thomas Erskine of Linlathen, F. W. Robertson of Brighton and F. D. Maurice. In the last of these the conception of Christ's Headship of the human race assumed a specially inspiring form. This conception, in a more definitely Biblical and Christian shape, attained forcible expression in the writings of R. W. Dale of Birmingham, the most influential Congregationalist in the closing decades of the 19th century, in whom lived afresh the high Congregationalism of the early Separatists.

Modern Tendencies.—Modern Congregationalism, as highly sensitive to the *Zeitgeist* and its solvent influence on dogma, shared for a time the critical and negative attitude produced by the first impact of a culture determined by the conception of

[1]The opposite of this external Independency, admission of civil oversight even for churches enjoying internal ecclesiastical self-government, was also common, being the outcome of the traditional Puritan attitude to the state. *See* A. Mackennal, *The Evolution of Congregationalism* (1901), pp. 43 ff.

[2]For the distinction between "Gathered" and "Re-formed" churches in this connection, *see* Dale, p. 376.

[3]A parallel is afforded by the history of Congregationalism in Scotland, which arose early in the 18th century through the evangelistic fervour of the Haldanes in an era of "moderatism"; also by the rise of the kindred Evangelical Union, shortly before the Disruption in 1843. These two movements coalesced in a single Congregational Union in 1896.

development as applying to the whole realm of experience. But it has largely outgrown this, and is addressing itself to the progressive re-interpretation of Christianity, in an essentially constructive spirit. Similarly its ecclesiastical statesmen have been developing the full possibilities of its polity, to suit the demands of the time for co-ordinated effort. While its principle of congregational autonomy has been gaining ground in the more centralized systems, whether Episcopal or Presbyterian, its own latent capacity for co-operation has been evoked by actual needs to a degree never before realized in England. Association for mutual help and counsel, contemplated in some degree in the early days, from Browne to the Savoy Declaration of 1658, but thereafter forced into abeyance, began early in the 19th century to find expression in County Unions on a voluntary basis, especially for promoting home missionary work. These in turn led on to the Congregational Union of England and Wales, formed in 1832, and consisting at first of "County and District Associations, together with any ministers and churches of the Congregational Order recognized by an Association." Later it was found that an assembly so constituted combined the incompatible functions of a council for the transaction of business and a congress for shaping or expressing common opinion: and its constitution was modified so as to secure the latter object only. But after half a century's further experience, public opinion, stimulated by growing need for common action in relation to certain practical problems of home and foreign work, proved ripe for the realization of the earlier idea in its double form. In 1904 the Union was again modified so as to embrace (1) a council of 300, representative of the county associations, to direct the business for which the Union as such is responsible, and (2) a more popular assembly, made up of the council and a large number of direct representatives of the associated churches. Association, however, remains as before voluntary, and some churches are outside the Union; nor has a resolution of the assembly more than moral authority for any of the constituent churches. As regards the "Declaration of Faith, Church Order and Discipline" adopted in 1833, and still printed in the official Year Book "for general information" as to "what is commonly believed" by members of the Union, what is characteristic is the attitude taken in the preliminary notes to "creeds and articles of religion." These are disallowed as a bond of union or test of communion, much as in the Savoy Declaration of 1658 it is said that constraint "causeth them to degenerate from the name and nature of Confessions," "into Exactions and Impositions of Faith."

Among topics which have exercised the collective mind of modern Congregationalism, and still exercise it, are church-aid and home missions, church extension in the colonies, the conditions of entry into the ministry and sustentation therein, Sunday school work, the social and economic condition of the people (issuing in social settlements and institutional churches), and, last but not least, foreign missions. Indeed the support of the London Missionary Society has come to devolve almost wholly on Congregationalists, a responsibility recognized by the Union in 1889 and again in 1904. To afford a home for the centralized activities of the Union, the Memorial Hall, Farringdon Street, London, was built on the site of the Fleet prison—soil consecrated by sacrifice for conscience under Elizabeth—and opened in 1875. There the Congregational Library, founded a generation before, is housed, as well as a publication department. A congregational hymn-book (including Watts' collection) was issued by the Union in 1836, and again in fresh forms in 1859, 1873 and 1887.

The *theological colleges* which train for the Congregational ministry have themselves an interesting history, which goes back to the private "academies" formed by ejected ministers. They underwent great extension owing to the evangelical revival, and became largely centres of evangelistic activity (Dale, p. 593 ff.). But they were burdened by the necessity of supplying literary as well as theological training, owing to the disabilities of nonconformists at Oxford and Cambridge till 1871. Even before that, however, owing partly to the impulse given by the university of London after 1836, the standard of learning in some of the colleges had been rising; and the last generation has seen marked advance in this respect. In 1886 Spring Hill college, Birmingham, was transplanted to Oxford, where it was refounded under the title of Mansfield college, purely for the post-graduate study of theology (first principal, Dr. A. M. Fairbairn); in 1905 Cheshunt college, founded by the countess of Huntingdon, was transferred to Cambridge, whilst the creation of the university of Wales, the reconstitution of London University, and the creation of Manchester University, led, between 1900 and 1905, to the affiliation to them of one or more of the other colleges. Indeed in all cases the students are now in some sort of touch with a university or university college. There are eight colleges in England, viz., besides Mansfield and Cheshunt, New and Hackney colleges, London; Western college, Bristol; Yorkshire United college, Bradford; Lancashire Independent college, Manchester; the Congregational Institute, Nottingham.

The outstanding features in the development of Congregationalism during the first quarter of the 20th century have been an intensifying of the denominational consciousness and a strengthening of the tendency towards Connectionalism. On its practical side this forward movement took the form of collecting £500,000 in order to establish the various organizations of Congregationalism on a sounder financial basis, and to supply more adequate retiring pensions for aged ministers. The latter object was the main element in the scheme, proving conclusively that the Congregational Union is now more prepared than it was to recognize some corporate responsibility for its ministers. This point was further emphasized by certain new and more stringent regulations for the admission and recognition of ministers. The normal entry to the ministry is through a recognized college. Failing this, exceptional cases may be provided for by a three years' probation and periodic examinations under the supervision of a county union. Nothing here interferes with the autonomy of the individual church. Churches are still at liberty to call whom they will to minister to them. But recognition by the union and a share in the union grants and superannuation funds is only available for those who submit to the conditions which the union imposes. The churches generally have accepted these conditions which safeguard their interests as well as those of the ministers and establish the status of the ministry on a much more satisfactory footing.

In 1919 the country was divided into nine administrative areas called provinces and a moderator appointed over each area to act as adviser and "Father in God" to the churches within it. The tentative scheme then adopted was after a few years' trial amended in 1924. It was provided that the provinces should be formed by the grouping of county unions, and that a moderator, who might be either a minister or a layman, should be appointed for each such group. The moderators act in concert with the county union executives, and with special provincial committees elected *ad hoc*. The fear that these arrangements would interfere unduly with the autonomy of the churches has not been realized.

British Dominions.—The growth of Congregationalism in the British dominions and colonies has steadily proceeded during the last hundred years, and was fostered by the union of 1832. In Canada an interesting development has to be recorded. The Congregational churches, with a few negligible exceptions, are now merged along with the Methodists and Presbyterians in the United Church of Canada. This reunion is the culmination of negotiations and discussions which have been going on for some years. Congregationalists have taken a leading part in the reunion movement. They have shown themselves willing to accept a central organization and a closely-knit church fellowship, while safeguarding spiritual liberties. In the doctrinal basis of the United Church they helped to secure that the declaration of faith accepted by the partners to the union should be purely declaratory and should not be made "an imposition upon any." Their college at Montreal, affiliated with others in the theological faculty of McGill University, is doing fine work in training men for the very varied types of ministry which the country requires.

Congregationalism in Australia has not kept pace with the growth of population. In spite of its freedom and adaptability it has made less progress than the more closely organized churches. It maintained too long an individualist type of independency and tended to live on the reputation of certain large and prosperous churches led by men of outstanding ability. But the general level of the ministry is higher than it ever was, and with three colleges in Sydney, Adelaide and Victoria it should not be difficult to maintain it. The Congregational Unions foster a sense of corporate responsibility among all the churches. The down-town and country churches now feel themselves part of a living organism and they and their stronger brethren stand or fall together. The establishment of provident, sustentation and building funds has done much to increase the denominational consciousness and makes for efficiency and home missionary enterprise. The failure of the recent negotiations for reunion among the Australian churches may prove a blessing in disguise. It is said that Congregationalism now breathes more freely and is preparing to give itself more heartily to its distinctive witness. The difficulties are very great in a country where practical materialism and religious conservatism seem to go hand in hand. But these very difficulties constitute a challenge and an opportunity, and there are many indications that the Congregational churches are alive to the need and are preparing themselves to meet it.

The Congregational problem in South Africa is much complicated by the existence of native and coloured churches. These greatly outnumber the white churches, and since the withdrawal of control by the London Missionary Society, have tended to interpret their independency very literally. But guidance and fostering are supplied partly by the white churches, which have to find men for administrative posts and most of the money, and partly by the Colonial Missionary Society. The Congregational Union of South Africa now comprises all the churches under a central organization and is creating a new sense of corporate fellowship and responsibility. It is tackling the educational problem among the natives, training teachers and preachers and initiating social work.

In the smaller Congregational Unions of Nova Scotia, British Guiana, New Zealand, Jamaica, Tasmania and Newfoundland, the new spirit of fellowship, co-operation and denominational responsibility is making itself felt to the great advantage of the churches themselves and to the increase of their capacity for aggressive work. They represent a new and very effective type of federated independency.

BIBLIOGRAPHY.—The literature bearing on the subject is given with some fulness in the appendix to R. W. Dale's *History of English Congregationalism* (1907), the most authoritative work at present available. For the ancient church the data are collected in T. M. Lindsay's *The Church and the Ministry in the early Centuries* (1902), and in papers by J. V. Bartlet in the *Contemp. Review* for July 1897 and April 1902. For the modern period in particular *see* H. M. Dexter's *Congregationalism of the Last Three Hundred Years, as seen in its Literature* (1880), supplemented by bibliographies in the first vols. of the *Congregational Historical Society's Transactions* (1901 ff.), themselves a growing store of fresh materials. Of the older histories Waddington's *Congregational History* in 5 vols. (1869–1880) contains abundant data; while for more detailed study reference may be made to various county histories, such as T. Coleman, *Independent Churches of Northamptonshire* (1853), T. W. Davids, *Annals of Evangelical Nonconformity in Essex* (1863), R. Halley, *Lancashire, its Puritanism and Nonconformity* (1869); G. H. Pike, *Ancient Meeting-Houses in London* (1870); J. Browne, *History of Cong. in Norfolk and Suffolk* (1877); W. Urwick, *Nonconformity in Hertfordshire* (1884); W. Densham and J. Ogle, *Congr. Churches of Dorset* (1899); W. H. Summers, *History of the Berks, S. Bucks, and S. Oxon. Cong. Churches* (1905); and F. J. Powicke, *History of the Cheshire Cong. Union,* 1806–1906. *The Victoria County Histories* (Constable) may also be consulted. Important documents for Congregational Faith and Order, with historical introductions, are printed in Williston Walker's *Creeds and Platforms of Congregationalism* (1893). Statistical and other information relating to the churches of the Congregational connection is set forth systematically in the annual issues of the *Congregational Year Book.* Two magazines have been successfully established: *The Congregational Church Monthly* and the *Congregational Quarterly.* For a brief but brilliant account of the Congregational connection at the present time *see* W. B. Selbie, *Congregationalism* (1928), in the series "The Faiths" edited by L. P. Jacks. (X.)

UNITED STATES

The history of Congregationalism in the United States is bound up with the development of the Protestant reformation in England. This resulted in the Puritan movement, whose purpose was, as its name indicates, still further to purify both the creeds and the practices of the Anglican Church as by law established. This movement developed an aggressive left wing, which carried its demand for change so far that its leaders finally insisted on separating, not only from what it regarded as the errors in the Church of England, but from the Anglican Church itself. Robert Browne (1550–1631) was a pioneer in this radical protest and those who followed him were first known as Brownists and later as Separatists, both of which names were greatly disliked by those who were forced to bear them. In the early years of the 17th century a congregation, among other groups whose history is uncertain and whose existence was unstable, gathered at Scrooby in the north of England, where William Brewster was postmaster. Their leaders were Richard Clyfton and John Robinson. This congregation sought refuge in Holland, arriving at Leyden in 1608. Here they enjoyed the wise and devoted leadership of John Robinson, won the respect of the Dutch, drew many members from England, and finally reached a membership of about 300. This Scrooby-Leyden group became the first permanent Congregational Church. Finally, however, they were convinced that there was no hope of their persistence in Holland. The economic struggle was too severe, and the second generation was intermarrying with the Dutch and tending to lose the sharpness and fervour of the principles which had guided their fathers in the emigration from the mother country. Return to England was impossible; they therefore turned to America. After long negotiations their plans won the support of certain English merchant adventurers, a charter was secured, and, after many vicissitudes, the stronger part of the congregation reached Plymouth, Mass., in 1620. The remainder of the group, under John Robinson's leadership, expected to follow in due time, as many did, although Robinson himself died in Holland in 1625. These Plymouth immigrants have always borne the name of the Pilgrim fathers. They met the rigours of the climate and the hard conditions of the new country, lived in comparative peace with the native Indians, and assumed a position of great influence in the subsequent settlement of New England.

The next step in the development of the Congregational Churches in the United States is concerned with the Puritan exodus from England, chiefly due to the persecution of nonconformists under the leadership of Laud. These immigrants were not Separatists when they left home. They still thought of the Church of England as their mother church, although they were forced to protest against and separate from the errors which they discovered in it. Laud's policy, however, was uncompromising. There is no more conspicuous example of a foolish programme of persecution than is seen in this relentless policy to "harry out of the land" a group of people of such quality as the English Puritans. They chose a better location for their new homes than the Pilgrim fathers had done. Boston had an excellent harbour; the region was favourable to agriculture; profitable fishing was within easy reach. The high tide of this Puritan exodus was reached between 1630 and 1640. The settlements were made at Salem, Boston, Charlestown, Watertown and other favourable locations around Massachusetts bay. The significant factor in this story, however, is not the number or quality of the immigration, but the changes which took place in their ideas of church organization and government after they had reached the new country and were forced to organize their churches. According to the statements which they had made before leaving England, it would have been their policy to establish a purified Anglican Church order in Massachusetts. They had said: "We esteem it our honour to call the Church of England our dear mother." Their leaders had never looked with favour upon the independent congregation at Plymouth. In the winter of 1628–29, however, there was dire sickness at Salem, and Samuel Fuller, deacon of the church of the Pilgrim Fathers at Plymouth, hurried to render such help as he could. He was both an ardent defender of the Congregational way in church government and a beloved physician. Our knowledge of this period is scanty, but when the colonists of Massachusetts bay organized their churches they followed the Plymouth model, and the New England colonies became Congregational and not Anglican, after the Salem practice.

The Covenant.—The peculiar factor in this form of church government was the use of the covenant instead of a creed as the basis of fellowship. There was little need of a doctrinal statement to guarantee their church government, for they were uniformly Calvinists, assenting to such precise enunciations as were to be found in the statement sanctioned by the Synod of Dort. Their covenant was short and simple:

"We covenant with the Lord and one with another; and do bind our selves in the presence of God, to walk together in all His ways, according as He is pleased to reveal Himself unto us in His blessed word of truth."

Another significant factor in this entrance upon a new church order was taken when Francis Higginson and Samuel Skelton, both of whom were ordained clergymen of the Church of England, were ordained at Salem by the laying on of hands. This broke with the entire doctrine and practice of Episcopal succession, as maintained in England, and recognized the essential Congregational principle that every congregation is endowed with the full right to choose and ordain its own ministers.

First Period.—The first period in the history of the Congregational Churches in the United States extends from 1620 to 1740. During these 120 years the principal interest in the development is concerned with church government rather than doctrine. It is an era of quite uniform Calvinism in theology. The two chief factors deserving attention are the beginning of missions to the Indians, and among the expanding settlements, the founding of schools and colleges. Clearly defined among the purposes which inspired the movement of the Pilgrim fathers from Holland to America was the desire to convert to the Christian religion the natives of the country, concerning whom fascinating reports had been brought back and given wide currency in England, especially from Virginia. When John Robinson learned that the death of certain natives had been a result of a collision between the Plymouth colonists he deplored the fact that it had been necessary to kill them before any had been converted. The beginning of missions to the Indians was first successfully made by John Eliot, minister of the Roxbury church, who learned the Indian language, reduced it to writing, translated the Bible into the native tongue, and established communities of "praying Indians" in the colony. He was one of many successors to carry on the effort to Christianize the Indians. The Congregational Churches have actively maintained their Indian missions from the day when Eliot first preached to them in their own language in 1646. Schools and churches are still maintained for the Indians on their reservations. Another noteworthy activity of the Congregational Churches has been their devotion to education. This was due to the importance placed by them upon accurate knowledge of the Bible and their firm conviction that ignorance is not the mother but rather the real foe of true religion. Therefore, as soon as they had built their houses and made a beginning with the agriculture which was necessary to their economic support, they laid the foundations of their common school system and soon after provided for higher education in colleges. They expressed their purpose clearly in the language of the legislature, or general court, to provide for a more thorough understanding of the Bible, "it being one chief project of that old deluder, Satan, to keep men from the knowledge of the Scriptures." In 1636 the legislature of Massachusetts voted funds for a college, to which the name of John Harvard was given in 1639. Thus began the continuous programme of organizing and sustaining colleges by the Congregational Churches, until the entire country where these churches have been in action is dotted with them. An educated ministry and an intelligent church membership have been insisted upon from the earliest days and institutions of learning to guarantee this result have been supported with sacrificial devotion.

The second period in the history of the Congregational Churches in the United States extends from 1740 to 1850. During this period the paramount interest was in questions of theology rather than church organization. Periods of spiritual fervour generally follow periods of decline. The upward movement is registered by a spiral rather than a uniform curve.

The loss in religious fervour of the colonial period was a source of profound distress to the ministers of the Congregational Churches, and under their efforts to stem the tide various religious manifestations took place. The general tendency of the time, however, was to lay stress upon "good works" as the effective means of producing a religious experience. Preaching was therefore concerned largely with ethical idealism. It was not until about 1734 that a widespread and profound movement of religious revival began, which has come to be known as the Great Awakening. Its origin was in the preaching of Jonathan Edwards of Northampton, Mass. Edwards was both a theologian and preacher of unique power and he ranks as perhaps the greatest intellectual leader produced in the Congregational Churches. In 1740, George Whitefield came from England to help in the Awakening, news concerning which had produced a profound impression in the mother country. The movement then swept rapidly on. Many physical expressions of excitement accompanied the revival and created sharp divisions between the leaders. The good results of the Great Awakening are unquestioned, however. The moral standards of communities were lifted and religion became a vital factor in human experience such as it had not been before. A most conservative estimate of the number added to the churches as a result of the revival is 25,000 out of a population of perhaps 300,000 in New England at that time.

The differences in opinion brought out by the Great Awakening quickly deepened and soon the churches were filled with controversy. The old, stable Calvinism, which had been generally dominant, was sharply assailed by those who were not satisfied with its affirmations of the absolute sovereignty of God, the total depravity of man, the inability of the human will in the process of salvation, and the doctrines of foreordination and election. Out of the discussions came at last the only distinctive system of divinity which has been contributed by the United States to the history of doctrine. It was a form of modified Calvinism which is generally known as the New England theology. The heart of it was an emphasis upon the love of God in relation to men and the power of man in responding to the divine influences in the experiences of religion. Theology became less austere and formal; it was humanized by the definers of the new point of view. In various aspects the New England theology was dominant in the pulpits and theological schools of the Congregational Churches until about the year 1800. As was inevitable, however, the theological developments issuing from the Great Awakening swung to a left wing, and a strong Unitarian movement was incipient even when the Awakening was at its height. This did not come to full strength, however, until about 1800. Then the anti-Trinitarians became aggressive. In 1805 they secured the election of one of their number to the Hollis Professorship of Divinity at Harvard, thus entrenching themselves in the oldest college of Congregational heritage. A strong group of leaders of the liberal movement arose, prominent among whom was William Ellery Channing. The conflict centred in New England. By 1815 the Unitarians had assumed such strength that they were able to carry a majority in many of the oldest and strongest of the New England Congregational churches, and, as a result of a favourable court decision, to maintain possession of the records and property of the organizations. In Boston, for example, out of 14 Congregational churches all but two became Unitarian, involving immense loss in members and money to the orthodox group, as they were currently known. In Massachusetts alone, 96 churches thus separated from the Congregational organization.

The period from 1800–1850 was marked by close union in missionary expansion with the Presbyterians, who had little strength in New England, but possessed larger resources in New York and Pennsylvania. In doctrine the two bodies were in practical agreement, both being Calvinists in their earlier history. In church government they were not sharply separated. When the westward emigration demanded organized agencies to follow the settlers with religious influences, it was therefore most natural that the Congregationalists and Presbyterians should seek to work together. They therefore adopted in 1801 a Plan of Union to govern their missionary expansion. The New England Congregational leaders felt that the more closely organized Presbyterian system fitted the needs of the isolated settlements of the expanding frontier and therefore were quite willing that their missionaries should use this form of government for the new churches. The financial support during this half century came principally from Congregational sources in New England and the missionaries were generally members of Congregational churches. They were not guided by any strong denominational consciousness and in the end the results of their work accrued far more to the Presbyterian than to their own fellowship. No statistics are accurate at this point; but one of the most careful students of the period has estimated that fully 2,000 churches which would naturally have been Congregational became Presbyterian in the country west of the Hudson river under the operation of the Plan of Union.

The third period in the history of the Congregational Churches in the United States, from 1850 onward, has been one of growing self-consciousness in purpose, and the creation of sufficient administrative machinery to carry on its common religious enterprises at home and abroad. No profound doctrinal controversies have rent the churches, which suffered great material losses from the Unitarian separation and the Plan of Union. The most significant developments of the period may be summed up as indicated below.

Missionary Expansion.—In 1810 the American Board of Commissioners for Foreign Missions was organized to sponsor the work indicated by its name. While entirely Congregational in origin, it included in its membership at first, representatives of the Presbyterian and Dutch Reformed Churches. Later both these bodies withdrew. After 1840 the board extended its work widely and it has borne a part in missionary work in foreign lands, quite out of proportion to the numbers and wealth of its supporting churches. This has been especially significant in Turkey. During the same time the boards established for home missions and education have been vigorously at work. The contribution of the American Missionary Association to the education of the negroes and other races in the United States has been conspicuous, particularly since the close of the Civil War in 1865.

Administration.—The ideals of Congregational Church government are the independence of the local congregation and the fellowship of the independent churches for mutual counsel and for the prosecution of those enterprises which no single church alone could compass. Harmonious balance between these two principles involves and assures the symmetry and success of the whole plan. The years since 1910 have witnessed a striking development of the fellowship of the churches. This appears in the growth of the influence of the state conferences and the larger function of the State superintendent, not merely because of counsel and financial support given to the small or missionary-aided congregations, but also through increasing co-operation in the affairs of the larger and self-supporting churches. In effecting pastoral relations, organizing and carrying out their own community programmes, and in all matters of policy, the churches have come to look for guidance to the superintendent and also, through him to the board of directors of the State conference. This service is rendered without assuming any rights of judicature, and it issues in a gratifying increase of practical efficiency.

National Organization.—The development of the national organization of the Congregational Churches has kept pace with that of the state units. The effort to perfect closer organization, cut down overhead cost, and increase the community service of the churches has been strongly influenced by similar movements in the economic world. After a period of careful study by a commission chosen for its representative character, the first step in advance was taken at Kansas City in 1913. The national council was given larger functions in the work of the church, still safeguarding the autonomy of the individual congregation. A general secretary was chosen to represent the churches of the nation in their relations with small congregational groups, other denominations and in international relationships. The various societies through which the churches had carried on their missionary work were more closely integrated with the national council. Again, after intensive study by a commission, new plans were adopted by the national councils in 1925 and 1927 by which the work of the denomination is divided into two groups, home and foreign, and the administrative costs are further simplified.

Doctrinal Position.—The Congregational Churches always have laid more emphasis upon their covenant with God and with one another, entered into in order to constitute church membership, than upon formal creeds. All Congregational creeds have been looked upon as platforms for action and testimonies as to faith generally accepted rather than as dogmatic statements and tests. No single statement can be indicated as the authoritative creed of all the Congregational Churches, since each congregation adopts its own creed and there is wide variety. During a period of intense doctrinal debate, which has caused division in other bodies of American Protestantism, the Congregational Churches have not been seriously disturbed. All shades of opinion are represented among the clergy and laity; their deepest unity seems to be in their worship and their programmes of service. They occupy in general a liberal evangelical position. Interdenominational movements towards comity and unity have been shared largely by the Congregational churches and their missionary programme has been sustained with growing power and enthusiasm. The Congregational Year Book for 1926 gives the number of churches as 5,608; total membership 914,695; number of ministers (in the United States and foreign mission lands, with and without pastorates), 5,571; Sunday School members, 769,372; gifts for benevolence, $4,618,660; home expenses, $22,104,535.

See Leonard Bacon, *The Genesis of the New England Church* (1874); Williston Walker, *The Creeds and Platforms of Congregationalism* (1893) and *A History of the Congregational Churches in the United States* (1894); Frank Hugh Foster, *A Genetic History of the New England Theology* (1907); William E. Strong, *The Story of the American Board* (1910); William E. Barton, *The Law of Congregational Usage* (1916); Ozora S. Davis, *The Pilgrim Faith* (1918).

(O. S. D.)

CONGRESS, in diplomacy, a solemn assembly of sovereigns or their plenipotentiaries met together for the purpose of definitely settling international questions of common interest. In this sense the word first came into use in the 17th century; an isolated instance occurs in 1636, when it was applied to the meeting of delegates summoned by the pope to Cologne, to attempt to put an end to the Thirty Years' War. In 1647 the meetings of delegates for the conclusion of peace, assembled at Osnabrück and Münster, were termed a congress; and in spite of objections to it on the ground that it was "coarse and inappropriate," based on the physiological sense of the word (Lat. *congressus*), it continued thenceforward in use.

The adoption of the name Congress for the national legislative body in the United States (and so for other American countries) was simply a development from this usage; for the "continental congresses" of 1774 and 1775–81, and the "congress of the confederation" (1781–88) were, as inter-state representative deliberative bodies, analogous to international congresses, and the Congress established under the Federal Constitution of 1789 ultimately consists of representatives of the sovereign States composing the Union (*see* UNITED STATES: *Constitution and Government*). The more general analogous use of the term (Church Congress, etc.) is of modern origin.

In its international sense the term "congress" has usually only been applied to gatherings of first-class importance, attended either by the sovereigns themselves or by their secretaries of State for foreign affairs, less important meetings being termed "conferences." The dividing-line between the congress and conference is, however, historically ill-defined, the two terms having often been used indifferently in official diplomatic correspondence even of such dignified assemblages as the meetings of sovereigns and statesmen at Aix-la-Chapelle (1818), Troppau (1820) and Laibach (1821). Since the World War, indeed, the word "congress" has fallen into disuse, even the great assemblage of its representatives of the Allied and Associated Powers which settled the terms of the Treaty of Versailles being known as the Conference of Paris.

The results of the work done at various international congresses and conferences in developing a sense of the common interests of nations are dealt with under INTERNATIONAL LAW, PUBLIC, and allied articles; while the more important congresses are treated under their topographical headings.

Convocation and Constituent Elements of a Congress.—Any sovereign Power has the right to issue invitations to a congress or conference. In principle, moreover, every State directly concerned in the matters to be discussed has the right to be represented. But this principle, though affirmed by the Powers at Aix-la-Chapelle in 1818, has rarely been translated into practice. At the congress of Vienna (1814–15), the decisions of which affected every State in Europe, a committee of the five great Powers claimed and exercised the right to settle everything of importance; and this set the precedent which has been followed ever since. At the congresses of Paris (1856) and Berlin (1878), as at that of Vienna, the great Powers regulated the affairs of lesser States without consulting the representatives of the latter. Similarly, at the conference of 1869 on the affairs of Crete no representative of Greece was present; and at the conference of London (1883), on the international regulation of the Danube, the sovereign state of Rumania, though a Danubian power, was not represented.

This procedure naturally caused much dissatisfaction among the lesser Powers, and led to frequent protests on their part from the Congress of Vienna onward. But, although the principle of the equality of all sovereign States was admitted in theory, such attempts as were made to apply it in practice, *e.g.,* at the Hague Conferences, proved most unsatisfactory. At the Peace Conference of Paris, though lip-service was paid to the rights of small nationalities, all matters of importance were settled by the Big Four in secret conference, the full public sessions being mere dress parades. Under the Covenant of the League of Nations, however, an attempt was made to secure the rights of small States, and so far as the right to be heard is concerned, this was done; but effective decisions can only be made by the Council, in which the great Powers preponderate, or with its consent. The Council and Assembly together form, in effect, a permanent congress, though the name is not applied to the Geneva meetings. The practical inconvenience of the theoretical equality of all sovereign states, and of the necessity for unanimity in all decisions, was well illustrated when the protracted efforts of the Assembly to "interpret" the obnoxious article X of the Covenant were defeated by the isolated vote of Persia.

Procedure.—When the congress assembles the first business is the verification of powers, which is done by a commission specially appointed to examine the credentials of the plenipotentiaries. If the foreign minister himself attend, he needs no credentials; those of his colleagues are countersigned by him. The verification being completed, questions of procedure, of precedence and the like, are settled. The question of precedence which, in earlier times caused much trouble, was settled by the rule observed at the congress of Berlin (1878), according to which the plenipotentiaries took their seat at a horse-shoe table in the alphabetical order of the states they represented, according to the French alphabet.

The presidency of the congress is by courtesy reserved for the minister for foreign affairs of the state in which the meeting is held; if, however, he decline to serve, a president is elected; or, if there be a mediating Power, the minister representing this presides.

The discussions are governed by carefully defined rules. Thus every proposition must be presented in writing, and all decisions to be binding on all must be unanimous. The secretary keeps the minutes (*procès-verbal*) of each session, which are signed by all present and read at the next meeting. This *protocol*—as it has been called since the congress of Vienna—takes the form of a bald, but very exact résumé of important points discussed, ending with a record of the conclusions and resolutions arrived at. If there be no such results, opinions are recorded. If any plenipotentiary dissent from the general opinion, such dissent must be recorded in the protocol. Sometimes short signed memoranda, known as a *vote* or *opinion,* are attached to the protocol, stating the reasons that have governed the Powers in question in agreeing to a given conclusion. Individual Powers may express their dissent in two ways: either by placing such dissent on record, or by withdrawing altogether from the sessions of the congress. The conclusions arrived at after the discussion of the various subjects before the congress are usually embodied in separate conventions, duly signed by the Powers who are a party to them. Finally, these separate conventions are brought together in an inclusive treaty, signed by all the plenipotentiaries present, known as the Final Act.

See P. Pradier-Fodéré, *Cours de droit diplomatique* (2nd ed., Paris, 1899); Ernest Satow, *A Guide to Diplomatic Practice* (1922). (W. A. P.)

CONGRESS OF INDUSTRIAL ORGANIZATIONS, a federation of labour unions in the U.S.A., was formed as the Committee for Industrial Organization Nov. 9, 1935, when John L. Lewis of the United Mine Workers and representatives of seven other unions decided to launch an independent drive to unionize unorganized labour. The type of organization promoted was the *vertical,* or industrial union (including all branches of a single industry) as opposed to the *horizontal,* or craft union long favoured by the American Federation of Labor. In Sept. 1936, the C.I.O., as it came to be known, was suspended with its adherents from the A.F. of L. But it proceeded to organize such key industries as steel, rubber, and motor cars, and reached agreements with such large corporations as U.S. Steel and General Motors. In the following years the C.I.O. and the A.F. of L. engaged in a bitter struggle for leadership of American labour. The C.I.O. held its first convention at Pittsburgh Nov. 14–18, 1938, adopted its new name and a constitution, and elected Mr. Lewis president.

CONGREVE, RICHARD (1818–1899), English Positivist, was born at Leamington on Sept. 4, 1818, was educated at Rugby and Oxford, and was a fellow of Wadham college. In 1878 he caused the split in English Positivism by refusing to admit the authority of P. Laffitte, Auguste Comte's successor. Congreve translated several of Comte's works, and in 1874 published a volume of essays advocating the renunciation by Britain of her foreign possessions. He died at Hampstead July 5, 1899.

His publications were: *Roman Empire of the West* (1855); annotated edition of Aristotle's *Politics* (1855; 2nd ed., 1874); *Catechism of the Positive Religion, translated from the French of A. Comte* (1858; 3rd ed., 1891); *Elizabeth of England* (1862); *Essays, political, social, and religious* (1874; 2nd series, 1892); *Historical Lectures* (collected in one volume, 1902).

See P. Thomas, *Auguste Comte and Richard Congreve,* 1910.

CONGREVE, SIR WILLIAM, BART. (1772–1828), British artillerist and inventor, was born on May 20, 1772, being the eldest son of Lieut.-Gen. Sir William Congreve (d. 1814), comptroller of the royal laboratory at Woolwich, who was made a baronet in 1812. He was educated at Singlewell school, Kent, and (1788–93) at Trinity college, Cambridge. He is chiefly remembered for his war rockets which, first fired at Boulogne in 1806 in salvos from boats of special construction, were very effective; and in 1807, 1808 and 1809 they were employed with excellent results on land and afloat at the siege of Copenhagen, in Lord Gambier's fight in the Basque Roads and in the Walcheren expedition. In 1810 or 1811 Congreve became equerry to the prince regent, with whom he was a great favourite, and in 1811 he was elected a fellow of the Royal Society; in the same year he at last received military rank, being gazetted lieut.-colonel in the Hanoverian artillery. In 1812 he became member of parliament for Gatton. In 1813, at the request of the Admiralty, he designed a new gun for frigates. That same year the new "Rocket Troop" of the Royal Artillery rendered excellent service at Leipzig. Congreve's rocket was replaced by Hale's, which had no stick.

In 1814, on the death of his father, Col. Congreve succeeded to the baronetcy and also to the office of comptroller of the royal laboratory. In 1820 Sir William Congreve was elected member of parliament. He died at Toulouse on May 16, 1828.

Congreve was an ingenious and versatile man of science. Besides the war rocket he invented a gun-recoil mounting, a time-fuse, a parachute attachment to the rocket, a hydro-pneumatic canal lock and sluice (1813), a perpetual motion machine, a process of colour printing (1821) which was widely used in Germany, a new form of steam-engine, and a method of consuming smoke (which was applied at the royal laboratory); he also took out patents for a clock in which time was measured by a ball rolling on an inclined plane; for protecting buildings against fire; inlaying and combining metals; unforgeable bank-note paper; a method of killing whales by means of rockets, improvements in the manufacture of gunpowder, stereotype plates; fireworks; gas meters, etc. The first friction matches made in England (1827) were named after him by their inventor, John Walker. He published a number of works, including three treatises on *The Congreve Rocket System* (1807, 1817, and 1821); *An Elementary Treatise on the Mounting of Naval Ordnance* (1812); *A Description of the Hydropneumatical Lock* (1815); *A New Principle of Steam Engine* (1819); *Resumption of Cash Payments* (1819); *Systems of Currency* (1819), etc.

See Col. J. R. J. Jocelyn, *Journal of the Royal Artillery*, vol. xxxii. No. 2 (1905).

CONGREVE, WILLIAM (1670–1729), English dramatist, the greatest English master of comedy, was born at Bardsey, near Leeds, where he was baptized on Feb. 10, 1670, although the inscription on his monument gives the date of his birth as 1672. He was the son of William Congreve, a soldier who was soon after his son's birth placed in command of the garrison at Youghal. To Ireland, therefore, is due the credit of his education—as a schoolboy at Kilkenny from 1681 to 1685, and then as an undergraduate at Dublin under St. George Ashe, where he was a contemporary and friend of Swift. His family moved from Ireland to Staffordshire, probably at the Revolution, and it seems to have been there, in 1690, that Congreve wrote *The Old Bachelor,* to amuse himself, as he says, during convalescence from an illness. From college he came to London, and was entered as a student of law at the Middle Temple in 1691. The first-fruits of his studies appeared under the boyish pseudonym of "Cleophil," in the form of a novel (*Incognita, or Love and Duty reconciled,* 1692), whose existence is now remembered only through the avowal of Dr. Johnson that he "would rather praise it than read it." Tradition has it that *Incognita* was written at the age of 17, but there are evidences of revision at a maturer age. Congreve took his place in the London of William and Mary very quickly. He had some poems in Gildon's *Miscellany* (1692), and was enlisted by Dryden among those who collaborated in his translation of Juvenal, contributing also the complimentary poem that was prefixed to Dryden's translation of Persius that accompanied it (1692).

In 1693 Congreve's career of fame began with the brilliant appearance and instant success of his first comedy *The Old Bachelor* (1693) under the generous auspices of Dryden, then, as ever, a witness to the falsehood of the vulgar charge which taxes the greater among poets with jealousy or envy. The discrowned laureate had never, he said, seen such a first play; and, indeed, the graceless grace of the dialogue was as yet only to be matched by the last and best work of Etherege, standing, as till then it had done, alone among the barefaced brutalities of Wycherley and Shadwell. The types of Congreve's first work were the common conventional properties of stage tradition, but the fine and clear-cut style in which these types were reproduced was his own. The gift of one place and the reversion of another were the solid fruits of his splendid success, but the tradition that portrays him as living in wealth on lavish sinecures does not need Swift's exaggerated picture of his poverty to refute it. Swift wrote of him that

> Congreve spent on writing plays
> And one poor office half his days.

Next year a better play from the same hand met with worse fortune on the stage, and with yet higher honour from Dryden. The noble verses, as faultless in the expression as reckless in the extravagance of their applause, prefixed by Dryden to *The Double Dealer* (1694) must naturally have supported the younger poet, if, indeed, such support can have been required, against the momentary annoyance of assailants whose passing clamour left uninjured and secure the fame of his second comedy; for the following year witnessed the crowning of his art and life, in the appearance of *Love for Love* (1695). The production of this play is a landmark in the theatrical history of the period. For some time the patentees of Drury Lane, in spite of their monopoly, had allowed the affairs of the theatre to get into such a condition that there seemed some danger of London being left without a theatre at all. Seeking to counteract falling profits by cutting salaries, they drove their players to the edge of mutiny, and the murder of Mountfort, closely followed by the deaths of Leigh and Nokes, had brought affairs to a crisis which even the brilliant success of *The Old Bachelor* could only mitigate. At last William III. was persuaded that he was not bound by his predecessor's monopoly, and the malcontents of the Theatre Royal opened a new theatre in the tennis-court in Lincoln's Inn Fields. The patentees did their best to wreck the scheme, seeking to recover some of the deserters by offers of increased salaries, but only two were tempted back (*see* the prologue of *Love for Love*), and the venture opened successfully on April 30, 1695, with *Love for Love.* In 1697 Congreve's ambition, rather than his genius, adventured on the foreign ground of tragedy, and *The Mourning Bride* (1697) began such a long career of good fortune as in earlier or later years would have been closed against a far better work. He was now manager of the new Lincoln's Inn theatre, and under contract to supply them with a new play every year—which he entirely failed to do. His health was already indifferent. Next year he attempted, without his usual success, a reply, *Amendments of Mr. Collier's False and Imperfect Citations* (1698) to the attack of Jeremy Collier, the nonjuror, "on the immorality and profaneness of the English stage"—an attack for once not discreditable to the assailant, whose honesty and courage were evident enough to prove him incapable alike of the ignominious precaution which might have suppressed his own name, and of the dastardly mendacity which would have stolen the mask of a stranger's. Against this merit must be set the mistake of confounding in one indictment the levities of a writer like Congreve with the brutalities of a writer like Wycherley—an error which, ever since, has more or less perverted the judgment of succeeding critics. The general case of comedy was then, however, as untenable by the argument as indefensible by the sarcasm of its more brilliant and comparatively blameless champion. Art itself, more than anything else, had been outraged and degraded by the recent school of the Restoration, and the comic work of Congreve, though different rather in kind than in degree from the bestial and blatant licence of his immediate precursors, was inevitably for a time involved in the sentence passed upon the comic work of men in all ways alike his inferiors. The true and triumphant answer to all attacks of honest men or liars, brave men or cowards, was then as ever to be given by the production of work unarraignable alike by fair means or foul, by frank impeachment or furtive imputation. In 1700 Congreve thus replied to Collier with *The Way of the World*—the unequalled and unapproached masterpiece of English comedy, which may fairly claim a place beside or just beneath the mightiest work of Molière. On the stage which had recently acclaimed with uncritical applause the author's more questionable appearance in the field of tragedy this final and flawless evidence of his incomparable powers met with a rejection then and ever inexplicable on any ground of conjecture. There is a persistent but insufficiently authenticated tradition that the author himself rushed in front and rated the unappreciative audience. Whether from disgust at this treatment or not, at any rate, he wrote no more plays, though there are two more pieces of more or less dramatic work from his pen. It is known that Congreve, Vanbrugh and Walsh collaborated to translate Molière's *M. de Pourceaugnac,* under the title of *Squire Trelooby;* it is, however, a matter of conjecture whether the anonymous work of this name, published in 1704, represents their work. The general opinion is that it does, and Summers includes it in his edition of Congreve's complete works (Nonesuch Press, 1925). The other is an opera *Semele,* set to music by Handel; it was performed at Cambridge in 1925.

In 1705 he was associated with Vanbrugh in the management of the Queen's theatre, while still retaining an interest in the Lincoln's Inn venture. But increasing gout made him unfit for the work and he soon retired definitely from theatre management. During the rest of his life Congreve produced little beyond a volume of fugitive verses, published ten years after the miscarriage of his masterpiece. But mention should be made of the *Discourse on the Pindaric Ode,* which accompanied his *Pindaric Ode to the Queen,* in 1786. This essay, based on the work of Lesueur and Schmid, is a valuable piece of literary criticism, bringing out clearly the true structure of the Pindaric ode, and helping to dam the flood of purposeless aggregations of long and short lines that had been assuming the name. His even course of good fortune under Whig and Tory Governments alike was counterweighed by the physical infirmities of gout and failing sight. He died on Jan. 19, 1729, in consequence of an injury received on a journey to Bath by the upsetting of his carriage; was buried in Westminster Abbey, after lying in state in the Jerusalem chamber; and bequeathed the bulk of his fortune to the chief friend of his last years, Henrietta, duchess of Marlborough, daughter of the great duke, rather than to his family, which, according to Johnson, was in difficulties, or to Mrs. Bracegirdle, the actress, with whom he had lived longer on intimate terms than with any other mistress or friend, but who inherited by his will only £200.

The one memorable incident of his later life was the visit of Voltaire, whom he astonished and repelled by his rejection of proffered praise and the expression of his wish to be considered as any other gentleman of no literary fame. The great master of well-nigh every province in the empire of letters, except the only one in which his host reigned supreme, replied that in that sad case Congreve would not have received his visit. His portrait, painted by Kneller, for the Kitcat club, depicts him as handsome and inclined to be stout. We get hints of taste rather in advance of his age in his collections of pictures and old ballads, and his love for his country house in Buckinghamshire. But it is remarkable how indefinite an impression we get of him. Dr. Protopopesco, in his study of him (*Un classique moderne*), says: "Hôte assidu de la maison des Marlborough, nous n'entendons que le bruit de ses mâchoires; avec ses amis, il ne fait que boire." We know him to have been a wit, but none of his talk is preserved. He had no enemies, and the most varying figures of his time, bitterly at war with each other, succeed each other in his rooms without embarrassment. Gay calls him "unreproachful."

We may conclude with the estimate of Congreve's work which A. C. Swinburne wrote for the ninth edition of the *Encyclopædia Britannica* in an article largely retained above, with certain additions of matters of fact.

"The fame of the greatest English comic dramatist is founded wholly or mainly on but three of his five plays. His first comedy was little more than a brilliant study after such models as were eclipsed by this earliest effort of their imitator; and tragedy under his hands appears rouged and wrinkled, in the patches and powder of Lady Wishfort. But his three great comedies are more than enough to sustain a reputation as durable as our language. Were it not for these we should have no samples to show of comedy in its purest and highest form. Ben Jonson, who alone attempted to introduce it by way of reform among the mixed work of a time when comedy and tragedy were as inextricably blended on the stage as in actual life, failed to give the requisite ease and the indispensable grace of comic life and movement to the action and passion of his elaborate and magnificent work. Of Congreve's immediate predecessors, whose aim had been to raise on French foundations a new English fabric of simple and unmixed comedy, Wycherley was of too base metal and Etherege was of metal too light to be weighed against him; and besides theirs no other or finer coin was current than the crude British ore of Shadwell's brutal and burly talent. Borrowing a metaphor from Landor, we may say that a limb of Molière would have sufficed to make a Congreve, a limb of Congreve would have sufficed to make a Sheridan. The broad and robust humour of Vanbrugh's admirable comedies gives him a place on the master's right hand; on the left stands Farquhar, whose bright light genius is to Congreve's as female is to male, or 'as moonlight unto sunlight.' No English writer, on the whole, has so nearly touched the skirts of Molière; but his splendid intelligence is wanting in the deepest and subtlest quality which has won for Molière from the greatest poet of his country and our age the tribute of exact and final definition conveyed in that perfect phrase which salutes at once and denotes him—'ce moqueur pensif comme un apôtre.' Only perhaps in a single part has Congreve half consciously touched a note of almost tragic depth and suggestion; there is something well-nigh akin to the grotesque and piteous figure of Arnolphe himself in the unvenerable old age of Lady Wishfort, set off and relieved as it is, with grace and art worthy of the supreme French master, against the only figure on any stage which need not shun comparison even with that of Célimène."

Bibliography.—(1) Works: The *Works* of William Congreve were published in 1710 (3 vols.). *The Dramatic Works of Wycherley, Congreve . . .* (edit. Leigh Hunt, 1840), contains a biographical and critical notice. *See* also *The Comedies of William Congreve* (1895), with an introduction by W. G. S. Street; *Semele* (edit. D. D. Arundell, 1925); *Incognita* (edit. Brett-Smith, Percy reprint no. 5, 1922). *The Complete Works of William Congreve* (4 vols., 1923, Nonesuch Press, edit. M. Summers) includes *Squire Trelooby* and his letters to the Keallys, as well as a full critical and biographical introduction. The theatrical history is prefixed to each play. It should be added that the productions of *Love for Love* (1917) and *The Way of the World* (1918) by the Stage Society caused a considerable revival of interest in Congreve, and *The Way of the World* was produced at the Lyric theatre, Hammersmith, in 1923, and ran for over 100 nights, being again successfully revived at Wyndham's in 1927. A few fragments otherwise unedited will be found in *A Sheaf of Poetical Scraps* (edit. D. Protopopesco, Bucharest, 1923).

(2) Biography: *Memoirs of the Life, Writings and Amours of William Congreve* by "C. Wilson" (London, 1730) is one of Curll's more blatant frauds, and is quite valueless; E. Gosse, *The Life of William Congreve* (1881, new ed., 1924); D. Protopopesco, *Un classique moderne, William Congreve* (Bucharest, 1925). *See* also Swift, *Journal to Stella,* and G. Meredith, *An Essay on Comedy* (1897).

CONGRUENCE, a mathematical term employed in several senses, each of them connoting harmonious relation, agreement or correspondence.

Two geometric figures are said to be *congruent,* or to be in the relation of *congruence,* if it is possible to superpose one of them on the other so that they shall coincide throughout. Thus two triangles are congruent if two sides and their included angle in the one are equal to two sides and their included angle in the other. This idea of congruence seems to be founded on that of a "rigid body," which may be moved from place to place without change in the internal relations of its parts. But it must rest on a previous concept of metrical relations among the parts of the body, since otherwise there would be no basis on which to determine whether the body had changed in shape and size.

The position of a (straight) line (of infinite extent) in space may be specified by assigning four suitably chosen co-ordinates. A *congruence* of lines in space is the set of lines obtained when the four co-ordinates of each line satisfy two given conditions. For example, all the lines cutting each of two given curves form a congruence. The co-ordinates of a line in a congruence may be expressed as functions of two independent parameters; from this it follows that the theory of congruences is analogous to that of surfaces in space of three dimensions. An important problem for a given congruence is that of determining the simplest surface into which it may be transformed.

Two integers a and b are said to be congruent modulo m if their difference a-b is divisible by the integer m. It is then said that a is congruent to b modulo m, and this statement is written in the symbolic form $a \equiv b \bmod m$. Such a relation is called a *congruence.* Congruences, particularly those involving a variable x, such as $x^p \equiv x \bmod p$, p being a prime number, have many properties analogous to those of algebraic equations. They are of great importance in the theory of numbers (*see* Numbers, Theory of).

(*See* also Differential Geometry; Line Geometry.)

CONGRUOUS, that which corresponds to or agrees with anything (Lat. *congruere,* to agree); the derivation appears in "congruence," a condition of such correspondence or agreement, a term used particularly in mathematics, *e.g.,* in the theory of numbers, for the relation of two numbers, which, on being divided by a third number, known as the *modulus,* leave the same remainder. (*See* Number.)

CONIBOS, a tribe of South American Indians belonging to the Panoan (*q.v.*) linguistic stock. The Conibos, one of the largest tribes of this group, live to-day on the upper Ucayali river in the vicinity of Cumarea. By tradition their former home was further south on the lower Urubamba. They are a sedentary, agricultural people, living in large rectangular thatched houses. They make excellent cotton textiles and beautifully decorated pottery, and are expert in the management of their dug-out canoes. The dead were formerly buried in large urns, beneath the floors of the houses. Monogamy is the rule except for chiefs, and each girl prior to marriage has to go through an artificial defloration ceremony.

See W. C. Farabee, "Indian Tribes of eastern Peru" (*Papers of the Peabody Museum of American Archaeology and Ethnology,* Harvard university, vol. x.).

CONICAL REFRACTION: *see* LIGHT.

CONIC SECTION, the intersection of a plane with a cone (*q.v.*). In Greek geometry and for centuries after the cone was regarded as a solid; hence any section was looked upon as a surface bounded by a curve. Later geometers feeling that conical properties belong to cones as surfaces, the bounded space within being relatively indifferent, define a cone as a surface. Hence the plane section becomes not an area but a plane-curve, though questions of areal content of course remain in place. The study of conics seems to have issued from Plato's Academy, with its inscription, "Let none unversed in geometry enter." Plato himself was abreast but hardly ahead of the mathematics of his day, such as was afterwards enshrined in Euclid's thirteen books of *Elements* (*c.* 300 B.C.), but the interest and enthusiasm he aroused accomplished wonders.

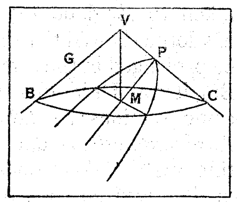

FIG. 1

The Triad.—Plato's associate, Menaechmus, was the brother of Deinostratus who was the exploiter if not inventor of the quadratrix of Hippias (*c.* 420 B.C.). It was Menaechmus who is said to have told Alexander that there is "no royal road to geometry," and who saw (*c.* 359 B.C.) that finding the mean proportional involved relations such as, for us, determine two parabolas and an hyperbola, defined by the equations $x^2=ay$, $y^2=bx$, $xy=ab$. But such curves did not exist in his day and it became necessary to invent them, as possessing geometric properties symbolized now in these equations. This he is said to have done (as appears probable from the epigram of Eratosthenes, *c.* 230 B.C., "Do not . . . cut the cone in triads of Menaechmus") by imagining a right circular cone cut by a plane perpendicular to the edge or generatrix, and in one of three curves (bounding the plane section) according as the cone was right-, acute- or obtuse-angled at the vertex. In the first and simplest case the plane, being parallel to the opposite edge, could never meet it. The section then extended indefinitely, yielding a curve, now named *parabola* (*q.v.*), always the same in shape though varying in size. In the second case the plane cut the opposite edge, the section was closed and finite, and was later named the *ellipse* (*q.v.*). In the third case the plane, diverging more and more from the opposite element of the cone, never meets it (except in the opposite nappe, as recognized by Apollonius),—the curve is now known as the *hyperbola* (*q.v.*). By help of this triad (figs. 1, 2, 3), says Eutocius of Ascalon (*c.* A.D. 560), its inventor found two solutions for the cube problem. Both the ellipse and the hyperbola change shape on varying the vertical angle, which in the parabola cannot vary. As the plane nears the vertex, the ellipse shrinks to a point, but the parabola and the hyperbola straighten out, each into a pair of right lines, divergent in the hyperbola but coincident in the parabola.

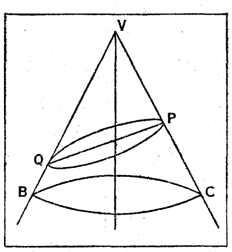

FIG. 2

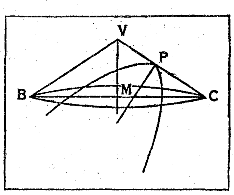

FIG. 3

Through more than a century much progress was made by such writers as Aristaeus, Euclid and Archimedes. Euclid's four books on conics, now lost but mentioned by Pappus (*fl. c.* 300) and Proclus (*c.* 412–485), were probably summed up in the first four books of the conics of Apollonius. Archimedes (287–212 B.C.) also may have written such a treatise, now lost. His extant works contain weighty contributions, such as the quadrature of the parabola, the first of its kind, improving Eudoxus's method of *exhaustion,* and inserted as a tract between the two books on mass-centres and the equilibrium of plane areas. Also in his books on *Conoids and Spheroids* he effected the cubature of these solids by like means (of compression), slicing each into thin parallel laminae, then forming two series of thin cylinders with bases respectively the larger and smaller bases of these layers, between which two series the volume sought must lie. As the strata become ever thinner, the two series close down upon the volume, lying always between,—a rigorous method suggesting integration. He also found the area of the ellipse (props. 5, 6 in the same work), but not of the hyperbola. The crowning peak in Greek mathematics, though not so broad-based as Archimedes, is Apollonius, born (*c.* 262 B.C.) in Perga, Pamphylia, a student in the Euclid-school at Alexandria and the author of eight books (387 propositions) on *Conics,* monumentally edited in two folios by Edmund Halley (Oxford, 1710), with commentaries. Books I.–IV. resume the science as known down to Conon of Samos, almost a contemporary, and books V.–VIII. contain higher developments by the author himself.

According to Geminus of Rhodes (*c.* 70 B.C.), cited by Eutocius, Apollonius first showed that all conics are sections of any circular cone, right or oblique; also, as Pappus tells us, he gave the names parabola (application or equality, literally, casting alongside), ellipse (defect), and hyperbola (excess), to express certain facts in the comparison of areas. He assumed the axis of the cone oblique to its circular base, also a principal plane through the vertex and upright on that base, cutting the cone in the axial triangle, its sides being elements of the cone, its base a diameter of the circle, and the diameter perpendicular thereto being conjugate. His section planes were all at right angles to this axial triangle, but at varying angles to the base (*e.g.,* rotating round the conjugate as axis), each section being thus symmetric as to the principal plane. He showed that all earlier types of conics (right-, acute- and obtuse-angled cones) result as follows: the right-angled cone gives a parabola when the rotating plane becomes parallel to a cone-element; the ellipse when it turns away from parallelism and from the axis; and hyperbola when it turns away oppositely toward the axis,—in which case it would cut the opposite congruent nappe traced by the same generatrix g prolonged backward (figs. 1–3).

The Parameter.—The intersection of the cutting plane with the axial triangle he called πλαγία πλευρά (transverse side, Lat. *latus transversum*); it is also called a diameter of the conic, as halving a system of parallel chords. The point where the diameter meets the cone surface (and conic) is named the vertex of the conic. Through the vertex is now drawn in the cutting plane a perpendicular to the diameter, tangent to the curve and of a length p determined by the Pythagorean *application of areas,* a favourite process in Greek geometry, as in Euclid, I., 44. This p may be defined for the ellipse and hyperbola as a third proportional to the length d of the diameter, and the length d' of its conjugate; that is, $d:d'=d':p$, whence $p=2b^2/a$. If in such application (the more familiar English is "construction upon") the area-length goes beyond the line-length, there is excess (hyperbole); but if the former falls short of the latter, there is defect (ellipsis, leaving out). This is what happens in the hyperbola and the ellipse, the two sections being named accordingly, whereas exact equality (or application) obtains in the midsection, therefore named parabola (fig. 4). This third proportional p he named ὀρθία (erect, whence *latus rectum,* for *latus erectum*); it is now

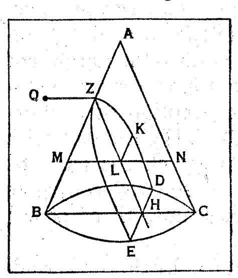

FIG. 4

called *parameter* (side-measure, condensing a long Apollonian clause).

These distinctive areal properties are expressed in cartesian co-ordinates, the rectangular axes being the diameter and the tangent at the vertex, by the equation $y^2=px-\frac{p}{d}x^2$ for the ellipse; $y^2=px$ for the parabola; and $y^2=px+\frac{p}{d}x^2$ for the hyperbola. Either form, the ellipse or hyperbola, would hold for the parabola, since $p/d=0$ for an infinite d; the parabola thus appears as a common limit of the ellipse and the hyperbola. Such equations were of course unknown to Apollonius, who employed their equivalents in their picturesque but cumbrous forms of areal relation.

Eccentricity.—In the parabola only one vertex seems actual, but in the ellipse the other side of the axial triangle is also cut by the plane, giving a second vertex; also in the hyperbola the other side prolonged is cut by the plane in a second vertex; in both cases the line joining the vertices is called a diameter, and its mid-point is called the conic's centre. With the notion of centre comes that of any diameter and its conjugate, each bisecting all chords parallel to the other, though in the hyperbola the conjugate's ends can be seen only on the conjugate hyperbola. Naturally Apollonius deals throughout with areas, parallelograms and proportions, so that his proofs now seem laboured and awkward, however ingenious. In Bk. III., Prop. 45, he first attains the notion of foci as "the points arisen from the application," a vague denotation, but a focus (so named by Kepler, 1604) is defined as dividing the major axis into parts whose rectangle equals one fourth the figure (*i.e.,* the rectangle of major axis and parameter). The focus of the parabola escaped the attention of Apollonius, but not of Pappus, his worthiest commentator, who "wrote under Diocletian" (284–305) and in a lemma of Bk. VII. of his mathematical collection (συναγωγή) shows that the ratio of the distances of any point on any conic from a fixed point (*focus*) and a fixed line (*directrix*) is constant, thus adding this latter concept to the Apollonian list. The constant ratio e is called the eccentricity; originally a term of Ptolemaic astronomy, it has passed from sense to sense till lodged at length in that just given. The conic is an ellipse, a parabola, or an hyperbola according as $e<1$, $e=1$, or $e>1$; in the circle, it is 0.

Other Definitions.—In Bk. II. Apollonius defines *asymptote:* On the tangent to an hyperbola at V lay off VA=VA′, making the whole length AA′ equal to the parallel diameter; then the lines MA, MA′, from the centre M, will continually approach but never meet the hyperbola. In Bk. IV. he discusses the mutual intersection of conics, showing that any two meet at most in four points (tangent points counting double), and continues the harmonic division begun in Bk. II. under the name of proportion. Bks. V.–VII.(I.) advance to brilliant original work on maximal and minimal lengths from any point (in the plane) to the conic, introducing the sub-normal found constant in the parabola. Apollonius determines centres of curvature, but neither the notion nor the measure of *curvature* itself, and may well have reached without realizing or comprehending fully the conception of evolute, the highest summit of Greek geometry. Bk. VII. develops with much ingenuity the doctrines of complementary chords (parallel to conjugate diameters), the constant sum of squared conjugate diameters, and the areas of related parallelograms, all of course strictly geometrically.

Greek mathematics culminated in Apollonius. Little further advance was possible without new methods and higher points of view. Much later, the Arabs and other Muslims absorbed the classic science greedily; it was the Persian poet Omar Khayyam (*c.* 1044–1123/4), one of the most prominent of mediaeval mathematicians, with his remarkable classification and systematic study of equations, which he emphasized, who blazed the way to the modern union of analysis and geometry. In his *Algebra* he considered the cubic as soluble only by the intersection of conics, and the biquadratic not at all.

Modern Treatment.—The first modern treatment of conics (1522), a *libellus* of 34 pages, ushered in a volume of collected papers of a theologian, Johann Werner of Nürnberg (1468–1528). It out-Greeked the Greeks in dealing with the conic, figuring the cone always, whereas Apollonius figures generally only plane curves, and treats not the ellipse but only the parabola and hyperbola, as they count only in the duplication of the cube, Werner's main concern. Also Francesco Maurolico (1494–1575) published in translation Bks. I.–IV. of Apollonius, with a mistaken attempt at restoring the others (1564).

Johann Kepler (1571–1630) was the first to proclaim the regnance of the conic in the sky. Apollonius had rightly ranked it among things worth study on their own account (Bk. V., Pref.); Kepler placed the sun in a world-focus, with planets rolling round it in ellipses, as confirmed and rationalized in Newton's Law of Inverse Squares. But Kepler's main advance in pure conic-doctrine lay in enunciating (1604) as "analogy" the principle or law of continuity, Leibniz's *lex continuationis,* which supplies the parabola with a "blind focus" and with a vertex at infinity, all diameters being parallel, therewith preparing a path for projective geometry (*see* PROJECTIVE GEOMETRY). He also found $\pi(a+b)$ as the approximate length of the ellipse, a and b being the semi-axes.

Projective Geometry and Co-ordinates.—Meantime Claude Mydorge (1585–1647), Girard Desargues (1593–1662), and Blaise Pascal (1623–62) made France the continuator of Greece in pure geometry. The first of these scholars published two books on conics in 1631 and two more in 1639. Four others were lost, being taken to England by Lord Cavendish and Lord Southampton. Mydorge showed that if all rays to a conic from a point in its plane be prolonged in the same ratio, their ends will form a similar conic. But it was Desargues who published (1639) a "Rough Draft" on conic sections so far beyond the age that, like Grassmann's *Ausdehnungslehre* and Möbius's *Statik,* it was cast into the scientific waste-basket; fortunately, however, Philippe De La Hire had made a written copy of it in 1679. This work introduced the Infinite, regarded the cylinder as a cone with its vertex at infinity, and grounded the notion of involution. The so-called Desargue's Theorem declared that a chord cuts a conic and an inscribed quadrangle in six points in involution ($OP.OP'=\pm c^2$); also if two triangles have their corresponding vertices on three compunctal lines, then their corresponding sides meet in three collinear points (and conversely),—the basis of homology (Poncelot) (fig. 5).

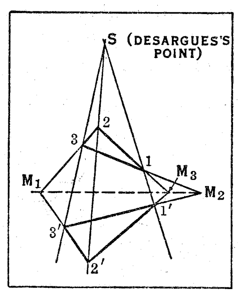

FIG. 5

Only Pascal seemed able to keep step with Desargues. He attended mathematical meetings with his father and before 1640 composed a book on conics. Leibniz wrote to Pascal's nephew (Aug. 30, 1676) vainly urging its publication; it perished, save for a small introductory fragment, so that the most that is known about it is only from Leibniz's letter. Pascal avows the leadership of Desargues, stating without proof, as the first lemma to the latter's theorem, his own about the hexagram inscribed in a circle, that the three intersections of its three pairs of opposite sides are collinear. The reciprocal, Bianchon's Theorem, was first published in 1806. Since both regarded the cone solely without any axial triangle, and viewed any conic as a shadow or projection on a plane of any circle of the cone from its vertex, such a property of the circle-hexagram would in their minds pass over into the corresponding *Hexagramma mysticum* of the conic. From this proposition Père Mersenne (1588–1648) declares that Pascal deduced 400 corollaries.

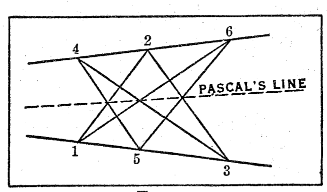

FIG. 6

To René Descartes (1596–1650) the algebraization and consequent transfiguration of geometry, especially of conics, is commonly ascribed, although his *Géométrie* (1637) reads more like a geometrization of algebra (*see* ANALYTIC GEOMETRY). Pierre de

Fermat (1601–65), keener and deeper in mathematical insight as well as earlier in his inventions, nevertheless was later in publication. Their chief achievement was to introduce motion into Greek static conceptions, by using a pair of variables (x, y) to represent a moving point tracing a curve. An equation connecting the variables defined the motion of the point. Thus all is life and motion, "mouvement continu." Equations symbolize the classic τοποι (*loci*), and conversely loci depict equations. All conics are grouped in a single equation of the second degree, $ax^2+2hxy+by^2+2gx+2fy+1=0$, each particular conic being determined by a set of values (a, h, b, f, g) constant for any one curve but varying from conic to conic, while individual points are fixed by special value-pairs (x, y), each pair satisfying the curve's equation.

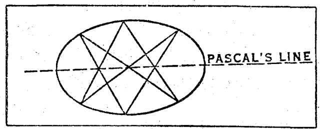

FIG. 6A

Thus the pair $x=3$, $y=4$ satisfies the equation $x^2+y^2=25$; hence the point (3, 4) is on the curve, a circle of radius 5 about the origin O (*see* CO-ORDINATES). Hints of this kind had already been put forth in Muslim works, and in France by François Viète (1540–1603), but not the notion of the moving point (x, y). This mutual depiction of value-pair (x, y) and moving point P, by its effecting a union of algebra and geometry, marks the birth of modern mathematics.

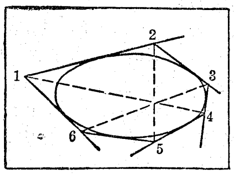

FIG. 7

A prompt reaction to the stimulus of Descartes's *Géométrie* was seen in John Wallis's *Tractatus* on conics, spreading the "new method," quite ignoring the classics, and notable for introducing the sign ∞: "Esto ∞ Nota numeri infiniti" (1655). A similar reaction appears in the writings of De l'Hôpital (1707), although De La Hire still followed his master's method of projection (1685). Despite the wide and clear vision thus opened, the classic precedent retained a fascination, more or less determining later works, which introduced new synthetic ideas even while following analytic paths. Thus Newton (1642–1727) conceived the conic as envelope of two sides of two constant angles rotating round fixed vertices, the other two sides meeting always on the same right line; and Colin Maclaurin (*Geometrica organica,* 1710) imagined the conic as a locus of the vertex of a triangle, each side fixed at one point, the other vertices moving each on a fixed line. Michel Chasles (1793–1880) employed and extended both these conceptions.

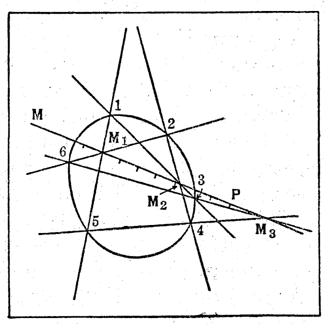

FIG. 8

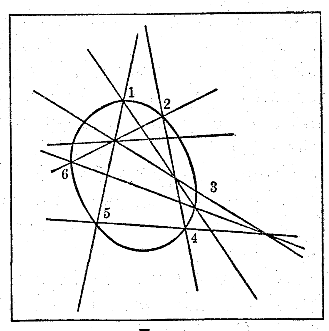

FIG. 9

Later advances in the doctrine of conics have been made mainly in connection with analytic and especially the projective geometry and co-ordinates (*qq.v.*). Nevertheless the Greek synthetic spirit found extraordinary reincarnation in the work of Jacob Steiner (1796–1863). As a pupil of Pestalozzi, he naturally laid especial stress on intuition and envisagement, while unjustly disliking all forms of analysis and eschewing its use as a reproach to geometry proper. But his insight and ingenuity were alike amazing and not only levelled the way for Von Staudt (1798–1867) and his followers in the geometry of position, but may also be said to have rounded out and filled in apparently the whole circuit of the theory of conic sections.

CONIC SURFACE: *see* CONE.

CONIFERS or **CONIFERALES:** *see* GYMNOSPERMS.

CONIINE. This alkaloid, first isolated by Giesecke in 1827, occurs in hemlock (*q.v.*) along with several closely related alkaloids (*see* ALKALOIDS) and can be prepared in a crude state by the process described for nicotine (*q.v.*); these alkaloids are all highly toxic. Coniine, $C_8H_{17}N$, is a colourless, strongly alkaline liquid, which boils at 166–167° C, and solidifies at −2° C to a crystalline mass. Its specific rotation is $[a]_D+15.7°$. It dissolves water, but is itself sparingly soluble in that solvent though readily soluble in ether or alcohol. The salts crystallize well; the picrate, which melts at 75° C, and the double compound with potassium cadmium iodide, which melts at 118° C, are characteristic and suitable for identification of the alkaloid. Coniine is one of the simplest of the natural alkaloids and was the first to be synthesized (Ladenburg, 1886).

CONINGTON, JOHN (1825–1869), English classical scholar, was born at Boston in Lincolnshire. He had a distinguished career at Oxford. In 1852 he began, in conjunction with Prof. Goldwin Smith, a complete edition of Virgil with a commentary, of which the first volume appeared in 1858, the second in 1864, and the third, in which H. Nettleship replaced Prof. Goldwin Smith, soon after Conington's death. In 1866 Conington published his most famous work, the translation of the *Aeneid* of Virgil into the octosyllabic metre of Scott.

His edition of Persius with a commentary and a spirited prose translation was published posthumously in 1872. In the same year appeared his *Miscellaneous Writings,* edited by J. A. Symonds, with a memoir by Prof. H. J. S. Smith (*see* also H. A. J. Munro in *Journal of Philology,* ii., 1869). Among his other editions are Aeschylus, *Agamemnon* (1848), *Choëphori* (1857); English verse translations of Horace, *Odes* and *Carmen Saeculare* (1863), *Satires, Epistles,* and *Ars Poëtica* (1869).

CONINXLOO, GILLIS VAN (1544–1607), Flemish painter, born on Jan. 24, 1544, probably at Antwerp. He studied under Lenaert Kroes and Gillis Mostert. After a period of travel in France he returned to Antwerp in 1570 and was made a member of the Guild of Painters. He had, however, to leave his home again in 1585 to escape from religious persecution, and stayed at Frankenthal in Germany for ten years. In 1595 he settled at Amsterdam. Van Mander (Hymens ed., 1884), calls him the best landscapist of his time. His work represents the gradual transition from the phantastic conception of landscape of the 16th century as seen in the early work of Paul Brill to the realistic representation of the 17th, and may accordingly be divided into three periods. His early work at Antwerp is well represented by "The Judgment of Midas" at Dresden; the second, or Frankenthal period by two landscapes, one at the Biblioteca Ambrosiana, Milan, the other at Schwerin; the last period, where all colours are blended in one harmonious tone, by "Landscape with Figures" (1598) in the Leichtenstein Gallery at Vienna. He brought the Flemish tradition to Holland and Germany.

See E. Plietzsch, *Die Frankenthaler Maler* (1910).

CONJEEVERAM, a town of British India, in the Chingleput district of Madras, 45 mi. W.S.W. of Madras by the South Indian railway. The population (74,635 in 1941) has largely increased in recent years. It is esteemed by the Hindus as one of the holiest places in southern India, ranking among the seven sacred cities of India, and is remarkable for the number of its temples and shrines. Of these the old Jain temple, situated in a hamlet some 2 mi. south of the Weavers' quarter of the city (Pillapalaiyam), dates from the time when the Chola power was at its height (12th or 13th century); the inscriptions contain an almost perfect record of the dynasties who held the country. Older than this temple are the great temples of Vishnu and Siva, which date from the time of the Pallava kings. The latter is remarkable for its lofty towers and the extreme irregularity of its design. It contains fine porches, great tanks, and a hall with 540 carved columns. About 2 mi. distant, in Little Conjeeveram, is the Vara-daraja-swami Vaishnava temple, also containing a hall of pillars, beautifully carved, and possessing a rich treasury of votive jewels. For a century or more quarrels between the Tangalai and Vadagalai sects, connected with the worship of the temple, as to the form of a symbol on the wall of the inner enclosure have led to much litigation. The general aspect of the city is pleasing, with broad streets lined with fine trees. Its only important industry is the weaving of superior silk and cotton cloths and *sārīs,* which supports a large proportion of the population.

Conjeeveram, a British corruption of Kanchipuram (the golden city), is very ancient, having been an influential place before the Christian era, and in its early centuries the capital of the Pallava dynasty. In the 11th century the city was conquered by the Cholas. Later it came to the Muslims, the kings of Vijayanagar, the Mahrattas and the emperor Aurungzeb. It remained in Muslim hands until 1752, when it was captured by Clive.

CONJUGAL RIGHTS: *see* DIVORCE.

CONJUNCTION, a general term signifying the act or state of being joined together. It is used technically in astronomy and grammar. In astronomy, two bodies are said to be in conjunction in right ascension or longitude when they have the same right ascension or longitude. The conjunction of Mercury or Venus with the sun is "superior" when the planet lies beyond the sun, and "inferior" when the planet is between us and the sun. In grammar the term "conjunction" is applied to one of the so-called "parts of speech," viz., those words which are used to "join together" words, clauses or sentences. Conjunctions are variously classified according to their specific function; *e.g., adversative* ("but," "though") which contrast, *illative* ("therefore") where the second sentence or clause is an inference from the first, *temporal* where a time-relation is expressed, and so forth.

CONJURING, the art of entertaining by pretended performance of those things which cannot be done. The conjurer is an actor who, to perform his feats, combines psychology with manual dexterity, and, frequently, with mechanical apparatus. Because the entertainment an audience derives from conjuring depends largely upon complete mystification, the profession always tries to keep its methods secret and permits the public to think what it will. Even into the 18th century, a majority of the people of the world believed the tricks they saw performed were the result of the aid of demons. The two most common terms used for the art, conjuring and magic, have in their earlier meanings association with devils, spirits and unholy powers. In the 18th century, more enlightened people began using the words Natural Magic, or White Magic, to indicate the entertainment. It still was confusing, for White Magic also has the meaning of curative magic, as opposed to Black Magic which destroys. Natural Magic, as well as White Magic, are unusual terms since 1875.

The newer words, *legerdemain, prestidigitation, sleight of hand,* also are confusing because all three suggest rapidity of movement and the elimination of apparatus. Conjuring does not depend upon the quickness of the hand deceiving the eye, and unseen, secret equipment frequently is used.

Only in a minority of feats does the magician attempt to deceive the eye, and, even in those, he designs his tricks primarily to fool the minds of the spectators. By his acting, the magician so presents his work that the mind will take no notice of a great many things which the eyes can see. This focussing of attention of the audience on some actions, in order that others will be disregarded, is called, by magicians, *misdirection.* That term, too, is a misnomer for the magician directs attention towards one action, rather than away from another. It is done, generally, by creating an unusual situation while acting as if it were quite normal. As an example: Much of the knowledge man has gathered through all time can be discovered by the use of these three magic words:

Acin nat irb

While the eyes can see the letters, the mind makes no sense of them. Taking out the spaces and reading the letters backwards gives "Britannica." First, by giving the mind something to mull over in the introduction to the "three magic words" and, second, by confusing the details of presentation, the mind, rather than the eyes, is deceived. While this one example serves to show a phase of the psychology of deception, the subject in entirety is much more involved. Another indispensable branch of psychology makes the work of the performer both more interesting and entertaining and is termed *showmanship.*

A magician's manual operations, though not performed rapidly, require great deftness of touch and complete certainty of action. Independent use of the digits and other unusual hand and arm movements are used in many tricks with the added handicap of each having to appear to be entirely normal. The magician's dexterity, unlike the musician's, is similar to the surgeon's in the type of deftness. Unlike the surgeon, the magician also must keep in mind the appearance of his movements. The magician is like the musician only in that he must have precision of time and exactness of rhythm.

Apparatus is of three types: 1. equipment which is exactly as it appears to the audience; 2. equipment which, secretly, has been prepared to aid the performance of the trick without altering its appearance; 3. equipment which is hidden from sight and used without the knowledge of the audience. Among those feats dependent upon apparatus some require but one type, while others need a combination of two, or even all three forms.

While tricks vary greatly, about 80% of the success of a conjurer's performance depends upon the use of psychology, 10% upon skilled manipulation, and 10% upon the use of equipment.

A performance of the impossible is not only an intriguing show, but one which can be understood and enjoyed by all types of people of every country. Magic is the one art of the theatre which is completely international. Most of the old and basic feats in magic are performed by the magicians of all nations, and, while slight variations exist in performance or equipment, the underlying principles are identical. It is unlikely that these basic tricks were taken from one land to another, but, rather, that they were developed locally and the methods were alike because each nationality adopted the most simple means of performance. As magicians advanced through the ages, different and more elaborate feats of magic were devised in various countries. With the 19th century, magicians of the world began interchanging their mysteries so that more and more oriental feats came into the programs of occidental performers and the eastern conjurers augmented their shows with the tricks of their western colleagues.

Early History.—Many scholars have written of the methods for the tricks shown in ancient times by the pagan priests of Egypt, Greece and Rome. It is known that optical illusions were used, apparently to bring forth divinities; that tubing was used to carry the voices of hidden humans, thus giving the effect of speaking idols; and that a variety of mechanical contrivances were used to produce weird occurrences before the altars. However, it is most unlikely that conjurers of the period, in any country, had such close association with the priests as to be told the methods of the temple illusions. It is also doubtful whether the conjurers even knew of the existence of the priestly magic. At any rate, the feats of the ancient conjurers were quite different. The conjurers were able to perform their mysteries anywhere, while, because of the required equipment and preparation, the pagan priests could show their magic only in the temples. Some of the conjurers, however, did turn to their own advantage the superstitious awe in which many held their work.

By the time people were civilized enough to record history, they described the performances of conjurers. These ancient notes are sketchy, but enough is told to know that conjurer's feats were much like those of later periods about which there are more complete reports. Throughout the entire world, the more skilful of the early conjurers were entertainers at the courts of the rulers, and those of lesser skill performed in the market places for the people, or at the feasts of the wealthy. Their feats were very much alike and quite limited in number. The principal trick, which, known as the "Cups and Balls," still is popular, was one in which three inverted cups and a ball were used. The ball mysteriously would jump about invisibly from cup to cup, then multiply into three balls with each seemingly having the ability of undiscernible locomotion. The basis for this mystery is a secret additional ball which, by skilled manipulation, is put under one cup while the known ball, as secretly, is removed from another cup. The manipulative work in this trick, as in most, is aided by the distracting conversation of the conjurer. Because the trick was in the program of every early conjurer, and always a favourite with audiences, magicians received more recognition for the performance of the Cups and Balls than for all their other feats. The ancient Greek term for conjurer was *Psephopaiktes,* and one of the old Roman words was *Calcularius.* Both meant "he who deals with pebbles." In different countries pebbles, or other small objects, were used for the trick instead of balls. The shape and type of cup used also varied. Another Roman word for conjurer, *Acetabularius,* meant, "he who deals with vinegar cups." Descendants of the Roman conjurers used the cylindrical boxwood measures, instead of vinegar cups, and a popular old Italian term for magic was *giuoco di bussolotti,* "the game with the measures." Similarly in France, a conjurer was called *joüeür de goubelets.* A usual adjunct of equipment for the Cups and Balls was a bag, with strings, tied around the waist of the conjurer, like an apron. It was not only a serviceable way to carry the properties of the trick, but was a handy place for the conjurer secretly to acquire or dispose of the balls. Throughout Europe the conjurer's pocket-apron was the badge of the profession and *Taschenspieler,* "pocket-player," became the common term for magician in German. The Cups and Balls is one of the basic tricks of magic, and the Egyptian, East Indian, Chinese and other eastern magicians performed the feat exactly as did the Europeans, except, because of the differences in clothing, the pocket-apron never was needed by oriental magicians. Other universal tricks of the early conjurers were the restoration of a piece of string, which had been severed, and apparently thrusting knives into the body. The first was accomplished by failing to cut the string in the manner suggested, and the second by substituting special, harmless knives for the real ones offered for inspection. Other generally used magic was performed with borrowed rings and coins. Any trick done with a borrowed object always has been doubly interesting.

The mediaeval magicians travelled more than had their predecessors, and, as itinerant mountebank performers, even toured countries other than their own. Their equipment was limited to what could be carried on their backs and, while the old tricks still were used, the performances were augmented with feats done with borrowed fruit, vegetables and small fowl, as well as with men's hats, and women's kerchiefs. With the advent of the printed playing cards, a whole new field of magic was opened, as an infinite number of tricks could be done with cards, and a deck could be carried easily. More and more, the magicians in their travels followed a regular itinerary and built a following for their annual appearances. Many cities had a *Street of the Conjurers* where performances could be seen daily. Some magicians were able to give more impressive shows by having extra equipment carried on a donkey or horse, while others joined with entertainers of various other types, ballad singers, story tellers, acrobats and musicians, to give more elaborate performances. These larger shows were given in rented barns, or store houses, and for more people than could see a street or market-place exhibition. The increased remuneration was, and is, the magician's greatest interest in the size of his audience.

At least the majority of the feats of the conjurers of olden times were recorded. The first book to describe the secrets of sleight of hand and magic equipment was the *Discoverie of Witchcraft* (1584), and it was written by Reginald Scot, who was not a magician, for the sole purpose of convincing the public that sorcery had no part in such performances. The first book devoted solely to the subject, *The Art of Jugling, or Legerdemain* (1614), by S.R. (probably Samuel Rid), and the anonymous later volume *Hocus Pocus Junior* (1634), both gave clearer descriptions of the methods employed in the art. It is likely both volumes were unsigned because their authors feared those who still believed that magicians had contact with devils. Scot's book was burned by the common executioner by order of such believers. Juggler (from the Latin *joculator*) was an early term for conjurer as was Hocus Pocus, used, with other pretended magic words, by performers throughout Europe. These books showed that magicians were learning more about mechanics and knew how to construct boxes with false bottoms, and to make a keg out of which several liquors could be drawn from the one spigot. A number of books describing the same tricks, written by other magicians, appeared on the continent during the 17th century, though *Engaños a Ojos Vistas* (Madrid, 1733), by Pablo Minguet e Yrol, was the single volume to stress the use of the pocket-apron. By the time the more advanced and literate conjurers began to write about their work, they not only had discovered better hiding places for the balls, but realized that the success of a trick depended more upon the acting ability and manner of the performer than on any piece of equipment.

Beginning of Stage Performances.—In the 18th century, many more books on magic appeared, but the only advance recorded of the art was the use of magical automata and apparent transference of thought from a magician to his assistant. The latter was first shown (1781) by Philip Breslaw (1726–1803), and later (1783), by Guiseppe Pinetti de Wildalle (1750–1800). Occasionally, magicians exhibited true automata (*i.e.,* motivated entirely by mechanics), though usually their figures were pseudo-mechanical masks for the tricks performed. While such automata as a doll, which would play on a flute any tune requested, or a toy bird, which would blow out the flame of one candle and light another by a further gust, were tricks, not mechanics, they added interest and variety to the performances. Real automaton figures were publicly exhibited, usually by the mechanics who made them, and were interesting to the public because of their ingenuity of construction. Magical automata did what was impossible for the mechanical kind.

The great increase in equipment made necessary semi-permanent quarters, with stages, the better to display the tricks, so conjurers rented stores and halls, and made them into small theatres. The portability of equipment no longer being the first consideration, magicians started using large and completely draped tables with trap doors operated by hidden assistants. An object placed on such a table, and momentarily covered from the sight of the spectators, could be caused to disappear, or to become totally different, by the mere command of the magician, plus the work of the hidden assistant. Because of the quantities of apparatus, magicians avowed super-mechanical knowledge and based their wonders on a scientific claim, rather than the magic words previously used. The public did not object, for people were becoming conscious of the remarkable possibilities of mechanics and were losing interest in the pretense of magic spells. *Professor* as a title for magician, invariably self-bestowed, became generally accepted. Many of the travelling conjurers also were using more equipment and had built special wagons for travelling. The rear of such a wagon would open to form a stage, the front would make the living quarters. In short, the wagon was both a home and a stage on wheels.

Of course, some magicians continued to perform in market places, at fairs, in barns and taverns, but changes were occurring in magic. Notable conjurers of this period were: Isaac Fawkes

(1675?–1731), Christopher Pinchbeck (1670–1732), Philadelphia (Jacob Meyer, 1735–90), Kalterfelto (1730?–99), Flockton (1740?–94), and Lane, about whom there is little personal data. Possibly, greater public interest in magicians and their work, than previously had been given, was accorded performers of the 18th century, because they advertised themselves in newspapers and further attracted personal attention by wearing striking costumes at all times. Though certain of the conjurers added to their magic exhibitions ventriloquism, juggling, sword swallowing or even fire eating and other heat resistant feats, such demonstrations are no more a part of conjuring than is medicine, because some conjurers sold curatives in connection with their shows.

Once magicians had theatres to play in, and could use quantities of equipment, their shows became extremely elaborate and, in the early 19th century, stages were filled with apparatus frequently claimed to be constructed of solid silver. Only a part of the equipment was employed in any one performance and some of the most ornate pieces had no use, other than to add to the number of articles displayed. The printed programs carried long lists of the names of tricks possessed by the magician "from which a selection will be made for each entertainment." While many of the tricks were performed by all the magicians, new program names for the tricks were devised by each one. The elaborate paraphernalia-decked stages, and the costly and fanciful costumes assumed by the magicians, lent a grandeur to the performances earlier shows had lacked. The greatest conjurers of this type were: Bartolomeo Bosco (1790–1863), Ludwig Leopold Döbler (1801–64), Philippe (Jacques Noel Talon, 1802–78), and Alexander (Johann Frederick Alexander Heimburger, 1819–1909). All were great travellers who gave their shows in many countries.

One of the last of these great ornamental conjurers was Henri Robin (Dunkell, 1805–74), a native of the Netherlands, who pretended to be French. He claimed to be the inventor and was, at least, the first to show (1847) the illusion later known as "Pepper's Ghost." It was based on an optical principle Baptista Porta, the Italian philosopher, had described in effect 300 years earlier (*Magia Naturalis,* 1588), by which, on an inclined plate glass, a transparent reflection, or ghost, could be made of a person hidden to the audience. The ghostly effect was enhanced because the spectre, on the unseen glass, seemed to walk about among living people. These actors were behind the glass and had rehearsed their parts carefully so that their actions coincided with those of the actor, who, in a different part of the theatre, was the original of the ghost. The illusion depended largely upon the arrangement of the lights, which could be controlled to give any amount of substantiability to the ghost, or cause it to disappear altogether. For the few years until the public learned of the method employed, the ghost illusion had great popularity. Its importance to the history of conjuring is that it was the first of the tricks utilizing glass. Later conjurers made full use of the sheet-glass, both plain and silvered, in designing magical illusions. Spectres, having little or no action, and lacking the ability to mingle with humans, had been produced earlier by means of magic lanterns. This method to produce ghosts had been mentioned, in a vague way, by writers long before the magic lantern's accredited invention by Athanasius Kircher in the 17th century. While such lanterns probably had long been used by charlatans to bring forth ghosts and demons, there is no evidence of their use for entertainment by conjurers until 1784 in a show produced by Robertson (Etrienne Gaspard Robert, 1763–1837), a Belgian optician and magician, even though they had been described most inadequately, since 1727, in books on magic.

Beginning of Modern Magic.—In contrast to the elaborately equipped, fantastically dressed school of conjurers, another group went to the opposite extreme. Actually Conus (sometimes called Comus, and whose real name was Cotte, d. 1836), was the forerunner of the advocates of simplicity of performance, though Wiljalba Frikell (1818–1903), was the real leader. Frikell was the first magician to appear in conventional evening clothes. His magic depended almost entirely upon his personal skill and he eschewed most of the usual equipment. He wrote (*Lessons in Magic,* 1858) that "the use of complicated and cumbrous apparatus diminishes the amount of astonishment conjurers are enabled to produce which is a defect not compensated by the external splendor and imposing effect of such paraphernalia." Johann Nepomuk Hofzinser (1806–75), an Austrian, who appeared only in his own country, was among the other conjurers to eliminate displays of apparatus from their shows. These simplified exhibitions required new tricks, and Hofzinser devised many varied feats of magic and was the most prolific inventor of card tricks. While comparatively few magicians went to the extreme of Frikell and Hofzinser, their work had an enormous effect on the shows of all later conjurers.

John Henry Anderson (1812–74), a Scot who called himself "The Great Wizard of the North," while considerably influenced by advocates of simplification in later life, was in another field a leader of magicians. Anderson was the first great advertiser and, by example, showed the tremendous public interest which could be invoked in exhibitions of magic, particularly when the interest first was directed towards the performer himself. The people showed their concern in Anderson and his magic by paid attendance at his shows.

Robert-Houdin (Jean Eugene Robert, 1805–71), a Frenchman, made so many improvements in magic equipment and so carefully and systematically classified all that was known about presentation that he is called the father of modern conjuring. While he claimed to have originated almost all the tricks he performed, as well as the innovations in performance, actually his work was based largely on the best ideas of his predecessors. Robert-Houdin followed Frikell in adopting gentlemen's attire, and though he did not do away with apparatus, he did, in the main, use what appeared to be common and familiar objects. He modernized the mechanical marvels originated by Pinchbeck and others, and improved the table mechanisms, which Pinetti had devised, to eliminate the necessity for draped tables with hidden assistants. Pinetti had used tables with tops which, while no thicker than normal tables, concealed levers with cords running to off-stage assistants, by which to operate mechanical tricks placed on the tables. Robert-Houdin ran electric wires to his tables which operated electro-magnets instead of levers, as well as cords, motivating pistons. He was the first, and one of the very few, magicians ever to utilize electro-magnetism though Döbler, previously, had used electricity in his feat of causing two hundred candles to light simultaneously upon the firing of a pistol, and Philip Breslaw had used a common magnet to control the activities, on the surface of water in a bowl, of "The Learned Swan," a wooden figure with an iron core.

In 1849, Robert-Houdin made a sensation with his floating boy. It was a marked improvement on a mysterious suspension which, in 1826, Ling Lau Lauro had been the first to show in the occident, although there are records of its having been shown several years earlier in Madras and, possibly, was of Indian invention. In the original effect, a person sat cross-legged, several feet in the air, upon nothing. The fingers of the floating man's one outstretched arm lightly touched a perpendicular bamboo rod set upon a stool, or platform, raised above the stage. The secret was that inside the bamboo pole, affixed to the platform, ran an iron bar bent at the top at right angles, and to which was attached a metal support to uphold the body. The body support, and such of the iron outside the bamboo pole, was covered by the sleeve and clothing of the subject, and, necessarily, screens or curtains had to mask the preparation for suspension. Robert-Houdin made a metal body rest which could be worn inside the subject's clothing and had a mechanical method by which the support and the pole could be connected, in full sight of the audience, to allow the boy to lie horizontally in the air. He added to the presentation by giving an acceptable, though false, reason for the suspension. It was claimed to be the effects of ether, which had the property of making a body totally devoid of weight. Ether was then a new discovery and its real qualities were known only to a few scientists. Robert-Houdin also materially improved the signalling method for apparent "thought-transference," which had been a feature of Pinetti and others. Many of Robert-

Houdin's "inventions" may be shown to be of earlier origin, but he brought each to a point of perfection undreamed of by the originators. Robert-Houdin influenced a number of magicians, including Anderson, and was copied slavishly by Robert Heller (William Henry Palmer, 1830–78) and others. Heller, an Englishman, even went to the length of dyeing his hair and assuming a French accent in his attempt to be like the other man. Heller's success waited upon resumption of his own personality, his brilliantly witty style of performance, and in following Robert-Houdin only in ideas.

Robert-Houdin led also in writing professional books on magic. Prior to his works there had been but one real manual on the subject, *Le Sorcellerie Ancienne et Moderne Expliquée, ou Cours Complet de Prestidigitation* (1853), by Jean Nickolas Ponsin (1777–1853), a French amateur. All the earlier publications, including Henri Decremps (1746–1826?), *La Magie Blanche Dévoilée* (1784), and later works, and Pinetti's *Amusemens Physiques, et Différentes Experiences Divertissants* (1784), while tremendously interesting as historical records, merely exposed, with little detail, the methods by which tricks were done and contained nothing on how to learn to do them. While Ponsin actually describes how to do tricks, Robert-Houdin, possibly because of his greater knowledge of the subject, gives an understanding of the underlying art of magic, as well as superb lessons in *Les Secrets de la Prestidigitation et de la Magie* (1868). Robert-Houdin's other books also are excellent and all have been translated into several languages. Following Robert-Houdin, hundreds of other magicians have contributed, in many languages, to the literature of the subject a total of several thousand volumes. A large proportion of the books on the art are privately circulated professional publications.

Two of the best known conjurers were Compars (Carl) Herrmann (1816–87) and his younger brother Alexander (1843–96), known as Herrmann The Great. They used comparatively little equipment and were most skilled manipulators, though, in later life, Alexander performed a number of large illusions which had come into vogue. Other prominent performers of the period were: Signor Antonio Blitz (1810–77), Joseph Michael Hartz (1836–1903), Louis Haselmayer (1839–85), Baron Hartwig Seeman (1833–86), Le Commander Bernard Marius Cazeneuve (1839–1913), The Fakir of Oolu (Alfred Sylvester, 1831–86), Dr. Lynn (Hugh Simmons, 1838?–96), and Colonel Stodare (John English, 1831–66). Through their constant travels they gathered the magic of the entire world and added it to their shows and all invented some magic. The Fakir of Oolu devised an improvement on the suspension, which permitted the floating person to be shown in several changes of position and permitted also the final removal of the supporting rod. The rod was removed only in a dim light and was accomplished by having a shell stick which could be taken off the iron rod. The iron rod was covered with dull material matching the back curtain and became invisible in dim light. Hartz and Stodare invented many small tricks which remain popular. Stodare, with an illusion the "Sphinx," invented by Thomas William Tobin of the Polytechnic institution, was the first magician to make use of mirrors to hide objects. The effect of the illusion was that a live (though bodiless) head of a man rested on a light three-legged table in the center of the stage. The secret was that between the legs of the table were mirrors set at the proper angles to reflect the sides of the stage which had hangings identical with those behind the table. The spectators apparently would be able to see the back curtain through the legs of the table, though actually they saw the reflections of the side curtains. The mirrors were invisible because the edges were masked by the table legs. Behind the mirrors was ample space for the body of the man who, through a hole in the table top, exhibited his "detached" head.

Beginning of Magic of Present Times.—John Nevil Maskelyne (1839–1917) played an enormous part in the advancement of magic. He invented a number of magical effects; he founded a theatre of magic in London, which he, his sons and grandsons, ran for over 50 years; he encouraged, engaged in and advised with the inventions of scores of other magicians. He originated (1865) the feat of escape from a box which was locked and roped after he had entered. He was the first (1875) to cause a levitated person to rise and fall in the air, and the first to eliminate all visible means of support. His son Nevil Maskelyne (1863–1924), added the use of a large solid hoop to pass over the floating lady, a convincing way of showing an absence of support. Again in "Cleopatra's Needle" (1875), Maskelyne was the first to use the counter-weight principle to make a heavy object void of weight. In this illusion, an obelisk-shaped box was carried about the stage as if it were extremely light, though two persons, who later appeared, were hidden inside all the time. Maskelyne, also, constructed the two best magical automaton figures: "Psycho" (1875) was a card player and calculator built on an idea of John Algernon Clarke; and "Zoe" (1877) was a portrait artist who drew likenesses of various celebrities. For many years, Maskelyne had George A. Cooke as a business associate and the names of Maskelyne and Cooke became synonomous with conjuring. After Cooke's death (1904), Maskelyne took David Devant (David Wighton, 1868–1941), into a partnership, which lasted until 1915. Devant, the greatest of English conjurers, was prolific with new ideas in magic. Buatier De Kolta (Joseph Buatier, 1845–1903), who appeared in many of Maskelyne's shows, invented some of the most striking magic ever performed. His "Vanishing Lady" (1886) and the "Flying Bird Cage" (1873) were the best of his many inventions. Both depended more upon the manner of performance than on the secret equipment used. De Kolta also improved "Black Art," or "Modern Black Magic," a series of effects first shown by Max Auzinger (1839–1928), who usually performed under the name of Ben-Ali-Bey. Black Art is based on the optical principle that, with proper lighting conditions, both shadow and form can be eliminated and objects will become invisible when covered with light-absorbing material (usually black, hence the name), identical with the background. Using this principle, anything can be caused to disappear upon being covered with cloth, or be made to appear by reversing the operation. Assistants, handling the covers, were themselves invisible, due to the material of their completely enveloping costumes.

Harry Kellar (1849–1922), first great American born magician, made many refinements in magic and performed superbly the large as well as the small tricks. Beginning with the final decade of the 19th century, American magicians were the first to specialize in their magic. Among these specialists were: Howard Thurston (1869–1936), who performed only with cards; Thomas Nelson Downs (1867–1938), who did magic only with coins; and Harry Houdini (1874–1926), who exhibited feats of extrication from ropes, handcuffs and shackles. These conjurers had, of necessity, to originate a large proportion of their tricks and, particularly in modes of manipulation, added materially to methods in magic. Thurston later took over the Kellar show and Houdini also added diverse magic to his performances. Other specialists were Horace Goldin (1873–1939), who featured large effects shown with extreme rapidity, and Nate Leipzig (1873–1939), who did only small tricks requiring great dexterity. Goldin invented many famous illusions among which was "Sawing a Woman in Half," with a motor driven circular saw.

Magicians strive constantly to add new material to their shows, but not all possess inventive abilities. Some of those who devise the best magic are not good showmen and the public will remember the tricks of a great performer rather than the original magic of one less skilled in presentation. As example, the performances of The Great Lafayette (Siegmund Neuberger, 1872–1911), or those of Chung Ling Soo (William Ellsworth Campbell, 1861–1918), who styled his stage name after the great Chinese magician, Ching Ling Foo (Chee Ling Qua, 1854–1918), advanced magic and the professional status of magicians more than did the inventions of Selbit (Percy Tibbles, d. 1938), one of the most original magicians.

The mechanical advance in the objects of everyday life has caused magicians to simplify their equipment in order to convince the spectators that the marvels of magic supersede science. Today's audiences, in the belief that the skill of the performer accounts for all his mysteries, are entertained quite as much as those of earlier times who believed the conjurer to be either a superscientist, or one possessed of truly magical words and spells. Never has conjuring been as popular an entertainment as it is today. Today one conjurer shows the "Cups and Balls" and another exhibits the newest mystery. One entertains kings, and another performs in taverns. One has a stageful of equipment, while another uses only the properties he can carry. In conjuring, one of the oldest and most delightful arts, the best of the old is kept and added to the best of what is new.

Qualifications for a Conjurer.—What makes an exhibition of mysteries effective is the agreeable personality of the conjurer, and the timing, naturalness and smoothness of his performance. Properly to enact the role of purveyor of the impossible, a conjurer must be assured in every word and action. His confident manner can come only from complete certainty that he knows precisely what he is doing and has practised thoroughly all the details of every trick until the performance can be done without thought or difficulty. A conjurer does not have to be of any particular type, nor have any unusual physical qualifications, but he must have, or develop, a pleasing manner. He should inherently like people and must study group psychology, as well as the psychology of deception and presentation. He must acquire a sense of rhythm and a precision of time in order to be able to execute his secret operations invisibly and apparently without effort. Real proficiency in conjuring comes only through experience. A conjurer must present all his tricks in a manner fitting his own personality, so he also has to be original. He does not need to devise his own magic, for there are thousands upon thousands of feats already invented, from which to form a program. However, a person original enough to plan new combinations of old ideas usually, also, can contrive new principles as well. Finally, a conjurer either must be able to talk convincingly, interestingly, even amusingly, with good diction and sufficiently loud voice, or he must be so skilled in pantomime as to express his thoughts without speech. The conjurer has to make the audience aware of the purpose of each mystery.

Bibliography.—H. Kellock, *Houdini's Life Story* (1928); Howard Thurston, *My Life of Magic* (1929); David Devant, *My Magic Life* (1931); and Horace Goldin, *It's Fun To Be Fooled* (1937). Maskelyne and Devant, *Our Magic* (1911) is the best book on the theory of the subject. Professor Louis Hoffmann, *The Secrets of Conjuring and Magic or How To Become a Wizard* (1877) is a translation of Robert-Houdin, *Secrets de la Prestidigitation et de la magie*. Hoffmann's own books, *Modern Magic, More Magic,* and *Later Magic,* cover both sleight of hand and equipment. *See* also: D. Devant, *Lessons in Magic* (1922); J. Mulholland, *The Art of Illusion* (1944). (J. Mu.)

CONKLIN, EDWIN GRANT (1863–), American biologist, was born at Waldo, O., on Nov. 24, 1863. He graduated at Ohio Wesleyan university in 1886 and received from Johns Hopkins university in 1891 the degree of doctor of philosophy. He was professor of biology at Ohio Wesleyan university in 1891–94, and professor of zoology at Northwestern university from 1894 to 1896 and at the University of Pennsylvania from 1896 to 1908 when he was appointed to a similar chair in Princeton university. He made valuable researches in embryology and cytology and in the mechanism of heredity and evolution, and by his skill as an investigator, teacher and writer, rose to foremost rank among American zoologists. Besides numerous and varied contributions to scientific journals, his writings include *Heredity and Environment in the Development of Men* (1915–21); *Direction of Human Evolution* (1921); *Problems of Organic Adaptation* (1921); and *A Synopsis of the General Morphology of Animals* (1921). He retired from active teaching in 1933.

CONKLING, ROSCOE (1829–1888), American lawyer and political leader, was born in Albany, N.Y., on Oct. 30, 1829. He was the son of Alfred Conkling (1789–1874), who was a representative in Congress from New York in 1821–23, a Federal district judge in 1825–52, and U.S. minister to Mexico in 1852–53. Roscoe Conkling was admitted to the bar at Utica, N.Y., in 1850, was appointed district attorney of Oneida county in the same year, and soon attained success in the practice of his profession. At first a Whig, he joined the Republican party at its formation, and was a Republican representative in congress from 1859 to 1863. He refused to follow the financial policy of his party in 1862, and delivered a notable speech against the passage of the Legal Tender act. In 1863 he resumed the practice of law, and in April 1865 was appointed a special judge advocate by the secretary of war. He was again a representative in congress from Dec. 1865 until 1867, when he entered the senate. After the war he allied himself with the radical wing of his party, was a member of the joint committee that outlined the congressional plan of reconstructing the late Confederate states, and laboured for the impeachment of President Johnson. During President Grant's administration he was a member of the senatorial coterie that influenced most of the president's policies. In the Republican national convention of 1876 Conkling sought nomination for the presidency, and after the disputed election of this year he took a prominent part in devising and securing the passage of a bill creating an electoral commission. In 1880 he was one of the leaders of the unsuccessful movement to nominate Grant for a third presidential term. With Grant's successors, Hayes and Garfield, his relations were not cordial; an opponent of civil service reform, he came into conflict with President Hayes over the removal of Chester A. Arthur and other federal officeholders in New York; and when in 1881 President Garfield, without consulting him, appointed William H. Robertson, a political opponent of Conkling, as collector of the port of New York, and when this appointment was confirmed by the senate in spite of Conkling's opposition, Conkling and his associate senator from New York, Thomas C. Platt, resigned their seats in the senate and sought re-election as a personal vindication. Being unsuccessful, Conkling took up the practice of law in New York city. While in public life Conkling attracted attention by his abilities, his keenness and eloquence in debate, his aggressive leadership and his striking personality. Though a strenuous worker in congress, he was not the originator of any great legislative measures, and his efficiency as a lawmaker is thought to have been much impaired by his personal animosities. His hostility to James G. Blaine, a fellow Republican senator, was especially marked. He died in New York city on April 18, 1888.

Boutwell, "Blaine and Conkling and the Republican Convention of 1880," in *McClure's Magazine*, vol. xiv., p. 281–286 (1900); Venila Lovina Shores, "The Hayes-Conkling Controversy, 1877–79," in *Smith College Studies in History*, vol. iv., No. 4 (1919).

CONN (d. A.D. 157?), king of Ireland, known as Conn of the Hundred Battles. Few facts about his reign have been definitely authenticated but it is thought that he became king in about 123, after he had killed in battle Cathair Mor, who had seized the throne after the death of Conn's father. One of the first of the wars which gave Conn his nickname occurred shortly after the beginning of his reign when he gave to one of his old tutors the province of Leinster. An officer in Conn's army, Cumhall, felt that Leinster should have been his for his services in gathering together the army and he therefore seized the territory for himself. In the ensuing battle Cumhall was killed and his forces defeated. Conn next became embroiled in the controversy over which of three princes was to be the ruler of the province of Munster. He espoused the cause of Aongus, who came to Conn for help after he had been defeated by the powerful armies of Modha Nuagat. Conn supplied him with 15,000 troops but Aongus was defeated and Modha Nuagat led his armies against Conn's, subsequently defeating the king in 10 battles. Conn was forced to divide the kingdom of Ireland with Modha Nuagat, taking for himself the territory north of a line of small hills running from Dublin to Galway and giving to Modha Nuagat the territory south of it. The wars between the two kings continued for many years. Finally, Modha Nuagat was killed, probably at the battle of Magh Lena, although some authorities hold that he was murdered by Conn. Conn continued to rule until 157 when he himself was assassinated by Tiobraidhe Tireach, king of Ulster. There is a legend that that king hired 50 men dressed as women to perform the murder.

CONN, LOUGH, a lake of western Eire, in Co. Mayo. Its length (N.N.W. to S.S.E.) is 9 mi. and its extreme breadth

5 mi. On the south a narrow passage communicates with Lough Cullin. The total length of the two loughs is nearly 12 mi. They drain eastward by a short channel tributary to the Moy. Lough Conn lies 42 ft. above sea level. It contains a few islands, and its shores are generally low.

CONNAUGHT, ARTHUR WILLIAM PATRICK ALBERT, DUKE OF (1850–1942), third son and seventh child of Queen Victoria, was born at Buckingham Palace on May 1, 1850. In 1874 he was created duke of Connaught and Strathearn and earl of Sussex. He was entered at the Royal Military Academy, Woolwich, in 1866, and gazetted to the Royal Engineers in 1868. Promoted captain in the Rifle Brigade in 1871, and lieutenant-colonel in 1876, he became general in 1893. The duke served with the expeditionary force in Egypt (1882), and commanded the Guards brigade at Tel-el-Kebir. In 1886 he went to India, where he commanded the Bombay army until 1890. On his return home he held command in the southern district (1890–93), and at Aldershot (1893–98), and in 1900 succeeded Lord Roberts as commander-in-chief in Ireland. On the re-organization of the War Office in 1904, he held the new office of inspector-general to the forces until 1907, when he was made commander-in-chief in the Mediterranean. In 1910 the duke opened the Union Parliament of South Africa on behalf of King George V. He succeeded Earl Grey as governor-general and commander-in-chief of Canada (1911–16); and in 1920 he went to India as the representative of the king, to inaugurate the provincial legislative councils of Madras, Bengal and Bombay.

On March 13, 1879, the duke married Princess Louise Marguerite of Prussia, third daughter of Prince Frederick Charles, who died in London on March 14, 1917. The duke's only son, Prince Arthur of Connaught (1883–1938), married, 1913, Princess Alexandra, Duchess of Fife, daughter of the Princess Royal, who had succeeded in 1912 to her father's dukedom by special remainder. Prince Arthur held the post of governor-general of the Union of South Africa from 1920 until Dec. 1923. The duke of Connaught's elder daughter, Margaret (1882–1920) was married in 1905 to the crown prince of Sweden, and died at Stockholm on May 1, 1920. The younger daughter, Patricia (1886–), resigned her royal title on her marriage, in 1919, with the Hon. Alexander Robert Maule Ramsay, third son of the 13th earl of Dalhousie. The duke of Connaught died Jan. 16, 1942.

CONNAUGHT (kŏn′ącht *or* kŏn′awt), a northwestern province of Eire, having as the greater part of its eastern boundary the river Shannon, over its middle course. It includes the counties Mayo, Sligo, Leitrim, Galway and Roscommon (*qq.v.* for topography, etc.). Population (1936) 525,468.

In early times, Connaught (*Connachta*) was a Firbolg or pre-Celtic state, but about A.D. 150 it passed under the Gaelic dynasty which ruled at Cruachu, now Croghan, in Co. Roscommon. This dynasty pushed over the Shannon and founded a new kingdom of Meath, with Tara as its capital about 250. Connaught and Meath then remained a joint kingdom till 483, when the former became a separate state which lasted till 1224. In the 12th century Connaught produced a great High King in Turloch O'Connor. On the death of Cathal "Crovderg," Henry III. made a grant of Connaught to Richard de Burgh, saving a few cantreds in Co. Roscommon to the O'Connors (1227). Richard's son Walter became earl of Ulster as well as lord of Connaught, but when Earl William was murdered in 1333 his heiress, marrying prince Lionel of Clarence, ultimately carried these titles to the Crown. Connaught was, however, occupied by junior branches of the de Burghs, who took respectively the appellations of MacWilliam "Uachtair" and "Iochtair" ("the Upper and Lower MacWilliam"), or the Clanrickard and Mayo Burkes. In 1543 Ulick Burke was created earl of Clanrickard, and in 1603 "MacWilliam Iochtair" Viscount Mayo. In 1576 Connaught was divided into shires by Sir Henry Sidney, who also placed it, like Munster, under a president, a system which lasted 70 years. In 1585 Sir John Perrot made with the resident gentry and chiefs the "Composition of Connaught," which confirmed them in their lands by knight-service of the Crown. The result was that the province remained loyal on the whole during the Tyrone rising, and till 1640 was the most Gaelic and Norman part of Ireland. Its history is henceforth part of the national history.

CONNAUGHT TUNNEL, on the main line of the Canadian Pacific railway, pierces Mt. Macdonald in the Selkirk Range east of Glacier, British Columbia. It reaches an elevation of 3,790ft., above sea level, has a concrete lined cross-section 23 by 29ft., is double tracked and 5mi. long. It was driven through rock and earth by the pioneer tunnel method involving a small working tunnel with cross-cuts to the main tunnel permitting the working of several faces simultaneously. The line change involved lowered the railway summit 552ft., eliminated 2,300 degrees of curvature, 4·3mi. of distance and 4·5mi. of snowsheds. Fans at the West portal drive 500,000 cu.ft. of air per minute through the tunnel. The total cost was $9,200,000.

CONNEAUT (kŏnny ŏtt), a city in northeast Ohio, U.S.A., in Ashtabula county; at the mouth of the Conneaut river, on lake Erie. It is on federal highway 20, and is served by the Bessemer and Lake Erie, the New York Central, and the Nickel Plate railways. The population in 1930 was 9,691; in 1940, 9,355 by the federal census. It is a port of entry, and its fine harbour has a large traffic, chiefly in receipts of iron ore, coal and steel (11,938,637 tons in 1940). The city has railroad shops, canneries, tin can and textile factories, lamp works, tanneries and various other manufacturing industries. Conneaut was settled in 1798, and was chartered as a city in 1898.

CONNECTICUT (kŏ-nĕt′ĭ-kŭt), called the "Nutmeg State," is one of the 13 original states of the union, and one of the New England group. It is bounded north by Massachusetts, east by Rhode Island, south by Long Island sound, and west by New York; the southwest corner projects along the sound indenting New York for about 13 miles. The state is situated between 40° 54′ and 42° 3′ N. and between 71° 47′ and 73° 43′ W., and its total area is 5,009 sq.mi., of which 110 are water surface. Only two states of the Union, Rhode Island and Delaware, are smaller in area. The state has 169 towns which are the principal units of local government. The counties, of which there are eight, have so little governmental importance that there are no county seats. There are 21 incorporated cities.

Physiography.—Connecticut lies in the south portion of the peneplain region of New England. Its surface is in general that of a gently undulating upland divided near the middle by the lowland of the Connecticut valley, the most striking physiographic feature of the state. The upland rises from the low south shore at an average rate of about 20 ft. in a mile until it has a mean ele-

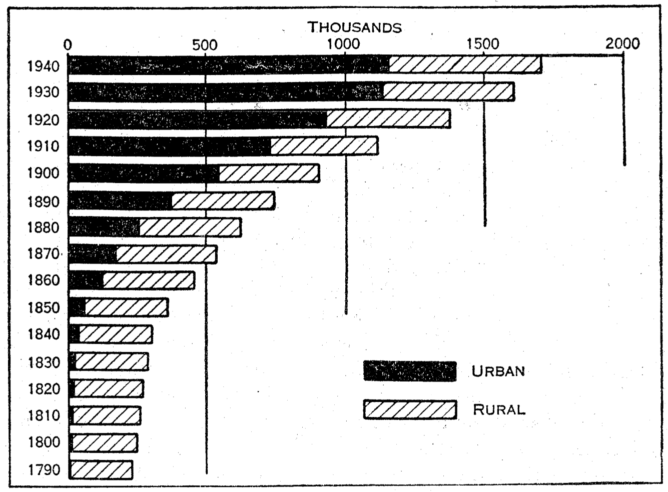
BY COURTESY OF THE U.S. DEPARTMENT OF AGRICULTURE

HARVESTING A FIELD OF BROADLEAF TOBACCO IN CONNECTICUT

vation along the north border of the state of 1,000 ft. or more, and a few points in the northwest rise to a height of about 2,000 ft. above the sea. The lowland dips under the waters of Long Island sound at the south and rises slowly to a height of only 100 ft. above them where it crosses the north border. At the north the lowland is about 15 mi. wide; at the south it narrows to only 5 mi., its total area is about 600 sq.mi. Its formation was caused by the removal of a band of weak rocks by erosion after the general upland surface had been first formed near sea level and then elevated and tilted gently south or southeast; in this band of weak rocks were several sheets of hard igneous rock (trap) inclined from the horizontal several degrees, and so resistant that they were not removed but remained to form the "trap ridges," such as West Rock ridge near New Haven and the Hanging hills of Meriden. These are identical in origin and structure with Mt. Tom range and Holyoke range of Massachusetts, being the south continuation of those ranges. The ridges are generally deeply notched, but their highest points rise to the upland heights directly to the east or west. The west section of the upland is more broken than the east section, for in the west are several isolated peaks lying in line with the south continuation of the Green and the Housatonic mountain ranges of Vermont and Massachusetts, highest among them being: Bear mountain, 2,355 ft.; Gridley mountain, 2,200 ft.; Mt. Riga, 2,000 ft.; Mt. Ball and Lion's Head, each 1,760 ft.; Canaan mountain (North Canaan), 1,680 ft.; and Ivy mountains (Goshen) 1,640 ft. Just as the surface of the lowland is broken by the notched trap-ridges, so that of the upland is often interrupted by rather narrow deep valleys, or gorges, extending usually from north to south or to the southeast. The lowland is drained by the Connecticut river as far south as Middletown, but here this river turns to the southeast into one of the narrow valleys in the east section of the upland, the turn being due to the fact that the river acquired its present course when the land was at a lower level and before the lowland on the soft rocks was excavated. The principal rivers in the west section of the upland are the Housatonic and its affluent, the Naugatuck; in the east section is the Thames, which is really an outlet for three other rivers (the Yantic, the Shetucket and the Quinebaug). In the central and north regions of the state the course of the rivers is rapid, owing to a relatively recent tilting of the surface. The Connecticut river is navigable as far as Hartford, and the Thames as far as Norwich. The Housatonic river, which in its picturesque course traverses the whole breadth of the state, has a short stretch of tide-water navigation. The lakes which are found in all parts of the state and the rapids and waterfalls along the rivers are largely due to disturbances of the drainage lines by the ice invasion of the glacial period. To the glacial action are due also the extensive removal of the original soil from the uplands and the accumulation of morainic hills in many localities. The sea coast, about 100 mi. in length, has a number of bays, making several good harbours which have been created by a depression of small valleys.

The climate of Connecticut, though temperate, is subject to sudden changes, yet the extremes of cold and heat are less than in the other New England states. The mean annual temperature is 49° F., the average temperature of winter being 27° and that of summer 72°. Since the general direction of the winter winds is from the northwest, the extreme of cold (−10° or −15°) is felt in the northwestern part of the state. The prevailing summer winds, which are from the southwest, temper the heat of summer in the coast region, but extreme heat (100°) is found in the central part of the state. The annual rainfall varies from 45 to 50 inches.

Government.—The present constitution of Connecticut is that framed and adopted in 1818 with subsequent amendments (41 up to 1941). Amendments are adopted after approval by a majority vote of the lower house of the general assembly, a two-thirds majority of both houses of the next general assembly, and ratification by the electors. The executive and legislative officials are chosen by the electors for a term of two years, the attorney-general for four years; the judges of the supreme court of errors and the superior court, appointed by the general assembly on nomination by the governor, serve for eight years, and the judges of the courts of common pleas (in Hartford, New London, New Haven, Litchfield and Fairfield counties) and of the district courts, chosen in like manner, serve for four years. In providing for the judicial system, the constitution says: "the powers and jurisdiction of which courts shall be defined by law." The general assembly has interpreted this as a justification for interference in legal matters. It has at various times granted divorces, confirmed faulty titles, annulled decisions of the justices of the peace, and validated contracts against which judgment by default had been secured. Qualifications for suffrage are: the age of 21 years, citizenship in the United States, residence in the state for one year and in the township for six months preceding the election, a good moral character, and ability "to read in the English language any article of the constitution or any section of the statutes of this state." The right to decide upon a citizen's qualifications for suffrage is vested in the selectmen and clerk of each township. A property qualification, found in the original constitution, was re-



BY COURTESY OF THE U.S. BUREAU OF THE CENSUS
URBAN AND RURAL POPULATION OF CONNECTICUT, 1790 TO 1940

moved in 1845. The 15th amendment to the federal constitution was ratified (1869) by Connecticut, but Negroes were excluded from the suffrage by the state constitution until 1876.

The jurisprudence of Connecticut, since the 17th century, has been notable for its divergence from the common law of England. In 1639 inheritance by primogeniture was abolished, and this resulted in conflict with the British courts in the 18th century. At an early date, also, the office of public prosecutor was created to conduct prosecutions, which until then had been left to the aggrieved party. A homestead entered upon record and occupied by the owner is exempt from liability for debts to the extent of $1,000 in value. There were 35 members in the senate and 267 in the house of representatives in 1939.

Population.—The population of Connecticut in 1790 was 237,946; in 1820 it was 275,248; in 1850, 370,792; in 1880, 622,700; in 1910, 1,114,756; and in 1940, 1,709,242. This last figure represents an increase of 6·4% over the population in 1930. The population per square mile was 348·9, as compared with 44·2 for the United States as a whole. Of the 1940 population, 1,158,162, or 67·8%, lived in urban areas, comprising all cities and boroughs of 2,500 or more and four large densely populated towns. The number of occupied dwelling units returned in the housing census of 1940 was 448,887, which is approximately the same as the number of families. The average population per family (occupied dwelling unit) declined from 4·1 in 1930 to 3·8 in 1940. The white population of Connecticut formed 98·1% of the total in both 1940 and 1930. The number of males in the population of the state was practically the same as the number of females. The population of the state and of its principal cities is summarized in the following table:

Area	Population			Per cent of increase	
	1940	1930	1920	1930–40	1920–30
The State	1,709,242	1,606,903	1,380,631	6·4	16·4
Urban	1,158,162	1,131,770	936,339	2·3	20·9
Rural	551,080	475,133	444,292	16·0	6·9
Per cent urban	67·8	70·4	67·8	..	..
Principal cities:					
Hartford	166,267	164,072	138,036	1·3	18·9
New Haven	160,605	162,655	162,537	−1·3	0·1
Bridgeport	147,121	146,716	143,555	0·3	2·2
Waterbury	99,314	99,902	91,715	−0·6	8·9
New Britain	68,685	68,128	59,316	0·8	14·9
Stamford	47,938	46,346	35,096	3·4	32·1

VIEWS OF CONNECTICUT AND THE CONNECTICUT RIVER

1. A street in New London, Connecticut, showing houses of the second quarter of the nineteenth century
2. Hartford, Connecticut's State capital and the head of water traffic on the Connecticut river. This photograph shows the Hartford vehicular bridge and the railroad bridge over the Connecticut
3. Covered bridge over the Connecticut river in the White Mountains. These bridges were built partly with the object of protecting horses from the sight of running water
4. Midwinter scene at Middletown on the Connecticut river, showing another house of the eighteenth century type common throughout the State
5. Growing tobacco under cheesecloth on the plantations of the American Sumatra Company in the Connecticut Valley near Avon
6. View of the Naugatuck river, which joins the Housatonic. These are the two chief rivers in the western section of the Connecticut upland

Finance.—The report of the state for the fiscal year ending June 30, 1940 showed state government revenue receipts of $74,596,669; governmental costs, $72,195,799, including capital outlay of $12,078,901. The state debt of $25,000,000 was largely offset by treasury balances. The principal sources of revenue were: the motor vehicle licence fees; an inheritance tax; a gasoline tax of two cents per gallon; a net income corporation tax; a tax on steam railways; a state tax on towns; taxes on savings banks; and a tax on stock insurance companies. The state has no personal income tax. There is a military commutation tax of $2, and all persons neglecting to pay it are liable to imprisonment. In 1937, taxes for local government purposes yielded $77,294,724. The legal rate of interest is 6% and days of grace are not allowed.

Education.—Education has always been a matter of public interest in Connecticut. Soon after the foundation of the colonies of Connecticut and New Haven, schools similar to the English grammar schools were established. The Connecticut code of 1650 required all parents to educate their children, and every township of 50 householders (later 30) to have a teacher supported by the men of family, while the New Haven code of 1656 also encouraged education. In 1672 the general court granted 600 ac. of land to each county for educational purposes; in 1794 the general assembly appropriated the proceeds from the sale of western lands to education, and in 1837 made a similar disposition of funds received from the federal treasury.

Beginning on July 15, 1909, the organization of public education was changed from the district type to town management type. In 1921 there were less than ten townships that had not availed themselves of the law by which all the schools are under the direction of the town school committee. Appropriations for the support of the schools are made at a town meeting. Compulsion was made more rigid by the enactment providing that after Sept. 1, 1911, no employment certificate should be accepted by any employer, except certificates issued by the state board of education.

There were 312,713 children between the ages of 4 and 16 inclusive, in 1939. Of this number, 242,427, or 77·5%, were enrolled in the public schools, and 53,065 of the remainder attended private or parochial schools. The public school attendance consisted of 164,874 in the kindergarten and elementary schools and 100,960 in the secondary schools. Fifty-six private high schools and academies helped to lessen the public secondary school attendance. In 1937 the total number of teachers in the public schools was 10,399. The public school expenditure for 1937 was $26,896,857—or $99.62 per capita of average attendance. The state maintains 11 trade schools, which had an enrolment of 10,391 in 1940 and helps in the maintenance of two others. Supplementing the educative influence of the schools are the public libraries, 199 in number in 1940.

Higher education is provided by Yale university (*q.v.*); by Trinity college (non-sectarian), at Hartford, founded in 1823; by Wesleyan university, at Middletown, founded in 1831; by the Hartford theological seminary (1834); by the University of Connecticut (1881) at Storrs, which has an experiment station; by the Connecticut experiment station at New Haven, which was established in 1875 at Middletown and was the first in the United States; by teachers' colleges at New Britain (established 1881), Willimantic (1890), New Haven (1894), and Danbury (1903); by Connecticut College for Women (1911), at New London; and by a women's college, Albertus Magnus, Roman Catholic, at New Haven, opened in 1925. Graduate institutions include the Berkeley Divinity school, at New Haven, and Hartford Seminary foundation. Since 1936 nine junior colleges have been established in the state.

Charities and Corrections.—A Commissioner of Welfare, assisted by an advisory Public Welfare Council, has supervision over all philanthropic and penal institutions. The institutions supported in whole or in part by the state are: a state prison at Wethersfield; ten county jails; Connecticut reformatory, at Cheshire; Connecticut state farm for women, at Niantic; Connecticut school for boys, at Meriden; Long Lane farm for girls, at Middletown; House of the Good Shepherd, at Hartford; Florence Crittenton mission, at New Haven; the Connecticut state hospital, at Middletown; the Norwich state hospital, at Norwich; the Fairfield state hospital, at Newtown; state training schools for feeble-minded at Mansfield and Southbury; the American school for the deaf, in Hartford; the oral school for the deaf, at Mystic; the Connecticut institute and industrial home for the blind, at Hartford; the Newington home for crippled children; Fitch's Home for soldiers and sailors, at Noroton Heights and Rocky Hill; a home for disabled soldiers under the direction of the Women's relief corps; five tuberculosis sanatoria for adults and one for children, 57 town alms-houses, eight county temporary homes for dependent and neglected children, and 40 public hospitals. Private institutions under the supervision of the state board include 12 hospitals for the insane, 27 homes for the aged, and 24 institutions for children.

The greatest part of these institutions are supported by religious or benevolent organizations.

Industry, Trade and Transportation.—Connecticut is not an agricultural state. Although one-half of the land surface is included in farms, only 11·5% of the land area was cropped in 1939, but agriculture is of considerable economic and historic interest. The accounts of the fertility of the Connecticut valley were among the causes leading to the English colonization, and until the middle of the 19th century agriculture was the principal occupation. In 1940, 32·2% of the population was classed as rural, though the actual farming population was somewhat smaller. In 1940 the farms of the state numbered 21,163, a loss of 5,652 since 1910. The average value of land and buildings per acre in 1940 was $135.41 as compared with $63.28 in 1910. Tobacco is one of the most important agricultural products; the crop decreased from 28,110,453 lb. valued at $4,415,948 in 1910, to 14,276,000 lb., valued at $4,844,000 in 1934, to 19,470,968 lb. in 1939, value not given. In the season of 1922 the Connecticut Valley Tobacco association, a pool with a Connecticut membership of 2,400 growers farming 90% of the acreage of outdoor tobacco in the state, was formed for the collective marketing of the crop. The association sorts, packs, sweats and sells the leaf. Dairying is practised on more than three-fifths of the farms of the state. The quality of the milk is being steadily improved through a system of inspection put into effect by the Milk Regulation board and administered by the Dairy and Food commission. The number of milch cows fluctuates around 115,000.

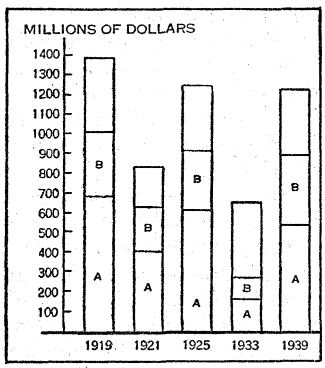
The production of milk increased from 45,749,849 gal. in 1909 to 71,983,767 gal. in 1939. In the same period the output of butter fell from 3,498,551 lb. to 364,190 lb. The poultry industry increased very rapidly, owing to the favourable climate and the large market close at hand, there being produced in 1940 20,289,094 doz. of chicken eggs.

For the same reason market gardening increased, the gardeners being organized into one state and 16 local organizations; the 1939 crop of farm garden vegetables was valued at $6,300,000. The values of five leading crops in 1939 were: hay, $6,826,000; tobacco, $10,442,000; potatoes, $3,238,000; Indian corn, $1,384,000; and apples, $978,000.

The mineral industries of Connecticut have had a declining fortune. The early settlers soon discovered metals and began to work them. About 1740 the production of iron became an important industry in the vicinity of Salisbury, and from Connecticut iron many of the American military supplies in the Revolutionary War were manufactured. The quarries of granite near Long Island sound, those of sandstone at Portland, and of feldspar at Branchville and South Glastonbury, however, have furnished building and paving materials for other states. The total production of mines and quarries of Connecticut in 1929 was valued at $3,810,000, and in 1938 at $3,059,688.

The fisheries are still a source of wealth but are not as important as formerly. According to the U. S. bureau of fisheries, there were 1,161 persons and 70 vessels of all types engaged in the industry in 1933. The fisheries products of the state in 1938 were 11,838,000 lb. and were valued at $1,420,000. The principal products, according to value, were market oysters, seed oysters, lobsters, flounders and bluefish.

Manufacturing has encountered none of the vicissitudes of other industries. Indeed, manufacturing in Connecticut is notable for its early beginning and its development of certain branches beyond their development in other states. Iron products were manufactured throughout the 18th century, nails were made before 1716 and were exported from the colony, and it was in Connecticut that cannon were cast for the continental troops and the chains were made to block the channel of the Hudson river to British ships. Tinware was manufactured in Berlin, Hartford county, as early as 1740, and tin, steel and iron goods were peddled from Connecticut through the colonies. The Connecticut clockmaker and clock pedlar was the 18th century embodiment of Yankee ingenuity; the most famous of the next generation of clockmakers were Eli Terry (1772–1859), who made a great success of his wooden clocks; Chauncy Jerome, who first used brass wheels in 1837 and founded in 1844 the works of the New Haven Clock company; Gideon Roberts, and Terry's pupil and successor, Seth Thomas (1786–1859), who built the factory at Thomaston carried on by his son Seth Thomas (1816–88). In 1732 the London hatters complained of the competition of Connecticut hats in their trade. From 1802 brass works were in operation at Waterbury—the great brass manufacturing business there growing out of the making of metal buttons. In 1768 paper mills were erected at Norwich, and in 1776 at East Hartford. In 1788 the first woollen mills in New England were established at Hartford, and about 1803 100 merino sheep were imported by David Humphreys, who in 1806 built a mill in that part of Derby which is now Seymour and which was practically the first New England factory town; in 1812 steam was first used by the Middletown Woollen Manufacturing company. In 1804 the manufacture of cotton was begun at Vernon, Hartford county; mills at Pomfret and Jewett City were established in 1806 and 1810 respectively. Silk culture was successfully introduced about 1732; and there was a silk factory at Mansfield, Tolland county, in 1758. The period of greatest development of manufacturing began after the war of 1812. The decade of greatest relative development was that of 1909–19, during which the value of the products increased 184%. During the period 1850–1900, when the population increased 145%, the average number of wage earners employed in manufacturing establishments increased 248·3%, the number so employed constituting 13·7% of the state's total population in 1850 and 19·5% of that in 1900. The average number of wage earners in establishments conducted under the factory system in 1923 was 263,232, or 17·6% of the total population.



GRAPH OF VALUE OF MANUFACTURED PRODUCTS (ENTIRE COLUMN), COST OF MATERIALS USED IN THEIR PRODUCTION (A), AND WAGES PAID (B)

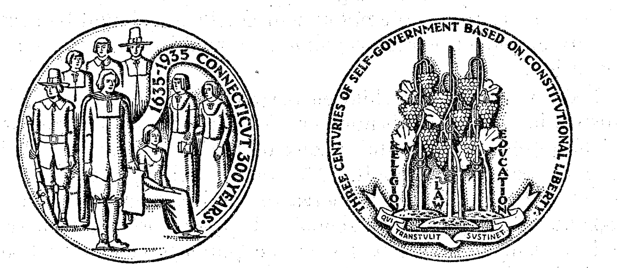
The war of 1914–18 brought a great volume of orders to Connecticut factories and caused large numbers of plants to change the character of their products. In May 1918, 80% of Connecticut's manufacturing was directly or indirectly engaged in producing munitions, rifles, machine guns, clothing and other articles used by the military forces, and there were five plants where ships and power boats were constructed. Wages were high during this period. In the years of rapid expansion there were a great many strikes, and labour organizations increased in membership. During the two years following the armistice the factories began the process of readjustment to peace-time conditions, which was completed by the depression of 1920–21. In 1922 the situation steadily improved; unemployment declined, and in Dec. 1922 the department of labour reported an actual shortage of labour in the state. The growth of industry after 1922 was indicated by the fact that in 1923 and 1924 the cost of new factory construction and additions was $16,807,775.

The 3,062 industrial establishments operating within the state in 1925 gave employment to 242,362 wage earners, and had an output valued at $1,274,951,562. Connecticut's decrease in rank as a producer of textiles, especially cotton goods, was caused, in part, by industrial readjustments and, in part, by the increase in cotton manufacturing in the south. On the other hand, new industries have been developed. Connecticut is one of the leading producers in the aeroplane industry.

In 1933, when the depression was at its worst, the 2,410 industrial establishments operating within the state gave employment to 183,322 wage earners and had an output valued at $634,705,000, but at the close of 1940 the 1929 records for employment, wage earnings and production were being surpassed. The following table for 1937 shows production as a whole practically at the 1925 level, but with fluctuations in the several industries.

Industry	*Wage earners*	*Value of products*
Electrical machinery	16,741	96,512,785
Hardware	14,143	48,305,548
Foundry and machine shop products	15,573	71,469,578
Hats, fur felt	6,936	28,458,885
Woollen goods	5,045	23,542,873
Silverware and plated ware	3,669	20,026,822
Cotton goods	13,283	36,529,572
Silk and rayon goods	5,408	19,200,666
Nonferrous metal products	22,210	155,725,947

Transportation of products is facilitated by water routes and 890 mi. (1940) of steam railways. The New York, New Haven and Hartford company controls the greater part of this railway mileage. Electric railways developed rapidly after 1895 until a maximum of 1,618 mi. was reached in 1922. The state highway system on June 30, 1940, was 2,817 mi., of which nearly all were surfaced. Motor vehicles registered in 1939 were 476,837. It is estimated that motor traffic on Connecticut roads averages over 500,000 mi. an hour. Motor trucks handle an extraordinarily large proportion of freight business in the state.



Connecticut Tercentenary Medal. Obverse (left): The founders of Connecticut with the figure of Thomas Hooker holding the Fundamental Orders. Reverse (right): The transplanted grapevines of the State Seal, and the motto, *"Qui transtulit sustinet"* ("He who brought us hither sustains us")

History.—The first settlement by Europeans in Connecticut was made on the site of the present Hartford in 1633 by a party of Dutch from New Netherland. In the same year a trading post was established on the Connecticut river, near Windsor, by members of the Plymouth colony, and John Oldham (1600–36) of Massachusetts explored the valley and made a good report of its resources. Encouraged by Oldham's account of the country, the inhabitants of three Massachusetts towns, Dorchester, Watertown and Newtown (now Cambridge), left the colony for the Connecticut valley. The emigrants from Watertown founded Wethersfield in the winter of 1634–35; those from Dorchester settled at Windsor in the summer of 1635; and in the autumn of the same year people from Newtown settled at Hartford. These early colonists had come to Massachusetts in the Puritan migration of 1630; their removal to Connecticut, in which they were led principally by Thomas Hooker (*q.v.*), Roger Ludlow (*c.* 1590–1665) and John Haynes (d. 1654), was caused by their discontent with the autocratic character of the government in Massachusetts; but the instrument of government which they adopted in 1639, known as the Fundamental Orders of Connecticut, reveals no radical departure from the institutions of Massachusetts. The general court—the supreme civil authority—was composed of deputies from the towns and a governor and magistrates who were elected by the freemen of the towns. Its powers were not clearly defined; there was also no separation of the executive, legislative and judicial functions, and the authority of the governor was limited to that of a presiding officer. The government thus established was not the product of a federation of townships as has often been stated; indeed, the townships had been governed during the first year by commissioners deriving authority from Massachusetts, and the first general court was probably convened by them. In 1638 the celebrated Fundamental Orders were drawn up, and in 1639 they were adopted. Their most original feature was the omission of a religious test for citizenship, though a precedent for this is to be found in the Plymouth colony; on the other hand, the union of Church and State was presumed in the preamble, and in 1659 a property qualification (the possession of an estate of £30) for suffrage was imposed by the general court.

In the meantime another migration to the Connecticut country had begun in 1638, when a party of Puritans who had arrived in Massachusetts the preceding year sailed from Boston for the Connecticut coast, and there founded New Haven. The leaders in this movement were John Davenport (1597–1670) and Theophilus Eaton, and their followers were drawn from the English middle class. Soon after their arrival these colonists drew up a "Plantation Covenant" which made the Scriptures the supreme guide in civil as well as religious affairs; but no copy of this is now extant. In June 1639, however, a more definite statement of political principles was framed, in which it was clearly stated that the rules of Scripture should determine the ordering of the Church, the choice of magistrates, the making and repeal of laws, the dividing of inheritances, and all other matters of public import; that only Church members could become free burgesses and officials of the colony; that the free burgesses should choose 12 men who should choose seven others, and that these should organize the Church and Civil Government. In 1643 the jurisdiction of the New Haven colony was extended by the admission of the townships of Milford, Guilford and Stamford to equal rights with New Haven, the recognition of their local governments and the formation of two courts for the whole jurisdiction—a court of magistrates to try important cases and hear appeals from "plantation" courts, and a general court with legislative powers, the highest court of appeals, which was similar in composition to the general court of the Connecticut colony. Two other townships were afterwards added to the colony—Southold, on Long Island, and Branford, Conn.

The religious test for citizenship was continued (except in the case of six citizens of Milford), and in 1644 the general court decided that the "judicial laws of God as they were declared by Moses" should constitute a rule for all courts "till they be branched out into particulars hereafter." The theocratic character of the government thus established is clearly revealed in the series of strict enactments and decisions which constituted the famous "Blue Laws." Of the laws (45 in number) given by Samuel Peters in his *General History of Connecticut,* more than one-half really existed in New Haven, and more than four-fifths existed in some form in the New England colonies. Among those of New Haven are the prohibition of trial by jury, the infliction of the death penalty for adultery, and of the same penalty for conspiracy against the jurisdiction; the requirement of strict observance of the Sabbath, and heavy fines for "concealing or entertaining Quaker or other blasphemous heretics."

A third Puritan settlement was established in 1635 at the mouth of the Connecticut river, under the auspices of an English company, whose leading members were William Fiennes, Lord Say and Sele (1582–1662), and Robert Greville, Lord Brooke (1608–43). In their honour the colony was named Saybrook. In 1636 George Fenwick (d. 1657), a member of the company, arrived, and as immigration from England soon afterwards greatly declined on account of the Puritan revolution, he sold the Saybrook colony to Connecticut in 1644. This early experiment in colonization at Saybrook and the sale by Fenwick are important on account of their relation to a fictitious land title. The Saye and Sele company secured in 1631 from Robert Rich, earl of Warwick (1587–1658), a quitclaim to his interest in the territory lying between the Narragansett river and the Pacific ocean. The nature of Warwick's right to the land is not stated in any extant document, and no title of his to it was ever shown. But the Connecticut authorities in their effort to establish a legal claim to the country and to thwart the efforts of the Hamilton family to assert its claims to the territory between the Connecticut river and the Narragansett bay—claims derived from a grant of the Plymouth Company to James, Marquess of Hamilton (1606–49) in 1635—elaborated the theory that the Plymouth Company had made a grant to Warwick, and that consequently his quitclaim conferred jurisdiction upon the Saye and Sele company; but even in this event Fenwick had no right to make his sale, for which he never secured confirmation.

The next step in the formation of modern Connecticut was the union of the New Haven colony with the older colony. This was accomplished by the royal charter of 1662, which defined the boundaries of Connecticut as extending from Massachusetts south to the seas and from Narragansett bay west to the South Sea (Pacific ocean). This charter had been secured without the knowledge or consent of the New Haven colonists, and they naturally protested against the union with Connecticut. But on account of the threatened absorption of a part of the Connecticut territory by the colony of New York, granted to the duke of York in 1664, and the news that a commission had been appointed in England to settle inter-colonial disputes, they finally assented to the Union in 1665. Hartford then became the capital of the united colonies, but shared that honour with New Haven from 1701 until 1875. The charter was liberal in its provisions. It created a corporation under the name of the governor and company of the English colony of Connecticut in New England in America, sanctioned the system of government already existing, provided that all acts of the general court should be valid upon being issued under the seal of the colony, and made no reservation of royal or parliamentary control over legislation or the administration of justice. Consequently there developed in Connecticut an independent, self-reliant colonial government which looked to its chartered privileges as the supreme source of authority.

Although the governmental and religious influences which moulded Connecticut were similar to those which moulded New England at large, the colony developed certain distinctive characteristics. Its policy was "to avoid notoriety and public attitudes; to secure privileges without attracting needless notice; to act as intensely and vigourously as possible when action seemed necessary and promising; but to say as little as possible, and evade as much as possible when open resistance was evident folly."

The relations of Connecticut with the neighbouring colonies were notable for numerous and continuous quarrels in the 17th century. Soon after the first settlements were made a dispute arose with Massachusetts regarding the boundary between the two colonies; after the brief war with the Pequot Indians in 1637 a similar quarrel followed regarding Connecticut's right to the Pequot lands; and in the New England Confederation (established in 1643) friction between Massachusetts and Connecticut continued. Difficulty with Rhode Island was caused by the conflict between the colony's charter and the Connecticut charter regarding the western boundary of Rhode Island; and the encroachment of outlying Connecticut settlements on Dutch territory, and the attempt to extend the boundaries of New York to the Connecticut river, gave rise to other disputes. These questions of boundary were a source of continuous discord, the last of them not being settled until 1881. The attempts of governors Joseph Dudley (1647–1720), of Massachusetts, and Thomas Dongan

(1634–1715), of New York, to unite Connecticut with their colonies also caused difficulty. The relations of Connecticut and New Haven with the mother country were similar to those of the other New England colonies. The period of most serious friction was that during the administration of the New England colonies by Sir Edmund Andros (*q.v.*), who in pursuance of the later Stuart policy both in England and in her American colonies visited Hartford on Oct. 31, 1687, to execute *quo warranto* proceedings against the charter of 1662. It is said that in the course of a discussion at night over the surrender of the charter the candles were extinguished, and the document itself (which had been brought to the meeting) was removed from the table where it had been placed. According to tradition it was hidden in a large oak tree, afterwards known as the "Charter Oak." But though Andros thus failed to secure the charter, he dissolved the existing government. After the Revolution of 1689, however, government under the charter was resumed, and the Crown lawyers decided that the charter had not been invalidated by the *quo warranto* proceedings.

Religious affairs formed one of the most important problems in the life of the colony. The established ecclesiastical system was the Congregational. The code of 1650 (Connecticut) taxed all persons for its support, provided for the collection of church taxes by civil distraint if necessary, and forbade the formation of new churches without the consent of the general court. The new Halfway Covenant of 1657, which extended church membership so as to include all baptized persons, was sanctioned by the general court in 1664. The custom by which neighbouring churches sought mutual aid and advice prepared the way for a presbyterian system of church government, which was established by an ecclesiastical assembly held at Saybrook in 1708, the Church constitution there framed being known as the "Saybrook Platform." At that time, however, a liberal policy towards dissent was adopted, the general court granting permission for churches "soberly to differ or dissent" from the establishment. Hence a large number of new churches soon sprang into being. In 1727 the court forbade any ordained minister to enter another parish than his own without an invitation and decided that only those were legal ministers who were recognized as such by the general court. Throughout the remaining years of the 18th century there was constant friction between the establishment and the nonconforming churches; but in 1791 the right of free incorporation was granted to all sects.

In the Revolutionary War Connecticut took a prominent part. At the time of the controversy over the Stamp Act the general court instructed the colony's agent in London to insist on "the exclusive right of the colonists to tax themselves, and on the privilege of trial by jury," as rights that could not be surrendered. The patriot sentiment was so strong that loyalists from other colonies were sent to Connecticut, where it was believed they would have no influence; the copper mines in East Granby were converted into a military prison; but among the nonconforming sects, on the other hand, there was considerable sympathy for the British cause. Preparations for war were made in 1774; on April 28, 1775, the expedition against Ticonderoga and Crown Point was resolved upon by some of the leading members of the Connecticut assembly; and although they had acted in their private capacity, funds were obtained from the colonial treasury to raise the force which on May 8 was put under the command of Ethan Allen. Connecticut volunteers were among the first to go to Boston after the battle of Lexington, and more than one-half of Washington's army at New York in 1776 was composed of Connecticut soldiers. Yet with the exception of isolated British movements against Stonington in 1775, Danbury in 1777, New Haven in 1779 and New London in 1781, no battles were fought in Connecticut territory.

In 1776 the government of Connecticut was reorganized as a State, the charter of 1662 being adopted by the general court as "the Civil Constitution of this State, under the sole authority of the people thereof, independent of any king or prince whatever." In the formation of the General Government the policy of the State was national. It acquiesced in the loss of western lands through a decision (1782) of a court appointed by the Confederation (*see* WYOMING VALLEY); favoured the levy of taxes on imports by Federal authority; relinquished (1786) its claims to all remaining western lands, except the Western Reserve (*see* OHIO); and in the Constitutional Convention of 1787 the present system of national representation in Congress was proposed by the Connecticut delegates as a compromise between the plans presented by Virginia and those presented by New Jersey.

For many years the Federalist party controlled the affairs of the State. The opposition to the growth of American nationality which characterized the later years of that party found expression in a resolution of the general assembly that a bill for incorporating State troops in the Federal army would be "utterly subversive of the rights and liberties of the people of the State, and the freedom, sovereignty and independence of the same," and in the prominent part taken by Connecticut in the Hartford Convention (*see* HARTFORD) and in the advocacy of the extensive amendments proposed by it. But the development of manufactures, the discontent of nonconforming religious sects with the establishment, and the confusion of the executive, legislative and judicial branches of government in the constitution opened the way for a political revolution. All the discontented elements united with the Democratic Party in 1817 and defeated the Federalists in the State election; and in 1818 the existing constitution was adopted. From 1830 until 1855 there was close rivalry between the Democratic and Whig Parties for control of the State administration.

In the Civil War Connecticut was one of the most ardent supporters of the Union cause. When President Lincoln issued his first call, for 75,000 volunteers, there was not a single militia company in the State ready for service. Gov. William A. Buckingham (1804–75), one of the ablest and most zealous of the "war governors," and afterwards, from 1869 until his death, a member of the United States Senate, issued a call for volunteers in April 1861; and soon 54 companies, more than five times the State's quota, were organized. Corporations, individuals and towns made liberal contributions of money. The general assembly made an appropriation of $2,000,000, and the State furnished approximately 48,000 men to the army. Equally important was the moral support given to the Federal government by the people. After the war the Republicans were more frequently successful at the polls than the Democrats. Representation in the lower house of the general assembly, by the constitution of 1818, was based on the townships, each township having two representatives, except townships created after 1818, which had only one each. This method constituted a serious evil when, in the transition from agriculture to manufacturing as the leading industry, the population became concentrated to a considerable degree in a few large cities and the relative importance of the various townships was greatly changed. The township of Marlborough, with a population in 1900 of 322, then had one representative, while the city of Hartford, with a population of 79,850, had only two; and the township of Union, with 428 inhabitants, and the city of New Haven, with 108,027, each had two representatives. The apportionment of representation in the State senate had become almost as objectionable. By a constitutional amendment of 1828 it had been provided that senators should be chosen by districts, and that in the apportionment regard should be had to population, no county or township to be divided and no part of one county to be joined to the whole or part of another county, and each county to have at least two senators; but by 1900 any relation that the districts might once have had to population had disappeared. The system of representation had sometimes put in power a political party representing a minority of the voters: in 1878, 1884, 1886, 1888 and 1890 the Democratic candidates for State executive offices received a plurality vote; but, as a majority was not obtained, these elections were referred to the general assembly, and the Republican Party, in control of the lower house, secured the election of its candidates; in 1901 constitutional amendments were adopted making a plurality vote sufficient for election, increasing the number of senatorial districts, and stipulating that "in forming them regard shall be had" to population.

The question of calling a constitutional convention, for which the present constitution makes no provision, was submitted to the people in 1901 and was carried. But the act providing for the convention had stipulated that the delegates thereto should be chosen on the basis of township representation instead of population. The small townships thus secured practical control of the convention, and no radical changes were made. A compromise amendment submitted by the convention, providing for two representatives for each township or 2,000 inhabitants, and one more for each 5,000 above 50,000, satisfied neither side, and when submitted to a popular vote, on June 16, 1902, was overwhelmingly defeated. The state added several amendments to its constitution, notably that of 1924 granting the governor power to veto specific sections of appropriation bills, but refused to ratify the national income tax, prohibition and proposed child labour amendments and only tardily endorsed woman's suffrage. A workmen's compensation law was adopted in 1914, but Connecticut's chief claim to rank among the more humane states rested upon her eleemosynary institutions. In 1931 the state broke another tradition by legalizing Sunday baseball. The financial crisis in 1933 forced a grant to the governor of extraordinary authority over the banks but failed to prompt an appropriation sufficient to match the desired federal allotment of $4,000,000 for relief. Discontent found expression in the election of a socialist mayor in Bridgeport and of several of that party to the legislature. Popular attention focused on the state's tercentenary in 1935. Despite a swing away from the New Deal in 1935 President Roosevelt carried Connecticut in the 1936 election, and again in that of 1940.

In 1937 the state administration was extensively reorganized by a series of legislative acts which increased the powers of the governor, centralized the administration, especially of the spending departments, placed the state civil service fully under a merit system, and provided for more effective handling of affairs in the interim between legislative sessions. In 1939 many improvements affecting the minor courts were enacted. In the decade of the '30s many important measures of social legislation were adopted, notably systems of unemployment compensation and old-age assistance. With the aid of federal funds the state conducted an extensive building program for the University of Connecticut and for humane institutions in the three years ending in 1940. Outstanding additions to the state's excellent system of highways were the Connecticut river bridge at Middletown (1938) and the Merritt parkway (1940) which is being continued by the Wilbur L. Cross highway which will complete the Connecticut section of a New York to Boston parkway route. The most notorious case of political corruption in the state's history—the Waterbury scandal—resulted in the most remarkable trial before the courts of Connecticut and ended in the sentencing of a group of offenders to long prison terms (1941).

Floods, particularly in the Connecticut river, attained record heights in March 1936 and wrought great damage as did the hurricane of Sept. 1938 which struck the eastern part of the state with terrific violence.

Beginning in 1940 the national program for military preparedness and for aid to Great Britain involved placing large contracts with Connecticut manufacturers, especially in such lines as machine tools, arms, ammunition and aeroplanes. As a result the state reached a new peak in employment and production.

Bibliography.—The "Acorn Club" has published a list of books printed in Connecticut between 1709 and 1800 (1904), and Alexander Johnston's *Connecticut* (1887) contains a bibliography of Connecticut's history up to 1887. Some of the recent histories are: E. B. Sanford, *A History of Connecticut* (1922); C. M. Andrews, *Connecticut's Place in Colonial History* (1924); G. L. Clark, *A History of Connecticut: Its People and Institutions* (1914); and N. G. Osborn, editor, *History of Connecticut in Monographic Form* (1925). Other recent works of value are: P. W. Bidwell, *Rural Economy in New England at the Beginning of the Nineteenth Century* (1916); R. J. Purcell, *Connecticut in Transition* (1918); and C. M. Douglas, *The Government of the State of Connecticut*, revised and rewritten by L. S. Mills (1917). Works dealing with colonial and early history are: *Connecticut as a Colony and as a State* (1904), which is written from secondary sources, as also is G. H. Hollister's *History of Connecticut* (1857); Alexander Johnston, *Connecticut*, a well-written work but presenting theories regarding the relationship between the townships and the state not generally accepted by historical scholars; B. Trumbull, *A Complete History of Connecticut from 1630 to 1764* (1804–18); E. E. Atwater, *History of the Colony of New Haven* (1881); and the monograph of C. H. Levermore, "The Republic of New Haven," and that of C. M. Andrews, "The River Towns of Connecticut," in *Johns Hopkins University Studies* (1886–89). There is a good chapter in H. L. Osgood's *History of the American Colonies in the Seventeenth Century* (1904). For the sources, see *Colonial Records of Connecticut* (Hartford, 1850–90); *The Records of the Colony and the Plantation of New Haven* (Hartford, 1857–58) and *Records of the State of Connecticut* (Hartford, 1894–95). *The Collections* (Hartford, 1860 *seqq.*) of the Connecticut Historical society contain valuable material, especially the papers of Gov. Joseph Talcott; and the *Papers* (New Haven, 1865 *seqq.*) of the New Haven Colony Historical society are extremely valuable for local history; but a vast number of documents relating to the colonial and state periods, now in the state library at Hartford, have never been published. For information concerning industries, agriculture, etc., *see* the *Sixteenth Census of the United States* and the *Census of Manufactures*, of 1937; for law and administration, consult the work of Douglas given above; the last two chapters on "The Constitution and Laws of Connecticut" in *New England States* (1897); "Town Rule in Connecticut" in *Political Science Quarterly;* B. Steiner's *History of Education in Connecticut* (1893); and the reports of the administrative boards and officials, especially those of the bureau of labour statistics, the board of education, the board of charities and the treasurer. The physical features of the state are treated in W. M. Davis's *Physical Geography of Southern New England* (1895) and the *Bulletins* of the State Geological and Natural History Survey commission. The following important works on Connecticut have appeared: J. M. Morse, *A Neglected Period of Connecticut's History, 1818–1850* (1933); Isabel M. Calder, *The New Haven Colony* (1934); C. M. Andrews, *Colonial Period of American History* (4 vol., 1934–39), of which the chapters relating to Connecticut are the best accounts now available for the topics covered; Florence S. M. Crofut, *Guide to the History and Historic Sites of Connecticut* (2 vol., 1937), containing accounts of all towns in the state and extensive bibliography; *Supplementary List* (1938) of more than 1,000 titles, prepared by A. C. Bates for the Acorn club; *Connecticut: A Guide to Its Roads, Lore and People* (American Guide Series, 1938); C. W. Burpee, *Story of Connecticut* (4 vol., 1939); Odell Shepard, *Connecticut Past and Present* (1939). The Committee on Historical Publications of the State Tercentenary commission issued a series of 60 pamphlets (1933–36), each a monograph on a topic in Connecticut history. *The Connecticut Guide* by E. L. Heermance (1935) is a convenient collection of information arranged for automobile trips to places of historic interest.

CONNECTICUT RIVER, a stream of the New England states, U.S.A. It rises in Connecticut lake in northern New Hampshire—several branches join in northeast Vermont, near the Canadian border, about 2,000 ft. above the sea—flows south, forming the boundary between Vermont and New Hampshire, crosses Massachusetts and Connecticut, and empties into Long Island sound. Its course is about 345 mi. and its drainage basin 11,085 sq.miles. The principal tributary is the Farmington, which rises in the Berkshire hills, in Massachusetts, and joins the Connecticut above Hartford. From its head to the Massachusetts border the banks are wooded, the bed narrow, the tributaries small and torrential, and the valley slopes cut sharply in crystalline rocks. In the 273 mi. of this upper portion of its course the average descent is 15 to 34 ft. a mile. In Massachusetts and Connecticut the river flows through a basin of weaker triassic shales and sandstones, and the valley consequently broadens out, making the finest agricultural region of large extent in New England.

Near Holyoke and at other points rugged hills of harder trap rock rise so high above the valley lowland that they are locally called mountains. The valley sides rise from the river channels by a series of steps or terraces noted for their perfection of form. They have been cut by the river in its work of removing the heavy deposits of gravel, sand and clay that were laid down in this lowland during the closing stages of the glacial period. In the course of this excavation of glacial deposits the river has here and there discovered buried spurs of rock over which the water now tumbles in rapids and falls. For example, 11 mi. above Hartford are the Enfield falls, where a descent of 31·8 ft. in low water (17·6 in highest water) is made in 5·25 miles. At Middletown (Conn.), the river turns abruptly southeast, leaving the belt of triassic rocks and again entering the area of crystalline rocks which border the lowland. Therefore, from near Middletown to the sea the valley again narrows. The river valley is a great manufacturing region, especially where there is a good water power derived from the stream, as at Wilder and Bellows Falls (Vt.), at Turner's Falls, and Holyoke (Mass.), and at Windsor Locks, Connecticut. Several huge power dams have been constructed for the purpose of developing commercial current.

From Hartford seaward the Connecticut is a tidal and navigable stream, with a 12 ft. channel at low water. The Connecticut, like the Hudson, is a migration route for birds going from the south to nest in Canada.

Bibliography.—See *Reports of Rivers and Harbors Committee* (U.S. House of Rep. 67 Cong. 2nd sess. 1922) and E. M. Bacon, *Connecticut River and the Valley of the Connecticut* (1906).

CONNECTING-ROD. A device to convert linear motion into circular motion, or vice versa, used in engines, pumps, compressors and machines. The connecting-rod is coupled to the piston-rod through the crosshead in steam-engines, air-compressors, pumps and the large gas and Diesel engines, but in other internal-combustion engines and in pneumatic and hydraulic engines it pivots directly in the piston. A crank and connecting-rod are employed to work slides in pressing, bending, stamping, forging, punching, shearing, sawing, slotting and shaping machines. The crank and connecting-rod were patented in 1780 by Pickard. This forced James Watt to devise the peculiar sun-and-planet motion for his beam-engines.

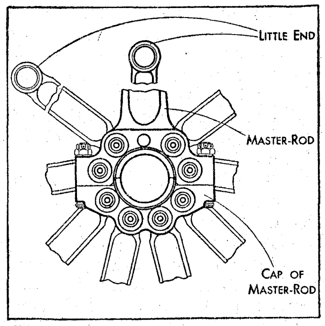


FIG. 1.—ARTICULATED ROD SYSTEM OF THE BRISTOL JUPITER RADIAL AERO-ENGINE, THE RODS OF WHICH ARE OF PRECISELY EQUAL WEIGHT

Various adjusting devices are fitted to connecting-rods to take up play in the *brasses* or *steps* as these wear down and cause knocking. In the majority of stationary engines the weight of a connecting-rod need not be considered as is necessary in the case of locomotives, motor cars and aero engines. It is, therefore, a solid circular or rectangular section. Fig. 2 shows a connecting-rod for a Galloway gas engine, of which the diameter near the forked end is 1 ft. 2 in.

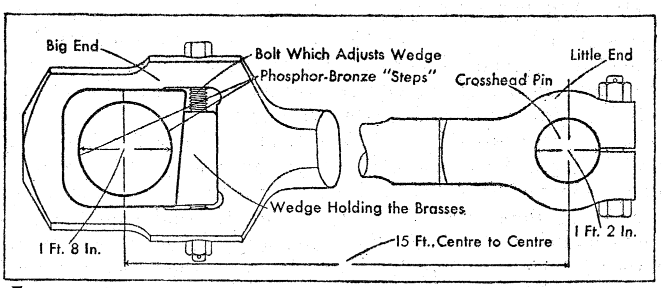

FIG. 2—CONNECTING-ROD FOR GALLOWAY GAS ENGINE, 15 FT. LONG; DIAMETER OF SMALLER END, NEAR THE FORK, BEING 1 FT. 2 IN.

Locomotive connecting-rods are either of rectangular cross-section or of girder or H-section, as are also those for car and aero engines. The articulated system, for V-engines and the radial engines, comprises a master-rod, and the other rods pivoted to its big end. This is seen in fig. 1, of a Bristol Jupiter radial outfit, with four articulated rods pivoted to the master rod, and four to its cap. Very light hollow pivot and gudgeon-pins are employed. All the rods are made of similar weights and the whole articulation is carefully hand polished so as to remove tool marks and scratches, which might possibly be the origin of fatigue cracks under the severe duties demanded.

CONNECTIVE TISSUES, in anatomy, the intercellular, supporting substances found in the tissues and organs of the animal body. They comprise the following types: areolar tissue, adipose tissue, reticular or lymphoid tissue, white fibrous tissue, elastic tissue, cartilage and bone. They are all developed from the same layer of embryonic cells and according to the nature of their work the ground substance varies in its texture, being fibrous in some, calcareous and rigid in others.

Areolar Tissue.—This is found in its most typical form uniting the skin to the deeper lying parts. It varies greatly in density according to the animal and the position of the body from which it is taken. A piece of the looser variety, microscopically, consists of bundles of fine white fibres (fig. 1) running in all directions and interlacing with one another to form a meshwork with intervening spaces. The bundles vary much in size, but the fibres of which they are composed are very uniform. A bundle may branch by sending fibres to unite with similar branches from neighbouring bundles, but the individual fibres neither branch nor fuse with one another. They are arranged parallel to one another, and in the bundles are bound together by a cement substance. The meshwork formed by these bundles is filled by a ground substance containing mucin. In this ground substance lie the cells of the tissue. In addition to the white fibres a second variety of fibres (yellow elastic fibres) is present in this tissue. They can be readily distinguished by their larger and variable size, by their more distinct outline, and by the fact that they, for the most part, run as straight lines through the preparation. Moreover they frequently branch, and the branches unite with those of neighbouring fibres. Several of these will be found torn across in any preparation especially at the edges, and the torn ends are curled up in a very characteristic manner. The two types of fibre further differ from one another both chemically and physically. Thus the white fibre swells up and dissolves in boiling water, yielding a solution of gelatin, whereas the yellow elastic fibre is quite insoluble under these conditions. The white fibres swell when treated with weak acetic acid, and are readily dissolved by peptic digestion but not by pancreatic. The yellow elastic fibres, on the other hand, are unaffected by acetic acid and resist the action of gastric juice for a long time, but are dissolved by pancreatic juice. Physically, the white fibres are inextensible and extraordinarily strong, being able, weight for weight, to carry a greater strain than steel wire. The yellow elastic fibres, on the other hand, are easily extensible and very elastic, but are far less strong than the white fibres.

Several types of cells are found in this tissue and may be classified as: (1) *Lamellar cells, i.e.,* flattened branching cells, usually attached to the bundles of white fibres or at the junction of two or more bundles. The branches commonly unite with similar branches of neighbouring cells. (2) *Plasma cells.* These have peculiar staining reactions, are small and, in the main, spherical. (3) *Granular cells:* spherical cells densely packed with granules which stain deeply with basic dyes. (4) *Leucocytes:* blood corpuscles which have left the capillaries. They vary in number and variety.

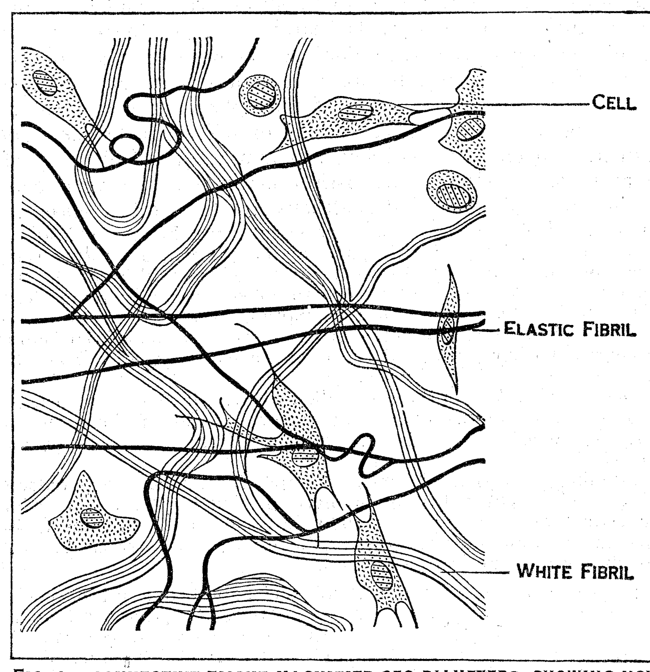

FIG. 1.—CONNECTIVE TISSUE MAGNIFIED 350 DIAMETERS, SHOWING HOW THE WHITE FIBRILS WHICH GIVE STRENGTH, AND THE ELASTIC FIBRILS, WHICH GIVE ELASTICITY, ARE DEVELOPED FROM CELLS OF THE KIND FOUND BETWEEN THE FIBRILS

Adipose or Fatty Tissue.—This is formed from areolar tissue by an accumulation of fat within certain of the cells of the tissue, especially the granular cells, though some regard fat cells as specific, and to be found in large numbers only in certain parts of the body. The fat is either taken in as such by the cell, or, more commonly is manufactured by the cell from other chemical material (carbohydrate chiefly) and deposited within it as small granules. As these accumulate they run together, and this process continuing, the cell at last becomes converted into a thin layer of living material surrounding a single large fat globule. The use of fatty tissue is as a storehouse of food. Hence, it is found where it will not interfere with the working of the tissues and organs, and in several positions as packing to fill up irregular spaces, *e.g.,* between the eyeball and the bony socket of the eye.

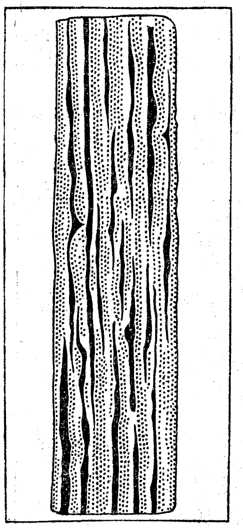

FIG. 2.—TENDON OF RAT'S TAIL STAINED WITH GOLD CHLORIDE, SHOWING INTERLACING BUNDLES OF WHITE FIBROUS TISSUE

Reticular Tissue.—Here, the reticulum of white fibres is built up of very fine strands leaving large interspaces in which the cells typical of the tissue are enclosed. The ground substance is reduced to a minimum. Many connective tissue and endothelial cells lie on the fibres which may in places be completely covered by them. Such a general scaffolding may be demonstrated in lymphatic glands, the spleen, liver and other cellular organs.

White Fibrous Tissue.—In this tissue the white fibres largely preponderate. It is found wherever great strength combined with flexibility is required and the fibres are arranged in the direction in which the stress has to be transmitted. The fibrous bundles may be parallel as in a tendon, or united to form a membrane. Such are the ligaments around the joints or the fasciae covering the muscles of the limbs, etc. In other positions, *e.g.* the *dura mater,* the fibrous bundles course in all directions, and form a very tough membrane. The cells of such tissues lie in the spaces between the bundles and are flattened in two or three directions where they are compressed by the oval fibrous bundles surrounding them (figs. 2 and 3). The cells thus lie in linear groups parallel to the bundles, presenting a characteristic appearance when examined under the microscope.

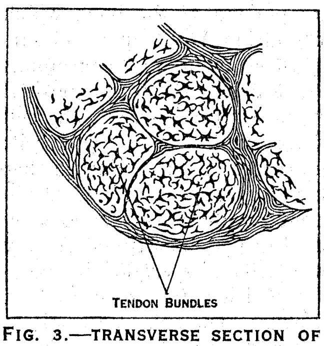

FIG. 3.—TRANSVERSE SECTION OF TENDON, SHOWING HOW THE BUNDLES OF WHITE FIBROUS TISSUE ARE BOUND TOGETHER BY CONNECTIVE TISSUE, THE STELLATE FORMS IN THE BUNDLES BEING TENDON OR CONNECTIVE TISSUE CELLS

Yellow Elastic Tissue.—This is mainly composed of elastic fibres. It is found where a continuous but varying stress has to be supported. In some positions the elastic tissue consists of branching fibres arranged parallel to one another and bound together by white fibres, *e.g., ligamentum nuchae* (fig. 4). In other cases it forms thin plates perforated in many directions and produces a fenestrated membrane. Such plates are arranged round the larger arteries forming a large proportion of the artery wall. All the connective tissues carry a small number of blood vessels and are supplied with lymphatics and nerves.

Cartilage.—Cartilage or gristle is a tough and dense tissue with a certain degree of flexibility and high elasticity. It is found where flexibility is required but a fixed shape must be retained, *e.g.* the trachea and the external ear or pinna. It is largely associated with the bones in the formation of the skeleton. The tissue consists of cells embedded in a solid matrix or ground substance. Three varieties are distinguished according to the nature of the matrix: hyaline, white fibro-cartilage and elastic cartilage. In the first the matrix is homogeneous, in the others the corresponding type of fibrous tissue is present.

Hyaline Cartilage (fig. 5).—In this variety the cells are rounded, have an oval nucleus and a granular, often vacuolated cell-body. Their number varies in different specimens, being, roughly, in inverse ratio to the age of the tissue. Cartilage grows by deposition of new matrix by the cartilage cells which thus become more and more separated from one other. They are often to be seen in groups of two, three or four cells, indicating the common origin of each group from a parent cell. Towards the surface of the cartilage they tend to become flattened in a direction parallel to the surface. Some of them near the surface of a piece of cartilage may be branched, appearing as a transition form between connective tissue corpuscles and typical cartilage cells. This is particularly the case at points where tendons or ligaments are attached. Lime salts are often deposited in the matrix of hyaline cartilage especially in old animals or in the deeper layers of articular cartilage where it is attached to bone. Such a deposit is well marked in the superficial parts of the skeleton of the cartilaginous fishes. In the development of vertebrata, the skeleton is first laid down as hyaline cartilage which is gradually removed, bone being deposited in its place. In the adult, hyaline cartilage is found at the ends of the long bones (articular cartilage), uniting the bony ribs to the sternum (costal cartilage), and forming the cartilages of the nose, trachea and bronchi, etc. All forms of cartilage are non-vascular so that the cells must obtain food and get rid of waste products by diffusion through the matrix.

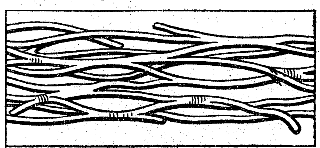

FIG. 4.—YELLOW ELASTIC FIBRES OF THE NUCHAL LIGAMENT, SHOWING THE BRANCHING AND INTERLACING CHARACTER, AND THE IRREGULARLY PLACED TRANSVERSE MARKINGS WHEN THE FIBRES HAVE BEEN TEASED OUT

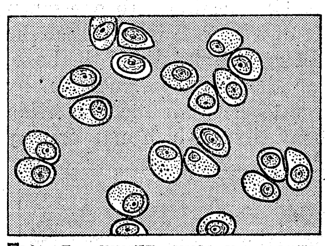

FIG. 5.—WHITE HYALINE CARTILAGE, A HOMOGENEOUS MATRIX INTERSPERSED WITH CARTILAGE CELLS WHOSE ARRANGEMENT SHOWS THEIR DEVELOPMENT BY DIVISION OF THE MOTHER CELL

White Fibro-Cartilage.—In this variety, white fibres ramify through the matrix (fig. 6). The cells lie separate and not in groups, and the amount of matrix between commonly is small. The white fibres may run in all directions or, chiefly, in one direction only. Owing to the presence of much fibrous tissue this variety of cartilage is tougher than hyaline cartilage and less flexible. It is found in places which have to withstand great compression but where a less rigid structure than bone is demanded. Thus it forms the intervertebral discs, the interarticular cartilages, or the edges of joint surfaces to deepen the surface.

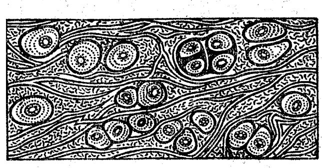

FIG. 6.—WHITE FIBRO-CARTILAGE
The matrix is permeated by numerous white fibres and contain large numbers of characteristic cartilage cells

Elastic Fibro-Cartilage.—In this variety the matrix is permeated by a complex and well-defined meshwork of elastic fibres (fig. 7). The size of the fibres varies much in different specimens. It is found in parts where flexibility and permanence of shape are requisite, as in the pinna of the ear, the epiglottis, etc.

Bone.—In bone, mineral salts are deposited in the intercellular matrix. If bone be incinerated so that the organic matter is burnt away, a residue is left which consists chiefly of calcium phosphate, and amounts to as much as two-thirds of the weight of the original bone. If, on the other hand, bone be macerated in hydrochloric or nitric acid the calcium phosphate is dissolved, leaving the organic matter practically unaffected and still showing the microscopic structure of bone. Hence it follows that the organic matrix is uniformly impregnated with the calcium salts. According to its naked-eye appearance bone is distinguished as *compact* or *cancellated.* The former is dense like ivory and forms the outer surface of all bones. The whole of the shaft of a long bone is composed of this compact form. Cancellated bone has a spongy structure and contains large interspaces filled with a fatty tissue rich in blood vessels. This variety forms the interior of most bones, especially the heads of the long bones, the interior of the ribs, etc. The cavity of the shaft of a long bone is filled, as are the smaller cavities in cancellated bone, with bone marrow (*see* below).

The minute structure of bone may be seen in a piece of dried bone which has been ground down until sufficiently thin for microscopic purposes. In a thin transverse slice of a long bone are seen (fig. 8) a number of circular units bound into a compact whole by intervening material showing in the main the same structural details. Each of these units is an Haversian system. Centrally, there is a dark area, the Haversian canal, around which the bone matrix is deposited as concentric laminae. Between the laminae are the bone lacunae and spreading away from them in directions generally transverse to the laminae are fine branching lines—the canaliculi. All dark parts of the specimen are natural spaces filled with debris during preparation. In the living bone the Haversian canal contains an artery and vein, some capillaries, a flattened lymph space, fine medullated nerve fibres—the whole being supported in a fine fatty tissue. Each lacuna is filled with a cell (the bone corpuscle) and the canaliculi contain fine branching processes of these cells. On comparing such a section with one taken parallel to the long axis of the shaft of a bone it is seen that the Haversian canals run some distance along the length of the bone, and frequently unite with one another or communicate by obliquely coursing channels. The spaces between the Haversian systems are filled in with further bony tissue which may or may not be arranged in laminae. Cancellous bone only differs from compact bone in the arrangement of the bone tissue. This encloses a number of irregular, communicating spaces strengthened in places by parallel trabeculae that run in the direction in which the bone has to support its maximum strain. Usually the bone trabeculae are so fine that they do not contain Haversian systems, but they include bone corpuscles.

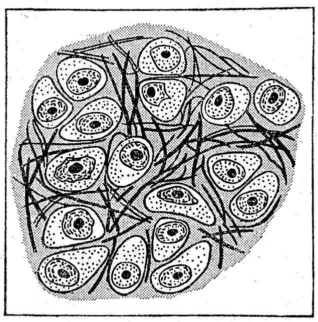

FIG. 7.—ELASTIC FIBRO-CARTILAGE, SHOWING NUMEROUS CARTILAGE CELLS AND ELASTIC FIBRES

SECTION OF BONE SHOWING FOUR HAVERSIAN SYSTEMS AND INTERLYING BONE MATERIAL THIS IS A DRY PREPARATION HENCE ALL THE CAVITIES (SUCH AS THE HAVERSIAN CANALS THE LACUNAE AND CANALICULI) BEING FILLED WITH DEBRIS FROM THE GRINDING APPEAR DARK

FIG. 8.—TRANSVERSE SECTION OF BONE SHOWING MINUTE STRUCTURE

Bone Marrow.—This fills the central cavity of tubular bones and the cavities of spongy bone tissue. It is largely composed of fat cells and is red or yellow in colour. Red marrow consists of fat cells lying in a tissue made up of large and small marrow cells and giant cells or myeloplaxes (fig. 9). The whole of these elements are supported in a delicate connective tissue. Some of the marrow cells are typical leucocytes and lymphocytes as found in circulating blood. Others (myelocytes) are larger than leucocytes, with round or oval nuclei, and a protoplasm containing small or large granules. These different types of cell probably develop into leucocytes. The giant cells are large spherical cells with several nuclei. In addition to fully developed red blood corpuscles there are also present numerous young nucleated red blood cells (erythroblasts or haematoblasts).

Development of Bone.—New bone is formed from a vascular fibrous membrane, either directly, or with interpolation of a cartilaginous stage. The development of bone from cartilage is the more complicated of the two because in it bone formation is taking place in two positions at the same time and in two rather different manners. Thus bone is being laid down from the outside by the fibrous membrane surrounding the cartilage, (perichondrium) and also within the substance of the cartilage (endochondral formation). Perichondral formation takes place somewhat earlier than endochondral, and in a long bone is first seen around the centre of the shaft, *i.e.* in that portion of the bone which forms the diaphysis. Here the perichondrium is vascular and carries on the surface next to the cartilage an almost continuous layer of cuboid cells, the *osteoblasts.* Calcium salts are deposited in the matrix of the immediately subjacent cartilage and the cell spaces of the cartilage increase in size while the cartilage cells shrink. Further growth of cartilage ceases in this region so that at one time the shaft of the cartilage may appear constricted in the middle. The formation of bone endochondrally is ushered in by the ingrowth of blood vessels from the perichondrium. A way through the calcified matrix of the cartilage is eroded by polynucleated giant cells, the *osteoclasts,* which apply themselves to the matrix and gradually dissolve it away. The enlarged cartilage spaces are thus opened to one another, and soon the only remnants of the matrix consist of irregular calcified trabeculae. In this way the primary marrow spaces are produced, the whole structure representing the future spongy portion of the bone. The next step in both perichondral and endochondral bone formation consists in the deposition of bone matrix by the osteoblasts. In the spongy portion they deposit a layer upon the surfaces of the calcified cartilage matrix, and thus in newly formed bone we find a central framework of cartilage enclosed in a layer of bone (*see* fig. 10). In the perichondral formation the deposition is effected in the same manner but is not uniformly spread over the whole surface, trabeculae being formed. These become confluent at places, thus leaving spaces through which blood vessels and osteogenetic tissue pass to reach the interior of the bone. As the deposition of bone matrix proceeds, some of the osteoblasts become included within the matrix, and ceasing to form fresh matrix become bone corpuscles. Increase in thickness of the new bone

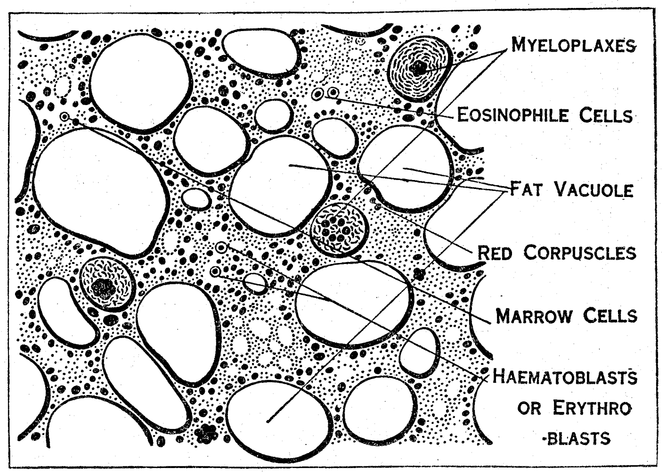

FIG. 9.—SECTION OF BONE MARROW TO SHOW THE COMPOSITION OF THE MAIN FACTORY OF CELLS OCCURRING IN THE BLOOD

is effected by the deposition of fresh matrix followed again by the inclusion of further osteoblasts. The spaces within the trabeculae become in this way gradually narrowed by the deposition of matrix until at last a centre is left only large enough to contain the blood vessels and their accompanying nerves, lymphatics and a small number of osteoblasts. Bone formation then ceases. In this manner the Haversian systems are produced.

Growth of the bone proceeds by deposition of more matrix on the exterior, but absorption is also taking place. This is most typically seen within the spongy portion. The absorption of the trabeculae is effected by the osteoblasts. These become applied to the trabeculae and gradually eat their way into the matrix thus coming to lie within lacunae. They possess the power of dissolving both bone and cartilage matrix. Side by side with this solution process we may often see new formation taking place by the activity of the osteoblasts (fig. 10). In this manner the whole framework of the bone may be gradually replaced. The process is most active in embryos and very young animals, but also continues during the whole life of an animal, thus effecting alterations in shape and structure of the whole bone. Growth in the length of a bone is effected by formation of new bone at either end of the shaft. After the ossification centre has been formed in the shaft (diaphysis) of the bone subsidiary centres make their appearance in the heads of the bones. These form, by a similar process of bone formation, fresh bone masses which, however, are not continuous with the bone tissue of the shaft. They form the epiphyses. They are attached to the diaphysis by an intermediate piece of cartilage, and it is by a process of growth of this cartilage and its subsequent replacement by bone that growth in length of the whole bone is effected (fig. 10). This piece of intervening cartilage can be easily seen in a young bone and persists as long as the bone can increase in length. Thus in man the last junction of epiphysis to diaphysis may not take place until the 28th year.

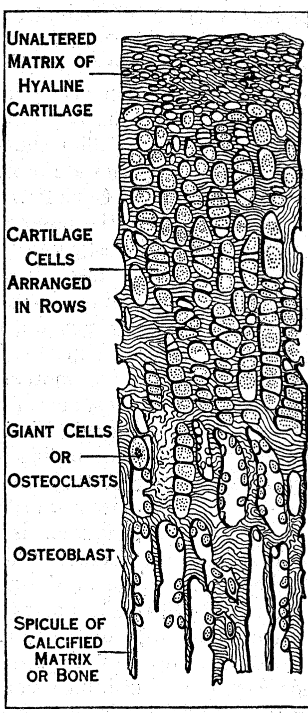

FIG. 10.—BONE DEVELOPMENT FROM CARTILAGE

Development of bone in membrane shows a course in all respects very similar to perichondral bone formation. A layer of osteogenetic tissue makes its appearance in the membrane from which the bone is to be formed. In this tissue a number of stiff fibres are deposited which soon become covered and impregnated with calcium salts. Around these bundles of fibres numbers of osteoblasts are deposited and by them bone matrix is deposited in irregular trabeculae. The bone increases by the deposition of fresh matrix just as in perichondral bone formation and Haversian systems are formed after precisely the same manner.

CONNELLITE, a rare mineral species, a hydrous copper chloro-sulphate, of very complex composition, crystallizing in the hexagonal system. It occurs as velvety tufts of delicate acicular crystals of a fine blue colour, and is associated with other copper minerals of secondary origin, such as cuprite and malachite.

CONNELLSVILLE, a city of Fayette county, Pa., U.S.A., on the Youghiogheny river, 60m. S.S.E. of Pittsburgh. It is on Federal highway 119, and is served by the Baltimore and Ohio, the Pennsylvania, the Pittsburgh and Lake Erie and the Western Maryland railways. Population, 1930 was 13,290; in 1940 it was 13,608. The city is the centre of the Connellsville coal-field which is famous for the coking qualities of its coal. The production of the entire district has ranged from 6 to 18 million tons of coke (one-sixth to one-third of the entire output of the country); before the development of the by-product process it sometimes amounted to 50% of the total. The city also manufactures coking and mining machinery, mine pumps, safes, iron, electrical steel, fire glass, paving brick, flour, lumber, candy and other products. Connellsville was settled in 1770 and was laid out in 1793 by Zachariah Connell.

CONNEMARA, a district in the west of Co. Galway, Eire. (*See* GALWAY.)

CONNERSVILLE, a city of Indiana, U.S.A., on the west fork of Whitewater river, 59 mi. E.S. of Indianapolis; the county seat of Fayette county. It is served by the Baltimore and Ohio, New York Central and the Nickel Plate railways, buses and nine commercial truck lines. Population (1940) was 12,898. Connersville is a manufacturing city set in a good farming community notable for production of corn and hogs. Products include positive rotary blowers, centrifugal blowers, gas meters, gas exhausters, automobile engine parts, delivery trucks, cabinets for electrical refrigeration, automobile and cabinet hardware, steel kitchen sinks and cabinets, bottle coolers, caskets, casket hardware, commercial rug cleaning equipment, flour, aeroplane parts.

Connersville was named after John Conner, frontiersman and Indian trader, reared by the Indians, who in 1813 laid out the town. It received a city charter in 1869.

CONNING TOWER: *see* SUBMARINE.

CONNOLLY, JAMES (1870–1916), Irish Socialist, was born in Clones, Co. Monaghan, Ulster, on June 5, 1870. He was the first effective propagandist of Socialism in Ireland, but did not come into prominence until 1913 when, in collaboration with James Larkin, he directed the six-months' strike of 20,000 Dublin transport and other workers against the combination of employers headed by William Murphy. Though the strike failed, it left behind an immensely increased semi-revolutionary Labour movement and the drilled but not armed Citizen Army. During the World War, Connolly decided Socialism could come in Ireland only after the Nationalist question was settled and the war stopped: for these reasons he joined with Sinn Fein and was commander-in-chief in the Easter week rebellion. He was executed by the British on May 12, 1916.

See Connolly's *Labour in Ireland* (1917), and D. Ryan, *James Connolly* (1924).

CONNOTATION, in logic, a term (largely due to J. S. Mill) sometimes equivalent to intension, which is used to describe the sum of the qualities regarded as belonging to any given thing, or, more usually, class of things, and suggested by the name by which it is known; thus the term "elephant" connotes the having a trunk, a certain shape of body, texture of skin, and so on. It is clear that as scientific knowledge advances the connotation or intension of terms increases, and, therefore, that the connotation of the same term may vary considerably according to the knowledge of the person who uses it. Again, if a limiting adjective is added to a noun (*e.g.*, African elephant), the connotation obviously increases. More usually the term connotation is now used for the conventionally fixed implication of a term, and is practically equivalent to definition. In all argument it is essential that the speakers should be in agreement as to the connotation of the words they use. General terms such as "socialism," "slavery," "liberty," and technical terms in philosophy and theology are frequently the cause of controversies which would not arise if the disputants were agreed as to the connotation of the terms. In addition *connotative* terms, as those which *denote* things and imply attributes, are opposed to *non-connotative,* which merely *denote* things, without implying attributes, or (in the case of abstract terms) which designate or name attributes, relationships, etc., instead of merely implying them, and which do not denote things.

See J. S. Mill *System of Logic,* 1874, etc.; J. N. Keynes, *Formal Logic,* 1906; H. W. B. Joseph *Introduction to Logic* (1916); A. Wolf *Essentials of Logic,* 1926, also articles EXTENSION, MEANING.

CONOID, in geometry, any surface traced by a conic section rotating round either of its axes. Hence there are more varieties of conoids than of conics. These include (1) the *ellipsoid,* which may be (*a*) a *prolate spheroid,* shaped like a lemon, formed when an ellipse rotates round its major axis, or (*b*) an *oblate spheroid*, shaped like an orange or the earth, formed when the rotation is round the minor axis; a special limiting case is (*c*) the *sphere*, formed when the ellipse becomes a circle, all diameters then being equal. Archimedes (287–212 B.C.) preferred the term *spheroid* to ellipsoid, as seen in his work on conoids and spheroids. (2) The *paraboloid* generated by a parabola rotating about its axis, rounded near the *vertex* but spreading out indefinitely more and more like a cylinder. All rays emerging from the focus would be reflected from the paraboloid, considered as a mirror, these rays being parallel to the axis, as one immense beam—whence the construction of such reflectors approximately paraboloidal. (3) The *hyperboloid*, either of one sheet (nappe), by rotation round the conjugate axis—funnel-like, spreading out from a narrow neck, asymptotic outside to the "asymptote-cone"; or of two symmetric congruent sheets, asymptotic inside to an "asymptote-cone," formed when rotation is round the transverse axis. (*See* ANALYTIC GEOMETRY; ELLIPSOID; PARABOLOID; HYPERBOLOID.)

The equations of the conoids are: $x^2+y^2+z^2=a^2$, for the sphere; $\frac{x^2}{a^2}+\frac{y^2+z^2}{b^2}=1$, for the prolate spheroid; $\frac{x^2+z^2}{a^2}+\frac{y^2}{b^2}=1$, oblate spheroid; $y^2+z^2=4px$, for the paraboloid; $\frac{x^2+z^2}{a^2}-\frac{y^2}{b^2}=1$, for the hyperboloid of one sheet; $\frac{x^2}{a^2}-\frac{y^2+z^2}{b^2}=1$, for the hyperboloid of two sheets. These "surfaces of rotation," or "revolutes," are only special cases of ellipsoid, paraboloid, hyperboloid (*q.v.*) as named in analytic geometry.

CONOLLY, JOHN (1794–1866), English physician, was born at Market Rasen, Lincolnshire, of an Irish family, on May 27, 1794. He graduated M.D. at Edinburgh in 1821, and in 1828, after practising at Lewes, Chichester and Stratford-on-Avon, was appointed professor of the practice of medicine at University college, London. In 1830 he published a work on the *Indications of Insanity*. In co-operation with Sir Charles Hastings and Sir John Forbes, he founded in 1832 the association which finally became the British Medical Association. In 1839 he was elected resident physician to the Middlesex County asylum at Hanwell, where he carried out on a large scale the principle of non-restraint in the treatment of the insane. The principle was ultimately accepted as fundamental despite continued and strong opposition. In 1844 he ceased to be resident physician at Hanwell, but remained visiting physician until 1852. He died on March 5, 1866, at Hanwell, where in the later part of his life he had a private asylum. His works include *Construction and Government of Lunatic Asylums* (1847); *The Treatment of the Insane without Mechanical Restraints* (1856); and an *Essay on Hamlet* (1863).

CONON, son of Timotheus, Athenian general. After having held several commands during the Peloponnesian War (*q.v.*), he was chosen as one of the ten generals who superseded Alcibiades in 406 B.C. He was defeated at sea and shut up in Mytilene. The Athenian victory at Arginusae (*q.v.*) rescued him (406), and as he had not been present at the battle, he was not tried with the other generals, and was allowed to retain his command. In 405, however, the Athenian fleet was defeated at Aegospotami, and Conon with difficulty escaped to Cyprus. On the outbreak of the war between Sparta and the Persians (400) he obtained from Artaxerxes joint command with Pharnabazus of a Persian fleet. In 394 he defeated the Lacedaemonians near Cnidus, and thus deprived them of the empire of the sea. He expelled the Lacedaemonian harmosts from most of the maritime towns of the Aegean, and restored the long walls and the fortifications of the Peiraeus. According to one account, he was put to death by Tiribazus, when on an embassy from Athens to the Persian court to counteract the intrigues of Sparta; but it seems more probable that he escaped to Cyprus and died there about 390.

See Xenophon, *Hellenica*, iv. 3. 8; Justin vi. 3; Cornelius Nepos, *Conon;* Lysias, *De bonis Aristophanis*, 41–44; Isocrates *Panegyricus* 41.

CONON, grammarian and mythographer, flourished at Rome in the time of Caesar and Augustus. He was the author of a collection of myths and legends, relating chiefly to the foundation of colonies. The work, dedicated to Archelaus Philopator, king of Cappadocia, contained 50 *Narratives;* an epitome, with brief criticisms, has been preserved in Photius (*cod.* 186). Nicolaus of Damascus is said to have made considerable use of the work (edition by U. Höfer, 1890).

CONON of Samos, Greek astronomer and geometer (3rd century B.C.), made astronomical observations in Italy and Sicily, but settled in Alexandria. He was the friend of Archimedes, who survived him. Conon is best known in connection with the *Kome Berenikes* (Hair of Berenice). Berenice, the wife of Ptolemy Euergetes, had in accordance with a vow dedicated her hair in the temple of Arsinoë of Zephyrium as an offering on the safe return of her husband from his Syrian expedition. It disappeared from the temple, and was declared by Conon to have been placed among the stars. Callimachus wrote a poem on the subject, of which only a few lines are preserved, but we possess the imitation of it by Catullus. Conon wrote on astronomy in seven books, and made a list of the observations of solar eclipses recorded in Egypt. He also investigated the question of the maximum number of points of intersection of two conics, and of a conic and a circle. (*See* Apollonius, *Conics*, Bk. iv., Pref.)

CONQUEST, in general, the subjugation of one belligerent force by another; in international law, the subjugation of one independent State by another, which may be followed by the acquisition by the conqueror of territory which admittedly belonged to the conquered. When this occurs the rights of conquest arise. These rights according to one view rest solely upon force; according to another they are governed by the principle of succession. Where the acquisition of territory is only partial, the title of the conqueror is usually confirmed by a treaty of peace. This may operate either expressly, by way of cession; or impliedly, by virtue of the principle of *uti possidetis*, whereby each belligerent retains possession of such territory as is under his control at the time of the termination of the war. In either case the title rests upon treaty rather than upon conquest alone. Where, however, the acquisition involves the whole of the territory, and there is no longer in existence any authority to cede, then the title of the conqueror rests upon conquest. But the conquest must be complete. There should be "firm possession" on the part of the conqueror, coupled with "intention," and "ability" to retain the acquired territory. The former will be manifested by some formal proclamation or declaration of annexation (*q.v.*). But proclamation will be premature unless the subjugation of the enemy is complete. The latter will be shown by the complete establishment of the authority of the conqueror indicated either by some formal act of surrender, such as the compact of Vereeniging of 1902, or by the cessation of substantial resistance. But the conquest will not be regarded as complete if the war is continued by a third Power in alliance with the particular State which is subjugated.

The rights and liabilities of the conqueror ought, according to modern opinion and practice, to be governed by the principle of succession subject to certain qualifications. Thus the conqueror succeeds to the rights and obligations of his predecessor in title, to the extent at any rate of the assets acquired. But he is not bound to recognize or to discharge the obligations incurred by his predecessor or by individuals for purposes of the war, nor by obligations arising out of tort, nor by the personal debts of the former head of the State. nor by obligations of a mixed public and private character.

Private rights, interests and property, to whomsoever belonging in the conquered territory are now generally understood not to be affected by conquest and annexation or cession. The municipal law relating to such rights, interests and property is not affected and remains in force until altered by the conqueror in the ordinary course of legislation, subject however to any provisions of the new constitution. (H. H. L. B.)

CONRAD or KONRAD, a German masculine proper name, borne by four German kings and emperors (M.H. Ger. *Kuonrât*, "keen in counsel"). The last of the Hohenstaufen, Conrad the younger, duke of Swabia, is known by the diminutive form Conradin (*q.v.*).

CONRAD II. (*c.* 990–1039), Roman emperor, son of Henry, count of Spires, and a descendant of Emperor Otto the Great. He was a member of the Conradine house, counts of Franconia, and he founded the Salian or Franconian imperial dynasty. After a contest with a younger member of his family, and in the face of much opposition on the part of the Polish and Burgundian kings and the duke of Swabia, Conrad was finally crowned at Rome on March 26, 1027. He did much to establish the imperial authority in Italy (he had been crowned with the Iron Crown of Lombardy in 1026) and might have done more if he had not had to face continual revolts among the German princes. He was very successful in crushing these outbreaks, and he left Germany far stronger and greater in territory than he found it. He sought to establish the hereditary principle in Italy, and in a lesser degree in Germany, and to unite the two countries by marriage ties; his ecclesiastical policy was firm and autocratic, and he substituted Justinian's Code in Lombardy for the old Lombard laws. He died at Utrecht on June 4, 1039, and was buried in the cathedral he had begun to build at Spires.

CONRAD I. (d. 918), German king, son of Conrad, count of Lahngau. When Louis the Child died, in 911, Conrad was chosen German king at Forchheim on Nov. 8, 911, owing to the efforts of Hatto I., archbishop of Mainz, and to the reputation he appears to have won in war and peace alike. He found the unity of Germany threatened by the Magyars and the Normans from without, and by the growing power of the stem-duchies from within. He failed to bring Lorraine into subjection, and was equally unsuccessful in his struggle with Henry, duke of Saxony, afterwards King Henry the Fowler. He died on Sept. 23, 918, and was buried at Fulda. He named his former enemy, Henry of Saxony, as his successor.

Konrad I." in *Monumenta Germaniae Historica Diplomata* (edit. T. von Sickel, Hanover 1879–84); E. Dümmler, *Geschichte des Ostfränkischen Reichs* in *Jahrb. d. Deut. Gesch.* (Leipzig, 1887–88).

CONRAD III. (1093–1152), German king, second son of Frederick I., duke of Swabia, and Agnes, daughter of the emperor Henry IV., was the first king of the Hohenstaufen family. His father died in 1105, and his mother married secondly Leopold III., margrave of Austria. In 1115 his uncle the emperor Henry V. appointed him duke of Franconia. In 1116, together with his elder brother Frederick II., duke of Swabia, he was left by Henry as regent of Germany, and when the emperor died in 1125 he became titular king of Burgundy, or Arles. In 1126 he took part in the war between his brother Frederick and the new king, Lothair the Saxon, and was chosen king in opposition to Lothair on Dec. 18, 1127. Hastening across the Alps he was crowned king of Italy at Monza in June 1128, and in spite of the papal ban was generally acknowledged in northern Italy. The rival popes, Innocent II. and Anacletus II., both declared against him; the Romans repudiated him; and after failing to seize the extensive possessions left by Matilda, marchioness of Tuscany, he returned to Germany in 1132. He continued the struggle against Lothair till Oct. 1135, when he submitted, was pardoned, and recovered his estates. In 1136 he accompanied the imperial forces to Italy in the capacity of standard-bearer, and sought to win the favour of Pope Innocent II.

In Dec. 1137 Lothair died, and some of the princes met at Coblenz and chose Conrad for a second time as German king on March 7, 1138, in presence of the papal legate. Crowned at Aix-la-Chapelle six days later, he was acknowledged at Bamberg by several of the South German princes; but his position could not be strong while Henry the Proud, the powerful duke of Bavaria and Saxony, refused his allegiance. Attempts at a peaceful settlement of this rivalry failed, and Henry was placed under the ban in July 1138, when war broke out in Bavaria and Saxony. The king was unable to make much headway, in spite of the death of Duke Henry, which occurred in Oct. 1139; and his half-brother Leopold IV., margrave of Austria, to whom Bavaria had been entrusted, was defeated by Henry's brother Welf, afterwards duke of Spoleto and margrave of Tuscany. Conrad captured the fortress of Weinsberg from Welf in Dec. 1140, and is said to have allowed the women to leave the town, each with as much of her property as she could carry on her back. To his surprise, so the story runs, each woman came out bearing on her back a husband, a father or brother who thus escaped the conquerors. Peace was made at Frankfort in May 1142, when Henry the Lion, son of Henry the Proud, was confirmed in the duchy of Saxony, while Bavaria was given to Conrad's stepbrother Henry Jasomirgott, margrave of Austria, who married Gertrude, the widow of Henry the Proud.

Affairs in Italy demanded the attention of the king, as Roger I., king of Sicily, had won considerable authority on the mainland and refused to recognize the German king, whose help Pope Lucius II. implored against the rebellious Romans. This state of affairs drove Conrad into alliance with the East Roman emperor, Manuel Comnenus, who in 1146 married his stepsister; but the condition of Germany prevented the contemplated campaign against Roger. The solitary success amid the general disorder in the empire was the expedition undertaken in 1142 by Conrad into Bohemia, where he restored his brother-in-law Ladislaus to this throne. An attempt, however, to perform the same service for another brother-in-law, also called Ladislaus, who had been driven from his Polish dukedom, ended in failure. Disorder was rampant in Saxony, Bavaria and Burgundy; and in 1146 war broke out between the Bavarians and the Hungarians. A term was placed to this condition of affairs by the preaching of Bernard of Clairvaux, and the consequent departure of many turbulent nobles on crusade. In Dec. 1146 the king himself took the cross, secured the election and coronation of his young son Henry as his successor, appointed Henry I., archbishop of Mainz, as his guardian, and set out for Palestine in the autumn of 1147. Marching with a large and splendid army through Hungary, he reached Asia Minor, where his forces were decimated by disease and by the sword. Stricken by illness, Conrad returned to Constantinople at Christmas 1147, but in March 1148 set out to rejoin his troops. Having shared in the fruitless attack on Damascus, he left Palestine in Sept. 1148 and passed the ensuing winter at Constantinople, where he made fresh plans for an attack on Roger of Sicily. He reached Italy by sea; but the news that Roger had allied himself with Louis VII., king of France, and his old opponent Welf of Bavaria, compelled him to return hastily to Germany. He was obliged to neglect repeated invitations from the Romans, who sent him a specially urgent letter in 1149, and consequently never received the imperial crown.

Conrad died on Feb. 15, 1152, at Bamberg, where he was buried. By his wife, Gertrude, daughter of Berenger, count of Sulzbach, he had two sons, the elder of whom, Henry, died in 1150. Passing over his younger son Frederick on account of his youth, he appointed as his successor his nephew Frederick III., duke of Swabia, afterwards the emperor Frederick I.

See Otto of Freising, "Chronicon," in the *Monumenta Germaniae historica. Scriptores,* Band xx. (Hanover and Berlin, 1826–92). The best modern authorities are O. von Heinemann, *Lothar der Sachse und Konrad III.* (Halle, 1869); W. von Giesebrecht, *Geschichte der deutschen Kaiserzeit,* Band iv. (Brunswick, 1877); L. von Ranke, *Weltgeschichte, achter Teil* (Leipzig, 1887–88); W. Bernhardi, *Konrad III.* (Leipzig, 1883); J. Jastrow, *Deutsche Geschichte im Zeitalter der Hohenstaufen* (Berlin, 1893).

CONRAD IV. (1228–1254), German king, son of the emperor Frederick II. and Isabella of Brienne, was born at Andria in Apulia on April 26, 1228. In 1235 he was made duke of Swabia and in 1237 was chosen king of the Romans, or German king, at Vienna, in place of his half-brother Henry, an election which was subsequently confirmed by the diet at Spires. In 1240 he called an assembly to Eger, where many of the princes declared openly against the pope, and was soon in arms against Siegfried, archbishop of Mainz, the leader of the papal party in Germany. Although defeated near Frankfürt in Aug. 1246 by the anti-king, Henry Raspe, landgrave of Thuringia, he obtained help from the towns and from his father-in-law, Otto II., duke of Bavaria, and drove Henry Raspe to Thuringia. He was carrying on the struggle against Henry Raspe's successor, William II., count of Holland, when the emperor died in Dec. 1250, and a few days later Conrad narrowly escaped assassination at Regensburg. He raised an army by pledging his Swabian estates and marched to Italy in 1251, where with the help of his illegitimate half-brother, Manfred, he overran Apulia and took Capua and Naples. He died at Lavello on May 21, 1254. He left a son named Conradin.

CONRAD (d. 955), surnamed the "Red," duke of Lorraine, was a son of a Franconian count named Werner. He rendered valuable assistance to the German king Otto, afterwards the emperor Otto the Great, and in 944 was made duke of Lorraine. In 947 he married Otto's daughter Liutgard (d. 953), and afterwards took a prominent part in the struggle between Louis IV., king of France, and Hugh the Great, duke of Paris. He accompanied his father-in-law to Italy in 951, and when Otto returned to Germany in 952, Conrad remained behind as his representative, and signed a treaty with Berengar II., king of Italy, which brought about an estrangement between the German king and himself. He entered into alliance with his brother-in-law Ludolf, and taking up arms against Otto, seized the person of the king, afterwards resisting successfully an attack on Mainz. He then ravaged the lands of his enemies in Lorraine; treated with the Magyars for support, but submitted to Otto in June 954, when he was deprived of his duchy, though permitted to retain his hereditary possessions. He was killed on the Lechfeld on Aug. 10, 955, while fighting for Otto against the Magyars, and was buried at Worms. He left a son Otto, who was the grandfather of the emperor Conrad II.

(Hanover and Berlin, 1826–92); W. von Giesebrecht, *Geschichte der deutschen Kaiserzeit* (Leipzig, 1881); R. Köpke and E. Dümmler, *Jahrbücher des deutschen Reichs unter Kaiser Otto I.* (Leipzig, 1876); K. Köstler, *Die Ungarnschlacht auf dem Lechfelde* (Augsburg, 1884).

CONRAD, JOSEPH (1857–1924), English novelist, was born on Dec. 6, 1857, in the Ukraine, of a Polish family of the name of Korzeniowski; his father, a man of letters, became involved in the Polish insurrection of 1863 and was banished to Vologda, whence he returned to Cracow before his death. In Cracow, the son, Joseph, passed his boyhood. He learned to speak and write French with fluency as a youth. His first acquaintance with English literature was made through Polish translations of Shakespeare and Dickens; later on Hugo's *Travailleurs de la mer* and the novels of Marryat and Fenimore Cooper—particularly Cooper's *The Pilot*—inspired him with romantic ideas of the seaman's life.

At the age of 17 he found his way to Marseilles, and for two years served in French ships in the Mediterranean and on the South American coast. With hardly a word of English speech at his command, he came to Lowestoft in 1878, qualified as able seaman on a coasting vessel, and in Aug. 1880 sailed as third mate to Sydney in the Clyde-built, Clyde-owned sailing ship "Loch Etive," commanded by a famous clipper captain, William Stuart of Peterhead. Four years later he had become a master in the British merchant service and a British subject, and for a number of years his calling sent him to many parts of the world and through a constant succession of adventures, all contributory to the cosmopolitan spirit and the range of incident in his subsequent stories.

"My first English reading was the *Standard* newspaper," he wrote to a friend as late as 1911; "and my first acquaintance by the ear with it was in the speech of fishermen, shipwrights and sailors of the East Coast. But in 1880 I had mastered the language sufficiently to pass the first examination for officers in the merchant service, including a *viva voce* of more than two hours. But 'mastered' is not the right word; I should have said 'acquired.' I've never opened an English grammar in my life."

A Sequence of Novels.—During a period of ill-health (the result of Congo fever), he started his first novel, *Almayer's Folly,* the writing of which engaged him, with frequent and protracted intermissions, from 1889 till 1894. Into its composition went many personal experiences of his own as first officer of a ship in which he had sailed between Singapore, Borneo, Celebes and Sumatra. When published in 1895 it was recognized, by acutely discerning readers, as a portent of something new in English fiction, the product of a rare temperament and of unusual experiences, expressed in a fastidious choice of phrase, in a studied cadence whenever that would carry an emotional effect, or best suggest half-lyrical moods evoked by natural scenes or moments of human crisis. His style in general had dignity, clarity and idiomatic vigour, with an elusive quality of charm which few readers probably suspected might be due to the writer being a foreigner, with at least three languages at his command wherefrom to choose and adapt the colours and harmonies of his verbal palette.

This first novel was enough to establish a small though devoted band of permanent Conradians, but neither it, nor its immediate successors—*An Outcast of the Islands* (1896), *The Nigger of the Narcissus* (1897), *Lord Jim* (1900), *Youth* (1902) and *Typhoon* (1903)—found any large body of the reading public to share the enthusiasm of the critics till many years after. Of *The Nigger of the Narcissus,* Conrad, in the year before he died, declared it was "the story by which as a creative artist I stand or fall; at any rate, no one else could have written it." It and *Youth* and *Typhoon* brought out hitherto unexploited aspects of life at sea with amazing effect, and gave ocean storms and the trials and endurance of the mariner an epic grandeur. The scene of *An Outcast of the Islands* and of *Lord Jim* was laid on the same coasts as *Almayer's Folly.*

Soon after his emergence as a writer, he gave up the sea, and went to live in Kent. But the public apathy regarding his work, and the stress of pecuniary cares paralysed his pen for a while; ever a slow writer, he began to find a whole day at the desk produced no more than a few sentences, and thoroughly disheartened, decided to go to sea again. Fortunately for himself and English letters, his efforts to get a command on a Clyde ship, four years after giving up the sea, failed. A modest Civil List pension was secured for him, and relinquished as soon as the sales of his books made his circumstances easier. Still in the prime of life, he wrought industriously and could yet call up reserves of zest, passion, poetic and romantic mood to vivify the recollections of his earlier strange experiences. In the following 25 years he produced a score of volumes of fiction; complete novels for the most part, others, collections of his short stories; as well as several volumes of his own reminiscent experiences.

Conrad's "first period" is generally classified as ending with *Nostromo* (1904), a tale of an imaginary state in South America, with its atmosphere created from an old book of South American travels. *The Mirror of the Sea* which followed, a blend of reminiscence, fable and reflection, may be looked upon as commentatory on a chapter closed.

The Second Period.—It was, in many respects, a new Conrad who produced in 1907 *The Secret Agent,* a fantastic tale of the anarchist and criminal underworld, which 15 years later, he dramatised. *Chance* (1914) first brought him a large public and adequate financial rewards. *Within the Tides* (1915)—a series of short tales—was followed by *Victory* (1915) (with the old Celebes and Java background), *The Arrow of Gold* (1919), *The Rescue* (1920) and *The Rover* (1923). For many of Conrad's earliest admirers those novels, though delightful, missed something of his first creative ecstasy, but by them he secured a great vogue for all his works in Britain and America, and on his death he was recognized and honoured on both sides of the Atlantic.

The Rover—an historical tale with its scene laid in the peninsula between Toulon and Hyères—was, in a sense, the residual product of a much greater Mediterranean story he had been brooding on since 1907, dealing with French intrigue at Napoleon's Elba period. This latter work, begun only in June 1920, was but half or two-thirds done when he died, and it was published in its fragmentary state in 1925, with the title of *Suspense.*

An Estimate.—Conrad, as has been said, brought to his first essays in English writing at least tri-lingual knowledge, and although he never contemplated writing in French, he found in the best French writers inspirational effects of balance, light and shade, a delight in words for their own sake, as well as more subtle psychological results arising from the indulgence of personal mood even at the cost of action, held momentarily in suspense. This French influence was rarely absent from his work, and wonderfully enriched it.

He came to the study and practice of English in his maturity, with an instinctive sense of verbal beauty, a respect for good technique, a cultivated mind and high ideals as an artist. In all his books is manifest a scrupulous avoidance of *cliché* either of thought or phrase, and a philosophy that forbade surrender to romantic sentimentalism on the one hand or "realistic" squalor on the other. It was his conviction that only through an unremitting care for the shape and ring of sentences, an approach could be made to plasticity, to colour, and the light of magic suggestiveness could be brought to play for an evanescent instant over the commonplace surface of words worn thin by ages of careless usage. "The sincere endeavour to accomplish that creative task, to go as far on the road as his strength will carry him, to be undeterred by falterings, weariness or reproach, was," he said, "the only justification of the worker in prose."

There was no deliberate ethical purpose in his books. "I suspect," he said, "that the aim of creation cannot be ethical at all. I would fondly believe that its object is purely spectacular—a spectacle for awe, love, adoration or hate, if you like, but in this view—never for despair. These visions, delicious or poignant, are a moral end in themselves." For the most renowned Russian novelists he had neither respect nor admiration, which perhaps is not to be wondered at in a Pole. Though he disliked the appellation of "romantic novelist" and preferred to be known as a "creative artist," he greatly vindicated romance in a period of "realistic" reaction. He died at Bishopsbourne, near Canterbury, on Aug. 3, 1924. A volume, *Last Essays,* was published in 1926.

CONRADIN or **CONRAD THE YOUNGER** (1252–1268), king of Jerusalem and Sicily, son of the German king, Conrad IV., was born at Wolfstein, Bavaria, on March 25, 1252. Although he had been entrusted by his father to the guardianship of the Church, pope Innocent IV. sought to bestow the kingdom of Sicily on a foreign prince. Innocent's successor, Alexander IV., continued this policy, offered the Hohenstaufen lands in Germany to Alphonso X. king of Castile, and forbade Conradin's election as king of the Romans. Having assumed the title of king of Jerusalem and Sicily, Conradin took possession of the duchy of Swabia in 1262. Conradin's first invitation to Italy came from the Guelphs of Florence, by whom he was asked to take arms against Manfred, who had been crowned king of Sicily in 1258. This invitation was refused, but after Manfred's fall in 1266 envoys came again to Bavaria. Conradin crossed the Alps and issued a manifesto at Verona setting forth his claim on Sicily. His partisans both in the north and south of Italy took up arms; his envoy was received with enthusiasm in Rome; and the young king himself was welcomed at Pavia and Pisa. In Nov. 1267 he was excommunicated; but his fleet was victorious over that of Charles, duke of Anjou, who had taken possession of Sicily on Manfred's death; and in July 1268 he was himself greeted with immense enthusiasm at Rome. In Aug. 1268 he unsuccessfully encountered the troops of Charles at Tagliacozzo. He was seized at Astura and handed over to Charles. Tried as a traitor, he was beheaded with his friend Frederick of Baden, titular duke of Austria. With his death the Hohenstaufen race became extinct. In the great 14th century "Manesse" ms. (*c*) collection of mediaeval German lyrics, preserved at Heidelberg, there are two songs by Conradin, and his fate has formed the subject of several dramas.

See F. W. Schirrmacher, *Die letzten Hohenstaufen* (Göttingen, 1871); del Giudice, *Il Giudizio e la condanna di Corradino* (Naples, 1876); K. Hampe, *Geschichte Konradins von Hohenstaufen* (Berlin, 1893); E. Miller, *Konradin von Hohenstaufen* (Berlin, 1897).

CONRAD OF MARBURG (*c.* 1180–1233), German inquisitor, born probably at Marburg, and educated at the university of Bologna. It is not certain that he belonged to any order, although he has been claimed both by the Franciscans and the Dominicans. In 1214 he was commissioned by Innocent III. to arouse interest in the proposed crusade, and during his mission of reforming convents he came to occupy, in 1226, a position of influence at the court of Louis IV., landgrave of Thuringia. He became confessor to the landgrave's wife, St. Elizabeth of Hungary (*q.v.*), and exercised the landgrave's rights of clerical patronage during his absence on crusade. In 1227 he was employed by Pope Gregory IX. to extirpate heresy in Germany, to denounce the marriage of the clergy, and to visit the monasteries. In 1233 he accused Henry II., count of Sayn, of heresy. An assembly at Mainz of bishops and princes declared Henry innocent, but Conrad demanded that this sentence should be reversed. As he rode from Mainz he was murdered near Marburg, on July 30, 1233. His *Epistola ad papam de miraculis Sanctae Elisabethae* was published at Cologne in 1653. Conrad is known to English readers through Kingsley's *Saint's Tragedy,* in which he is a prominent character.

See E. L. T. Henke, *Konrad von Marburg* (Marburg, 1861); B. Kalter, *Konrad von Marburg und die Inquisition in Deutschland* (Prague, 1882); A. Hausrath, *Der Ketzermeister Konrad von Marburg* (Leipzig, 1883); Michael, *Gesch. des deutschen Volkes,* vol. ii. (Freiburg, 1899).

CONRAD OF WÜRZBURG (d. 1287), the chief German poet of the second half of the 13th century. By birth probably a native of Würzburg, he seems to have spent part of his life in Strasbourg and his later years in Basle, where he died on Aug. 31, 1287. Like his master, Gottfried of Strasbourg, Conrad did not belong to the nobility. His style is dignified in tone; his metre is clearly influenced by Gottfried's tendency to relieve the monotony of the epic-metre with ingenious variations, but it is always correct; his narratives—if we except *Die halbe Birn,* of which the authorship is doubtful—are free from coarseness, and, although mysticism and allegory bulk largely in his works, they were not allowed to usurp the place of poetry. Conrad's powers are to be seen to best advantage in his shorter verse romances, such as *Engelhart und Engeltrut, Kaiser Otto* and *Die Herzemaere;* the last mentioned is one of the best poems of its kind in Middle High German literature.

Bibliography.—There is no uniform edition of Conrad's works. *Der trojanische Krieg* was edited by A. von Keller for the Stuttgart *Literarische Verein* (1858); *Partenopier und Meliur,* by K. Bartsch (1871); *Die goldene Schmiede* and *Silvester,* by W. Grimm (1840 and 1841); *Alexius,* by H. F. Massmann (1843) and R. Henczynski (1898); *Der Welt Lohn,* by F. Roth (1843); *Engelhart und Engeltrut,* by M. Haupt (1844, 2nd ed., 1890); *Klage der Kunst,* by E. Joseph (1885). The shorter poems, *Otto* and *Herzemaere,* will be found most conveniently in *Erzählungen und Schwänke des Mittelalters,* edited by H. Lambel (2nd ed., 1883). Modern German translations of Conrad's most popular poems have been published by K. Pannier and H. Krüger in Reclam's *Universalbibliothek* (1879–91). On Conrad *see* F. Pfeiffer in *Germania,* iii. (1867), and W. Golther in the *Allgemeine deutsche Biographie,* vol. xliv. (1898), *s.v.* "Würzburg, Konrad von." Paul Genke has edited *Die Legenden* (Halle, 1925–27).

CONRAD VON HÖTZENDORF, FRANZ (1852–1925), Austro-Hungarian soldier, was born in Vienna Nov. 11, 1852. Conrad was the leading military figure of the old Dual Monarchy, and also one of its most influential politicians. In 1899, as a brigadier in Trieste, his observations on Italian Irredentist propaganda inspired him with a lasting mistrust of the third member of the Triple Alliance. Here he made the acquaintance of the heir to the throne, the Archduke Francis Ferdinand, whose ideas coincided with his own in many respects. Francis Ferdinand's influence elevated Conrad to the post of chief of staff in 1906. His predecessor, Gen. Beck, had held this post for some 20 years, in the course of which Beck, who shared the emperor Francis Joseph's optimism, had allowed the army to lag far behind modern progress, in technical matters and had paid little attention to the national problems.

Conrad at once began to reorganize the army, especially the artillery. His activities earned him the hatred not only of the German Liberals but also of the Slavs and the Magyars, all of whom, if for different reasons, were opposed to an aggressive army policy. His most serious conflict, however, came with the emperor himself and the minister of foreign affairs, Count Aehrenthal. Conrad was convinced that the Monarchy could not avoid a conflict with Serbia; and further that Italy must be considered not as an ally but an enemy. He believed the only salvation to be in aggressive "preventive" measures. Both before and after the annexation of Bosnia and Hercegovina he urged that the only solution of the Southern Slav question would be the "preventive" annexation of Serbia. When Italy became engaged in war with Turkey in 1911, he again advocated a "preventive" war against the Monarchy's ally. This last suggestion led to such a conflict of views with Aehrenthal, who believed that peace could be maintained, that Conrad was forced to resign. He was reappointed, however, a few months later, when events in the Balkans again grew critical. Conrad did not overestimate the strength of his army, and, therefore, when war broke out and the attitude of Italy and Rumania grew critical, he urged—vainly—that these former Allies be appeased by territorial concessions. Meanwhile he conducted the operations of the Austro-Hungarian troops in Galicia with skill and boldness, and later, when they entered the World War, also saved his country from much devastation by his bold strategy. When, however, the young emperor Charles himself took over the command of his army in place of the previous nominal commander, the Archduke Frederick, he took offence at Conrad's assured manner and dismissed him from his post. From March 1917 on Conrad commanded an army group on Austria's Italian Front. No further successes crowned his efforts, and finally the troops under his command disintegrated with the collapse of the Monarchy.

Conrad's political views aroused much controversy. From his own point of view—the maintenance at all costs of the dynastic power of the Habsburgs—they were undoubtedly correct; he took too little account however of the stronger but more remote influence of world politics. As a strategist he was bold and skilful but unlucky. As a personality he was simple and deeply respected; his chief failing was his often faulty judgment of human character. After the downfall of the Monarchy Conrad withdrew entirely into private life and occupied himself with the preparation of his monumental memoirs, *Aus Meiner Dienstzeit,* the fifth volume of which appeared in 1925. He died at Mergentheim Aug. 26, 1925.

(C. A. M.)

CONRADY, AUGUST (1864–1926), German orientalist, was born at Wiesbaden on April 28, 1864. In 1897 he was appointed a professor at the University of Leipzig, where he eventually became director of the school of oriental studies. He became an authority on Chinese languages and literature and on Indo-Chinese philology, the study of which he originated.

Among his works are *Eine indochinesische Kausativ-Denominativbildung* (1896); the section on "China" in J. von Pflugk-Harttung's *Weltgeschichte* (1910); *Die chinesischen Handschriftenkunde Sven Hedins in Lou-lan* (1920).

CONRART or **CONRARD, VALENTIN** (1603–1675), one of the founders of the French academy, was born in Paris of Calvinist parents. He was made councillor and secretary to the king; and in the year 1629 his house became the resort of men of letters. Cardinal Richelieu offered to give the society his protection, and in this way (1635) the French academy was created. Its first meetings were held in the house of Conrart, who was unanimously elected secretary, and discharged the duties of his post for 43 years, till his death on Sept. 23, 1675. The most important of Conrart's works is his *Mémoires sur l'histoire de son temps,* published by L. J. N. de Monmerqué in 1825.

See also R. Kerviler and Édouard de Barthélemy, *Conrart, sa vie et sa correspondance* (1881); C. B. Petitot, *Mémoires relatifs à l'histoire de France,* vol. xlviii.; and Sainte-Beuve, *Causeries du lundi* (July 19, 1858).

CONS, EMMA (1838–1912), English philanthropist, was born in London on March 4, 1838. Through an acquaintance with Miss Octavia Hill she became interested in social work, and in particular in housing questions. She became known for her work in connection with Morley College and the Royal Victoria Hall, Waterloo Road, which is generally known as the "Old Vic." Miss Cons, whose social work in Lambeth had shown her the difficulty of providing decent amusement at a cheap rate, obtained an interest in the Royal Victoria Hall in 1880. At one time a well-known theatre, it later degenerated into a disreputable haunt where only the lowest melodramas were played. It was then enlarged and improved, the sale of drink was forbidden, and programmes of music, drama and lectures were undertaken. In 1882 the wealthy manufacturer and philanthropist Samuel Morley began to take an interest in the Hall, and in 1884 joined the executive committee, contributing not only money but sympathy and practical business advice. The "Old Vic" attained high repute, and in 1889 concert performances of grand opera were started, a chorus being formed in 1896. Symphony concerts were given in 1905 and for several seasons. Emma Cons was elected to the first London County Council (1888) and was chosen an alderman, but retired owing to difficulties raised as to the right of women to sit. She died at Hever, Kent, on July 24, 1912.

Her sister, Ellen Cons (1840–1920), was also closely associated with many philanthropic schemes, and was one of the governors of the "Old Vic." She died in London on June 25, 1920.

CONSALVI, ERCOLE (1757–1824), Italian cardinal and statesman, was born at Rome on June 8, 1757. In 1776 he entered the Academia Ecclesiastica at Rome, in which Pope Pius VI. took a strong personal interest. This led to his being appointed in 1783 *camariere segreto* to the pope, then a domestic prelate, a member of the Congregation *del buon governo,* and, on the first vacancy, auditor of the Rota for Rome.

In 1798, when the French occupied Rome (dethroning the pope and dispersing the cardinals), Consalvi was imprisoned in the castle of St. Angelo, but on being deported to Naples he managed with difficulty to reach Pius VI., who had sought refuge in the Certosa of the Val d' Ema, and was present at his death-bed.

As secretary to the conclave of November 1799, Consalvi helped secure Cardinal Chiaramonti's election as Pius VII. (March 14, 1800). On Aug. 11, Consalvi was appointed cardinal-deacon and secretary of state, or prime minister, an appointment for which he was admirably fitted. He recognized the urgent need for reform in the system of papal government. He permitted laymen to hold certain public offices, under surveillance of prelates, organized a guard from the Roman nobility, decreed a plan for redeeming the base coinage, permitted the communes a certain municipal liberty, and promised the liquidation of the public debt. In the long debates between Rome and France about the Concordat, Consalvi took the leading part, and it was largely owing to his firmness and tact that the Concordat as ultimately signed was free from the objectionable clauses on which the first consul had at first insisted. Owing to continuous friction with Napoleon, Consalvi resigned in June 1807, and when in 1808 Gen. Miollis entered Rome, and the temporal power of the pope was formally abolished, he broke off all relations with the French. In 1809 he was at Paris, where he received from Napoleon an apology for the treatment he had received. With unbending dignity, however, he retained his antagonism; and shortly afterwards he was one of the 13 cardinals who refused to attend the emperor's marriage with Marie Louise. For this he was banished to Reims, and not released till some three years later, when Napoleon had extorted terms from the captive pope at Fontainebleau. Consalvi was soon after allowed to resume his functions under the restored pontificate.

In 1814 Consalvi was sent as papal plenipotentiary to the congress of Vienna. Here he obtained for the pope the restitution of the marches (Ancona, Treviso and Fermo) and legations (Bologna, Ferrara and Ravenna), but he failed to prevent Austria from annexing the possessions on the left bank of the Po and obtaining the right to garrison Ferrara and Comacchio. This led to his presenting at the close of the congress a formal *protestatio,* in which he denounced the failure of the Powers to do justice to the Church, and their refusal to re-establish that "centre of political unity," the Holy Roman empire.

Consalvi was now practically governor of Rome, and his rule, in times of singular difficulty and unrest, was characterized by wisdom and moderation. His foreign policy was guided by the traditional antagonism of the papacy to German domination in Italy, and by a desire to free the Holy See from the political entanglements of the age. Thus he resisted all Metternich's efforts to draw him into his "system," and stoutly maintained the doctrine of non-intervention against the majority of the Powers of the Continental alliance.

On the death of Pius VII. (Aug. 21, 1823), Consalvi retired to his villa of Porto d' Anzio; and, though he accepted from the new pope the honorary office of prefect of the college *De propaganda fide,* his political career was closed. He died on Jan. 24, 1824. He was a notable patron of the arts and sciences, music being his main passion. For the city of Rome he did much; ancient buildings were excavated and preserved by his direction; chairs of natural science and archaeology were founded in the university; and extensive purchases were made for the Vatican museum, which was augmented by the beautiful Braccio Nuovo.

CONSANGUINITY or **KINDRED,** in law, the connection or relation of persons descended from the same stock or common ancestor (*vinculum personarum ab eodem stipite descendentium*). This consanguinity is either lineal or collateral. Lineal consanguinity is that which subsists between persons of whom one is descended in a direct line from the other, while collateral relations descend from the same stock or ancestor, but do not descend the one from the other. Collateral kinsmen, then, are such as lineally spring from one and the same ancestor, who is the *stirps,* or root, as well as the *stipes,* trunk or common stock, whence these relations branch out. It will be seen that the modern idea of consanguinity is larger than that of *agnatio* in the civil law, which was limited to connection through males, and was modified by the ceremonies of adoption and emancipation, and also than that of *cognatio,* which did not go beyond the sixth generation, and was made the basis of Justinian's law of succession. The degrees of collateral consanguinity were differently reckoned in the civil and in the canon law. "The civil law reckons the number of descents between the persons on both sides from the common ancestor. The canon law counts the number of descents between the common ancestor and the two persons on one side only," and always on the side of the person who is more distant from the common ancestor. English law follows the canon law in beginning at the common ancestor and reckoning downwards. The question of consanguinity owes its great importance to the relationship it bears to the laws of marriage and inheritance. The laws of inheritance and descent are regulated in a great measure according to consanguinity, however much they may vary in different jurisdictions.

Apart from those countries which have made either the civil or the canon law the basis of reckoning degrees of consanguinity (and practically all civilized countries adopt one or other), it is impossible to describe any method or system, for they are as various as the countries and tribes. *See,* however, the article INDIAN LAW; and consult J. F. McLennan, *On Primitive Marriage* (1865); L. H. Morgan, *Systems of Consanguinity and Affinity of the Human Family* (1870); E. A. Westermarck, *History of Human Marriage* (2nd ed., 1894); E. Crawley, *The Mystic Rose* (1902); A. Lang and J. J. Atkinson, *Social Origins and Primal Law* (1903); E. B. Tylor, *Primitive Culture* (4th ed., 1903). *See* also AFFINITY; MARRIAGE; INHERITANCE; MATRIARCHY.

CONSCIENCE, HENDRIK (1812–1883), Flemish writer, of mixed French and Flemish parentage, was born at Antwerp on Dec. 3, 1812. His father, Pierre Conscience, from Besançon, had been *chef de timonerie* in the navy of Napoleon, and was appointed under-harbourmaster at Antwerp in 1811, when that city formed part of France. About 1826 he retired to that Kempen or Campine which Hendrik Conscience so often describes in his books—the desolate flat land that stretches between Antwerp and Venloo. At the age of 17 Hendrik left Kempen to be a tutor in Antwerp, and to prosecute his studies. He volunteered as a private in the new Belgian army at the revolution of 1830, and served in barracks at Venloo, and afterwards at Dendermonde, until 1837, when he retired with the grade of sergeant-major. Thrown in this way with Flemings of every class, the young man formed the idea of writing in the despised idiom of the country—an idiom which was then considered too vulgar to be spoken, much less written in, by educated Belgians. His poems, however, written while he was a soldier, were all in French. He received no pension when he was discharged, and going back idle to his father's house, he determined to write a Flemish book. A passage in Guicciardini fired his fancy, and straightway he wrote the wonderful series of sketches of the War of Dutch Independence entitled *In't Wonderjaar 1566* (Ghent, 1837).

His father thought it so vulgar to write a book in Flemish that he turned his son out of doors, and Hendrik started for Antwerp, with two francs and a bundle of clothes. An old schoolfellow gave him shelter, and soon various people, amongst them the painter Wappers, interested themselves in the young man. Wappers presented him to the king, who expressed a wish that the *Wonderjaar* should be added to the library of every Belgian school. It was under the patronage of Leopold I. that Conscience published his second work, *Fantasy,* in the same year, 1837. A small appointment in the provincial archives relieved him from want, and in 1838 he wrote the historical romance called *The Lion of Flanders,* which was followed by *How to become a Painter* (1843), *What a Mother can Suffer* (1843), *Siska van Roosemael* (1844), *Lambrecht Hensmans* (1847), *Jacob van Artevelde* (1849), and *The Conscript* (1850). It was long before the sale of his books, greatly praised but seldom bought, made him in any degree independent. His ideas, however, began to be generally accepted.

At a Flemish congress which met at Ghent so early as 1841, the writings of Conscience were mentioned as the seed of a really national literature. In 1845 was published his *History of Belgium,* but he was well advised to return to those exquisite pictures of Flemish home life which form his best work. He was now at the height of his genius, and *Blind Rosa* (1850), *Rikketikketak* (1851), *The Decayed Gentleman* (1851), and *The Miser* (1853) rank among the most important of the long list of his novels. These had an instant effect upon contemporary fiction, and Conscience had many imitators. In 1855 the earliest translations of his tales began to appear in English, French, German and Italian. In 1867 the sinecure of keeper of the Royal Belgian museums was created for him. He died in Antwerp on Sept. 10, 1883, and was awarded a public funeral.

The portraits of Conscience present to us a countenance rather French than Flemish in type, with long smooth hair, contemplative dark eyes under heavy brows, a pointed nose, and a humorous broad mouth; in late life he wore the ornament of a long white beard. In spite of too rhetorical a use of soliloquizing, and of a key of sentiment often pitched too high for modern taste, the stories of Conscience are animated by a real spirit of genius, mildly lustrous, perhaps, rather than startlingly brilliant. Whatever glories may be in store for the literature of Flanders, Conscience is always sure of a distinguished place as its forerunner and its earliest classic.

CONSCIENCE, a philosophical term used both popularly and technically in many different senses for that mental faculty which decides between right and wrong. In popular usage "conscience" is generally understood to give intuitively authoritative decisions as regards the moral quality of single actions; this usage implicitly assumes that every action has an objective or intrinsic goodness or badness, which "conscience" may be said to discern much in the same way as the eye sees or the ear hears. Moralists generally, however, are agreed that in all moral judgments of this character there is an implied reference to moral laws, the validity of which is in some ethical systems the true subject-matter of conscience. The part played by conscience in relation to general moral laws and particular cases will vary according to the view taken of the character of the general laws. If, on what is called the "jural" theory, these laws are regarded as deriving their authority from an external source, the operation of conscience is so far limited. It may be held to recognize the validity of divine laws, for example; or it may be confined to the deductive process of applying those laws to particular cases, known as "cases of conscience" (*see* CASUISTRY). If, on the other hand, the general laws are regarded as intuitive, then the discernment of them may be taken as the true function of conscience. In either theory, conscience may be understood as the active principle in the soul which, in face of two alternatives, tells a man that he ought to select the one which is in conformity with the moral law. Apart from the two functions of discerning between right and wrong, and actively predisposing the agent to moral action, conscience has further a retrospective action whereby remorse falls upon the man who recognizes that he has broken a moral law. *See* ETHICS; CHARACTER; also BUTLER, JOSEPH; and compare the "moral sense" doctrine of Shaftesbury.

There are certain special uses of the word "conscience." A *Conscience clause* is the term given to a special provision often inserted in an English act of parliament to enable persons having religious scruples to absent themselves from certain services or to abstain from certain duties, such as war service as a combatant, otherwise prescribed by the act. *Conscience money* is the name given to a payment voluntarily made by a person who has evaded his obligations, especially in respect of taxes and the like. This usage derives from the last function of conscience mentioned above. *Conscience Courts* were local courts, established by acts of parliament in London and various provincial towns, for the recovery of small debts, usually sums under £5. They were superseded by county courts (*q.v.*).

CONSCIENTIOUS OBJECTOR, one who on moral or religious grounds declines to serve as a combatant, or who refuses obedience to military service acts on the ground that the State has no right to force the individual to perform military service of any kind. In Great Britain the Military Service Act of 1916 raised the issue of the conscientious objectors on a large scale; tribunals were set up to deal with them, many were sent into non-combatant units or put to agricultural or other necessary work, while of the large numbers not granted exemption many suffered imprisonment for disobedience to army orders. The Representation of the People Act, 1918, disfranchised for five years after the war any conscientious objector who had refused to undertake the work of national importance allotted him.

The United States.—Conscientious objection among drafted men in the United States was of various sorts: objection to all wars on religious or humanitarian grounds; to the World War on economic and political grounds; to combatant service; to all service in the army or under military orders; to alternative service under conscription and for the avowed purpose of helping the war. This last class of objectors in the United States as in Great Britain were called absolutists.

The United States by reason of its geographical position had never found necessary the European system of universal military training and service. Save for a limited use of the draft in the latter part of the Civil War it had fought its wars with volunteers. This fact and the avowed intention of certain young men to imitate British conscientious objectors, early impressed the Government. In the conscription bill, exemption, but only from combatant service, was granted to members of recognized religious sects or organizations in existence at the time of the passage of the law, whose creed or principles opposed participation in war. The President found it necessary considerably to enlarge the measure of exemption for objectors. "Sincere" objectors were offered alternative service, in some cases with the Friends' Red Cross unit in France, more often in agricultural work. "Insincere" objectors and absolutists who refused all service were court martialled not as objectors but for refusal to obey some specific military order. The last objectors, 31 in number, were released in Nov. 1920. It should be explained that "sincere" objectors as interpreted meant objectors to all war; "insincere" objectors meant objectors to this particular war. In practice the distinction was hard to maintain.

The number of objectors was surprisingly small. According to the Government report, of 3,989 objectors in camps 1,300 "accepted or were assigned to non-combatant service," 1,299 were furloughed for alternative service, 450 were sent to prison by courts-martial and the remainder were still in camp when the Armistice was signed. (N. M. T.)

CONSCIOUSNESS in its widest sense denotes mental experience of every kind. In this sense of the term consciousness may be described as the subject matter of psychology (*q.v.*), and psychology might be defined as the science of consciousness. Very frequently, however, the term is used in the sense of self-consciousness, or of what is in the focus of consciousness, or at least in the margin of consciousness. It is then contrasted with the sub-conscious and the unconscious, etc. (*See* ABNORMAL PSYCHOLOGY, and PSYCHOANALYSIS.)

Physiology of Consciousness.—Physiologists and most psychologists assume that physical awareness is wholly dependent upon some definite bodily structure or structures. Various theories exist as to the identity of this bodily organ of consciousness. One theory holds that each atom of the physical body possesses an inherent attribute of consciousness. If each atom, or, in later forms of this theory, each cell of the body emanates its own consciousness, then the "self" must actually consist of an amalgamation of all these tiny units of awareness. Experimental evidence is against this theory, since physical consciousness seems to disappear from any part of the body disconnected from the central nervous system.

A second theory assumes that there exist, in the brain, special nerve cells capable of producing consciousness whenever activated. There is no physical evidence for the existence of such special consciousness cells.

A third theory seeks to identify consciousness with some aspect of the simple nerve impulse. There are two lines of evidence against this theory. First, the physical phenomena most closely corresponding with consciousness do not occur *within* individual nerve cells, but rather *between* the individual cells joined together in any reflex-arc system. Some of these phenomena are inhibition, irreversability of direction of propagated disturbances, fatigue, marked susceptibility to drugs, conflict and mutual facilitation of impulses, marked delay of reflex conduction, after discharge and summation of impulses. Second, identical nerve cells are activated in producing very dissimilar states of consciousness; and different nerve cells are stimulated to produce identical elements of consciousness.

The psychonic theory, based on the correspondences between consciousness and inter-neuronic phenomena, suggests that consciousness occurs each time any unit of junctional tissue between individual neurones is energized. Units of junctional tissue are termed *psychons,* and each *psychonic impulse* is regarded as a single unit of physical consciousness. This theory is now under experimental investigation.

See W. M. Marston, "The Psychonic Theory of Consciousness," *Journal of Abnormal and Social Psychology* (July 1926).

CONSCRIPTION. Compulsion as applied to military recruitment should not be confused with conscription, which entails not only the natural obligation of every able-bodied man to defend his hearth, home and country against foreign aggression, but the establishment of a standing army of short service men entirely at the call of the government of the land. Whilst in all such military organizations as the Greek and Roman city militias and the

Saxon fyrd compulsion was by natural right and tradition, in most of the great modern armies it is by law, and in such as do not enforce conscription by the inducement of pay, or the avoidance of starvation. We thus obtain two main systems of recruitment, the compulsory and the voluntary; both are professional, the latter in that its men undergo a prolonged training, and the former in that its instructional cadre and its corps of officers are permanent, whilst the bulk of its men serve but for one, two, or three years. Conscription in its modern sense dates from the French Revolution, and was exactly adapted to the environment of its times, namely equality of service, liberty of popular opinion backed by force, and the fraternity of all classes of society; such were theoretically the governing ideals of this period. To understand its influence on the history of the 19th and 20th centuries, and to trace its future demands a brief survey of military development preceding the date of its initiation, namely 1798.

Early History of Military Development.—The principle that every able-bodied man should assist in the defence of the community to which he belongs held good in fact as long as agricultural instruments could be effectively used as military weapons, though naturally weapons of the chase—bow, spear and long knife—were preferred. It was the manufacture of armour, a purely military invention, which introduced the professional soldier, and since that early date, lost in the dawn of human history, each purely military invention has had a marked influence on the militarization of civil life. If the invention was costly, or difficult to come by, armies became small and aristocratic, as was the case during the middle ages when armour was of predominant military importance; if cheap and easy, then large and democratic, as after the advent of gunpowder. When trade began to become more profitable than plunder, that is after the crusades, occupations began to become specialized, wealth was accumulated and fortifications became a necessary safeguard to wealth, trade and commerce. Fortifications demanded permanent garrisons, and as it was uncongenial and beneath the dignity of a military aristocracy, or a rich burgher community, to man and protect castle or city walls, hired soldiery came into existence, and in time specialized into two classes: the defenders and attackers of fortresses. It is in these troops, rather than in the feudal levy, that the origin of present day standing armies must be sought. As fire arms were introduced, organization and training became more complicated, and in the 16th century we find Machiavelli and Maurice of Nassau suggesting the idea of universal service. At this period it was reckoned that 5,000 disciplined Spanish troops were more than a match for four times their number of Burghers, but except for Spain, enriched by the gold and silver of the New World, nations were too poor to maintain large professional armies, and continued to depend on citizen militia forces and the hire of mercenaries.

With the close of the Wars of Religion in 1648, conflicts between nations centred more and more round dynastic questions, the object being territorial acquisition, and as such was useless without revenue and inhabitants to pay it, as Clausewitz says: "The principle of moderation was introduced into the conduct of hostilities altogether foreign to their nature." Plunder and pillage were forbidden, with the result that the profession of the soldier became less and less remunerative, and armies more and more dependent on the lower strata of society—those men who were lacking in spirit and intelligence, and unsuited to earn a livelihood in civil employment. Thus it happened that immediately preceding the outbreak of the French Revolution, except for a few *corps d'elites,* the human quality of all armies throughout Europe "reached the very nadir of degradation." It was time for something new.

The Birth of Conscription.—The general upheaval which followed the outbreak of the Revolution in 1789 swept away the old royal army of France, and simultaneously initiated the problem of national defence. The theory of equality logically led to the demand for universal service, and as the majority of the people are naturally adverse to risking their skins, universal service was tantamount to compulsory enlistment. The proposal accepted was a threefold one, namely, voluntary enlistment for the line, all unmarried citizens between 18 and 40 years of age to constitute the militia, and the rest of the male population to form the National Guards for home defence. The last mentioned category proved popular, and 2,571,000 names were inscribed, but only 60 out of the 169 battalions of volunteers it was hoped to raise were obtained. The result was so disappointing that on July 11, 1792 a decree was passed according to which every able-bodied man was to consider himself liable for active service, it being left to the communes to select those who were to proceed to the front. The means of enforcing this law were so imperfect that not more than 30,000 men reached the field armies, and only remained with them for a few months. To fill the ever increasing gaps in the ranks, on Feb. 20, 1793 the Convention decreed a compulsory levy of 500,000 men, which was so unpopular that thousands deserted their homes, and Vendée rose in revolt. At length in August Carnot succeeded in introducing a workable scheme which limited liability to service to men between 18 and 25. This was accepted by the people, because the class called upon was not politically strong enough to resist coercion, and by Jan. 1, 1794 no less than 770,000 men were under arms.

The successes of Bonaparte in Italy, which brought wealth and glory to France, as well as the consolidation of political power and the revival of trade, brought to the notice of political economists the loss of productive energy in compelling highly skilled civil workers to enlist whilst those in the ranks were willing to renew their contract. This consideration coupled with the fact that by the summer of 1798 a renewal of the war with Austria was inevitable, General Jourdan proposed a system of conscription which became law on the 19th Fructidor (Sept. 4) that year. "The young men in each Department were to be registered in five classes, the first consisting of those between twenty and twenty-one, and so on in an ascending scale of age to the last class, those between twenty-four and twenty-five. The conscripts each year were to be drawn from the first class, each subsequent class to be called out only in case the first did not furnish a sufficient number." Such were the main clauses of this law which not only rendered the Napoleonic conquests possible, but which were destined to influence the subsequent course of European history in a manner quite unrealized by its initiators.

Conscription Under Napoleon.—Though under the Directory this law proved worse than a failure, only 37,000 conscripts being obtained out of the required 200,000, when once Bonaparte seized the reins of power he forged out of it his tremendous armies. At Schönbrunn, in 1805, he said to Metternich: "I can use up 25,000 men a month"—such was the pivotal argument in his theory and practice of "absolute warfare"—the nation was but a vast manufactory of cannon-fodder. In 1800, France provided him with 30,000 men; 60,000 in 1801; 60,000 in 1802; 60,000 in 1803; 60,000 in 1804; 210,000 in 1805; 80,000 in 1806; 80,000 in 1807; 240,000 in 1808; 76,000 in 1809; 160,000 in 1810; 120,000 in 1811; 237,000 in 1812; and 1,140,000 in 1813—a total of 2,613,000. These figures are not only interesting in themselves, but are indicative of the whole course of European warfare, and its nature, from 1800 to the present day. The cheapness of the musket as a weapon coupled with the democratic spirit of the age threw nations back to the primitive idea of military power, namely, the nation in arms. The theory that "God marches with the biggest battalions" coloured the entire strategy and tactics of the wars of the 19th century, whether in Europe, Asia or America, and formed the crucial military problem of the Russo-Japanese war of 1904–05, and the World War of 1914–18. This theory sprang full-armed from out the head of the French Revolution, and it is of interest to trace its influence on the national life and military art of its greatest exponent during the last 130 years of its existence.

The Influence of Conscription on Prussia.—Napoleon's conquests brought with them the French law of conscription which was immediately enforced. Prussia pursued this idea to its logical conclusion, and in 1808 "definitely affirmed the principle of universal service without distinction of class, or right of exemption by purchase." After Tilsit her enthusiasm was checked by the Emperor, but only temporarily so, for she returned to it in full force once her adversary was crushed. From 1815 onwards, as one writer aptly expresses it: "Army expenditure became the fly-wheel which steadied her disorganized finance." The nationalization of the Prussian army not only stimulated trade, for it had to be fed, clothed and equipped, but consolidated the nation which, since the peace of Westphalia, had been groping in the dark toward the realization of Wallenstein's dream of a united Germanic Empire. Compulsory service brought all classes and ranks into close intercourse. The army became the national university in which was cultivated a common spirit. The better class recruits, consciously, or unconsciously, instructed their social inferiors, and in the exercise of these functions mutually added to each other's character and sympathies. The intelligence of the men reacted on their officers who were compelled to keep pace with the general intellectual movement. As the duration of service was limited to three years, the regimental officers had to become in every way instructors of their men, with the result that a magnificent corps of officers was created. During the 50 years following Napoleon's defeat at Waterloo, the Prussian military machine separated the wheat from the chaff, yearly turning out as it did an increasing number of men whose physical and moral training were vastly superior to the unconscripted man of the classes from whom they had sprung. This system of national reconstruction through universal service reached the apex of its perfection in the sixties and swept all before it in the victories of 1866 and 1870.

The Causes of Decline.—Perfection in war as in peace is the herald of death. Prussia's greatness grew out of Jourdan's law of conscription, and the results of this law reached their zenith at Sedan. Since 1870 a new social environment has been created which has vastly influenced the organisation of armies. First, the general introduction of compulsory education, has largely replaced the educative value of compulsory service. Secondly, the enormous advances in science and industrial production, with their consequents—luxury, wealth and intellectual pursuits—have changed the character of nations, and have replaced agriculture by manufacture as the key industry of civilised countries. Thirdly, a still more important consequent was and still is the change in the power and nature of weapons themselves.

From 1870 onwards the value of conscription, both as a national stimulant and a means of military recruitment, began to sag. The pay of the conscript was negligible, and, as luxuries increased, it had to be supplemented by small paternal and maternal allowances, unless the soldier was of the type who could cheerfully tolerate acute discomfort and the normal lack of art in military cooking. The best men refused to re-engage and returned to civil life, consequently inferior soldiers had to be promoted to non-commissioned rank, and when invested with authority frequently abused it; this tended by degrees to make conscription unpopular. Industrialization was at first followed by a vast increase in the population, and as years followed, more and more did it become impossible to absorb the ever-increasing numbers of men of military age. In all conscript armies this led to a host of exemptions, which though in theory strictly regulated, in practice resulted in many abuses, the richer classes of men of military age normally being able to avoid service, or if conscripted to carry out their duties on easier terms. In spite of these disabilities, which became apparent before the 19th century reached its close, all great nations, other than Great Britain and America, placed their faith in conscription, and still fervently believed with Napoleon and Clausewitz that God marches with the biggest battalions, and that, consequently, numbers of men are the deciding factor in war.

The World War of 1914–1918.—The World War of 1914–1918 was fought out on this assumption at terrific cost. Amongst the combatants conscription became universal, Great Britain and America being compelled to adopt it. In all some 50 millions of men were conscripted, and the total casualties in killed alone has been reckoned at more than 10 millions. What the war cost directly and indirectly it is impossible to calculate. Throughout its entire duration the Central Powers were outnumbered, yet it was only after over four years' incessant struggle that the Allies were able to enforce an armistice on Germany. The "big battalions" had grotesquely failed as an instrument whereby economical victory could be gained. There was no Sadowa and no Sedan, in place battles such as Verdun, the Somme and Ypres (1917) were fought to mutual destruction. As the war proceeded it became more and more apparent that, as in 1798, it was nothing less than a national, let alone military crime to conscript all classes of men as if they were one class and of equal value, and to fill the trenches, which were little more than altars of human sacrifice to a discredited god, with highly skilled mechanics, miners and professional men. Throughout the war it was scarcely realised by any of the General Staffs that the one great tactical problem was not to increase fighting man power, but as far as it was possible to eliminate the fighting man, the human slop-butt, and replace him by a mechanic. In spite of tank attacks, air attacks, naval attrition and chemical attacks, it was not realised that weapons give blows and men receive them, and that the main problem in tactics is how to give blows without receiving them, and not a mere mathematical question of human tonnage. It was not grasped that quality and not quantity was the problem, and so little was this realised that, in 1919, Germany was denied the power to maintain a conscript army, and was compelled to establish a voluntary one, that is to rely on quality, whilst her most powerful land enemy—France—adhered to bulk numbers.

The Future.—To those who can read the past and follow present tendencies, the future development of recruitment is clear and certain. Conscription is the military expression of an agricultural democracy, and when nations cease to depend on agriculture as their staple industry it rapidly becomes a burden. An industrial democracy lives in a totally different world. As military power was once based on the numbers of sturdy yeomen and peasants who could be impressed or enlisted, to-day it depends on the numbers of skilled mechanics, not only to manufacture war machines but to fight them. The advent of the motor-driven battle vehicle has reintroduced armour as an essential in tactical organisation. Another armoured age faces the great armies of the world, an age of costly machines in place of cheap muskets, and the tendency is, consequently, one towards small armies in which quality will replace the quantity theory of the present cannon fodder masses. None but industrial powers are likely to wage great wars with any hope of success, for in spite of all opposition, petrol-power is transforming armies as surely as steam-power transformed navies from 1860 onwards; the result must be the same. Whilst 100 years ago any merchantman could be converted into a warship at a few days' notice, to-day not all the merchantmen in the world could fight, on equal terms, a single Dreadnought.

The theory of conscription, as some military men believe, is growing out of date. In their opinion no conscript army will be able to face an organised attack by armed motor cars, let alone by tanks and kindred weapons. It will have its use solely as an army of occupation, a force of men which will occupy a conquered area but not conquer it. The fighting armies of the future will be voluntary, highly professional and highly paid, consequently, comparatively small; this is the whole tendency of present day military evolution.

THE UNITED STATES

Revolution and War of 1812.—During the Revolution and the War of 1812 the volunteer system failed to procure the men required for military purposes. To stimulate voluntary enlistments bounties, consisting of gifts of money, land, and clothing, were granted to recruits. Massachusetts and Virginia resorted to conscription in 1777. On February 6, 1778, two-thirds of the authorized Continental Army being unrecruited, Congress recommended that the other colonies follow the example set by Massachusetts and Virginia. Washington, himself, wrote to the president of the Continental Congress in 1778, "I believe our greatest and only aid will be derived from drafting, which I trust may be done by the United States." The aid extended by France averted the necessity for conscription. During the latter part of the War of 1812, when volunteers failed to fill the depleted ranks of the Army, Congress considered several methods of conscription, but peace prevented definite action.

Civil War.—The volunteer system which enthusiastically filled the Union ranks in 1861 practically collapsed in 1862 after the president had issued a call for 300,000 additional volunteers. In the summer of 1862, the States attempted conscription, but without success. The Federal Government was then forced to accept the necessity of a Federal draft, an obligation the Confederacy had already been driven to assume nearly one year before. On March 3, 1863, the Enrollment Act was passed, boldly declaring the liability to military service in the national forces of all males, except certain exempted persons, between the ages of 20 and 45. The law imposed upon the citizen a direct and personal obligation to the nation.

Unfortunately, the principle of universal liability of all citizens to perform military service was not carried to its logical conclusion; the law was weakened by provisions authorizing the payment of bounties and the hiring of substitutes. The calls for men were apportioned among the States. If not filled by volunteers before a certain date, the deficit had to be supplied by conscription. In order to avoid conscription, each State, and the subdivisions thereof, entered upon a race for volunteers. Larger and larger became the bounties. Wealthy communities reached into the poorer districts and bought up the necessary manpower. The result was inevitable. Riots broke out especially in New York city and order was restored only by the arrival of troops withdrawn from the front.

The Confederate conscription law was enacted in April, 1862. Its purpose was to insure the retention of the men already in the service as well as to obtain others. In its administration emerged the modern theory that the industrial organization behind the line was quite as important as the military organization. This theory was not successfully applied because the army officers by whom the act was administered lost sight of every consideration except the single one of procuring soldiers.

World War.—In 1917 the Administration decided to rely upon conscription for the recruitment of the army. In urging the passage of the bill, known as the Selective Service Act, the secretary of war stated "This is no time to tolerate uncertainty in the raising and the maintenance of the large numbers of men which the present emergency is likely to require nor uncertainty in the methods to be adopted for the establishment of an adequate efficient military service. The bill makes certain the raising and maintenance of the required forces with the utmost expedition. It establishes the principle that all arms-bearing citizens owe to the nation the duty of defending it. It selects only those who, by reason of their age and physical capacity, are best fitted to receive the training and withstand the actual hardship of campaign, and who, happily, can be taken with least disturbance of normal economic and industrial conditions." The law was unequivocal in its terms. It vested the president with plenary power of prescribing regulations which should strike a balance between industrial, agricultural, and economic need of the nation on the one hand and the military need on the other, and which should summon men for service in the place in which it should best suit the common good to call them. The regulations for the Administration of the law were written so as to avoid the mistakes made in the execution of conscription in the Civil War.

The governors of States, the mayors of cities, and the officials of counties were called upon to lend their aid in the accomplishment of registration which began on June 5, 1917. Over 10,000,000 men, between the ages of 21 and 30 years, were enrolled in a single day. Later the age limits were changed to 18 to 45 years, and the number enrolled was increased to 24,000,000. With the registration completed, it became necessary to provide a system of local selection boards and to prescribe their procedure in hearing and resolving claims for exemption. The life histories and the most intimate relations of the enrolled men were carefully examined and their future status fixed. Questionnaires, which elicited detailed information, and physical examinations formed the basis of classification. The available manpower was grouped into four classes in the inverse order of its industrial importance; a fifth group contained those exempted from all liability under the terms of the Selective Service Law. The first class constituted the reservoir of manpower, the drain of which for military duty would least disturb the domestic and economic life of the nation. The other classes contained the men whose domestic and industrial relations were such that their call to the colours should be deferred as long as the exigencies of the military situation would permit. In order to determine the order in which men were to be called to the colours, a great central lottery was established in Washington. 2,810,296 men were inducted into the service through selective service, while approximately 2,000,000 additional men, anticipating their call, voluntarily enlisted in the Army and Navy.

The task of selective service did not stop with the raising of armies; rather it became more intricate and more highly difficult. The classification scheme sorted out from the 24,000,000 registrants and placed in the Army those whose withdrawal from domestic and industrial connections would create the least disturbing effect upon the current of national life. But the remainder far outnumbered those who went to the fighting forces. The efforts of the residue, the deferred classes, which formed the great army behind the lines, had to be directed so that they could contribute most effectively to the fighting forces. How to mould this vast group of manpower, how to weave its energies into the general pattern of national effectiveness, attaining a maximum of war-time production and a minimum of peace-time disturbance—these were the problems, herculean in magnitude, yet susceptible of only the most delicate treatment, to which the selective service organization had to address itself. From the war-time standpoint, occupations may be roughly placed in three groups: (1) Those enterprises such as shipbuilding and the manufacture of munitions; (2) Those enterprises contributing to the general good, without which the normal life of the nation would be seriously affected and the continuance of which must be fostered to render a return to peace-time conditions easy; (3) The non-productive employments. The ultimate aim of the system was to eliminate useful manpower in the third group, to comb the second to the minimum consistent with the preservation of the framework of normality and to fill the first to the utmost possible limits. The whole scheme may be envisioned as an instantaneous destruction of the third group, a gradual compression of the second and a constant expansion of the first.

The Future.—The value of the conscription method over the volunteer method was so clearly demonstrated in the World War that there can never be a question as to the choice, provided large armies are required. The volunteer system always constitutes a serious drain upon essential war industries; large numbers of men whose energies may be of infinitely more value in the industrial world than on the battlefield will abandon their productive labours. The modern conscription method inventories the nation's manpower. By means of it, the most available men may be drawn at such times and in such numbers as required for use in the fighting forces with the least possible disturbance of the economic structure of the country.

In war, as in the industrial world, a modern machine, operated by a few men under favourable conditions, may be capable of greater execution than a much larger number of men unaided by the machine. However, war machines now have physical, tactical and strategical limitations which prevent universal use of them. Mechanical fighting elements of this kind must always manoeuvre above ground. A gun can always be found to destroy the heaviest armour. Immobilized, such elements are quite vulnerable. Replacement is slow and costly. Above all, they alone cannot hold conquered ground. This can be done only by men, usually in large numbers. A completely mechanized fighting force, therefore, has distinct limitations as to the terrain on which it can be employed and as to time and manner of its employment. It is essentially an element of offense. The use of modern war machines will not materially reduce the size of armies in future wars of great magnitude and conscription will be as necessary as it has been in the past. (E. H. Cr.; X.)

CONSECRATION, the act by which a person or thing is separated from common use and permanently dedicated to the service of God. In the primitive forms of religion, natural objects, such as rivers and springs, rocks and trees, were often considered as consecrated because they were regarded as the haunts of gods or spirits. Other things were made holy by some ritual form of consecration, as in tabus and fetishes. In Graeco-Roman times, the augurs hallowed sites for the erection of temples which were then dedicated by the priests. The Vestal virgins were set apart by a ceremony of inauguration. In the Old Testament, Aaron and his sons were consecrated as priests by a special ritual and there was also a priestly consecration of the Levites (Num. iii) and of the Nazarites (Num. vi). Similarly, the Hebrews dedicated temples, altars, first fruits and other objects to the service of God.

In the Roman Catholic Church, consecration is distinguished from simple blessing by reason of its greater solemnity and its more permanent character. The highest form of consecration is that act during the celebration of Mass, when the bread and wine are changed into the body and blood of Jesus Christ, repeating what He Himself did at the Last Supper and what He bade the apostles perform in commemoration of Him. This consecration is known to theologians as transubstantiation, the changing of the substance of bread and wine into the substance of the body and blood of Christ, while the outward appearances of bread and wine remain as before.

Aside from transubstantiation in the Mass, consecration is either of a person, as a bishop, or of a place or thing, as a church or an altar. A feature of all consecrations is unction with blessed oil, though there is anointing in other ceremonies which are not regarded as consecrations; for example, in the rituals of baptism and of confirmation and in the ordination of priests. On the other hand, the ceremony for the solemn profession of virgins, in which no sacred oil is used, is officially designated as the blessing *and* consecration of virgins. Non-Catholic rites have retained the term consecration for a more solemn form of dedication, so the Book of Common Prayer has the ceremony for "The Consecration of Bishops" and the form for "The Consecration of a Church or Chapel."

The consecration of a Roman Catholic bishop centres about the laying-on of hands by the three officiating bishops and the placing of the book of the Gospels on the head and shoulders of the bishop-elect. There is an unction of the crown of his head and the palms of his hands. The pastoral staff is handed the new bishop, the episcopal ring is placed on his finger, and the book of the Gospels taken from his head and delivered to him. Then the newly consecrated bishop celebrates Mass together with the consecrating prelate, receiving Holy Communion both under the form of bread and under that of wine. Near the conclusion of the ceremony, the new bishop is invested with the episcopal mitre and the pontifical gloves and is solemnly enthroned.

The consecration of a Christian church may be said to be a development of the Jewish rite employed for the dedication of Solomon's temple. Under Roman Catholic law, no building may be regularly used for the celebration of Mass until it has been either solemnly consecrated or at least blessed. Blessing is a more simple ceremony, which though properly performed by a bishop, may also be done by a priest delegated for the purpose. The essential rite of consecration is the unction of twelve crosses on the interior walls of the church. Twelve stones surrounded the altar which Moses erected when he descended from Mount Sinai. (Ex. xxiv, 4). The preliminary ceremonies include the sprinkling of the outer walls of the building with holy water and of the interior walls with specially blessed water, to which salt, ashes and wine have been added. Ashes are strewn on the floor of the church and the alphabet, first in Greek and then in Latin, is traced by the officiant along two diagonal lines, which intersect in the middle of the nave. The altar, or altars, of the church are consecrated together with the building, though an altar may be the subject of consecration apart from that of the church. Relics of martyrs are enclosed in a cavity in the altar, after the cavity and its cover have been anointed with sacred oil. Previous to this ceremony, the altar is repeatedly sprinkled and signed with the specially blessed water mentioned above. After the relics have been enclosed in it, the altar is incensed many times by the bishop and then there is a continuous incensing by a priest who circles about the altar with a smoking censer until the conclusion of the function. The altar table is anointed several times at the four corners and in the centre, two varieties of blessed oil being used, and finally both oils are poured out and spread over the surface of the table. All these ceremonies are performed with the recitation of prayers and the chanting of psalms and anthems. The burning of wax crosses, together with incense, at the four corners and in the centre of the altar, is a spectacular rite, near the end of the ceremony, which concludes with a final unction of the altar, this time on the front and at the four places where the table is joined to its supports. A slightly condensed version of the same ritual is used when an altar stone, a more or less portable slab, often employed for Mass in place of a permanently erected altar, is consecrated.

Of all the paraphernalia set apart for public worship in the Catholic Church, only the chalice and paten, the cup and plate used at Mass, receive solemn consecration. The vestments and other appurtenances are merely blessed. The ceremony of the consecration of a chalice and paten consists of the unction of the upper surface of the plate and of the inside of the cup, to the accompaniment of appropriate prayers, and a final sprinkling with holy water.

In a more generic sense, consecration is used, outside of its technical, ecclesiastical significance, to designate any kind of solemn dedication from religious, patriotic or romantic motives.

CONSEIL DE FAMILLE ("family council"), in France, an institution for the protection of the interests of minors. By the Code Civil (art. 407–410) it is composed of seven members; the local justice of the peace is the presiding officer. The other six members must be relations of the minor, chosen from the mother's and father's side of the family respectively (three on each side). Five members make a quorum. The council has power to appoint a guardian to the minor; to authorize marriage or oppose it; to audit the accounts and decide questions concerning the minor's estate. The French family council is founded on the Roman Law of Tutelage.

CONSEQUENS is the Latin form of "consequent," and means "that which follows." Its correlative term is "antecedent," that which precedes. In logic both terms are used with special reference to the hypothetical or conditional judgment or proposition. Such a proposition usually expresses a connection between a condition and a result. The condition is commonly expressed first, the consequent last. The general form is *If A, then C,* where *A* stands for the condition or *antecedent,* and *C* for the result or *consequent, e.g., If it rains the streets are wet; If a triangle is equilateral, then it is equiangular.* Now if a given hypothetical proposition is true, its consequent must be realized whenever its antecedent is. On the other hand, the consequent may in some cases be realized or brought about in other ways than that indicated by the antecedent. Streets, *e.g.,* may be sprinkled by water carts instead of by rain. It is therefore not legitimate to argue from the truth of the consequent (say, *the streets are wet*) to the truth of the antecedent (say, *it is, or has been, raining*). Such an inconclusive inference is known as the *Fallacy of consequens,* or simply *Consequens.*

CONSERVATIVE PARTY. In Great Britain, the name of the successors of the Tories (*see* WHIG AND TORY). J. W. Croker popularized the term in an article in the *Quarterly Review,* Jan. 1830, but the name had already been used by Canning at a city dinner as early as 1824, and Greville had written in his diary on March 14, 1829, "Herries told Hyde Villiers that their policy was conservative, that of the Whigs subversive." For some time it was only used sporadically, and many of the old Tory régime disliked it. The term "Tory" has, in fact, never quite fallen out of use, and has been commonly retained by many modern Conservatives who wish to emphasize that theirs is a constructive and positive policy of constitutional as opposed to radical reform, and not merely one of letting things remain simply "as they are." After the Reform act of 1832 associations known as "Constitutional" or "Conservative" multiplied throughout the country; and a "National Union of Conservative and Constitutional Associations" formed a confederation in 1867, in alliance with the work of the central Conservative office under the Party whips. It was, however, unlike the similar Liberal "National Liberal Federation," under the control of influential people who were loyal to the central office. In this respect the Conservative Party, as an internally loyal party, had some advantage in organization; and such independent outbreaks as that of the "Fourth Party" (in the Parliament of 1880), while stimulating to the central office, may be said to have applied a useful *massage* rather than to have led to any breaking of bones; while the Primrose League and any similar new bodies, acted as cooperating agencies. Gladstone's proposal of home rule for Ireland in 1886 resulted in a great accession of strength to the party, owing to the splitting off of the Liberal Unionists from the Liberal Party. From this time the term "Unionists" began to come into use, to signify both the Conservative and the Liberal Unionist Parties; and, as the distinction between the two wings gradually grew smaller, to signify the whole party.

For ten years prior to 1906 the Conservatives, in close alliance with the Liberal Unionists, were continuously in power. In 1903, however, Joseph Chamberlain raised a new issue by promulgating his policy of tariff reform. Tariff reform split the Unionist Party, as home rule, 20 years before, had split the Liberal Party, though neither so fundamentally nor so permanently. Nevertheless at the general election of 1906 the Unionists suffered a crushing reverse, and the Liberals came into power, fettered only by the still coordinate authority of the House of Lords. To curb the Lords they introduced (April 1910) the Parliament bill, which the Unionists stoutly but unavailingly opposed. In November 1911 the Conservative Party was compelled, by the resignation of Mr. Balfour, to elect a new leader. The industrialists and protectionists urged the claims of Mr. (now Sir) Austen Chamberlain; the old Tories, the churchmen, and the country folk, preferred Mr. Walter Long. Ultimately both stood aside in order to secure unanimity, and the choice of the party fell on Mr. Bonar Law.

Leadership of Bonar Law.—The choice proved a happy one, though the new leader's powers were displayed to much greater advantage in the House of Commons than on the platform. His leadership continued until his resignation of the premiership, after only a few months' tenure, in 1923. After the passage of the Parliament act in April 1912, Mr. Asquith introduced and ultimately, by the aid of the Parliament act, carried a home rule bill. Meanwhile Ulster was preparing to resist forcible disjunction from the United Kingdom, and behind Ulster stood the bulk of the Unionist Party. But by that time the issues of European peace and war were hanging in the balance. Party controversies were instantly put aside, and the Conservative leaders promised, in the event of war, the whole-hearted support of the party to the Government.

The War Period.—That promise was fulfilled in the letter and the spirit. In May 1915 Mr. Bonar Law and other Conservative leaders joined forces with the Liberals and Socialists in an administration formed to conduct the War to a successful issue. But the issue was not yet; victory tarried; public dissatisfaction grew; in Dec. 1916 a political crisis supervened and Mr. Asquith resigned. Mr. Bonar Law was invited to form a government but declined, and chose instead to serve as chancellor of the Exchequer and leader of the House of Commons under Mr. Lloyd George as premier. A new coalition of the three parties ensued, and was maintained until the conclusion of the Armistice (Nov. 11 1918).

Post-War Changes.—The long parliament was at last dissolved (Nov. 1918) and Mr. Lloyd George and Mr. Bonar Law jointly appealed, as leaders of the Coalition, to the new and vast electorate created by the Reform act of 1918. The country gave them an overwhelming majority and, as spokesmen for the nation, they attended the Peace Conference at Paris. After the conclusion of peace the cohesion between the two wings of the Coalition manifestly weakened. A considerable section of the Conservative Party became increasingly restless under Mr. Lloyd George's leadership, and after the concession of dominion home rule to southern Ireland (1921), the "die-hards," as they were termed, decided that when the inevitable appeal to the country came, they would make it as Conservatives, *sans phrase* and under their own leaders. Matters reached a crisis on Oct. 19, when a meeting of Conservative M.P.'s held at the Carlton Club, decided by 187 to 87 votes, "that the Conservative Party, while willing to co-operate with the Liberals, should fight the election as an independent party, with its own leader and with its own programme."

To this result two speeches largely contributed. One was a singularly direct, manly, and courageous speech by Mr. Stanley Baldwin; the other was a firm declaration by Mr. Bonar Law, who had been reluctantly persuaded to emerge from retirement and head the revolt against the Coalition. But it was a soldiers' battle; the victory was that of the rank and file, who for the last two years had been increasingly suspicious of Mr. Lloyd George's policy.

The die was now cast. The Coalition was smashed; Mr. Lloyd George resigned and Mr. Bonar Law became prime minister and the head of a purely Conservative ministry—the first since 1905. The electorate showed its confidence in the new administration by returning (Nov. 1922) 344 Conservatives as against 53 Asquithian Liberals and 61 National (or Lloyd George) Liberals, and 142 Labour-Socialist members. The parliament elected in Nov. 1922, on the cry of rest and recuperation, was short-lived. Mr. Bonar Law was compelled by illness to resign in May 1923. Who was to succeed him? Length and distinction of service, great experience, intellectual endowments—all pointed to Lord Curzon of Kedleston. The King, however, decided that a peer premier was, under the circumstances, impracticable, and his choice fell on Mr. Stanley Baldwin.

The new Government did not last long. Mr. Baldwin, convinced that only protection could provide a positive cure for unemployment, asked the country (Nov. 1923) to endorse that conviction. At the ensuing general election the country declined. The Liberals and Socialists combined to turn out Mr. Baldwin's Government; the Labour Party took office on Liberal sufferance, but in the early autumn of 1924 became involved in irretrievable difficulties and appealed to the country. The country showed even less liking for Socialism than for protection, and Mr. Baldwin achieved a victory almost national in dimensions. The new parliament contained nearly 420 Conservatives and 151 Socialists, while the Liberal Parties were in the aggregate reduced to 40. Mr. Baldwin, rightly interpreting the verdict of the country as a call to the union of all constitutionalists, included in his new ministry not only those Unionists who, like Sir Austen Chamberlain and Lord Birkenhead, had gone into temporary exile with Mr. Lloyd George, but Mr. Winston Churchill, who for nearly 20 years had been a member of the Liberal Party and now took office as chancellor of the Exchequer. Though defeated in the 1929 election, the Conservatives and the National Government won a decisive majority in that of 1931 and again in 1935. (*See* ENGLISH HISTORY.) (J.A.R.M.)

CONSERVATOIRE, a public institution for instruction in music and declamation. The name conservatoire has come to be used not only of the French institutions to which it properly applies, but also of similar establishments in other countries. In the United States, however, the anglicized form "conservatory" is employed, a form far more satisfactory from the point of view of linguistic purity, but difficult to adopt in England, where the word has long since meant something quite different, to wit, a particular kind of greenhouse. The Italian conservatorios were the earliest, and originated in hospitals for the rearing of foundlings and orphans in which a musical education was given. The first to which a definite date can be assigned is the Conservatorio di Santa Maria di Loretto, at Naples, founded by Giovanni di Tappia in 1537. Three other similar schools were afterwards established in the city, of which the Conservatorio di Sant' Onofrio deserves special mention on account of the fame of its teachers, such as Alessandro Scarlatti, Leo, Durante and Porpora.

The celebrated conservatoire of Paris owes its origin to the École Royale de Chant et de Declamation founded by Baron de Breteuil in 1784, for the purpose of training singers for the opera. Suspended during the stormy period of the Revolution, its place was taken by the Conservatoire de Musique, established in 1795. The plan and scale on which it was founded had to be modified more than once in succeeding years, but under the successive direction of eminent musicians, including Cherubini, Auber, Ambroise Thomas, Gabriel Fauré, it thereafter occupied, as it continues to do (1939), a foremost place among institutions of its kind. Of other European conservatoires of the first rank may be named those of Berlin, the famous Hochschule für Musik, founded in 1869, and long directed by Joachim; of Vienna, founded in 1817; of Leipzig, which assumed such importance in the days of Mendelssohn, by whom it was founded in 1843; of Brussels, founded in 1833 and long presided over by the celebrated Fétis; and of Cologne, founded in 1849; to mention but a few.

In England the functions of a conservatoire have been discharged by the Royal Academy of Music, of London, founded in 1822, the Royal College of Music (1882), the Guildhall School of Music and similar institutions.

In the United States the leading teaching institutions include the National Conservatory of Music of America, founded in New York in 1885, of which Dvořák was director for a time, the Institute of Musical Art and the American Institute of Applied Music, both also in New York. Other well-known American establishments are the Peabody Conservatory in Baltimore (1868), the American Conservatory of Music (1886) and the Conservatory of Dramatic and Musical Art (1885) in Chicago, the Cincinnati Conservatory of Music (1867), and the New England Conservatory of Music in Boston (1867).

CONSERVATOR, a title given in the middle ages to various officers, such as those appointed by the council of Würzburg in 1287 to protect the privileges of certain religious persons, the guardians of academic rights in the University of Paris, certain Roman magistrates as late as the 16th century, or the *conservator Judaeorum,* who was enjoined to look after the Jews of the county of Provence in 1424. By the statute 2 Henry V. there was appointed a conservator of truce and safe conducts in each English seaport "to enquire of all offences done against the king's truce and safe conducts, upon the main sea, out of the liberties of the cinque ports." In Scotland the conservator of the realm (*c.* 1503) had jurisdiction to settle the disputes and protect the rights of Scottish merchants in foreign ports or places of trade. In England the conservators of the peace (*custodes pacis*) were the precursors of the modern justices of the peace. Stubbs traces their origin to the assignment of knights, in 1195, to enforce the oath to preserve the peace which Richard I. ordered to be taken by all persons above the age of 15. By the statute 1 Edward III. conservators of the peace were appointed for each county to guard the peace and to hear and determine felonies. The office was reconstituted by the parliament of 1327, and its powers were extended in 1360. From the sovereign and the lord chancellor down to the justice and the village constable, all who have to do with the repression of crime are included within the general term of conservators of the peace. As commonly used nowadays in England the term conservator is applied only to the guardian of a museum or of a river (*see* THAMES).

In some countries the registrar of land transfers, etc., is called conservator.

CONSETT, an urban district of Durham, England, 12 mi. S.W. of Newcastle-upon-Tyne by a branch of the L.N.E.R. Pop. (1938) 37,340. Area 2.5 sq.mi. At Shotley Bridge a colony of German metalworkers, making swords and knives, was established in the 17th century. Metalworking, iron smelting, furnace building and the production of coke are important. There was unemployment in these industries during the depression of the 1930s.

CONSHOHOCKEN, a borough of Montgomery county, Pennsylvania, U.S.A., on the Schuylkill river, 12m. N.W. of Philadelphia; served by the Pennsylvania and the Reading railways. Pop. (1940) 10,776. Industries include the manufacture of fire trucks and pumps, steel sheets and plates, water heaters, tanks, steel containers, rubber tires, rubber mechanical goods, glass bottles and scientific glassware; textiles, caps and uniforms, paper fibre, steel conduits for electrical insulation. Across the river is the borough of West Conshohocken (pop. 1940, 2,464) which has woolen yarn mills, stone quarries, and manufactures cement and chemicals. Conshohocken is an Indian word meaning "pleasant valley." The borough was settled about 1820 and incorporated in 1850. Until 1830 it was called Matson's Ford.

CONSIDÉRANT, VICTOR PROSPER (1808–1893), French socialist, was born at Salins (Jura) on Oct. 12, 1808. Educated at the École Polytechnique in Paris, he entered the French army as an engineer, rising to the rank of captain. He resigned his commission in 1831, in order to devote himself to advancing the doctrines of François Fourier (*q.v.*). On the death of Fourier in 1837 he became the acknowledged head of the movement, and took charge of *La Phalange,* the organ of Fourierism. He also established *phalanges* at Condé-sur-Vesgres and elsewhere. During this period he published his *Destinée sociale* (1834–38), undoubtedly the most able and most important work of the Fourierist school. After the revolution of 1848 he was elected to the Constituent Assembly for the department of Loiret, and in 1849 to the Legislative Assembly for the department of the Seine. Considérant's share in the "demonstration" under the leadership of Alexandre Ledru-Rollin (*q.v.*) on June 13, 1849, made it necessary for him to leave France. He made Brussels his headquarters and from there made his visits to America. On the second of these visits he founded at San Antonio, Texas, the short-lived communistic colony of La Réunion. He returned to Paris in 1869, and died there on Dec. 27, 1893. The most important of Considérant's other writings were *Exposition du système de Fourier* (1845), *Principes du socialisme* (1847), *Théorie du droit de propriété et du droit au travail* (1848).

See Mme. Coignet, *Victor Considérant, sa vie, son oeuvre* (1895); P. Collard, *Victor Considérant, sa vie, ses idées* (Dijon, 1910).

CONSIDERATION, in the law of contract, an act or forbearance, or the promise thereof, offered by one party to an agreement, and accepted by the other as an inducement to that other's act or promise (Pollock on *Contract*). Consideration in the legal sense is essential to the validity of every contract unless it is made in writing under seal. The meaning of the word is quite accurately expressed by a phrase used in one of the earliest cases on the subject—it is strictly a *quid pro quo.* Something, whether it be in the nature of an act or a forbearance, must move from one of the parties in order to support a promise made by the other. A mere promise by A to give something to B cannot be enforced unless there is some consideration "moving from B." While every contract requires a consideration, it is held that the court will not inquire into the adequacy thereof, but it must be of some value in the eye of the law. It must also be legal, and it must be either present or future, not past. "Valuable consideration" differs from *causa,* which was required in the Roman law of contracts, since this, *i.e.,* the reason, such as affection or moral duty, was sufficient to make a contract sustainable. In Scots law a mere promise without consideration is enforceable. *See* CONTRACT.

CONSIDERATION MONEY. In the transfer of stocks and shares, this is the amount of money stated on the deed of transfer as being paid by the buyer to the seller. If shares are sold on the Stock Exchange, however, it by no means follows that the seller will find named on the transfer the sum for which his stockbroker sold the shares, and which was stated on the stockbroker's contract note. That is because shares may change hands several times during a stock exchange settlement period, and, under the Stamp act, it is the amount paid by the sub-purchaser which has to be stated on the transfer for the purpose of assessment of the transaction to *ad valorem* stamp duty.

CONSIGNMENT, generally, the delivery or transmission of any person or thing for safe custody, *e.g.*, of a malefactor to prison, or of a horse to the care of a groom. In law, consignment is used for the sending or transmitting of goods to a merchant or factor for sale. The person who consigns the goods is called the consignor, and the person residing at the port of delivery or elsewhere to whom the goods are to be delivered when they arrive there is called the consignee. Consignation as used in the Code Napoléon and similar systems means payment into court. (*See* AFFREIGHTMENT.)

CONSISTORY, a term which, like many other expressions, has undergone a regular evolution in the course of centuries. It was first applied (from Lat. *consistorium,* literally, a standing place, hence meeting place) to the audience-chamber in which the emperors received petitions and gave judgment; it soon came to mean also the persons who took part in the deliberation, and, by an extension of meaning, a tribunal or jurisdiction (*see* Du Cange, *Glossarium, s.v.*). But the expression has now long been exclusively applied to gatherings of ecclesiastical persons for the purpose of administering justice or transacting business.

In the Western Church the episcopal consistory was simply the bishops' tribunal, the proceedings of which took a more or less strictly judicial form. But the name has disappeared almost everywhere; the only episcopal consistories outside England (*see* CONSISTORY COURTS) which survive are in Austria and in certain dioceses of Bavaria and Germany (*see* Vering, *Kirchenrecht,* § 149). Thus the name has come to be applied almost exclusively to meetings of the college of cardinals with the pope as president, formerly for deliberative purposes, but nowadays purely formal and ceremonial, the business upon which they are supposed to meet being discussed and decided previously; they are now merely a kind of solemn promulgation.

There are three kinds of consistory: the secret consistory, in which only the cardinals take part; the public consistory, to which are admitted persons from outside and a fairly large audience; and finally, the semi-public consistory, in which the bishops present in Rome take part with the cardinals, and are allowed to state their opinion. The last form is only used in the case of the consistory preceding a canonization. The public consistory is now only held for the ceremony of conferring the hat on newly created cardinals; formerly the popes used to receive in public consistory sovereigns and certain other great persons, but in this case the consistory was not deliberative in form.

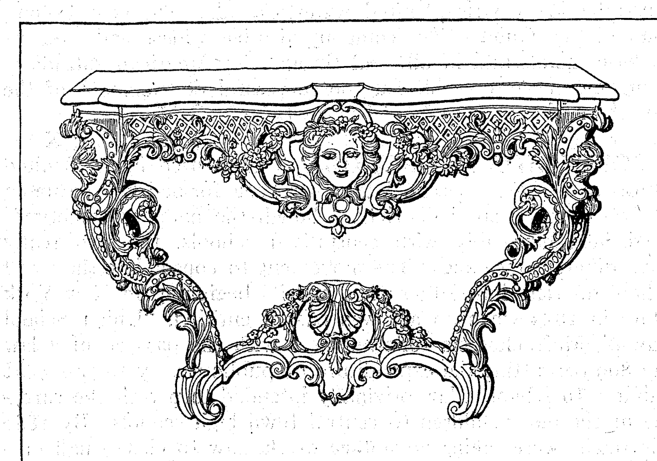
Finally, in secret consistories were discussed matters of general interest, such as the creation of cardinals, the provision of cathedral churches and other higher benefices,—hence called consistorial,—the creation, union or division of dioceses, the conferring of the pallium (*q.v.*), and other matters of importance. The custom is for the pope to open the meeting by a discourse, or "consistorial allocution." Such, for example, were the allocutions of Pius IX. against the successive invasions of his temporal domain, or that of Pius X. against the breaking of the Concordat by the French government.

See the *Catholic Encyclopaedia,* art. "Consistory," and for full historical information, Bouix, *De Curia romana,* pt. ii. c. 1. (Paris, 1850); Plattenberg, *Notitia congregationum,* cap. 3 (Hildesheim, 1693); Cardinal de Luca, *Theatrum veritatis,* lib. xv. p. 2 (Rome, 1671).

CONSISTORY COURTS, those ecclesiastical courts wherein the ordinary jurisdiction of the bishop is exercised (*see* CONSISTORY). They exist in every diocese of England. Consistory courts were established by a charter of William I., which appointed the cognizance of ecclesiastical causes in a distinct place or court from the temporal. The officer who exercises jurisdiction in a consistory court is known as the chancellor (*q.v.*), and he is appointed by patent from the bishop or archbishop. All jurisdiction, both contentious and voluntary, is committed to him under two separate offices, those of official principal and vicar-general; the distinction between the two offices is that the official principal usually exercises contentious jurisdiction and the vicar-general voluntary jurisdiction. (In the province of York there is an official principal of the chancery court and a vicar-general of the diocese.) Since about the middle of the 19th century consistory courts have been shorn of much of their importance. Before the year 1858 consistory courts exercised concurrently with the courts of their respective provinces jurisdiction over matrimonial and testamentary matters. This jurisdiction was taken away by the Court of Probate Act 1857 and the Matrimonial Causes Act 1857. They had also corrective jurisdiction over criminous clerks, but this was abrogated by the Church Discipline Act 1840. The principal business of consistory courts is now the dispensing of faculties. The procedure in such is strictly forensic, for all applications for faculties, though they may be unopposed, are commenced by citation, calling on all who may have an interest to oppose. From the consistory courts an appeal lies to the provincial courts, *i.e.* the arches court of Canterbury and the chancery court of York. Also, by the Clergy Discipline Act 1892, a clergyman may be prosecuted and tried in a consistory court for immoral acts or conduct. Under this act, either party may appeal either to the provincial court or to the king in council against any judgment of a consistory court.

CONSOLATION, in general the soothing of disappointment or grief. In the sense of compensation for loss the word "consolation" has had a variety of adaptations; *consolatio* was the name for the evening meal given to monks after a regular collation "by way of consolation," and to certain payments made to members of chapters over and above the revenues of their benefices. In an analogous sense we use the word in such combinations as "consolation prize," "consolation race," "consolation stakes," meaning such as are open only to competitors who have not won in any preceding "event."

CONSOLE, in architecture, a corbel (*q.v.*) or built-in bracket whose height is greater than its projection. Decorative consoles were used by the Greeks and Romans of the classic period to support the projecting cornice over a door, as in the door of the Erechtheum (*q.v.*) at Athens (completed 408 B.C.), and the temple of Vesta at Tivoli (early first century). The type of console decoration thus set, consisting of "S" scrolls on the sides, a moulded edge with, occasionally, an applied leaf, was widely used throughout the Renaissance styles (*see* RENAISSANCE ARCHITECTURE), not only for door and window cornices, but also as a decoration under window sills and sometimes in cornices or other



BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

CONSOLE TABLE OF THE FIRST QUARTER OF THE EIGHTEENTH CENTURY

This example is of gilded wood and topped with a royal red marble slab

positions, such as the reversed consoles used as buttresses in the dome of S. Maria della Salute in Venice, begun 1631. It was a favourite form of the baroque period (*see* BAROQUE ARCHITECTURE), which treated it with the utmost fantasy.

In furniture, the word console, or console table, is used to describe a type of table supported either upon brackets, like consoles, or by legs of similar form, and always designed to be placed against the wall. This type of table was particularly important in France from the time of Louis XIV. to the fall of Napoleon. In almost all cases French console tables are richly decorated with carved scrolls, shells, flowers, wreaths and even masks. During the Louis XVI. and empire periods the design is much more restrained. These console tables were frequently of bronze or brass, with marble tops, and when of wood usually gilded or painted, except under the empire, when they were of natural wood with brass mountings. A console mirror is a long narrow mirror designed to occupy the space above a console table.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LTD. The Gold Fields of South Africa, Ltd. was formed in 1887 by Cecil Rhodes and Charles Rudd with the principal object of exploiting gold mines on the newly discovered Witwatersrand.

Together with other companies it was absorbed in 1892 by the Consolidated Gold Fields of South Africa, Ltd. The objects of this company being limited by its memorandum of association, an operating company, New Consolidated Gold Fields, Ltd., was formed in 1919 in order to enlarge the scope of the business. All the shares in the operating company are held by the parent company. The capital of the company has been increased from time to time from the original £250,000 to a figure of £6,500,000 in 1939. The capital has never been written down and is exceeded by the book value of the investments which "show a further unrealized profit". The average return on the ordinary share capital over the life of the company is over $17\frac{1}{2}\%$.

A subordinate company, the Gold Fields Rhodesian Development Co., Ltd., was formed in 1911 to undertake business in this field, followed by others of similar objects and title for America (1911) and Australia (1932). The central administration is in London and offices are maintained in Johannesburg, New York, Bulawayo, and Kalgoorlie.

The company's main field of activity has always been the Witwatersrand where it has taken a prominent part in technical progress and has, in recent years, been responsible for the development of the western extension of the field (West Witwatersrand Areas, Ltd.) over a distance of 40 miles. Since, however, further extensions of the gold fields became limited, the management considered it essential to extend its field and scope of investment to other parts of the world. As a result of such developments other interests held directly or through associated companies are world wide and include gold mining in Western Australia, West Africa, United States, Canada, Venezuela, Colombia and New Guinea. The company also has widespread interests in base metals and in oil, and through its American subsidiary company was responsible for the successful development of the potash and borax deposits at Searles Lake in California.

(L. C. M.; X.)

CONSOLIDATED SCHOOL, a term used in the United States to designate a school that has been formed by the union of two or more rural districts. Though the name is sometimes used interchangeably with centralized schools, the two really have different meanings. The movement to consolidate the small school districts into larger ones had its beginning in New York State in 1853 when an act was passed entitled, "Union School Laws." Massachusetts followed next with the passage of a law in 1869 permitting the expenditure of public money to transport children to school, a law originally intended to permit the carrying of the older children to central town high schools. By 1880 the towns were taking advantage of the law to close small outlying schools and transport the children to a central town school. This movement was accelerated in Massachusetts when in 1882 the district system was abolished and the township system restored in its place. The consolidation movement had spread to all the New England States by 1890. By this time New Jersey and Nebraska had passed legislative acts that made consolidation possible; and Indiana had started the movement without waiting for legislative provisions. In 1894 Ohio passed a law permitting the expenditure of public money for the transportation of pupils. By 1910 38 States had enacted permissive legislation, and by 1927 there were in the United States about 15,000 consolidated schools. The consolidated schools vary in size from the small two-room school to the large modern school of 600 or more pupils equal in physical equipment, curriculum, teaching force and financial support to the better town and city schools.

Advantages.—The advantages of the consolidated school may be summarized as follows: (1) Better classification and gradation of pupils is made possible, and classes large enough to stimulate rivalry and enthusiasm in the work of the school. (2) The number of grades a teacher must handle and the number of recitations are materially reduced, while the length of the recitations are materially increased. (3) The curriculum can be enriched by the introduction of instruction in agriculture, home economics, manual training, music, art and nature study. (4) The larger school unit makes possible buildings with better equipment in heating, ventilation, lighting and sanitary conveniences; professionally trained teachers, and modern teaching equipment and supplies. (5) Consolidation makes possible longer terms of school than the small districts usually can afford; provides supervision of instruction; and higher salaries for teachers which lengthens the tenure of office. (6) Transportation, which is an essential feature of consolidation, provides for the placing of the children under the care of a responsible person in travelling to and from the school. (7) Enrolment in the school is increased and absences and tardiness are reduced to the minimum. (8) It brings together at one place enough pupils to permit of organized plays and games, making it possible to utilize the educative value of play which is largely lost to the small district school. (9) It offers to rural children and rural communities all the desirable educational advantages which the city children now enjoy.

(W. D. A.; W. H. Ha.)

CONSOLIDATION. In military language, the act of making secure, against enemy counter-attack, ground or trenches that have been captured. Consolidation is effected in two ways—by the reorganization and suitable distribution of the occupying troops and by the rapid provision of entrenchments. For Consolidation in Industry and Commerce, *see* Merger.

CONSOLIDATION ACTS. Where opportunity offers, the law expressed in many statutes is sometimes recast in a single statute, called a Consolidation Act. In settling private acts, such as those relating to public undertakings, common clauses were embodied in separate statutes, and their provisions are ordered to be incorporated in any private act of the description mentioned therein.

CONSOLS. An abbreviation of Consolidated Annuities, a form of British government stock which originated in 1751. Previous to World War I Consols formed the larger part of Britain's "funded debt"—*i.e.,* that portion of the national debt the redemption of which is at the option of the government. During the 19th century the practice of the government was not to borrow at various rates of interest, but to keep the rate of interest constant while offering principal in various amounts. Thus subscribers of £100 might be offered £150 in 3% stock. In 1815, at the close of the French wars, a large loan was raised at as much as £174 of 3% stock for £100 cash. This practice dated from the reign of George II. In 1888 a great conversion operation took place. All outstanding Consols together with certain 3% annuities were consolidated into one stock, the rate of interest being reduced to $2\frac{3}{4}\%$ for the first 14 years and to $2\frac{1}{2}\%$ thereafter. Following this operation, at one time $2\frac{3}{4}\%$ Consols touched 114, but in the early years of the 20th century $2\frac{1}{2}\%$ Consols fell below par.

The huge increase in the national debt during World War I meant that Consols became only one of many government stocks. Funding operations culminating in the war loan conversion of 1933, when nearly £2,000,000,000 of 5% stock was successfully replaced by a corresponding amount of $3\frac{1}{2}\%$ stock, placed the national debt on a simpler footing, but expenditure upon rearmament prior to Sept. 3, 1939, led to the issue of fresh government loans for defense purposes.

At the outbreak of World War II in Sept. 1939 the British national debt totalled £8,163,000,000, of which only £276,100,000 was represented by $2\frac{1}{2}\%$ Consols. Other forms of funded debt outstanding were £1,911,000,000 of $3\frac{1}{2}\%$ war loan, repayable in or after 1952; £739,000,000 of $3\frac{1}{2}\%$ conversion loan, repayable in or after 1961; and £400,000,000 of 4% Consols, repayable in or after 1957. The total funded debt was then £3,365,000,000. Unfunded debt included loans repayable at specific dates and also national savings certificates. It totalled nearly £3,000,000,000. The floating debt was about £900,000,000.

World War II raised the national debt to £22,398,000,000 by March 31, 1945. The chief new issues consisted of national savings certificates, 2½% national war bonds, and 3% savings bonds. All debt raised during the war consisted of unfunded or floating debt.

As a result 2½% Consols in 1945 represented only a minute fraction of the British national debt. Yet they are not without their importance. They are the only government loan in which no specific year is mentioned as even a possible date of repayment. This means that the yield obtainable from them is the best available measurement of the long-term rate of interest, because no element of amortization enters therein. Here is the actual record:

		Price	Yield
1939	Aug. 31	64¾	3.86%
	Sept. 7	62¼	4.02%
1940	June 22	71⅝	3.49%
1941	Dec. 8	82⅛	3.04%
1945	May 7	83⅛	3.00%

In round figures, despite a war increase in the national debt from about £8,000,000,000 to over £22,000,000,000, the long-term rate of interest was brought down from 4% to 3%. This is a measure of the success of the British government's cheap money policy. (N. E. C.)

CONSORT, in general, a partner or associate, but more particularly a husband or wife. The word is also used in conjunction with some titles, as "queen consort," "prince consort." Under the law of Great Britain, the queen consort is a subject, but has certain privileges. By the Treason Act 1351, the compassing and imagining her death is high treason, as is also the commission of adultery with her. With regard to the acquisition and disposal of property, the incurring of rights and liabilities under contract, suing and being sued, a queen consort is regarded as a *feme sole* (32 Henry VIII. c. 51, 1540; Private Property of the Sovereign Act 1800). In other words she may sue and be sued as a private subject. The queen consort has her own ceremonial officers and appears in the courts by her attorney- and solicitor-general. At one time she had a revenue out of the demesne lands of the Crown and a portion of any sum paid by a subject to the king in return for a grant of any office or franchise; this was termed *aurum reginae* or queen-gold. Provision is now made for the queen consort by statute. When the husband of a queen consort dies she becomes a queen dowager. A queen regnant, holding the crown in her own right, has all the prerogatives of a sovereign. In the four cases of queens regnant in English history, the husbands' positions have each been different. When Mary I. married Philip of Spain it was provided by every safeguard that words could suggest that the queen alone should exercise all the powers of the Crown; official documents, however, were to issue in their joint names. William III. occupied the throne jointly with his wife, Mary II. The husband of Queen Anne, George of Denmark, who was naturalized by act of parliament in 1689, occupied no definite position, and differed only from other subjects of the queen in the conditions of his naturalization. The position of Prince Albert of Saxe-Coburg-Gotha, the husband of Queen Victoria, was somewhat like that of Prince George of Denmark. A few days before his marriage he had been naturalized as a British subject, and immediately after his marriage letters patent were issued, giving him precedence next to the queen. He had, however, no distinctive title, and the privileges and precedence he received were only by courtesy. As the patent which gave him precedence was inoperative outside Great Britain, certain difficulties occurred at foreign courts, and in order to settle these, the formal title of "Prince Consort" was conferred upon him by letters patent in 1857.

CONSPIRACY, in English law, an agreement between two or more persons to do an unlawful act, or to do a lawful act by unlawful means. It is not necessary that the unlawful act or the unlawful means should be criminal; they need be only wrongful, *i.e.,* tortious. At common law conspiracy is an indictable misdemeanour, but by s. 4 of the Offences against the Person Act 1861 conspiracy to murder, whether the victim be a subject of the king or not, and whether he is within the king's dominions or not, is declared also a misdemeanour and is punishable by penal servitude not exceeding ten years. Conspiracy to commit treason is treason. It is also interesting to note that the legislature has interfered in the case of illegal agreements as to bidding at auctions, and has made it an offence for a dealer to abstain from bidding for a consideration (Auctions Bidding Agreements Act 1927).

Criminal conspiracy may be classified as follows:—(1) To cheat and defraud; (2) to injure by wrongful acts other than fraudulent acts; (3) to commit any offence punishable by law; (4) to do any act with intent to pervert the course of justice; (5) conspiracies or combinations in relation to trade and employments. A husband and a wife cannot commit the offence as they are in law one person, but they can conspire with a third person.

Individuals Acting in Concert.—The most important question in the law of conspiracy, apart from the statute law affecting labourers, is how far things which may be lawfully done by individuals can become criminal when done by individuals acting in concert, and some light may be thrown on it by a short statement of the history of the law. In the early period of the law down to the 17th century, conspiracy was defined by the Ordinance of Conspirators of 1305:—"Conspirators be they that do confedre or bind themselves by oath, covenant, or other alliance, that every of them shall aid the other falsely and maliciously to indite, or cause to indite, or falsely to move or maintain pleas, and also such as cause children within age to appeal men of felony, whereby they are imprisoned and sore grieved, and such as retain men in the country with liveries or fees to maintain their malicious enterprizes, and this extendeth as well to the takers as to the givers." The offence aimed at here is conspiracy to indict or to maintain suits falsely; and it was held that a conspiracy under the act was not complete, unless some suit had been maintained or some person had been falsely indicted and acquitted. A doctrine, however, grew up that the agreement was in itself criminal, although the conspiracy was not actually completed (Poulterer's case, 1611). This developed into the rule that any agreement to commit a crime might be prosecuted as a conspiracy.

A still further development of this doctrine is that a combination might be criminal, although the object apart from combination would not be criminal. A dictum of Lord Denman's is often quoted as supplying a definition of conspiracy. It is, he says, either a combination to procure an unlawful object, or to procure a lawful object by unlawful means; but the exact meaning to be given to the word "lawful" in this antithesis has nowhere been precisely stated. A thing may be unlawful in the sense that the law will not aid it, although it may not expressly punish it. The extreme limit of the doctrine is reached in the suggestion of Lord Mansfield, C.J., in 1809 (2 Camp. 369) that a combination to hiss an actor at a theatre is a punishable conspiracy.

The application of the wide conception of conspiracy to trade disputes and to civil questions arising out of contracts for service is dealt with under the headings LABOUR LAW, STRIKES AND LOCKOUTS, and TRADE UNIONS.

The Conspiracy and Protection of Property Act.—The criminal side is regulated by the Conspiracy and Protection of Property Act, 1875, which enacted by s. 3 that "an agreement or combination by two or more persons to do, or procure to be done, any act in contemplation or furtherance of a trade dispute between employers and workmen shall not be indictable as a conspiracy, if such act committed by one person would not be punishable as a crime. By s. 4 of that statute a person employed on the supply of gas and water, breaking his contract with his employer, and knowing or having reasonable cause to believe, that the consequence of his doing so, either alone or in combination with others, will be to deprive the inhabitants of the place wholly or to a great extent of their supply of gas or water, shall be liable on conviction to a penalty not exceeding £20, or a term of imprisonment not exceeding three months. And by s. 5 any person wilfully and maliciously breaking a contract of service or hiring, knowing or having reasonable cause to believe that the probable consequences of his so doing either alone or in combination with others will be to endanger human life or cause serious bodily injury, or to expose valuable property whether real or personal to destruction or serious injury, shall be liable to the same penalty. By s. 7 every person who, with a view to compel any other person to abstain from doing or to do any act which such other person has a legal right to do or abstain from doing, wrongfully and without legal authority, (1) uses violence to or intimidates such other person, or his wife and children, or injures his property; or (2) persistently follows such other person about from place to place; or (3) hides any tools, clothes or other property owned or used by such other person, or deprives him of or hinders him in the use thereof; or (4) watches or besets the house or other place where such other person resides or works, or carries on business, or happens to be, or the approach to such house or place; or (5) follows such other person with two or more other persons, in a disorderly manner, in or through any street or road, shall be liable to the before-mentioned penalties."

The Trade Disputes and Trade Unions Act, 1927, prescribes that: "3. (1) It is hereby declared that it is unlawful for one or more persons (whether acting on their own behalf or on behalf of a trade union or of an individual employer or firm, and notwithstanding that they may be acting in contemplation or furtherance of a trade dispute) to attend at or near a house or place where a person resides or works or carries on business or happens to be, for the purpose of obtaining or communicating information or of persuading or inducing any person to work or to abstain from working, if they so attend in such numbers or otherwise in such manner as to be calculated to intimidate any person in that house or place, or to obstruct the approach thereto or egress therefrom, or to lead to a breach of the peace; and attending at or near any house or place in such numbers or in such manner as is by this subsection declared to be unlawful shall be deemed to be a watching or besetting of that house or place within the meaning of section seven of the Conspiracy, and Protection of Property Act, 1875. (2) In this section the expression 'to intimidate' means to cause in the mind of a person a reasonable apprehension of injury to him or to any member of his family or to any of his dependents or of violence or damage to any person or property, and the expression 'injury' includes injury to a person in respect of his business, occupation, employment or other source of income, and includes any actionable wrong. (3) In section seven of the Conspiracy, and Protection of Property Act, 1875, the expression 'intimidate' shall be construed as having the same meaning as in this section. (4) Notwithstanding anything in any Act, it shall not be lawful for one or more persons, for the purpose of inducing any person to work or to abstain from working, to watch or beset a house or place where a person resides or the approach to such a house or place, and any person who acts in contravention of this subsection shall be liable on summary conviction to a fine not exceeding 20 pounds or to imprisonment for a term not exceeding three months." It was further provided by s. 6: "(4) There shall be added to section five of the Conspiracy, and Protection of Property Act, 1875, the following provision, that is to say:—

'If any person employed by a local or other public authority wilfully breaks a contract of service with that authority, knowing or having reasonable cause to believe that the probable consequence of his so doing, either alone or in combination with others, will be to cause injury or danger or grave inconvenience to the community, he shall be liable, on summary conviction, to a fine not exceeding ten pounds or to imprisonment for a term not exceeding three months.' " A combination of two or more persons, even where not expressly provided for, would be punishable as a conspiracy, as provided in s. 3 of the act of 1875. (X.)

UNITED STATES

The American law of conspiracy is rooted firmly in the English common law, the influence of which is plainly discernible in most American decisions. In the United States the most important field to which the law of conspiracy has been applied is that of combinations in restraint of trade, whether these combinations are of labour with a view to securing concessions by employers or of industrial enterprises with a view to price fixing through control of production.

The Sherman Act.—In this connection a large body of law centres around the Sherman Anti-trust Act of 1890 and the Clayton Anti-trust Act of 1914. The first section of the Sherman Law makes every "conspiracy in restraint of trade and commerce among the states or with foreign nations illegal." Again in the third section it is made an offence "to combine or conspire with any other person or persons to monopolize any part" of such trade or commerce. The decisions interpreting the scope of the word "conspiracy" as used in the Sherman Law are very broad. A mere tacit understanding between persons to work to a common purpose will be a conspiracy. The exchange of trade information through organized channels with a view to influencing prices through control of production may be a violation. Always a criminal intent, that is, the intent to do something forbidden by the act, must be present, but the result intended is the criterion, and there need be no deliberate intention to violate the act. A series of acts in themselves innocent when taken together may give rise to the charge of conspiracy, when the collective effect is to limit commerce or to restrain trade. Furthermore a person who joins the combination or conspiracy after its inception will be equally guilty with the originators. Corporations, though artificial, may be guilty of conspiracy. Necessarily they act through agents and these agents together with the corporation are responsible.

The Sherman Law, being enacted in pursuance of Federal authority, is limited to interstate commerce or commerce between the nations. But it has been held that even though various defendants may be engaged exclusively in intrastate commerce, if they conspire to restrain the trade of other persons who are engaged in interstate commerce they will be guilty under the act.

The Clayton Act undertakes to define with greater precision certain types of conspiracy or combination in restraint of trade which are punishable. One of its principal purposes was to eliminate as a crime under the Sherman Law combinations among labourers for the purpose of achieving legitimate trade-union purposes. To that end certain trade-union practices were specifically permitted. In some instances, however, these practices were lawful at common law and therefore also under the Sherman Law. Thus the Clayton Act to a considerable degree is simply a legislative pronouncement of what was already the law. (R. P. B.)

CON SPIRITO (It.), "with spirit," a common direction in music, *spiritoso* having the same meaning.

CONSTABLE, ARCHIBALD (1774–1827), Scottish publisher, was born on Feb. 24, 1774, at Carnbee, Fife. In 1795 he started in business as a dealer in rare books. He bought the *Scots Magazine* in 1801, and John Leyden, the orientalist, became its editor; in Nov. 1802 he issued the first number of the *Edinburgh Review,* to which Lord Jeffrey, Sir Walter Scott, Henry Hallam, and afterwards Macaulay were the leading contributors. In 1805, jointly with Longman and Co., Constable published Scott's *Lay of the Last Minstrel,* and in 1807, *Marmion;* but in 1808 there was a split between Constable and Scott, who transferred his business to John Ballantyne and Co., until 1813, when that firm was in difficulties and Constable again became Scott's publisher. In 1812 Constable purchased the copyright of the *Encyclopædia Britannica,* adding the supplement (6 vols., 1816–24) to the 4th, 5th and 6th editions (*see* ENCYCLOPÆDIA); and in 1814 he bought the copyright of *Waverley.* The firm also published the *Annual Register.* In 1826 Constable failed for over £250,000, through over-speculation, while James Ballantyne and Co. also went bankrupt; Sir Walter Scott was involved in the failure of both firms; but Constable started business afresh, and began in 1827 *Constable's Miscellany of original and selected works,* a series of original works and of standard books republished in cheap form. He died on July 21, 1827. Archibald Constable's son, Thomas (1812–81), was appointed, in 1839, printer and publisher in Edinburgh to Queen Victoria.

See T. Constable, *Archibald Constable and his literary Correspondents* (3 vols. 1873).

CONSTABLE, HENRY (1562–1613), English poet, graduated from St. John's college, Cambridge, in 1580. He became a Roman Catholic, but nevertheless appears to have been in the secret service of the English Government in Paris in 1584 to 1585. In 1598 he was sent by the pope to Scotland to indicate the terms on which James VI. would be supported in his claim to the English throne, and later he was in the service of the king of France. Most of his adult life was spent abroad, and when he ventured to visit England in 1604 he was arrested. He died at Liége on Oct. 9, 1613. Constable has an early place in the development of the English sonnet. His *Diana, the praises of his Mistress in certain sweet sonnets, by H. C.*, which owes something to the *Diane* of Desportes, contained 23 poems, and was printed in 1592. The reprint of 1594 contains 76 pieces, many of them by other hands. Constable contributed four sonnets to Sidney's *Apologie of Poetry*, and four pastoral poems to *England's Helicon* (1600), one of which, the *Shepheardes Song of Venus and Adonis*, was certainly known to Shakespeare.

The second edition of *Diana* was reprinted by Arber in the *English Garner*, vol. ii. (1877). Sixteen *Spirituall Sonnettes* attributed to Constable were found in ms. and printed by Thomas Park in *Heliconia* (1815), and another small collection found in Canterbury by H. J. Todd was printed in the *Harleian Miscellany* (1813). Constable's works were edited by W. C. Hazlitt in 1859.

CONSTABLE, JOHN (1776–1837), English landscape painter, was born at East Bergholt in Suffolk on June 11, 1776. His father was a man of some property, including water-mills at Dedham and Flatford, and two windmills, in which John, the second son, was set to work at the age of 17, after leaving Dedham grammar school. From boyhood he was devoted to painting, which he studied in his spare time in company with John Dunthorne, a local plumber and glazier. While working thus he made the acquaintance of Sir George Beaumont, a mediocre painter but a keen patron of the arts, and was inspired by the sight of Claude's "Hagar and Ishmael" and by some drawings of Girtin which Sir George possessed. His passion for art increasing, he was allowed by his father to visit London in 1795 to consult the landscape-painter Joseph Farington, R.A. (1747–1821), who recognized his originality and gave him some technical hints. He also made the acquaintance of the engraver J. T. Smith, who taught him etching, and corresponded with him during the next few years, which were spent partly in London and partly in Suffolk. In 1797 he was recalled to work in his father's counting-house at Bergholt, and it was not till Feb. 1799 that he definitely adopted the profession of painting, and became a student at the Royal Academy. The few existing works of this period are heavy, clumsy and amateurish. Recognizing their faults, Constable worked hard at copying old masters "to acquire execution." In 1802 he exhibited at the Royal Academy, and was much helped and encouraged by the president, Benjamin West, who did him a further service by preventing him from accepting a drawing-mastership (offered by Archdeacon Fisher, of Salisbury), and thereby greatly stimulating his efforts. The manner of West appears strongly in the altar-piece painted by Constable for Brantham church in 1804, but Gainsborough, the Dutch masters and Girtin are the predominant influences upon his landscape, especially Girtin in the year 1805, and in 1806, when he visited the Lake District. From 1806 to 1809 Constable was frequently engaged in painting portraits or in copying portraits by Reynolds and Hoppner. The effect on his landscape was great. He learned how to construct an oil painting, and the efforts of the next few years were devoted to combining this knowledge with his innate love of the fresh colour of nature.

With the year 1811 began a critical period. He exhibited a large view of Dedham Vale, in which the characteristic features of his art appear for the first time almost fully developed, and he became attached to Miss Maria Bicknell. His suit was opposed by the lady's relatives, and Constable's apparently hopeless prospects drove him again to portrait-painting, in which he acquired considerable skill. Not until the death of his father in 1816 was he able to marry and settle in No. 1 Keppel street, Russell square, London, where a succession of works now well known was painted: "Flatford Mill" (1817), "A Cottage in a Cornfield," and in 1819 "The White Horse," which was bought by his great friend Archdeacon Fisher for £105, as was the "Stratford Mill" of 1820. In 1819 two legacies each of £4,000 diminished his domestic anxieties, and his talent was recognized by his election in November to the associateship of the Royal Academy. The series of important works was continued by "The Haywain" (1821), "A View on the Stour" (1822), "Salisbury Cathedral from the Bishop's Garden" (1823), and "The Lock" (1824). This last year was a memorable one. "The Haywain" was sold to a Frenchman, was exhibited at the Louvre, and, after creating a profound sensation among French artists, was awarded a gold medal. In the following year "The White Horse" won a similar distinction at Lille. In 1825 he exhibited "The Leaping Horse" (perhaps his masterpiece), in 1826 "The Cornfield," in 1827 "The Marine Parade and Chain Pier, Brighton," and in 1828 "Dedham Vale."

In 1822 Constable had taken Farington's house, 35 Charlotte street, Fitzroy square, London, but his wife's health failing he turned his attention to Hampstead. After temporary occupation first of 2 Lower terrace and then of a house on Downshire hill, he took No. 6 Well walk in 1827, letting the greater part of his London house. In 1828 his financial position was made secure by a legacy of £20,000 from Mr. Bicknell, but the death of his wife towards the end of the year was a shock from which he never wholly recovered. His election to membership of the Academy in the following year did not lessen his distress: he felt that the honour had been delayed too long. His chief exhibit in 1829 was "Hadleigh Castle," and this was succeeded by the great "Salisbury Cathedral from the Meadows" (1831), "The Opening of Waterloo Bridge" (1832), which had been begun in 1817, "Englefield House" (1833), "The Valley Farm" (1835), "The Cenotaph" (1836) and "Arundel Mill and Castle" (1837). Constable had long suffered from rheumatism and nervous depression but his sudden death on March 31, 1837, could be traced to no definite disease. He was buried in Hampstead churchyard, where his tomb may still be seen.

In May 1838 his remaining works were sold at auction, but fetched very small prices. Many were bought in by his children, and through their generosity have passed to the English nation, as the various national collections testify. Nowhere else can Constable's art be studied completely or safely, since forgeries and imitations are common and have crept into the Louvre and other famous galleries. Much of the power of his work survives in the noble series of mezzotints made after his sketches by David Lucas, and first issued in 1833. Though a commercial failure at the time of publication, this *English Landscape* series is now deservedly prized, as are the other plates which Lucas engraved after Constable. Constable himself made a few desultory experiments in etching, but they are of no importance.

As already indicated, the mature art of Constable did not develop till after the year 1811, when he began to combine the fresh colour of nature, which he had learned to depict by working in the open air, with the art of making a picture, which he had learned from painting portraits and copying those of other masters. His development was unusually slow, and his finest work, with but few exceptions, was done between his 40th and 50th years (1816–26). During the last 12 years of his life his manner became more free, and the palette knife was constantly used to apply spots and splashes of pure colour, so that his technique often suggests that afterwards employed by the Impressionists. Yet his direct influence upon French landscape has sometimes been overrated. When Constable first exhibited at the Salon in 1825 Théodore Rousseau, the pioneer of French naturalism, was only 12 years old, and the movement of 1830 was really originated in France by Gros and Géricault, while in England the water-colour painters led the way. Constable's death in 1837 removed the man and most of his work from the public eye for another generation, and he became a famous shadow rather than a living force. So Monet and the Impressionists, when they sought after the secret of painting air and sunshine, looked to Turner rather than to Constable, and in England the eloquence of Ruskin pointed in the same direction.

Since the British nation came into the possession of a large portion of Constable's pictures and sketches, his work has been better understood. Though limited in range of subject to the scenery of Suffolk, Hampstead, Salisbury and Brighton, his sketches express the tone, colour, movement and atmosphere of the scenes represented with unrivalled force and truthfulness, and modern criticism tends to rate their spontaneity above the deliberate accomplishment of his large finished works. His treatment of skies is specially notable. Here his early experience as a miller told in his favour. No one has painted English cloud effects so truthfully, or used them as a compositional quantity with so much skill. Though in looking at nature he was determined to see with his own eyes and not with those of any former master, he found that the science of his predecessors was necessary to him before his sketches could be translated into large pictures. In these pictures his vivid tones and fresh colour are grafted upon the formulae of Claude and Rubens, and it is a common error to regard Constable as an opponent of the great old masters. His pictures, like his writings and lectures, prove just the reverse. His dislike was reserved for the painters who took their ideas from other painters instead of getting them directly from nature.

(C. J. H.)

Bibliography.—C. R. Leslie, *Memoirs of the Life of John Constable, R.A.* (2nd ed. 1845, 3rd ed. 1896) (the classical work on the subject); *English Landscape Scenery, a Series of Forty Mezzotint Engravings on Steel, by David Lucas, from pictures painted by John Constable, R.A.* (folio, 1855). The large work on *Constable and his Influence on Landscape Painting*, by C. J. Holmes (1902), contains the only chronological catalogue of Constable's paintings and sketches. Leslie's biography has been admirably rendered into French by Léon Bazalgette (1905). *See* also A. B. Chamberlain, *John Constable* (1903); Lord Windsor, *John Constable, R.A.* (1903); Sir J. D. Linton, *Constable's Sketches in Oil and Water-colour* (1905); E. V. Lucas, *John Constable, the Painter* (1924).

CONSTABLE, SIR MARMADUKE (*c.* 1455–1518), English soldier, was descended from a certain Robert (d. 1216), lord of Flamborough, who was related to the Lacys, hereditary constables of Chester, hence the surname of the family. A son of Sir Robert Constable (d. 1488), Marmaduke was in France with Edward IV. in 1475 and with Henry VII. in 1492. After being sheriff of Staffordshire and Yorkshire, he fought at the battle of Flodden in 1513. He died on Nov. 20, 1518.

Sir Marmaduke's eldest son, Sir Robert Constable (*c.* 1478–1537), helped Henry VII. to defeat the Cornish rebels at Blackheath in 1497. In 1536, he took part in the rising known as the Pilgrimage of Grace which broke out in the north of England. He was tried for treason and hanged in 1537.

Sir Marmaduke's second son, Sir Marmaduke (*c.* 1480–1545), was knighted after the battle of Flodden, and was at the Field of the Cloth of Gold in 1520. He was a knight of the shire for Yorkshire and then for Warwickshire, and was a member of the Council of the North from 1537 until his death.

Another noteworthy member of this family was the regicide, Sir William Constable (d. 1655), created a baronet in 1611. He fought with the parliamentarians at Edgehill and in 1644 in north Yorkshire. In 1648, he became governor of Gloucester. He was one of the king's judges, was a member of the council of state under Cromwell, and died on June 15, 1655.

CONSTABLE, a title now confined to the lord high constable of England, the lord constable of Scotland, the constables of some royal castles in England, and to certain executive legal officials of inferior rank in Great Britain and the United States.

The Byzantine *comes stabuli* (κόμης τοῦ σταβλοῦ) was in his origin simply the imperial master of the horse, the head of the imperial stables, and a great officer of state. From the East the title was borrowed by the Frankish kings, and during the Carolingian epoch a *comes stabuli* was at the head of the royal stud, the marshals (*marescalci*) being under his orders. The office survived and expanded in France under the Capetian dynasty; in the 11th century the constable has not only the general superintendence of the royal stud, but an important command in the army—though still under the orders of the seneschal—and certain limited powers of jurisdiction. From this time onward the office of constable tended, in France, continually to increase in importance. In the 14th century, owing to the confusion of his prerogatives as the royal lieutenant with his functions as constable, the constable was recognized as commander-in-chief of the army. The French kings never allowed the office of constable to become hereditary, and in Jan. 1627, after the death of François de Bonne, duc de Lesdiguières, the office was suppressed by royal edict.

The jurisdiction of the constable, known as the *connétablie et maréchaussée de France,* was held in fee until the abolition of the office of constable, when it became a royal court, presided over by the *lieutenant général* with the *lieutenant particulier* and the *procureur du roi* as assessors. Its seat was ultimately fixed at Paris, as part of the organization of the parlement. Its jurisdiction, which included all military persons and causes, was somewhat vaguely extended to embrace all crimes of violence, etc., committed outside the jurisdiction of the towns; it thus came often into conflict with that of the other royal courts.

The Gothic kings of Spain and, later on, the kings of Naples also, had their *comites stabuli* with similar functions.

In England the title of constable was unknown before the Conquest, though the functions of the office were practically those of the English *staller*. In the laws of Edward the Confessor the title constable is mentioned as the French equivalent for the English *heretoga*. After the Conquest the constable duly makes his appearance as "quartermaster general of the court and of the army." From the first, however, the title of constable was not confined to the constable proper, whose office in the reign of Stephen was made hereditary under the style of high constable (*see* Lord High Constable); for under the Norman and Angevin kings, the title soon came to be loosely applied to any high military command. Its extension to officials exercising civil jurisdiction is not difficult to account for. In feudal society, based as this was on a military organization, it is easy to see how the military jurisdiction of the constables would tend to encroach on that of the civil magistrates. The origin of the modern chief and petty constables, however, is to be traced to the Statute of Winchester of 1285, by which the national militia was organized by a blending of the military system with the constitution of the shires. Under this act a chief or high constable was appointed in every hundred; while in the old tithings and *villatae* the village bailiff was generally appointed a petty constable. The high and petty constables remained the executive legal officers in the counties until the County Police Acts of 1839 and 1840 reorganized the county police. In 1842 an important statute was passed enacting that for the future no appointment of a petty constable, headborough, borsholder, tithing-man or peace officer of the like description should be made for any parish at any court leet, except for purposes unconnected with the preservation of the peace, and providing, as a means of increasing the security of persons and property, for the appointment by justices of the peace in divisional petty sessions of fit persons or their substitutes to act as constables in the several parishes of England, and giving vestries an optional power of providing paid constables. Under the Acts of 1839 and 1840 the establishment of a paid county police force was optional with the justices. With the Police Act of 1856 this optional power became compulsory, and thenceforth the history of the petty constable in England is that of the police. By the High Constables Act, 1869, the office of high constable was abolished, and, as the establishment of an efficient police force rendered the general appointment of parish constables unnecessary, the appointment ceased, subject to the appointment by vestries of paid constables under the chief constable of the county (Parish Constables Act 1872). *See* further, Police.

"Special constables" are peace officers appointed to act on occasional emergencies when the ordinary police force is thought to be deficient.

In the United States, outside the larger towns, the petty constable retains much the same status as in England before the Act of 1842. He still has a limited judicial power as conservator of the peace, and often exercises various additional functions, such as that of tax-collector or overseer of the roads or other duties, as may be decided for him by the community which appoints him. In the old colonial days the office, borrowed from England, was of much importance. The office of high constable existed also in Philadelphia and New York, in the latter city until 1830, and in some towns the title has been retained for the chief of the police force.

CONSTANCE or **KONSTANZ,** a town in the *Land* of Baden, Germany, on the south or left bank of the Rhine, as it flows from the Lake of Constance to form the Untersee. Pop. (1939) 38,469. It is some 30 mi. by rail from Schaffhausen (on the west) and 22½ mi. along the south-west shore of the lake from Rorschach. A fine bridge leads north over the Rhine to one suburb, Petershausen, while to the south the town gradually merges into the Swiss suburb of Kreuzlingen. Constance, originally a Roman station, was a bishop's see from the 6th century (transferred hither from Vindonissa, near Brugg, in the Aargau) till its suppression in 1821. To this it owes its importance. The bishop was a prince of the Holy Roman empire, while his diocese included at one time most of Baden and Württemberg and a large portion of Switzerland. Towards the end of the 12th century the city became an imperial free city, but the bishop practically ruled it till the time of the Reformation. The former cathedral church was erected 1069–89, but was later rebuilt in Gothic style. The Dominican convent, on an island east of the town, is now a hotel, but the buildings (especially the cloisters) are well preserved. The *Kaufhaus* (warehouse for goods) is 14th century, while the town hall dates from 1592. In the market-place are the *Gasthaus zum Barbarossa,* where Frederick Barbarossa is said to have signed the peace of Constance (1183), while in the house named *zum Hohen Hafen* the emperor Sigismund is said to have invested Frederick of Hohenzollern with the mark of Brandenburg (1417). A great Reforming Church council was held in Constance from 1414–18. It condemned and burned John Huss in 1415 and Jerome of Prague in 1416. Constance is the natural capital of the Thurgau, so that when in 1460 the Swiss wrested that region from the Austrians, the town and the Swiss Confederation should have been naturally drawn together. But Constance refused to give up to the Swiss the right of exercising criminal jurisdiction in the Thurgau, which it had obtained from the emperor in 1417, while the Austrians, having bought Bregenz, were also desirous of securing the city. In 1530 Constance (whose bishop had been forced to flee in 1527 to Meersburg) joined, with Strasbourg, Memmingen and Lindau, the Schmalkalden League. But after the defeat of the Protestants in 1547 at Mühlberg the city found itself isolated in southern Germany. The Austrians had long tried to obtain influence in the town, especially when its support of the Protestant cause attracted the sympathy of the Swiss. Hence Charles V. in 1548 forced it to surrender to the imperial authority and to receive the bishop again and consent to annexation to the Austrian dominions. Protestantism was then vigorously stamped out. In 1633 Constance resisted successfully an attempt of the Swedes to take it, and in 1805, by the treaty of Pressburg, was handed over by Austria to Baden. Constance trades in textiles and iron goods and is a tourist centre.

CONSTANCE, COUNCIL OF. This council, convoked at the instance of the emperor Sigismund by Pope John XXIII.—one of the three popes among whom Christendom was at the time divided—with the object of putting an end to the Great Schism of the West and reforming the church, was opened on Nov. 5, 1414, and did not close until April 22, 1418. In spite of his reluctance to go to Constance, John XXIII., who succeeded Alexander V. (the pope elected by the council of Pisa), hoped that the new council, while confirming the work of the council of Pisa, would proclaim him sole legitimate pope and definitely condemn his two rivals, Gregory XII. and Benedict XIII. But he was soon forced to renounce this hope. So urgent was the need of restoring union at any cost that even prelates who had taken an active part in the work of the council of Pisa, *e.g.,* Pierre d'Ailly, cardinal bishop of Cambrai, were forced to admit, in view of the fact that the decisions of that council had been and were still contested, that the only possible course was to reconsider the question of the union *de novo,* entirely disregarding all previous deliberations on the subject, and treating the claims of John and his two competitors with the strictest impartiality. Feebly supported by the Italians, by the majority of the cardinals, and by the representatives of the king of France, John soon found himself in danger of being driven to abdicate and fled into Austria.

The fathers, determined to have their will carried out, drew up in their 4th and 5th sessions (March 30 and April 6, 1415) a set of decrees with the intention of justifying their attitude and putting the fugitive pope at their mercy. Interpreted in the most general sense, these decrees, which enacted that the council of Constance derived its power immediately from Christ, and that everyone, even the pope, was bound to obey it and every legitimately assembled general council in all that concerned faith, reform, union, etc., were tantamount to the overturning of the constitution of the church by establishing the superiority of the council over the pope. The validity of the decrees was especially contested on the ground that the council was not ecumenical, since it represented at that date the obedience of only one of three rival popes. Nevertheless, John, who had been abandoned by the duke of Austria and imprisoned in the castle of Radolfzell, near Constance, was arraigned, suspended and deposed (May 29), and himself ratified the sentence of the council. Gregory XII. was next required to renounce his rights, and this he did, with as much independence as dignity, through a legate, who previously convoked the council in the name of his master, and thus in some sort gave it the necessary confirmed authority. This was the regular extinction of the line of pontiffs who, if the validity of the election of Urban VI. on April 8, 1378, be admitted, had held the legitimate papacy for thirty-seven years. All that remained was to obtain the abdication of Benedict XIII., the successor of the Avignon pope, Clement VII, but the combined efforts of the council and the emperor were powerless to overcome the obstinacy of the Aragonese pope. Abandoned by almost all his adherents Benedict found refuge in the impregnable castle of Peñiscola, overlooking the Mediterranean, and remained intractable. At the council proceedings were instituted against him, which ended at last on July 26, 1417, in his deposition.

The action of the council of Constance in renewing the condemnation of the doctrines of Wycliffe pronounced at Rome in 1413, and in condemning and executing John Huss and Jerome of Prague (*qq.v.*), is dealt with elsewhere; nor is it possible to mention here all the intrigues and quarrels that arose during three and a half years among the crowd of prelates, monks, doctors, simple clerks, princes and ambassadors composing this tumultuous assembly. From the outset, voting by count of heads had been superseded by voting according to nations, *i.e.,* all questions were deliberated and settled in four distinct assemblies—the Italian, the French, the German and the English,—the decisions of the nations receiving a formal ratification afterwards by the council in general congregation, and also, if occasion arose, in public session (it is noteworthy that the English, who had hitherto been considered to form part of the German "nation," were recognized as a separate nation at this council for the first time). These four groups, however, were of unequal importance, and thanks to this arrangement the English, although weakest in point of numbers, were able to exercise the same influence in the council as if they had formed a fourth of the voters.

The reform which the council had set itself to effect was a subject the fathers could not broach without stirring up dissension: some stood out obstinately for preserving the *status quo,* while others contemplated nothing less than the transformation of the monarchical administration of the church into a parliamentary democracy, the subordination of the sovereign pontiff, and the annihilation of the Sacred College. In view of these difficulties, the opinion which tended to assure the success of one at least of the great tasks before the council, viz., the re-establishment of unity by the election of a single pope, finally prevailed. The general reform on which the council had failed to come to an understanding had to be adjourned, and the council contented itself with promulgating, on Oct. 9, 1417, certain reforming decrees on which an agreement could be reached; *e.g.,* the principle of the periodicity of the councils (the first was to assemble after the lapse of five years, the second within the next seven years, and subsequent councils were to meet decennially). In the event of a fresh schism, the council, which bound itself to assemble immediately, even without formal convocation, was to remain sole judge of the conflict. The execution of the general reform of the church in its head and members was left in the hands of the future pope, who had to proceed conjointly with the council, or rather with a commission appointed by the nations—in other words, once the new pope was elected, the fathers, conscious of their impotence, were disinclined to postpone their dispersion until the laborious achievement of the reform. On March 21, 1418, however, seven additional points were agreed on.

In order to rebuild the see of St. Peter on a basis now cleared of obstacles, an attempt was made to surround the election of the future pope with all the necessary guarantees. The authority of the cardinals, who were the only persons judicially invested with the right of electing the pope, emerged from the crisis through which the church had just passed in far too feeble and contested a condition to carry by its own weight the general assent. It was therefore decided that with the cardinals each nation should associate six delegates, and that the successful candidate should be required to poll two-thirds of the suffrages, not only in the Sacred College, but also in each of these five groups. The advantage of this arrangement was that the choice of the future pope would depend, not only on the vote of the cardinals, thus safeguarding tradition, but at the same time on the unanimous consent of the various nations, by which the adhesion of the whole Catholic world to the election would be guaranteed. There was, indeed, a danger lest the rivalries in the assembly might render it exceedingly difficult, not to say impossible, to obtain such unanimity. But at the end of three days the conclave resulted in the election of Cardinal Otto Colonna, who took the name of Martin V. (Nov. 11, 1417), and the Great Schism of the West was at an end.

To all seeming the pope had admitted the canonicity of several of the decrees of Constance—for instance, he had submitted to the necessity of the periodical convocation of other councils; but from his reticence on some points, as well as from his general attitude and some of his constitutions, it appeared that the whole of the decrees of Constance did not receive his unqualified approval, and without any definite pronouncement he made some reservations in the case of decrees which were detrimental to the rights and pre-eminence of the Holy See.

See Hefele-Leclercq, *Histoire des conciles,* VII, 108–584 (1916); art. "Constance" in the *Catholic Encyclopaedia;* M. Creighton, *History of the Papacy from the Great Schism,* vols. i., ii. (1897); N. Valois, *La France et le grand schisme de l'Occident* (1896 ff.); H. Finke, *Forschungen u. Quellen zur Geschichte des Konstanzer Konzils* (1889).

CONSTANCE, LAKE OF (Bodensee), after Lake Geneva the largest lake in the Alpine region, is on the north-east frontier of Switzerland, and is formed by the Rhine. Its north-west end divides into two arms, the *Untersee* (from Constance to Stein-am-Rhein) and the *Überlingersee* (running up to Ludwigshafen). From Bregenz to Stein-am-Rhein it is 46½ mi. long and from Bregenz to Ludwigshafen 40 miles. Its surface is 1,309 ft. above sea-level, greatest width 10½ mi., and greatest depth 827 feet. The area of the lake is 204¾ sq.mi., part being in Switzerland (cantons of Thurgau and St. Gall), part in Austria, and portions in Baden, Württemberg and Bavaria. For accounts of ancient lake dwellings *see* H. Reinerth, *Die jungere Steinzeit der Schweiz* (1927).

CONSTANS I, FLAVIUS JULIUS (d. 350), emperor of the west, was the son of Constantine the Great and Fausta. Under his father he governed western Illyricum, Italy and Africa, and at the division of the empire in 337 he received this share as emperor. His brother Constantine II invaded him in 340, but was defeated and killed. He was killed in the rebellion of Magnentius, in the Pyrenees, in 350.

See Aurel, Vict., *de Caes.* xli; *Cambridge Mediaeval History,* vol. i.

CONSTANS II (FLAVIUS HERACLIUS) (630–668), emperor of the east from 641 to 668, was the son of Constantine III and Gregoria and was born on Nov. 7, 630. He succeeded, after an interval due to the usurpation of Heracleonas, in 641, with Valentine as regent. His reign is notable for disasters at the hands of the Arabs and the Lombards. He fitted out an expedition to recover Egypt then occupied by the Arabs and tried to get assistance from China. The only result was that the Arabs attacked Greek North Africa, and while he was engaged there, Mu-Awijah took Syria and Cyprus and ravaged Cilicia. In 651 the Arabs extended their hold on Sicily and captured Rhodes. In 655, the loss of the sea fight off Lycia endangered Constantinople itself, but Constans profited by the internal dissensions of the Arabs and won some successes on the Danube. The Lombards invaded north Italy at the beginning of his reign. Constans decided to turn them out, and made the last recorded attempt to re-establish Rome as the centre of the united empire. He left for Italy in 662 and at first was successful, but then failed and went to live in Syracuse. Africa then revolted under a new tribute and was lost, and the reign closed with further losses in Italy and the Greek provinces. Constans died mysteriously in his bath at Syracuse on July 15, 668. The reign is also notable for heretical disturbances, and an edict of Constans, the *Typus,* prohibits all religious discussion. In 653 the exarch Calliopas captured the pope.

See Zonaras ii, 87.

CONSTANS, JEAN ANTOINE (1833–1913), French statesman, was born at Béziers on May 3, 1833, and died in Paris on April 7, 1913. He was professor of law at Douai and then at Toulouse until he was elected deputy for the latter city in 1876. He was minister of the interior in the Freycinet cabinet of 1880, and again, during the Boulangist agitation, in the Tirard and Freycinet cabinets (1889–92). He took strong measures against the Boulangists and against the Ligue des Patriotes, and was violently attacked for his action in the press. Constans was ambassador at Constantinople from 1898 to 1907.

CONSTANT, BENJAMIN JEAN JOSEPH (1845–1902), French painter, was born in Paris, and studied under Cabanel. His first Salon picture, "Hamlet et le Roi," was hung in 1869, and he became at once one of the recognized modern masters in France. In addition to a number of subject-pictures, such as "Trop Tard" (1870), "Samson et Délilah" (1871), and others taken from Moroccan studies, he was an eminent painter of portraits of some of the most prominent men and women of the day, one of his last being that of Queen Victoria (1900).

See G. Haller, *Le Salon: Dix ans ae Peinture* (1902).

CONSTANT, a quantity which does not vary. In mathematics and physics a quantity may be constant with respect to one variable but not with respect to another. Many so-called physical constants are constant under certain conditions only; *e.g.,* the boiling point of a pure substance is constant only if the atmospheric pressure is constant (*see* VAPORIZATION). On the other hand there are constants which express invariable ratios, such as the *gas constant R* (*see* THERMODYNAMICS), the *gravitational constant* (*see* GRAVITATION), and *Avogadro's constant* (*q.v.*) *N.* The elementary electric charge *e* (*see* ELECTRON) is an example of the invariable measure of a physical property. Another type of physical constant is the *universal constant, e.g.,* Plank's constant *h,* the element of action (*see* QUANTUM MECHANICS). A famous physical constant is the *velocity of light* (*see* LIGHT), approximately 3×10^{10} cm. per second.

CONSTANȚA, a seaport on the Black Sea, and capital of the department of Constanța, Rumania; 149 mi. east by south from Bucharest by rail. Pop. (1939) 61,412. Constanța was founded as Constantiana by Constantine the Great (A.D. 274–337) in honour of his sister Constantia. Tomi, where Ovid spent eight years of exile, is near by. The bulk of the town was rebuilt after its cession to Rumania in 1878. It was severely damaged in World War I, but afterwards recovered very rapidly, especially owing to the absence of competition from Odessa. It likewise developed as a bathing station, and there are mineral springs in the neighbourhood. There are hotels, a casino, broad streets and numerous mosques, churches and synagogues for the mixed population; it has a small local industry, but Constanța's principal importance is as Rumania's chief outlet to the Black sea, and it does a large transit trade, the main exports being oil and cereals, and imports coal, coke, machinery, iron goods and textiles. A pipe line runs to the Rumanian oil fields; there are many oil storage tanks, and a special basin for vessels loading with petroleum. The harbour is protected by two breakwaters; it requires constant dredging, but has a depth of 20 ft. beside the quays, and 24 ft. in the eastern portion. There are nearly 3 mi. of quays, with coal and timber wharfs, warehouses and grain elevators, and the railway alongside. The harbour accommodates 30 large steamers, with further space on the western side. There are steamship services to Constantinople-Peiraeeus-Naples, Constantinople and Alexandria, and two runs monthly are made to Jaffa and Haifa. Constanța was used by the Germans in World War II as a supply base for their armies in the U.S.S.R.

CONSTANT DE REBECQUE, HENRI BENJAMIN (1767–1830), French writer and politician, was born in Lausanne on Oct. 25, 1767, the son of Juste Arnold de Constant, who commanded a regiment in the Dutch service. After a good private education at Brussels he was sent to Oxford, Erlangen and then to Edinburgh, where he came into contact with prominent Whigs. He returned to Switzerland in 1786, and in the next year visited Paris, where he met Madame de Charrière, who, although 27 years older than Constant, became his mistress, and the *liaison,* an affair possibly more of the intellect than of the heart, lasted until 1796, when Constant became intimate with Madame de Staël. He became chamberlain at the court of Charles William, duke of Brunswick, and in 1789 he married one of the ladies-in-waiting, Wilhelmina, Baroness Chramm. On the dissolution of his marriage in 1794 he resigned a post which his republican opinions made distasteful.

Constant, who had met Madame de Staël at Lausanne in 1794, followed her in the next year to Paris; by 1796 he had established with her intimate relations, which, in spite of many storms, endured for ten years. In 1796 he published two pamphlets in defence of the Directory and against the counter-revolution, and he supported Barras in 1797 and 1799 in the *coups d'état* of 18 Fructidor, and of 18 Brumaire. In Dec. 1799 he was nominated a member of the Tribunate, where he showed from the outset an independence quite unacceptable to Napoleon, by whom he was removed in the "creaming" of that assembly in 1802. The salon of Madame de Staël was a centre for those disaffected from the Napoleonic régime, and in 1803 he followed her into exile. Much of Constant's time was spent with her at Coppet; but he also made long sojourns at Weimar, where he mixed in the Goethe-Schiller circle, and accumulated material for the work on religion which he had begun, so far back as 1787, at Colombier. His relations with Madame de Staël became more and more difficult, and in 1808 he secretly married Charlotte von Hardenberg, whom he had known at Brunswick, and whose divorce from her second husband, General Dutertre, he had secured.

The Napoleonic reverses of 1813 brought him back to politics, and in November he published at Hanover his *De l'esprit de conquête et de l'usurpation dans leurs rapports avec la civilisation européenne,* directed against Napoleon. He also entered into relations with the crown prince of Sweden (Bernadotte). On his return to Paris, during its occupation by the allied sovereigns, he was well received by the emperor Alexander I. of Russia, and resumed his old place in the Liberal salon of Madame de Staël. In a series of pamphlets he advocated the principles of a Liberal monarchy and the freedom of the press. At this point began the second great attachment of his life, his infatuation for Madame Récamier, under whose influence he committed the worst blunder of his political career, for, after an interview with Napoleon on April 10, he became a supporter of his Government and drew up the *Acte constitutionnel.* The return of Louis XVIII. drove him into exile.

In London in 1815 he published *Adolphe,* one of the earlier examples of the psychological, autobiographical novel. In 1816 he was again in Paris, advocating Liberal constitutional principles. He founded in 1818 with other Liberal journalists the *Minerve française* and in 1820 *La Renommée.* In 1819 he was returned to the Chamber of Deputies. Perhaps the greatest service he rendered to his party was his consistent advocacy of the freedom of the press. At the outbreak of the revolution of 1830 he was absent from Paris, but he returned at the request of Lafayette to take his share in the elevation of Louis Philippe to the throne. On Aug. 27 he was made president of the council of State. He died on Dec. 8 of the same year. During his later years he had been a cripple in consequence of a fall in the Chamber of Deputies, and he fought the last of his many duels sitting in a chair. After the death, in 1817, of Madame de Staël, whom he continued to visit daily until the end, he had ceased to go into society, giving himself up to his passion for play.

In the most important of his writings, *De la religion considérée dans sa source, ses formes, et ses développements* (5 vols., 1825–31), Constant traces the successive transformations of the religious sentiment imperishable under its varying forms. Besides *Adolphe,* in its way as important as Chateaubriand's *René,* he left two other sketches of novels in ms., which are apparently lost. His political tracts were collected by himself as, *Collection complète des ouvrages publiés sur . . . la France, formant une espèce de cours de politique constitutionnelle* (4 vols., 1818–20), as were his *Discours à la Chambre des Députés* (2 vols., 1827).

BIBLIOGRAPHY.—See Constant's *Cahier rouge,* published first in 1907, containing his autobiography from 1767 to 1787; *Journal intime* (1804–16), re-edited with the *Lettres à sa famille* by D. Melegari in 1895; the semi-autobiographical *Adolphe;* his letters to Madame de Charrière; to Madame Récamier, edited by Madame Lenormant in 1882. His ordinary diary has disappeared, with his letters to his wife and to Madame de Staël. *See* further, Éd. Herriot, *Madame de Récamier et ses amis* (1904); Sainte-Beuve in *Derniers portraits littéraires* (B. Constant and Madame de Charrière), *Causeries du lundi* (vol. xi.), *Nouveaux lundis* (vol. i.); É. Faguet, *Politiques et moralistes du XIX^{e} siècle* (1ère série, 1891); P. Godet, *Madame de Charrière et ses amis* (Geneva, 1905); L. Michon, *Le Gouvernement parlementaire sous la Restauration* (1905), containing an analysis of the more important of Constant's political writings; G. Rudler, *La Jeunesse de B. Constant,* and *Bibliographie critique* (1909); G. Declareuil, *De l'esprit de conquête ou Benjamin Constant, cosmopolite, positiviste et anti-militariste* (1920).

CONSTANTIA, a district of Cape Colony, in the Cape peninsula, noted for the excellent quality of its wines, the best produced in South Africa. The Government wine farm, Groot Constantia, 10 mi. S. of Capetown, contains over 150,000 vines. This and the adjacent farm of High Constantia are the only farms on which the vines yielding the finest wines flourish. The district is also celebrated for the excellence of the fruit it yields. Groot Constantia House is a good example of the Dutch colonial dwelling-houses of the 17th century. It was built (*c.* 1684) by the governor Simon van der Stell, and named in honour of his wife Constance. Van der Stell also laid out the vineyard, which soon attained a wide reputation. *Old Cape Colony,* by Mrs. A. F. Trotter (1903) contains a plan and sketches of Groot Constantia.

CONSTANTINE VI. (1861–1930), Patriarch of the Greek Orthodox Church, whose family name was Araboghlou, was born at Sigmi, Anatolia, became metropolitan of Derkos, and succeeded Gregory VII. as Oecumenical Patriarch on Dec. 17, 1924, but was expelled from Constantinople on Jan. 30, 1925, on the ground that he was not "domiciled" in the sense of the terms of the treaty of Lausanne. He retired to Salonika, and resigned in order to avoid friction. He was succeeded in the patriarchate by Basil Georgiades, metropolitan of Nicaea.

For a full account of the dispute over the expulsion of Constantine see *Survey of Internat. Aff. 1925,* vol. ii., pp. 266 *et seq.* (1927).

CONSTANTINE, the name of several Roman emperors.

CONSTANTINE I., known as "The Great" (288?–337), Roman emperor, was born on Feb. 27, probably A.D. 288, at Naissus (the modern Nish) in upper Moesia (Serbia). He was the illegitimate son of Constantius I. and Flavia Helena (described by St. Ambrose as an innkeeper). While still a boy, Constantine was sent—practically as a hostage—to the Eastern court. He accompanied Diocletian to the East in 302, was invested with the rank of *tribunus primi ordinis* and served under Galerius on the Danube. In 305 Diocletian and Maximianus abdicated, and Constantius and Galerius became Augusti, while Severus and Maximin Daia attained the rank of Caesars. Constantius now demanded from Galerius the restoration of his son, which was unwillingly granted; indeed, we are told that Constantine only escaped from the court of Galerius by flight, and evaded pursuit by carrying off all the post-horses! He found his father at Bononia (Boulogne), on the point of crossing to Britain to repel an invasion of Picts and Scots. After gaining a victory, Constantius died at Eboracum (York) and on July 25, 306, the army acclaimed his son as

Augustus. Constantine, however, accepted the nomination of the army with feigned reluctance and wrote a carefully worded letter to Galerius, disclaiming responsibility for the action of the troops, but requesting recognition as Caesar. Galerius was not in a position to refuse the request, in view of the temper of the western army, and for a year Constantine bore the title of Caesar not only in his own provinces, but in those of the East as well. He fought with success against the Franks and Alamanni, and reorganized the defenses of the Rhine. The rising of Maxentius (*q.v.*) at Rome (Oct. 28), supported by his father Maximianus (*q.v.*), led to the defeat, capture and death of the western Augustus, Severus. Maximianus thereupon recognized Constantine as Augustus (A.D. 307); their alliance was confirmed by the marriage of Constantine with Fausta, the daughter of Maximianus, and the father and son-in-law held the consulship, which, however, was not recognized in the East. Galerius now invaded Italy, but was forced by a mutiny of his troops to retire from the gates of Rome. Maximianus urged Constantine to fall upon the flank of his retreating army, but he once more showed his determination to tread the strict path of legitimacy. In 308 Diocletian and Galerius held a conference at Carnuntum and determined to annul the actions of the Western rulers. Maximianus was set aside, Licinius invested with the purple as Augustus of the West (Nov. 11), while the title *filius Augustorum* was conferred upon Constantine and Maximin Daia. Constantine tacitly ignored this arrangement; he continued to bear the title of Augustus, and in 309, when he himself was proclaimed consul (with Licinius) in the East, no consuls were recognized in his dominions. In 310, while Constantine was engaged in repelling an inroad of the Franks, Maximianus endeavoured to resume the purple at Arelate (Arles). Constantine returned in haste from the Rhine, and pursued Maximianus to Massilia, where he was captured and put to death. Since Constantine's legal title to the Empire of the West rested on his recognition by Maximianus, he had now to seek for a new ground of legitimacy, and found it in the assertion of his descent from Claudius Gothicus (*q.v.*), who was represented as the father of Constantius Chlorus.

Constantine's patience was soon rewarded. In 311 Galerius died, and Maximin Daia (who had assumed the style of Augustus in 310) at once marched to the shores of the Bosporus and at the same time entered into negotiations with Maxentius. This threw Licinius into the arms of Constantine, who entered into alliance with him and betrothed his half-sister Constantia to him. In the spring of 312 Constantine crossed the Alps, before Maxentius had completed his preparations. The force he commanded was of uncertain strength; according to his panegyrist (who may have underrated it) it consisted of about 25,000, according to Zonaras of nearly 100,000 men. He stormed Susa, defeated Maxentius's generals at Turin and Verona, and marched straight for Rome. This bold move, which contrasted strongly with Constantine's usual caution, was, it would seem, the result of an event which, as told in Eusebius's *Life of Constantine,* takes the form of a conspicuous miracle—the Vision of the Flaming Cross which appeared in the sky at noonday with the legend Ἐν τούτῳ νίκα ("By this conquer"), and led to Constantine's conversion to Christianity. Eusebius professes to have heard the story from the lips of Constantine; but he wrote after the emperor's death, and it was evidently unknown to him in the shape given above when he wrote the *Ecclesiastical History.* The author of the *De mortibus persecutorum* was a well-informed contemporary, and he tells us that the sign was seen by Constantine in a dream; and even Eusebius supplements the vision by day with a dream in the following night. In any case, Constantine adopted the monogram ☧ (borne on the *labarum* [*q.v.*]) as his device.

Maxentius, trusting in superiority of numbers, marched out of Rome and prepared to dispute the passage of the Tiber at the Pons Mulvius (Ponte Molle), beside which a bridge of boats was constructed (*see* SAXA RUBRA). The army which Constantine had been training for six years at once proved its superiority. The Gallic cavalry swept the left wing of the enemy into the Tiber, and with it perished Maxentius, owing, as was said, to the collapse of the bridge of boats (Oct. 28, 312). The remainder of his troops surrendered at discretion and were incorporated by Constantine in the ranks of his army, with the exception of the praetorian guard, which was finally disbanded.

Thus Constantine became undisputed master of Rome and the West, and Christianity, although not as yet adopted as the official religion, secured by the edict of Milan toleration throughout the empire. This edict was the result of a conference between Constantine and Licinius in 313 at Milan, where the marriage of the latter with Constantia took place. In 314 war broke out between the two Augusti, owing, as we are told, to the treachery of Bassianus, the husband of Constantine's sister Anastasia, for whom he had claimed the rank of Caesar. After two hard-won victories Constantine made peace, Illyricum and Greece being added to his dominions. Constantine and Licinius held the consulship in 315.

Peace was preserved for nearly nine years, during which the wise government of Constantine strengthened his position, while Licinius (who resumed the persecution of the Christians in 321) steadily lost ground. Great armaments were called into being by both emperors, and in the spring of 324 Licinius (whose forces are said to have been superior in numbers) declared war. He was twice defeated, first at Adrianople (July 1) and afterwards at Chrysopolis (Sept. 18), when endeavouring to raise the siege of Byzantium, and was finally captured at Nicomedia. His life was spared on the intercession of Constantia and he was interned at Thessalonica, where he was executed in the following year on the charge of treasonable correspondence with the barbarians.

Constantine now reigned as sole emperor in East and West, presiding at the council of Nicaea (*see* under NICAEA, COUNCIL OF and COUNCIL) in 325. In the following year his eldest son, Crispus, was banished to Pola and there put to death on a charge brought against him by Fausta. Shortly afterwards, as it would seem, Constantine became convinced of his innocence, and ordered Fausta to be executed. The precise nature of the circumstances remains a mystery.

In 326 Constantine determined to remove the seat of empire from Rome to the East, and before the close of the year the foundation-stone of Constantinople was laid. At least two other sites—Sardica and Troy—were considered before the emperor's choice fell on Byzantium. It is probable that this step was connected with Constantine's decision to make Christianity the official religion of the empire. Rome was naturally the stronghold of paganism, to which the great majority of the senate clung with fervent devotion. Constantine did not wish to do open violence to this sentiment, and therefore resolved to found a new capital for the new empire of his creation. He announced that the site had been revealed to him in a dream; the ceremony of inauguration was performed by Christian ecclesiastics on May 11, 330, when the city was dedicated to the Blessed Virgin.

In 332 Constantine was called in to aid the Sarmatians against the Goths, over whom his son gained a great victory. Two years later there was again fighting on the Danube, when 300,000 Sarmatians were settled in Roman territory. In 335 a rebellion in Cyprus gave Constantine an excuse for executing the younger Licinius. In the same year he carried out a partition of the empire between his three sons and his two nephews, Delmatius and Hannibalianus. The last named received the vassal-kingdom of Pontus with the title of *rex regum,* while the others ruled as Caesars in their several provinces. Constantine, however, retained the supreme government. Finally, in 337, Shapur (Sapor) II. of Persia asserted his claim to the provinces conquered by Diocletian, and war broke out. Constantine was preparing to lead his army in person, when he was taken ill and after a vain trial of the baths at Helenopolis, died at Ancyrona, a suburb of Nicomedia, on May 22, having received Christian baptism shortly before at the hands of Eusebius. He was buried in the church of the Apostles at Constantinople.

It has been said by Stanley that Constantine was entitled to be called "Great" in virtue rather of what he did than of what he was; and it is true that neither his intellectual nor his moral qualities were such as to earn the title. His claim to greatness rests mainly on the fact that he divined the future which lay before Christianity, and determined to enlist it in the service of his empire, and also on his achievement in completing the work begun by Aurelian and Diocletian, by which the quasi-constitutional monarchy or "principate" of Augustus was transformed into the naked absolutism sometimes called the "dominate." There is no reason to doubt the sincerity of Constantine's conversion to Christianity, although we may not attribute to him the fervent piety which Eusebius ascribes to him, nor accept as genuine the discourses which pass under his name. The moral precepts of the new religion were not without influence upon his life, and he caused his sons to receive a Christian education. Motives of political expediency, however, caused him to delay the full recognition of Christianity as the religion of the state until he became sole ruler of the empire, although he not merely secured toleration for it immediately after his victory over Maxentius, but intervened in the Donatist controversy as early as 313, and presided at the council of Arles in the following year. By a series of enactments, immunities and privileges of various kinds were conferred on the Catholic Church and clergy—heretics being specifically excluded—and the emperor's attitude towards paganism gradually revealed itself as one of contemptuous toleration. From being the established religion of the state it sank into a mere *superstitio.* At the same time its rites were allowed to subsist except where they were held to be subversive of morality, and even in the closing years of Constantine's reign we find legislation in favour of the municipal *flamines* and *collegia.* In 333, or later, a cult of the *Gens Flavia,* as the Imperial family was called, was established at Hispellum (Spello); the offering of sacrifices in the new temple was, however, strictly prohibited. Nor was it until after Constantine's final triumph over Licinius that pagan symbols disappeared from the coinage and the Christian monogram (which had already been used as a mint mark) became a prominent device. From this time forward the Arian controversy demanded the emperor's constant attention, and by his action in presiding at the council of Nicaea and afterwards pronouncing sentence of banishment against Athanasius he not only identified himself more openly than ever with Christianity, but showed a determination to assert his supremacy in ecclesiastical affairs, holding no doubt that, as the office of *pontifex maximus* gave him the supreme control of religious matters throughout the empire, the regulation of Christianity fell within his province. In this matter his discernment failed him. It had been comparatively easy to apply coercion to the Donatists, whose resistence to the temporal power was not wholly due to spiritual considerations, but was largely the result of less pure motives; but the Arian controversy raised fundamental issues, which to the mind of Constantine appeared capable of compromise, but in reality, as Athanasius rightly discerned, disclosed vital differences of doctrine. The result foreshadowed the process by which the church which Constantine hoped to mould into an instrument of absolutism became its most determined opponent. It is unnecessary to give more than a passing mention to the legend according to which Constantine, smitten with leprosy after the execution of Crispus and Fausta, received absolution and baptism from Silvester I. and by his Donation to the bishop of Rome laid the foundation of the temporal power of the papacy (*see* DONATION OF CONSTANTINE).

The political system of Constantine was the final result of a process which, though it had lasted as long as the empire, had assumed a marked form under Aurelian. It was Aurelian who surrounded the imperial person with oriental pomp, wearing the diadem and the jewelled robe, and assuming the style of *dominus* and even *deus,* who assimilated Italy to the condition of the provinces and gave official furtherance to the economic process by which a régime of status replaced a régime of contract. Diocletian endeavoured to secure the new despotism against military usurpation by an elaborate system of co-regency with two lines of succession, bearing the names of *Jovii* and *Herculii,* but maintained by adoption and not by hereditary succession. This artificial system was destroyed by Constantine, who established dynastic absolutism in favour of his own family, the *Gens Flavia,* evidence of whose cult is found both in Italy and in Africa. To form a court he created a new official aristocracy to replace the senatorial order, which the military emperors of the 3rd century A.D. had reduced to practical insignificance. Upon this aristocracy he showered titles and distinctions, such as the revised patriciate, which carried with them the coveted immunity from fiscal burdens. As the senate was now a *quantité négligeable,* Constantine could afford to readmit its members freely to the career of provincial administration, which had been almost closed to them since the reign of Gallienus, and to accord to it certain empty privileges such as the free election of quaestors and praetors, while on the other hand the right of the senator to be tried by his peers was taken away and he was placed under the jurisdiction of the provincial governor.

In the administration of the empire Constantine completed the work of Diocletian by effecting the separation of civil from military functions. Under him the *praefecti praetorio* ceased entirely to perform military duties and became the heads of the civil administration, more especially in the matter of jurisdiction: in 331 their decisions were made final and no appeal to the emperor was permitted. The civil governors of the provinces (*vicarii* and *praesides*) had no control of the military forces, which were commanded by *duces;* and not content with the security against usurpation which was afforded by this division of power, Constantine employed the *comites* who formed a large element in the official aristocracy to supervise and report upon their conduct of affairs (*see* COUNT), as well as an army of so-called *agentes in rebus* who, under colour of inspecting the Imperial posting service, carried on a wholesale system of espionage. In the organization of the army Constantine was responsible for the creation of the great commands under the *magistri peditum* and *equitum.* He also introduced the practice of placing barbarians, especially Germans, in posts of high responsibility.

The organization of society in strictly hereditary corporations or professions was no doubt partly completed before the accession of Constantine; but his legislation contributed to rivet the fetters which bound each individual to the caste from which he sprang. Such *originales* are mentioned in Constantine's earliest laws, and in 332 the hereditary status of the agricultural *colonus* was recognized and enforced. Above all, the municipal *decuriones* on whom the responsibility for raising taxation rested saw every avenue of escape closed against them. In 326 they were forbidden to acquire immunity by joining the ranks of the Christian clergy. It was the interest of the government by such means to secure the regular payment of the heavy fiscal burdens both in money and in kind which had been laid on the subjects of the empire by Diocletian and were certainly not diminished by Constantine. One of our ancient authorities speaks of him as having been for 10 years an excellent ruler, for 12 a robber and for 10 a spendthrift, and he was constantly forced to make fresh exactions in order to enrich his favourites and to carry out such extravagant projects as the building of a new capital. To him are due the taxes, known as *collatio glebalis,* levied on the estates of senators, and *collatio lustralis,* levied on the profits of trade.

In general legislation the reign of Constantine was a time of feverish activity. Nearly 300 of his enactments are preserved to us in the Codes, especially that of Theodosius. They display a genuine desire for reform and distinct traces of Christian influence; *e.g.,* in their humane provisions as to the treatment of prisoners and slaves and the penalties imposed on offences against morality. Nevertheless, they are often crude in conception as well as turgid in style, and were manifestly drafted by official rhetoricians rather than by trained *legists.* Like Diocletian, Constantine believed that the time had come for society to be remodelled by the fiat of despotic authority, and it is significant that from henceforth we meet with the undisguised assertion that the will of the emperor is the sole fountain of law. Constantine, in fact, embodies the spirit of absolute authority which, both in church and State, was to prevail for many centuries.

BIBLIOGRAPHY.—The principal ancient sources for the life of Constantine are the biography of Eusebius, which is, however, untrustworthy owing to the ecclesiastical bias of its author, the tract *de mortibus persecutorum* ascribed to Lactantius, the orations of the *Panegyrici,* Nos. vi.–x., the second book of the history of Zosimus (written from the pagan standpoint), the so-called *Excerpta Valesiana* and the writings of Aurelius Victor and Eutropius. Among modern books may be mentioned H. Schiller, *Geschichte der römischen Kaiser-*

zeit, ii. 2, 164 ff. (1887); C. H. Firth, *Constantine the Great* (1905); Seeck, *Geschichte des Untergangs der antiken Welt,* vol. i. (1909); and, above all, *Cambridge Mediaeval History,* vol. i. chap. 1 (1911), with useful bibliography. On the religious policy of Constantine, G. Costa, *Religione e politica nel impero romano* (1923) should be consulted. For an examination of the "Constantine Myth," *see* Burch, *Myth and Constantine the Great* (1927). (H. S. J.)

CONSTANTINE II. (317–340), son of Constantine the Great, Roman emperor (337–340), was born at Arelate (Arles) in February 317. On March 1 in the same year he was created Caesar, and was consul in 320, 321, 324 and 329. The fifth anniversary of his Caesarship was celebrated by the panegyrist Nazarius. He gained the credit of the victories of his generals over the Alamanni (331), and over the Goths (332). From 335 he administered the Gallic portion of the empire as Caesar till his father's death, May 22, 337. On Sept. 9 in the same year he assumed the title of Augustus, together with his brothers Constans and Constantius, and in 338 a meeting was held at Viminiacum, on the borders of Pannonia, to arrange the distribution of the empire. In accordance with the arrangements made by his father, Constantine received Britain, Spain, and the Gauls. By virtue of his seniority he claimed a kind of control over his brothers. Constans declined to submit; and Constantine demanded from Constans the cession of Africa and equal authority in Italy. In 340 Constantine invaded Italy, but was killed near Aquileia.

See Zosimus ii., xii.; Aurelius Victor, *Epit.* 41; Eusebius, *Vita Constantini,* iv.; O. Seeck in Pauly-Wissowa's *Realencyclopädie,* iv. pt. I. (1900); Gibbon, *Decline and Fall,* ch. 18.

CONSTANTINE III., son of the emperor Heraclius (d. 641) by his first wife, succeeded as joint-emperor with Heracleonas, the son of Heraclius by his second wife. Court intrigues nearly led to a civil war, which was prevented by the death of Constantine (May 641). He was supposed to have been poisoned by order of his step-mother.

CONSTANTINE IV., *Pogonatus* (the "bearded"), son of Constans II., was emperor from 668 to 685. After his accession he crushed an Armenian usurper in Sicily. For six years (672–77) the Arabs under the caliph Moawiya (*see* CALIPHATE) besieged Constantinople, but were obliged at last to make peace and agree to pay tribute for 30 years. The attacks of the Slavs and Avars upon Thessalonica were repulsed. But Constantine was unable to prevent the Bulgars from crossing the Danube and settling in the district where their name still survives. The Bulgarian kingdom was established under its first king Isperich in 679. The tribute paid by the Arabs was used to purchase the good will of the new settlers. Constantine summoned the sixth ecumenical council at Constantinople, which sat from Nov. 7, 680, to Sept. 16, 681.

CONSTANTINE V., *Copronymus,* son of Leo III. the iconoclast, was emperor 740–75. Immediately after his accession, while he was fighting against the Arabs, his brother-in-law, an Armenian named Artavasdus, a supporter of the image-worshippers, had been proclaimed emperor, and it was not till the end of 743 that Constantine re-entered Constantinople. When he felt his position secure, he determined to settle the religious controversy. In 754 he assembled at the palace of Hiereion 338 bishops, by whom the worship of images was forbidden as opposed to all Christian doctrine. But the resistance to iconoclasm continued, chiefly owing to the influence of the monks. A vigorous campaign against monasticism took place; the monasteries were closed, and monks and nuns were compelled to marry. One of the most important results of the struggle was the defection of the pope, who sought and obtained protection from Pippin, king of the Franks. From this time onward the nominal dependence of Rome and the papacy on emperors at Constantinople ceased. Constantine has been described by the orthodox historians of his time as a monster of iniquity; but it is now generally admitted that he was one of the most capable rulers who ever occupied the Byzantine throne. He restored the aqueduct built by Valens and destroyed by the barbarians in the reign of Heraclius, re-peopled Constantinople (after it had been devastated by a great plague) and some of the cities of Thrace, revived commercial prosperity, and fought with considerable success against the Arabs, Slavs and Bulgarians.

CONSTANTINE VI., grandson of Constantine V., was emperor 780–97. At ten years of age he succeeded his father, Leo IV., under the guardianship of his mother Irene (*q.v.*). In 782 the Arabs under Harun al-Rashid penetrated as far as the Bosporus, and exacted an annual tribute as the price of an inglorious peace. Even when Constantine came of age, Irene practically retained the supreme power. At length Constantine had her arrested, but foolishly pardoned her in 792. In 796 she organized a plot against him and in June 797 he was seized and blinded. According to some, he died on the same day; according to others, he survived for several years. With Constantine VI. the Isaurian dynasty became extinct.

See Theophanes and the biographies of the patriarch Tarasius and Theodore of Studium; also F. C. Schlosser, *Geschichte der bilderstürmenden Kaiser des oströmischen Reichs* (Frankfurt am Main [1812]).

CONSTANTINE VII., *Porphyrogenitus* ("born in the purple") (905–959), East Roman emperor, author and patron of literature, was the son of Leo VI. the Wise. Though nominally emperor from 912–59, he was practically excluded from all real share in the government by ambitious relatives until 945. He was poisoned by his son Romanus in 959. Constantine was a painter and a patron of art and literature. Knowledge of his times is due to the following works written by or directly inspired by him: (1) *De Thematibus,* an account of the military districts (Themata) of the empire during the time of Justinian, chiefly borrowed from Hierocles and Stephanus of Byzantium; (2) *De administrando imperio,* written for the use of his son; (3) *De cerimoniis aulae Byzantinae,* describing the customs of the Eastern Church and court; (4) a life of Basilius I., his grandfather, based on the work of Genesius; also two treatises on military subjects are attributed to him: one on tactics which, as the title shows, was really written by his grandson Constantine VIII., the other a description of the different methods of fighting in fashion amongst different peoples. A speech on the despatch of an image of Christ to Abgar, king of Edessa, is also preserved. Of works undertaken by his instructions the most important were the Encyclopaedic Excerpts from all available treatises on various branches of learning: (1) *Historica,* in 53 sections, of which *De legationibus, De virtutibus et vitiis, De sententiis, De insidiis,* have been wholly or partly preserved; (2) *Basilica,* a compilation from the different parts of the Justinian Corpus Juris; (3) *Geoponica,* agricultural treatises; (4) *Iatrica,* a medical handbook compiled by one Theophanes Nonnus, chiefly from Oribasius; (5) *Hippiatrica,* on veterinary surgery, the connection of which with Constantine is, however, disputed; (6) *Historia animalium,* a compilation from the epitome of Aristotle's work on the subject by Aristophanes of Byzantium, with additions from other writers such as Aelian and Timotheus of Gaza.

See A. Rambaud, *L'Empire grec au dixième siècle* (1870); also Gibbon, *Decline and Fall,* ch. 53, and G. Finlay, *Hist. of Greece,* ii. 294 (1877). Many of Constantine's works will be found in Migne, *Patrologia Graeca,* cix., cxii., cxiii.; for editions of the rest, C. Krumbacher, *Geschichte der byzantinischen Literatur* (1897), and the article by Cohn in Pauly-Wissowa's *Realencyclopädie der classischen Altertumswissenschaft* (1900) should be consulted. The former contains a valuable note on the "Gothic Christmas" described in detail in the *De ceremoniis; see* also Bury in *Eng. Hist. Rev.* xxii. (1907).

CONSTANTINE VIII. This title is given by Gibbon to the son of Romanus I. Lecapenus, one of the colleagues of Constantine VII. Porphyrogenitus, but it is now generally bestowed upon Constantine, the brother and colleague of Basil II. from 976–1025, sole ruler 1025–28. He gave himself up to pleasure and allowed the administration to fall into the hands of six eunuchs.

CONSTANTINE IX. Monomachus, emperor 1042–54, owed his elevation to Zoë, the empress who, in order to secure her position, married Constantine, with whom she shared the throne till her death in 1050. In his old age, Constantine, who had once been a famous warrior, utterly neglected the defences of the empire and reduced his army by disbanding 50,000 of his best troops; on the other hand, he spent extravagant sums on luxuries and the erection of magnificent buildings. Rebellions broke out at home and abroad; the Normans conquered Lombardy, which subsequently (1055) became the duchy of Apulia, and thus Italy was lost to the empire; the Petchenegs (Patzinaks) crossed the Danube and attacked Thrace and Macedonia; and the Seljuk Turks made their appearance on the Armenian frontier.

CONSTANTINE X. *Ducas,* emperor 1059–67, succeeded Isaac I. (*q.v.*) Comnenus. But the choice was not justified, for Constantine, who had shown himself a capable minister, proved incompetent as an emperor. He reduced the army, cut down the soldiers' pay, failed to keep up the supply of war material, and neglected the frontier fortresses at a time when the Seljuk Turks were pressing hard upon the eastern portion of the empire. Alp Arslan overran Armenia in 1064. The Magyars occupied Belgrade, the Petchenegs (Patzinaks) continued their inroads, and in 1065 the Uzes (called by the Greeks Comani), a Turkish tribe from the shores of the Euxine, crossed the Danube in vast numbers, ravaged Thrace and Macedonia, and penetrated as far as Thessalonica. The empire was only saved by an outbreak of plague amongst the invaders and the bravery of the Bulgarian peasants. In the year before Constantine's death the remnant of the Byzantine possessions in Italy was finally lost to the empire, and the chief town, Bari, taken by the Normans. (H. S. J.)

For the later Constantines references to general authorities will be found under ROMAN EMPIRE, LATER; *see* also CALIPHATE and SELJUKS for the wars of the period.

CONSTANTINE, king of the Hellenes (1868–1923), eldest son of George I. and of the Grand Duchess Olga Constantinova of Russia, was born at Athens on Aug. 2, 1868. The prince completed his education in Germany, where he attended the university of Leipzig, served in the Guards and studied at the Prussian Staff college. In 1889 he married the Princess Sophia Dorothea of Hohenzollern, daughter of the Emperor Frederick. This union was popular in Greece because of the superstition that when a Constantine and a Sophia were upon the throne the empire of Byzantium would be restored, and, coupled with the fact that he was appointed a field marshal in the Prussian Army in 1913, it affected the king's attitude during the World War.

On returning to Greece, the crown prince was given various military appointments; in 1897 he took over the command of the army in Thessaly, and he was held largely responsible for the disastrous campaign of that year. In 1909 Constantine and his brothers were once more made scapegoats by the Military league, and were compelled to resign their commissions. Subsequently, on the initiative of Venizelos, the royal princes were recalled from their practical exile. Thenceforward, acting in co-operation with the French military mission, Constantine, now inspector-general of the army, devoted himself to reforms which were markedly apparent during the Balkan wars, and the successes that were then gained completely re-established his prestige. He succeeded his father on the throne of Greece on March 18, 1913.

On Aug. 7, 1914, immediately after the outbreak of the World War, Constantine expressed his personal sympathy for the German emperor and advocated a neutrality which would be useful to him, but took no active steps. But after the entry of Turkey into the war, the king, probably influenced by his military advisers, vetoed Venizelos' proposal to co-operate with the Western Powers in the Dardanelles in exchange for their promises of concessions in Asia Minor. Venizelos resigned (March 1915), but at the subsequent election in June he obtained a large parliamentary majority. (*See* VENIZELOS.)

For some months the struggle between the king and Venizelos continued, but from Oct. 1915 the rupture was complete, and thenceforward Constantine was more occupied by his relations with the Allies than by the internal crisis. The closing months of 1915 and the earlier part of 1916 passed without any overt signs of hostility, but in May of the latter year Fort Rupel, which commanded the Struma pass into eastern Macedonia, was surrendered to the Bulgarians, and the Allies demanded the complete demobilization of the Hellenic army, which menaced them in Macedonia. Five months later (Oct). the Greek fleet (except three vessels) was taken over by the Allies, and in November, the demobilization having proceeded slowly, a further demand was made for the cession of war material. This request was not complied with, and, although it would appear that the king had given personal assurances to the French admiral, an Allied landing at the Peiraeeus was opposed, and the naval contingents, disembarked there on Dec. 1, had to be withdrawn after material losses. A month later a further blockade was declared and the removal of the whole Greek army to the Peloponnesus was insisted on. This was agreed to and a formal apology was made for the events of Dec. 1, but it soon became obvious that the king's attitude constituted a danger to the Allied position at Salonika.

In June 1917 M. Jonnart, the High Commissioner of the protecting Powers, arrived at Athens, where, backed up by strong forces, he demanded better guarantees for the safety of the Allied army in Macedonia, a more loyal adherence to the constitution and the departure of the king. Constantine, accompanied by the queen and the crown prince, sailed from Greece on June 12, leaving his son Alexander upon the throne; but the proclamation then issued by the king was ambiguous, and contained no final renunciation of his rights. Constantine spent the next three years in Switzerland.

As a result of the election of Nov. 1920, and of the subsequent plebiscite, Constantine returned to Athens at the end of December. His position was exceedingly difficult. Never recognized by Great Britain and France, he was compelled either to pursue the Asiatic policy of his predecessors or to make himself unpopular by sacrificing gains promised to Greece under the already signed Treaty of Sèvres. Rightly or wrongly, he adopted the former alternative; he declared himself in favour of a continuation of the Turkish campaign, and he failed to condemn, if he never encouraged, the Greek objections to the several offers of mediation made by the Western Powers. For the disastrous results of the campaign in Asia Minor *see* GREECE: *Modern History*. By the last week in Sept. 1922 an insurrection had broken out in the army, and, at the demand of a revolutionary committee headed by Col. Gonatas, the king abdicated in favour of his son George. On Sept. 30 Constantine left Athens for Palermo, where he died on Jan. 11, 1923, from haemorrhage of the brain.

CONSTANTINE (FLAVIUS CLAUDIUS CONSTANTINUS), usurper in Britain, Gaul and Spain (A.D. 407–410) during the reign of Honorius, was a common soldier, invested with the purple by his comrades in Britain. He at once crossed over to Gaul and soon made himself master of the country as far as the Alps and Pyrenees, and established his capital at Arelate (Arles). Spain was finally annexed by Constans, the son of Constantine. After the downfall of Stilicho, Honorius, hard pressed by the barbarians, pardoned Constantine, recognized him as joint ruler, and permitted him to confer the title of Caesar upon Constans. This gave Constantine his opportunity. With a large army he marched into Italy, avowedly to assist Honorius, in reality with the intention of making himself ruler of the West. But his plans were upset by the revolt of Gerontius. This capable general set up one of his own adherents as emperor, invaded Gaul, and put Constans to death at Vienna (Vienne). He then besieged Constantine himself in Arelate, but the advance of an Italian army forced him to retire. The generals of Honorius themselves continued the siege. Constantine, seeing that resistance was useless, surrendered the city on condition that his life should be spared. He was, however, executed by order of Honorius.

CONSTANTINE PAVLOVICH (1779–1831), grand-duke and cesarevich of Russia, was born at Tsarskoye Selo on April 27, 1779, the second son of the tsar Paul and his wife Maria Feodorovna, and was educated under the direction of his grandmother, Catherine II. The only person who really took him in hand was César La Harpe, who was tutor-in-chief from 1783 to May 1795, and educated both the empress's grandsons.

Like Alexander, Constantine was married by Catherine when not yet 17 years of age, and he made his wife, Juliana of Coburg, intensely miserable. After a first separation in the year 1799, she went back permanently to her German home in 1801, the victim of a frivolous intrigue. Constantine's first campaign took place under the leadership of the great Suvorov. The battle of Bassignano was lost by Constantine's fault, but at Novi he distinguished himself by such personal bravery that the emperor Paul bestowed on him the title of cesarevich, which according to the fundamental law of the constitution belonged only to the heir to the throne.

In command of the Guards during the campaign of 1805 Constantine shared the responsibility for the battle of Austerlitz; while in 1807, 1812, 1813 and 1814 he showed courage but not competence as a soldier.

Constantine's importance in political history dates only from the moment when Alexander made him commander-in-chief of the forces of Congress Poland. The command of the Lithuanian troops and of those of the Russian provinces that had formerly belonged to the kingdom of Poland was added in 1819. He organized their army for the Poles, and felt himself more a Pole than a Russian, especially after his marriage (May 27, 1820), with a Polish lady, Johanna Grudzinska. After this marriage he formally renounced any claim to the succession to the tsardom, but the fact was only revealed to two or three persons, and his brother Nicholas was left in ignorance of it. On the death of Alexander (Dec. 1, 1825), there was much confusion and uncertainty. After three weeks hesitation Constantine sent an unconditional renunciation of any claim to Nicholas, whose accession was then announced. On the 26th the Dekabrist rising in Petrograd took place and the mutineers shouted, "Long live Constantine!" The rising was easily suppressed. Constantine had had no part in the plot. But differences soon arose between him and his brother in consequence of the share taken by the Poles in the Dekabrist conspiracy. Constantine held obstinately to the belief that the Polish army and bureaucracy were loyally devoted to the Russian empire. The eastern policy of the tsar and the Turkish War of 1828 and 1829 caused a fresh breach between them. It was owing to the opposition of Constantine that the Polish army took no part in this war.

The insurrection at Warsaw in Nov. 1830 took Constantine completely by surprise. It was owing to his utter failure to grasp the situation that the Polish regiments passed over to the revolutionaries; and during the continuance of the revolution he showed himself as incompetent as he was lacking in judgment. The suppression of the revolution he did not live to see. He died of cholera at Vitebsk on June 27, 1831.

CONSTANTINE (ancient CIRTA), city of Algeria, capital of the department of the same name, 54 mi. by railway S. by W. of the port of Philippeville, in 36° 22′ N., 6° 36′ E. Constantine is the residence of a general commanding a division, of a prefect and other high officials, is the seat of a bishop, and had a population by the census of 1936 of 106,830. The city occupies a romantic position on a rocky plateau, cut off on all sides save the west from the surrounding country by a beautiful ravine, through which the river Rummel flows. The plateau is 2,130 ft. above sea-level, and from 500 to nearly 1,000 ft. above the river bed. The ravine, formed by the Rummel, through erosion of the limestone, varies greatly in width—at its narrowest part the cliffs are only 15 ft. apart, at its broadest the valley is 400 yd. wide. At the N.E. angle of the city the gorge is spanned by an iron bridge built in 1863, N. and S. by a bridge and a viaduct built in 1912. Along the north-eastern side of the city the Rummel is spanned in all four times by natural stone arches or tunnels.

Walls and Buildings.—Constantine is walled, the extant mediaeval wall having been largely constructed out of Roman material. Through the centre from north to south runs a street (the rue de France) roughly dividing Constantine into two parts. The place du Palais, in which are the palace of the governor and the cathedral, and the kasbah (citadel) are west of the rue de France, as is likewise the place Négrier, containing the law courts. The native town lies chiefly in the south-east part of the city. A striking contrast exists between the Moorish quarter, with its tortuous lanes and Oriental architecture, and the modern quarter, with its rectangular streets and wide open squares, frequently bordered with trees and adorned with fountains. Of the squares the place de Nemours is the centre of the commercial and social life of the city. New quarters have arisen to the S.W. of the town. The palace, built by Ahmed Pasha, the last bey of Constantine, between 1830 and 1836, is a specimen of Moorish architecture of the 19th century. The kasbah, which occupies the northern corner of the city, dates from Roman times, and preserves in its more modern portions numerous remains of other Roman edifices. It is now turned into barracks and a hospital. The fine mosque of Sidi-el-Kattani (or Salah Bey) dates from the close of the 18th century.

The native industry of Constantine is chiefly confined to leather goods and woollen fabrics. A considerable trade is carried on over a large area by means of railway connection with Algiers, Bona, Tunis and Biskra, as well as with Philippeville.

History.—Constantine, or, as it was originally called, Cirta or Kirtha, from the Phoenician word for a city, was in ancient times one of the most important towns of Numidia, and the residence of the kings of the Massyli. Under Micipsa (2nd century B.C.) it reached the height of its prosperity, and was able to furnish an army of 10,000 cavalry and 20,000 infantry. Though it afterwards declined, it still continued an important military post, and is frequently mentioned during successive wars. Caesar having bestowed a part of its territory on his supporter Sittius, the latter introduced a Roman settlement. In the war of Maxentius against Alexander, the Numidian usurper, it was laid in ruins; and on its restoration in A.D. 313 by Constantine it received the name which it still retains. It was not captured during the Vandal invasion of Africa, but on the conquest by the Arabians (7th century) it shared the same fate as the surrounding country. Successive Arab dynasties looted it. During the 12th century it was still a place of considerable prosperity; and its commerce was extensive enough to attract the merchants of Pisa, Genoa and Venice. Frequently taken and retaken by the Turks, Constantine finally became under their dominion the seat of a bey, subordinate to the dey of Algiers. To Salah Bey, who ruled from 1770 to 1792, we owe most of the existing Moslem buildings. In 1826 Constantine asserted its independence of the dey of Algiers, and was governed by Haji Ahmed, the choice of the Kabyles. In 1836 the French under Marshal Clauzel made an unsuccessful attempt to storm the city, which they attacked by night by way of El-Kantara. The French suffered heavy loss. In 1837 Marshal Valée took it by assault. During the Allied campaign against the axis, 1942–43, the city and nearby setif were important bases and centres of command. *See* E. Mercier, *Histoire de Constantine* (Constantine, 1905).

CONSTANTINE THE AFRICAN (*c.* 1020–1087) is one of the few important medical figures of the Middle Ages. He was the initiator of the significant "Arabist" movement, the process of translation into Latin from Arabic. Legends have clustered about his name and his early career is still obscure.

It is said that he was born at Carthage. He was certainly an Arabic-speaking Christian and led a wandering life. Later he claimed that he had studied in many Eastern centres of learning. The legends tell that on his return to his native city his learning brought him under suspicion of witchcraft and he had to flee. We hear of him in the service of the Norman duke, Robert Guiscard (*q.v.*). This was probably about 1071, in Sicily rather than at Salerno, with which Constantine's name is more closely linked. There is in fact some evidence that Constantine was actually a native of Sicily rather than of Carthage, and it must be remembered that some Arabic was still spoken in Sicily in the eleventh century. Moreover, in addition to Arabic he knew some Latin and had a smattering of Greek, and this trilinguality is fully consistent with his birth in the "many-tongued isle" where all three vernaculars were in use. Constantine probably followed Robert Guiscard to Salerno. There he became a monk and ended his days at the Benedictine house of Monte Cassino. He translated at Monte Cassino a number of Arabic works into Latin, and it seems that he had help with the Latin. The character of these works and the knowledge displayed in them suggest that he had neither visited Cairo nor Irak in the way that he claimed. The books themselves are mainly renderings of works by Jewish writers living in North Africa. These works, though wretchedly translated, are yet exceedingly important for the history of culture. They represent the first inflow of a group of new ideas and their appearance marks the end of the "dark ages" and the dawn of the scholastic period.

Among the works which Constantine thus conveyed were two philosophical treatises by Isaac Israeli (855–955) of Kairosuan, known to the West as Isaac the Jew. One of these writings, *On definitions,* contains an account of some of the favourite terms used by the Latin scholastics and later adopted by them from him. Another, *On the Elements,* was an exposition of Aristotelian physics. From the same author he translated a number of medical works which he issued under his own name. He treated similarly the works of Isaac's pupil Ibn Jezzar. The most important medical work that he rendered into Latin he called *Pantechne.* It was in fact an abbreviated version of the *Liber Regius* of the Persian Ali ibn al Abbas (died 994), known as Haly Abbas to the Latins. This was extremely important as the first work which gave the Western world a view of Greek medicine as a whole, though the view was somewhat dimmed by the Arabic cloud that was around it.

Constantine sought to pass off his translations as his original work and it is probable that he never produced any independent writing. Nevertheless his works spread through Europe with extraordinary rapidity and it is difficult to overestimate their influence on the ages which followed. They continued to be read until the sixteenth century and were particularly influential at the important medical school at Salerno (*q.v.*).

CONSTANTINOPLE, Turkey, now called Istanbul, formerly the capital of the Turkish empire, situated in 41° 0′ 16″ N. and 28° 58′ 14″ E. The city stands at the southern extremity of the Bosporus, upon a hilly promontory that runs out from the European side of the straits towards the Asiatic bank. The sea of Marmora is on the south, and the bay of the Bosporus, forming the magnificent harbour of the Golden Horn, some 4 m. long, on the north. Two streams, the ancient Cydaris and Barbysus, now Ali-Bey-Su and Kiahat-Hanè-Su, enter the bay at its north-western end. A small winter stream, the Lycus, flowing through the promontory west to south-east into the Sea of Marmora, separates a long ridge, divided by cross-valleys into six eminences, overhanging the Golden Horn, from a large isolated hill in the south-west. Hence the claim of Constantinople to be enthroned, like Rome, upon seven hills. The first hill has the Seraglio, St. Sophia and the Hippodrome; the second the column of Constantine and the mosque Nuri-Osmanieh; the third the war office, the Seraskereate tower and the mosque of Sultan Suleiman; the fourth the mosque of Sultan Mohammed II., the Conqueror; the fifth the mosque of Sultan Selim; the sixth Tekfour Serai and the quarter of Egri Kapu; the seventh Avret Tash and the quarter of Psamatia. In Byzantine times the two last hills were named respectively the hill of Blachernae and the Xerolophos or dry hill.

HISTORY

Origin and Site.—Constantinople is famous in history, in the first place as the capital of the Roman empire in the East for more than eleven centuries (330–1453), and in the second as the capital of the Ottoman empire which followed. In respect of influence over the course of human affairs, its only rivals are Athens, Rome and Jerusalem. Yet even the gifts of these rivals to the cause of civilization often bear the image and superscription of Constantinople upon them. Roman law, Greek literature, the theology of the Christian church, for example, are intimately associated with the history of Constantinople.

The city was founded by Constantine the Great, through the enlargement of the old town of Byzantium (*q.v.*) in A.D. 328, and was inaugurated as a new seat of government on May 11, A.D. 330. To indicate its political dignity, it was named New Rome, while to perpetuate the fame of its founder it was styled Constantinople. The chief patriarch of the Greek church still signs himself "archbishop of Constantinople, New Rome." The old name of the place, Byzantium, however, continued in use.

The creation of a new capital by Constantine was not an act of personal caprice or individual judgment. It was the result of causes long in operation, and had been foreshadowed, 40 years

The arch over the street is adjacent to Mosque Validé Sultane, while at the other end of the vaulted passage is the bridge which leads across the Golden Horn to Pera, the European quarter

before, in the policy of Diocletian. After the senate and people of Rome had ceased to be the sovereigns of the Roman world, and their authority had been vested in the sole person of the emperor, the eternal city could no longer claim to be the rightful throne of the state. That honour could henceforth be conferred upon any place in the Roman world which might suit the convenience of the emperor, or serve more efficiently the interests he had to guard. Furthermore, the empire was now upon its defence. Dreams of conquests and extension had long been abandoned, and the pressing question of the time was how to repel the persistent assaults of Persia and the barbarians upon the frontiers of the realm, and so retain the dominion inherited from the valour of the past. The size of the empire made it difficult, if not impossible, to attend to these assaults, or to control the ambition of successful generals, from one centre. Further, the East had grown in political importance, both as the scene of the most active life in the state and as the portion of the empire most exposed to attack. Hence the famous scheme of Diocletian to divide the burden of government between four colleagues, in order to secure a better administration of civil and of military affairs. It was a scheme, however, that lowered the prestige of Rome, for it involved four distinct seats of government, among which, as the event proved, no place was found for the ancient capital of the Roman world. It also declared the high position of the East, by the selection of Nicomedia in Asia Minor as the residence of Diocletian himself. When Constantine, therefore, established a new seat of government at Byzantium, he adopted a policy inaugurated before his day as essential to the preservation of the Roman dominion. He can claim originality only in his choice of the particular point at which that seat was placed, and in his recognition of the fact that his alliance with the Christian church could be best maintained in a new atmosphere.

But whatever view may be taken of the policy which divided the government of the empire, there can be no dispute as to the wisdom displayed in the selection of the site for a new imperial

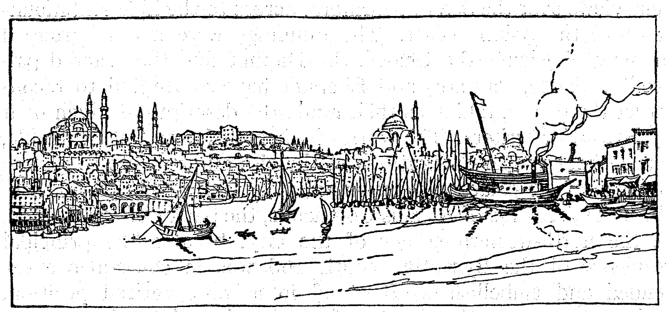
GENERAL VIEW OF CONSTANTINOPLE SHOWING THE GOLDEN HORN

throne. Situated where Europe and Asia are parted by a channel never more than 5 m. across, and sometimes less than half a mile wide, placed at a point commanding the great waterway between the Mediterranean and the Black Sea, the position affords immense scope for commercial enterprise and political action in rich and varied regions of the world. Moreover, the site constituted a natural citadel, difficult to approach or to invest, and an almost impregnable refuge in the hour of defeat, within which broken forces might rally to retrieve disaster. To surround it, an enemy required to be strong upon both land and sea. Foes advancing through Asia Minor would have their march arrested, and their blows kept beyond striking distance, by the moat which the waters of the Bosporus, the Sea of Marmora and the Dardanelles combine to form. The narrow straits in which the waterway connecting the Mediterranean with the Black Sea contracts, both to the north and to the south of the city, could be rendered impassable to hostile fleets approaching from either direction, while on the landward side the line of defence was so short that it could be strongly fortified, and held against large numbers by a comparatively small force. Nature, indeed, cannot relieve men of their duty to be wise and brave, but, in the marvellous configuration of land and sea about Constantinople, nature has done her utmost to enable human skill and courage to establish there the splendid and stable throne of a great empire.

Architecture and Antiquities.—Byzantium, out of which Constantinople sprang, occupied most of the land comprised in the two hills nearest the head of the promontory, and the level ground at their base. The landward wall started from a point near the present Stamboul custom-house, and reached the ridge of the second hill, a little to the east of the point marked by Chemberli Tash (the column of Constantine). There the principal gate of the town opened upon the Egnatian road. From that gate the wall descended towards the Sea of Marmora, touching the water in the neighbourhood of the Seraglio lighthouse. The Acropolis, enclosing venerated temples, crowned the summit of the first hill, where the Seraglio stands. Immediately to the south of the fortress was the principal market-place of the town, surrounded by porticoes on its four sides, and hence named the Tetrastoon. On the southern side of the square stood the baths of Zeuxippus, and beyond them, still farther south, lay the Hippodrome, which Septimius Severus had undertaken to build but failed to complete. Two theatres, on the eastern slope of the Acropolis, faced the bright waters of the Marmora, and a stadium was found on the level tract on the other side of the hill, close to the Golden Horn. The Strategion, devoted to the military exercises of the brave little town, stood close to Sirkedji Iskelessi, and two artificial harbours, the Portus Prosforianus and the Neorion, indented the shore of the Golden Horn. A graceful granite column, still erect on the slope above the head of the promontory, commemorated the victory of Claudius Gothicus over the Goths at Nissa, A.D. 269. All this furniture of Byzantium was appropriated for the use of the new capital.

According to Zosimus, the line of the landward walls erected by Constantine to defend New Rome was drawn at a distance of nearly 2 m. (15 stadia) to the west of the limits of the old town. It therefore ran across the promontory from the vicinity of Un Kapan Kapusi (Porta Platea), at the Stamboul head of the Inner Bridge, to the neighbourhood of Daud Pasha Kapusi (Porta S. Aemiliani), on the Marmora, and thus added the third and fourth hills and portions of the fifth and seventh hills to the territory of Byzantium. We have two indications of the course of these walls on the seventh hill. One is found in the name Isa Kapusi (the gate of Jesus) attached to a mosque, formerly a Christian church, situated above the quarter of Psamatia. It perpetuates the memory of the beautiful gateway which formed the triumphal entrance into the city of Constantine, and which survived the original bounds of the new capital as late as 1508, when it was overthrown by an earthquake. The other indication is the name Alti Mermer (the six columns) given to a quarter in the same neighbourhood. The name is an ignorant translation of Exakionion, the corrupt form of the designation Exokionion, which belonged in Byzantine days to that quarter because marked by a column outside the city limits. Hence the Arians, upon their expulsion from the city by Theodosius I., were allowed to hold their religious services in the Exokionion, seeing that it was an extra-mural district. This explains the fact that Arians are sometimes styled Exokionitae by ecclesiastical historians. The Constantinian line of fortifications, therefore, ran a little to the east of the quarter of Alti Mermer. In addition to the territory enclosed within the limits just described, the suburb of Sycae or Galata, on the opposite side of the Golden Horn, and the suburb of Blachernae, on the sixth hill, were regarded as parts of the city, but stood within their own fortifications. It was to the ramparts of Constantine that the city owed its deliverance when attacked by the Goths, after the terrible defeat of Valens at Adrianople, A.D. 378.

Fortifications Against Barbarism.—To his courtiers, the bounds assigned to New Rome by Constantine seemed too wide, but after 80 years they were too narrow for the population that had gathered within the city. The barbarians had meantime also grown more formidable, and this made it necessary to have stronger fortifications for the capital. Accordingly, in 413, in the reign of Theodosius II., Anthemius, then praetorian prefect of the East and regent, enlarged and refortified the city by the erection of the wall which forms the innermost line of defence in



VIEW ACROSS THE GOLDEN HORN TOWARD STAMBOUL

the bulwarks whose picturesque ruins now stretch from the Sea of Marmora, on the south of Yedi Kuléh (the seven towers), northwards to the old Byzantine palace of the Porphyrogenitus (Tekfour Serai), above the quarter of Egri Kapu. There the new works joined the walls of the suburb of Blachernae, and thus protected the city on the west down to the Golden Horn. Somewhat later, in 439, the walls along the Marmora and the Golden Horn were brought, by the prefect Cyrus, up to the extremities of the new landward walls, and thus invested the capital in complete armour. Then also Constantinople attained its final size. For any subsequent extension of the city limits was insignificant, and was due to strategic considerations. In 447 the wall of Anthemius was seriously injured by one of those earthquakes to which the city is liable. The disaster was all the more grave, as the Huns under Attila were carrying everything before them in the Balkan lands. The desperateness of the situation, however, roused the government of Theodosius II., who was still upon the throne, to put forth the most energetic efforts to meet the emergency. If we may trust two contemporary inscriptions, one Latin, the other Greek, still found on the gate Yeni Mevlevi Khanéh Kapusi (Porta Rhegium), the capital was again fully armed, and rendered more secure than ever, by the prefect Constantine, in less than two months. Not only was the wall of Anthemius restored, but, at the distance of 20 yd., another wall was built in front of it, and at the same distance from this second wall a broad moat was constructed with a breastwork along its inner edge. Each wall was flanked by 96 towers. Here was a barricade 190–207 ft. thick, and 100 ft. high, with its several parts rising tier above tier to permit concerted action, and alive with large bodies of troops ready to pour, from every coign of vantage, missiles of death—arrows, stones, Greek fire—upon a foe. It is not strange that these fortifications defied the assaults of barbarism upon the civilized life of the world for more than a thousand years. As might be expected, the walls demanded frequent restoration from time to time in the course of their long history. Inscriptions upon them record repairs, for example, under Justin II., Leo the Isaurian, Basil II., John Palaeologus, and others. Still, the ramparts extending now from the Marmora to Tekfour Serai are to all intents and purposes the ruins of the Theodosian walls of the 5th century.

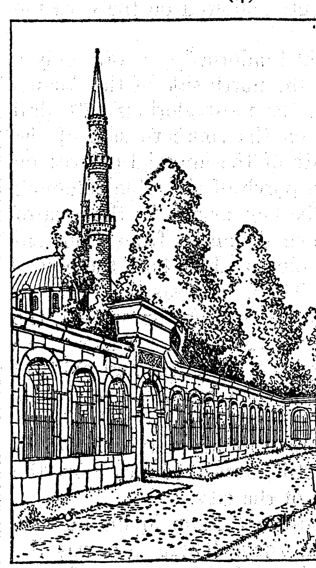
This is not the case in regard to the other parts of the fortifications of the city. The walls along the Marmora and the Golden Horn represent the great restoration of the seaward defences of the capital carried out by the emperor Theophilus in the 9th century; while the walls between Tekfour Serai and the Golden Horn were built long after the reign of Theodosius II., superseding the defences of that quarter of the city in his day, and relegating them, as traces of their course to the rear of the later works indicate, to the secondary office of protecting the palace of Blachernae. In 627 Heraclius built the wall along the west of the quarter of Aivan Serai, in order to bring the level tract at the foot of the sixth hill within the city bounds, and shield the church of Blachernae, which had been exposed to great danger during the siege of the city by the Avars in that year. In 813 Leo V. the Armenian built the wall which stands in front of the wall of Heraclius to strengthen that point in view of an expected attack by the Bulgarians.

The splendid wall, flanked by nine towers, that descends from the court of Tekfour Serai to the level tract below Egri Kapu, was built by Manuel Comnenus (1143–1180) for the greater security of the part of the city in which stood the palace of Blachernae, then the favourite imperial residence. Lastly, the portion of the fortifications between the wall of Manuel and the wall of Heraclius presents too many problems to be discussed here. Enough to say, that in it we find work belonging to the times of the Comneni, Isaac Angelus and the Palaeologi.

If we leave out of account the attacks upon the city in the course of the civil wars between rival parties in the empire, the fortifications of Constantinople were assailed by the Avars in 627; by the Saracens in 673–677, and again in 718; by the Bulgarians in 813 and 913; by the forces of the Fourth Crusade in 1203–04; by the Turks in 1422 and 1453. The city was taken in 1204, and became the seat of a Latin empire until 1261, when it was recovered by the Greeks. On May 29, 1453 Constantinople ceased to be the capital of the Roman empire in the East, and became the capital of the Ottoman dominion.

MONUMENTS AND ART

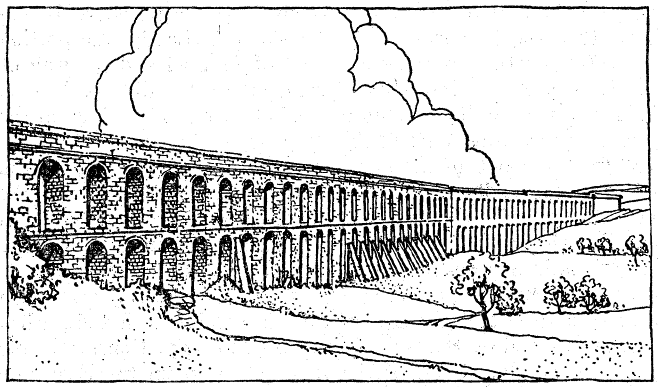
The Walls.—Notable points in the circuit of the walls of the city are the following: (1) The Golden Gate, now included in the Turkish fortress of Yedi Kuléh. It is a triumphal archway, consisting of three arches, erected in honour of the victory of Theodosius I. over Maximus in 388, and subsequently incorporated in the walls of Theodosius II., as the state entrance of the capital. (2) The gate of Selivria, or of the Pegé, through which Alexius Strategopoulos made his way into the city in 1261, and brought the Latin empire of Constantinople to an end. (3) The gate of St. Romanus (Top Kapusi), by which, in 1453, Sultan Mahommed entered Constantinople after the fall of the city into Turkish hands. (4) The great breach made in the ramparts crossing the valley of the Lycus, the scene of the severest fighting in the siege of 1453, where the Turks stormed the city, and the last Byzantine emperor met his heroic death. (5) The palace of the Porphyrogenitus, long erroneously identified with the palace of the Hebdomon, which really stood at Makrikeui. It is the finest specimen of Byzantine civil architecture left in the city. (6) The tower of Isaac Angelus and the tower of Anemas, with the chambers in the body of the wall to the north of them. (7) The wall of Leo, against which the troops of the Fourth Crusade came, in 1203, from their camp on the hill opposite the wall, and delivered their chief attack. (8) The walls protecting the quarter of Phanar, which the army and fleet of the Fourth Crusade under the Venetian doge, Henrico Dandolo, carried in 1204. (9) Yali Kiosk Kapusi, beside which the southern end of the chain drawn across the mouth of the harbour during a siege was attached. (10) The ruins of the palace of Hormisdas, near Chatladi Kapu, once the residence of Justinian the Great and Theodora. It was known in later times as the palace of the Bucoleon, and was the scene of the assassination of Nicephorus Phocas. (11) The sites of the old harbours between Chatladi Kapu and Daud Pasha Kapusi. (12) The fine marble tower near the junction of the walls along the Marmora with



THE MOSQUE OF THE STANDARD BEARER
Erected by Mohammed the Conqueror in 1463–69 in memory of the Standard Bearer of the Prophet, this was the first imperial mosque

the landward walls.

Internal.—Arrangements inside the city were determined by the configuration of its site, which falls into three great divisions—the level ground and slopes looking towards the Sea of Marmora, the range of hills forming the midland portion of the promontory, and the slopes and level ground facing the Golden Horn. In each division a great street ran through the city from east to west, generally lined with arcades on one side, but with arcades on both sides when traversing the finer and busier quarters. The street along the ridge formed the principal thoroughfare, and was named the Mesé (Μέση), because it ran through the middle of the city. On reaching the west of the third hill, it divided into two branches, one leading across the seventh hill to the Golden gate, the other conducting to the church of the Holy Apostles, and the gate of Charisius (Edirnéh Kapusi). The Mesé linked together the great fora of the city,—the Augustaion on the south of St. Sophia, the forum of Constantine on the summit of the second hill, the forum of Theodosius I. or of Taurus on the summit of the third hill, the forum of Amastrianon where the mosque of Shah Zadéh is situated, the forum of the Bous at Ak Serai, and the forum of Arcadius or Theodosius II. on the summit of the seventh hill. This was the route followed on the occasion of triumphal processions.



THE LONG AQUEDUCT (USUN KEMER) NEAR PYRGOS

Of the edifices and monuments which adorned the fora, only a slight sketch can be given here. On the north side of the Augustaion rose the church of St. Sophia, the most glorious cathedral of Eastern Christendom; opposite, on the southern side of the square, was the Chalcé, the great gate of the imperial palace; on the east was the senate house, with a porch of six noble columns; to the west, across the Mesé, were the law courts. In the area of the square stood the Milion, whence distances from Constantinople were measured, and a lofty column which bore the equestrian statue of Justinian the Great. There also was the statue of the empress Eudoxia, famous in the history of Chrysostom, the pedestal of which is preserved in the Museum gardens. The Augustaion was the heart of the city's ecclesiastical and political life. The forum of Constantine was a great business centre. Its most remarkable monument was the column of Constantine, built of 12 drums of porphyry and bearing aloft his statue. Shorn of much of its beauty, the column still stands to proclaim the enduring influence of the foundation of the city.

In the forum of Theodosius I. rose a column in his honour, the basis of which was identified in 1927. There also was the Anemodoulion, a beautiful pyramidal structure, surmounted by a vane to indicate the direction of the wind. Close to the forum, if not in it, was the capitol, in which the university of Constantinople was established. The most conspicuous object in the forum of the Bous was the figure of an ox, in bronze, beside which the bodies of criminals were sometimes burnt. Another hollow column, the pedestal of which is now known as Avret Tash, adorned the forum of Arcadius. A column in honour of the emperor Marcian still stands in the valley of the Lycus, below the mosque of Sultan Mohammed the Conqueror. Many beautiful statues, belonging to good periods of Greek and Roman art, decorated the fora, streets and public buildings of the city, but conflagrations and the vandalism of the Latin and Ottoman conquerors of Constantinople have robbed the world of most of those treasures.

The imperial palace, founded by Constantine and extended by his successors, occupied the territory which lies to the east of St. Sophia and the Hippodrome down to the water's edge. It consisted of a large number of detached buildings, in grounds made beautiful with gardens and trees, and commanding magnificent views over the Sea of Marmora, across to the hills and mountains of the Asiatic coast. The buildings were mainly grouped in three divisions—the Chalcé, the Daphné and the "sacred palace." Labarte, Paspates and Ebersolt have attempted to reconstruct the palace, taking as their guide the descriptions given of it by Byzantine writers. The work of Ebersolt is specially valuable, but without proper excavations of the site all attempts to restore the plan of the palace with much accuracy lack a solid foundation. With the accession of Alexius Comnenus, the palace of Blachernae, at the north-western corner of the city, became the principal residence of the Byzantine court, and was in consequence extended and embellished. It stood in a more retired position, and was conveniently situated for excursions into the country and hunting expeditions. Of the palaces outside the walls, the most frequented were the palace at the Hebdomon, now Makrikeui, in the early days of the empire, and the palace of the Pegé, now Balukli, a short distance beyond the gate of Selivria, in later times. For municipal purposes, the city was divided, like Rome, into fourteen regions.

CHURCHES

As the seat of the chief prelate of Eastern Christendom, Constantinople was characterized by a strong theological and ecclesiastical temperament. It was full of churches and monasteries, enriched with the reputed relics of saints, prophets and martyrs, which consecrated it a holy city and attracted pilgrims from every quarter to its shrines. It was the meeting-place of numerous ecclesiastical councils, some of them ecumenical (*see* below, CONSTANTINOPLE, COUNCILS OF). It was likewise distinguished for its numerous charitable institutions. Only some 20 of the old churches of the city are left. Most of them have been converted into mosques, but they are valuable monuments of the art which flourished in New Rome. Among the most interesting are the following: St. John of the Studium (Emir-Achor Jamissi) is a basilica of the middle of the 5th century, and the oldest ecclesiastical fabric in the city; it is now, unfortunately, almost a complete ruin. SS. Sergius and Bacchus (Kutchuk Aya Sofia) and St. Sophia are erections of Justinian the Great. The former is an example of a dome placed on an octagonal structure, and in its general plan is similar to the contemporary church of S. Vitale at Ravenna. St. Sophia (*i.e.*, Ἁγία Σοφία, Holy Wisdom) is the glory of Byzantine art, and one of the most beautiful buildings in the world. St. Mary Diaconissa (Kalender Jamissi) is a fine specimen of the work of the closing years of the 6th century. St. Irené, founded by Constantine, and repaired by Justinian, is in its present form mainly a restoration by Leo the Isaurian, in the middle of the 8th century. St. Mary Panachrantos (Fenari Isa Mesjidi) belongs to the reign of Leo the Wise (886–912). The Myrelaion (Bodrum Jami) dates from the 10th century. The Pantepoptes (Eski Imaret Jamissi), the Pantocrator (Zeirek Kilissè Jamissi), and the body of the church of the Chora (Kahriyeh Jamissi) represent the age of Comneni. The Pammakaristos (Fetiyeh Jamissi), St. Andrew in Krisei (Khoja Mustapha Jamissi), the narthexes and side chapel of the Chora were, at least in their present form, erected in the times of the Palaeologi. It is difficult to assign precise dates to SS. Peter and Mark (Khoda Mustapha Jamissi at Aivan Serai), St. Theodosia (Gul Jamissi), St. Theodore Tyrone (Kilissé Jamissi). The beautiful façade of the last is later than the other portions of the church, which have been assigned to the 9th or 10th century.

For a study of the church of St. Sophia, the reader must consult the article BYZANTINE ART. The present edifice was built by Justinian the Great, under the direction of Anthemius of Tralles and his nephew Isidorus of Miletus. It was founded in 532 and dedicated on Christmas Day 538. It replaced two earlier churches of that name, the first of which was built by Constantius and burnt down in 404, on the occasion of the exile of Chrysostom, while the second was erected by Theodosius II. in 415, and destroyed by fire in the Nika riot of 532. Naturally the church has undergone repair from time to time. The original dome fell in 558, as the result of an earthquake, and among the improvements introduced in the course of restoration, the dome was raised 25 ft. higher than before. Repairs are recorded under Basil I., Basil II., Andronicus III. and Cantacuzene. Since the Turkish conquest a minaret has been erected at each of the four exterior angles of the building, and the interior has been adapted to the requirements of Muslim worship, mainly by the destruction or concealment of most of the mosaics which adorned the walls. In 1847–48, during the reign of Abd-ul-Mejid, the building was put into a state of thorough repair by the Italian architect Fossati. Happily the sultan allowed the mosaic figures, then exposed to view, to be covered with matting before being plastered over. They may reappear in the changes which the future will bring. The dome, which had fallen into considerable disrepair, was reinforced on the outside and reroofed in 1926–27.

The Hippodrome.—Citizens of Constantinople found recreation in the chariot-races held in the Hippodrome, now the At Meidan, to the west of the mosque of Sultan Ahmed. So much did the race-course (begun by Severus) enter into the life of the people that it has been styled "the axis of the Byzantine world." It was not only the scene of amusement, but on account of its ample accommodation it was also the arena of much of the political life of the city. The factions, which usually contended there in sport, often gathered there in party strife. There emperors were acclaimed or insulted; there military triumphs were celebrated; there criminals were executed, and there martyrs were burned at the stake. Three monuments remain to mark the centre of the building; an Egyptian obelisk of Thothmes III., on a pedestal covered with bas-reliefs representing an emperor, presiding at scenes in the Hippodrome; the triple serpent column, which stood originally at Delphi, to commemorate the victory of Plataea 479 B.C.; an obelisk, once covered with plates of gilded bronze. Excavations begun by the British Academy in 1927 have recovered the plan and dimensions of the Hippodrome. It is 480 metres long and 117·5 wide.

The city was supplied with water mainly from two sources; from the streams immediately to the west, and from the springs and rain impounded in reservoirs in the forest of Belgrade, to the north-west, very much on the system followed by the Turks. The water was conveyed by aqueducts, concealed below the surface, except when crossing a valley. Within the city the water was stored in covered cisterns, or in large open reservoirs. The aqueduct of Justinian, the Crooked aqueduct, in the open country, and the aqueduct of Valens that spans the valley between the 4th and 3rd hills of the city, still carry on their beneficent work, and afford evidence of the attention given to the water-supply of the capital during the Byzantine period. The cistern of Arcadius, to the rear of the mosque of Sultan Selim (having, it has been estimated, a capacity of 6,571,720 cu.ft. of water), the cistern of Aspar, a short distance to the east of the gate of Adrianople, and the cistern of Mokius, on the seventh hill, are specimens of the open reservoirs within the city walls. The cistern of Bin Bir Derek (cistern of Illus) with its 224 columns, each built up with three shafts, and the cistern Yeri Batan Serai (Cisterna Basilica) with its 420 columns show what covered cisterns were, on a grand scale. The latter is still in use.[1]

Byzantine Constantinople was a great commercial centre. To equip it more fully for that purpose, several artificial harbours were constructed along the southern shore of the city, where no natural haven existed to accommodate ships coming up the Sea of Marmora. For the convenience of the imperial court, there was a small harbour in the bend of the shore to the east of Chatladi Kapu, known as the harbour of the Bucoleon. To the west of that gate, on the site of Kadriga Limani (the Port of the Galley), was the harbour of Julian, or, as it was named later, the harbour of Sophia (the empress of Justin II.). Traces of the harbour styled the Kontoscalion are found at Kum Kapu. To the east of Yeni Kapu stood the harbour of Kaisarius or the Heptascalon, while to the west of that gate was the harbour which bore the names of Eleutherius and of Theodosius I. A harbour named after the Golden gate stood on the shore to the south-west of the triumphal gate of the city.

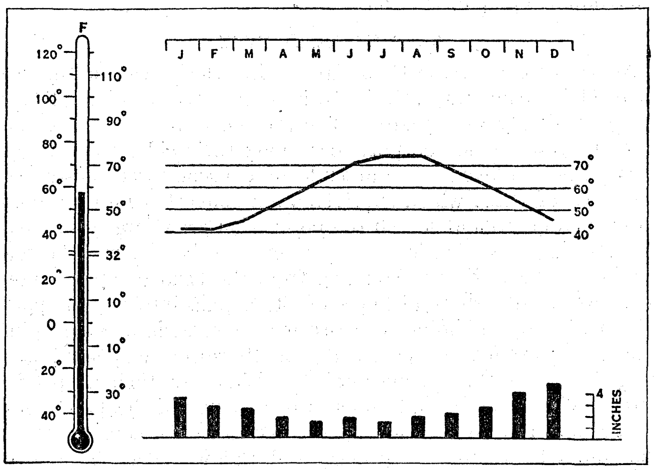
[1]For the ancient water-supply *see* Count A. F. Andréossy, *Constantinople et le Bosphore;* Tchikatchev, *Le Bosphore et Constantinople* (2nd ed., 1865); Forchheimer and Strzygowski, *Die byzantinischen Wasserbehälter;* also article AQUEDUCTS.

THE MODERN CITY

As the capital of the Ottoman empire, the aspect of the city changed in many ways. The works of art which adorned New Rome gradually disappeared. The streets, never very wide, became narrower, and the porticoes along their sides were almost everywhere removed. A multitude of churches were destroyed, and most of those which survived were converted into mosques. In race and garb and speech the population grew largely oriental. One striking alteration in the appearance of the city was the conversion of the territory extending from the head of the promontory to within a short distance of St. Sophia into a great park, within which the buildings constituting the seraglio of the sultans, like those forming the palace of the Byzantine emperors, were ranged around three courts, distinguished by their respective gates—Bab-i-Humayum, leading into the court of the Janissaries; Orta Kapu, the middle gate, giving access to the court in which the sultan held state receptions; and Bah-i-Saadet, the gate of Felicity, leading to the more private apartments of the palace. From the reign of Abd-ul-Mejid, the seraglio was practically abandoned, first for the palace of Dolmabagché on the shore near Beshiktash, and then for Yildiz Kiosk, on the heights above that suburb. The older apartments of the palace, such as the throne-room, the Bagdad Kiosk, and many of the objects in the imperial treasury are of extreme interest to all lovers of oriental art. The seraglio was thrown open to the public in 1926. Another great change in the general aspect of the city has been produced by the erection of stately mosques in the most commanding situations. The most remarkable mosques are the following:—The mosque of Sultan Mohammed the Conqueror, built on the site of the church of the Holy Apostles (1463–69), rebuilt in 1768 owing to injuries due to an earthquake; the mosques of Sultan Selim, of the Shah Zadeh, of Sultan Suleiman and of Rustem Pasha—all works of the 16th century, the best period of Turkish architecture; the mosque of Sultan Bayezid II. (1497–1505); the mosque of Sultan Ahmed I. (1610); Yeni-Validé-Jamissi (1615–1665); Nuri-Osmanieh (1748–1755); Laleli-Jamissi (1765). The Turbehs containing the tombs of the sultans and members of their families are often beautiful specimens of Turkish art.

In their architecture, the mosques present a striking instance of the influence of the Byzantine style, especially as it appears in St. Sophia. The architects of the mosques have made a skilful use of the semi-dome in the support of the main dome of the building, and in the consequent extension of the arched canopy that spreads over the worshipper. In some cases the main dome rests upon four semi-domes. At the same time, when viewed from the exterior, the main dome rises large, bold and commanding, with nothing of the squat appearance that mars the dome of St. Sophia, with nothing of the petty prettiness of the little domes perched on the drums of the later Byzantine churches. The great mosques express the spirit of the days when the Ottoman empire was still mighty and ambitious.

For all intents and purposes, Constantinople is now the collection of towns and villages situated on both sides of the Golden Horn and along the shores of the Bosporus, including Scutari and Kadikeui. But the chief parts of this group of towns are Istanbul, or Stamboul (from Gr. εἰς τὴν πόλιν, "into the city"), the official name of the city since the founding of the republic, Galata and Pera. Galata has a long history, which becomes of general interest after 1265, when it was assigned to the Genoese merchants in the city by Michael Palaeologus, in return for the friendly services of Genoa in the overthrow of the Latin empire of Constantinople. In the course of time, notwithstanding stipulations to the contrary, the town was strongly fortified and proved a troublesome neighbour. During the siege of 1453 the inhabitants maintained on the whole a neutral attitude, but on the fall of the capital they surrendered to the Turkish conqueror, who granted them liberal terms. The walls have for the most part been removed. The tower, however, which formed the citadel of the colony, still remains. There are also churches and houses dating from Genoese days. Galata is the chief business centre of the city, the seat of banks, post-offices, steamship offices, etc. Pera is the principal residential quarter of the European communities settled in Constantinople.



WEATHER GRAPH OF CONSTANTINOPLE. THE THERMOMETER INDICATES THE ANNUAL MEAN TEMPERATURE. THE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE, AND THE COLUMNS, THE NORMAL MONTHLY PRECIPITATION

Since the middle of the 19th century the city has yielded more and more to western influences, and is fast losing its oriental character. The Galata quay, completed in 1889, is 756 metres long and 20 metres wide; the Stamboul quay, completed in 1900, is 378 metres in length. The harbour, quays and facilities for handling merchandise, which have been established at the head of the Anatolian railway, at Haidar Pasha, would be a credit to any city. The growth of the imperial museum of antiquities, under the direction of Hamdy Bey and Halil Bey has been remarkable; and while the collection of the sarcophagi discovered at Sidon constitutes the chief treasure of the museum, the institution has become a rich storehouse of many other valuable relics of the past. The museum of Ottoman art in Tchinili Kiosk and the museum of the ancient Orient are two new additions since 1923. The fine medical school between Scutari and Haidar Pasha, the Hamidieh hospital for children and the asylum for the poor tell of the advance of science and humanity in the place.

Many foreign educational institutions flourish in Constantinople itself, and they are largely attended by the youth belonging to the native communities of the country. The Greek population is provided with excellent schools and gymnasia, and the Armenians also maintain schools of a high grade. The old War Office (Seraskerat) in Stamboul is now used to house the University of Stamboul, a new but flourishing institution, based upon the French system.

Transfer of the Capital.—Constantinople passed through several periods of political and economic disaster, relieved only by very brief periods of normal life and prosperity, during the years 1900 to 1925. Four wars following each other in quick succession caused at times a complete cessation of trade, the influx of hordes of refugees, demoralization in the organization and regulation of civic life, loss of population and an acute impoverishment of all classes. Within this period also Constantinople lost, in theory as well as in fact, the position held well-nigh uninterruptedly for 16 centuries—that of the headship of a great empire. During the Balkan wars (1912–13) the city narrowly escaped capture by the Bulgarians; the refugees who poured in from Thrace taxed the resources of the city to the utmost, and the loss of European provinces unfavourably affected its trade position. During World War I the city was in a state of complete blockade by sea, subjected to numerous air attacks, and during the last months before the Armistice, almost denuded of food, fuel and other necessities of life. The outstanding features of the period of the occupation by Great Britain, France and Italy (Nov. 13, 1918–Oct. 2, 1923) were: a short period in 1919–20 of intense commercial activity and relative prosperity, brought to an abrupt end in 1921 by the combined effects of the war in Anatolia and the worldwide trade depression; the outbreak in 1919 of the nationalist movement and the Greek war; the invasion of the city in 1919 and 1920 by some 100,000 destitute refugees, the bulk of whom were Turks (30,000) and Russians (65,000); the arrival in the city at intervals, mostly in 1922 and 1923, of over 200,000 Greek deportees from Anatolia, most of whom were speedily moved on to Greece; the seizure of the machinery of government by the nationalists after the Mudaniya armistice in Oct. 1922; the flight of the deposed sultan, Mehmed VI., on Nov. 17, 1922; and the formal evacuation of the city by the Allies on Oct. 2, 1923.

The vital factor in the fortunes of the city was its relation to the nationalist movement. When, in March 1920, the British attempted to suppress the activities of those supporters of the nationalist movement who were still in the city, many were exiled to Malta, and thousands of sympathizers left for Anatolia to assist in the task of liberation. The Anatolian leaders determined that Constantinople should no longer exact that tragic tribute of lives and treasure which had repeatedly exhausted their country in the past and the subordination of Constantinople to Angora and Anatolia was definite and complete when, on March 3, 1924, the caliph, Abdul Mejid, was expelled.

During World War II Constantinople was on a constant *qui vive*, especially after the axis conquest of the Balkans, fearing a German attempt to drive through Turkey to the middle east or the southern Caucasus.

Climate.—The climate of the city is healthful, but relaxing. It is damp and liable to sudden and great changes of temperature. The winds from the north and those from the south are at constant feud, and blow cold or hot in the most capricious manner, often in the course of the same day. "There are two climates at Constantinople, that of the north and that of the south wind." The winters may be severe, but when mild they are wet and not invigorating. In summer the heat is tempered by the prevalence of a north-east wind that blows down the channel of the Bosporus. Observations at Constantinople and at Scutari give the following results, for a period of twenty years.

	Constantinople	Scutari
Mean temperature	57° 17′	58° 1′
Maximum	99° 1′	103° 6′
Minimum	17° 2′	13° 0′
Rain	28·3 in.	29·29 in.
Number of rainy days	112	128·6

The sanitation of the city has been improved, although much remains to be done in that respect. No great epidemic has visited the city since the outbreak of cholera in 1866. Typhoid and pulmonary diseases are common.

Population.—The population in 1940 was 793,949 for the city and 991,237 for the vilayet. The census of 1927 credited the vilayet with 794,444, of whom 547,126 were Muslims, 100,214 Greeks, 53,129 Armenians, 47,035 Jews, 23,930 Catholics, and 4,421 Protestants. The pop. of the city in 1927 was 690,857.

Water-supply.—The sultans enlarged and increased the reservoirs in the forest of Belgrade, and new aqueducts were added to those erected by the Byzantine emperors. Old cisterns within the walls were abandoned, and water led to basins in vaulted chambers (*Taxim*), from which it is distributed by underground conduits to fountains.

For the supply of Pera, Galata and Beshiktash, Sultan Mahmud I. constructed, in 1732, four bends in the forest of Belgrade, N.N.W. and N.E. of the village of Bagchekeui, and the fine aqueduct which spans the head of the valley of Buyukderé. After 1885 a French company, La Compagnie des Eaux, rendered a great service by bringing water to Stamboul, Pera, and the villages on the European side of the Bosporus, from Lake Dercos, which lies close to the shore of the Black Sea some 29 mi. distant from the city. The Dercos water is laid on in many houses. After 1893 a German company supplied Scutari and Kadikeui with water from the valley of the Sweet Waters of Asia.

Administration.—For the preservation of order and security, the city is divided into four divisions (Belad-i-Selassi), viz., Stamboul, Pera-Galata, Beshiktash and Scutari.

The municipal government of the four divisions of the city is in the hands of a prefect, appointed by the president of the republic, and subordinate to the minister of the interior. He is officially styled the prefect of Stamboul, and is assisted by a council of twenty-four members, appointed by the president or the minister of the interior. The city is furthermore divided into ten municipal circles as follows. In Stamboul: (1) Sultan Bayezid, (2) Sultan Mehemet, (3) Djerah Pasha (Psamatia); on the European side of the Bosporus and the northern side of the Golden Horn: (4) Beshiktash, (5) Yenikeui, (6) Pera, (7) Buyukderé; on the Asiatic side of the Bosporus: (8) Anadol Hissar, (9) Scutari, (10) Kadikeui. Each circle is subdivided into several wards (*mahalleh*). The outlying parts of the city are divided into six districts (*Cazas*), namely, Princes' islands, Guebzeh, Beicos, Kartal, Kuchuk-Chekmedjé and Shilé, each having its governor (*kaimakam*). These districts are dependencies of the ministry of the interior, and their municipal affairs are directed by agents of the prefecture.

Modernization of Constantinople.—The modernization of the city made remarkable strides in spite of the adverse conditions. In 1912 electric lighting and in 1913 and 1914 the first electric tramways and telephones were introduced. During World War I the municipal organization and services seriously deteriorated. With the restoration of complete Turkish control, and particularly under the energetic administration of the prefect, Dr. Emin Bey, a decided change for the better took place. A genuinely effective fire-fighting organization was created for the first time in the history of the city, periodically devastated throughout its long history by terrible fires; the condition of the streets, which during the occupation were morally and materially in a deplorably unclean state, was improved; 25 km. of new roads were constructed and 250 km. of old roads repaired; the water supply was augmented; the construction of a thoroughly modern sewage system was begun in Stamboul; a new slaughter house, an ice factory and refrigerating plant, six dispensaries and a hospital were built and placed under municipal management.

The city remains the educational and cultural centre of the nation. The National university was installed in the commodious buildings of the old war office. It was founded in 1900 and completely reorganized in 1933. In 1936 it had 4,812 students, among whom were 929 women. The two normal schools, one for men and one for women, continue to function. The foreign schools which existed before 1914 are allowed to continue their work, but no new ones may be opened, and like all private schools they are under strict supervision of the ministry of public education.

The most striking social changes relate to the status of women. The veil was almost completely discarded during World War I, and in 1925 the European hat began to supplant the traditional "charshaf." Men and women mingle freely in the streets and at public gatherings, and the compartments reserved for women in public conveyances have been done away with. The university has opened all its departments to women. The new municipal law of 1930 granted Turkish women the right to vote and to be elected in municipal elections. In Dec. 1934 they received the same right for national elections. The complete suppression in 1925 of the fez and the adoption of European headgear for men removed one more picturesque and distinctive feature of the life of the city, as did the introduction of the Latin alphabet in 1928 instead of the picturesque Arab characters.

The capitulations (*q.v.*) were abolished in 1914 and their abolition confirmed by the treaty of Lausanne. The old Ottoman code has been replaced by one based upon the Swiss code. It became effective in Oct. 1926. Foreigners have a right to establish their own schools and hospitals, and to hold their special religious services.

The commercial life of Constantinople was revolutionized by the wars of 1912–23. In 1919 and 1920 the port revived in connection with transit trade to Russia and Rumania, but in 1921 this revival collapsed. Instability of Turkish currency, world-wide trade depression and war in Anatolia were prime causes. However, there was a gradual improvement until the world depression of the 1930s. Coastwise trade was reserved for Turkish vessels, and a port monopoly for handling goods was established. The tonnage of vessels in transit through the port of Constantinople in 1926 was only 11.6% less than the corresponding tonnage for 1908, and the years after 1926 showed a further gain in the traffic of the port as Turkish commercial life was stimulated by government measures. In 1938, 15,041 ships of 13,059,000 tons passed through the Bosporus and 9,025 ships of 15,370,000 tons through the Dardanelles. Air service connects Istanbul with Ankara during the summer. (A. van M.; X.)

CONSTANTINOPLE, COUNCILS OF. Of the numerous ecclesiastical councils held at Constantinople the most important are the following:

(1.) The second ecumenical council, in 381, which was in reality only a synod of bishops from Thrace, Asia and Syria, convened by Theodosius with a view to uniting the church upon the basis of the orthodox faith. No Western bishop was present, nor any Roman legate; from Egypt came only a few bishops, and these tardily. Yet, despite its sectional character, the council came in time to be regarded as ecumenical alike in the West and in the East. The council reaffirmed the Nicene faith and denounced all opposing doctrines. The so-called "Niceno-Constantinopolitan Creed," which has almost universally been ascribed to this council, is probably a Jerusalem baptismal formula revised by the interpolation of a few Nicene test-words. More recently its claim to be called "Constantinopolitan" has been challenged. It is not found in the earliest records of the acts of the council, nor was it referred to by the council of Ephesus (431), nor by the "Robber Synod" (449), although both of these confirmed the Nicene faith. At all events, it became the creed of the universal church, and has been retained without change, save for the addition of *filioque.*

(2.) The council of 553, the fifth ecumenical (acknowledged to be so in 680), grew out of the controversy of the "Three Chapters," an adequate account of which, up to the time of the council, may be found in the articles Justinian I and Vigilius. It was utterly subservient to the emperor. The "Three Chapters" were condemned, and their authors, long dead, anathematized, without, however, derogating from the authority of the council of Chalcedon, which had given them a clean bill of orthodoxy. The orthodox faith was set forth in fourteen anathemas with special reference to Nestorians (*q.v.*). Opinion is still divided as to whether Origen was condemned. His name occurs in the eleventh anathema, but some consider it an interpolation; Hefele defends the genuineness of the text, but finds no evidence for a special session against Origen, as some have conjectured. A smaller council was held in Constantinople in 543 to which the anathemas against

Origen probably belong.

(3.) The sixth ecumenical council (680–681) was convened by the emperor Constantine Pogonatus to terminate the Monothelite (*q.v.*) controversy. All the patriarchates were represented, Constantinople and Antioch by their bishops in person, the others by legates. The council approved the first five ecumenical councils and reaffirmed the Nicene and "Niceno-Constantinopolitan" creeds. Monothelitism was unequivocally condemned; Christ was declared to have had "two natural wills and two natural operations, without division, conversion, separation or confusion." Prominent Monothelites, living or dead, were anathematized, in particular Sergius and his successors in the see of Constantinople, the former pope, Honorius, and Macarius, the patriarch of Antioch. An imperial decree confirmed the council, and commanded the acceptance of its doctrines under pain of severe punishment. The Monothelites took fright and fled to Syria, where they gradually formed the sect of the Maronites (*q.v.*).

(4.) The "Quinisext Synod" (692), so-called because it was regarded by the Greeks as supplementing the fifth and sixth ecumenical councils, was held in the dome of the Imperial Palace (*"In Trullo,"* whence the synod is called also "Trullan"). Its work was purely legislative and its decisions were set forth in 102 canons. The sole authoritative standards of discipline were declared to be the "eighty-five apostolic canons," the canons of the first four ecumenical councils, of the Eastern Fathers and of Cyprian, and also of a number of Eastern synods. They proceeded to add a series of disciplinary canons which became a recognized part of the canon law of the Eastern church. The council was confirmed by the emperor and accepted in the East; but the pope protested against various canons, chiefly those respecting the rank of Constantinople, clerical marriage, the Saturday fast, and the use of the symbol of lamb; and refused, despite express imperial command and threat, to accept the "Pseudo-Sexta." So that while the synod adopted a body of legislation that has continued to be authoritative for the Eastern Church, it did so at the cost of aggravating the irritation of the West, and by so much hastening the inevitable rupture of the church.

The iconoclastic synods of 754 and 815, both of which promulgated harsh decrees against images and neither of which is recognized by the Latin Church, and the synod of 842, which repudiated the synod of 815, approved the second council of Nicaea, and restored the images, are described under the "iconoclastic controversy" in the general histories of the Eastern Church, to which the reader is also referred for details of the synods of 869 and 879. The former, regarded by the Latin Church as the eighth ecumenical council, condemned Photius as an usurper and restored Ignatius to the see of Constantinople; the latter, which the Greeks considered to have been the true eighth ecumenical council, held after the death of Ignatius and the reconciliation of Photius with the emperor, repudiated the synod of 869, restored Photius, and condemned all who would not recognize him.

CONSTANTINOPLE, SIEGE OF (A.D. 1453). Mohammed II., becoming sultan of the Ottoman empire, in Feb. 1451, set his heart on the capture of Constantinople. A pretext was found, and a castle was at once built on the Bosphorus to secure his army during the projected siege. On June 21, 1452, the Greek Emperor, Constantine Palaeologus, closed the gates of Constantinople, and the sultan declaring war appeared before the city at the head of 250,000 men supported by a blockading fleet of 300 galleys and 200 smaller ships. Fourteen batteries of cannon were at once brought to play on the land face of the city, among which was an immense piece drawn by 50 oxen. The garrison of Constantinople was weak, comprising 5,000 armed Greeks, 2,000 foreigners and some 400 Genoese who were the heart and soul of the defence. The fleet of the emperor consisted of 13 war ships, and his artillery was vastly inferior to Mohammed's.

Whilst the bombardment was in progress, 150 Turkish vessels attempted to force the harbour, and astonishing as it may seem were defeated by one Greek and five Genoese galleys. Mohammed then dragged 72 galleys five miles over land from the Bosphorus to the inner part of the harbour, and to assist their work he built a bridge of casks across the harbour, but all to no purpose. Bombardment and assault having failed, the sultan sent his brother-in-law to treat with the emperor, who refused to yield. Thereupon the sultan announced to his army that on May 28 a general assault would take place. Trumpets were sounded and fires lit around the city until it was surrounded by a glowing half-moon of flame symbolic of its approaching capture.

The defences were held as follows: The gate of St. Romanus by the emperor, Gustiniani, captain of the Genoese, and Don Francis of Toledo; that of "The Thousand Men," by Paul and Anthony Troilus Bochiardi of Genoa; the Charsis gate by Theodorus of Caristos, the noted archer, and John Grant the German artillerist. At the gate of Kynegion was posted Cardinal Isodorus, whilst the palace of Blachernae was held by Jerome Minotto the Venetian. At the Xyloporta stood the Genoese, Leonard of Langasco. Then along the harbour came Lucas Notarias, high admiral, Gabriel Trevisano, the galley-captain, Andreas Dinio and Pedro Giuliani, the Spaniard. Between the Golden Gate and the gate of Selivria stood Maurice Cataneo, and Theophilus Paleologus held the defences between Selivria and the gate of St. Romanus.

The assault took place on May 28, and after two hours' fierce fighting was repulsed. Gustiniani was, however, wounded, and to the consternation of the emperor retired to his galley and sailed for Galata. A second assault was then made and repulsed, when an astonishing event took place. The Kerkoporta, or gate of fluted wood, long ago blocked up by Isaac Comnenus to frustrate a prophecy that the Emperor Frederick would enter the city by it, had been a few days before opened up to facilitate a sortie, but so accustomed had the defenders become to disregard it that no garrison was posted over it. Fifty Turks stole through this gate, and though they were at once despatched, this rear attack, one of the most famous in all history, was followed by the direst results. A cry went up that the Turks were in the city. The garrison, overwrought by the strain of the defence, suddenly took panic. Mohammed, noticing the disorder, flogged his men on to a third assault, and the almost undefended walls were scaled. The emperor seeing his men fall back cried: "Is there, then, no Christian who will kill me," and rushing on his enemy, he fell under the swords of the Osmanli. Thus perished the last of the Roman emperors.

CONSTANTINUS, pope from 708 to 715, was a Syrian by birth. He asserted the supremacy of the papal see and at the command of the emperor Justinian II. visited Constantinople. He died on April 9, 715.

CONSTANTIUS III. was born in Illyria in the second half of the 4th century A.D. He fought for Honorius against Gerontius in Gaul and Spain, reduced Arles and captured Constantine the Tyrant. He was consul in 414, defeated Ataulphus and married Placidia, the sister of Honorius. In 421 he was named Augustus and co-emperor of the West, and he died at Ravenna in September of that year.

See Zosimus v. and vi.

CONSTANTIUS, FLAVIUS JULIUS (317–361), emperor of the East 337–361, was the son of Constantine the Great and Fausta, and was born at Sirmium in Pannonia on Aug. 6, 317. When the three sons of Constantine were made Caesars, Constantius was given the Eastern provinces. Constantine's death in 337 was followed by a wholesale massacre of the rest of the family by the soldiers, to secure the succession of the designated sons, in which only Julian and Gallus escaped. A conference in Pannonia followed, at which it was arranged that Constantine II. took the West, Constantius the East (Thrace, Macedonia, Greece, Asia and Egypt) and Constans Italy and Illyricum. Constantius was immediately plunged into war with Shapur (*q.v.*), which lasted throughout the reign. The early campaigns are obscure and seem to have been indecisive, but he won a fairly complete victory at Singara in 344 or 348. In 350 occurred the revolt of the West and the usurpation of Magnentius. Constantius refused to abandon the war with Shapur, but took advantage of the insurrection of Vetranio to use him against Magnentius. Then Shapur's attention was diverted by the Massagetae; Constantius at once sent Gallus to Syria with the title of Caesar, and turned west to join Vetranio. Together they defeated Magnentius at a great battle at Mursa on the Drave on Sept. 28, 351. The losses on both sides were enormous, and the Roman forces were permanently weakened. The eastern and western empires were thus again united under Constantius, a monarchy of the oriental type.

In 355 the critical situation in Gaul led to the appointment of Julian as commander there, which was entirely successful (for these campaigns *see* JULIAN). Constantius visited Rome in 357, where he set up the obelisk from Heliopolis (now the Lateran obelisk) in the Circus Maximus, and moved the altar of Victory from the Curia, marking the end of official paganism. In 359 he went back to Asia to meet Shapur. His order that the Gallic troops should come East after Julian's victories in Gaul led to their revolt and proclamation of Julian as emperor. Constantius was unwilling to leave the war with Shapur, and both sides made attempts at compromise. Eventually Constantius started to march West, but he died on the way, near Tarsus in Cilicia, on Nov. 3, 361.

Constantius took his responsibilities as emperor very seriously. On two critical occasions he sacrificed his own interests to the claims of the empire, and stayed on the eastern frontier when his fortunes were at stake in Gaul. His fault was his dependence on the inner circle of palace officials, due to the unapproachable nature of the oriental monarchy founded by Diocletian. In the religious quarrels of the time he supported the anti-Athanasian party, was forced by Constans to take Athanasius back in 346, but had him accused at Arles after his victory over Magnentius in 351.

See Amm. Marc., xiv.–xxi.; Zosimus, ii., iii.; Agathion, iv.; Zonaras, xiii.; *Cambridge Mediaeval History,* vol. i.

CONSTANTIUS, FLAVIUS VALERIUS, commonly called CHLORUS (the Pale), Roman emperor and father of Constantine the Great (*q.v.*), was born about A.D. 250. He was of Illyrian origin. Having distinguished himself by his military ability and his able and gentle rule of Dalmatia, he was, on March 1, 293, adopted and appointed Caesar by Maximian. In the distribution of the provinces Gaul and Britain were allotted to Constantius. But Britain, where Allectus had declared himself independent, was not re-united to the empire until 296. In 298 Constantius overthrew the Alamanni in the territory of the Lingones (Langres) and strengthened the Rhine frontier. During the persecution of the Christians in 303 he behaved with great humanity. He obtained the title of Augustus on May 1, 305, and died the following year before July 25 at Eboracum (York) during an expedition against the Picts and Scots.

See Aurelius Victor, *De Caesaribus,* 39; Eutropius ix. 14–23; Zosimus ii. 7.

CONSTELLATION, in astronomy the name given to certain groupings of stars (from the Lat. *constellatus,* studded with stars; *con,* with, and *stella,* a star).

From the earliest times the star-groups known as constellations, the smaller groups (parts of constellations) known as asterisms, and also individual stars, have received names connoting some meteorological phenomena, or symbolizing religious or mythological beliefs. At one time it was held that the constellation names and myths were of Greek origin; this view has now been disproved, and an examination of the Hellenic myths associated with the stars and star-groups in the light of the records revealed by the decipherment of Euphratean cuneiforms leads to the conclusion that in many, if not all, cases the Greek myth has a Euphratean parallel, and so renders it probable that the Greek constellation system and the cognate legends are primarily of Semitic or even pre-Semitic origin.

The Sumerians and Accadians, the non-Semitic inhabitants of the Euphrates valley prior to the Babylonians, described the stars collectively as a "heavenly flock"; the sun was the "old sheep"; the seven planets were the "old-sheep stars"; the whole of the stars had certain "shepherds," and *Sibzianna* (which, according to Sayce and Bosanquet, is the modern Arcturus, the brightest star in the northern sky) was the "star of the shepherds of the heavenly herds." The Accadians bequeathed their system to the Babylonians, and cuneiform tablets and cylinders, boundary stones, and Euphratean art generally point to the existence of a well-defined system of star names in their early history. From a detailed study of such records, in their nature of rather speculative value, R. Brown, junr. (*Primitive Constellations,* 1899) has compiled a Euphratean planisphere, which he regards as the mother of all others. The tablets examined range in date from 3000–500 B.C., and hence the system must be anterior to the earlier date. Of great importance is the *Creation Legend,* a cuneiform compiled from older records during the reign of Assur-bani-pal, *c.* 650 B.C., in which there occurs a passage interpretable as pointing to the acceptance of 36 constellations: 12 northern, 12 zodiacal, and 12 southern.

The Phoenicians—a race dominated by the spirit of commercial enterprise—appear to have studied the stars more especially with respect to their service to navigators; according to Homer "the stars were sent by Zeus as portents for mariners." But all their truly astronomical writings are lost, and only by a somewhat speculative piecing together of scattered evidences can an estimate of their knowledge be formed. The inter-relations of the Phoenicians with the early Hellenes were frequent and far-reaching, and in the Greek presentation of the legends concerning constellations a distinct Phoenician, and in turn Euphratean, element appears. One of the earliest examples of Greek literature extant, the *Theogonia* of Hesiod (*c.* 800 B.C.), appears to be a curious blending of Hellenic and Phoenician thought. Although not an astronomical work, several constellation subjects are introduced. In the same author's *Works and Days,* a treatise which is a sort of shepherd's calendar, there are distinct references to the Pleiades, Hyades, Orion, Sirius, and Arcturus. It cannot be argued, however, that these were the only stars and constellations named in his time; the omission proves nothing.

The same is true of the Homeric epics wherein the Pleiades, Hyades, Ursa major, Orion, and Boötes are mentioned, and also of the stars and constellations mentioned in Job. Further support is given to the view that, in the main, the constellations were transmitted to the Greeks by the Phoenicians from Euphratean sources in the fact that Thales, the earliest Greek astronomer of any note, was of Phoenician descent. According to Callimachus he taught the Greeks to steer by Ursa minor instead of Ursa major; and other astronomical observations are assigned to him. But his writings are lost, as is also the case with those of Phocus the Samian and the history of astronomy by Eudemus, the pupil of Aristotle; hence the paucity of our knowledge of Thales's astronomical learning.

From the 6th century B.C. onwards, legends concerning the constellation subjects were frequently treated by the historians and poets. Aglaosthenes or Agaosthenes, an early writer, knew Ursa minor as Κυνόσουρα, Cynosura, and recorded the translation of Aquila; Epimenides the Cretan (*c.* 600 B.C.) recorded the translation of Capricornus and the star Capella; Pherecydes of Athens (*c.* 500–450 B.C.) recorded the legend of Orion and stated the astronomical fact that when Orion sets Scorpio rises; Aeschylus (525–456 B.C.) and Hellanicus of Mytilene (*c.* 496–411 B.C.) narrate the legend of the seven Pleiades.

In the 5th century B.C. the Athenian astronomer Euctemon, according to Geminus of Rhodes, compiled a weather calendar in which Aquarius, Aquila, Canis major, Corona, Cygnus, Delphinus, Lyra, Orion, Pegasus, Sagitta, and the asterisms Hyades and Pleiades are mentioned, always, however, in relation to weather changes. The earliest Greek work which purported to treat the constellations *qua* constellations, of which we have certain knowledge, is the Φαινόμενα of Eudoxus of Cnidus (*c.* 403–350 B.C.). The original is lost, but a versification by Aratus (*c.* 270 B.C.), a poet at the court of Antigonus Gonatas, king of Macedonia, and an Ἐξήγησις or commentary by Hipparchus are extant.

THE OLD CONSTELLATION FIGURES.

PROJECTED ON THE PLANE OF THE ECLIPTIC.

FROM SIR WM. PECK, "THE OBSERVER'S ATLAS OF THE HEAVENS" (GALL & INGLIS)

In the *Φαινόμενα* of Aratus 44 constellations are enumerated, viz., 19 northern: Ursa major, Ursa minor, Boötes, Draco, Cepheus, Cassiopeia, Andromeda, Perseus, Triangulum, Pegasus, Delphinus, Auriga, Hercules, Lyra, Cygnus, Aquila, Sagitta, Corona and Serpentarius; 13 central or zodiacal; Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, Pisces and the Pleiades; and 12 southern: Orion, Canis, Lepus, Argo, Cetus, Eridanus, Piscis australis, Ara, Centaurus, Hydra, Crater and Corvus. In this enumeration Serpens is included in Serpentarius and Lupus in Centaurus; these two constellations were separated by Hipparchus and, later, by Ptolemy. On the other hand, Aratus kept the Pleiades distinct from Taurus, but Hipparchus reduced these stars to an asterism. Aratus was no astronomer, while Hipparchus was; and from the fact that the latter adopted, with but trifling exceptions, the constellation system portrayed by Aratus, it may be concluded that the system was already familiar in Greek thought.

Three hundred years after Hipparchus, the Alexandrian astronomer, Ptolemy, adopted a very similar scheme in his uranometria, which appears in the seventh and eighth books of his *Almagest*, the catalogue being styled the Ἔκθεσις κανονική or "accepted version." The names and orientation of the 48 constellations therein adopted are, with but few exceptions, identical with those used at the present day; and as it cannot be doubted that Ptolemy made only very few modifications in the system of Hipparchus, the names were adopted at least three centuries before the *Almagest* was compiled.

A later innovator of moment was Johann Bayer, a German astronomer, who published a *Uranometria* in 1603, in which 12 constellations, all in the southern hemisphere, were added to Ptolemy's 48, viz., Apis (or Musca) (Bee), Avis Indica (Bird of Paradise), Chameleon, Dorado (Sword-fish), Grus (Crane), Hydrus (Water-snake), Indus (Indian), Pavo (Peacock), Phoenix, Piscis volans (Flying fish), Toucan, Triangulum australe. According to W. Lynn (*Observatory*, 1886, p. 255), Bayer adapted this part of his catalogue from the observations of the Dutch navigator Petrus Theodori (or Pieter Dirchsz Keyser), who died in 1596 off Java.

The *Coelum stellatum Christianum* of Julius Schiller (1627) is noteworthy for the attempt made to replace the names connoting mythological and pagan ideas by the names of apostles, saints, popes, bishops, and other dignitaries of the Church, etc. Aries became St. Peter; Taurus, St. Andrew; Andromeda, the Holy Sepulchre; Lyra, the Manger; Canis major, David; and so on. This innovation (with which the introduction of the 12 apostles into the solar zodiac by the Venerable Bede may be compared) was shortlived. A similar confusion was attempted by E. Weigelius, who sought to introduce a *Coelum heraldicum*, in which the constellations were figured as the arms or insignia of European dynasties, and by symbols of commerce.

In Edmund Halley's southern catalogue (*Catalogus stellarum australium*), published in 1679 and incorporated in Flamsteed's *Historia coelestis* (1725), the following constellations are named: Piscis australis, Columba Noachi, Argo navis, Robur Caroli, Ara, Corona australis, Grus, Phoenix, Pavo, Apus or Avis Indica, Musca apis, Chameleon, Triangulum australe, Piscis volans, Dorado or Xiphias, Toucan or Anser Americanus, and Hydrus. Flamsteed's maps also contained Mons Menelai. This list contains nothing new except Robur Caroli, since Columba Noachi (Noah's dove) had been raised to the skies by Bartschius in 1624.

In 1690 two posthumous works of Johann Hevelius (1611–87), the *Firmamentum sobiescianum* and *Prodromus astronomiae*, added several new constellations to the list, viz., Canes venatici (the Greyhounds), Lacerta (the Lizard), Leo minor (Little Lion), Lynx, Sextans Uraniae, Scutum Sobieskii (the shield of Sobieski), Vulpecula et Anser (Fox and Goose), Cerberus, Camelopardus (Giraffe), and Monoceros (Unicorn); the last two were originally due to Jacobus Bartschius. In 1679 Augustine Royer introduced the most interesting of the constellations of the southern hemisphere, the Crux australis or Southern Cross.

Nicolas Louis de Lacaille, who made extended observations of the southern stars in 1751 and in the following years, and whose results were embodied in his posthumous *Coelum australe stelliferum* (1763), introduced the following new constellations: Apparatus sculptoris (Sculptor's workshop), Fornax chemica (Chemical furnace), Horologium (Clock), Reticulus rhomboidalis (Rhomboidal net), Caela sculptoris (Sculptor's chisels), Equuleus pictoris (Painter's easel), Pyxis nautica (Mariner's compass), Antlia pneumatica (Air pump), Octans (Octant), Circinus (Compasses), Norma *alias* Quadra Euclidis (Square), Telescopium (Telescope), Microscopium (Microscope), and Mons Mensae (Table Mountain).

Attempts have been made to introduce new constellations since that date, but none of these is now accepted. The large Ptolemaic constellation of Argo is, however, subdivided into Vela (Sails), Puppis (Stern), and Carina (Keel).

The delimitation of precise boundaries for the constellations was undertaken by a committee of the International Astronomical union. At the present time (1945) it is possible to assign any star to its proper constellation without ambiguity.

The following list contains the constellations now used. The Ptolemaic constellations are printed in small capitals. Those marked with an asterisk are the subject of separate articles.

Northern:

*ANDROMEDA	*CYGNUS	*OPHIUCHUS
*AQUILA	DELPHINUS	*PEGASUS
*AURIGA	*DRACO	*PERSEUS
*BOÖTES	EQUULEUS	SAGITTA
Camelopardalis	*HERCULES	SERPENS
*Canes Venatici	Lacerta	TRIANGULUM
*CASSIOPEIA	Leo Minor	*URSA MAJOR
*CEPHEUS	Lynx	*URSA MINOR
*Coma Berenices	*LYRA	Vulpecula
CORONA BOREALIS		

Zodiacal:

*AQUARIUS	*GEMINI	*SAGITTARIUS
*ARIES	*LEO	*SCORPIUS
*CANCER	*LIBRA	*TAURUS
*CAPRICORNUS	*PISCES	*VIRGO

Southern:

Antlia	Dorado	*ORION
Apus	ERIDANUS	Pavo
ARA	Fornax	Phoenix
Caelum	Grus	Pictor
*CANIS MAJOR	Horologium	Piscis Austrinus
CANIS MINOR	HYDRA	Puppis
Carina	Hydrus	Pyxis
*CENTAURUS	Indus	Reticulum
*CETUS	LEPUS	Sculptor
Chamaeleon	LUPUS	Scutum
Circinus	Mensa	Sextans
Columba	Microscopium	Telescopium
CORONA AUSTRINA	Monoceros	Triangulum Australe
CORVUS	Musca	Tucana
CRATER	Norma	Vela
Crux	Octans	Volans

(C. E.; A. S. E.; X.)

CONSTIPATION, the condition of body when the faeces are unduly retained, or there is difficulty in evacuation (*see* DIGESTIVE ORGANS; and THERAPEUTICS). It may be due to constitutional peculiarities, sedentary or irregular habits, improper diet, etc. The treatment varies with individual cases, according to the cause at work, laxatives, dieting, massage, tonics, etc., being prescribed. In diagnosis it is essential to eliminate constipation due to intestinal obstruction, peritonitis and similar conditions.

CONSTITUENCY, a political term for the body of electors within a defined political area who choose a representative for parliament or other public assembly, for the place or district so represented, and for the residents therein generally.

CONSTITUTION, the fundamental system of laws governing a country. For U. S. Constitution *see* the articles UNITED STATES and CONSTITUTION AND CONSTITUTIONAL LAW.

CONSTITUTION, a United States frigate familiarly known as "Old Ironsides," is without doubt the most famous ship in the annals of the American navy. She was one of the first three naval vessels built by the United States; designed by Joshua Humphreys of Philadelphia, her keel was laid at Hartt's ship-yard, Boston, in 1794. She was launched in 1797 and in the following year was first commissioned and placed in service against the French privateers then infesting American waters. In 1804–05, the "Constitution" participated in the war against Tripoli, which resulted in peace with the Barbary States, and stopped the tribute the United States had been paying the African pirates. It was not until the War of 1812, however, that she won her enduring place in American history. On Aug. 19, 1812, when the moral of the country was at its lowest ebb, the "Constitution," under the command of Captain Isaac Hull, won a brilliant victory over the British frigate "Guerrière." This naval duel was followed by numerous other victories hardly less notable, the better known being the destruction of the "Java" (Dec. 29, 1812) and the capture of the two armed vessels "Cyane" and "Levant" on Feb. 20, 1815. It was during the "Constitution's" engagement with the "Guerrière" that the American sailors, on seeing the British shot bounding off the solid oak sides of their ship, dubbed her "Old Ironsides," and it is by this name that she is known to millions of Americans to-day.

On June 16, 1927, "Old Ironsides" was dry-docked at the Charlestown navy yard, Boston, for her fourth reconstruction, a fact which testifies to the abiding place which she holds in the love and admiration of the American people. Congress, on March 3, 1925, authorized her restoration by funds raised by popular subscription. The greater part of the necessary funds (estimated at $650,000) have been raised by the donations of school children. When the work is completed, this historic old ship will again be able to sail the seas. "Old Ironsides" is what is generally known as a 44-gun frigate, although she always carried more than that number; in the battle with the "Guerrière" she carried 55 guns and 456 men. Her length over all is 204 ft., beam 44 ft. 8 in., draught 22 ft. 6 in., armour $21\frac{1}{2}$ in. oak, and gun range 1,200 yards. She was originally built of live oak and red cedar, all well seasoned wood, and the bolts which fastened her timbers and the copper sheathing were made in Paul Revere's shop. The present restoration is to follow faithfully her original lines.

See F. A. Magoun, *The "Constitution" and other Historic Ships* (1928); and the *Scientific American* vol. cxxxiii., p. 20 and vol. cxxxvii., p. 530.

CONSTITUTION AND CONSTITUTIONAL LAW.

The word constitution is in its modern sense a term which, originally generic, has, like the word "parliament" undergone a specialization of function. In the time of Cicero it (*constitutio*) is used indifferently for a point in rhetoric, the nature or form of the human body, and lastly, in a legal, but very wide, sense, any regulation or ordinance. In this last application it acquires majestic significance in the time of Justinian as a term for a law or collection of laws issued by the sovereign. Such were the many hundreds of *novellae constitutiones* or "novels" in which Justinian codified the law of Rome. In this plural use it makes one of its rare appearances in English history, namely in those Constitutions of Clarendon (1164) in which Henry II. attempted to delimit the spiritual and temporal jurisdictions in this country, "the first authoritative redaction" in our history, as Pollock and Maitland call them, "of hitherto unwritten custom." But it was still an exotic word, belonging to the civil and canon law, and never took root in our legal language. Instead of it we find "Assize" or "Charter" for a law or collection of laws, to be displaced later by the words "Statute" and "Ordinance." When it re-emerges in England in the 18th century, it is as a word used exclusively in the singular, not in the plural, and with a specialized and somewhat abstract meaning. It then came to mean in English what it means to-day, *i.e.,* no longer any particular law, or any particular collection of laws, but the whole structure of a political society, its legislative and executive organs and their function, and, also, the rights and duties of subjects in relation to the supreme power in the State. This is as near to a general definition as one can get, but it is at best a loose definition for the simple reason that the term, although definitely naturalized in the domain of "Public Law," has a different meaning in different countries. How different may be illustrated by contrasting Chesterfield's statement in the 18th century that "England is the only monarchy in the world that properly can be said to have a constitution" with De Tocqueville's declaration a hundred years later that England was the only country which had got no constitution at all. What De Tocqueville meant was that England has no fundamental law or written instrument creating, organizing and defining the legislature and the executive and delegating to them certain powers. That is true enough and the term "constitution" in nearly every modern country, except England, means just this, because they possess, and England does not, an instrument of this character.

The Sovereign and the Constitution.—What Chesterfield meant, on the other hand, was that England was the only country in which the exercise of the power of the sovereign was subject to the control of the courts of law and of parliament. In other words by a "constitution" he meant certain legal principles restrictive of arbitrary power. And this also was true. In all other countries at that time the king was above the law, alike in the executive sphere and in the legislative. And it was just because the sovereign was above the law in every country but our own that a revolution was necessary to subjugate him to it and to create legislatures, more or less representative of the public will, to control him. Hence the appearance with the French Revolution in 1789, still more with the revolutions of 1848, of "written" constitutions on the continent of Europe. Parliaments, *i.e.,* assemblies of "estates," once universal in Europe, had disappeared everywhere, except in England, in the 17th century and it was necessary to re-create them. That could only be done by a supreme act of legislation, namely a "written" constitution. So, too, with the invasion of Roman law, which England alone escaped, the will of the sovereign had become supreme over his subjects and it was necessary to concede to them "rights" which, again, could only be done by some written constitution. Such "constitutions" have nearly all originated in secession, as in the case of the United States, or in revolution as in France or, as in the case of the Treaty of Versailles, in the creation of new States by treaty. In England, owing to the continuity of her parliament and still more the supremacy of her common law (*q.v.*), with its doctrine that the king has no prerogatives except those which the common law allows him, no such written constitution—except during the revolutionary and republican interval of the Commonwealth and Protectorate—was ever necessary. Hence the notable fact that both the substantive "constitution" and the adjective "constitutional" are unknown to English law; they are not what English lawyers call "words of art"; they have no technical meaning. Blackstone in his more literary moments sometimes, but rarely, speaks of "our constitution," but the term finds no place in the rubrics of his chapters; Bolingbroke appears to have been the first to use it, and he uses it, like Chesterfield and Burke, in a philosophical sense as meaning the principles of English liberty.

The Term "Unconstitutional."—To-day the term "unconstitutional" in England is yet more vague. It does not mean, as it does in the United States, "illegal," but unconventional, that is to say, something which, though legal, is unusual or contrary to political usage. It is "unconstitutional" for the prime minister to remain in office after a vote of "no confidence" by the House of Commons but it is in no sense illegal, for the law, which knows not the office of prime minister nor the conventional usage of the responsibility of the executive to parliament, is silent on the point. But where, as in most modern states, the constitution is embodied in a fundamental law, the executive and the legislature are, with certain exceptions, alike subject to it, are indeed delegations of it, and their proceedings, if contrary to its provisions, *may* be illegal in the strictest sense of the term, *i.e.,* such as the courts will refuse to enforce. In such a case the legislature is, of course, not sovereign. In England, on the other hand, parliament, in the absence of any such "constitution," is supreme. But an Act of the American congress may be declared "unconstitutional" by the Supreme Court or rather disregarded and such a declaration, or rather such a repudiation means that it is "illegal." An Act of the British parliament, on the other hand, can never be illegal although its Acts have often been called "unconstitutional" in the sense of being arbitrary or unprecedented. This sharp distinction between "legal" and "constitutional," in the case of the

English use of the adjective, does not, however, extend to the use of the substantive.

The Theory of the English Constitution.—The "constitution" in England includes both law, *i.e.*, common law and statute law, in so far as they deal with the sovereign's power and the rights of the subject as against it, and conventional usage. The strictly legal theory of the English constitution involves a dualism, *i.e.*, the legislative power is in the king in parliament and the executive power is in the king in council, and each is independent of the other. But political usage or convention has developed an informal body known as the "cabinet" which, legally speaking, is merely a meeting of certain members of the privy council, but conventionally is a meeting of privy councillors who should be, and invariably are, members of one or other house of parliament and belong to the party which is in a majority, whether an absolute or a relative majority, in the lower house. Political usage also dictates that if this body ceases to command the confidence of a majority in the house of commons the members shall either resign their respective offices, although they are *legally* responsible only to the king, or shall, through the prime minister, ask the king to exercise his prerogative of dissolution and here again political usage dictates, though the law does not, that the king shall not refuse the prime minister its exercise. The legal theory, and the political usages which thus qualify it, are both included in the term "the English constitution"; so also are included all that part of the common law which recognizes and enforces the rights of the subject such as the right to a writ of Habeas Corpus (*q.v.*), the right to trial by jury (*see* PRACTICE AND PROCEDURE), and the right to sue any officer of the Crown for wrongful acts even though committed in his official capacity. This last brings out another characteristic of the term "constitution" in England, that British law knows not the distinction, familiar in Europe, between "public law" (*droit public* in France, *Staatsrecht* in Germany) and "private law" (*droit privé* or *Privatrecht*), between law relating to the State and law relating to private individuals. In other words so much of the English constitution as is not to be found in statute law or political usage is to be found—and it is by far the larger part—in the common law. Even a right so "political," and therefore so peculiar in other countries to the domain of "public law," as the right to vote was in England as much a "private" right as the right to sue for trespass or for recovery of one's freehold. It was, except in the parliamentary boroughs, simply a right arising out of the law of real property, namely, a freeholder's right, and a returning officer who refused to allow the freeholder to exercise it could be sued in an ordinary "private" action for damages. In a word British constitutional law, if we exclude mere conventional usages, is common law, and the common law, which is "unwritten," is supreme. The difference between Great Britain and the United States may with some exaggeration be expressed by reversing the historic words of Article VI. of the "written" American Constitution, which declares "This Constitution . . . shall be the supreme law of the land." In England we may say "the supreme law of the land *is* the constitution." England's statute law does, indeed, also secrete some part of her constitutional law, but more often than not, especially in earlier times, such statutes purported merely to declare the common law, as in the case of the Statute of Treasons, or to bond the king by a kind of contract to cease disregarding the common law, as in the case of the Petition of Right, or to expedite the existing process of the common law, as in the case of the Habeas Corpus Acts. Other "constitutional" statutes have indeed changed the law, the most notable example being the Parliament Act (1911) which, in effect, destroyed the legislative power of the house of lords as one of the estates of the realm.

Written Constitutions.—Far too much has been made, however, by jurists, particularly by Dicey, of the distinction between countries with a "written" constitution, or fundamental law, and countries without it. A written constitution can never exhaust the whole sphere of constitutional law. Such a constitution always presupposes an advanced state of society with a common law of its own, without which, indeed, the written constitution is unintelligible for its very terms have to be interpreted in the light of it. In Germany, where "written" constitutions came into existence as long ago as 1848, jurists have been quick to see this. As Hatschek (*Deutsches und Preussisches Staatsrecht,* I., p. 8), employing the German juristic distinction of "material" law and "formal" law, points out, every State, just because it is a State, has always had a constitution in the "material" sense, *i.e.,* some common law ruling the relation between subject and sovereign. Such a "constitution" belongs to every State as the clothes belong to the body—"*es gehört zu jedem Staat wie das Kleid zum Körper.*" Without it there is no State except that "state of nature," so satirized by Hobbes, which was naked indeed. This material constitution is to be found in the customary law (*Gewohnheitsrecht*) even though the country knows nothing of representative institutions and the will of the monarch be supreme. A "constitution" in the "formal" sense, *i.e.,* a written fundamental law (a *Grundgesetz*), may be wrested from the monarch but even if it were revoked the "material" constitution would remain. This is equally true of the United States.

In the United States.—The United States constitution is full of terms such as "treason," "trial by jury," "the obligation of contracts," all of which imply, as a condition precedent to the constitution, the pre-existence of common law, and the first two are some of the constitutional elements in the common law which the English settlers carried with them across the Atlantic. The constitutional law of America is therefore not to be found solely in the "constitution" but also in the common law. It has been said that there is no common law of the United States and that there is only the common law of the individual States. This is true enough as regards criminal law (*cf.* Mr. Justice Chase in *U.S.* v. *Warrall*: 1798; 2 Dallas, 384). The common law, it has been declared, could "only be made part of our federal system by legislative adoption" (*Wheaton* v. *Peters,* 8 Pet., 591), a statement which requires some qualification when it comes to the interpretation of the duties of common carriers in interstate commerce. But in the interpretation of the American constitution itself the Supreme Court has been driven to admit that the common law must be resorted to for the definition of terms used in the Constitution when such terms are not there defined (*United States* v. *Smith,* 5 Wheaton, 153). In this sense, and to this extent, the "constitution" of America itself is unwritten. Behind the framework of the formal constitution there stands the "material" constitution of the English common law, without which the American constitution is but a skeleton. As is well observed by Mr. Burdick, the American constitution is not an invention but a codification. Furthermore, there has been an accretion of "conventional" usage, particularly as to the relations between president and congress, of a non-legal character in America just as there has been in England. No country can ever be permanently imprisoned in the strait-jacket of a written constitution. Either the jacket is "stretched" by judicial interpretation—witness the immense developments, in the hands of the Supreme Court, of the Interstate Commerce clause—or it is expanded by the growth of "conventions." If it were not, a written constitution would indeed be the lethal thing of De Maistre's epigram: "*Dès que l'on écrit une constitution, elle est morte.*" (*See* United States section of this article further on.)

The Legislature and the Constitution.—Nor, again, is the distinction in the powers of the legislature which Dicey makes between countries with a written constitution and countries without one at all as sharp and decisive as Dicey makes it. That distinguished writer assumes, almost as a matter of course, that when a country has a written constitution, two things follow, (1) that the legislature is "subordinate" to the constitution, (2) that statutes passed by it in conflict with the constitution are *ultra vires,* and, as a necessary consequence, that the courts can refuse to enforce them. But this is only true of federal constitutions, *i.e.,* constitutions where the legislative power is divided (and, with it, the "internal sovereignty" of the country) between a central legislature and a number of local legislatures, each supreme in its respective sphere. In such a case the central legislature, as in the United States and in Germany, is restricted to legislation in respect of certain enumerated subjects, but in respect of them is "supreme" or as it is tersely put in the new German constitution "Federal law fractures (*bricht*) State law." In case of conflict, *i.e.*, when it is a question whether the overriding federal law is within federal competence, some kind of external arbitration is necessary and this is naturally found in a court. In the case of the United States this arbitral power was, curiously enough, never expressly entrusted to the Supreme Court, it assumed it (in *Marburg* v. *Madison*, 1 Cranch, 137) or more truly, it inherited it from the privy council, and, even so, the court never directly *declares* a Federal (or State) statute *ultra vires*, it merely refuses to enforce it when it arises as an issue in legislation. In the new German constitution (Article 13), however, express provision is made for the direct reference of such conflicts to the Reichsgericht, *i.e.*, the Supreme Court at Leipzig, which was formally invested with this "constitutional" jurisdiction by a Reich Statute of April 8, 1921. But in a non-federal or "unitary" country like France, the existence of a written constitution in no way implies any power on the part of the courts to declare an enactment of the legislature unconstitutional. The interpretation of the constitution is in France entrusted to a branch of the legislature, viz., the Senate, on the initiative of the Government. If the interpretation is disputed as amounting to a judicial act, the decision of the senate is treated as equivalent to a "revision" or amendment of the constitution. In that case the two chambers sitting together under the name of the "National Assembly" decide the issue. The French legislature, in spite of the existence of a written constitution, is thus in reality sovereign. It is sovereign not only in the immunity of its legislation from the control of the courts but also in its power to change the constitution itself. No external authority, such as a plebiscite as in Australia and Switzerland or a majority of the State legislatures as in America, is required in France to effect a change in the constitution. The legislature has therefore the "constituent" power, and is truly sovereign. So too in Germany, alike under the old imperial constitution (Act 78) and the constitution of 1919, "the constitution can be altered in the ordinary course of legislation." The American idea of some power superior to the Federal legislature, and external to it, in the matter of constitutional change is, as Anschütz remarks, quite "foreign" to German public law. And ever since the decision of the Privy Council in *McCauley* v. *the King*, A.C. (1920), 691, it can no longer be said of the British colonies with their written constitutions, that their legislatures are, as Dicey said they were, "subordinate" bodies unable to pass laws which conflict with their "constitution." In that case it was held that, unless the constitution itself specifically prescribes a special procedure for its amendment, it can be amended by mere implication by an ordinary law with no more formality than "an Act for the licensing of dogs." A "written" constitution therefore in no way excludes the existence of a "sovereign" legislature except in a Federal system. It all depends on the terms of the constitution, or, to quote Lord Birkenhead's phraseology in the *McCauley case*, whether it is "controlled" or "uncontrolled."

The Sphere of Constitutional Law.—It will be fairly obvious from what has been said above that restrictive attempts to define the sphere of constitutional law as something distinct from other branches of law are futile. It cannot be segregated, whether the constitution be written or unwritten, from the common law of each particular country. Hence the futility of those frequent excursions into its domain by the exponents of what is called "Political Science" who, ignorant of law, are the unlicensed practitioners of this branch of learning. So far as they treat of a particular constitution they are ill-informed; so far as they attempt generalizations from all constitutions they are beating the air. As Maitland ironically observed, "Political Science is very apt to look like sublimated jurisprudence," but it is jurisprudence without jurists, a kind of cloudy exhalation of sociology, ethics, economics, "crowd psychology," with a little ill-digested law to give it a certain density of atmosphere. There is no such thing as a "science" of State institutions even in the case of "Federalism" which, as Jellinek, himself a lawyer, points out in his *Allgemeine Staatslehre* (3rd ed., s. 737) is not a "general concept" (*Allgemeinbegriff*) at all but resolves itself into the legal study of each particular "empirical type" of Federation.

Sovereign Power and the Referendum.—One of the chief problems with which constitutional law is occupied is the definition of the sovereign power in the State. But it is by no means the only problem. For this reason Austin's attempt to delimit the scope of "constitutional law" is singularly unsatisfactory. He describes it in the following terms: "In a country governed by a monarch, constitutional law is extremely simple, for it merely determines the person who shall bear the sovereignty." Simple indeed is such a definition, and all too passive, for it excludes the activity of the legislature and the executive, *i.e.*, the process of legislation, the modes in which the sovereign power is exercised, the sanctions attendant on its exercise, the control of the courts over the executive, the "rule of law" and the whole sphere of the rights of the subject. Nor is his attempt, followed by Holland, to distinguish constitutional law from "administrative law" any happier. There is no such thing as administrative law in England in any technical sense of the term at all, nor, even if there were, would it be possible to separate the functional activity of the institutions of the State from their organic character. Such ill-nourished definitions, if accepted, would exclude, for example, all consideration of two such great instruments of the English constitution as the writ of mandamus and the writ of habeas corpus.

None the less, the definition of the sovereign power is, as has been observed, important; and Austin's definition of it, famous for its heresy, is, although universally rejected, and rightly so, by English lawyers, interesting and, if applied to other countries than England, including certain British colonies, not quite so questionable as it was. He defines it as residing not in the king, lords and commons, in other words in "parliament" but as in the king, lords and the electorate. But this, to adopt the terminology of Bryce in his *Essays in Jurisprudence*, is to confound "political" sovereignty with "legal" sovereignty. The commons are, it is true, merely representatives of the electorate and may be called to account by the latter, but in the interval between one general election and another the participation of the commons with the king and the lords in the sovereign power is unquestionable—"the English people" as Rousseau, writing in the days of the Septennial Act, said, "are free only once every seven years." To-day he would have said every "five." And there is nothing to prevent parliament postponing the appeal to the electorate indefinitely by prolonging its own existence. It did so in the 17th century during the Civil War, again in the 18th century when it repealed the Triennial Act, and again in the present century when, during the World War, it lengthened its term of existence from the five years prescribed by the Parliament Act to eight. Where, however, as in Queensland and Manitoba, infected by the political experiments of the Western States of America, British colonies have, by adopting the referendum, introduced a new factor into legislation, namely a plebiscite, it may be argued with much plausibility that the "sovereignty" has passed to the electorate. The argument, however, is not decisive, for the simple reason that, both in Manitoba and in Queensland, the legislature remains sovereign inasmuch as it can at any time repeal the Acts instituting the referendum and thereby deprive the electorate of the voice in legislation conferred on it. Moreover the decision as to *what* bills shall be submitted to the referendum rests, in the case of Queensland, with the Government which is not bound to submit them at all (see *Taylor* v. *the Attorney General of Queensland* [1917] 23 Commonwealth Law Reports 457). Where, as in the case of Manitoba, provision is made not only that bills must be submitted to the electorate but that the electorate may *"initiate,"* as well as vote upon, legislative proposals, to which, in the event of a majority of votes being cast for them the Lieut.-Governor shall give his assent as though the proposal had been passed by the legislature itself, we seem to encounter the "sovereign people" in the full sense of the word, as in the Western States of America—where such institutions had been adopted on the principle that, as Ostrogorski puts it, "the best cure for democracy is more democracy." But not quite! The Manitoba Act itself still excluded Supply Bills and Appropriation Bills from the proposed referendum, for the very obvious reason that if it lay with the electorate to vote taxes it would vote none. The legislature therefore remained supreme in certain matters. This "Initiative and Referendum Act" was, however, declared *ultra vires* by the privy council (*see* A.C. [1919], p. 935), on the ground, among others, that it purported to deprive the Crown, *i.e.*, the Lieut.-Governor, of its voice in legislation. Indeed, there can be no doubt that great as the "constituent" powers of British legislatures in the Dominions are, as has been seen above, they do not include the power either of excluding the Crown as a factor in legislation or of depriving the legislature of its representative character. The legislature is internally sovereign but its sovereignty stops short of the paradoxical power of destroying its own existence and substituting for it that of the electorate. The same is true of the German Reichstag under the present German constitution. That constitution is remarkable for the extent to which it adopts the institution of the Referendum, not merely in the matter of revision of the constitution but of ordinary legislation which *must* be submitted to a referendum if the president so decides or one-fourth of the members so request, and it *may* be so submitted if one-tenth of the electorate so petition. But as Hatschek observes, not one of these provisions makes the popular decision (*Volksentscheid*) an independent source of law, and all of them require the co-operation of the Reichstag at one stage or another. The Reichstag, together with the Reichsrat, continue to participate in the sovereign power of legislation, in so far as, under a Federal system, a Federal legislature is "sovereign" at all. The most that can be said in such cases of the Referendum is that sovereignty is *shared* with the electorate. Indeed it is impossible to say that the people are ever sovereign, in the full legal sense, in any country with a legislature in the real sense of the word, except where it comes to a revision of the constitution, and not always even then. The sacramental words, faithfully copied in the preamble of the Australian constitution, with which the constitution of the United States commences: "We, *the people* of the United States, in order to form a more perfect Union . . . do ordain and establish this "Constitution" no more confer sovereignty on "the people" in America than in Australia. This, because the people who "ordained and established" the constitution have no power to change it; a majority of the State legislatures alone can do that. The same is the case in Australia, because, in spite of the fact that constitutional amendment is referred to the electorate, such amendment can only take effect if the majority of the electorate also represents a *majority of the States*. And as in Australia, so in Switzerland. Popular sovereignty is therefore apt to resolve itself, legally speaking, into a myth in any organized society. It is a purely primitive idea, belonging to the days when, in the words of Tacitus, the freemen of the German tribes decided every question with a loud shout and, we may surmise, by knocking the minority on the head. We may also find the idea of popular sovereignty in the Anglo-Saxon folkmote and the Landesgemeinde of the forest cantons of Switzerland: we shall find it nowhere else.

Federal Constitutions.—The sovereignty of the legislature is, as has been seen, qualified in the case of a federal system by the fact that the powers of the central legislature are limited, and can only be increased, by an external authority, namely the constituent States, who have been, and are, the contracting parties to the federal contract. Is it qualified in the case of a unitary State? Laband, by far the most authoritative of the older generation of constitutional lawyers in Germany, answers the question (*Reichsstaatsrecht* Bd. IV., pp. 5 *et seqq.*, 1914) by saying "Yes" in the case of a monarchy, "No" in the case of a republic. To Englishmen his affirmative would seem unintelligible. England is a monarchy, they would retort, the legislature is the "king in parliament" and parliament is supreme. So too, one might say, was the Landtag of Prussia from 1851 to 1919. But looking at the matter from the point of view of French and German constitutional law, Laband was right. The sovereignty of the legislature in the Prussian monarchy *was* qualified because, to a German jurist no law, even when assented to by the king of Prussia as part of the legislature, was complete without a "sanction" and Laband carefully distinguishes between the sanction of the law (*Gesetzbefehl*) and the law itself (*Gesetzinhalt*). Now in England no separate "sanction" is necessary to every Act of Parliament (it is an imputed misdemeanour at common law to disobey any Act of parliament, for the law imputes a command to obey it, whether the Act itself provides for a penalty or not), and the legal obligation of the Act is complete from the moment it receives the royal assent. But in Germany and in France an Act of the legislature is incomplete until a decree is issued by the head of the State to "promulgate" it. This promulgation was in those countries the exclusive prerogative of the monarch, and he could withhold it as the head of the Executive, even when he had assented to the "law" as the head of the legislature. To-day no president has replaced the king of Prussia where, by a curious anomaly, the prime minister elected by the legislature, is the only visible head of the State. But in the "Empire" (Reich), the president, who has replaced the kaiser, has no power to withhold the decree of promulgation, although he may, in his discretion, submit the bill to a referendum; while in France all that the president can do is to postpone the *promulgation*—the *"acte de naissance"* of the law, as Moreau calls it—by asking the two chambers to reconsider the bill, a power which, in fact, has never been exercised and would only encounter defeat if it were. Hence it is that Laband regards the sovereignty of the legislature as only complete in countries with a republican form of government.

The Sovereignty of the Executive.—So far we have confined our consideration of sovereignty to legislative sovereignty. But in spite of Austin, legislative sovereignty is not the whole of sovereignty. There is the sovereignty of the executive, and we have authority for the distinction. Both Laband and Salmond make it. Laband treats the enforcement of a law as of equal importance with the enactment of it, and points out that this power resides in the monarch alone, or, as we should say in England, in the "king in council" and in such of the king's servants as the Attorney General, the Director of Public Prosecutions and the police. Here we come up against the venerable principle, originating with Montesquieu, of "the separation of powers." This doctrine may be said to originate in that famous chapter of Montesquieu's (*Esprit de Lois* liv. ix. chap. vi.) in which he describes the ideal constitution from the point of view of political liberty as that where the legislature, the executive and judiciary are mutually independent of one another. That chapter has been much misunderstood, for he reduces the ultimate "powers" in a State not to three but to two, namely the legislature and the executive. Obviously if the judiciary were invested with a co-equal and irreducible power, there could be no legislation without its consent, which is exactly what happened in France when the "Parlement of Paris," which was a court, and nothing else, claimed to control with a kind of judicial veto, exercised by way of "registration," the legislative powers of the king on the one hand, and the States General on the other; a claim which, as Aubert, the historian of the Parlement of Paris observes, had no real foundation in law or in fact, and was easily overcome by a *lettre de jussion, i.e.*, a formal command of the king. The important thing, in the interest of the liberty of the subject, is not that the judiciary should be supreme but that the judges should be independent—in other words secure in their tenure of office. Practically every country has adopted this principle; it took root in Prussia as early as the time of Frederick the Great and in the Germany of to-day no judge can be removed from his office except by a judgment of his colleagues. Beyond this the doctrine of separation of powers has nowhere taken root with any degree of completeness except in America, where the "Fathers of the Constitution" adopted Montesquieu's theory, or what they took to be such, as if they believed in the doctrine of verbal inspiration. Hamilton's great sentence in No. 47 of the *Federalist* is classic: "The accumulation of all powers, legislative, executive and judiciary, in the same hands, whether of one, a few or many, and whether hereditary, self-appointed or elected, may justly be pronounced the very definition of tyranny." Upon this rock the American constitution is built. The Supreme Court is established, and its jurisdiction to a large extent determined, by the constitution itself and to that extent it is co-ordinate with the legislature and independent of it. The same holds good of Australia where the adoption of this American principle qualifies the British principle of parliamentary sovereignty which otherwise prevails—the qualification was inevitable if one adopted, as the Australian Convention was determined to do, the American model of a Federal system. But even congress may regulate the jurisdiction of the Federal Courts, as it has done by the Judicial Code, and the judges are necessarily subject to the joint authority of the president and congress in that their appointment must be vested somewhere. The most striking feature of the American constitution is the complete separation of the executive and the legislature—here there is not only, as in England, a dualism in law, but a dualism in fact. On the other hand in England the legislature being omnipotent can delegate its powers of legislation to the Executive—and does so to an increasing extent—whereas in America it is a fundamental principle, resulting from the separation of powers and the theory that congress itself is but a delegate of the constitution, that the Federal legislature cannot in turn delegate its power of law-making to the executive. But the Supreme Court had had to keep pace with the development of governmental functions attendant on the increasing complexity of society, and it has come to recognize as "constitutional" the devolution by congress of powers of "subordinate legislation" to commissions particularly the Interstate Commerce Commission (see *Interstate Comm. Comm.* v. *Illinois Cent. R. R. Co.* [1910] 215 U.S. 452). The truth is that a complete separation of powers is impossible in any highly organized political society. The Executive, quite apart from the powers of legislation delegated to it, in Parliamentary times, has always legislated in monarchical countries, just as the courts have always legislated by developing the Common Law (*q.v.*). Until the 17th century the king legislated by proclamation in this country; and in some matters, such as the King's Regulations and the Orders in Council regulating the Civil Service, he—or rather his Government—legislates still, although he cannot create new offences. But in Prussia, till 1919, the relative sphere of royal ordinances and parliamentary statutes was, in spite of the constitution of 1851, a debatable subject, and Bismarck did not hesitate, in his conflict with the Prussian chamber, to fall back on an ordinance (*Verordnung*) when he could not procure a statute (*Gesetz*). The position taken up by the putative fathers of the new Reich and Prussian constitutions of 1919 is that the executive shall have no power to make regulations affecting the rights and duties of the citizen except when empowered to do so by statute. In this sense, and to this extent, all modern executives legislate. The result is often to confer, by a draft statute, powers of a most arbitrary kind upon Government departments—even to the paradoxical extent of enabling them to make regulations inconsistent with the Act under which they are made—*cf.* sect. 67 (1) of the Rating and Valuation Act of 1925 and *Rex* v. *Ministry of Health* (T.L.R., April 30, 1927). So too judicial powers are sometimes conferred on Government departments in the interpretation of statutes without appeal to the courts (*cf.* Small Holdings Act, 1908, and *Ex parte Ringer* 25 T.L. Rep. p. 718). Such developments are objectionable, not because they offend against any abstract theory of separation of powers, still less because they are unprecedented, for there was a time when the king's council legislated, administered and judged, and until 1888 (and to some extent still) the lower organs of the governmental hierarchy, namely the Justices of the Peace, were both judges and administrators. The real objection is that no Government department should be judge in its own cause, or act as a legislator without the check of popular control. The great constitutional problem in most countries today is how to subjugate these encroachments of the bureaucracy to the continuous control of the courts on the one hand and of the legislature on the other.

The Elasticity of Constitutions.—It will be apparent from the foregoing that there are no fixed principles in constitutional law. Here, as elsewhere, the life of the law, to adapt the words of O. W. Holmes, "is not logic but experience." Constitutional law is not a matter for categories. Some writers have indeed distinguished constitutions into "rigid" and "flexible," but even the most rigid of constitutions, such as the Federal type, have their elasticity. The "War Power" under the American constitution has, under the inexorable test of the World War, proved itself an instrument capable of completely transforming, for the time being, all constitutional limitations on the legislative power of Congress, enabling, as it has been held to do, congress to regulate prices, requisition ships, control railroads, and even temporarily to enforce "Prohibition" (cf. *Hamilton* v. *Kentucky Distilleries Co.*, 251 U.S. 146, 1919) before the Constitution had been amended. This magic invocation of the "War Power" completely upset the carefully devised balance of powers between the Federal and the State legislatures. Exactly the same thing happened in the federally constituted Dominions of the British Empire—in Canada (cf. *Fort Frances Pulp Co.* v. *Manitoba Free Press Co.*, A.C. [1923] p. 695), and in Australia (cf. *Farey* v. *Barrett* 21 C.L.R. 433) where the "Defence Power" was held, like the "War Power" in America, to cover, *in time of war*, all kinds of extensions of Federal powers which, in time of peace, would be "a trespass on the reserved powers of the States." In constitutions, as in other things, it is the letter that killeth and the spirit that giveth life.

In no department of law has there been so much conscious imitation as in constitutional law. It is, indeed, the only department of law in which nations have deliberately borrowed from one another on a large scale, and it is fashionable to say that England is the foster-mother of the constitutions of the world. A very little reflection should, in the light of what has been written above, serve to show that this is only very partially true. No country could borrow our "constitution" without first destroying its common law and adopting our own. Such a repudiation of its historic past would be impossible. It is only that part of the constitution which relates to the legislature, in particular the bi-cameral system and the law and custom of parliament, that has been deliberately copied from England. Here, indeed, the transcription has been great. When England, almost alone among the countries of Europe, escaped the shock of the French Revolution, the prestige of her constitution became immense. Montesquieu had already singled out the English constitution for the admiration of mankind as the one polity which secured the liberty of the subject—and in his time he was right. After the French Revolution, men set themselves everywhere in Europe to follow Burke's advice and "study the British constitution." From Guizot to Gneist a whole school of European thinkers set themselves to understand it, and indeed to transplant it. And yet even here it may be said, paradoxically enough, that it was only possible to imitate the English constitution in proportion as it was possible to misunderstand it. No constitution will ever bear transplantation from one political climate, *i.e.*, from one legal atmosphere, to another. It is always an exotic. Of no institution is this more true than of our own Second Chamber. Hamilton counselled the adoption of a Second Chamber in the American constitution by analogies drawn from the functions of the house of lords—"a most noble institution" he called it—as a council of the Crown which, at the time he wrote in the *Federalist*, it appeared to be but no longer was. The result is that the American senate has acquired an ascendancy in the American legislature which, ever since the Reform Act took the constituencies out of the pockets of the peers, the house of lords has definitely lost, and no two institutions could be more unlike. Exactly the same divergence has occurred in the case of another "second chamber" which was deliberately adopted from our own country; the French senate—the creation of the Monarchists—has become the creature of the Republicans by that strangest of political ironies by which, as a classical authority tells us, "men realized a Republic while dreaming of a monarchy." None the less, the house of lords stood in the eyes of continental jurists for a principle, namely the division of the legislative body into two chambers, of which bi-cameral principle Esmein remarks, with perfect truth, that it is "*une institution presque générale chez les peuples qui pratiquent le gouvernement représentatif*" and, equally truly, that "*toutes les nations qui ont adopté ce système l'ont directement, ou indirectement, emprunté à l'Angleterre.*" But beyond the mere "division" of the legislature they borrowed little or nothing, and the second chambers of European countries exhibit little or no uniformity of type and in their constitution no resemblance whatsoever to the house of lords—it would have been necessary to borrow our law of incorporeal hereditaments, in other words our law of peerage, before such a resemblance could have been achieved. Another institution which was copied with some fidelity from England was the principle of "responsible government." Here, however, the transcription came much later. Before 1919 responsible government did not exist in Germany. In France, indeed, it has existed ever since 1870, and at intervals before that date, and yet here again it has only been possible to adopt it by transforming it. Hanotaux describes the French cabinet in terms borrowed from Bagchot's account of the English analogue when they have already ceased to apply to the original. The most definitive feature of cabinet government in England to-day is the prescriptive right of a prime minister to exercise the prerogative of dissolution, but a French prime minister has no such power, and the cabinet in France, as also in post-war Germany, is subject to a degree of control by committees of the legislature which would be inconceivable in this country.

There are thus no general principles, common to all mankind, in constitutional law. If there were, it would partake of the character of International Law, whereas its character is almost as national as common law itself. Many a revolution, and with it the apparent "adoption" of an exotic constitution may appear to contradict this but, in the long run, nations always "revert to type."

UNITED STATES

The term "Constitutional Law" has, in the United States, the restricted meaning of the law that is handed down by courts in construing and applying the provisions of written Constitutions, State and Federal. It is not commonly used to embrace the political practices of departments of Government or the legislation and the executive action in the exercise of the powers conferred by Constitutions. In the United States as in England there are customs and conventions which influence or control the relations between the different departments of Government and are therefore part of the fundamental law of the land. In a broad sense they belong to the realm of constitutional law. The narrow use of the term in the United States is due to the fact that the judicial interpretation of Constitutions controls constitutional development to an extent unknown in any other country.

State and Federal Constitutions in the United States not only distribute powers of government but contain restraints on governmental action in favour of individual liberty and property. The Federal Constitution restricts State as well as national action. Some of its restrictions on State action are for the purpose of leaving the field clear for national authority; others are to leave individuals free from State coercion. All these restrictions are interpreted and applied by courts. State courts are final authorities on the application of State Constitutions to State executive and legislative action. The U.S. Supreme Court is the final authority on the application of the Federal Constitution to national and State legislative and executive action.

Strangely enough this power of the courts to interpret and enforce constitutional clauses is not explicitly granted in American Constitutions. It has been inferred by the courts from the existence of the constitutional restrictions and the duty of courts to apply in lawsuits the higher law of the Constitution against the inferior law of the legislatures whenever the courts find a conflict between the two. The exercise of the judicial power is confined to lawsuits, though in some States there is the practice of securing advisory opinions from the judiciary upon the request of the governor or the legislature. Such opinions may indicate what the court would do if legislation should come before it in its judicial capacity, but it is not strictly a binding adjudication of constitutional law.

Requirement of Due Process.—The powers of the national Government are dependent upon grant in the Federal Constitution and any statute of Congress may be questioned in the courts on the ground that the Constitution did not confer the authority to enact it. Thus when Congress imposed an additional tax on the net income of employers who made use of the labour of children under designated ages or beyond designated hours, the Supreme Court held that the detailed enumerations in the statute indicated clearly that it was in substance a regulation of child labour rather than a tax, and therefore was not within any power conferred on Congress. An earlier statute of Congress which prohibited the inter-State transportation of products from factories in which children worked was also held to be a regulation of the manufacture rather than of the interstate commerce and therefore an encroachment on the reserved powers of the States. These illustrations indicate that the question whether a statute is constitutional may be a very debatable one which the court answers without any clear guidance in the language of the Constitution. This is even more apparent when the courts are called upon to decide whether statutes are void because they deprive persons of liberty or property without due process of law. The requirement of due process is not confined to the procedure by which law is made or enforced, but is held to apply to the substance of the command or the prohibition of a statute. A statute violates the requirement of due-process if it comes within the judicial condemnation of arbitrariness. The due-process clauses in State and Federal Constitutions set no standard by which to determine what is arbitrary and what is reasonable. The courts set the standards as well as apply them. Since the Federal Constitution subjects both State and national legislation to this test of the judicial conception of due-process, the U.S. Supreme Court may in cases properly before it annul for undue harshness not only statutes of Congress but acts of State legislatures and ordinances of municipal councils.

This power of courts in the United States to annul statutes because, to the judicial mind, they seem unreasonable, is peculiar to the American system of government. It differs from the executive veto power only because the opportunity for judicial action must arise in an actual lawsuit and because the courts practice a degree of self-restraint in positing the limit of reasonableness. Courts undoubtedly sustain as constitutional many statutes for which they would not vote as members of the legislature or would not approve as governor. None the less, it is apparent from the actual results of the judicial decisions that in many instances the controlling element in judicial annulment of statutes is the aversion of a majority of the court to the policy of the legislation before it. A striking illustration of this is the decision of the U.S. Supreme Court by a five to three vote that an employer is denied due process of law if compelled to pay women employés a living wage so long as he retains them in his employ. This question came before 45 judges of State and Federal courts, of whom 35 thought the legislation constitutional and ten thought it unconstitutional. The negative opinion of five out of nine justices of the Supreme Court outweighs the affirmative opinion of 35 judges and annuls minimum wage legislation both by Congress and by State legislature. No such legislation can be enforced until the majority of the Supreme Court changes its mind or until there is an amendment to the Federal Constitution.

At one time the Supreme Court held that a State may not restrict hours of labour in bakeries to ten a day, but later a ten-hour law applying to all factories was sustained. The court has allowed the States to prescribe the minimum weight of loaves of bread but prohibited them from fixing maximum weights in order to prevent confusion. The States may regulate employment agencies in a number of ways but may not forbid private agencies to accept fees from employés seeking work. While in an emergency landlords may be restricted in the rents charged, ticket scalpers may not be forbidden to charge more than 50 cents in excess of the box-office price.

More numerous are the decisions sustaining State regulatory laws. Many trivial objections are brought to the Supreme Court year by year to meet with merited rejection. Among the more important legislation to find judicial approval are laws requiring banks to contribute to a guarantee fund to secure the safety of deposits in all banks, laws substituting the system of workmen's compensation for the common law of liability to injured employés and laws establishing a zoning plan which designates areas in which manufacturing or commerce is forbidden and which excludes apartments or two-family houses from certain residential districts.

Control of Taxation.—Questions raised by tax laws of the States and of the United States bring many constitutional issues before the courts. Most important is the issue of jurisdiction, since it is held to be a denial of due process to tax persons or property not subject to the jurisdiction of the taxing authority. The equal-protection clause of the 14th amendment is a safeguard against unjustified discrimination in imposing taxes, and the courts have to pass on the question whether it is reasonable to impose special taxes on special enterprises, to vary the rates on different kinds of property, to impose progressive rates on inheritances or incomes or to indulge in eccentricities in assessing property. While the Supreme Court has been liberal in allowing variations in the tax systems of the States, it is not infrequent that a discrimination is held to be without justification.

Under the canon that a tax is unconstitutional unless it is levied for a public purpose, the courts review the propriety of the enterprises into which public moneys are put. The Supreme Court has held the States to rather strict account in their various efforts to appropriate money in aid of private enterprises conducted by private corporations or by individuals, but has shown liberality in allowing States and cities to go into businesses that compete with private undertakings. The North Dakota enterprise of operating State banks, State grain elevators and State home-building agencies was sustained by an unanimous Supreme Court, and there seems little likelihood that any business conducted by States or cities will be declared unconstitutional under the 14th amendment. The spending power of the United States may go even farther, both because of the difficulty of getting any complaint before the courts for consideration and because of the latitude which the Supreme Court has shown toward contributions by the United States in aid of individuals.

Owing to the constitutional requirement that all direct taxes levied by the United States must be apportioned among the several States in accordance with their population, there has arisen the important question of what is a direct tax. At one time the Supreme Court announced that it was doubtful whether any tax is a direct tax except capitation taxes and taxes on land. This, however, was receded from, and the court held that income taxes are in substance direct taxes when levied on income from property, thereby overruling an earlier decision which had sustained the Civil War income taxes. This change of judicial front led to the adoption of the 16th amendment which relieves income taxes from the requirement of apportionment among the States. This makes a constitutional issue out of the question what is income and what is capital. The Supreme Court has laid down that income from capital must be a gain derived from capital and separated therefrom. It held, therefore, that a stock dividend is not income, because such a dividend withdraws no assets from the corporation to turn over to the stockholder. Some payments by one corporation to another have been held not income because the two corporations though separate in form were regarded as identical in substance. All genuine dividends by which a corporation pays corporate assets to a distinct corporation or to an individual stockholder are treated as income, even though in fact they may represent no economic gain to the recipient, because he paid for his stock a price determined by the expectancy of the dividend.

Other Federal taxes held to be indirect taxes are customs duties, excises on doing business in corporate form or in special kinds of business like extracting oil, manufacturing tobacco or liquor, making oleomargarine, and taxes on estates or legacies. The constitutional requirement that duties, imposts and excises shall be uniform throughout the United States is construed to require only geographical uniformity. The United States may therefore impose progressive rates on incomes and inheritances and may select the enterprises it will tax and those it will exempt about as whimsically as it chooses. The smoker and the motorist and the theatre-goer still suffer from the incidence of Federal excises which are not applied to manufacture and sales generally. The Federal customs tariffs have from the beginning been discriminatory, and there is no judicial doubt as to their constitutionality, notwithstanding contrary constitutional doctrine occasionally announced in political party platforms.

Eminent Domain.—Taxation and regulatory legislation bring to the courts most of the cases involving constitutional issues. There is also the power of eminent domain under which the Government takes private property for public use, or authorizes such taking by railroads and other enterprises, privately owned and managed, but regarded as quasi-public. In every case it is a judicial question whether the taking is for a public use and whether the compensation offered is just. This power of eminent domain must be distinguished from the police power under which noxious activities may be suppressed without compensation. The injury from a police prohibition may be greater than that from an eminent domain injury such as the obstruction to light, air and access caused by the erection of an elevated railroad in the highway, but for the latter there must be compensation, while for the former there is no redress. The theory is that the police power is confined to the suppression of what is harmful, while the power of eminent domain causes an injury by actually taking title to property or preventing the full enjoyment of it. These constitutional questions as to the propriety of exercises of the powers of police, taxation and eminent domain arise under broad constitutional clauses which leave the courts fairly free to apply such canons as they choose. In addition to these broad limitations there are in the Federal Constitution a number of more specific restrictions applying mainly to the action of the National Government. Similar clauses in State Constitutions restrict the action of State authorities. Prohibitions against *ex-post-facto* legislation, against laws impairing the obligation of contracts, against unreasonable searches and seizures, against compulsory self-incrimination, against cruel and unusual punishments and against conviction and imprisonment except after indictment by grand jury and trial by petit jury are contained in the Federal Constitution and in many State Constitutions. Even these specific clauses leave to the courts a considerable latitude in interpreting them, and from year to year novel questions arise which provoke contrariety of judicial opinion. Many State courts allow the use of evidence obtained by wrongful searches and seizures though the Supreme Court holds that the introduction of such evidence amounts to compulsory self-incrimination. On the whole, the Supreme Court applies these restrictions on Federal action more rigidly than State courts apply corresponding restrictions on State action.

These specific clauses designed to keep governmental action within the limits of propriety arose out of historic abuses from which the colonists deemed that they had suffered. They derive from English precedents and were regarded as guarantees of the historic rights of Englishmen. They have, however, been of relatively less importance in American constitutional law, partly perhaps because their monitions have commonly been heeded, but largely because they are confined mainly to modes of executing the laws while the due-process and equal-protection clauses apply to the substantive commands of legislation. Judicial control of the methods of governmental action is of minor importance compared with judicial control of the sphere of governmental action. These broad constitutional restrictions in favour of individual liberty and private property put it within the power of the judiciary to impose the judicial conception of the proper scope of governmental activity upon the contrary conceptions of legislatures and electorates, except as these agencies act by way of constitutional amendment. It is this far-reaching power of the courts to set limits to the ends to be sought by legislation that makes American constitutional law a unique phenomenon in the process of government.

Federal System.—Since the Federal Constitution ordains a Federal system of government, it is necessary to have some organ vested with authority to restrict the States and the nation to their respective spheres. The Constitution declares itself to be the supreme law of the land, and directs State judges to disregard State statutes that are in conflict with valid exercises of national power. This is ample warrant for the power exercised by the Supreme Court to declare State statutes invalid as encroachments on national authority and to declare national statutes invalid as encroachments on State authority. The States do not look to the Federal Constitution as the source of their powers. They have all powers of government not denied to them by prohibitions in the Federal Constitution or by inference from grant of competing powers to the National Government. Since many of the clauses granting power to the National Government do not explicitly make the national authority exclusive, the Supreme Court has to determine for itself whether an exercise of State power is consistent with the possession of a similar power by the United States or with an exercise thereof.

For half a century the Supreme Court was uncertain as to whether the grant of power to Congress to regulate interstate and foreign commerce should be construed as a negation of State power over such commerce. Then it decided that no single answer could be given to the question. In some ways and for some purposes the States may regulate interstate commerce and in other ways and for other purposes they may not. Though the court has framed formulae for marking the division between what the States may and may not do, the formulae are not sufficiently explicit to be much more than baskets into which to put the decisions after they have been reached. Thus there comes before the Supreme Court an infinite variety of problems each with peculiarities that leave each case to turn pretty much on its own facts. The only general rule that can be laid down is that the States may regulate interstate commerce somewhat but not too much, and this is so general that it does not give much guidance.

State police power has been allowed to forbid the exportation to a sister State of dead game, green lemons and water from running streams, but not natural gas or oil. States may prevent the entrance of oleomargarine coloured to resemble butter but not of cigarettes or intoxicating liquor, except as authorized by Congress or by the 18th amendment. States may require some interstate trains to stop at some cities but not other interstate trains at other cities. States may regulate interstate ferry fares but not interstate railroad rates. What the court does is to compare the need of the State for the local regulation with the need of the nation for interstate commerce measurably free and unfettered, and to decide in each case which need seems to be the greater. As cases accumulate, some more general canons develop, and standards appear to aid in deciding cases that arise later.

Regulation of Commerce.—State taxation is a form of regulation which is said to be invalid when applied to interstate commerce. The doctrine is better expressed that the States may not tax interstate commerce "as such." They may, by taxes on property or on net income, take toll from the economic fruits of inter-State commerce, since such taxation is not regarded as a burden on the commerce itself. The decisions in this field of constitutional law have often seemed erratic, and lower courts have frequently confessed or proved their inability to discern the purport of Supreme Court distinctions. If we look at the results of the Supreme Court decisions we find that in economic fact the States are allowed to tax interstate commerce in ways that afford adequate safeguards that this commerce will not be burdened more heavily than property and business generally.

This work of umpiring the Federal system without any clear guidance in the language of the Constitution is a work that the courts cannot escape if the Federal system is to continue. The Constitution for the most part contents itself with broad outlines and eschews details. Had it done otherwise, it could hardly have lasted so long with so little formal amendment. In effect it left to the judiciary the work of drafting details which the framers wisely failed to do. Thus the courts are year by year makers of the Constitution in the sense of the Constitution that actually controls. Constitutional law in the United States is continuous Constitution-making by judiciary. In conventional theory, constitutional law is the interpretation of the language of the Constitution, but in plain fact it is to a large extent a law created by the courts from considerations of statesmanship and with but little restraint or direction in the language of the written instrument. The written instrument is but a small part of the real effective Constitution. The actually controlling Constitution is in large part the constitutional law that the courts have made in the name of the written instrument. (T. R. P.)

CONSTITUTION OF ATHENS, a work attributed to the philosopher Aristotle (384–322 B.C.), forming one of a series of *Constitutions,* 158 in number, which treated of the institutions of the various states in the Greek world. The work was extant until the 7th century A.D., or even later, but was subsequently lost. A copy of the treatise was discovered in Egypt in 1890 and acquired by the trustees of the British Museum, for whom it was edited by Mr. (now Sir) F. G. Kenyon, at that time an assistant in the department of manuscripts.

Date.—It may be regarded as established by internal evidence that the treatise was composed sometime between 329 and 322 B.C. In *c.* 54, 7 an event is dated by the archonship of Cephisophon (329); on the other hand in *c.* 42, 1 the author proceeds to describe the constitution as it existed *in his own day*—a democracy —but the democratic constitution was abolished, and a timocracy established, on the surrender of Athens to Antipater, at the end of the Lamian war, in the autumn of 322.

Authorship.—There can be no question that the treatise discovered in Egypt is identical with the work upon the constitution of Athens which is repeatedly referred to by writers such as Plutarch, and by the scholiasts and lexicographers, and which passed in antiquity under the name of Aristotle. Of 91 quotations from Aristotle, bearing on Athenian constitutional history, of which 58 are expressly referred to "The Constitution of Athens," 78 are found in our treatise. The remaining 13 must have come either from the beginning of the work, which is wanting in the papyrus, or from the latter portion of it, which is mutilated. Controversy has centred mainly round the question, In what sense is the treatise "Aristotelian"? Is it the work of Aristotle himself, or is it the work of a pupil or pupils and so has merely proceeded from his school?

The objections urged against the attribution of the work to Aristotle himself have been based partly on three contradictions between the *Constitution* and the *Politics* and partly on style. One of the contradictions is easily resolved, and as regards the remaining two there is nothing improbable in the suggestion that as the *Constitution* is a later work than the *Politics,* Aristotle found reason in the interval to change his mind on certain points. In the matter of style, stress has been laid on the occurrence in the "Constitution" of many words that are not found in the other writings of Aristotle, and, conversely, on the absence of so many of the expressions that are typical of his style. But such arguments are beside the point; the "Constitution" is a historical work intended for popular use; hence its style must necessarily be different from that of a philosophical treatise. The one serious argument against the attribution of the work to Aristotle himself is that drawn from its general character. Many scholars, deeply concerned for the credit of Aristotle as a historian, have argued that a treatise so inadequate could not possibly have come from his pen. They point to the absence of proportion in the narrative part, to the acceptance of erroneous views and to the undue predominance of the anecdotic element. But on the other side is the consensus of antiquity. Every ancient writer who mentions the "Constitution" attributes it to Aristotle, while no writer is known to have questioned its genuineness. Again the date which can with certainty be assigned to its composition, on internal grounds, coincides with the period of Aristotle's second residence in Athens. Doubtless a series such as the "Constitutions," 158 in number, might well be entrusted to pupils working under the direction of their master, but the "Constitution of Athens" must have been infinitely the most important of the series and one that would most properly be reserved for the master's hand.

Contents.—The treatise consists of two parts, one historical, and the other descriptive. The first 41 chapters compose the former part, the remainder of the work the latter. The first part comprised an account of the original constitution of Athens, and of the 11 changes through which it successively passed. The papyrus, however, is imperfect at the beginning, but a reference to chap. 41 makes it clear that the missing chapters contained a sketch of the original constitution and of the changes introduced in the time of Ion and Theseus. In this connection it is remarkable that while mention is made of "the constitution of Theseus," there is no reference to the incorporation of Attica into one state or process of *Sunoikismos,* traditionally associated with the name of Theseus. Such a process may have been effected only gradually and may not have been complete before the 7th century, but the final result of it surely merited a place among the "changes," or constitutional landmarks, of Athenian history. Its importance in the minds of the Athenians of the age of Pericles is sufficiently indicated by Thucydides (II. chap. 15) who points to the festival of the *Sunoikia.*

The second part describes the constitution as it existed at the period of the composition of the treatise (329–322 B.C.); the subjects which receive the fullest treatment are the Council, the Archons and the Law-courts.

Sources.—The labours of several workers in this field, notably Keil and Wilamowitz-Möllendorf, have rendered it comparatively easy to form a general estimate of Aristotle's indebtedness to previous writers.

Among these sources are unquestionably Herodotus, Thucydides, Xenophon, and the poems of Solon. There is now among critics a general consensus in favour of the view that the most important of his sources was the *Atthis* of Androtion. An *Atthis* is a local history of Athens and Attica. This *Atthis* was published only a few years earlier than the "Constitution," probably about 340. From it are derived not only the passages which are annalistic in character and read like excerpts from a chronicle (*e.g.,* chap. 13 *init.,* in which is described the "anarchy" which followed the legislation of Solon, and chap. 22, which contains an account of "ostracism" and a list of ostracized statesmen), but also most of the matter common to the "Constitution" and to Plutarch's *Solon.* It is also generally agreed that among the sources was a work, written towards the end of the 5th century B.C., by an author of oligarchical sympathies, with the object of defaming the character and policy of the heroes of the democracy. This source can be traced in passages such as chap. 6.2 (Solon turning the *Seisachtheia* to the profit of himself and his friends) and chap. 27.4 (Pericles' motive for the introduction of the dicasts' pay). The authorship of this pamphlet is uncertain, as is also its relationship to another source of importance, viz., that from which are derived the accounts of the Four Hundred and the Thirty. The chief characteristics of that part of the "Constitution" are the prominence given to the term "traditional constitution" (πάτριος πολιτεία) and the favourable view taken of the character and aims of Theramenes. It has been maintained, on the one hand, that this last source (the authority followed in the accounts of the Four Hundred and the Thirty) is identical with the oligarchical pamphlet, and, on the other, that it is none other than the *Atthis* of Androtion. The former hypothesis is possible. The latter is impossible. We know from the fragments that have descended to us that the Atthides uniformly adopted a democratic tone. We also know that Androtion belonged to the radical wing of the democratic party at Athens. The probability is that Aristotle followed not one but several oligarchical works composed about the end of the 5th or at the beginning of the 4th century B.C. and that he was indebted to one or other of these, not merely in his account of the Four Hundred and the Thirty but also in the earlier constitutional history. (*Cf.* the prominence assigned to the Areopagus throughout the treatise.)

Value.—It will be realized that the value of any particular statement will vary with the character of the source from which it comes. For the history of the 5th century the passages which come from Androtion's *Atthis* carry with them a high degree of authority, but in passages which are derived from other sources than the *Atthis* a much lower degree of authority can be claimed, even for statements relating to the 5th century. The constitution of Dracon in chap. 4 is certainly an interpolation; the 17 years' ascendancy of the Areopagus after the Persian Wars must be regarded as unhistorical, also the introduction of payment for the citizens by Aristeides and the association of Themistocles with Ephialtes in the overthrow of the Areopagus. It is remarkable that there is not a word about the organization of the Empire in the 5th century. The period between Cleisthenes and the Peloponnesian War is treated very inadequately. But even so it must be admitted that our debt to the narrative contained in the first part is great. Much new material has been supplied which throws light not only on the Solonian reforms but also on the economic and political conditions of Athens in pre-Solonian days and on the period of confusion which immediately followed the reforms. To estimate what the discovery of the treatise has meant to our knowledge of Cleisthenes, it is only necessary to compare the histories of Greece written before 1891 with those published after that date. Many questions which had given rise to controversy in the past are now settled; the Areopagus was in existence long before Solon; Solon, however, not Cleisthenes was the founder of the Heliaea; the Archons were not appointed by lot until 487 B.C., and Ephialtes, not Pericles, was the democratic leader when the Areopagus was deprived of its powers. Further, from the treatise we realize the great part played by the moderate men in the revolutions of the Four Hundred and the Thirty.

Again, there can be no question as to the importance, or the trustworthy character of the Second Part. True, there are some omissions even here, *e.g.*, the Ecclesia is touched on only incidentally, but it remains as our chief authority for the institutions of the 4th century. We need, however, to be continually on our guard against arguing from the practice of the 4th century to that of the 5th, unless corroborative evidence is available.

BIBLIOGRAPHY.—A conspectus of the literature of the *Constitution* down to 1912 is given in Sandy's "Aristotle's Constitution of Athens" (Macmillan, 1912), which is the most complete edition of the treatise published in any language. Other editions: *Editio princeps*, ed. by F. G. Kenyon, Jan. 1891, with commentary; 3rd and revised ed. Jan., 1892. *Aristotelis* Πολιτεία Ἀθηναίων ed. G. Kaibel and U. von Wilamowitz-Möllendorf (1891; 3rd ed. 1898). *Aristotelis qui fertur* Ἀθηναίων πολιτεία recensuerunt H. van Herwerden et J. van Leeuwen (Leyden, 1891). A school edition, with notes in German, by Karl Hude (Teubner: 2nd ed., 1916). The best translations are those of Kenyon, in English, and of Kaibel and Kiessling, in German.

Works dealing with the subject: Bruno Keil, *Die Solonische Verfassung nach Aristoteles* (1892), and most important of all U. von Wilamowitz-Möllendorf, *Aristoteles und Athen* (1893; also in anastatic reprint). *See* also Vol. 2 of G. Busolt, *Griechische Staatskunde*, new edition by Swoboda (Munich, 1926). (E. D. T. J.)

CONSUETUDINARY, customary, especially in law, as opposed to statutory. As a noun, a manual of the ritual customs of a particular monastery, cathedral or religious order.

CONSUL, the title borne by the highest of the ordinary magistrates of Rome during the republic. The consulship arose with the fall of the ancient monarchy (*see* ROME: *Ancient History: The Republic*). The deep-seated Roman reverence for the abstract conception of the magistracy, as expressed in the *imperium* and the *auspicia,* led to the preservation of the regal power in a qualified form. The two new officials who replaced the king bore the titles of leaders (*praetores*) and of judges (*iudices*). But the new fact of colleagueship (*collegium*) caused a third title to prevail, that of *consules* or "partners." This first example of the collegiate principle assumed the form familiar in the Roman commonwealth. Each of the pair of magistrates could act up to the full powers of the *imperium;* but the dissent of his colleague rendered his decision or his action null and void. At the same time the principle of a merely annual tenure of office was insisted on. The two magistrates at the close of their year of office were bound to transmit their power to successors; and these successors, whom they nominated, were obliged to seek the suffrages of the people. The only body known to us as electing the consuls during the republican period was the *comitia centuriata* (*see* COMITIA). The consulate was originally confined to patricians. A struggle for office ensued between patricians and plebeians which was brought to an end by the Licinio-Sextian laws of 367 B.C., which enacted that one consul must be a plebeian (*see* PATRICIANS).

The executive power of the consuls was gradually limited (1) in jurisdiction, by the grant of appeal (*provocatio*), the growth of the praetorship and the publication of law (*e.g.*, the XII. Tables); (2) in administration, by the appointment of the tribunes of the *plebs* and the creation of new magistrates (censor in 443, curule aediles in 367 B.C.) to take over parts of their functions. The result of these limitations and of this specialization of functions in the community was to leave the consuls with less specific duties at home than any magistrates in the State. But this may be of itself a sign of a general duty of supervision. The consuls were in a very real sense the heads of the State. They exercised control in concert with the senate, whose chief servants they were. They were the most regular consultants of this council, they formulated its decrees as edicts, and they brought before the people legislative measures which the senate had approved. They also represented the State to the outer world and introduced foreign envoys to the senate. The consulate was, as Cicero expresses it, the culminating point in an official career. The consuls retained certain powers of jurisdiction. This jurisdiction was either (1) administrative or (2) criminal. (1) Their administrative jurisdiction was concerned with financial matters such as claims made by the State and by individuals against one another, when the censors were not in office, and with disputes about property between the cities of Italy. (2) Their criminal jurisdiction was of three kinds. In the first place, it was their duty to set in motion the criminal law for ordinary, as opposed to political crimes. The reference of such cases to the assembly of the people was effected through their quaestors (*see* QUAESTOR). Secondly, when the people and senate, or the senate alone, appointed a special commission (*see* SENATE), the commissioner named was often a consul. Thirdly, we find the consul conducting a criminal enquiry raised by a point of international law. It is possible that in this case his advising body (*consilium*) was composed of the *fetiales* (*see* HERALD, *ad fin*).

The consuls were recognized as the heads of the administration abroad as well as at home. It thus became necessary that departments of administration (*provinciae*) should be determined and assigned. The method of assignment varied. Foreign wars often demanded the attention of both consuls. In this case the regular army of four legions was usually divided between them. When it was necessary that both armies should co-operate, the principle of rotation was adopted, each consul having the command for a single day—a practice which may be illustrated by the events preceding the battle of Cannae (Polybius iii. 110; Livy xxii. 41). During the great period of conquest from 264 to 146 B.C. Italy was generally one of the consular "provinces," some foreign country the other; and when at the close of this period Italy was at peace, this distinction approximated to one between civil and military command. The consuls settled their departments by agreement or by lot (*comparatio, sortitio*); the power of declaring what should be the consular *provinciae* was usurped by the senate (*see* SENATE). But the home officials invested with the *imperium* proved insufficient for the military needs of the empire, and the system of prolonging the command (*prorogatio imperii*) grew up (*see* PROVINCE). The ex-magistrates after their year of office began to go abroad to undertake a year of provincial government and, in some special cases, appointments were made by law for longer periods. Technically the provinces might still be consular, actually they were proconsular. The Lex Pompeia, 52 B.C., established a five years' interval between home and foreign command.

Since the theory of the persistence of the republican constitution was of the essence of the principate, the consuls necessarily lost little of their outward position and dignity under the rule of the Caesars. In the interval between the death or deposition of one princeps and the appointment of another the consuls resumed their normal position as the heads of the State. As the presidents of the senate, who after A.D. 14 elected them to their office, they directed that high criminal jurisdiction which the senate of this period assumed (*see* SENATE). A restored power of jurisdiction is indeed one of the features of their position during this time, and it is probable that the civil appeals which came to the senate were delegated to the consuls. They acted for a time as delegates to the princeps in matters of chancery jurisdiction such as trusts and guardianship. The consulship was also a preparation for certain commands abroad, and for the praefecture of the city. The tenure of the office was progressively shortened. In the early principate the consuls held office for six months, later for four to two months. The consuls appointed for Jan. 1 were called *ordinarii,* the others *suffecti;* and the whole year was dated by the names of the former. This distinction continued in the empire of Diocletian and Constantine. The *ordinarii* were nominated by the emperor, the *suffecti* by the senate, and their appointment was ratified by the emperor. The consulship was still the greatest dignity which the empire had to bestow; and the pomp and ceremony of the office increased in proportion to the decline in its actual power. The entry of the consuls into office was celebrated by a great procession, by games given to the people and by a distribution of gifts. But the senate, over which they presided, was little more than the municipal council of Rome; and the justice which they meted out had dwindled down to formal and uncontested acts. The last consul born in a private station was Basilius in the East in A.D. 541. But the emperors continued to bear the title for some time longer.

E. Sandys, *Companion to Latin Studies* (1921) with useful bibliography; W. E. Heitland, *Roman Republic* (1923)

IN MODERN TIMES

A consul is a public officer authorized by the state whose commission he bears to protect the interests and to foster the commercial affairs of its subjects in a foreign country, and formally permitted by the government of the country wherein he resides to perform the duties which are specified in his commission. (For the ancient magisterial office of consul *see* above.)

A consul, as such, is not invested with any diplomatic character, and he cannot enter on his official duties until permission in the form of an exequatur has been granted to him by the authorities of the state to which his nomination has been communicated by his own government. The exequatur may be revoked at any time at the discretion of the government where he resides. The status of consuls commissioned by the Christian powers to reside in certain oriental countries, and to exercise judicial functions in civil and criminal matters between their own countrymen and strangers, is exceptional to the common law, and has been founded on special conventions or capitulations (*q.v.*).

History.—The title of consul, in the sense in which it is used in international law, is derived from that of certain magistrates in the cities of mediaeval Italy, Provence and Languedoc, charged with the settlement of trade disputes whether by sea or land (*consules mercatorum, consules artis maris,* etc.). With the growth of trade it early became convenient to appoint agents with similar powers in foreign parts, and these often, though not invariably, were styled consuls (*consules in partibus ultramarinis*).

It was not till the beginning of the 19th century, that the system developed universally. Hitherto consuls had, for the most part, been business men with no special qualification as regards training; but the French system, under which the consular service had been long established as part of the general civil service of the country—a system that had survived the Revolution unchanged—was gradually adopted by other nations; though, as in France, consuls not belonging to the regular service, and having an inferior status, continued to be appointed. In Great Britain the consular service was organized in 1825; in France the series of ordinances and laws by which its modern constitution was fixed began in 1833. In Germany progress was at first hindered by the political conditions of the country under the old confederation, but a well organized consular system followed the establishment of the united empire. The functions, duties and privileges of French and German consuls do not differ materially from those of British consuls; but there is a great difference in the organization and personnel of the various consular services. In France, Germany, Italy, the United States, Japan, Belgium and other countries, members of the consular and diplomatic services are interchangeable; in Great Britain, although the entrance examination is practically the same, the consular and diplomatic services are still entirely separate. It was France which led the way in amalgamating these two services, by decrees of July 10, 1880, and April 27, 1883, and other countries have gradually followed its example.

Few countries can afford the cost of career officers at every consular post, and the corps of career officials is therefore supplemented by honorary officers, usually residents engaged in trade, who are citizens of the country which nominates them, or in which they reside.

Privilege.—Whereas diplomatic privileges and immunities are clearly defined, those to be enjoyed by consuls are not yet established, and considerable difference of opinion exists on the subject. France on the one hand has negotiated many consular conventions; Great Britain, on the other, has always refused to be a party to one. The right to establish consuls is now universally recognized by Christian civilized states. Jurists at one time contended that according to international law a right of "ex-territoriality" attached to consuls, their persons and dwellings being sacred, and themselves amenable to local authority only in cases of strong suspicion on political grounds. Apart from treaty and convention, custom has established very few consular privileges, and the 20th century view is that perhaps consuls may be arrested and incarcerated, not merely on criminal charges, but for civil debt; and that, if they engage in trade or become the owners of immovable property, their persons certainly lose protection. This question of arrest has been frequently raised in Europe:—In the case of Barbuit, a tallow-chandler, who from 1717 to 1735 acted as Prussian consul in London, and to whom the exemption conferred by statute on ambassadors was held not to apply; in the case of Cretico, the Turkish consul in London in 1808; in the case of Begley, the United States consul at Genoa, arrested in Paris in 1840; and in the case of De la Fuente Hermosa, Uruguayan consul, whom the *Cour Royale* of Paris in 1842 held liable to arrest for debt. In the same way consuls are often exempt from all kinds of rates and taxes, and always from personal taxes. They are exempt from billeting and military service, but are not entitled (except in the Levant, where also freedom from arrest and trial is the rule), to have private chapels in their houses. The right of consuls to exhibit their national arms and flag over the door of the consular office is not disputed, and the inviolability of consular archives is generally admitted.

GREAT BRITAIN

Until the year 1825 British consuls were usually merchants engaged in trade in the foreign countries in which they acted as consuls, and their remuneration consisted entirely of fees. An act of that year, however, organized the consular service as a branch of the civil service, with payment by a fixed salary instead of by fees; consuls were forbidden also to engage in trade, and the management of the service was put under the control of a separate department of the foreign office, created for the purpose. The restriction as to engaging in trade was withdrawn in 1832, except for salaried members of the British consular service. Since then, and especially as the result of the reorganization of the consular service, consequent on the recommendations as to the creation of new posts, training, pay and allowances made by Sir Arthur Steel-Maitland in 1919, the service has become a first-class one, and its members are recruited from the same examination as the higher division of the home civil service, the foreign office and diplomatic service, and the Indian civil service. (*See* CIVIL SERVICE.) It is now grouped in three divisions, (1) the general service, (2) the Levant, (3) the far east (China, Japan and Siam).

At posts where the cost of living is very high, local allowances are granted in addition.

Routine.—The routine duties of a British consul are very varied; his chief work is connected with shipping, commercial, political, judicial and notarial matters. Under the Merchant Shipping acts of 1894 and 1906, British consuls have certain statutory duties and powers relating mainly to the welfare of the crew and to discipline on board. At a foreign port engagements and discharges of seamen have to be sanctioned by the consul, who arranges suitable hospital treatment for sick seamen, and takes charge of their wages. The consul also provides for the subsistence of seamen who are shipwrecked or left behind; they are generally sent home in the first British ship. Complaints by crews as to their treatment on board are investigated by the consul, who enters a statement in the log book and reports to the board of trade. When an offense has been committed on the high seas by British seamen, the consul may make inquiry on oath and send home the offender and the witnesses. In certain cases, a consul can summon a naval court to deal with a grave offense or casualty, but the procedure is cumbersome, and effect cannot always be given to the findings. Naval courts are now rarely called. The master of every British ship, not carrying passengers, is obliged to deposit at the consular office at a port where there is a British consul the copy of the articles of agreement with the crew, if the ship remains 48 hours in port. It has been the aim of the British government to reduce consular formalities in connection with shipping to a minimum, and foreign ships, as well as British, are saved time and money by this enlightened policy.

Having regard to the great importance attached to the commercial duties of a British consul and as the result of a recommendation contained in the majority report of a committee set up in 1919, under the chairmanship of Lord Cave, to examine the question of Government machinery for dealing with trade and commerce, the Consular department of the Foreign Office, which is responsible for the administration of the consular service, was placed under the administrative control of the department of Overseas Trade, a joint department of the Foreign Office and the Board of Trade. This department is also authorized to communicate with, and give instructions to, consuls on all questions relating to commercial intelligence and the development of British overseas trade. Consuls report direct to the department of Overseas Trade on commercial matters, and they are also, as regards the commercial side of their work, under the general supervision of the commercial diplomatic officer attached to the embassy or legation to the country in which they are stationed. By this co-operation of the consular and commercial diplomatic services a net-work of Government commercial representatives is thrown over the majority of foreign countries. Thus suitable prominence is given to this side of a consul's duties, and proficiency in this respect is now an important factor in deciding upon claims for promotion.

It is the duty of a consul to deal to the best of his ability with all questions on commercial subjects addressed to him not only by the departments at home but also by individual British traders. He is expected also to furnish on his own initiative reports on matters of commercial interest. In addition to such important questions as tariffs, customs regulations, patents, regulations respecting commercial travellers and their samples, formation of industrial syndicates, legislation regarding transport, organization of international exhibitions and fairs, aerial navigation, labour legislation, crops and fishery matters, the consul is expected to report regularly on changes in the general financial and other conditions affecting local trade and industry; openings for the sale of British goods and effects of foreign competition; the development and organization of local industry, trade, finance, public utilities and means of transport; and the development of local export trade in raw materials.

The furnishing of reports on individual trades or industries is amongst the most important of the consul's duties, and necessitates making exhaustive and at times difficult enquiries into the extent of the demand for the particular goods in question, the nature of foreign and local competition, the buying methods of local purchasers and the selling methods of competitors, as well as into such cognate subjects as suitable packing, distribution of trade literature, advertising and transport. The consul has also to report, so soon as it comes to his notice, any specific opening for the introduction of British manufactures, such for instance, as a public works contract. Another matter of great importance to the British manufacturer at home is the knowledge of new sources of supply of raw materials for use in industry, and the consul must watch developments in this direction.

A consul may be called upon, in connection with his commercial work, to answer inquiries of the nature outlined above received from firms in the British dominions or from the Trade Commissioners of any dominion Government. It is, in fact, the function of a consul to help British trade within his area in every way in which he properly can.

Political and judicial duties form a large part of the work of the Levant and Far East consular services.

The consul acts as a notary public; he draws up marine and commercial protests, attests documents, draws up wills, and powers of attorney. He celebrates marriages, or witnesses marriages performed by a local authority, and, if required, reads the burial service when the ministrations of a clergyman cannot be obtained. He gives advice to British subjects of whatever race, issues passports, and at most posts keeps a register of British residents. A system of inspection was inaugurated in 1913, and developed after the World War. This work is carried out by a corps of four inspector-generals, whose duty it is to visit consular posts all over the world, furnish reports and make recommendations as regards personnel, work and conditions, to the Consular department of the Foreign Office.

UNITED STATES

After the War of the Revolution, the United States appointed unpaid consuls from among American merchants residing abroad. This system worked badly and although the consular system was established by acts of Congress in 1790 and 1792, it was not until 1856 that the organization of the service was effected in a satisfactory manner. By a law passed by Congress in that year the service was reduced to a regular system similar to the British consular service. Salaries were fixed and the relations between official and business duties were clearly defined. The appointment of consular officers was placed in the hands of the President.

The consular service continued to operate under this law until the Rogers Act was passed in 1924, when complete re-organization of the diplomatic and consular services was effected, the two being merged in the "Foreign Service of the United States." Although these services had been on a civil service basis for almost two decades there was much criticism regarding salaries, promotions, interchangeability of position between the two services, and retirement provisions.

The new act took cognizance of rewards for meritorious service, the admission of persons not possessing independent means, the development of a schedule of advancement whereby an official of the consular service may rise to the rank of a minister, the adoption of an adequate pension and retirement system, and the principle of the interchangeability of diplomatic and consular posts. The old classes were abolished and all officials below the rank of minister were designated as Foreign Service officers. Nine new classes were created with salaries ranging from $9,000 a year in class one, down to $3,000 a year in class nine. Unclassified subordinates draw salaries of $3,000 or less.

Only those who pass a satisfactory examination and serve a probationary period, or who may be transferred after a period of five years continuous service in the Department of State, are eligible for appointment in the Foreign Service. The Secretary of State refers to the President matters relating to applicants and promotions. Although "representation allowances" may be granted by the President, Ambassadors and Ministers receive no increase in salaries, which are fixed at $7,500 and $10,000 (with a maximum of $12,000) respectively. A board dealing with all matters relating to personnel and a Foreign Service school, which provides for one year of instruction, were established in 1924.

The duties of the American consuls include discharge and relief of seamen of American vessels; issuing and viséing of passports; settlement of estates of American citizens who may die intestate in foreign countries; issuance of bills of health certifying to the sanitary condition of passengers, cargo and crew of vessels clearing from foreign ports for ports of the United States; and certification of invoices on dutiable merchandise for export to the United States.

The solemnization of marriages is not permitted by consuls but they may be witnesses thereto. Consular officers in China, Morocco, Maskat, Siam, Persia, Zanzibar and Tripoli are invested with judicial powers. The exemptions and privileges of consular officers depend largely upon the treaties existing between the United States and the countries to which they are credited.

The duties of consular officers with respect to the development of American foreign trade are of comparatively recent origin but of great importance today. Every member of the service is expected to have accurate and full knowledge of all conditions affecting trade and industry in the community to which he is accredited. He reports to the government new markets for American manufactures and notes all developments. Much of this information is published in *Commerce Reports,* issued weekly. On the basis of this material monthly and yearly studies of trade are compiled and are issued by the government under the name of *Monthly Consular Reports* and *Commercial Relations.* For special manufactures, at the suggestion of individuals or firms seeking information, independent studies are made by consuls and printed in separate form. (E. T. F. C.)

"CONSULATE OF THE SEA," a celebrated collection of maritime customs and ordinances (*see* also SEA LAWS) in the

Catalan language, published at Barcelona, Spain, in the latter part of the 15th century. Its proper title is *The Book of the Consulate,* or in Catalan, *Lo Libre de Consolat,* the name being derived from the fact that it embodied the rules of law followed in the maritime cities of the Mediterranean coast by the commercial judges known generally as consuls (*q.v.*). The earliest extant edition of the work, which was printed at Barcelona in 1494, is without a title page or frontispiece, but it is described by the above-mentioned title in the epistle dedicatory prefixed to the table of contents. The only known copy of this edition is preserved in the National library in Paris. Capmany, in his *Codigo de los costumbres maritimas de Barcelona* (Madrid, 1791), states that there was extant to his knowledge a more ancient edition of the *Book of the Consulate,* printed in semi-Gothic characters, which he believed to be prior to 1484. This is the earliest period to which any historical record of the *Book of the Consulate* being in print can be traced back. There are, however, two Catalan mss., preserved in the National library in Paris, the earliest of which (ms. Espagnol 124) contains the first two treatises in the *Book of the Consulate* of 1494, written in a hand of the 14th century.

The edition of 1494, which is justly regarded as the *editio princeps* of the *Book of the Consulate,* contains (1) a code of procedure issued by the kings of Aragon for the guidance of the courts of the consuls of the sea, (2) a collection of ancient customs of the sea and (3) a body of ordinances for the government of cruisers of war. A colophon at the end states that "the book commonly called the *Book of the Consulate* ends here"; after which there follows *The Acceptations,* which purports to record that the previous chapters and ordinances had been approved by the Roman people in the 11th century, and by various princes and peoples in the 12th and 13th centuries, but this document clearly has no proper reference to the *Book of the Consulate,* and is, in fact, of no historical value whatsoever. The remainder of the volume consists of what may be regarded as an appendix to the original *Book of the Consulate.* This appendix contains various maritime ordinances of the kings of Aragon and of the councillors of the city of Barcelona, ranging over a period from 1340 to 1484.

An excellent translation into French of "The Customs of the Sea," which are the most valuable portion of the *Book of the Consulate,* was published by Pardessus in the second volume of his *Collection des lois maritimes* (1834), under the title of "La Compilation connue sous le nom de consulat de la mer." *See* introduction, by Sir Travers Twiss, to the *Black Book of the Admiralty* (London, 1874), which in the appendix to vol. iii contains his translation of "The Customs of the Sea," with the Catalan text.

CONSUMER ADVERTISING, advertising directed to those who use or consume goods rather than to wholesalers, retailers, or others who are interested in distributing the goods. Advertising directed to distributors is called dealer advertising.

CONSUMERS' CREDIT: *see* INSTALMENT SELLING.

CONSUMER'S SURPLUS, in economics, the excess which the purchaser of an article would be willing to pay over the price which he actually pays rather than go without it. Thus, "consumer's surplus" is an economic expression of the surplus satisfaction which a bargain yields to the purchaser. In the case of a good bargain there is a big consumer's surplus, as when a woman buys at a low price a fine dress for which she would willingly pay much more. For many articles consumers would gladly give higher prices rather than go without them. The news of the day, well printed for a penny, is a case in point; probably a few would give five shillings, many would give sixpence, and tens if not hundreds of thousands would give twopence, rather than go without a newspaper. Here is a very clear case of consumer's surplus. The intelligent consumer strives so to apportion his expenditures as to make his total consumer's surplus a maximum. (*See* ECONOMICS.)

CONSUMPTION, in economics, means much more than the "destroying" or "consuming" which is the literal meaning of the word (Lat. *consumere*). The economist means by consumption the utilization of services or material goods for the gratification of human beings. This is not destruction, for that implies failure to satisfy wants. (*See* ECONOMICS.)

CONSUMPTION: *see* TUBERCULOSIS.

CONSUS, an ancient Italian deity, cult partner of Ops. The time at which his festival was held (after harvest and seed sowing), the nature of its ceremonies and amusements, his altar at the end of the Circus Maximus always covered with earth except on such occasions, all point to his connection with agriculture. His name is clearly derived from *condere,* to store away, and he is in all probability god of the store bin. Anciently, when the true meaning of his cult was forgotten, three explanations were rife: (1) he was a god of good counsel (*consilium*): Varro *ap.* Augustine, *Civ. Dei,* iv, 11; (2) he was Neptunus Equester; *i.e.,* Poseidon *Hippios:* Dion. Hal., i 33, 2; (3) he was god of hidden or secret (*condita*) policy, Dion. Hal., ii, 31, 3.

His festival was celebrated on Aug. 21 and Dec. 15. On the former date, the flamen Quirinalis, assisted by the vestals, offered sacrifice, and the pontifices presided at horse and chariot races in the circus. Horses and mules, crowned with garlands, were given rest from work. A special feature of the games in the circus was chariot racing, in which mules took the place of horses. The origin of these games was generally attributed to Romulus, sometimes to Evander. There was a sanctuary of Consus on the Aventine, dedicated by L. Papirius Cursor in 272 B.C.

CONTACT WEATHER denotes the state of atmospheric turbidity and cloudiness to provide sufficient visibility for an aircraft to be navigated and manoeuvred by visual reference.

Rules governing contact flight vary with the location and altitude of flight. In 1946 in the U.S., in regions of potentially heavy traffic, such as inside airport traffic zones and control areas, the pilot had to have at least 3 mi. visibility and remain 500 ft. vertically and 2,000 ft. horizontally clear of clouds. A control tower or control centre could issue a traffic clearance when visibility was less than 3 mi. but the aircraft had to remain clear of clouds.

Outside an airport approach zone and airport traffic zone, or inside a control area with traffic clearance, at least 1 mi. visibility was required in 1946. Elsewhere, if the flight was at an altitude of 700 ft. or less above the surface, the 500 ft. vertical and 2,000 ft. horizontal cloud proximity limit did not apply but the aircraft had to remain clear of clouds.

See Civil Air Regulations, U.S. Part 60. (E. J. MR.)

CONTAINERS, METALLIC, a phrase describing cylinders, tank cars, barrels, drums and cans used to hold substances either in gaseous solid or liquid form at atmospheric or high pressures.

Cylindrical Types.—Cylindrical containers are built to withstand rough usage and high pressure. Gases and liquids under pressure that are likely to be explosive, highly combustible or poisonous are usually held in them. Increases in temperature due to weather or fire might easily double or treble the original pressure in the container and if the strength of the container were insufficient, an explosion causing serious damage or loss of life might result. These containers or cylinders range in size from very small flasks containing only a few ounces of material to tank cars carrying a battery of tanks designed to carry several tons. The design of cylinders varies depending on the physical and chemical properties of the material to be shipped. Some are equipped with special safety devices which operate when the internal pressure increases to a point where further increase in pressure might rupture the container. Others are equipped with devices to permit the escape of the contents when the temperature of the vessel and contents becomes excessive. Substances shipped in cylinders are oxygen, acetylene, hydrogen, nitrogen, chlorine, sulphur dioxide, nitrous oxide, ethylene, methyl chloride, ammonia, carbonic acid gas, liquefied petroleum gases, helium, argon, blaugas, pintsch gas and a number of others.

Containers designed to transport materials having considerable weight, or bulk, which are in suitable form to permit being shipped at ordinary atmospheric pressure are designated as tank cars, barrels, drums and cans (*see* CANNING, COMMERCIAL).

Tank Cars.—These consist of railway cars equipped with one or more tanks, the total capacity being generally about 8,000 gallons. They are equipped with piping for heating and liquefying viscous liquids, valves and vents to facilitate filling and emptying. Where large quantities of material are to be transported, and the existing regulations permit that material to be shipped in bulk, these tank cars offer a very economical service as containers.

Barrels.—Because the number of consumers whose business warrants delivery of material in tank cars is limited, barrels, drums and cans play a large part in the distribution of many products to the consumer. Those containers having a bilged shape similar to the wooden barrel or keg, are termed barrels. They are made of heavy gauge steel and are designed to withstand extreme abuse. Their shape makes them easy to handle especially when filled with heavy materials, and because of their sturdy construction and long life they are treated as transport equipment, being depreciated on a basis of probable life and number of trips through which they are likely to remain sound. Records show that bilged steel barrels of the seamless type have a life of over 20 years with an average of eight trips per year. Bilged type containers of 30 and 50 gal. sizes are produced in the United States. Germany produces bilged steel barrels up to 110 gal. capacity. There are two distinct types of barrels, those fitted with threaded bung and vent for liquid substances and those equipped with removable plates or full removable heads to facilitate emptying semi-liquids, paste or solid substances. These containers having straight sides and a capacity ranging from 10 gal. up to 110 gal. are usually termed drums. They are made in a variety of designs depending on the product to be shipped. For liquid products they are provided with threaded bungs and vents. For semi-liquids, pastes and solid substances the drums are equipped with removable heads to facilitate the removal of the contents.

Drums.—Two distinct types of drums are produced in the United States. Heavy gauge drums are required for the shipment of substances which are combustible, explosive or corrosive. Those for highly corrosive substances such as acids, are specifically designed to give service under extreme conditions. Substances having a low flash point, or those of the non-corrosive type may be shipped in very light gauge steel drums used only for one shipment, the drum being destroyed after it has been emptied. When the material shipped is non-combustible or non-corrosive and where long distance shipments are made, or where the substances pass through several hands before reaching the ultimate consumer, the light gauge single trip drum is economical. Where return freight rates are not excessive and when marketing conditions are favourable the returnable type or heavy gauge drum and the bilged type steel barrel have proved themselves to be an economy over the light gauge single trip container of the drum type.

Cans.—The number of consumers who purchase smaller quantities of materials than are contained in standard drum sizes, is legion. Also many substances are of such a nature that they are used in small quantity by the consumer. For these substances cans of a variety of shapes and sizes varying from a few ounces to 10 gal. capacity are manufactured. They are strictly of the single trip container type, are sold with their contents, are non-returnable and are often made non-refillable. Tank cars, barrels, drums and cans are used for the distribution of vegetable, animal and mineral oils, gasolene, kerosene, turpentine, alcohol, soaps, ink, paint, varnish, shellac, lacquers, putty, lard and lard substitutes, acids, medicines and many thousands of chemical compounds.

The construction of the large majority of tank cars, cylinders, barrels, drums and cans is often (particularly in the United States) under Government supervision. (H. ME.)

CONTANGO, a Stock Exchange term for the rate of interest paid by a "bull" who has bought stock for the rise and who, when the settlement arrives, is unable or unwilling to take it up and pay for it. He arranges to "carry over" or "continue" his bargain, and does so by entering into a fresh bargain with his seller, or some other party, by which he sells the stock for the settlement and buys it again for the next, the price at which the bargain is entered being called the making-up price. The rate that he pays for this accommodation, which amounts to borrowing the money involved until the next settlement, is called the contango.

CONTARINI, a distinguished Venetian family, who gave to the republic eight doges and many other eminent citizens. The story of their descent from the Roman family of Cotta, appointed prefects of the Reno valley (whence Cotta Reni or Conti del Reno), is probably a legend. One Mario Contarini was among the 12 electors of the doge Paulo Lucio Anafesto in 697. Domenico Contarini, elected doge in 1043, subjugated rebellious Dalmatia and recaptured Grado from the patriarch of Aquileia. He died in 1070. Jacopo was doge from 1275 to 1280. Andrea was elected doge in 1367; during his reign the war of Chioggia took place (1380); he was the first to melt down his plate and mortgage his property for the benefit of the state. Other Contarini doges were: Francesco (1623–24), Niccolò (1630–31), who built the church of the Salute, Carlo (1655–56), during whose reign the Venetians gained the naval victory of the Dardanelles, Domenico (1659–75) and Alvise (1676–84). Many members of the family distinguished themselves in the wars against the Turks, and no less than seven Contarini fought at Lepanto. Other members of the house were famous as merchants, prelates and men of letters; among these we may mention Cardinal Gasparo Contarini (1483–1542), and Marco Contarini (1631–89), who was celebrated as a patron of music and collected at his villa of Piazzola a large number of valuable musical mss., now in the Marciana library at Venice.

See J. Fontana, "Sulla patrizia famiglia Contarini," in *Il Gondoliere* (1843).

CONTÉ, NICOLAS JACQUES (1755–1805), a French mechanical genius, chemist and painter, born at Aunou-sur-Orne, near Sées, on Aug. 4, 1755. The war with England deprived France of plumbago; he substituted for it an artificial substance obtained from a mixture of graphite and clay. In 1795 he was associated with Monge and Berthollet in experiments for the inflation of military balloons, was conducting the school for that department of the engineer corps at Meudon, was perfecting the methods of producing hydrogen in quantity, and was appointed (1796) by the Directory to the command of all the aerostatic establishments. He was at the head of the newly created Conservatoire des arts et métiers, and occupied himself with experiments in new compositions of permanent colours, and in 1798 constructed a metal-covered barometer for measuring comparative heights, by observing the weight of mercury issuing from the tube. As chief of the aerostatic corps in the expedition to Egypt, he was for three years and a half, to quote Berthollet, "the soul of the colony." He made, in an almost uncivilized country, utensils, tools and machinery of every sort from simple windmills to stamps for minting coin. The expedition was provided with bread, cloth, arms and munitions of war; the engineers with the exact tools of their trade; the surgeons with operating instruments. He made the designs, built the models, organized and supervised the manufacture, and seemed to be able to invent immediately anything required. He died at Paris on Dec. 6, 1805.

CONTE, literally a "story," is a word so frequently used in English literary criticisms that some definition of it seems to be demanded. A *conte,* in French, differs from a *récit* or a *rapport* in the element of style; it may be described as an anecdote told with deliberate art, and in this introduction of art lies its peculiar literary value. As early as the 13th century, the word is used in French literature to describe an anecdote thus briefly and artistically told, in prose or verse. The fairy-tales of Perrault and the apologues of La Fontaine were alike spoken of as *contes,* and stories of peculiar extravagance were known as *contes bleus,* because they were issued to the common public in coarse blue paper covers. The most famous *contes* in the 18th century were those of Voltaire, who has been described as having invented the *conte philosophique.* But those brilliant stories, *Candide, Zadig, L'Ingénu, La Princesse de Babylone* and *Le Taureau blanc,* are not, in the modern sense, *contes* at all. The same may be said of those of Marmontel, and of the insipid imitations of Oriental fancy which were so popular at the close of the 18th century. The most perfect modern writer of *contes* is Guy de Maupassant, and his celebrated anecdote called "Boule de suif" may be taken as an absolutely perfect example of this class of literature, the precise limitations of which it is difficult to define.

CONTEMPT OF COURT, in English law, any disobedience or disrespect to the authority or privileges of a legislative body, or interference with the administration of a court of justice.

The High Court of Parliament.—Each of the two houses of parliament has by the law and custom of parliament power to protect its freedom, dignity and authority against insult, disregard or violence by resort to its own process and not to ordinary courts of law and without having its process interfered with by those courts. The nature and limits of this authority to punish for contempt have been the subject of not infrequent conflict with the courts of law, from the time when Lord Chief Justice Holt threatened to commit the speaker for attempting to stop the trial of *Ashby* v. *White* (1701), as a breach of privilege, to the cases of *Burdett* v. *Abbott* (1810), *Stockdale* v. *Hansard* and *Howard* v. *Gosset* (1842, 1843), and *Bradlaugh* v. *Gosset* (1884). It is now the accepted view that the power of either house to punish contempt is exceptional and derived from ancient usage, and does not flow from their being courts of record. Orders for committal by the Commons are effectual only while the house sits; orders by the Lords may be for a time specified, in which event prorogation does not operate as a discharge of the offender. It was at one time considered that the privilege of committing for contempt was inherent in every deliberative body invested with authority by the constitution, and consequently that colonial legislative bodies had by the nature of their functions the power to commit for contempt. But in *Kielley* v. *Carson* (1843; 4 Moore, P.C. 63) it was held that the power belonged to parliament by ancient usage only and not on the theory above stated, and in each colony it is necessary to inquire how far the colonial legislature has acquired, by order in council or charter or from the imperial legislature, power to punish breach of privilege by imprisonment or committal for contempt. This power has in some cases been given directly, in others by authority to make laws and regulations under sanctions like those enforced by the houses of the imperial parliament. In the case of Nova Scotia the provincial assembly has power to give itself by statute authority to commit for contempt (*Fielding* v. *Thomas*, 1896; L.R.A.C. 600). In *Barton* v. *Taylor* (1886; 11 A.C. 197) the competence of the legislative assembly of New South Wales to make standing orders punishing contempt was recognized to exist under the colonial constitution, but the particular standing orders under consideration are held not to cover the acts which had been punished. (*See* May, *Parl. Pr.*, 10th ed., 1896; Anson, *Law and Custom of the Constitution*, 3rd ed., 1897.)

Courts of Justice.—The term contempt of court, when used with reference to the courts or persons to whom the exercise of the judicial functions of the Crown has been delegated, means insult offered to such court or person by deliberate defiance of its authority, disobedience to its orders, interruption of its proceedings or interference with the due course of justice, or any conduct calculated or tending to bring the authority or administration of the law into disrespect or disregard, or to interfere with or prejudice parties or witnesses during the litigation. For practical purposes most, if not all, contempts fall within the classification which follows:—

(*a*) Disobedience to the judgment or order of a court commanding the doing or abstaining from a particular act, *e.g.*, an order to execute a conveyance of property or an order on a person in a fiduciary capacity to pay into court trust moneys as to which he is an accounting party. This includes disobedience by the members of a local authority to a *mandamus* to do some act which they are by law bound to do.

(*b*) Disobedience by inferior judges or magistrates to the lawful order of a superior court. Such disobedience, if amounting to wilful misconduct, would usually give ground for amotion or removal from office, or for prosecution or indictment or information for misconduct.

(*c*) Disobedience or misconduct by executive officers of the law, *e.g.*, sheriffs and their bailiffs or gaolers. The contempt consists in not complying with the terms of writs or warrants sent for execution. A sheriff who fails to attend the assizes is liable to severe fine as being in contempt (Oswald, 51). The Sheriffs Act 1887 enumerates many instances in which misconduct is punishable under that act, but reserves to superior courts of record power to deal with such misconduct as a contempt (s. 29). *See* also *Harvey's Case*, 1884, 26 Ch. D. 644.

(*d*) Misconduct or neglect of duty by subordinate officials of courts of justice, including solicitors. In these cases it is more usual for the superior authorities to remove the offender from office, or for disciplinary proceedings to be instituted by the Law Society. But in the case of an unqualified person assuming to act as a solicitor or in the case of breach of an undertaking given by a solicitor to the court, proceedings for contempt are still taken.

(*e*) Misconduct by parties, jurors or witnesses. Jurors who fail to attend in obedience to a jury summons and witnesses who fail to attend on subpoena are liable to punishment for contempt, and parties, counsel or solicitors who practise a fraud on the court are similarly liable.

(*f*) Contempt *in facie curiae*. It is immaterial whether the offender is juror, party, witness, counsel, solicitor or a stranger to the case at hearing, and occasionally it is found necessary to punish for contempt persons under trial for felony or misdemeanour if by violent language or conduct they interrupt the proceedings at their trial.

(*g*) Attempts to prevent or interfere with the due course of justice, whether made by a person interested in a particular case or by an outsider. This branch of contempt takes many forms, such as frauds on the court by justices, solicitors or counsel, tampering with witnesses, threatening judge or jury or attempting to bribe them and the like; and also "scandalizing the court itself" by abusing the parties concerned in a pending case, or by creating prejudice against such persons before their cause is heard.

Invectives Against Judges.—The *locus classicus* on the subject of contempt by attacks on judges is a judgment prepared by Sir Eardley-Wilmot in the case of an application for an attachment against J. Almon in 1765, for publishing a pamphlet libelling the court of king's bench. The object of the discipline enforced by the court by proceedings for contempt of court is not now, if it ever was, to vindicate the personal dignity of the judges or to protect them from insult as individuals, but to vindicate the dignity and authority of the court itself and to prevent acts tending to obstruct the due course of justice. The question whether a personal invective against judges should be dealt with *brevi manu* by the court attacked, or by proceedings at the instance of the attorney-general by information or indictment for a libel on the administration of justice or on the judge attacked, or whether it should be dealt with by a civil action for damages, depends on the nature and occasion of the attack on the judge.

In *Macleod* v. *St. Aubyn*, 1899, A.C. 549 it was said that proceedings for scandalizing the court itself were obsolete in England. But in 1900 the king's bench division, following the Almon case, summarily punished a scurrilous personal attack on a judge of assize with reference to his remarks in a concluded case, published immediately after the conclusion of the case (*R.* v. *Gray*, 1900, 2 Q.B. 36). A recent example of the application of the principle laid down in this case will be found in *R.* v. *Editor of the New Statesman* (1928) 44 Times Law Reports 301. The same measure may be meted out to those who publish invectives against judges or juries with the object of creating suspicion or contempt as to the administration of justice. But the existence of this power does not militate against the right of the press to publish full reports of trials and judgments or to make with fairness, good faith, candour and decency, comments and criticisms on what passed at the trial and on the correctness of the verdict or the judgment. To impute corruption is said to go beyond the limits of fair criticism which is, of course, allowable.

The exact limits of the power to punish for contempt of court in respect of statements or comments on the action of judges and juries, or with reference to *pending* proceedings, have been the subject of some controversy, owing to the difficulty of reconciling the claims of the press to liberty and of the public to free discussion of the proceedings of courts of justice with the claims of the judges to due respect and of the parties to litigation that their causes should not be prejudiced before trial by outside interference. As the law now stands it is permissible to publish contemporaneous *reports* of the proceedings in cases pending in any court (Law of Libel Amendment Act 1888, s. 3), unless the proceedings have taken place in private (*in camera*), or the court has in the interests of justice prohibited certain references, such as to names, or even any report, until the case is concluded. But it is not permissible to make any comments on a pending case calculated to interfere with the due course of justice in the case, or to publish statements about the cause or the parties calculated to have that effect.

The difference between pending and decided cases has been frequently recognized by the courts. What would be a fair comment in a decided case may tend to influence the mind of the judge or the jury in a case waiting to be heard, and will accordingly be punished as a contempt. When an action is at an end the courts will not interfere though the proceedings are misrepresented to the injury of the applicant; but scandalizing the court, *e.g.*, by attacks on the judge, may be punished even after the end of the action (*Dunn* v. *Brown*, 1922, 1 Ch. 276).

Punishment.—"In the superior courts the power of committing for contempt is inherent in their constitution, has been coeval with their original institution and has been always exercised" (Oswald, *On Contempt*, 3). The high court in which these courts are merged is the only court which has a general jurisdiction to deal summarily with all forms of contempt. Each division of that court deals with the particular contempts arising with reference to proceedings before the division; but the king's bench division, in the exercise of the supervisory authority inherited from the old court of king's bench as *custos morum*, also from time to time deals with acts constituting interference with justice in other inferior courts whether of record or not.

Inferior courts of record have, as a general rule, power to punish only those contempts which are committed *in facie curiae* or consist in disobedience to the lawful orders or judgments of the court. For instance, a county court may summarily punish persons who insult the judge or any officer of the court or any juror or witness, or wilfully interrupt the proceedings, or misbehave in the court-house (County Court Act 1888, s. 162), and may also attach persons who, having means, refuse to comply with an order to pay money, or refuse to comply with an order to deliver up a specific chattel or disobey an injunction. A court of quarter sessions has at common law a like power as to contempts *in facie curiae* and is said to have power to punish its officials for contempt in non-attendance or neglect of duty.

Contempt of court is a misdemeanour and is punishable by fine and imprisonment or either at discretion. The offence may be tried summarily, or may be prosecuted on information or on indictment. The prerogative of pardon extends to all contempts of court which are dealt with by a sentence of clearly punitive character; but it is doubtful whether it extends to committals for disobedience to orders made in aid of the execution of a civil judgment.

Except in cases of contempt *in facie curiae* evidence on oath as to the alleged contempt must be laid before the court, and application made for the "committal" or "attachment" of the offender. The differences between the two modes are technical rather than substantial.

The procedure for dealing with contempt of court varies somewhat according as the contempt consists in disobeying an order of the High Court made in a civil cause, or in interference with the course of justice by persons not present in court nor parties to the cause. In the first class of cases the court proceeds by order of committal or giving leave to issue writ of attachment. In proceedings on the Crown side of the king's bench division it is still usual to apply in the first place for a rule *nisi* for leave to attach the alleged offender who is given an opportunity of explaining, excusing or justifying the incriminated acts. The king's bench procedure is that generally used for interference with the due course of criminal justice or disobedience to prerogative writs such as *mandamus*.

An order of committal is an order in execution specifying the nature of the detention to be suffered, or the penalty to be paid. The process of attachment merely brings the accused into court; he is then required to answer on oath interrogatories administered to him, so that the court may be better informed of the circumstances of the contempt. If he can clear himself on oath he is discharged; if he confesses the court will punish him by fine or imprisonment, or both, at its discretion.

Scotland.—In Scotland the courts of session and justiciary have, at common law, and exercise the power of punishing contempt committed during a judicial proceeding by censure, fine or imprisonment *proprio motu* without formal proceedings or a summary complaint. The nature of the offence is there in substance the same as in England (*see* Petrie, 1889: 7 Rettie Justiciary 3; Smith, 1892: 20 Rettie Justiciary 52).

Ireland.—In Ireland the law of contempt is on the same lines as in England, but conflicts have arisen between the bench and popular opinion, due to political and religious differences, which have led to proposals for making juries and not judges arbiters in cases of contempt.

British Dominions Beyond Seas.—The courts of most British possessions have acquired and freely exercise the power of the court of king's bench to deal summarily with contempt of court; and it is not infrequently the duty of the privy council to restrain too exuberant a vindication of the offended dignity of a colonial court. In British Guiana proceedings for contempt, not committed *in facie curiae*, must be tried before a jury.

In the United States, contempt also exists as applied to legislative bodies. A person who has offended the dignity of the Senate or House of Representatives of Congress, may be brought before the offended body by its sergeant-at-arms and reprimanded by its presiding officer. In the event of an individual having defied the authority of either House of Congress, he may be indicted by the Federal Courts, when such defiance becomes a matter of fact. The state legislatures are similarly protected by state constitutions and statutes from contempt.

Contempt of court in the Federal and State courts exists: In direct cases, in the presence of the court; in constructive cases, not in the presence of the court; in criminal cases, such as bribery of court officials; and in civil cases, where an individual declines to observe a civil order of the court, but does not offend the dignity of the court. Contempt cases are punished by the court, without the intervention of a jury.

CONTI, PRINCES OF. The title of prince of Conti, assumed by a younger branch of the house of Condé, was taken from Conti-sur-Selles, a small town about 20m. S.W. of Amiens, which came into the Condé family by the marriage of Louis of Bourbon, first prince of Condé, with Eleanor de Roye in 1551.

FRANÇOIS (1558–1614), the third son of this marriage, was made marquis de Conti, and between 1581 and 1597 received princely rank. Conti appears to have taken no part in the wars of religion until 1587, when he declared in favour of Henry of Navarre, afterwards King Henry IV. of France. He signed the declaration recognizing Henry IV. as king, and he continued to support Henry, although on the death of Charles, cardinal de Bourbon, in 1590 he himself was mentioned as a candidate for the throne. In 1605 Conti married, as his second wife, the beautiful and witty Louise Marguerite (1574–1631), daughter of Henry duke of Guise and Catherine of Cleves, whom, but for the influence of his mistress Gabrielle d' Estrées, Henry IV. would have made his queen. Conti died in 1614. His widow was secretly married to François de Bassompierre (*q.v.*) who joined her in conspiring against Cardinal Richelieu. Upon the exposure of the plot the cardinal exiled her to her estate at Eu, near Amiens, where she died. The princess wrote *Aventures de la cour de Perse*, in which, under the veil of fictitious scenes and names, she tells the history of her own time.

In 1629 the title of prince de Conti was revived in favour of ARMAND DE BOURBON (1629–1666), second son of Henry II. of Bourbon, prince of Condé, and brother of Louis, the great Condé. He played a conspicuous part in the two Frondes, and then fought in the Italian and Spanish campaigns, but after his defeat before Alessandria in 1657 retired to Languedoc, where he devoted himself to study and mysticism until his death. At Clermont, Conti had been a fellow-student of Molière's for whom he secured an introduction to the court of Louis XIV.

LOUIS ARMAND DE BOURBON, prince de Conti (1661–1685), eldest son of the preceding, succeeded his father in 1666, and in 1680 married Marie Anne, a daughter of Louis XIV. and Louise de la Vallière. He served with distinction in Flanders in 1683, and against the wish of the king went to Hungary, where he assisted the Imperialists to defeat the Turks at Gran in 1683.

FRANÇOIS LOUIS DE BOURBON, prince de Conti (1664–1709), younger brother of the preceding, was known until 1685 as prince de la Roche-sur-Yon. In 1683 he assisted the Imperialists in Hungary, and while there he wrote some letters in which he referred to Louis XIV. as *le roi du théâtre,* for which on his return to France he was temporarily banished to Chantilly. Conti was a favourite of his uncle, the great Condé, whose granddaughter Marie Thérèse de Bourbon (1666–1732) he married in 1688. In 1689 he accompanied his intimate friend, Marshal Luxembourg, to the Netherlands, and shared in the French victories at Fleurus, Steinkirk and Neerwinden. In 1697 Louis XIV. offered him the Polish crown, and by means of bribes the abbé de Polignac secured his election. Conti started rather unwillingly for his new kingdom, probably, as St. Simon remarks, owing to his affection for Françoise, wife of Philip II., duke of Orléans, and daughter of Louis XIV. and Madame de Montespan. When he reached Danzig and found his rival Augustus II., elector of Saxony, already in possession of the Polish crown, he returned to France. The misfortunes of the French armies during the earlier years of the war of the Spanish Succession compelled Louis to appoint Conti, whose military renown stood very high, to command the troops in Italy. He fell ill before he could take the field, and died on Feb. 9, 1709.

LOUIS ARMAND DE BOURBON, prince de Conti (1696–1727), eldest son of the preceding, was a prominent supporter of the financial schemes of John Law, by which he made large sums of money.

LOUIS FRANÇOIS DE BOURBON, prince de Conti (1717–1776), only son of the preceding, saw his first fighting in Bohemia in 1741. He was appointed to command the army in Italy, where he forced the pass of Villafranca and won the battle of Coni in 1744. In 1745 he was sent to check the Imperialists in Germany, and in 1746 was transferred to the Netherlands, where some jealousy between Marshal Saxe and himself led to his retirement in 1747. In this year a faction among the Polish nobles offered Conti the crown of that country, and was supported by Louis XV. Although Conti did not secure the Polish throne he remained in the confidence of Louis until 1755, when his influence was destroyed by the intrigues of Madame de Pompadour. When the Seven Years' War broke out in 1756 he was refused the command of the army of the Rhine, and began the opposition to the administration which caused Louis to refer to him as "my cousin the advocate." In 1771 he was prominent in opposition to the chancellor Maupeou. He supported the parlements against the ministry, was especially active in his hostility to Turgot, and was suspected of aiding a rising which took place at Dijon in 1775. Conti, who died on Aug. 2, 1776, inherited literary tastes from his father, was a brave and skilful general, and a diligent student of military history. His house, over which the comtesse de Boufflers presided, was the resort of many men of letters, and he was a patron of Jean Jacques Rousseau.

LOUIS FRANÇOIS JOSEPH, prince de Conti (1734–1814), son of the preceding, distinguished himself during the Seven Years' War. He took the side of Maupeou in the struggle between the chancellor and the parlements, and in 1788 declared that the integrity of the constitution must be maintained. He left France in 1789, but returned in 1790. Arrested by order of the National Convention in 1793, he was acquitted, but his estates were confiscated. The Directory banished him from France, but he took no part in royalist intrigues, and lived in retirement at Barcelona till his death in 1814, when the house of Conti became extinct.

CONTI, NICOLO DE' (*fl.* 1419–1444), Venetian explorer and writer, was a merchant of noble family, who left Venice about 1419 for 25 years. We next find him in Damascus, whence he made his way over the north Arabian desert, the Euphrates and southern Mesopotamia, to Baghdad. From Baghdad he sailed down the Tigris to Basra and the head of the Persian gulf; he next descended the gulf to Ormuz, coasted along the Indian ocean shore of Persia to Cambay, where he began his Indian life and observations. He next dropped down the west coast of India and struck inland to Vijayanagar, the capital of the principal Hindu state of the Deccan (destroyed in 1555), of which he gives an interesting description. Thence he travelled to Maliapur near Madras, the traditional resting-place of the body of St. Thomas, and the holiest shrine of the native Nestorian Christians. He then went for a year to Sumatra, gaining a good knowledge of the cannibal natives, and of the camphor, pepper and gold of this "Taprobana." From Sumatra he took a stormy voyage of sixteen days to Tenasserim, near the head of the Malay peninsula. We then find him at the mouth of the Ganges, which he ascends and descends, visiting Burdwan and Aracan, penetrating into Burma, and navigating the Irrawaddy to Ava. From Pegu he went to Java, his farthest point. After remaining there for nine months, he returned by Ciampa (usually Cochin-China in later mediaeval European literature, but here perhaps some more westerly portion of Indo-China), Coloen (Kulam or Quilon), Cochin, Calicut and Cambay, to Sokotra, which he describes as still mainly inhabited by Nestorian Christians; to the "rich city" of Aden; to Gidda (or Jidda), the port of Mecca; over the desert to Cairo; and so to Venice, arriving in 1444.

As a penance for his (compulsory) renunciation of the Christian faith during his wanderings, Eugenius IV. ordered him to relate his history to Poggio Bracciolini, the papal secretary. The narrative closes with Conti's replies to Poggio's questions on Indian life, social classes, religion, fashions, manners and customs. Conti divides the Indies into three parts; from Persia to the Indus; from the Indus to the Ganges; and beyond the Ganges. This last he considered to excel the others in wealth and culture, and to be abreast of Italy in civilization. He notes many interesting Indian customs, and reproduced several old legends. Conti's name-forms, partly through Poggio's vicious classicism, are often unrecognizable, but on the whole this is the best account of southern Asia by any European of the 15th century; while the traveller's visit to Sokotra is an almost unique performance for a Latin Christian of the middle ages.

The original Latin is in Poggio's *De varietate Fortunae,* book iv. (ed. Abbé Oliva, Paris, 1723). The Italian translation printed in Ramusio's *Navigationi et viaggi,* vol. i., is from a Portuguese translation. *India in the Fifteenth Century* (1857), contains an English translation made by J. Winter Jones for the Hakluyt Society, with an introduction by R. H. Major.

CONTINENT, a term used in physical geography for the larger continuous masses of land, namely: Asia, Africa, North America, South America, Europe and Australia in the order of their size. *See* CONTINENTS, ORIGIN OF; CONTINENTAL SHELF.

It is interesting to take into consideration that the areas of volcanic activity are mostly where continent and ocean meet; and that around the continents there is an almost continuous "deep" from 100 to 300m. broad, of which the Challenger Deep (11,400ft.) and the great Tuscarora Deep are fragments. The great floating segments are the Eurasian (with an area roughly of 24, reckoning in millions of square miles), strongly ridged on the south and east, and relatively flat on the northwest; the African (twelve) rather strongly ridged on the east, less abruptly on the west and north; the North American (ten), strongly ridged on the west, more gently on the east, and relatively flat on the north and in the interior; the South American (nine), strongly ridged on the west and somewhat on the northeast and southeast, leaving ten for the smaller blocks. The delicate balance or isostasy of lighter land material and heavier ocean bed substance was made the subject of considerable work by Hayford in *The Figure of the Earth and Isostasy* (1909) and a statement of modern views on the subject was made by A. Morley Davies in the *Geographical Journal* (July 1925).

The foundation structures of the continents are similar. Their rocks and soils are due to differential minor movements in the past, by which various deposits were produced. These movements, followed by long periods of rest, allow of the development and migration of forms of life, the development of varied characteristic land forms, the migration and settlement of human beings and intercourse between races and communities, with finally the commercial interchange of commodities produced upon different parts of the continental surface by varying soil and climatic conditions; in short, for those geographical factors which form the chief influences upon past and present human history. That such movements have not ceased is known by the fact that certain coastal regions are now undergoing changes of level by which land is emerging from the sea, or sinking beneath it. Such changes take place very slowly. There is general agreement that the positions of the present continents were determined as long ago as archaean times. (*See* GEOGRAPHY.)

CONTINENTAL CAOUTCHOUC AND GUTTA PERCHA COMPANY. This rubber company was founded in Hanover, with a capital of 900,000 marks, in Oct. 1871. Owing to difficulties in construction, etc., the actual work of the company was not begun until Sept. 1873. The first full year was 1874, when a loss of 26,587 marks was sustained. In the course of time, new uses were being found for rubber and the gradual growth of the concern may be judged from the increase in the number of employees: (1874) 246; (1884) 450; (1889) 500, and during the years of World War I, 8,000 in Hanover and, including all others elsewhere in the pay of the company, 13,000. In the three years 1910–13 the capital of the Continental rose from 9,000,000 to 15,000,000 marks. The activities of the company fall into several well-defined classes. The surgical productions comprise hot-water bags, ice-bags, bathing caps, air cushions, syringes, sponges, surgical gloves, bath shoes, bath mats, shaving brushes and so forth; the industrial products include motor car accessories of all kinds, from tires, mats, treads, insulating pads, grips, rings, tubes, etc.; there are also specialized technical products connected with electrical undertakings, typewriters (platens, etc.) and even furnishings, covers for upholstery, etc.

The company has several times extended its premises in the course of its development, has large works and a spacious residential clubhouse for employees. The workers publish a monthly called *Echo Continental,* with a circulation of 90,000. (W. HR.)

CONTINENTAL CONGRESS, THE, representing the British colonies in America, met on Sept. 5, 1774, in Carpenters' hall, Philadelphia, to consider colonial rights and liberties and their violation through a series of oppressive measures imposed by Great Britain. Growing resistance to a common source of grievances bound them into a loose unity which was finally activated when British authorities closed the port of Boston (*see* UNITED STATES OF AMERICA: *History*). On May 27, 1774, at an unofficial meeting of the Virginia burgesses, the Boston Port act was denounced as a "most dangerous attempt to destroy the constitutional liberty and rights of all North America," and a protest meeting of colonial representatives was suggested. Similar action was soon proposed and acted upon in all of the 13 colonies but Georgia, and a date set for committees from the colonies to meet in Philadelphia.

Delegates were not chosen with any particular rule as to number. When the congress assembled, there were 44 members, originating as follows: two each from New Hampshire and Rhode Island; three each from Connecticut, Delaware and Maryland; four from Massachusetts; five each from New York, New Jersey and South Carolina; and six each from Virginia and Pennsylvania. Three delegates arrived later from North Carolina, and when all late comers had reported, the delegates numbered 54. (Georgia did not participate until 1775 during the second congress.) Each committee had been commissioned by its electors, but not all credentials bore an equal weight. Those for Rhode Island carried the governor's signature, those for Massachusetts, the clerk's; others offered as their credentials the vote of their assemblies. Methods of elections varied as well, including election by provincial congresses (Md., N.J., Del., N.C.), by deputies appointed by the several towns (N.H.) and by "a general meeting of the inhabitants," later ratified by the assembly (S.C.). Peyton Randolph of Virginia was unanimously chosen president of the congress, and the historic choice of the terms president and congress, for the chairman and the assemblage, were also made at this time. Charles Thomson was elected secretary, and served in this office during the 15 years that the congress functioned. The question of voting gave rise to considerable debate, with arguments ranging from Patrick Henry's for a vote based on population (excluding Negroes), and a compromise proposal based on population and property, to those of the smaller colonies who argued for absolute equality. Practically no statistics on population were available, and it was agreed that each colony was to have one vote.

The congress had not been called with any design toward changing the administrative structure of the colonies. The Virginia delegation, for example, which included Washington, Henry and Randolph, was commissioned simply to "procure a redress of grievances for the much injured province of Massachusetts" which they were nevertheless cautioned to do "in the most proper and effectual manner" by "operating upon the commercial connection of the colonies with the mother country."

On Oct. 14, a declaration of rights was adopted, listing among others, the rights of life, liberty, property, assembly, trial by jury, representative government and the freedom from a standing army in time of peace. But the most significant outcome of this first congress was the adoption, on Oct. 20, of the plan of the association, a series of resolutions calling for commercial nonintercourse with Great Britain. These resolutions, enforced by committees set up in the colonies, became the first evidence of a practical union among the soon to be federated states. A petition addressed to the king was adopted on Oct. 26, after which the first congress adjourned, having agreed to return to Philadelphia on May 10, 1775, should its grievances remain unanswered.

When the second congress reassembled on that date at the state house, its character had become less that of a deliberative assembly than a provisional government. For armed conflict had broken out some weeks earlier in Massachusetts, and public opinion behind the congress had grown substantially. Having been forced to take up arms in self-defense, a declaration to justify such action was proposed in the spring of 1776 and adopted on July 2 (*see* DECLARATION OF INDEPENDENCE). Delegates had in fact come prepared. The commission of Francis Hopkinson of New Jersey, read into the *Proceedings* of June 28, instructed him, if necessary, "to join in declaring the United Colonies independent of Great Britain, entering into a confederation for union and common defence," etc. By the close of 1775, the congress had accepted the duties of an executive and legislative body charged with the conduct of a war (*see* AMERICAN REVOLUTION, THE). In 1777 an instrument of self-government was drawn up, entitled the articles of confederation, under which the united colonies operated imperfectly but successfully until 1789, when they formed the United States.

Sessions of the continental congress were begun as follows: Sept. 5, 1774, and May 10, 1775, at Philadelphia; Dec. 20, 1776, at Baltimore; March 4, 1777, at Philadelphia; Sept. 27, 1777, at Lancaster, Pa.; Sept. 30, 1777, at York, Pa.; July 2, 1778, at Philadelphia; June 30, 1783, at Princeton, N.J.; Nov. 26, 1783, at Annapolis, Md.; Nov. 1, 1784, at Trenton, N.J.; and Jan. 11, 1785, at New York. The latter continued to be the meeting place

Presidents of the Continental Congress, 1774 to 1788

	From	Elected
Peyton Randolph	Virginia	Sept. 5, 1774
Henry Middleton	South Carolina	Oct. 22, 1774
Peyton Randolph	Virginia	May 10, 1775
John Hancock	Massachusetts	May 24, 1775
Henry Laurens	South Carolina	Nov. 1, 1777
John Jay	New York	Dec. 10, 1778
Samuel Huntington	Connecticut	Sept. 28, 1779
Thomas McKean	Delaware	July 10, 1781
John Hanson	Maryland	Nov. 5, 1781
Elias Boudinot	New Jersey	Nov. 4, 1782
Thomas Mifflin	Pennsylvania	Nov. 3, 1783
Richard Henry Lee	Virginia	Nov. 30, 1784
Nathaniel Gorham	Massachusetts	June 6, 1786
Arthur St. Clair	Pennsylvania	Feb. 12, 1787
Cyrus Griffin	Virginia	Jan. 22, 1788

until the adoption of the United States constitution. From 1781 to 1788, congress met annually on the first Monday in November as provided in the articles of confederation.

CONTINENTAL ILLINOIS NATIONAL BANK AND TRUST COMPANY OF CHICAGO, chartered Oct. 15, 1932, under the National Bank act, succeeded the Continental Illinois Bank and Trust company, chartered under the laws of the state of Illinois, through an exchange of stock, share for share. The present bank represents a union, consummated March 18, 1929, of the Continental National Bank and Trust Company of Chicago and the Illinois Merchants Trust company, and is the outgrowth of a series of consolidations and mergers of banks, savings associations and trust companies in Chicago, the oldest of which was chartered in 1857.

The Continental National Bank and Trust Company of Chicago, one of the two components of the present bank, resulted Dec. 1, 1927, from a union of the business of the Continental and Commercial National Bank of Chicago and its state chartered affiliate, the Continental and Commercial Trust and Savings bank. These merging banks were themselves integrations of 14 banking institutions. The oldest of this group, the Merchants association, had been founded in 1861.

The Illinois Merchants Trust company, the other component bank, assumed corporate existence April 9, 1923, as a consolidation of the Illinois Trust and Savings bank and The Merchants Loan and Trust company. The Corn Exchange National Bank of Chicago was a member of this merging group, but was not physically united with the Illinois Merchants Trust company until Sept. 29, 1924. The oldest component of this group, the Merchants Savings Loan and Trust company, had been organized in 1857. Four other banks also were identified with the Illinois Merchants group through consolidation prior to 1903 with the Corn Exchange National Bank of Chicago.

As of March 26, 1940, the capital account of the Continental Illinois National Bank and Trust company was \$97,776,000, consisting of: common stock \$50,000,000 (with par value of \$33⅓); surplus, \$30,000,000; undivided profits, \$17,776,000.

Reserve for contingencies was \$16,154,000. Total resources amounted to \$1,422,505,000, while aggregate deposits stood at \$1,301,972,000. The bank is housed in the building originally erected for the Illinois Merchants Trust company, and is a member of the federal reserve system, the Federal Deposit Insurance corporation and the Chicago Clearing House association.

CONTINENTAL SHELF, the term in physical geography for the submerged platform upon which the continental areas stand in relief. The volume of the hydrosphere is a little too great for the true ocean basins, and it runs over, covering the borders of the continents. If a medal be partly sunk under water the image and superscription standing above water would represent a continent with adjacent islands and the sunken part just submerged would represent the continental shelf. The lithosphere's surface may be considered to consist of three parts, namely, the continent heights 21%, the deep ocean 64½% and a transitional area separating them. This transitional area of slight gradient is almost bisected by the present coast-line, for nearly one-half of it (10,000,000 sq.mi.) lies under water less than 600 ft. deep, and the remainder is under 600 ft. in elevation. The former is called the continental shelf, and represents the area which would be added to the continents if the land rose 600 ft. This shelf varies in width; surrounding it, leading to the great depths, is Wagner's continental slope. Around Africa—except for isolated patches—and off the western coasts of America the shelf scarcely exists. It is wide under the British Isles and northern France, and extends as a continuous platform under the whole of the North sea except off southwest Norway. It unites Australia to New Guinea on the north and to Tasmania on the south, connects the Malay Archipelago along the broad shelf east of China with Japan and unites northwestern America with Asia. It curves southward outside Newfoundland and northward holds Hudson bay in the centre of a shallow dish. It adds considerable areas to the real oceanic boundaries of eastern United States, Florida, the gulf states, eastern Central America and equatorial Brazil, while southward the Falklands rise from its eastern border. In many places it is a plain of marine denudation, where the waves have battered down the cliffs and dragged the eroded material under the present sea level. If there were no compensating action in the differential movement of land and sea in the transitional area the whole of the land would be gradually planed down to a submarine platform, and all the globe would be covered with water. There are, however, periodical movements of this transitional area by which fresh areas of land are raised above sea level, while the sea sinks more deeply into the great ocean basins, and the enlarged continents offer a new strip to the unceasing action of the waves.

CONTINENTAL SYSTEM, the name given to Napoleon's design for paralysing Great Britain through the destruction of her commerce. By the Berlin decree (Nov. 21, 1806) and the Milan decree (Dec. 17, 1807) he declared Great Britain to be in a state of blockade, and forbade either neutrals or French allies to trade with her or her colonies. To Napoleon's "continental system" England responded by orders in council which subjected all countries in alliance with Napoleon to a counter-blockade. The campaign of starvation brought great suffering to both countries, and vast annoyance to neutrals, causing in particular the Anglo-American War of 1812. But since England held the command of the sea with an overwhelming superiority never before witnessed, the contest proved disastrous to Napoleon—not only because of the resulting privations, but also because, in the effort to maintain his system, Napoleon was forced to undertake responsibilities too great for him to support. (*See* FRANCE: *History;* ENGLISH HISTORY; NAPOLEON I, etc.)

CONTINENTS, ORIGIN OF. Throughout the greater part of the 19th century geologists in general believed that our present continents and oceans were only temporary features of the globe. In the last quarter of the century, however, the idea of the permanence of the ocean basins began to gain ground. It cannot be said that there is any universal agreement upon the question even yet. Many geologists are now inclined to ascribe a high antiquity to the Pacific ocean but to look upon the Atlantic and Indian oceans as comparatively modern. Haug and others still suspect the former existence of a Pacific continent. If continents and oceans are not permanent, the present distribution of land and sea is only an episode in the history of the globe and has no more significance than the distribution in the past. It was not geologists, therefore, who first endeavoured to formulate general theories to account for the present shapes of continents and oceans. Those who made such attempts ignored the changes in the past and their speculations were received with little favour by geologists. The most suggestive of these speculations was the tetrahedral theory of Lowthian Green, who assumed that the earth is cooling, the interior contracting more rapidly than the exterior, and under the force of gravity the outer crust collapses. William Fairbairn's experiments on the crushing of wrought-iron tubes led him to believe that the collapsing sphere will tend to approach a tetrahedral form. The corners of the tetrahedron will rise above the water, forming triangular masses of land; the faces of the tetrahedron will remain covered and will form the oceans. He places one corner at the south pole and the other three in the northern hemisphere. The corner at the south pole is the Antarctic continent and the opposite face of the tetrahedron is covered by the Arctic ocean. The triangular masses of land formed by the other three corners are represented respectively by North and South America, Europe and Africa, Asia and Australia, all of them wide toward the north and tapering toward the south. The two last are united in the north, but the Caspian depression is below sea level and the plain of the Obi but little above it. Between these three land-masses lie the Atlantic, Indian and Pacific oceans, all narrowing toward the north and, in the south, where the tetrahedral edges are lowest, uniting into a continuous belt around the globe. The actual form which Lowthian Green believes the earth to have reached is the hexakistetrahedron with all the faces so much rounded that the departure from the spheroidal form is slight. Lowthian Green's theory was entirely neglected in England for many years, but was more favourably received in France. Albert de Lapparent seems to have been the first to recognize it as a probable hypothesis, and at a later date both Michel Lévy and Marcel Bertrand adopted it in a modified form. After the closing years of the 19th century a tetrahedral theory in some shape or other was accepted by many writers in England, Germany and America; but once more it is generally discredited. On physical grounds objection has been raised that the tetrahedron is not a figure of equilibrium for a rotating earth, and even a slight approximation to it cannot be retained.

Suess's Theories.—A great advance in our knowledge of the history of the globe was made by Eduard Suess in his *Das Antlitz der Erde*. He showed that there are large areas where even the oldest fossiliferous beds still lie horizontal. Here the crust of the earth has been rigid, in the ordinary sense of the term, from Cambrian times. It has broken, but it has never crumpled. Between these areas lie broad belts in which the strata are often folded. Here the crust has been weaker and has yielded to tangential pressures by crumpling and overthrusting. The crumpling was not a continuous process. There were well-defined periods of folding separated by intervals during which the whole earth was free, or almost free, from such disturbances. During these intervals, however, fracturing of the resistant areas took place and large blocks sank; and there were also wide extensions or *transgressions* of the sea over the land.

In the northern hemisphere there are three areas in which the Cambrian beds remain unfolded. These are: (1) *Laurentia,* which includes most of Canada east of the Rockies and probably stretched to the western islands of Scotland, (2) the *Baltic shield* and *Russian platform,* (3) *Angara land,* which includes a great part, but not the whole, of eastern Siberia.

In the southern hemisphere also there are areas in which the oldest fossiliferous beds known show no folding. The most extensive is *Gondwanaland,* which includes the greater part of South America east of the Andes, most of Africa between the Atlas and the mountains of the Cape, Arabia, Syria and the peninsula of India. The upper Cretaceous sea extended over a considerable area and even marine Jurassic beds are found in places, but much the larger part was land throughout the Mesozoic era. A similar remark applies to a great part of Australia. Between the Mesozoic land-areas of the north and those of the south lies a belt in which the Mesozoic beds are for the most part marine. This is the *Tethys* of Suess. Between the rigid masses of the north and those of the south the more yielding crust beneath the sea of Tethys was crushed, and the great series of mountain ranges which run from west to east across the old world was elevated. Tethys was much reduced in size and is now represented chiefly by the Mediterranean sea. About the same time Laurentia and Gondwanaland broke up, large portions sinking beneath the sea, and thus the present Atlantic came into existence. The Pacific appears to have been sea throughout the Mesozoic era at least, but nevertheless it has functioned as a rigid area.

The Wegener Hypothesis.—Alfred Wegener introduces an entirely different conception, according to which the relative positions even of whole continents have altered greatly in quite recent times. It has long been known to geologists that the visible part of the earth's crust consists chiefly of the lighter and more acid rocks, and beneath this it has been commonly supposed that there lies a layer of the denser and more basic rocks. The interior core must be denser still. In formulating these ideas Suess proposed the names *sal, sima* and *nife* for the three concentric regions respectively. The term sal is now usually replaced by *sial,* and with this modification Suess's nomenclature is widely adopted. It has generally been supposed that the sial covers the whole globe. It may be thinner under the oceans and thicker on the continents, but it is present everywhere. Wegener believes that it is discontinuous. The floor of the ocean is formed of sima, and the continents are sheets of sial floating in the sima. Because the sial is of smaller density its surface rises above the surface of the sima. The sima is not liquid in the ordinary sense of the word; but there is no perfect solid, and the sheets of sial, supposed to be about 61 mi. thick, could not lie upon the sima without the force of gravity pressing them in until they floated.

Wegener's view is that the sheets of sial are not only separate and floating in the sima but also moving laterally, and that their positions relatively to one another have altered in the past and are altering still. According to him if we take the edge of the continental shelf as the edge of the sial sheets and allow for the effects of Tertiary folding, the pieces of sial can be fitted together into one continuous sheet covering about a third of the globe. This, he thinks, was the condition at the close of the Palaeozoic era. He does not follow the edge of the continental shelf with any precision, and the allowance that he makes for the Tertiary folding is purely fanciful.

It is in the southern hemisphere that the geological evidence for a former union of the continental masses is strongest, and it is perhaps significant that the nearest approach to a fit is that between Africa and South America. The close similarity between the rocks and fossils of these two areas has led most geologists to assume a former land connection. Both regions are characterized by the occurrence of the fossil *Glossopteris* flora, which differs considerably from the contemporaneous flora of Europe. The same flora has also been found in India and Australia. All these are brought together in Wegener's scheme and the similarity in rocks and fossils is at once explained. But the *Glossopteris* flora is also found in Siberia and northern Russia, which in his reconstruction become farther away from the presumed home of *Glossopteris* than they are at present.

Joly and Radioactivity.—John Joly's theory is based on the effects of radioactivity. He thinks that the continents are sheets of sial floating in the sima, which forms the floor of the ocean. Relative displacements of the continents may have taken place at certain periods. The sial and the sima are both radioactive and the radioactive elements in them are continually generating heat. Unless this heat can escape the temperature must rise. The melting point of the sial rocks is known to be much higher than that of the sima, which is basaltic in composition.

Suppose that at a certain period the whole of the sial is solid and the sima also is solid down to a considerable depth. Heat can only escape by the slow process of conduction. Beneath the sial, according to Joly, there will be no escape from the sima, because the base of the sial itself, owing to its own radioactivity, must be nearly at the melting point of sima. Since the escape of heat is so slow the temperature rises and the sima melts from below upward. Tidal movements in the molten sima acting upon the downward projections of the sial move the whole crust so that the local accumulations of heat originally formed beneath the sial come to lie under the thin layer of solid sima beneath the ocean. This is quickly thinned still further, and molten sima escapes through fractures. The loss of heat now becomes more rapid and an era of cooling and consolidation begins.

We must suppose, then, that there are periods during which the sima layer melts more or less completely and periods during which it solidifies down to a considerable depth. It has been shown experimentally that basalt, and most other rocks that have been tested, expand on melting and decrease in density. As the sima melts it expands, and therefore the general level of the earth's surface is raised. But because the density of the sima is decreased the masses of sial which are floating in it sink more deeply into the layer. Their surfaces, owing to the general rise, become farther from the earth's centre, but, relatively to the surface of the sima they are depressed. In this way the widespread transgressions characteristic of certain geological periods are explained. As the sima cools again and becomes denser the surface falls but the sial masses rise relatively to the sima. When the sima begins to cool, the crust upon it, if not already complete, is soon completed by the consolidation of molten material in its fissures. Together with the sial masses it now covers the whole globe. But the sima continues to contract further and the covering becomes too large. Now begins a period of folding and other earth movements to enable the crust to descend with the sima.

The great merit of the theory, from the geological point of view, is that it offers an explanation of the most remarkable features in the history of the globe, the periodicity of earth-folding and sea-transgressions and their widespread character. However, in view of our ignorance of what goes on in by far the greater part of the interior of the globe it remains improbable that any theory founded on examination of a thin external skin can be complete.

CONTINUATION: *see* CARRYING OVER (CONTINUATION); CONTANGO.

CONTINUATION SCHOOLS (DAY AND EVENING). Early in the 19th century, it came to be recognized in Great Britain that the existing elementary schools could no longer satisfy the national educational needs, which had increased through the immense social and economic changes brought about by the industrial revolution: accordingly, attempts were made to supplement their work by that of night schools for persons fully occupied during the daytime. Under the influence of such men as Dr. George Birkbeck and Lord Brougham, "Mechanics' Institutes" were founded to give factory workers instruction in the scientific principles of workshop practice. (*See* also COMMERCIAL EDUCATION.)

These institutes at first attracted large numbers of artisans, but their popularity amongst working men quickly declined; one of the most important reasons for this was that the elementary education of the workman was in general not sufficient to enable him to profit by the instruction provided in science and mathematics. Other organizations, including "night schools" taught by elementary teachers, came into existence and were carried on for many years without any public assistance. In 1851, however, the government decided to make additional grants to elementary day schools which held continuation classes and the number of these increased steadily until 1870, when they had more than 80,000 students. Elementary education became compulsory after 1876 and the attendance at night schools declined for a time; the attendance increased, however, after the removal by the evening school code of 1893 of the previous age limit of 21 and of the requirement that all scholars should be instructed in elementary subjects.

The Act of 1902.—Side by side with these night schools, there were in existence from 1856 state-aided classes in science and art. There was, however, no definite connection between the two, though after the fusion of the education department and the science and art department into a single board of education, steps were taken in 1901 to secure some connection between the two groups of schools. The Education Act of 1902, which placed the responsibility for both elementary schools and schools for "further education" on the county and county borough authorities, made it possible to organize continuation schools and to fix their position in schemes of education.

When pupils leave full time day education and commence work, provision is now generally made for them to continue their education in the evenings: the courses of instruction usually require attendance at school for two hours on three evenings a week from September until Easter. For boys who are in industrial occupations, instruction is usually given in mathematics, technical drawing or workshop practice, science and English. For those in commercial occupations, the instruction includes English and arithmetic, together with subjects of a more vocational character. For those not needing vocational instruction or for whom organized courses may not be suitable, instruction is provided which is designed to create interest and stimulate intellectual enthusiasm. After World War I, the increase in the demand for adult education continued in remarkable fashion.

During the year 1926–27—the latest period for which statistics are available—there were 727,650 students (18.5 per 1,000) in England and Wales in attendance at evening technical courses; of these 389,813 were men and boys and 337,837 women and girls. In the day continuation courses, 23,884 boys and girls (6 per 10,000) were in attendance.

Act of 1918.—The Education Act of 1918 (later included in the Education Act 1921) laid upon local authorities for higher education the duty of establishing and maintaining day continuation schools in which suitable courses of general instruction (up to 16) and with a vocational bias (from 16 to 18) were to be provided for all "young persons"; attendance to be compulsory and free.

Some of the smaller as well as some of the larger L.E.A.'s (Local education authorities) decided to exercise their powers at once and proceeded to establish day continuation schools; accordingly in 1921–22 there were in the country 122 of these schools with 95,530 pupils. During the next year all the authorities except Rugby closed their compulsory schools, mainly owing to the financial crisis through which the country was passing at that time. Moreover, an important administrative difficulty had not been fully appreciated, though it had been foreseen, viz.: the "appointed day" for the operation of the continuation school clauses was not fixed. L.E.A.'s were allowed to fix their own "appointed days"; and, in consequence, the enforcement of the act created obvious unfairness between the juveniles living in an area where the act was in operation, and juveniles in a contiguous area which had decided not to establish compulsory day continuation schools; also, the small employer who had a very limited number of junior employees was more heavily handicapped by the withdrawal of his assistants during working hours than the big employers who had large staffs of juniors.

The compulsory schools were, however, open for long enough to reveal that there was a real demand among certain classes for the continued education of their children, and some L.E.A.'s opened voluntary schools in order to meet it. It was significant also that within a short time of the closing of the compulsory schools it was found to be necessary to open unemployment educational centres throughout the country for juveniles who were in receipt of the out-of-work donation. Proprietary schools and colleges also increased in number and enrolments.

The V.D.C. Schools.—The voluntary day continuation schools supply the needs chiefly of two types of juveniles: (*a*) those whose parents cannot afford to pay school fees but are able to maintain their children while they are receiving a training designed to enable juveniles to escape "blind alley" occupations; (*b*) those who have the opportunity of "earning and learning" at the same time. The numbers of students provided by these two categories are relatively small at present, though persistent. There remains the type of juvenile who regards organized education as finished when the wage-earning period commences and moreover does not enter a club, church or social organization of any kind; the Education Act of 1918 brought these juveniles under continuous educational control until they reached 18 years; at the present time they are free and a potential menace to progress.

In London an endeavour has been made to entice these juveniles (who incidentally are in danger of permanent blind alley occupation) into a special type of evening institute where the instruction is just that which makes an appeal to boys whose daily occupations are of a routine or repetitive kind. The subjects offered in these institutes are mainly practical, *e.g.*, woodwork, metal work, boot-repairing, hobbies, physical exercises and boxing, drawing and painting; the amenities of club life are also available. Similar provision has been made for the corresponding type of girls in the (free) women's evening institutes. There has been a very marked tendency in recent years to increase and widen the scope of the teaching in the evening schools, this applies to both vocational and nonvocational instruction; the former has been greatly encouraged by various well-known examining bodies while the latter has received invaluable support from the L.E.A.'s and the adult education movement which has succeeded, especially after World War I, in reaching types of students who have hitherto shown little desire to pursue any form of cultural study.

Co-operation with Employers and Outside Bodies.—Employers are now attaching more importance to "further education" and are either co-operating effectively with the L.E.A.'s or maintaining their own works schools and classes; this co-operation is no longer confined to the better known occupations (*e.g.* engineering, building, commerce, printing, etc.) but is being extended to such occupations as the distributing and outfitting trades, grocery and meat trades, laundries, milk shops, etc. The readiness with which employers are prepared to serve on advisory and consultative education committees is also indicative of an awakened interest. Co-operation between L.E.A.'s and the Boy Scouts' association, Girl Guides, Church Lads' brigade, Juvenile advisory committees, Juvenile organization committees, Toc H and organizations of this kind is doing much to ensure that the work begun in the day elementary schools is carried to a more profitable stage in the day continuation and evening schools, and eventually into the polytechnics, higher commercial schools and schools of art.

The aim of "further education" at the present time is to make a provision which recognizes the facts that hours of labour are not so long as formerly and that the work itself has become more tedious and monotonous owing to improvements in mechanical methods and appliances. The general tendency therefore is in the direction of securing that form of co-operation between employers, social agencies and educational bodies by which the increased leisure time of the workers may be occupied more happily and, at the same time, technical skill in daily occupations so developed as to improve the workers' own economic position *pari passu* with the industry in which they are engaged. (B. I.)

UNITED STATES

In the United States continuation (or compulsory part-time) schools are found in more than half the states, the age of required attendance reaching 17 or 18 in several states, as New York, California and Wisconsin. Generally, however, four to six hours of daytime attendance per week are required for all employed young persons between 14 and 16 years of age. The first state to establish compulsory continuation schools was Wisconsin (1909). Before 1915 Massachusetts and New York had enacted legislation permitting any community to require such attendance. All other state legislation has been enacted after 1915, and its application very generally is state-wide, leaving no option to local areas.

U.S. interest in continuation schools derives from several sources. As far back as the middle of the 19th century the decay of apprenticeship as a means of superior technical training led to the foundation of "Mechanics' Institutes" in many cities. These inspired the extensive establishment of public evening classes, especially in industrial centres. But evening classes, valuable as they might be for young adults, seemed poorly adapted for juvenile workers.

Investigations made in Massachusetts (1905), New York (1919) and elsewhere very generally indicated: (*a*) excessive withdrawal from schools of poorly equipped juvenile workers between 14 and 16 years of age; (*b*) unsuitability of evening classes for their needs, and (*c*) possibilities of either full-time or part-time training, for industrial pursuits or for still much needed general education of part-time day attendants. The successful examples of Bavaria, Saxony, Baden and Scotland in providing such schools were carefully studied. The passage of the (English) Education Act of 1918 served as an additional stimulus.

Continuation schools are generally administered by city and town school authorities, but with fairly close state and some federal supervision because of the fact that relatively large proportions of their support derive, not from local funds, but from state and (under the Smith-Hughes act) federal sources. A few cities (notably Boston, Milwaukee, New York and Newark) have established central schools exclusively for continuation-school pupils. In some cases classes are maintained in commercial or industrial establishments employing large numbers of workers within the required attendance age.

The difficulty of providing competent teachers for continuation schools has heretofore prevented the public from having anything like a full realization of their possible benefits. Classes or groups formed in continuation schools are necessarily more heterogeneous than are classes in ordinary public schools. Each teacher must meet from 150 to 300 pupils per week, with a consequent dispersion of personal contact and impairment of understanding. Theoretically the subjects taught should be very differently organized from subjects of similar names in ordinary public schools.

The problems of appropriate curricula have been found still more complicated. Doubtless many of the earlier supporters of compulsory part-time schools believed that these schools would solve the problems of vocational training. In practice they have done so only in a limited number of instances. At best these schools have been found very efficacious in making more real and significant such kinds of general education as pupils had already had, and also in keeping them in touch with school procedures in such ways that many have returned to full-time schools.

Authorities still differ as to the actual educational functions that should be made the primary objectives of continuation schools. One group favours a considerable range of studies, even though profound learning is not practicable within the limits of the time available. Another group favours concentration on the part of individual pupils according to bent, outside employment, prospects and the like. In the meantime, minority groups of dissatisfied employers or parents in certain states have made many attempts to repeal the legislation establishing continuation schools. In practically no instance have these attempts succeeded. It is reasonable to assume that continuation school education has been adopted as an integral and important part of the U.S. public school system.

CONTINUED FRACTIONS. A continued fraction is obtained from a sequence of ordinary fractions a_1/b_1, a_2/b_2, a_3/b_3, $\cdots$, called partial quotients, by adding each fraction to the denominator of the preceding fraction of the sequence, thus

$$\cfrac{a_1}{b_1+\cfrac{a_2}{b_2+\cfrac{a_3}{b_3+\ddots}}}.$$

To this may be added a number b_0. The partial numerators a_p and partial denominators b_p may be any real or complex numbers. The continued fraction may terminate, or there may be infinitely many partial quotients. The ordinary fractions

$$\frac{A_0}{B_0}=\frac{b_0}{1},\quad \frac{A_1}{B_1}=\frac{b_0b_1+a_1}{b_1},\quad \frac{A_2}{B_2}=\frac{b_0b_1b_2+a_1b_2+a_2b_0}{b_1b_2+a_2},\ \cdots,$$

obtained by cutting off the continued fraction with the successive partial quotients are called the approximants. These may be computed by means of the fundamental recurrence formulas

$$\begin{matrix} A_p=b_pA_{p-1}+a_pA_{p-2}, \\ B_p=b_pB_{p-1}+a_pB_{p-2}, \end{matrix}\quad p=2, 3, 4, \cdots,$$

starting with the initial values $A_0=b_0$, $A_1=b_0b_1+a_1$, $B_0=1$, $B_1=b_1$. If the denominators B_p are different from zero from and after some value of p, and the sequence of approximants converges to a finite limit V, then the continued fraction is said to converge, and V is called its value. Otherwise the continued fraction is said to be divergent, and is assigned no value.

Continued fractions occupy an important place in mathematics because of their interesting properties and their connections with many different branches of science: number theory, theory of equations, probability, summability, theory of integration, infinite matrices and the theory of functions. They find applications in the physical sciences, for instance in the theory of electrical networks and in certain problems in dynamics. Some questions relating to convergence and divergence of continued fractions will be discussed first and then some of the above-mentioned connections described.

Convergence and Divergence.—It is easily seen that the values of the approximants of the continued fraction are unchanged if a_p and b_p are replaced by $c_{p-1}c_pa_p$ and c_pb_p, respectively, $(p=1, 2, 3, \cdots)$, where $c_0=1$, and $c_1, c_2, c_3, \cdots$ are any numbers not zero. This is called an equivalence transformation. If the a_p are different from zero, the c_p can always be chosen so that the transformed continued fraction will have all its partial numerators equal to unity. Similarly, if the b_p are different from zero, the continued fraction is equivalent to another whose partial denominators are all equal to unity. Thus, most continued fractions can be written in the forms

$$\text{(A)}\quad b_0+\cfrac{1}{b_1+\cfrac{1}{b_2+\cfrac{1}{b_3+\cdots}}}\quad\text{and}\quad\text{(B)}\quad b_0+\cfrac{a_1}{1+\cfrac{a_2}{1+\cfrac{a_3}{1+\cdots}}}.$$

If the denominators B_p of the continued fraction are different from zero, then the continued fraction is equivalent, in a certain sense, to the infinite series

$$\frac{A_0}{B_0}+\sum_{p=1}^{\infty}\left(\frac{A_p}{B_p}-\frac{A_{p-1}}{B_{p-1}}\right).$$

In fact, the sum of the first n terms of this series is precisely the nth approximant of the continued fraction. If the series converges, its sum is the value of the continued fraction, and if the series diverges, the continued fraction diverges. The general term of the series is equal to $(-1)^{p-1}a_1a_2\cdots a_p/B_pB_{p-1}$. This is an immediate consequence of the determinant formula

$$A_pB_{p-1}-A_{p-1}B_p=(-1)^{p-1}a_1a_2\cdots a_p,$$

which one may readily obtain from the fundamental recurrence formulas. By way of illustration, consider the so-called simple continued fraction, which is of the form (A) where b_0 is an integer, and $b_1, b_2, b_3, \cdots$ are positive integers. Then, $B_0=1$, $B_1=b_1$, $B_2=b_1b_2+1$, $\cdots$ are positive integers, and $B_0\leqq B_1<B_2<B_3<\cdots$. The above series is now $b_0+\Sigma_{p=1}^{\infty}(-1)^{p-1}/B_pB_{p-1}$. This is an alternating series in which the terms decrease numerically to zero, and is therefore convergent. Hence the simple continued fraction is convergent. If V is its value, then the alternating character of the series shows that the even approximants increase to the limit V, the odd approximants decrease to the limit V, and

$$\left|V-\frac{A_n}{B_n}\right|\leqq\frac{1}{B_nB_{n+1}}<\frac{1}{B_n^2}.$$

If the b_p are arbitrary numbers such that the series $\Sigma|b_p|$ converges, then (A) is divergent. Thus, a necessary condition for (A) to converge is that the series $\Sigma|b_p|$ diverge. This condition is sufficient only when the b_p are subject to certain restrictions, *e.g.*, if the b_p are real and positive, or if $b_1\neq 0$ and $0<c\leqq\arg b_p\leqq\pi-c$, $p=1, 2, 3, \cdots$, where c is a positive constant. One may easily verify that if $b_p=(-1)^{p+1}$, then (A) is divergent although the series $\Sigma|b_p|$ diverges.

The continued fraction (B) converges if $|a_p|\leqq 1/4$, $p=2, 3, 4, \cdots$. On the other hand, it is divergent if $a_p=-1/4-c$, $p=2, 3, \cdots$, $a_1\neq 0$, where c is any positive constant. For convenience, let $b_0=0$ and $a_1=1$ in (A). In the plane of the complex variable $z=x+iy$, draw the parabola whose equation is $y^2=x+1/4$. If $a_2, a_3, a_4, \cdots$ are in any bounded portion of the region contained in this parabola, then the continued fraction converges, and its value is in the circle whose equation is $x^2-2x+y^2=0$. The statement is no longer true if either the circle is replaced by a smaller region, or the parabolic region is replaced by a larger region which is symmetrical with respect to the x-axis.

These statements may perhaps serve to indicate some of the remarkable convergence properties of continued fractions.

The Arithmetic Theory.—It has been shown that the simple continued fraction is always convergent. Every real number has a simple continued fraction expansion, which terminates if and only if the number is rational. To obtain the expansion of a rational fraction, one uses the familiar Euclidean algorithm for the greatest common divisor. For example, $31/17=1+14/17$, $17/14=1+3/14$, $14/3=4+2/3$, $3/2=1+1/2$, so that

$$\frac{31}{17}=1+\cfrac{1}{1+\cfrac{1}{4+\cfrac{1}{1+\cfrac{1}{2}}}}.$$

To expand an irrational number w, put $w=b_0+w_1$, where b_0 is the largest integer less than w, so that $0<w_1<1$. Then put $1/w_1=b_1+w_2$, where b_1 is the largest integer less than $1/w_1$, so that $0<w_2<1$. On continuing this process one obtains step by step the simple continued fraction expansion (A) for the number w. For example, if $w=\sqrt{7}$, we find that $w_1=\sqrt{7}-2$, $w_2=(\sqrt{7}-1)/3$, $w_3=(\sqrt{7}-1)/2$, $w_4=(\sqrt{7}-2)/3$, $w_5=\sqrt{7}-2=w_1$. Therefore, $b_0=2$, $b_1=1$, $b_2=1$, $b_3=1$, $b_4=4$, $b_5=1$, $\cdots$. The partial denominators run 1, 1, 1, 4, 1, 1, 1, 4, 1, 1, 1, 4, $\cdots$, repeating in blocks of four. Thus, the continued fraction is periodic. It can be shown that every quadratic surd has a periodic expansion, and that every periodic simple continued fraction is equal to a quadratic surd. From the above example one finds the following approximations to $\sqrt{7}$: $2/1$, $3/1$, $5/2$, $8/3$, $37/14$, $45/17$, $\cdots$. These fractions are alternately less than and greater than $\sqrt{7}$. It is easy to obtain the value of a periodic continued fraction. For example, let $b_0=1$, $b_p=2$, $p=1, 2, 3, \cdots$. Then if v is the value, we must have $(v+1)=2+1/(v+1)$, $(v+1)^2-2(v+1)-1=0$, $v=\pm\sqrt{2}$. Since v cannot be negative, then $v=\sqrt{2}$.

The rational approximants for $\sqrt{N}$ obtained from the simple continued fraction have interesting geometrical properties. Consider the equation $x^2-Ny^2=h$, where h is an integer. This may be written in the form $(x/y)-\sqrt{N}=h/[(x/y)+\sqrt{N}]y^2$. If $x=A_n$ and $y=B_n$, the left-hand member of this equality is less in absolute value than $1/y^2$, and therefore $|h|<(A_n/B_n)+\sqrt{N}$, so that $|h|\leqq 2\sqrt{N}$. This shows that if one substitutes $x=A_n$ and $y=B_n$ in the expression x^2-Ny^2, and lets $n=0, 1, 2, \cdots$, then this expression can take on but a finite number of different values. Geometrically, this means that there are a finite number of hyperbolas all having the line $x-\sqrt{N}y=0$ as asymptote, such that for every n the point with co-ordinates (A_n, B_n) lies on one of them. If $N=7$, the first six of these points are (*vide supra*) (2,1), (3,1), (5,2), (8,3), (37,14), (45,17). There are in this case three hyperbolas, namely $x^2-7y^2=1$, $x^2-7y^2=2$, $x^2-7y^2=-3$. The equation $x^2-Ny^2=1$ is called Pell's equation. It can be shown that every solution in positive integers of Pell's equation is of the form $x=A_n$, $y=B_n$, where A_n/B_n is the nth approximant of the simple continued fraction for $\sqrt{N}$.

Irrational numbers which are not quadratic surds have infinite nonperiodic simple continued fractions. For example, in the simple continued fraction for $e=2.71828\cdots$, $b_0=2$, and $b_1, b_2, b_3, \cdots$ are 1, 2, 1, 1, 4, 1, 1, 6, 1, 1, 8, $\cdots$. In the case of $\pi=3.14159\cdots$, $b_0=3$, and $b_1, b_2, b_3, \cdots$ are 7, 15, 1, 292, 1, 1, 1, 2, $\cdots$, where the law of formation is not known. The numbers e and π have been proved transcendental, *i.e.*, they are not roots of algebraic equations with integral coefficients. Historically, the first proof of the existence of transcendental numbers was given by Joseph Liouville by means of continued fractions. He showed that if for every positive integer n an index k can be found such that $b_{k+1}>B^n$, then the simple continued fraction is equal to a transcendental number. One could, for instance, take $b_{k+1}=1+B_k^k$, $k=0, 1, 2, \cdots$.

The first half of the book of O. Perron, *Die Lehre von den Kettenbrüchen* (Leipzig and Berlin, 1929) is devoted to the arithmetic theory of continued fractions.

The Analytic Theory.—The most important continued fractions in the analytic theory are

$$\text{(C)}\quad \cfrac{1}{b_1+z-\cfrac{a_1^2}{b_2+z-\cfrac{a_2^2}{b_3+z-\cdots}}} \quad\text{and (D)}\quad \cfrac{1}{k_1z+\cfrac{1}{k_2+\cfrac{1}{k_3z+\cfrac{1}{k_4+\cdots}}}}.$$

Here the a_p and k_p are constants not zero, the b_p are constants, and z is a complex variable; (C) is called a Jacobi-fraction or J-fraction, and (D) is called a Stieltjes-fraction or S-fraction. The J-fraction is closely related to the Jacobi-matrix or J-matrix, which is the infinite matrix of coefficients of the system of equations

$$-a_px_p+(b_p+z)x_{p+1}-a_{p+1}x_{p+2}=0,\quad p=0, 1, 2, \cdots, (a_0=0).$$

The notation is chosen in (C) in such a way as to avoid square roots in the coefficients in this matrix. The theory of the J-fraction may be regarded as a part of David Hilbert's theory of infinite matrices and quadratic forms in infinitely many variables.

T. J. Stieltjes used the continued fraction (D), with the k_p real and positive, to solve his celebrated moment problem. Let $x_1, x_2, x_3, \cdots$ be an increasing sequence of points along the positive half of the x-axis, and let m_p be a positive mass concentrated at x_p. If the sums $c_p=\Sigma_{k=1}^{\infty} x_k^p m_k$, $p=0, 1, 2, \cdots$, are finite, they are called the moments of the distribution of mass. The Stieltjes moment problem is the problem of determining a distribution of mass which will have preassigned moments $c_0, c_1, c_2, \cdots$. Stieltjes found that the problem has a solution if and only if the formal power series $\Sigma_{p=0}^{\infty}(-1)^pc_p/z^{p+1}$ has an S-fraction expansion (D) in which the k_p are positive. He then constructed from the S-fraction by successive approximation a system of masses having the given moments. He had to permit continuous as well as discontinuous distributions of mass. Moreover, there is just one solution of the moment problem if the series Σk_p diverges. In this case, the S-fraction converges to a function of the form $\int_0^{\infty}dm(u)/(z+u)$. The function $m(u)$ then gives the distribution of mass, and $c_p=\int_0^{\infty}u^pdm(u)$, $p=0, 1, 2, \cdots$. If the series Σk_p converges, then the problem has infinitely many different solutions.

This moment problem has been extended and applied in various directions. For instance, the ideas of Stieltjes are in the background of Hilbert's famous theory of quadratic forms in infinitely many variables; they were used by Felix Hausdorff in his method of summing divergent series; and T. Carleman applied the theory to prove the fundamental theorems on quasi-analytic functions. The more general problem in which a distribution of mass is allowed along the entire real axis has been solved by means of J-fractions.

An important role of the continued fraction is to serve as an intermediary between a divergent power series and a definite integral. Whenever the power series has a J-fraction or S-fraction expansion of suitable type, then it is necessarily asymptotically equal to one or more definite integrals of the form $\int_{-\infty}^{+\infty}dm(u)/(z+u)$. Consider, for example, the totally divergent series $\Sigma_{p=0}^{\infty}(-1)^pp!/z^{p+1}$. This has the S-fraction expansion (D) in which $k_1=1$, $k_2=1$, $k_3=1$, $k_4=1/2$, $k_5=1/3$, $k_6=1/4$, $\cdots$. This S-fraction converges, and its value is $\int_0^{\infty}e^{-u}du/(z+u)$, a function which may be regarded as the "sum" of the divergent series. In a comprehensive class of problems the continued fraction can be used in this way to connect divergent series with definite integrals. Continued fractions are used to construct electrical networks which will have preassigned properties embodied in a given function. If this function is expanded into a continued fraction the characteristics of the required network can be read off immediately.

In certain problems of stability of dynamical systems it is important to have a simple algorithm for deciding whether or not all the zeros of a polynomial $p(z)=z^n+a_1z^{n-1}+a_2z^{n-2}+\cdots$ have negative real parts. In case the coefficients a_p are real, it is only necessary to expand $Q(z)/P(z)$, where $Q(z)=a_1z^{n-1}+a_3z^{n-3}+a_5z^{n-5}+\ldots$, into a continued fraction of the form

$$\cfrac{1}{c_1z+1+\cfrac{1}{c_2z+\cfrac{1}{c_3z+\begin{matrix}\cdot\\ \cdot\\ \cdot\end{matrix}\; +\cfrac{1}{c_nz}}}}.$$

The required criterion is that the c_p be all positive. This expansion can be obtained by ordinary long division. If k of the c_p are positive and $n-k$ are negative, then k of the zeros of the polynomial have negative real parts and $n-k$ have positive real parts. This algorithm may be modified to cover polynomials with arbitrary complex coefficients.

Continued fractions are often useful in computing values of functions. For example, perhaps the best way to compute values of the integral $\int_0^a e^{-x^2}dx$ is to use the expansion $\sqrt{\pi}/2-e^{-a^2}K$, where K is the continued fraction in which $b_0=0$, the sequence of partial numerators is $1, 1, 2, 3, 4, 5, \cdots$, and the sequence of partial denominators is $2a, a, 2a, a, 2a, a, \cdots$. Karl F. Gauss obtained a continued fraction expansion for the quotient $F(a, b+1, c+1; z)/F(a, b, c; z)$ of contiguous hypergeometric functions. By specializing the parameters a, b, c one may obtain expansions for many particular functions.

It is natural to ask whether or not it is possible to express, in a simple way, the sum, difference, product or quotient of two continued fractions as a continued fraction. The answer is in the negative. The operations of differentiation and integration are not suited to continued fractions. Thus, one is denied the use of these familiar operations of analysis. The operations which can be performed stem from the fact that a continued fraction is essentially the symbolic product of infinitely many linear fractional transformations in the complex plane. It may also be regarded as arising from a single linear transformation in the space of infinitely many variables. From the first point of view, the continued fraction theory becomes a part of the theory of Möbius transformations; while from the second point of view, it becomes a part of the theory of infinite matrices and of quadratic forms in infinitely many variables.

Bibliography.—The one existing treatise on continued fractions is the book of O. Perron, *Die Lehre von den Kettenbrüchen* (Leipzig and Berlin, 1929, and an earlier edition of 1913). Several treatises on algebra have chapters on continued fractions. E. B. Van Vleck, *Selected Topics in the Theory of Divergent Series and of Continued Fractions* (1905) contains an introduction to the analytic theory, and an extensive bibliography. The celebrated memoir of T. J. Stieltjes, "Recherches sur les Fractions Continues," *Oeuvres*, vol. 2, pp. 407–566 (1894), ranks among the most important mathematical papers of modern times. A large number of papers on continued fractions have appeared in the mathematical journals, especially in the periods from 1920–23 and from 1940–45. (H. S. Wl.)

CONTINUITY. The mathematical concept of continuity has been made completely clear and unambiguous only in comparatively recent times. It is a pertinent concept in geometry and in the theory of functions, and so enters into their applications to the physical world. Intuitively, an entity is regarded as continuous if it is unbroken, that is, has no gaps. Physical space and time are commonly considered as continuous. On the other hand matter is discrete, that is, it is made up of particles which are separated in space. However, for convenience matter is frequently treated as if it were continuous, when this gives a sufficiently close approximation to the observed facts.

More precise definitions follow. In geometry, a straight line is said to be continuous in case: (1) between every two points on the line there is a third point on the line, and (2) whenever the line is separated into two pieces there is always an extreme point on one of the pieces which may be taken to define the separation. This property of the straight line is an assumption or postulate, and geometric systems have been studied in which it is absent. The continuity property of the real number system consists of two corresponding parts: (1) between every two real numbers there is a third real number, and (2) if the real numbers are separated into two subclasses A and B such that every number in A is less than every number in B, then either A contains a greatest number, or else B contains a least number. For the real numbers this property may be proved. Thus the possibility of setting up a correspondence between the real numbers and the points on a line, such as lies at the basis of analytic geometry, depends on the continuity postulate in geometry. The rational numbers do not form a continuous system according to the definition above, since for example if A consists of all negative rational numbers, and all positive rational numbers whose squares are less than two, and if B consists of the remaining rational numbers, then A contains no greatest number, and B contains no least.

A function $f(x)$ is said to be continuous at a point c in case it has a value at c, and $f(x)$ approaches $f(c)$ when x approaches c. (*See* LIMIT, and also FUNCTION.) A function is continuous in a domain if it is continuous at every point of the domain. A continuous curve in a plane in which an xy-co-ordinate system has been set up consists of the points given by two continuous functions $x=f(t)$, $y=g(t)$ of a real variable t on an interval $a \leqq t \leqq b$. In topology the notion of continuous curve is used in a somewhat different sense. (*See* TOPOLOGY.)

See E. W. Hobson, *Theory of Functions of Real Variables,* vol. i, (3rd ed., 1927); Pierpont, *Theory of Functions of Real Variables,* vol. i, (1905). (L. M. G.)

CONTINUO (BASSO CONTINUO): *see* FIGURED BASS.

CONTINUOUS VOYAGE: *see* CONTRABAND; NEUTRALITY.

CONTINUOUS WAVES, in radio communication, alternating electric waves in space, of constant amplitude and frequency. They are produced by certain types of radio transmitting sets, the waves being made the "carrier" of the desired intelligence by modulating them by an appropriate method.

CONTOUR, CONTOUR LINE, a line drawn upon a map through all the points upon the surface represented that are of equal height above sea level. The word is French and means generally "outline," from the med. Lat. *contornare,* to round off. The points mentioned lie upon a horizontal plane at a given elevation passing through the land shown on the map, and the contour line is the intersection of that horizontal plane with the surface of the ground. The contour line of O, or *datum level,* is the coastal boundary of any land form. If the sea be imagined as rising 100 ft. a new coastline with bays and estuaries indented in the valleys would appear at the new sea level. If the sea sank again to its former level the 100 ft. contour would be represented by the beach mark made when the sea was 100 ft. higher. If instead of receding the sea rose continuously at 100 ft. per day a series of levels 100 ft. above one another would be marked daily upon the land until at last the highest mountain peaks appeared as islands less than 100 ft. high. A record of this series of advances marked upon a flat map of the original country would give a series of contour lines at 100 ft. intervals. Contour lines of this character, at varying intervals according to the scale of the map, are marked on most maps that indicate topographical features.

CONTRABAND, a term denoting commodities the import or export of which is prohibited by law. With the development of neutrality (*q.v.*) it was extended to those commodities which the subjects of neutral states were forbidden to supply to belligerents. These became known as "contraband of war." Under the British system contraband has been defined as "neutral property found on board ship either on the high seas, or in the territorial waters of either belligerent, which is by nature capable of being used to assist in, and is on its way to assist in, the naval or military operations of the enemy" (see *Parl. Pap.* 1909 [Cd. 4,554] p. 3). Speaking on this point in the house of commons as long ago as 1801 Sir William Grant, then solicitor general, declared that the distinction of contraband was artificial; there was no such distinction; all articles designed for and conducive to the advantage of the enemy were inadmissible to be freely conveyed and therefore contraband. Nevertheless, a distinction was drawn by Great Britain, adopting the classification propounded by Grotius, viz.:—(1) absolute contraband, *i.e.,* articles primarily adapted and used for purposes of war, *e.g.,* arms, ammunition and materials for making the same, articles of military equipment, military and naval stores and the like; (2) conditional and occasional contraband, *i.e.,* articles *ancipitis usus,* capable of use in peace or war, *e.g.,* provisions, money, railway and transport material, horses, hay, hemp and the like; such articles were only to be liable to seizure and condemnation if shown to be destined for the naval or military forces of the enemy or for a place of naval or military equipment belonging to or occupied by him. In declarations notifying neutrals, the crown was entitled to extend or reduce the lists of both absolute and conditional contraband, subject to any restriction by treaty or international law.

The harshness of the doctrine of conditional contraband was in practice mitigated by the British practice of pre-emption.

With this view the United States and Japan substantially agreed. Continental opinion, on the other hand, was opposed to the doctrine of conditional contraband and sought to restrict contraband to articles of immediate warlike use. In practice, however, many continental powers when belligerents enforced rules of contraband even more severe than those under the British system. France, for instance, in her war with China in 1885 declared rice bound for ports north of Canton absolute contraband although Great Britain refused to recognize this unless the rice was destined to a place of naval or military equipment (see *Parl. Pap.* 1885 [Cd. 4,359]). Spain in the Spanish-American War of 1898 claimed to include anything which the government might determine as contraband; whilst Russia in the Russo-Japanese War of 1904 declared foodstuffs, fuel and raw cotton to be absolute contraband whether bound for a military destination or not (see *Parl. Pap.* 1900 [Cd. 2,348]). Seizures under this declaration aroused strong remonstrances from both Great Britain and the United States which led to some revision whereby articles unless consigned to the belligerent government or its administration, or to its armed forces, fortresses or naval ports, or consigned to agents or contractors for the naval or military authorities, were exempt from capture.

In consequence of these differences of opinion and of practice, not only between different states but also in the practice of the same state at different times, according to whether it was neutral or belligerent, an attempt, which proved abortive, was made at The Hague Peace Conference of 1907 to settle the vexed distinction between absolute and conditional contraband. Ultimately at the London Conference of 1908–09 after much discussion and many compromises an agreement found expression in the declaration of London. Three lists of articles were drawn up. By art. 22 the articles therein described, viz., articles exclusively used in war, such as arms, etc., and some articles also used in peace, such as horses, might without notice be treated as absolute contraband. By art. 23 articles exclusively used in war might be added to this list by declaration followed by notification to the powers. By art. 24 articles *ancipitis usus,* such as foodstuffs, fodder, clothing, money, vehicles, vessels, railway material, aircraft, fuel, powder and explosives not specially prepared for use in war, barbed wire, horseshoes, harness, field-glasses and nautical instruments, might be treated as conditional contraband if shown to be destined to (1) the armed forces of the enemy, or (2) a government department, *i.e.,* either to enemy officials or to a contractor in the enemy territory who notoriously supplies articles of this kind to the enemy, or (3) to a fortified place belonging to the enemy or to any other place serving as a base of operations. The latter phrase was, as Pitt Cobbett suggested it might be, interpreted by Germany in World War I to mean "a base of supply." By Arts. 33 and 36 where a belligerent had no seaboard, conditional contraband was liable to capture even though bound for a neutral port, if shown to be destined for the use of the armed forces or of a Government department. With this exception "the doctrine of continuous voyage" was wholly excluded in the case of conditional contraband, although by Art. 30 absolute contraband was liable to capture if destined to the territory belonging to or occupied by the enemy or his armed forces, and this whether directly or by transhipment or by subsequent land transport. By Art. 27 articles not susceptible of use in war might not be declared contraband of war, and by Arts. 28 and 29 the articles therein described might not be declared contraband of war, including raw cotton, wool, silk, jute, flax, hemp and other raw materials of the textile industries and yarns of the same, rubber, metallic ores, paper, soap and articles serving exclusively to aid the sick and wounded. By Art. 37 a vessel carrying contraband with a hostile destination was liable to capture and condemnation throughout the whole of her voyage, but by Art. 38 this liability ceased with the deposit of the goods. By Art. 39 the contraband itself was liable to condemnation, but by Art. 40 the vessel was only liable to condemnation if the contraband amounted to more than one-half of the cargo. If the contraband were less than one-half, the vessel by Art. 41 was only liable to the costs and expenses incurred by the captor. By Art. 42 all other goods belonging to the owner of the contraband were liable to condemnation. Where the vessel was ignorant of the outbreak of war or of some declaration adding to or altering the existing lists, Art. 43 gave the captor the right of pre-emption of such part of the cargo as was contraband. With some notable exceptions these provisions were in substantial agreement with Anglo-American doctrines and practice. It was these exceptions which caused the House of Lords to refuse to ratify the Declaration. Nevertheless upon the outbreak of the World War the Declaration was adopted by all the belligerents, but with important modifications. As, however, the war progressed the list of conditional contraband became merged in that of absolute contraband and the "free list" practically disappeared. Germany was the first to declare cotton absolute contraband. Rubber was declared absolute contraband by Great Britain in Oct. 1914. Foodstuffs, however, remained in the British and German lists as conditional contraband. But with the application of the doctrine of continuous voyage by the Allies, and the treatment of every Allied port by Germany as a base of supplies, continued adherence to this provision of the Declaration became impracticable. Accordingly by the British and French Orders of July 7, 1916, the Declaration was formally abandoned and all commodities directly or indirectly of use to the enemy in the prosecution of the war were declared absolute contraband. Another innovation was the rejection by the British Prize Courts of the old rule which excluded the captor's evidence. Evidence "out of the ship's mouth," *i.e.*, the evidence supplied by the ship's papers, was found in modern conditions to be insufficient. In lieu of this it has been suggested that the system embodied in the treaty between Great Britain and Sweden of 1661, whereby the ship's papers should be officially certified at the port of export, should be substituted. But whilst it would protect the normal trade of a neutral, it would also protect an abnormal trade. Belligerents cannot be expected to permit neutrals to carry on an abnormal trade which is of direct assistance to the enemy and helps to prolong the war. Just as neutrals are entitled to supply either belligerent with all commodities at their own risk, so either belligerent may prevent such commodities reaching the other by blockade and the application of the doctrine of continuous voyage. The right to declare any article of direct or indirect use to the enemy in the prosecution of the war appears to some to be a naval weapon conferring upon a belligerent the right to starve the civilian population. It was so regarded by Germany, and the German jurist, Dr. Sieveking, accepts the doctrine that the distress of the civil population is a legitimate and indeed the chief weapon of a modern belligerent. But it is conceived that the chief aim of Great Britain was not to starve the civilian population. It was a return to her old principle stated at the head of this article, viz., to prevent commodities which would be of use in the prosecution of the war from reaching the enemy. A belligerent will no more allow, for instance, jute and cotton from which high explosives may be manufactured to reach the enemy in the future than he allowed hemp and timber in the past. "In view of present conditions of both war and commerce," writes the American Charles Cheney Hyde, "a belligerent should enjoy the right to intercept and condemn all articles capable of assisting the enemy, even though consigned to neutral territory, if shown to be ultimately destined by land or sea to the domain of the enemy, and that irrespective of the final destination of ships which bear them on their way towards an intervening port." (H. H. L. B.)

CONTRACEPTION: *see* BIRTH CONTROL.

CONTRACT, the legal term for a bargain or agreement; some writers, following the Indian Contract Act, confine the term to agreements enforceable by law: this, though not yet universally adopted, seems an improvement. Enforcement of good faith in matters of bargain and promise is among the most important functions of legal justice. It might not be too much to say that, next after keeping the peace and securing property against violence and fraud so that business may be possible, it is the most important. Yet we shall find that the importance of contract is developed comparatively late in the history of law. The commonwealth needs elaborate rules about contracts only when it is advanced enough in civilization and trade to have an elaborate system of credit. The Roman law of the empire dealt with contract, indeed, in a fairly adequate manner, though it never had a complete or uniform theory; and the Roman law, as settled by Justinian, appears to have satisfied the Eastern empire long after the Western nations had begun to recast their institutions, and the traders of the Mediterranean had struck out a cosmopolitan body of rules and custom known as the Law Merchant, which claimed acceptance in the name neither of Justinian nor of the Church, but of universal reason. It was amply proved afterwards that the foundations of the Roman system were strong enough to carry the fabric of modern legislation. But the collapse of the Roman power in western Christendom threw society back into chaos.

In this condition of legal ideas, which it would be absurd to call jurisprudence, the general duty of keeping faith is not recognized except as a matter of religious or social observance. Those who desire to be assured of anything that lies in promise must exact an oath, or a pledge, or personal sureties; and even then the court of their people—in England the Hundred Court in the first instance—will do nothing for them in the first case, and not much in the two latter. Probably the settlement of a blood-feud, with provisions for the payment of the fine by instalments, was the nearest approach to a continuing contract, as we now understand the term, which the experience of Germanic antiquity could furnish. It is also probable that the performance of such undertakings, as it concerned the general peace, was at an early time regarded as material to the commonweal; and that these covenants of peace, rather than the rudimentary selling and bartering of their day, first caused our Germanic ancestors to realize the importance of putting some promises at any rate under public sanction. The history of the law, and even the present form of much law still common to almost all the English-speaking world, can be understood only when we bear in mind that our forefathers did not start from any general conception of the State's duty to enforce private agreements, but, on the contrary, the State's powers and functions in this regard were extended gradually, unsystematically, and by shifts and devices of ingenious suitors and counsel, aided by judges, rather than by any direct provisions of princes and rulers. Money debts, it is true, were recoverable from an early time. But this was not because the debtor had promised to repay the loan; it was because the money was deemed still to belong to the creditor, as if the identical coins were merely in the debtor's custody. The creditor sued to recover money, for centuries after the Norman Conquest, in exactly the same form which he would have used to demand possession of land; the action of debt closely resembled the "real actions," and, like them, might be finally determined by a judicial combat; and down to Blackstone's time the creditor was said to have a property in the debt—property which the debtor had "granted" him. Giving credit, in this way of thinking, is not reliance on the right to call hereafter for an act, the payment of so much current money or its equivalent, to be performed by the debtor, but merely suspension of the immediate right to possess one's own particular money, as the owner of a house let for a term suspends his right to occupy it. This was no road to the modern doctrine of contract, and the passage had to be made another way.

In fact the old action of debt covered part of the ground of contract only by accident. It was really an action to recover any property that was not land; for the remedy of a dispossessed owner of chattels, afterwards known as detinue, was only a slightly varying form of it. If the property claimed was a certain sum of money, it might be due because the defendant had received money on loan, or because he had received goods of which the agreed price remained unpaid; or, in later times at any rate, because he had become liable in some way by judgment, statute or other authority of law, to pay a fine or fixed penalty to the plaintiff. Here the person recovering might be as considerable as the lord of a manor, or as mean as a "common informer"; the principle was the same. In every case outside this last class, that is to say, whenever there was a debt in the popular sense of the word, it had to be shown that the defendant had actually received the money or goods; this value received came to be called *quid pro quo*—a term unknown, to all appearance, out of England. Nevertheless the foundation of the plaintiff's right was not bargain or promise, but the unjust detention by the defendant of the plaintiff's money or goods.

Modes of Proof.—We are not concerned here to trace the change from the ancient method of proof—oath backed by "good suit," *i.e.*, the oaths of an adequate number of friends and neighbours—through the earlier form of jury trial, in which the jury were supposed to know the truth of their own knowledge, to the modern establishment of facts by testimony brought before a jury who are bound to give their verdict according to the evidence. But there was one mode of proof which, after the Norman Conquest, made a material addition to the substantive law. This was the proof by writing, which means writing authenticated by seal. Proof by writing was admitted under Roman influence, but, once admitted, it acquired the character of being conclusive which belonged to all proof in early Germanic procedure. Oath, ordeal and battle were all final in their results. When the process was started there was no room for discussion, though any formal irregularity was fatal. So the sealed writing was final too, and a man could not deny his own deed. We still say that he cannot, but with modern refinements. Thus the deed, being allowed as a solemn and probative document, furnished a means by which a man could bind himself, or rather effectually declare himself bound, to anything not positively forbidden by law. Whoever could afford parchment and the services of a clerk might have the benefit of a "formal contract" in the Roman sense of the term. At this day the form of deed called a bond or "obligation" is, as it stands settled after various experiments, extremely artificial; but it is essentially a solemn admission of liability, though its conclusive stringency has been relaxed by modern legislation and practice in the interest of substantial justice. By this means the performance of all sorts of undertakings, pecuniary and otherwise, could be and was legally secured. Bonds were well known in the 13th century, and from the 14th century onwards were freely used for commercial and other purposes; as for certain limited purposes they still are. The "covenant" of modern draftsmen is a direct promise made by deed; it occurs mainly as incident to conveyances of land. The mediaeval "covenant," *conventio,* was, when we first hear of it, practically equivalent to a lease, and never became a common instrument of miscellaneous contracting, though the old books recognize the possibility of turning it to various uses of which there are examples; nor had it any sensible influence on the later development of the law. On the whole, in the old common law one could do a great deal by deed, but very little without deed. The minor bargains of daily life, so far as they involved mutual credit, were left to the jurisdiction of inferior courts, of the Law Merchant, and—last, not least—of the Church.

Fidei Laesio.—Popular custom, in all European countries, recognized simpler ways of pledging faith than parchment and seal. A handshake was enough to bind a bargain. Whatever secular law might say, the Church said it was an open sin to break plighted faith; a matter, therefore, for spiritual correction, in other words, for compulsion exercised on the defaulter by the bishop's or the archdeacon's court, armed with the power of excommunication. In this way the ecclesiastical courts acquired much business which was, in fact, as secular as that of a modern county court, with the incident profits. Mediaeval courts lived by the suitors' fees. What were the king's judges to do? However high they put their claims in the course of the rivalry between Church and Crown, they could not effectually prohibit the bishop or his official from dealing with matters for which the king's court provided no remedy. Continental jurists had seen their way, starting from the Roman system as it was left by Justinian, to reduce its formalities to a vanishing quantity, and expand their jurisdiction to the full breadth of current usage. English judges could not do this in the 15th century, if they could ever have done so. Nor would simplification of the requisites of a deed, such as has now been introduced in many jurisdictions, have been of much use at a time when only a minority even of well-to-do laymen could write.

There was no principle and no form of action in English law which recognized any general duty of keeping promises. But could not breach of faith by which a party had suffered be treated as some kind of legal wrong? There was a known action of trespass and a known action of deceit, this last of a special kind, mostly for what would now be called abuse of the process of the court; but in the later middle ages it was an admitted remedy for giving a false warranty on a sale of goods. Also there was room for actions "on the case," on facts analogous to those covered by the old writs, though not precisely within their terms. If the king's judges were to capture this important branch of business from the clerical hands which threatened to engross it, the only way was to devise some new form of action on the case. There were signs, moreover, that the court of chancery would not neglect so promising a field if the common law judges left it open.

Assumpsit.—The mere fact of unfulfilled promise was not enough, in the eyes of mediaeval English lawyers, to give a handle to the law. But injury caused by reliance on another man's undertaking was different. The special undertaking or "assumption" creates a duty which is broken by fraudulent or incompetent miscarriage in the performance. I profess to be a skilled farrier, and lame your horse. It is no trespass, because you trusted the horse to me; but it is something like a trespass, and very like a deceit. An action on the case was allowed without much difficulty for such defaults. The next step, and a long one, was to provide for total failure to perform. A builder, instead of doing bad work, does nothing at all within the time agreed upon for completing a house. Can it be said that he has done a wrong? At first the judges felt bound to hold that this was going too far; but suitors anxious to have the benefit of the king's justice persevered, and in the course of the 15th century the new form of action, called *assumpsit* from the statement of the defendant's undertaking on which it was founded, was allowed as a remedy for non-performance as well as for faulty performance. Being an action for damages, and not for a certain amount, it escaped the strict rules of proof which applied to the old action of debt; being in form for a kind of trespass, and thus a privileged appeal to the king to do right for a breach of his peace, it escaped likewise the risk of the defendant clearing himself by oath according to the ancient popular procedure. Hence, as time went on, suitors were emboldened to use "assumpsit" as an alternative for debt, though it had been introduced only for cases where there was no other remedy. By the end of the 16th century they got their way; and it became a settled doctrine that the existence of a debt was enough for the court to presume an undertaking to pay it. The new form of action was made to cover the whole ground of informal contracts, and, by extremely ingenious devices of pleading, developed from the presumption or fiction that a man had promised to pay what he ought, it was extended in time to a great variety of cases where there was in fact no contract at all.

Consideration.—The new system gave no new force to gratuitous promises. For it was assumed, as the foundation of the jurisdiction, that the plaintiff had been induced by the defendant's undertaking, and with the defendant's consent, to alter his position for the worse in some way. He had paid or bound himself to pay money, he had parted with goods, he had spent time in labour, or he had foregone some profit or legal right. If he had not committed himself to anything on the strength of the defendant's promise, he had suffered no damage. To sum up the foregoing in modern language, the plaintiff must have given value of some kind, more or less, for the defendant's undertaking. This something given by the promisee and accepted by the promisor in return for his undertaking is what we now call the *consideration* for the promise. In cases where debt would also lie, it coincides with the old requirement of value received (*quid pro quo*) as a condition of the action of debt being available. But the conception is far wider, for the consideration for a promise need not be anything capable of delivery or possession. It may be money or goods; but it may also be an act or series of acts; further (and this is of the first importance for our modern law), it may itself be a promise to pay money or deliver goods, or to do work, or otherwise to act or not to act in some specified way. Again, it need not be anything which is obviously for the promisor's benefit. His acceptance shows that he set some value on it; but in truth the promisee's burden, and not the promisor's benefit, is material. The last and not strictly logical refinement of holding that, when mutual promises are exchanged between parties, each promise (though by itself of no value) is a consideration for the other and makes it binding, was conclusively accepted only in the 17th century. The result was that promises of mere bounty could no more be enforced than before, but any kind of lawful bargain could; and there is no reason to doubt that this was in substance what most men wanted. Ancient popular usage and feeling show little more encouragement than ancient law itself to merely gratuitous alienation or obligations. Also (subject, till quite modern times, to the general rule of common-law procedure that parties could not be their own witnesses, and subject to various modern statutory requirements in various classes of cases) no particular kind of proof was necessary. The necessity of consideration for the validity of simple contracts was unfortunately confused by commentators, almost from the beginning of its history, with the perfectly different rules of the Roman law about *nudum pactum*, which very few English lawyers took the pains to understand.

The doctrine of consideration is in fact peculiar to those jurisdictions where the common law of England is in force, or is the foundation of the received law, or, as in South Africa, has made large encroachments upon it in practice. Substantially similar results are obtained in other modern systems by professing to enforce all deliberate promises, but imposing stricter conditions of proof where the promise is gratuitous.

As obligations embodied in the solemn form of a deed were thereby made enforceable before the doctrine of consideration was known, so they still remain. When a man has by deed declared himself bound, there is no need to look for any bargain, or even to ask whether the other party has assented. This rugged fragment of ancient law remains embedded in our elaborate modern structure. Nevertheless gratuitous promises, even by deed, get only their strict and bare rights. There may be an action upon them, but the powerful remedy of specific performance—often the only one worth having—is denied them. For this is derived from the extraordinary jurisdiction of the chancellor, and the equity administered by the chancellor was not for plaintiffs who could not show substantial merit as well as legal claims. The singular position of promises made by deed is best left out of account in considering the general doctrine of the formation of contracts; and as to interpretation there is no difference. In what follows, therefore, it will be needless, as a rule, to distinguish between "parol" or "simple" contracts, that is, contracts not made by deed, and obligations undertaken by deed.

Promise and Offer.—From the conception of a promise being valid only when given in return for something accepted in consideration of the promise, it follows that the giving of the promise and of the consideration must be simultaneous. Words of promise uttered before there is a consideration for them can be no more than an offer; and, on the other hand, the obligation declared in words, or inferred from acts and conduct, on the acceptance of a consideration, is fixed at that time, and cannot be varied by subsequent declaration, though such declarations may be material as admissions. It was a long while, however, before this consequence was clearly perceived. In the 18th century it was attempted, and for a time with considerable success, to extend the range of enforceable promises without regard to what the principles of the law would bear, in order to satisfy a sense of natural justice. This movement was finally checked as late as 1840, and traces of it remain in certain apparently anomalous rules which are indeed of little practical importance, but which private writers, at any rate, cannot safely treat as obsolete. However, the question of "past consideration" is too minute and technical to be pursued here. The general result is that a binding contract is regularly constituted by the acceptance of an offer, at the moment it is accepted. It also follows that an offer before acceptance creates no duty of any kind; which is by no means necessarily the case in systems where the English rule of consideration is unknown. The question what amounts to final acceptance of an offer is, on the other hand, a question ultimately depending on common sense. The rules that an offer is understood to be made only for a reasonable time, according to the nature of the case, and lapses if not accepted in due time; that an expressed revocation of an offer can take effect only if communicated to the other party before he has accepted; that acceptance of an offer must be according to its terms, and a conditional or qualified acceptance is only a new proposal, and the like, stand on general convenience as much as on any technical ground.

Correspondence.—Great difficulties have arisen, in other systems as well as in the English, as to the completion of contracts between persons at a distance. There must be some rule, and yet any rule that can be framed must seem arbitrary in some cases. On the whole the modern doctrine is as follows:

The proposer of a contract can prescribe or authorize any mode, or at least any reasonable mode, of acceptance, and if he specifies none he is deemed to authorize the use of any reasonable mode in common use, and especially the post. Acceptance in words is not always required; an offer may be well accepted by an act clearly referable to the proposed agreement, and constituting the whole or part of the performance asked for—say the despatch of goods in answer to an order by post, or the doing of work bespoken; and it seems that in such cases further communication—unless expressly requested—is not necessary as matter of law, however prudent and desirable it may be. Where a promise and not an act is sought (as where a tradesman writes a letter offering goods for sale on credit), it must be communicated; in the absence of special direction letter post or telegraph may be used; and, further, the acceptor having done his part when his answer is committed to the post, English courts have held for about half a century (since 1879), after considerable previous doubt, that any delay or miscarriage in course of post is at the proposer's risk, so that a man may be bound by an acceptance he never received. It is generally thought—though there is no English decision—that, in conformity with this last rule, a revocation by telegraph of an acceptance already posted would be inoperative. Much more elaborate rules are laid down in some Continental codes. It seems doubtful whether their complication achieves any gain of substantial justice worth the price. At first sight it looks easy to solve some of the difficulties by admitting an interval during which one party is bound and the other not. But, apart from the risk of starting fresh problems as hard as the old ones, English principles, as above said, require a contract to be concluded between the parties at one point of time, and any exception to this would have to be justified by very strong grounds of expediency. We have already assumed, but it should be specifically stated, that neither offers nor acceptances are confined to communications made in spoken or written words. Acts or signs may and constantly do signify proposal and assent. One does not in terms request a ferryman to put one across the river. Stepping into the boat is an offer to pay the usual fare for being ferried over, and the ferryman accepts it by putting off. This is a very simple case, but the principle is the same in all cases. The term "implied contract," current in this connection, is ambiguous. It sometimes means a contract concluded by acts, not words, of one or both parties, but still a real agreement; sometimes an obligation imposed by law where there is not any agreement in fact, for which the name "quasi-contract" or "constructive contract" is more appropriate and now usual.

Interpretation.—The obligation of contract is an obligation created and determined by the will of the parties. Herein is the characteristic difference of contract from all other branches of law. The business of the law, therefore, is to give effect so far as possible to the intention of the parties, and all the rules for interpreting contracts go back to this fundamental principle and are controlled by it. Every one knows that its application is not always obvious. Parties often express themselves obscurely; still oftener they leave large parts of their intention unexpressed, or (which for the law is the same thing) have not formed any intention at all as to what is to be done in certain events. But even where the law has to fill up gaps by judicial conjecture, the guiding principle still is, or ought to be, the consideration of what either party has given the other reasonable cause to expect of him. The court aims not at imposing terms on the parties, but at fixing the terms left blank as the parties would or reasonably might have fixed them if all the possibilities had been clearly before their minds. For this purpose resort must be had to various tests: the court may look to the analogy of what the parties have expressly provided in case of other specified events, to the constant or general usage of persons engaged in like business, and, at need, ultimately to the court's own sense of what is just and expedient. One important application of this principle is the doctrine of "frustration of the adventure" now largely developed in cases arising out of the World War. Where the fulfilment of a contract according to the true intention is rendered impossible by emergent facts not within the control or contemplation of the parties, the court will treat the contract as if it had been conditional and hold performance excused: a strictly exact statement cannot be given in a short compass, but the result is that the possibility of liberal performance has ceased to be an adequate test, and various detailed rules and exceptions are now brought under a more general concept. All auxiliary rules of this kind are subject to the actual will of the parties, and are applied only for want of sufficient declaration of it by the parties themselves. A rule which can take effect against the judicially known will of the parties is not a rule of construction or interpretation, but a positive rule of law. However artificial some rules of construction may seem, this test will always hold. In modern times the courts have avoided laying down new rules of construction, preferring to keep a free hand and deal with each case on its merits as a whole. It should be observed that the fulfilment of a contract may create a relation between the parties which, once established, is governed by fixed rules of law not variable by the preceding agreement. Marriage is the most conspicuous example of this, and perhaps the only complete one in our modern law.

There are certain rules of evidence which to some extent guide or restrain interpretation. In particular, oral testimony is not allowed to vary the terms of an agreement reduced to writing. This is really in aid of the parties' deliberate intention, for the object of reducing terms to writing is to make them certain. There are apparent exceptions to the rule, of which the most conspicuous is the admission of evidence to show that words were used in a special meaning current in the place or trade in question. But they are reducible, it will be found, to applications (perhaps oversubtle in some cases) of the still more general principles that, before giving legal force to a document, we must know that it is really what it purports to be, and that when we do give effect to it according to its terms we must be sure of what its terms really say. The rules of evidence here spoken of are modern, and have nothing to do with the archaic rule already mentioned as to the effect of a deed.

Performance.—Every contracting party is bound to perform his promise according to its terms, and in case of any doubt in the sense in which the other party would reasonably understand the promise. Where the performance on one or both sides extends over an appreciable time, continuously or by instalments, questions may arise as to the right of either party to refuse or suspend further performance on the ground of some default on the other side. Attempts to lay down hard and fast rules on such questions are now discouraged, the aim of the courts being to give effect to the true substance and intent of the contract in every case. Nor will the court hold one part of the terms deliberately agreed to more or less material than another in modern business dealings. "In the contracts of merchants time is of the essence," as the Supreme Court of the United States has said in our own day. Certain ancient rules restraining the apparent literal effect of common provisions in mortgages and other instruments were in truth controlling rules of policy. New rules of this kind can be made only by legislation. Whether the parties did or did not in fact intend the obligation of a contract to be subject to unexpressed conditions is, however, a possible and not uncommon question of interpretation, as we have noted above. One class of cases giving rise to such questions is that in which performance according to the real intent of the parties is frustrated by some external cause not due to the promisor's own fault. As to promises obviously absurd or impossible from the first, they are unenforceable only on the ground that the parties cannot have seriously meant to create a liability. For precisely the same reason, supported by the general usage and understanding of mankind, common social engagements, though they often fulfil all other requisites of a contract, have never been treated as binding in law. The singular case has actually occurred of parties framing a complete business agreement and adding an "honourable pledge clause" which expressly excluded legal jurisdiction. Here the manifest intention not to create an enforceable obligation prevents the other specific terms, however precise, from creating any.

Illegality.—In all matters of contract, as we have said, the ascertained will of the parties prevails. But this means a will both lawful and free. Hence there are limits to the force of the general rule, fixed partly by the law of the land, which is above individual will and interests, partly by the need of securing good faith and justice between the parties themselves against fraud or misadventure. Agreements cannot be enforced when their performance would involve an offence against the law. There may be legal offence, it must be remembered, not only in acts commonly recognized as criminal, disloyal or immoral, but in the breach or nonobservance of positive regulations made by the legislature, or persons having statutory authority, for a variety of purposes. Again, there are cases where an agreement may be made and performed without offending the law, but on grounds of "public policy" it is not thought right that the performance should be a matter of legal obligation, even if the ordinary conditions of an enforceable contract are satisfied. A man may bet, in private at any rate, if he likes, and pay or receive as the event may be; but for many years the winner has had no right of action against the loser. Unfortunate timidity on the part of the judges, who attempted to draw distinctions instead of saying boldly that they would not entertain actions on wagers of any kind, threw this topic into the domain of legislation; and the laudable desire of parliament to discourage gambling, so far as might be, without attempting impossible prohibitions, has brought the law to a state of ludicrous complexity in both civil and criminal jurisdiction. But what is really important under this doctrine of public policy is the confinement of "contracts in restraint of trade" within special limits. In the middle ages and down to modern times there was a strong feeling—not merely an artificial legal doctrine—against monopolies and everything tending to monopoly. Agreements to keep up prices or not to compete were regarded as criminal. Gradually it was found that some kind of limited security against competition must be allowed if such transactions as the sale of a going concern with its goodwill, or the retirement of partners from a continuing firm, or the employment of confidential servants in matters involving trade secrets, were to be carried on to the satisfaction of the parties. Attempts to lay down fixed rules in these matters were made from time to time, but they were finally discredited by the decision of the House of Lords in the Maxim-Nordenfelt company's case in 1894. Contracts "in restraint of trade" will now be held valid, provided that they are made for valuable consideration (this even if they are made by deed), and do not go beyond what can be thought reasonable for the protection of the interests concerned, and are not injurious to the public. (The Indian Contract Act, passed in 1872, has unfortunately embodied views now obsolete, and remains unamended.) All that remains of the old rules in England is the necessity of valuable consideration, whatever be the form of the contract, and a strong presumption—but not an absolute rule of law—that an unqualified agreement not to carry on a particular business is not reasonable.

Fraud.—Where there is no reason in the nature of the contract for not enforcing it, the consent of a contracting party may still not be binding on him because not given with due knowledge, or, if he is in a relation of dependence to the other party, with independent judgment. Inducing a man by deceit to enter into a contract may always be treated by the deceived party as a ground for avoiding his obligation, if he does so within a reasonable time after discovering the truth, and, in particular, before any innocent third person has acquired rights for value on the faith of the contract. (*See* FRAUD.) Coercion would be treated on principle in the same way as fraud, but such cases hardly occur in modern times. There is a kind of moral domination, however, which our courts watch with the utmost jealousy, and repress under the name of "undue influence" when it is used to obtain pecuniary advantage. Persons in a position of legal or practical authority—guardians, confidential advisers, spiritual directors and the like—must not abuse their authority for selfish ends. They are not forbidden to take benefits from those who depend on them or put their trust in them; but if they do, and the givers repent of their bounty, the whole burden of proof is on the takers to show that the gift was in the first instance made freely and with understanding. Large voluntary gifts or beneficial contracts, outside the limits within which natural affection and common practice justify them, are indeed not encouraged in any system of civilized law. Professional money-lenders were formerly checked by the usury law: since those laws were repealed in 1854, courts and juries have shown a certain astuteness in applying the rules of law as to fraud and undue influence—the latter with certain special features—to transactions with needy "expectant heirs" and other improvident persons which seem on the whole unconscionable. The Money-lenders Act of 1900 and subsequent amendments have fixed and (as finally interpreted by the House of Lords) also sharpened these developments. In the case of both fraud and undue influence, the person entitled to avoid a contract may, if so advised, ratify it afterwards; and ratification, if made with full knowledge and free judgment, is irrevocable. A contract made with a person deprived by unsound mind or intoxication of the capacity to form a rational judgment is on the same footing as a contract obtained by fraud, if the want of capacity is apparent to the other party.

Misrepresentation.—There are many cases in which a statement made by one party to the other about a material fact will enable the other to avoid the contract if he has relied on it, and it was in fact untrue, though it may have been made at the time with honest belief in its truth. This is so wherever, according to the common course of business, it is one party's business to know the facts, and the other practically must, or reasonably may, take the facts from him. In some classes of cases even inadvertent omission to disclose any material fact is treated as a misrepresentation. Contracts of insurance are the most important; here the insurer very seldom has the means of making any effective enquiry of his own. Misdescription of real property on a sale, without fraud, may according to its importance be a matter for compensation or for setting aside the contract. Promoters of companies are under special duties as to good faith and disclosure which have been worked out at great length in the modern decisions. But company law has become so complex within the present generation that, so far from throwing much light on larger principles, it is hardly intelligible without some previous grasp of them. Sometimes it is said that misrepresentation (apart from fraud) of any material fact will serve to void any and every kind of contract. It is submitted that this is certainly not the law as to the sale of goods or as to the contract to marry, and therefore the alleged rule cannot be laid down as universal. But it must be remembered that parties can, if they please, and not necessarily by the express terms of the contract itself, make the validity of their contract conditional on the existence of any matter of fact whatever, including the correctness of any particular statement. If they have done this, and the fact is not so, the contract has no force; not because there has been a misrepresentation, but because the parties agreed to be bound if the fact was so and not otherwise. It is a question of interpretation whether in a given case there was any such condition.

Mistake is said to be a ground for avoiding contracts, and there are cases which it is practically convenient to group under this head. On principle they seem to be mostly reducible to failure of the acceptance to correspond with the offer, or absence of any real consideration for the promise. In such cases, whether there be fraud or not, no contract is ever formed, and therefore there is nothing which can be ratified—a distinction which may have important effects. Relief against mistake is given where parties who have really agreed, or rather their advisers, fail to express their intention correctly. Here, if the original true intention is fully proved—as to which the court is rightly cautious—the faulty document can be judicially rectified.

Disability.—By the common law an infant (*i.e.,* a person less than 21 years old) was bound by contracts made for "necessaries," *i.e.,* such commodities as a jury holds, and the court thinks they may reasonably hold, suitable and required for the person's condition; also by contracts otherwise clearly for his benefit; all other contracts he might confirm or avoid after coming of age. An extremely ill-drawn act of 1874 absolutely deprived infants of the power of contracting loans, contracting for the supply of goods other than necessaries, and stating an account so as to bind themselves; it also disabled them from binding themselves by ratification. The liability for necessaries is now declared by legislative authority in the Sale of Goods Act, 1893; the modern doctrine is that it is in no case a true liability on contract. There is an obligation imposed by law to pay, not the agreed price, but a reasonable price. Practically, people who give credit to an infant do so at their peril, except in cases of obvious urgency.

Married women were incapable by the common law of contracting in their own names. At this day they can hold separate property and bind themselves to the extent of that property—not personally—by contract. The law before the Married Women's Property Acts (1882 and 1893, and earlier acts now superseded and repealed) was a very peculiar creature of the court of chancery; the cases in which it is necessary to go back to it are now, of course, very few. But a married woman can still be restrained from anticipating the income of her separate property, and the restriction is still commonly inserted in marriage settlements.

There is a great deal of philosophical interest about the nature and capacities of corporations, but for modern practical purposes it may be said that the legal powers of British corporations are directly or indirectly determined by acts of parliament. For companies under the Companies Acts the controlling instrument or written constitution is the memorandum of association. Company draftsmen, taught by experience, nowadays frame this in the most comprehensive terms. Questions of either personal or corporate disability are less frequent than they were. In any case they stand apart from the general principles of our law of contract.

Contract and Property.—The rights created by contract are personal rights against the promisors and their legal representatives, and therefore different in kind from the rights of ownership and the like which are available against all the world. Nevertheless they may be and very commonly are capable of pecuniary estimation and estimated as part of a man's assets. Book debts are the most obvious example. Such rights are property in the larger sense: they are in modern law transmissible and alienable, unless the contract is of a kind implying personal confidence, or a contrary intention is otherwise shown. The rights created by negotiable instruments are an important and unique species of property, being not only exchangeable but the very staple of commercial currency. Contract and conveyance, again, are distinct in their nature, and sharply distinguished in the classical Roman law. But in the common law property in goods is transferred by a complete contract of sale without any further act, and under the French civil code and systems which have followed it a like rule applies not only to movables but to immovables. In English law procuring a man to break his contract is a civil wrong against the other contracting party, subject to exceptions which are still not clearly defined. (F. Po.)

Modern: Pollock, article "Contract" in *Encyclopaedia of the Laws of England* (2nd ed., 1907), a technical summary of the modern law; the same writer's edition of the Indian Contract Act (with D. F. Mulla, London and Bombay, 5th ed., 1924) restates and discusses the principles of the common law besides commenting on the provision of the act in detail. Of the text-books, Anson, *English Law of Contract,* reached a 16th edition in 1923; Harriman, *Law of Contracts* (2nd ed., 1901); Leake, *Principles of the Law of Contract* (7th ed., by Randall, 1921); Pollock, *Principles of Contract* (9th ed., 1921), third American ed., Wald's, completed by Williston (1906); the title "Contract" in Halsbury's *Laws of England,* vol. vii. (1909) and Suppl. (1927). An unfinished book by the late Sir John Salmond was edited and completed by Prof. Winfield of Cambridge in 1927. O. W. Holmes (justice of the Supreme Court of the United States), *The Common Law* (Boston, Mass., 1881) is illuminating on contract as on other legal topics.

UNITED STATES

In a few points the American law differs from the English. The deed has rather generally been deprived of its full effect in creating a contractual obligation without consideration, by legislation providing that a seal shall merely raise a rebuttable presumption of consideration being present. As to usury, the States have almost all maintained in general the older English policy of fixing a statutory maximum interest rate, and in some manner penalizing the contracting for more. (*See* USURY; on contracts in restraint of trade in America *see* especially TRUSTS: *Legal Position of: United States.*)

The rule that inducing one contracting party to break his contract is a legal wrong to the other contracting party has become of great social importance in the United States in recent years in the field of labour and its relations; this not so much because of the usual remedy for civil wrongs, by way of damages, as because of the willingness of the courts to find an "irreparable injury" threatened, and hence to issue an injunction against inducing such breach. The usual case is that of attempted organization of a non-union factory personnel by union organizers. Where the men are employed from week to week, inducing them to quit work has generally been recognized as enjoinable; and a similar rule has sometimes been applied even where the employment was from day to day. Open shop employers, to bring themselves within the protection of the rule, have often required their employés to sign, as part of their contract of employment, an agreement not to join a union (except, perhaps, a designated company union) while they continue on the job; such an agreement has been held to make an attempt to unionize the men enjoinable.

This leads directly into two other major phases of contracts in the United States: (1) liberty of contract under the Constitution; and (2) the use of standardized contract.

Liberty of Contract.—The Federal Constitution not only guarantees contract by forbidding any State to pass "any law impairing the obligation of contracts," but provides also in the 5th and 14th amendments that neither Congress nor any State shall deprive any person of "liberty or property" "without due process of law." Since the '90s a good deal of legislation which attempted to restrict the theretofore customary scope of property rights or of freedom of economic action has been declared unconstitutional—and therefore invalid—under these clauses. The argument of unconstitutionality has been pressed with peculiar force against restrictions on a worker's freedom to contract for employment, irrespective of whether the legislation was intended for the worker's benefit and designed to remedy abuses which his power to choose between jobs seemed insufficient to prevent. Thus statutes have fallen which made it an offence to make employment conditional upon the worker's agreement not to join a union; or required him to be paid in money rather than in truck or in a check on the company store; or prescribed a minimum wage for women employés; though hours and sanitary conditions of labour can validly be subjected to considerable regulation. Unconstitutionality has also afflicted, peculiarly, attempts at price regulation outside the businesses traditionally regarded as public utilities; prices, as the heart of free contract, are to be free from Government control; indeed, even private agreements by competitors to raise prices or keep them up are both illegal and penal offences. Finally, various attempts to regulate particular businesses by prescribing certain terms of contracts, *e.g.*, to prevent fraud (maximum and minimum sizes of loaves of bread), have been held invalid by the Supreme Court, as undue deprivations of liberty or property; the two concepts fuse in these cases. It is clear that two policies are here in conflict. One is the traditional view of the 19th century, buttressed by the individualism of a territory far from fully exploited; a free hand in acting and bargaining is the country's salvation—hence the constitutional language should be construed to annul any legislative restraint. The other is the need to control those abuses which emerge repeatedly when the powerful bargainer crushes the weaker, or when the anonymous producer slips fraudulent or dangerous articles into an uncontrolled market; under this view no reasonable legislative restraint on contract should be annulled, and a liberal view should be taken as to what is reasonable. Which view will prevail in new cases is still extremely difficult to predict.

Standardization of Contract.—The freedom of contract thus guaranteed by the Constitution extends to wide freedom in drawing up the terms of association of any group. This is a sort of private self-government, recognized and intended by law. Private government of this sort, but of some persons over others, develops, however, to an unanticipated extent, where freedom of contract is accompanied by concentration of bargaining power, on the one hand, and by the introduction of standardized forms of contract, on the other. Such standardized contracts are of vast and increasing importance. In a sense the law itself provides them, in such codes as the Uniform Sales Act (*see* SALE OF GOODS) or the Negotiable Instruments law (*see* BILL OF EXCHANGE), which lay down a sort of frame for all contracts which come within their terms and hence cover hundreds of unforeseen possibilities which the contracting parties did not stop to consider. But the law in such matters is commonly directed largely to indicating results *where the expressed agreement is silent.* It thus becomes feasible and useful for concerns specializing in particular lines to capitalize their experience by building form-contracts which expressly resolve in their own favour all the points commonly left to implication. The advantages of this are obvious. Not only are the scales tipped, in most of the possible contingencies, in favour of the concern drawing the form, but that concern can automatically make available to untrained clerks or salesmen the full skill, forethought and experience of both the high executives and legal counsel; moreover, the contracts being standardized, the handling of performance as well as of claims and disputes becomes simpler and cheaper. Some effects of standardized employment contracts have been mentioned above. Those of standardized business contracts fall into two classes. On the one side are the cases where bargaining power on the two sides is somewhat even, as where associated buyers negotiate a form of contract with associated sellers; the uniform bill of lading is in substance of this character, with the consequence of reasonable and careful protection of all parties concerned. On the other side are the cases where bargaining power is not balanced, and one side must take or leave what the other offers; the forms of residence and small office lease, of policies of insurance, of contracts for sale of agricultural implements and of automobile agency contracts are examples. Here the law has sometimes intervened to hold the scales more even. The courts often "construe the contract strictly" in the interests of fairness; they have often made use of the doctrine of consideration to hold what seemed an unfair contract to be wholly unenforceable because one side was not sufficiently bound to do anything for the other; finally, in fields where experience showed the need, there has come in due time legislative regulation of the permissible forms of contract, notably in the case of insurance policies. The whole situation brings out clearly the sometimes neglected fact that free contract, as a device to accomplish the multitude of adjustments no Government can foresee or attend to, is for proper effectiveness none the less conditioned by the existence and continuance of something approaching equality of power among the bargaining parties. Most legislative interference with freedom of contract, whether constitutional or not, will be found traceable to the absence of such substantial equality.

In closing, it should be noted that during the 19th century the field of contract was the scene of a hitherto unparalleled development of Anglo-American legal theory. Out of a great variety of traditional specific relations—"vendor and purchaser," "buyer and seller of goods," "bailor and bailee," etc.—a sustained effort was made to build a general law and theory of contract. It was the first sweeping attempt to systematize a large field of the common law in the manner in which the civil law of the Continent is systematized. For good or for bad it was really most remarkably successful; the results reaching their fruition in the restatement of the law of contracts approved in 1928 by the American Law Institute. As yet the movement toward systematization shows less promise in other sections of American law.

CONTRACT BRIDGE, which, since 1930, has won a worldwide popularity unequalled in the history of cards, is the fourth in a succession of card games of which the basic game is Whist. In Contract Bridge, two pairs of players, as partners, compete for tricks, as in Whist; the cards of one player, known as the dummy, are exposed upon the table, as in Bridge-Whist, the second game of the series; and the four players bid for the right to name the trump suit, as in Auction Bridge, the third game of the series. The distinctive feature of Contract Bridge is that a pair cannot score the tricks it wins toward making a game unless it previously has contracted to win those tricks.

A game is won and ended when a pair scores 100 points for tricks as contracted. For this purpose, the value of tricks is translated into points, varying with the suit named as trump. Each trick over six contracted for and won counts, if spades are trumps, 30; hearts, 30; diamonds, 20; clubs, 20; notrumps, 40 for the first trick and 30 thereafter. The pair which first makes two games wins the rubber. If the opposing side has made a game, the rubber-winning pair scores a bonus of 500 points and, if the opposing side has not made a game, a bonus of 700 points. All bonuses and all points, other than trick points toward game, are scored as premiums. These premiums include the regular points for tricks won but not contracted for; undertrick penalties when opponents fail to fulfill their contract; bonuses for bidding and making a small slam (twelve tricks) or a grand slam (thirteen tricks); and 100 points for holding four trump honours in one hand, or 150 points for holding, in one hand, five trump honours, or all four Aces, if there are no trumps.

When a pair has made a game it is "vulnerable" and undertrick penalties and slam bonuses are affected by vulnerability. A contract may be doubled and redoubled, which doubles or quadruples the trick points toward game if the contract is fulfilled. When not doubled, each undertrick costs a penalty of 50 points not vulnerable and 100 points vulnerable. When doubled, the first undertrick counts 100 points not vulnerable and 200 points vulnerable, and subsequent undertricks 200 points not vulnerable and 300 points vulnerable. Not vulnerable, the small slam bonus is 500 points and the grand slam bonus 1000 points; vulnerable, they are 750 and 1500 points respectively. Overtricks at a doubled contract count 100 each not vulnerable, 200 vulnerable. Redoubling doubles the value of doubled undertricks or overtricks.

Contract Bridge, as it is played today, originated in November, 1925, in a Bridge game on a steamship enroute from Los Angeles to Havana. Harold S. Vanderbilt, one of the participants in this game, is credited with introducing the game to New York clubs, in which it gradually supplanted Auction Bridge. The game of plafond, developed in France about 1922, as an evolution of Auction Bridge, already had introduced the condition that tricks must be contracted for in order to be scored toward game, but Mr. Vanderbilt added the vulnerability feature, the slam bonuses, and a new schedule of scoring which, with a few variations, remains in force today.

A greater measure of skill is required in Contract Bridge than in its predecessors. Whereas, in Auction Bridge, the object of calling (bidding) was solely to name the trump suit, players at Contract Bridge must determine how many tricks they can expect to win. To accomplish this, an interchange of accurate partnership information is essential. Ely Culbertson of New York conceived, for this purpose, the method of systematic bidding which now is in general use by Contract Bridge players. He introduced to Contract Bridge the Approach Principle, which holds that suit bids should be preferred to notrump bids and he originated the Forcing Principle, under which certain bids require partner to make some responding bid. His system of bidding is called the Culbertson or Approach-Forcing System.

Those who had been active in writing and teaching the game of Auction Bridge soon turned to Contract Bridge and developed or recommended various systems of bidding. Many of these made use of artificial conventions, with certain calls which indicated a certain number of high cards rather than willingness to play at the contract named. Mr. Vanderbilt's system, in which an opening bid of one club shows three "quick" tricks in Aces and Kings, remains the most popular of these systems. Most systems of bidding have now disappeared and those which remain are so similar that, except for the few users of artificial conventions, good players throughout the world use the same methods. These, in basis, comprise the original Approach-Forcing system.

Contract Bridge was not generally adopted in Great Britain until 1930. The leading Whist and Bridge players in the London clubs objected to the use of systematic bids, and, even when they turned to Contract Bridge, their sentiment was against all "systems." Their playing methods, however, approximate those of all other good players, and they actually play a system without so terming it. The adoption of Contract Bridge in Great Britain was rapid after an American team, which included Mr. and Mrs. Culbertson, Theodore A. Lightner and Waldemar von Zedtwitz, played a series of matches in London in 1930 against teams made up of Lt.-Colonel Walter E. Buller, Mrs. Gordon Evers, Lieutenant Cedric Kehoe and Dr. Nelson Wood-Hill, and two teams representing Crockford's Club of London, one team being Colonel H. M. Beasley, Sir Guy Domville, George Morris and Captain K. Hogg, the other Miss Ethel Thomas, Mrs. Cavendish-Bentinck, F. Lyon and Ivor Birts. In 1933 Charles M. Schwab of New York offered a trophy for a World's Championship match, in which American and British teams competed in 1933 and 1934. The American team both years included Mr. and Mrs. Culbertson and Lightner, with Michael T. Gottlieb in 1933 and Albert Morehead in 1934. The 1933 British team was made up of Colonel Beasley, Domville, Morris, P. V. Tabbush, Graham Mathieson and Lady Doris Rhodes; the 1934 team, of R. Lederer, W. Rose, H. St. J. Ingram and S. Hughes, with Colonel G. G. J. Walshe and A. Frost as alternates. The American teams won all these matches, the three in 1930 and the contests for the Schwab Trophy in 1933 and 1934.

The first laws drafted for Contract Bridge were issued by the Knickerbocker Whist Club in New York, but were replaced a few months later in 1927 by a code promulgated by The Whist Club of New York. International interest in Contract Bridge made it desirable that there be an international code, and in 1932 the Portland Club of London, which had been making the laws for Great Britain and several European countries since it issued its first code in January 1929, cooperated with The Whist Club of New York and with the Commission Française du Bridge in the drafting of the first International Code. This was replaced, in March 1935, by the present International Code, which is followed in nearly every country in the world.

Contract Bridge tournaments are played in duplicate; the cards dealt to each player are kept separated so that other players may later have exactly the same cards, and the luck of the deal is eliminated. Duplicate tournaments are governed by laws which follow the International Code except for a few differences which are unavoidable because of the difference in playing procedure.

The popularity of Contract Bridge has made it an industry which gives employment, directly or indirectly, to thousands. (E. Cul.)

CONTRACTILE VACUOLE, in biology, a spherical space filled with liquid, which at intervals discharges into the medium; it is found in all fresh-water groups of Protozoa (*q.v.*), also in the naked aquatic reproductive cells of Algae and Fungi. It is absent in states with a distinct cell-wall to resist excessive turgescence. Its function is to remove the water which must diffuse into unprotected cells in a medium of lower osmotic pressure than themselves. Possibly, it also serves as an organ of excretion.

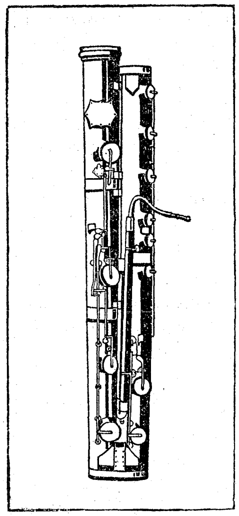
CONTRACT NOTE. A document issued by a stockbroker to his client, giving details of the sale or purchase of stock on the client's account. In the case of the London Stock Exchange, a typical contract note shows the cost of the shares, the cost of the Government stamp duty required to legalise the transfer, the fee charged by the company for registering the transfer and issuing a new certificate, the brokerage charged by the stockbroker. It also states the settlement day when the shares must be paid for.

CONTRADICTION, PRINCIPLE OF (*principium contradictionis*), in logic, the term applied to the second of the three primary "laws of thought." The oldest statement of the law is that contradictory statements cannot both at the same time be true, *e.g.,* the two propositions "A is B" and "A is not B" are mutually exclusive. A may be B at one time, and not at another; A may be partly B and partly not B at the same time; but it is impossible to predicate of the same thing, at the same time, and in the same sense, the absence and the presence of the same quality. This is the statement of the law given by Aristotle. It takes no account of the truth of either proposition; if one is true, the other is not; one must be false.

Modern logicians, following Leibniz and Kant, have generally adopted a different statement, by which the law assumes an essentially different meaning. Their formula is "A is not not–A"; in other words it is impossible to predicate of a thing a quality which is its contradictory. Unlike Aristotle's law this law deals with the necessary relation between subject and predicate in a single judgment. Whereas Aristotle states that *one* or *other* of two contradictory propositions must be false, the Kantian law states that a particular kind of proposition is *in itself* necessarily false. On the other hand there is a real connection between the two laws. The denial of the statement "A is not–A" presupposes some knowledge of what A is, *i.e.,* the statement A is A. In other words a judgment about A is implied. Kant's analytical propositions depend on presupposed concepts which are the same for all people. His statement, regarded as a logical principle purely, does not therefore amount to more than that of Aristotle.

CONTRAFAGOTTO, DOUBLE BASSOON or **CONTRABASSOON,** a wood-wind instrument of the double reed family, which it completes as the bass, the other members being the oboe, cor anglais, and bassoon. The modern wooden contrafagotto (there is also a type made of brass) has a pitch one octave below that of the bassoon and three below that of the oboe, its compass extending from 16ft. C. to middle C. The notes of both extremes are difficult to produce. The quality of tone is somewhat rough. The contrafagotto has a complete chromatic compass, and it may therefore be played in any key. It forms a fine bass to the reed family, and supplies in the orchestra the notes missing in the double-bass in order to reach 16ft. C.

The origin of the contrafagotto, like that of the oboe (*q.v.*) must be sought in the highest antiquity (*see* Aulos). Its immediate forerunner was the double bombard or bombardino, or the great double quint-pommer. Handel scored for the instrument and it was used in military bands before being adopted in the orchestra. Owing to its faulty construction and harsh tone the double bassoon fell into disuse, in spite of the fact that Haydn, Mozart, and Beethoven all scored for it abundantly; the last used it in the C minor and choral symphonies and wrote an *obbligato* for it in *Fidelio.* Improved methods of construction have, however, restored it to favour as an instrument of value for sparing use.



FROM SCHLESINGER, "INSTRUMENTS OF THE ORCHESTRA AND PRECURSORS OF THE VIOLIN FAMILY" (BESSON & CO.)

THE CONTRAFAGOTTO

CONTRALTO, the term for the lowest variety of the female voice, as distinguished from the soprano and mezzo-soprano. Originally it signified, in choral music, the part next higher than the alto, given to the falsetto counter-tenor.

CONTRAPUNTAL FORMS, in music. The forms of music may be considered in two aspects, the texture of the music from moment to moment, and the shape of the musical design as a whole. Historically the texture of music became definitely organized long before the shape could be determined by any but external or mechanical conceptions. The laws of musical texture were known as the laws of "Counterpoint" (*see* Counterpoint and Harmony). The "contrapuntal" forms, then, are historically the earliest and aesthetically the simplest in music; the simplest, that is to say, in principle, but not necessarily the easiest to appreciate or to execute. Their simplicity is like that of mathematics, the simplicity of the elements involved; it develops into results more subtle and intricate than popular; whereas much of the art that is popular contains many and various elements combined in ways which, though familiar in appearance, are often not recognized for the complex conventions of civilization that they really are.

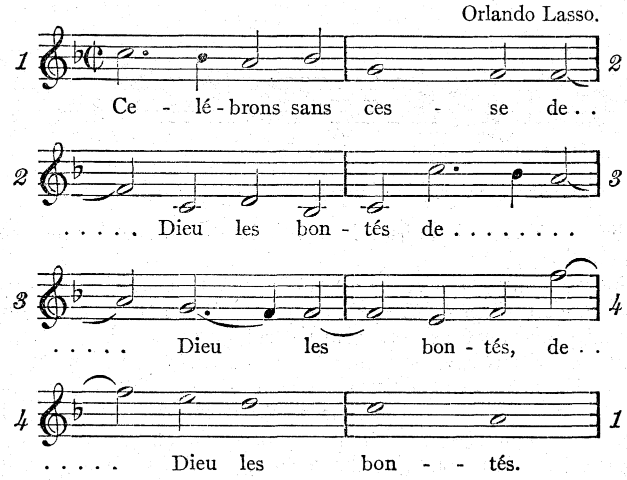
I. CANONIC FORMS AND DEVICES

In the *canonic* forms, the earliest known in music as an independent art, the laws of texture also determine the shape of the whole, so that it is impossible, except in the light of historical knowledge, to say which is prior to the other. The principle of canon being that one voice shall reproduce note for note the material of another, it follows that in a composition where all parts are canonic and where the material of the leading part consists of a pre-determined melody, such as a Gregorian chant or a popular song, the composer has nothing to do but to adjust minute detail till the harmonies fit. The whole composition is the predetermined melody plus the harmonic fitness. The art does not teach composition, but it does teach fluency under difficulties, and thus the canonic forms play an important part in the music of the 15th and 16th centuries; nor indeed have they since fallen into neglect without grave injury to the art. But strict canon is inadequate, and may become a nuisance, as the sole regulating principle in music; nor is its rival and cognate principle of counterpoint on a Canto Fermo (*see* p. 349) more trustworthy in primitive stages. These are rigid mechanical principles; but even mechanical principles may force artistic thought to leave the facile grooves of custom and explore the real nature of things. Even to-day the canonic forms are great liberators if studied with intelligence.

The earliest canonic form is the *rondel* or *rota* as practised in the 12th century. It is, however, canonic by accident rather than in its original intention. It consists of a combination of short melodies in several voices, each melody being sung by each voice in turn. Now it is obvious that if one voice began alone, instead of all together, and if when it went on to the second melody the second voice entered with the first, and so on, the result would be a canon in the unison. Thus the difference between the crude counterpoint of the rondel and a strict canon in the unison is a mere question of the point at which the composition begins, and a 12th century rondel is simply a canon at the unison begun at the point where all the voices have already entered. There is some reason to believe that one kind of rondeau practised by Adam de la Hale was intended to be sung in the true canonic manner of the modern round; and the wonderful English rota, "Sumer is icumen in," shows in the upper four parts the true canonic method, and in its two-part *pes* the method in which the parts began together (*see* MUSIC, Ex. 1). In these archaic works the canonic form gives the whole a stability contrasting oddly with its cacophonous warfare between nascent harmonic principles and ancient antiharmonic criteria. As soon as harmony became established on the true contrapuntal basis, the unaccompanied round attained the position of an elegant trifle, with hardly more expressive possibilities than the triolet in poetry, a form to which its brevity and lightness renders it fairly comparable. Orlando Lasso's *Célébrons sans cesse* is a beautiful example of the 16th century round with a delightful climax in its fourth line: (*see* I., below).

I. *Round (originally for male voices). When the first voice reaches the 2nd line, the 2nd voice begins the 1st line, and so on.*

Orlando Lasso.



In classical times the possibilities of the round enormously increased; and with the aid of elaborate instrumental accompaniments it plays an important feature at points where a *tableau* is possible in an operatic *ensemble.* In such a round the first voice can execute a long and complete melody before the second voice joins in. Even if this melody be not instrumentally accompanied, it will imply a certain harmony, or at all events arouse curiosity as to what the harmony is to be. And the sequel may shed a new light upon the harmony, and thus by degrees the whole character of the melody may be transformed. The humorous and subtle possibilities of this form were first fully revealed by Mozart, whose astounding unaccompanied canons would be better known but for his habit of extemporizing unprintable texts for them.

The round or the *catch* (which is simply a specially jocose round) is a favourite English art-form, and the English specimens of it are almost as numerous and sometimes as anonymous as folksongs. But they are apt to achieve only the easy task comprised in a good piece of free and fairly contrapuntal harmony in three or more parts, so arranged that it remains correct when the parts are brought in one by one. Even Cherubini gives hardly more than a valuable hint that the round may rise to higher things; and, unless he be an adequate exception, the unaccompanied rounds of Mozart and Brahms stand alone as works that raise the round to the dignity of a serious art-form.

With the addition of an orchestral accompaniment the round obviously becomes a larger thing; and in such specimens as that in the finale of Mozart's *Così fan tutte,* the quartet in the last act of Cherubini's *Faniska,* the wonderfully subtle quartet "Mir ist so wunderbar" in Beethoven's *Fidelio,* and the very beautiful numbers in Schubert's masses where Schubert finds expression for his genuine contrapuntal feeling in lyric style, we find that the length of the initial melody, the growing variety of the orchestral accompaniment and the finality and climax of the free coda, combine to give the whole a character closely analogous to that of a set of contrapuntal variations, such as the slow movement of Haydn's "Emperor" string quartet, or the opening of the finale of Beethoven's 9th symphony. Berlioz is fond of beginning his largest movements like a kind of round; *e.g.* his *Dies Irae,* the *Scène aux Champs* in the Symphonie Fantastique, and the opening of his *Damnation de Faust.*

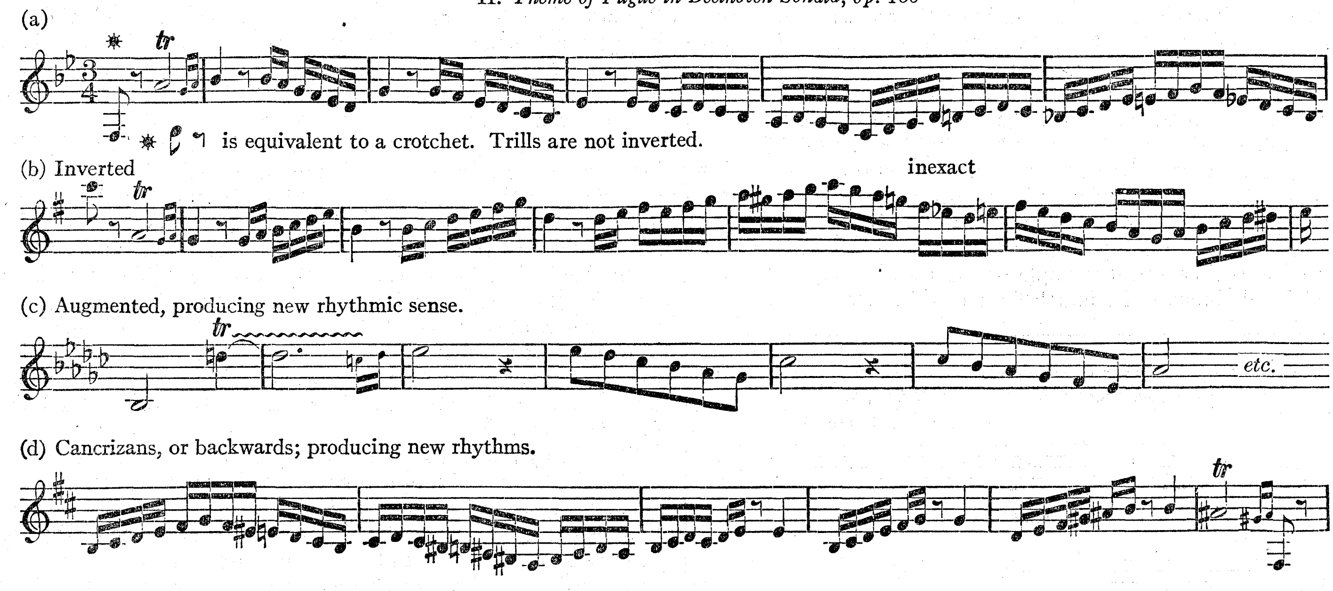
Three conditions are necessary if a canon is to be a round. First, the voices must imitate each other in the unison; secondly, they must enter at equal intervals of time; and thirdly, the whole melodic material must be as many times longer than the interval of time as the number of voices; otherwise, when the last voice has finished the first phrase, the first voice will not be ready to return to the beginning. Strict canon is, however, possible under innumerable other conditions, and even a round is possible with some of the voices at the interval of an octave, as is of course inevitable in writing for unequal voices. And in a round for unequal voices there is obviously a new means of effect in the fact that, as the melody rotates, its different parts change their pitch in relation to each other.

The art by which this is possible without incorrectness is that of double, triple and multiple counterpoint (*see* COUNTERPOINT). Its difficulty is variable, and with an instrumental accompaniment there is none. In fugues, multiple counterpoint is one of the normal resources of music; and few devices are more self-explanatory to the ear than the process by which the subject and countersubjects of a fugue change their positions, revealing fresh melodic and acoustic aspects of identical harmonic structure at every turn. This, however, is rendered possible and interesting by the fact that the passages in such counterpoint are often separated by episodes and are free to appear in different keys. Many fugues of Bach are written throughout in multiple counterpoint; but the possibility of this depends upon the freedom of the musical design which allows the composer to select the most effective permutations and combinations of his counterpoint, and also to put them into whatever key he chooses. Some of Bach's choruses might be called Round-Fugues, so regular is the course by which each voice proceeds to a new counter-subject as the next voice enters. *See* the *Et in terra pax* of the B minor Mass, and the great double chorus, *Nun ist das Heil.*

The resources of canon, when emancipated from the principles of the round, are considerable when the canonic form is strictly maintained, and are inexhaustible when it is treated freely. A canon need not be in the unison; and when it is in some other interval the imitating voice alters the expression of the melody by transferring it to another part of the scale. Again, the imitating voice may follow the leader at any distance of time; and thus we have obviously a definite means of expression in the difference of closeness with which various canonic parts may enter; as, for instance, in the stretto of a fugue. Again, if the answering part enters on an unaccented beat where the leader began on the accent (*per arsin et thesin*), there will be artistic value in the resulting difference of rhythmic expression. All these devices ought to be quite definite in their effect upon the ear, and their expressive power is undoubtedly due to their special canonic nature. The beauty of the pleading, rising sequences in crossing parts in the canon at the 2nd at the opening of the *Recordare* in Mozart's *Requiem* is attainable by no other technical means. The close canon in the 6th at the distance of one minim in reversed accent in the 18th of Bach's *Goldberg Variations* owes its smooth harmonic expression to the fact that the two canonic parts move in sixths which would be simultaneous but for the pause of the minim which reverses the accents of the upper part while it creates the suspended discords which give harmonic character.

Two other canonic devices have important artistic value, viz., *augmentation* and *diminution* (two different aspects of the same thing) and *inversion.* In augmentation the imitating part sings twice as slow as the leader, or sometimes still slower. This obviously should impart a new dignity to the melody, and in diminution the usual result is an accession of liveliness. Beethoven, in the fugues in his sonatas *opp.* 106 and 110, adapted augmentation and diminution to sonata-like varieties of thematic expression, by employing them in triple time, so that, by *doubling* the

II. *Theme of Fugue in Beethoven Sonata, op. 106*



length of the original notes across this triple rhythm, they produce an entirely new rhythmic expression. (*See* C.)

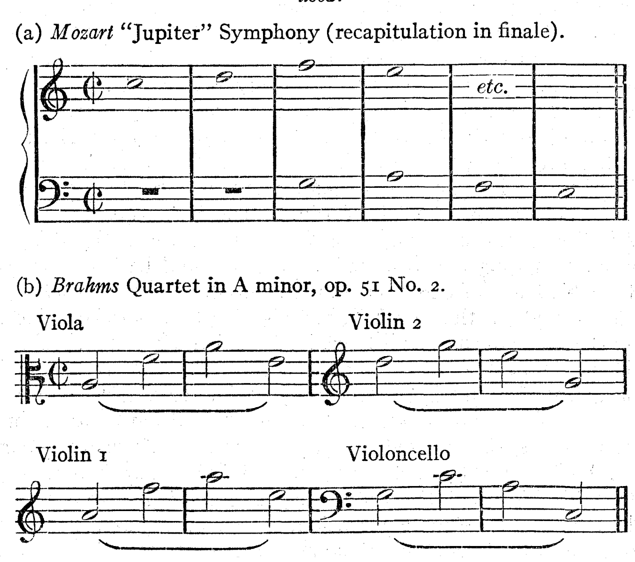
The device of *inversion* consists in the imitating part reversing every interval of the leader, ascending where the leader descends and *vice versa.* Its expressive power depends upon so fine a sense of the harmonic expression of melody that its artistic use is one of the surest signs of the difference between classical and merely scholastic music. There are many melodies of which the inversion is as natural as the original form, and does not strikingly alter its character. Such are, for instance, the theme of Bach's *Kunst der Fuge,* most of Purcell's contrapuntal themes, the theme in the fugue of Beethoven's sonata, *op.* 110, and the eighth of Brahms's variations on a theme by Haydn. But even in such cases inversion may produce harmonic variety as well as a sense of melodic identity in difference. Where a melody has marked features of rise and fall, such as long scale passages or bold skips, the inversion, if productive of good harmonic structure and expression, will be a powerful method of transformation. This is admirably shown in the 12th of Bach's *Goldberg Variations,* in the 15th fugue of the first book of his *Forty-eight Preludes and Fugues,* in the finale of Beethoven's sonata, *op.* 106, and in the second subjects of the first and last movements of Brahms's clarinet trio. The only remaining canonic device which figures in classical music is that known as *cancrizans,* in which the imitating part reproduces the leader backwards. It is of extreme rarity in serious music; and, though it sometimes happens that a melody or figure of uniform rhythm will produce something equally natural when read backwards (as in III.), there is only one example of its use that appeals to the ear as well as the eye. This is to be found in the finale of Beethoven's sonata, *op.* 106, where it is applied to a theme with such sharply contrasted rhythmic and melodic features that with long familiarity a listener would probably feel not only the wayward humour of the passage in itself, but also its connection with the main theme. All these devices are also independent of the canonic idea, since there are so many methods of transforming themes in themselves, and need not always be used in contrapuntal combination.

II. FUGUE

In the polyphonic 16th century motets the essentials of canonic effect are embodied in the entry of one voice after another with a definite theme stated by each voice, often at its own convenient pitch, thus producing a free canon for as many parts as there are voices, in alternate intervals of the 4th, 5th and octave, and at artistically proportionate distances of times. It is not necessary for the later voices to imitate more than the opening phrase of the earlier, or, if they do imitate its continuation, to keep to the same interval.

Such a texture differs in no way from that of the fugue of more modern times. But the form is not what is now understood as fugue, inasmuch as 16th century composers did not normally think of writing long movements on one theme or of making a point of the return of a theme after episodes. With the appearance of new words in the text, the 16th century composer naturally took up a new theme without troubling to design it for contrapuntal combination with the opening; and the form resulting

III. *Harmless cancrizans devices for the eye, depending on the clefs used.*



from this treatment of words was faithfully reproduced in the instrumental *ricercari* of the time. Occasionally, however, breadth of treatment and terseness of design combined to produce a short movement on one idea indistinguishable in form from a *fughetta* of Bach; as in the *Kyrie* of Palestrina's *Missa Salve Regina.* But in Bach's art the preservation of a main theme is more necessary the longer the composition; and Bach has an incalculable number of methods of giving his fugues a symmetry of form and balance of climax so subtle and perfect that we are apt to forget that the only technical rules of a fugue are those which refer to its texture.

In *Die Kunst der Fuge* Bach has shown with the utmost clearness how in his opinion the various types of fugue may be classified. That extraordinary work is a series of fugues, all on the same subject. The earlier fugues show how an artistic design may be made by simply passing the subject from one voice to another in orderly succession (in the first example without any change of key except from tonic to dominant). The next stage of organization is that in which the subject is combined with inversions, augmentations and diminutions of itself. Fugues of this kind can be conveniently called stretto-fugues.[1] The third and highest stage is that in which the fugue combines its subject with contrasted counter-subjects, and thus depends upon the resources of double, triple and quadruple counterpoint. But of the art by which the episodes are contrasted, connected climaxes attained, and keys and subtle rhythmic proportions so balanced as to give the true fugue-forms a beauty and stability second only to those of the true sonata forms, Bach's classification gives us no direct hint.

A comparison of the fugues in *Die Kunst der Fuge* with those elsewhere in his works reveals a necessary relation between the nature of the fugue-subject and the type of fugue. In *Die Kunst der Fuge* Bach has obvious didactic reasons for taking the same subject throughout; and, as he wishes to show the extremes of technical possibility, that subject must necessarily be plastic rather than characteristic. Elsewhere Bach prefers very lively or highly characteristic themes as subjects for the simplest kind of instrumental fugue. On the other hand, there comes a point when the mechanical strictness of treatment crowds out the rhetorical development of musical ideas; and the 7th fugue (which is one solid mass of stretto in augmentation, diminution and inversion) and the 12th and 13th (which are inverted bodily) are academic exercises outside the range of free artistic work. On the other hand, the fugues with well-developed episodes and the fugues in double and triple counterpoint are perfect works of art and as beautiful as any that Bach wrote without didactic purpose. The last fugue Bach worked out up to the point where three subjects, including the notes B, A, C, H, were combined. It has been found that the theme of the rest of *Die Kunst der Fuge* makes a fourth member of the combination and that the combination inverts. This accounts for the laborious exercises shown in the 12th and 13th fugues. It is high time that teachers of counterpoint took *Die Kunst der Fuge* seriously.

Fugue is still, as in the 16th century, a texture rather than a form; and the formal rules given in most technical treatises are based, not on the practice of the world's great composers, but on the necessities of beginners, whom it would be as absurd to ask to write a fugue without giving them a form as to ask a schoolboy to write so many pages of Latin verses without a subject. But this standard form, whatever its merits may be in combining progressive technique with musical sense, has no connection with the true classical types of fugue, though it played an interesting part in the renascence of polyphony during the growth of the sonata style, and even gave rise to valuable works of art (*e.g.* the fugues in Haydn's quartets, *op.* 20).

One of its rules was that every fugue should have a stretto. This rule, like most of the others, is absolutely without classical warrant; for in Bach the ideas of stretto and of counter-subject almost exclude one another except in the very largest fugues, such as the 22nd in the second book of the Forty-eight; while Handel's fugue-writing is a masterly method, adopted as occasion requires, and with a lordly disdain for recognized devices. But the pedagogic rule proved to be not without artistic point in later music; for fugue became, since the rise of the sonata-styles a contrast with the normal means of expression instead of being itself normal. And while this was so, there was considerable point in using every possible means to enhance the rhetorical force of its peculiar devices, as is shown by the astonishing dramatic fugues in Beethoven's last works. Nowadays, however, polyphony is universally recognized as a permanent type of musical texture, and there is no longer any reason why if it crystallizes into the fugue-form at all it should not adopt the classical rather than the pedagogic type. It is still an unsatisfied wish of accurate musicians that the term fugue should be used to imply rather a certain type of polyphonic texture than the whole form of a composition. We ought to describe as "written in fugue" such passages as the first subjects in Mozart's *Zauberflöte* overture, the andantes of Beethoven's first symphony and C minor quartet, the first and second subjects of the finale of Mozart's G major quartet, the second subject of the finale of his D major quintet, and the exposition of quintuple counterpoint in the coda of the finale of the *Jupiter Symphony,* and countless other passages in the developments and main subjects of classical and modern works in sonata form.

[1]For technical terms *see* articles COUNTERPOINT and FUGUE.

III. COUNTERPOINT ON A CANTO FERMO

The early practice of building polyphonic designs on a voice-part confined to a given plain-song or popular melody furnishes the origin for every contrapuntal principle that is not canonic, and soon develops into a canonic principle in itself. When the *canto fermo* is in notes of equal length and is sung without intermission, it is of course as rigid a mechanical device as an acrostic. Yet it may have artistic value in furnishing a steady rhythm in contrast to suitable free motion in the other parts. When it is in the bass, as in Orlando Lasso's six-part *Regina Coeli,* it is apt to cramp the harmony; but when it is in the tenor (its normal place in 16th century music) or any other part, it determines little but the length of the composition. It may or may not appeal to the ear; if not, it at least does no harm, for its restricting influence on the harmony is small if its pace is slower than that of its surroundings. If, on the other hand, its melody is characteristic, or can be enforced by repetition, it may become a powerful means of effect.

When the rhythm of the *canto fermo* is not uniform, or when pauses intervene between its phrases, whether these are different figures or repetitions of one figure in different parts of the scale, the device passes into the region of free art. An early example of its simplest use, as it appears in Josquin's wonderful Miserere, is described in the article MUSIC and in a motet by Lasso. A 16th century mass, when it is not derived from those secular melodies to which the Council of Trent objected, is often so closely connected with the Gregorian tones, or at least with the themes of some motet appropriate to the holy day for which it was written, that in a Roman Catholic cathedral service the polyphonic music of the best period co-operates with the Gregorian intonations to produce a consistent musical whole with a thematic coherence oddly suggestive of Wagnerian *Leitmotif.* In later times the Protestant music of Germany attained a similar consistency, under more popular and complex musical conditions, by the use of chorale-tunes; and in Bach's hands the fugal and other treatment of chorale-melody is one of the most varied and expressive of artistic resources. The chorale is not unknown in Handel's English works. The passage "the kingdoms of the world" in the "Hallelujah Chorus" (down to "and He shall reign for ever and ever") is a magnificent development of the second part of the chorale *Wachet auf* ("Christians wake, a voice is calling"); and it would be easy to trace a German or Roman origin for many of the solemn phrases in long notes which in Handel's choruses so often accompany quicker themes.

From the use of an old *canto fermo* to the invention of an original one is a small step; and merges into the free development of counterpart on a *canto fermo* the general art of combining melodies which gives harmony its deepest expression and musical texture its liveliest action. Nor is there any such line to separate polyphonic from non-polyphonic methods of accompanying melody; and Bach's *Orgelbüchlein* and Brahms's posthumous organ-chorales show every conceivable gradation between plain harmony or arpeggio and the most elaborate canon.

In Wagnerian polyphony canonic devices are rare except in such simple moments of anticipation or of communion with nature as we have before the rise of the curtain in the *Rheingold* and at daybreak in the second act of the *Götterdämmerung.* On the other hand, the art of combining contrasted themes crowds almost every other kind of musical texture (except tremolos and similar emotional symptoms) into the background, and is itself so transformed by new harmonic resources, many of which are Wagner's own discovery, that it may almost be said to constitute a new form of art. The influence of this upon instrumental music is as yet helpful only in forms which break away from the limits of the sonata style. Styles which break further away than the omnivorous art of Richard Strauss generally revolt against polyphony altogether. That revolt is suicidal, and polyphony returns every time a brand-new theory of harmony has pitchforked it out. All that is certain is that the two elements by which the music of the future will solve its problem are not those of instrumentation and external expression, but phrase-movement (or musical paragraphing) and counterpoint. These have always been the elements which suffered from neglect or anarchy in earlier transition periods, and they have always been the elements that gave rationality to the new art to which the transitions led. (D. F. T.)

CONTRAST, a term used in psychological discussion to designate the tendency of a given mental phenomenon to arouse or to encourage its opposite. Contrast has been alleged as one basis of "idea association," but its most definite demonstrations are found in the domain of sensation, particularly vision. The action may be either "simultaneous" or "successive," according as the aroused opposite appears concomitantly in a separate sensory area, or in the same area as the primary phenomenon at a later time. Thus, a bright surrounding field makes a grey spot look darker, while a dark outlying field causes it to appear brighter, than normal. After stimulation of the retina with white a dark after-image appears. Colour or chromatic contrast consists of an analogous tendency for each hue to arouse its complementary. Contrast is probably less potent for all aspects of mental life than is the opposed principle of *assimilation.*

CONTRAVALLATION: *see* CIRCUMVALLATION, LINES OF.

CONTREDANSE, a dance derived from the English country dance, whence also it takes its name, which enjoyed much popularity both in France and Germany during the 18th century and later. Although the derivation of the name has been disputed, it is confirmed by the character of the dance itself, which had obvious features in common with those of its English original. The name was also applied to the music for such dances, of which Beethoven and Mozart both left examples.

CONTRERAS, a hamlet about eight miles S.W. of the city of Mexico. It was in the vicinity of this small town that Maj-Gen. Winfield Scott, with some 4,200 American troops of his column in the southern campaign of the war between Mexico and the United States (1846–48) encountered first the difficult barriers of *pedregal* (lava beds) and lakes surrounding his adversary's capital. In this particular defence Gen. Santa Anna employed about 7,000 Mexicans, although possibly three times that number occupied forts and redoubts at critical points elsewhere about the city. Scott, having circled to the south of his goal, found, upon determined reconnaissance, that San Antonio directly in his front was so heavily defended that an assault might cripple him. He decided to build a road over the *pedregal* toward the west, thereby pinching out Santa Anna's strong position. Accordingly on Aug. 19, 1847, Maj.-Gen. G. J. Pillow's division was ordered to supply working parties and push forward the road the engineers were building and to brush aside any small resistance without bringing on a general engagement. Pillow, however, after being stopped, decided to attack. In the premature struggle only the natural team work of the trained leaders, such as Riley, Smith and Magruder, saved defeat until Scott, coming upon the field, ordered a concentration of his forces at San Gerónimo, the key position. Darkness, aggravated by a storm, cut Scott off from the knowledge of the whereabouts of his troops. In the early morning, Aug. 20, Capt. Robert E. Lee, after a voluntary, desperate ride across the *pedregal,* bore Scott the intelligence that Brig.-Gen. P. F. Smith had found a way to the enemy's rear and would attack at dawn. Scott prepared Twiggs to co-operate in front, and, as a result, San Gerónimo was taken in front, flank and reverse in less than 20 minutes. San Antonio was evacuated and the battle of Churubusco begun the same day. The cannon and ammunition captured from the Mexicans aided Scott materially. The Mexican losses were approximately 1,500 as against less than 100 Americans.

CONTREXÉVILLE, a watering-place of north-eastern France, in the department of Vosges, on the Vair, a tributary of the Meuse, 39 mi. W. of Épinal by rail. Pop. (1936) 959. Its mineral springs became generally known towards the end of the 18th century, and were developed after 1864 by the Société des Eaux de Contrexéville. The season is from May to September. The *Colonnade des Sources* (1911) covers most of the mineral springs in use, and their cold saline waters are drunk as treatment for gout and gravel. The surrounding hilly country (Monts Faucilles) is well wooded.

CONTROL, that which checks or regulates anything (Fr. *contrôle,* older form *contre rolle,* a counter roll or copy of a document used to check the original), and so especially command of body or mind by the will, and generally the power of regulation. In England the "Board of Control," abolished in 1858, was the body which supervised the East India Company in the administration of India. In the case of "controller," a general term for a public official who checks expenditure, the more usual form "comptroller" is a wrong spelling due to a false connection with "accompt" or "account." A "control" or "control-experiment," in science, is an experiment used, by an application of the method of difference, to check the inferences drawn from another experiment.

For control in wartime of trade, industry, shipping, etc., *see* WAR CONTROL OF FOOD; WAR CONTROL OF SHIPPING; ALLIED MARITIME TRANSPORT COUNCIL.

CONTROLLED ESTABLISHMENTS. Controlled establishments (1915–1918) were factories mobilized in Great Britain under the Munitions of War Act, passed in July 1915, shortly after the Ministry of Munitions was set up. Under this act, and the amending statute passed in Jan. 1916, the minister of munitions had power to make an order declaring any establishment to be controlled if munitions work were carried on in it, and if he judged such control to be expedient.

The term munitions work, in its extended use, embraced not only the manufacture of arms, ammunition and explosives, ships, vessels, vehicles and aircraft, but also the production of metals, machinery and tools, and the carrying out of other ancillary processes and services involved in munitions production, such as works of construction for naval or military purposes, the provision of houses for munition workers, work on docks and harbours, the supply of light, heat, water, power or tramways, and the repair of fire engines. The minister of munitions was thus given a wide discretion in selecting factories to be controlled as essential munition works.

Within a month of the passing of the act, 345 establishments were declared controlled, including the great armament and shipbuilding firms and firms making aircraft. To these the machine tool makers were added and the list was gradually extended to include all the principal firms in the engineering, iron and steel and chemical trades, together with makers of mechanical vehicles, rubber goods and optical instruments, as well as certain miscellaneous establishments engaged on textile and printing work. By Oct. 1915 the number had reached 1,000. It was 2,000 by December; 3,500 by May 1916; 4,600 by the end of that year. It reached 5,000 in July 1917, and the extension of control to certain smaller factories brought the final total up to 5,600 at the time of the Armistice. In Jan. 1918 more than 1,600,000 men and 600,000 women were employed in controlled establishments, including the 160 Government factories. While employment in controlled establishments accounted for only a portion of the 2,500,000 men and 1,000,000 women war workers in 1918, the importance of whose work was recognized by its inclusion in the "schedule of protected occupations," its true significance is shown by the fact that the controlled establishments included practically all the 1,200,000 workpeople estimated to have been employed at the date of the Armistice on the production of destructive munitions proper. These establishments thus constituted the central and essential nucleus of war-time factories, and their work was properly regarded as of the same order of importance as that of the national factories established during the World War and administered directly by the Government.

The Underlying Bargain.—The form of regulation to which an establishment was subjected by an order declaring it to be controlled was concerned primarily with: (*a*) the suspension of trade union rules and practices tending to restrict output, and the avoidance of strikes, (*b*) the limitation of the owners' profits to a reasonable level. The restriction of trade union activities on the one side, and of profiteering on the other, might appear at first sight to be less essential than the control of industrial and manufacturing activities proper. The explanation of this anomaly is historical, for the genesis of the controlled establishment lies in the vain efforts made during the first eight months of the war to secure sufficient labour for armament manufacture, and to mitigate disputes in the engineering and shipbuilding trades by negotiation. The culminating point in this process was reached at a conference with trade union leaders held on March 17–19, and March 25, 1915, at which the full forces of the Government were brought into play to secure a voluntary agreement ensuring industrial peace for the duration of the war. The outcome of the conference was a declaration, known as the Treasury Agreement, by which some 35 trade unions declared their willingness to recommend to their members that each union should take into favourable consideration such changes in working conditions and trade customs as might be necessary to accelerate output, and that during the war period there should in no case be any stoppage of work upon munitions.

In view of this declaration it was announced by the chancellor of the Exchequer (Mr. Lloyd George) that "it is the intention of the Government to conclude arrangements with all the important firms engaged wholly or mainly upon engineering or shipbuilding work for war purposes, under which their profits will be limited, with a view to securing that benefit resulting from the relaxation of trade restrictions or practices shall accrue to the State." It was further laid down that the contemplated relaxation of trade practices should apply solely to war work, for war purposes and during the war period. The pledge was thus limited on either side to a statement of intentions, and the trade unions looked to the Government to take the first step, believing that, so long as contractors' profits were unregulated, any sacrifice of rules and restrictions would directly enhance the profits of private persons. Thus three months went by. Then the Munitions of War Act was passed, containing among its leading provisions the necessary sanctions for the carrying out of the bargain.

Implications of Control.—The act prescribed that in a controlled establishment any rule, practice or custom tending to restrict production or employment should be suspended, and that the workpeople should be bound under penalties to observe rules, approved by the minister of munitions, affecting workshop discipline and efficiency. On the other hand the profits of the establishment were to be regulated, and any excess over a standard amount was to be paid into the Exchequer.

The broad principle under which limitation of profits was imposed was subject to important adjustments and qualifications necessitated by the increase of capital expenditure or the adoption of costly methods of speeding up output. To secure the maximum scale of production it was in fact as necessary to guarantee an equitable return as to confiscate the proportion of profit which might be held to be excessive. Clearly, as a mode of war-time taxation the munitions levy, with its narrowly restricted area of application, was something of an anomaly, and in any case this aspect of the controlled establishment lost its importance after Dec. 31, 1916, from which time the levy was merged in the provisions of the general excess profits tax instituted by the Finance Act of 1917.

In addition to the control of profits, the owner of a controlled establishment was in a special sense subjected to the oversight of the minister of munitions as regards wages and employment, these questions being inevitably involved in the endeavour to enforce the fulfilment of the terms of the Treasury Agreement, now enshrined in a schedule to the act. In carrying out this policy the owner received the fullest measure of official direction and assistance, and had substantial inducements to apply for control. In particular, submission to control earned the right to apply for skilled workmen enrolled as war munition volunteers, who could be assigned only to a controlled establishment.

A controlled establishment was thus an industrial concern in which the State held a partnership, sharing both in the management and in the profits. The extent of this participation was, however, strictly limited. The Government did not, as has often been supposed, take over the management of the establishment, nor did it accept financial responsibility for its operation or liabilities. There was no transfer of ownership, nor did the owner become an agent of the Government. The situation of a controlled establishment remained, indeed, throughout its history in sharp contrast to that of the new national factories built or established on Government account and occupied and operated by the State. These were in a different category, though by the powers of the Munitions of War (Amendment) Act, 1916, they were definitely classified among controlled establishments for purposes of labour regulation.

War-Time Control.—It is well to emphasize the fact that the forms of control specifically applicable to this special class of establishment constituted only a minor part of the general system of industrial control exercised by the minister of munitions, to say nothing of those parts of the industrial field which fell to the War Office, Admiralty and Air Ministry, the Board of Trade, the Ministry of Food, and other departments. The minister of munitions was armed with wider powers than those relating exclusively to controlled establishments not only by the Munitions of War Acts but also, and in particular, by the Defence of the Realm Acts. Thus the Defence of the Realm (Amendment) No. 2 Act, 1915, gave powers to take possession of and use *any* factory or workshop of whatever sort, or the plant of any factory. Authority was also given to require any work done in *any* factory or workshop to be carried on in accordance with directions given for the purpose of making the factory or workshop, or the plant or labour engaged in it, as useful as possible for the production of war material. This control included the right to restrict and regulate the kind of work done, the employment of labour, the supply of metals or materials, the transfer of plant to other establishments. One particularly important application of these powers was the imposition on industry generally of a system of priority control, devised to ensure that war work should receive preference over other work.

The official control of munitions industries could never have been effective had these regulative provisions been confined to controlled establishments, unless the latter category, as was never contemplated, had been made co-extensive with munitions manufacture. In point of fact the number of firms which executed contracts for the minister of munitions was three or four times as great as the number of controlled establishments. In such circumstances the regulations affecting labour inside controlled establishments clearly had to be applicable to similar labour elsewhere. So, again, the control over certain categories of wages in controlled establishments, set up by the Munitions of War (Amendment) act, 1916, inevitably spread over the whole sphere of industrial employment. Similarly the efforts to apply the policy of labour dilution by forcing the infiltration of women and semi-skilled workers, so as to make up for the ever growing scarcity of fully trained operatives, obviously implied the restriction of employment outside, as well as its encouragement inside, the sacred circle of essential occupations. Since the fulfilment of all the more urgent tasks of the Ministry of Munitions was conditional on the removal of these stumbling blocks, it was inevitable that the controlled establishment as such, had less and less administrative significance as the months grew into years and the mobilization of the whole of the national resources became more and more comprehensive.

Restoration of pre-war Practices.—The obligation to restore the practices and customs abandoned for war purposes was not likely to be overlooked by the trade unions concerned, and was, in fact, the subject of continuous and jealous watchfulness. Thus, when the amendment of the Munitions of War Act was under consideration in the summer of 1917, the inclusion of a clause providing guarantees and sanctions for fulfilment of the pledge was pressed upon the Government, but was postponed. A further bill was drafted and considered in the early months of 1918 in which this question was prominently dealt with, but action was again suspended, until the trade union protests became clamorous. It was feared that rigid insistence on immediate fulfilment might result in chaos, since it would involve the wholesale dismissal of dilutees and gravely accentuate the inevitable displacement of labour due to the cessation of the war demands. Finally, on Nov. 13, 1918, the prime minister (Mr. Lloyd George) and other ministers met representatives of employers and trade unions and asked for an advisory committee to consider and agree upon the form to be taken by the bill. It was not, however, until the spring of 1919 that agreement could be reached, and the Restoration of Pre-War Practices Act, 1919, was not actually passed until Aug. 15. Though admittedly incomplete, the records of departures from pre-war customs then numbered between 30,000 and 40,000. The act made it obligatory, subject only to mutual agreement, that these practices should be restored within two months and be maintained in force for one year thereafter. Thus was the Treasury Agreement finally implemented. (G. I. H. L.)

CONTROLLING INTEREST, a financial term having two significations: (1) a person or group of persons who own 51% or more of the voting stock of a corporation and who could thereby control stockholders' meetings; and, (2) a person or group of persons who either by ownership or proxy have the voting rights to a sufficient amount of the capital stock of a corporation to control a stockholders' meeting.

The voting rights to 51% of the voting stock will always give this power of control, but it can often be exercised with a much smaller percentage for one or more of the following reasons: (1) A considerable minority of the voting stockholders may be closely organized and in agreement to vote together on certain questions, or at an election. The remainder may be unorganized and their votes divided in several ways. Let us suppose that about 30% of the votes are banded together and that the other 70% have no organization. If the 70% is divided several ways, some of it even voting inadvertently with the organized minority, the minority will very probably carry its points. (2) A minority of all the stock may constitute a majority of the stock actually voting, as it is very unusual to have more than 75% of the stock represented at a meeting. In such a case a minority consisting of 38% of all the voting stock would control the meeting, even if all the remaining stock present were united against it. (3) Sometimes stock votes by classes and a minority class may be given the privilege of choosing a majority of the board of directors. Consider a case of a company whose common stock represents 60% and whose preferred stock represents 40% of the whole. If there are nine directors, it may be so arranged that the preferred stock always chooses five of them and the common stock the remaining four. In such a case, the majority of the preferred stock, which is about 21% of all the stock, can elect a majority of the directors and thus control. (4) Stock with a strict vetoing power exerts a strong negative control over various affairs. A certain class of stock, for example, 20% of the total, may be classified as non-voting for ordinary purposes, and yet the certificate of incorporation may provide that certain things may not be done without the consent of the majority of this class. In such a case, the holders of the majority of this stock, which would be only about 11% of the entire stock, can block action. (5) Where statutes do not prohibit it, certificates of incorporation sometimes provide that more than a bare majority of the total vote shall be required to perform certain acts, such as the election of directors, the necessary portion being sometimes $\frac{3}{5}$, $\frac{2}{3}$ or $\frac{3}{4}$. In such cases a minority once in power can remain so by blocking elections and other actions requiring the large vote. (J. H. B.)

CONTROLS, RECEIVING SET (RADIO): *see* RADIO RECEIVER.

CONTUMACY, a stubborn refusal to obey authority, obstinate resistance; particularly, in law, the wilful contempt of the order or summons of a court (*see* CONTEMPT OF COURT). In ecclesiastical law, the contempt of the authority of an ecclesiastical court is dealt with by the issue of a writ *de contumace capiendo* from the court of chancery at the instance of the judge of the ecclesiastical court; this writ took the place of that *de excommunicato capiendo* in 1813, by an act of George III ch. 127 (*see* EXCOMMUNICATION).

CONUNDRUM. Originally a term meaning whim, fancy or ridiculous idea; later applied to a pun or play upon words, and thus to a particular form of riddle in which the answer depends on a pun. The word is also used of any puzzling question or difficulty.

CONVECTION, the transference of a mass of fluid against the force of gravity. If a fluid is heated from below it becomes less dense than the super-incumbent fluid and rises, the latter falling and taking its place. This motion involves an upward transfer of heat and is quite distinct from conduction (*see* HEAT), whereby the heat is transferred in all directions equally by the vibrations of molecules (for isotropic media, ISOTOPES) and from radiation (*see* RADIATION, RAYS), which is transmitted by the ether (*q.v.*).

Convective equilibrium occurs in the atmosphere in temperate regions where a steady circulation of the atmosphere is preserved. It is adiabatic (*see* THERMODYNAMICS).

CONVENIENCE GOODS, a name applied in the United States to a large class of articles which, whatever the source, are so similar in quality that consumers will accept them without making any effort to enquire into them or to compare values. (*See* STANDARDIZATION.)

CONVENT, a term applied to the body of persons associated together in a monastery, whose official designation is "the abbot (or prior, etc.) and convent" of the place in question (Lat. *conventus,* from *convenire,* to come together). The popular use of the word for a nunnery, as distinct from a monastery or house of male religious, is strictly inaccurate: all houses of religious communities are monasteries, irrespective of the sex of the convent which inhabits them, and the term convent is equally free from such limitations.

CONVENTION, a word of very various meanings, but always conveying the sense of its Latin original (*conventio,* from *convenire,* to come together). Thus it may mean a meeting or assembly; an agreement between parties; a general agreement on which is based some custom, institution, rule of behaviour or taste, or canon of art; hence extended to the abuse of such an agreement, whereby the rules based upon it become "conventional" *i.e.* lifeless and artificial. The word is of some interest historically and politically. It is used of an assembly of the representatives of a nation, state or party, and is particularly contrasted with the formal meetings of a legislature. It is thus applied to those parliaments in English history which, owing to the abeyance of the crown, have assembled without the formal summons of the sovereign; *e.g.* the convention parliament which in 1660 restored Charles II. to the throne. More recently it has had the meaning of an assembly summoned to frame a constitution, as distinct from a merely legislative assembly. Such, at least in its original intention, was the National Convention which ruled France from Sept. 1792 to Oct. 1795. The statutory assembly of delegates which framed the Constitution of the United States of America in 1787 was called the Constitutional Convention; and the various American State Constitutions have been drafted and are from time to time revised by constitutional conventions. In the party system of the United States the nomination of party candidates for office or election was formerly in the hands of delegates chosen by the primaries, meeting in the convention of the party; and the convention system was universal, from the national conventions of the Republican and Democratic Parties, which still nominate the candidates for the Presidency and Vice-Presidency, down to city or county conventions, which nominated the candidates for local offices. Except for the nomination of candidates for the highest offices, the convention has been superseded by the primary election in most instances. In diplomacy, "convention" is a general name given to international agreements other than treaties, but not necessarily differing either in form or subject-matter from a treaty, and sometimes used quite widely of all forms of such agreements (*see* TREATIES).

CONVENTION, THE NATIONAL, in France, the constitutional and legislative assembly which sat from Sept. 20, 1792 to Oct. 26, 1795 (the 4th of Brumaire of the year IV.). It was the first French assembly elected by universal suffrage, without distinctions of class.

See FRANCE: *History;* GIRONDISTS; MOUNTAIN, THE; DANTON; ROBESPIERRE; MARAT, etc.

CONVERGENCE: *see* SERIES.

CONVERSANO, a town and episcopal see of Apulia, Italy, province of Bari, 17m. S.E. by rail from the town of Bari. Pop. (1936) 13,234 (town), 15,677 (commune). It has a fine southern Romanesque cathedral of the end of the 11th century (the interior was destroyed by fire in 1912) and a picturesque castle which from 1456 belonged to the Acquaviva family, dukes of Atri and counts of Conversano. The convent of S. Benedetto is one of the earliest offshoots of Montecassino.

CONVERSION, a general term for the operation of converting, changing or transposing; used technically in special senses in logic, theology and law. (Lat. *conversio,* from *convertere,* to turn or change.)

In logic, conversion is one of three chief methods of immediate inference by which a conclusion is obtained directly from a single premise without the intervention of another premise or middle term. A proposition is said to be "converted" when the subject and the predicate change places; the original proposition is the "convertend," the new one the "converse." The chief rule governing conversion is that no term which was not *distributed* in the convertend may be distributed in the converse; nor may the quality of the proposition (affirmative or negative) be changed. A term is said to be "distributed" when it is taken universally; in the proposition "men are mortal" (meaning "all men") the term "men" is "distributed" while "mortal" is undistributed, because there are mortal beings which are not men. It follows that of the four possible forms of propositions A, E, I and O, E and I can be converted simply. *No S is P* implies *No P is S;* and *Some S is P* implies *Some P is S.* This form of conversion is called Simple Conversion; E propositions convert into E, and I into I. On the other hand, A cannot be converted simply. If all men are mortal, the most that can follow by conversion is that some mortals are men. This is called Conversion by Limitation or *Per Accidens.* Only if it be known otherwise that the predicate also is distributed can there be simple conversion of a universal affirmative. Neither of these forms of conversion can be applied to the particular negative proposition O, which has to be dealt with under a secondary system of conversion, as follows. The terminology by which these secondary processes are described is not altogether satisfactory, and logicians are not agreed as to the application of the terms. The following system is perhaps the most commonly used. We have seen that the converse of *All S is P* is *Some P is S;* we can, in addition, derive from it another, though purely formal, proposition *No S is non-P, i.e.,* an E proposition. This process is called Obversion, Permutation or Immediate Inference by Privative Conception; it is applicable to every proposition including O. A further process known as Contraposition or Conversion by Negation, consists of conversion following on obversion. Thus from *All S is P* we get *No non-P is S.* In the case of the O proposition we get (by obversion) *Some S is non-P* and then (by conversion) *Some non-P is S* (*i.e.,* an I proposition). In the case of the I proposition the contrapositive is impossible, as infringing the main rule of conversion. Another term, Inversion, has been used by some logicians for a still more complicated process by the alternative use of conversion and obversion, which is applicable to A and E, and results in obtaining a proposition concerning the contradictory of the original subject; thus *All S is P* becomes *Some non-S is not P.*

Considerable discussion has centred on the problem as to whether the process of conversion can properly be regarded as inference. The essence of inference is that the conclusion should embody knowledge which is not in the premise or premises, and many logicians have contended that no fact is stated in the converse which was not in the convertend, or, in other words, that conversion is merely a transformation or verbal change of the same statement. Hence the term Eductions and Equivalent Propositional Forms have been given to converse propositions. It is clear, for instance, that if the universal affirmative is taken connotatively as a scientific law, and not historically, no real inference is achieved by stating as another scientific fact its converse, the particular affirmative. Moreover, even if the convertend is stated as an historic fact, though there is acquired a certain new significance, it may well be argued that the inference is not immediate but syllogistic.

RELIGIOUS

Religious conversion is, in English, a convenient label for describing a considerable group of human experiences which have in common the one general feature that they involve a change from an unorganized life to a life organized around a central idea. Medical psychology has given its considered opinion that such organization is not only normal but necessary to the general well-being of the individual. Those persons who demur to the interpretation of life in any sense in terms of religion declare that conversion is merely a psychological phenomenon, though still a fact to be studied. Those, however, who accept the religious interpretation of life in its widest sense are universally agreed that whatever form conversion may take it is the most momentous event in the life of every individual and is indispensable to the task of making the best use of that life.

Essential Features.—The essential feature of conversion is the unification of character. Nevertheless, a distinction is to be drawn between true conversion and other kindred phenomena, which are described respectively as counter-conversion, reversion, recognition, return, development and crises of conscience. In the case of an ardent Roman Catholic priest who became a freethinker what happened may be described as "counter-conversion." The return of a lapsed individual to the faith of his earlier days may be more correctly termed "reversion." "Recognition" is the vital realization of a truth to which hitherto only verbal assent has been given. "Return" is either a conscious reversion to the faith and habits of childhood or an unconscious transference from systems which have weakened (because they have become unserviceable) to older objects of consciousness. "Development" may be distinguished from gradual conversion in that it involves no overturning of values. "Crisis of conscience" involves a change less searching than conversion, such, for example, as when a politician changes from one party to another. On the other hand, true moral conversion is an actual overturning of values and involves a species of new creation. It has been defined as "a mutation of life occurring under the impulse of an ultra-terrestrial ideal" (De Sanctis). Or again as "a reaction taking the form of a psychological surrender to an ideal and issuing in moral development" (Underwood). It has been further subdivided into gradual and sudden, or, as De Sanctis calls it, fulminant and progressive, and Starbuck, impulsive and volitional. There are those who shrink from admitting that any conversion is really sudden or fulminant, and will only allow that a gradual process extending over a considerable time may culminate in a crisis. In some cases a real change occurs, but the crisis is apparently absent; it would seem that these are not true conversions but merely instances of development, since the term "mutation" in zoology is applied only to sudden or saltatory changes. It must be admitted that those who have been brought up to expect a crisis often tend to experience one, or, at any rate, to think that they do. This may be due either to auto-suggestion or to inherited temperament. It is further to be noted that the so-called turning-point at which the consciousness of the absolute ideal, hitherto marginal and vague, becomes focal and clearly defined, not infrequently occurs at the beginning rather than at the end of the process. Thus it has been pointed out that not all the early Buddhist converts were unified and made happy as soon as they accepted the rule of life prescribed by the Buddha, and that John Bunyan was accustomed to date his conversion from the time when he gave up lying and profanity, although unification and happiness did not come to him until some years later. Among Christians the necessity of "conversion" has in particular always been strongly urged by the Methodists, as it was by their founder, John Wesley, and it is specially characterized by them as the "new birth." Re-birth from sin has certainly been a constant feature connected with Christian discipleship from the first, and among adult converts, especially in the mission-field, it is an indisputable fact. Revival preachers, and especially Salvationists, insist on the importance of instantaneous conversion.

Age When Experienced.—The main features of conversion have been traced, however, in the life-stories of adherents of most of the great religions of the world. It is said that the phenomena belong almost exclusively to the years between the ages of 10 and 25, and that the number of instances outside that range appear few and scattered; in other words, that conversion belongs distinctively to the years of adolescence. The American psychologist, Starbuck, holds that the event comes earlier in general among females than among males, and most frequently at the ages of 13 and 16, while among males it occurs most frequently at the age of 17 or immediately before or after. The difficulty about accepting these conclusions is that Starbuck, like his fellow-countryman, William James, has drawn nearly all his evidence from protestant evangelical circles, and seems to have overlooked the fact that outside these circles and even sometimes inside them conversion may take place at much later periods of life. The American school in general seems, in fact, to confine conversion to the moral and religious crisis of adolescence. But this, however important, is only one type of conversion, and it is by no means certain that many of the recorded instances of it are not the result of strong suggestion. The most that can be said is that the period between the ages of 15 and 25 is the time when the greatest changes occur in human personality, and that therefore this is the most propitious epoch for the occurrence of decisive events in the history of individuals. Adolescence is only an extrinsic or indirect cause, a provocative stimulus to an intellectual and ethical transformation which requires for its completion the additional presence of a psychic factor. Indeed, the physiological causes of conversion can be greatly exaggerated.

Accompanying Phenomena.—Certain features commonly accompany the change, and they so greatly resemble the phenomena belonging to eroticism that conversion has actually sometimes been defined as "falling in love with God." In less picturesque language it has been described as a concentration of affective energy on the object of faith, a practical revision and a new economy of love. It is marked by an ecstasy of joy, a sensation of heat or fire in the breast, or the consciousness of a bright light (technically called a photism), great buoyancy and lightheartedness, a feeling of peace and release from perplexity, a sense of newness of life extending even to the external world surrounding the converted individual, voices or auditions which appear to be sensorial automatisms produced by the excited physical and mental condition of the subject, and above all (except, perhaps, in Buddhism) a sense of being under divine control so that the conversion seems something given rather than something achieved and is, in fact, felt to be the product of divine grace, not of human energy. Considerable difference of opinion has always existed as to the relation of individual free will to such a bestowal of grace. Some have held that man is merely the passive recipient, while others declare that a preliminary act of free will is necessary. Autobiographical accounts of many conversions exist, and have been collected in recent years. Two of the most striking are those relating to St. Augustine of Hippo and to Blaise Pascal. It is necessary, however, to bear in mind that converted subjects tend to indulge in autobiography, and that many devout persons whose religious development has been tranquil and unruffled have no such tales to tell.

The important question has further been raised whether the sense of "givenness" or grace is an illusion and whether conversion is not a predictable phenomenon due entirely to natural causes. The antithesis is a dangerous one, and involves our whole conception of the nature of divine activity. If a predictable mutation is to be excluded from the sphere of divine activity, the operation of the divine is then limited to the abnormal and (at present) unexplained. Such a limitation is now less in favour among religious thinkers than formerly. Nevertheless, it is admitted by many psychologists on both sides of the Atlantic that conversion, even if it be a normal phenomenon, can only be systematized and predicted to a limited extent, since the object studied by psychology, *i.e.,* the way in which personal beings usually think and act, is in its nature essentially different from the object of the physical sciences.

Favouring Conditions.—The situations favourable for the occurrence of religious conversion in an individual may be briefly summarized as follows:

(1) The presence of general religious tendencies deriving either from heredity, from the family or from early impressions.

(2) An habitual tendency of the intellect towards absolute convictions.

(3) A tendency of the individual spontaneously to fix the attention beyond and above the realities of the senses.

(4) A richness of affective potential or psychic energy held in suspension by the individual.

(5) The tendency of the individual to transfer his chief interests to questions of origin, purpose, destiny, and so forth.

(6) The recurrence of painful experiences.

In a narrower sense "conversion" is used to denote the acceptance of Christianity by non-Christians or the acceptance of Catholicism by non-Catholics. The problem is often debated in Christian circles as to the relation of the sacraments to conversion, the general Catholic view being that sacraments convey grace and confer character, while the general Protestant view is that they declare in symbolic form a change which has already taken place as the result of an act of faith on the part of the individual.

Modern Views.—The modern critical study of the Old Testament, coupled with the conclusions of science as to man's ancestry, status and prospects, have greatly modified the belief in the relation of man to grace and conversion. The view stated in the tenth article of the Church of England was as follows: "The condition of man after the fall of Adam is such that he cannot turn and prepare himself by his own natural strength and good works to faith and calling upon God: wherefore we have no power to do good works pleasant and acceptable to God, without the grace of God by Christ preventing us that we may have a good will, and working with us when we have that good will"; but this is no longer literally held by many persons who would still insist that they were believing Christians. The results of the science of anthropology show no indication of a primeval fall, but rather of a struggle upward marred by acts and periods of retrogression. Man may in consequence be hindered and hampered in his response to the love of God, but although it might still be held that the Divine approach to man preceded man's response, man's feeble responsiveness would no longer be regarded as due to a single primeval catastrophe, but rather to the vestiges in his nature of a sub-human ancestry—the unwilling dross which checks the flight of the soul to its Creator—or at most to the wounds and disease produced by the failures and acts of rebellion committed in the course of human history.

In English and American Law, conversion is the unauthorized exercise of dominion by one person over the property (other than money or chattels real) of another, in a manner inconsistent with his rights of possession. The history and exact definition of this form of actionable wrong have occupied the attention of many learned writers, and the incidents of actions to assert the rights of the true owner form a considerable part of treatises on the rules and forms of civil pleading. There are many ways in which the wrong may be committed. In some cases the exercise of the dominion may amount to an act of trespass or to a crime, *e.g.*, where the taking amounts to larceny or fraudulent appropriation by a person entrusted with the property of another. In such cases, except where money is taken, the civil remedy of the owner is by action for conversion or detention of the property. The remedy in use in these cases used to be by what was called an action on the case for trover and conversion, the plaintiff putting aside all suggestions of trespass and of crime, and resting his case on the fiction that the defendant had found and used goods not his own. The fictitious averment of loss, never required in the United States, was abolished in England by the Common Law Procedure Act 1852. Under the present procedure, in which the old forms of action are not in use, the remedy is by a claim (usually called conversion) for wrongfully depriving the true owner of personal property of its use and possession by some specified act inconsistent with his dominion over it, usually by dealing with the property in a manner inconsistent with the owner's rights. Originally, the action of trover and conversion was limited to goods and chattels, but it is now accepted as applying to valuable securities, such as cheques and bills of exchange.

Refusal to deliver up to the owner is sufficient to prove conversion, though it is often made the ground of an action for detinue, if the plaintiff desires to have the property returned in specie. The knowledge, motive or good faith of the person wrongfully dealing with the property of another is for civil purposes immaterial, and the action is often brought to try the title of two claimants to the same goods. Merely carrying or warehousing goods does not render the carrier or warehouseman liable for conversion, as they do not purport to change the property in the goods and exercise no dominion.

The exact measure of compensation due to a plaintiff whose goods have been wrongfully converted may be merely nominal if the wrong is technical and the defendant can return the goods; it may be limited to the actual damage where the goods can be returned, but the wrong is substantial; but in ordinary cases it is the full value to the owner of the goods of which he has been deprived. In fact the measure of damages is the loss actually sustained. Fraudulent conversion by any person to his own use (or that of persons other than the owner) of property entrusted to him was larceny at common law and under modern statutes (Larceny Act, 1916).

The term "conversion" is also used with reference to the rule of courts of equity which, in certain cases (following the maxim of treating as done what ought to have been done), treats as converted into personalty land which has been directed so to be converted by a will, contract, or settlement, or as converted into land personalty which has been by such instrument directed to be applied for purchase of realty. The rule is also applied where a vendor of land dies between the making of the contract of sale and its completion by conveyance of the land.

CONVERSION OF DEBT: *see* Debt Conversion.

CONVERTER: *see* Bessemer Steel.

CONVEX, the exterior of a rounded surface as opposed to "concave." (*See* Optics.)

CONVEYANCE, the act of conveying or transporting anything. The word is now used in three special senses: (1) a carriage or other means of transport; (2) in law, the transference of property by deed or writing between living persons; and (3) the written instrument by which such transference is effected. (*See* Laws Relating to Real Property and Conveyancing.)

CONVEYORS IN MASS PRODUCTION of manufactured articles of different kinds were used in non-mechanical industries long before the development of modern manufacturing made it profitable to consider their use. An indication of their age may be had from a book on millwrighting, published in Philadelphia by Oliver Evans in 1807 which shows the use of bucket, belt and screw conveyors in flour or grist mills. Whether these were in actual use or, like devices shown in some of Leonardo da Vinci's works, existed only in the mind of the author, it is impossible to say. Foundries were among the first of modern industries to adopt conveyors extensively, for the handling of materials on a large scale. Belts were used for carrying moulding sand for storing, for mixing or tempering, and for removing the sand from moulds. Moving platforms were also used at an early date for carrying moulds past the cupolas or pouring ladles, pausing long enough to have the metal poured and then continuing their travel until the moulds were cool enough to be dumped. This dumping in some cases, occurred while the metal casting was still very hot. Conveyors have been developed along many lines to meet the requirements of many industries. The best early example, and the one that probably gave the use of conveyors its greatest impetus, was in the Highland Park plant of the Ford Motor Company in Detroit, Mich. (*see* Mass Production). From a small beginning in one department this grew to enormous proportions, and contained many varieties of conveyors, devised or adapted to suit the peculiar requirements of the work in this plant. This development, beginning in about 1912 or 1913 has grown into use in practically every automobile plant, regardless of the size or quality of car built, and is now a standard part of factory equipment in any sort of manufacturing where the quantity handled is sufficient to justify it. The principle kept in mind in introducing conveyors at the Ford plant has been "to keep material three feet from the floor, and moving." The proper distance from the floor depends, of course, on the size and weight of the work and the convenience of the operator. One of the chief objects of the conveyor is to relieve the operators of as much manual labour as possible and so enable more and better work to be done. Keeping the work moving prevents the piling up of work in any department, avoids congestion around machines and aids in securing a steady flow of work by acting as a pacemaker to the men. This helps to secure a more constant output and at a higher rate than seems possible by the old method.

Conveyors are made in many forms and are adapted for use for widely diversified purposes. They may be gravity slides, rollers, either level or inclined enough to allow the work (either in single units or in some sort of container), to travel by gravity toward the next station. Power driven chains or belts, with cleats, hooks or other devices, carry raw materials, semi-finished or completed, from machine to machine, from department to department, from machine to inspection or to sub-assembly, and from there to the final assembly. The final assembly itself is frequently done on some sort of a chain, belt or truck that is power driven at a predetermined speed. Much ingenuity is displayed in devising special forms of conveying mechanisms by which the material being carried can be automatically diverted from one line to another, or be shunted to a side track to await removal. Conveyors move material, either by power or with a minimum of human effort, supply operators with material to work upon, and carry it away after the operations are completed. One of the advantages of conveyors is the reduction of the amount of material in process, since there is no accumulation of work or material in large quantities. This greatly reduces the amount of capital invested in material. The constant flow of material, coupled with the smaller quantities in process, also enables the output to be varied to meet sales requirements, as the work can be made to flow through at varying rates of speed.

Each type or system of conveying should have individual study, the best solution being largely influenced by the results of experience gained in previous installations. The main considerations are the convenience of the operator, keeping the conveyor and its load out of the way of operators and of the machines and benches. For work that is light in weight and is easily handled, the overhead conveyor is very convenient and is frequently employed in various forms. Such a conveyor is usually supported by wheels on each side of a suspended I-beam and has flat links with vertical pins so as to turn short corners. Joints must also be loose enough to permit an upward or downward movement. A typical overhead conveyor for handling fans is shown in plate I., fig. 1. It is over the assembly benches and the fan parts are hung on hooks within easy reach of the operator. The worker reaches up and picks off the part he needs. When the fan is completed it is placed on a belt conveyor in the centre of the bench. From here it goes to the waist high conveyor shown in the foreground at the left. This is a slow moving conveyor and is wired with electric current so that the fans can receive a running test of the desired duration before reaching the other end of their travel. The conveyor is wired for two kinds of current so that both types of fans can be tested at the same time. A notable feature of this conveyor combination is the compactness and the way in which it conserves space. It is interesting to note that the introduction of conveyors throughout a plant makes it frequently unnecessary to enlarge the factory to meet the needs of increased demands. This is possible both because of the saving in space and also because of the speeding up of production, through material being in front of the operators when needed. The waist high type of conveyor is probably used more than any other type, because of the convenience with which work can be handled from it and to it. When used in the production line it is frequently of the plain roller type and is not power driven. It is either set on a slight incline so that the work will move slowly from one machine to the next, or is level and a slight effort pushes the work along on the rollers. Conveyors of this type are usually behind the operator where the work is light enough to be easily handled. When however the pieces are heavy enough to be fatiguing, the conveyors run directly between the machines, where the operator has no lifting. He simply pushes the work over the rollers into the fixture on the machine. In some cases the rollers drop out of the way, in others the work is raised on locating points, but in most cases it simply slides on to the table of the machine and is located in various ways. After the operation is performed the work is restored to the production line and it proceeds to the next machine. In some cases spurs, or side tracks, are provided for taking work that requires a few extra operators. In other plants the conveyor line carries the work past the inspector's bench. After inspection it goes to the assembly line, is returned for salvage, or scrapped. The roller type conveyor probably finds wider application than any other. It is the least expensive to install, and operating and maintenance costs are very low. It can be used in plants with small output and it also has an important place in large plants, in connection with the various types of power driven conveyors that have become so much a part of modern manufacturing. An example of the utility of the roller conveyor in large or small plants is the case where a boxed article to be shipped comes down a line and is carried into the freight car where another short piece of roller conveyor, at right angles, carries it to the end of the car for stacking. These rollers can be moved without difficulty and aid greatly in loading easily and rapidly. Adaptations of this method are used in both large and small plants.

Power Driven Conveyors.—Power driven conveyors, of which the belt, platform and chain types are the most common, are of various types. There are also many modifications such as elevators, automatic or hand-controlled, for transferring articles from one floor to the next. Boxes are frequently carried by roller conveyor to an elevator where they are moved to floors above or below as desired. The boxes slide on carriers that hang from cross bars on the elevator chains and so remain right side up as the chain passes over the top of the wheel. The boxes can be unloaded at any desired floor by setting the necessary switches. There are two principal methods of using power driven conveyors: in connection with roller or other conveyors during the machining processes, and in the assembly of the various units and sub-assemblies into a complete whole. When used in the production division the power conveyor, usually a belt as shown in plate I., fig. 2, carries the work from one department to another, rather than from machine to machine. Here a power driven belt goes down one of the long bays of the shop, several hundred feet long. Boxes, usually of steel and called "tote" boxes, are placed on the power driven belt and start on their way down the shop. At the end of each box is a series of holes to receive pegs or bars that throw the proper switches and control the destination of the box. A peg at the left of the box in the foreground, for example, would strike the angular projection of the first switching arm and push the front end of the box to the left. By the time the switching peg reaches the end of the switching arm the box has been swung to the left sufficiently to clear the moving belt and to start it down the roller conveyor at right angles to the power belt in the centre. Similar switching stations are placed the whole length of the belt line so that work of various kinds can be sent to any desired department. The angular side tracks at the left enable the gathering of the desired material in boxes and sending it down the line to the other departments. In another type of belt conveyor line a wire stretched taut from the central position and a short distance above the belt, keeps the boxes or material placed on either side of the belt from becoming mixed with the other. In some cases a single, wide belt will carry several lines of material. In still another application from the same plant the belt ends at the bench and has numerous side tracks, each provided with a short roller conveyor, and a switch arm. When used for assembling, the conveyor belt may either carry parts to be used by the assemblers or carry the machine being assembled from the beginning to its completion. In some plants the belt moves in the centre of the bench and the operators pick off the pieces needed as they pass. The assembling is done on the bench in front of the operators.

Another method of using a belt conveyor for small parts is where boxes are placed on the belt and the proper parts are placed in the boxes as they move along in front of the assemblers who pick the necessary parts from the small bins in front of the belt line. In a combination of belt and chain conveyor, the belt, made up of wooden slats, carries such large pieces as cylinder blocks, transmission housings and manifolds from one shop to another, while the chain conveyor carries smaller parts than can be placed on hooks or carriers. In one installation they are carried between two buildings and require no handling except to put them on and take them off the conveyors. An excellent example of the use of gravity in handling finished work from the piston department in an automobile manufacturing plant is seen in plate I., fig. 3. After inspection the pistons are placed in the trough at the left, and, when this is filled, it is raised so as to let the pistons roll down the long inclined way to the line where the motors are being assembled. Conveyors now form a part of some types of machines. A case is found in an automobile plant where a standard washing machine is used for cleaning castings and metal parts from the oil and dirt which accumulates during the machining processes. The cylinder block in this case is placed on the conveyor and is fed slowly through the washing machine where jets of hot cleaning compound play on it from various nozzles. The speed of the conveyor is so timed that the cylinder block will be thoroughly cleaned when it reaches the other end of the machine. A somewhat similar application of the conveyor is in heat treating apparatus where the work to be treated passes through the furnace at a predetermined rate that gives it just the desired time in the furnace. With oil, gas or electric heat and pyrometer control of the heat, the use of conveyors give a much more uniform product than can possibly be secured by dependence on human observation and skill.

Roller Conveyors.—There are of course places where for one reason or another the work cannot well flow through at an absolutely uniform rate. Such a case might be where one man performed several different kinds of operations such as weighing and checking material as in plate I., fig. 4. Here the work comes in boxes from the other end of the building by a gravity roller conveyor, ending in a rather small radius spiral that delivers the boxes to the weigher at almost the floor level. This type of short radius spiral slows down the movement of the boxes due to the friction of the sides against the guard rail. This movement allows quite a number of boxes to accumulate until the weigher is ready to handle them. The boxes are delivered between two scales. the conveyors on each side taking the boxes away from

CONVEYORS IN LARGE SCALE AUTOMOBILE MANUFACTURING

1. Piston and connecting-rod assembly department. Visible in the photograph are both chain and belt types of conveyors, which carry the parts to the motor assembly department
2. Large rack type conveyors through which automobile bodies pass
3. Workmen assembling motors on a chain conveyor, before installation in the chassis
4. Large vertical conveyors, or elevators, which carry automobile bodies from upper floors for delivery to assembly department
5. Merry-go-round type of mould conveyor in an automobile foundry. The large ladle at the left fills the moulds as they reach the location
6. A milling machine containing automobile castings. The chips fall into the grating and are carried by conveyor back to the foundry

the scales in either direction, as desired. The boxes are delivered to the metal platform, slid on to either scale, weighed, and sent on their way. It will be noted that the nearest scale has rollers on the platform to aid in handling the boxes. There is also a tote box storage near the spiral where boxes of material are held for inspection. An installation of this kind is very flexible and can be used to advantage in shops that are comparatively small in size. A modification of the roller conveyor in the direct product line has also been adopted in some fields. Instead of rollers to form the track, two tubes act as rails and guide and support the work fixture under the machine as well as allow it to pass to the next operation without delay. There are many applications of this type of conveyor work fixtures which allows the work to remain in the same fixture but to be worked on by different machines in the production line. In this particular case the first machine drills all the holes in the top of the crank case and the second machine all of the holes in the bottom, without disturbing the work itself. Although a power conveyor could be used and so timed as to move intermittently between the drillings, it is not often practicable to do so. There are probably few cases where manual movement cannot be used to better advantage in work of this kind.

Positively driven conveyors are probably more used in assembling work than in the departments where the machining operations are performed. While in some cases the work is removed from the conveyor, this does not often fit in with the plan of the power driven idea, the purpose being to time the operations and to constantly urge a uniformly fast speed. It must not be forgotten however that while the power driven conveyor speeds up the slower operators it also slows down the very rapid workers, bringing them all to the greatest uniform speed that can be economically maintained. In spite of the necessary slowing down of the few extra fast workers however, the net gain is usually well worth while by increasing the speed of the great majority concerned.

Planning Installations.—It takes very careful planning and observation to determine the best speed and so to divide the work that each operator will have time to perform his or her operations satisfactorily, without either wasting time or hurrying the operators to the point of unprofitable nerve tension. After a little experience in a properly timed line however the average operator rather prefers to have his pace set for him, and the added earnings compensate for any sentimental objection that may be held. Farm machinery, electric refrigerators, carpet sweepers, cash registers and automobiles of all types are now assembled by the use of conveyors, usually power driven. Work of the highest grade can be secured in this manner by utilizing trained men and driving the conveyor at the proper speed. After assembling, many types of products are tested, painted, crated and deposited on the shipping platform without ever stopping. Nor is distance any longer a barrier. In one automobile plant a conveyor carries the completed engine a mile and a half, part of the way over the top of a large building, to meet the chassis on the assembly line. In another shop the building devoted to bodies contains over eight miles of conveyors handling the various parts and finally passing the completed body through the painting booths. Among the problems to be considered in installing moving conveyors are those of speed and flexibility. It is not possible to rely on maximum production at all times and the successful conveyor system must function satisfactorily when only half the maximum output is required. Conveyor assembly necessitates the division of the work into single operations, sometimes to the extent of putting in a single screw, in order to tie-up, or synchronize with the other operations that must be performed. Then when business falls off, one operator can do two or more operations and so keep the conveyors going at a portion of their capacity. In some cases of decreased production the men move with the conveyor through two or more stations. In other instances operators stop the conveyor periodically so that each man can handle two or more operations from the single station. Some of the largest users of this method claim greater flexibility than can be secured in any other way. They can increase or decrease the output at very short notice by changing the spacing of the men, the way in which they handle the operations, and by the speed of the conveyor.

When considering conveyors as an aid to production it must be remembered that the great consideration is the number of completed units or mechanisms per hour or per day that will pass inspection. Speed in one department or by a single operator does not necessarily aid final production of completed machines. Nothing is gained by piling up a surplus of certain parts if the rest of the mechanism lags behind. The surplus simply ties up both labour and material and reduces the turnover of capital. Exceptionally rapid operators are of little direct value on actual production except as spur to raising the average or unless they can be used as instructors for the same purpose. Increased output comes from raising the efficiency of the average operator and the power driven conveyor helps by holding them to the speed that experience shows to be practical, without undue fatigue. Too high speed means fatigue and poorer work and the percentage of spoiled work goes up. It is much more economical to run the conveyors a little more slowly and get perfect work than to increase the output 10% and have a 5% spoilage. So it is necessary to study the speed of power driven conveyors very carefully in order to secure the maximum output consistent with true economy, which must consider the quality of work and must not impose undue fatigue on the operators. Some classes of work make it advisable to have the conveyor movement automatically intermittent, moving a given space and stopping for a sufficient period to have the necessary work performed at that station. In other places the conveyor movement is manually controlled, usually by push button electric switch and varies according to the time required by the work in hand. This method is not at all common except in trying out the time at which to set the intermittent movement, or even the continuous movement.

Intermittently Moving Conveyors.—Perhaps the best example of intermittently moved conveyors in mass production work is the great specially built automobile frame making plant in Milwaukee, Wis. The cut sheets or strips that form the side rails of the frames come in from the side on a special conveyor that runs across the end of the main conveyor system. These strips are held under suitable dies and the "kink" or offset in the side frame is made to give the desired drop in the frame. After the strip is kinked the conveyor is so designed that it turns every second piece over on the other side so as to make pairs, or rights and lefts, before they reach the large presses that form these strips into channels with the proper offset and so complete the side rails. These side rails, in pairs of rights and lefts, now start down the great central conveyor, one on each side, stopping every 18 ft. Here previously formed cross members are fed in from the side and are put in place by operators. Special riveting machines held on long, pivoted arms, swing in from each side and rivet the cross members in place, withdrawing while the conveyor moves another 18 ft. and takes the first frame to the next position while a new frame has come into position for welding in the first cross member. At each station more parts are put into place and riveted either automatically or semi-automatically. Spring horns or supports, step brackets and other parts are fed to the central conveyor and attached to the frame at the proper point. When the conveyor has carried the frame to the other end it is complete and ready to be transferred to another conveyor that carries it into another building where it is automatically painted. The painting conveyor first carries the frame through a washing tank to remove all grease, after which it is dried before going into the paint tanks where the painting proper is done. From the paint tanks the frames go by devious routes to the storage racks where they dry. This is as high as a four or five storey building and can hold thousands of completed frames while they are awaiting shipment. Conveyors also carry them from the storage racks to the shipping platform, and to the cars that carry them away. The actuating mechanism of this huge intermittent conveying system is a very large Geneva stop motion, so designed and timed as to move the conveyor 18 ft.

and pause for a specific number of seconds while the various operations are performed. Although other mechanisms, such as interrupted gears or various linkages can be used to secure the same result, the Geneva stop motion has much to commend it for work of this kind.

Some idea of the engineering problem presented in designing this plant can be had from the rather startling fact that it was necessary to synchronize 552 operations in making the average automobile frame.

These operations, when performed on a day's production of 7,000 frames at the rate of 360 frames per hour, aggregate about 4,000,000 operations in the day's production. And yet, in spite of the necessary complications in such a plant, a force of 200 men can change the plant over for the production of an entirely different frame, in ten hours.

In one type of conveyor mechanism for motor car production, the frame conveyor is an entirely separate unit which comes to a junction with the final conveyor where the cars are completed. The frames are turned upside down on the first conveyor and both the front and rear axles are bolted in place, as well as the fuel tank, the step brackets and a few minor parts. The wheels are also mounted before the chassis reaches the end of the line.

At this point the frame pauses over a pair of substantial arms provided with hooks, which swing up over the side frames and clamp them to the arms.

Then suitable mechanism actuates a chain, and the arms swing over until the chassis is right side up and the wheels are in a set of V-shaped tracks.

When the chassis is deposited right side up in the assembly track, four clamps release automatically, and the arms swing back ready for the next chassis. The final assembly is driven by a chain located usually between the tracks, and just beyond this point the engine comes out of the test room on an overhead carrier and is lowered onto the front end of the chassis. The steering mechanism, body, etc., all feed into the assembly line within a short space.

An entirely different type of assembly line is one in which each end of the chassis is carried by a light four wheel truck. These trucks are moved from a chain located between the tracks, these tracks being channels sunk in the floor so that they may guide the wheels of the trucks. A short double conveyor for handling fenders is of the slat type. Slats with blocks support the fenders while they are being assembled to their running boards. Each belt has its own motor; the motion is reduced by gears from the motor to variable speed pulleys and further reduced by a worm gear speed reducer, a chain from this driving the conveyor, whose speed can be varied by adjustable cone pulleys.

Two motor lines, one empty so as to show the chain and carriers, can also be used.

Small trucks or carriers are fastened to the chain, the front truck having a trough to accommodate two different wheelbases. Steel racks containing small parts for the assembler are at convenient positions beside the track. Over the end of this line is a large opening in the floor through which the chassis is lifted to the second floor.

The two hoist operators control the monorail hoists which lift the chassis to the upper tracks and also handle the bodies over the chassis after it is in line.

The bodies come in from an opening in the side. These hoists are usually operated by girls, who become very expert and fast in their work.

Conveyors also play an important part in the construction of the bodies themselves. A general view down one of the aisles of a body plant, with its conveyors, is given in plate II., fig. 2. This building is approximately 1,000ft. long and perhaps 400ft. wide and contains $8\frac{1}{3}$mi. of conveyors. The bodies are on low trucks, the doors are hung, and they are nearly complete except for the roof. The seat cushions come from their special department on the conveyors shown and can be picked off and put into place with a minimum of effort. In another way of handling the bodies as they approach completion, trucks hold the bodies at the most convenient height for the final operations, but the trucks also fold down so that they can be used in the low position if desired. At the end of the building is a huge vertical conveyor plate II., fig. 4, which carries the bodies in an almost continuous stream, from the finished floor to the great body motor trailers that carry them to the shop where they are put on the chassis. Just outside the vertical conveyor is the body trailer, holding 16 bodies, on the low roller trucks that enable them to be rolled into place easily and quickly. Then the small tractor hauls them to the other plant.

An interesting conveyor application is shown in plate II., fig. 5. The first is in the foundry of an automobile plant and is known as the merry-go-round, where the moulds are carried past the pouring station, although, being small castings, the ladles of molten metal can be carried to any of the moulds. The metal comes to this conveyor in large ladles so as to reduce the labour of carrying to the minimum. After the castings reach the machine shop the chips, which accumulate rapidly in these days of modern machining, must be disposed of. To reduce labour and to keep the chips off the floor and out of the way, they are returned to the foundry without human labour by the conveyor in plate II., fig. 6. Running under the shop floor at convenient intervals, are chain conveyors with drags or scoops that carry the chips with them. Above the chain is a narrow opening covered by grating, part of which has been removed to show the conveyor chain beneath. This carries the chips direct to the foundry and is not only a convenience but a great time saver.

Both expansion and construction must be considered in planning a conveyor line, and great care and experience are required to get the best results from a given amount of floor space. Instead of using straight line conveyors it is frequently found advisable to curve the conveyor line and even to let it double on itself. Sometimes this doubling on itself occurs two or three times and may bring the finishing point rather near the beginning. In such a case the parts in question would probably be made or assembled in a department at right angles to the main conveyor line. This doubling, or sinuous conveyor line frequently lends itself to expansion more readily than the straight line conveyor. Where the department provides sufficient room for expansion, as is nearly always necessary, it has often been found more desirable to lay out a sinuous conveyor that doubles on itself before reaching the end of the department. With such a lay-out additional workers can be put on the conveyor line by extending one of the "loops," following this with other and similar extensions as occasion demands. One great advantage of this method is that, regardless of the expansion made in the department, the relation to the main conveyor line is not disturbed. The material continues to enter and leave the department at the same point until the room provided for the department is entirely outgrown. (*See* MECHANICAL HANDLING.) (F. H. C.; X.)

CONVICT, a term of somewhat loose signification technically applicable to anyone who has been adjudged guilty of a criminal offence by a court of competent jurisdiction. Specifically and in common parlance it is confined to one who has been convicted of what is known in England as an "indictable offence," *i.e.*, one triable by jury, and, in the United States, of an offence involving moral turpitude, usually punishable by death or by confinement in a State prison. It is not the plea of guilty nor the verdict of the jury that fixes the status of the culprit as a convict—the one may be rejected or the other set aside by the court—but the judgment of the court, and the same consequence follows whether punishment is imposed or sentence suspended. The status of convict thus created is put an end to by a reversal of the judgment, by an unqualified pardon or by the completion of the sentence that may have been imposed on the offender.

Apart from the punishment specifically imposed on him the convict incurs other incidental but heavy disabilities. Far the worst of these is the social stigma which attaches to him from the moment of his conviction and which, in the vast majority of cases, practically involves a species of outlawry for life from the law-abiding community. But the legal disabilities incurred are scarcely less onerous. By the English common law, if convicted of a felony—and most criminal offences were felonies punishable by death—the convict became civilly dead, his estate was forfeited to the Crown and he suffered "corruption of blood," with the result that he could neither inherit nor transmit property. Forfeiture of estate was abolished in England by Act of parliament in 1870 and, while nominally in effect, was never exacted in the English colonies in America.

In the United States to-day, in the same way as in England, the convict sentenced to a State or convict prison loses all his civil rights during the period for which he was sentenced. This loss or suspension of civil rights does not, however, place the convict outside the pale of the law. To kill him without warrant is murder and the person who assaults or robs him is no less amenable to the law of the land than he would be if the victim of the act had been a free citizen. So the prisoner may be sued and in most States may sue and bind himself by contract, may grant or devise real or personal property, and may be a witness in a civil or criminal action. Everywhere, however, the sentence or the judgment of conviction disqualifies the convict from holding public office, from serving as a juror and from exercising the elective franchise. These disabilities continue, even in the event of a parole or conditional release, until his status as a convict has been removed. (*See* CRIMINAL LAW; CRIMINOLOGY; JUVENILE OFFENDERS; PRISON.) (G. W KI.)

CONVOCATION, an assembly of persons met together in answer to a summons. The term (from Lat. *convocatio,* a calling together), is applied to assemblies of the clergy or of the graduates of certain universities, and in England to an assembly of the spirituality or clergy of the realm, summoned by the metropolitan archbishops of Canterbury and York respectively, within their ecclesiastical provinces, pursuant to a royal writ, whenever the parliament of the realm is summoned, and which is also continued or discharged, as the case may be, whenever the parliament is prorogued or dissolved. These assemblies consist of two Houses, an upper and lower. In the upper house sit the archbishops and bishops, and in the lower the deans and archdeacons of every cathedral, the provost of Eton College, with one proctor elected by each cathedral chapter and two by the beneficed clergy in each diocese in the province of Canterbury (in the province of York two proctors are elected by each archdeacon), with a prolocutor at their head.

For the early history of convocation in the Church of England the reader is referred to the works named at the close of this article, and to the relative portions of the articles ENGLISH HISTORY and ENGLAND, CHURCH OF. The present account proceeds from the period of the Reformation.

The period of greatest activity and greatest importance of convocation extends from about 1534 to 1664. It is marked by four important assemblies of the spirituality of the realm in pursuance of a royal writ—the two first of which occurred in the reign of Edward VI., the third in that of Elizabeth, and the fourth in that of Charles II. The two earliest were summoned to complete what is known as the reformation of the Church of England, which had been begun by Henry VIII., the third was called together to reconstruct that work, which had been interrupted by the reign of Mary (the consort of Philip II. of Spain), whilst the fourth was summoned to re-establish the Church of England, the framework of which had been demolished during the civil war. On all of these occasions the convocations worked hand in hand with the parliament of the realm under a licence and with the assent of the crown. On the restoration of the monarchy in 1661 convocation was not anxious to retain the liberty of taxing itself apart from the laity, seeing that its ancient liberty was likely to prove of questionable advantage to it. It voted, however, a benevolence to the crown on the occasion of its first assembling in 1661 after the Restoration and it continued to do so until 1664, when an arrangement was made between Archbishop Sheldon and Lord Chancellor Hyde, and afterwards confirmed by Act of Parliament, under which convocation silently waived its long-asserted right of voting its own subsidies to the crown, and submitted itself thenceforth to be assessed to the "aids" directly granted to the crown by parliament. In consequence of this practical renunciation of their separate status, as regards their liability to taxation, the clergy have assumed and enjoyed in common with the laity the right of voting at the election of members of the House of Commons, in virtue of their ecclesiastical freeholds.

The most important and the last work of the convocation during this period of its activity was the revision of the Book of Common Prayer which was completed in the latter part of 1661.

The Revolution in 1688 is the most important epoch in the next following period of the history of the synodical proceedings of the spirituality, when the convocation of Canterbury, having met in 1689 in pursuance of a royal writ, obtained a licence under the great seal to prepare certain alterations in the liturgy and in the canons and to deliberate on the reformation of the ecclesiastical courts. A feeling, however, of panic seems to have come over the Lower House, which took up a position of violent antagonism to the Upper House. This led to the prorogation of the convocation and to its subsequent discharge without any practical fruit resulting from its meeting. Ten years elapsed during which the convocation was prorogued from time to time without any meeting of its members for business being allowed. The next convocation which was permitted to meet for business, in 1700, was marked by great turbulence on the part of the members of the Lower House, who denied the right of the archbishop to prorogue their sessions. In the first year of Queen Anne convocation was summoned again, when the Lower House, under the leadership of Dean Aldrich, its prolocutor, again challenged the right of the archbishop to prorogue it, and presented a petition to the queen, praying her majesty to call the question into her own presence. The question was thereupon examined by the queen's council, which decided against the claim of the Lower House. During the remaining years of Anne's reign the two Houses were engaged either in internecine strife, or in censuring sermons or books, as teaching latitudinarian or heretical doctrines; and, when it had been assembled concurrently with parliament on the accession of George I., a great breach was before long created between the two Houses by the Bangorian controversy (*q.v.*). Dr. Hoadly, bishop of Bangor, having preached a sermon before the king, at St. James's Palace in 1717, against the principles and practice of the nonjurors, which had been printed by the king's command, the Lower House, which was offended by the sermon and had also been offended by a treatise on the same subject published by Dr. Hoadly in the previous year, lost no time in representing the sermon to the Upper House, and in calling for its condemnation. A controversy thereupon arose between the two Houses which was kept up with untiring energy, until the convocation was prorogued in 1717 in pursuance of a royal writ; from which time until 1861 no licence from the crown was granted to convocation to proceed to business. During this period, it was usual for a few members to meet when first summoned with every new parliament, in pursuance of the royal writ, for the Lower House to elect a prolocutor, and for both Houses to vote an address to the crown, after which the convocation was prorogued from time to time, pursuant to royal writs, and ultimately discharged when the parliament was dissolved.

In 1852 the clergy at last aroused themselves from their long repose, and the Upper House took the lead. The active spirit of the movement was Samuel Wilberforce, bishop of Oxford, but the master mind was Henry Phillpotts, bishop of Exeter. On the convocation assembling several petitions were presented to both Houses, praying them to take steps to procure from the crown the necessary licence for their meeting for the despatch of business, and an address to the Upper House was brought up from the Lower House, calling the attention of the Upper House to the reasonableness of the prayer of the various petitions. After some discussion the Upper House, influenced mainly by the argument of Henry, bishop of Exeter, consented to receive the address of the Lower House, and the convocation was thereupon prorogued, shortly after which it was discharged concurrently with the dissolution of parliament. On the assembling of the next convocation of the province of Canterbury, the sessions of the convocation were continued for several days; and from this time forth it may be considered to have resumed its action as a consultative body, while it has also been permitted on more than one occasion to exercise its functions as a deliberative body. In 1865, under licence from the crown, the convocations of Canterbury and York framed a limited number of new canons; and in 1872 it was empowered by letters of business from the crown to frame resolutions on the subject of public worship, which were incorporated in the Act of Uniformity Amendment act of that year.

As a deliberative body, convocation has done much useful work, but it suffers considerably from its unrepresentative nature. The nonbeneficed clergy still remain without the franchise, but the establishment of the groups known as Houses of Laymen for both provinces has, to a certain extent, secured the co-operation of the lay element. Several attempts were made to promote legislation to enable the convocations to reform their constitutions and to enable them to unite for special purposes; in 1905 a bill was introduced into the house of lords; it did not, however, get beyond a first reading. An important advance was made in 1920, when the *Church of England (Assembly) Powers Act* (1919) took effect. The assembly consists of three houses, composed of bishops, clergy, and laity respectively. The first two consist of the convocations of Canterbury and York, of which the respective upper houses form the *House of Bishops,* and the respective lower houses the *House of Clergy;* the *House of Laity* comprises representatives of the Laity of the provinces of Canterbury and York, elected every five years by the lay members of the diocesan conferences, which consist of representatives elected by the members of the Church of England on a roll prepared in each parish. None of the powers belonging to the convocations of Canterbury and York is to be diminished by the assembly, which is also prohibited from exercising any power belonging to the bishops by right of their episcopal office.

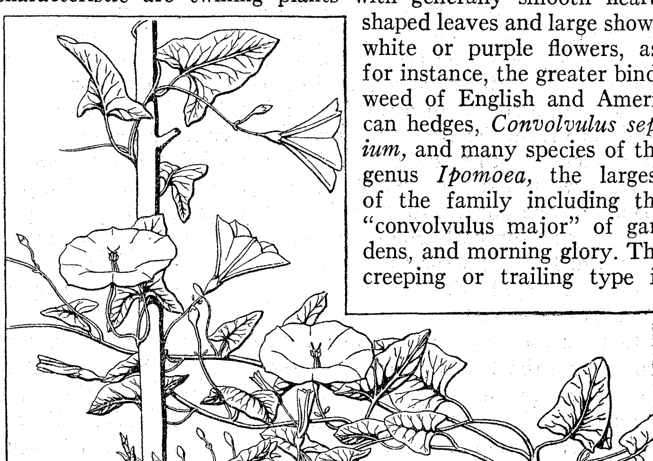
CONVOLVULACEAE, a botanical family belonging to the tube-flowered series of the group of Dicotyledons having joined petals. It contains about 50 genera with more than 1,000 species, and is found in all parts of the world except the coldest, but is best developed in tropical Asia and tropical America. The most characteristic are twining plants with generally smooth heart-shaped leaves and large showy white or purple flowers, as, for instance, the greater bindweed of English and American hedges, *Convolvulus sepium,* and many species of the genus *Ipomoea,* the largest of the family including the "convolvulus major" of gardens, and morning glory. The creeping or trailing type is common, as in the field bindweed (*Convolvulus arvensis*), which has also a tendency to climb, and *C. soldanella,* the sea bindweed, the long creeping stem of which forms a sand binder on temperate seashores; a widespread and efficient tropical sand binder is *Ipomoea Pes-Caprae.* In hot dry districts such as Arabia and northeast tropical Africa occur several genera with a low, much-branched, dense, shrubby habit, with small hairy leaves and very small flowers. An exceptional type is represented by *Humbertia;* a native of Madagascar, which forms a large tree; the dodder (*q.v.*) is a genus (*Cuscuta*) of leafless parasites with slender, thread-like twining stems. The flowers stand singly in the leaf-axils or form cymose inflorescences; they are sometimes crowded into small heads. The bracts are usually scale-like, but sometimes foliaceous, *e.g. Convolvulus* (section *Calystegia*), where they are large and envelop the calyx. In North America, much the largest genera are *Ipomoea* (morning glory), *Cuscuta* (dodder, love vine) and *Convolvulus* (bindweed).



HEDGE BINDWEED (CONVOLVULUS SEPIUM), A TWINING PLANT COMMON IN TEMPERATE REGIONS, SOMETIMES GROWN AS A TRELLIS VINE

The parts of the flower are in fives in calyx, corolla and stamens with two carpels which unite to form a superior ovary. The sepals, generally free, show much variation in size, shape and covering, and afford characters for the distinction of genera. The corolla is generally funnel-shaped, more rarely bell-shaped or tubular; the outer face is often marked out in longitudinal areas, five well-defined areas tapering from base to apex, and marked with longitudinal striae corresponding to the middle of the petals and alternating with five nonstriated weaker triangular areas. The slender filaments of the stamens vary widely, often in the same flower; the anthers are linear to ovate in shape, attached at the back to the filament and open lengthwise. The ovary is generally two-chambered, with two inverted ovules standing side by side at the inner angle of each chamber. The style is simple or branched, and the stigma linear, capitate or globose. The fruit is usually a capsule opening by valves; the seeds, where four are developed, are each shaped like the quadrant of a sphere; the seed coat is smooth, warty or hairy; the embryo is large with generally broad cotyledons surrounded by a horny endosperm. *Cuscuta* has a thread-like spirally twisted embryo with no trace of cotyledons.

The large showy flowers are visited by insects for the honey secreted by a ring-like disk below the ovary; large-flowered species of *Ipomoea* with narrow tubes are adapted for the visits of birds.

The largest genus, *Ipomoea,* has about 400 species distributed throughout the warmer parts of the earth. *Convolvulus* has about 150 species, mainly in temperate climates. *Cuscuta* contains nearly 100 species in the warmer and temperate regions; two are British.

The tuber-like roots of *Ipomoea batatas* are rich in starch and sugar, and, as the "sweet potato," form one of the most widely distributed foods in the warmer parts of the earth. Several species are used medicinally for the strong purging properties of the milky juice they contain; jalap is the product of the tubercles of *I. Purga,* a native of Mexico. The resinous cathartic scammony is obtained from the roots of *Convolvulus scammonia,* native to Asia Minor. Species of *Ipomoea* (morning glory) and *Convolvulus* are cultivated as ornamental plants. *Convolvulus sepium* and *C. arvensis* (bindweed) are pests in fields and gardens and many of the dodders (*Cuscuta*) cause damage to crops.

CONVOLVULUS, a genus of twining plants of the family Convolvulaceae (*q.v.*), commonly known as bindweeds or wild morning glories, comprising 200 or more species widely distributed in temperate and tropical regions. The genus consists of two distinct sections, *Calystegia,* with calyx inclosed in two broad leafy bracts, and *Strophocaulos,* with no bracts at or near the base of the calyx. *C. arvensis,* field bindweed (or creeping Jenny of the western United States), originally native to Europe but now widely introduced, is one of the most troublesome weeds of arable lands in the temperate zone. Its roots may penetrate the soil to a depth of more than 20 ft. *C. sepium,* hedge bindweed, native to both Europe and North America, is a common weed with shallow creeping rootstocks. It has been introduced as an ornamental vine is some places. Other well-known species include the Japanese bindweed, *C. japonicus,* with a double-flowered form, introduced from eastern Asia as an ornamental; and the seaside bindweed *C. soldanella,* widespread on beaches of the Atlantic and Pacific oceans. (W. C. M.)

CONVOY. Merchant vessels, transports, or naval auxiliaries assembled for passage together usually protected by combatant ships known as the escort. Also, a train of vehicles carrying troops or supplies. Obsolete, the escorting vessels or troops. In early days all merchantmen were more or less armed. Thus the ships of the Hanseatic league and of Venice were required to sail in convoy for mutual protection. Both these methods continued to be employed, until, with the advent of iron ships and steam power, merchantmen ceased to be armed. In the meantime many nations had entered into treaties for the purpose of exempting from visit and search (*q.v.*) ships under convoy, from which arose the so-called "right of convoy." This right Great Britain refused to recognize and the United States took the same view. It

was put to the test during the war between Great Britain and France, when a fleet of Swedish merchantmen with naval stores on board, under convoy of a Swedish frigate, resisted the exercise of visit and search by a British squadron. The merchantmen were captured, sent in for adjudication and condemned with their cargoes. Lord Stowell held that the right of visit and search could not be displaced by the intervention of the neutral sovereign or by the fact of the vessel being under convoy (see *The Maria,* 1 C., Rob. 340). At the Naval conference of 1908, however, in view of the general acceptance of the doctrine of the "right of convoy" Great Britain expressed her willingness to come into line. By Art. 61 of the Declaration of London "Neutral vessels under national convoy are exempt from search. The commander of a convoy gives in writing at the request of the commander of the belligerent warship, all information as to the character of the vessels and their cargoes, which could be obtained by search." By Art. 62, if the commander of the belligerent warship had reason to suspect the accuracy of the information furnished, he could demand further investigation by the convoy commander. The latter was required to withdraw his protection from any vessel if this investigation indicated that she was legally subject to capture. With the abandonment of the Declaration in 1916 Great Britain reverted to her former practice, and when the Dutch Government in 1918 declared that certain vessels would be convoyed by a Dutch warship to the East Indies, she refused to recognize the right of convoy and eventually agreed not to exercise the right of visit in this instance only upon terms agreed between the two governments (see *Parl. Papers* 1908 [Cd. 9028]). There has been no general agreement with the British viewpoint. The U.S.A. Naval Instructions, 1917 follow the Declaration of London. However, during the war of 1939, neutrals did not challenge the British practice. For the contrasting viewpoints, *see* Hyde, *International Law,* vol. 2, and Lauderpacht, *International Law,* vol. 2.

The use of belligerent convoy by neutral vessels is analogous to shipping neutral goods on an enemy armed vessel. On principle the use of belligerent convoy is a good ground for seizure, and resistance will justify condemnation. By the U.S.A. Naval Instructions, 1917, "any vessel under convoy of a vessel of the enemy is liable to capture." This is in accord with the British practice.

(H. H. L. B.; R. M. G.)

NAVAL CONVOY

Naval convoy is a term used in naval warfare to describe the system of defending merchant ships, whereby the vessels sail in groups "convoyed" by warships. The practice of sailing in convoy was common in the middle ages, because most ships, whether ostensibly warships or not, had some sort of armament, and they could thus afford each other some mutual protection.

The problem of mercantile convoy was fundamentally different in the War of 1914–18 from what it had been in the days of sailing ships. Merchant vessels in the 18th century made very few round voyages in the year, often only one. The length of each passage was uncertain, depending on wind and weather conditions, and the delays caused by assembly, awaiting escort and sailing in groups, were comparatively unimportant. The owners of fast sailing vessels might lose the profits to be gained by forestalling the market, but the nation suffered little. Hence trade could be carried on in time of war by a comparatively few convoys of great size. A homeward bound West Indian convoy might comprise 100 or 150 vessels; there are records of Baltic convoys during the Napoleonic wars of over 500 sail. Warships for escort could usually be provided from vessels of war returning home for refit, or returning to station after refit. Since those days, the greater frequency and certainty of voyages under steam has permitted the growth of massed industrial populations, depending for their very life, not merely on an immense volume of imported foodstuffs and raw materials, but on its arrival in a steady, continuous stream of cargoes. Throughout the World War the stocks of food, of munitions and of materials for civil industries were small in comparison with annual requirements, and had to be continually renewed. The holding back of supplies for a few months, or even for a few weeks, might entail irremediable disaster. Thus, if trade were to be run in convoy at all, it must be in numerous small convoys run to a regular schedule, not in a few large convoys at irregular intervals. The contrast may be illustrated by the fact that, during the first two years of the War of the Austrian Succession, 35 outward and 45 homeward convoys sufficed for the requirements of the ocean trades; in the summer of 1918, 40 outward and 42 homeward convoys were run in the ocean trades alone every 32 days. In these circumstances convoy called for a greater allocation of force and a far more elaborate organization than in the past. At the best, too, it entailed very serious delays to the faster ships, owing to the wide discrepancies in speed between steamers, even of similar type. Neither to the commercial nor to the naval mind was convoy a light matter.

Early Part of the World War.—During the first two and a half years of war, the use of convoy was restricted to the protection of troop movements. As the submarine campaign increased in intensity, escort was frequently given, within the danger zone, to tankers and vessels with important Government cargoes; but the introduction of organized mercantile convoy was delayed until 1917. So long as the attack on commerce was carried on by surface warships, the total effect, despite the notoriety attained by the "Emden" and other raiders, was comparatively trifling, and even the submarine campaign, in its earlier stages, produced an astonishingly small effect on the flow of commerce. Towards the end of 1916, however, the losses of neutral as well as of British and Allied shipping, became very serious, and the outbreak of unrestricted submarine warfare in Feb. 1917 compelled a reconsideration of the whole problem of trade protection. At this time the general run of opinion at the British Admiralty was strongly against convoy. It was condemned both as impracticable and undesirable; impracticable because there were not enough cruisers, destroyers and patrol craft to provide escorts for the trade, and because accurate station keeping would be impossible in a group of steamers of varied type and speed; undesirable because of the delays involved, and because any protection derived from escort would be outweighed by the disadvantage of offering a large target to torpedo attack.

Organized Convoys Begin.—The delays caused by the holding up of shipping and by deviation to avoid danger areas were now, in fact, so serious as to discount one of the chief objections to convoy, and the losses suffered during the first three months of unrestricted warfare (*see* SUBMARINE CAMPAIGNS) were so heavy as to threaten disastrous results to the supply system of the Allies. The existing methods of protection were clearly inadequate, and the advocates of convoy became insistent. In Feb. 1917 the French coal trade was organized in a system of controlled sailings which rapidly developed into regular convoys, and in April a Scandinavian convoy was introduced to protect the helpless, unarmed neutral, trading on Allied account, in the North sea. Meanwhile, the application of convoy to the ocean trades was being persistently urged both within and without the anti-submarine division of the Admiralty. A special committee was appointed at the Admiralty during May to draw up a detailed scheme of convoys for the ocean trades, and during the same month two experimental convoys were sailed from Gibraltar and Hampton Roads respectively. Both these experimental convoys arrived without loss, and the experience gained went far to dispose of the bogey of station keeping. Meanwhile, investigations had shown that the difficulty of providing escort had been magnified by an exaggeration of the number of voyages to be protected, and the arrival of United States destroyers at Queenstown (Cobh) increased the available force. Regular convoys from Hampton Roads were started in June; from Sydney (Cape Breton), New York and Gibraltar in July; in August the system was extended to the south Atlantic trades and the outward traffic.

The system adopted for convoys bound for England was for a group of steamers, collected at a port of assembly, to be escorted by a cruiser or armed merchant cruiser, giving protection against surface raiders, to a rendezvous outside the submarine danger zone, whence the convoy was brought in by a destroyer escort. Outward convoys, collected at assembly ports on the west and south coasts of England, were taken through the danger zone by a destroyer escort, to a point of dispersal outside the ordinary limits of submarine activity, whence the ships made their way individually to their ports of destination. In order to economize the forces used as destroyer escorts, which included destroyers, sloops and in some instances P-boats and trawlers, the escort, which had taken an outward convoy clear of the danger zone, was required to steam from the point of dispersal to the rendezvous with a homeward convoy, which it then brought in.

A seldom noted feature of the British mercantile convoy system, both of the wars of 1914 and 1939 and of earlier wars, was the containing of the main enemy fleets in their home waters by heavy concentrations of war vessels between them and the open sea, thus permitting the safeguarding of convoys with escorts sufficient only to deal with submarines and other weak raiders. When this part of the system failed the results were disastrous, as in 1693 when the French Fleet under Tourville left Brest with 71 vessels in May before the blockade was established, and destroyed 100 vessels of a convoy of four hundred. In 1918 when there was danger of German battle cruisers eluding the blockade, a division of American battleships was stationed at Berehaven, Ireland, to be in a position to reinforce the escorts quickly if necessary.

Work of the Convoys.—The merchant convoys were organized by the British Admiralty and escorted chiefly by the British Navy, with valuable assistance by the United States cruisers and destroyers in the Atlantic, Japanese destroyers in the Mediterranean and French vessels in the Bay of Biscay. There were 99,083 vessels convoyed with a loss of approximately 0·5%. Two million United States troops were carried to Europe, with the loss of only 637 soldiers, by special troop convoys organized and escorted by the United States Navy, augmented in the spring of 1918 by British convoys to Liverpool and London. United States vessels escorted 82% and transported 46·25%, British vessels transported 51·25%, and the remainder were transported by French and Italian ships.

Success of the System.—From the first the convoys proved a triumphant success, and conclusively refuted the arguments against the system. The grouping of the ships diminished the number of targets offered to the attack, and the convoys could be routed by wireless to evade areas of known submarine activity. When located by a submarine, they proved far less vulnerable than the opponents of the system had supposed. The threat of instant retaliation by the escort, and the menace presented to a submarine by a group of ships manoeuvring in concert on a broad front, hampered the movements of the assailant, and even when the attack was successful, there was no such wholesale havoc as had been feared.

In the North sea in the World War of 1914–18 there were two serious disasters, both due to attacks by surface vessels; but in the ocean trades, even when a successful attack was made on a comparatively large convoy, it was rarely that the submarine claimed more than one, or at most two victims. The total percentage of loss was as follows:—

Ships escorted safely in ocean convoy	16,539	99·08%
Torpedoed in convoy	102	0·61%
Lost by marine peril	16	0·09%
Lost after parting company, etc.	36	0·22%
Total sailings	16,693	100·00%

In the short sea convoys (Scandinavian, Dutch, British east coast, French coal trade and Mediterranean local) there were over 80,000 sailings, with a loss of less than 0·5%.

Delays, which were considerable at first, were subsequently reduced to acceptable proportions by grouping ships into fast and slow convoys, by adjusting sailings to the convoy programs and by better planning and co-operation.

War of 1939.—In 1939 convoy was instituted on the pattern of previous wars, with the main German fleet contained. The submarine was no longer such a serious menace due to the development of adequate counter measures. But meanwhile air power had developed, without a corresponding development of the defence, and, particularly after the German occupation of northern France, took a serious toll of shipping to British east coast ports. Due to the inability of Britain to contain the main German air fleet, East Coast and Channel convoys were subjected to the full force of its attack. (*See* also BLOCKADE and SUBMARINE CAMPAIGN.)

CONVULSIONS, the pathological condition of body associated with abnormal, violent and spasmodic contractions and relaxations of the muscles, taking the form of a fit. Convulsions may be a symptom resulting from various diseases, *e.g.,* in uraemia, eclampsia, rabies, tetanus, hysteria, epilepsy, strychnine poisoning, cerebral tumour and diseases. They are usually, but not always, accompanied by loss of consciousness. Popularly, the term is commonly restricted to the infantile variety, occurring in association with teething, or other causes which upset the child's nervous system. The treatment (plunging into a hot bath, or administration of chloroform) must be prompt, as convulsions are responsible for a large part of infant mortality.

The name "Convulsionaries" (Fr. *Convulsionnaires*) was given to certain Jansenist fanatics in France in the 18th century, owing to the convulsions, regarded by them as proofs of divine inspiration, which were the result of their religious ecstasies (*see* JANSENISM). The term "Convulsionists" is sometimes applied to them, as also, more loosely, to other religious enthusiasts who exhibit the same symptoms.

CONWAY, HENRY SEYMOUR (1721–1795), British soldier and statesman, sat in the Irish parliament from 1741 to 1761 as member for Antrim, and in the British House of Commons from 1741 to 1784 for various constituencies. In 1755 he went to Ireland as secretary to the lord-lieutenant, but after returning to England in the following year he was brought into discredit by the complete failure of an abortive expedition he participated in against Rochfort. As lieutenant-general he served under Prince Ferdinand of Brunswick in the campaigns of 1761–63. His opposition in parliament to the views of the court on the Wilkes case led to his being deprived of his military command and of his appointment in the royal household.

In the Rockingham ministry of 1765 Conway took office as secretary of State, with the leadership of the House of Commons. In the dispute with the American colonies his sympathies were with the latter, and in 1766 he carried the repeal of the Stamp Act. In Jan. 1768, offended by the growing influence of the Bedford faction which joined the Government, Conway resigned the seals of office, though he was persuaded by the king to remain a member of the cabinet and "Minister of the House of Commons." When Lord North became premier in 1770, Conway resigned from the cabinet and was appointed to the command of the Royal Regiment of Horse Guards. In 1772 he became governor of Jersey. In 1781 his opposition to Lord North's American policy brought about the resignation of the premier, and in the Rockingham Government that followed, Gen. Conway became commander-in-chief with a seat in the cabinet. On Pitt's elevation to the premiership, Conway supported Fox in opposition; but after the dissolution of parliament in 1784 he retired from political life. He was made field-marshal in 1793, and died on July 9, 1795.

See Horace Walpole, *Letters,* ed. P. Cunningham (9 vols., 1857); the duke of Buckingham and Chandos, *Memoirs of the Court and Cabinets of George III.* (4 vols., 1853).

CONWAY, HUGH, the nom-de-plume of FREDERICK JOHN FARGUS (1847–1885), English novelist, who was born at Bristol on Dec. 26 1847, the son of an auctioneer. At the age of 13 he joined the training-ship "Conway" in the Mersey. In deference to his father's wishes, however, he abandoned the sea, and eventually, in 1868, took over the family business. In 1883 Fargus published through Arrowsmith his first long story, *Called Back,* of which over 350,000 copies were sold within four years. A dramatic version of this book was produced in London in 1884, and in this year Fargus published another story, *Dark Days.* He died at Monte Carlo on May 15 1885.

CONWAY, MONCURE DANIEL (1832–1907), American clergyman and author, was born of an old Virginia family in Stafford county, Va., on March 17, 1832. He graduated at Dickinson college in 1849, studied law for a year, and then became a Methodist minister in his native State. In 1853, owing largely to the influence of Ralph Waldo Emerson, he entered the Harvard Divinity school, where he graduated in 1854. His abolitionist views aroused the bitter hostility of his old neighbours, and brought his dismissal from a Unitarian church in Washington, D.C. From 1856 to 1861 he was a minister in the First Congregational Church in Cincinnati, O., at that time a centre of western culture, where, also, he edited a short-lived liberal periodical named after its eastern predecessor *The Dial.* Subsequently with F. B. Sanborn he was an editor of the *Commonwealth* in Boston, Mass. During the Civil War he lectured in England in behalf of the North. From 1863 to 1884 he was the minister of the South Place chapel, Finsbury, London. During this time he wrote frequently for the London press, and in 1884 he returned to the United States to devote himself to literary work. He died in Paris, on Nov. 15, 1907. His publications include *Tracts for To-day* (1858); *Republican Superstitions* (1872); *Idols and Ideals* (1871); *Demonology and Devil Lore* (1878); *A Necklace of Stories* (1879); *The Wandering Jew* (1881); *Pine and Palm* (1887); *The Life of Thomas Paine,* with an unpublished sketch of Paine by William Cobbett (1892); *Solomon and Solomonic Literature* (1899); and *My Pilgrimage to the Wise Men of the East* (1906). His *Autobiography* (1904) is especially valuable for its sketches of important figures in the 19th century by whom he was esteemed as a leader of liberal thought. *Moncure D. Conway, Addresses and Reprints* (1909) contains *The Golden Hour* (1862), *The Earthward Pilgrimage* (1870) and shorter pieces.

CONWAY, WILLIAM MARTIN CONWAY, 1ST Baron (1856–1937), English art critic and mountaineer, was born at Rochester on April 12, 1856, and educated at Repton and at Trinity college, Cambridge. In 1880 his interest in early printing and engraving led him to make a tour of the principal libraries of Europe, the result appearing in 1884 as a *History of the Woodcutters of the Netherlands in the Fifteenth Century.* His later works on art include *Reynolds and Gainsborough* (1886); *Early Flemish Artists* (1887); *The Literary Remains of Albrecht Dürer* (1889); *The Dawn of Art in the Ancient World* (1891), dealing with Chaldaean, Assyrian and Egyptian art; *Early Tuscan Artists* (1902); *The Sport of Collecting* (1914); *The Van Eycks and their Followers* (1921); *Art Treasures of Soviet Russia* (1925). From 1884 to 1887 he was professor of art at University college, Liverpool; and from 1901 to 1904 Slade professor of the fine arts at Cambridge. He was knighted in 1895.

Sir Martin Conway began mountaineering in the Alps at the age of 16 and after devoting several years to the mountains about Zermatt he published a guide-book to them for climbers, entitled *The Zermatt Pocket Book.* This was reissued as one of the series of Climbers' Guides, which he edited in conjunction with the Rev. A. B. Coolidge, and these in form and arrangement were the original of scores of imitations issued in many languages and dealing with mountain ranges in four continents. He was president of the Alpine club 1902 to 1904. In 1892 he made the first complete ascent of any of the great Himalayan peaks, reaching a height of 23,000ft., in the course of the first scientific mountaineering expedition undertaken in any part of the snow region of the Himalayas, and supported by the Royal Society, the Royal Geographical Society and the British Association. In 1896–97 he explored the interior of Spitsbergen and crossed the main island for the first time; in the next year he explored and surveyed the Bolivian Andes, making the first ascent of the highest mountain of the group, Illimani (21,200ft.). He also ascended Aconcagua (23,080ft.) and explored Tierra del Fuego, making the first and almost successful attempt to climb Mt. Sarmiento, being driven down when near the summit by a terrific gale. At the Paris exhibition of 1900 he received the gold medal for mountain surveys, and in 1905 the founder's medal of the Royal Geographical Society, of which he was vice-president. His expeditions are described in his *Climbing and Exploration in the Kara-Koram Himalayas* (1894), *The Alps from End to End* (1895), *The First Crossing of Spitsbergen* (1897), *With Ski and Sledge over Arctic Glaciers* (1898), *The Bolivian Andes* (1901), *Aconcagua in Tierra del Fuego* (1902), and *Mountain Memories* (1920). *No Man's Land, a History of Spitsbergen from . . . 1596 . . .*, was published in 1906.

In 1902 he began the acquisition and chronological classification of photographic and other reproductions of works of art of all kinds from the Stone Age down to the 18th century, now some 250,000 in number. In 1905 he purchased the extensive ruins of Allington castle, near Maidstone, and proceeded to bring them back into a habitable condition, a work which has been continuously carried on for 21 years and is still in progress. He was vice-president of the Society of Antiquaries. From 1917 he was director-general of the Imperial War Museum. In 1918 he entered the House of Commons as member for the combined English universities, and urged the reform of the passport system. In 1931 he was created a baron. He died Apr. 19, 1937.

CONWAY, CONWY or **ABERCONWY,** municipal borough, Caernarvonshire, Wales, 14 mi. by the L.M.S.R. from Bangor. Pop. (est. 1938) 8,989. Area, 7.4 sq.mi. The river on the North Wales coastal route has always been important. Caerhun, 4½ mi. from the present town, is on the high road from London to Holyhead and is the *Canovium* of the Romans. The site was excavated in 1926–27 revealing a Roman fort occupied down to Antonine times (see *Arch. Camb.,* 1926–27 *seq.*). Diganhwy (Dyganwy, Deganwy) is mentioned in the *Mabinogion* (*Geraint and Enid*), if the reading is sound; it is certainly mentioned in the *Annales Cambriae* (years 812–822), and in the *Black Book of Carmarthen,* xxiii, 1. The town is enclosed by a high wall, roughly triangular, about 1 mi. round, with 21 dilapidated round towers and their gateways. The castle in the south-east angle, built in 1284 by Edward I, was, in 1389, the scene of Richard II's agreement to abdicate. There are ruins of the Cistercian abbey (1185), whose site is occupied by the Gothic church of St. Mary (13th century and later). The castle was held for Charles I by Archbishop Williams and taken by Gen. Mytton in 1646. It was later dismantled. Pearl fisheries existed at Conway for centuries, dating back to the Roman occupation. Two bridges, a tubular one for the railway and a suspension one, designed by Stephenson (1846–48) and Telford (1822–26) respectively, cross the Conwy. The Elizabethan Plâs Mawr is the *locale* of the Royal Cambrian Academy of Art. Conway is in the Caernarvon Boroughs parliamentary division. In 1937 the corporation acquired the Bodlondeb hall estate, now a public park with the mansion for municipal offices.

CONWAY, a city in central Arkansas, U.S.A., 30 mi. N.W. of Little Rock, on the Missouri Pacific railroad; the county seat of Faulkner county. The population in 1940 was 5,782. It is the trading and shipping centre of a rich cotton-growing, farming and dairying country, and the seat of Central college (Baptist), Hendrix college (Methodist) and the State teachers college. The city was settled about 1871, and incorporated in 1875.

CONY or **CONEY,** a name originally applied to the rabbit and still sometimes used for it, notably in the fur trade. The cony of the Bible is a different beast (*see* HYRACOIDEA), which, although superficially rodent-like, is a hoofed animal of dubious affinities, and is better termed the hyrax (*q.v.*). It is a small, stocky animal, living among rocks in deserts, hills and mountains.

CONYNGHAM, GUSTAVUS (*c.* 1747–1819), U.S. naval officer, was born in County Donegal, Ireland, about 1747. He was taken to the U.S. in his youth, and apprenticed to a captain in the West Indian trade. Advancing to shipmaster, he was employed to bring gunpowder from Holland at the outbreak of the American Revolution, but became stranded in Holland. The American commissioners in France supplied him with a commission dated March 1, 1777, and sent him forth from Dunkirk in May in an armed lugger. He captured a packet plying with mail between England and Holland, and brought it and another prize back to Dunkirk. Upon British protest, Conyngham and his crew were imprisoned, the prizes restored and the captain's commission confiscated. The commissioners secured his release, supplied him with a new commission and the cutter "Revenge," and sent him again on a cruise out of Dunkirk. Sailing around the British Isles and operating off Spain and in the West Indies, he took 29 prizes in the ensuing two years, but was finally captured, carried to England, and threatened with death as a pirate. Amid threatened reprisals on the part of the Continental congress, Conyngham escaped to Holland, where, in 1780, he joined John Paul Jones in a cruise in the frigate "Alliance." From the end of the war until his death in Philadelphia on Nov. 27, 1819, he waged a hopeless fight to gain recognition by congress of his rank in the navy. Almost a century after his death the commission the French had confiscated and which could have substantiated his claim, was found in the collection of a Parisian autograph dealer. (W. B. Ck.)

COOCH BEHAR or **KUCH BEHAR,** a state of India, in Bengal, consisting of a submontane tract entirely surrounded by British territory. Area, 1,321 sq.mi. Population (1941) 640,842; estimated revenue 3,867,000 rupees. The state forms a level plain of triangular shape, intersected by numerous rivers. The greater portion is fertile and well cultivated, but tracts of jungle are to be seen in the northeast corner, which abuts upon Assam. The rivers, of which the most important are the Tista and Sankosh, all pass through the state from north to south, to join the main stream of the Brahmaputra. Rice is grown on three-fourths of the cultivated area. Jute and tobacco are also largely grown for export. The state is connected with the Eastern Bengal State railway by the Cooch Behar State railway.

The Koch or Rajbansi, from whom the name of the state is derived, were a widely spread tribe akin to the Indo-Chinese races of the northeast frontier, and were the masters of northeastern Bengal and lower Assam till they were overcome by the Mohammedans and Ahoms. They have now become largely Hinduized, especially in their own home, where the appellation "Koch" has come to be a term of reproach.

Cooch Behar at the dawn of its history formed part of Kamarupa. In the 15th century it was held by Khen kings, and early in the next century became the centre of the kingdom of the Koch king Biswa Singh. The greatest monarch of the dynasty was Nar Narayan, the son of Biswa Singh, who extended his power over a large part of Assam and southward over what is now part of the British district of Rangpur. His son became tributary to the Mogul empire. In 1772 the country was invaded by the Bhutanese and an appeal for assistance was made to Warren Hastings. A detachment of sepoys drove out the Bhutanese who were forced to sue for peace through the mediation of the Tashi Lama of Tibet. By the resulting treaty the raja acknowledged subjection to the East India company, and made over to it one-half of his annual revenues. The administration of the state was for some years under a regent, H.H. the Maharani of Cooch Behar, on behalf of her son, H.H. Jagaddipendra Narayan Bhup Bahadur, who succeeded at the age of seven in 1922. There was a regency council, the vice-president of which was an officer lent by the British government. The governor of Bengal acted as the agent of the governor general for the purpose of superintending the administration. The town of Cooch Behar is situated on the river Torsa, and has a railway station. Pop. (1941) 16,000. It has a college affiliated with the Calcutta university.

COODE, SIR JOHN (1816–1892), English engineer, was born at Bodmin, Cornwall, on Nov. 11, 1816, the son of a solicitor. In 1847 he was appointed resident engineer at the national harbour works at Portland then in progress, and in 1856 engineer-in-chief, a post which he occupied till the completion of the works in 1872. After the Portland harbour his best-known work is the harbour of Colombo, Ceylon. He was made a K.C.M.G. in 1886. From 1884 till his death he was a member of the Suez Canal commission, and was president (1889–91) of the Institution of Civil Engineers. He died at Brighton on Mar. 2, 1892.

COOK, ARTHUR JAMES (1884–1931), English socialist and labour leader, was born at Wookey in Somerset, the son of a soldier. He was educated at the elementary schools and at the London Labour college, and worked as a miner in the pits, especially in the Rhondda area. In 1924 he was elected general secretary of the Miners' Federation of Great Britain. He took a prominent part in the events leading up to the threatened general strike of 1925 and the actual strike and coal lockout of 1926.

COOK, SIR EDWARD TYAS (1857–1919), British journalist and author, was born at Brighton and educated at Winchester and New college, Oxford. Cook was connected with the *Pall Mall Gazette* under John Morley, and then under W. T. Stead, whom he succeeded as editor (1890–92). He was the first editor (1893–96) of the *Westminster Gazette,* then editor of the *Daily News* (1896–1901) and leader writer on the *Daily Chronicle* (1901–12). He was knighted in 1912. His strong political convictions led to his resignation from the *Pall Mall Gazette* when it changed hands, and from the *Daily News* on account of its attitude on the Boer War.

Among Cook's publications are *Studies in Ruskin* (1890); *Rights and Wrongs of the Transvaal War* (1901); *The Life of John Ruskin* (1911); *Life of Florence Nightingale* (1913); *Delane of "The Times"* (1915); *Literary Recreations* (1918); and *More Literary Recreations* (1919). He also edited, in collaboration with A. Wedderburn, the standard edition of the works of Ruskin (1903–07). *See* J. Saxon Mills, *Sir Edward Cook* (1921).

COOK, ELIZA (1818–1889), English author, was born on Dec. 24, 1818, in Southwark, the daughter of a local tradesman. She was self-taught, and began when a girl to write poetry for the *Weekly Dispatch* and *New Monthly.* From 1849 to 1854 she conducted a paper for family reading called *Eliza Cook's Journal.* She also published *Jottings from my Journal* (1860), and *New Echoes* (1864); and in 1863 she was given a civil list pension. As the author of a single poem, "The Old Armchair," Eliza Cook's name was for a generation after 1838 a household word in England and in America. She died at Wimbledon on Sept. 23, 1889.

COOK, JAMES (1728–1779), English naval captain and explorer, was born on Oct. 28, 1728, at Marton village, Cleveland, Yorkshire, where his father was first an agricultural labourer and then a farm bailiff. At 12 years of age he was apprenticed to a haberdasher at Staithes, near Whitby, and afterward to Messrs. Walker, shipowners, of Whitby, whom he served for years in the Norway, Baltic and Newcastle trades.

In 1755, having risen to be a mate, Cook joined the royal navy, and after four years' service was, on the recommendation of Sir Hugh Palliser, his commander, appointed master successively of the sloop "Grampus," of the "Garland" and of the "Solebay," in the last of which he served in the St. Lawrence. He was employed also in sounding and surveying the river, and he published a chart of the channel from Quebec to the sea. In 1762 he was present at the recapture of Newfoundland, and was employed in surveying portions of this coast (especially Placentia harbour); in 1763, on Palliser becoming governor of Newfoundland, Cook was appointed "marine surveyor of the coast of Newfoundland and Labrador"; this office he held till 1767; and the volumes of sailing directions he now brought out (1766–68) showed remarkable abilities. At the same time he began to make his reputation as a mathematician and astronomer by his observation of the solar eclipse of Aug. 5, 1766, at one of the Burgeo Islands, near Cape Ray, and by his account of the same in the *Philosophical Transactions* (vol. lvii, pp. 215–216).

In 1768 Cook was appointed to conduct an expedition, suggested by the revival of geographical interest now noticeable, and resolved on by the English admiralty at the instance of the Royal society, for observing the impending transit of Venus, and prosecuting geographical researches in the South Pacific ocean. For these purposes he received a commission as lieutenant (May 25), and set sail in the "Endeavour," of 370 tons, accompanied by several men of science, including Sir Joseph Banks (Aug. 25). On April 13, 1769, he reached Tahiti, where he observed the transit on June 3. From Tahiti he sailed in quest of the great continent then supposed to exist in the South Pacific, explored the Society Islands, and thence struck to New Zealand, whose coasts he circumnavigated and examined with great care for six months, charting them for the first time with fair accuracy, and especially observing the channel ("Cook Strait") which divided the north and south islands. His attempts to penetrate to the interior, however, were thwarted by native hostility. From New Zealand he proceeded to "New Holland" or Australia, and surveyed with the same minuteness and accuracy the whole east coast. New South Wales he named after a supposed resemblance to Glamorganshire; Botany bay, sighted on April 28, 1770, was so called by the naturalists of the expedition. On account of the hostility of the natives his discoveries here also were confined to the coast, of which he took possession for Great Britain. From Australia Cook sailed to Batavia, satisfying himself upon the way that (as Torres had first shown in 1607) New Guinea was in no way an outlying part of the greater land mass to the south.

Arriving in England, by way of the Cape of Good Hope, on June 12, 1771, Cook was made a commander, and after was appointed to command another expedition for examining and determining once for all the question of the supposed great southern continent. With the "Resolution" of 462 tons, the "Adventure" (Captain Furneaux) of 330 tons, and 193 men, he sailed from Plymouth on July 13, 1772; he touched at the Cape of Good Hope, and striking thence south-east (Nov. 22) passed the Antarctic Circle (Jan. 16, 1773), repassed the same, and made his way to New Zealand (March 26) without discovering land. From New Zealand he resumed his "search for a continent," working up and down across the South Pacific, and penetrating to 67° 31′ and again to 71° 10′ S., with imminent risk of destruction from floating ice, but with the satisfaction of disproving the possibility of the disputed continent in the seas south-eastward of New Zealand. He made for Easter Island, the exact position of which he determined, for the first time, with accuracy; noticing and describing the gigantic statues which Roggewein, the first discoverer of the island, had made known. In the same manner he accomplished a better determination and examination of the Marquesas, as well as of the Tonga or Friendly Islands, than had yet been made; and after a stay at Tahiti to rest and refit, crossed the central Pacific to the "New Hebrides," as he renamed Quiros's "Southern Land of the Holy Spirit" (a name preserved in the modern island of *Espiritu Santo*), called by Bougainville the "Great Cyclades" (*Grandes Cyclades*), whose position, extent, divisions and character were now verified as never before. Next followed the wholly new discoveries of New Caledonia, Norfolk Island, and the Isle of Pines. Another visit to New Zealand, and yet another examination of the far southern Pacific, which was crossed from west to east through the whole of its extent, from south Australia to Tierra del Fuego, were now undertaken by Cook before he finally closed his work in refutation of the Antarctic continent, as previously understood, on this side of the world. The voyage closed with a rapid survey of the "Land of Fire," the rounding of Cape Horn, the rediscovery of the island now named Southern Georgia, the discovery of Sandwich Land, the crossing of the South Atlantic (here also exploding the great *Terra Australis* delusion), and visits to the Cape of Good Hope, St. Helena, Ascension, Fernando Noronha and the Azores. The voyage (reckoning only from the Cape of Good Hope and back to the same) had covered considerably more than 20,000 leagues, nearly three times the equatorial circumference of the earth; it left the main outlines of the southern portions of the globe substantially as they are known to-day; and it showed a possibility of keeping a number of men for years at sea without a heavy toll of lives. Cook only lost one man out of 118 in more than 1,000 days; he had conquered scurvy.

The discoverer reached Plymouth on July 25, 1775, and his achievements were promptly, if meanly, rewarded. He was immediately raised to the rank of post-captain, appointed a captain in Greenwich hospital, and soon afterwards unanimously elected a member of the Royal Society, from which he received the Copley gold medal for the best experimental paper which had appeared during the year.

Cook's third and last voyage was primarily to settle the question of the north-west passage, practically abandoned since before the middle of the 17th century, but now taken up again, as a matter of scientific interest, by the British government. The explorer, who had volunteered for this service, was instructed to sail first into the Pacific through the chain of the newly discovered islands which he had recently visited, and on reaching New Albion to proceed northward as far as latitude 65° and endeavour to find a passage to the Atlantic. Several ships were at the same time fitted out to attempt a passage on the other side from the Atlantic to the Pacific. Sailing from the Nore on June 25, 1776 (Plymouth, July 12), with the "Resolution" and "Discovery," and touching at the Cape of Good Hope, which he left on Nov. 30, Cook next made Tasmania and thence passed on to New Zealand and the Tonga and Society Islands, discovering on his way several of the larger members of the Hervey or Cook Archipelago, especially Mangaia and Aitutaki (March 30–April 4, 1777); some smaller isles of this group he had already sighted on his second voyage, Sept. 23, 1773. From Tahiti, as he moved north towards the main object of his expedition, he made a far more important discovery, or rather rediscovery, that of the Hawaiian or Sandwich Islands, the greatest and most remarkable of the Polynesian archipelagos (early Feb. 1778). These had perhaps first been seen by the Spanish navigator Gaetano in 1555; but their existence had been kept a close secret by Spain at the time, and had long been forgotten. Striking the west American coast in 44° 55′ N. on March 7 following, he made an almost continuous survey of the same up to Bering Straits and beyond, as far as 70° 41′, where he found the passage barred by a wall, or rather continent, of ice, rising 12 ft. above water, and stretching as far as the eye could reach. The farthest point visible on the American shore (in the extreme north-west of Alaska) he called Icy Cape. On his way towards Bering Straits he discovered and named King George's ("Nootka") and Prince William's Sound, as well as Cape Prince of Wales, the westernmost extremity of North America, never yet seen by English navigators, but well known to Russian explorers, who probably first sighted it in 1648; he also penetrated into the bay afterwards known as Cook's Inlet or River, which at first seemed to promise a passage to the Arctic Seas, to the south-east of the Alaska peninsula. Cook next visited the Asiatic shores of Bering Straits (the extreme north-east of Siberia); returning to America, he explored Norton Sound, north of the Yukon; touched at (Aleutian) Unalaska, where he met with some Russian-American settlers; and thence made his way back to the Hawaiian group, which he had christened after his friend and patron Lord Sandwich, then head of the British admiralty (Jan. 17, 1779). Here he visited Maui and Hawaii itself, whose size and importance he now first realized, and in one of whose bays (Kealakekua) he met his death early in the morning of Feb. 14, 1779. During the night of the 13th, one of the "Discovery's" boats was stolen by the natives; and Cook, in order to recover it, made trial of his favourite expedient of seizing the king's person until reparation should be made. Having landed on the following day with some marines, a scuffle ensued which compelled the party to retreat to their boats. Cook was the last to retire; and as he was nearing the shore he received a blow from behind which felled him to the ground. He rose immediately, and vigorously resisted the crowds that pressed upon him, but was soon overpowered.

Had Cook returned from his third voyage, there is ground for believing King George would have made him a baronet. Distinguished honours were paid to his memory, both at home and by foreign courts, and a pension was settled upon his widow. But in his life a very inadequate share of official reward was dealt out to the man who not only may be placed first among British maritime discoverers, but also gave his country her title, and so her colonies, in Australasia. As a commander, an observer and a practical physician, his merits were equally great. Reference has been made to his survey work and to his victory over scurvy; it must not be forgotten that along with a commanding personal presence, and with sagacity, decision and perseverance quite extraordinary, went other qualities not less useful to his work. He won the affection of those who served under him by sympathy, kindness and unselfish care of others as noteworthy as his gifts of intellect.

See the *Account of a Voyage round the World in 1769–1771, by Lieut. James Cook,* in vols. ii. and iii. of Hawkesworth's Voyages (1773); the *Voyage towards the South Pole and round the World . . . in . . . 1772–1775, written by James Cook . . .* (1777); a *Voyage to the Pacific Ocean . . . in 1776–1780,* vols. i. and ii. written by Cook (1784); also the *Narrative of the Voyages round the World performed by Captain James Cook,* by A. Kippis, D.D., F.R.S. (1788), long the standard life of the navigator, but now superseded by Arthur Kitson's *Captain James Cook, the Circumnavigator* (1907). *See* also E. S. Hodgson, *Captain Cook's Voyages* (1910); Y. G. Rowe, *Captain Cook, Explorer and Navigator* (1928). (C. R. B.)

COOK, SIR JOSEPH (1860–), Australian politician, was born at Silverdale, Staffs., and at the age of nine started life in a coal-mine. In 1885 he went to Australia and, six years later, entered the New South Wales Legislature, holding office as postmaster-general 1894–98 and minister of mines and agriculture 1898–99. He was elected to the Commonwealth Parliament for Parramatta as a free trader in 1901 and became minister for defence under Deakin 1909–10. In 1913, after the defeat of the Labour party, he became Premier and retained office until immediately after the outbreak of the World War. He did not take office again until 1917, when he was minister for the navy in W. M. Hughes's second ministry. From 1921 to 1927 he was high commissioner in London for the Commonwealth. In 1922 he was senior Australian delegate to the third Assembly of the League of Nations. He was created G.C.M.G. in 1918.

COOK, THOMAS (1808–1892), English travelling agent, was born at Melbourne in Derbyshire on Nov. 22, 1808. Beginning work at the age of ten, he was successively a gardener's help and a wood-turner at Melbourne, and a printer at Loughborough. At the age of 20 he became a Bible-reader and village missionary for the county of Rutland; but in 1832, on his marriage, combined his wood-turning business with that occupation. Cook persuaded the Midland Counties Railway Company to run a special train from Leicester to Loughborough and back at a shilling a head for a temperance meeting on July 5, 1841, and this is believed to be the first publicly-advertised excursion train ever run in England. In 1844 he entered into a permanent arrangement with the Midland Railway Company to place trains at his disposal, for which he should provide the passengers. At the Great Exhibition of 1851 Cook helped 165,000 visitors to attend. On the occasion of the Paris exhibition of 1855 there was a Cook's excursion from Leicester to Calais and back for £1 10s. The following year saw the first grand circular tour in Europe. "Cook's tourists" were at first personally conducted, but in the early '60s he began to be an agent for the sale of English and foreign tickets, the holders of which travelled independently. Switzerland was the first foreign country accessible under these conditions, and in 1865 nearly the whole of Europe was included in the scheme. Its extension to the United States followed in 1866. In the same year he began his system of "hotel-coupons," providing accommodation at a fixed charge. In 1882, on the outbreak of Arabi Pasha's rebellion, Thomas Cook & Son were commissioned to convey Sir Garnet Wolseley and his suite to Egypt, and to transport the wounded and sick up the Nile by water, for which they received the thanks of the war office. The firm was again employed in 1884 to convey General Gordon to the Sudan, and the men (18,000) and stores necessary for the expedition afterwards sent to relieve him. In 1889 Thomas Cook & Son acquired the exclusive right of carrying the mails, specie, soldiers and officials of the Egyptian Government along the Nile. In 1891 the firm celebrated its jubilee, and on July 19 of the following year Thomas Cook died.

COOKE, JAY (1821–1905), American financier, was born at Sandusky (O.), on Aug. 10, 1821. At the age of 18 he entered the Philadelphia house of E. W. Clark and Co., private bankers. Three years later he was admitted to membership in the firm. In 1858 he retired from the firm, and devoted himself to reorganizing some of the abandoned Pennsylvania railways and canals. On Jan. 1, 1861 he opened in Philadelphia the private banking house of Jay Cooke and Co., and floated at par a war loan of $3,000,000 for the State of Pennsylvania. In 1862 Salmon P. Chase, secretary of the Treasury, engaged him as special agent for the sale of the $500,000,000 of so-called "five-twenty" bonds. Cooke secured the influence of the American press, appointed 2,500 subagents, and before the machinery he set in motion could be stopped he had sold $11,000,000 more of bonds than had been authorized, an excess which Congress immediately sanctioned. At the same time he used all his influence in favour of the establishment of national banks, and organized a national bank at Washington and another at Philadelphia almost as soon as such institutions were authorized by Congress. In the early months of 1865, when the needs of the government were pressing, and the sale of the new "seven-thirty" notes by the national banks had been very disappointing, Cooke's services were again secured. As a result, between Feb. and July 1865 he had disposed of three series of the notes, reaching a total of $830,000,000.

After the Civil War Cooke became interested in the development of the north-west, and in 1870 his firm undertook to finance the construction of the Northern Pacific railway, but failed at the approach of the financial crisis of 1873. By 1880 Cooke had discharged all his obligations, and had again become wealthy. He died at Ogontz (Pa.) on Feb. 18, 1905. Cooke was noted for his piety. His estate at Ogontz became a school for girls.

See E. P. Oberholtzer, *Jay Cooke, Financier of the Civil War* (Philadelphia, 1907).

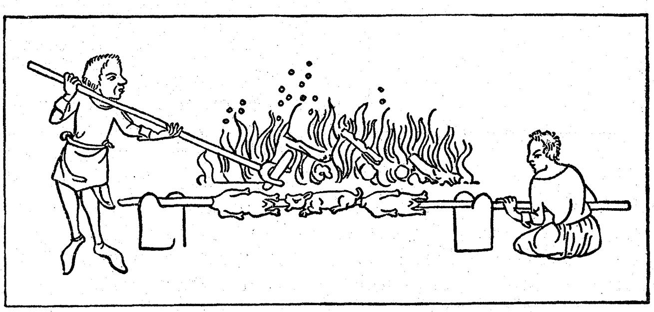
COOKE, ROSE TERRY (1827–1892), American writer, *née* Terry, was born at West Hartford (Conn.), Feb. 17, 1827, was educated at the Hartford Female seminary, and then found employment as a teacher. Her intense nature soon found vent in writing, however, and before she was 20 she had contributed to many magazines. She published in 1860 a volume of *Poems,* but after her marriage in 1873 to Rollin H. Cooke she was best known for her fresh and realistic stories, though in 1888 she published more verse in her *Complete Poems.* Her chief volumes of fiction, dealing mainly with New England country life, were *Happy Dodd* (1878), *Somebody's Neighbors* (1881), *Root-bound and Other Sketches* (1885), *The Sphinx's Children and Other People's* (1886), *Steadfast,* a novel (1889) and *Huckleberries Gathered from New England Hills* (1891). She died at Pittsfield (Mass.), on July 18, 1892.

COOKE, THOMAS (1703?–1756), English author, was born at Braintree, Essex, probably on Dec. 16, 1703. He went to London at an early age and in 1725 published his first important work, *The Battle of the Poets,* a poem which attacked some of the leading authors of the day, most notably Pope and Swift. Pope later retaliated by mentioning Cooke unfavourably in his *Dunciad.* Cooke wrote a number of other original works but he is best known for his translation of Hesiod into rhymed couplets, a work which gave him the nickname of "Hesiod" Cooke. He also translated some of the works of Terence, Plautus and Cicero. He died Dec. 29, 1756, at Lambeth.

COOKE, SIR WILLIAM FOTHERGILL (1806–1879), English inventor, was born at Ealing, Middlesex, May 4, 1806. He attended the University of Edinburgh and in 1826 joined the East Indian army, returning to England in 1832. In 1836 he attended at Heidelberg a demonstration of an experiment in transmitting messages by wire. Cooke at once began to experiment with the construction of an electric telegraph. Early in 1837, having returned to England, he was introduced to Charles Wheatstone, who had also been working with the telegraph and the two determined to form a partnership. In June of that year they were granted their first patent and subsequently made a number of tests of their new apparatus, but in that early model it proved too expensive for practicality. It was about this time that the quarrel between the two men arose over which should have the principal credit for their invention. Cooke alleged that Wheatstone was taking full credit undeservedly, while Wheatstone said that Cooke's invention had been impractical and that the patented telegraph was largely, if not wholly, his (Wheatstone's) work. In 1841 the dispute was submitted for settlement to Sir Marc Isambard Brunel, engineer of the Thames tunnel and a partisan of Cooke and Professor J. F. Daniell, King's college, a partisan of Wheatstone. On April 27, 1841, they published the statement that "Whilst Mr. Cooke is entitled to stand alone as the gentleman to whom this country is indebted for having practically introduced and carried out the Electric Telegraph . . . Professor Wheatstone is acknowledged as the scientific man, whose profound and successful researches had already prepared the public to receive it as a project capable of practical application . . ." This apparently settled the quarrel, for Cooke and Wheatstone issued a joint statement expressing their satisfaction with the decision, but in a few years the dispute flared again. There is, actually, little doubt that Wheatstone was the more important of the two in the history of the telegraph, but Cooke at least contributed his superior business skill to the partnership and his scientific contribution was not negligible. In 1845 the two men were issued the patent for their most important joint invention, an electric telegraph employing only a single needle. Cooke, who was knighted in 1869, died in Surrey, June 25, 1879.

COOKERY. The art of preparing and dressing food of all sorts for human consumption, of converting the raw materials, by the application of heat or otherwise, into a digestible and pleasing condition, and generally ministering to the satisfaction of the appetite and the delight of the palate.

Ancient Cookery.—It is obvious that opportunity has dominated its history, for the art of cookery is to some extent the product of an increased refinement of taste, consequent on culture and increase of wealth. To this extent it is a decadent art, ministering to the luxury of man, and to his progressive inclination to be pampered and have his appetite tickled. The Greeks learned by contact with Asia to increase the sumptuous character of their banquets, but we know little enough of their ideas of gastronomy. Athens was the centre of luxury. According to our chief authority, Athenaeus, Archestratus of Gela, the friend of the son of Pericles, the guide of Epicurus, and author of the *Heduphagetica,* was a great traveller, and took pains to get information as to how the delicacies of the table were prepared in different parts. His lost work was versified by Ennius. Other connoisseurs seem to have been Numenius of Heraclea, Hegemon of Thasos, Philogenes of



MEDIAEVAL COOKING IN ENGLAND (AFTER THE LOUTERELL PSALTER)

Leucas, Simonaclides of Chios and Tyndarides of Sicyon. The Romans, emerging from their pristine simplicity, borrowed from the Greeks their achievements in gastronomic pleasure. We read of this or that Roman gourmet, such as Lucullus, his extravagances and his luxury. The name of the connoisseur Apicius, after whom a work of the time of Heliogabalus is called, comes down to us in association with a manual of cookery. And from Macrobius and Petronius we can gather very interesting glimpses of the Roman idea of a menu. In the later empire, tradition still centred round the Roman cookery favoured by the geographical position of Italy; while the customs and natural products of the remoter parts of Europe gradually begin to assert themselves as the middle ages progress.

The Renaissance.—It is, however, not till the Renaissance, and then too with Italy as the starting-point, that the history of modern cookery really begins.

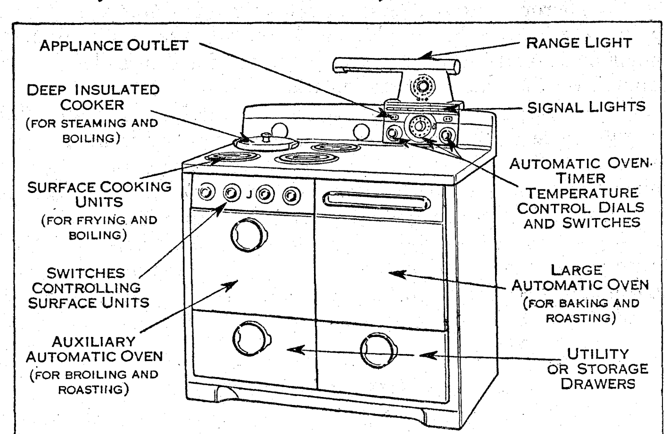
Montaigne's references to the revival of cookery in France by Catherine de Medici indicates that the new attention paid to the art was really novel. She brought Italian cooks to Paris and introduced there a cultured simplicity which was unknown in France before. It is to the Italians apparently that later developments are originally due. It is clearly established, for instance (says Abraham Hayward in his *Art of Dining*), that the Italians introduced ices into France. Fricandeaus were invented by the chef of Leo X. And Coryate in his *Crudities,* writing in the time of James I, says that he was called "furcifer" (evidently in contemptuous jest) by his friends, from his using those "Italian neatnesses called forks." The use of the fork and spoon marked an epoch in the progress of dining, and consequently of cookery.

Under Louis XIV further advances were made. His *maître d'hôtel,* Béchamel, is famous for his sauce; and Vatel, the great Condé's cook, was a celebrated artist, of whose suicide in despair at the tardy arrival of the fish which he had ordered Madame de Sévigné relates a moving story. The prince de Soubise, immortalized by his onion sauce, also had a famous chef.

In England, the names of certain cookery books may be noted, such as Sir J. Elliott's (1539), Abraham Veale's (1575), and the *Widdowe's Treasure* (1625). The *Accomplisht Cook,* by Robert May, appeared in 1665, and from its preface we learn that the author (who speaks disparagingly of French cookery, but more gratefully of Italian and Spanish) was the son of a cook, and had studied abroad and under his father (*c.* 1610) at Lady Dormer's, and he speaks of that time as "the days wherein were produced the triumphs and trophies of cookery." From his description they consisted of most fantastic and elaborately built-up dishes intended to amuse and startle, no less than to satisfy the appetite and palate.

French Cookery.—Louis XV was a great gourmet; and his reign saw many developments in the culinary art. The mayonnaise (originally *mahonnaise*) is ascribed to the duc de Richelieu. Such dishes as *"potage à la Xavier," "cailles à la Mirepoix," "chartreuses à la Mauconseil," "poulets à la Villeroy," "potage à la Condé," "gigot à la Mailly"* owe their titles to celebrities of the day, and the Pompadour gave her name to various others. The Jesuits, Brunoy and Bougeant, who wrote a preface to a contemporary treatise on cookery (1739), described the modern art as "more simple, more appropriate and more cunning, than that of old days," giving the ingredients the same union as painters give to colours, and harmonizing all the tastes. The very phrase "cordon bleu" (strictly applied only to a woman cook) arose from an enthusiastic recognition of female merit by the king himself.

The French Revolution was temporarily a blow to Parisian cookery, as to everything else of the *ancien régime.* "Not a single turbot in the market," was the lament of Grimod de la Reynière, the great gourmet, and author of the *Manuel des amphitryons* (1808). But while it fell heavily on the class of noble amphitryons it had one remarkable effect on the art which was epoch-making. It is from that time that we notice the rise of the Parisian restaurants. To 1770 is ascribed the first of these, the *Champ d'oiseau* in the rue des Poulies. In 1789 there were 100. In 1804 (when the *Almanach des gourmands,* the first sustained effort at investing gastronomy with the dignity of an art, was started) there were between 500 and 600. And in 1814, to such an extent had the restaurants attracted the culinary talent of Paris, that the allied monarchs, on arriving there, had to contract with the two brothers Véry for the supply of their table. Among the great gastronomic names of Napoleon's day was that of his chancellor Cambacérès, of whose dinners many stories are told. Robert (the eponym of the *sauce Robert*), Rechaud, and Mérillion were at this period esteemed the Raphael, Michelangelo and Rubens of cookery; while A. Beauvilliers (author of *Art des cuisines*) and Carême (author of the *Maître d'hôtel français,* and chef at different times to the tsar Alexander I, Talleyrand, George IV and Baron Rothschild) were no less celebrated. Perhaps the greatest name of all in the history of the literature of cookery is that of Anthelme Brillat-



COURTESY OF BOSTON EDISON COMPANY

Fig. 2.—Modern automatic electric refrigerator

Savarin (1755–1826), the French judge and author of the *Physiologie du Goût* (1825), the classic of gastronomy.

Later History.—In England, Louis Eustache Ude, Charles Elmé Francatelli and Alexis Soyer carried on the tradition, all being not only cooks but authors of treatises on the art. The *Original* (1835) of Thomas Walker, the Lambeth police magistrate, is another work which has inspired later pens. Like the *Physiologie du Goût,* it is no mere cookery book, but a compound of observation and philosophy. Among simple hand-books, Mrs. Glasse's, Dr. Kitchener's, and Mrs. Rundell's were standard English works in the 18th and early 19th centuries; and in France the *Cuisinière de la Campagne* (1818) went through edition after edition. An interesting old English work is Dr. Pegge's *Forme of Cury* (1780), which includes some historical reflections on the subject. "We have some good families in England," he says, "of the name of Cook or Coke. . . . Depend upon it, they all originally sprang from real professional cooks, and they need not be ashamed of their extraction any more than Porters, Butlers, etc." He points out that cooks in early days were of some importance; William the Conqueror bestowed land on his *coquorum praepositus* and *coquus regius;* and Domesday Book records the bestowal of a manor on Robert Argyllon, by the service of a dish called "de la Groute" on the king's coronation day.

At the present time, whatever the local varieties of cooking, and the difference of national custom, French cooking is admittedly the ideal of the culinary art, directly we leave the plain roast and boiled. And the spread of cosmopolitan hotels and restaurants over England, America and the European continent has largely accustomed the whole civilized world to the Parisian type. The improvements in the appliances and appurtenances of the kitchen have made the whole world kin in the arts of dining, but the French chef remains the typical master of his craft. *See* GASTRONOMY, MODERN. (E. G. C.)

EARLY AMERICAN COOKERY

Early American cookery was very simple. A primitive method was to build a fire on stones, to heat them, rake off the ashes and coals, lay the food on the stones, and cover it to steam cook. Another method was to roast food in the hot ashes. Both of these survive in the New England clam bake, for which the clams, as well as lobsters, chickens, sweet potatoes, corn or other foods, are put on the hot stones, covered with seaweed and then with canvas, and left an hour or more. Hunters still cook birds by coating them with clay, feathers and all, and roasting in hot ashes. The name, if not the method, still survives in the south, in the hoe cake, originally cooked in the fields on a hoe blade thrust into the ashes.

Open fireplaces followed the Indian method of fire on the floor in the centre of the tepee. With the open fire, a large three-legged iron kettle, an iron frying pan, also with three short legs, wooden spoons or pudding sticks with long handles, and ladles often made of hollowed out gourds, sufficed for the preparation of cornmeal mush, stews made of wild game, including rabbits and woodchucks, and for frying bannocks or pancakes, fish and tender cuts of meat. Roasting was done on a spit before the open fire and baking in a Dutch oven before the fire. Most of the food eaten on the farm was raised there or found in woods and streams, and most of the people lived in the "country." Very few foods had to be purchased. The accounts in the cash book kept in 1801 in a country store within 50 mi. of Boston include only:

Molasses	Salt
Sugar	Chocolate and
Coffee	Biscuit
Tea	

For equipment they bought:

Earthen pots	Sugar bowls
Milk pans	Teapot
Platters	Cake pans, etc.

Many more entries in this book were for:

Tobacco	Brandy and
Rum	other liquors

Butter, cheese and veal were sometimes brought in to be exchanged for one of the above.

Following the open fireplace, a large brick oven was popular, built above and at one side of the fireplace so as to use the large chimney, on the other sides of which were the fireplaces to warm the living rooms. A fire was built inside this oven, usually only once a week, and in it was cooked enough baked food to last through the week. First, pies which were often served at every meal. Mince pies, after baking, were sometimes frozen then reheated during the winter, as needed, a precursor of modern quick-frozen cooked foods.

Bread was then baked, made light with liquid yeast to which more water, potato, sugar, salt, cornmeal, etc., were added from week to week, often making it last for years. If the yeast gave out, more was borrowed from a neighbour. Next, gingerbread, the hard thin kind that kept well, or for special occasions a pound cake would go in the oven, and always baked beans, brown bread and Indian pudding as the fire died down.

EQUIPMENT

Stoves.—About 1830 the first cook stoves were marketed. They were built to burn wood, of which there was an abundance. They had built-in ovens and a tank at the end for heating water. Then the coal stove came, and with the advent of city water, a coil of pipe was built into the range and running hot water was available. The kerosene oil stove was a boon for quick cooking and then came the range that used natural or artificial gas, and a separate gas-heated water boiler was installed in kitchen or cellar. Since about 1904 constant improvements have been made in gas ranges, and electric ranges now seem almost perfect (fig. 1). The oven heat of these ranges is controlled by a thermostat. The regulator is set for the temperature desired and the gas flame or electricity is automatically reduced when that temperature is reached and the heat is held there until shut off. Many ranges have electric clocks that can be set to turn on and shut off the electric current. Thermostats are also used to control the temperature of large fry kettles in which are cooked potatoes, fish, doughnuts, etc., in institutions, restaurants and hotels, and for many other pieces of large equipment.

Refrigerators.—With the perfected ranges have come gas and electric refrigerators (fig. 2) for the preservation of food, so that we no longer have to cool our food in the well or in the cellar or by means of huge cakes of ice. Units for the quick freezing and storage of fresh foods, commercially and in the home, are gaining in popularity.

Small Equipment.—Much small electric equipment has made cooking easier and pleasanter. Coffee percolators, toasters and orange juicers are used in preparing the typical American breakfast. Many toasters are automatic. Sliced bread is inserted, upright, and heat is turned off as soon as the bread is a golden brown. Egg cookers, waffle irons, chafing dishes, broilers and other electric gadgets have their uses.

Labour-saving electric equipment for the preparation of many kinds of food for large numbers of people is used in institutions, hospitals, hotels, restaurants and factories. Equipment with smaller motors is used in the home for beating and mixing, grating and chopping and grinding, extracting fruit juice, freezing ice cream and sherbets, and even shelling peas and shredding green beans.

Black iron utensils for cooking have practically disappeared. Frying pans, saucepans and double boilers are made of aluminum, steel, stainless, chromium plated or with enamel coating, and heat-proof glass. Large kettles and steamers are of aluminum to save weight. Tin, sheet-iron and aluminum are used for bread, cake and roasting pans and cookie sheets. Oven glass is very popular for all kinds of baking. Covered dishes, called casseroles, are used for stews, scalloped dishes and baked desserts. Oven platters of glass or chromium-plated steel and heavy oak planks go directly from the oven to the table.

Pressure cookers (fig. 3) or canners are kettles made of cast or sheet aluminum, porcelain-enamelled steel, or tinned steel. Each has a cover held on with screws or other device, and some type of pressure gauge, pet cock, safety valve and closure.

The stores are full of small gadgets some of which are a great help in saving time and labour. Knives and flexible spatulas are made of stainless steel which needs little scouring. The rotary eggbeater is superseded, for many purposes, by the electric mixer, the chopping bowl and knife by the food chopper, etc.

Thermometers.—Cookery is becoming more and more a matter of using thermometers to get the best results in keeping and cooking food. Candy thermometers are used in sugar cookery and candy making. They register up to 400° F.

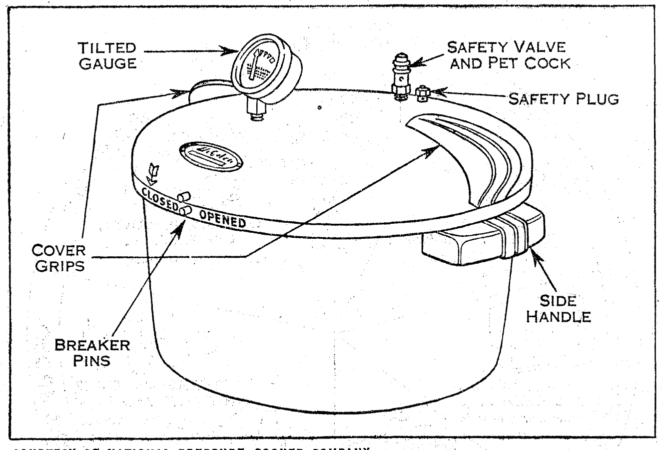
Fat thermometers are used to test fat for deep-fat frying and register up to 600° F.

Oven thermometers register the temperature of the oven and are used to test the accuracy of thermostat control or when there is no thermostat.

Meat thermometers thrust into the centre of a piece of meat or poultry show when the roast is cooked rare, medium or well done.

Refrigerator thermometers show the temperature in any part of a refrigerator. The temperature should not go above 40°–45° F.

Milk thermometers are used in testing the temperature of milk in bread and cheese making and for the baby's formula.



COURTESY OF NATIONAL PRESSURE COOKER COMPANY

Fig. 3.—Modern pressure cooker, used for the preparation of meals and for canning

Tables showing the temperatures that are best for baking, frying, candy making, etc., are found in modern cook books.

The teaching of cookery commenced in the United States about 1870. It is now taught in most public schools, and many colleges have home economics departments in which the preparation of foodstuffs and especially the nutritive value of foods is taught most scientifically. The composition of food has received increasingly more attention since about 1890.

NUTRITION

Since the discovery of factors in food, unknown until about 1914 and now called vitamins, millions of dollars have been spent in scientific food investigations in the laboratories of universities and food and equipment factories. In 1942 a national nutrition council of leading doctors, dietitians and nutritionists was called in Washington, D.C., U.S.A., to consider the best methods by which to acquaint the public with the necessity for a wiser daily choice of foods in order to promote better general health.

While food values had been stressed for years in schools, hospitals and dispensaries and by home demonstration agents and many others, this had not prevented a large number of men from being unfit for military service.

The chart shown in fig. 4 has been used on posters, in books, magazines and advertisements to acquaint the public with what they should eat. In thousands of classes women have been taught the best way to prepare these foods to conserve vitamins and minerals, and cooking today, 1944, is based on laboratory findings that show how to retain the greatest amount of nourishment in the food.

Dietitians.—Since 1900 more and more women trained in nutrition and in the purchase, preparation and serving of food, have taken charge of the feeding of groups of people in hospitals, schools and institutions and in many hotels, restaurants and factories. More people eat away from home every year, and they are getting better food, better prepared and in better planned meals, because of the educated women who are in charge of the cooks.

PROCESSING FOOD

From the time when nearly every family took its own corn to be ground, and slaughtered its own pig, to the present time, enormous strides have been made in the processing, in quantity, of almost every kind of food. Less and less raw food is being cooked in the home. The necessities of feeding the soldiers and Allies during World War II brought about the development of many new methods of processing food to conserve vitamins and minerals and make it keep without spoiling in any climate, under every adverse condition and to occupy the smallest possible space.

Smoking is used not only for the preservation of ham and bacon, but for many kinds of sausages and for turkeys, haddock and salmon.

Drying in the sun or under controlled conditions is used for codfish and for prunes, raisins, dates and figs, and all kinds of beans and peas. Modern machinery is used to remove the moisture

Fig. 4.—Chart showing the Seven Basic Foods as advocated by the U.S. government for the promotion of health

from milk, eggs, fresh vegetables, fruits, fruit juices, soups, baked beans and meat so that they will keep a long time and occupy little space. In most cases this is done with very little loss of food value.

Canning.—Nearly every kind of food can be purchased in a can of glass or tin, ready to be eaten either hot or cold.

The homemaker with a victory garden in 1944 is canning millions of pints, and quarts of fruit, vegetables, meat, poultry and fish, to replace that which is being sent all over the world.

Freezing.—Since 1930 quick freezing of foods has become very popular, and many kinds of fruit and berries, vegetables, poultry, meat and fish are available in this form. The food is prepared for cooking, wrapped and packaged in 1-lb. and larger cartons and frozen very rapidly. As long as they remain frozen these foods are just as good as though freshly picked or killed or caught. Frozen foods should remain frozen until they are put to cook, or if to be used without cooking, defrosted as short a time as possible before being used. Frozen food may be put directly into boiling water or into a steamer, pressure cooker, oven or broiler.

Enriching.—Because much of the food value of wheat is removed in the process of milling, the U.S. government decreed that this nourishment should be returned to white flour and to white bread and bakery products, and beginning early in 1944, vitamins and minerals were being added to wheat products including cereals, to make them of equal value with the whole grain. Vitamin A is added to most brands of margarine to make it compare favourably with butter of which there is not always a sufficient amount to supply the demands of the public. Vitamin D is produced in much of the evaporated milk that is sold. It is called irradiated milk.

Packaging.—Methods of packaging have made it possible to take from the shelves of the modern food shop almost every kind of food. Fresh fruits and vegetables are exposed where the customer can select them and meat, fish and poultry are shown in glass-topped refrigerated cabinets where one can see and select just what one wishes.

Many packages show their contents through glass or cellophane, and all packaged and canned goods for interstate shipment must tell on the label what the package or can contains.

METHODS OF COOKING

Baking is cooking in an oven. Best results are obtained by having a thermostatic control or using an oven thermometer.

Kind of Oven	*Temperature*
Very slow	220° F.
Slow	250° F.
Moderate	350° F.
Hot	400° F.
Very hot	450°–500° F.

Casserole cookery is baking in the oven in a covered dish of glass or pottery.

Roasting, originally applied to meat cooked on a spit before an open fire, is now applied to food, usually meat, baked in an oven. A meat thermometer is a great help in serving roast meats done as they should be.

Braising is cooking in a small amount of liquid, below boiling point, on top of the stove or in the oven. The meat is first browned in a small amount of added fat, then covered and cooked slowly in the juices from the meat, or in a small amount of added liquid. This is usually water but may be meat stock, milk, cream, dilute vinegar or juices from vegetables. Vegetables and seasonings are usually cooked with the meat for additional flavour.

Boiling is the term applied to water when in a state of ebullition or when it has reached a temperature of 212° F. at sea level. At high altitudes the boiling point is appreciably lower, and food takes longer to cook. The pressure cooker is of advantage at high altitudes as it raises the temperature of the water and makes for more rapid cooking. Boiling water is used in making beverages as tea and coffee, and in cooking vegetables, cereals, macaroni and other pastes. Boiling water is used in the under part of double boilers, in bains-marie and pressure cookers, and in processing canned foods. Most top-of-the-stove cooking is done at boiling point or a few degrees below.

Blanching is achieved by dipping food in boiling water to assist in removing skin, or to bleach.

Parboiling is to partly boil or partially cook, in water or (for shellfish) in their own juices.

Water and sugar, molasses or syrups are boiled for candy, frostings, etc. Fruit or fruit juices and sugar are boiled in making jams and jellies. The candy thermometer is a help in these types of cooking.

Sauces made with fat, flour and liquid are brought to the boiling point with frequent stirring or cooked in a double boiler, with boiling water underneath, until thickened.

Scalding is to heat just below boiling point, usually in the top of a double boiler. Milk is scalded at 196° F.

Simmering is cooking in water a little below the boiling point or at 185° F. This is the best temperature for "boiled" meat and eggs. Stock is made by cooking meat, poultry, fish, vegetables and seasonings in water at simmering temperature.

Stewing is cooking in water, preferably at 185° F. on the stove or in the oven.

Steaming.—When water boils it goes off as steam. Steaming is cooking food in the steam from boiling water. Fish and most vegetables may be cooked in this way in a covered perforated steamer over boiling water or in a covered saucepan or other utensil with less water than will cover the food. Many foods are cooked in covered moulds or tins or in double boilers surrounded by boiling water and steam.

Pasteurizing is cooking food in bottles or jars surrounded by water at a temperature of 140° F. to 145° F., or sufficient to kill any possible germs. City milk is usually pasteurized before being delivered.

Broiling or **grilling** is cooking food on a broiler or gridiron over hot coals or under or over a gas or electric unit. Food is seared first on one side and then on the other, then cooked more slowly to the desired condition. This has always been considered the best method for cooking tender cuts of meat and slices of fish. Tomatoes, some fruits and sliced cooked vegetables may be prepared in this way. Fireplaces in parks and backyards are frequently used in the summer for broiling. Bread is toasted or browned by broiling. Two slices of bread or split buns "broiled" with meat or other sandwich filling between are popular as toasted sandwiches.

Pan-broiling is cooking in a heated pan on top of the range with only enough fat to prevent sticking.

Sautéing is cooking in a pan on top of the range, in a small quantity of fat.

Frying in a small amount of fat is really sautéing—sometimes called pan-frying. Frying in deep fat or French frying is cooking in fat or oil deep enough to cover the object to be fried. Most articles, except potatoes, that are fried in deep fat contain egg or are coated with egg. A fat thermometer that registers up to 600° F. is best for testing the fat.

The best temperature for:

Uncooked mixtures—doughnuts, fritters, etc.	370° F.
Croquettes and other cooked mixtures	390° F.
Potatoes, raw	370–395° F.
Breaded chops	360–400° F.
Fish, small, whole or fillets	370° F.

Fricasseeing is browning meat or poultry in a small amount of fat and simmering in or serving with a sauce. Food is usually pre-cooked but tender cuts may be fricasseed without previous cooking.

FOOD PREPARATION

Beverages.—Glass and china are best for coffee and tea pots. The flavour is better than when they are brewed in metal. Coffee is made in a drip or percolator pot or by boiling for from one to three minutes.

Tea is made by pouring fresh boiling water over tea leaves or tea bags and straining off after five minutes.

Cocoa and chocolate are usually boiled with a small amount of water and added to milk heated in a double boiler.

Fruit drinks and punches are made of fruit juices, fresh or canned, diluted with plain or carbonated water, sweetened to taste and served iced.

Appetizers.—The Swedish smorgasbord, the Italian antipasto and the French hors d'oeuvre tray are popular in the United States. Many dainty tidbits, served as a first course, make a party meal of a simple luncheon, dinner or tea.

Small crackers and thin pieces of toast spread with highly seasoned cheese, fish pastes, devilled meat, etc., are called canapés. Fruit or shellfish in small pieces with a sauce are called cocktails, as are fruit and vegetable juices and liquors served in small glasses.

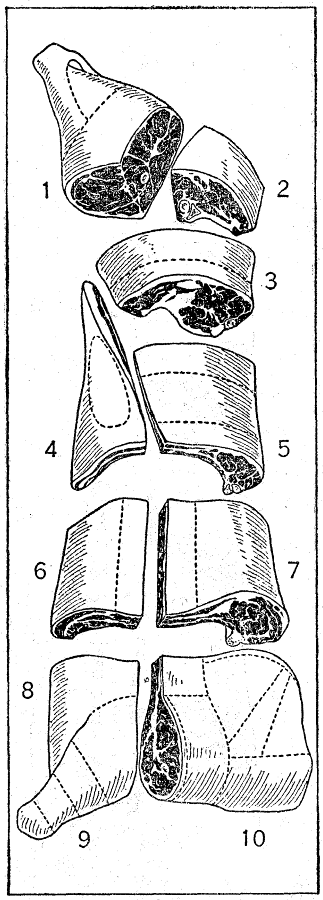
Fish, eggs, vegetables, fruit and cheese in various shapes and combinations are used as appetizers or hors d'oeuvres.

Fresh Fruits.—Many kinds are served without cooking. Citrus fruits and juices are especially popular at breakfast since they are the best source of vitamin C. A fruit cup or cocktail is a mixture of fruits, cut in small pieces, chilled and served in a cocktail glass. Many fruits are stewed or canned in a syrup of sugar and water. Apples, bananas, pears and quinces are baked with sugar and little or no water. Prunes, apricots and other dried fruits are usually soaked in water to cover before being boiled or simmered.

Yeast breads are made light with compressed or dry yeast. Most bread is made in 1944 from enriched white wheat flour with salt, sugar, fat and water or milk. Whole-wheat flour, rye flour, soybean flour, corn meal, rolled oats, bran and other cereals, or cooked potato may replace part of the wheat flour. In a dark bread, molasses is used instead of sugar. Orange juice, or tomato juice may replace other liquid. Eggs, raisins, prunes, nuts, cheese, cinnamon and other spices, cardamom and caraway seeds are sometimes added.

Rolls and biscuits in many shapes and sizes are made from yeast mixtures. After mixing, yeast dough is kept covered in a warm place until it has become light and full of bubbles of CO_2 gas, it is then cut down, shaped, put in pans and left to rise again before being baked. Bread needs a 375° F. to 425° F. oven. Rolls and biscuits a 425° F. to 450° F. oven. More bread and rolls are probably baked in commercial bakeries than in the American home.

Sandwiches are made of two slices of bread, usually spread with butter, put together with a filling of meat, chicken, eggs, fish, cheese, nuts, jam, etc. Fillings should be smooth and well flavoured. For lunch boxes these are cut in two and wrapped in wax paper. For teas and parties the bread is thinner and sandwiches are in small fancy shapes. Sandwiches are often toasted.



COURTESY, NATIONAL LIVE STOCK AND MEAT BOARD

Fig. 5.—Chart showing the wholesale cuts of beef: 1, round; 2, rump; 3, loin end; 4, flank; 5, short loin; 6, plate; 7, rib; 8, brisket; 9, shank; 10, chuck

Toast is crisp or soft, used plain with butter, jam or marmalade, in sandwiches and as a base for serving all kinds of meat, fish, eggs and vegetables in a sauce, and with milk plain or thickened as milk toast. Melba toast is made of very thin slices of bread, dried and browned in a slow oven. Stale bread may be cut in slices, buttered and cut in strips or dice, browned in moderate oven and served with salad or soup. As an accompaniment to soup these cubes are called croutons. Dry bread is forced through a food chopper or grater and as bread crumbs is used for coating food to be fried. When mixed with one-fourth as much melted fat, these are called buttered crumbs and used as a coating on baked dishes.

Stale bread with fat, seasoning and water or other liquid is used for stuffing veal, lamb, poultry and fish. Oysters, mushrooms, sausage meat and many other ingredients are often added. Soft bread crumbs are used in many made dishes.

Quick bread and biscuits are made light with baking powder or with soda, and cream of tartar, sour milk or molasses. These mixtures may be made of the same ingredients as suggested for bread. After mixing they are put in bread or cake pans or shaped and placed on cookie sheets and baked at once, usually in a 450° F. oven, except Boston brown bread which is put in a tightly covered tin and steamed, surrounded with boiling water.

Biscuit mixtures, in packages, needing only milk or water to be added are on the market.

Griddle cakes and waffles are cooked on top of the stove or in a waffle iron. A soft mixture, or batter, made of flour, milk and eggs, with baking powder, salt and shortening is used. Other ingredients, suggested under bread, may be added. Many packaged mixtures are on the market, some requiring the addition of liquid only.

Doughnuts are made of a similar but stiffer mixture. Shaped in rings or braids they are fried in deep fat at 370° F.

Batters are thin mixtures of flour, milk and egg. Fish, tripe, and many vegetables and fruits are dipped in or coated with batter and fried in deep fat heated to 370° F.

Cereals are made from different grains left whole, cracked, rolled or ground coarse or fine. Some are entirely cooked and served as they come from the package. Some are partially cooked so that five minutes cooking in boiling water with salt is sufficient. A double boiler is used to prevent burning. Whole grains and coarse cereals require one to three hours. Cereals which lose vitamins and minerals in being milled often have them restored before being packaged. Cooked cereals, especially corn products, are moulded, sliced and pan-fried.

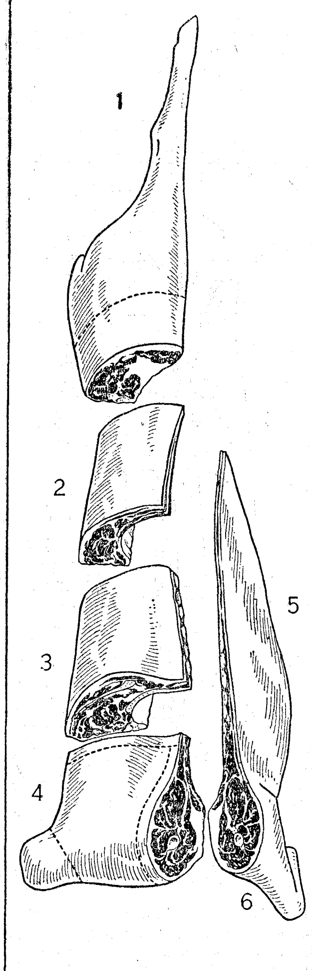
Rice is boiled or steamed or baked, in water, milk or tomato juice.

Macaroni is boiled until tender in plenty of salted water, drained and combined with white or tomato sauce, with cheese, meat or mushrooms. Noodles and spaghetti are cooked in the same way. Many of these pastes are made with soybean flour added to the wheat flour.

Eggs are soft or hard cooked in the shell, or poached out of the shell in salted water just below the boiling point. They may be combined with a sauce or used in salad. Eggs are baked, scrambled, pan-fried, used in custards, soufflés and French and puffy omelets, and are a necessity in many desserts, in cakes and most cookies.

Cheese is obtainable in many varieties. It is used without cooking as an accompaniment to many foods or in sandwiches. Cream, cottage and Roquefort cheese are extensively used in salads, especially with fruit. Firm cheese is often grated and used with vegetables and eggs. Cheese is added to bland dishes made with bread, macaroni, cereals and potatoes. Cheese mixtures, like rarebits and sauces, and in other combinations, should be cooked below boiling point or in a double boiler. Care should be taken that it is never over-cooked.

Soups are made from stock to which salt, pepper, onion, herbs and other seasonings are added for flavour. Many varieties of soup may be purchased dehydrated, in cartons, or condensed in cans requiring only to be boiled with water for a few minutes.



COURTESY, NATIONAL LIVE STOCK AND MEAT BOARD

Fig. 6.—Chart showing the wholesale cuts of lamb: 1, leg; 2, loin; 3, rack; 4, shoulder; 5, breast; 6, shank

Brown stock is the water in which beef has been cooked.

White stock is the water in which chicken, fowl or veal has been cooked.

The water in which ham or pork bones have been cooked is often used for pea and bean soups.

Fish stock is the water in which fish and fish bones have been cooked.

Vegetable stock is the water in which vegetables have been cooked.

Broth is made from beef, lamb or chicken cut in small pieces. Cooking is started in cold water and completed by simmering. Rice or barley are frequently added.

Bouillon is beef stock cleared with egg white. Bouillon cubes, powders and pastes with beef or chicken flavour, largely replace meat stock in home cooking. Clam bouillon is made from clams in the shell.

Consommé is soup made of beef, chicken or veal, vegetables and other seasoning, and cleared with egg whites.

Cream soups are made of white stock, fish stock, or vegetable stock with milk or cream and seasonings, and slight thickening of flour and fat. Any vegetable stock and cooked vegetable rubbed through a sieve may be used.

Bisque is made from shellfish or tomato with milk and seasonings.

Vegetable soups are made with stock or water and one or more vegetables in small pieces.

Chowders are made from fish, fresh or canned, or shellfish or from corn or other vegetable with salt pork, onion, potato dice, milk or tomato and seasonings.

Sauces for meat, fish and vegetables are made of liquid thickened usually with fat and flour, called roux, and well seasoned.

White sauce is made of milk, or a combination of milk or cream and white stock for the liquid.

Fish sauce is made like white sauce, using fish stock or hot water for the liquid.

Brown sauce is made from brown stock or water. The fat and flour are well browned before the liquid is added.

Gravy is made from the fat in the roasting pan. Flour is browned in the fat and liquid added.

Tomato sauces are made with strained tomato or tomato juice as all or part of the liquid called for.

Cheese, eggs, egg yolks, green and red peppers, celery, onion, mushrooms and other vegetables, when added, give their own name to these sauces.

Hollandaise sauce is made of egg yolks, butter, lemon juice and seasonings, and has many variations. Other sauces that add variety to meat, fish, egg and vegetable dishes include raisin sauce, orange sauce, and butter creamed with lemon juice, chopped parsley, etc.

Fish.—There are many edible varieties of salt-water fish, and of fresh-water fish and many kinds of shellfish. Fish is purchased whole; in slices; in thick portions from the centre of large fish; or skinned and boned as fresh or frozen fillets. Fish should be kept covered closely in a cool place and used as soon as possible. Fish is at its best when very fresh, served free of skin and bones, and with butter, lemon, or a suitable sauce. Quick-frozen fish, canned fish, especially salmon and tuna, and salt and smoked fish are available far from ocean, lake or river.

Broiled Fish.—Small or medium-sized fish, steaks or fillets are seasoned with salt and pepper, brushed with melted fat and broiled until brown first on one side then on the other (see *Broiling*).

Fried Fish.—Small fish, fillets or steaks are seasoned, coated with corn meal, flour or crumbs and sautéed in a small amount of fat; or coated with egg and crumbs, or dipped in batter, and fried in deep fat.

Baked Fish.—Whole, medium-sized fish, steaks and fillets are baked until nicely browned and tender. Fish are often stuffed before baking or stuffing may be put between two fillets. If fish are not fat, salt pork or other fat should be placed on top of the fish. Fish is often baked in milk, tomato, brown sauce, cheese sauce or wine.

Boiled Fish.—Medium-sized fish or thick pieces of fish are placed on a plate, wrapped in a square of cheesecloth and plunged into boiling water with salt and vinegar, then cooked below boiling point until flesh leaves the bone. Onion and other seasonings are usually added to the water. A sauce is always served with boiled or steamed fish.

Steamed Fish.—Steaming is preferable to boiling as more flavour is retained in the fish.

Creamed Fish.—Fish cooked, canned, including shellfish, salt or smoked are separated in flakes, free from skin and bones, and reheated in white sauce in a double boiler, or in the oven with buttered crumbs on top.

Fish Hash.—Cooked fish, or freshened shredded salt fish, is mixed with twice as much cooked and mashed potato, and pan-fried in pork fat.

Fish Balls.—The mixture for fish hash is shaped in flat cakes before pan-frying, or with an egg added is cooked in deep fat at 385° F. for one minute or until brown.

The most commonly used shellfish are clams, crabs, including soft-shelled and oyster crabs, lobsters, oysters, scallops and shrimps. Oysters and clams are often served raw with cocktail sauce. All are used in soups and chowders. Clams are steamed and served in their shells. Live lobsters are split and baked or broiled. Clams, oysters and scallops are fried. Crabs, lobsters and shrimps are boiled and the meat used, as are the other shellfish, in salads, with sauces and in many other ways.

Meat.—The wholesale cutting of the carcasses of live stock is uniform throughout the United States (see figs. 5–8). Local butchers separate the large cuts into the many smaller pieces listed in Tables I-IV.

Meat Cookery.—Since 1929 a vast amount of research has been sponsored by the National Live Stock and Meat Board, and the U.S. department of agriculture, bureau of home economics, and in universities and colleges, with the following conclusions:

Roast Meat.—Tender cuts of meat are placed in the roasting pan, fat side up, and cooked in a 300°–350° F. oven. At this temperature the roast is uniformly done throughout, cooking losses are less than with higher temperatures, the meat is more palatable, and bones and fat are not charred. Searing in a hot oven and basting are not necessary, no cover is used on the pan, and no water is needed in the pan. This method requires little attention, not much fuel, and there is little spattering of fat in the oven. An oven thermometer or thermostat is necessary and a meat thermometer thrust into the thickest part of the roast registers rare, medium and well done for beef, and well done for other meats. The time for roasting meat depends on the oven temperature, the weight and the shape of the roast, the degree of doneness desired and the proportion of lean and fat in the meat.

TABLE I.—*Meat Cuts for Roasting*

Beef	Veal	Pork	Lamb
Rib	Leg	Ham	Leg
Standing	Loin	Fresh	Loin
Rolled	Shoulder	Smoked	Shoulder
Chuck ribs	Boned and	Loin	Boned and
(of good quality)	rolled	Picnic shoulder	rolled
Tenderloin	Boned and	Fresh	Boned and
Rump	stuffed	Smoked	stuffed
Top round		Boston butt	Ribs
(of good quality)		Crown roast	Crown roast

TABLE II.—*Meat Cuts for Broiling*

Beef	Lamb	Pork
Sirloin steaks	Shoulder chops	Ham slice
Pin-bone	Rib chops	Bacon
Round-bone	Loin chops	Sausage
Wedge-bone	English lamb chops	
Double-bone	Steaks from the leg	
Porterhouse steak	Ground lamb patties	
Club steak		
Rib steak		
Tenderloin (filet mignon)		
Chuck steak		
(of good quality)		
Ground beef patties		

Broiled Meat.—Experiments in broiling steaks have shown that a moderately low broiling temperature is best. The temperature at the top of the steak (or about three inches below the broiling unit) is about 350° F. during all or most of the cooking. Steak may first be seared at a higher temperature if a very brown, crisp exterior is preferred, then the heat can be decreased. Broiled meat is seasoned with salt and pepper and spread with butter. Beef steaks and lamb chops, one to two inches thick, are best

TABLE III.—*Cuts Cooked by Braising*

Beef	Pork	Lamb	Veal
Neck	Rib chops	Breast	Breast
Fore shank	Loin chops	Neck slices	Steak
Chuck	Shoulder steaks	Shank	Rib chops
Brisket	Tenderloin	Shoulder	Loin chops
Plate	Steaks from leg	Shoulder chops	Shoulder chops

Kidney			
Liver			

and it is desirable that a meat thermometer be inserted horizontally to test the doneness.

Pan-broiled Meat.—Steaks and chops that are less than one inch thick may be pan-broiled. Hamburg, minute and cube steaks are pan-broiled.

Braising is used in the preparation of those cuts of meat that are not quite tender enough for roasting or broiling, and for pork and veal steaks and chops, which usually become too dry when broiled. Meat is cooked by low heat on top of the stove, or in a slow oven until it is tender. As with roast meats, the time depends on the size, shape and tenderness of the meat, and varies from 45 minutes to four hours.

Pot-roast is the name applied to a large piece of beef that is braised. A piece weighing three to four pounds requires 40 to 50 minutes per pound.

Meats Cooked in Water.—This is a moist heat method and

TABLE IV.—*Cuts Used for Stews*

COURTESY, NATIONAL LIVE STOCK AND MEAT BOARD

Fig. 7.—Chart showing the wholesale cuts of pork: 1, ham; 2, loin; 3, side; 4, spareribs; 5, butt; 6, picnic; 7, jowl

used in the preparation of the less tender cuts, in small or in large pieces.

Stews.—A stew is made of small uniform pieces of meat, simmered in liquid in a heavy covered kettle, with or without vegetables. For a brown stew the meat is browned before water is added; for a light stew the meat is not browned. Almost any vegetable or combination of vegetables may be added, with due regard to uniform shapes and pleasing colour and flavour.

Large Cuts Cooked in Water.—Corned beef and cured hams, shoulders and spareribs, neck and shank of veal, and tongues and hearts are the chief large cuts cooked in water, although other pieces may be so cooked. The meat is completely covered with water and simmered until tender. The time varies according to the weight and method of processing. In a pressure cooker two cups of water is sufficient. The pressure is kept at 10 lb. and meat cooks more quickly than when simmered.

Variety Meats.—During World War II emphasis was placed on the nutritive value, economy and many uses of brains, hearts, kidneys, liver, sweetbreads, tongue and tripe, and also of oxtails and pigs' feet. These are prepared by various methods; most of them are first simmered in water and then served with a sauce. Calf's liver is often pan-fried or broiled or baked with bacon.

Sausages.— Those made of fresh pork are cooked slowly, first in a little water then browned. Smoked sausages require reheating only. Bologna needs no cooking. Dry or summer sausages are ready to serve.

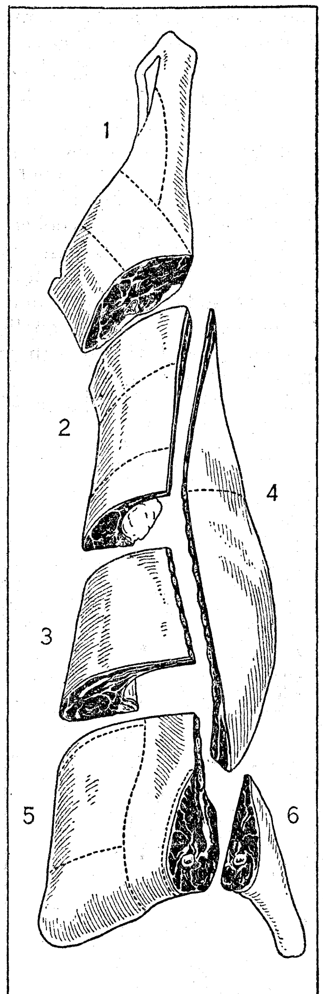
Cooked specialties or prepared meat products of many kinds in cans, loaves and casings need no cooking.

Cooked meat is used in hash, meat pies, scallops, sandwiches and other entrees.

Poultry and Game.—Poultry includes all domestic birds suitable for food, as chickens, fowl, guinea fowl, turkey, duck, geese, pigeons and squab. Rabbits and Belgian hares are raised for the market.

Game includes all wild animals and birds suitable for food, such as quail, partridge, plover, wild duck, deer, reindeer and moose.

Chicken, turkey and duck are first cleaned and dressed and then most of them may be baked or roasted, braised, broiled, fried, stewed or fricasseed. After cooking they may be creamed and used in other made dishes, salads and sandwiches, and served in a great variety of ways.



COURTESY, NATIONAL LIVE STOCK AND MEAT BOARD

Fig. 8.—Chart showing the wholesale cuts of veal: 1, round; 2, loin; 3, rib; 4, breast; 5, shoulder; 6, shank

Entrees.—Entrees are served as a special course at very formal dinners or as a main course at informal lunches, dinners and suppers. They are dishes made from cooked meat, poultry, fish, eggs or cheese and vegetables. These are called:

Croquettes when combined with a thick sauce, shaped in individual portions, coated with egg and crumbs and fried.

Timbales when mixed with eggs, crumbs and liquid and baked in small moulds.

Loaves when made of timbale mixture baked in a loaf pan.

A la king when added to a white sauce with red or green pepper and mushrooms.

Patties when mixed with a rich sauce and served in patty shells.

Soufflés when mixed with sauce and eggs separated and beaten very light, and baked.

Au gratin when combined with a sauce and baked with buttered crumbs, or grated cheese and crumbs, on top.

Many menus include among the entrees stews, fricassees and other meat dishes that are served with a sauce.

Vegetables.—The cooking of vegetables has received a great deal of attention in many food laboratories in order to conserve vitamin values.

The United States bureau of home economics offers the following suggestions as a summary of all available knowledge about the conservation of vitamin values in the cooking and serving of foods in the home:

Buy firm, fresh vegetables.

Don't let vegetables soak before cooking.

Don't stir air into foods while cooking.

Don't put them through a sieve while still hot.

Don't use soda in cooking green vegetables.

In boiling foods, raise the temperature to the boiling point as rapidly as possible.

Use as little water as possible.

Don't use long cooking processes such as stewing when shorter methods are feasible.

Don't throw away the water in which vegetables have been cooked. Use it in making gravies, sauces and soups.

Prepare chopped fruit and vegetable salads just before serving.

Start cooking frozen foods while they are still frozen.

Serve raw frozen foods immediately after thawing.

Green and yellow vegetables and tomatoes stand at the head of the list, being especially rich in vitamins.

Most vegetables may be eaten raw. Vegetable juices, especially tomato juice, retain most of their vitamins, and are popular served as cocktails, plain, or with additional seasoning, and are easy to use for sauces, jellied salads and in made dishes.

Boiled Vegetables.—Most vegetables are boiled or steamed, then dressed in various ways with sauces, chopped parsley, etc. Pressure cookers reduce the time for boiling vegetables; asparagus tips for instance cook in one to two minutes and even whole beets take only 15 to 18 minutes.

Baked Vegetables.—Vegetables that are good baked include:

American artichokes	Onions
Beets	Potatoes and
Acorn squash, halved	Sweet potatoes
Marrow squash in strips	

Cooked vegetables are used in soups and salads, reheated in a sauce, broiled or pan-fried.

Potatoes are served almost daily. Boiled in their skins until tender they retain most of their vitamins. Baked in their jackets is the next best way to conserve vitamins. They are fried in deep fat. After boiling they are browned in the oven with roast meat, pan-fried, mashed, served with a sauce, or used in soup or salad. One cook book has directions for serving potatoes in 224 different ways.

Sweet potatoes are baked or boiled, then may be served mashed, candied, creamed, etc.

Dried vegetables, including beans of many varieties, peas, green and yellow, whole and split, lentils and peanuts, which belong to the same family, are all used as meat substitutes. Ordinarily dried beans, peas and lentils are soaked in water overnight or for several hours, then baked or simmered until tender, or used in soup or with a sauce. Soybeans are being used more extensively since 1943 than ever before in the United States. They are purchased whole, tenderized, as grits, as flour and as nuts. The grits are used in sausages and other meat preparations. The flour is used in the manufacture of macaroni and other pastes and in prepared flours, as well as in the home to replace about one-fourth the wheat flour in many recipes. The protein of soybeans being more nearly like meat protein than that of other kinds of beans makes them especially valuable.

Baked beans, canned or quick frozen, require only to be heated.

Nuts.—Almonds, Brazilnuts, cashew nuts, filberts, pecans and walnuts are roasted and salted, or used in salads, cakes, cookies, candy, etc.

Peanuts are roasted or baked before being eaten and are much used in cooking. As peanut butter they are used in sandwiches and added to many dishes, as muffins, cakes, soup, sauces, candy, etc., for flavour and food value.

Salads are served as a first course, as a main course, with or following the main course, and as desserts. The suggestion to eat something raw every day has caused a great increase in the use of salads in the United States.

Salads usually have a base of something raw and green, like lettuce, romaine, chicory, escarole or watercress, or white and crisp like cabbage, Chinese cabbage, endive and celery. These are served with a salad dressing in which the leaves are tossed about until marinated. Almost all kinds of fruits and vegetables, raw or cooked; meat, poultry, fish, cooked or canned, eggs, cheese of many kinds and nuts alone or in combination, may be mixed with the greens or arranged attractively on them. Some salads are combined with gelatin and liquids and jelled, some containing cream are frozen. All are arranged to appeal to the eye as well as the palate. The simplest or French dressing is a combination of oil and vinegar, or lemon juice, seasoned with salt and pepper, and just before serving, beaten or shaken well. Many variations are possible. Mayonnaise dressing is a thick, smooth combination of oil and vinegar, beaten with egg yolks and seasoning. Cooked dressings usually are made with milk and butter, to replace the oil, and may be thickened with flour as well as egg. Many dressings are made with cream, lemon juice and other fruit juices.

Desserts.—Most luncheons and dinners conclude with something sweet, called a dessert. These are usually classified as hot, cold and frozen, cakes and pies. Desserts also include fruit, raw, cooked and canned, with or without cookies.

Hot Desserts.—Baking powder biscuit mixtures combined with fruit include cobblers, dumplings, shortcakes and steamed puddings.

Baked mixtures of milk, with or without eggs, include bread puddings in variety, cereal puddings, as rice and Indian pudding, tapioca puddings with milk or with fruit. Bread crumb and fruit "betties" are baked with neither milk nor eggs.

Soufflés are sweet mixtures of eggs separated and beaten light combined with a white sauce and flavour, or with fruit.

Steamed puddings are made of flour or bread crumbs, and with little or much fruit, with and without suet.

Cottage or castle puddings are like plain cake served with a sauce. Upside-down cakes are cottage puddings baked on top of fruit.

Dutch apple, peach or apricot cakes are cottage puddings with fruit baked on the top.

Fritters.—Batters made light with yeast, baking powder or eggs, enclosing pieces of fruit, fried in deep fat and served with a sauce.

Cream Puffs and Eclairs.—Crisp cakes with open space in the centre are made with choux paste, a cooked mixture of flour, shortening and water, beaten with eggs, then baked or fried, served with a filling, and sometimes frosting or sauce.

Many other mixtures that do not come under any particular heading and served with or without a sauce are listed as hot desserts.

Desserts served hot *or* cold include cream puffs and tarts and tortes, or thin layer cakes, chiefly eggs and sugar, served with whipped cream.

Cold Desserts.—These may be made and chilled before being served.

Soft custard is made with milk, egg yolks and sugar, cooked and stirred over hot water until a coating is formed on the spoon. With many different flavours, added ingredients, and baked instead of cooked in double boiler, at least 1,001 different desserts are possible. Gelatin added to soft custard poses as Spanish cream, or with whipped cream added as Bavarian cream. When cooked in custard cups or a mould in a pan of hot water in a 350° F. oven, this becomes baked custard. Some tapioca and rice puddings are in this class.

Cornstarch pudding or blancmange is milk thickened with cornstarch. Mixtures for these puddings come in packages requiring only to be cooked with milk.

Rennet custards are made of milk thickened with rennet.

Gelatin with fruit juice, coffee or wine makes jellies that may contain fruit, nuts and marshmallows, in great variety. (Many packaged jellies are flavoured synthetically and require the addition of hot water only.) Egg whites beaten light with fruit and sugar make snows and whips. Gelatin added to whipped cream with lady fingers or sponge cake becomes charlotte russe.

Icebox or refrigerator puddings are moulded with several layers of cake or cookies with a rich sweet mixture between.

Frozen desserts include: Ices or sherbets, generally made of fruit juices, sweetened, combined with water, milk or cream, and frozen until firm.

Frappé or sorbet are the same mixtures frozen to a mush only.

Ice cream is cream sweetened, flavoured and frozen. Many varieties contain milk thickened with flour, tapioca, eggs or gelatin. The above mixtures are placed in a metal container with a dasher and a cover, surrounded with ice and salt and churned by hand, or mechanically, until frozen, or they are put in an ice cube pan in freezing compartment of a mechanical refrigerator and left until frozen. Usually they are stirred or beaten once or twice to make them less icy.

Mousse.—A whipped cream mixture usually containing gelatin, frozen without stirring.

Parfait.—A whipped cream, syrup and egg mixture frozen without stirring.

Bombe.—A dessert made by lining a mould with a frozen mixture, filling centre with a different mixture and freezing until centre is firm.

Coupes and Sundaes.—An ice or ice cream served in a glass with a sauce, a fruit or a combination of fruits.

Dessert Sauces.—Some sauces are made of sugar and water, flavoured usually with chocolate or coffee or lemon or other fruit juice, and sometimes with a thickening of flour or cornstarch. They are served, hot and cold, on desserts and ice cream.

Butter and sugar creamed together with flavour added make hard sauce. Adding liquids, beaten eggs or whipped cream provides many variations. Eggs, separated and beaten very light, with sugar and flavour, make sauces with various names.

Whipped cream is used extensively as a sauce, a garnish or a cake filling.

Pastry, including dishes made with plain paste or puff paste, requires flour, salt, water and shortening, as lard, vegetable shortening or butter. Lightness depends on the amount of air enclosed while mixing or rolling, and the expansion of that air during baking. Chilling before baking is desirable, especially for puff paste.

Pies.—Plain paste of fat and flour (with salt), usually one part fat to three parts flour, mixed to a firm dough with water and rolled thin, is used to line a plate and to cover a filling of sweetened fruit. Sometimes a bottom crust only is used with a custard filling; sometimes only a top crust is preferred. Small pies, tarts, turnovers and many other combinations of pastry and filling provide a great variety of desserts. In the United States apple pie is the most popular pie. Pies are baked in a 450° F. oven at first, then at 350° F.

Cracker crumbs or ready to eat cereals, sugar and melted butter mixed and pressed into a pie plate make a bottom crust for many kinds of pies.

Ice Cream Pies.—Baked pie shells, holding a layer of fruit and a layer of ice cream, covered with meringue and browned quickly before serving.

Puff Paste.—A mixture of equal parts, by weight, of flour and fat, with water to make a firm dough, is rolled out and folded several times to enclose air which makes the paste rise with as many as 1,000 paper-thin layers. This is used for patties, vol-au-vent, and many small desserts. Puff paste requires a hot oven, 450° to 500° F. for the first five minutes, then 350° F.

Choux Paste. (See *Cream Puffs.*)

Cakes.—Sponge cakes are made of sugar, eggs, wheat flour, salt and flavour. Butter cakes require, in addition, butter, margarine or other shortening, milk or water, and baking powder or soda, except in pound cakes.

Sponge cakes are made by separating the eggs and beating whites until stiff and yolks until very light. Sugar and flavouring are beaten in. Flour and salt are sifted in and mixtures are cut and folded together. Angel cakes require egg whites only.

Butter cakes are usually made by creaming butter and sugar together, adding beaten eggs, then flour, sifted with other dry ingredients, alternately with the liquid. Chocolate cakes have melted chocolate or cocoa added to the mixture. Fruit cakes have raisins, currants, dates or figs added to the mixture. Molasses cakes have molasses instead of, or in addition to, part of the sugar. Ginger is added for gingerbread. Spices give flavour to many cakes.

Loaf, Layer and Cup Cakes.—Cake mixtures are baked in loaf pans, layer cake pans, angel cake pans, muffin pans and others.

Angel and sponge cakes require a 325° F. oven.

Butter cakes in loaves require a 350° F. oven.

Thin layer cakes and cup cakes require a 375° F. oven.

Chocolate or molasses cakes require a 325° F. oven.

Fruit and pound cakes require a 250–325° F. oven.

Frostings are made of sugar and liquid combinations of a consistency that can be spread on cakes. Vanilla or other flavour is needed in the frostings mentioned below:

Confectioners' frosting is made of sifted confectioners' sugar with egg white, water, coffee, fruit juice or other liquid. Many flavours and colours are possible.

Butter frosting is made by creaming butter and confectioners' sugar together with sufficient liquid to make it of the right consistency to spread.

Plain frosting is made by adding to beaten egg white, sugar and water syrup boiled to 240° F., or until it spins a long thread.

Seven-minute frosting is made by beating sugar, water, egg white and flavour over hot water until it holds its shape.

Fudge frostings are made by boiling sugar, milk or water, and chocolate to 234° F., cooling to 100° F. and beating to right consistency.

Brown sugar and maple sugar may be used in cooked frostings.

Frosted Cakes.—Many loaf cakes are covered with frosting. Layer cakes may have frosting between and on top, or jam or cream filling between and sugar on top. Cup cakes are usually frosted. Pound cakes and other firm cakes may be cut in small shapes and covered with melted fondant or frosting.

Decorations.—Nuts, candies and frosting forced through a pastry bag, with a tiny tube in the end, are the principal decorations used on cakes.

Cake Filling.—A great variety of sweet mixtures is used between layers of cake and in cream puffs. Cream filling is made with milk, sugar, flour and eggs, cooked over hot water until thick, and flavoured with chocolate, vanilla, etc. Fruit juice may be used instead of milk. Whipped cream may be added, or nuts, raisins, figs, etc.

Cookies are made of the same ingredients used for cake, but with less liquid so that they will hold their shape when dropped from a spoon onto a greased cookie sheet, forced through a cookie press, or chilled and sliced, or rolled out and shaped with cookie cutters before baking. Nuts, spices, fruit, flavour and shapes make hundreds of kinds of cookies possible. Some cookies are frosted and decorated for special occasions, or put together with a filling between.

Meringues.—Egg whites beaten stiff, with sugar beaten in, are shaped on a tin sheet and baked in a 250° F. oven.

Macaroons.—Combinations of sugar and egg whites, with almond paste, chopped nuts, cornflakes or other cereals, shaped in small balls and baked in 300° F. oven.

Candy.—Most candy is made in factories where conditions of cooking, coating and storing are accurately controlled. Many kinds can be made in the home from sugar, fruit, nuts, chocolate, etc. Uncooked candies require confectioners' sugar combined with egg white or fruit juice.

Chocolate-coated bonbons have centres of fondant, nuts, etc.

Fudges are made by cooking white, brown or maple sugar with milk or cream to from 234° F. to 238° F., cooling, and beating or working to a smooth creamy consistency that holds its shape. Chocolate, nuts, etc., may be added.

Fondant is made of sugar and water cooked and worked like fudge. Cream of tartar or corn syrup are usually added to prevent the formation of large crystals. Fondant is used for mints, and for the centres and coatings of many candies.

Caramels and nougatines are made of sugar, corn syrup and cream cooked to a firm ball.

Taffy is usually made of a molasses mixture, cooked to 256° F., cooled and pulled until porous and light in colour.

Hard candies include butterscotch, made of brown sugar, butter and water cooked to 290° F.; nut brittle, cooked to about 295° F.; and glacéed fruits and nuts, dipped in syrup cooked to 310° F.

Marshmallows contain gelatin.

Turkish paste contains agar agar.

Gumdrops require gum arabic.

Most cook books contain some candy recipes, as well as recipes for all the things suggested above.

Canning may be divided into six steps.

1. Preparation as for immediate table use.
2. Blanching of some vegetables and fruits.
3. Packing in jars or tins with water or syrup.
4. Sealing, entirely or partially, according to type of jar and contents.
5. Processing of jar and contents, according to timetables for different products, which must be followed exactly.
6. Storing, preferably in a cool dry space.

To prevent botulinus poisoning it is recommended that home canned vegetables (except tomatoes), meat, poultry and fish be processed in a pressure cooker.

Jams, jellies, marmalades, conserves and preserves, and relishes of many kinds are made of fruit or fruit juice and sugar, cooked to the desired consistency. Different fruits, combinations of fruits, and the addition of nuts make for a great variety of sweets that will keep indefinitely and can be used at any meal. Pickles are made from both fruits and vegetables with vinegar, and often with sugar and spices, added.

Jam of every kind can be purchased ready to serve but many are still prepared in the home. Some are made from recipes that have been in the family for generations, others are made firm very quickly by adding to the fruit and sugar mixture, pectin prepared commercially from certain fruits.

It must appear from the foregoing that in its modern aspect cookery is both an art and a science. It is an art because it requires special manipulative skill, and colour, design and attractive form and service are essential, especially in the higher grades. It is a science because exact knowledge is necessary in determining the correct time and amount of heat needed by the food material to be cooked to make it palatable and digestible, of food values so that the preparation may conserve vitamins and minerals and a rightly proportioned diet may be given, and of all food stuffs so that they may be combined suitably, satisfactorily and in definite and correct proportions.

Cook Books.—The first cook book published in the United States, called the *Compleat Housewife, or Accomplished Gentlewoman's Companion,* was printed in Williamsburg, Va., in 1742. A bibliography of American cookery books lists 490 books published from that time up to 1860. These were written for the housewife, not the chef. Cook books have continued to come from the press until it is said that books on foods and beverages rank second only to the Bible in the number printed. There has been a constant evolution in cookery, food preservation and cooking equipment. In the United States there is found, at least in the large cities, foods of every kind from all over the world, and in the book stores, books of recipes for dishes that are common in every civilized country. In the United States with its population made up from many different countries, housewives may retain their own recipes but, so far as funds allow, everybody uses the most modern equipment.

Probably the book that has had the greatest influence in raising the standard of American cookery is *The Boston Cooking School Cook Book,* written by Fannie Merritt Farmer in 1896. This book featured for the first time level measurements in cups and spoons and stressed the use of standard $\frac{1}{2}$ pint cups, divided in quarters and thirds, tablespoons holding $\frac{1}{16}$ of a cup and teaspoons holding $\frac{1}{3}$ of a tablespoon. More than 2,000,000 copies have been printed as the book has gone into edition after edition with frequent revisions that keep it up to date. Unnumbered cook books, large and small, pamphlets, magazine articles and newspaper columns appear every year, but this book continues to set the standard for all of them. (A. By.)

COOKING APPARATUS: *see* HOUSEHOLD APPLIANCES.

COOK ISLANDS: *see* PACIFIC ISLANDS.

COOKSTOWN, market town and urban district, Co. Tyrone, Northern Ireland, $53\frac{1}{2}$ mi. N.W. of Belfast on the Northern Counties (L.M.S.) and Great Northern railways. Pop. (1937) 3,369. Area 263 ac. It was founded in 1609 by the landlord, Allan Cook. Linen manufacturing and pork curing are the chief industries.

COOKTOWN, a seaport of Banks county, Queensland, Australia, opposite a gap in the eastern highlands at the mouth of the

Endeavour river, about 1,050 mi. N.N.W. of Brisbane. In 1770 Captain Cook here beached his ship the "Endeavour," to repair the damage caused by striking a reef 25 mi. to the S.E. Cooktown became a municipality in 1876. Pop. (1933 census) 504.

It is visited by ocean steamers and is a centre of the bêche-de-mer and pearl fishery. Tin and gold are mined and coffee and rice are grown. Cooktown is the port of the Palmer goldfields. A railway runs to Laura on the goldfield. It is the chief port of Queensland for the New Guinea trade; and is also the seat of a Roman Catholic vicariate whose bishop has jurisdiction over Queensland north of lat. 18° 50′.

COOKWORTHY, WILLIAM (1705–1780), English potter, famous for his discovery of china-clay and china-stone in Cornwall, and as the first manufacturer from English materials of a porcelain similar to the Chinese, was born at Kingsbridge, Devon, of Quaker parents. At 14 he was apprenticed to a London apothecary named Bevans, and afterwards carried on business at Plymouth with his master, under the title of Bevans & Cookworthy. The manufacture of porcelain was at the time attracting great attention in England, and while the factories at Bow, Chelsea, Worcester and Derby were introducing the artificial glassy porcelain, Cookworthy spent many years in searching for English materials similar to those used by the Chinese. From 1745 onwards he travelled over the greater portion of Cornwall and Devon in search of these minerals until he located them near to St. Austell. With some financial assistance from Mr. Thomas Pitt of Boconnoc he established the Plymouth China Factory at least as early as 1768.

But Cookworthy is remembered for his discovery of those supplies of clay and rocks which form the foundation of English porcelain and fine earthenware (*see* POTTERY AND PORCELAIN).

COOLIDGE, CALVIN (1872–1933), 30th president of the United States, was born at Plymouth, Vt., on July 4, 1872, the son of John C. Coolidge and Victoria J. Moor. He was descended from a long line of typical New England farmers and storekeepers, living in Puritan simplicity and taking a characteristic interest in local civic affairs. His father, like others in the ancestral line, was selectman and moderator of the town meeting; he held the office of town constable for many years, and became a member of each House of the State Legislature.

It is possible that much of the younger Coolidge's flair for practical politics was developed at an early age as he listened to the conversation that passed in his father's country store, where the Yankee democracy settled political issues over the nail and cracker barrels. His early education was characteristic of the region; he was first sent to the rural school-house, later to Black River academy and to St. Johnsbury academy, where he was prepared for Amherst college, which he entered in 1891. There he displayed the qualities which were to distinguish his later career, a dislike of ostentation, a capacity for hard work and clear thought, an ability to express his ideas in phrases that were frequently humorous and invariably terse. Such qualities did not make him a leader in his class (1895), either as scholar, social light or athlete; they did capture the admiration of a small group of the stronger men, and in senior year he was chosen "Grove Orator" for the class commencement. His interest in history had led him to prepare an essay on "Principles fought for in the War of the American Revolution," which was awarded the prize by the Sons of the Revolution in a national competition of college students.

As Lawyer and Legislator.—Upon graduation, Coolidge studied law with a Northampton firm, Hammond and Field, and two years later, in 1897, began its practice. The members of the firm were interested in local politics, and he himself soon found opportunity to follow his natural inclination. He was elected a councilman of Northampton in 1899, city solicitor in 1900, and was appointed clerk of the courts, a county office, in 1904. He was a member of the Republican city committee. In 1907 and 1908 he served as a member of the general court of Massachusetts, the legislative body of the State, winning the reputation of a hard-working committeeman; he returned to Northampton to become mayor for two terms in 1910 and 1911. At the close of his second term he secured the Republican nomination for State Senator, which in his district was tantamount to election. From that time his political career in the State progressed by regular steps. In 1914 and 1915 he was chosen president of the Senate; he was elected lieutenant-governor of Massachusetts for three terms, 1916, 1917, 1918 and governor of Massachusetts for two terms, 1919 and 1920. In each case of re-election he was returned to office by an increased majority.

His success was not achieved by conventional electoral methods, for he avoided ostentatious advertising and was regarded personally as a poor "mixer," shy, taciturn and apparently cold. Coolidge himself expressed in a characteristic phrase his conviction that electoral success ought to depend upon the candidate's devotion to official duty. "Let men in public office," he said, "substitute the light that comes from the midnight oil for the limelight." And again, "We need more of the office desk and less of the show window in politics." He translated his epigram into action, and the success he achieved as mayor of Northampton and as governor of Massachusetts, in securing both economy and efficiency, explains much of his consequent recognition at the polls. At all times he displayed a political shrewdness which saved him from mistakes, and a dry common-sense, skilfully expressed in trenchant phrases that caught the imagination of his auditors.

Governor of Massachusetts.—Coolidge, as governor of Massachusetts, proved himself an expert administrator; he was the first governor of the State to submit an executive budget for legislation and he pushed through various laws providing for the reduction in the number of administrative agencies in the State. But it is likely that his name would not have become nationally prominent if it had not been for his handling of the strike of the Boston policemen. The Boston charter provided that the police department should be under the direction of a commissioner appointed by the governor (in this case the commissioner had been chosen by Coolidge's predecessor); the mayor of Boston, however, may in certain contingencies take control of the police, and in "case of tumult, riot or mob," may call out such part of the State guard as is within the city of Boston; if the situation passes beyond his control he may call upon the governor to mobilize the remaining State militia.

The Boston Police.—During the first week of Sept. 1919, the Boston police threatened to go on strike because of the refusal of the commissioner to permit affiliation with the American Federation of Labor; the commissioner was steadily supported in his position by Gov. Coolidge. On the afternoon of Sept. 9, about three-fourths of the policemen left their posts; disorder in the streets commenced during the night, which became riotous the following morning. The mayor, who had been previously informed by the commissioner that he did not need the State guard, on the morning of Sept. 10 called out the State guard in Boston and requested the governor to send at least three regiments of infantry. Coolidge immediately issued the order. It is possible that, thus reinforced and with the aid of young college graduates, the local authorities might have handled the situation successfully. In view, however, of a threatened general strike calculated to disorganize transportation and business activities, as well as the danger of continued rioting, Coolidge called out the entire State guard, and on Sept. 11 took charge of the police department. The strike was broken and order restored. Coolidge steadfastly supported the commissioner in his refusal to reinstate the striking policemen, and in a public reply to an appeal of Samuel Gompers clarified the issues involved: "The right of the police of Boston to affiliate has always been questioned, never granted, is now prohibited. . . . There is no right to strike against the public safety by anybody, anywhere, at any time." Warned that organized labour would prevent his election to any office in the future, he replied, "It does not matter."

As Vice-President.—The action and words of Coolidge in this crisis were eminently characteristic. He took no step until it seemed necessary, but then he took it decisively. The effect upon the popular mind was impressive. In the election of Nov. 1919, standing for re-election as governor, he received a majority of 125,000. His name was at once included in the list of possible presidential nominees for the following year. Already mentioned in 1916 by a few supporters, he might have received the nomination in 1920 if he had been given the solid backing of politicians from his own State. But at the National Republican Convention, where the senatorial group in control did not approve him, the Massachusetts delegation was divided and he did not have the support of the senior senator, Henry Cabot Lodge. He failed thus to profit by the deadlock, which was finally broken in favour of Warren G. Harding. But when it came to a call for vice-presidential nominees, a wave of enthusiasm for Coolidge caught the convention which, with 674½ votes, nominated him on the first ballot. He was elected Vice-president of the United States in the following November, receiving with Senator Harding 404 electoral votes.

As Vice-president, Coolidge was the first who attended meetings of the Cabinet, but he made no attempt to enlarge the functions of his office. He attended faithfully to the routine duties that went with the presidency of the Senate, consistently supported the policies of the Harding administration, and did nothing to bring himself before the public eye. Early in the morning of Aug. 3, 1923, in his father's house at Plymouth, Vt., he learned of the death of President Harding. The oath of office was administered by his father, a justice of the peace, and he immediately left for Washington.

Becomes President.—Characteristically, President Coolidge's first interest was to assure the efficiency of the public administration, his second not to weaken his future position by any false step. Following four months' silence, his first presidential message, in Dec. 1923, commanded universal attention. It was brief and categorical. In it he made plain his opinion on the major problems before the country. He approved the maintenance of the tariff without frequent revision, a reduction of taxes; he disapproved the soldiers' bonus as well as any complicated scheme of Government relief for the farmers. As regards foreign policy, he advocated co-operation without entanglement, opposing entrance into the League of Nations, but approving adherence to the World Court. The message was courageous in its lack of equivocation and attractive in its emphasis upon economic common-sense.

With its delivery Coolidge caught the admiration and confidence of the ordinary citizen of the United States as a whole, as he had previously in Massachusetts. None the less, he faced a difficult situation in Washington. The Republican Party in Congress was broken into *blocs,* disinclined to accept his leadership, torn by factional struggles to secure advantage in the coming National Convention. Congress sustained the veto of Coolidge of the Postal Salaries bill by only one vote, and passed the Bonus bill over his veto. In the spring the disclosures of the Teapot Dome leases threatened to involve his Cabinet and discredit the Republican Party. The President met the demands for wholesale purification of the Administration with discretion and restraint; he immediately appointed special counsel to prosecute an investigation, but refused to satisfy popular clamour by hasty dismissal of accused officials: "I do not propose to sacrifice any innocent man for my own welfare, nor do I propose to maintain in office any unfit man for my own welfare." At the Republican Convention, largely because of popular feeling in his favour, his control was unthreatened and he was nominated with ease; the vote of the convention was in many cases an unwilling tribute by the party leaders to the overwhelming power of public opinion "back home."

Coolidge did not take an active part in the 1924 campaign, staying for the most part in Washington and dealing with current problems of administration. In the few speeches which he made he reiterated the basic principles which he had already stated: economy in public affairs, efficiency of public service, abstention from the League of Nations, adherence to the World Court. He made slight effort to answer the bitter criticism passed on the Republican Party for the scandals and its reactionary attitude, by the Democratic and Third Party nominees; he relied upon the increasing prosperity of the country under his administration and the widespread feeling that he embodied a shrewd common-sense in which the nation might trust. He was vindicated by the result of the election, which gave him 382 electoral votes against 136 for Davis and 13 for La Follette. The popular vote was 15,700,000 for Coolidge, 8,400,000 for Davis, 4,800,000 for La Follette.

Presidential Administration.—On March 4, 1925, Coolidge was inaugurated President by virtue of election. His position in the country and the party was strong. He still met difficulties with the old Congress, in which the insurgent senators combined on occasion with the Democrats to oppose his wishes; but the back of the insurgent-radical movement seemed broken, and his control of the new Congress became solidified. Rarely has a President fulfilled so exactly the predictions that were made of Coolidge. Indeed, his popularity with business elements and the warm admiration felt for him by the common citizen largely resulted from the fact that he was "predictable." His administration was characterized by no striking development apart from the continued maintenance of unparalleled national prosperity. In matters of policy the President depended upon the three outstanding figures in his cabinet, Mellon, Hoover and Frank B. Kellogg, who on Jan. 10, 1925 succeeded Charles E. Hughes as Secretary of State. His other cabinet appointments were sound rather than brilliant: William M. Jardine as Secretary of Agriculture, John G. Sargent as Attorney-General, Dwight F. Davis as Secretary of War, Curtis D. Wilbur as Secretary of the Navy, Dr. Hubert Work as Secretary of the Interior. For the first time in more than 50 years, the Senate refused to confirm a presidential nomination to a cabinet position, in the case of Mr. Charles Warren, whom Coolidge had named Attorney-General; the President avoided a constitutional issue by sending in the name of Mr. Sargent.

In domestic affairs Coolidge, relying chiefly upon Mellon and Hoover, continued the policy already laid down in his year and a half of office: economy of administration, reduction of taxation, non-interference in industrial affairs. "Economy," he said, "is idealism in its most practical form." He demanded the reduction of the national budget and constantly supported the principle of the retirement of national indebtedness as a means of employing Treasury surplus. In his message of Dec. 1926 he approved the plan to reduce the income tax payments of March 15 and June 15 following, as a refund on taxes in excess of Treasury needs; but he opposed definitive tax reduction. In the case of Mississippi flood control he refused to be hurried into calling an extra session of Congress for the purpose of making special appropriations, but awaited the report of the engineers, without whose expert advice he felt that no wise action could be taken. He insistently opposed the McNary-Haugen Farm Relief Bill (*see* under "Becomes President"), as partly unconstitutional, but chiefly because he looked upon its price-fixing stipulations as economically unsound. His own solution of the farmers' problem was found in the application of the principle of co-operative marketing. His invariable conviction that the Government should not interfere in business lay behind his refusal to take action in the coal strike of 1927.

In the field of foreign relations President Coolidge laid constant emphasis upon the traditional principles of U.S. foreign policy, especially control of the Caribbean and the devising of mechanism for settling differences between the powers by peaceful methods. He urged the desirability of American adhesion to the World Court and the necessity of progressive and reciprocal limitation of armaments. His policy in these respects was not crowned with success. On Jan. 27, 1926, the Senate voted in favour of participation in the World Court but with reservations which did not prove acceptable to the participating powers; the President thereupon announced in his Armistice Day speech at Kansas City that he did not intend to ask the Senate to modify its reservations in any further attempt to make participation in the World Court possible. In 1927 the conference of Great Britain, Japan and the United States called at Geneva for the purpose of securing further limitation of naval armaments, was unable to reach any decision because of a deadlock on the problem of cruiser tonnage. In view of this failure the President approved a programme for the increase of U.S. naval armament. The administration of foreign policy and the conduct of negotiations he left to Secretary Kellogg. Although President Coolidge showed his interest in settling differences with Mexico by the appointment of his close friend, Dwight Morrow, as Ambassador to Mexico, responsibility for negotiations with President Calles as well as for the sending back of American marines into Nicaragua, rested upon the Secretary of State. Mr. Kellogg also conducted the important negotiations which followed upon M. Briand's proposal, in 1927, that the United States and France sign a treaty renouncing war as an instrument of national policy; through the diplomacy of Mr. Kellogg this proposal was extended to cover a plan for a multilateral treaty of similar intent, which was accepted by all the great and most of the small States of the world. Negotiations *re* the debts of foreign Governments to the United States were left to Secretary Mellon. In the case of Italy, Belgium, Yugoslavia and Greece, the arrangements made by Mr. Mellon were ratified; the agreement which he negotiated with the French Ambassador was not ratified by the French Chamber, although France agreed on March 1, 1927, to pay provisionally at the rate of $10,000,000 a year.

Although his name was not connected with any positive policy, except perhaps that of thrift, Coolidge's prestige among the American people increased each year. The economic prosperity of the nation, combined with his refusal to embark upon any imaginative policy which people did not understand, doubtless accounts in large degree for the confidence generally placed in him. Lacking many of the conventional traits of the orator, President Coolidge proved himself a political preacher second only to Roosevelt, and the public addresses in which he set forth his views systematically, made a strong popular appeal. His speeches on economy, better local Government, the need of the spiritual element in politics, obedience to law, religious toleration and the like, were readily understood and warmly approved by the average citizen. Whatever the cause, his prestige was such that it was generally assumed that the Republican Party would disregard the third-term tradition and renominate him for the presidency. With characteristic simplicity and without any warning, President Coolidge, on Aug. 2, 1927, stated: "I do not choose to run for President in 1928." The phrase, used in the New England sense, connoted a determination that could not be broken, regardless of any wealth of reason that might be brought to bear. All efforts to "draft Coolidge for President," which were continued up to the time of the Republican Convention in June 1928, proved fruitless. The President exercised no clear influence at the Convention, but the nomination of Herbert Hoover was looked upon as an endorsement of the Coolidge administration. Upon the record of that administration the Republicans rested their case most successfully in the election of 1928. President Coolidge retired on Mar. 4, 1929, and in that year published *The Autobiography of Calvin Coolidge.* He died, Jan. 5, 1933, at Northampton, Mass.

On Oct. 4, 1905, Coolidge married Grace Anne Goodhue, of Burlington, Vt. Two sons, John and Calvin, were born on Sept. 7, 1906, and April 13, 1908, respectively. The younger died on July 7, 1924, as a result of blood poisoning. (C. Sey.)

COOLIDGE, WILLIAM AUGUSTUS BREVOORT (1850–1926), American alpinist and writer on alpine subjects, was born on Aug. 28, 1850, near New York, and educated at St. Paul's school, Concord, New Hampshire, Elizabeth college, Guernsey and Exeter college, Oxford, where he became modern history tutor. From 1880 to 1881 he was professor of English history at St. David's college, Lampeter, and from 1881 to 1885 modern history tutor at Magdalen college, Oxford. During the period 1883 to 1895 he was curate at South Hinksey, near Oxford. Climbing and alpine literature were always his main interests, and in 1909 he went to Switzerland, and settled at Grindelwald. His chief ascents were made, during vacations, between 1865 (Col du Géant) and 1898 (Ortler), and he made the first winter ascent of the Wetterhorn (1874) and the Schreckhorn (1879). His guide was the famous Christian Almer, and later Almer's son. Coolidge made altogether over a thousand ascents in the French, Swiss and Italian Alps, but the Dauphiné was his favourite district. His most notable books are *Swiss Travel and Swiss Guide-books* (1889), and *The Alps in Nature and History* (1908). He edited the first volume of Ball's *Alpine Guide,* and two issues of Murray's *Handbook for Switzerland.* He was the sole author of several volumes in the *Climbers' Guide* series, and contributed to the *Encyclopædia Britannica.* He died at Grindelwald on May 6, 1926.

COOLIDGE TUBE, an X-ray tube with a hot cathode (*q.v.*) (*see* also X-Rays, Nature of).

COOLIE, a term applied generally to Asiatic unskilled labourers and specially to Indian or Chinese emigrants of this class. In many tropical countries, where the needs of the existing population were few and simple, and there was an abundance of fertile land open to its use, it was found impossible, after the abolition of slavery, to obtain an adequate supply of steady labour for the planting industry from local sources. The emancipated negroes were able to obtain land on easy terms, and had no incentive to work for regular hours on the estates of the planters. The deficiency was remedied by promoting the immigration of a fresh labouring population drawn from the industrious inhabitants of India and China.

Indian Indentured Emigration.—The needs of the British sugar-producing colonies after the abolition of slavery in 1834 gave the first great impetus to the emigration of coolies from India. Labourers were recruited under "indenture," a contract enforceable by penal sanctions, to serve for a term of years, usually five, in return for their wages and certain benefits and the cost of their passage. A considerable number of Indians had been introduced into Mauritius, and a few into British Guiana, by 1838 when the recruitment was stopped pending enquiry into abuses. In 1842 indentured emigration to Mauritius was re-opened under proper safeguards; in 1844 it was allowed to Jamaica, Trinidad and British Guiana, in 1860 to Natal and in 1885 to Fiji. Emigration to certain French colonies was regularized by a convention of 1861, but was suspended about 1890, and not subsequently renewed. After 1872 emigration was allowed to Surinam under a convention with the Netherlands Government. The system of indentured emigration to distant colonies was strictly regulated by Indian legislation, which was progressively amended to remedy such abuses as came to light from time to time. The object was three-fold: first, to prevent kidnapping or any kind of coercion or fraud, and to ensure that the recruited labourers properly understood the terms of their contracts before they left India; secondly, to secure their well-being prior to embarkation and during the voyage; thirdly, to insist, as a condition of permitting emigration, on adequate provision being made in the colonies for the equitable treatment of the immigrants.

Colonial Governments made themselves responsible for recruitment through their agents in India; these agents employed recruiters approved by the Indian Government's protector of emigrants; persons recruited were taken before the magistrates, who registered their engagements, and were then conveyed to Calcutta, Madras or Bombay and housed in depots, licensed by the protector, pending embarkation on vessels which were also licensed and required to be equipped in every respect with what was needed to ensure the safety and welfare of the passengers on their long voyage. On arrival in the colony the labourers were distributed among the estates on which they were to work. The employer was responsible for the welfare of his indentured labour force. Under the colonial laws he was bound to provide regular but not excessive work, at fair wages, and to house his labourers and their families. Rations at less than cost price were sometimes supplied. Medical care and inspection were provided by the employers and the Government. Special officials were appointed for the protection of immigrants. The labourer on his side was bound to give regular work, and penalties, of fine or imprisonment, were provided by law for offences such as refusal to work or desertion.

At the expiry of his contract the labourer was free either to re-indenture for a further period or to seek other employment or occupation; he frequently became a peasant proprietor; after a minimum period of residence in the colony he had the option of a free or assisted return passage to India, but many ex-indentured coolies settled permanently in the colonies, where their descendants form a large and, for the most part, flourishing population. In 1926 the approximate Indian population, mostly of this origin, was 277,000 in Mauritius, 125,000 in British Guiana, 126,000 in Trinidad, 17,000 in Jamaica, 130,000 in Natal and 68,000 in Fiji. In British East Africa Indian labourers were supplied under Government auspices for the construction of the Uganda railway, which commenced in 1895; they were engaged on three-year contracts with the right of a return passage to India. At one time there were as many as 18,000 Indians thus employed; but only a few of them remained permanently in the country, and the bulk of the present Indian population in Kenya has a different origin.

BY COURTESY OF THE NATIONAL BOARD OF THE Y.W.C.A.
TYPICAL CHINESE COOLIE

Cessation of Indenture System.—The Indian Government neither encouraged nor discouraged indentured emigration but confined itself to the neutral rôle of an honest broker between two parties to a commercial transaction, the colonial Government and planters on the one side and the Indian labourer on the other; the elaborate regulation of the system was no more than was necessary to avoid risk of the ignorance and weakness of the coolie class being imposed upon or exploited. In 1875 the late Lord Salisbury, as secretary of State for India, suggested that coolie emigration should be actively encouraged with a view to relieving congestion in India and promoting prosperous Indian settlements in the under-populated colonies. The Government of India, however, declined to change their policy, considering that any probable flow of emigration would be negligible in proportion to the vast population of India, and that its promotion would cause misunderstanding and suspicion and would lay on themselves an embarrassing degree of responsibility for the prosperity of the emigrants and the quality of the labour supplied to the colonies. As time went on, the Government of India's attitude was affected by two further considerations; firstly, it was felt in India that her labour supply was not in excess of her growing industrial requirements; secondly, the treatment of ex-indentured Indians in Natal led to acute political difficulty after the colony obtained self-government, and encouragement of Indian settlement in other colonies might sow the seeds of similar trouble. Recruitment for Mauritius ceased in 1911 because the large Indian population rendered further immigration unnecessary. Meanwhile the grievances in Natal were one of several factors which were making the whole system unpopular in India; others were the penal clauses of the colonial labour laws in general, and evils resulting from the small number of women who emigrated; but above all it was felt that indenture attached a stigma of inferiority to the Indian race, and that the diffusion of coolies spread abroad a false estimation of India's cultural development by giving the impression that she was merely a reservoir of unskilled labour; the term "coolie," for example, had come to be mistakenly used in the West Indies as synonymous with "Indian," and in South Africa with "Hindu." In 1910, Gokhale, in the Indian legislative council proposed that further indentured emigration to Natal should be forbidden, and this was done in the following year; in 1912 he urged that all recruitment under indenture should be abolished. During the war the system was suspended and the Government of India proposed its final abolition; the British Government agreed, and the decision not to revive it was announced in 1917. The conventions with the Netherlands and France were formally terminated in 1919 and 1921. In the colonies outstanding indentures have come to an end either through cancellation, as in Fiji and British Guiana (1920) and Mauritius (1923), or through time expiry, save in a few cases of labourers who have entered into successive re-indentures.

Modern Regulations.—After the abolition of indentured recruitment the way was open for the consideration of other methods of attracting labour to the colonies with a view to eventual settlement of the labourers as colonists. Memories of the indentured system, however, made unpopular any scheme based solely on the labour requirements of distant countries. The Government of India's policy in regard to all forms of labour emigration has been embodied in the Indian Emigration act, 1922. No restrictions are placed on unassisted emigration, but the act applies to persons who receive financial assistance to leave India for the purpose of working for hire or engaging in agriculture; the assisted emigration of skilled workers may be permitted under adequate safeguards, but that of unskilled workers, including agriculturists, is prohibited except to such countries and on such conditions as may be specified by the Government of India with the concurrence of the Indian legislature; any scheme of assisted emigration would be examined by these authorities in respect of the conditions of work and wages offered, medical and educational facilities, the cost of living, the terms of repatriation and the provisions of the labour laws in the country of emigration, as well as the political status of Indian immigrants and their opportunities for economic and social advancement. The act provides minutely for the protection of assisted emigrants against abuses in recruitment and hardships in transit, and for securing that a due proportion of women accompany their male relatives. Under the act emigration to Mauritius was again permitted for one year in 1923, but was then discontinued as enquiry showed that the Indian population in the colony had reached saturation point. An attractive scheme for the settlement of a small number of families as colonists in British Guiana was approved in 1926 but lapsed owing to the difficulty of financing it.

Indian Non-contract Labour in Ceylon and Malaya.—There is a large movement of Indian labour from the Madras Presidency to Ceylon and Malaya, especially for work on the tea and rubber estates. The estimated Indian estate population in Ceylon was over 700,000 in 1926. The total Indian population of Malaya was about 470,000 in 1921, of which more than half was on the estates, and is rapidly increasing, the estimate for 1926 being 660,000. In Malaya prior to 1910 there was a certain number of indentured immigrants; otherwise emigration to these neighbouring countries, which has taken place from an early date, has been a natural and largely a spontaneous process. Recruitment is effected through *kanganies* (labour headmen), originally the senior members of emigrant families, who return home and persuade other relatives and friends to join them, financing the transaction with funds supplied by their employers. Recruitment for Ceylon was supervised by a labour commission set up by the planters in 1904; that for Malaya is financed by an Indian immigration fund established in 1907, which is officially managed and is maintained by a levy on employers. But this emigration was not regulated by the Indian Government till 1922; absence of long-term contracts, ease of communication with India and the patriarchal organization of the labour force made the system immune from the abuses to which emigration under indenture was liable, though it had defects of its own in Ceylon, such as the initial indebtedness of the coolie to his *kangani,* from which the former might never escape, and the consequent power possessed by the latter, in times of labour shortage, to barter the transfer of his gang from one estate to another in consideration of receiving advances which he pocketed himself.

This assisted emigration became subject to regulation by the act of 1922. It was temporarily allowed to continue, and in 1923 was definitely legalized under certain rules and conditions; the Governments of Ceylon and Malaya each appoint an emigration commissioner in India who is responsible for the organization of recruitment; the *kanganies* are licensed by the colonial authorities; each recruit must be examined by his village headman, in the presence of the *kangani,* to ascertain that he understands the conditions attaching to his emigration and that his family agrees to his departure; engagements are limited to one month's duration; the Government of India has its agents in Ceylon and Malaya to assist and advise Indian residents; free repatriation is granted within one year of an immigrant's arrival when considered desirable by the agent; in the case of Ceylon it is provided that no payment made by a *kangani* to enable a coolie to liquidate his debts in India before emigrating shall be recoverable. Besides agreeing to these conditions the colonial Governments abolished penalties for labour offences and made a number of amendments in their labour laws affecting Indians; a minimum age has been prescribed for the employment of children on estates, and machinery has been set up for fixing standard wages sufficient to maintain a labourer and his family comfortably, and provide a margin for savings for sickness and old age. Emigrants to Malaya are accompanied on the voyage (of five to ten days' duration) by travelling inspectors appointed by the colonial authorities.

Assam.—In the Assam tea gardens there is a large immigrant population drawn from other parts of India to make up the deficiency of the local labour supply; in the year ending June, 1927, the number of new immigrants was over 45,000; recruitment under careful official safeguards is carried on by *sardars* (labour headmen) who have themselves worked in the gardens; previously the labourers often entered into contracts which could be enforced by penal sanctions under the Assam Labour and Emigration act, or the Indian Workmen's Breach of Contract act; but more recently the penal provisions of the former act have been withdrawn, and the latter was repealed in 1925.

Chinese Indentured Emigration.—Indentured emigration from China commenced about 1845. It was nominally prohibited before 1859, but owing to the weakness and corruption of the Chinese officials the prohibition was not effective; at the same time the refusal of legal recognition made it impossible to regulate recruitment and it was accompanied by all kinds of abuses. European firms employing Chinese recruiters were engaged in the traffic. Many coolies were actually kidnapped or decoyed; the ships were badly equipped and overcrowded, and many died on the voyage. Their principal destinations were Cuba and Peru; on arrival the contracts, which ran for seven or eight years, were sold by auction, and the coolies frequently found themselves in a position virtually little better than slavery, owing to the absence or non-enforcement of laws for their protection. So far as British ships were concerned, the traffic was checked by the Chinese Passengers act, 1855; under this the certificate of an emigration officer was required for all vessels clearing from Hongkong, or British vessels clearing from Chinese ports, which carried more than 20 passengers on a voyage of more than seven days, and the certificate was to be withheld unless the coolies understood the terms of their contracts, and the vessel satisfied minimum requirements as to space and provisions.

In 1859 the British Government obtained the co-operation of the Chinese authorities at Canton in establishing a legal and regulated system of emigration to the British West Indies on five-year contracts; the system was applied also to emigration to the territories of other powers. In the following year the Imperial Chinese Government by the Anglo-Chinese convention of 1860 formally sanctioned contract emigration to British territory under regulation. Similar conventions were concluded by other powers. Henceforward it became possible to control recruitment. The system adopted in 1859 continued in force till 1866, when British, French and Chinese representatives signed a convention which provided for the grant of a free return passage to the coolies at the expiry of their five-year contracts. This convention was not ratified by Great Britain and France, but the Chinese Government refused to continue countenancing emigration on other terms; the trade at Chinese ports was thus diverted to the Portuguese settlement of Macao, where its abuses had largely continued unchecked.

In Hongkong the law was strengthened in 1868, 1870 and 1873, and contract emigration to places outside the British empire was prohibited. In 1874 Macao was closed to the traffic, and, after an enquiry into the treatment of the coolies in Cuba, the Chinese Government was more than ever averse to allowing it through the treaty ports. Throughout this period the Chinese emigrants to the British West Indies went chiefly to British Guiana; about 14,000 landed there between 1853 and 1879, and a few more in the course of the next generation, but the majority subsequently re-emigrated, and the Chinese population in 1921 was only about 2,000. Indentured emigration to British territory was legalized afresh by the Anglo-Chinese convention of 1904 in order to enable Chinese to emigrate under three-year contracts for unskilled work in the Transvaal gold mines (*see* TRANSVAAL). More recently Chinese contract labourers were introduced by the Germans into Western Samoa. In 1920 the New Zealand Government adopted similar arrangements for the territory, but in 1923 they abolished the indenture system and replaced it by one of free labour.

Chinese in Malaya.—From early times there has been a large spontaneous immigration of Chinese into Malaya. In the 19th century it was supplemented by assisted immigration organized on a "credit-ticket" system; passages were paid by Chinese agents who recouped themselves from the immigrants or their prospective employers. From 1877 onwards this system was brought under strict regulation by the British Government with a view to preventing abuse and ensuring that immigration was voluntary; a protector of Chinese was appointed and registration of contracts was compulsory. In 1914 (1916 in the state of Kelantan) the system was abolished and immigrants could no longer be compelled to enter into any particular employment as security for repayment of passage money or any advance. The labour codes make special provision for the protection of Chinese. The law provides for the proper equipment of coolie ships and the comfortable accommodation of their passengers. Vessels carrying more than 20 immigrants must have a qualified medical practitioner on board. Specially appointed protectors examine the coolies on arrival, particularly in regard to the existence of any engagements to undertake labour or repay debts; their financial liability is limited to sums fixed by the protectors; immigrants under 16, or over 45, years of age, or physically unfit, and any who have been induced to travel by fraud or misrepresentation may be repatriated at the expense of their creditors; any indebted immigrant who has obtained assistance by promising to enter into a labour contract may also be repatriated at his creditor's expense, or released from his obligation, at the discretion of the protector. Penalties for labour offences have been abolished, and, apart from the special protection of Chinese, the laws in their general application provide amply for the well-being of labourers and their dependants on the estates, for housing, water supply, sanitation, medical treatment, hospital accommodation, maternity benefits, nurseries for infants and education of children. The popularity of work in Malaya is shown by the increase in the Chinese population of the Straits Settlements and Federated Malay States from 583,000 in 1901 to 993,000 in 1921. The total Chinese population in the whole of Malaya was about 1,174,000 in 1921, of whom 257,000 were born in the country; it includes many independent agriculturists, merchants and mine-owners, as well as labourers in the tin mines and on the estates.

COOLING EFFECT, the drop in temperature of a system whose internal potential energy is increased without heat being absorbed from outside is the Joule-Thomson cooling effect. (*See* ADIABATIC CHANGE; ENERGY; THERMODYNAMICS.)

COOLING SYSTEMS. In certain industrial processes cooling has to be effected to render the working of an engine or machine practicable. All the internal-combustion engines generate such heat in the cylinder that unless cooled the lubricating oil would burn up, pistons and other parts would seize, and unequal expansions would create difficulties. Air cooling by means of *fins,* though adopted in motor-cycles and some aero-engines, has as yet been adopted by only a few motor-cars.

In the water cooling, the most suitable system, a jacket is cast around the cylinders, or made separately from thin sheet in aero-engines. Two systems, the thermo-syphon and the pump are in use for passing the water through a radiator, which exposes it to large cooling surfaces, past which air is drawn by a fan. In the thermo-syphon method, the hot water from the jacket rises to the top of the radiator and, becoming cooled, sinks to the bottom and flows again to the jacket as illustrated in fig. 1. Refinements which assist in maintaining the required temperature in spite of weather and running conditions are the radiator shutter, adjusted over part of the radiator and the thermostat, which automatically operates the shutter. In large gas and Diesel engines the piston cannot sufficiently be cooled by the transmission of heat into the cylinder walls, consequently a hollow water-cooled piston is used. Either pump or thermo-syphon flow is employed for these engines. Among other machinery that requires cooling are the cylinders for compressing air or ammonia, and parts of furnaces, such as tuyeres and hearth-jackets, which would otherwise rapidly burn away. Shaft and other bearings may have a much increased flow of oil, beyond that actually necessary for lubrication, if the speed is high or the shafts are big, or they may have water-cooling passages in the bearings. When a cooler deals with the oil in its course of circulation it may be of air-cooled pattern for aero-engines, or water-cooled in other instances. The condenser is a specimen of cooling apparatus for steam, gas, ammonia, or carbon dioxide, and there are also the cold air and brine circulating systems around cold stores. Water has to be cooled in large volumes in several classes of plant, including condensing equipments and large internal-combustion engines. There are three methods employing, severally, a large reservoir, into which the water goes and

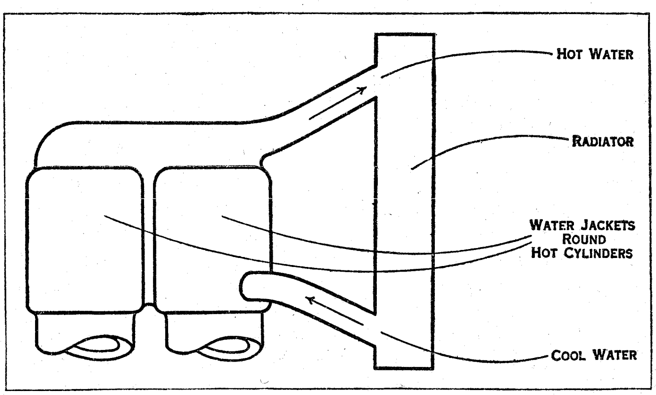

FIG. 1.—THERMO-SYPHON COOLING SYSTEM USED IN MODERN MOTOR CAR
Cool water, after being heated by contact with cylinders, rises and passes through the radiator to be cooled again, before circulating once more through the jacket

cools by the surface area, a smaller pond with spraying devices, and a cooling tower filled with a framing of laths, up which air flows by natural or forced draught and meets the water falling in a finely divided state as shown in fig. 2. The spray pond has the water sprayed through a series of nozzles out over the water, the cooling effect being due to the water going up in the air in a finely atomized state.

Several schemes for cooling are to be found in electrical apparatus to check injurious rises in temperature. In motors, generators, transformers, etc., care is taken to provide paths for free circulation of either air or oil as near as possible to the points where the heat is generated. Small transformers depend on natural air circulation, while others are mounted in tanks filled with insulating oil and are self cooling by means of tubes or radiators. Forced cooling is essential for large transformers, with air supplied by a fan, or water passed through piping in the oil, or the oil itself being cooled. Small and medium sizes of motors and gener-

ators are cooled by a fan. For large units a closed system of cooling is preferable, as it avoids the dust present in supplies of air drawn from outside.

Heat generated in metal-working processes, such as turning, drilling, milling and grinding, must be dealt with by copious flooding with oil, water or compound, otherwise the tools would not endure and the work would be roughened and warped.

COOLUS, ROMAIN, known as RENÉ WEIL (1868–), French dramatist, born at Rennes on May 25, 1868. His first popular success seems to have been *Les Amants de Sazy* (1901), a daring play full of biting irony, which has not yet lost its appeal. Among the plays which definitely made Coolus' reputation are *Antoinette Sabrier* (1903), *L'Enfant Chérie* (1906), *Coeur à Coeur* (1907), and *Une Femme passe* (1910). Since the World War he has tended to abandon serious comedy in favour of vaudeville: *L'Autruche* (1923) and *Né un Dimanche* (1924). The distinguishing features of Coolus' more important works are an extremely lucid analysis of human character under the stress of passion, and an endeavour to show that in questions of love we ought to judge with an indulgence founded on understanding and sympathy, and in that spirit of broad humanity which alone can avert tragedy in individual lives. *L'Enfant Chérie* and *Coeur à Coeur* are particularly characteristic in this respect. Coolus has sometimes been accused of an immoral tendency, but he has always claimed that, on the contrary, he defends the rights of conscience against the blind cruelty of convention. Since the death of Robert de Flers, Coolus has been president of the Society of Dramatic Authors and Composers. He was also one of the founders of the C.T.I. (Confederation of Intellectual Workers).

COOMA: *see* ALPS, AUSTRALIAN.

COON-CAN is an adaptation of the old Spanish game of Conquian—derived from the Spanish word Conquién, "with whom." The game was taken over by the Spaniards to Mexico, where it is played at the present time under the slightly altered name of "Conquain."

There is no record as to when, or by whom, Coon-Can was introduced into England. It was first heard of at the Bath club in Dover street in the early years of the twentieth century. The Bath club has been the nursery of various new card games. It was played for a time at the Portland club for high points, but the committee stepped in and decided that it was a gambling game and opposed to the rules of the club, and it was promptly forbidden. It was also played at the Travellers' club in Paris for a short time, but it soon died a natural death there. It has no real pretensions to rank as a scientific card game, but it makes an excellent family game, easy to learn, and requiring no great card skill.

The game can be played by any number of players up to seven, but five is the best number. Two full packs of fifty-two cards are used, with the addition of two jokers. If proper joker cards are not available, it is usual to consider the twos of spades as jokers. A joker may be made to assume the place of any card which the holder of it chooses.

The dealer deals ten cards, one at a time, to each player. He then places the remaining cards, in a pack, face downwards in the middle of the table, turning up the top card and placing it by the side of the pack.

The object of the game is to dispose of all the cards in one's hand by forming combinations of three or more of a kind, such as three knaves, or four eights, or into sequences of three or more cards of the same suit, such as seven, eight, nine of hearts, or king, queen, knave, ten of spades, and placing them, face upwards, on the table. This is called "showing down." For the purpose of forming sequences an ace can be reckoned as the highest or lowest card, *e.g.*, ace, two, three or ace, king, queen, but the cards must be of the same suit, it must be a "straight flush" in poker parlance.

When the deal is completed, and the top card exposed, the player on the dealer's left must take into his hand either the exposed card, or the top unexposed card from the pack. If the exposed card is likely to be of use to him in forming any of the above mentioned combinations he will naturally take it. If it is of no use to him he leaves it on the table and takes the top card from the pack. He must take one or the other. After taking in a card, he may at once, if he wishes, show down on the table in front of him any combination, or combinations, such as have been described, that is, any sequence of three or more cards of the same suit, or three of a kind. Lastly, he must discard a card from his hand, placing it, face upwards, on the top of the exposed card, or, if he has taken the exposed card, in place of it. His proceedings must be in the specified order. He must first take in a card, then show down anything that he may wish to, and last of all, discard a card from his hand. After he has made his discard he can do nothing further until his turn comes round again. Each player, in turn, proceeds as described, first taking in either the exposed card or the top card from the pack, then showing down if he can do so, and if he wishes to, and lastly discarding a card, which must always cover up the last card exposed.

In addition to this, any player, in his proper turn, may add to a sequence already shown down by himself or anybody else, any card, or cards, which will continue the sequence at either end, or he may add to three or more of a kind any cards of the same kind which he may happen to hold. If a sequence is shown down with a joker at either end of it, any player, in his proper turn, may move the joker to the other end of the sequence, if so doing will enable him to add any cards to it, but when once a joker has been so moved, its position becomes fixed, it cannot be moved back again.

The game continues round and round in regular rotation, until one player is able to show down all his cards. The game is then over. The player who has got rid of all his cards wins from each of the others the value of the cards which they still hold in their hands, *i.e.* which have not been shown down.

A joker counts 15 points, an ace counts 11 points, each court card counts 10 points, other cards count their face value. There is only one winner in each game. Losers do not pay the balance of points to one another.

There are many variations of the game, principally turning on the question of "ratting." "Ratting" is when a player shows down some of his cards, possibly only three of them, with a view to decrease his liability, before he is prepared to show down his whole hand. One variation is to allow no ratting at all. Another variation is that no one is allowed to show down less than six cards. Another variation, and probably a better one is that a player may rat at any time, but if he fails to win the game he must add 30 points to his losing score. When one player has ratted, anyone else may show down without penalty. This is the game as played in England. It was popular for a time, and it is still played in parts of the country. (*See* also RUMMY.)

See W. Dalton, *Coon-Can* (1913).

COOPER, ALEXANDER (d. 1660), English miniature painter. His works are of great rarity, and the chief are a series representing the king and queen of Bohemia and their children, some very remarkable portraits belonging to the queen of Holland, and others in the possession of the king of Sweden and in various Swedish galleries. He came to Sweden in 1646, and the Swedish documents declare that he was a Jew, and that his full name was Abraham Alexander Cooper. He had previously been residing in Holland, but on reaching Sweden entered the service of Queen Christina, and continued to be her miniature painter until 1654, when she resigned the Crown. Two years later Cooper was in Denmark, carrying out some commissions for Christian IV., but in 1657 was back again in Stockholm, where he died in the early part of 1660. The date of his birth is not known, but he is believed to have been born in London. He was the brother of Samuel Cooper (*q.v.*).

For full information regarding his career, and for various documents bearing his signature, see *The History of Portrait Miniatures*, by G. C. Williamson, ch. vi. 78, and the *Nineteenth Century*, Oct. 1905.

(G. C. W.)

COOPER, SIR ASTLEY PASTON (1768–1841), English surgeon, was born at Brooke, Norfolk, on Aug. 23, 1768, the son of a clergyman. He studied under Henry Cline, surgeon at St. Thomas's Hospital, London, and attended the lectures of John Hunter. He was connected with St. Thomas's as demonstrator in anatomy (1789–91), joint lecturer with Cline on anatomy and surgery (1791–1800), and then went to Guy's as surgeon. In 1813 he became professor of comparative anatomy to the Royal College of Surgeons, of which body he was president in 1827 and 1836. He was vice-president of the Royal Society in 1830, and received a baronetcy in 1820. He died in London on Feb. 12, 1841.

Sir Astley Cooper was a great surgeon and his operation (1817) of tying the abdominal aorta for aneurism is historic; the achievement can only be appreciated when it is borne in mind that the operation was accomplished before the days of antiseptic surgery. In the first volume of the *Transactions* of the Chirurgical Society, of which he was one of the founders, he published (1805) an account of an attempt to tie the carotid artery. Of his numerous works the most important is *The Anatomy and Surgical Treatment of Hernia*.

See *Life of Sir Astley Cooper*, by his son, B. B. Cooper (1843).

COOPER, CHARLES HENRY (1808–1866), English antiquary, was born at Great Marlow, on March 20 1808, and died at Cambridge on March 21 1866. He was borough coroner and then town clerk of Cambridge. His earliest production, *A New Guide to the University and Town of Cambridge*, was published anonymously in 1831. *The Annals of Cambridge* (1842–53) contained a chronological history of the university and town from the earliest period to 1853. His most important work, the *Athenae Cantabrigienses* (1858, 1861), a companion work to the famous *Athenae Oxonienses* of Anthony à Wood, contains biographical memoirs of alumni of the university from 1500 to 1609. He left an immense collection of ms. materials for a biographical history of Great Britain and Ireland.

COOPER, JAMES FENIMORE (1789–1851), American author, was born at Burlington, N.J., Sept. 15, 1789. In the next year, the family moved to the lake region of central New York. He entered Yale college in the class of 1806; a silhouette taken of him in his undergraduate days shows a profile chiefly marked by determination. A boy of 14, he was old enough to display that pugnacity which was later to be one of his chief characteristics; he showed insubordination, and the faculty expelled him, unaware of the fact that he was to be the most important man of letters ever connected with Yale. He went before the mast on a merchant vessel, and saw Europe for the first time. On Jan. 1, 1808, he became a midshipman in the U.S. navy. He resigned in 1811, was happily married and retired to the beautiful family estate at Cooperstown, where he died Sept. 14, 1851.

In 1826 he took his family to Europe and lived abroad seven years. From 1833 until his death he lived in Cooperstown. The later years were clouded by continual quarrels with the newspapers, and by the suits for libel that he brought against them. The echoes of this fight were heard across the ocean, and the London journals joined with those of New York in brutal attacks upon Cooper the controversialist. They never succeeded in frightening or quieting him, but they took up his time—the time that he might have more profitably employed in writing novels.

Cooper's ideals in literature were not shaken, and his letter to the editor of a new magazine in 1841 is characteristic. The editor had written in boastful terms about the size of the periodical, and the large sums that would be paid to distinguished contributors. "I never asked or took a dollar in my life, for any personal service, except as an officer in the navy, and for full-grown books. . . . Do you think size as important in a journal as quality? We have so much mediocrity in this country that, excuse me for saying it, I think distinction might better now be sought in excellence."

Cooper was prolific. He wrote more than 30 novels, many books of travel and several tons of polemics. The wonder is that he survived such a mass of production. He came to the gates of immortality with a vast amount of excess baggage. He himself, however, is on the right side of the gates, although only a small portion of his works followed him.

His happiest years were from 1821 to 1831. He was internationally famous and the clear sky of domestic happiness and literary fame had not been stained by clouds of hostility. He was welcomed everywhere in Europe as a distinguished man of letters; he revisited as a luxurious traveller the scenes he had first witnessed as a common seaman. During this decade, moreover, he composed masterpieces with fluent ease. Very few authors can show in so short a period so splendid an output. In 1821 appeared *The Spy,* in 1823 *The Pioneers* and *The Pilot* (both germinal works), in 1825 *Lionel Lincoln,* in 1826 *The Last of the Mohicans,* in 1827 *The Prairie* and in 1828 *The Red Rover.*

Cooper never refused a challenge; and it is possible that if he had not been challenged, he would have remained in obscurity. He had reached the age of 30 without any apparent desire to write, when after reading aloud to his wife a novel of English society, he said, "I believe I could write a better story myself." Mrs. Cooper dared him to try. The result was *Precaution,* one of the worst novels in history, hopelessly bad in style, structure and characters, and disfigured by typographical errors.

If this book had been a success, it is possible that he might never have written another. His temperament was encouraged by success, but inspired by failure. In Browning's phrase, he made the stumbling-block a stepping-stone. The dates are significant: *Precaution,* 1820; *The Spy,* 1821. John Jay had told Cooper the story of a spy, and Cooper turned it into one of the most successful novels in literature. Never was a work written with such contemptuous carelessness. The publisher became alarmed at the increasing size of the manuscript as it reached him in instalments, and expressed his misgivings. Cooper immediately wrote the last chapter, told the publisher to have it set up, printed and the pages numbered, so that he might know the extreme limit of the book. Then Cooper filled the intervening space. The novel scored a prodigious success and deserved it.

From 1821 to the present moment Cooper has been a "household word." Russian and Polish children are as familiar with the Leather-stocking Tales as are the boys and girls of America. Morse, the inventor of the electric telegraph, wrote (1833): "I have visited, in Europe, many countries, and what I have asserted of the fame of Mr. Cooper I assert from personal knowledge. In every city of Europe that I visited, the works of Cooper were conspicuously placed in the windows of every bookshop. They are published as soon as he produces them in 34 different places in Europe. They have been seen by American travellers in the languages of Turkey and Persia, in Constantinople, in Egypt, at Jerusalem, at Ispahan."

Probably no writer ever showed greater inequalities in his work than Cooper. When he attempted "society" novels, he fell beneath criticism; on the high seas or in the forest primeval, he is impressive. He could not make ladies and gentlemen seem real; but his men of the wood and of the wave are gloriously alive. His failure was not due to unfamiliarity with the material; he was a gentleman by birth and breeding, and knew the manners of aristocratic society. Why, then, could he not make them seem real? Perhaps because in that field he had no sympathetic imagination. In the forest and on the ocean he lived with his characters; they were more real to him than his neighbours; but apparently he could not visualize the children of fashion.

One reason for Cooper's enormous popularity in foreign countries is that his tales lend themselves easily to translation. It is not the style but the narrative that gives them distinction. Not only do Cooper's novels lose nothing in translation, they positively gain. Every time they were translated they were improved. French, German, Spanish, Italian, Russian, Polish, Turkish and Japanese children hold in their little hands a better book than the original.

American literature began like a child learning to talk, imitating its British parents. Cooper suffers from the same drawback in his novels of social life. But in his masterpieces he was, of all early American writers, the most truly and consistently American. We can see this more clearly than it was perceived by his contemporaries. He created an American literature out of American materials. It had in its robust tones no echoes of Europe. He was less influenced by foreign authors and foreign topics than any other American writer of his time. He was a path-maker.

Apart from the excellence of his best works, he deserves credit as the founder of two great schools of fiction. He was apparently the only man in America who thought a sea story could be made interesting. While he was engaged in the composition of *The Pilot,* he talked it over with many men and women, and received not one favourable opinion. In a preface to the later edition, dated Aug. 10, 1849, Cooper gave an account of the inception of this work and the constantly discouraging comments he had from all sides. "Not a single individual among all those who discussed the merits of the project, within the range of the author's knowledge, either spoke or looked encouragingly. It is probable that all these persons anticipated a signal failure." The book appeared in 1823. Its success was immediate. It founded a new school in fiction, which has flourished and will flourish indefinitely. One of Cooper's friends declared that the sea could not be made "interesting," but Cooper's followers, Marryat, Melville, Clark Russell, Stevenson and Conrad have had no difficulties in engaging the attention of readers. Seventeen years after *The Pilot* appeared Richard Henry Dana's *Two Years Before the Mast,* which resembled Cooper's work in its accidental entrance into immortality.

Cooper was, is, and will be best known for the Leather-stocking Tales. They have often been called a drama in five acts. There is an orderly development in the character of the hero; the incidents have a regular and disciplined march; hence it is surprising that no two of the novels appeared in their logical order. *Deerslayer,* which comes first, was written last; *Mohicans,* the second, was written after *Pioneers,* the fourth; *Pathfinder,* the third, was written fourth; *Pioneers* was written first, and the series concluded with *Prairie,* which was written third. They were published in this order: *Pioneers,* 1823; *Mohicans,* 1826; *Prairie,* 1827; *Pathfinder,* 1840; *Deerslayer,* 1841.

When Cooper wrote *The Pioneers,* he apparently had no thought of continuation. It was a chance remark by a friend on an excursion to Lake George, that emboldened him to make the risky experiment of reviving the hero. *The Last of the Mohicans* justified the adventure. Then he produced *The Prairie,* and left his scout dead and buried. But the popularity of Hawkeye called for a resurrection; and after 13 years he brought him back in *Pathfinder,* and then crowned the series by the most difficult feat of all—he wrote *Deerslayer* and gave the immortal scout not only a new lease of life, but the freshness and glory of early youth.

Cooper's powers developed with his hero. Natty Bumppo, in

Pioneers, is an ignorant and almost peevish elderly man, who regrets the advance of civilization. The ideal side is missing. But Hawkeye is alert, adroit, strong, resourceful, rejoicing in the plenitude of his powers. He is an addition to the population of immortals. He will live with D'Artagnan and Cyrano de Bergerac. His is essentially a romantic character; so that attacks on his "naturalness" are of no moment. Cooper knew perfectly well what he was about. He said, "In a moral sense this man of the forest is purely a creation. A leading character in a work of fiction has a fair right to the aid which can be obtained from a poetical view of the subject." Cooper's "noble red man" has often been matter for laughter, but those who know most laugh least. If one will read Franklin's *Remarks Concerning the Savages of North America,* he will find that the great realist drew as favourable a picture of these people as the great romanticist.

Cooper's chief faults are faults of style; his English is chronically bad. His powers of characterization did not include subtlety. But he is a master of action; and his books have in them the principle of life. Balzac said, "If Cooper had succeeded in the painting of character to the same extent that he did in the painting of the phenomena of nature, he would have uttered the last word of our art."

Bibliography.—The chief authorities for the life of Cooper are the biography by T. R. Lounsbury, in the "American Men of Letters" series, the letters in two volumes, edited by James Fenimore Cooper, his grandson; and *Le Roman de Bas-de-Cuir,* by Margaret Murray Gibb, published at Paris in 1927. (W. L. P.)

COOPER, PETER (1791–1883), American manufacturer, inventor and philanthropist, was born in New York city on Feb. 12, 1791. He received practically no schooling, but worked with his father at various trades. At 17 he was apprenticed to a coach-builder in New York city. On coming of age he got employment at Hempstead (L.I.), making machines for shearing cloth; three years afterwards he set up in this business for himself. After the war of 1812 he turned his shop into a furniture factory; soon sold this and for a short time was engaged in the grocery business on the site of the Bible house, opposite Cooper Union; and then invested in a glue and isinglass factory. About 1828 he built the Canton ironworks in Baltimore, Md., the foundation of his great fortune. In 1830 he designed and constructed the first steam locomotive built in America, the "Tom Thumb," which was about the size of a modern hand-car. He built, in 1836, a rolling mill in New York; in 1845 he removed it to Trenton, N.J., where iron structural beams were first made in 1854 and the Bessemer process first tried in America in 1856; and at Philippsburg, N.J., he built the largest blast furnace in the country at that time. He built other foundries at Ringwood (N.J.), and at Durham (Pa.), bought iron mines in northern New Jersey and carried the ore thence by railways to his mills. Actively interested with Cyrus Field in the laying of the first Atlantic cable, he was president of the New York, Newfoundland and London Telegraph Company, and his frequent cash advances made the success of the company possible; he was also president of the North American Telegraph Company, which controlled more than one-half of the telegraph lines of the United States. For his work in advancing the iron trade he received the Bessemer gold medal from the Iron and Steel Institute of Great Britain in 1879. He took a prominent part in educational affairs, and conducted the campaign of the Free School Society to its successful issue in 1842, when a State law was passed forbidding the support from public funds of any "religious sectarian doctrine." He is probably best known, however, as the founder of the Cooper Union (*q.v.*). Though he had been a hard-money Democrat, he joined the Greenback Party after the Civil War, and in 1876 was its candidate for the presidency. He died in New York city on April 4, 1883. He published *The Political and Financial Opinions of Peter Cooper, with an Autobiography of his Early Life* (1877), and *Ideas for a Science of Good Government, in Addresses, Letters and Articles on a Strictly National Currency, Tariff and Civil Service* (1883).

THE "TOM THUMB," FIRST STEAM LOCOMOTIVE IN AMERICA, BUILT BY PETER COOPER IN 1829–30, AND RUN ON THE BALTIMORE & OHIO R.R.

There is a brief biography by R. W. Raymond, *Peter Cooper* (Boston, 1900).

COOPER, SIR RICHARD POWELL, 1st Bart. (1847–1913), English agriculturist, was born on Sept. 21, 1847. He became a member of the firm of Cooper and Nephews, chemical manufacturers and exporters of pedigree live stock, and achieved a great reputation as a breeder of shorthorn cattle and Shropshire sheep. He rendered great service to the Argentine republic by supplying it with British live stock. He died at Berkhampstead on July 30, 1913, being succeeded as second baronet by his son Richard (b. 1874), M.P. for Walsall from 1910 to 1922.

COOPER, SAMUEL (1609–1672), English miniature painter. This artist was undoubtedly the greatest painter of miniatures who ever lived. He is believed to have been born in London, and was a nephew of John Hoskins, the miniature painter, by whom he was educated. He lived in Henrietta St., Covent Garden, and frequented the Covent Garden coffee-house. Pepys, who makes many references to him, tells us he was an excellent musician, playing well upon the lute, and also a good linguist, speaking French with ease. According to other contemporary writers, he was a short, stout man, of a ruddy countenance. He married one Christiana, whose portrait is at Welbeck Abbey, and he had one daughter. In 1668 he was instructed by Pepys to paint a portrait of Mrs. Pepys, for which he charged £30. He is known to have painted also the portrait of John Aubrey, which was presented in 1691 to the Ashmolean museum, as we learn from his correspondence with John Ray, the naturalist. Evelyn refers to him in 1662, when, on the occasion of the visit that the diarist paid to the king, Cooper was drawing the royal face and head for the new coinage.

Magnificent examples of his work are to be found at Windsor Castle, Belvoir Castle, Montague House, Welbeck Abbey, Ham House, the Rijks Museum at Amsterdam and in the collection of the late Mr. J. Pierpont Morgan. His largest miniature is in the possession of the duke of Richmond and Gordon at Goodwood. A piece of the artist's handwriting is to be seen at the back of one of his miniatures in the Welbeck Abbey collection, and one of his drawings in black chalk is in the University gallery at Oxford. His own portrait of himself is in the collection of J. Pierpont Morgan.

For a fuller account *see* the *History of Portrait Miniatures,* by G. C. Williamson, vol. i., p. 64. (G. C. W.)

COOPER or COUPER, THOMAS (*c.* 1517–1594), English bishop and writer, was born in Oxford, where he was educated. He became master of Magdalen college school, and afterwards practised as a physician in Oxford. In 1565 appeared the first edition of his greatest work, *Thesaurus Linguae Romanae et Britannicae,* followed by three other editions.

Queen Elizabeth was greatly pleased with the *Thesaurus,* generally known as *Cooper's Dictionary;* and its author, who had been ordained about 1559, was made dean of Christ Church, Oxford, in 1567. Two years later he became dean of Gloucester, in 1571 bishop of Lincoln and in 1584 bishop of Winchester. Cooper defended the practice and precept of the Church of England against the Roman Catholics on the one hand and against the Martin Marprelate writings and the Puritans on the other. He died at Winchester April 29 1594.

Cooper's *Admonition against Martin Marprelate* was reprinted in 1847, and his *Answer in Defence of the Truth against the Apology of Private Mass* in 1850.

COOPER, THOMAS (1759–1840), American educator and political philosopher, was born in London, Oct. 22, 1759, and studied at Oxford. Because of his active sympathy with the French Revolution he emigrated to the United States about 1793 and began the practice of law, becoming president-judge of the 4th District of Pennsylvania in 1806–11. Like his friend Joseph Priestley, Cooper was very highly esteemed by Thomas Jefferson, who secured for him the appointment as first professor of natural science and law in the University of Virginia, a position which Cooper was forced to resign under the fierce attack made upon him by the Virginia clergy. After filling the chair of chemistry in Dickinson College, Carlisle (Pa.), and in the University of Pennsylvania, in 1819 he went to South Carolina college, Columbia, where he taught chemistry and political economy.

In 1820 he became acting president of that institution, and was president from 1821 until 1833, when he resigned his presidency and, in the following year, his professorship, owing to the opposition within the State to his liberal religious views. He was a born agitator: John Adams described him as "a learned, ingenious, scientific, and talented madcap." Before his college classes, in public lectures, and in numerous pamphlets he constantly preached the doctrine of free trade and tried to show that the protective system was especially burdensome to the South. His remedy was State action. Each State, he contended, was a sovereign power and was in duty bound to protest against the tyrannical acts of the Federal Government. He exercised considerable influence in preparing the people of South Carolina for nullification and secession. The last years of his life were spent in preparing an edition of the Statutes at Large of the State. Dr. Cooper died in Columbia on May 11, 1840. As a philosopher he was a follower of Hartley, Erasmus Darwin, Priestley, and Broussais; he was a physiological materialist and a severe critic of Scottish metaphysics.

Among his publications are *Some Information Respecting America* (1794); *Political Essays* (1800); *Lectures on the Elements of Political Economy* (1826); *A Treatise on the Law of Libel and the Liberty of the Press* (1830); and a translation of Broussais' *On Irritation and Insanity* (1831), with which were printed several of his own essays.

See I. Woodbridge Riley, *American Philosophy: The Early Schools* (1907); E. F. Smith, *Chemistry in America* (1914); and "The Possible Origin of a Lincoln Phrase" in the *Review of Reviews* (Feb., 1901).

COOPER, THOMAS (1805–1892), English Chartist and writer, the son of a working dyer, was born at Leicester on March 20, 1805, and was apprenticed to a shoemaker. He had a passion for knowledge; studied Greek, Latin and Hebrew in his spare time; and in 1827 gave up cobbling to become a schoolmaster, and, later, a Methodist preacher. His affairs did not prosper, and in 1840 he joined the staff of the *Leicestershire Mercury*. Here he was converted to Chartism and became one of the most ardent supporters of Feargus O'Connor (*q.v.*). He organized the most poverty-stricken Leicester workers into an "army" devoted to Chartist propaganda and the study of literature, assuming himself the title of "the Shaksperean General." He edited the *Midland Counties Illuminator* for the Chartists and took a prominent part in the general strike of 1842, making an organizing tour in the Potteries. For this he was imprisoned in Stafford gaol for two years, where he produced *The Purgatory of Suicides,* a political epic in ten books. After his release from prison he became disillusioned in Feargus O'Connor, and his political enthusiasm waned. After 1848 historical and educational subjects predominated in his lectures, and from 1856 he lectured in defence of Christianity. He died at Lincoln on July 15, 1892. *See* the *Life of Thomas Cooper, written by Himself* (1872).

COOPER, THOMAS SIDNEY (1803–1902), English painter, was born at Canterbury on September 26, 1803. At the age of 20 he went to London and was admitted as a student of the Royal Academy. He then returned to Canterbury, where he was able to earn a living as a drawing-master and by the sale of sketches and drawings. By showing his first picture at the Royal Academy (1833) he began an unprecedentedly prolonged career as an exhibitor. Cooper's name is mainly associated with pictures of cattle or sheep, of which he produced many hundreds. He was elected A.R.A. in 1845 and R.A. in 1867. He presented to his native place, in 1882, the Sidney Cooper art gallery. He wrote his reminiscences, under the title of *My Life,* in 1890, and died on Feb. 7, 1902.

COOPERAGE. The trade of making casks of staves and hoops. The term is also applied to the factory where casks are made. The word is from "cooper," a maker of casks, derived from such forms as Mid. Dutch *cuper,* Ger. *Küfer,* Lat. *cuparius;* the same root is seen in various Teutonic words for a basket, such as Dutch *kuip* and Eng. "kipe" and "coop," but cooper is apparently not formed directly from "coop," which never means a "cask" but always a basket-cage for poultry, etc. Cooperage is of great antiquity; Pliny ascribes its invention to the inhabitants of the Alpine valleys.

The trade is one in which there are numerous subdivisions, the chief of which are tight or wet and dry or slack cask manufacture. To these may be added white cooperage, a department which embraces the construction of wooden tubs, pails, churns and other even-staved vessels. Of all departments, the manufacture of tight casks or barrels for holding liquids is that which demands the greatest care and skill since, in addition to being perfectly tight when filled with liquid, the vessels must bear the strain of transportation to great distances, and in many cases have to resist considerable internal pressure when they contain fermenting liquors.

The staves are best made of well-seasoned oak. Since a cask is a double conoid, usually having its greatest diameter (technically the bulge or belly) at the centre, each stave must be properly curved to form a segment of the whole, and must be so cut as to have a suitable bilge or increase of width from the ends to the middle; it must also have its edges bevelled to such an angle that it will form tight joints with its neighbours.

Setting up the Barrel.—The staves being prepared, the next operation is to set up or raise the barrel. For this purpose as many staves as are necessary are arranged upright in a circular frame, and round their lower halves are fitted truss hoops which serve to keep them together for the permanent hooping. The upper ends are then drawn together by means of a rope which is passed round them and tightened by a windlass, and other truss hoops are dropped over them, the wood being steamed or heated to enable it to bend freely to shape. The two ends of the cask are next finished to receive the heads by forming the chime, or bevel on the extremity of the staves, and the croze or groove into which the heads fit. Finally the heads and permanent hoops are put in place. The heads, when made of two or more pieces, are jointed by wooden dowel pins, and after being cut to size are chamfered or bevelled round the edge to fit into the croze grooves. The hoops are generally of iron. The manufacture of slack casks proceeds on the same general lines, but is simpler in various respects, both because less accurate workmanship is required, and because softer woods, largely fir, may be employed.

Machinery of the most elaborate and specialized character has been devised to perform most of the operations in making both slack and tight casks, and though it involves considerable capital outlay it effects so great an economy of time that it has largely superseded hand labour. Barrels without separate staves are made by bending a sheet of wood, sawn from a log in a continuous strip, into the required circular shape, the bulge at the centre being obtained by cutting out V gores from the ends. Barrels are also made of steel, either of the ordinary bulging form or consisting of straight-sided drums provided near the middle with rings on which they may be rolled. Immense numbers of casks of different shapes and sizes are employed in various industries. Tight barrels are a necessity to the wine and cider maker, brewer and distiller, and are largely used for the transport of oils and liquid chemicals, while slack barrels are utilized by the million for packing cement, alkali, china, fruit, fish and numerous other products.

CO-OPERATION. Co-operation in the sense of working together for a common result is as old as human nature. When primitive men hunted and their womenfolk prepared the meat there was elementary co-operation. In this sense Dr. Johnson wrote, of the larger and infinitely more varied economic order of his time, that "the business of life is carried on by a general co-operation." Despite an obvious lack of intention, different activities did, in fact, work to one end. But that, at best, is unconscious co-operation; even in its general sense the word usually is reserved for a designed common effort. Wishes are expressed that political parties should co-operate for some national object, or that there should be co-operation of labour and capital. These bodies or interests are conceived as equal, and free each to take its own course. They are then asked to proceed together to a mutual end—to co-operate.

The same implication of agents equal and free underlies the particular sense of the word in co-operation and the co-operative movement. Galley slaves pulled together; but they did not co-operate. In the gilds amongst the freemen of the English villages of the 15th century, as in the *mujins* or mutual-aid societies of Japan, and in the *fruitières* of Switzerland, it was different. In these countries, as elsewhere, such bodies were voluntary, and they arose amongst groups of people roughly on an equality. Of the two principles the voluntary element is even more necessary: in the Russia of 1920, when co-operative membership was compulsory and State control complete, the name "co-operative" lost all meaning. Free association is essential. In Britain this spirit of association, in which each seeks his own benefit through that of the whole, is shared by friendly societies, clubs, trade unions and other bodies. From these kindred movements co-operation diverges by applying itself to businesses such as usually are conducted for profit. A co-operative society thus becomes a voluntary union of persons, on a democratic basis, to supply its members with goods and services, or to employ its members in producing for sale, or to sell its members' produce, or to finance its members, or to combine all these aims in one, and at the same time to distribute surpluses in a manner agreed upon by the members as fair to each and all.

Building societies may also come within the terms of this definition, but have never been included with co-operative societies in Great Britain. (*See* BUILDING SOCIETIES.)

Co-operation under any of these forms has roots which go back far into the past; but it is the modern world which has both created the need and given opportunity for the modern co-operative movement. This world came into existence when domestic hand labour, for domestic needs, was replaced by production in factories, for markets; when the peoples of Europe began to mass together in industrial towns; and when virgin continents became new factors in the world's life. At first, in Britain, the threatened workers co-operated in self-defence and to get for themselves the benefits of the new machinery. Then, gradually, a newer co-operation came into effect, namely, combination (on the same mutual lines) of the consumers massed in the spreading towns, to possess a larger share of the riches of the new production. Later, under the disturbing influence of new American food exports, there came the peasant co-operation of Ireland and Europe, again in self-defence. Last of all, there followed a somewhat similar movement of exporting farmers, equally to benefit each individual member while pursuing the gain of the whole number. These different movements we may now survey in detail, remembering, however, a factor sometimes overlooked. The success of "all for each and each for all" is seen to depend very considerably on the degree of knowledge and intelligence, of honesty and loyalty and of active self-direction and self-reliance possessed by each. Thus writers on co-operation in Asiatic countries have pointed out how illiteracy, dependence on others, unpunctuality, inertia and the spirit of faction have checked or prevented the spread of the movement in the East; while elsewhere the zeal for education of the Rochdale pioneers is perceived to have been well-inspired. (For Co-operation in the United States *see* page 389.)

CO-OPERATION IN GREAT BRITAIN

Primitive Efforts and Failures.—Great Britain is the classic home of co-operation as a movement, and of consumers' co-operation in particular. As early as 1761 a Fenwick weavers society in Ayrshire, Scotland, supplied its members with weavers' reeds, and also oatmeal for home consumption; and this was not the only Scottish effort. In England 1,400 inhabitants of Hull, to protect themselves "from the invasions of covetous and merciless men," managed in 1795 to establish the Hull Anti-Mill society, whose flour mill continued for 100 years. Again, in the dockyard towns of Devonport and Sheerness the high prices of the period of the Napoleonic wars quickened the more responsible workers into devising societies to supply themselves at least with the most urgent necessaries.

But these spontaneous beginnings did not constitute a concerted movement. That came after 1820, with Robert Owen. By that time capitalist large-scale manufacture had so developed in Great Britain as to destroy much of the old domestic handwork. The new system had separated thousands of workers from the purchasers of the products they handled; it had also assembled working populations in new industrial towns as massed consumers dependent on new and unfamiliar sources of supply. Meanwhile England had escaped the direct effects of war and revolution, and devoted religious and secular teachers had created a capacity in many workers to be something better than industrial machines. Robert Owen, himself a capitalist, but fresh from his famous pioneer welfare work at New Lanark, found an immediate response to his teaching that livelihood and security could be gained through forming self-employing co-operative communities. In London in 1821 the Co-operative and Economical Society set out to create a community of families buying at cost price through its own co-operative store, employing (gradually) its own members, and providing for both education and recreation.

The London society ended; but its aims were born again in 1827, at Brighton, with active and wise support from Dr. King, a Brighton physician. Dr. King emphasized the store as a means to employing members in producing for the assured market of its organized consumers. Other propagandists were busy, and, though statistics are lacking, by 1830 there were perhaps two to three hundred co-operative societies, two or more journals, and several paid co-operative missionaries. And co-operative congresses held in Manchester and Birmingham projected a wholesale society—in this case against Owen's advice. In 1831 the North-west of England United Co-operative Company was established in Liverpool. Yet within three years all this effort and enthusiasm had faded like a rainy sunset. The societies aimed at capitalizing profits, in order to buy land and settle thereon communally. If they enjoyed any success (as at Brighton) in view of the distance to the communal ideal, it became tempting to divide the capital. But success was rare. Co-operators found then, as many times since, that when shopkeeping (or other business) is made secondary to creating employment, on the principle that economic value inheres in labour and production independently of serviceableness, then even the simplest shopkeeping fails.

The Rochdale Pioneers.—At Rochdale this truth was soon to be proved in a happier way. There, in 1844, a simple idea was applied which revolutionized co-operation, and gave it a place in a world very rapidly outgrowing the pioneers' localized hope of an Owenite "self-supporting home colony of united interests." Two societies had failed in Rochdale; and to tread another path the Rochdale pioneers (the idea is attributed to Charles Howarth) proposed neither to sell at cost nor to capitalize profits, but to charge the accustomed market prices and credit each member personally with his share of the surplus in precise proportion to his general purchases at the society's store. The idea was not entirely new. Scotland (Lennoxtown) and Yorkshire (Meltham) had harboured it (with Lyons in France); but by opening membership to all householders at the cost of only a shilling entrance fee, and by permitting members to withdraw accrued profits down to £1, as well as through systematic and commonsense capacity, combined with missionary zeal, the pioneers established their society and made its example infectious. Cash sales, liberal depreciation, the limited interest on capital (5%) and the educational grant from profits (2½%) further commended the Rochdale system.

Enabling Acts and Expansion.—Four years later, in 1848, Maurice and Kingsley were joined by Ludlow, already afire with the idea of co-operative workshops, and the raising of the Christian Socialist banner attracted Hughes and Neale. The last three, especially, supported the northern co-operators, not only by advocacy, but by legal and parliamentary help, both unsparing and unpaid. Enabling Acts for friendly societies had developed since 1793 and for building societies since 1836. In 1852 the first Industrial and Provident Societies Act extended the area of sanction, and expressly legalized dividends on purchases. In 1862 a further act, amongst other changes, allowed the autonomous societies increasing in the northern towns to federate, and so form a wholesale society related to the retail societies exactly as the latter were to their individual members. The co-operators immediately made good their project for the trading federation afterwards known as the Co-operative Wholesale Society. A similar federation was established for Scotland, and separate British federations for insurance and for publishing; while the Co-operative Union of Great Britain and Ireland came into being as a general protective, legal, propagandist and educational association. George Jacob Holyoake, a prince of co-operative propagandists, and Dr. Watts, of Manchester, shared vigorously in this work with the Christian Socialists.

Yet the change which the pioneers had made, empirically, in shifting the practical co-operative appeal from the man in the workshop to the domestic consumer—the woman in the home—remained unperceived. The veteran Dr. King disliked the new dividend. Holyoake, Hughes and Neale supported it, but they limited pure Rochdale co-operation to "distributive" societies. "Production," they held, should be differently organized, in workshops supplying the retail stores but self-governing; and the "productive" workers should share the profits with the customers and with the providers of capital. It was J. T. W. Mitchell, a late-comer to the Rochdale band, who saw new principles in the Rochdale practices. He, for the first time, distinctly taught a consumers' co-operation. Consumers were everybody. Consumers' needs were the reason for existence of all industry; industry prospered as it served use and enjoyment. Consumers paid for all profits, distributive or productive; it was the consumers who were entitled through co-operative control to reduce their cost of living, and abolish poverty, by possessing and sharing all surpluses arising throughout industry. On this basis Mitchell looked forward to a universal co-operation based on the common needs of mankind, without distinction of class or race.

Emergence of Consumers' Co-operation.—Holyoake, Hughes and Neale (the latter becoming the self-sacrificing, honorary, working secretary of the Co-operative Union) opposed Mitchell with a sincerity equal to his own, with much superior literary and oratorical powers, and with all the support of the educated onlookers, until, in 1891, Miss Potter (Mrs. Sidney Webb) wrote her *Co-operative Movement in Great Britain.* But as the indefatigable chairman of the English C.W.S. for 21 years, Mitchell saw "The Wholesale" succeed as distributor, as banker, and in industry after industry, as manufacturer for its organized market, while productive societies rose and fell. By its financial success rather than through any theoretical comprehension, his view triumphed. In bootmaking, printing and industries similarly open at the time to small-scale effort, a group of productive societies remained as an alternative source of supply for the retail stores and, in bootmaking, a participator in Government contracts and export trade. These societies formed their own Co-operative Productive Federation and remained influential, especially in the English midlands, as a partner in the Co-operative Union. But the tide flowed with the consumers movement. Societies modelled on the Rochdale success extended over Europe and gained a footing in the Dominions and in the United States. And where populations were too scattered for consumers' societies, and the large, common economic interest which is essential to co-operation was found instead in farming communities widely interested in a staple product like wheat, fruit or butter, the Rochdale system was adapted to serve the whole in a manner as equitable to each participator.

War-time and Later Extensions.—Britain, curiously, though the mother of co-operation, has continued to call her offspring by other names. The law, as further amended in 1867, 1876, 1893 and 1913, speaks officially of "industrial and provident societies." Consumers' societies are classed as "distributive," and the title "consumers" remains officially unknown. But in Europe "societies for consumption" carry that name from France to Russia; and in the United States the title "consumers" is also used. And in Britain as in France, Germany, Austria and elsewhere, the World War brought the basis of consumers' service to the front. The different governments found themselves obliged to work with the societies in recognizing the necessities of their nationals as consumers, and in doing justice equitably to their hungry populations. Thus the importance of organized consumption was emphasized, while high prices the world over drove consumers into co-operative membership. In Great Britain the number increased from 2,878,648 consumer members in 1913, to 3,788,490 in 1917 and 4,548,557 in 1921. In 1927 the figure had increased to over five millions. This British increase was typical of the growth in other lands; and though many European societies had to strike off lapsed members, later on, there remained a large net increase.

After 1921 the falling food prices which benefited consumers created a crisis in agriculture and stimulated ideas of co-operation there. Themselves farming 64,000 acres, the consumers societies were not unaware of what the fall meant. Relations were established in Britain with the National Farmers' Union, and though in matters of general supply it proved difficult and sometimes impossible to reconcile special functional societies—farmers and labourers—with general societies of consumers covering the same areas, the existing movement for bringing agricultural societies into trading membership with the C.W.S. was considerably quickened. In 1922, for example, the C.W.S. created a precedent by successfully extending to an agricultural society in difficulties exactly the same financial and administrative service which had re-established many subsequently prosperous consumers' societies. Through the same agency, the British consumers entered into new relations with Dominion farmers' societies, and with Russian co-operators and English capitalists in respect to Russian grain and other exports. When in 1927 an outcry arose because the Co-operative Party agreed to facilitate its work by avoiding competition with the Labour Party, it was not quite realized how wide in other directions the contacts of the co-operative movement were becoming.

Their history has proved British co-operators true to type. Theorizing has rarely guided them or misguided. Oblivious to merely logical consequences, they have travelled in whatever direction promised success, provided the path approved itself to the instincts and common sense of their movement as a whole.

RETAIL DISTRIBUTIVE OR CONSUMERS' SOCIETIES

Extent and Character.—Consumers' co-operation in Britain has spread far beyond the industrial regions of the Midlands and the North. From Penzance to Wick and Thurso there extends a network of between 1,200 and 1,300 independent, self-governing, territorial societies, the number decreasing through amalgamations while the societies enlarge. Some have grown enormously, like the London Co-operative Society, which covers an area north of the Thames from Hounslow to Southend-on-Sea, and includes 230,000 members. Others continue as tiny village societies with perhaps less than 100 adherents. In agricultural areas, as around Lincoln and Peterboro, Shrewsbury and Hereford, the society at the centre has branched out over hundreds of square miles. Elsewhere, as in parts of Lancashire, West Yorkshire or Durham, societies, perhaps too independent, are crowded together. All are equal in their complete autonomy. Their membership is by no means purely industrial. With factory workers, miners and railwaymen, they include clerks and professional men, farmers and rural labourers; while the revenues of the peerage have been known to benefit by dividend on purchases. By the older rules, either husband or wife holds the share book. In the newer practice all adults are accepted. It is the C.W.S. of which people hear; but it is these local societies which form the basis, and are the chief owners, of the federal institutions.

At the Co-operative Congress of 1928 it was recognized that the societies were too numerous for modern ideas of efficiency, and steps for hastening amalgamations were recommended from the chair; while by a small majority the C.W.S. was authorized to start retail stores from its wholesale centres rather than leave the localities to attempt to create more small societies. All such steps, however, remain subject to the will of the present local societies as composing the governing bodies.

Practically all the consumers' societies have begun with a public meeting, an enrolment of members subscribing capital, the election of a committee of management, and the subsequent purchase or tenanting of a shop by the committee, and the appointment of a paid manager. From selling plain groceries—just as any shopkeeper, except for the dividend-check given with every purchase—they have extended to universal supply and to baking, boot-repairing, tailoring, coal and milk delivery, laundering, dairy-farming and meat production. On the educational and recreative side, the societies maintain libraries, arrange lectures and week-end schools, entertain conferences, distribute their own periodicals, give concerts, dances and entertainments in their own halls, establish choirs, hold mammoth "field days" for their members' children, conduct rambles and motor tours and organize travel guilds. They have outstanding between six and seven millions advanced for house purchase by members, and they own houses worth over three millions. Such services are not all found in every place; for one society will be a "live" one, and another seem content with a rather dull-minded routine shopkeeping. This variation, like the sometimes varying prices of the societies for the same article, is felt nationally to be an obstacle. But all these activities widely exist. In general, the societies in Great Britain do not supply intoxicants, and avoid overlapping with their own national institutions in manufacture and insurance. Otherwise they recognize no barriers in the field open to local voluntary association.

Government—Trade—Taxation.—The government of all the distributive societies is entirely democratic, following usually the model rules of the Co-operative Union. Each member has one vote and only one. Membership rules, and not capital. The newcomer with £1 invested ranks equally with the holder of shares to the legal limit of £200. For the committee of management, as for other selected positions, all are equally eligible, except for varying qualifications in respect to the management committee, and these are as likely to be concerned with purchases as with the holding of capital. The Royal Arsenal Society in South London, with 180,000 members, has a salaried executive, but the usual payment is a small fee for each meeting. Control may be through a group of departmental managers or (the newer practice) a general manager or managing-secretary. Employees as consumers may be members, and the more progressive societies do not debar them from election to the boards of management; joint advisory councils of the management committee and the employees exist in certain societies and are officially recommended. Trade union wages and conditions are all but universal, and, since the World War, pension schemes have come into existence. Interest on capital is limited generally to 5% or less, and rules are found that further limit the interest paid to non-purchasing members. Much of the members' capital represents dividends on past purchases, allowed to accumulate with the society. Cash sales in respect to groceries is the general rule; in other departments practices vary, many societies having introduced instalment clubs and hire-purchase for furniture. In 1926, a sum of four million pounds, or 16/ per member, was due to the societies for goods at the end of the year. It is widely believed that the societies are privileged in being excused income tax; but they are, in fact, taxed on their land and numerous buildings, while taxable members are liable to income tax on their share interest. The only untaxed money is the "disposable surplus," and, whether paid or reserved, this is legally regarded as a deferred discount—a saving through buying practically at cost price. A new kind of "income" would need to be defined, a "wage" of the consumer, earned whenever his pocket benefited by economy in self-supply, in order to bring within the limits of any income tax the excess payments revealed in co-operative transactions at each accounting.

Prosperity and Its Problems.—That nothing succeeds like success is not always true. The consumers' societies have by no means ousted multiple shops or individual traders. But they have so far prospered as to incur the danger of affluence. Amongst the thousands of members in each locality only hundreds at most attend the local business meetings. With millions passing through the coffers, many people prefer to befriend causes deemed to be more needy, and voluntary help becomes apt to depend on a few. Employees in turn develop the disposition which led to the short but determined struggle for special wages which occurred between societies and the National Union of Distributive Workers in Lancashire in 1924; or their co-operative loyalty is overcome by their class loyalty, as in certain areas during the general strike of May, 1926. Yet to infer decadence from these signs would be as idle as for co-operators to see the millennium in a congress vote. What is more important is the really astonishing fact that having begun in 1844 from nothing but tiny incomes and pressing needs, the British retail co-operative societies founded and continued by the "rude unlettered mass" should, for the troubled year of 1926, be able to show members' purchases of £184,000,000, a surplus of £17,000,000 returned on these purchases, a capital held by members of over £87,000,000, and a body of workers numbering 147,000[1]. In a world deemed to be incurably selfish these figures still constitute a revelation of new social forces.

The Guilds.—The Women's Co-operative Guild, founded in England in 1883, with later-born sisters in Scotland and Ireland; the National Co-operative Men's Guild, dating from 1911, and the more recently founded mixed guild, form a core of activity within the consumers' movement. The women's guild, having 58,000 members, and holding an important annual congress, is a self-governing organization mainly of married women, intent on stimulating and organizing the ideas and abilities of the woman in the home, both as a co-operator and a citizen.

THE NATIONAL (FEDERAL) CO-OPERATIVE ORGANIZATIONS

The Co-operative Wholesale Societies.—The wholesale societies have grown from the retail as naturally as a tree from its roots. It would not be inapt to speak of their relationship to their members as resembling that of the Federal Government in America to the States of the Union. The original English (and Welsh) C.W.S. came into being during the American Civil War, and the Lancashire promoters of the society were influenced by that struggle for federal unity. Unity is the note of the wholesale society, as diversity is of the retail. What would be a medley of local units competing against one another for supplies is transformed by a C.W.S. into an organized body, buying and selling together. Where the larger local societies would each be setting up rival wholesale departments, the national wholesale pools the strength of all, and supplies all, on open terms strictly equal toward all society-members. On the other hand a C.W.S. has no monopoly of the co-operative market. It is a wholesale department, which the retail society may or may not elect to use. Only corporate bodies are members; for no individual in his own right holds any "wholesale" shares or enjoys any C.W.S. control.

The society-members provide capital in the ratio of one £5 share for every two members; and these shares, also, may accumulate out of the dividend of 3d. or 4d. in the £ on wholesale purchases. Once a quarter, on Saturday afternoons, several hundred delegates from the society-members attend regional meetings, and the general meetings subsequently held at its Manchester headquarters by the C.W.S., and at Glasgow by the S.C.W.S. The voting power is based on membership qualified by purchases. Salaried full-time directors are elected, 32 by the societies in England and Wales for the C.W.S., 12 by Scottish societies for the S.C.W.S. Independent auditors are similarly chosen. The federations are so far servants that, except by consent, they cannot fix retail prices—maximum prices, and not minima, being desired. On the other hand they possess very great influence. All the directors have been elected from well-known and trusted local leaders. With their officials they represent the knowledge and power of a world-wide business. They can match their national oversight against the strength of local independence. The C.W.S. Bank with its annual turnover of six or seven hundred millions is a giant in co-operative finance. In addition there are the accountants and auditors appointed by the C.W.S., and the managers and travellers, all without any compulsory powers, yet constituting a body of vigilance, while themselves subject to the criticism of the local managers and executives, and of the C.W.S. directors elected by those executives.

Along these lines the C.W.S. conducts a trade that—from semi-failure and derision in the days when, literally, the federation employed two men and a boy—has grown to over seventy-five

[1]Retail societies employees. The total number of employees of all societies in 1927 was 209,616.

millions yearly. From solicitors to artists, from bankers and tailors to land workers, miners and seamen, it employs at home and abroad, approximately, 50,000 workers. In its own workshops, wholly or in part, it manufactures goods to the value (at wholesale prices) of over twenty-five millions, these being supplied only to its corporate members. Besides its depots scattered over the world, in partnership with the S.C.W.S. it cultivates tea estates in India and Ceylon. The Co-operative Insurance Society is jointly held by itself and the S.C.W.S.; and it is also represented on the board of the Manchester Ship Canal and of a colliery company. Apart from its own 31,000ac. of English land, held as a consumers' federation, it has dealings with 160 agricultural societies, 100 of which are members. In its relations with employees, by resolution of the delegate meetings, it has to insist on trade-union membership, however oddly that action may seem to come from an employer; and though it has no immunity from strikes, no stoppage has been of long duration. Welfare work for employees is carried on, with a thrift fund, and a pension scheme is in view; while with other responsibilities toward the millions who are its ultimate customers and owners, it maintains a convalescent home, subsidizes and conducts publications, and subscribes to co-operative and guild education and propaganda. The tendency is to enlarge rather than to narrow the scope and responsibilities of the most powerful and most experienced co-operative organization in the world.

Other Federations.—Since the period when the co-operative idea was one function, one organization, amalgamation has reduced the number of separate federations. Of those which remain, the National Publishing Society, the United Baking Society, of Glasgow, and the Co-operative Printing Society, of Manchester, are the most important. The two first, like the C.W.S., are limited to society-members, and come definitely within the consumers' movement. The third includes trade unions and individuals. The *Co-operative News* and the *Scottish Co-operator* are both issued (weekly) by the publishing society. Local federations of consumers' societies for laundering are found chiefly in Lancashire and Yorkshire, one of these claiming to possess the largest laundry in the world. Federations for milk supply form the newest development along the same local lines.

The Productive Societies.—To meet with a picturesque name like "guild of cricket-ball" makers is to have one's sympathies enlisted at once on the side of productive independence. Shoemaking, printing and the clothing trades, however, are those which engage most of the societies representing partnerships in the co-operative movement between consumers, workers and individual small capitalists. Consumers' societies take employees into membership as consumers. The productive societies seek to make their employees direct participants in workshop gains and control. Membership confers no right to work; but employment, for the adult, does carry a right to membership. The Co-operative Productive Federation, of Leicester, which secures joint invoicing and joint exhibiting, but not joint selling, includes 41 societies with 5,700 employees, and sales reaching two and a quarter millions yearly. In 1926, amongst these societies, 22 shared profit with their workers in ratios of from $1\frac{3}{4}$d. to 2s. 8d. in the £ on wages. Altogether, of a surplus of £107,000 just over 5% (in addition to share interest) was distributed to capital, 25% to labour and 35% to purchasers. The societies' copartnerships thus vary from private forms of copartnership in recognizing the consumer and not regarding their industry as simply the possession of capital and labour. On the other hand, the consumers' average share in control is only 21%, the remainder being divided between the trade union and individual holders of capital (40%), and employees (39%). In post-war years the societies have not increased in number, and in the favourable field of bootmaking, for example, their sales have fallen behind those of the consumers' factories; but they hold their ground in the counsels of the movement, and with educational and social committees, and provident or pension schemes, maintain the co-operative spirit.

The Co-operative Union.—The defensive, educational and propagandist union of the British co-operative movement exists as the necessary means to those ends, and may be said to have outgrown the moralist and copartnership aims inherited from its Christian Socialist co-founders in the form in which these aims are still expressed. It is a comprehensive body, including the consumers' movement, local and national, the productive societies and their federation, some farmers' societies, and tenants', building and recreational societies. There is also an Irish section, and altogether 1,300 societies are affiliated. There is no salaried executive, but a complex control of sectional boards forming a central board which delegates work to smaller bodies. The union organizes co-operative opinion through district and regional conferences, especially through its great annual three-day congress of 1,700 delegates. Much of its work is done with the other national organizations through joint committees, particularly the joint parliamentary committee. The central education committee is another important arm, having control of a co-operative college and a teaching staff, conducting classes and summer schools, and sharing in an international school. Amongst the co-operative millions it is surprising to find the union's yearly subscription revenue no more than £41,000—a quarter of what the societies subscribe to hospitals and charities. The local character of the movement largely accounts for this, while there might be added the value of the regular hospitality given to union conferences by the local societies.

The Co-operative Party.—Political co-operation is relatively a new force, born during the World War, when the congress of 1917 turned from a traditional neutrality to organize a political party that should be the co-operators' and consumers' own. One member of Parliament was elected from ten candidates in 1918; four in 1922; six in 1923 (one of whom held office in the first British Labour Government); and five in 1924. In Parliament the group keeps general touch with the Labour Party, which contains many co-operative members, but with its own leader and whips it concentrates on the innumerable issues in modern legislation affecting the mass of consumers. It also stands for the support of voluntary co-operation against any policy, from any quarter, which might fail in understanding and considering co-operative public interests. Municipal trading proposals it aims at reconciling with co-operative commitments, to prevent any clash. Two million out of nearly five million co-operators are collectively affiliated to the party, with a great majority in support in the South and Midlands. Through a relationship rather like that of the Established Church to Parliament, the party is under the authority of the Co-operative Union and the congress.

Agricultural Co-operation in Great Britain and Ireland.—Before the British farmer is assailed for not co-operating in his business affairs as the Danish farmers do, it should be remembered that he does not live by exporting two or three staple products, but by supplying variously a varied home market, often close at hand. The national conditions in general prevent or discourage both large-scale production and mass selling. But it has been estimated that one in every five English farmers is associated for the purchase of requisites; and in England and Wales societies with 60,000 members, dealing mainly in requisites, show a turnover of eight millions yearly. Societies for marketing dairy produce, eggs and poultry are found throughout Great Britain. In the eastern and southern counties of England organized farmers possess large bacon factories; and auction marts, slaughter-houses, butter factories and retail shops are similarly held. Yet it is difficult either to classify or to generalize about British agricultural co-operation. In scattered areas, as in Wales, many societies become general distributors; and the manager has to hold the scales between member-producers who want a good price for pigs, poultry or eggs, and member-consumers who quote the price at which they could buy in the market town. Everywhere the associations tend to do business, not by system, but as circumstances demand; while the problem of specially federating for national trading so many varied and often conflicting aims proves insoluble. In England different attempts have failed; but the National Farmers' Union undertakes the duty of promoting co-operation, and the Co-operative Wholesale Society, as already stated, invites farmers' societies into membership on equal terms with all other members. Generally, British agricultural co-operation is a business rather than a movement. (For details about farmers' co-operative effort *see* AGRICULTURAL CO-OPERATION.)

Co-operation in Ireland.—In 1906 in a little cabin amongst the barren hills of Donegal, a few Irish peasants conducted in turn, every evening, a tiny co-operative store. Under the leadership of one "Paddy the Cope" this Templecrone society has become a peasant consumers' and producers' co-operative, employing 70 persons and possessing several branches, a bakery, a hosiery factory and a local hall. Templecrone is an outstanding example of an Irish co-operation which in Belfast and in a few cities and towns is urban and wholly consumers', like the British, but elsewhere is represented by some hundreds of rural societies supplying farmers' requisites along with domestic needs. In the Free State the rural societies are federated for such purchases in the Irish Agricultural Wholesale Society. Since the disturbances and losses of the Irish political conflicts, the I.A.W.S. has been brought back to a sound position with assistance from the English C.W.S. Of the two other main forms of co-operation which in the pre-war years inspired poetic hopes of a new social Ireland, the farmers' creameries again are prospering under Government supervision, but the credit movement has been merged in commercial banking. In joining a creamery the farmers take shares in proportion to their cows, guarantee milk supplies, and receive payment monthly, or oftener, in proportion to the butter fat from each supplier (less the value of separated milk returned), with the surplus on working costs divided in the same way at each year end. The principle is the simple Rochdale idea adapted; and in abolishing profiteering, distributing material benefit, and removing the sense of being exploited, is in this form almost as far-reaching. The Agricultural Organization Society in the Free State, as a non-trading, propaganda body, represents over 150,000 farmers.

CO-OPERATION IN CONTINENTAL EUROPE, INDIA, JAPAN AND ELSEWHERE

The Two Types: Peasants' and Consumers'.—That the world is so full of a number of things becomes quite an imposing truth when one glances at co-operation as it extends through Europe to Palestine, India and Japan. Socialist, Christian and Liberal societies, credit unions and land banks, distilleries, oil-pressing, horse-breeding, cattle-insurance and land-renting societies, school and army societies—many unfamiliar forms convey, perhaps, a more confused than a happy sense of plenty. But the full picture can be put into simple outline. In the main, these all represent two types of co-operation. One is the Rochdale consumers' type, found throughout the world; but strongest in North-western and Central Europe. The other is the co-operation of peasant farmers.

In Britain the proportion of consumers' societies' members to population is one in nine—the figure would be one in three if families were wholly included. Finland, Denmark, Switzerland, adding the families, show approximately the same ratio of one in three. Germany, Austria, Estonia, Sweden (including families, one in four to five) are not far behind; and France, Belgium and Czechoslovakia follow—one in five to six. On the Danube, in Hungary, there is a change. The proportion of co-operators is high (one in three), but that is due to the farmers; and the national wholesale society, the "Hangya" is first agricultural and then general. Eastward, consumers' societies diminish until few but peasant societies are found. In India there are some 3,000,000 co-operative members—perhaps more than one in 20—but they are lightly organized in loan and supply groups which are less societies than clubs. And in Japan, though more developed, the character of the movement is not dissimilar.

The two types are distinct. Socialist or Christian (Roman Catholic), the consumers, by conserving for themselves the value of their customs, in effect seek a reduction in the cost of living for an unlimited number of members. The farmers, also hard pressed, aim at increasing the wages of production by saving for themselves the gains made at their expense by usurers, merchants caring only to take advantage of markets and even consumers. Issues such as those of food taxes would, if raised, divide type from type. Yet both bodies work to prevent exploitation by middlemen. And all are co-operative, in so far as they represent free association, and in each association a government based on equality in membership, and not on unequal capital holdings. The persons rule, and not the money.

Western Europe.—In Continental Europe, France was first in co-operative effort. While Owen appealed to Britain, St. Simon and Fourier laboured in France. In 1835 two disciples, Derrion and Reynier, started a store-keeping co-operative society in Lyons, the *Commerce Veridique et Social,* as a monument there attests. But French energy turned from the store to the workshop, and founded workers' societies, from which Ludlow took to England the idea of workshop self-government. Neither this eventually State-aided movement nor the paternal Familistere of Guise has led to any considerable result in modern France; but the consumers' movement—which began again at Nimes in 1885, derived strength from union in 1912, was conspicuous during the war, and is developing regional societies—has attained a membership of over 2,000,000. Equally successful are the farmers' butter-making and casein societies of Poitou and west-central France.

In Belgium, with its *maisons du peuple,* co-operation has been developed by the Socialist movement as providing incidentally a party servant of great value; and this has very naturally led to separate Catholic and Liberal societies, with the result of weakening co-operation as a purely economic power, especially in the smaller centres of population. The peasant movement, including butter and cheese production and rural supply, is almost wholly Catholic, with the clergy taking an active part. In Holland an amalgamation of the neutral and workers' movements has helped to overcome a similar weakness.

Belgian rural co-operation, derived from Germany, where, about 1849, Professor Huber made known the new success of co-operation in England, and where Schulze-Delitzsch and Raiffeisen adapted the Rochdale idea to the more primitive economic conditions then found in Germany. The loan societies of Schulze-Delitzsch for the town craftsmen and artisans, and the land banks of Raiffeisen for small farmers, became very successful, and created new movements for co-operative credit in other countries. The rural co-operation extended to the purchase of requisites and the provision of threshing and other machines; while building societies and consumers' societies grew up under the shelter of the General Union established by Schulze-Delitzsch. Following their improved legal position from 1889 onwards, and following, also, a new co-operative enthusiasm amongst German workers previously hostile, and an exclusion of consumers' societies by the General Union, a new Central Union was established in 1903 for consumers' societies only. This federation represented over 3,000,000 members in 1927; while 750,000 were affiliated to the National Union—Catholic—at Dusseldorf-Reiszholz. German societies distinguish between management and supervision. Boards of management are composed of a few appointed officials, co-operating with elected boards of supervision and both with the general membership. Large societies like that in Berlin, or the progressive Hamburg "Produktion," replace general meetings of members by councils elected from the membership, and these are the final authority. (Comparisons with England, however, show that differences of organizations count for less than the general quality and spirit of a movement.) Joint committees for co-ordinating consumers, farmers and all other forms of co-operation are established in Germany, Denmark and Estonia. Denmark, avowing her debt to Rochdale, exhibits a rural population using its double power as producers and consumers to attain a very complete co-operative welfare. Copenhagen, besides its big consumers' society, has a remarkable Workers' Co-operative Building Association. Scandinavia is also notable for the young and vigorous movement in Sweden, which in 1926 ended a rubber shoe monopoly. The Scandinavian C.W.S., established by the trading federations of the three countries, is regarded as a possible model for a general international inter-trading association. In Iceland, also, the movement is well-established.

From Switzerland Eastward.—Switzerland, amongst its equally advanced developments, can point to the creation of a co-operative village at Freidorf, Basle. Austria has the large Vienna society, and the land settlement societies. Poland, with nearly 2,000,000 consumer and peasant co-operators, since 1924 had led in unity by the amalgamation of civil service, labour and Christian workers' co-operative federations. Finland, followed by the Baltic countries generally, shows an active co-operative development perhaps superior to that of Denmark. In the heart of Central Europe racial divisions weaken co-operation, Czech and German members in Czechoslovakia being separately organized. But in Silesia the friendly inter-relations of German, Czech or Polish societies have helped to ease the friction of frontiers. Passing to Asia, a similar reconciling influence is found in the credit societies of India, where members of different castes, and even "untouchable" Regars and Chamars, serve together on the committees.[1] In India, however, as in Japan, peasant co-operation has been initiated and furthered from above, by governmental power. Consumers' co-operation in Japan mainly represents employers' benevolence, like Owen's at New Lanark, though the Christian social movement led by Mr. Kagawa has created independent societies.

Russia and Italy.—Russia is the most co-operative of all countries in Europe, the consumers' societies—apart from the Ukraine—including 15,000,000 shareholding members, and conducting 48% of the country's retail trade. The consumers' societies buy from State factories and also market rural members' produce; and their trade with the English C.W.S. easily outdistances any other in Europe. Yet, measured by employing power, the Centrosoyus falls much below the level of either of the British wholesale societies; while notwithstanding the restored freedom of 1924, it remains difficult to say how far voluntary co-operation, in a State under a class dictatorship, can be itself. The same question arises more acutely in Italy, where the National Union of Co-operative Societies was suppressed in Nov. 1925, Fascist organizations having been set up instead. In Jan. 1927, the board of management of the large consumers' society at Trieste was similarly dismissed, and a Fascist commissioner installed. Under such conditions the roots of co-operation die. What remains is State machinery.

Consumers' Societies in the Newer Lands.—But farmers—to say nothing of the farm labourers, so far omitted—are themselves important consumers; and in 1927 the then premier of Alberta (Mr. Brownlee) declared that, with the pools successful, the next step would be the consolidation and extension of co-operative purchasing. In Saskatchewan the important community hall movement, as part of the farmers' co-operation, shows a spirit at work very like that which built the co-operative halls of Lancashire; while the Co-operative Union in Ontario, representing the few thousand co-operative consumers between Cape Breton island and the West, enjoys direct relations with the prairie grain growers. Apart from the latent rural power, consumers' co-operation in the newer countries is naturally weak. It is found in New Zealand and in the Australian capitals, and in South Africa chiefly amongst dockyard and railway employees. In South America, the Workers' Household Credit Building and Consumers' Society, at Buenos Aires had, in 1927, over 7,000 members.

Meanwhile, the U. S. Bureau of Labour Statistics, reporting in 1926, found 700,000 co-operative consumers throughout the United States. These co-operative societies are curious in being organized frequently amongst immigrant races, especially Finns, Scandinavians, Germans and Russians, so that a group of societies possessing their own wholesale federation may conduct a very considerable business while using almost entirely a language foreign to America. This segregation, with the American distances and the consequent difficulties for united and trustworthy efforts amongst a population much more restless, economically, than in European cities, must long delay a powerful consumers' movement. But cafeterias and housing societies in New York—where the forward movement of consumers' co-operative services is notable—loan societies in the Eastern States, and general consumers' societies in the Middle West (including the Franklin Creamery Association of Minneapolis), have laid solid foundations. There are also negro societies amongst negro students from New York to Colorado. Since 1915 the Co-operative League of America, with New York headquarters, has federated for all non-trading purposes American societies genuinely conforming with Rochdale principles, and has also linked up American co-operation with the international movement.

[1] B. L. Mahtur, *Wheatsheaf*, June 1926.

International Co-operation.—Because of its million-fold memberships, its roots in home, farm and workshop, its forward possibilities and its everyday constructive work, the co-operative movement is imposing in a way hardly to be guessed from co-operative store windows and advertisements of goods. The International Co-operative Alliance, first suggested by the French pioneer, de Boyve, and constituted in 1895, is a minor league of nations, representing 85,000 societies in 36 countries. Kept in being formally during the World War, the alliance resumed its triennial international congresses in 1921. It has headquarters in London, issues a monthly *Bulletin* in English, French and German, and at Stockholm in 1927 found it necessary to promise to consider a wider lingual basis. The International Co-operative Wholesale Society, based on the C.W.S. headquarters at Manchester, solidly represents 26 national trading federations, covering 28,000,000 individual members, and since 1924 it has explored the possibilities of international co-operative trade. The International Co-operative Women's Guild, pioneered in 1921, and established in 1924, speaks for the new place and new interests which women are finding through consumers' co-operation in Europe and America, as well as in Britain. An international co-operative summer school (held annually) and a students' fellowship, are fresh evidences of growth. All were active at Stockholm in 1927; and they look to Vienna for 1930.

The Future.—The question of the future of co-operation is of particular interest. The movement never was more vigorous. In Great Britain its recovery from industrial depression has filled its supporters with confidence. Where numbers of its own members once anticipated its supersession in trade after trade by the "larger co-operation" of the municipalities, the Congress of 1928 showed a unanimous belief in the power of voluntary co-operation to perform the services required. What might be a source of weakness in the division of the societies into political and non-political, appears to be proving, instead, a stimulus to healthy rivalry, since both wings remain united through the general federations, while vying with one another in producing results. And the extension of credit trading in the form of "mutuality clubs" was in 1928 too successful to create forebodings.

The case is not dissimilar with consumers' co-operation abroad. In Germany, especially, not only industrial depression but the more disastrous inflation had to be surmounted; in 1928 success in both tasks inspired the German co-operators. In Sweden, recent co-operation has encouraged its supporters by enlisting a higher artistic skill than that which co-operative societies often command. Yet there, as throughout Europe, the movement still has far to go in supplying those articles into which individual taste and skill in design (as well as fashion) enter: In Great Britain 80% of the societies' trade is in groceries; and the Continent has advanced less than Great Britain. Meanwhile the strike of employees in the model Finnish Society, Elanti, in May, 1928, together with the challenge of the Russian conception of co-operation as a workers' instrument for the socialism of a class, constituted a warning of the task that lies before co-operation in leading its whole membership to understand and respond to the common interests of the millions and to bring over sectional and individual interests into serviceable relation to the whole.

These underlying issues of the individual and the mass, the section and the whole, the class and the community, form the real problem of co-operation's future. Avowedly neutral in religion and politics, the international movement does not regard itself as excluded from pursuing—although on a vaster, world-wide scale—the original aim of a co-operative community proposed by the co-operative fathers, the pioneers of Rochdale. How far is that aim practicable? It does not stand as the design of a theorist; to any friendly constant observer it must appear as arising from the social instincts of the masses. But amongst the masses themselves, there are multitudes bound to the co-operative movement only by self-interest and monetary ties. To make economic democracy widely effective, the co-operators evidently need to find profounder means than those yet employed for arousing disinterested human enthusiasm.

Furthermore, to have great effect in life's varied field, a movement must be complex, as well as extensive. Conscious mass power is a new thing, tremendous and far-extending, but it is not everything. Individual and personal integrity and skill will not be submerged; the side which enlists this latter power will also be hard to defeat. As a free movement, neither class-bound nor State-bound, co-operation appears to have before it a magnificent opportunity. Both producers' and consumers' co-operation present, it is urged by co-operators, a solution of the industrial problem by showing capital as a hired yet contented servant. Consumers' co-operation further offers the outline of a new economic society in which the workshop is related to the home and economic surplus to human needs, and where industry begins to look to its human ends instead of simply to profits and money wages. Whether the movement can lead a stubborn world decisively along this co-operative road, probably will depend more and more not only on its numbers, but also on its power to enlist intelligence, and develop in all ranks a leadership capable both of creating enthusiasm and producing everyday conviction amongst the masses of mankind.

CO-OPERATION IN THE UNITED STATES

Speaking generally, the co-operative movement in America is far less developed than in Europe. It came into prominence at the beginning of this century and reached its zenith about 1920, when the instability of economic conditions caused the failure of many co-operative stores; those which did survive have prospered. Co-operative organizations are most developed in the Middle West, the majority being in towns of less than 2,500. They operate retail and wholesale stores, gasolene (petrol) filling stations, bakeries, laundries, restaurants, creameries, etc. The capital for such stores is raised through non-returnable entrance fees, the issue of non-assessable capital stock and money borrowed from members and others. The entrance fee, usually ranging from 25 cents to $2, covers the cost of organization work; any balance forms a reserve fund. Most stores sell at current prices to avoid the antagonism of competitors. From the profits, a fixed rate of interest is paid on the share capital after which a percentage is put in reserve for losses, etc. The remainder of the profits is then returned to the members in proportion to their patronage. Co-operative stores tend to check profiteering in local merchants, to raise the quality of goods sold and to encourage fair wages for clerks. The system purports to apply the principles of democracy to business enterprises.

CO-OPERATION, AGRICULTURAL: *see* Agricultural Co-operation.

CO-OPERATIVE INSURANCE: *see* Agricultural Insurance.

COOPERING, or Copering. A system of traffic in spirituous liquors, tobacco and other articles amongst the fishermen in the North Sea. The practice began in the middle of the 19th century, when Flemish and Dutch *koopers* (traders) frequented the fishing fleets for the purpose of barter. Trading first in tobacco, they extended their operations, and soon became practically floating grog-shops.

The demoralizing nature of the traffic was brought to the public notice in 1881, and a convention was held at The Hague in 1882 to consider means of remedying the abuses. In 1887 Great Britain, Germany, Belgium, Denmark, France and the Netherlands signed an agreement to prevent the sale or purchase of spirituous liquors among fishermen at sea. In Great Britain an act (the North Sea Fisheries Act, 1888) was passed to carry into effect the terms of the convention. The act (now repealed and replaced by the North Sea Fisheries Act, 1893, with which it is identical but for some slight verbal modifications) imposes a fine not exceeding £50 or a term of imprisonment not exceeding three months for supplying, exchanging or otherwise selling spirits. It imposes a like penalty for purchasing spirits by exchange or otherwise, and requires every British vessel dealing in provisions or other articles to have a licence and to carry a special flag.

See E. J. Mather, *Nor'ard of the Dogger* (1888), and publications of the Royal National Mission to Deep-Sea Fishermen.

COOPERSTOWN, a village of New York, U.S.A., 70 mi. W. of Albany, at the foot of Otsego lake, where the Susquehanna river emerges from it, 1,200 ft. above sea level; the county seat of Otsego county. It is served by the Delaware and Hudson and several bus lines. The population in 1940 (federal census) was 2,599.

The charming village, with many quaint old houses, is in the midst of the romantic scenes of J. Fenimore Cooper's "Leather-stocking Tales," now a prosperous dairying region. The shores of the lovely lake (9 mi. long and from $\frac{1}{4}$ to 2 mi. wide), Cooper's "Glimmerglass," are now lined, as he predicted in 1838 they would be, with beautiful estates and modest cottages. The village is the site of the National Baseball museum and Doubleday field, the game having been invented at Cooperstown in 1839 by General Abner Doubleday. There also is the museum headquarters of the New York State Historical association.

In 1785 Judge William Cooper, of Burlington (N.J.), acquired large tracts of land in this region, and in 1788 laid out the village, which was incorporated in 1807. The Cooper home, Otsego hall, was for many years the largest private residence in the State. It was burned in 1852, and its site is now a public park. Cooperstown was the home also of Erastus F. Beadle (d. 1894), who originated the "dime novel," and of Samuel A. Nelson, a justice of the supreme court. *See* J. Fenimore Cooper, *The Chronicles of Cooperstown* (Cooperstown, 1838).

COOPER UNION, a unique educational institution "for the advancement of science and art" in New York city, founded in 1859 by Peter Cooper. It is housed in two buildings on Cooper square at the northern terminus of the Bowery, Third avenue, and Seventh street. In a letter to the trustees accompanying the trust-deed to the property, Cooper said that he wished the endowment to be "forever devoted to the advancement of science and art, in their application to the varied and useful purposes of life." Cooper's most efficient assistants in establishing and developing the Union were his son, Edward Cooper, and his son-in-law, Abram S. Hewitt. In 1900 Andrew Carnegie increased the financial resources of the Union by generous gifts.

The instructing staff, laboratories and studios are excellent. All instruction is free and is open to all who meet the entrance requirements irrespective of race, creed, colour, or place of residence. The library contains full files of current journals and magazines, and in 1939–40 had 71,000 volumes; the number of readers per year averages 250,000. There is a museum for the arts of decoration, which opened in 1897, containing the famous J. Pierpont Morgan collection of textiles, the Decloux collection of 17th and 18th century drawings of ornaments and decoration, the Winslow Homer sketches, an outstanding collection of wallpapers, and an encyclopaedic picture reference library of 500,000 classified clippings and photographs relating to the decorative arts. Apart from evening lecture courses, the principal departments of the Union, with their attendance in 1939–40 were: a day school of engineering offering standard four-year day college courses in civil, electrical, mechanical and chemical engineering, 336; a night school of engineering offering co-ordinated courses of six years' duration in civil, electrical, mechanical and chemical engineering, and awarding degrees identical with those granted in the day school, 961; a day school of art offering a four-year course in art and its industrial applications, which includes drawing, painting, decorative design, architecture, plastic design and advanced study in painting, sculpture, fashion illustration and costume design, graphic design, advertising design and architecture, 200; a night school of art also offering a four-year course in art and its industrial applications, 480; making a total enrolment of 1,977. All courses are of college grade. Admission is restricted to graduates of recognized secondary schools who have qualified in rigorous intelligence and aptitude tests. Free lectures for the public are given throughout the winter under the auspices of the Department of Social Philosophy, in the Great Hall of the Union, where on Feb. 27, 1860, Abraham Lincoln gave before an audience of notables the famous "Cooper Union Address" which was largely instrumental in securing his nomination for the presidency. Since that eventful winter, thousands of lectures and addresses have been heard there, including those of John Tyndall, the English physicist, who gave the lectures on light, which stimulated the building of scientific laboratories in American universities. It was there that Robert G. Ingersoll gave one of his earliest addresses on religion and Victoria Woodhull defended rights for women. Gano Dunn succeeded to the presidency of Cooper Union following the death of R. Fulton Cutting in 1934. With the installation of Dr. Edwin Sharp Burdell as director in 1938, a policy of scientific humanism, which aims to accomplish an intellectual synthesis of the natural sciences and the humanities, was inaugurated. A Department of Humanities, functioning as an integral part of the Institute of Technology, was established in 1939.

CO-OPTATION, the election to vacancies on a legislative, administrative or other body by the votes of the existing members of the body instead of by an outside constituency (Lat. *co-optare*). Such bodies may be purely co-optative like the Royal Academy, or elective with power to add to the numbers by co-optation. An example of the latter are the municipal corporations in England.

CO-ORDINATES in the widest sense are class characteristics (in mathematics, primarily magnitudes) that serve to distinguish and arrange the elements or units of an assemblage, specifically of a continuum. More particularly, in geometry they determine the position of each point, line, plane or other extent in a total of such. Co-ordinates of the simplest and principal type are called *Cartesian* from René Descartes in whose *Géométrie* (1637) they first made a somewhat disguised and informal appearance, though vague hints may be found much earlier, as in Nicole Oresme's Latin *Treatise on the Latitudes of Forms* (*c.* 1361). Perhaps with exacter justice they might be named "Fermatian," as invented by Pierre de Fermat (1601–65) in his study of maxima and minima (1629), who communicated his idea to M. Despagnet of Bordeaux, according to Fermat's letter to Roberval (Sept. 22, 1636). Immediately following the appearance of the *Géométrie*, Fermat wrote to Descartes (Jan. 10, 1638) setting forth his own conceptions, first published, however, in his *Varia Opera* in 1679—ideas and methods far in advance of Descartes' and nearer to the modern form, range and system. Indeed, it may be said that they almost distinguish him as the "sole founder of analytic geometry" (H. Wieleitner, 1927), if not of modern mathematics.

Parallel Co-ordinates.—The *Cartesians* are the two distances (x, y) of a point $P(x, y)$ from two axes (OX, OY) in its plane, that meet (commonly at right angles) in the origin O. A fitting name is *parallel co-ordinates* (fig. 1). Suppose the plane filled completely with each of two systems of parallel lines, the two intersecting at any angle. Suppose also that the lines are all numbered, from a base line in each system, along the base line in the other (OX, OY); then through each point of the plane passes one and only one line of each system, and each line bears a number representing the length it cuts off from O on the other axis, and is given by an equation as $x=3$, $y=4$; these lengths, numbers and equations are called co-ordinates of the point of intersection $P(x, y)$, *rectangular* or *oblique* according to angle XOY, but in both cases *parallel* (or rectilinear).

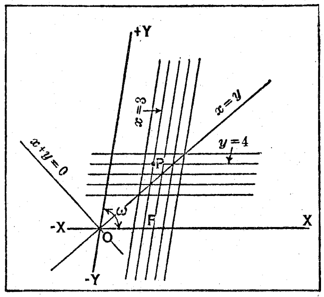

FIG. 1

The co-ordinate y is often called the *ordinate*, a term reproducing the Latin adverb *ordinatē* or *ordinatim* (arrangedly), long used with the participle *applicata*, in translating Apollonius, for the Greek τεταγμένος, especially of parallel chords (in a conic) bisected by their conjugate diameter. *Applicata* itself furnished an equivalent for "ordinate," as in Fermat's *appliquée*. *Abscissa* (abscisse), "off-cut" (Gr. ἀποτομή) explains itself, as segment cut off from an axis, or diameter (reckoned either from vertex or centre) by a conjugate chord (or ordinate). Both ordinate and co-ordinate, as nouns, were slow in being recognized, being first used in their present sense by Leibniz (1692).

Equations. The whole system of points forming the plane may now be indicated by a symbol (x, y), both x and y "real" and arbitrary, ranging from zero (0) both ways to infinity (from $-\infty$ to $+\infty$), each point corresponding to one and only one pair of values (x, y), and conversely. But if x and y be subjected to some condition, as $x-y=0$, the points (x, y) cannot be just anywhere in the plane, but only in a certain region of value, viz., on the line bisecting the angle XOY (ω); hence $x-y=0$ (fig. 1) or $x=y$ is called the equation of the bisector. To each of its points corresponds a value-pair (x, y) satisfying its equation, and conversely. The equation symbolizes a system of value-pairs (all that satisfy it), all depicted together by all the points on the line and, conversely, a one-to-one correspondence of point and value-pair. Likewise the system of value-pairs $x^2+y^2=25$ symbolizes an assemblage of points, a circle about O, of radius 5; conversely, such a circle depicts such a system of value-pairs. So for any curve and its symbolizing equation, and for any equation and its depicting curve.

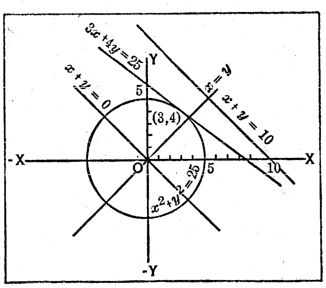

FIG. 2

Degrees. All equations of the first degree in point co-ordinates (as $lx+my+n=0$) are depicted by lines, and hence are called *linear*, and conversely; all of the second degree (as $ax^2+2hxy+by^2+2jx+2fy+c=0$) by *conics* (*see* CONIC SECTION), of which both circles and line-pairs are limiting cases, and conversely; equations of a higher degree, by higher curves, and conversely; the numerical fact of degree corresponding to the geometric fact of intersection by a line. A curve of the nth order (its equation being of the nth degree in x and y) meets a line in exactly n points, some perhaps coincident, or even *nul*, non-existent in the plane of real x and y. Thus $3x+4y=25$ meets $x^2+y^2=25$ in the double tangent-point (3, 4), while $x+y=10$ meets it in the imaginary points $x=5\pm\frac{5}{2}\sqrt{-2}$, $y=5\mp\frac{5}{2}\sqrt{-2}$ (fig. 2). Concentric circles, as $x^2+y^2=36$, $x^2+y^2=100$, meet only in imaginary points at ∞.

Transformation. There is often occasion to change the axes of reference. In the simplest change of origin only, OX, OY are pushed, without turning, into new positions $O'X'$, $O'Y'$: if O' be (a', b'), plainly $x=x'+a'$, $y=y'+b'$ (fig. 3). If OX, OY be not pushed, but only turned round O, say counter-clockwise through the angle a, then clearly $x=x' \cos\alpha - y' \sin\alpha$, $y=x'\sin\alpha+y'\cos\alpha$ (fig. 4). For both changes at once, the formulae are combined. This is the case for rectangular axes; for oblique axes we have similar processes with more complex results.

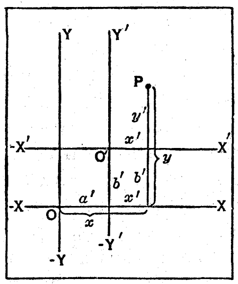

FIG. 3

Polar Co-ordinates.—The second primitive type of co-ordinates is the *polar*, used by Jakob (Jacques) Bernoulli in 1694; a length or distance $\rho(OP)$ radius vector, inclined θ, direction angle, to an initial direction OD (fig. 5). The co-ordinate net-work consists of all concentric circles about O, with all their radii, each radius meeting each circle in one point only, and conversely. Rectangular co-ordinates are readily expressed by polar co-ordinates, thus $x=\rho\cos\theta$, $y=\rho\sin\theta$; conversely, $\rho=\sqrt{x^2+y^2}$, $\theta=\tan^{-1}y/x$.

Threefold and Fourfold Space.—Rectangular co-ordinates are easily extended to spaces of three or more dimensions. Imagine three planes mutually perpendicular, meeting by twos in OX, OY, OZ, like the walls of a room and the edges at a corner. Then the co-ordinates of P are its three distances a, b, c, from the planes YOZ, ZOX, XOY, parallel to OX, OY, OZ. Or imagine space filled with each of three sets of parallel planes, OX, OY, OZ, being three intersections taken as axes. Then for all points of a plane upright on OX, parallel to YOZ, the distance x to YOZ, parallel to OX, is the same—say $x=a$; and similarly for $y=b$, $z=c$. Hence these three lengths (fig. 6) or their numbers a, b, c, or the three planes through P, or their equations are co-ordinates of P. Clearly any equation of the first degree in x, y, z, as $lx+my+nz+c=0$, is depicted by a plane, with axial intercepts $-c/l$, $-c/m$, $-c/n$, and conversely. Also an equation of the second degree in x, y, z, symbolized by

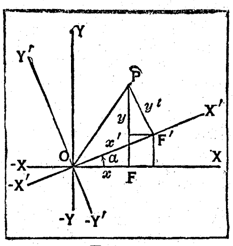

FIG. 4

$$(a, h \cdots)(x, y, z)^2=0,$$

is depicted by a quadric (ellipsoid, paraboloid, hyperboloid), and so on for higher degrees and surfaces.

If there be four such independents (x, y, z, u), any set of values named will specify an element in a manifold of four dimensions, and all such would constitute the total fourfold extent. Any single equation binding together the four would be depicted by a threefold extent, a section of the fourfold, as a curve is a section of a surface, and a surface a section of a solid. Similarly for any number of co-ordinates or values determining elements. Although no logical difficulty arises, the geometric representation offers a serious one; for the constructive power of our space sense does not reach beyond three dimensions, and so we cannot envisage a fourfold, although the assemblage of musical notes appears to be such, since we distinguish a note by four marks high, loud, long, rich (timbre), that is by four co-ordinates. But we do not imagine a fourth axis U perpendicular to X, Y, Z, to the whole XYZ space, as Z is to XOY, to the XY-plane. In spite of this difficulty, however, the abstract reasoning is undisturbed. Thus, in transforming to polar co-ordinates, consider this example: in XOY draw OP or ρ_1 to P (x, y), inclined ϕ_1 to Y, so that $x=\rho_1\sin\phi_1$, $y=\rho_1\cos\phi_1$. So in $O-XYZ$ draw OP or ρ_2 to $P(x, y, z)$, inclined ϕ_2 to Z, $90°-\phi_2$ to the XY-plane, on which its orthogonal projection is $\rho_2\sin\phi_2$; *i.e.*, a ρ_1 inclined as above, so that,

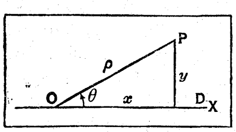

FIG. 5

on putting $\rho_3\sin\phi_2$ for ρ_1 we have $x=\rho_2\sin\phi_2\sin\phi_1$, $y=\rho_2\sin\phi_2\cos\phi_1$, and besides $z=\rho_2\cos\phi_2$. Quite similarly, in four dimensions, $x=\rho_2\sin\phi_3\sin\phi_2\sin\phi_1$, $y=\rho_3\sin\phi_3\sin\phi_2\cos\phi_1$, $z=\rho_3\sin\phi_3\cos\phi_2$, $u=\rho_3\cos\phi_3$; and so on for other dimensions.

Triangular Co-ordinates.—Thus far only parallel (especially rectangular) and polar co-ordinates have been considered. During the past century, there have been devised many others both linear and curvilinear. The first are *linear combinations of parallel co-ordinates* introduced by Möbius (1827) in *Der barycentrische Calcül*, and then by Plücker (1828) in his *Analytisch-geometrische Entwicklungen*—of signal importance in projective geometry. Möbius imagined three masses (p_1, p_2, p_3) at the vertices of a $\triangle\ ABC$, as co-ordinates of their own mass centre P. Of course, only the ratios $p_1:p_2:p_3$ are significant. If h_1, h_2, h_3 be (fig. 7) the altitudes of ABC, and d_1, d_2, d_3 the distances of P from BC, CA, AB, we have the static equalities: $p_1h_1=(p_1+p_2+p_3)d_1$, and so for the indices 2, 3; whence at once

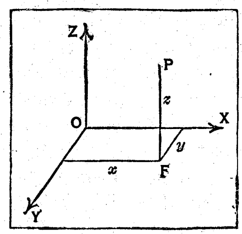

FIG. 6

$$p_1:p_2:p_3=d_1/h_1:d_2/h_2=d_3/h_3,$$

that is, the p's vary as the d's multiplied by the height-reciprocals, a special case of general *trilinear co-ordinates* in which the assumed three lines must form a triangle. In any $\triangle\ ABC$ (fig. 7) take CA, CB as OX, OY, and any point $P(x, y)$. Then $d_1=\alpha=x\sin C$, $\beta=y\sin C$, and

$$a\alpha+b\beta+c\gamma = 2\triangle. \qquad \text{(i)}$$

If P lie beyond any side, as at P', the corresponding distance is negative. We may now take α, β, γ strictly $\alpha:\beta:\gamma$ as trilinear or trimetric co-ordinates of P, under condition (i). The quotient $(a\alpha+b\beta+c\gamma)/2\triangle=1$ and may serve as multiplier to make all terms of an equation explicitly homogeneous in α, β, γ. If for $a\alpha/2\triangle$, $b\beta/2\triangle$, $c\gamma/2\triangle$ we put x, y, z, called *areal co-ordinates* the quotient becomes $x+y+z=1$ and serves to make such equations homogeneous, x, y, z being any numbers rightly signed and proportioned. The advantages of trilinear co-ordinates lie in homogeneity, adaptability, and the treatment of infinity (Klein).

Extensions.—Epoch-making were the works of J. Plücker (1828, 1831, 1835, 1839, 1846, 1868–69), broadening the notion not only of point-co-ordinates but also of co-ordinates in general, by regarding any geometric (or algebraic) form as a co-ordinate base and reckoning with the co-ordinates so defined. Thus he regarded any rational integral combination of point-co-ordinates denoted by a single letter, as itself a co-ordinate. Hence geometrically the most general co-ordinates of a point in three-space would be any three definite surfaces (of three surface-systems) meeting in the point. "The most general system of co-ordinates of a point consists of three sets of surfaces, on one of each of which it lies." (Thompson and Tait, *Nat. Philos.*, ii. 202.)

Curvilinear Co-ordinates.—We now reach the type of *curvilinear co-ordinates*, as especially treated by Lamé in the period from 1830 to 1860. Any surface-systems $U_i=C_i$ $(i=1, 2, 3)$, the C's being constants, whose functional-determinant Ux, y, z does not equal 0, by their intersections (in twos of two systems) determine points in space just as do three systems of parallel planes in three-space (or two systems of parallel lines in two-space, the plane). But this they do only within a region free from singularities of any such co-ordinate surface, which hardly affects their availability in mathematical physics. Of these curvilinear systems the *elliptic* (announced in 1839 by both Lamé in *Liouville's Journal* and Jacobi in *Crelle's Journal*) are of note as applicable throughout three-space, unhemmed by singularities. They are in a sense the three roots λ_1, λ_2, λ_3 of the cubic in,

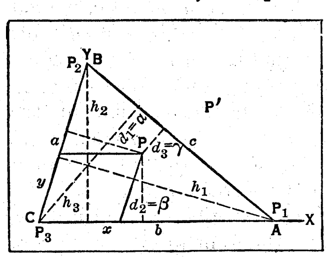

FIG. 7

$$\lambda x^2/(a-\lambda)+y^2/(b-\lambda)+z^2/(c-\lambda)=1.$$

symbolizing three confocal quadrics (for the three roots) through the point (x, y, z). For $-\infty<\lambda<c>0$, an ellipsoid E; for $c<\lambda<b$, an hyperboloid H_1 of one nappe; for $b<\lambda<a$, an hyperboloid H_2 of two nappes; for $a<\lambda$, a nullibi (nullteilig) quadric without real points. Such confocals intersect at right angles, forming an orthogonal system. So through each point P there pass three such surfaces (E, H_1, H_2), all intersecting by twos in P, and by Dupin's theorem each two meet on *curvature-curves* common to the two-space-curves of the fourth order, each in general of two branches.

Specially useful in the study of spheres are *pentaspheric co-ordinates*, in which five spheres are assumed—one always a (nullibi) sphere without real points, if the five are all to meet at right angles, forming an orthogonal system. If $S_i (i=1, 2, 3, 4, 5)$ be the five powers (squared tangent-lengths from point to spheres) of a point P as to the five spheres, then the five-sphere co-ordinates (strictly, their four independent ratios, which alone count) are fixed by $\sigma x_i=k_iS_i$ there σ denotes the proportionality-factor and k_i the arbitrary constants. These five are homogeneous, and since three-space has only a fourfold of spheres (an assemblage around each point as centre), some homogeneous equation of the second degree must connect the five; it is written $\Omega=0$. Just here emerges a notable distinction. Hitherto, in point-and-plane geometry, the co-ordinates used in determining an element of space have been quite independent of each other, wherefore the space as so constituted is called a *linear manifold;* but in the point-geometry of pentaspheric co-ordinates as in various other types, there appear *supernumerary co-ordinates* which must satisfy a quadratic equation, wherefore the space so constituted is known as a *quadratic manifold.* Made generally known by Darboux (1873), but already used since 1869, pentaspherics have been studied and developed mainly by Sophus Lie and Felix Klein.

Other Elements.—Thus far the *point P* has been treated as the only geometric irreducible, but others are often useful. If $lx+my+1=0$ be a line L, then its intercepts $\left(-\frac{1}{l}, -\frac{1}{m}\right)$ on OX, OY fix it and are constant for any one line, while x and y vary from point to point. But now suppose $P(x, y)$ fixed (as 3, 4) and let l, m vary; then as the intercepts $\left(-\frac{1}{l}, -\frac{1}{m}\right)$ change, the line will swing round $P(x, y)$. Hence the equation no longer symbolizes a *row* or *range* of points all on the same line L, but a *sheaf* or *pencil* of all lines in the plane on (through) the same point P. Thus the notions of P and L are interchanged, giving lines on a point instead of points on a line, the equation remaining unchanged; hence l and m are *line co-ordinates;* that is, co-ordinates of the lines on (or *flat pencil* through) the point (x, y). So in $lx+my+nz+1=0$, on holding l, m, n fixed and letting x, y, z change, we get the twofold of value-triplets depicted by all points $P(x, y, z)$ of the plane; but on holding P fast (say 2, 3, 6) and letting l, m, n loose, we get the twofold of value-triplets correlated with the (*bundle* of) planes on (through) the point $P(2, 3, 6)$. So l, m, n become *plane co-ordinates*, specifying all planes lying on a point (x, y, z).

Duality.—This discussion leads to the recognition of the principle of *duality* (Gergonne, 1771–1859) or *reciprocity.* An equation is understood in two ways, as a symbol both (1) of a line (or plane) total of points, in point co-ordinates, and (2) of a point-total of lines (or planes) in line (or plane) co-ordinates. And so on prolifically; to every such theorem in either type of co-ordinates corresponds the *dual* or *reciprocal* in the other; proving either proves both, as in the theorems of Pascal and Brianchon. (*See* CONIC SECTION.) But the theorem must be *such, i.e.*, concerning *positional* relations, and not *metrical*, as lengths or sizes of angles. *Order* (number of intersections by a line) in the point-co-ordinate *locus* corresponds to *class* (number of tangents from a point) in the line (or plane) co-ordinates. In the line (or plane) co-ordinate *envelop,* each number being given by the degree of the equation in the respective co-ordinates; these latter co-ordinates are also called *tangential*, since they are tangent to the forms they envelop and thus determine.

Thus there appear as many lines as points in a plane, and as many planes as points in space. This is not strange, since there are infinitely more circles in the plane and spheres in space than points in either; in fact, around each point as centre a countless number of circles and spheres. It is no question of room or of crowding, but only of definition, of distinction one from another. Equations in point-co-ordinates (x, y, z) symbolize forms as aggregates of points (P) co-ordinated in specific ways; equations in line or plane-co-ordinates symbolize such forms themselves as units co-ordinated into other aggregates, each individual in which is specified by a special set of values (l, m, n). The mind makes space of more dimensions in complexes than in simples. In the line geometry proper of Plücker (1868–69), the line displaces the point as "space-element." But it is fixed by four co-ordinates (not three), as in two projections on co-ordinate planes (traces of two planes through the line and perpendicular to the co-ordinate planes), which are (say) $x=az+\alpha$, $y=bz+\beta$; hence a, α, b, β are the line's four co-ordinates, though the preferred line-co-ordinates are *six homogeneous* co-ordinates connected by one quadratic equation. Hence, as an aggregate of lines our three-space is fourfold. According as these four independents are joined by 1, 2, 3 equations, there result three configurations: (1) a triple *complex*, as the total of tangents to a surface, a plane or sheaf of tangents at each point of the twofold surface of points; (2) a double *congruence*, as the total of common tangents to two surfaces, as quadrics; (3) a simple *regulus* (or *skew*), as the system of tangents to H, H_1, an hyperboloid of one sheet, whichever half of the total be regarded.

The query will at once arise, may not still other geometric wholes, as circle, conic or quadric, be taken as space-elements, raising still higher the dimensionality of our triple space of points? The answer is that this is possible and that it has been done, in a way, with the *circle* (by C. Stephanos, 1881), the aggregate of circles in space appearing as a sixfold extended domain of the fifth order in a ninefold extent. If the quadric be taken as space-element, our three-space attains nine dimensions, and so on. These brief hints may suggest the range and significance of the concept co-ordinates, and how the mind develops the notion of space, constituted at will of forms differing endlessly in complexity and degree, but all obeying the same logical laws and all united into one self-consistent whole. (*See* also ANALYTIC GEOMETRY; NOMOGRAPHY.)

CO-ORDINATION, in chemistry, denotes a mode of linking between atoms first recognized by Alfred Werner in 1893. In accordance with the co-ordination theory, which affords a simple and comprehensive explanation of the chemical constitutions of complex salts, amines (*q.v.*) and mordant dyes, certain salts of boron, beryllium, chromium, cobalt, copper and many other elements should exist in optically active forms. This prediction has since been verified experimentally in many instances. (*See* STEREOCHEMISTRY.)

An electronic interpretation of co-ordination was provided by N. V. Sidgwick in 1923, thus bringing this chemical conception into line with modern views of the constitution of matter. (*See* VALENCY.)

COORG, a province of India, administered by a commissioner, subordinate to the governor-general through the resident of Mysore, who is officially also chief commissioner of Coorg. A legislative council with five nominated and fifteen elected members, was set up in 1923. Coorg (an anglicized corruption of *Kodagu,* said to be derived from the Kanarese *Kudu,* "steep," "hilly"), lies in the south of the peninsula, on the plateau of the Western Ghats, sloping inland towards Mysore. It is the chief coffee-producing state after Mysore, coffee cultivation having held its own in the face of severe competition. The administrative headquarters are at Mercara. There is no railway. Coorg is the smallest province in India, its area being only 1,593 sq.mi. It was constituted a province on account of its isolation. It lies at the top of the Western Ghats, and is cut off by them from easy communication with the British districts of South Kanara and Malabar, which form its western and southern boundaries, while on its other sides it is bordered by the native state of Mysore. It is a mountainous land of wooded hills, the lowest 3,000 ft. high, and deep valleys; the loftiest peak, Tadiandamol, has an altitude of 5,729 ft. The principal river is the Cauvery, which rises on the eastern side of the Western Ghats, and with its tributaries drains the greater part of Coorg. During the rainy season, from June to the end of September, the rivers are very rapid. Coorg has a rainfall which may exceed 160 in. yearly, particularly heavy in the jungle tract, but the climate is on the whole healthy. The hottest time is April and May. In the undergrowth are cardamom, areca, plantain, canes, wild pepper, tree and other ferns, and arums. In the forest of the less thickly-wooded bamboo country in the west of Coorg the trees most common are blackwood, kino, mutti, acacia, etc., with teak and sandalwood in the eastern part. Elephants, tigers, cheetahs, wild boar, deer and buffalo are found. The most interesting antiquities of Coorg are the earth redoubts or war-trenches (*kadangas*) with a linear extent of between 500 and 600 m. They are mentioned in inscriptions of the 9th and 10th centuries. Rice is the staple product and the chief export. Coffee growing is the main industry, rubber and some tea are grown and there are sandalwood works.

In 1941, the population, which is mainly agricultural, was 168,-726. Of the various tribes inhabiting Coorg, the Coorgs proper, or Kodagas, and the Yeravas, both special to the country, are the most numerous. The Kodagas, a light-coloured race of unknown origin, constitute a highland clan of independent spirit and free from the trammels of caste. Their religion consists of ancestor- and demon-worship, with a certain admixture of Brahman cults. The men are by tradition warriors and hunters, and while they will plough the fields and reap the rice, they leave all menial work to the women and servants. They speak Kodagu. The Yeravas are an inferior race, dark-skinned and thick-lipped. Though now nominally free, they were, before the establishment of British rule, the hereditary praedial slaves of the Kodagas. They are demon-worshippers. Their language, a dialect of Malayalam, is peculiar to them. Among the other tribes or castes special to Coorg are the Heggades, cultivators from Malabar, the Ayiri, who constitute the artisan caste and the Medas. There are several other tribes peculiar to Coorg. Of those not special to the country, the Holeyas, from Mysore, Malabar and South Kanara, are the most numerous. They were formerly the slaves of the Kodagas and now act as their menials. Of the Tulu (farmer) class the Gaudas, who live principally along the western boundary, are the most important; they speak Tulu and wear the Coorg dress. The official language of Coorg, which is that spoken by nearly half of the population, is Kanarese, the Coorg language (Kodagu) coming next. There are three secondary schools in the state, but no college.

History.—Early accounts of Coorg are purely legendary, and it was not till the 9th and 10th centuries that its history became the subject of authentic record. At this period, according to inscriptions, the country was ruled by the Gangas of Talakād, under whom the Changalvas, kings of Changa-nād, held the east and part of the north of Coorg. After the overthrow, in the 11th century, of the Ganga power, the Changalvas became tributary to the Cholas, the Hoysalas and the Vijayanagar empire in turn. On the fall of the last-named empire a prince of the Ikkeri or Bednur family brought Coorg under his sway, his descendants continuing to be rajas of Coorg till 1834. Hyder Ali of Mysore occupied the country in 1780 but was expelled in 1782. Two years later Tippoo Sahib reduced the country; but the Coorgs having again rebelled in 1785 he vowed their destruction. Having secured some 70,000 of them by treachery, he drove them to Seringapatam, where he had them circumcised by force. Coorg was partitioned among Muslim proprietors; but in 1788 Vira Raja succeeded in driving the forces of Tippoo out of the country. The British, who were about to enter on the struggle with Tippoo, concluded a treaty with Vira Raja; and during the war that followed the Coorgs proved invaluable allies. By the treaty of peace, Coorg, though not adjacent to the East India Company's territories, was included in the cessions forced from Tippoo. On the spot where he had first met the British commander, the raja founded the city of Virarajendrapet.

Vira Raja (d. 1809) was guilty towards the end of his reign of hideous atrocities, rivalled by his nephew, Vira Raja, a monster of sensuality and cruelty, who ascended the throne in 1820, at the age of 20. Among his victims were all the members of the families of his predecessors. In 1832, evidence of treasonable designs on the raja's part led to inquiries by the British resident at Mysore, and a British force marched into Coorg in 1834. On April 11 the raja was deposed by Colonel Fraser, the political agent with the force, and on May 7 the state was annexed to the East India Company's territory.

The "Coorg rebellion" of 1837 was really a rising of the Gaudas, due to a grievance at having to pay taxes in money instead of in kind. A man named Virappa, who pretended to have escaped from the massacre of 1820, tried to take advantage of this to assert his claim to be raja, but the Coorgs remained loyal to the British and the attempt failed. In 1861, after the Mutiny, the loyalty of the Coorgs was rewarded by their being exempted from the Disarmament Act.

See Rev. G. Richter, *Castes and Tribes found in the Province of Coorg* (Bangalore, 1887); *Imperial Gazetteer of India* (Oxford, 1908) vol. xi. *s.v.* where, besides an admirable account of the country and its inhabitants, the history of Coorg is dealt with in some detail. *The Cambridge History of India,* ed. Prof. E. J. Rapson (1922); Vincent Smith, *Early History of India,* revised by S. M. Edwardes (1924).

COORNHERT, DIRCK VOLCKERTSZOON (1522–1590), Dutch politician and theologian, was born at Amsterdam. He settled in Haarlem, as engraver on copper, and produced works which retain high values. He published Dutch translations from Cicero, Seneca and Boethius. He was appointed secretary to the city (1562) and secretary to the burgomasters (1564). Throwing himself into the struggle with Spanish rule, he drew up the manifesto of William of Orange (1566). Imprisoned at The Hague (1568), he escaped to Cleves, where he maintained himself by his art. Recalled in 1572, he was secretary of State for a short time; his aversion to warfare led him back to Cleves, where William continued to employ his services and his pen. He stood for toleration and against capital punishment for heretics. He had no party views; the Heidelberg catechism, authoritative in Holland, he criticized. The great Arminius, employed to refute him, was won over by his arguments. He died at Gouda on Oct. 29, 1590. His Dutch version of the New Testament, following the Latin of Erasmus, was never completed. His works, in prose and verse, were published in 1630, 3 vols.

See F. D. J. Moorrees, *Dirck Volckertszoon Coornhert* (1887); N. Delvenne, *Biog. des Pays-Bas* (1829); A. J. van der Aa, *Biog. Woordenboek der Nederlanden* (1855).

COOT, a bird of the genus *Fulica,* belonging to the family *Rallidae* or rails. The European coot (*Fulica atra*) breeds abundantly in many of the larger inland waters of the northern parts of the Old World, in winter resorting to river mouths or shallow bays of the sea. Hunted in winter, at other times it is comparatively unmolested. The nest is a large mass of flags, reeds or sedge, among rushes in the water or on the margin, and frequently contains as many as ten eggs. The young are beautiful little creatures, clothed in jet-black down, with heads of a bright orange-scarlet, varied with purplish-blue. This brilliant colouring is soon lost, and they assume the sooty-black plumage which is worn for the rest of their lives; a characteristic of the adult is a bare white patch or callosity on the forehead. The coot is about 18 in. in length, and sometimes more than 2 lb. in weight. Though its wings appear to be short and it seems to rise with difficulty from the water, it is capable of long-sustained and rapid flight. It swims buoyantly, and dives with ease. When wounded it is said to clutch the weeds at the bottom. It is not often found on dry land. The feet of the coot are remarkable, the toes being fringed by a lobed membrane, to facilitate swimming and walking over the ooze.

The coot is found throughout the palaearctic region and in most other parts of the world is represented by nearly allied species, having almost the same habits. An African species (*F. cristata*) is distinguished by two red knobs on its forehead. The Australian and North American species (*F. australis* and *F. americana*) closely resemble the English bird; in South America half a dozen species are found, one (*F. gigantea*) being of considerable size. The remains of a large extinct species (*F. newtoni*) were discovered in Mauritius.

COOTE, SIR EYRE (1726–1783), British soldier, the son of a clergyman, was born near Limerick, and entered the 27th regiment. He saw active service in the Jacobite rising of 1745, and some years later obtained a captaincy in the 39th regiment, which was the first British regiment sent to India. In 1756 a part of the regiment, then quartered at Madras, was sent forward to join Clive in his operations against Calcutta, and Coote was soon given the local rank of major. After the battle of Plassy he led a detachment in pursuit of the French for 400m. under extraordinary difficulties. His conduct won him the rank of lieutenant-colonel and the command of the 84th regiment, newly-raised for Indian service. In Oct. 1759 Coote's regiment arrived to take part in the decisive struggle between French and English in the Carnatic; in 1760 he led them in the decisive victory of Wandiwash (Jan. 22). Coote loyally supported Monson in the siege and capture of Pondicherry, and soon afterwards (1761) was given the command of the East India Company's forces in Bengal. In 1762 he returned to England, receiving from the Company rewards for his great services. In 1771 he was made a K.B. In 1779 he returned to India as lieutenant-general commanding in chief. Following generally the policy of Warren Hastings, he nevertheless refused to take sides in the quarrels of the council, and made a firm stand in all matters affecting the forces. Hyder Ali's progress in southern India called him again into the field, but his difficulties were very great and it was not until June 1, 1781, that the crushing and decisive defeat of Porto Novo struck the first heavy blow at Hyder's schemes. The battle was won under most unfavourable conditions against odds of five to one, and is justly ranked as one of the greatest feats of the British in India. It was followed up by another hard-fought battle at Pollilur and by the rout of the Mysore troops at Sholingarh a month later. His last service was the arduous campaign of 1782. Sir Eyre Coote died at Madras on April 28, 1783.

COPAIBA or **COPAIVA,** an oleo-resin—sometimes termed a balsam—obtained from the trunk of the *Copaifera langsdorfii* (family Leguminosae) and from other species of *Copaifera* in the West Indies and Amazon valley. It is a viscous transparent liquid, occasionally fluorescent and light yellow to pale golden in colour. The odour is aromatic and characteristic, the taste acrid and bitter. It is insoluble in water, but soluble in absolute alcohol, ether and oils.

COPAL, a hard lustrous resin, varying in hue from an almost colourless transparent mass to a bright yellowish-brown, having a conchoidal fracture, and, when dissolved in alcohol, spirit of turpentine, or other suitable menstruum, forming a valuable varnish. Copal is obtained from a variety of sources; the term is vaguely used for resins which, though similar in physical properties, differ in their constitution, and are altogether distinct as to their source. In Brazil and other South American countries, copal is obtained from *Hymenaea courbaril,* and other species, while the dammar resins and the piney varnish of India are occasionally spoken of as copal. By far the most important from a commercial point of view is the Zanzibar or East African copal, yielded by *Trachylobium verrucosum.* The resin is found in two distinct conditions: (1) raw or recent ("jackass" copal); and (2) ripe or true copal. The raw copal obtained direct from the trees, or found at their roots or near the surface of the ground, does not enter into European commerce. It is sent to India and China, where it is manufactured into a coarse varnish. The true or fossil copal is found embedded in the earth over a wide belt of the mainland coast of Zanzibar, on tracts where not a single tree is now visible. It is not found at a greater depth than 4ft., and occurs in pieces varying from the size of small pebbles up to masses of several ounces in weight, and occasionally lumps weighing 4 or 5lb. have been obtained. Kauri copal is found in New Zealand, which exports large quantities. It is derived from the Kauri pine (*Agathis australis*), and like the East African copal is found in the earth often far from living trees of this pine.

COPALITE or **COPALINE,** also termed "fossil resin" and "Highgate resin," a naturally occurring organic substance found as irregular pieces of pale-yellow colour in the London clay at Highgate hill. It has a resinous aromatic odour when freshly broken, volatilizes at a moderate temperature, and burns readily with a yellow, smoky flame, leaving scarcely any ash.

COPAL VARNISH: *see* VARNISH.

COPÁN, a ruined city of Honduras, located near the Guatemalan border and on the Copán river, a tributary of the Motagua. The ancient city, buried under vegetation and alluvial deposits, is cut through by the river, so that the banks give a vertical section of centuries of life and building under the ancient Maya Indians. The ruins are named after a nearby modern town; this was captured by the Spaniards in 1530.

COPARCENARY, in law, the descent of lands of inheritance from an ancestor to two or more persons possessing an equal title to them. It arose either by common law, as where an ancestor died intestate, leaving two or more females as his co-heiresses, who then took as coparceners or parceners; or, by particular custom, as in the case of gavelkind lands, which descend to all males in equal degrees, or in default of males, to all the daughters equally. All such special forms of descent were abolished by the Law of Property Act 1922 and the Administration of Estates Act 1925.

The term "coparcenary" is not in use in the United States, joint heirship being considered as *tenancy in common.*

CO-PARTNERSHIP, a term used (often with the prefix "Labour" or "Industrial" added) to denote (1) the ideal that workers should enjoy full participation in the profits and administration of industry, and (2) a specialized type of business organization (more or less embodying this ideal) introduced into the fabric of the existing economic order.

As an ideal it has a history as old as that of the co-operative movement (*see* CO-OPERATION), and like the latter it drew its inspiration in the second quarter of the 19th century from a refusal to recognise that the divorce between productive labour and the ownership and control of capital was either just or inevitable. During the period of the Chartist movement, John Stuart Mill was not alone among economists in setting great store by co-partnership as a solvent of industrial discontent, and even as late as 1862 one finds him predicting that "the relationship of masters and workpeople will be gradually superseded by partnership in one of two forms: in some cases association of the labourers with the capitalist, in others, and perhaps finally in all, association of labourers among themselves."

Already in the 'forties efforts to achieve co-partnership in the forms to which Mill refers had met with wide support. The first form was held in view by the advocates of the limited partnership, legalisation of which would, it was hoped, put capital, protected by limited liability, at the disposal of the capital-less worker. The second form found expression in the starting of numerous societies for co-operative production. In neither of these directions can it be said that the course of economic development since 1850 has confirmed the accuracy of Mill's prediction. The introduction (1855–62) of the registered limited liability company swamped the more modest proposal for the limited partnership. And though the reorganization of industry and trade on joint-stock lines has steadily developed (quite overshadowing even the ordinary partnership) that event has not *in itself* contributed much to bring about co-partnership between capital and labour. Only in one respect, and that indirectly, have the British

Companies Acts favoured employee membership of companies. As the result of legislation, 1907–13, the restriction of the membership of private companies to 50 has been waived in the case of employee or ex-employee shareholders.

Nor again were the high hopes placed by Robert Owen (*q.v.*), and later by the Christian Socialists, in the "self-governing workshop" form of co-partnership destined to be realised. The English co-operative movement, while always ready to encourage employee-membership, has won its main victories on the side of consumers' control rather than of producers' or of workers' control. The Scottish co-operative movement, however, has had notable success in giving the employee as such a joint share in control with the ordinary consumer-member.

Closely connected though it was in the 'eighties with the co-operative movement and drawing part of its inspiration from the ideals of the Christian Socialists (*see* CHRISTIAN SOCIALISM), the organised movement has tended, especially in the present century, to develop on lines of its own and to put forward on behalf of labour claims more moderate than those advocated, for example, by the Guild Socialists (*see* GUILD SOCIALISM). These claims as formulated by the Industrial Co-partnership Association (the present title of the propagandist body founded in 1884) are that all workers "shall share to some extent in the profits, capital, and control of the business in which they are employed." By share in profits is meant an arrangement whereby as a matter of fixed rules the worker is entitled to receive, in addition to the standard wages of the trade, some share in the final profit (if any) of the business. By share in capital is meant the accumulation by the worker of his share of profit, or part thereof, in the capital of the business. Share in control is to be acquired in one or both of two ways:

(a) by acquiring share capital, and thus gaining the ordinary rights and responsibilities of a shareholder.

(b) by the formation of a co-partnership committee of workers having a voice in the internal management.

It is obvious that even these fairly precise definitions leave considerable latitude in the planning of individual schemes, while the extent to which the ideal of co-partnership is in any case realizable depends not only on the amount of the share (in net profits, capital and control) to which the employees of an undertaking are to become entitled but also on the *kind* of share contemplated under each head.

Workers and Profit-Sharing.—On account of this element of uncertainty the annual statistics of the Ministry of Labour on "Profit-sharing and Labour Co-partnership" do not furnish a complete guide either to the success which co-partnership has already won or to the rôle which it is likely to play in the future. The latest official figures show that at the end of 1926 there were in Great Britain 280 schemes (the survivors of 554 launched during the past 50 years), one-half dating after the World War. These schemes were operated by 274 firms, employing 400,000 people of whom approximately one-half were eligible to participate in the benefits conferred. But at least 50% of these existing schemes contemplate nothing more than a distribution of part of the net profits in cash (*see* PROFIT-SHARING). On the other hand, the official figures are far from being comprehensive—(1) as regards capital ownership by employees, (2) as regards schemes which provide for their participation in internal management. Under the former head the Committee on Industry and Trade had to record (in 1926) that "no information is available as to the extent to which employees own capital at the present time in the undertakings by which they are employed." But there is little doubt that the amount (*e.g.,* in certain sections of the cotton industry) must be large. Under the latter head must be reckoned the extensive movement (stimulated by the Whitley Report) in favour of setting up joint works councils representing the management and the workpeople employed in a particular establishment. In some industries provision for joint consultation has been organised nationally as well as locally, and a tendency is observable—*e.g.,* among railway companies—to use the machinery for administrative purposes. Whitleyism, though it does not approach co-partnership from the profit-sharing angle, has yet contributed much towards the rationalisation of industry on co-partnership lines by insisting that collective bargaining is not the only matter in which joint consultation between employer and employee is desirable.

Apart from these two developments there is little doubt that profit-sharing has up to the present been the basis of most of the experiments in co-partnership in Great Britain. Three types may be distinguished: (1) that in which either a specified proportion of the net profits or a bonus rising or falling with the rate of dividend is divisible among the employees; (2) that in which the bonus or part of it must be left with the firm either on deposit or in the form of special "co-partnership shares" to earn interest varying with the rate of dividend; (3) that in which the profit is given indirectly through the offer of share or stock purchase facilities not available to the outside public or to non-employee shareholders. These facilities may take the form of opportunity to purchase by small instalments (a full dividend being payable before the last instalment is due), opportunity to buy shares below the current price offered, or a right to receive an extra bonus on dividend. In any case the arrangement does not, like the second type, involve the creation of a special, new class of share.

Practical British Schemes.—This third type of scheme comes nearest to satisfying the three conditions laid down by the I.C.A. It is, however, a type better suited for adoption by the large public company than by the small concern whose shares do not command a ready market. In the gas industry, where in combination with direct profit-sharing it has stood the test of years, 44 English gas companies (60% of the total number) have adopted with slight variations the scheme originally launched by the South Metropolitan Gas Company in 1889. This scheme, under which the employees have, since 1894, been given the opportunity of investing in the company's ordinary stock and, since 1896, of appointing their own directors to the board, was made statutory in 1920 on the basis of a division of profits (after payment of standard dividends) among consumers, shareholders, and employees in the proportions of three-fourths, one-eighth, and one-eighth respectively.

Although the economic conditions in the gas industry (standardized product, local monopoly, statutory limitation of dividend) are no doubt favourable to co-partnership, the fact remains that in Great Britain, as in America, employee stock or share ownership has received recently marked encouragement by some of the larger British companies, more often than not in connection with schemes to give employees security of tenure and a direct voice in the control of the conditions under which they work. Viewed as an integral part of these larger administrative changes the co-partnership scheme of Imperial Chemical Industries Ltd., one of the largest British combines with a pay-roll of over 40,000, is of special interest. Under this scheme facilities are given to all employees to purchase ordinary shares in the company at 2s. 6d. below the mean market price, while employees earning less than £200 p.a. are entitled to a bonus of one free share for every four shares purchased. It is also provided that the payment of all instalments outstanding on his shares are cancelled by the death of the employee-holder. The objection often urged against a scheme of this type, that it is unwise to encourage people of small means to invest their savings in the industry in which they are employed, can hardly be sustained in regard to a company controlling the production of necessaries under conditions of virtual monopoly.

Another interesting variety of scheme (which avoids this particular objection without entailing the issue of shares carrying restricted rights of ownership) is that of the Brush Electrical Engineering Company Ltd. Under this scheme the employees collectively are entitled to take their share of the surplus profits either in cash or in shares in the company.

Of schemes in general it may be said that wherever the employers or directors show (as in the case of the two schemes just mentioned) a sincere desire to adopt co-partnership in a form and for objects which are acceptable to organized labour outside as well as inside their particular businesses the prospects of successful working will be fair. Much, too, depends upon the possibility (of which there are many signs) that the traditionally lukewarm attitude of Labour towards co-partnership may change to one of acceptance when it is realized that co-partnership (in the broad sense of the term) is an essential ingredient in the scientific rationalisation of industry.

Movement outside Great Britain.—In the United States, as a recent investigation by Princeton university shows, the "acquisition by employees of stock in the companies they work for has reached the proportions of a comprehensive movement." Though there is no doubt that this movement, fostered by instalment-purchase arrangements, has stimulated a similar development in other countries it is difficult to say whether co-partnership is likely to result from it as a permanent factor in the organization of American industries. It must be borne in mind that a large and increasing proportion of stock issued by American corporations is of the non-voting variety, that economic conditions have in themselves for many years past been favourable to investors, and that the investment capacity of the average American employee has been considerably greater than the employee in any other part of the world. He has had both the capacity and the opportunity to invest. Even then, of the total stock, the amount held by employee-investors is only something like 2 per cent.

In New Zealand an act known as the Companies Empowering act was passed in 1924 which enables any company registered under the general company laws to issue labour shares to its employees, these shares to be of no-par value and not to form part of the share capital. Voting rights, however, as well as rights to a share in the profits are to attach to these "shares" according to the regulations made by the company.

In France a somewhat similar arrangement was authorized by an act in 1917 for Sociétés Anonymes that choose to adopt it. Under this act, however, the "labour shares" (actions de travail) become the collective property of the employees organized in a "Société commerciale co-operative de main d'oeuvre" with voting powers at the company's meetings. (*See* PROFIT-SHARING.)

COPE, EDWARD MEREDITH (1818–1873), English classical scholar, was born in Birmingham on July 28 1818, and died on Aug. 5 1873. He was a sound scholar, with perhaps a tendency to over-minuteness. He was the author of *An Introduction to Aristotle's Rhetoric* (1867), a standard work; *The Rhetoric of Aristotle,* with a commentary, revised and edited by J. E. Sandys (1877); translations of Plato's *Gorgias* (2nd ed., 1884) and *Phaedo* (revised by H. Jackson, 1875).

The chief authority for the facts of Cope's life is the memoir prefixed to vol. i. of his edition of *The Rhetoric of Aristotle.*

COPE [Med. Lat. *cappa*], a liturgical vestment of the Western Church. The word "cope," now confined to this sense, was in its origin identical with "cape" and "cap," and was used until comparatively modern times also for an outdoor cloak, whether worn by clergy or laity. This, indeed, was its original meaning, the *cappa* having been an outer garment common to men and women whether clerical or lay. The word *pluviale* (rain-cloak), which the cope bears in the Roman Catholic Church, is exactly parallel so far as change of meaning is concerned. In both words the etymology reveals the origin of the vestment, which is but a glorified survival of a garment worn by all and sundry in ordinary life. When spread out the cope forms an almost complete semicircle. Along the straight edge there is usually a broad band, and at the neck is attached the "hood" (in Latin, the *clypeus* or shield); *i.e.,* a shield-shaped piece of stuff which hangs down over the back. The vestment is secured in front by a broad tab sewn on to one side and fastening to the other with hooks, sometimes also by a brooch (called the morse, Lat. *morsus*).

The cope thus preserves the essential shape of its secular original, and even the hood, though now a mere ornamental appendage, is a survival of an actual hood. The evolution of this latter into its present form was gradual; first the hood became too small for use, then it was transformed into a small triangular piece of stuff (13th century), which in its turn grew (14th and 15th centuries) into the shape of a shield, and this again, losing its pointed tip in the 17th century, expanded in the 18th into a flap which was sometimes enlarged so as to cover the whole back down to the waist. In its general effect, however, a cope no longer suggests a "waterproof." It is sometimes elaborately embroidered all over; more usually it is of some rich material, with the borders in front and the hood embroidered, while the morse has given occasion for some of the most beautiful examples of the goldsmith's and jeweller's craft.

The use of the cope as a liturgical vestment can be traced to the end of the 8th century. Before this the so-called *cappa choralis,* a black, bell-shaped, hooded vestment with no liturgical significance, had been worn by the secular and regular clergy at choir services, processions, etc. This was in its origin identical with the chasuble, and if, as Father Braun seems to prove, the cope developed out of this, cope and chasuble have a common source. In the 10th century, partly under the influence of the splendour-loving community of Cluny, the use of the cope became widespread; in the 11th century it was universally worn, though the rules for its ritual use had not yet been fixed. It was at this time, however, *par excellence* the vestment proper to the cantors, choirmaster, and singers.

By the beginning of the 13th century the liturgical use of the cope had become finally fixed. The substitution of the cope for the chasuble in many of the functions for which the latter had been formerly used was primarily due to the comparative convenience of a vestment opened at the front, and so leaving the arms free. A natural conservatism preserved the chasuble (q.v.) as the vestment proper to the celebration of Mass; but the cope took its place in lesser functions; *i.e.,* the censing of the altar during the Magnificat and at matins (whence the German name *Rauchmantel,* smoke-mantel), processions, solemn consecrations, and as the dress of bishops attending synods. It is clear from this that the cope, though a liturgical, was never a sacerdotal vestment. If it was worn by priests, it could also be worn by laymen, and it was never worn by priests in their sacerdotal, *i.e.,* their sacrificial, capacity. For this reason it was not rejected with the "Mass vestments" by the English Church at the Reformation, in spite of the fact that it was in no ecclesiastical sense "primitive." A cope was worn by the prelate who consecrated Archbishop Parker, and by the "gentlemen" as well as the priests of Queen Elizabeth's chapel; and, finally, by the 24th canon (of 1603) a "decent cope" was prescribed for the "principal minister" at the celebration of Holy Communion in cathedral churches as well as for the "gospeller and epistler." Except at royal coronations, however, the use of the cope, even in cathedrals, had practically ceased in England before the ritual revival of the 19th century restored its popularity.

It will be convenient here to note other vestments that have developed out of the *cappa.* The *cappa choralis* has already been mentioned; it survived as a choir vestment that in winter took the place of the surplice, rochet (q.v.) or almuce (q.v.).

The Cappa Magna.—From the hood of the *cappa* was developed the almuce. At what date the *cappa choralis* developed into the *cappa magna,* a non-liturgical vestment peculiar to the pope, cardinals, bishops, and certain privileged prelates, is not known; but mention of it is found as early as the 15th century. This vestment is a loose robe, with a large hood (lined with fur in winter and red silk in summer) and a long train, which is carried by a cleric called the *caudatarius.* Its colour varies with the hierarchical rank of the wearer.

The Mozzetta.—Lastly, from the *cappa* is probably derived the *mozzetta,* a short cape with a miniature hood, fastened down the front with buttons. The name is derived from the Italian *mozzare,* to cut off, and points to its being an abbreviated *cappa,* as the episcopal "apron" is a shortened cassock. By the pope, cardinals, bishops, and prelates, it is worn over the rochet, the colours varying as in the case of the *cappa magna.*

See J. Braun, S.J., *Die liturgische Gewandung* (1907); also the bibliography to the article VESTMENTS.

COPELAND, HENRY, an 18th century English cabinet-maker and furniture designer. The dates of his birth and death are unknown but he was still living in 1768. He appears to have been the first manufacturing cabinet-maker who published designs for furniture. *A New Book of Ornaments* appeared in 1746, but a few of the plates are all that are known to exist. Between 1752 and 1769 several collections of designs were produced by Copeland in conjunction with Matthias Lock; in one of them Copeland is described as of Cheapside. Some of the original drawings are in the library at the Victoria and Albert Museum, London. Copeland was probably the originator of a peculiar type of chair-back, popular for a few years in the middle of the 18th century, consisting of a series of interlaced circles.

COPENHAGEN, the capital of Denmark (Danish *Kjøbenhavn*), on the east coast of the island of Zealand (*Sjaelland*) at the southern end of the Sound, in 55° 41′ N., 12° 35′ E. Pop. (1940) 890,130, including Frederiksberg (113,208) and Gentofte (76,457). The nucleus of the city is on low-lying ground between the sea and a series of small freshwater lakes, known as St. Jørgens Sø, Peblings Sø and Sortedams Sø, a southern portion occupying the northern part of the island of Amager. An excellent harbour is furnished by the natural channel between the two islands; and communication from one division to the other is afforded by two bridges—the Langebro and the Knippelsbro, which replaced the wooden drawbridge built by Christian IV. in 1620. The fertile island of Amager produces vegetables for the capital; it was peopled by a Dutch colony planted in 1516, and many peculiarities of dress and language are retained. The older city, including both the Zealand and Amager portions, was formerly surrounded by ramparts and moats; but boulevards and gardens now occupy the landward site of fortifications. Outside the lines of the original city (about 5 mi. in circuit), there are extensive suburbs, especially on the Zealand side (Østerbro, Nørrebro and Vesterbro or Østersøgade, etc.) and Frederiksberg and Amagerbro to the south of Christianshavn.

Copenhagen (*i.e.,* Merchant's Harbour, originally simply Havn, Latinized as *Hafnia*), first mentioned in 1043, remained a mere fishing village until the 12th century, when Valdemar I. presented that part of the island to Axel Hvide, renowned in Danish history as Absalon (*q.v.*) bishop of Roskilde, and afterwards archbishop of Lund. In 1167 he erected a castle on the spot where the Christiansborg palace now stands, and the building was called after him Axel-huus. The settlement gradually became a great resort for merchants, and thus acquired the name of Kaupmannahöfn or Kjøbmannshavn, corrupted to Kjøbenhavn. In 1186, Bishop Absalon bestowed the castle and village, with the lands of Amager, on the see of Roskilde; but the Danish kings became anxious to regain it, and in 1245 King Eric IV. drove out Bishop Niels Stigson. On the king's death (1250), however, Bishop Jacob Erlandsen obtained the town, and, in 1254, gave to the burghers their first municipal privileges, confirmed by Pope Urban III. in 1286. Trade or craft gilds were expressly prohibited in the later charter of Bishop Johann Kvag (1294); and the distinctive character of the constitution of mediaeval Copenhagen consisted in the absence of the free gild system, and the right of any burgher to pursue a craft under licence from the *Vogt* (*advocatus*) of the overlord. Later on, though gilds were established they were strictly subordinate to the town authorities. Copenhagen was attacked by Lübeck in 1248, and by Prince Jaromir of Rügen in 1259. In 1306 it repelled the Norwegians, but in 1362, and again in 1368, it was captured by the opponents of Valdemar Atterdag. In the following century a new enemy appeared in the Hanseatic league, which was jealous of its rivalry, but their invasion was frustrated by Queen Philippa. Various attempts were made to obtain the town from the see of Roskilde, as the most suitable for the royal residence; but it was not till 1443 that Copenhagen became the capital of the kingdom. From 1523 to 1524 it held out for Christian II. against Frederick I., who captured it at length and strengthened its defensive works; and it was only after a year's siege that it yielded in 1536 to Christian III. From 1658 to 1660 it resisted Charles Gustavus of Sweden, and was rewarded by various privileges for its defence. In 1660 it gave its name to the treaty which concluded the Swedish war of Frederick III. In 1700 it was bombarded by the united fleets of England, Holland and Sweden. In 1801 the Danish fleet was destroyed in the roadstead by the English and in 1807 the city was bombarded by the British when the university buildings and its principal church were destroyed.

The area occupied by the inner city is known as Gammelsholm (old island). The main artery is the Gothersgade, running from Kongens Nytorv to the western boulevards, and separating a district of rectangular blocks to the north from one of irregular, narrow streets to the south. The Kongens Nytorv, the focus of the life of the city and the centre of road communications, is an irregular open space at the head of a narrow arm of the harbour (Nyhavn). The Palace of Charlottenborg (1672) on the east side, takes its name from Charlotte, the wife of Christian V., and was granted by Frederick V. to the Academy of Arts, which holds its annual exhibition of paintings and sculpture in the adjacent *Kunstudstilling* (1883). On the south is the Royal theatre. Other buildings in Kongens Nytorv are the Foreign Office, several great commercial houses, the commercial bank and the Thotts Palais of *c.* 1685. The quays of the Nyhavn are lined with old gabled houses.

From the south end of Kongens Nytorv, a street called Holmens Kanal winds past the National Bank to the Holmens Kirke, or church for the royal navy, originally erected as an anchor-smithy by Frederick II., but consecrated by Christian IV., with a chapel containing the tombs of the great admirals Niels Juel and Peder Tordenskjold, the wood-carving of the 17th century. The street then crosses a bridge on to the Slottsholm, an island divided from the mainland by a narrow arm of the harbour, occupied mainly by the Christiansborg, originally built (1731–1745) by Christian VI. Twice destroyed by fire, in 1794 and 1884, the royal palace was rebuilt after 1903 for use on occasions of state. After 1918 it was occupied by parliament, the supreme court and the foreign office. The Thorvaldsen bronze statues which stood over the portal of the palace before the fire, and the palace chapel, adorned with works by Thorvaldsen and Bissen, were saved from the fire.

The exchange (Børsen), on the quay to the east, is an ornate gabled building erected in 1619–1640, surmounted by a remarkable spire. To the south is the arsenal (Tøjhus) with a collection of ancient armour. The Thorvaldsen museum (1839–1848) has an open court, containing the artist's tomb. Most of the original works of the famous sculptor are housed here.

On the mainland, immediately west of the Slottsholm, is the Prinsens Palais, once the residence of Christian V. and Frederick VI. when crown princes, containing the national museum. This consists of six sections, the prehistoric collections, the Danish historical and Folk museums, the ethnographical and the numismatic collections and the collection of classical antiquities. It was founded in 1807 by Professor Nyerup, and extended between 1815 and 1885 by C. J. Thomsen and J. J. A. Worsaae. The prehistoric Danish finds, in particular those of the Bronze Age, constitute one of the most remarkable collections in existence. From this point the Raadhusgade leads north-west to the combined Nytorv-og-Gammeltorv, where is the old town hall (*Raadhus,* 1815), and continues as the Nørregade, to the Vor Frue Kirke (Church of Our Lady), the cathedral church of Copenhagen. This church, on a 12th century site, was almost completely rebuilt after the bombardment of 1807. The façade is surmounted by a group of 16 figures, one of Thorvaldsen's masterpieces, representing John the Baptist preaching.

Just north of Vor Frue Kirke is the university, until 1933 the only one in Denmark, founded by Christian I. in 1479, though its constitution dates from 1788. The building dates from 1836. There were some 5,000 students in 1940. In connection with the university are the observatory, the surgical academy in Bredgade, founded in 1786, and the botanic garden. The university library, incorporated in 1867 with the Classen library, collected by the famous merchants of that name, contains about 430,000 volumes, besides some 180,000 theses. Rask's famous Persian manuscripts and the Arnamagnaean collection of old Norse-Icelandic documents are housed here. It shares with the royal library the right of receiving a copy of every book published in Denmark. Adjacent is St. Peter's church, built in a quasi-Gothic style, with a spire 256 ft. high, and appropriated since 1585 as a parish church for the German residents in the city. A short distance along the Krystalgade is Trinity church. Its round tower (111 ft.), considered to be unique in Europe, was formerly used as an observatory. It is ascended by a broad inclined spiral way, up which Peter the Great is said to have driven in a carriage and four. The Høibro-plads has an equestrian statue of Bishop Absalon. The quarter north-east of Kongens Nytorv and Gothersgaden extending to the strong moated citadel (1662–63) which guards the harbour on the north-east, includes the palaces of Amalienborg, the castle and gardens of Rosenborg, etc. The Frederikskirke or Marble church was begun in the reign of Frederick V. (1749), but was left unfinished, until 1874, when it was purchased by a wealthy banker, M. Tietgen, who added the conspicuous dome. The four palaces, of uniform design, encircling the neighbouring Amalienborg-plads, became, on the destruction of Christiansborg in 1794, the residence of the king and court till 1848. One of the four is inhabited by the king, the second and third by the crown prince and other members of the royal family, while the fourth is occupied by the coronation and state rooms.

South-west from the citadel extends a line of gardens on the site of former landward fortifications, skirted on the inner side by three wide boulevards, Østervold, Nørrevold and Vestervold Gade. The botanical gardens (1874) contain an observatory with a statue of Tycho Brahe. On the inner side of Østervold Gade is Rosenborg Park, with the palace of Rosenborg (1608–1617), an irregular building in Gothic style, with a high pointed roof, flanked by four unequal towers. It contains a museum, including fine collections of Venetian glass and oriental tapestry, the famous silver drinking-horn of Oldenburg (1474) and the crown jewels. Noteworthy among modern buildings is the Renaissance town hall (1901) with a tower at the eastern angle. Here is also the museum of industrial art, and the Ny-Carlsberg Glyptotek, with its collection of sculpture, is on this boulevard, which skirts the Tivoli pleasure garden.

The western (residential) quarter contains the park of Frederiksborg, with its palace erected under Frederick IV. (d. 1730) used as a military school. The park contains a zoological garden and is continued south in the Søndermarken. The quarter of Christianshavn skirts the harbour to the south, and lies within the fortifications. It contains the Vor Frelsers Kirke (Church of Our Saviour) dedicated in 1696, with a curious steeple 282 ft. high.

The railway along the coast northward passes the seaside resorts of Klampenborg (6 mi.) and Skodsborg (10 mi.). Near Klampenborg is the Dyrehave (Deer park) or Skoven (the forest), a beautiful forest of beeches. The Zealand Northern railway passes Lyngby, on the lake of the same name, and Hillerød (21 mi.), a considerable town close to the palace of Frederiksborg, erected in 1602–1620 by Christian IV., embodying two towers of an earlier building, and partly occupying islands in a small lake. It was restored as a national historical museum after a fire in 1859. The palace church is an interesting medley of Gothic and Renaissance detail.

The city is the centre of several important learned societies including the Royal Danish Academy of Sciences and Letters, founded in 1742, for the advancement of mathematics, astronomy, natural philosophy, etc., by the publication of scientific works, and by the endowment of research; and the Royal Antiquarian Society (1825) for diffusing a knowledge of Northern and Icelandic archaeology. The Academy of Arts was founded by Frederick V. in 1754. The Carlsberg foundation, established in 1876 by Captain J. C. Jacobsen, promotes research and publication and supports the Frederiksborg museum. Among educational institutions, other than the university, may be mentioned the veterinary and agricultural college, established in 1773 and adopted by the state in 1776. Technical instruction is provided by the technological institute (1908). A high school of commerce was founded in Copenhagen in 1924. Churches other than Lutheran include the Reformed church, founded in 1688, and rebuilt in 1731, the Catholic church of St. Ansgarius, consecrated in 1842, and the Jewish synagogue in Krystalgade, which dates from 1853. Of the monastic buildings of mediaeval Copenhagen traces are preserved in the present nomenclature of the streets. The Franciscan establishment gives its name to the Graabrødretorv or Grey Friars' market; and St. Clara's Monastery, the largest of all, which was founded by Queen Christina, is still commemorated by the Klareboder or Clara buildings, near the present postoffice. The Duebrodre Kloster occupied the site of the hospital of the Holy Ghost.

Copenhagen is by far the most important commercial town in Denmark. Most of the foreign trade passes through the capital, while its transit trade is considerable. It is further the headquarters of nearly all the steamship and motorship owners of Denmark. The harbour is mainly comprised in the narrow strait between the outer Sound and its inlet the Kalvebod or Kallebo Strand. The trading capabilities were aided by the construction in 1894 of the Frihavn (free port) at the northern extremity of the town, well supplied with warehouses. The area of the free port is ·14 sq.mi.; of the customs port, 1·4 sq.mi. Within the limits of the piers the harbour has a total water area of 6·8 sq.mi. The free port has contributed largely towards the position of Denmark as an emporium of Baltic trade. In 1937 ships arriving at Copenhagen numbered 20,051, with 7,121,000 net register tonnage. Danish neutrality in World War I brought a great increase of trade and general prosperity. After 1917, however, unemployment became serious. Copenhagen is not essentially a manufacturing town, though mention must be made of the Royal Copenhagen porcelain manufactory, employing about 1,000 hands, and celebrated for its models of Thorvaldsen's works in biscuit china. Hand-wrought silver, especially that of Georg Jensen, is internationally famous. Here also are great shipbuilding yards, such as that of Burmeister and Wain. Diesel engines are manufactured on a large scale. Mostly the manufacturing is for domestic consumption: chocolate, tobacco, leather goods, distilleries and breweries, etc. The machine shops became targets for British bombing in World War II, after the German occupation.

See O. Nielsen, *Københavns Historie og Beskrivelse* (Copenhagen, 1877–1892); C. Bruun and P. Munch, *København, Skrildring of dets Historie*, etc. (*ibid.* 1887–1901); Bering-Lüsberg, *København i gamle Dage* (*ibid.* 1898, *seq.*). (X.)

The Battle of Copenhagen.—The sending of a British Fleet to the Baltic Sea in 1801 was the outcome of the formation of an Armed Neutrality, consisting of Russia, Prussia, Denmark and Sweden, backed by France, to resist the British claim to right of search. The fleet included eighteen ships of the line, and was commanded by Sir Hyde Parker who was fortunate enough to have Nelson as his Second-in-Command. The naval forces at the disposal of the Neutrality Powers were, on paper, considerable, but they were scattered in various ports, and no apparent effort was made to concentrate them. Indeed, many of the Russian ships were frozen in at Reval.

The British force was at the entrance to the Sound on March 21st. Here they heard that Denmark refused to come to any agreement and was putting Copenhagen into a state of defence. Nelson was in favour of immediately tackling Russia, which he rightly regarded as leader of the Armed Neutrality, but Parker declined to do this until Copenhagen had been reduced; neither would he approach that city by way of the Great Belt which would have enabled them to attack it from the South and also have cut off Denmark from Russian help. After long delay the fleet entered the Sound where they were at once engaged by the guns of Kronborg Castle. The Danish shot, however, fell short and the Swedes made no effort to second their attempts. Thus the British passed through successfully and in the afternoon of March 30th brought up under the lee of Hven Island, whence they began reconnoitring the approaches to Copenhagen.

Copenhagen lies on the islands of Zealand and Amag; the channel between them forms the harbour which was protected by the guns of the citadel, of the Trekroner forts situated on islands at the harbour mouth, and by several large ships placed at the entrance. The remainder of the Danish ships, 18 in number and of various types, were anchored along the sea-front of Amag Island, in a line stretching south from the Trekroner forts. They were on the edge of the shoals in front of the island and thus their position could not be turned, and it appeared to the Danes that any enemy attacking from the north—the situation of the British fleet—must pass the Trekroner to reach the line of battle. Parker thought likewise, but Nelson's unerring eye had already discovered the weakness in the Danish position. East of Amag lies the island of Saltholm; between them are two navigable passages, bisected by a shoal—the Middle Ground. Along the westernmost edge of the western passage—the King's Deep—lay the Danish fleet. On the other side of the Middle Ground lay the other passage—the Outer Deep. Nelson saw that, could he find that passage, he would be able to round the Middle Ground and approach the Danish force from the south, unhampered by the Trekroner. He offered to make the attempt with half the fleet. Parker, accepting, gave him ten sail of the line, two fifties and all the smaller vessels.

Throughout the night of March 31st–April 1st soundings were taken, and in the morning of April 1st the whole fleet proceeded to the northern end of the Middle Ground and from there Nelson's squadron successfully navigated the Outer Deep. During the night the wind, to Nelson's delight, changed to south and in the morning the signal was made to weather the shoal into the King's Deep. Nelson had ordered that his leading ship should anchor opposite the fifth Danish vessel and that each successive ship, passing on the disengaged side of those already at grips, should take her place ahead. The leading Danish vessels he hoped to destroy by the continuous fire of the English as they passed in succession. The "Agamemnon" failed to weather the shoal, and the "Bellona" and "Russell" went ashore in the King's Deep. This seriously depleted Nelson's force and compelled him to engage the Trekroner with only the light craft. The remainder were soon engaged in a stubbornly-contested action. At one o'clock Parker signalled to Nelson to withdraw, but the latter, putting his telescope to his blind eye, declined to obey. Anyhow withdrawal by the way they had come was impossible and by the Trekroner risky. An hour later the Danish fire slackened and Nelson tried to take possession of such Danish vessels as had struck, but the Danes, contrary to the usage of war, fired upon him as he did so. They agreed, however, to an armistice. Nelson collected his prizes and withdrew. All but three of the Danish ships had been taken or sunk.

Denmark eventually agreed to abandon the neutrality for 14 weeks, but the death of the Czar before Nelson reached Russia, and a consequent change in Russian policy, brought about its complete collapse.

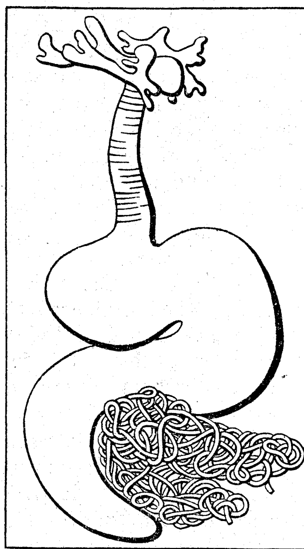
FROM SARS "CRUSTACEA OF NORWAY," BY PERMISSION OF THE BERGEN MUSEUM

FIG. 1.—CYCLOPS VULGARIS

Female, carrying a pair of egg masses

COPEPODA, one of the subclasses of the Crustacea (*q.v.*), the members of which, for the most part of microscopic size, are abundant in the sea and in fresh waters. They form one of the most important constituents of the plankton and it would be difficult to find a sample taken with the tow net in any part of the world which would not contain some representatives of the group. The bottom-living species, which have been less studied, are not so numerous as individuals but probably include more species than the pelagic forms. A ten-quart pail of wash water from the sand of Katama bay, Martha's Vineyard, yielded 800 sand-dwelling copepods distributed among 25 species, with one exception (Cyclopoida) all Harpacticoida. A large number of Copepoda are parasitic on other aquatic animals of all classes and these exhibit a wide range of modification in structure and life history. Copepods rank perhaps first as food for other animals, occurring in the sea in enormous numbers. Off Cape Cod, Mass., in 1916, between 2,000,000 and 3,000,000 (6 qt.) *Calanus* species, chiefly *C. finmarchicus,* were taken in a 15 minute tow of a fine-meshed net with an opening about a yard wide.

The typical free-swimming Copepoda have usually a somewhat pear-shaped body, divided into somites and narrowing behind to end in a "caudal fork." There is no distinct carapace, although one or two of the body somites are coalesced with the head. There are four or five pairs of two-branched, oarlike, swimming feet. The unbranched antennules are generally large and many-jointed, the antennae smaller, sometimes two-branched, and both are used in swimming. The mandibles are often of very primitive structure, the biramous palp retaining the form, and to some extent the function, of a two-branched swimming foot. The unpaired or "nauplius" eye is usually present but the paired eyes are not developed in the typical Copepoda. The eggs are usually carried by the female, cemented together into one or a pair of masses (ovisacs) attached to the genital openings. The young are hatched, as a rule, in the nauplius stage and attain the adult form by the successive addition of somites and appendages without any very sudden change. The antennules, antennae and mandibles may retain in the adult, more nearly than in any other Crustacea, the form they have in the nauplius stage.



BY COURTESY OF THE RAY SOCIETY FROM SCOTT "BRITISH PARASITIC COPEPODA"

FIG. 2.—LERNAEA BRANCHIALIS

One of the Lernaeopodoida, a parasite found on the gills of the cod and other fishes. Above are the branched rootlike processes of the head region, which are buried in the tissue of the host, and below the body proper are the two intertwined tubular egg masses.

The parasitic habit has been acquired in the evolution of many unrelated families of Copepoda and the modifications of structure and of life history to which it has led are correspondingly diversified. In some parasites the power of swimming has been retained and the general form does not differ greatly from that of free-living species, the mouth parts only becoming modified for sucking the juices of the host. In many other cases the male remains free-swimming and little modified while the adult female has a vermiform or distorted body and loses most of the appendages. In others again the minute and degenerate male is attached, like a secondary parasite, to the body of the much larger female. In all cases, probably, the earliest stages are free-swimming while the adults may be sedentary parasites. Some life histories are more complicated, as in the family Monstrillidae, in which only the later larval stages are endoparasitic, living in annelid worms, while the early larvae and the adults are free-swimming, the latter not feeding, neither mouth parts nor alimentary tract being developed; like the May flies, existing only for reproduction. In the Lernaeidae there are in the female two parasitic phases, passed on two different species of fishes, with a temporary free-swimming phase intervening. Some of the parasitic Copepoda are much larger than any of the free-living species. The largest are species of *Pennella* which are parasitic on whales, and sometimes exceed a foot in length.

A small group of Crustacea parasitic on fish, both fresh-water and marine, and heretofore known as the Branchiura or carp lice, have been renamed the Arguloida after the typical genus *Argulus* as the eighth order of the subclass by C. B. Wilson (1932) following the earlier suggestion of G. O. Sars. Some perhaps valid questions have been raised regarding their close affinity with the copepods because they have paired compound eyes which, however, are characteristic of many Crustacea though not possessed by other copepods; because there is no ovisac in the female and the eggs are deposited on some suitable surface (a few copepods shed their eggs directly into the water); and because the larvae, which after all much resemble a partly developed *Caligus,* are well developed when hatched. Generally speaking, their broad, flat, oval body is not unlike that of some other copepods. The segmentation of their body corresponds closely to that of the copepods; the appendages also are similar in number and grouping, but differ in having on some of the legs of some species an inward extension of the exopodite not found in the other Copepoda. On the under side of the head there is, in most of the species, a pair of suckers which are shown by their development to be modified maxillae. In front of the mouth in the genus *Argulus* is a sharp protrusible spine connected with a supposed poison gland. As the parasitic Copepoda do not constitute a single order and the details of the distribution of many of them among the free-living families have still to be worked out, the classification of the Copepoda is not yet settled. The system proposed by Wilson extending that of Sars recognizes eight orders:—the Calanoida, almost exclusively planktonic; the Harpacticoida, for the most part bottom-living; the Cyclopoida, both free-swimming and parasitic; and the Notodelphyoida, Monstrilloida, Caligoida, Lernaeopodoida and Arguloida, exclusively parasitic. (W. T. C.; W. L. St.)

COPERNICUS or **KOPPERNIGK, NICOLAUS** (1473–1543), Polish astronomer, was born Feb. 19, 1473, at Thorn in Prussian Poland, where his father, a native of Cracow, had settled as a wholesale trader. Nicolaus was virtually adopted by his uncle Lucas Watzelrode, later (1489) bishop of Ermeland. He studied mathematical science at the University of Cracow under Albert Brudzewski (1445–97), and incidentally acquired some skill in painting. At the age of 23 he repaired to Bologna, and there varied his studies of canon law by attending the astronomical lectures of Domenico Maria Novara (1454–1504). At Rome, in the Jubilee year 1500, he himself lectured with applause; but having been nominated in 1497 canon of the cathedral of Frauenburg, he recrossed the Alps in 1501 with the purpose of obtaining further leave of absence for the completion of his academic career. Late in 1501 he entered the medical school of Padua, where he remained until 1505, having taken a doctor's degree in canon law at Ferrara on May 31, 1503. After his return to Poland he resided at the episcopal palace of Heilsberg as his uncle's physician until the bishop's death on March 29, 1512. He then retired to Frauenburg, and attended to his capitular duties. He never took orders, but acted continually as the representative of the chapter under harassing conditions, administrative and political; he was besides commissary of the diocese of Ermeland; his medical skill, always at the service of the poor, was frequently in demand by the rich; and he laid a scheme for the reform of the currency before the Diet of Graudenz in 1522. Yet he found time to elaborate a new system of astronomy, by the adoption of which man's outlook on the universe was fundamentally changed.

The main lines of his great work were laid down at Heilsberg; at Frauenburg, from 1513, he sought, with scanty instrumental means, to test by observation the truth of the views it embodied (*see* ASTRONOMY: *History*). His dissatisfaction with Ptolemaic doctrines was of early date; and he returned from Italy, where so-called Pythagorean opinions were then freely discussed, in strong and irrevocable possession of the heliocentric theory. The treatise in which it was set forth, virtually finished in 1530, began to be known through the circulation in manuscript of a *Commentariolus,* or brief popular account of its purport, written by Copernicus in that year. Johann Albrecht Widmanstadt lectured upon it in Rome; Clement VII. approved, and Cardinal Schönberg transmitted to the author a formal demand for full publication. But his assent to this was only extracted from him in 1540 by the importunities of his friends, especially of his enthusiastic disciple George Joachim Rheticus (1514–76), who printed, in the *Narratio prima* (Danzig, 1540), a preliminary account of the Copernican theory, and simultaneously sent to the press at Nuremberg his master's complete exposition of it in the treatise entitled *De revolutionibus orbium coelestium* (1543). But the first printed copy reached Frauenburg barely in time to be laid on the writer's death-bed. Copernicus was seized with apoplexy and paralysis towards the close of 1542, and died on May 24, 1543, happily unconscious that the fine Epistle, in which he had dedicated his life's work to Paul III., was marred of its effect by an anonymous preface, slipt in by Andreas Osiander, with a view to disarming prejudice by insisting upon the purely hypothetical character of the reasonings it introduced. The trigonometrical section of the book had been issued as a separate treatise (Wittenberg, 1542) under the care of Rheticus. The only work published by Copernicus on his own initiative was a Latin version of the Greek epistles of Theophylact (Cracow, 1509). His treatise *De monetae cudendae ratione* (1526) (first printed in 1816), written by order of King Sigismund I., is an exposition of the principles on which it was proposed to reform the currency of the Prussian provinces of Poland.

BIBLIOGRAPHY.—Rheticus was the only contemporary biographer of Copernicus, and his narrative perished irretrievably. Gassendi's jejune Life (Paris, 1654) is thus the earliest extant of any note. It was supplemented, during the 19th century, by the various publications of J. Sniadecki (Warsaw, 1803–18); of J. H. W. Westphal, J. Czynski, M. Curtze, H. A. Wolynski, F. Hipler, and others, but their efforts were overshadowed by Dr. Leopold Prowe's exhaustive *Nicolaus Coppernicus* (Berlin, 1883–84), embodying the outcome of researches indefatigably prosecuted for over 30 years. The first volume (in two parts) is a detailed biography of the great astronomer; the second includes some of his minor writings and correspondence, family records, and historical documents of local interest. The effects of his Italian sojourn upon the nascent ideas of Copernicus may be studied in Domenico Berti's *Copernico e le vicende del sistema Copernicano in Italia* (Roma, 1876), and in G. V. Schiaparelli's *I Precursori del Copernico nell' antichità* (Milano, 1873). A centenary edition of *De revolutionibus orbium coelestium* was issued at Thorn in 1873, and a German translation by C. L. Menzzer in 1879. (A. M. C.)

COPIAPÓ, a city of northern Chile, capital of the province of Atacama, about 35m. from the coast on the Copiapó river. Pop. (1940) 15,877. The Caldera and Copiapó railway (built 1848–51 and one of the first in South America) extends beyond Copiapó to the Chañarcillo mines (50m.) and other mining districts. Copiapó stands 1,400ft. above sea-level and has a mean temperature of about 67° in summer and 51° in winter. Its port, Caldera, 50m. distant by rail, is situated about 6m. N. of the mouth of the Copiapó river. Copiapó is perhaps the best built and most attractive of the desert region cities. The river brings down from the mountains enough water to supply the town and irrigate a considerable area in its vicinity. Beyond the small fertile valley in which it stands is the barren desert, on which rain rarely falls and which has no economic value apart from its minerals (especially saline compounds). Copiapó was settled about 1540 and took its name from the Copayapu Indians who occupied that region. It was primarily a military station and transport post on the road to Peru, but after the discovery of the rich silver deposits near Chañarcillo by Juan Godoy in 1832 it became an important mining centre. It has a good mining school and reduction works, and is the supply station for an extensive mining district. For many years the Famatina mines of Argentina received supplies from this point by way of the Come-Caballo pass.

COPING, in architecture, a capping or covering for the top of a wall, to prevent the entrance of water. In those countries and times in which parapets are common, coping design becomes of great importance; especially in Gothic work, where copings are usually of stone with a steeply sloped, and sometimes moulded, profile. Copings may be made of stone, brick, tile, slate, metal, wood or thatch and are usually sloped so as not to hold water, and projected beyond the face of the wall they cover in order to prevent the wall below from becoming saturated.

COPLAND, ROBERT (fl. 1515), English printer and author, is said to have been a servant of William Caxton, and certainly worked for Wynkyn de Worde. The first book to which his name is affixed as a printer is *The Boke of Justices of Peace* (1515), at the sign of the Rose Garland, in Fleet street, London. His best known works are *The hye way to the Spyttell hous,* a dialogue in verse between Copland and the porter of St. Bartholomew's hospital, containing much information about the vagabonds who found their way there; and *Jyl of Breyntfords Testament.* He translated from the French the romances of *Kynge Appolyne of Thyre* (W. de Worde, 1510), *The History of Helyas Knyght of the Swanne* (W. de Worde, 1513) and *The Life of Ipomydon* (*Hue of Rotelande*), not dated. Among his other works is *The Complaynte of them that ben too late maryed,* an undated tract printed by W. de Worde.

William Copland, the printer, supposed to have been his brother, published three editions of *Howleglas,* perhaps by Robert, which in any case represent the earliest English version of *Till Eulenspiegel.*

Bibliography.—The *Knyght of the Swanne* was reprinted in Thom's *Early Prose Romances,* vol. iii., and by the Grolier Club (1901); the *Hye Way* in W. C. Hazlitt's *Remains of the Early Popular Poetry of England,* vol. iv. (1866). *See* further the "Forewords" to Dr. F. J. Furnivall's reprint of *Jyl of Breyntford* (for private circulation, 1871) and J. P. Collier, *Bibliographical and Critical Account of the Rarest Books in the English Language,* vol. i. p. 153 (1865). For the books issued from his press see *Hand-Lists of English Printers* (1501–56), printed for the Bibliographical Society in 1896.

COPLESTON, EDWARD (1776–1849), English bishop, was born on Feb. 2, 1776, at Offwell in Devonshire, and died on Oct. 14, 1849. He was elected to a tutorship at Oriel college in 1797, and in 1800 was appointed vicar of St. Mary's, Oxford. He was university professor of poetry (1802–12), dean of Oriel for some years, and succeeded to the provostship in 1814. The great prosperity of the college during the first quarter of the 19th century was partly due to Copleston. In 1826 he was appointed dean of Chester, and in the next year he was consecrated bishop of Llandaff.

Copleston's best known writings are on economic subjects. He wrote *Letters to the Rt. Hon. Robert Peel . . . on the pernicious effects of a Variable Standard of Value, especially as it regards the condition of the Lower Orders and the Poor Laws* (1819). In these two "letters" he did considerable service in drawing attention to the imperfect adaptation of wages and prices to currency depreciation.

See W. J. Copleston, *Memoir of E. Copleston, bishop of Llandaff* (1851), with selections from his diary and correspondence; Morley, *Reminiscences of Oriel College* (1883).

COPLEY, JOHN SINGLETON (1737–1815), English historical painter, was born of Irish parents at Boston, Massachusetts. He was self-educated, and commenced his career as a portrait-painter in his native city. The germ of his reputation in England was a little picture of a boy and squirrel, exhibited at the Society of Arts in 1760. In 1774, after a successful career as a portrait painter in Boston, he went to Rome, and thence in 1775 to England. In 1777 he was admitted associate of the Royal Academy; in 1783 he was made Academician on the exhibition of his most famous picture, the "Death of Chatham," popularized immediately by Bartolozzi's elaborate engraving; and in 1790 he was commissioned to paint a portrait picture of the defence of Gibraltar. The "Death of Major Pierson," in the National Gallery, also deserves mention. Copley's powers appear to greatest advantage in his portraits. The Boston museum of fine arts owns his portraits of Samuel Adams, John Quincy Adams, General Joseph Warren, Mrs. Warren and others. He was the father of Lord Chancellor Lyndhurst.

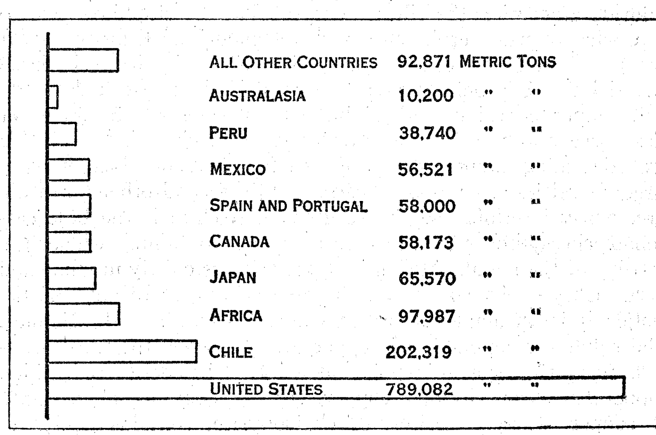
See M. Badcock Amory, *Life of Copley* (Boston, 1872).

COPPÉE, FRANÇOIS (1842–1908), French poet and novelist, was born in Paris on Jan. 12, 1842. After passing through the Lycée Saint-Louis he became a clerk in the ministry of war, and from 1878 to 1884 was archivist to the Comédie Française. Meanwhile he had made a reputation as a poet, and was admitted to the Académie Française in 1884. Coppée became known as the *poète des humbles* because he chose as subjects for his often exquisite verse the cares, loves and sorrows of the common people. The first of his many volumes of verse, *Le Reliquaire,* appeared in 1867; his first play, *Le Passant,* in 1869, and his first prose story, *Une Idylle pendant le siège,* in 1875. His plays include *Severo Torelli* (1883) and *Pour la couronne* (1895), the English translation of which, by John Davidson, was produced in 1896. His stories, describing with real insight the lives of simple people, had a great vogue, especially after his reconversion to religion, and the publication of his *La bonne Souffrance* (1898) made him popular with the *bien pensants.* After this he became a violent Nationalist, took a leading part against Dreyfus, and was one of the founders of the Ligue de la Patrie française. He died on May 23, 1908.

See M. de Lescure's *François Coppée, l'homme, la vie, l'oeuvre* (1889); G. Druilhet, *Un Poète français* (1902); Gauthier-Ferrières, *François Coppée et son oeuvre* (1908).

COPPER, a metal which has been known to and used by the human race from the most remote periods. Its alloy with tin (bronze) was the first metallic compound in common use by mankind, and so extensive and characteristic was its employment in prehistoric times that the epoch is known as the bronze age. By the Greeks and Romans both the metal and its alloys were indifferently known as χαλκός and *aes.* As, according to Pliny, the Roman supply was chiefly drawn from Cyprus, it came to be termed *aes cyprium,* which was gradually shortened to *cyprium,* and corrupted into *cuprum,* whence comes the English word copper, the French *cuivre* and the German *Kupfer.*

Copper is a brilliant metal (symbol Cu, atomic number 29, atomic weight 63·57) of a peculiar red colour which assumes a pinkish or yellowish tinge on a freshly fractured surface of the pure metal, and is purplish when the metal contains cuprous oxide. Its specific gravity varies between 8·91 and 8·95, according to the treatment to which it may have been subjected; J. F. W. Hampe gives 8·945 (0°/40) for perfectly pure, compact copper. Ordinary commercial copper is somewhat porous and has a specific gravity ranging from 8·4 to 8·9. It takes a brilliant polish, is in a high degree malleable and ductile, and in tenacity it only falls short of iron, exceeding in that quality both silver and gold. By different authorities its melting-point is stated at from 1,000° to 1,200° C; C. T. Heycock and F. H. Neville give 1,080·5°; P. Dejean gives 1,085° as the freezing point. Its boiling point is variously given as between 1,980° and 2,310° C. The molten metal is sea-green in colour, and at higher temperatures (in the electric arc) it vaporizes and burns with a green flame. G. W. A. Kahlbaum succeeded in subliming the metal in a vacuum, and H. Moissan (1905) distilled it in the electric furnace. Molten copper absorbs carbon monoxide, hydrogen and sulphur dioxide; in addition, to all appearances, it decomposes hydrocarbons (methane, ethane) in absorbing the hydrogen. These occluded gases are liberated when the copper cools, and so give rise to porous castings, unless special precautions are taken. The gases are also expelled from the molten metal by lead, carbon dioxide or water vapour. Its specific heat is 0·0899 at 0° C and 0·0942 at 100°; the coefficient of linear expansion per 1° C is 0·001869. In electric conductivity it stands next to silver; the conducting power of silver being equal to 100, that of perfectly pure copper is given by A. Matthiessen as 96·4 at 13° C.



GRAPH SHOWING SOURCES OF WORLD PRODUCTION OF COPPER IN 1926

Copper is not affected by exposure in dry air, but in a moist atmosphere, containing carbonic acid, it becomes coated with a green basic carbonate (verdigris). When heated or rubbed it emits a peculiar disagreeable odour. Sulphuric and hydrochloric acids have little or no action upon it at ordinary temperatures, even when in a fine state of division; but on heating, copper sulphate, cuprous sulphide and sulphur dioxide are formed in the first case, and cuprous chloride and hydrogen in the second. Concentrated nitric acid has also very little action, but with the dilute acid a vigorous action ensues. The first products of this reaction are copper nitrate and nitric oxide, but, as the concentration of the copper nitrate increases, nitrous oxide and, eventually, free nitrogen are liberated. Many colloidal solutions of copper have been obtained. A reddish-brown solution is obtained from solutions of copper chloride, stannous chloride and an alkaline tartrate.

Occurrence.—Copper is widely distributed in nature, occurring in most soils, ferruginous mineral waters and ores. It has been discovered in seaweed; in the blood of certain Cephalopoda and Ascidia as haemocyanin, a substance resembling the ferruginous haemoglobin, and of a species of *Limulus;* in straw, hay, eggs, cheese, meat and other foodstuffs; in the liver and kidneys and, in traces, in the blood of man and other animals; it has also been shown by A. H. Church to exist to the extent of 5·9% in turacin, the colouring-matter of the wing-feathers of the Turaco.

Native copper, sometimes termed by miners malleable or virgin copper, occurs as a mineral having all the properties of the smelted metal. It crystallizes in the cubic system, but the crystals are often flattened, elongated, rounded or otherwise distorted. Usually the metal is arborescent, dendritic, filiform, moss-like or laminar. Native copper is found in most copper-mines, usually in the upper workings, where the deposit has been exposed to atmospheric influences. The metal seems to have been reduced from solutions of its salts, and deposits may be formed around mine-timber or on iron objects. It is not infrequently found in serpentine and in basic eruptive rocks, where it occurs as veins and in amygdales. The largest known deposits are those in the Lake Superior region, near Keweenaw Point, Mich., where masses upwards of 400 tons in weight have been discovered. The metal was formerly worked by the Indians for implements and ornaments. It occurs in a series of amygdaloidal dolerites or diabases, and in the associated sandstones and conglomerates. Native silver occurs with the copper, in some cases embedded in it, like crystals in a porphyry. The copper is also accompanied by epidote, calcite, prehnite, analcite and other zeolitic minerals. Pseudomorphs after calcite are known and also after aragonite, the latter being found at Corocoro, in Bolivia.

Ores.—The principal ores of copper are the oxides cuprite and melaconite, the carbonates malachite and chessylite, the basic chloride atacamite, the silicate chrysocolla, the sulphides chalcocite, chalcopyrite, erubescite and tetrahedrite. Cuprite (*q.v.*) occurs in most cupriferous mines, but never by itself in large quantities. Melaconite was formerly extensively worked in the Lake Superior region, and is abundant in some of the mines of Tennessee and the Mississippi valley. Malachite is a valuable ore containing about 56% of the metal; it is obtained in very large quantities from South Australia, Siberia and other localities. Frequently intermixed with the green malachite is the blue carbonate chessylite or azurite (*q.v.*), an ore containing when pure 55·16% of the metal. Atacamite (*q.v.*) occurs chiefly in Chile and Peru. Chrysocolla (*q.v.*) contains in the pure state 30% of the metal; it is an abundant ore in Chile, Wisconsin and Missouri. The sulphur compounds of copper are, however, the most valuable from the economic point of view. Chalcocite, redruthite, copperglance or vitreous copper (Cu_2S) contains about 80% of copper. Copper pyrites, or chalcopyrite, contains 34·6% of copper when pure; but many of the ores, such as those worked specially by wet processes on account of the presence of a large proportion of iron sulphide, contain less than 5% of copper. Cornish ores are almost entirely pyritic; and indeed it is from such ores that by far the largest proportion of copper is extracted throughout the world. In Cornwall copper lodes usually run east and west. They occur both in the "killas" or clay-slate, and in the "growan" or granite. Erubescite, bornite (*q.v.*), or horseflesh ore is much richer in copper than the ordinary pyrites, and contains 56 or 57% of copper. Tetrahedrite (*q.v.*), fahlore (fahlerz), or grey copper, contains from 30 to 48% of copper, with arsenic, antimony, iron and sometimes zinc, silver or mercury.

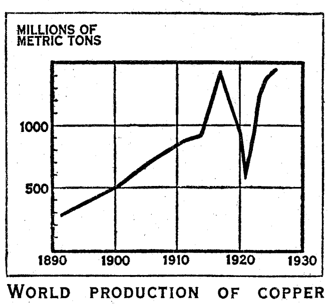
Alloys.—Copper unites with almost all other metals, and a large number of its alloys are of importance in the arts. The principal alloys in which it forms a leading ingredient are brass, bronze and German or nickel silver; under these several heads their respective applications and qualities will be found.

COMPOUNDS

Oxides.—Copper forms two definite oxides, cuprous oxide, Cu_2O, and cupric oxide, CuO, both of which give rise to well-defined series of salts. The other less definite oxides, Cu_4O and Cu_3O, do not possess this property, as is also the case of the hydrated oxides, $Cu_3O_2 2H_2O$ and $Cu_4O_3 5H_2O$, described by M. Siewert.

Cuprous oxide, Cu_2O, occurring as the mineral cuprite (*q.v.*), may be prepared artificially by heating copper wire to a white heat, and afterwards at a red heat, by the atmospheric oxidation of copper reduced in hydrogen, or by the slow oxidation of the metal under water. It is obtained as a fine red crystalline precipitate by reducing an alkaline copper solution with sugar. In its finely divided form it is of a fine red colour. It colours glass a ruby-red. The property was known to the ancients and during the middle ages; it was then lost for several centuries, to be rediscovered in about 1827. Cuprous oxide is reduced by hydrogen, carbon monoxide, charcoal or iron, to the metal; it dissolves in hydrochloric acid, forming cuprous chloride, and in other mineral acids to form cupric salts, with the separation of copper. It dissolves in ammonia, forming a colourless solution which rapidly oxidizes and turns blue. A hydrated cuprous oxide, ($4Cu_2O$, H_2O), is obtained as a bright yellow powder from cuprous chloride and potash or soda. Cuprous salts are generally white, insoluble in water, and readily oxidized to cupric salts, but stable soluble cuprous salts, giving neutral aqueous solutions, are obtained by co-ordinating the cuprous radical with sulphur containing agenda such as thiourea or ethylenethiocarbamide (Morgan and Burstall, 1928).

Cupric oxide, CuO, occurs as the mineral melaconite, and can be obtained as a hygroscopic black powder by the gentle ignition of copper nitrate, carbonate or hydroxide; also by heating cuprous oxide. It oxidizes carbon compounds to carbon dioxide and water, and therefore finds extensive application in analytical organic chemistry (*q.v.*). It is also employed to colour glass, to which it imparts a light green colour. Cupric hydroxide, $Cu(OH)_2$, is obtained as a greenish-blue flocculent precipitate by mixing cold solutions of potash and a cupric salt. This precipitate always contains more or less potash, which cannot be entirely removed by washing. A purer product is obtained by adding ammonium chloride, filtering and washing with hot water. Both the oxide and hydroxide dissolve in ammonia to form a beautiful azure-blue solution (Schweizer's reagent), which dissolves cellulose, or perhaps holds it in suspension as water does starch; accordingly, the solution rapidly perforates paper or calico (*see* SYNTHETIC FIBRES). The salts derived from cupric oxide are generally white when anhydrous, but blue or green when hydrated.



WORLD PRODUCTION OF COPPER FOR THE YEARS 1891–1926

Copper quadrantoxide, Cu_4O, is an olive-green powder formed by mixing well-cooled solutions of copper sulphate and alkaline stannous chloride; the tritoxide, Cu_3O, is obtained when cupric oxide is heated to 1,500°–2,000° C. Both are of doubtful composition. Copper dioxide, CuO_2H_2O, is obtained as a yellowish-brown powder, by treating cupric hydrate with hydrogen peroxide. When moist, it decomposes at about 6° C, but when dry at about 180° (L. Moser, 1907).

Cuprous Hydride.—Cuprous hydride, $(CuH)_n$, was first obtained by A. Wurtz in 1844, who treated a solution of copper sulphate with hypophosphorous acid, at a temperature not exceeding 70° C. According to E. J. Bartlett and W. H. Merrill, it decomposes when heated and gives cupric hydride, CuH_2, which is a strong reducing agent.

Halides.—Cuprous fluoride, CuF, is a ruby-red crystalline mass, formed by heating cuprous chloride in an atmosphere of hydrofluoric acid at 1,100°–1,200° C. It is soluble in boiling hydrochloric acid, but it is not reprecipitated by water, as is the case with cuprous chloride. Cupric fluoride, CuF_2, is obtained by dissolving cupric oxide in hydrofluoric acid. The hydrated form ($CuF_2,2H_2O,5HF$), is obtained as blue crystals, sparingly soluble in cold water.

Cuprous chloride, CuCl or Cu_2Cl_2, was obtained by Robert Boyle by heating copper with mercuric chloride. It is also obtained by burning the metal in chlorine, by heating copper and cupric oxide with hydrochloric acid, or copper and cupric chloride with hydrochloric acid. It dissolves in the excess of acid, and is precipitated as a white crystalline powder on the addition of water. It melts at below red heat to a brown mass, and its vapour density at both red and white heat corresponds to the formula Cu_2Cl_2. Its solution in hydrochloric acid readily absorbs carbon monoxide and acetylene; hence it finds application in gas analysis. Its solution in ammonia absorbs acetylene, with the precipitation of red cuprous acetylide, Cu_2C_2, a very explosive compound. Cupric chloride, $CuCl_2$, is obtained by burning copper in an excess of chlorine, or by heating the hydrated chloride, obtained by dissolving the metal or cupric oxide in an excess of hydrochloric acid. It is a yellowish-brown deliquescent powder, which rapidly forms the green hydrated salt $CuCl_2,2H_2O$ on exposure. The oxychloride occurs in nature as the mineral atacamite $[Cu\{Cu(HO)_2\}_3]Cl_2$. It may be artificially prepared by heating salt with ammonium copper sulphate to 100°. "Brunswick green," a light green pigment, is obtained from copper sulphate and bleaching powder.

Cuprous iodide, Cu_2I_2, is obtained as a white powder by the direct union of its components or by mixing solutions of cuprous chloride in hydrochloric acid and potassium iodide; or, with liberation of iodine, by adding potassium iodide to a cupric salt. Cupric iodide is only known in combination, as in $CuI_2,4NH_3,H_2O$, which is obtained by exposing $Cu_2I_2,4NH_3$ to moist air, or in combination with ethylenediamine as $[Cu,2en,2H_2O]I_2$.

Sulphides and Sulphate.—Cuprous sulphide, Cu_2S, occurs in nature as the mineral chalcocite (*q.v.*) or copper-glance, and may be obtained as a black brittle mass by the direct combination of its constituents. Cupric sulphide, CuS, occurs in nature as the mineral covellite. It may be prepared by heating cuprous sulphide with sulphur, or as a dark brown precipitate by treating a copper solution with sulphuretted hydrogen. A cuproso-cupric sulphite, $Cu_2SO_3,CuSO_3,2H_2O$, is obtained by mixing solutions of cupric sulphate and acid sodium sulphite.

Cupric sulphate or "blue vitriol," $CuSO_4$, one of the most important salts of copper, occurs in cupriferous mine waters and as the minerals chalcanthite or cyanosite, $CuSO_4 \cdot 5H_2O$, and boothite, $CuSO_4 \cdot 7H_2O$. Cupric sulphate is obtained commercially by the oxidation of sulphuretted copper ores, or by dissolving cupric oxide in dilute sulphuric acid. It was obtained in 1644 by Van Helmont, who heated copper with sulphur and moistened the residue, and in 1648 by Glauber, who dissolved copper in strong sulphuric acid. It crystallizes with five molecules of water in large blue triclinic prisms. When heated to 100° C it loses four molecules of water and forms the bluish-white monohydrate, which, on further heating to 250°–260°, is converted into the white $CuSO_4$. The anhydrous salt is very hygroscopic, and hence finds application as a desiccating agent. It also absorbs gaseous hydrochloric acid. Copper sulphate is readily soluble in water, but insoluble in alcohol; it dissolves in hydrochloric acid with a considerable fall in temperature, cupric chloride being formed. The copper is readily replaced by iron, a knife-blade placed in an aqueous solution being covered immediately with a bright red deposit of copper. This was formerly regarded as a transmutation of iron into copper. Copper sulphate finds application in calico printing and in the preparation of the pigment Scheele's green.

Carbonates.—Normal cupric carbonate, $CuCO_3$, has only been obtained in the form of such complex salts as $[Cu(CO_3)_2]K_2$ (Reynolds, 1898) and $[Cu,2C_2H_4(NH_2)_2]CO_32H_2O$ (Morgan and Burstall, 1927), basic hydrated forms being formed when an alkaline carbonate is added to a cupric salt. Basic copper carbonates are of wide occurrence in the mineral kingdom, and constitute the valuable ores malachite, azurite and mountain or mineral green. Copper rust has the same composition as malachite; it results from the action of carbon dioxide and water on the metal. Basic copper carbonate is also the basis of the valuable blue to green pigments, verditer, Bremen blue and Bremen green.

Other Compounds.—A copper nitride, Cu_3N, is obtained by heating precipitated cuprous oxide in ammonia gas (A. Guntz and H. Bassett, 1906). A maroon-coloured powder, of composition $CuNO_2$, is formed when pure dry nitrogen dioxide is passed over finely-divided copper at 25°–30°. It decomposes when heated to 90°; with water it gives nitric oxide and cupric nitrate and nitrite. Cupric nitrate, $Cu(NO_3)_2$, is obtained by dissolving the metal or oxide in nitric acid. It forms dark blue prismatic crystals containing 3, 4 or 6 molecules of water according to the temperature of crystallization.

Copper combines directly with phosphorus to form several compounds. The phosphide obtained by heating cupric phosphate, $Cu_2H_2P_2O_8$, in hydrogen, when mixed with potassium and cuprous sulphides or levigated coke, constitutes "Abel's fuse," which is used as a primer. Basic copper phosphates occur frequently in the mineral kingdom:—libethenite, $Cu_2(OH)PO_4$; chalcosiderite, a basic copper iron phosphate; torbernite, a copper uranyl phosphate; andrewsite, a hydrated copper iron phosphate; and henwoodite, a hydrated copper aluminium phosphate.

Copper forms several arsenides occurring in the mineral kingdom:—whitneyite, Cu_9As, algodonite, Cu_6As, and domeykite, Cu_3As. Copper arsenate is similar to cupric phosphate, and the resemblance is to be observed in the naturally occurring copper arsenates, which are generally isomorphous with the corresponding phosphates. Copper arsenite forms the basis of a number of once valuable, but very poisonous, pigments. Scheele's green is a basic copper arsenite; Schweinfurt green, an aceto-arsenite; and Casselmann's green a compound of cupric sulphate with potassium or sodium acetate.

Copper silicates occur in the mineral kingdom, many minerals owing their colour to the presence of a cupriferous element. Dioptase (*q.v.*) and chrysocolla (*q.v.*) are the most important forms.

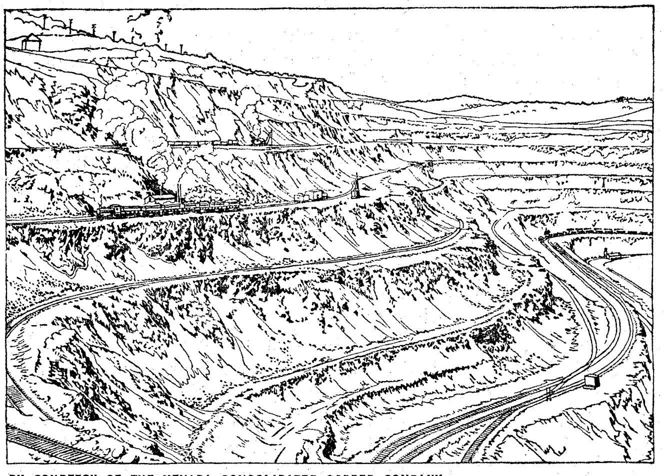
Detection.—Compounds of copper impart a bright green coloration to the flame of a Bunsen burner. Ammonia gives a characteristic blue coloration when added to a solution of a copper salt; potassium ferrocyanide gives a brown precipitate, and, if the solution be very dilute, a brown colour is produced. This latter reaction will detect one part of copper in 500,000 of water. For the borax beads and the qualitative separation of copper from other metals (*see* CHEMISTRY: *Analytical*). For the quantitative estimation (*see* ASSAYING: *Copper*).

Medicine.—In medicine copper sulphate is employed occasionally as a rapid emetic, but its employment is very rare, as it is exceedingly depressant and, if it fails to act, may seriously damage the gastric mucous membrane. It is, however, a useful superficial caustic and antiseptic. A colloidal copper lysalbuminate has been used tentatively in malignant disease. All copper compounds are poisonous.

BIBLIOGRAPHY.—J. W. Mellor, *A Comprehensive Treatise on Inorganic and Theoretical Chemistry*, vol. iii. (1923); J. Newton Friend, *A Text-book of Inorganic Chemistry*, vol. ii. (1924); Gmelin-Kraut, *Handbuch der Anorganischen Chemie*, vol. v. pt. I. (Heidelberg, 1909); R. Abegg, *Handbuch der Anorganischen Chemie*, vol. ii., pt. I. (Leipzig, 1908). (X.; G. T. M.)

Copper was probably the first metal to be utilized by mankind, apart from gold and silver which were, no doubt, employed chiefly for ornamental purposes. In the native state, as metal, it is found in various parts of the world, and from these sources the first supplies are presumed to have been obtained, the metal in this state being malleable and requiring no metallurgical treatment prior to use. At some later date the more readily reducible oxide ores were treated by primitive peoples, ample evidence of this being obtained from time to time as new copper deposits are discovered and prehistoric workings are revealed. The extraction of the metal from the sulphide ores presented more difficulty than from the simpler oxide ores; in some districts the sulphides appear to have resisted satisfactory treatment, and were therefore neglected.

The development of the extraction processes until the middle ages was very gradual, and was confined mainly to obtaining



BY COURTESY OF THE NEVADA CONSOLIDATED COPPER COMPANY

AN OPEN CUT COPPER MINE AT RUTH, NEVADA, WHICH IS MINED BY STEAM SHOVELS AND YIELDS ABOUT 20 POUNDS OF COPPER PER TON OF ORE

greater recovery of metal from a given quantity of ore. By that time, however, the general principles which underlie the methods for the dry extraction of copper were appreciated, and they may be stated as follows. Since all sulphuretted copper ores (and these are of chief economic importance) are invariably contaminated with arsenic and antimony, it is necessary to eliminate these impurities as far as practicable at the earliest possible stage in the treatment. This is effected by calcination or roasting.

The roasted ore is then smelted to a mixture of copper and iron sulphides, known as "copper matte" or "coarse-metal," which contains little arsenic, antimony or silica. This coarse-metal is smelted with coke and siliceous fluxes (in order to slag away the iron) and the product, consisting of an impure copper sulphide, is variously known as "blue-metal" when more or less iron is still present, "pimple-metal" when richer in copper, or "fine" or "white-metal" which is a matte consisting of comparatively pure copper sulphide and containing approximately 75% of the metal. This product is re-smelted to form "coarse copper" or "blister copper" containing 95–97% of the metal, which is then refined.

Refining.—Blister or coarse copper contains numerous impurities. Sulphur, iron, lead, arsenic and antimony are almost invariably present. Silenium, tellurium, zinc, nickel and cobalt are also liable to occur, and in addition, silver and gold, which are frequently found in sufficient quantity to pay for their extraction. The object of refining is to remove these impurities as far as possible and to cast the copper into cakes and other forms suitable for mechanical treatment and conversion into rods, sheets, tubes, etc. The elimination of the impurities is effected by oxidation and removal either as slag or by volatilization. During the process the molten metal itself becomes partly oxidized, and this oxidation is continued and aided by the agitation of the bath with iron rabbles, or in more modern plants by means of compressed air blown either on the surface of the bath or below it. This operation is termed "flapping" and is continued until the metal contains approximately 6% of cuprous oxide. The iron, sulphur, zinc, tin and cobalt will have been almost completely eliminated. Arsenic, nickel and some other metals are not so completely removed, whilst the gold and silver and rarer metals still remain in the bath of metal. A sample ingot taken at this stage and allowed to solidify, contracts on solidification and exhibits a brick red surface when fractured.

The metal in this condition is known as "sett copper," and is relatively hard and easily fractured owing to the presence of the cuprous oxide. It is therefore necessary to reduce this oxide and reconvert it into metal. This is effected by "poling," which consists in forcing green trees or logs under the surface of the molten metal. The products which are evolved from the combustion and distillation of the wood reduce the oxide to metal, and if the operation be properly conducted, "touch-pitch" copper, soft, malleable and exhibiting a lustrous, silky fracture, is obtained. The progress of the reduction is checked from time to time by the removal of small test buttons which are hammered out hot, quenched and fractured. Fracture must only occur when the button is completely doubled over and flattened, and should show a silky texture and be of a salmon pink colour. Considerable skill is needed at this stage of refining, as if the poling be carried too far the metal again becomes brittle and porous owing to the absorption of furnace gases. Such metal is termed "over-poled," and on solidification the top surface of the ingot rises owing to the liberation of the absorbed gases during solidification. When the operation is carried out correctly, the castings solidify with a flat rippled surface but this appearance although essential to good "touch-pitch" copper is only indicative of good material when the furnace condition as regards temperature and atmosphere are known to have been satisfactory.

The "touch-pitch" condition is closely associated with the oxygen remaining in the metal and this is, in turn, influenced by a variety of factors, including the furnace conditions and temperature in addition to the collective effect of the various impurities present in the metal. Modern refining practice gives very close attention to all these factors and the larger furnaces and mechanical devices enable very close control of the oxygen content to be maintained.

The processes so far described are those developed to deal with a diversity of ore mixtures which were obtained from various sources and were treated on a relatively small scale both in Wales and in Germany. This position changed with the development of the enormous American ore bodies of comparatively uniform composition, whilst in addition, an immensely greater scale of operations was rendered possible by the increasing quantities of the metal required for the various forms of electrical development.

Towards the end of the 19th century, America rose very rapidly to be the world's greatest producer of copper, and in 1926 the United States produced 789,000 metric tons or over one-half of the world's total output. The fact that 86% of the total was produced by 35 companies shows the scale of the operations that have been in use.

The treatment methods have been continually modified to take full advantage of all modern metallurgical improvements, the direct result of which has been considerable simplification of the extraction process. In principle the operations are similar to those already described, and may be classified under three main headings:—(1) concentration, (2) furnace treatment, (3) electrolytic refining. In addition, some ores and residues are now treated by hydro-metallurgical extraction methods or leaching followed by electrolytic deposition.

Concentration.—Apart from the general development of ordinary crushing and dressing plant practice, the outstanding feature is the use of the oil flotation process and the high recoveries obtained from this method. Selective flotation is now applied to copper sulphide-pyrites ores so that there is an elimination of both silica and iron, leaving a high grade copper concentrate for smelting. In the case of mixed oxidized and sulphide ores it is still a question whether the oxide portion can be floated with the sulphide, although success is claimed by the use of potassium xanthanate. These improvements in dressing practice are permitting very poor ore bodies to be mined economically; for example, in 1926 the Miami Copper Company were working at a profit an ore body containing but 20 lb. copper per ton. Differential flotation is being applied on various plants, including Anaconda, and results in a much greater ratio of concentration which permits the smaller tonnage of richer concentrates obtained to be treated in reverberatory furnaces.

Furnace Treatment.—Prior to 1910 the blast furnace and the reverberatory furnace were in close competition for the ascendancy in the smelting of copper ore. With the increasing fineness of the ore to be smelted, resulting from the fine crushing necessary to obtain satisfactory recoveries from the poorer ores treated by the dressing plant, the leaning began to be definitely in favour of the reverberatory furnace. But with the advent of the Dwight-Lloyd and other sintering plants, which enabled fine ores to be agglomerated cheaply and efficiently, the blast furnace gained a new prestige. The recent developments of selective flotation enabling higher grade concentrates to be obtained, combined with the successful application of coal dust firing to reverberatory furnaces have again given this type of furnace an unquestioned predominance which it is likely to maintain. The modern copper smelting plant designed for the treatment of fine ore comprises roasting furnaces of the McDougall type and very large reverberatory furnaces. The process of extraction consists of (*a*) roasting in mechanical furnaces, (*b*) smelting to matte in reverberatory furnaces, (*c*) blowing the matte to blister in basic converters, (*d*) casting the blister into anodes either direct or after partial refining in reverberatory furnaces, and (*e*) electrolytic refining.

Roasting.—The McDougall type furnace is essentially a vertical cylinder with superimposed horizontal hearths and a central rotating shaft with radial arms for stirring the ore. The ore is fed in mechanically at the top of the furnace and is displaced by the rabble arms towards the periphery when it drops to the hearth beneath. The rabbles are here arranged to move the ore in the opposite direction, succeeding hearths being arranged alternately with slots provided for the ore to drop from one hearth to the next beneath. The central shaft and arms, water cooled in the original design, are now pressure air cooled as this offers several advantages, amongst which may be cited the absence of scaling and the possibility of returning the heated air to the bottom of the furnace for combustion purposes. Various other types of mechanical roasting furnaces were at one time used for copper ores but they have all been superseded by one of the several modifications of the McDougall furnace, variously known as Evans-Klepetko, Herreshoff or Wedge furnace. The modern practice is to treat this calcine or roasted material in reverberatory furnaces, which have been continuously increasing in size, although they now appear to have reached their maximum as regards length. The tendency in most recent construction is to make them approximately 100ft. in length and to increase the width, although constructional difficulties have hampered this development and few exceed 25ft. in width. All these modern furnaces use either pulverized coal or oil as a fuel, the choice depending on economic factors, great economy being effected by passing the flue gases through waste heat boilers to recover rather more than a third of the heating value of the fuel in the form of steam. The charging of the hot calcines is carried out along the sides of the furnace at frequent intervals, and this practice combined with the addition of highly siliceous ore for fettling purposes preserves the furnace sides. The furnace has two distinct functions, the first being the smelting of the charge, and the second the settling of the matte produced. The matte usually contains approximately 40% copper and is withdrawn intermittently as required for further treatment. The slag is withdrawn continuously from the far end of the furnace and flows into slag cars or granulating troughs. Such slags contain rather more copper than blast-furnace slag, and this is probably accounted for by dusting during the charging of such fine material. Special precautions are taken to collect the flue dust which is returned for further treatment. The next operation consists in the elimination of the sulphur from the matte and the production of blister copper in one operation.

Converting.—The converting process consists in blowing thin streams of air under pressure through the molten matte retained in a suitable container. It was first used for copper by Manhés and David in France, and at a later date the process was introduced both at Butte, Montana, and in Wales. Originally the converters were lined with siliceous material, the lining furnishing the silica required to flux the iron oxide produced during the blowing. Numerous attempts were made to replace this lining by a basic lining owing to the short life of the acid linings, but not until 1910 was success achieved by Pierce and Smith in America. Subsequently it was found that the basic lining was not limited in its application to the horizontal converters originally used, but could be applied to other forms of both the horizontal and vertical types. Amongst the advantages of the basic lined converter, as compared with the acid lined type, are an increased life of the lining (one basic lining produces 2,500 tons copper as compared with ten tons from an acid lining), greater air efficiency, and ability to convert low grade matte. Modern basic lined converters are lined with magnesite, and the Pierce-Smith type, which is generally favoured, consists of a horizontal cylindrical shell of steel plate supported on cast steel rings, which can revolve on rollers. The converters are of varying dimensions, to meet the operating conditions in various plants. An ordinary large size converter measures 13ft. x 30ft. and the air is supplied through 41 $1\frac{3}{4}$in. tuyeres spaced at $6\frac{1}{2}$in. centres. In order to utilize the sulphurous gases for acid manufacture or SO_2, special arrangements are made in the form of hoods to prevent dilution with air. In converting 40% matte to blister copper, the daily capacity of such a converter varies from 110–125 tons. The method of operation is to charge in liquid matte and siliceous ore in given proportions and blow for 30 to 40 minutes. The slag formed is then poured off, and further additions of liquid matte, siliceous ore together with converter cleanings and cold matte, are added and help to lower the temperature of the bath. The charge is again blown, and the operation repeated until the converter is fully charged and the matte is enriched to "white-metal" (70–75% copper). The slag is then cleaned off as thoroughly as possible, scrap copper, cold white metal, etc., are added to reduce the temperature, and the final blow to blister copper is made. This blister copper is frequently tapped into ladles and transferred molten to reverberatory furnaces for partial refining and conversion into anodes for treatment in the electrolytic refining. In some instances the anodes are cast direct from the converter, and although in such cases, owing to their uneven thickness, the electrolytic treatment is less efficient, the expense saved by eliminating the reverberatory treatment may balance the smaller recovery. In preparing anodes in the reverberatory refining furnace the same care need not be taken as for finished copper, and it is usual to leave a larger proportion of cuprous oxide in the metal. The furnace can be of large capacity, and casting is carried out by means of a mechanical casting machine, the anodes passing to the electrolytic refining. The procedure described is applicable to fine ores such as sulphide concentrates, but for the smelting of coarse ore the blast-furnace operated on a pyritic or semi-pyritic principle still holds its place.

Pyritic Smelting.—In this process the oxidation of pyritic ores and the formation of the slag furnish the heat necessary to carry on the operation. Partial pyritic smelting is one in which the deficiency of sulphur in the charge is made up by the addition of some carbonaceous fuel. In both cases considerably more air is required than when carbon forms the fuel. This pyritic effect is utilized in some degree in practically all blast furnace practice and the modern blast furnaces have been designed to meet these requirements. They are oblong in shape, with vertical ends and sloping sides fitted with the necessary tuyeres. The discharge is continuous, the slag matte mixture running continuously over a raised spout trapping the blast. The matte and slag collect in a large fore-hearth settler where the matte settles and is tapped periodically for feeding to the converters. The slag is run off continuously, either into a slag car or into some granulating device. The large furnaces at Anaconda are 87ft. long by 56in. wide at the tuyeres. Increasing the length in this manner decreases the heat losses at the ends, giving greater regularity in operation with lower fuel and labour costs. In cases when a low grade matte is produced this is enriched sufficiently for converting by a second smelting, and is transferred molten or re-melted if the conditions are not favourable for immediate treatment.

Hydro-metallurgical Treatment.—The development of this type of treatment has received considerable attention in certain cases where it is particularly applicable. It is eminently suited for low grade ores and residues with finely disseminated copper mineral and a gangue that is not attacked by the solvent. Leaching may be divided into three classes:—(1) leaching in place, (2) heap leaching, (3) confined leaching in vats, tanks or other vessels. The first is only applicable when the mineral in the natural state is in a form soluble in the solvent, with the gangue in such a condition that the solution can operate. It is in successful operation at the Ohio Copper Co.'s mine, Utah, where the rock is shattered, leaving the mineral exposed along cleavage planes. Water introduced on the surface emerges in the main haulage tunnel with little loss. The ore ranges between 0·3% and 1·3% copper, and natural ventilation aids oxidation and renders the mineral readily soluble. The copper in the solution pumped out is precipitated on de-tinned scrap, yielding a 90% copper precipitate, whilst one-third of the de-coppered liquor with two-thirds fresh water is returned to the mine.

Heap leaching was first practised at Rio Tinto, Spain, and is in successful operation there and at other mines in Spain and Portugal. At Rio Tinto weathering is used to render the mineral soluble, the ore being a sulphide mineral which is crushed and sorted into coarse and fine. The heaps are of large dimensions, and are made up of alternate layers of coarse and fines, the top layers consisting of fine ores to assist the distribution of the water. Whilst the heap is in course of formation, water is added to dissolve any copper sulphate already existent, and to hasten oxidation. The top of the heap is divided up with ridges for the even distribution of the water and the temperature during oxidation is adjusted by manipulating the outlets from the stacks which are built up through the heap. It is essential for the oxidation to be regular and gradual to produce the desired porous material suitable for wet extraction. When the heap is sufficiently oxidized, water and liquor from the depositing tanks are run on until the soluble copper has been extracted. At intervals of approximately one year the water distributing channels are changed in position, and it takes six to seven years with massive ore to reduce the heap of approximately 100,000 tons to 0·25–0·30% copper, which is the economic limit of extraction. The liquor obtained is first reduced by contact with freshly mined pyritic fines, and the copper is then precipitated with pig-iron in the usual manner.

Confined leaching in vats is the most general method of leaching in Chile. Thus at Chuquicamata a deposit of approximately 709,000 tons assaying 2% copper is being treated by such methods. The copper occurs in the ore as brochantite contaminated with chlorides. The process consists in crushing 90% of the mineral to pass a ⅜in. sieve, leaching with sulphuric acid, purification of the solution and deposition of the copper by electrolysis, using ferro-silicon anodes. The copper cathodes produced are cast into bars equal in grade to standard electrolytically refined copper.

Ammonia leaching has not found very general acceptance, but in one or two instances, under special conditions, it has been successfully instituted. Low grade carbonate ores and native copper tailings yield readily to this treatment, and successful plants are in operation in Alaska and at the Calumet and Hecla property, Michigan. At the latter plant, tailings from concentrating native copper are being treated, the solution used containing 3% copper, 6% NH_3 and 4% CO_2. The copper content of the solution is regulated by withdrawals for precipitation whilst losses of ammonia and CO_2 are replaced. In order to maintain the solution in an oxidized condition, it is circulated through towers with an upward air current, any ammonia passing away during this treatment being recovered in absorption towers. The copper is precipitated from the ammoniacal solutions by boiling in special evaporators and the ammonia is recovered. A further development of ammonia leaching is being applied in Africa at Bwana M'Kubwa. A process has been developed for obtaining satisfactory recoveries from silicate ores (such as chrysocolla) which have previously presented many difficulties. The ore is first crushed to about ½in. to 1in. and is then fed to a preheater, which is a cylindrical furnace of the rotary kiln type, where it is heated to 400–500° C. for about 30 minutes. The furnace de-hydrates the ore and heats it to the necessary temperature for a reaction to occur in the next furnace, to which it is transferred. The second furnace is maintained with a reducing atmosphere by a stream of producer gas, the heat of the reaction being sufficient to maintain the temperature. The reduction takes place rapidly, but the furnace has to be arranged with water cooling at the exit, so that the ore may be cooled down before passing into the air. The reduced ore is then crushed in rolls to the size necessary for successful extraction by leaching. The copper content of the ore is now readily soluble in ammonium carbonate in the presence of oxygen, and the usual methods are employed for the subsequent precipitation of the copper in the form of oxide. Tar and ammonia are both by-products in the manufacture of the producer gas required for the process. The tar is utilized by mixing with the oxide produced and aids reduction during the final refining, whilst the ammonia is stated to be sufficient in quantity to make up the losses during leaching.

Electrolytic Refining.—Copper made by this process contains a negligible quantity of impurities, and constitutes by far the greater portion of the world's production. The earliest attempt to refine copper electrolytically was made by Elkington, whose first patent is dated 1865. He cast crude copper into plates which were used as anodes, sheets of electro-deposited copper being used as cathodes. Six anodes were suspended alternately with four cathodes in a saturated solution of copper sulphate in a fireclay trough; all the anodes being connected in one parallel group and all the cathodes in another. A hundred or more troughs were coupled in series, the cathodes of the one to the anodes of the next, and they were so arranged that, with the aid of side pipes with leaden connections and India rubber joints, the electrolyte could be made to circulate once daily through them all from the top of one jar to the bottom of the next. The passage of current was continued until the anodes were of no further use and the cathodes, when thick enough, were removed and either cast into cakes and

COPPER MINING, SMELTING AND REFINING

1. Miner operating pneumatic drill preparatory to blasting ore in a copper mine
2. Copper converters. The copper product of the reverberatory furnace, matte, is charged into the converters, where streams of air are blown under pressure into the molten mass, burning the sulphur and oxidizing the iron and other elements. This oxidized matte is poured off, leaving metallic "blister" copper—99% pure
3. Copper anodes are placed in tanks containing an electrolyte of copper sulphate solution. Then thin sheets of pure copper, or cathodes, are suspended between the anodes. With the passage of the current from the anodes through the electrolyte to the cathodes, copper dissolves from the anodes, and is deposited, more than 99.9% pure, on the cathodes. The impurities, which sometimes contain gold and silver, settle to the bottom of the tank and are recovered
4. Copper cathodes being removed from tanks. Copper refined by electrolysis comprises the bulk of production
5. After the cathode copper is removed from the tanks, it is melted and conditioned in furnaces. Then the pure molten copper, as shown here, is cast into shapes suitable for industrial use

rolled or disposed of as cathodes. Silver, gold and other insoluble impurities collected at the bottom of the tanks up to the level of the lower side tubes and were then run off as mud through plugs or holes in the bottom, and collected in settling tanks for further treatment. Elkington's method is now known as the multiple system; a second method of connecting up the tanks, known as the series system, being introduced in 1886. America produces the greater part of the electrolytic copper required and over 80% of this copper output is prepared in this manner. The efficiency of the process is dependent on the composition, character and temperature of the electrolyte, the current density and the voltage, all of which have to be carefully controlled.

LOADING COPPER ORE INTO ORE CARS AT ONE OF THE ANACONDA MINING COMPANY'S MINES IN BUTTE, MONTANA

The Multiple System.—This is now worked in oblong tanks with anodes made from copper partially refined after converting, and cathodes of pure copper. The usual composition of the electrolyte is 30% copper and 12% free sulphuric acid. The temperature of the bath ranges from 40 to 60° C and continuous circulation of the liquid is essential to correct variations in composition. The drop in potential between tanks ranges from 0·2 to 0·4 volts, and it was found at Anaconda that more than 20% of the drop was due to contact resistance and leakages. The current density in use ranges from 15 to 25 amperes per sq. ft., depending on the purity of the material to be treated and the power cost in relation to the increased output obtained. The anodes used should be as pure as possible, to avoid contamination of the electrolyte, and commonly average 99% copper, the precious metals recovered very largely defraying the cost of the process. In modern plants the anodes are usually cast about 3ft. square and may be up to 1½in. in thickness. Mechanical arrangements are provided for handling them in and out of the tanks in groups. The cathodes now used consist of thin sheets of deposited copper which are deposited on rolled sheet copper in special tanks arranged to form a slow deposit of sufficient strength to allow the starting sheet formed to carry the full weight of the finished cathode. These cathodes, after seven to 14 days depositing in the tanks, are removed, washed and transferred to the refining-furnace for remelting, poling to pitch and casting into marketable forms. The slime which collects in the bottom of the tanks carries the impurities, and from time to time certain tanks are thrown out of circuit for the collection of the mud, which is then treated for the extraction of the rare metals.

The Series System.—In the Hayden series system cast or rolled anodes are placed vertically in series in the tanks so as to fit closely along the sides, the electrolyte used being very similar to that of the multiple system. As the current passes, the electrodes other than those at the ends become negatively charged on one side and positively charged on the opposite or exit side. Copper is deposited on the negative side, and the anode dissolves away from the opposite side until it is only a few per cent of its original weight and the impurities have passed into the mud in the usual manner. Current connections are made through bus bars at the ends of the tanks, and the current density is approximately 22 amperes per sq. ft., with an E.M.F. of 22 volts for a tank containing 135 electrodes. The high voltage gives a large leakage of current, but the actual current carried is considerably less than in the multiple system, 500 amperes as compared with 10,000 amperes. In some instances rolled electrodes are used, in other cases refined cast anodes have given satisfaction, but it has been found that for this method the anode should be as high grade as possible. The two systems have been frequently compared. The multiple system has the advantage of being able to treat all grades of copper, whereas the series system requires relatively pure material. Owing to the fact that the electrodes can be placed much closer together, the power cost for the series system is lower, and, in addition, much less copper is required for conductors. These advantages are, however, counterbalanced in the multiple system by cheaper produced anodes and lower handling and operating costs. Both systems are being operated successfully on a large scale. (C. A. E.)

COPPER, OUTPUT AND MANUFACTURE. Before the World War, the world's production of copper had risen to about 1,000,000 tons per annum. From 1916–18 this rose to approximately 1,400,000 tons. For the next few years, owing to trade depression, production was restricted, but in 1926 the production exceeded the war-time maximum with 1,469,463 tons. Important new sources of the metal are being developed in Chili, Peru, Africa and Canada.

Copper in the Electrical Trade.—The major portion of the world's production of copper is utilized by the electrical industries, and of the remainder the greater part is finally used mixed with other metals in the form of alloys. This leaves a comparatively small portion of the total production to be absorbed for general purposes. The table on page 407 gives an approximate analysis of the consumption of copper in the United States and the purposes for which it was utilized.

Standard Electrolytic Copper.—Typical samples of electrolytic copper will contain from 99·92% to 99·96% copper, and of the remainder the major portion will consist of oxygen. A metal of this purity will show a conductivity of 99·8% to 100·3% as compared with the International Annealed Copper standard of 5,328 ohms at 20° C, this system of measurement being universally adopted for industrial purposes. The conductivity of commercial electrolytic copper is now expressed as a percentage of this value.

The specifications of the American Society for Testing Materials require a minimum value of 99·9% for wire bars and cakes, and 97·5% for ingots, the determinations to be made on annealed samples. The average copper produced to-day is fully up to this standard, and much of it will possess a conductivity exceeding 100% owing to the great improvement in purity since the time when the standard was fixed. The majority of electrolytic copper is supplied in the form of wire bars which are mainly of American origin. In order to facilitate mass production the sizes of these have been standardized, the several standard sizes varying in weight from 135 to 500 pounds. Wire bars vary in length from 3 ft. to 5 ft., and in cross-section they are approximately 4 in. square.

As a result of the large outputs to be handled, rolling mills for dealing with wire bars have reached a very high state of development, and modern mills are capable of dealing with the two bars simultaneously. The wire bars are first reheated to 800° to 900° C and are rolled without any further reheating to approximately $\frac{3}{8}$ in. diameter, the size depending on the class of material to be made. Very high rolling speeds are used in the finishing passes in order to increase the output, and such mills probably represent the highest stage of rolling development in the non-ferrous industry. In the early stages, steel or white iron dies are used for drawing, but for the finer wires and finishing passes, diamond dies are almost universally employed.

Great advances have been made in the machinery used for wire drawing and multiple die machines are now in common practice. In order to minimize oxidation and scaling, special types of annealing furnaces are employed for annealing the coils between the drawing operations. The Bates-Peard furnace is a typical example of the type of plant used, and consists of a gas-fired furnace chamber, the ends of which pass beneath water seals. The coils of wire are fixed to a moving chain which passes through the water seal into the furnace chamber; the furnace is continuous in operation, the coils passing slowly from one end to the other on the moving chain, and passing out through the water seal at the opposite end where they are quenched. Annealing by this method preserves the bright surface on the wire, and avoids any loss due to oxidation and scale. A considerable quantity of copper wire is marketed in the form of bare coils in the half-hard condition, but there is also a considerable tonnage which is subsequently covered with paper, cotton, silk, rubber or other insulating material for use in the form of covered conductors. Much of the wire is also supplied stranded, and all these operations are carried out on special machines which are largely automatic in operation. The machines consist essentially of a number of drums on which the wire or covering material is wound, and these drums are arranged so that they can be rotated on an axis through the central core as this passes through the machine. As the coils rotate round the core, the strands of wire or the covering material are automatically fed out under tension, and wind themselves round the core or central wire.

The cables have now, in many cases, to undergo a special process to render them as impervious as possible to moisture and at a later stage they may receive an outer protective covering, lead being the final protection in many instances. Lead covering is extruded on to the outside of the cable by means of a special pressure extruding plant. For immersion under water an additional protection has sometimes to be given in the form of hemp or metal armouring. Various designs of multiple cored and other special types of cable are manufactured and supplied for various purposes. The electrical industries also consume large quantities of bare copper strip for incorporation in electrical machinery. In the narrow widths and thicker gauges this form of the metal is produced mainly from wire bars which are rolled in a similar type of mill to that used for the production of wire. In addition, copper strip of greater width and much thinner gauge is produced in long lengths, and is usually supplied in the form of coils.

The term copper "strip" as distinct from copper "sheet" is usually assumed to apply to material less than 24 in. wide which is supplied in the form of long lengths. The majority of the strip used is under 12 in. wide and is manufactured by a process which has not yet found application in the rolling of material over 3 ft. in width. In the preliminary stages, the copper castings are rolled hot but in the later stages of manufacture, all the rolling is carried out cold, the material being coiled on coiling drums on each side of the rolling mills. Material produced by this method is of very even gauge and possesses an exceptionally good surface finish. The coils can be easily handled and are in general use for the manufacture of stampings, both in the electrical and other industries. Copper strip is supplied in various degrees of hardness according to the rolling it has received subsequent to the last annealing. The usual grades of hardness or temper are termed soft, quarter-hard, half-hard, three-quarters-hard and hard. These various tempers are selected according to the amount of subsequent mechanical deformation to which they will be subjected. Copper sheets are produced by somewhat similar methods of manufacture, and in America especially, the majority of copper sheets are made from electrolytic copper, but in Europe fire-refined arsenical copper is used very largely in the manufacture of sheets and plates. American and English practice is to use relatively small castings from 1 cwt. to 4 cwt. in weight, which are rolled out and cut to size. Both hot rolling and cold rolling is practised, depending on the surface of the sheet required, but American practice is tending more and more to use cold rolling for the final stages in sheet production, irrespective of the surface finish required. In Europe several finishes are marketed; the hot rolled and descaled sheet is known as ordinary quality and has a distinct red colour which is greatly valued in certain parts of the world. The red coloration is due to a thin film of cuprous oxide, which is easily removed by immersion in dilute acid, and sheets cleaned in this way, known as acid cleaned or dipped sheets, are gaining favour for many purposes, especially when they have to be tinned or soldered. The so-called "ash" copper is a special finish obtained by annealing the sheets in air-tight packs, sheets annealed in this manner having an exceptionally adherent coating of cuprous oxide, which gives them a distinctive red colour.

Cold Rolling.—Cold rolling is an operation carried out subsequent to hot rolling, and gives a sheet with an exceptionally smooth, bright finish, suitable for working up into highly polished articles. Cold-rolled sheets are manufactured in a variety of tempers similar to those already quoted for strip copper. In Europe methods have been developed to allow the use of large castings up to several tons in weight for sheet manufacture, and progress is also being made in the manufacture by strip rolling methods of much greater widths than have previously been attempted. In this method of manufacture the greater part of the rolling is a modified form of cold rolling, and the resultant sheets show a surface finish which is smoother than that obtained by the ordinary methods of hot rolling. In the thicker gauges, copper sheets find application in many industries, and are manufactured into pans and vessels of all kinds. The high heat conductivity of copper is of great value for such purposes, in addition to which the malleable nature of the metal allows it to be worked into very intricate shapes. Where the metal is subjected to furnace gases and relatively high temperatures, it is generally considered that pure copper is not as satisfactory as arsenical copper containing approximately .5% arsenic. This applies also to the use of copper in locomotive fireboxes. The Engineering Standards specifications and the British railway specifications require the metal to contain .3% to .5% arsenic. Copper is used almost exclusively for British locomotives' fireboxes, and also by many foreign railways. The plates used in their construction vary in thickness from ½ in. to 1 in., and undergo a very rigid testing before acceptance. Where alkaline waters are used, copper-nickel alloys are coming into favour, as it has been found that they withstand these conditions better and have a longer life than the ordinary arsenical copper fireboxes.

The use of copper for ordinary cooking utensils has declined owing to the competition of other metals, but its use still remains an important factor in the consumption of the metal in the eastern market owing to religious rites which necessitate food being cooked in metallic vessels. A large tonnage of copper is exported annually from Europe in the form of circles and square sheets for consumption in India and the eastern market, and owing to the severe hand working to which this material is subjected it requires to be of high quality. As one of the most malleable of common metals, copper is of great utility for working up by hand or by mechanical means into various shapes, and its increased use is mainly prevented by its cost as compared with other competitive metals. In general, however, the main qualities on which its use depends are its malleability, high heat conductivity and relative resistance to corrosion.

Alloys of Copper.—These are the most generally used of all nonferrous alloys and comprise mixtures of copper with zinc, tin, nickel, aluminium, lead, iron, manganese and phosphorus. In many instances they consist simply of binary alloys formed by the addition of one other metal to copper, but in other cases two or more metals may be added in order to impart certain special properties. The principal series of alloys in which copper forms the chief constituent are brass (copper-zinc), bronze (copper-tin) and German or nickel silver (copper-zinc-nickel) (*qq.v.*). In addition to these better known alloys, there are many others which are finding increasing application in industry as their properties become more widely recognized. Those of copper and nickel afford a typical example of this kind, and their manufacture has greatly increased during the 20th century. Owing to the fact that copper and nickel are completely miscible in the solid state, forming a complete series of solid solutions, the useful range of alloys is not confined within any definite limits of composition, although certain compositions have come into general use. Additions of 2–15% nickel to copper provide a series of alloys which are considerably stronger and more resistant to oxidation at high temperatures than copper. These alloys possess the additional quality of greater resistance to corrosion in alkaline water than arsenical copper, and have been adopted for locomotive firebox manufacture where these conditions are encountered. The alloy formed of 20% nickel with the remainder copper is one of the most ductile of commercial alloys, and may be subjected to the most severe cold working without the need of any intermediate annealing. It is also readily forged and rolled at a temperature above 800° C. These properties make it a very suitable alloy for drop forgings and cold stamping and pressing, and it has a variety of uses in automobile construction for exposed fittings as it takes a high polish and is resistant to atmospheric tarnishing. Other uses include bullet sheathing, for which purpose it is used by many nations including Great Britain and France. In the form of tubes its use is being rapidly extended for steam condensers, although the alloys containing 25% nickel and 30% nickel are stated by some authorities to give better results as condenser tubing than the softer and less resistant alloys of lower nickel content. The chief use of the 25% nickel alloy has been for coinage, and several of the British colonies employ it largely because of its resistance to corrosion. The alloy containing 40% nickel has become very widely known under the name "Constantan." It has a high electrical resistance which remains practically constant over an appreciable range of temperature. This property renders it of value to the electrical industry, in addition to which its resistance to corrosion by organic acids and its silvery white colour when polished are causing it to be employed in increasing quantities for tableware that has not to be silver-plated. Monel metal (*q.v.*) is a so-called natural alloy prepared by the reduction of a copper-nickel ore and containing 60%–70% nickel. In addition to copper and nickel it contains iron and manganese in small amounts, together with other impurities which influence its properties to some extent. It has been widely used in America for various engineering and culinary purposes, and possesses exceptional high strength at both normal and elevated temperatures. Alloys of similar nickel content are also being manufactured from the pure metals.

Copper also forms an important series of alloys with aluminium which are classed under the general term "aluminium bronzes" (*q.v.*). The properties of these alloys have been the subject of numerous scientific investigations which have shown that the useful alloys rich in copper contain up to 11% aluminium. They may be classified into two main groups: those containing up to 7.5% aluminium are extremely ductile, while those containing 8%–11% aluminium possess high tensile strength in the cast state. The ductile series containing less than 7.5% aluminium are especially useful for deep stamping, spinning and severe cold working of all kinds, and are finding application as a substitute for brass, compared with which they possess greater strength and resistance to atmospheric corrosion. The new bronze coinage introduced in France contains 8.25% aluminium together with a little manganese, and this mixture approaches very nearly the upper limit for satisfactory cold working. The alloys with 8%–11% aluminium usually contain in addition 1%–3% of iron and are in very general use for die castings, for which their high tensile strength and clean casting properties are a great advantage. They are resistant to corrosion by mineral acids and also resist oxidation at relatively high temperatures.

In addition to the alloys mentioned, copper is the standard alloying material used for gold and silver although the new British silver coinage also contains nickel. Manganese copper containing 3%–5% manganese is used in the form of rod by many continental railways for the manufacture of locomotive stay bolts as it is relatively resistant to oxidation and retains its strength at moderate temperatures. Manganin contains 17% manganese, 1%–2% nickel and the remainder copper, and has been extensively used for electrical resistances. It possesses the property of having a practically negligible temperature coefficient of electrical resistance at normal temperatures. There are also numerous more complex alloys containing three or more metals, such as the propeller bronzes, manganese bronzes, phosphor-bronzes, lead bronzes, etc., the properties of which render them particularly suitable for the purpose for which they are designed. Such alloys do not represent any important tonnage but their development indicates the progress of metallurgical science in providing materials to meet modern requirements.

(C. A. E.)

COPPERAS (Fr. *couperose;* Lat. *cupri rosa,* the flower of copper), a term formerly synonymous with vitriol and applied to the sulphates of copper, iron (ferrous) and zinc as blue, green and white copperas respectively. It is now applied exclusively to ferrous sulphate, $FeSO_4.7H_2O$, a light green solid which has an astringent, inky and somewhat sweetish taste and which is used in medicine, in dyeing and tanning, and in the manufacture of ink. (*See* Iron.) (J. B. Ps.)

COPPERHEAD (*Agkistrodon mokasen*), a North American snake allied to the moccasin (*q.v.*); one of the best known species of pit vipers.

COPPERHEADS, an American political epithet, applied by Union men during the Civil War to those men in the north who, deeming it impossible to conquer the Confederacy, were earnestly in favour of peace and, therefore, opposed to the war policy of the president and of congress. The term originated in the autumn of 1862, and its use quickly spread throughout the north. In the western States early in 1863 the terms "Copperhead" and "Democrat" had become practically synonymous. The name was adopted because of the fancied resemblance of the peace party to the venomous copperhead snake which strikes without warning. Though applied as a term of opprobrium, it was willingly assumed by those upon whom it was bestowed, and some advocates of the peace policy, to emphasize it, wore badges of heads cut from copper one-cent pieces.

COPPERMINE, a river of Mackenzie district, Canada, about 475m. long, rising in a small lake in approximately 110° 20′ W. and 65° 50′ N., and flowing south to Lake Gras and then northwestward to Coronation gulf in the Arctic ocean.

COPPERSMITH, in zoology, a bird (*Xantholaema haematocephala*) belonging to the barbet family (*Capitonidae*) and deriving its name from its metallic note. About the size of a sparrow, the coppersmith, which inhabits India, has green plumage with a red and yellow head. The allied Tinker (*Barbutula pusilla*), inhabits South Africa. It is black, yellow and white with a red cap.

COPPICE or **COPSE.** A small plantation of trees which are cut periodically for use or sale, before the trees grow into large timber. The produce is employed for hurdle, crate and basket-making, hop poles and many other purposes. Whether naturally or artificially grown the produce is looked on by the English law as *fructus industrialis.* The tenant for life or years may appropriate this produce. The word is derived from O. Fr. *copeis* or *coupeis,* from Late Lat. *colpare,* to cut with a blow.

COPRA, the dried, broken kernel of the coco-nut, from which coco-nut oil is extracted by boiling and pressing. Copra is the form in which the product of the coco-nut is exported for commercial purposes. It is dried in the sun or in kilns to prevent putrefaction. The oil is used largely in the soap, margarine and candle trades. The total annual production, mostly in the oriental tropics, is estimated at about 4,500,000,000 lb., with a plantation value of about £45,000,000. The Philippine Islands are among the foremost producers, the total production in 1926 exceeding 800,000,000 pounds. The imports of copra into Great Britain amounted in 1926 to 74,372 tons valued at £2,127,210; for the same year the imports into the United States were 204,312 tons valued at £4,838,065. The word copra is a Spanish-Portuguese adaptation of the Malay word *Kopperah* (Hindustani *Khopra*), the coco-nut. (*See* COCO-NUT OIL AND CAKE; OILS, FATS AND WAXES.)

COPROLITES. The name was originally given by Dr. William Buckland to certain bodies in the Lias of Gloucestershire which formerly had been considered fossil fir cones. He showed that they possessed characters which could be best explained on the supposition that they were the fossilized excreta of reptiles (from Gr. *κόπρος,* dung and *λίθος,* stone). Chemical analysis showed that they were very rich in phosphatic minerals.

Since Buckland's time the term has been extended to include practically all phosphatic nodules found in sedimentary rocks. The nodules, such as those of the Cambridge greensand, are largely lumps of phosphatized mud and frequently have been formed around some fossil which was derived from older beds or formed in and around shells of that period. Their formation appears to take place in a sea rich in phosphatic matter and where there are strong currents. Coprolites in the wide sense have been extensively dug in the past for artificial manure, since they yield from 50 to 55% $Ca_3P_2O_8$, but the industry is now almost extinct. (*See* also PHOSPHATES.) (W. B. R. K.)

COPTIC LANGUAGE. Amongst the Egyptian natives, Coptic, the descendant of the ancient Egyptian language (*q.v.*), survived the formidable inroads of Greek both in its pagan and Christian forms, and only succumbed at length to the overwhelming influence of Arabic, dying out finally in the 16th century. Early in the 2nd century A.D., pagan Egyptians, or perhaps foreigners settled in Egypt, essayed to write the native language for magical purposes in Greek letters with some necessary supplements borrowed from demotic. This "Old Coptic," as it is termed, was still almost entirely free from Greek loan-words, and its strong archaisms are doubtless accounted for by the fact that the literary language, even in its most "vulgar" forms, moved more slowly than the speech of the people. Christian literary Coptic, though at first contemporary with some of the documents of Old Coptic, is very different. The unknown evangelizers who must have perfected the adaptation of the alphabet to the various dialects of Egypt and translated the Scriptures out of Greek, flung away all pagan traditions, adopting, however, eight letters from demotic writing. The basis which they chose for the new literature was doubtless the simple language of their intercourse with Christians and others among the peasants. They found this already charged with expressions from Greek, and the Greek element was reinforced by words borrowed from the books which they were translating, until written Coptic became full of Greek words, including even particles of the most varied kinds; some of these were very useful additions to the language, while others were really superfluous. Written Coptic, once established, did not greatly change with time, although after the Muslim conquest it began to borrow scantily from Arabic and eventually took on the character of a dead language.

Four leading dialects of Christian Coptic are recognized: Sahidic (formerly called Theban) spoken in the Upper Thebais; Akhmīmic, in the neighbourhood of Akhmīm; Fayumic, with which are associated the dialects of Middle Egypt as far as Memphis—Fayumic was wrongly identified as "Bashmūric" by early scholars; Bohairic, the dialect of the "coast district" (formerly named "Memphite") spoken in the north-western Delta. The last, in accordance with its geographical position, shows wide differences from all the others. Native writers record also a special dialect among the rude inhabitants of the marshes in the province of Bashmūr in the north-east of the Delta, but no remnant has come down to us. The fragments of Old pagan Coptic show an Akhmīmic colouring, and in Akhmīmic and "sub-Akhmīmic" there are some very old translations from the Old and New Testaments and various Apocrypha. But the immense literary and other influence of the "archimandrite Shenūte" and his monastery near Akhmīm was exerted to spread its rival Sahidic ("Upper Egyptian") as the sole literary dialect throughout the south, and Akhmīmic disappeared in the 5th or 6th century even as far as the Fourth Cataract. The survivor actually penetrated far into Nubia, Nubian tomb-stones down to the 11th century being usually inscribed in Sahidic, even as far south as the Fourth Cataract. Middle Egyptian continued to be used longer than Akhmīmic at least for business purposes. Nothing is known of the early history of Bohairic which survives only in literary texts, beginning with an ms. of the end of the 9th century, and others somewhat later from the monastery of St. Macarius in the Nitrian desert. But Bohairic (with Arabic interpretations) has been the language of the sacred books of Christianity throughout the country since the 14th century. When Coptic ceased to be spoken or understood, Bohairic assumed this position owing to the hierarchical importance of Alexandria and the influence of the ancient monasteries established in the north-western desert.

Literature.—Coptic literature (apart from mere business documents and letters in Sahidic and Fayumic expressed in monkish language) is almost entirely religious and consists mainly of translations from Greek. Such was the enthusiasm for Christianity amongst the lower classes in Egypt that versions from the Old and New Testaments were made into Sahidic, Akhmīmic and Fayumic before the Council of Chalcedon (451); they probably date back at least as early as the middle of the 4th century, and are therefore of considerable textual importance. For dwellers in and about the Delta the Greek version was probably sufficient, until the break with the Greek (Melkite) Church in the 5th century induced them to make a separate Bohairic translation. The Gnostic heresy, otherwise known only through the works of its opponents, is illustrated in some Coptic mss. of the 4th century, the so-called *Pistis Sophia,* and the Bruce Codex, respectively in the British Museum and Bodleian libraries. According to Schmidt and Harnack they are translations dating from the 3rd century and belong to an ascetic or encratitic sect of the Gnostics which rose in Egypt itself. There is abundance of apocryphal works, of apocalypses, of patristic writings from Athanasius to the Council of Chalcedon, homilies, lives of saints and anecdotes of holy men, acts of martyrs extending from the persecution of Diocletian to that of the Persians in the 7th century, and lives of later ascetics and martyrs reaching down to the 14th century. Unless some of the Egyptian *acta sanctorum et martyrum* should prove to have been originally written in Coptic, almost the only original works in that language of any importance are the numerous sermons and letters of Shenūte, the long-lived and now celebrated monk of Atrēpe near Akhmīm, written in the Sahidic dialect in the 4th and 5th centuries. After the Arab conquest, as a defence to the threatened Church language and nationality, versifications of the Proverbs, of Solomon's Song and of various legends were composed, with other religious songs. They are mostly antiphonal, the numbers of stresses in a line marking the rhythm. There is no musical notation in the mss., but traditional church tunes are generally referred to or prescribed for the songs. Of secular literature strangely little existed or at least has survived; only a few magical texts and fragments of a medical treatise, of the story of Alexander, and of a story of the conquest of Egypt by Cambyses are known. According to all the evidence available, the Coptic portion of the great library in the monastery of St. Macarius, made after its restoration in the 9th century, was bare of everything but religious books.

Coptic was occasionally employed for literary purposes as late as the 14th century, but from the 10th century onwards the Copts wrote mostly in Arabic. Severus of Eshmunain (*c.* 950) who wrote a history of the patriarchs of Alexandria, was one of the first to employ Arabic; Cyril ibn Laklak and others in the 13th and 14th centuries translated much of the older literature from Coptic into Arabic and Ethiopic for the use of the Egyptian and Abyssinian churches. From this period also date the Arabic grammars of Coptic and vocabularies of Sahidic and Bohairic by Ibn ʻAssal and others. (*See* Copts.)

COPTOS, the modern Kuft (a village near the east bank of the Nile about 25m. N.E. of Thebes), an ancient city, capital of the fifth nome of Upper Egypt, and the starting-point of several roads to the Red sea, particularly the route to Berenice (*q.v.*). The trade with Arabia and India raised Coptos to great commercial prosperity; but in A.D. 292 its share in the rebellion against Diocletian led to an almost total devastation. It again appears, however, as a place of importance and as the seat of a considerable Christian community, though the stream of traffic turned aside to the neighbouring Kūs. During part of the 7th century it was called Justinianopolis in honour of the emperor Justinian.

The local god of Coptos, as of Chemmis (Akhmīm, *q.v.*), was the ithyphallic Min; but in late times Isis was of equal importance in the city. Min was especially the god of the desert routes. Petrie's excavations on the site of the temple brought to light three very primitive limestone statues of the god with figures of an elephant, swords of sword-fish, sea-shells, etc., engraved upon them: there were also found some very peculiar terra-cottas of the Old Kingdom, and the decree of an Antef belonging to the latter part of the Middle Kingdom, deposing the nomarch for siding with the king's enemy.

COPTS, the early native Christians of Egypt and their successors of the Monophysite sect, now racially the purest representatives of the ancient Egyptians. The name is a Europeanized form, dating perhaps from the 14th century, of the Arabic Kibt (or Kubt), which, in turn, is derived from the Greek Αἰγύπτιοι "Egyptians" (the Copts in the Coptic language likewise style themselves "people of Egypt," "Egyptians"). (*See* Egypt: *History, Religion;* Egyptian Language.)

The beginnings of Christianity in Egypt are obscure; its existence among the natives (as opposed to the mixed "Greek" population of Egypt and Alexandria which produced so many leading figures and originated leading doctrines in the early church) can be traced back as far as the Decian persecution (249–251) in the purely Egyptian names of several martyrs. St. Anthony (*c.* 270) was a Copt; so also was Pachomius, the founder of Egyptian monasticism at the beginning of the 4th century. The Scriptures were translated into Coptic not later than the 4th century. A religion founded on morality and with a clear doctrine of life after death was specially congenial to the Egyptians; thus the lower orders in the country embraced Christianity fervently, while the Alexandrian pagans were lost in philosophical speculation and Neoplatonism was spread amongst the rich "Greek" landowners; these last, partly out of religious enthusiasm, partly from greed, annoyed and oppressed their Christian peasantry. Egypt was then terribly impoverished; the upper country was constantly overrun by raiders from Nubia and the desert; and the authority of the imperial government was too weak to interfere actively on behalf of the Christians. The monasteries, however, were refuges that could bid defiance to the most powerful of the pagan aristocracy as well as to barbarian hordes, and became centres of united action that, at the summons of Shenoute, the organizer of the national church, swept away the idols of the oppressors in riot and bloodshed. In the course of the 5th century the Christians reached a position in which they were able to treat the pagans mercifully as a feeble remnant.

The Copts had little interest in theology; they were content to take their doctrine as prepared for them by the subtler minds of their Greek leaders at Alexandria, choosing the simplest form when disputes arose. In 325 their elected patriarch, Athanasius, and his following of Greeks and Copts, triumphed at the council of Nicaea against Arius; but in 451 the banishment of Dioscorus, patriarch of Alexandria, by the council of Chalcedon created a great schism, the Egyptian church holding to his Monophysite tenets (see *Coptic Church,* below), while the Catholic and imperial party at Constantinople, called "Melkites," ever sought to further the orthodox theology of Chalcedon at the expense of the native church. Thenceforward there were generally two patriarchs, belonging to the rival communities, and the Copts were oppressed by the Melkites; Heraclius, in 638 after the repulse of the Persians, endeavoured to unite the churches, but, failing in that, he persecuted the Monophysites more severely than ever, until ʻAmr brought Egypt under the Moslem rule of ʻOmar during the period 627–641. Under the persecution many Copts had gone over to the Melkites, but now it was the turn of the Melkites, as supporters of the emperor of Constantinople to suffer, and they almost entirely disappeared from Egypt, though a remnant headed by a patriarch of Alexandria of the Orthodox Christians has survived to this day.

After a few years of the mild rule of ʻAmr the Egyptians began to suffer for the benefit of the Muslim exchequer and for their religion. Many of the more thoughtful Christians had already embraced the simple and congenial doctrines of Islam; others went over for the sake of material gain. Conflicts took place between the Mohammedan minority and the Christians. The Copts were excellent scribes and accountants and were continued in their posts under the Arab rule. The pride of the Copts was a serious danger, perhaps even a chief source of their troubles, in earlier days; devout Moslems on more than one occasion stirred the mob to fury when they saw Christians lording it over "true believers." The lower orders of the Copts were continually oppressed. Thus there was every inducement amongst the Christians to turn Mohammedan. Arab tribes, too, were encouraged to settle in Egypt until the Mohammedans exceeded the Copts in numbers.

The history of the Copts consists on the one hand of the record of religious strife, of simony and other scandals in the church, and attempted reforms; and on the other hand of persecutions at the hands of the Muslims. In the 8th century, the monks were not only compelled to pay a capitation tax, but were branded with name and number, civilians were oppressed with heavy taxation, churches demolished, pictures and crosses destroyed (722–723). Degrading dresses were imposed upon the Christians (849–850); later, under Hakim (997), they were compelled to wear heavy crosses and black turbans as an ignominious distinction. Saladin in 1171 re-enforced these statutes and defiled the churches. In 1301, the blue turban was introduced, but many Copts preferred a change of religion to its adoption. In 1348 a religious war raged at Cairo between the Copts and Mohammedans, and large numbers of Copts embraced Islam.

There have been very few cases of conversion from Mohammedanism to Coptic Christianity; and, as intermarriage of Christians with Mohammedans implied conversion to Islam, the Copts have undoubtedly preserved the race of the Egyptians as it existed at the time of the Arab conquest in remarkable purity. The Coptic fellahīn of Upper Egypt and elsewhere are not markedly different from the Mohammedan fellahīn, who, of course, are of the same stock, but mixed with Arab blood.

In trades and professions, so long as the Copts had no foreign competition, they held their own. But, with the extension of railways and agricultural roads and the increased facilities of communication and prosperity, there has been a great influx of Italian, Greek, Armenian and other Levantine workmen, who, with their better tools, are undoubtedly superior to the Copts, and have proved formidable rivals. Furthermore, the importation of cheap European wares of every description is slowly killing all native industry. Lastly, when the British, as the dominant race filled most posts of responsibility in the government, the Muslims, in general, were obliged to content themselves with the subordinate posts which in the past they left to the Copts. Some Copts have attained high office, and in 1908 a Copt became prime minister. Moreover, the Copts have to a certain extent made up for the ground they lose elsewhere by engaging in agriculture and banking, and there are now to be found many rich Coptic landowners and farmers, especially in Upper Egypt.

Language.—The language spoken by the Copts was of various dialects, named Sahidic, Akhmimic, Fayumic, etc., descended from the ancient Egyptian with more or less admixture of Greek (for the Coptic dialects *see* EGYPTIAN LANGUAGE). Coptic, however, has been entirely extinct as a spoken language for over 200 years, having been supplanted by Arabic; in the 13th century it was already so much decayed that Arabic translations of the liturgies were necessary. The literature is almost entirely religious, and consists mainly of translations from the Greek. Such was the enthusiasm for Christianity among the lower classes in Egypt that translations of the Bible were made into three of the dialects of Coptic before the council of Chalcedon; they probably date back at least as early as the middle of the 4th century. Coptic was occasionally employed for literary purposes as late as the 14th century, but from the 10th century onward the Copts wrote mostly in Arabic.

The Coptic Church.—Up to the 5th century the church of Alexandria played a part in the Christian world scarcely second to that of Rome; the names of Origen, Athanasius and Cyril bear witness to her greatness. But in the time of the patriarch Dioscorus the church, always fond of speculation, was rent asunder by the controversy resulting from the doctrine of Nestorius (*q.v.*) that the divine and human natures of Christ were "conjoined" by a moral not a metaphysical union, and the contrary doctrine of Eutyches that the divine and the human in Christ constituted a nature absolutely one. The Eutychian doctrine was condemned by the council of Chalcedon in 451. But to this decision, though given by 636 bishops, the Copts refused assent—a refusal which profoundly affected both the religious and the political history of their country. From that moment they were treated as heretics. The emperor appointed a new bishop of Alexandria, whose adherents the Copts styled Melkites or Imperialists, while the Copts are distinguished as Monophysites and Jacobites. The opposition was national as well as theological; it was in part an opposition of the native party and the Byzantine or court party.

The distinctive Monophysite doctrine of the Copts is not easy to state intelligibly, and yet they clung to it with something of the tenacity which marked their whole history. It is set forth in the Liturgy and recited at every Coptic mass in the following words:—"I believe that this is the life-giving flesh which thine only Son took from the . . . Holy Mary. He united it with His Divinity without mingling and without confusion and without alteration. . . . I believe that His Divinity was not separated from His Manhood for one moment or for the twinkling of an eye." On all other points of dogma the Copts agree with the Greek Orthodox Church.

The Hierarchy.—"The most holy pope and patriarch of the great city of Alexandria and of all the land of Egypt, of Jerusalem the holy city, of Nubia, Abyssinia and Pentapolis, and all the preaching of St. Mark," as he is still called, had originally jurisdiction over all the places named; but of places outside Egypt only jurisdiction over Abyssinia remains. The ancient rule is that no bishop is eligible for the patriarchate. The requirement of a period of desert life has so far prevailed that no one but a monk from one of the desert monasteries is now qualified. This rule, harmless perhaps when the monasteries were the great schools of learning and devotion, now puts a premium on ignorance, and is disastrous to the church; more particularly as even bishops must be chosen from the monks. The patriarch is elected by an assembly of bishops and elders. The patriarch's seat was transferred some time after the Arab conquest from Alexandria to the fortress town of Babylon (Old Cairo), and in modern times it was shifted to Cairo proper. The other orders and offices in the church are metropolitan, bishop, chief priest, priest, archdeacon, deacon, reader and monk.

Churches.—The numerous remaining churches in Egypt but faintly represent the vast number standing in ancient times. Rufinus says that he found 10,000 monks in the one region of Arsinoe. Later, in 616, the Persians are described as destroying 600 monasteries near Alexandria. Abū Sālih (12th century) gives a list of churches surviving in his day, and their number is astonishing. The earliest were cut out of rocks and caverns. In the days of Constantine and Justinian basilicas of great splendour were built, such as the church of St. Mark at Alexandria and the Red Monastery in Upper Egypt. This type of architecture permanently influenced Coptic builders, but there prevailed also a type, probably native in origin, though possessing Byzantine features, such as the domed roofing. There is no church now standing which bears any trace of the fine glass mosaics which once adorned the basilicas, nor is there any example of a well-defined cruciform ground-plan. But the use of the dome by Coptic architects is almost universal, and nearly every church has at least three domes overshadowing the three altars. The domes are sometimes lighted by small windows; but the walls are windowless, and the churches consequently gloomy.

Every church has three altars at the eastern end in three contiguous chapels. The central division, the *haikal* or sanctuary, is always divided from the choir by a fixed partition or screen with small arched doorway closed by double doors. This resembles the Greek iconostasis, the screen on which the sacred pictures are placed. Haikal screen and choir screen are often sumptuously carved and inlaid. A marble basin for the mandatum in the nave, and an epiphany tank at the west are common features. The altar is usually built of brick or stone, hollow within, and having an opening to the interior. A wooden altar-slab covered with crosses, etc., lies in a rectangular depression on the surface, and is used in case of need as a portable altar. Chalice and paten, ewer and basin, crewet and chrismatory, are found as in the Western churches. The aster consists of two crossed half-hoops of silver and is placed over the wafer. The flabellum is used, though now rarely made of precious metal. Some examples of silver-cased textus now remaining are very fine. Every church possesses thuribles—the use of incense being universal and frequent—and diadems for the marriage service. Church bells are forbidden by the Muslims, except in the desert, and church music consists merely of cymbals and triangles which accompany the chanting.

Ritual.—The Coptic ritual deserves much fuller study than it has received. Since the 7th century the church has been so isolated as to be little influenced by changes affecting other communions. Consequently it remains in many respects the most ancient monument of primitive rites and ceremonies in Christendom. But centuries of continuous subjection to Muslim rule have very greatly weakened it.

The Modern Copts.—The British occupation of Egypt profoundly modified Coptic religious life. Before it the Copts lived in their own semi-fortified quarters in Cairo or Old Cairo or in country or desert Dairs (Ders). Walls and gates were now thrown down or disused: the Copts began to mix and live freely among the Muslims, their children to frequent the same schools, and the people to abandon their distinctively Christian dress, names, customs and even religion. Freedom and prosperity threatened to injure the Church more than persecution; confession and fasts fell into neglect and the number of communicants diminished; while the facility of divorce granted by Islam occasioned many perversions from among the Copts to Mohammedanism. On the other hand the necessity of resistance to these tendencies and of reform from within was strongly realized.

COPYHOLD, in English law, an ancient form of land tenure, legally defined as a "holding at the will of the lord according to the custom of the manor." Its origin is to be found in the occupation by villani, or non-freemen, of portions of land belonging to the manor of a feudal lord. In the time of the Domesday survey the manor was in part granted to free tenants, in part reserved by the lord himself for his own uses. The estate of the free tenants is the freehold estate of English law; as tenants of the same manor they assembled together in manorial court or court baron, of which they were the judges. The portion of the manor reserved for the lord (the *demesne,* or domain) was cultivated by labourers who were bound to the land (*adscripti glebae*). They could not leave the manor, and their service was obligatory. These villani, however, were allowed by the lord to cultivate portions of land for their own use. It was a mere occupation at the pleasure of the lord, but in course of time it grew into an occupation by right, recognized first of all by custom and afterwards by law. This kind of tenure is called by the lawyers *villenagium,* and it probably marks a great advance in the general recognition of the right when the name is applied to lands held on the same conditions not by villeins but by free men. The tenants in villenage were not, like the freeholders, members of the court baron, but they appear to have attended in a humbler capacity, and to have solicited the succession to the land occupied by a deceased father, or the admission of a new tenant who had purchased the goodwill, as it might be called, of the holding, paying for such favours certain customary fines or dues. In relation to the tenants in villenage, the court baron was called the customary court. The records of the court constituted the title of the villein tenant, held by copy of the court roll (whence the term "copyhold"); and the customs of the manor therein recorded formed the real property law applicable to his case.

Copyhold had long been established in practice before it was formally recognized by the law. At first it was in fact, as it is now in the fictitious theory of the law, a tenancy at will, for which none of the legal remedies of a freeholder were available. In the reign of Edward IV., however, it was held that a tenant in villenage had an action of trespass against the lord. In this way a species of tenant-right, depending on and strongly supported by popular opinion, was changed into a legal right. But it retained many incidents characteristic of its historical origin. The life of copyhold assurance, it is said, is custom. Copyhold was necessarily parcel of a manor, and the freehold was said to be in the lord of the manor. The court roll of the manor is the evidence of title and the record of the special laws as to fines, quit rents, heriots, etc., prevailing in the manor. The lord, as legal owner of the fee-simple of the lands, had a right to all the mines and minerals and to all the growing timber, although the tenant may have planted it himself. A species of tenure resembling copyhold was what is known as *customary freehold.*

The feudal obligations attaching to copyhold tenure were found to cause much inconvenience to the tenants, while being of no great value to the lord. One of the most vexatious of these was the *heriot,* under which name the lord was entitled to seize the tenant's best beast or other chattel in the event of the tenant's death. The inconvenience caused by these feudal incidents of the tenure led to a series of statutes, having for their object the conversion of copyhold into freehold. By the Copyhold Act 1894, which thereafter governed statutory enfranchisement, the former Copyhold Acts 1841–87, were repealed, and the law was consolidated and improved. By Part V. of the Law of Property Act 1922, all copyhold land was enfranchised on the terms therein set forth and becoming effective on Jan. 1, 1925.

COPYING MACHINES: *see* OFFICE APPLIANCES.

COPYRIGHT, the right now secured by the law of every civilized country to authors of literary, musical and artistic works, to prevent any reproduction of their works without their consent. The growth of the law of copyright protection has closely followed the development of mechanical means of reproduction. Literary copyright was protected only after the invention of printing; artistic copyright was only established with the expansion in the use of engravings and lithographs. It was only on July 1, 1912, that the law of copyright in England was given a general form by the statute which, passed in 1911 as a result of two years' investigation by the international copyright committee, came into force on that date.

The history of the law of copyright in England is one of a number of statutes passed from time to time to deal with abuses as they arose. It is still necessary in the case of works created before 1912 to ascertain whether they were protected under the pre-existing law, because by s. 24 of the act of 1911 copyright protection is given to persons enjoying copyright before its commencement. Some account of these statutes will therefore be useful.

Literary copyright was protected by the Literary Copyright Act 1842, which provided that the copyright in every book published in the life of the author should endure for the life of the author and for seven years after his death or for 42 years, if longer, and should be the property of the author and his assignees, and that the copyright in works published after the death of the author should endure for 42 years from publication and should be the property of the proprietor of the author's manuscript and his assigns. Provision was made for registration at Stationers' Hall and no action for infringement could be brought without prior registration. By s. 18 it was provided that the proprietor of every encyclopaedia, review, magazine, periodical or work published in a series of books or parts, who should have employed any person to compose any part thereof on the terms that the copyright should belong to the proprietor, should enjoy the copyright therein. "Book" was defined as including volume, part or division of a volume, pamphlet, sheet of letter press, sheet of music, map, chart or plan separately published. Engravings were protected by three acts, the Engraving Copyright Acts of 1734 and 1736 and the Prints Copyright Act 1777, and were entitled to copyright for 28 years from publication. Registration was not required but the name of the proprietor and the date of first publication had to be engraved on the plate and printed on each print. Copyright was given to sculptors by an act of 1814, provided that the name of the author and date of issue to the public appeared on each work. The period of copyright under this act was 14 years with a renewed period of 14 years if the author was alive at the end of the first period. The last class to be protected were artists and photographers whose protection was first secured by the Fine Arts Copyright Act 1862. This act gave protection for the life of the author and seven years after his death but such protection was lost if the author in selling the original failed to obtain a written reservation of copyright from the purchaser, and registration was required before any action could be brought. The sole right to perform dramatic pieces was secured by the Dramatic Copyright Act of 1833 and to play musical works by the act of 1842, but the making of gramophone records of musical works was held, in *Boosey* v. *Whight,* 1900, 1 Ch. 122, not to infringe the copyright therein on the ground that these were not "books" within the meaning of the act of 1842. Unpublished works had no statutory protection but a common law copyright in them was recognized.

The Copyright Act of 1911 repealed the whole of the earlier copyright statutes, except one section of the Fine Arts Copyright Act 1862 which penalized fraudulent alterations of artists' works and two short penal acts dealing with the sale of pirated copies of musical works. It provided that no person should be entitled to copyright otherwise than under and in accordance with its provisions, so that the common law copyright previously recognized in unpublished works is no longer in force. Copyright in published and unpublished works is in fact assimilated except in the case of the provisions limiting the area of protection and in respect of the term of protection. It is also important to observe that registration at Stationers' Hall is no longer necessary, so that copyright is now secured to the author by the act of creation and no formality of any kind is required.

The Subject Matter of Copyright.—Copyright, as is provided by s. 1 of the act of 1911, subsists in every original literary, dramatic, musical and artistic work, and these expressions are extended by the definition section of the act. "Literary work" includes maps, charts, plans, tables and compilations. It has been decided that the word "literary" does not connote style or literary finish but is used merely to indicate written or printed matter. Thus there may be copyright in a dictionary or in a mere list of meaningless words forming a telegraphic code or in a railway time-table. The only limit would appear to be that the work in which copyright is claimed must be sufficiently extensive to have demanded some skill in composition. Copyright protection is given not to ideas but to literary forms, and information will not be protected unless it is expressed in an original form. A list of horses published by a racing tipster failed to obtain copyright protection for this reason and the same difficulty arises in the case of a chemical formula. In such cases the real objection is not so much that there is no literary form but that the literary form, as distinct from the idea which it represents, is not original. The same difficulty arises in the case of compilations such as directories, dictionaries and selections of poems. The matter contained in such works is largely unoriginal but that which is protected is the compiler's arrangement. In a recent case it was held that the list of broadcast programmes published by the British Broadcasting company was the subject matter of copyright although in effect they consisted only of a list of titles and names not separately the subject of copyright. So long as the work as a whole represents original effort it will be protected although the component parts are taken from a non-copyright source. On the other hand, mere hack work such as the cutting down of a standard work into a form suitable for schools has failed to receive protection. But though originality is required for all protected works, in the case of artistic works a further difficulty arises. Artistic works are defined as including works of painting, drawing, sculpture and artistic craftsmanship and architectural works of art and engravings and photographs. But an engraving or photograph may be made of a picture and it has been decided that such a work is original though depicting the same object or scene. The protection of architectural works of art in the 1911 act is new and it means that not only can the copying of architectural plans be restrained but that it is an infringement to reproduce a building without the consent of the designer. The definition of dramatic work includes any piece for recitation or choreographic work or entertainment in dumb show, the scenic arrangement or acting form of which is fixed in writing or otherwise. This definition excludes mere "gag" which has no fixed form but it would include, for example, the movements of a musical comedy chorus which are often represented for the producer by a rough sketch or by symbols. The wide definition of artistic works in the act included of necessity designs, which were already protected by the Patents and Designs Act 1907 but for a shorter period and subject to registration. It was therefore provided by s. 22 of the Copyright Act that designs falling within the Designs Act and intended to be reproduced in large numbers by mechanical means should not receive copyright protection. This provision has given rise to a great deal of difficulty because, although the intention obviously was to exclude only purely utilitarian devices, the definition in the Designs Act is wide enough to include purely artistic works such as sculptures or paintings. If reproductions of these are intended to be sold in any quantity, therefore, and this intention is to be ascertained at the time of making the original, such works would appear only to enjoy the lesser protection given by the Designs Act and to require registration.

The cinematograph was for the first time recognized by the act of 1911. In the first place there is included in the means by which the copyright in literary, dramatic or musical works may be infringed "the making of any cinematograph films" thereof. In the second place it is made an infringement of copyright to produce "any visual representation of any dramatic action in a work by means of any mechanical instrument." In the third place copyright is defined as subsisting in "any cinematographic production where the arrangement or acting form, or the combination of incidents represented give the work an original character." In addition a cinematograph film is of course a series of photographs each of which is protected as an artistic work.

The making of any contrivance by means of which a literary, dramatic or musical work may be mechanically performed is an infringement of the copyright therein. The contrivances when made are also protected. Complicated provisions are, however made for the compulsory licensing of the making of gramophone records of musical works. Once the owner of copyright has allowed anyone to make records of a particular work he must permit any other person to make such records in return for a statutory royalty. The procedure for the collection of these royalties is that the person intending to make records gives to the owner notice of his intention to make records and particulars of the price at which he proposes to sell these. The owner then has to supply the manufacturer with adhesive stamps of the required value. If the owner of the copyright fails to send the stamps or cannot be found, the records may be sold unstamped and the royalty becomes a debt due to the owner, but in any other case the sale of such records unstamped is an infringement of copyright. The rate of the royalty prescribed by the act of 1911 is $2\frac{1}{2}\%$ of the retail selling price of each contrivance in case of works published before the commencement of the act and 5% thereof in the case of other works, and it is also provided that a minimum of one halfpenny shall be payable in respect of each separate musical work on every contrivance. The act provides for alteration of these rates by the Board of Trade; an enquiry was held in April 1928 with a view to the increase of these rates, and the tribunal recommended an increase of the 5% rate to $6\frac{1}{4}\%$ and of the minimum royalty from one halfpenny to three farthings.

Rights Under the Act.—The basic right of the owner of copyright is that he has "the sole right to produce or reproduce his work or any substantial part thereof in any material form whatsoever." He is also, however, given by the act of 1911 certain other important rights of which the most important is the sole right to perform his work in public. The question of what amounts to publicity for the purposes of this act has been recently discussed by the court of appeal in the case of *Harms (Incorporated)* v. *Martans Club Ltd.,* 1927, 1 Ch. 526, in which it was held that a performance at a private dance club in the presence of some 200 members and guests was an infringement of copyright. While declining to lay down any definition, the court indicated that matters which had to be considered were the profit made by the performer and the probable injury to the owner of the right and, if there were no charge for entry, whether the class of public admitted were such as would pay at a theatre to hear the same performance. It is also an infringement of copyright for a person for his private profit to permit a theatre or other place of entertainment to be used for the performance in public of a work without the consent of the owner of the copyright. It was for some time uncertain whether "broadcasting" was an infringement of copyright, since it was difficult to bring the operation within the definition in the act of "an acoustic representation of a work in public by means of a mechanical instrument." Liability on this point was, however, admitted by the British Broadcasting company in a recent case.

Other rights given to the owner of copyright are the sole right of translating his work, and the sole right of converting novels into dramas and dramas into novels. Section 2 (2) of the act provides for the liability of persons dealing with articles which they know to infringe copyright by selling such works or by distributing or exhibiting them by way of trade. It is also an infringement of copyright to import for sale into the country any work which to the importer's knowledge would infringe copyright if made there. For example a copy of an English novel may have been printed in France under a licence from the owner confined to France. The making of this copy, by the person who made it, in England would have been unlawful and if the importer knows of this he infringes the owner's copyright by importing it. It is obvious, however, that proof of such knowledge is a matter of difficulty. An additional protection to copyright owners is the provision in s. 7 that any copy of a work made or imported in infringement of the owner's copyright is the property of the owner. The owner can therefore bring an action for detinue or conversion against anyone in possession of such copies irrespective of his knowledge of the original unlawfulness of the manufacture, though in the case of an imported work, as has already been pointed out, the importing itself is not an infringement of the owner's copyright unless the importer knew that the work would have infringed it if made here, so that in the case of such works the owner has to establish in any event the guilty knowledge of the importer.

The Owner of the Right.—Section 5 (1) of the act of 1911 provides that subject to the provisions of the act the author of a work shall be the first owner of the copyright therein. "Author" is nowhere defined. It is clear however that, where the idea of a work is suggested by one person and the work is executed by another, the latter is the author for purposes of copyright. Thus a person who suggests the plot of a play (*Tate* v. *Thomas,* 1921, 1 Ch. 503), the inventor of a design for voting cards (*Kenrick* v. *Lawrence,* 1890, 25 Q.B.D. 99) and, under the old law, the poser of a photograph (*Nottage* v. *Jackson,* 1883, 11 Q.B.D. 627) have been held not to be authors. Section 21 of the 1911 act provides that the owner of the negative of a photograph at the time when such negative was made shall be deemed to be the author of the work. In two cases, however, the author of a work is not the first owner. In the case of an engraving, photograph or portrait, where the original has been ordered by some person and made for valuable consideration in pursuance of the order, then, in the absence of agreement to the contrary, the person ordering is the first owner. The agreement to the contrary may apparently be oral or implied from the conduct of the parties, so that in the vaguely defined relations which usually exist between canvassing photographers and their sitters it is extremely difficult to determine to whom the copyright belongs. The other provision is that a person employing the author of a work under a contract of service or apprenticeship shall, in the absence of agreement to the contrary, be the first owner of the copyright therein. The employment must be under a "contract of service" which implies a relationship of master and servant and does not include the case of isolated contributions for payment such as were included in s. 18 of the Literary Copyright Act 1842 referred to above. The first owner however can assign his right or may grant interests therein by way of licence provided that he does so in writing signed by himself or his authorized agent. He may assign any separate part of the rights given him by the act and he may assign his rights for a limited area or for a limited period of time and the assignee is in the position of an owner in respect of the right assigned. If however the assignment is made before the work is created, any action must be brought in the name of the assignor. The position of a licensee is more doubtful. If the licence is in writing and is expressed as a grant of an interest by way of licence there is some authority for the view that the licensee can in his own name bring actions against infringers of the right licence. On the other hand the owner of copyright may by words or conduct be held to have consented to reproductions of his work and if value be given for such consent it has been held to amount to an irrevocable license which, though it does not enable the licensee to sue infringers, affords him a good defence against the owner. There are certain provisions for compulsory licences. At the expiration of 25 years from the death of the author of a published work or from the publication of a work unpublished at the author's death copies may be reproduced and sold upon payment of a compulsory 10% royalty collected by stamps in a manner similar to that already explained in the case of gramophone records. The judicial committee of the privy council may also at any time after the author's death order the owner of the copyright of a literary, dramatic or musical work which has already been published or performed in public to grant licences for the reproduction in or performance of the work in such terms as they think fit.

Apart from the provisions already discussed there are two sets of special provisions as to the ownership of copyright. By s. 18 the copyright in any work prepared or published under the direction or control of the sovereign or any Government department is vested in the sovereign and is to endure for a period of 50 years from publication. The Government however does not insist on its right in the case of acts of parliament and parliamentary reports. Section 33 preserves the old perpetual copyright by an act of 1775 to books bequeathed in trust for the Universities of Oxford and Cambridge, the four universities of Scotland or the colleges of Eton, Westminster or Winchester and there printed for their sole benefit. The university libraries also enjoy the right under s. 15 of demanding a copy of every book published and a copy of every book must be sent without demand to the British Museum. It should be observed however that non-compliance with these provisions does not affect the copyright in the book but renders the publisher liable to a fine of £5 and the value of the book.

Duration of Copyright Protection.—As has been shown already, prior to the commencement of the Copyright Act of 1911, the period during which an author enjoyed copyright varied for different classes of work. Under the act of 1911 however, with certain limited exceptions, the copyright in all works endures for the life of the author and 50 years after his death. In the case of works of joint authorship, which are defined as works produced by the collaboration of two or more authors in which the contribution of one author is not distinct from the contribution of the other author, copyright subsists during the life of the author who dies first and 50 years after his death, or during the life of the author who dies last, whichever period is the longer. Works unpublished at an author's death enjoy copyright until publication and for 50 years thereafter, and publication means the issue of copies of the work to the public but does not include performance or exhibition in public. The chief exceptions to the general rules above stated are in regard to mechanical instruments, photographs and Government publications. By s. 19 (1) of the act copyright in gramophone records and similar contrivances subsists for 50 years from the making of the original plate. By s. 21 the term of copyright in photographs is to be 50 years from the making of the original negative. In the case of Government publications the term of copyright, as has been stated above, is 50 years from publication.

Infringement of Copyright.—Infringement of copyright is defined in the act of 1911 as the doing of anything the sole right to do which is conferred by the act on the owner of copyright. It is rather surprising that the act does not directly state the proposition which has always been put forward as the proper ground for distinguishing copyright from a monopoly, namely that it is no infringement of copyright to reproduce the same result provided that resort is not had to the author's original. The point is of considerable importance in the case of compilations, of commercial designs and of photographs since it is quite possible for works of this class to be practically identical although the author of neither work has seen the other. It has however always been assumed that the real basis of an action for infringement of copyright is culpable wrong-doing on the part of the defendant—literary theft—and there is no doubt that now, as under the old law, it is essential for the owner of copyright to prove that a defendant has either copied his work or copied something which was itself a copy. The inventor of a particular form of words or the artist who composes a picture of a particular scene or arrangement of figures has no monopoly of his inventions, and if, by chance, another author or artist hits upon the same words or the same scene he has committed no wrong either in fact or in law. Resemblance, therefore, though it may often lead to the inevitable conclusion that the defendant has in fact seen the plaintiff's work and so be excellent evidence that copying has occurred, is not in itself sufficient to substantiate a claim for infringement. Resemblance again may not amount to infringement of copyright because the resemblance, though due to the second author having seen the original, is so remote as not to injure the first author. The act of 1911 is not clear in regard to this matter either. In the early days of copyright protection, when this was extended only to "books" as such, attempts were made to evade the law by expressing the contents of books in other words. It was soon established that any "colourable imitation" of a book could be proceeded against and the doctrine was in due course extended to infringement of other copyright works. The act of 1911 however does not state this in any definite form. The expression "colourable imitation" is only employed in the definition of "infringing copies" and this phrase is not used in that part of the act which defines infringement. In fact however one of the most difficult questions which the courts have to determine is whether a defendant has so far copied the plaintiff's work that he can be said to have created a colourable imitation of it, or whether he has taken the idea only and clothed it in a new literary or artistic form. This problem arises forcibly in the case of plays which are alleged to infringe the copyright in a novel and in the case of cinematograph films. In such cases the form of artistic expression being different it is unlikely that much literal copying will be discoverable. The result of decisions on the subject appears to be that while the mere taking of a plot is not sufficient in itself to constitute an infringement, yet this, coupled with a close resemblance of situations and incidents, even without the taking of actual words or phrases, will be enough to give rise to a cause of action. In dealing with the question of colourable imitations in relation to artistic works the test has been suggested:—"A copy is that which comes so near the original as to suggest that original to the mind of every person seeing it." Similar principles have to be considered when dealing with burlesques which may constitute infringements if they are really representations of the original work in an altered form.

Another matter which has to be considered in relation to infringements is whether enough of the first work has been taken to create a wrong. Of course in dealing with composite works such as catalogues or magazines or cinematograph films of several reels it may be possible to split up the offending work into infringing and innocent matter and limit the injunction accordingly. On the other hand a work which it is not practicable to split up may contain a small amount of admittedly copyright matter but so small a quantity that it would be a hardship upon the defendant to restrain the circulation of the work. Certain specific cases where it is permissible to use copyright matter are dealt with below but besides this the act provides that it is only an infringement to take "a substantial part" of the original work. Cases dealing with the earlier acts which, though they did not use this exact phrase, were held to have implied it, have decided that "substantial" does not refer to quantity alone but also to the importance of the part taken in relation to the whole; a few bars out of a long piece of music may contain the essential melody or a few lines may hold the real beauty of a poem and the taking of these bars or lines would certainly be prohibited.

A matter of difficulty always is to decide how far copyright can be infringed by reproductions in a different form of art. The infringement of literary and dramatic works by their respective reproduction as plays or novels has already been mentioned as has also the question of mechanical reproductions. It had been considered before the act of 1911 that a statue would not infringe the copyright in a picture. The "Living Picture" cases had decided that *tableaux vivants* did not infringe the copyright in the picture which they purported to represent and it was thought that this doctrine would apply also in the case of sculptures. Under the act of 1911 however Coleridge J. in *Bradbury Agnew* v. *Day* 32 T.L.R. 349 indicated that the law as to *tableaux vivants* is now changed and it would seem that under the wide words of the act sculptures and pictures may be infringements of one another respectively.

A further right given to the author by s. 1 (2) is that of "authorizing" any of the acts in respect of which he is given the sole right by the act. For some time it was thought that this provision added nothing. No doubt it made the authorizing of a reproduction of a work without the author's consent an infringement of copyright, but apart from express provision the master whose servant commits a tort is liable and it has been indicated in the case of the *Performing Right Society* v. *Ciryl Syndicate,* 1924, 1 K.B. 1 that there was nothing in this provision to make a man liable for the infringements of copyright by persons employed as independent contractors. The court of appeal has however recently held in *Falcon* v. *Famous Players' Film Co.,* 1926, 2 K.B. 474 that the phrase "to authorize" does add something to the ordinary law of responsibility for servants and that anyone who "sanctions, approves or countenances" an infringement is liable for it.

Permitted Reproductions.—Section 2 (1) of the Copyright Act expressly provides that certain acts shall not constitute an infringement of copyright. There is in the first place a general provision that any fair dealing with a work for the purposes of private study, research, criticism, review or newspaper summary shall be allowed. Obviously "fair dealing" is difficult to define but it would seem that the question of whether the two works compete is of importance in judging of the fairness of the reproduction. Liberties of a similar nature are:—the publication of short passages from published literary works in collections for the use of schools; the publication in a newspaper of a report of a lecture, unless such report is prohibited by a conspicuous notice maintained during the lecture near the entrance of the building where the lecture is given; and the publication of reports of political speeches in a newspaper. Authors of artistic works in respect of which they do not own the copyright are entitled to use again sketches and moulds prepared by them in connection with the work, provided that they do not thereby repeat the main design of the work. Drawings and photographs of works of sculpture permanently situate in public buildings may be made and sold, and also, provided that they are not architectural plans, such reproductions of any architectural work. The reading or recitation in public of reasonable extracts of published works is also permitted. There is in s. 8 of the act a further provision which was also intended to protect the innocent since it provides that if a defendant proves that at the date of the infringement he was not aware of and had no reasonable ground for suspecting that copyright subsisted in the work the plaintiff shall not be entitled to damages. It was held however in *Byrne* v. *Statist,* 1914, 1 K.B. 622 that this provision did not assist defendant who thought he had a licence to copy but was innocently mistaken. Since any work may be the subject matter of copyright it is very difficult for any defendant to prove that he had no ground for suspecting that any particular work is the subject matter of copyright, so that the section does not in practice afford much protection. No action for infringement of copyright may be brought after the expiration of three years from the infringement.

Primarily the remedy for infringement of copyright is by action for an injunction and damages, but s. 11 of the act of 1911 provides certain summary remedies whereby the making, sale, distribution or importation of infringing copies is punishable by fine or imprisonment. The Musical (Summary Proceeding) Acts of 1902 and 1906 are also still in force, by which pirated copies of musical works may be seized by a constable without a warrant. There is also under the section of the Fine Arts Copyright Act 1862 still unrepealed a penalty upon persons fraudulently signing their name to paintings or photographs or selling or uttering such works so signed. The owner of copyright has a further remedy in the case of large importations of infringing copies in that he can apply to the commissioners of customs and excise for an order that all such copies shall be detained by the customs authorities under the provisions of s. 14 of the act.

Limits of Copyright Protection.—Copyright protection is limited to the safeguarding of the literary or artistic form of a work. What is known in Continental countries as the "droit moral"—the right of an author in the reputation of his work—is not directly recognized in English law. There are, however, certain forms of action available to authors from this point of view. There is the "passing off" action. An author has the right to restrain the passing off to the public of another's work as his. This form of action has been used to preserve an author's *nom-de-plume* and is available in the case of similar titles. In the latter case, however, it has to be shown that the public really so associated the title with the author plaintiff that they believed that the other work was also his. The converse case, however, is more difficult. The assignee of copyright has the right, as far as copyright goes, to make any use he pleases of the work assigned though such a use may be displeasing or even injurious to the author. Of course if alterations are made which suggest, for example, that the author writes illegal or immoral works the ordinary law of libel is available, but short of this the only form of action open to the author is one in the nature of slander of goods. As success in this action requires proof of real malice on the part of the defendant and actual damage to the plaintiff, it is not one which is often available. The literary reputation of authors is therefore not fully protected in English law as it exists at present. There is, however, in the case of artistic works the section of the Fine Arts Copyright Act 1862 already mentioned. The fourth clause of this section provides that it is an offence to sell, publish, or offer for sale any artistic work which to the knowledge of the vendor or publisher has been altered or added to without the consent of the artist. The sale must, however, be made under circumstances which amount to a representation that the original artist is the author of the work as altered (*Preston* v. *Raphael Tuck,* 1926, 1 Ch. 667).

Colonial Copyright.—The scheme of the Copyright Act of 1911 was that it should extend throughout the British dominions as one comprehensive code. The act throughout in speaking of the area covered by it uses the phrase "the parts of His Majesty's dominions to which this act extends," and it may be said at the present time that the act extends to the whole of His Majesty's dominions. Colonial copyright is dealt with in ss. 25–28 of the act. The act initially applied to British possessions but not to the self-governing dominions. It was provided that either the act might be declared to be in force in such a dominion by its own legislature or that, if a self-governing dominion enacted a similar act, the secretary of State for the colonies might by certificate cause the imperial act to apply to the colony, or, if the dominion legislature did not go so far in following the imperial act, but gave adequate protection to British subjects residing elsewhere, an Order in Council could give protection in Britain to the subjects of this dominion. The dominions took different courses. Newfoundland adopted the imperial act without qualification. The Commonwealth of Australia and the Union of South Africa have also adopted the act but with certain modifications. The Australian act of 1912 provides for registration though this is not compulsory except for the purpose of enjoying certain summary remedies. The South African act of 1916 has similar provisions for registration. New Zealand and Canada have their own Copyright Acts, but in the case of both dominions the certificates of the secretary of State for the colonies already mentioned have been given. The New Zealand act of 1913 contains sections identical with those of the imperial act arranged in a different order. It also provides for voluntary registration and there is a section enabling the governor in council to exclude published works from protection whose authors are subjects of a foreign country not giving reciprocal protection to New Zealand subjects. The original Canadian Copyright Act of 1921 contained certain provisions enabling compulsory licences to be obtained for the publication of books and serials. Such provisions were repugnant to the Berne Convention and by an amending act of 1923 it is provided that these provisions shall not apply to works whose authors are British subjects other than Canadian citizens or subjects or citizens of a country which has adhered to the Convention. The act, however, still contains provisions requiring the compulsory registration of assignments of copyright which appear to be difficult for foreigners to comply with. Apart from this the act contains sections similar to those in the imperial act. The colonies are therefore now all subject to the same code and by Orders in Council made from time to time under the provisions of s. 28 of the act of 1911 that act has been extended to the following protectorates:—Cyprus, Bechuanaland, East Africa, Gambia, Gilbert and Ellice islands, Northern Nigeria, Northern Gold Coast, Nyasaland, Northern Rhodesia, Southern Rhodesia, Sierra Leone, Somaliland, Southern Nigeria, Solomon islands, Swazieland, Uganda, Weiheiwei and Palestine. British India came under the act of 1911 initially but in 1914 passed an act introducing local modifications and in particular limiting the term of copyright of works first published in India to ten years. The Irish Free State was at first subject to the provisions of the act of 1911 by the effect of the Irish Free State Constitution Act 1922. The local legislature in 1927 repealed the 1911 act within the limits of the State and enacted a new Copyright Act which follows closely the old act but has certain additional provisions.

International Copyright.—International copyright has two aspects: the right extended to foreigners by Great Britain, and the right extended to British subjects by foreign countries. The act of 1911 in the first place by S. 1 extends, in the case of published works, to such works as are published in His Majesty's dominions before or within 14 days after publication elsewhere, and in the case of unpublished works to works whose authors were at the date of the making of the work British subjects or resident within His Majesty's dominions. But by S. 29 the act may by Order in Council be made to extend to works first published in a foreign country or to the unpublished works of authors who are foreigners or were resident in a foreign country at the date of the making of the work, provided that before the making of such an order in respect of any country, the foreign country must have undertaken to make similar provision for works of British subjects or first published in Britain. Such orders have been made in respect of all the foreign countries mentioned below as being members of the Berne Convention and the provisions of the act of 1911 consequently apply to works first published in these countries and to the unpublished works of their citizens and residents.

The orders however contain some limitations of which the most important is that the term of copyright is not to exceed that prescribed by the country to which the order relates. Besides these orders an order has been made extending the act to the unpublished works of citizens of the United States of America or of persons resident there at the date of the making of their works; there is however no copyright in works first published in the United States since that country does not extend reciprocal rights to British works. These orders do not apply to the self-governing dominions to which it is open to make their own arrangements with foreign countries, but in fact all the dominions are now members of the Berne Convention and afford reciprocal rights to other members.

The rights of British subjects abroad chiefly arise by reason of the provisions of the Berne Convention. This Convention consists of a series of treaties known as The Berne Convention of 1886, the Additional Act of Paris of 1896, The Revised Convention of 1908 and the Additional Protocol of 1914. The scheme of the Convention is that each of the contracting countries shall provide for works first published in other countries of the Union and for unpublished works whose authors are citizens of or resident in such countries a certain minimum copyright protection. The greater part of the countries of the Union have now acceded to the 1908 Revised Convention and so it will be sufficient to refer here to the provisions of this Convention.

The operative provision of the Convention is contained in art. 4 which provides that authors who are subjects or citizens of any of the countries of the Union shall enjoy in countries other than the country of origin of the work, for their works, whether unpublished or first published in a country of the Union, the rights which the respective laws do now or may hereafter grant to natives as well as the rights specially granted by the present Convention. The article proceeds to provide that no formality shall be required for the enjoyment of such rights. In other respects the extent of protection and the means of redress are to be governed exclusively by the laws of the country where protection is claimed. By art. 6 the same rights are extended to authors who are not subjects of a country of the Union who first publish their works in one of those countries. By art. 7 it is provided that the term of protection is to be regulated by the law of the country where protection is claimed but is not to exceed the term fixed by the country of origin. The provisions with regard to the publication of articles in newspapers are of importance. These are contained in art. 9. News items have no protection at all. Newspaper articles other than serials or tales may be copied unless the reproduction is expressly forbidden but the source from which they are copied must be indicated in relation to any reproduction. Stories, tales and other works may not be reproduced at all. It is not necessary to set out here the articles in the Convention defining the subject matter of copyright and the methods in which copyright may be infringed because the British act of 1911 was in fact based on the Convention and drawn up so as to put the provisions of the Convention into force in Britain, and consequently follows closely and works out in detail these provisions. By art. 13 authors of musical works are to have the exclusive right of authorizing the adaption of their works to instruments which can produce them mechanically and of authorizing the public performance of the said works by means of these instruments, but reservations and conditions as to the application of this article may be determined by the domestic legislation of each country. The provisions in Britain as to compulsory recording licences which have already been discussed are in pursuance of this proviso. The Convention established an international office under the authority of the Government of the Swiss Confederation to examine copyright questions and to publish a periodical report of the current changes in the law of copyright. The expense of the office is shared proportionately by the different countries. Provision is made for the revision of the Convention and discussions with regard to such revisions were held at Rome in May 1928. Non-member States may accede to the Union by giving notice of their accession in writing to the Swiss Government. The present members of the Copyright Union are:—Austria, Belgium, Brazil, Bulgaria, Czecho-Slovakia, Danzig, Denmark, Esthonia, France (including Algeria and other colonies and Syria and Lebanon), Germany, Great Britain (including her colonies and possessions, the self-governing dominions being individual members), Greece, Haiti, Hungary, Irish Free State, Italy, Japan, Siberia, Luxemburg, Morocco (excluding the Spanish zone), Monaco, the Netherlands and Dutch colonies, Norway, Poland, Portugal, Rumania, Spain, Sweden, Switzerland and Tunis.

Isaacs, *The Law of Theatres, Music Halls and Cinemas* (1927); W. A. Copinger, *The Law of Copyright*, 6th ed. by F. E. Skone James (1927). (F. E. S. J.)

UNITED STATES

The protection of copyright by statute in the United States began with the enactment by the State of Connecticut in Jan. 1783, and by the State of Massachusetts in March of the same year, of acts which gave copyright for a term of 14 years, with the right of a 14-year renewal if the authors were living at the expiration of the first term. This action was the result of a vigorous crusade by Noah Webster. Before May 1786 ten more States had passed copyright acts for varying terms. These acts followed in principle, and substantially in form, the English statute of 1710 known as the Act of Queen Anne. Prior to the organization of the States in 1783, what protection had been enjoyed in America by authors had to be secured in the colonies, as in Great Britain, under the principles of common law.

In 1790, the U.S. Congress, influenced in large part by the arguments of Noah Webster and other literary workers, enacted the first national statute. This act gave to authors who were citizens or residents, and to their heirs and assigns, copyright protection for books, maps and charts for a term of 14 years, with the right to renewal for 14 years more at the expiration of that time. The statute provided for the deposit, before publication, of a printed title page in the clerk's office of the local U.S. district court. It provided further for the advertising of the book, with specification of the copyright entry, four times within the first two months after publication. Requirement was made for the deposit, within six months of publication, of a copy of the book with the U.S. secretary of State. The penalties imposed upon a printer of an unauthorized impression of the book so copyrighted included the forfeiture of his piratical copies and a fine of 50 cents for each sheet that was found. Half of this fine went to the owner of the copyright and half to the United States. The statute also made provision, in confirmation of rights existing under common law, against the unauthorized publication of manuscripts. This original act was followed by the act of 1802 which required the record of copyright to be printed on or following the title page. The same requirement was made for designs, engravings and etchings entered for copyright. The statute of 1819 gave to the U.S. circuit courts original jurisdiction in cases of copyright. The act of 1831 which was, in substance, a consolidation of the previous acts, included a provision for the protection of musical compositions. The term was extended to 28 years, with renewal for 14 years to the author, his widow or his children. The requirement of newspaper notice, except in the case of renewals, was cancelled. This statute confirmed the requirement for the deposit of a copy with the U.S. district clerk, this copy to be transmitted to the secretary of State within three months after publication. The act of 1834 required that record in the court of original entry should be made of any assignment of the copyright.

In 1846, the Smithsonian Institution was established by act of Congress, this act making provision for the delivery of one copy of a book securing copyright to the library of this institution. The same act provided for the delivery of one copy of the copyrighted book to the library of Congress. This was important because depositing and cataloguing these books in the library of Congress—a requirement confirmed in all subsequent acts—made it practicable, after 1846, to secure prompt and trustworthy information from the library and in later years from the bureau of copyright connected with this library, as to the status of the copyright of any literary work. The applicant desiring to ascertain whether or not a book is in the public domain, or who is the recorded owner of the copyright, made application, under the act of 1846, to the librarian of Congress, and since the establishment of the bureau of copyright, makes application to the register of the bureau, and secures for a fee of $1 the information required. This opportunity of ascertaining the precise status of literary productions which have been entered for copyright is of assured convenience and importance to the publishers and to the book-buying public.

The U.S. act of 1856 secured to dramatists the protection for the right of performance. The act of 1859 made the Interior Department, instead of the State Department, the custodian of copyright. The act of 1861 provided for an appeal to the Supreme Court in all copyright cases, irrespective of the estimated value of the property in question. For other than copyright appeals it is required that the property in question shall have value of not less than $5,000. The act of 1865 again placed under the control of the library of Congress the copies of books deposited in connection with the entry of copyright. This deposit had to be made within one month from publication. The provision covers not only books, but works of art, photographs and negatives. An amendment in 1867 provided for a penalty of $25 in the case of failure to deposit within the month specified. Twelve acts having to do with copyright had become law prior to 1870. That year brought a general act which provided protection not only for works of literature, but for paintings, drawings, statues, chromos, models or designs, and superseded previous statutes. This act cancelled the control by the local district courts of the system of registry, and made the librarian of Congress the copyright officer. It was required that the printed title of the book be filed in his office before publication, and two copies deposited within ten days after publication.

The application of copyright law, unlike that regarding patents, is solely a question for the courts. The librarian of Congress is simply an officer of record and makes no decisions. In 1874 an amendatory act made legal a short form of record—"Copyright, 18—, by A.B."—and the protection of label designs was transferred to the patent office. In 1879 the appropriation bill of the U.S. post office contained a provision prohibiting the transmission of any publication that violated copyright. In 1891, after a campaign extending over many years, a copyright measure providing international copyright became law. The first attempt to bring about international copyright had been made by a committee instituted in 1837 by George P. Putnam, who all his life worked actively for the establishment of copyright relations between the United States and the other literature producing nations of the world.

International Copyright.—In 1885 a copyright committee of authors and publishers was organized for the purpose of securing international copyright relations under United States statute. It became evident, during the succeeding years in which the committee was endeavouring to secure the enactment of an international copyright bill, that the United States could not secure membership in the Convention of Berne, under whose regulations copyright protection was secured for all countries accepting membership in the convention, the Governments of which were prepared to extend such protection to works originating in the other member States. The United States book-manufacturing interests took the ground that works securing the protection of copyright under United States statute must be entirely manufactured within the territory of the United States. This restriction was subsequently modified so that in the act of 1909 permission is accorded to include in a work securing American copyright and manufactured in the United States illustrations that have been produced outside of the United States, provided that "the article in the design did not exist within the territory of the United States."

This statute, which was enacted in March 1909, and which came into effect on the first of July, 1909, provided that the term of copyright should be twenty-eight years from the date of first publication, with a right of renewal for a further term of twenty-eight years, when application for such renewal and extension shall have been made within one year prior to the expiration of the original term of copyright. The right to secure such renewal is vested in the author, the members of the author's family, or his executors. In 1891, after six years of persistent effort, the committee representing the authors and the publishers secured the enactment of a measure which conceded copyright protection in the United States to countries, the copyright statutes of which granted similar protection to the works of American authors. This statute provided, as above specified, for the manufacture in the United States of all works securing American copyright. In 1919, the copyright bureau of the American Publishers' Copyright League secured the enactment of a statute which gave protection to the transatlantic works that during the years of the World War had failed to meet the requirements of the American copyright law, with the exception of books which had been reprinted in the United States during the war period. The reprinters were left at liberty to continue publishing books which at the time of their reprint had fallen into public domain. An Order in Council, issued through the efforts of Lord Askwith, secured for Great Britain similar copyright protection for works by American authors which during the war years had failed to meet the requirements of the English statute. Both in the American act and in the English Order in Council provision was made for the fulfilment at the time of the application for copyright of the original requirements.

Since 1891, repeated efforts have been made to bring about the enactment of a measure which should enable the United States to accept membership in the Convention of Berne, and in April 1928 a measure with this purpose was on the calendar of the House and of the Senate. This bill waives the requirement for American manufacture, but provides that the exclusive control of the work securing American copyright shall rest with the owner of the copyright, the author, or with his assign, the publisher. Under the statute existing in 1928, libraries and individuals have permission to import "for use and not for sale" copies of the transatlantic editions of books, the copyright of which is the property of the assign (the American publisher) of the trans-Atlantic author. In the absence of membership in the Convention of Berne, the United States has, since 1891, come into copyright relations with Great Britain and most of the States of Europe, and also with Japan, under special agreements. The act of 1891 went into force on July 1, and the list of countries with which from that date the United States was in copyright relations included Great Britain, France, Italy, Belgium, Switzerland, Spain and the Scandinavian States. The following year a copyright relation was established by treaty with Germany and some years later Japan, which had accepted membership in the Convention of Berne, brought into force a copyright treaty with the United States. It is the hope of authors, publishers and others who are interested in literary property, and who want to bring about the largest possible distribution of literary productions throughout the civilized world, that in the near future all barriers and restrictions interfering with the recognition of the property rights of the producer and his assign may be removed. The publishers have in mind, particularly, the extension of the publication of what have been called international series, such as the *Science Series*, the *Heroes of the Nations*, the *Story of the Nations*, etc. In such international series, the authors secure remuneration based upon the number of markets in which editions of the books can be placed. The cost of the authorship is divided between the editions issued in those markets. In like manner, the cost of the illustrations can be divided. As a result, the author secures from the increased circle of readers a larger remuneration than would ever come to him from the production of an edition for his home market alone, while the reader has placed in his hands, at a lower cost than would otherwise be practicable, a work which may have been written by the world's highest authority on the subject. Such an extension of publishing methods, for the benefit not only of authors and publishers but of the book-buying public, can be possible, however, only under world-wide international copyright, with a system in which the author is left at liberty to sell each market separately and to give to his assign, the publisher, an exclusive control of the market thus sold. (G. H. Pu.)

COQUELIN, BENOÎT CONSTANT (1841–1909), French actor, known as Coquelin *aîné*, was born at Boulogne on Jan. 23, 1841. He was originally intended to follow his father's trade of baker (he was once called *un boulanger manqué* by a hostile critic), but he entered Regnier's class at the Conservatoire in 1859. He won the first prize for comedy within a year, and made his début on Dec. 7, 1860, at the Comédie Française as the comic valet, Gros-René, in Molière's *Dépit amoureux*, but his first great success was as Figaro, in the following year. He was made *sociétaire* in 1864, and during the next 22 years he created at the Français the leading parts in 44 new plays, including Théodore de Banville's *Gringoire* (1867), Paul Ferrier's *Tabarin* (1871), Émile Augier's *Paul Forestier* (1871), *L'Étrangère* (1876) by the younger Dumas, Charles Lomon's *Jean Dacier* (1877), Edward Pailleron's *Le Monde où l'on s'ennuie* (1881), Erckmann and Chatrian's *Les Rantzau* (1884). In consequence of a dispute with the authorities over the question of his right to make provincial tours in France he resigned in 1886. Three years later, however, the breach was healed; and after touring in Europe and the United States he rejoined the Comédie Française as *pensionnaire* in 1890. In 1892 he broke definitely with the Comédie Française, and toured for some time through the capitals of Europe with a company of his own. In 1895 he joined the Renaissance theatre in Paris, and played there until he became director of the Porte Saint Martin in 1897. Here he won successes in Edmond Rostand's *Cyrano de Bergerac* (1897), Émile Bergerat's *Plus que reine* (1899), Catulle Mendès' *Scarron* (1905), and Alfred Capus and Lucien Descaves' *L'Attentat*

(1906). In 1900 he toured in America with Sarah Bernhardt, and on their return continued with his old colleague to appear in *L'Aiglon,* at the Théâtre Sarah Bernhardt. He was rehearsing for the creation of the leading part in Rostand's *Chantecler,* which he was to produce, when he died suddenly in Paris, on Jan. 27, 1909. Coquelin was an Officer de l'Instruction Publique and of the Legion of Honour. He published *L'Art et le comédien* (1880), *Molière et le misanthrope* (1881), essays on *Eugène Manuel* (1881) and *Sully-Prudhomme* (1882), *L'Arnolphe de Molière* (1882), *Les Comédiens* (1882), *L'Art de dire le monologue* (with his brother, 1884), *Tartuffe* (1884), *L'Art du comédien* (1894). *See* Schoen, *V. Sardou et Constant Coquelin* (1910).

His brother, ALEXANDRE COQUELIN (1848–1909), called Coquelin *cadet,* was born May 16, 1848, at Boulogne and entered the Conservatoire in 1864. He graduated with the first prize in comedy and made his début in 1867 at the Odeon. The next year he appeared with his brother at the Théâtre Français, and became a *sociétaire* in 1879. He played a great many parts, in both classic and the modern répertoire, and also had much success in reciting monologues of his own composition. He wrote *Le Livre des convalescents* (1880), *Le Monologue moderne* (1881), *Fairiboles* (1882), *Le Rire* (1887), *Pirouettes* (1888). He died on Feb. 8, 1909.

COQUEREL, ATHANASE JOSUE (1820–1875), French Protestant divine, son of A. L. C. Coquerel (*q.v.*), was born at Amsterdam on June 16, 1820. He studied theology at Geneva and Strasbourg, and at an early age succeeded his uncle, C. A. Coquerel, as editor of *Le Lien,* a post which he held until 1870. In 1852 he took part in establishing the *Nouvelle Revue de théologie,* the first periodical of scientific theology published in France, and in the same year helped to found the "Historical Society of French Protestantism." He had gained a high reputation as a preacher and an advocate of religious freedom; but his teaching offended the orthodox party, and on the appearance (1864) of his article on Renan's *Vie de Jésus* in the *Nouvelle Revue de théologie* he was forbidden by the Paris consistory to continue his ministerial functions. The *Union Protestante Liberale* provided him with the means to continue his preaching. He received the cross of the Legion of Honour in 1862. He died at Fismes (Marne), on July 24, 1875. His chief works are *Jean Calas et sa famille* (1858); *Des Beaux-Arts en Italie* (Eng. trs. 1859); *La Saint Barthélemy* (1860); *Précis de l'église reformée* (1862); *Le Catholicisme et le protestantisme considerés dans leur origine et leur développement* (1864); *Libres études,* and *La Conscience et la foi* (1867).

COQUEREL, ATHANASE LAURENT CHARLES (1795–1868), French Protestant divine, was born in Paris on Aug. 17, 1795. He received his early education from his aunt, Helen Maria Williams, an Englishwoman, author of the *Letters from France.* He studied at the Protestant seminary of Montauban. Coquerel became pastor of the Reformed Church in Paris, where he displayed liberal views on religion and education which caused some criticism. His defence of the University of Paris brought him membership of the consistory of the Legion of Honour. In 1841 appeared his *Réponse* to the *Leben Jesu* of Strauss. He sat as a moderate republican in the National Assembly of 1848, subsequently becoming a member of the Legislative Assembly. He supported the first ministry of Louis Napoleon, but after the *coup d' état* of Dec. 2, 1851, he confined himself to the duties of his pastorate. He died in Paris on Jan. 10, 1868. A large collection of his sermons was published in 8 vols. between 1819 and 1852. Other works were *Biographie sacrée* (1825–26); *Histoire sainte et analyse de la Bible* (1839); *Orthodoxie moderne* (1842); *Christologie* (1858), etc.

COQUES or **COCX, GONZALEZ** (1614–1684), Flemish portrait painter, son of Pieter Willemsen Cocx, was born at Antwerp on Dec. 8, 1614. At the age of 12 he entered the house of Pieter, the son of "Hell" Breughel, an obscure portrait painter, and later became a journeyman in the workshop of David Ryckaert the second. At 26 he matriculated in the gild of St. Luke; he then married Ryckaert's daughter, and in 1653 joined the literary and dramatic club known as the "Retorijkerkamer." He became president of his gild in 1665, and in 1671 painter in ordinary to Count Monterey, governor-general of the Low Countries. He married again in 1674, and died full of honours in his native place on April 18, 1684. Partnership in painting was common amongst the small masters of the Antwerp school; and it has been truly said of Coques that he employed Jacob von Arthois for landscapes, Ghering and van Ehrenberg for architectural backgrounds, Steenwijck the younger for rooms, and Pieter Gysels for still life and flowers; but the model upon which Coques formed himself was Van Dyck, whose sparkling touch and refined manner he imitated with great success.

COQUET (pronounced Cócket), a river of Northumberland, draining a beautiful valley about 40m. in length. Rising in the Cheviot hills, it follows a course generally easterly, past Rothbury, Brinkburn priory (with its fine transitional Norman church) and Warkworth. A short distance below this the Coquet has its mouth in Alnwick bay (North sea), with the small port of Amble on the south bank, and Coquet island a mile out to sea. The river is frequented by sportsmen for salmon and trout fishing.

COQUET, to simulate the arts of love-making, from motives of vanity, to flirt; figuratively, to trifle with anything (from Fr. *coqueter,* to strut like a cock). The French substantive, *coquet,* in the sense of "beau" was once common in English, but only the feminine form, *coquette,* has survived, in the sense of a woman who gratifies her vanity by using her powers of attraction frivolously. Hence "to coquet" is now more often written "to coquette." "Coquet" is still occasionally used as an adjective, but the usual form is coquettish. The crested humming-birds of the genus *Lophornis* are known as coquettes.

COQUIMBO, city and port of the province of Coquimbo and department of La Serena, Chile. Pop. (1940) 18,863. The extension northward of Chile's railway system has brought Coquimbo into direct communication with Santiago. The city has a good well-sheltered harbour, reputed the best in northern Chile, and is the port of La Serena, the provincial capital, 9 mi. distant, with which it is connected by rail. There are copper-smelting establishments in the city, which exports copper, gold and silver, and cattle and hay to the more northern provinces.

The province of Coquimbo, which lies between those of Aconcagua and Atacama and extends from the Pacific inland to the Argentine frontier, has an area of 15,401 sq.mi., a small part of which was annexed from Aconcagua in 1928. Pop. (1940) 245,-609. It is less arid than the province of Atacama, the surface near the coast being broken by well-watered river valleys, which produce alfalfa, and pasture cattle for export. Near the mountains grapes are grown, from which wine of a good quality is made. The mineral resources include extensive deposits of copper, iron and some less important mines of gold and silver. At El Tofo, about 40 mi. north of La Serena, rich deposits of iron are being exploited, and a railway, 15 mi. long has been built to Cruz Grande on the coast for the shipment of ore. The climate is dry and healthful, and there are occasional rains. Several rivers, the largest of which is the Río de Elquí with a length of 125 mi., cross the province from the mountains. The capital is La Serena, population (1940) 21,383. The principal cities are Coquimbo, Ovalle, population (1940) 15,033 and Illapel, population (1940) 6,048.

CORABECAN, a small group of tribes of South American Indians, regarded on very meagre evidence, as constituting an independent linguistic stock. The Corabecas and other tribes of the group lived in eastern Bolivia on the border of the Chaco, between the Lago de la Concepcion in 18° S. lat. eastward toward the Paraguay river. They were an intractable, nomadic hunting folk, who early broke away from the mission of San Rafael and withdrew into the forested country where possibly some remnants may yet survive. Apart from brief references in the mission chronicles, nothing is known in regard to them.

See A. D'Orbigny, *L'Homme Americain* (Paris, 1839).

CORACIIDAE: *see* ROLLER.

CORACIIFORMES, an order of birds comprising 14 families of doubtful mutual affinities, and including the oilbird, frogmouths, kingfishers, rollers, motmot, hoopoes, hornbills, nightjars, swifts and hummingbirds (*qq.v.*) and bee-eaters. In the most recent classifications, the oilbird, frogmouths and nightjars are separated as the order *Caprimulgiformes* and the swifts and hummingbirds as the order *Micropodiformes*. (*See* ORNITHOLOGY.)

CORACLE, a leather-covered wicker boat used in Wales.

CORAËS, ADAMANTIOS (in French, Diamant Coray) (1748–1833), Greek scholar and patriot, was born at Smyrna, the son of a merchant. His name is also spelt Koraïs. As a schoolboy he distinguished himself in the study of ancient Greek, but from 1772 to 1779 he managed his father's business affairs in Amsterdam. In 1782, on the collapse of his father's business, he went to Montpellier, where for six years he studied medicine. He then settled in Paris, where he lived until his death on April 10, 1833. He devoted himself to the cause of Greek independence, endeavouring to rouse the enthusiasm of the Greeks for the idea that they were the true descendants of the ancient Hellenes by teaching them to regard as their own inheritance the great works of antiquity. He sought to purify the ordinary written language by eliminating the more obvious barbarisms, and by enriching it with classical words (*see* further GREEK LANGUAGE: *Modern*). Under his influence, though the common patois was practically untouched, the language of literature and intellectual intercourse was made to approximate to the pure Attic of the 5th and 4th centuries B.C. His chief works are his editions of Greek authors contained in his Ἑλληνικὴ Βιβλιοθήκη and his Πάρεργα; his editions of the *Characters* of Theophrastus, of the *De aere, aquis, et locis* of Hippocrates, and of the *Aethiopica* of Heliodorus, elaborately annotated.

BIBLIOGRAPHY.—His literary remains have been edited by Mamoukas and Damalas (1881–1887); collections of letters written from Paris at the time of the French Revolution have been published (in English, by P. Ralli, 1898; in French, by the Marquis de Queux de Saint-Hilaire, 1880). His autobiography appeared at Paris (1829; Athens, 1891), and his life has been written by D. Thereianos (1889–1890); *see* also A. R. Rhangabé, *Histoire littéraire de la Grèce moderne* (1877).

CORAL. The hard skeletons of various marine organisms. It is chiefly carbonate of lime, and is secreted from sea-water and deposited in the tissues of Anthozoan polyps, the principal source of the coral-reefs of the world (*see* ANTHOZOA), of Hydroids (*see* HYDROZOA), much less important in modern reef-building, but extremely abundant in Palaeozoic times, and of certain Algae. The skeletons of many other organisms, such as Polyzoa and Mollusca, contribute to coral masses but cannot be included in the term "coral." The structure of coral animals (sometimes erroneously termed "coral insects") is dealt with in the articles cited above; for the distribution and formation of reefs *see* CORAL REEFS.

Beyond their general utility and value as sources of lime, few of the corals present any special feature of industrial importance, excepting the red or precious coral (*Corallium rubrum*) of the Mediterranean Sea. It, however, is and has been from remote times very highly prized for jewellery, personal ornamentation and decorative purposes generally. About the beginning of the Christian era a great trade was carried on in coral between the Mediterranean and India, where it was highly esteemed as a substance endowed with mysterious sacred properties. It is remarked by Pliny that, previous to the existence of the Indian demand, the Gauls were in the habit of using it for the ornamentation of their weapons of war and helmets; but in his day, so great was the Eastern demand, that it was very rarely seen even in the regions which produced it. Among the Romans branches of coral were hung around children's necks to preserve them from danger, and the substance had many medicinal virtues attributed to it. A belief in its potency as a charm continued to be entertained throughout mediaeval times; and even to the present day in Italy it is worn as a preservative from the evil eye, and by females as a cure for sterility.

The precious coral is found widespread on the borders and around the islands of the Mediterranean Sea. It ranges in depth from shallow water (25 to 50ft.) to water over 1,000ft., but the most abundant beds are in the shallower areas. The most important fisheries extend along the coasts of Tunisia, Algeria and Morocco; but red coral is also obtained in the vicinity of Naples, near Leghorn and Genoa, and on the coasts of Sardinia, Corsica, Catalonia and Provence. It occurs also in the Atlantic off the north-west of Africa, and recently it has been dredged in deep water off the west of Ireland. Allied species of small commercial value have been obtained off Mauritius and near Japan. The black coral (*Antipathes abies*), formerly abundant in the Persian Gulf, and for which India is the chief market, has a wide distribution and grows to a considerable height and thickness in the tropical waters of the Great Barrier Reef of Australia.

Coral Fisheries. From the middle ages downwards the securing of the right to the coral fisheries on the African coasts was an object of considerable rivalry among the Mediterranean communities of Europe. Previous to the 16th century they were controlled by the Italian republics. For a short period the Tunisian fisheries were secured by Charles V. to Spain; but the monopoly soon fell into the hands of the French, who held the right till the Revolutionary Government in 1793 threw the trade open. For a short period (about 1806) the British Government controlled the fisheries, and now they are again in the hands of the French authorities. Previous to the French Revolution much of the coral trade centred in Marseilles; but since that period, both the procuring of the raw material and the working of it up into the various forms in which it is used have become peculiarly Italian industries, centring largely in Naples, Rome and Genoa. On the Algerian coast, however, boats not flying the French flag have to pay heavy dues for the right to fish, and in the early years of the 20th century the once flourishing fisheries at La Calle were almost entirely neglected. Two classes of boats engage in the pursuit—a large size of from 12 to 14 tons, manned by ten or twelve hands, and a small size of three or four tons, with a crew of five or six. The large boats, dredging from March to October, collect from 650 to 850 lb. of coral, and the small, working throughout the year, collect from 390 to 500 lb. The Algerian reefs are divided into ten portions, of which only one is fished annually—ten years being considered sufficient for the proper growth of the coral.

The range of value of the various qualities of coral, according to colour and size, is exceedingly wide, and notwithstanding the steady Oriental demand its price is considerably affected by the fluctuations of fashion. In China large spheres of good coloured coral command high prices, being in great requisition for the button of office worn by the mandarins. It also finds a ready market throughout India and in Central Asia; and with the negroes of Central Africa and of America it is a favourite ornamental substance.

CORAL GABLES, a residential city on the east coast of Florida, U.S.A., adjoining Miami (*q.v.*) which is served by the Florida East Coast and Seaboard Air Line railways. It has a land area of 14 sq.mi., laid out on a comprehensive plan and developed in Spanish and Moorish architecture, with 6 mi. of Venetian waterways. The city was created in a few years by immense investment of capital and modern engineering. In 1925 the population (state census) was 901; in 1940 it was 8,294 by the federal census. Assessed valuation of property in 1941 was $25,-052,331. It has a commission-manager form of government.

CORAL REEFS are formed of the whitish calcareous framework of various marine organisms, of which corals (*q.v.*) and nullipores are the two most important. These reef-builders flourish only at moderate depths—the nullipores usually not below 50 fathoms and the corals not below 25—in the warmer oceans. The minute larval forms of corals and the still more minute spores of nullipores given off in myriads by the adult forms float passively in the ocean waters; if they happen to drift with currents of fitting temperature to a shore of firm rock or to a shallow bank where pebbles or shells lie undisturbed by surface waves, they may attach themselves there and in time form a new reef.

Coral reefs are of three kinds: fringing reefs, barrier reefs and atolls. Fringing reefs are sea-level flats, up to a quarter or half mile in width built out upon salient parts of continental or insular shores, with fronts that fall off seaward to moderate depths. They are composed largely of dead reef rock, and are occupied by living reef-builders chiefly on their outer edge and slope. Reefs of this kind are common in the East Indies. Barrier reefs have, like fringes, a narrow or broad sea-level flat and an outer growing face; but they are separated from the coast which they front by a salt-water lagoon, from half a mile to a score of miles or more in width and from 20 to 40 or more fathoms in depth. The lagoon floor is usually rather smoothly strewn over with fine calcareous detritus. The inner shore is commonly occupied by a fringing reef, the growth of which is less vigorous than that of non-enclosed fringes. The outer or growing face of a barrier is continued in a gentle slope to 40 or 50 fathoms, followed by a steep pitch to great depths. Barrier reefs are frequently interrupted by passages or "passes," through which ocean-going vessels may enter the protected lagoon. When barriers encircle islands, the leeward arc of their circuit is, as a rule, interrupted by wide breaches, largely because of the leeward drift of lagoon sediments. The Great Barrier Reef of north-eastern Australia, 900 nautical miles in length, is the largest of its kind; the lagoon is from 20 to 70m. in width. Many small and large islands rise from the lagoon within this great natural breakwater, and they as well as the embayed mainland coast are little cliffed or not at all, indicating long-continued protection from ocean waves by the reef; but the cooler and reefless coast farther south, also embayed, is island-free and strongly cliffed, indicating its long exposure to ocean waves while an inorganic continental shelf was accumulating off-shore.

Atolls resemble barrier reefs, except that no island rises from their lagoon. The largest atolls are about 40m. in diameter; the smallest, less than a mile with no lagoon. They are rarely circular, usually irregular in pattern. The reef flats of barriers and atolls are often heaped with low islands of reef sand, which come to be covered with vegetation. The reef-islands of atolls are frequently inhabited, although exposed to the occasional danger of being overwhelmed by earthquake waves. The origin and history of barrier reefs may be inferred less from the facts observed in the reefs than from those seen in the coasts that they adjoin or front; and in the absence of neighbouring lands, sea-level atolls are inscrutable structures. The three classes of reefs grade into each other. A fringe separated from its coast by a shallow water belt resembles a close-set barrier; the central islands of certain barriers are so small that the reefs may be called almost atolls. All classes of reefs are found either elevated above or depressed below sea-level. Vatu Vará is a small atoll in central Fiji, 1,030ft. in altitude. The large island of Timor in the East Indies has many elevated reefs at various altitudes on its slopes, the loftiest being almost atolls or atolls on the island crest, about 4,000ft. above sea-level. Chagos atoll, from 65 to 95m. in diameter, in the Indian ocean, is slightly submerged nearly all around its circuit. Reef-building corals have been dredged in the Ceram sea, Dutch East Indies, from a depth of over 700 fathoms, 30m. distant from the nearest shore.

Three contrasted theories of coral reefs are as follows: Darwin (1838–42) explained barrier reefs as the upgrowth of fringing reefs on slowly subsiding coasts or islands, and atolls in the main as the continued upgrowth of barrier reefs until the central island sinks below sea-level. Murray (1880) rejected subsidence and explained barrier reefs by the outgrowth of fringing reefs from stationary coasts on their own talus. He believed the lagoon was excavated by solution of the dead reef rock behind the growing reef front, thus repeating an idea of Semper's (1863–81). He suggested also that atolls might be developed from barrier reefs by the gradual degradation of the central island, but his preferred view was that they are coral crowns on banks that were organically built up over still-standing foundations, usually volcanic cones, of whatever depth, thus repeating an idea of Rein's (1870). Guppy (1887) thought that coral reefs were formed on rising foundations; atolls would thus crown shoaling but not emerging banks; barrier and fringing reefs would lie on emerged coastal slopes. He explained the lagoons of barrier reefs as covering platforms of abrasion cut in coastal slopes during a pause in their emergence, thus repeating in essence an idea of Tyerman and Bennet's (1832).

The inventors of these theories adopted them without making a sufficiently thorough deduction of their consequences. Thus Guppy overlooked three significant points: (1) If fringing reefs are formed on rising coasts, they should lie on non-eroded slopes; but most fringes lie on eroded slopes, showing that subsidence had preceded reef growth, even if in some cases the subsidence were followed by upheaval. (2) If barrier reefs rise from abraded platforms on rising coasts, the shore back of them should be cliffed and not embayed, but such shores are in nearly all cases embayed and not cliffed. (3) If atolls are based on non-emerged shoals, their limestones should lie on the non-eroded surface of the shoals, but several elevated atolls are known to rest unconformably on subaerially eroded foundations. which must therefore have sunk before the atolls were built upon them.

Murray overlooked five significant points: (1) Narrow fringing reefs would ordinarily be smothered by detritus outwashed from valleys in a stationary coast before they could grow out as barriers. (2) If a fringe on a stationary coast succeeded in growing out as a barrier, the shore behind it would not be embayed, but such shores are always embayed. (3) If lagoons are excavated by solution their floors should be covered by insoluble residue, instead of by accumulating calcareous detritus, as is usually the case. (4) If barrier reefs are transformed into atolls by the degradation of their stationary central island, then the islets of almost atolls should be low and flat; but almost atoll islets are of steep-sloping, mountain-top form. (5) If most atolls are crowns on organically aggraded banks, then elevated atolls should show pelagic deposits between a non-eroded volcanic base and the coral crown; but only two elevated atolls—Roti in the East Indies and Barbadoes in the Lesser Antilles—are known to be underlaid by pelagic deposits, and in both cases these deposits rest unconformably on a subaerially eroded, non-volcanic rock, thus showing that island subsidence, at a rate too rapid to be compensated by reef upgrowth, had preceded a later and slower upheaval, with reef growth and emergence.

Darwin failed to recognize three significant consequences of his theory: (1) Subsidence provides by far the best means of disposing of the great volume of detritus that has been eroded from the coasts fronted by barrier reefs. (2) If barrier reefs have grown up from slowly subsiding foundations, the coasts from which they are offset should be embayed by the partial submergence of the coastal valleys. (3) If the formation of barrier reefs and atolls is associated with the subsidence of their foundations, their lagoon limestones—but not necessarily their external talus—should lie unconformably on the eroded surface of the foundation rocks. But while the unnoticed consequences of Murray's, Guppy's and certain other theories are contradicted by the facts of observation, thus invalidating those theories, all the unnoticed consequences of Darwin's theory are confirmed by the facts. (1) The volume of detritus that has been eroded from reef-fronted coasts would in nearly all cases have filled—often much more than filled—the lagoons and overwhelmed the reefs if the coasts had remained stationary. (2) The central islands of barrier reefs are embayed, as Darwin knew, but it was Dana who first showed (1849) that the embayments result from the entrance of arms of the sea into the valleys of subsiding coasts. (3) In the elevated atoll of Tuvutha in eastern Fiji, Foye has reported (1918) an unconformable contact of the atoll limestones on a subaerially eroded volcanic foundation, and the same observer found in the neighbouring Exploring isles a similar relation between the limestones of several elevated reefs and their volcanic bases. The elevated barrier reef of Mangaia in the Cook group has recently been shown by Marshall (1927) to rest unconformably upon the slopes of a well-dissected volcanic island. In all these cases the association of subsidence with reef growth seems unquestionable, and the same association is therefore probable in the case of sea-level barriers and atolls; for it is not to be believed that deep-seated telluric forces selected reefs of exceptional origin to be elevated. Hence, inasmuch as the consequences of Darwin's theory, though they were not perceived by its inventor, have now been confirmed by previously unknown facts, the theory is strongly supported.

The novel glacial-control theory, recently put forth by Daly (1910–15), is based upon the similar depth of many reef-enclosed lagoons, which he believes cannot be explained by Darwin's subsidence theory. He assumes that, as a rule, reef foundations have long been stationary; that many of the older volcanic islands of the Pacific had been degraded in pre-glacial times to low relief with deep-weathered soils: that with the coming of the Glacial period the ocean was lowered some 30 or 40 fathoms by withdrawal of water to form continental glaciers and ice sheets; that even in the torrid zone the chill of the lowered ocean killed the reef-builders, the ocean waves abrading the reefs and worn-down islands to low-level platforms; and that as the ocean rose and warmed in post-glacial time, barrier and atoll reefs grew up with it on the platform margins. But this theory is largely invalidated by the evidence given above of island instability, also by the prevailing absence of cliffed shores within close-set barrier reefs in the coral seas; yet as a good number of plunging-cliff islands surmounting imperfectly reefed banks occur in the marginal belts of the Pacific and Atlantic coral seas, it seems probable that Daly's factor of low-level abrasion—but not his postulate of insular stability—has there had application. In this and a few other respects Darwin's theory may be subordinately modified to advantage, as follows:—

Young volcanic islands are as a rule unfavourable sites for fringing reefs because of the abundance of down-washed detritus which soon forms a reef-smothering beach around the shore; such islands are therefore attacked by the waves and cut back in cliffs; witness Réunion in the Indian ocean. Not until the subsidence of such an island has disposed of a great volume of detritus eroded from it—the isostatic subsidence of the island being likely because of its imense weight, as Molengraaff has suggested (1916)—will the eventual submergence of its rising, cliff-base beach permit reef growth to begin, either on the faces of the plunging cliffs or somewhat off-shore. The Marquesas islands, strongly cliffed and well embayed, seem to offer examples of incipient cliff-face reefs so conditioned. Thus subsidence favours the initiation of fringing reefs as well as their further development and transformation into barriers. But not unless subsidence continues slowly and maintains embayments in the coastal valley mouths, where down-washed detritus will be deposited in bay-head deltas, are up-growing reefs likely to persist. Even then they may be drowned by rapid subsidence, as seems to have happened with a young barrier now submerged around Tutuila, Samoa. But if subsidence continues slowly an on-shore or a near-shore reef may grow up as an off-shore barrier before the cliffs previously cut are wholly submerged; this appears to be the case at Tahiti, in the Society group, where the island spurs are cut off in cliffs that seem to plunge below sea-level. Yet here an extended pause has permitted the filling of the drowned valley embayments with deltas which have now advanced into the lagoon, smothering many cliff-face fringes, and even the off-shore barrier appears to be endangered by out-flowing floods of muddy fresh water. A renewal of subsidence would widen the narrowed lagoon and re-embay the valleys, and the barrier reef would then be rescued from the danger of muddy floods. Thus in time the early-cut cliffs would disappear and the inter-bay spurs of the diminishing island would slope gradually into the widening lagoon. This stage appears to have been reached in the other barrier-reef members of the Society group, for as one proceeds north-westward, the islands are found to be more and more dissected and degraded, and of smaller and smaller size as if increasingly submerged. Borabora, Darwin's type barrier-reef island, is the next to the last of the series. Several atolls follow, the volcanic foundations of which have entirely disappeared. It would be difficult to imagine a better confirmation of Darwin's theory than these islands and their reefs provide. In Fiji the distribution of various kinds of reefs, both at sea-level and elevated above it, especially in the eastern part of the group, at first appears so confused that Darwin's theory has been held to be inapplicable there; but a closer examination shows that this old theory is really the only one which can reasonably account for the Fiji reefs. In the East Indies movements of elevation and subsidence have been so active that typical sea-level barrier and atoll reefs are not often found there, but sea-level fringes and elevated reefs of various kinds abound.

The several groups of atolls in the central Pacific can be to-day explained only by analogy with elevated reefs elsewhere, as above intimated, except that on the atoll of Funafuti in the Ellice group a boring in the reef, made under the direction of the Royal Society of London, 1,184ft. deep—a small measure compared to the presumable reef thickness—has shown that shallow-water organisms prevail to that depth in the reef rock, while deep-water organisms are found at similar depths on the exterior slope of the reef. This supports Darwin's theory. A number of reefs in Florida have been shown by Vaughan to have been formed at times of subsidence, but they are of small thickness. In view of what is at present known concerning the coral reef problem, it may be concluded that although Darwin's theory was abandoned by many students of the subject during the past 50 years, it may—slightly modified as above—regain in the next 50 years the general acceptance that it enjoyed through the middle of the last century.

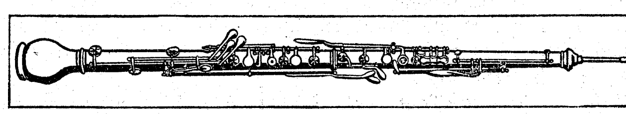
CORAM, THOMAS (1668–1751), English philanthropist, was born at Lyme Regis, Dorset. He began life as a seaman and rose to the position of merchant captain. He settled at Taunton (Mass.) for several years, engaging there in farming and boat-building, and in 1703 returned to England. After 17 years of unwearied exertion, he obtained in 1739 a royal charter authorizing the establishment of his hospital for foundling infants (*see* FOUNDLING HOSPITALS). His later years were spent watching over the interests of the hospital; he was also one of the promoters of the settlement of Georgia and Nova Scotia; and his name is honourably connected with various other charities. In carrying out his philanthropic schemes he spent nearly all his private means; and an annuity of £170 was raised for him by public subscription.

COR ANGLAIS, or ENGLISH HORN, a wood-wind double-reed instrument of the oboe family, of which it is the tenor. It is not a horn, but bears the same relation to the oboe as the basset horn does to the clarinet. The cor anglais differs slightly in construction from the oboe; the conical bore of the wooden tube is wider and slightly longer, and there is a large globular bell and a curved metal crook to which the double reed mouthpiece is attached. The fingering and method of producing the sound are, however, so similar in both instruments that the player of the one can, in a short time, master the other. The quality of the



BY COURTESY OF MESSRS. BOOSEY AND CO., LTD.

THE COR ANGLAIS, OR ENGLISH HORN

cor anglais is penetrating like that of the oboe, but mellower and more melancholy. The cor anglais is the alto Pommer (*q.v.*) or *haute-contre de hautbois* (*see* OBOE), gradually developed, improved, and provided with key-work.

The origin of the name of the instrument is a matter of conjecture. Two theories exist—one that cor anglais is a corruption of *cor anglé,* a name given on account of the angular bend of the early specimens. The other is that when the instrument was given a bend in order to facilitate its handling, the name was adopted to mark its resemblance to a kind of hunting-horn said to be in use in England at the time. But this suggestion does not seem to be a happy one in default of record of any kind of horn of the sort implied.

CORAOPOLIS, a borough of Allegheny county, Pennsylvania, U.S.A., 10m. N.W. of Pittsburgh, on the west bank of the

Ohio river, and served by the Pittsburgh and Lake Erie railroad. The population in 1940 was 11,086. It is in an oil and gas field, and has steel and iron foundries, glass works and factories making springs, nuts and bolts. The borough was incorporated in 1886.

CORATO, a city of Apulia, Italy, in the province of Bari, 26 mi. W. of Bari by steam tramway. Pop. (1936), town 43,907; commune 44,561. It is in the centre of an agricultural district.

CORBAN (קָרְבָּן), an Aramaic word meaning "a consecrated gift." Josephus uses the word of Nazirites and of the temple treasure of Jerusalem. Such a votive offering lay under a curse if it were diverted to ordinary purposes, like the spoil of Jericho which Achan appropriated (Josh. vii.), or the temple treasure of Delphi which was seized by the Phocians, 356 B.C. The word is found in Mark vii. 11, the usual interpretation of which is that Jesus refers to an abuse—a man might declare that any part of his property which came into his parents' hands was *corban,* consecrated, *i.e.,* that he might evade the fifth commandment by pleading a vow. But this interpretation is impossible. In fact, Jesus and the Rabbis agree on this point. The rule which Jesus attributes to tradition is in flat contradiction to the Mishnah and universal Jewish practice. Further, the assertion that the Pharisees violated the Law of God in order to maintain their own rules is not proved by this instance. A totally different explanation of the passage is put forward by J. H. A. Hart in *The Jewish Quarterly Review* for July 1907, the gist of which is that Jesus commends the Pharisees for insisting that when a man has vowed a vow to God he should pay it even though his parents should suffer.

See pp. 148 foll. of vol. i. of sec. ed. of C. G. Montefiore's *Synoptic Gospels* (1927); J. V. Bartlet in *Century Bible* (Mark *in loc.*) (Edinburgh, 1922): p. 711 of vol. i. of H. L. Strack and P. Billerbeck, *Komm. z. Neuen Test.* (Munich, 1922).

CORBEIL, WILLIAM OF (d. 1136), archbishop of Canterbury, was born probably at Corbeil on the Seine, and educated at Laon. He was soon in the service of Ranulf Flambard, bishop of Durham; then, having entered the order of St. Augustine, he became prior of the Augustinian foundation at St. Osyth in Essex. In 1123 he was chosen archbishop of Canterbury, and as he refused to admit that Thurstan, archbishop of York, was independent of the see of Canterbury, this prelate refused to consecrate him, and the ceremony was performed by his own suffragans. Proceeding to Rome the new archbishop found that Thurstan had anticipated his arrival and had prejudiced Pope Calixtus II.; however, the exertions of the English king Henry I. and of the emperor Henry V. prevailed, and the pope gave William the pallium. The archbishop's next dispute was with the autocratic papal legate, Cardinal John of Crema, which ended in William himself being appointed papal legate (*legatus natus*) in England and Scotland, an important precedent in the history of the English Church. The archbishop had sworn to Henry I. to support the claim of his daughter Matilda to the English crown, but nevertheless he crowned Stephen in Dec. 1135. He died at Canterbury on Nov. 21, 1136. William built the keep of Rochester Castle, and finished the cathedral at Canterbury, which he dedicated with great pomp in May 1130.

See the article by F. Tout in the *Dict. of Nat. Biog.*, where earlier work on the subject is summed up.

CORBEIL, a town of northern France, capital of an arrondissement in the department of Seine-et-Oise, at the confluence of the Essonne with the Seine, 21 m. S. by E. of Paris. Pop. (1936) 11,180. From the 10th to the 12th century Corbeil was the chief town of a powerful countship, but it was united to the crown by Louis VI.; it continued for a long time to be an important military post. In 1258 St. Louis concluded a treaty here with James I. of Aragon. It was besieged by the Huguenots in 1562, and by Alexander Farnese, prince of Parma, in 1590. A bridge across the Seine unites the main part of the town on the left bank with a suburb; handsome boulevards lead to the town of Essonnes (pop. 10,397), about 1 mi. S.W. St. Spire, the only survivor of the formerly numerous churches of Corbeil, dates from the 12th to the 15th centuries. Behind the church there is a Gothic gateway. Corbeil is the seat of a sub-prefect, and has tribunals of first instance and commerce and a chamber of commerce. It has flour-mills, tallow-works, printing-works and paper-works and manufactures plaster.

CORBEL, in architecture, a means of supporting a projecting weight; a bracket or weight-carrying member, built deeply into the wall so that the pressure on its embedded portion counteracts any tendency to overturn or fall outwards. Corbels may be either individual pieces of stone, separated from each other like brackets, as in the case of many mediaeval cornices, or continuous courses of masonry, *e.g.,* the corbels under projecting oriel windows (*see* BAY). A "corbel table" is a projected band or string course carried on corbels. Corbels are favourite places for decoration. Mediaeval cornices frequently have corbels ornamented with leaves, animals or human heads; and the corbels common in English Gothic, to support vaulting shafts, are rich with leafage. The sides and faces of Renaissance corbels are carved with scrolls and acanthus leaves. In many cases corbels are moulded, without other carving, especially those carrying mediaeval battlements. Corbels decorated with an S-scroll are known as consoles. (*See* CONSOLE.)

CORBET, RICHARD (1582–1635), English bishop and poet, was born in 1582 at Ewell, Surrey, and died at Norwich on July 28 1635. At Oxford, to which he proceeded from Westminster school in 1597, he was noted as a wit. In 1628 he was made bishop of Oxford, and in 1632 was translated to the see of Norwich. Corbet's verses were first collected and published in 1647. He was a boon companion in his early days of Ben Jonson, who always remained his close friend.

CORBETT, GAIL SHERMAN, American sculptor, wife of Harvey Wiley Corbett, born in 1873 in Syracuse, N.Y. She was educated in public and private schools, at the Art Students League in New York and at the École des Beaux Arts in Paris. Later she was a pupil of Augustus Saint Gaudens. Her best-known works are the Hamilton S. White memorial and the Kirkpatrick fountain in Syracuse, the bronze entrance doors of the municipal group at Springfield, Mass., and the medallion head of Washington in the pediment of the George Washington National Masonic memorial at Alexandria, Va.

CORBETT, HARVEY WILEY (1873–), American architect, born in San Francisco, Jan. 8, 1873. He graduated from the University of California in 1895 and from the École des Beaux Arts, Paris, in 1900. He is a member of the firm of Corbett and MacMurray, New York city. Among the buildings his firm has designed are the Bush Terminal office building, New York city, Bush house, London; and Kings county hospital, Holy Innocents church and St. Francis Xavier's school in Brooklyn, New York. Corbett is a member of the Societé Beaux Arts Architectes, the Societé des Architectes Diplômés par le Gouvernement Français, the Architectural League, New York, and the National Sculpture Society. He is also a fellow of the Society of Architects of London and of the Royal Institute of British Architects and was architectural chairman of Chicago's Century of Progress in 1933.

CORBRIDGE, a town of Northumberland, England; 3½ mi. E. of Hexham, on the north bank of the river Tyne, which is here crossed by a fine seven-arched bridge dating from 1674. Pop. (1931) 2,050. Its name is derived from the small river Cor, a tributary of the Tyne. The Roman station of *Corstopitum* (also called Corchester) lay half a mile west of Corbridge at the junction of the Cor with the Tyne. Excavations have shown the site to have had at first a military importance, but it was later occupied by a civilian population. Corstopitum ceased to exist early in the 5th century, and the site was never again occupied.

About 760 Corbridge became the capital of Northumbria. In 1138 David of Scotland made it a centre of military operations, and it was ravaged by Wallace in 1296, by Bruce in 1312, and by David II. in 1346. It has a square peel-tower and a cruciform church (St. Andrew), partly of pre-Conquest date, but mainly Early English.

CORBULO, GNAEUS DOMITIUS (1st century A.D.), Roman general. In the reign of Tiberius, he was praetor, and was appointed to the charge of the roads and bridges. Under Claudius he was governor of lower Germany (A.D. 47). He punished the Frisii who refused to pay the tribute, and was about to advance against the Chauci when he was ordered by the emperor to withdraw behind the Rhine. Corbulo cut a canal from the Mosa (Meuse) to the northern branch of the Rhine, which still forms one of the chief drains between Leyden and Sluys.

Soon after the accession of Nero, Vologaeses (Vologasus), king of Parthia, overran Armenia, drove out the Roman nominee, and set his own brother Tiridates on the throne. Corbulo was thereupon sent out to the East with full military powers. Two years were spent in reorganizing the demoralized Syrian legions; in 58 Corbulo took the offensive, and in the brilliant campaign of 59 he captured Artaxata and Tigranocerta. In 60 a Romanized prince, Tigranes, was set up as king of Armenia; but in 61 he provoked the Parthians by invading their territory, and was driven from Armenia. Corbulo concluded an armistice for the winter (61–62) by which both sides were to evacuate Armenia, and the matter was to be referred to Nero. Nero decided to annex Armenia, and Paetus was sent out to attack from Cappadocia while Corbula held Syria, but his incompetence led to his total defeat at Rhandeia (62). Corbulo was now given supreme command, and in 63 crossed the Euphrates with a strong army; the enemy submitted, and Tiridates laid down his diadem at the foot of the emperor's statue at Rhandeia, promising not to resume it until he received it from the hand of Nero in Rome. In 67 disturbances broke out in Judaea, but Nero gave the command to Vespasian and summoned Corbulo to Greece. On his arrival at Cenchreae he received the order to commit suicide. Without hesitation he obeyed, exclaiming, "I have deserved it" ("Ἄξιος"). Whether he was really guilty of conspiracy is unknown, but so great was his popularity that he could easily have seized the throne. Corbulo wrote an account of his Asiatic experiences, which is lost.

See Tacitus, *Annals,* xii.–xv.; Dio Cassius, lix. 15, lx. 30, lxii. 19–23, lxiii. 6, 17, lxvi. 3; H. Schiller, *Geschichte des römischen Kaiserreichs unter der Regierung des Nero* (1872); E. Egli, "Feldzüge in Armenien von 41–63," in M. Büdinger's *Untersuchungen zur römischen Kaisergeschichte,* i. (1868); Mommsen, *Hist. of the Roman Provinces,* ii. (1886); for the Armenian campaigns *see* B. W. Henderson in *Classical Review* (April, May, June, 1901) and W. Schur, "Untersuchungen zur Geschichte der Orient feldzüge Corbulos" (*Klio* xix.) and *Die Orientpolitik des Kaisers Nero* (Leipzig, 1923); in general D. T. Schoonover, *A Study of Gn. Domitius Corbulo* (Chicago, 1909).

CORD, a length of twisted or woven strand (Lat. *chorda,* the string of a musical instrument). From the use of such a cord for measuring, the word is applied to a quantity of cut wood. For "vocal cords" *see* PHONETICS; VOICE; SINGING. For "umbilical cord" *see* INFANCY; PLACENTA.

CORDAY D'ARMONT, MARIE ANNE CHARLOTTE (1768–1793), the murderess of Marat, born at St. Saturnin des Lignerets, near Séez in Normandy, was descended from a noble but poor family, and numbered among her ancestors the dramatist Corneille. Charlotte Corday was educated in the convent of the Holy Trinity at Caen, and then sent to live with an aunt. Here she saw hardly any one but her relative, and passed her lonely hours in reading the works of the *philosophes,* especially Voltaire and the Abbé Raynal. Another of her favourite authors was Plutarch. On the downfall of the Girondins on June 2, 1793, many of the leaders took refuge in Normandy. Charlotte attended their meetings, and heard them speak; but there is no reason to believe that she saw any of them privately till the day when she went to ask for introductions to friends of theirs in Paris. She saw that their efforts to rouse Normandy in their favour were doomed to fail. She had heard of Marat as a tyrant and the chief agent in their overthrow, and conceived the idea of going alone to Paris and assassinating him. In Paris she wrote to Marat: "Citizen, I have just arrived from Caen. Your love for your native place doubtless makes you desirous of learning the events which have occurred in that part of the republic. I shall call at your residence in about an hour; have the goodness to receive me and give me a brief interview. I will put you in a condition to render great service to France." She was twice refused admittance at Marat's door, but on her third visit (July 13) Marat, hearing her voice in the antechamber, consented to see her. She spoke to Marat of what was passing at Caen, and his only comment (as she alleged) was that all the men she had mentioned should be guillotined in a few days. As he spoke she drew from her bosom a dinner-knife (which she had bought the day before for two francs) and plunged it into his left side. It pierced the lung and the aorta. When she was brought before the Revolutionary Tribunal her advocate, C. F. C. Lagarde, put forward the plea of insanity. She was sentenced to death, and was guillotined on July 17, 1793, meeting her fate with complete calmness. Lamartine called her *l'ange de l'assassinat,* and Vergniaud said, *"Elle nous perd, mais elle nous apprend à mourir."*

See *Oeuvres politiques de Charlotte Corday* (Caen, 1863; some letters and an *Adresse aux Français amis des lois et de la paix*), with a supplement printed in the same year; C. Vatel, *Dossiers du procès criminel de Charlotte de Corday . . . extraits des archives impériales* (1861), and *Dossier historique de Charlotte Corday* (1872); Austin Dobson, *Four Frenchwomen* (1890); Dr. Cabanes "La vraie Charlotte Corday," in *Le Cabinet secret de l'histoire* (1897–1900); E. Defrance, *Charlotte Corday et la mort de Marat* (1909). Her tragic history was the subject of two anonymous tragedies, *Charlotte Corday* (1795), said to be by the Conventional F. J. Gamon, and *Charlotte Corday* (Caen, 1797), neither of which has any merit.

CORDELE, a city of Georgia, U.S.A., 140 mi. S.E. of Atlanta; county seat of Crisp county. It is on federal highways 41 and 280, and is served by the Atlanta, Birmingham and Coast, the Georgia South-western and Gulf, the Seaboard Air Line and the Southern railways. The pop. in 1920 was 6,538, of whom 3,254 were Negroes, and was 7,929 by the federal census in 1940. It ships great quantities of peanuts, and manufactures peanut confections, cotton oil and fertilizer. Cordele was for a time the home of Joseph E. Brown, the Civil War governor of Georgia, and was a temporary capital of the state. It was incorporated as a city in 1888, and in 1923 adopted a commission-manager form of government.

CORDELIERS, CLUB OF THE, or SOCIETY OF THE FRIENDS OF THE RIGHTS OF MAN AND OF THE CITIZEN, a popular society of the French Revolution. It was formed by the members of the district of the Cordeliers, when the Constituent Assembly suppressed the 60 districts of Paris to replace them with 48 sections (May 21, 1790). It held its meetings at first in the suppressed monastery of the Cordeliers,—the name given in France to the Franciscan Observantists. From 1791, however, it met in a hall in the rue Dauphine. Its principal function, according to its charter, was "to denounce to the tribunal of public opinion the abuse of the various powers and all infractions of the Rights of Man." Its badge was an open eye—symbol of suspicious watchfulness. Though its leaders were men of middle class, it identified itself with the interests of the masses, its power being based on its association with the popular fraternal societies and its influence in the revolutionary sections. It raised and organized the popular battalions and inspired and directed the great demonstrations and risings (*e.g.,* those of June 20 and Aug. 10, 1792). After the withdrawal of the more moderate elements, it was dominated by the *enragés,* by Marat, and, after his death, by Hébert and his associates. After the execution of the Hébertists, March 24, 1794, the club ceased to exist.

The papers emanating from the Cordeliers are enumerated in M. Tourneux, *Bibliographie de l'histoire de Paris pendant la Révolution* (1894), i. (on the trial of the Hébertists) Nos. 4204–4210, ii. Nos. 9795–9834 and II, 813. *See* also A. Bougeart, *Les Cordeliers, documents pour servir à l'histoire de la Révolution* (Caen, 1891); G. Lenotre, *Paris révolutionnaire* (1895) and Albert Mathiez, *Le Club des Cordeliers* (1910).

CORDES, a town of southern France, in the department of Tarn, 15 mi. N.W. of Albi. Pop. (1936), 912. It was a bastide founded by Raymond VII, count of Toulouse, in 1222, and was named *Cordua* after the Spanish city Cordova. A large number of houses of the 13th and 14th centuries, with decorated fronts, form its chief attraction. A church of the same periods and remains of the original ramparts are also to be seen.

CORDIERITE, a silicate of magnesia, alumina and ferrous oxide ($2\,[Mg,FeO]\cdot 2Al_2O_3\cdot 5SiO_2$) occasionally cut as a gem stone, and named in 1813 by Haüy in honour of P. L. Cordier, who discovered its remarkable pleochroism, or exhibition of varying colours viewed from different directions. The natural mineral commonly contains 0·5%–3% of water, and is sometimes referred to as iolite (ἴον, violet; λιθος, stone) in allusion to the violet colour of many specimens, or dichroite in allusion to its dichroism (pleochroism).

Cordierite crystallizes in the orthorhombic system, well developed crystals being usually short prisms with large basal planes. In rocks cyclic twins are common, giving crystals a pseudo-hexagonal habit. The pleochroism of the mineral is often strongly marked, the colours being dark blue or violet, pale blue and yellowish. These colours can be frequently seen without the dichroscope. In refraction, density and hardness, it much resembles quartz, but in thin sections it is distinguished by its biaxial character and common alteration. The pure magnesian cordierite has been prepared artificially. Through formation of solid solution with silica the artificial cordierite shows a range of composition from $2MgO \cdot 2Al_2O_3 \cdot 5SiO_2$ to $2MgO \cdot 2Al_2O_3 6SiO_2$. It melts incongruently with formation of mullite ($3Al_2O_3 \cdot SiO_2$) and glass. By crystallization of glasses of the composition of cordierite at 900° C, an unstable modification (U. cordierite) has been obtained. This passes at 925°–1,150° into the normal α cordierite, but the reverse change has not been effected.

Cordierite occurs in igneous rocks only as a result of contamination of the magma by aluminous sediment. As such it is known in granites, norites, rhyolites, andesites and lamprophyres. The true home of cordierite is in the thermally altered argillaceous sediments surrounding igneous intrusions and in the paragneisses and schists. In the former it is the commonest constituent of the spots of spotted slates (spilosites, desmosites). In the hornfelses it is frequently associated with andalusite, sillimanite, spinel and corundum. The common alteration product of cordierite—often developed as pseudomorphs—is known as pinite, a variable mixture of chlorite and sericite. Fine, well-developed crystals of cordierite are rare. (C. E. T.)

CORDILLERA, a Spanish term for a range or chain of mountains, derived from the Old Spanish *cordilla,* the diminutive of *cuerda,* a cord or rope. The name first given to certain mountain-ranges of South America, *Las Cordilleras de los Andes,* was applied to the extension of the system into Mexico. In North America the Rocky Mountains, the Sierra Nevada and the mountains between them are collectively known as the "Cordilleras," and the entire area has been termed the "Cordilleran region." The name is now not restricted to America but is often used as a generic term for any long parallel ranges of mountains.

CORDITE, a propellant employed in various military services, so called because of its usual cord-like form. It is also made up into other shapes such as flakes, ribbons or tubes with one or more perforations. Cordite is essentially a thoroughly blended mixture of nitro-glycerine and gun-cotton gelatinized effectively by acetone. Soft paraffin or vaseline, obtained during the distillation of petroleum, is added as a stabilizing agent. The original cordite (Cordite, Mark 1), as manufactured at the Royal gunpowder factory, Waltham Abbey, England, in 1890, was composed of 37 parts of gun-cotton, 57·5 parts of nitro-glycerine and 5 parts of mineral jelly together with 0·5% of acetone. Owing to its large content of nitro-glycerine this cordite had a high temperature of explosion and produced considerable erosion of big guns. A modified composition—Cordite M.D.—which was introduced in 1901, contains 64 parts of gun-cotton, 30·2 parts of nitro-glycerine and 5 parts of vaseline with about 0·8% of acetone. Both varieties are in use and other modifications have been adopted. Soluble nitro-cellulose has been used instead of gun-cotton with a higher proportion of nitro-glycerine in order to give a similar ballistic effect to that produced by Cordite M.D. (*See* EXPLOSIVES.)

CÓRDOBA, GONZALO FERNÁNDEZ DE (1453–1515), Spanish general and statesman, was the son of the count of Aguilar. He was born near Cordova on March 16, 1453. He was first attached to the household of Don Alphonso, the king's brother, and upon his death devoted himself to Isabella, afterwards queen. During the civil war, and the conflict with Portugal which disturbed the first years of her reign, he fought under the grand master of Santiago, Alonso de Cardenas. The ability he displayed during the ten years' war for the conquest of Granada led the queen to choose him as commander of the Spanish expedition sent to support the Aragonese house of Naples against Charles VIII. of France. In Italy, where he won the title of the Great Captain, he twice held the command. In 1495 he was sent with about 5,000 men to aid Ferdinand of Naples to recover his kingdom, and he returned home after achieving success in 1498. His mountain warfare in Calabria against the French forces, consisting largely of Swiss pikemen and of their own men-at-arms, led him to see the inadequacy of foot soldiers armed with sword and buckler, or arquebuses and crossbows, and light cavalry, and to introduce the pike as a weapon, insisting at the same time on a much closer infantry formation.

After a brief interval of service in Spain against the Moors, Gonzalo returned to Italy in 1501, and was first employed in driving the Turks from Cephalonia. In the subsequent campaign against the French, Gonzalo stood at bay in the entrenched camp at Barletta, on the shores of the Adriatic, awaiting reinforcements and harassing the French communications. Then in the early part of 1503 he pounced on the enemy's depot of provisions at Cerignola, took a strong position, threw up hasty field works, and strengthened them with a species of wire entanglements. The French made a headlong front attack, were repulsed, assailed in flank, and routed. The later operations on the Garigliano were very similar, and led to the total expulsion of the French from Naples. Gonzalo remained as governor of Naples till 1507. The death of the queen in 1504 had deprived him of a friend, and King Ferdinand, after loading him with titles and fine words, recalled him and left him unemployed till his death on Dec. 2, 1515.

The Great Captain is sometimes spoken of as the first of modern generals. There is much in his methods which bears a likeness to those of the duke of Wellington; Barletta, for instance, has a distinct resemblance to the Torres Vedras campaign, and the battle on the Garigliano to Assaye. As an organizer he founded the Spanish infantry of the 16th and 17th centuries, and he gave the best proof of his influence by forming a school of officers.

(1846–80); and W. H. Prescott in his *Ferdinand and Isabella* (3 vols., Boston, 1838).

CÓRDOBA, a large central province of Argentina; pop. (1914 census) 735,476, (1943 est.) 1,358,523; area, 65,195 sq.mi. The western sixth of the province is traversed from north to south by the famous Sierras de Córdoba, comprised of three parallel chains separated by beautiful valleys. Of the numerous rivers that originate on the eastern slopes of the Cadena Oriental (Sierra Chica), only the Tercero has sufficient volume and force to cross the plains to the Paraná; the others are lost in swamps or the saline waters of Mar Chiquita and other large, shallow lakes. The climate is characterized by wet summers and rather marked seasonal contrasts in temperature. Except for the scattered woodlands and cultivated areas, the eastern plains are covered with natural grasses; forests extend up the slopes of the Sierras to an altitude of about 5,000 ft., above which lie the pasturelands of the *pampa serrana.*

The climate and scenic attractions of the province make it a favorite vacation and touring centre for tens of thousands of Argentines annually. The tourist trade and a well developed agricultural and industrial economy make Córdoba one of the most prosperous states in the republic. The Central Argentino, Pacífico, Central Norte Argentino, Central Córdoba and Santa Fé railways, with a combined total of more than 3,000 mi. of track, provide the province with excellent transportation facilities. More than 3,000 mi. of national and provincial highways, many of them paved, complement the railroads, and the province is served by both national and international air lines. Among the varied sources of wealth in the province, agriculture occupies first place. The total area cultivated during the agricultural year 1940–41 approached 17,000,000 ac., nearly one-fourth of which was planted in wheat. Other cereals grown extensively include corn, flax (linseed), rye, oats, barley and birdseed. Compared with other provinces and territories in Argentina, Córdoba ranks second in the production of wheat and birdseed, third in corn, rye and barley and fourth in flax and oats. Commensurate with the importance of livestock in the economy more than 3,500,000 ac. are planted in alfalfa. In 1936 there were more than 3,500,000 cattle, 1,500,000 each of horses and sheep and about 800,000 hogs in Córdoba. The majority of the 4,192 industrial establishments of the province (1939) are engaged in the processing of foods.

(R. W. Rd.)

CÓRDOBA, a city in the central part of the Argentine Republic, capital of the above province, on the Río Primero, 432 mi. by rail northwest of Buenos Aires by way of Rosario, 246 mi. from the latter. Pop. (1914) 134,935—the suburbs having some 20,000 more; 1943 estimate 287,598. The city is connected by railway with Buenos Aires and Rosario, and with the capitals of all the surrounding provinces. Córdoba stands on a high eastward-sloping plain called the "Altos," 1,440 ft. above sea-level, and is built in a broad river bottom washed out by periodical inundations and the action of the rains on the alluvial banks. The inundations have been brought under control by the construction of barriers and dams, but the banks are constantly broken down. The city is regularly laid out and contains many fine edifices and dwellings. Several suburban settlements surround the city, the more important of which are served by the urban tramway lines. The noteworthy public buildings include the cathedral, a handsome edifice curiously oriental in appearance, a massive old Jesuit church with a ceiling of richly carved and gilded cedar, the old university, founded in 1613, which still occupies the halls built by the Jesuits around a large quadrangle, the fine old *cabildo,* or Government house, of Moorish appearance, and the national observatory on the *barranca* overlooking the city. There are also two national colleges (*Colegio Nacional de Monserrat* and *Colegio Nacional y Liceo de Señoritas*), four libraries, a provincial museum, zoological gardens and a meteorological station. The water supply of Córdoba is derived from the Río Primero, 12 mi. above the city, where an immense dam (Dique San Roque), one of the largest of its kind in South America, has been built across the river valley. This dam also serves to irrigate the valley below and to furnish power for the electric plant which provides Córdoba with light and electric power. In and about the city there are several industrial establishments which have sprung into existence since the opening of the first railway in 1870. The surrounding country is well cultivated, and produces an abundance of fruit and vegetables.

The city was founded in 1573 by Jerónimo Luis de Cabrera and was for a long time distinguished for its learning and piety. It was the headquarters of the Jesuits in this part of South America for two centuries, and for a time the capital of the Spanish *intendencia* of Tucumán.

CÓRDOBA, a town of the state of Veracruz, Mexico, 55 mi. W.S.W. of the port of Veracruz, in a highly fertile valley, near the volcano of Orizaba, and 2,880 ft. above sea level. Pop. (1940) 17,865. The surrounding district produces sugar, tobacco and coffee, Córdoba being one of the principal coffee-producing centres of Mexico. It also manufactures cotton and woollen fabrics. Córdoba was a town of considerable importance in colonial times, but fell into decay after the revolution. The railway from Veracruz to Mexico City, which passes through it, and the development of coffee production helped the city to recover a part of its lost trade.

CORDON, a word used in many applications of its meaning of "line" or "cord," and particularly of a cord of gold or silver lace worn in military and other uniforms. The word is especially used of the sash or ribbon worn by members of an order of knighthood, crossing from one shoulder to the opposite hip. The *cordon bleu,* the sky-blue ribbon of the knight's grand cross of the order of the Holy Spirit, the highest order of the Bourbon kings of France, was, like the "blue ribbon" of the English Garter, taken as a type of the highest reward or prize to which anyone can attain (*see* also Cookery). In heraldry, "cordons" are the ornamental cords which, with the hats to which they are attached, ensign the shields of arms of certain ecclesiastical dignitaries; they are interlaced to form a mesh or network and terminate in rows of tassels. A cardinal's cordon is red with five rows of 15 tassels, an archbishop's green with four rows of ten, and a bishop's also green with three rows of six. In architecture a "cordon" is a projecting band of stone along the outside of a building, a string-course. The word is frequently used in a transferred sense of a line of posts or stations to guard an enclosed area from unauthorized passage, *e.g.,* a military or police cordon, and especially a sanitary cordon, a line of posts to prevent communication from or with an area infected with disease.

CORDONNIER, VICTOR LOUIS ÉMILIEN (1858–1936), French general, was born at Surgy (Nièvre) on March 23, 1858. After passing through the military college of St. Cyr he entered the infantry as sub-lieutenant in 1879. In 1887 he graduated from the École de Guerre, and staff and regimental service (including duty in the Alps and in Algeria) alternated until in 1905 he became instructor at the École de Guerre. From this time until 1910 his work was wholly instructional. In this period he wrote *Les Japonais en Mandchourie* (1911, Eng. trs. Part I 1912, Part II, 1914). In 1913 he was promoted general of brigade and appointed to command the new 87th Brigade, forming part of the reinforced *couverture* created by the Three Years' Service Act. In command of this brigade, Cordonnier distinguished himself at Mangiennes on Aug. 10, 1914, and in the heavy fighting of the IV. Army in the Ardennes. He was advanced to the command of the 3rd Division, which he led in the battle of the Marne, and in the advance to Ste. Menehould and the Argonne which followed. On Sept. 15 he was severely wounded, and though he resumed his command in October, he had again to be invalided. In December, having become general of division and an officer of the Legion of Honour, he commanded his division in the bitter trench-warfare fighting in the Argonne, and in Jan. 1915 commanded the VIII. Corps in the St. Mihiel sector. In July 1916, after receiving the grade of commander in the Legion of Honour, he was appointed to command the French contingent of the Salonika armies grouped under Sarrail, which became the "Armée francaise d'Orient."

In general charge of the Allied left wing in Sarrail's autumn offensive he fought the actions of Ostrovo, Florina, Armenohor and Kenali, but owing to acute differences with Sarrail, he returned to France just before the battle at Monastir which his movements and combats had prepared. He was already gravely ill, and was unable to hold any further command. He then devoted himself to historical and critical work on the war. In 1921 he published an account of the operations of the 87th Brigade under the title *Une Brigade au feu, Potins de Guerre.*

CÓRDOVA, a province of southern Spain, bounded N.E. by Ciudad Real, E. by Jaén, S.E. by Granada, south by Málaga, southwest and west by Seville, and northwest by Badajoz. Pop. (1940) 761,150; area, 5,300 sq.mi. The river Guadalquivir, flowing through the province from east-northeast to west-southwest, divides it into two very dissimilar portions. North of the river lies the mountain belt of the Sierra de Morena, south of it the more fertile and populated great plains (*La Campiña*), rising in the southeast through undulating country to the borders of the Sierra de Nevada. The Cuzna, Guadiato and Bembezar tributaries join the Guadalquivir on its right bank and the Guadajoz and Genil on its left. Small tributaries of the Guadiana drain the northern districts (*Los Pedroches*). The climate exhibits great contrasts. Snow may lie for months on the mountain peaks while temperatures are mild in the plains, except in the few torrid summer months, when rain seldom falls. The chief wealth of the province lies in the agricultural products of its plains and the mineral deposits of its mountains, though, owing to the conservatism and backward education of the people, neither are fully developed. The fertile Campiña produces much wine and oil of high quality, cereals, fruits and vegetables and a famous breed of horses. In the Sierra de Morena sheep are reared on the pastures and pigs in the oak forests, but far more important are coal, including anthracite from the Belmez district, silver-lead and zinc, and small quantities of copper, iron and bismuth obtained from various localities. South of the river salt is mined at Rute There are no large manufacturing towns but there is a marked contrast between the ancient market centres of the south and the more modern mining towns of the Sierra A fairly complete road and railway system exists, especially in the mining districts. The main Madrid-Linâres-Seville line follows the Guadalquivir valley. At Córdova it meets the north-south line from Almorchón to Málaga which has four important branches—Bélmez-Fuente del Arco, Bélmez-Conquista, Córdova-Utrera and Puente Genil-Jaén. The principal towns (pop. 1940) are Córdova (*q.v.*), Lucena (22,659), Priego de Córdoba (12,134), Puente Genil (22,309), Baena (19,787), Montilla (18,224), Fuenteovejuna (5,688), Cabra (15,172), Pozoblanco (13,466), Montoro (9,541) and Aguilar (15,144). These are described in separate articles. Others of less importance are the mining centres, Hinojosa del Duque (13,393), Bélmez (8,088), and Villanueva de Córdoba (15,903), Penarroya-Pueblonuevo (19,105), and the market towns Castro del Rio (15,916), Rute (13,155) and Bujalance (14,392). (*See* also ANDALUSIA.)

CÓRDOVA, capital of the Spanish province described above; on the southern slopes of the Sierra de Córdova, and the right bank of the river Guadalquivir; on the junction of the main Madrid-Seville railway with branch lines to Almorchón, Utrera and Málaga. Pop. (1940) 116,046 (mun., 143,296). Córdova is an episcopal see. It is typically Moorish, with narrow, winding streets, especially in the older quarter of the centre and west. Beyond several ruined towers and gates, few fragments remain of the ancient walls which once surrounded it, except in the southwest where they show traces of Roman foundations, and in the northeast. The hills behind the city are planted with olive and orange groves and there are gardens beyond the walls on the west. A Moorish bridge with 16 arches on Roman bases connects Córdova with its suburb across the river. At the south end of the bridge stands the tower of La Calahorra; at the north a ruined gateway and near by an elevated statue of the city's patron saint, St. Raphael. West of the bridge, near the river, lies the Alcázar or palace quarter, probably the original nucleus of the town. Here stood the Roman civil and military buildings which the Arab caliphs converted into a royal residence. The site of the Old Alcázar, where the royal guards were quartered, has been gradually built over by workmen's houses. The New Alcázar, which was the palace itself and was later the residence of the Holy Inquisition, is now mainly in ruins, except one wing, which is used as a prison. Gardens overlooking the river, the bishop's palace and an ecclesiastical seminary also occupy part of the site. Other important public buildings are the old monastic establishments, the churches, the city hall, the hospitals and the schools and colleges, including the academy for girls, founded in 1590 by Bishop Pacheco of Córdova, which is empowered to grant degrees.

But the glory of Córdova, surpassing all its other Moorish or Christian buildings, is the *mezquita,* or mosque, now a cathedral, but originally founded on the site of a Roman temple and a Visigothic church by Abd-ar-Rahman I (756–788), who wished to confirm the power of his caliphate by making its capital a great religious centre, rivalling those of the East. The growing population of the city soon rendered a larger mosque necessary and, by orders of Abd-ar-Rahman II (822–852) and Al-Hakim II (961–976), the original size was doubled. After various minor additions, Al-Mansur, the vizier of the caliph Hisham II (976–1009), again enlarged the *Zeca,* or House of Purification, as the mosque was named, to twice its former size, rendering it the largest sacred building of Islam, after the Kaaba at Mecca. The ground plan of the completed mosque forms a rectangle, measuring 590 ft. by 425 ft., or little less than St. Peter's in Rome. About one-third of this area is occupied by the famous Court of the Oranges and the cloisters which surround it on the north, west and east. Passing through the courtyard, the visitor enters on the south a labyrinth of pillars in which porphyry, jasper and many-coloured marbles are boldly combined. Part came from the spoils of Nîmes or Narbonne, part from Seville or Tarragona, some from the older ruins of Carthage, and others as a present to Abd-ar-Rahman I from the East Roman emperor Leo IV, who sent also from Constantinople his own skilled workmen, with 16 tons of tesserae for the mosaics. Originally of different heights, the pillars have been adjusted to their present standard of 13 ft. either by being sunk into the soil or by the addition of Corinthian capitals. The present 850 pillars divide the building into 19 north to south and 29 east to west aisles, each row supporting a tier of open Moorish arches of the same height (12 ft.), with a third and similar tier superimposed upon the second. The Moorish character of the building was unfortunately impaired in the 16th century by the erection in the interior of a *crucero,* or high altar and large cruciform choir, by the formation of numerous chapels along the sides of the vast quadrangle, and by the addition of a belfry 300 ft. high in place of the old minaret. Modern vaulting is now being removed to reveal a wooden Moorish ceiling carved and painted and still practically intact. The most exquisite work in the whole mosque is found in the third *Mihrab,* or prayer niche, a small octagonal recess roofed with a single block of white marble, carved in the form of a shell and with its walls inlaid with Byzantine mosaics. Córdova was celebrated in the time of the Moors for its silversmiths, its silk embroideries and for a peculiar kind of leather which took its name from the city, whence is derived the word *cordwainer.* Fine gold and silver filigree ornaments are still produced but the leather industry has degenerated into an imitation of Moorish work. The chief modern industries of Córdova are brewing and distilling and the manufacture of textiles. The exports, besides some copper from neighbouring mines, are filigree work and oil and rough clothing for sale in the Andalusian fairs.

Córduba, probably of Carthaginian origin, was occupied by the Romans under Marcus Marcellus in 152 B.C., and shortly afterward became the first Roman *colonia* in Spain, later with the title of *Patricia.* After the battle of Munda in 45 B.C. the city was severely punished by Caesar and 20,000 of its inhabitants massacred for having supported the sons of Pompey. Under Augustus, if not before, it became a municipality, and capital of the province of Baetica. Strabo (*c.* 63 B.C.–A.D. 21) testifies to its importance at this period. Its prosperity was due partly to its position on the Baetis, then navigable up to the city, and on the Via Augusta, the great commercial road from northern Spain built by Augustus, and partly to its proximity to mines and rich grazing and grain-producing districts. Under the rule of the Visigoths from the 6th century to the beginning of the 8th its importance declined but, captured and largely destroyed by the Moors in 711, it entered 50 years later on its period of greatest prosperity. In 756 'Abd-ar-Rahman I (*q.v.*) made it the capital of Moorish Spain, and the centre of an independent caliphate. Under the Omayyad dynasty the city was reconstructed and filled with palaces and mosques and the walls extended so that the enclosed area was doubled. It reached the summit of its splendour in the middle of the 10th century, under Abd-ar-Rahman III. A period of decadence began during the year of 1010 owing to rivalry for the caliphate and in 1236 Córdova was easily captured by Ferdinand III of Castile. The substitution of Spanish for Moorish supremacy rather accelerated than arrested the decline of art, industry and population; and in the 19th century Córdova never completely recovered from the disaster of 1808, when it was stormed and sacked by the French. It was captured by Franco's nationalist troops early in the civil war of 1936–39. Tourist traffic ordinarily forms an important source of wealth to its inhabitants. Córdova also was the birthplace of the rhetorician Marcus Annaeus Seneca, and his more famous son Lucius (*c.* 3 B.C.–A.D. 65); of the poet Lucan (A.D. 39–65); of the philosophers Averroes (1126–98) and Maimonides (1135–1204); of the Spanish men of letters, Juan de Mena (*c.* 1411–56), Lorenzo de Sepúlveda (d. 1574) and Luis de Gongora y Argote (1561–1627); and the painters Pablo de Céspedes (1538–1608) and Juan de Valdés Leal (1630–91). The celebrated captain Gonzalo Fernández de Córdoba (*q.v.*), the conqueror of Naples (1495–98), was born in the nearby town of Montilla.

See *Estudio descriptivo de los monumentos árabes de Granada y Córdoba,* by R. Contreras (Madrid, 1885); *Córdoba,* a large illustrated volume of the series "España," by P. de Madrazo (Barcelona, 1884); *Inscripciones árabes de Córdoba,* by R. Amador de los Ríos y Villalta (Madrid, 1886).

CORDOVA, a town of southwestern Alaska within the embayment known as Prince William's sound; situated in lat. 60° 31′ N., long. 145° 45′ W., about 1,500 mi. N.W. of Seattle. Pop. (1940) 938.

Cordova is an old town in name and place and an old fishing centre. Its importance once lay in the fact that it was the ocean terminus of the Copper river and North-western railway. This road, 196 mi. in length, was constructed (1907–11) for the sole purpose of bringing to the coast the copper ores from the Kennicott mines. These famous mines, four in number, reached a depth of some 2,500 ft., with more than 40 mi. of underground workings, and in the thirty years of their operation produced $200,000,000 worth of copper. What was probably the richest copper deposit known was exhausted in 1938 and the railroad and mine were shut down.

Cordova is now dependent on its fisheries, salmon, crab and clam canneries. (W. P. R.; X.)

CORDUROY, a cotton cloth of the fustian kind, made like a ribbed velvet. It is generally a coarse heavy material and is used largely for workmen's clothes, but some finer kinds are used for ladies' dresses, upholstery, etc. According to the *New English Dictionary* the word is understood to be of English invention, "either originally intended, or soon after assumed, to represent a supposed French *corde du roi.*" It is said that a coarse woollen fabric called *duroy,* made in Somerset during the 18th century, has no apparent connection with it. From the ribbed appearance of the cloth the name *corduroy* is applied, particularly in America, to a rough road of logs laid transversely side by side, usually across swampy ground. (*See* FUSTIAN.)

CORDUS, AULUS CREMUTIUS, Roman historian of the later Augustan age. He was the author of a history of the civil wars and the reign of Augustus, from at least 43–18 B.C. In A.D. 25 he was brought to trial for having praised Brutus and Cassius. His real offence was a jibe against Sejanus, who put up two of his creatures to accuse him in the senate. Cordus starved himself to death. The senate ordered his works to be confiscated and burned by the aediles, but his daughter saved some copies of the eulogy, and after the death of Tiberius the work was published at the wish of Caligula. It is impossible to form an opinion of it from the scanty fragments (H. Peter, *Historicorum Romanorum Fragmenta,* 1883). According to ancient authorities, the writer was very outspoken (Quintilian, *Instit.* x. 1, 104). Two passages in Pliny (*Nat. Hist.* x. 74 [37], xvi. 108 [45]) seem to refer to a different work—perhaps a treatise on *Admiranda* or remarkable things.

See Tacitus, *Annals,* iv. 34, 35; Suetonius, *Tiberius,* 61, *Caligula,* 16; Seneca, *Suasoriae,* vii., esp. the *Consolatio* to Cordus's daughter Marcia; Dio Cassius lvii. 24. There are monographs by J. Held (1841) and C. Rathlef (1860). Also H. Peter, *Die geschichtliche Literatur über die römische Kaiserzeit* (1897); Teuffel-Schwabe, *Hist. of Roman Lit.,* Eng. trans., 277, 1.

CORELLI, ARCANGELO (1653–1713), Italian violin-player and composer, holds an honoured place in musical history in both capacities. Of his life little is known except that he travelled widely about Europe and was everywhere held in the highest esteem. The style of execution introduced by Corelli and preserved by his pupils, such as Geminiani, Locatelli, and many others, has been of vital importance for the development of violin-playing, even though he employed only a limited portion of the instrument's compass, as may be seen by his writings, wherein the parts for the violin never proceed above D on the first string, the highest note in the third position. It is even said that he refused to play, as impossible, a passage which extended to A in altissimo in the overture to Handel's *Trionfo del Tempo,* and took serious offence when the composer played the note in evidence of its practicability. His compositions for the instrument mark an epoch in the history of chamber music. Nor was his influence confined to his own country; even Sebastian Bach was not insensible to it. Corelli's numerous compositions are distinguished by a beautiful flow of melody and by a masterly treatment of the accompanying parts, which he is justly said to have liberated from the strict rules of counterpoint.

CORELLI, MARIE (1855–1924), English novelist, was the daughter of Dr. Charles Mackay (*q.v.*) the song-writer and journalist, and his second wife, formerly Mary Elizabeth Mills. She was sent to be educated in a French convent with the object of training her for the musical profession. She became suddenly famous in 1886 with the publication of her brilliant and fantastic *Romance of Two Worlds.* She then wrote in succession a series of melodramatic romantic novels which had an enormous vogue; these were *Vendetta* (1886), *Thelma* (1887), *Ardath* (1889), *The Soul of Lilith* (1892), *Barabbas* (1893), *The Sorrows of Satan* (1895), *The Mighty Atom* (1896), and others, down to *The Master Christian* (1900), and *Temporal Power* (1902). Her later books were less successful. Marie Corelli wrote quite sincerely and with conviction, if in bad style. Her later years were spent at Stratford-on-Avon, where she died on April 24, 1924.

CORENZIO, BELISARIO (1558 or 1560–1643), Italian painter, a Greek by birth, studied at Venice under Tintoretto, and then settled at Naples. Though careless in composition and a mannerist in style, he possessed an acknowledged fertility of invention and readiness of hand. When Guido Reni came, in 1621, to Naples to paint in the chapel of St. Januarius, Corenzio suborned an assassin to take his life. The hired bravo killed Guido's assistant and effectually frightened Reni, who prudently withdrew to Rome. Corenzio later supplanted Ribera in the good graces of Don Pedro di Toledo, viceroy of Naples, who made him his court painter. His best works were frescoes, one of the principal examples at Naples being the "Miracle of the Loaves and Fishes" for the refectory of San Severino. Corenzio died, it is said, at the age of 85 by a fall from a scaffolding.

CO-RESPONDENT: *see* DIVORCE.

CORFE CASTLE, a small town of Dorsetshire, England, in the district called the Isle of Purbeck, 129½ mi. S.W. by W. from London by the Southern railway. Pop. (1931) 1,409. The castle guarded a gap in the line of hills which rise in the centre of Purbeck. It is strongly placed and its ruins are extensive, dating from the Norman period to the reign of Edward I., with traces of an earlier settlement (Saxon).

According to William of Malmesbury the church was founded by St. Aldhelm in the seventh century. In 1086 the abbey of Shaftesbury held the manor, which afterwards passed to the Norman kings. The castle was held for Maud against Stephen in 1139, was frequently the residence of John, and was a stronghold of the barons against Henry III. The town dependent on it seems to have grown up during the 13th century, being first mentioned in 1290. Elizabeth in 1577 gave exclusive admiralty jurisdiction within the island of Purbeck to Sir Christopher Hatton. The castle withstood a protracted siege by the Parliamentarians in 1643, and fell to them by treachery in 1646, after which it was dismantled and wrecked. Elizabeth incorporated Corfe Castle in 1576 and Charles II in 1663, but the corporation was abolished following the Corporations Act of 1883. It first returned two representatives to parliament in 1572, but was disfranchised in 1832. As early as the 14th century the quarrying and export of marble gave employment to the men of Corfe, and during the 18th century the knitting of stockings was a flourishing industry.

CORFINIUM, in ancient Italy, the chief city of the Paeligni, 7m. N. of Sulmona in the valley of the Aternus, near the modern village of Pentima. It does not appear in Roman history before the Social War (90 B.C.), in which it was adopted by the allies as the capital and seat of government of their newly founded state under the name Italia. The Via Valeria (according to Strabo) had reached Corfinium before the time of Claudius: he extended it to the Adriatic, and at the same time constructed the *Via Claudia Nova* (*q.v.*). Another road ran south-south-east past Sulmo to Aesernia. It was thus an important road centre, and in the imperial period, a town of some size. The origin of the imposing church of S. Pelino may be traced to the end of the 5th century when it was the cathedral of the see of Valva, the immediate successor of Corfinium. *See* R. Gardner in *Papers of the British School at Rome* ix. 89.

CORFU (anc. and mod. Gr. *Κέρκυρα* or *Κόρκυρα,* Lat. *Corcyra*), an island of Greece, in the Ionian Sea, separated from the coast of Epirus by a strait from 2 to 15 m. broad. The name Corfu is an Italian corruption of the Greek *κορυφαί* (crests, Byz. *κορυφώ*). Its length is about 40 m.; greatest breadth about 20. The island consists of three districts, of which the northern is mountainous, the central undulating and the southern low-lying: all are of limestone formation and picturesque scenery. Two principal ranges are San Salvador (3,300 ft.) (ancient Istone) lying east and west from Cape St. Angelo to Cape St. Stefano. The second culminates in Santa Decca (Greek οἱ Ἅγιοι Δέκα, "The Ten Saints"). Pop. (1938) 106,253.

Corfu is well-watered, widely fertile, and the most beautiful of the Greek isles, but the prevalent olives give monotony to its colouring. Undisturbed by cultivation, myrtle, arbutus, bay and ilex form thick brushwood. Once planted all the fruit trees known in southern Europe thrive, with the Japanese medlar. Olive oil is a principal crop; the wine is for local consumption.

The common form of land tenure is the *colonia perpetua,* by which the landlord grants a lease to the tenant and his heirs for ever, in return for a rent, payable in kind, and fixed at a certain proportion of the produce. Such a tenant could not be expelled except for non-payment, bad culture or the transfer of his lease without the landlord's consent. Attempts have been made to prohibit so embarrassing a system; but, as it is preferred by the agriculturists, the existing laws permit it. The large old fiefs (*baronie*) in Corfu, as in the other islands, have left traces in quit-rents generally equal to one-tenth of the produce. But they have been much subdivided, and the vassals may by law redeem them. None of the Corfu wines is much exported. The capital is the only city in the island; but there are numerous villages. Near Gasturi stands the Achilleion palace, built for the Empress Elizabeth of Austria, and later owned by William II. of Germany. The town of Corfu stands on the broad part of a peninsula within the central bay of the east coast. The steep twin-peaked citadel has the sea on two sides, and is cut off from the town by a natural gully, with an artificial salt-water ditch at the bottom. The old fortifications were in great part thrown down by the English, and defences were limited to the island of Vido and the old capital; even these are now dismantled. Having grown up within fortifications, the town is a labyrinth of narrow, tortuous, up-and-down streets. But there is a wide esplanade between town, citadel and palace, and a promenade by the seashore towards the suburb Castrades. The palace, built by Sir Thomas Maitland (?1759–1824; lord high commissioner of the Ionian Islands, 1815), is of white Maltese stone. A few houses survive from Venetian times with traces of past splendour, but the modern buildings are in French or Italian style. There are thirty-seven Greek churches. The cathedral is dedicated to Our Lady of the Cave (ἡ Παναγία Σπηλιώτισσα); St. Spiridion's has the tomb of the patron saint of the island; and the suburban church of St. Jason and St. Sosipater is reputed the oldest. The city has a Greek and a Roman Catholic archbishop; a gymnasium, a theatre, and a library and museum preserved in the buildings of the former university, founded by Frederick North, 5th earl of Guilford in 1823, but disestablished when the English protectorate ceased.

The site of the ancient city is about 1½ mi. to the south-east of Corfu, between the lagoon of Calichiopulo and the bay of Castrades, in each of which it had a port. The circular tomb of Menecrates, and the remains of a very simple Doric temple are noteworthy. Of ancient Cassiope the name is preserved by the village of Cassopo; but the temple of Zeus Cassius has disappeared. There are numerous monasteries and Venetian buildings. Many of Corfu's buildings were destroyed during World War II.

History.—In local tradition Corcyra was the Homeric island of Scheria, the home of Phaeacians. In early Greek times it was colonized from Corinth, but seems to have had earlier settlers from Eretria. The position of Corcyra on the highway between Greece and the West favoured rapid growth, and freedom of action; and its people, contrary to the practice of Corinthian colonies, maintained an independent and even hostile attitude towards the mother city. In the early part of the 7th century, their fleets fought the first naval battle recorded in Greek history (about 664 B.C.). The Corinthian tyrant Periander (*c.* 600), governed Corcyra by deputy, and induced it to join in the colonization of Apollonia and Anactorium. But the island regained its independence and devoted itself to purely mercantile policy. During the Persian invasion of 480 it manned 60 ships, but took no active part. In 435 in a quarrel with Corinth it sought assistance from Athens. This was one of the chief immediate causes of the Peloponnesian War (*q.v.*), in which Corcyra was of considerable use to the Athenians as a naval station and base for supplies though it was twice nearly lost to Athens by internal feuds; on each occasion, 427 and 425, the popular party ultimately won; after a third abortive rising in 410 it passed out of the war. In 375 a fresh Athenian alliance resulted in hostilities with Sparta. In the Hellenistic period Corcyra was besieged by Cassander, and occupied in turn by Agathocles Pyrrhus and Illyrian corsairs. From these last, in 229, it was delivered by the Romans, who retained it as a naval station and made it a "free state." In 31 B.C. Octavian used it as a base against Antony, but his victory-foundation, Nicopolis, soon out-rivalled it and Corcyra for long passed out of notice.

With the rise of the Norman kingdom in Sicily and the Italian naval powers, Corcyra again became a frequent object of attack. In 1081–1085 it was held by Robert Guiscard, in 1147–1154 by Roger II. of Sicily, in 1197–1207 by Genoese privateers who were expelled by the Venetians. In 1214–1259 it passed to the Greek Despots of Epirus, and in 1267 to the Neapolitan house of Anjou. Under this weak rule the island suffered from various adventurers; in 1386 it placed itself under the protection of Venice, and in 1401 under its formal sovereignty. Corcyra remained in Venetian hands till 1797, though several times attacked by the Turks with notable sieges in 1536 and 1716–1718. Under Venetian feudalism the island took the new name of Corfu. The Corfiotes were encouraged to cultivate the olive, but were debarred from commercial competition with Venice. The island served as a refuge for Greek scholars from Turkish conquests and in 1732 became the home of the first academy of modern Greece, but no serious impulse to Greek thought came from this quarter.

By the treaty of Campo Formio, Corfu was ceded to the French, who occupied it for two years, until they were expelled by a Russo-Turkish armament (1799). For a short time it became the capital of the self-governing federation of the Hephtanesos ("Seven Islands"); in 1807 its faction-ridden government was again replaced by a French administration, and in 1809 it was attacked by a British fleet. By the treaty of Paris of November 5th, 1815, the Ionian Islands were placed under the protectorate of Great Britain and Corfu became the seat of the British high commissioner. Though the native senate and assembly were retained, British administration improved conditions, but its strictness displeased the natives, and in 1864 Corfu was ceded with the other Ionian Islands to the kingdom of Greece, in accordance with the wishes of the inhabitants. (J. L. My.)

Although the neutralization of Corfu was maintained after the Balkan wars, its military importance grew so greatly during World War I, after the Serbian retreat across Albania, that the French, ignoring a Greek protest, landed there on Jan. 11, 1916. They were followed by the first detachment of retreating Serbs four days later, and by Feb. 10 some 75,000 Serbian troops, as well as Montenegrin soldiers, had been landed in the island, whither on the previous day the Serbian Government had transported its seat and where, on Sept. 10, the Serbian Parliament met in the theatre. In July 1917 the "Pact of Corfu" was signed, which proclaimed the union of the Yugoslavs.

On Aug. 27, 1923, the Italian delegate for the delimitation of the Albanian frontier, Gen. Tellini, was assassinated at Kakavia. There was no proof that the assassins were Greeks; but Signor Mussolini held the Hellenic Government responsible and sent an Italian fleet to Corfu, which bombarded the town and killed several Greek and Armenian refugees. After exacting from Greece 50,000,000 lire as an indemnity, the Italians evacuated Corfu. In World War II, the island was bombed heavily by the Italians. It fell to the Germans during the Balkan campaign of April 1941.

CORI (anc. *Cora*), a town and episcopal see of the province of Littoria, Italy, 36 mi. S.E. by rail from the town of Rome, on the lower slopes of the Volscian mountains, 1,300 ft. above sea-level. Pop. (1936) 7,191 (town), 9,289 (commune). It occupies the site of the ancient Volscian town of Cora. It was devastated by the partisans of Marius during the struggle between him and Sulla. It lay just above the older road from Velitrae to Terracina, which followed the foot of the Volscian hills, but was 6m. from the Via Appia. Three different *enceintes,* one within the other, enclose the upper and lower town and the acropolis. They are built in "Cyclopean" work, and different parts vary considerably in the roughness or fineness of the jointing and hewing of the blocks; but explorations at Norba have clearly proved that this has nothing to do with their relative antiquity. There is a fine single-arched bridge, now called the Ponte della Catena, just outside the town on the way to Norba. At the summit of the town is a Doric tetrastyle temple, belonging probably to the 1st century B.C., built of limestone. Lower down are two columns of a Corinthian temple dedicated to Castor and Pollux. The church of Santa Oliva stands upon the site of another temple. The cloister, constructed in 1466–80, is in two stories. There are remains of a series of large cisterns probably belonging to the imperial Roman period. The chapel of Annunziata outside the town has frescoes of the Roman school of the 15th century.

CORIANDER, the fruit, improperly called seed, of an umbelliferous plant (*Coriandrum sativum*), a native of the south of Europe and Asia Minor, but cultivated in the south of England and on the continent, where it is also found as an escape from cultivation. The plant produces a slender, erect, hollow stem rising 1 to 2 ft. in height, with bipinnate leaves and small flowers in pink or whitish umbels. The fruit is globular and externally smooth, having five indistinct ridges, and the mericarps, or half-fruits, do not readily separate from each other. It is one of the few umbelliferous plants producing seeds with concave face. It is used in medicine as an aromatic and carminative. The active principle of its volatile oil (*Coriandrol*) consists mainly of linalool (2:6 dimethyl$-\triangle^{2:7}$ (or $\triangle^{1:7}$)$-$octadien$-6-$ol). It is a favourite ingredient in hot curries and sauces. The fruit is also used in confectionery, and as a flavouring ingredient in liqueurs. As a medicine, it possesses carminative properties. The young leaves and shoots are used in soups and salads.

CORINGA, a seaport of British India, in the district of Godavari and the presidency of Madras, on a canal from the Godavari to the sea. The Dutch were the first to establish themselves at Coringa. In 1759 the English took possession of the town and erected a factory 5 m. to the south of it. The harbour is protected by the projection of Point Godavari, and affords shelter to vessels during the south-west monsoon; but though formerly the most important on this coast it has been silted up and lost its trade. The repairing and building of small coasting ships is an industry at Tallarevu in the vicinity.

CORINNA, surnamed "the Fly," a Greek poetess, born at Tanagra in Boeotia, flourished about 500 B.C. She was the instructress of Pindar, whom she defeated in five poetical contests. According to Pausanias (ix. 22. 3), her success was chiefly due to her beauty, and her use of the local Boeotian dialect. The extant fragments of her poems, dealing chiefly with mythological subjects, such as the expedition of the Seven against Thebes, will be found in Bergk's *Poëtae Lyrici Graeci.*

Some considerable remains of two poems on a 2nd-century papyrus (*Berliner Klassikertexte,* v., 1907) have also been attributed to Corinna (W. H. D. Rouse's *Year's Work in Classical Studies,* 1907; J. M. Edmonds, *New Frags. of . . . and Corinna,* 1910; E. Diehl, *Supplementum Lyricum,* 1910).

CORINTH, LOVIS (1858–1925), German painter, was born at Tapiau, East Prussia, on July 21, 1858, the son of a tanner. With Walter Leistikow and Max Liebermann he became one of the main supporters of the Berlin Secessionists. The last years of his life he spent, for the greater part, in his cottage on the Walchensee in Bavaria, where some of his most beautiful pictures of still life and landscape were painted. Corinth died July 18, 1925 at Zandvoort, Holland.

Among his most famous pictures are his portraits of Graf E. Keyserling (1896), Pfarrer Moser (1899), Max Liebermann (1899), Peter Hille (1902), Konrad Ansorge (1904), Rudolf Rittner as Florian Seyer (1907), and of himself (1918). Corinth wrote: *Das Erlernen der Malerei* (1909); *Legenden aus dem Künstlerleben* (1909); *Das Leben Walter Leistikows* (1910). *See* Alfred Kuhn, *Lovis Corinth* (1925).

CORINTH, a city of Greece, situated 1½ m. south of the isthmus (*see* CORINTH, ISTHMUS OF) which connects Peloponnesus and central Greece, and separates the Saronic and the Corinthian gulfs. The citadel, or Acro-Corinthus, rises precipitously on the south to a height of 1,886 ft. and commands all routes into Peloponnese. The territory of Corinth was small and unfertile; but its position made it a commercial centre, and ships were hauled across the isthmus. With its western port of Lechaeum it was connected by two continuous walls, with Cenchreae and Schoenus on the east by forts.

Modern Town.—The modern town of New Corinth, the head of a district in the province of Corinth, is situated on the western side of the Isthmus, 3½ m. north-east from the ancient city. It was founded in 1858, when Old Corinth was destroyed by earthquake, and was almost wholly destroyed by earthquake in 1928. It is connected by railway with Athens (57 m.), with Patras (80 m.) and with Nauplia (40 m.), the capital of Argolis. Communication by sea with Athens, Patras, the Ionian Islands and the Ambracian Gulf is frequent since the opening of the ship canal, in 1893. But it has few local resources. Its chief exports are currants (which have their name from the town), olive-oil, silk and cereals from north-east Peloponnese. Old Corinth, being a considerable town, after the War of Liberation was suggested as the capital of the new kingdom. Since the earthquake of 1858, it is a poor village, mostly Albanian, with a pop. of 6,141.

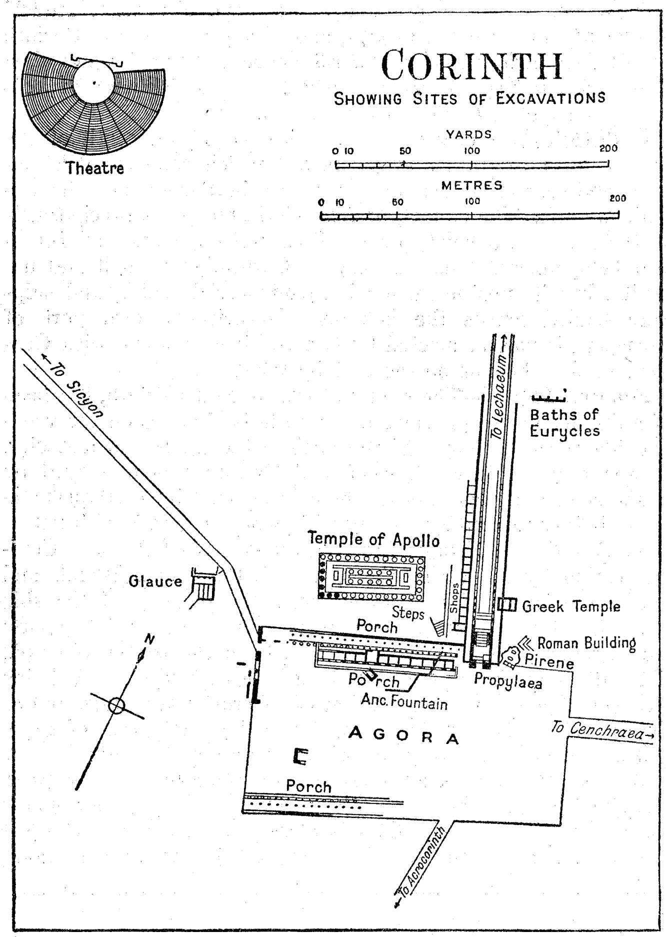
Archaeology.—The ancient city spreads out over two terraces, one about 100 ft. above the other; both are ancient shore-lines: the present coast of the Gulf is about 1½ m. distant. Here at the nearest point to the city was laid its western harbour,

BY COURTESY OF THE AMERICAN WOMEN'S HOSPITAL
RUINS ON THE SITE OF ANCIENT CORINTH

Lechaeum, excavated far into the shore and joined with the city by long walls. The heart of the ancient city was in an indentation about the middle of the upper terrace. At its lower end is the modern public square, shaded by a gigantic plane tree. On the terrace to the west is a venerable temple ruin, and, directly up the hollow, Acro-Corinthus rises over 1,500 ft. above the village. Even from the village, the view over the gulf includes Parnassus on the north, Cyllene on the west, and Geraneia on the north-east. From Acro-Corinthus the view is still finer.

Excavations begun in 1896 by the American School of Classical

Studies at Athens, and still in progress, have brought to light important monuments of the ancient city, both Greek and Roman. Principal discoveries are the ancient market-place (*agora*), on the terrace south of the ancient temple, surrounded with colonnades and monuments; the harbour road which enters the *agora* up the hollow east of the temple, through a stately gateway; the famous fountain of Pirene, east of this gateway; large public baths a short distance along the harbour road, and the theatre some way below and to the west. Other roads towards Sicyon, Cenchreae and Acro-Corinth leave the *agora* on its other three sides. Many bases of statues have been found, but little sculpture of outstanding merit, even of periods subsequent to the spoliation of 146 B.C. Pottery of all periods from the earliest bronze age enable the main phases of early settlement to be reconstructed; but for prehistoric archaeology the stratified village-site at Korakon close to Lechaeum is of greater significance.



At Korakon settlement begins early in the bronze age, and passes through periods of Cycladic, Minyan and Mycenaean influence, declining in importance during the domination of Mycenae (1600–1200 B.C.), but disappearing with its collapse, and the establishment of the Dorian city at Corinth itself. *See* reports of excavations annually in *American Journal of Archaeology* from 1896; C. W. Blegen, *Korakon,* Boston, 1921.

History.—In mythology, Corinth, the home of Medea, Sisyphus and Bellerophon, had over-sea commercial activity. The presence of Phoenician traders was attested by Sidonian cults (*Aphrodite Ourania,* Melikertes; *i.e.,* Melkarth, etc.). In the Homeric poems Corinth is a dependency of Mycenae. Conquered by the Dorians, it retained much of its "Ionian" population whose god Poseidon was worshipped at the Isthmian games. The maritime expansion of Corinth in the 8th and 7th centuries B.C. is proved by the foundation of colonies at Syracuse and Corcyra and the equipment of a fleet of triremes to quell a revolt of the latter city.

Corinth's real prosperity dates from the time of the tyranny (657–581 B.C.), established by Cypselus (q.v.) and continued under his son Periander (q.v.). Under these remarkable men the city rapidly developed. She extended her sphere of influence throughout the coast-lands of the western gulf; she controlled the Italian and Adriatic trade-routes and secured a large share of the commerce with the western Greeks. Connexions grew up with Miletus, Lydia, Phrygia, Cyprus, and Egypt. As an industrial centre, Corinth achieved pre-eminence in pottery, metal-work, and decorative handicraft; her bronze and her pottery were widely exported over the Mediterranean.

The tyranny was succeeded by an oligarchy which pursued a commercial policy to the neglect of military efficiency. Late in the 6th century, Corinth joined the Peloponnesian league under Sparta, in which her financial resources and strategic position secured her an unusual degree of independence. The city befriended the Athenians against Cleomenes I. (q.v.) and supported them against Aegina, their common commercial rival. In the great Persian war of 480 B.C., Corinth served as the Greek headquarters; her army took part at Thermopylae and Plataea (q.v.) and her navy at Salamis and Mycale. Later the development of Athenian trade and naval power became a serious menace. In 459 B.C. the Corinthians, with the Aeginetans, made war upon Athens, but lost both by sea and land. The Athenians extended their rivalry even into the Corinthian gulf. Syracuse remained friendly, but the disaffection of Corcyra hampered the Italian trade. The alliance of Corcyra with Athens led the Corinthians to incite Sparta to war with Athens in 432 B.C. In the war Corinth displayed great activity, and gave valuable support to Syracuse (*see* PELOPONNESIAN WAR).

In 395 B.C., the domineering attitude of Sparta impelled the Corinthians to conclude an alliance with Argos, Thebes and Athens. Later Corinth rejoined Sparta and after Leuctra (q.v.) opposed the Thebans. In 344 B.C. a political struggle ended in the tyranny of Timophanes, who was put to death by his brother Timoleon (q.v.).

After Chaeroneia (q.v.), Philip II. of Macedon summoned a Greek congress at Corinth and left a garrison on the citadel. This citadel, one of the "fetters of Greece," after Alexander's death fell to Antigonus Gonatas. In 243 B.C. Corinth was freed by Aratus and incorporated into the Achaean league (q.v.), but was again surrendered to Macedonia. T. Quintius Flamininus, after proclaiming the liberty of Greece at the Isthmus, restored Corinth to the league (196 B.C.). With the revival of its political and commercial importance the city became the centre of resistance against Rome. After the war of 146 B.C. the Romans despoiled Corinth of its art treasures and destroyed the entire settlement.

In 46 B.C. Julius Caesar repeopled Corinth with Italian freedmen and dispossessed Greeks; it rapidly recovered its commercial prosperity. Augustus made it the capital of Achaea; Hadrian enriched it with public works. Its prosperity is attested by the New Testament, by Strabo, and by Pausanias.

CORINTH, a city of northeastern Mississippi, U.S.A., on federal highways 45 and 72, 90 mi. E. by S. of Memphis; the seat of Alcorn county. It is served by the Illinois Central, the Gulf, Mobile and Ohio and the Southern Railway systems. Population was 7,818 in 1940 by federal census. Corinth has two machine shops, a hosiery mill, a pants factory, an automobile trailer factory, a brick plant and other manufacturing plants. It was an important objective in the western campaigns of the American Civil War. The national cemetery there has 5,754 graves. Corinth was fortified early in 1862 by Gen. P. G. T. Beauregard. The battle of Shiloh, April 6–7, 1862, fought 20 mi. N.E., in Tennessee, and the battle of Corinth, Oct. 3–4, 1862, were decisive victories for the Union forces, under Gen. Grant and Gen. Rosecrans respectively.

The Shiloh battlefield is a national military park.

CORINTH, ISTHMUS OF, in Greece, dividing the Gulf of Corinth from the Saronic Gulf. Ships were dragged across it in ancient times. Nero, in A.D. 67, began a canal through it. A ship canal begun in 1881 was opened in 1893 with its western entrance about $1\frac{1}{4}$ m. N.E. of New Corinth. It is about 4 m. long, 70 ft. broad, and 26 ft. deep. It shortens the journey from the Adriatic to the Peiraeus by 202 m., for such vessels as can navigate it. Traces of an ancient wall may still be seen parallel to the canal. Just to the south of it lies the fortified sanctuary of Poseidon, where the Isthmian games were celebrated.

CORINTHIAN ORDER, the third of the Greek and the fourth of the Roman orders of architecture, characterized by an elaborate capital decorated with acanthus leaves and scrolls (*see* ORDER).

CORINTHIANS, EPISTLES TO THE, two books of the New Testament. The founding of the Church in Corinth is told in Acts xviii. 1–18. St. Paul's success was prompt and large, and in the year and six months of his stay a vigorous Church was gathered, including Aquila and Priscilla, as well as Crispus, the "ruler of the synagogue" (*cf.* 1 Cor. i. 14); whether Sosthenes, who seems to have succeeded Crispus in his office (Acts xviii. 17), was afterwards converted and became the Christian brother mentioned in 1 Cor. i. 1 cannot be known. The Church evidently consisted mainly of Gentile converts (1 Cor. x. 14; xii. 2), but may have included some Jews (vii. 18). The latter must have been such as were willing to live under the conditions imposed by full fellowship with Gentile Christians.

The apostle's next long stay was at Ephesus, whither he seems to have gone in the course of the same year in which he left Corinth, and where he stayed three years. Before he arrived at Ephesus, Aquila and Priscilla, who had settled there, had made the acquaintance of Apollos (*q.v.*), a well-educated Jew from Alexandria, who with imperfect Christian knowledge was zealously preaching the gospel of Jesus in the synagogue. He presently went to Corinth (Acts xviii. 24–28). "I planted," says Paul (1 Cor. iii. 6), "Apollos watered." From this point on, our information comes from the two epistles, of which the first was written from Ephesus before Pentecost, probably in the year in which Paul left that city, A.D. 54–58 (1 Cor. xvi. 8). It appears that the Church grew in numbers, for Paul refers in 2 Cor. i. 1, to "the saints who are in all Achaea." Its membership was mostly of humble people (1 Cor. i. 26–29), but Crispus, Stephanas (who with his household was able to render services that may well have been costly, 1 Cor. xvi. 15), Gaius and Erastus (Rom. xvi. 23) would appear to have been persons of some substance. It included tradesmen prosperous enough to enter into law-suits; its earning-capacity was sufficient to make gifts to the Jerusalem Christians possible; and the letters imply some degree of education in the readers.

The first need of the Church for help from Paul seems to have grown out of the dangers from surrounding heathenism. In 1 Cor. v. 9 we read of a letter in which Paul had directed the Christians "not to have company with fornicators." Some hold that this letter is partly preserved in 2 Cor. vi. 14–vii. 1, but the evidence that those verses do not belong in their present position is insufficient. While at Ephesus, where communication with Corinth was easy and frequent, Paul was visited by persons of the household of Chloe (1 Cor. i. 11), and by Stephanas with Fortunatus and Achaicus (perhaps his slaves, xvi. 17). From them and from a letter (vii. 1), perhaps brought by Stephanas, he was able to gain the intimate knowledge which the epistles everywhere reveal. The letter from Corinth must have contained enquiries as to practical conduct with regard to marriage (vii. 1), meat offered to idols (viii. 1), and the spiritual gifts (xii. 1), and may well have related to other matters, such as the collection of money for Jerusalem (xvi. 1), the visit of Apollos (xvi. 12), the position of women (xi. 2). Paul's reply includes many other topics. At the time of sending it, his trusted helper Timothy had also started on his way (probably through Macedonia) to Corinth, to contribute there to the edification of the Christians (iv. 17, xvi. 10). The letter itself was doubtless sent by the hand of Corinthians returning home by sea, possibly by the unnamed brethren referred to in xvi. 11, and was expected to arrive before Timothy.

FIRST EPISTLE TO THE CORINTHIANS

The first epistle is a pastoral letter, dealing both with positive evils that need correction and with difficult questions of practice and thought. Through it all runs a genial undercurrent of confidence in the loyalty of the Corinthian Church to Paul as its spiritual father. After the opening paragraphs (i. 1–9) in which the usual sequence of Paul's epistles, as of many simple Greek letters, is followed, the first large section (i. 10–iv. 21) introduces us to conditions at Corinth. First Corinthians shows us the earlier stage of a quarrel, which later, flaring into passion, caused Paul the greatest anxiety, and of which the dying embers still contained fire when Second Corinthians was written. The sensitiveness of the situation can be recognized from the guarded way in which Paul approaches it by reproving a tendency to divide into parties (i. 10–17; iii. 4–9; iv. 6)—of Paul, of Apollos, of Cephas, and perhaps (although his meaning is here disputed) of Christ. This factiousness would, indeed, have been an evil, but the actual topic of the section is in the main a different issue. The vagueness of Paul's allusions is studied, and avoids direct references, but his language shows that he had chiefly in mind certain persons who prided themselves on their eminent possession of the Spirit and vaunted the superiority of their divinely bestowed "wisdom" as well as their excellency of speech, and who set themselves up in outspoken and arrogant personal hostility to Paul. It is against such as these that Paul directs his actual attack, not against the mere division into a Cephas-party of Judaizers like those in Galatia, an Apollos-party of admirers of learning and rhetoric, a Paul-party of personal adherents, and a Christ-party of (for us) undiscoverable aim and character. Sharing, we may suppose, Paul's great principle that believers in the risen Christ have received the Holy Spirit, are a "new creation," and by being withdrawn from the domain of the flesh into that of the Spirit, have become free from obligation to the Law, these persons would appear to have drawn the logical, but impossible, conclusion that moral discipline pertains only to those who walk in the flesh, not to the "spiritual," and that they themselves constituted a body of superior Christians, indeed the only "perfect" Christians. Against such elements, perhaps intruders in Corinth, Paul here extends to the Church, as to beloved children, his warning, in language sharp, ironical, sarcastic. He avoids direct mention of the dangerous would-be leaders, but makes the pregnant observation (iv. 6); "And these things, brethren, I have in a figure transferred to myself and to Apollos." From such an understanding of this section, as furnishing a curiously veiled indication of the ultimate ground of Paul's concern, most of the particular situations outlined in the rest of the epistle become comprehensible. It is only fair to state that most scholars take the division into parties (i. 10–17) more seriously, as a direct reference to a grave evil, and emphasize the conjectured characteristics of the several parties. But under this view it is admitted that these parties cannot be brought into any significant relation to the problems treated later in the First Epistle, while in the Second Epistle the factions are nowhere mentioned—unless it be the Christ-party, the existence of which is highly problematical even for the First Epistle.

From First Corinthians we gain a vivid picture of the experience of a Christian Church in a centre of Greek life. A member of the Church has married his widowed stepmother, an offence detestable even by heathen standards; he must be cut off (v. 1–13). The previous letter from Paul referred to above has been misunderstood (or misrepresented); its real purpose is now clearly explained (v. 9–13). Law-suits between Christians before heathen judges call forth indignant protest (vi. 1–11). Sexual incontinence occurs, and appears to have been excused (as to-day) by various sophistries (vi. 12–20). Marriage presented its problems, some of which the Corinthians had raised in their letter and Paul gives a wide range of advice (vii. 1–40). A great section (viii. 1–xi. 1) is devoted to the question of participation in feasts at heathen temples and in social meals where the guests were offered meat that had been, or might have been, previously employed in heathen sacrifices. Was it a denial of the faith to eat such food or not? The scrupulous, or "weak," made it a religious principle to abstain; the "strong" denied that such food differed from other food. Paul sides with neither and gives well-balanced counsel.

A certain degree of emancipation of women under the principle of Christian equality raised problems (xi. 2–16, xiv. 34–36); the observance of the Lord's Supper in connection with a meal in the proper sense had been the occasion of indecorous practices degrading the sacramental solemnity (xi. 17–34). The "gifts of the Spirit," that is, unusual powers and capacities possessed by Christians, are treated at length (xii.–xiv.), because it was claimed that the "gift of tongues" (a semi-ecstatic unintelligible speech manifesting itself in praise and prayer at Christian meetings) entitles its possessors to a consciousness of God's special favour. (*See* TONGUES, GIFT OF.) The answer is that the "gifts" are valuable in proportion to their usefulness to others, and that love, from which graces of character proceed, is superior to any of them (xiii.). The only theological topic treated with any fullness comprises questions about the resurrection (xv.), evidently raised by Gentiles for whom Jewish conceptions made difficulty. The last chapter of the epistle (xvi.) is occupied with personal matters, including the collection of money for the Jerusalem brethren and Paul's plans for a visit at Corinth.

SECOND EPISTLE TO THE CORINTHIANS

After the despatch of First Corinthians Paul left Ephesus and went to Macedonia (Acts xx. 1; 2 Cor. ii. 13), and there wrote Second Corinthians, probably nearly a year after the earlier epistle. In the meantime exciting events had taken place which (though we can trace them but imperfectly) explain the great difference in tone between the second epistle and the first. While still at Ephesus Paul was led, evidently by the growing insubordination of the Corinthians, to go to Corinth (*cf.* 2 Cor. ii. 1; xii. 14; xii. 21; xiii. 2). On this occasion some insult was offered to the apostle (*cf.* 2 Cor. ii. 5–11; the offender cannot safely be identified with the gross sinner of 1 Cor. v. 1–8), and his adversaries seem to have triumphed for the moment. This visit seems to have been followed by a severe letter (2 Cor. ii. 3, 4, 9; vii. 8, 12), perhaps sent by Titus, whom Paul commissioned to go to Corinth and try to mend matters. In Macedonia, while Paul was in extreme anxiety about the situation (2 Cor. ii. 12, 13), Titus rejoined him with good news of the penitence of the Corinthian Church. The way was now open, and Titus, equipped with Second Corinthians, was sent back to finish his good work and prepare for Paul's own coming (viii. 6, 16–24) by effecting the completion of the collection of money for Jerusalem.

The greater part of the epistle (i.–vii.) consists of an outpouring of Paul's gratitude to God and affectionate feelings for the Corinthians, with defence of his sincerity, explanations of his personal conduct, justification of his procedure and assumption of dignity as an apostle and a minister of the New Covenant, and interpretation of his many sufferings as incurred in God's service. Incidentally he takes occasion to enlarge on various topics, and the whole epistle, though intensely personal and intimate, is full of striking sentences of much significance for Paul's deeper religious thought. After an extended appeal (viii.–ix.) for generosity in their gifts to the collection, which evidently played a large (though to us obscure) part in the whole series of events, the epistle returns to Paul's personal relations. The background of all the earlier chapters (*cf.* iii. 1; ii. 17; v. 12, 13, etc.) is the activity in Corinth of bitter opponents of Paul, and in all probability many of Paul's vehement protestations of probity and affection were called out by their calumnies. They had, indeed, been disavowed by the Corinthian Church, which as a whole he addresses, but nevertheless, in a final appeal for the strengthening of the Corinthians' loyalty (x. 1–xii. 10), he not unnaturally proceeds to meet some of the abusive flings of his enemies, to point out his superiority at the very points which they have chosen for their condescending comparison, and with an emphasis enhanced by his repeated affirmations of reluctance, to reaffirm his dignity as an apostle and unselfish devotion as a minister of Christ. In it all he seems to count on the reader's substantial agreement with his fiery utterances.

These paragraphs of invective leave the motives and principles of the disturbing intruders uncertain. They were Jews (xi. 22), but nothing suggests an effort like that in Galatia, probably much earlier, to induce these Gentile Christians to subject themselves to circumcision and the Jewish law. This would have been so vital an issue that somewhere in this long epistle Paul would surely have made unmistakable reference to it. To call the opponents "Judaizers" is not justified. The intolerable arrogance of these "very chiefest apostles" with their "letters of commendation" (doubtless from some other Church) is their clearest trait. They seem to have charged Paul with walking "according to the flesh" (x. 2), not "according to the spirit," and they perhaps prided themselves on their superior "knowledge" (xi. 6). In the earlier part of the epistle Paul repels with an almost angry rejoinder the accusation of "hiding his gospel" (iv. 2–4) and of having "known Christ after the flesh" (v. 16), and the most reasonable theory of the matter is that the opponents were persons who believed themselves completely transformed by the Spirit, a "new creation," possessing divine gifts of knowledge, and who regarded Paul's attitude of conservative good sense and practical insistence on moral discipline as the half-way hesitancy of a teacher recreant to his announced principles. Although of Jewish origin they were in thought and piety much further removed from Judaism than was Paul. On this theory their character clearly coincides with that of the persons against whom 1 Corinthians i. 18–iv. 13 is really levelled, and from this point of view Second Corinthians throws a good deal of light on First Corinthians. The concluding paragraphs of Second Corinthians (xii. 11–xiii. 13) explain why Paul has written as he has—partly to demonstrate the inferiority in every way of these "apostles," partly to ensure that his approaching visit shall find the Corinthians under no mistake either as to his power to be severe or as to his affectionate desire to render them helpful service. Paul's success is attested by the calm tone of the Epistle to the Romans, written at Corinth in the following spring, and by the reverence felt for Paul at Corinth some 35 years later (Clement of Rome, *c.* A.D. 95).

CRITICAL QUESTIONS

The use of first Corinthians by early writers, from Clement of Rome on, is abundant; that of Second Corinthians is sufficient; and the external and internal evidence together leave no doubt as to the genuineness of both epistles. In Second Corinthians the right of vi. 14–vii. 1 to its present position has been challenged, but the arguments to show that the passage is drawn from some other lost epistle of Paul are not convincing. The view that 2 Cor. x.–xiii. is drawn from a different letter, possibly the intermediate letter preceding Second Corinthians, has found favour (more in England and America than in Germany), and is supported by the obvious increase of tensity of feeling in these chapters and by a supposed difference of implied situation, together with other more special arguments; but to other scholars the chapters seem not inappropriate as the conclusion of this epistle. Full discussion of these questions will be found in the works named below.

CORINTO, chief seaport of Nicaragua, Central America, terminus of the Pacific Ry., which serves the capital and the principal towns of western Nicaragua between Puerto Morazán on the Gulf of Fonseca and Granada on Lake Nicaragua. Pop. of *municipio* (1940) 4,876. It is built on a small, sandy island of the same name at the entrance of Realejo bay. The island, 87 mi. from Managua, is connected to the mainland by a bridge. About

75% of the foreign commerce of Nicaragua passes through Corinto, which is normally a port for lines running from the west coast of North America to Panamá, South America, and the east coast of North America.

The city lies on the shore side of the island, furnishing practically the only sheltered port on the Pacific coast of Central America, with the exception of La Unión, Salvador, and Amapala, Honduras, both on the Gulf of Fonseca. A semicircular pier, with rail and warehouse facilities, extends out into deep water. The principal exports are coffee, sugar, hides, cattle, woods and gold.

CORIOLANUS, GAIUS or **GNAEUS, MARCIUS,** early Roman hero of patrician descent. According to tradition, his surname was due to his bravery at the siege of Corioli (493 B.C.) in the war against the Volscians (but *see* below). In 492, when there was a famine in Rome, he advised that the people should not share the corn obtained from Sicily unless they would consent to the abolition of their tribunes. For this he was accused by the tribunes, and, being condemned to exile, took refuge with the king of the Volscians and led the Volscian army against Rome. In vain the Romans prayed for moderate terms. He would agree to nothing less than the restoration to the Volscians of all their land and their admission among the Roman citizens. A mission of the chief priests also failed. At last, persuaded by his mother and his wife, he led back the Volscian army and restored the conquered towns. He died at an advanced age in exile amongst the Volscians; according to others, he was put to death by them as a traitor; a third tradition (mentioned, but ridiculed, by Cicero) represents him as having taken his own life.

The legend is open to serious criticism. At the traditional date (493 B.C.) Corioli was not a Volscian possession, but a Latin city in alliance with Rome; further, Livy himself states that the chroniclers knew nothing of a campaign against the Volscians in which Coriolanus is said to have served. The conquest of Corioli by Coriolanus seems to have been invented to explain the surname. The details of the famine are borrowed from those of later years, especially 433 and 411, while the flight of Coriolanus to the Volscian king bears a suspicious likeness to the story of Themistocles. It is suggested that the historical nucleus of the tradition is an attack on Rome by Herdonius *c.* 443, when the city was in distress, perhaps as a result of pestilence.

See Plutarch's *Life;* Livy ii. 34–40; Dion. Halic. vi. 92–4, vii. 21–7, 41–7, viii. 1–60; Cicero, *Brutus,* x. 42. The story is the subject of Shakespeare's *Coriolanus.* For a critical examination of the story *see* Schwegler, *Römische Geschichte,* bk. xxiv.; Sir G. Cornewall Lewis, *Credibility of Early Roman History,* ch. xii. 19–23; W. Ihne, *History of Rome,* i.; T. Mommsen, "Die Erzählung von Cn. Marcius Coriolanus," in *Hermes,* iv. (1869); E. Pais, *Storia di Roma,* i. ch. 4 (1898).

CORIOLI, an ancient Volscian city in *Latium adiectum,* taken, according to the Roman annals in 493 B.C., with Longula and Pollusca, and retaken for the Volsci by Gaius Marcius Coriolanus, its original conqueror, who, in disgust at his treatment by his countrymen, had deserted to the enemy. After this it does not appear in history, and we hear soon afterwards (443 B.C.) of a dispute between Ardea and Aricia about some land which had been part of the territory of Corioli, but had at an unknown date passed to Rome with Corioli. The site cannot be accurately fixed and even in the time of Pliny it ranked among the lost cities of Latium. *See* CORIOLANUS.

CORIPPUS, FLAVIUS CRESCONIUS, Roman epic poet of the 6th century A.D. He was a native of Africa, but is not to be identified with the 7th century bishop of the same name. He is known only from his own poems. He appears to have held the office of tribune or notary (*scriniarius*) under Anastasius, imperial treasurer and chamberlain of Justinian, at the end of whose reign he left Africa for Constantinople, having lost his property during the Moorish and Vandal wars. He was the author of two poems, one of which was not discovered till the beginning of the 19th century. This poem, which comes first in point of time, is called *Iohannis* or *De bellis Libycis,* and relates the overthrow of the Moors by a certain Johannes, *magister militum* in 546; it is in eight books (the last is unfinished) and contains about 5,000 hexameters. The other poem (*In laudem Iustini minoris*), in four books, contains the death of Justinian, the coronation of his successor, Justin II. (Nov. 14 565), and the early events of his reign. It is preceded by a preface, and a panegyric on Anastasius. The *Laus* was published at Antwerp in 1581 from a 9th or 10th century ms. The preface contains a reference to a previous work by the author on the wars in Africa; it was not till 1814 that this was discovered at Milan by Cardinal Mazzucchelli, librarian of the Ambrosian library, from the codex Trivultianus (in the library of the marquis Trivulzi), the only ms. of the *Iohannis* still extant.

The *Iohannis* is of great value, as giving a description of the land and people of Africa; a number of its statements as to manners and customs are confirmed by independent ancient authorities and by our knowledge of the modern Berbers. The *Laus* throws much light upon Byzantine court ceremony, as in the account of the accession of Justin and the reception of the embassy of the Avars. The language and metre of Corippus are remarkably pure.

The editions of the *Iohannis* by P. Mazzucchelli (1820) and of the *Laus* by P. F. Foggini (1777) are still valuable for their commentaries. They are both included in the 28th vol. of the Bonn *Corpus scriptorum historiae Byzantinae.* The best modern editions are by J. Partsch (in *Monumenta Germaniae historica,* 1879), with very valuable prolegomena, and M. Petschenig (*Berliner Studien für klassische Philologie,* iv., 1886); *see* also Gibbon, *Decline and Fall,* ch. xlv.

CORISCO, the name of a bay and an island on the Guinea coast, West Africa. The bay is bounded north by Cape San Juan (1° 10′ N.) and south by Cape Esterias (0° 36′ N.), and is about 31m. across, while it extends inland some 15 miles. The bay is much encumbered with sandbanks, and the southern entrance to it is obstructed by the Bana bank, which extends for 9 miles. The bay encloses many small islands and islets, some submerged at high water, giving rise to a native saying that "half the islands live under water." The principal islands are Corisco, and Great and Little Elobey; they were annexed to Spain in 1846.

Corisco island is the largest of the group, with an area of approx. 5½ sq.mi. Maximum elevation above the sea is less than 100 ft. There is great variation in conditions on the island, ranging from swampland to forest or grassland. Forest products are ebony and logwood, with construction of boats or canoes a local industry. The natives gain their livelihood through both fishing and agriculture. Pop. *c.* 650; it is steadily declining. The natives are a Bantu-Negro tribe called Benga. Corisco has a Catholic mission house classed as one of the most pretentious in the area. Little Elobey (area: 35 ac.), with a climate better than that of neighbouring islands, is devoted to coco-nut culture. Pop. (also declining) 10 Europeans and 130 natives. Great Elobey (area *c.* .6 sq.mi.; pop. 120) is similar to Corisco in general conditions. The islands are in the Kogo governmental district.

See E. L. Perea, "Guinea española: La isla de Corisco," in *Revista de geog. colon. y mercantil* (Madrid, 1906); *Anuario-guia Oficial de Marruecos* (Madrid, 1928); *Spanish Guinea* (Brit. For. Off. 1920).

CORK, RICHARD BOYLE, 1ST EARL OF (1566–1643), Irish statesman, was born at Canterbury on Oct. 3, 1566, and educated at King's school and Bennet (Corpus Christi) college, Cambridge. He afterwards studied law at the Middle Temple, and, settling in Dublin, became escheator to John Crofton, the escheator-general. On losing his rapidly acquired fortune during the rebellion in Munster, in Oct. 1598, Boyle returned to England, was taken into the service of Essex, and after successfully repudiating before the Star Chamber various accusations, won the graces of Elizabeth, who made him clerk of the council of Munster.

In 1602 Boyle bought for £1,000 the whole of Sir Walter Raleigh's lands in Cork, Waterford and Tipperary. On these 12,000 acres he established manufactures and the mechanical arts, opened mines, built bridges and roads, settled towns, and generally resuscitated a war-devastated country. In 1603 he married his second wife, Catherine Fenton, daughter of the secretary of State, and was knighted. In 1606 he became a privy councillor for Munster, and in 1613 for Ireland. Three years later he became Lord Boyle, baron of Youghal, and in 1620 was created earl of Cork and Viscount Dungarvan. He was appointed a lord justice in 1629 and lord high treasurer in 1631. The appointment of Wentworth (Lord Strafford), however, as lord deputy in 1633 ended the power of Cork in Ireland. Wentworth forced him to remove his wife's tomb from the choir in St. Patrick's, Dublin, and arbitrarily deprived him of much of the revenue from Youghal, a part of the Raleigh estates. In Wentworth's fall, Cork played no retaliatory part. His last service to the State was his repression of the Munster rebellion. Cork died on Sept. 15, 1643.

Four of his seven sons received independent peerages—Richard (d. 1698) created Baron Clifford and earl of Burlington (he inherited his father's title and from 1680–95 was lord treasurer of Ireland); Lewis, Viscount Kinalmeaky, killed at the battle of Liscarrol (1642); Roger, baron of Broghill and earl of Orrery; and Francis, Viscount Shannon. Another son was Robert Boyle (*q.v.*), the famous natural philosopher and chemist.

In 1753 the earldom of Cork fell to the younger branch of the family, in the person of John, 5th earl of Orrery, he and later earls being "of Cork and Orrery." John, who was born on Jan. 2, 1707, and died on Nov. 16, 1762, translated the *Letters of Pliny the Younger,* and published *Remarks on the Life and Writings of Jonathan Swift* and *Memoirs of Robt. Carey, earl of Monmouth.* The earldom is now held by the 10th earl (b. 1861). The wife of the 7th earl (*see* CORK AND ORRERY, MARY, COUNTESS OF) was famous in early 19th century society.

BIBLIOGRAPHY.—*True Remembrances,* written by the 1st earl and published in Birch's ed. of the works of Robert Boyle; *Lismore Papers,* ed. A. B. Grosart (10 vols. 1886–87), the first series containing the diary and autobiographical notes and the second the correspondence; D. Townshend, *Life of Lord Cork* (1904); Strafford's *Letters; Calendars of State Papers, Domestic and Irish,* and *Carew Papers;* E. Budgell, *Memoirs of the Boyles* (1737) and E. Edwards, *Life of Raleigh* (1868).

CORK, a county of Eire, in the province of Munster, bounded south by the Atlantic ocean, east by the counties Waterford and Tipperary, north by Limerick, and west by Kerry. It is the largest county in Eire, having an area of 2,880 sq.mi. Pop. (1936), 355,957.

The physical structure is closely related to the "Hercynian" folds. In the north the Old Red sandstone may be seen in the Bally Loura hills, and in the western spur of the Knockmealdown mountains. To the south of this line occur carboniferous limestone, millstone grit and coal-measures, now forming the valley of the Blackwater. Between this river and the Lee the Old Red sandstone reappears, the chief heights being the Boggeragh mountains (Musheramore, 2,118 feet). In the lower Lee valley, and extending to the east beyond Midleton, are carboniferous limestone and limestone shales. Some of the limestone here has become crystalline, veined and brecciated, while a fine red staining, especially at Little Island, adds to its value as a marble. After another anticlinal of the Old Red sandstone, the Carboniferous slate occupies most of the country southward, with occasional appearances of the basal Coomhola grits and of the underlying Old Red sandstone along anticlinals. The rivers, especially the Blackwater, provide excellent examples of river capture.

There are several Ogham stones scattered throughout the county and also two round towers, one opposite Cloyne cathedral, the other at Kinneigh. The remains of the old ecclesiastical buildings, of which the chief are Kilcrea, Timoleague church and Buttevant abbey, are, on the whole, in a very ruinous condition. Many of the vantage points have castles in varying degrees of preservation. At Kilcolman castle, near Doneraile, the "Faerie Queene" was written by Spenser.

Cork is one of the counties which is generally considered to have been instituted by King John. Its existing boundaries include part of the ancient territory of Desmond (*q.v.*), which, in the latter half of the 16th century, ranked as a separate county. In 1598, however, there were two sheriffs in the county Cork, one especially for Desmond, which was then included in Cork, but was afterwards amalgamated with the county Kerry. In the same period lands in the county were given to settlers under the Crown, and among these were Sir Walter Raleigh and Edmund Spenser the poet. Richard Boyle, 1st earl of Cork, had large areas colonized with English settlers; and by founding or rebuilding the towns of Bandon, Clonakilty, Baltimore, Youghal, and afterwards those of Midleton, Castlemartyr, Charleville and Doneraile, which were incorporated and made parliamentary boroughs, the family of Boyle became possessed of nearly the entire political power of the county.

The soils vary from sandy loams, usually on the higher ground, to stiff clays along the limestone hollows. Agriculture is important in the river valleys and on the coastal plains; oats, potatoes and turnips being the principal crops.

The county has been famous for its copper-mines, notably at Allihies in the extreme west. The region south-west of Bantry has been mined in several places. Both gold and silver have been found in the copper-ores of this latter area. Barytes has been mined near Bantry, Schull and Clonakilty, and manganese-ore at Glandore. Anthracite has been raised from time to time in the band of coal measures south-west of Kanturk. The marble of Little Island near Cork is quarried under the name of "Cork Red," and the veined pink and grey marble of Midleton is also much esteemed.

Dairies are numerous, and Cork butter and farmyard produce are noted for their quality. Youghal, Kinsale, Queenstown, Castletown and Bearhaven are the deep-sea and coast fishing district centres of the county; while the salmon fishing is distributed among the districts of Cork, Bandon, Skibbereen and Bantry. The mackerel fishery is especially productive from mid-March to mid-June. The Blackwater, Lee and Bandon, apart from the netting industry, afford good rod-fishing for salmon and trout.

Blackrock, Passage, Monkstown, Queenstown, and other waterside villages in the vicinity of Cork, together with Bantry, Baltimore, Kinsale, Glengarriff and Youghal are much frequented during the summer months.

The county is served by lines of the Great Southern railway radiating from Cork. A gap to the north of that city has facilitated communications with central Ireland, whilst the valleys of the Bride, a tributary of the Lee and the Bandon have been utilized for western routes. To the east the coastal plain is followed by the line to Midleton and Youghal. Branch lines serve the towns of the south coast.

There are three electoral areas—North Cork, West Cork and South-East Cork. The first-named returns four members, the second five and the last three members to Dáil Eireann.

CORK, county borough and seaport of Co. Cork, Eire, at the head of the inlet of Cork Harbour, on the river Lee, 165½ m. S.W. of Dublin by the Great Southern Railway. Pop. (1936) 80,765. Until the middle of the 19th century it ranked second only to Dublin, but is now surpassed by Belfast in commercial importance. It is an important centre of the Great Southern Railway system. There are regular steamer routes to British ports.

The nucleus of the city occupies an island formed by the North and South Channels, two arms of the river Lee, and in former times no doubt merited its name, which signifies a swamp.

The original site of Cork seems to have been in the vicinity of the Protestant cathedral; St. Finbar's ecclesiastical foundation attracting many students and votaries. In the 9th century the town was frequently pillaged by the Northmen. According to the *Annals of the Four Masters* a fleet burned Cork in 821; in 846 the Danes appear to have been in possession of the town, for a force was collected to demolish their fortress; and in 1012 Cork again fell in flames. The Danes then appear to have founded a trading centre on the banks of the Lee. It was anciently surrounded with a wall, an order for the reparation of which is found as late as 1748 in the city council books (which date from 1610). The town submitted to Henry II. in 1172, and was subsequently held by the English for a long period. Cork showed favour to Perkin Warbeck in 1492. In 1649 it surrendered to Cromwell and in 1689 to the earl of Marlborough. It was a borough by prescription, and successive charters were granted to it from the reign of Henry II. onward. By a charter of Edward IV. the lord mayor of Cork was created admiral of the port. The island still includes many of the principal thoroughfares.

Bridges across the North and South Channels connect it with later extensions of the city. Public grounds are few, but on the outskirts are a park and race-course. The Mardyke walk, on the west of the island, was the site of the international exhibition held in 1902. Both branches of the Lee are lined with quays.

The Protestant cathedral, founded in 1865, is built in the Early French (pointed) style, with an eastern apse and a striking west front. Dedicated to St. Fin Barre or Finbar, who founded the original cathedral in the 7th century, it is situated in the southwest part of the city, and replaces a structure erected in 1735 on the site of the ancient cathedral, which suffered during the siege of Cork in Sept. 1689. The Roman Catholic cathedral, also dedicated to St. Finbar, is conspicuous on the north side of the city; it dates from 1808, but has been since restored. The court house in Great George's street has a Corinthian portico. The custom-house commands the river at the lower junction of the branches. The commercial and public buildings are mainly on the island. The most notable educational establishment is the University college. Founded as Queen's college under an Act of 1845, it became a constituent college of the National University of Ireland in 1908. Built in Tudor style, it stands near the river in the west of the city, where Gill abbey, of the 7th century, formerly stood. The Cork library (founded 1790) contains a valuable collection of books. The Royal Cork Institution (1807), in addition to a library and a rare collection of oriental mss., possesses a valuable collection of minerals, and collections of casts from the antique.

The harbour, sheltered by many islands, is considered one of the finest natural harbours in the kingdom. Military depots occupy several of the smaller islets, and batteries guard the entry. This is about 1 mi. wide, but within the width increases to 3 mi. while the length is about 10 mi. The Atlantic port of Queenstown (*see* Cobh) is on Great Island at the head of the outer harbour. Tivoli (the residence of Sir Walter Raleigh), Fort William, Lota Park and Blackrock castle are notable features on the shore; and Passage, Blackrock, Glenbrook and Monkstown are waterside resorts. Trade is mainly with Bristol and the ports of south Wales. The imports include wheat and maize, while the exports are chiefly of cattle, provisions, butter and fish. The Cork Butter exchange was important in the early part of the 17th century, and the present market was founded in 1769. There are distilleries, breweries, tanneries and iron foundries, and manufactures of woollen and leather goods, tweeds, friezes, gloves and chemical manure. Cork's industrialization advanced as a result of de Valera's self-sufficiency policy. There are large tractor works in the city. Nearly six-sevenths of the population are Roman Catholics. During the troubles of 1919–20 there were riots in and near the city, and the city hall and Carnegie library were burned during reprisals. The government of Cork is by a manager and an elected council. The county borough of Cork returns four members to Dáil Eireann.

CORK, the outer layer of bark of an evergreen oak (*Quercus suber* and a subspecies, *Quercus suber occidentalis*). The adult tree averages 30 to 40 ft. in height and grows in the south of Europe and on the North African coasts. Annual production varies from 275,500 to 330,500 short tons, of which more than 90% comes from Portugal, Spain, Algeria, Morocco and Tunisia. The outer layer of bark of the cork oak by annual additions from within gradually becomes a thick soft homogeneous mass, possessing those compressible and elastic properties upon which the economic value of the material chiefly depends. The bark of most trees contains cork cells but only in the cork oak are these cells in layers of sufficient thickness to be of commercial importance. In some cases, as on young shoots of the cork elm, the development is irregular and winglike outgrowths of cork are formed. In northern U.S.S.R. a method similar to that used for obtaining cork from the cork oak is employed with the birch. In Brazil, several native trees, of which the Pao Santo is the most common, produce a bark which can be used for the manufacture of cork-like products. The bark of the Japanese Abemaki is an inferior cork substitute. Considerable experimenting has been done in the United States with the bark of the Douglas fir, which contains corky flakes.

The first stripping of the cork oak occurs when the trees are from 15 to 20 yr. of age. The yield, which is rough and somewhat woody in texture, is called virgin cork and is used principally for the manufacture of cork insulation and isolation products. Subsequently the bark is removed every 8 or 10 yr., the quality of the cork (known as reproduction cork) improving with each successive stripping through the 5th or 6th, whereupon quality remains fairly stable. The trees continue to live and thrive under the operation for 150 yr. more or less. Much of the 2nd and subsequent strippings or barkings is of a low grade known as refugo, which, like virgin, is ground up for the manufacture of insulation and composition cork products.

The operation of stripping the trees takes place during June through August. Two cuts are made round the stem—one a little above the ground, and the other immediately under the spring of the main branches. Between these cuts three or four longitudinal incisions are then made, the utmost care being taken not to injure the inner bark. The cork is thereafter removed in the sections into which it has been cut, by inserting under it the wedge-shaped handle of the stripping axe used in making the incisions. The lower limbs of the larger and older trees are also stripped, especially in years of high cork prices. The structural part of the cork oak which is hard and dense has a very limited use as lumber because of its tendency to check and crack. The wood of old and fallen trees makes excellent charcoal, and charred or calcined cork ground into a very fine dead black powder is the pigment known as Spanish black.

Cork possesses a combination of properties which peculiarly fits it for many and diverse uses, for some of which it alone is found applicable. Most of its distinctive properties result from the fact that it is completely cellular in structure. A one-inch cube of natural cork contains approximately 200,000,000 tiny air-filled cells, so that slightly more than 50% of the volume of a piece of cork is accounted for by the captive air within the cells. This cellular structure results in cork having a specific gravity of only .25 and accounts for its buoyancy, compressibility, elasticity and relatively high degree of imperviousness to both air and water penetration as well as for a high coefficient of friction and a low thermal conductivity value.

Like most products of nature, cork in its natural state has very few uses, and these are relatively unimportant as witness the use of virgin cork by florists for decoration and rustic work. It is as the raw material for an industry that the bark of the cork oak assumes importance and economic significance. Until about the end of the 19th century, cork was used almost entirely for the manufacture of bottle stoppers and bungs and a variety of natural cork articles including life preservers, floats and buoys, hat linings and shoe soles, the latter use dating back to ancient Rome. The manufacture of all these products continues, but during the decade 1900–10, the character of the cork industry was completely changed from that of a relatively simple cork-cutting trade to that of a much more complex industry, the principal products of which result from grinding up and then combining under heat and pressure the lower qualities of cork such as the virgin and refugo referred to above and the by-product scrap from the natural cork product manufacture. This transformation of the cork industry was partly the cause and partly the effect of a number of economic changes which revolutionized the technique in whole industries. For example, the invention and manufacture of insulation corkboard completely altered cold-storage construction and usage by providing an efficient insulating material to take the place of such makeshift materials as sawdust, shavings, hay, cinders and charcoal. Again, the composition cork gasket helped make possible the mass production technique of the automobile industry which required the substitution of parts stamped out of sheet steel for heavy, expensive castings with machined faces. In similar fashion, the transformation of the cork industry was both a cause and effect factor in the development of the beverage and food packing industries, so that in order of economic importance, the industry's leading products became:

Insulation Corkboard, pipe covering and ground cork and isolation corkboard are used extensively as low-temperature insulation in cold storages, photographic material and gasoline and synthetic rubber plants, air-conditioning installations, in ship and submarine construction and for deadening or dampening vibrations and sound. Insulation corkboard is one of the most efficient forms of low-temperature insulation and has a thermal conductivity coefficient (k) of only $0.275\pm$ under the usual operating conditions.

Composition Cork Products.—Made of finely ground cork with a binder, these products include automotive engine and equipment gaskets, beverage and food cap liners, shoe fillers and inner soles, polishing wheels, road joint material, textile spinning cots, cigarette tips and numerous other specialty products.

Cork Stoppers.—The well-known closures used on bottles, jars, jugs, casks and kegs, commonly called "corks," were a development, apparently, of the 15th century. The stopper division of the cork industry also makes a wide variety of natural-cork specialty products including clutch corks, carburetor and tank floats, handle grips and badminton "birds."

Cork Marine Products.—These include life preservers, ring and mooring buoys, floats and fenders. The use of cork as a buoyant material was so common among the ancient Romans that the Latin phrase *nare sine cortice* meaning literally "to swim without (the use of) cork" came to mean idiomatically "to need no (more) assistance."

Floor and Wall Covering Material and Miscellaneous.—Ground cork in the form of linoleum, cork tile, cork carpet and cork brick is one of the most widely used materials for floor and wall covering. Among a number of miscellaneous cork products are cork insulating brick, steel ingot insulation (to reduce the wasteful cavity which forms in cooling) and synthetic rubber and plastic products containing cork. Before World War II, the U.S.S.R. imported French cork oak acorns for experimental planting in the Caucasus, and the possibility during 1941–43 that the United States might be completely cut off from its Mediterranean cork sources resulted in a large expansion in a cork planting project in California and several other southwestern states sponsored by one of the large American cork companies with state and federal government co-operation.

CORK AND ORRERY, MARY, COUNTESS OF (Mary Monckton) (1746–1840), was born on May 21, 1746, the daughter of the first Viscount Galway. Through her influence her mother's house in London became a favourite meeting-place of literary celebrities. Dr. Johnson was a frequent guest. Sheridan, Reynolds, Burke and Horace Walpole were among her constant visitors, and Mrs. Siddons was her closest friend. In 1786 she married the 7th earl of Cork and Orrery, who died in 1798. As Lady Cork she was an even more famous hostess. Among her regular guests were Canning and Castlereagh, Byron, Sir Walter Scott, Lord John Russell, Sir Robert Peel, Theodore Hook and Sydney Smith. She is supposed to have been the original of Lady Bellair in Disraeli's *Henrietta Temple,* and Dickens is believed to have drawn on her for some of the peculiarities of Mrs. Leo Hunter in *Pickwick.* She died in London on May 30, 1840.

CORKWOOD, the name given to several tropical American trees and shrubs with light porous wood, especially to the alligator-apple or pond-apple (*Annona glabra*), found in the Everglades of Florida and widely in the tropics; the magaguabush (*Hibiscus tiliaceus*) of the Florida Keys, the West Indies and other warm regions; and the balsa (*Ochroma Lagopus*), widespread in tropical America. The North American corkwood (*Leitneria floridana*), a small tree with pale yellow wood, is confined to semi-tropical swamps in Florida and Texas and to muddy sloughs in southeastern Missouri. In New South Wales, a tree, *Duboisia myoporoides,* of the nightshade family (Solanaceae), is called corkwood. The buoyant wood of these trees is utilized for floats and numerous other purposes, especially that of the balsa (*q.v.*).

CORLEONE, a town of Sicily, province of Palermo, 42m. S. of Palermo by rail and 21m. direct, 1,949ft. above sea-level. Pop. (1936) 14,197 (town); 14,725 (commune). The town was a Saracen settlement, but a Lombard colony was introduced by Frederick II. Two mediaeval castles and some churches are of interest.

CORLEY MOUNTAIN HIGHWAY, a thoroughfare that begins at Colorado Springs and ends at Cripple Creek, Colo., covers 45m. of unusual mountain scenery. It was built along the railroad bed of the old Cripple Creek Short Line, now abandoned, and leads to what formerly were the greatest gold-mining camps of the world.

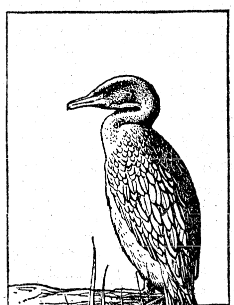
CORMENIN, LOUIS MARIE DE LA HAYE, VICOMTE DE (1788–1868), French jurist and political pamphleteer, was born in Paris on Jan. 6, 1788, and died there on May 6, 1868. The son of a State official, he became auditor of the council of State (1810) under Napoleon I., and after the Bourbon restoration master of requests. To this period of his life belongs his most important work as a jurist, his *Questions de droit administratif* (1822; 5th rev. ed., 1840), in which he gave scientific shape to the scattered elements of administrative law. In 1828 he entered politics, and became a most effective political pamphleteer on behalf of civil liberty, universal suffrage and other causes. His pamphlets were at first issued under the pseudonym of "Timon," and had an enormous circulation. Cormenin sat in the chamber of deputies from 1828 to 1846, when he lost his seat by his tracts on behalf of religious liberty—*Oui et non* (1845) and *Feu! Feu!* (1846). After the Revolution of 1848 he was one of the vice-presidents of the constituent assembly, and for some time president of the constitutional commission for drafting the republican constitution. Nevertheless he accepted office under the Empire. Among Cormenin's best works are *Livre des orateurs* (1838; 18th ed., 1860), containing studies of the great orators of the restoration and the reign of Louis Philippe, and the *Entretiens du village* (1846).

CORMON, FERNAND (1845–1924), French historical and portrait painter, was born in Paris in 1845 and died there in 1924. He became a pupil of Cabanel, Fromentin and Portaels, and at an early age attracted attention by the better class of sensationalism in his art, as in the "Murder in the Seraglio" (1868) and the "Death of Ravara, Queen of Lanka," at the Toulouse Museum. The Luxembourg has his "Cain flying before Jehovah's Curse"; and for the Mairie of the fourth arrondissement of Paris he executed in grisaille a series of Panels: "Birth," "Death," "Marriage," "War," etc.

CORMONTAIGNE, LOUIS DE (*c.* 1697–1752), French military engineer, was born at Strasbourg. He was present as a volunteer at the sieges of Freiburg and Landau in the later years of the War of the Spanish Succession, and in 1715 he entered the engineers. After being stationed for some years at Strasbourg he became captain, and was put in charge (at first in a subordinate capacity, and subsequently as chief engineer) of the new works, Forts Moselle and Bellecroix, at Metz, which he built according to his own system of fortification. He was present at the siege of Philipsburg in 1733, and took part in most of the sieges in the Low Countries during the War of the Austrian Succession. His *Architecture militaire,* written in 1714, was long kept secret by order of the authorities, but, an unauthorized edition having appeared at The Hague in 1741, he himself prepared another version called *Premier mémoire sur la fortification,* which from 1741 onwards was followed by others. His ideas are closely modelled on those of Vauban (*q.v.*). It was not until 20 years after his death that his system became widely known. Fourcroy de Rainecourt, then chief of engineers, searching the archives for valuable matter, chose the numerous memoirs of Cormontaigne for publication amongst engineer officers in 1776. The *Oeuvres posthumes de Cormontaigne* (1806–09) were edited by Fourcroy and La Fitte de Clavé.

See Von Brese-Winiari, *Über Entstehen . . . der neueren Befestigungsmethode* (1844); Prévost du Vernois, *De la fortification depuis Vauban* (1861); Cosseron de Villenoisy, *Essai historique sur la fortification* (1869).

CORMORANT, a sea-bird of the genus *Phalacrocorax* and the family *Phalacrocoracidae.* The cormorant (*P. carbo*) is distributed throughout the world. It frequents the sea-coast of Europe, and breeds in societies at various stations, generally on steep cliffs. The nest consists of a large mass of sea-weed. The eggs, from four to six in number, are small, and have a thick, soft, calcareous shell, bluish-white when first laid, but soon becoming discoloured. The young are hatched blind, and covered with an inky-black skin. As squabs they are highly esteemed for food by the northern islanders. Their first plumage is of a sombre brownish-black above, and more or less white beneath They take two or three years to assume the fully adult dress, which is deep black, glossed above with bronze, and varied in the breeding season with white on the cheeks and flanks, besides being adorned by filamentary feathers on the head, and a bright yellow gape. The brilliant gape is displayed in courtship. The flesh of the adult is uneatable.



BY COURTESY OF THE LONDON ZOOLOGICAL SOCIETY

THE CORMORANT, A SEA BIRD TRAINED BY THE CHINESE TO CATCH FISH IN SHALLOW RIVERS

Taken from the nest, this bird is easily tamed and can be trained to fish for its keeper, as was of old time commonly done in England, where the master of the cormorants was one of the officers of the royal household. The practice is nearly obsolete in Europe, though still common in China. A strap is fastened round the bird's neck so as, without impeding its breath, to hinder it from swallowing its captures. The activity the bird displays under water is almost incredible. *See* Salvin and Freeman, *Falconry* (1859).

Nearly allied to the cormorant, and having much the same habits, is the shag, or green cormorant (*P. graculus*). The shag is about one-fourth smaller, is much more glossy in plumage, and its nuptial embellishment is a nodding plume. Its tail feathers number 12 instead of 14.

In the south of Europe a much smaller species (*P. pygmaeus*) is found. This is a fresh-water bird. Further species, to the number of more than 30, have been discriminated from other parts of the world, but all have a great similarity; New Zealand and the west coast of northern America are particularly rich, and the species found there are the most beautifully decorated of any. All are remarkable for their curiously formed feet with all four toes connected by a web, for their long, stiff tails, and for the absence, in the adult, of any exterior nostrils. When gorged they are fond of sitting on an elevated perch, with extended wings, and in this attitude they will remain motionless for a considerable time. Their voracity is proverbial.

Besides the common cormorant, the crested cormorant (*P. auritus*) is found in the eastern United States, with a more southerly distribution.

CORN, originally meaning a small hard particle or grain, as of sand, salt, gunpowder, etc. It thus came to be applied to the small hard seed of a plant, as still used in the words barleycorn and peppercorn. In agriculture it is generally applied to the seed of the cereal plants. It is often locally understood to mean that kind of cereal which is the leading crop of the district; thus in England it refers to wheat, in Scotland and Ireland to oats, and in the United States to maize (Indian corn). (*See* GRAIN PRODUCTION AND TRADE; CORN LAWS; AGRICULTURE; WHEAT; MAIZE; etc.). The term "corned" is given to a preparation of meat (especially beef) on account of the original manner of preserving it by the use of salt in grains or "corns."

The differences in the application of the word corn in various countries and districts have sprung from the nature of the favourite grain-crop in the locality. "Corn in Egypt" is a world-wide expression for plenty. When first used, it probably meant wheat, but may have meant barley as well, the only two cereals in cultivation in contemporary civilizations. In Britain, where the only cereals widely grown are wheat, barley and oats, "corn" has come to mean two things. It is either a generic term for these three cereals, though it would also cover maize and rye, or it is a synonym for wheat alone; and wheat has generally been regarded in Britain, as in many other countries, as the essential grain of arable farming. In Scotland, on the other hand, corn commonly (though by no means invariably) means oats, for the reason that oats are the chief cereal of the country and so the index of plenty.

The strictest use of the word is found in America. Throughout the United States and in South America wherever English is used, corn means specifically maize, often called in Britain Indian corn. Maize has doubtless acquired the name because the crop is of more importance than all the other grains in these countries; but this American use of the word has spread to Canada and is gaining ground elsewhere. Where maize is used as a cooked vegetable, as even in Britain, it is frequently eaten from the cob and is then known as corn-on-the-cob. So corn may be said to carry three meanings in Britain; and the result has been to confuse many minds. Indeed a large proportion of the vast urban populations has no clear idea of the meaning of the word. But the generic use is the commonest. A corn-field means a field given up to grain; and a cornflower and a corncockle describe flowers whose habitat is in the arable field where any sort of grain is sown.

Nor do these interpretations exhaust the meaning of the word. As its derivation and verbal connection with "grain" and "kernel" indicate, corn may mean a single grain of any of the cereals. In this regard local use varies a great deal. In the chief corn-growing counties of England, farmers chiefly use the scientifically incorrect word "berry" for the single grain of an ear.

See MAIZE.

CORN, in pathology, a small local outgrowth of the outer skin (epidermis) with great enlargement of the horny layers (callosity). Most of the underlying nerve-bulbs waste away, but, if only one or two remain, pressure on the enlarged part causes acute pain. The condition results from intermittent pressure, particularly that of ill-fitting boots. If the horny layers are sheltered from evaporation, *e.g.,* between the toes, the corn is soft. Infection may occur leading to suppuration. The only certain treatment is removal of the cause, but in otherwise healthy subjects much may be done by hot water bathing, paring with a sharp knife or painting with a solution of salicylic acid in collodion.

CORNARO, CATERINA (1454–1510), queen of Cyprus, was the daughter of Marco Cornaro, a Venetian noble, whose brother Andrea was an intimate friend of James de Lusignan, natural son of King John II. of Cyprus. On the king's death in 1458 the succession was disputed, and James, with the help of the sultan of Egypt, seized the island. It was important that he should make a marriage such as would secure him powerful support. Andrea Cornaro suggested his niece Caterina, famed for her beauty, as that union would bring him Venetian help. The contract was signed in 1468. Caterina was solemnly adopted by the doge as a "daughter of the Republic" and sailed for Cyprus in 1472 with the title of queen of Cyprus, Jerusalem and Armenia. In 1473 her husband died of fever, leaving his kingdom to his queen and their child as yet unborn. In August the child James III. was born, but as soon as the Venetian fleet sailed away a plot to depose him in favour of Zarla, James's illegitimate daughter, broke out, and Caterina was kept a prisoner. The Venetians returned, and order was soon restored, but the republic was meditating the seizure of Cyprus, although it had no valid title whatever, and after the death of Caterina's child in 1474 Venice really governed the island. In 1488 the republic, fearing that Sultan Bayezid II. intended to attack Cyprus, and having also discovered a plot to marry Caterina to King Alphonso II. of Naples, decided to recall the queen to Venice and formally annex the island. Caterina at first refused, for she clung to her royalty, but Venice would not be gainsaid; she was forced to abdicate in favour of the republic, and returned to Venice in 1489. The Government conferred on her the castle and town of Asolo for life, and there in the midst of a learned and brilliant little court, of which Cardinal Bembo was a shining light, she spent the rest of her days in idyllic peace. She died in July 1510. Titian's famous portrait of her is in the Uffizi gallery in Florence.

Centelli, *Caterina Cornaro e il suo regno* (Venice, 1892); L. Forrer, *Caterina Cornaro, Regina di Cipro, e le sue monete* (Orbetello, 1906); H. Brown, "Caterina Cornaro, Queen of Cyprus" in his *Studies in the History of Venice,* vol. i. (1907), which gives the best sketch of the queen's career and a list of authorities.

CORNARO, LUIGI (1467–1566), a Venetian nobleman, who, after a severe illness at the age of 40, became an apostle of abstinence. In later life he found one egg a day sufficient solid food. His *Discorsi sulla vita sobria* (1558) was translated into many languages and has often been reprinted. He died at Padua at the age of 98 on May 8, 1566.

CORN BELT, a name applied to that region of the United States where Indian corn is the chief crop. The belt, which extends westward from central Ohio, includes, besides the western portion of that State, Indiana, Illinois, Iowa, the southern third of Minnesota, eastern Nebraska, the south-eastern corner of South Dakota, the northern three-fourths of Missouri and the north-eastern end of Kansas. A deep soil, an abundant rainfall and hot summer nights make this region peculiarly adapted to the culture of Indian corn. The nine States above named produce annually about 65% of the total corn crop of the United States; in 1925 it was 70% and in 1926, 62%. While every State in the Union produces some corn, it is from this area that most of the commercial crop is shipped.

CORNEILLE, PIERRE (1606–1684), French dramatist and poet, was born at Rouen, in the rue de la Pie, on June 6, 1606. His father, Pierre Corneille, a magistrate of Rouen, was ennobled in 1637, and the honour was renewed in favour of his sons Pierre and Thomas in 1669, though the poet himself did not assume the "de" of nobility. His mother's name was Marthe le Pesant.

Corneille was educated by the Jesuits at Rouen, was entered as *avocat,* and in 1624 took the oaths. He was afterwards appointed advocate to the admiralty, and to the "waters and forests," posts which he disposed of in 1650 for the insignificant sum of 6,000 livres. In that year and the next he was *procureur-syndic des Etats de Normandie.* His first play, *Mélite,* was acted in 1629. In 1632 *Clitandre,* a tragedy, was printed (it may have been acted in 1631); in 1633 *La Veuve* and the *Galerie du palais,* in 1634 *La Suivante* and *La Place Royale,* all the last-named plays being comedies, saw the stage. Having composed a Latin elegy to Richelieu on the occasion of the cardinal's visit to Rouen (1634), he was enrolled among the "five poets." These officers (the others being G. Colletet, Boisrobert, C. de l'Etoile and J. de Rotrou), had the task of working up Richelieu's ideas into dramatic form. No one could be less suited for such work than Corneille, and he soon (it is said) incurred his employer's displeasure by altering the plan of a play which had been entrusted to him.

Meanwhile the year 1635 saw the production of *Médée,* a grand but unequal tragedy. In the next year the singular extravaganza entitled *L'Illusion comique* followed, and was succeeded about the end of November by the *Cid,* based on the *Mocedades del Cid* of Guillen de Castro. The triumphant success of this, perhaps the most "epoch-making" play in all literature, the jealousy of Richelieu and the Academy, the open attacks of Georges de Scudéry and J. de Mairet and others, and the pamphlet-war which followed, are among the best-known incidents in the history of letters. The trimming verdict of the Academy, which we have in J. Chapelain's *Sentiments de l'Académie française sur la tragi-comédie du Cid* (1638), when its arbitration was demanded by Richelieu, and not openly repudiated by Corneille, was virtually unimportant; but it is worth remembering that no less a writer than Georges de Scudéry, in his *Observations sur le Cid* (1637), gravely and apparently sincerely asserted and maintained of this great play that the subject was utterly bad, that all the rules of dramatic composition were violated, that the action was badly conducted, the versification constantly faulty, and the beauties as a rule stolen! Corneille himself was awkwardly situated in this dispute. The *esprit bourru* by which he was at all times distinguished, and which he now displayed in his rather arrogant *Excuse à Ariste,* unfitted him for controversy, and it was of vital importance to him that he should not lose the outward marks of favour which Richelieu continued to show him. Perhaps the pleasantest feature in the whole matter is the unshaken and generous admiration with which Rotrou, the only contemporary whose genius entitled him to criticise Corneille, continued to regard his friend, rival, and in some sense (though Rotrou was the younger of the two) pupil. Finding it impossible to make himself fairly heard in the matter, Corneille (who had retired from his position among the "five poets") withdrew to Rouen and passed nearly three years in quiet there, perhaps revolving the opinions afterwards expressed in his three *Discours* and in the *Examens* of his plays, where he bows, somewhat as in the house of Rimmon, to "the rules." In 1639, or at the beginning of 1640, appeared *Horace* with a dedication to Richelieu. The good offices of Madame de Combalet, to whom the *Cid* had been dedicated, and perhaps the satisfaction of the cardinal's literary jealousy, had healed what breach there may have been, and indeed the poet was in no position to quarrel with his patron. Richelieu not only allowed him 500 crowns a year, but soon afterwards, it is said, though on no certain authority, employed his omnipotence in reconciling the father of the poet's mistress, Marie de Lampérière, to the marriage of the lovers (1640). In this year also *Cinna* appeared. A brief but very serious illness attacked him, and the death of his father the year before had increased his family responsibilities.

In 1643 appeared *Polyeucte,* the memorable comedy of *Le Menteur,* which though adapted from the Spanish stood in relation to French comedy very much as *Le Cid,* which owed less to Spain, stood to French tragedy; its less popular and far less good *Suite,*—and perhaps *La Mort de Pompée. Rodogune* (1644) was a brilliant success; *Théodore* (1645), a tragedy on a somewhat perilous subject, was the first of Corneille's plays which was definitely damned. On Jan. 22, 1647 the Academy at last (it had twice rejected him on frivolous pleas) admitted the greatest of living French writers. *Héraclius* (1646), *Andromède* (1650), a spectacle-opera rather than a play, *Don Sanche d'Aragon* (1650) and *Nicomède* (1651) were the products of the next few years' work; but in 1652 *Pertharite* was received with decided disfavour, and the poet in disgust resolved, like Ben Jonson, to quit the loathed stage. In this resolution he persevered for six years, during which he worked at a verse translation of the *Imitation of Christ* (finished in 1656), at his three *Discourses on Dramatic Poetry,* and at the *Examens* which are usually printed at the end of his plays. In 1659 Fouquet, the Maecenas of the time, persuaded him to alter his resolve, and *Oedipe,* a play which became a great favourite with Louis XIV., was the result. It was followed by *La Toison d'or* (1660), *Sertorius* (1662) and *Sophonisbe* (1663). In this latter year Corneille (who had at last removed his residence from Rouen to Paris in 1662) was included among the list of men of letters pensioned at the proposal of Colbert. He received 2,000 livres. *Othon* (1664), *Agésilas* (1666), *Attila* (1667), and *Tite et Bérénice* (1670), were generally considered as proofs of failing powers,—the cruel quatrain of Boileau—

> Après l'*Agésilas*
> Hélas!
> Mais après l'*Attila*
> Holà!

in the case of these two plays, and the unlucky comparison with Racine in the *Bérénice,* telling heavily against them. In 1665 and 1670 some versifications of devotional words addressed to the Virgin had appeared. The part which Corneille took in *Psyché* (1671), Molière and P. Quinault being his coadjutors, showed signs of renewed vigour; but *Pulchérie* (1672) and *Suréna* (1674) were allowed even by his faithful followers to be failures. He lived for ten years after the appearance of *Suréna,* but was almost silent save for the publication, in 1676, of some beautiful verses thanking Louis XIV. for ordering the revival of his plays. He died at his house in the rue d'Argenteuil on Sept. 30, 1684.

Corneille was buried in the church of St. Roch, where no monument marked his grave until 1821. He had six children, of whom four survived him. Pierre, the eldest son, a cavalry officer who died before his father, left posterity in whom the name has continued; Marie, the eldest daughter, was twice married, and by her second husband, M. de Farcy, became the ancestress of Charlotte Corday.

The portraits of Corneille (the best and most trustworthy of which is from the burin of M. Lasne, an engraver of Caen), represent him as a man of serious, almost of stern countenance, and this agrees well enough with such descriptions as we have of his appearance, and with the idea of him which we should form from his writings and conduct. His nephew Fontenelle admits that his general address and manner were by no means prepossessing. Others use stronger language, and it seems to be confessed that either from shyness, from pride, or from physical defects of utterance, probably from all three combined, he did not attract strangers. Racine is said to have assured his son that Corneille made verses "cent fois plus beaux" than his own, but that his own greater popularity was owing to the fact that he took some trouble to make himself personally agreeable. Almost all the anecdotes which have been recorded concerning him testify to a rugged and somewhat unamiable self-contentment. "Je n'ai pas le mérite de ce pays-ci," he said of the court. "Je n'en suis pas moins Pierre Corneille," he is said to have replied to his friends as often as they dared to suggest certain shortcomings in his behaviour, manner or speech. "Je suis saoul de gloire et affamé d'argent" was his reply to the compliments of Boileau. Yet tradition is unanimous as to his affection for his family; and as to the harmony in which he lived with his brother Thomas who had married Marguerite de Lampérière, younger sister of Marie, and whose household both at Rouen and at Paris was practically one with that of his brother. No story about Corneille is better known than that which tells of the trap between the two houses, and how Pierre, whose facility of versification was much inferior to his brother's, would lift it when hard bestead, and call out "Sans-souci, une rime!" Notwithstanding this domestic felicity, an impression is left on the reader of Corneille's biographies of a certain natural melancholy of temperament.

Although his actual poverty has been denied, he cannot have been affluent. His pensions covered but a small part of his long life and were most irregularly paid. Thomas Corneille himself, who to his undoubted talents united wonderful facility, untiring industry, and (gift valuable above all others to the playwright) an extraordinary knack of hitting the public fancy, died, notwithstanding his simple tastes, "as poor as Job." We know that Pierre received for two of his later pieces 2,000 livres each, and we do not know that he ever received more.

But his reward in fame was not stinted. Corneille, unlike many of the great writers of the world, was not driven to wait for "the next age" to do him justice. The cabal or clique which attacked the *Cid* had no effect whatever on the judgment of the public. All his subsequent masterpieces were received with the same ungrudging applause, and the rising star of Racine, even in conjunction with the manifest inferiority of Corneille's last five or six plays, with difficulty prevailed against the older poet's towering reputation. The great men of his time—Condé, Turenne, the maréchal de Grammont, the knight-errant duc de Guise—were his fervent admirers. Balzac did him justice; Rotrou, as we have seen, never failed in generous appreciation; Molière in conversation and in print recognized him as his own master and the foremost of dramatists. Racine, in discharge of his duty as respondent at the Academical reception of Thomas Corneille, pronounced upon the memory of Pierre perhaps the noblest and most just tribute of eulogy that ever issued from the lips of a rival.

His Plays.—Producing, as he certainly has produced, work which classes him with the greatest names in literature, Corneille also signed an extraordinary quantity of verse which has not merely the defects of genius, irregularity, extravagance, *bizarreté,* but the faults which we are apt to regard as exclusively belonging to those who lack genius, to wit, the dulness and tediousness of mediocrity. Molière's manner of accounting for this is famous in literary history or legend. "My friend Corneille," he said, "has a familiar who inspires him with the finest verses in the world. But sometimes the familiar leaves him to shift for himself, and then he fares very badly." That Corneille was by no means destitute of the critical faculty his *Discourses* and the *Examens* of his plays (often admirably acute, and, with Dryden's subsequent prefaces, the originals to a great extent of specially modern criticism) show well enough. But an enemy might certainly contend that a poet's critical faculty should be of the Promethean, not the Epimethean order. The fact seems to be that the form in which Corneille's work was cast, and which by an odd irony of fate he did so much to originate and make popular, was very partially suited to his talents. He could imagine admirable situations, and he could write verses of incomparable grandeur—verses that reverberate again and again in the memory, but he could not, with the patient docility of Racine, labour at proportioning the action of a tragedy strictly, at maintaining a uniform rate of interest in the course of the plot and of excellence in the fashion of the verse. On the English stage the liberty of unrestricted incident and complicated action, the power of multiplying characters and introducing prose scenes, would have exactly suited his somewhat intermittent genius, both by covering defects and by giving greater scope for the exhibition of power.

How great that power is can escape no one. The splendid soliloquies of Medea which, as Voltaire happily says, "annoncent Corneille," the entire parts of Rodogune and Chimène, the final speech of Camille in *Horace,* the discovery scene of *Cinna,* the dialogues of Pauline and Sévère in *Polyeucte,* the magnificently-contrasted conception and exhibition of the best and worst forms of feminine dignity in the Cornélie of *Pompée* and the Cléopâtre of *Rodogune,* the singularly fine contrast in *Don Sanche d'Aragon,* between the haughtiness of the Spanish nobles and the unshaken dignity of the supposed adventurer Carlos, and the characters of Aristie, Viriate and Sertorius himself, in the play named after the latter, are not to be surpassed in grandeur of thought, felicity of design or appropriateness of language. Therefore his rank among the greatest of dramatic poets is not a matter of question. For a poet is to be judged by his best things, and the best things of Corneille are second to none.

We have seen it said of the *Cid* that it is difficult to understand the enthusiasm it excited. But the difficulty can only exist for persons who are insensible to dramatic excellence, or who so strongly object to the forms of the French drama that they cannot relish anything so presented. Rodrigue, Chimène, Don Diègue are not of any age, but of all time. The conflicting passions of love, honour, duty, are here represented as they never had been on a French stage, and in the "strong style" which was Corneille's own. Of the many objections urged against the play, perhaps the weightiest is that which condemns the frigid and superfluous part of the Infanta. *Horace,* though more skilfully constructed, is perhaps less satisfactory. There is a hardness about the younger Horace which might have been, but is not made, imposing, and Sabine's effect on the action is quite out of proportion to the space she occupies. The splendid declamation of Camille, and the excellent part of the elder Horace, do not altogether atone for these defects. *Cinna* is perhaps generally considered the poet's masterpiece, and it undoubtedly contains one of the finest scenes in all French tragedy. The blot on it is certainly the character of Emilie, who is spiteful and thankless, not heroic. *Polyeucte* has sometimes been elevated to the same position. There is, however, a certain coolness about the hero's affection for his wife which somewhat detracts from the merit of his sacrifice; while the Christian part of the matter is scarcely so well treated as in the *Saint Genest* of Rotrou or the *Virgin Martyr* of Massinger. On the other hand, the entire parts of Pauline and Sévère are beyond praise, and the manner in which the former reconciles her duty as a wife with her affection for her lover is an astonishing success. In *Pompée* (for *La Mort de Pompée,* though the more appropriate, was not the original title) the splendid declamation of Cornélie is the chief thing to be remarked. *Le Menteur* fully deserves the honour which Molière paid to it. In *Sertorius* we have one of Corneille's finest plays.

Bibliography.—The subject of the bibliography of Corneille was treated in the most exhaustive manner by M. E. Picot in his *Bibliographie Cornélienne* (1875–76). Less elaborate, but still ample information may be found in J. A. Taschereau's *Vie* and in M. Marty-Laveaux's edition of the *Works.* The individual plays were usually printed a year or two after their first appearance; but these dates have been subjected to confusion and to controversy. The chief collected editions in the poet's lifetime were those of 1644, 1648, 1652, 1660 (with important corrections), 1664 and 1682, which gives the definitive text. In 1692 T. Corneille published a complete *Théâtre* in 5 vols. Numerous editions appeared in the early part of the 18th century, that of 1740 (6 vols., Amsterdam) containing the *Oeuvres diverses* as well as the plays. Several editions are recorded between this and that of Voltaire (12 vols., Geneva, 1764; 8 vols., 1776), whose *Commentaires* have often been reprinted separately. In the year IX. (1801) appeared an edition of the *Works* with Voltaire's commentary and criticisms thereon by Palissot (12 vols.). Of the numerous editions published since that date that of Ch. Marty-Laveaux in Regnier's *Grands Ecrivains de la France* (12 vols., 1862–68) is still the standard. It contains the entire works, a lexicon, full bibliographical information, and an album of illustrations of the poet's places of residence, his arms, some title-pages of his plays, facsimiles of his writings, etc. Nothing is wanting but variorum comments, which Lefèvre's edition supplies. Fontenelle's life of his uncle is the chief original authority on that subject, but Taschereau's *Histoire de la vie et des ouvrages de P. Corneille* (1st ed. 1829, 2nd in the *Bibl. elzévirienne,* 1855) is the standard work. Of the exceedingly numerous writings relative to Corneille we may mention the *Recueil de dissertations sur plusieurs tragédies de Corneille et de Racine* of the abbé Granet (1740), the criticisms already alluded to of Voltaire, La Harpe and Palissot, the well-known work of Guizot, first published as *Vie de Corneille* in 1813 and revised as *Corneille et son temps* in 1852, and the essays, repeated in his *Portraits littéraires,* in *Port-Royal,* and in the *Nouveaux Lundis* of Sainte-Beuve. More recent, besides essays by MM. Brunetière, Faguet and Lemaître and the pertinent part of M. E. Rigal's work on 16th century drama in France, *see* Gustave Lanson, *Corneille* in the *Grands Ecrivains français* (1898); F. Bouquet, *Points obscurs et nouveaux de la vie de Pierre Corneille* (1888); J. Levallois, *Corneille inconnu* (1876); J. Lemaître, *Corneille et la poétique d'Aristote* (1888); J. B. Segall, *Corneille and the Spanish Drama* (1902); and the recently discovered and printed *Fragments sur Pierre et Thomas Corneille* of Alfred de Vigny (1905). On the *Cid* quarrel E. H. Chardon's *Vie de Rotrou* (1884) bears mainly on a whole series of documents which appeared at Rouen in the proceedings of the *Société des bibliophiles normands*

during the years 1891–94. *See* also Benedetto Croce, *Scritti di storia letteraria* (*XIV. Ariosto, Shakespeare e Corneille* 1911; Eng. trans., 1921); Abbé Renault, *Une fille inconnue de Pierre Corneille* (1922); E. de Saint-Auban, *Maître Pierre Corneille, avocat* etc. (1923); L. M. Riddle, *The Genesis and Sources of Pierre Corneille's Tragedies from Medée to Partherite* (1926, Johns Hopkins Studies in Romance Literatures and Languages, vol. 3); R. Bray, *La Tragédie Cornelienne devant la critique classique, d'après la querelle de Sophonisbe, 1663* (1927).

CORNEILLE, THOMAS (1625–1709), French dramatist, was born at Rouen on Aug. 20, 1625, being nearly 20 years younger than his brother, the great Corneille. At the age of 15 he composed a play in Latin which was represented by his fellow-pupils at the Jesuits' college at Rouen. His first French play, *Les Engagements du hasard,* was acted in 1647. *Le Feint Astrologue,* imitated from the Spanish, and imitated by Dryden, came next year. At his brother's death he succeeded to his vacant chair in the Academy. A complete translation of Ovid's *Metamorphoses* (he had published six books with the *Heroic Epistles* some years previously) appeared in 1697. In 1704 he lost his sight and was constituted a "veteran," a dignity which preserved to him the privileges, while it exempted him from the duties, of an academician. Nevertheless in 1708 he produced a large *Dictionnaire universel géographique et historique* in three volumes folio. This was his last labour. He died at Les Andelys on Dec. 8, 1709, aged 84. The two Corneilles were strongly attached to one another, and practically lived in common. Of 42 plays by Thomas (this is the utmost number assigned to him) the last edition of his complete works contains only 32, but he wrote several in conjunction with other authors. Two are usually reprinted as his masterpieces at the end of his brother's selected works. These are *Ariane* (1672) and the *Comte d'Essex.*

See G. Reynier, *Thomas Corneille, sa vie, ses ouvrages* (1892), and Alfred de Vigny, *Fragments inédits de critique sur Pierre et Thomas Corneille* (1905).

CORNELIA (2nd cent. B.C.), daughter of Scipio Africanus the elder, mother of the Gracchi and of Sempronia, the wife of Scipio Africanus the younger. She was so devoted to her sons Tiberius and Gaius that it was even asserted that she was concerned in the death of her son-in-law Scipio, who by his achievements had eclipsed the fame of the Gracchi, and was said to have approved of the murder of Tiberius. When asked to show her jewels she presented her sons, and on her death a statue was erected to her memory inscribed, "Cornelia, the mother of the Gracchi." After the murder of her second son Gaius she retired to Misenum, where she devoted herself to Greek and Latin literature and to the society of men of letters. She was a highly educated woman, and her letters were celebrated for their beauty of style.

CORNELIUS, pope, was elected in 251 during the lull in the persecution by the emperor Decius. In 253, under the emperor Gallus, he was exiled to Centumcella (Civita Vecchia), where he died in the same year. He is commemorated with his friend, St. Cyprian, on Sept. 16.

CORNELIUS, CARL AUGUST PETER (1824–1874), German musician and poet, born at Mainz, son of an actor at Wiesbaden, grandson of the engraver Ignaz Cornelius, and nephew of Cornelius the painter, was himself intended to be an actor, but turned his attention to music. In 1852 he came in touch with Liszt, and at Weimar he heard Berlioz' delightful *Benvenuto Cellini,* a work which ultimately exercised great influence over him. For the time, however, he devoted himself, on Liszt's advice, to Church compositions, the influence of the Church on him at that time being so great that he applied, but vainly, for a place in a Jesuit college. At the same time his mind was bent on the production of a long contemplated comic opera, but the composition of this was delayed by the work of translating the prefaces to Liszt's symphonic poems and the texts of works by Berlioz and Rubinstein. Eventually, however, he wrote the *Barbier von Bagdad,* supplying the "book" as well as the music himself, and on Dec. 15, 1858, the opera was produced at Weimar under Liszt. It was however completely misunderstood by the public of that day, and hissed off the stage, whereupon Liszt indignantly resigned his post. Shortly afterwards Cornelius went to Vienna and Munich, and still later came very much under Wagner's influence. Subsequently his opera *Le Cid* was completed and produced at Weimar. For the last nine years of his life (1865–74) Cornelius was occupied with his opera *Gunlöd* and other compositions, besides writing ably and abundantly on Wagner's music-dramas. In 1867 he became teacher of rhetoric and harmony at the Musikschule, Munich, and married Berthe Jung. He died on the 26th of October, 1874. Not the least of Cornelius's many claims to fame was his remarkable versatility. Many of his original poems, as well as his translations from the French, rank high. Among his songs, special mention may be made of the lovely "Weihnachtslieder," and of the "Vätergruft," an unaccompanied vocal work for baritone solo and choir.

CORNELIUS, PETER VON (1783–1867), German painter, was born in Düsseldorf on Sept. 27, 1783. His earliest work of importance was the decoration of the choir of the church of St. Quirinus at Neuss. At the age of 26 he produced his designs from *Faust.* On Oct. 14, 1811, he arrived in Rome, where he soon became one of the most promising of that brotherhood of young German painters which included Overbeck, Schadow, Veit, Schnorr and Ludwig Vogel (1788–1879)—a fraternity (some of whom selected a ruinous convent for their home) who were banded together for resolute study and mutual criticism. Out of this association came the men who, though they were ridiculed at the time, were destined to found a new German school of art.

At Rome Cornelius participated, with other members of the fraternity, in the decoration of the Casa Bartoldi and the villa Massimi. From Rome he was called to Düsseldorf to remodel the academy, and to Munich by the then crown-prince of Bavaria, afterwards Louis I., to direct the decorations for the Glyptothek. On the death of Director Langer (1825), he became director of the Munich academy.

The fresco decorations of the Ludwigskirche, which were for the most part designed and executed by Cornelius, are perhaps the most important mural works of the 19th century. Amongst his other great works in Munich may be included his decorations in the Pinakothek and in the Glyptothek. About the year 1839–40 he left Munich for Berlin to proceed with that series of cartoons, from the Apocalypse, for the frescoes for which he had been commissioned by Frederick William IV., and which were intended to decorate the Campo Santo or royal mausoleum. Cornelius and his associates endeavoured to follow in their works the spirit of the Italian painters. But the Italian strain is to a considerable extent modified by the Dürer heritage. This Dürer influence is manifest in a tendency to overcrowding in composition, in a degree of attenuation in the proportions of, and a poverty of contour in the nude figure, and also in a leaning to the selection of Gothic forms for draperies. These peculiarities are even noticeable in Cornelius's principal work of the "Last Judgment" in the Ludwigskirche in Munich. Karl Hermann was one of Cornelius's earlier and most esteemed scholars, a man of simple and fervent nature, painstaking to the utmost, a very type of the finest German student nature; Kaulbach and Adam Eberle were also amongst his scholars.

To comprehend and appreciate thoroughly the magnitude of the work which Cornelius accomplished for Germany, it must be remembered that at the beginning of the 19th century Germany had no national school of art and was in painting and sculpture behind all the rest of Europe. Yet in less than half a century Cornelius founded a great school, revived mural painting, and turned the gaze of the art world towards Munich. The German revival of mural painting had its effect upon England, as well as upon other European nations, and led to the famous cartoon competitions held in Westminster hall, and ultimately to the partial decoration of the Houses of Parliament. When the latter work was in contemplation, Cornelius, in response to invitations, visited England (Nov. 1841). He died on March 6, 1867.

See Förster, *Peter von Cornelius* (1874); A. Kuhn, *Peter Cornelius und die geistigen Strömungen Seiner Zeit* (1921).

CORNELL, EZRA (1807–1874), American capitalist and philanthropist, was born at Westchester Landing, N.Y., on Jan.

11, 1807, of Quaker parents. His early education was received in the common schools but throughout life he was an ardent student and became noted for his practical and scientific attainments. In 1828 he settled at Ithaca, N.Y., where he later served as manager of flour mills. In 1842 he became associated with S. F. B. Morse in the early development of the electric telegraph and superintended the construction of the first telegraph line in America, opened between Baltimore and Washington in 1844. He then became one of the most active pioneers in the establishment of telegraph lines throughout the country, in connection with which he accumulated a substantial fortune, being a founder and for some time the largest stock-holder in the Western Union Telegraph company, organized in 1855. Settling on a farm near Ithaca, he became especially interested in the development of agriculture. Following the passage in 1862 of the Morrill Act providing national support for agricultural colleges, he took steps which led to the founding at Ithaca of Cornell university, which was formally opened in 1868. His original endowment of $500,000, given in 1865, was increased by further personal contributions of about $400,000, and by more than $3,000,000 realized as profits from his operations in purchasing and allocating public lands for the benefit of the new institution, which has since risen to front rank among American universities. He also established the Cornell library at Ithaca and built railway lines facilitating access to the university town. He died in Ithaca on Dec. 9, 1874.

See Alonzo B. Cornell, *True and Firm: a Biography of Ezra Cornell* (1884).

CORNELL UNIVERSITY, an American institution of higher education, situated at Ithaca, New York. Its campus has a fine situation on a hill 800ft. above sea level and 400ft. above Cayuga lake, between deep gorges cut by two creeks, and commands a wide view of the lake and the town. The university was founded in 1865 and was named in honour of Ezra Cornell, its principal benefactor. It was organized by Andrew D. White, its first president, and was opened in 1868. It is co-educational (since 1872) and comprises the graduate school, with 630 students in 1927; the college of arts and sciences (1,898 students); the law school (175 students), established in 1887; the medical college (263 students), a graduate college established in 1898 by the gift of Oliver Hazard Payne, situated in New York city but maintaining a division in Ithaca; the New York State veterinary college (107 students), established by the State legislature in 1894; the New York State college of agriculture (664 students), maintained by the State since 1904 and closely related to two experiment stations, the one at Ithaca supported by the Federal Government and the other at Geneva, 40m. away, maintained by the State Government; the State college of home economics (451 students), established by the State legislature in 1925; the college of architecture (182 students); and the college of engineering, comprising three schools: civil engineering (328 students), mechanical engineering (431 students) and electrical engineering (309 students). The total enrolment was 5,438 students, including 1,271 women. In addition, 2,053 students were enrolled in the 1927 summer session and 79 in the short winter courses in agriculture. Nearly all the States and territories of the United States and 35 foreign countries were represented.

The government is vested in a board of trustees consisting of 15 persons co-opted, ten elected by the graduates and five appointed by the governor of New York, these 30 persons for terms of five years; the president of the university, the governor and lieutenant governor of New York, the speaker of the assembly, the State commissioners of education and agriculture, the president of the State agricultural society and the librarian of the Cornell library in the town of Ithaca, each of these eight persons *ex officio;* the eldest male descendant of Ezra Cornell for the term of his natural life, and a representative of the State Grange elected annually. The university faculty elects three delegates who sit with the board and have the usual powers of trustees except the right to vote. The group of State colleges, the graduate school and the medical college are each governed by the board through a council composed of trustees and members of the faculty. The presidents have been Andrew Dickson White, 1866–85; Charles Kendall Adams, 1885–92; Jacob Gould Schurman, 1892–1920; Livingston Farrand, 1921–37, and Edmund Ezra Day, 1937– .

The university libraries contain about 750,000 vols., most of them in the general library building, which, with an endowment (1891) of $300,000 for the purchase of books and periodicals, was the gift of Henry Williams Sage (1814–97), who had succeeded Ezra Cornell as chairman of the board of trustees; in

BY COURTESY OF CORNELL UNIVERSITY

BUILDINGS OF CORNELL UNIVERSITY

1906 the general library received an additional endowment fund of about $500,000 by the bequest of Willard Fiske, who gave it also four rich collections; viz., the Dante (8,000 vols.), Petrarch (4,000 vols.), Rhaeto-Romanic (1,300 vols.) and Icelandic (15,000 vols.). It includes the President White historical library, 23,000 vols. and pamphlets, given by President White, especially rich in the primary sources of history and containing useful collections on the period of the Reformation, on the English and French revolutions, on the American Civil War and on the history of superstition. Other special collections are the classical library of Charles Anthon, the philological library of Franz Bopp, the Goldwin Smith library (1869), the White architectural library, the Spinoza collection presented by President White (1894), the library of Jared Sparks, the Samuel J. May collection of works on the history of slavery, the Zarncke library of Germanic philology and literature, the Eugene Schuyler collection of Slavic folk-lore, literature and history, the Wordsworth collection made by Mrs. Cynthia Morgan St. John, the Charles W. Wason collection of works relating to China and the Chinese, the James Verner Scaife collection of books relating to the American Civil War and the Emil Kuichling library of hydraulic and sanitary engineering. The law library (60,000 vols.) includes complete collections of the reports of the Federal courts and the several American State jurisdictions and of the English, Scotch, Irish and English colonial reports. The Flower veterinary library has 6,000 vols. and an endowment of $10,000. The general library has published catalogues of the Dante, Petrarch and Icelandic collections given by Willard Fiske; it issues *Islandica,* an annual relating to Iceland and to the Icelandic collection.

In common with many of the State universities, Cornell university was founded on the Morrill Act of 1862, by which the Federal Government apportioned to the several States 9,500,000ac. of the public lands, from the proceeds of the sale of which each State was to endow at least one college "where the leading object shall be . . . to teach such branches of learning as are related to agriculture and the mechanic arts." But it was Ezra Cornell (*q.v.*) who established the foundations, and Andrew D. White who determined the form of the new university. They were members of the New York legislature that in 1863–65 considered what disposition should be made of this State's share of the Federal grant. In 1864 Cornell, at White's suggestion, determined to found a university of a new type, "an institution"—as he expressed his own ideal—"where any person can find instruction in any study." He offered to give it $500,000 and 200ac. of land if the State would agree to endow it with all the proceeds of New York's portion of the Federal grant. The proposed charter provided that, besides those branches of learning which the Morrill Act had specified, "such other branches of science and knowledge may be embraced in the plan of instruction and investigation pertaining to the university as the trustees may deem useful and proper"; the university was to be made non-sectarian by a provision that a majority of the board of trustees should never be of one religious sect or of no religious sect and that persons of every religious denomination or of no religious denomination should be equally eligible to all offices and appointments. Despite bitter opposition, especially on the part of the denominational schools and press, a charter was granted April 27, 1865.

The trustees committed to Mr. White the task of preparing a scheme for the university's internal organization, and in 1866 they accepted his report and elected him president. (For his own account of his labours in organizing the university consult the *Autobiography of Andrew D. White,* vol. i. [1905].)

In the early years there were three or four general courses designed to afford the student some freedom in his choice of studies, ranging from a course in which the classics preponderated to one which was built around the modern sciences. At first all the work of each of these courses was prescribed, but after a few years the student was permitted to elect some or all of the subjects of his study in the latter years of the course; in 1896 the system of freely elective studies was adopted and the general courses were organized in a college of arts and sciences.

The college of agriculture, the veterinary college and the college of home economics, with the State agricultural experiment station, form a group unique in their organization, being maintained by the State but administered by the trustees as units of the university, a privately endowed institution. The college of agriculture, established on a foundation of courses given since 1868 and with a Federal experiment station founded in 1879, was organized in 1890 and made a State college in 1904 with Prof. L. H. Bailey (b. 1858) as director. The present director is Prof. A. R. Mann (b. 1880). The veterinary college was organized by Prof. James Law (1838–1921), F.R.C.V.S., and is now under the direction of Prof. V. A. Moore (b. 1859). This group of colleges has steadily enlarged its resources both for instruction and for scientific research; the State government has given it buildings and equipment costing more than $3,000,000; and through its experiment stations and departments of extension it renders constant service to agricultural enterprise and rural interests throughout the State.

The school of mechanical engineering owes its foundation to Hiram Sibley (1807–88), a banker of Rochester, N.Y., who gave $180,000 for its endowment and equipment and whose son Hiram W. Sibley has helped to maintain it; it was built up under Prof. R. H. Thurston (1839–1903), its director in 1885–1903; in 1921 it was combined with the college of civil engineering and the school of electrical engineering in a single college under the direction of Prof. D. S. Kimball (b. 1865). The college occupies the Sibley group of laboratories and shops, Lincoln, Franklin and Rand halls and the Fuertes observatory, and possesses a hydraulic laboratory built so as to use a 70ft. fall of water in the gorge of Fall Creek; it maintains various museums and laboratories of research and publishes a *Bulletin* of its engineering experiment station. The college of architecture gives courses leading to degrees in architecture, landscape architecture and fine arts. The law school became a graduate school in 1925; it publishes the *Cornell Law Quarterly,* established in 1915.

The medical college after its foundation in 1898 occupied a building extending from 27th to 28th street in First avenue opposite Bellevue hospital, in New York, and enjoyed relations with New York hospital and Bellevue hospital by which they admitted its students to their wards for instruction and research. In 1927 the university entered into an agreement with New York hospital by which that hospital and the college are permanently affiliated and are to occupy for their joint operation a new building to be erected at 68th street and Avenue A, near the Rockefeller Institute for Medical Research. To aid in carrying out this project the general education board appropriated $7,500,000; large legacies to both the hospital and the college were contained in the will of Payne Whitney, the vice president of the hospital, who had devoted himself for several years to the perfecting of the project. The college is affiliated with the Memorial hospital for the study and treatment of cancer and with the John E. Berwind maternity clinic; it operates a pay clinic whose attendance has averaged 335 patients daily.

A group of dormitories for men was begun in 1914. For undergraduate women, in addition to Sage college (1874) and Prudence Risley hall (1913), a group of new halls was provided for by a gift of $1,650,000 received in 1928. There were 64 fraternities, most of them chapters of national "Greek-letter" societies, in 1927, and 14 similar organizations of student women, housing and boarding their members.

The regular annual tuition fees in 1927 ranged from $500 in the medical college to $200 in the State colleges, which, however, receive residents of New York State free of tuition in their undergraduate courses.

For athletic recreation the trustees in 1902 appropriated to the students 55ac. of the campus, 35ac. of which are always open for games; the athletic association uses the remainder, having a football field, a baseball field, two quarter-mile cinder tracks and appropriate stands and buildings. The association owns and operates two boat-houses and their equipment of racing boats and motor launches on the main inlet of Cayuga lake, and, in the winter, provides conveniences for skaters on Beebe lake, above the dam of the hydraulic laboratory, where it conducts a clubhouse and restaurant. During their first two years all undergraduate students are required to receive physical training, which for the men takes the form of military training under officers detailed by the War department; the university's unit of the reserve officers' training corps of the army occupies the New York State drill hall (1913), the floor of which is 2ac. in area. A staff of medical advisers safeguards the students' health by means of periodical consultations or examinations; weekly lectures on hygiene and preventive medicine are prescribed for all first year undergraduate students.

In the years 1869–1927 the university conferred 29,532 degrees, including 3,375 advanced degrees. The graduates are organized in many local associations and clubs, and in the Cornell alumni corporation, which meets at Ithaca every June with the primary duty of canvassing the postal ballot for alumni members of the board of trustees. Through the Cornellian council, which they organized in 1908, former students have contributed more than $1,500,000 to the university; they publish the *Cornell Alumni News,* a 16-page weekly newspaper. An undergraduate board publishes the *Cornell Daily Sun,* founded in 1880, and undergraduate boards with faculty advisers publish the *Sibley Journal of Engineering,* the *Cornell Civil Engineer,* and (in the college of agriculture) the *Cornell Countryman.* (W. P.)

CORNER. In commerce, the manipulation of a market to secure the monopoly of the supply of a commodity, or such a degree of control of supply as will enable the speculator to raise prices. From time to time corners have been made in the shares of companies, in corn and in metals. It sometimes happens that when "bears" (*see* BEAR) sell heavily on the stock exchange the shares of a company which they do not possess, the shares are cornered against them so that they are eventually forced to pay an exorbitant price to buy back what they have sold. There have been large-scale instances of wheat cornering, but such examples are rare, for the risks involved are very great (*see* MONOPOLY).

CORNET, a word having two distinct significations and two etymological histories, both, however, ultimately referable to the same Latin origin:—

1. (Fr. *cornette,* dim. of *corne,* from Lat. *cornu,* a horn), a small standard, formerly carried by a troop of cavalry, and similar to the pennon in form, narrowing gradually to a point. The term was then applied to the body of cavalry which carried a cornet, and later to the junior officer who, like the "ensign" of foot, carried the colour.

2. (Fr. *cornet,* Ital. *cornetto,* Med. Lat. *cornetum,* a bugle, from Lat. *cornu,* a horn), in music, the name of two varieties of wind instruments (*see* below), and also of certain stops of the organ.

(*a*) CORNET or CORNETT is the name given to a family of not brass, but wood wind instruments, now obsolete, and differing entirely from the modern cornet à pistons. In Germany in the

17th and 18th centuries, they were used with trombones in the churches to accompany the chorales, and there are examples of this use of the instrument in the sacred cantatas of J. S. Bach. Gluck was the last composer of importance who scored for the cornet.

(*b*) Cornet à Pistons, Cornet and Cornopaean are the names of a modern brass wind instrument, a transformation of the old post-horn, of the same pitch as the trumpet. There are no fixed notes on the cornet, as in instruments with lateral holes, or with keys; the musical scale is obtained by means of the power the performer possesses of producing the notes of the harmonic series by over-blowing, *i.e.,* by varying the tension of the lips and the pressure of breath, the intermediate notes being obtained by means of three pistons. The *timbre* of the cornet lies somewhere between that of the horn and the trumpet, having the blaring, penetrating quality of the latter, without its brilliant, noble sonorousness.

MODERN CORNET

CORNETO TARQUINIA: *see* Tarquinia.

CORNFLOUR. The starch of maize (Indian corn) refined for use as a foodstuff. A grain of maize has a complicated structure, consisting mainly of an embryo plant and starchy food to sustain its early growth. The endosperm or store of food is a mass of minute granules of starch, corn gluten and protein. Each granule is a unit of definite shape and size, and the cell in which it lies might be compared to the cells of a honeycomb, only infinitely smaller; this is the common characteristic of the grass family.

The main problems of the manufacture of cornflour are: (1) the separation of the starch granules from the germs, hull, and gluten; (2) the purifying of these granules; and (3) the selection of those granules which possess in the highest degree purity and strength, *i.e.,* the quality of forming a stiff paste when boiled with water or milk. To obtain the best result, the grain used must be carefully selected. Maize is now grown in many parts of the world. The chief exporting countries in the past have been the United States, the Danubian provinces, and Argentina. More recently maize has been shipped from South Africa and Rhodesia, West and East Africa, and to a lesser extent Rangoon, Egypt, and elsewhere.

The grain first undergoes dry cleaning, all dirt and dust being removed. It is then scoured in water to remove the last traces of foreign matter. The clean grain is carried by elevators and conveyors to steeping tuns. Steeping is done with a dilute solution of sulphuric dioxide gas. This prevents fermentation and helps to soften the kernels so that the germs are easily separated and the hull loosened. The steep water is evaporated and valuable solubles recovered. The time of steeping and the temperature are important factors. The grains, brought to the right degree of softness, are ground and split, to free the germ from the rest of the grain. The broken mass passes into a germ separator, where the germ, being lighter, is floated off. The germ, which contains about 40% of oil, is then dried and sent to the oil mill for the extraction of the oil. This oil, which in its crude state is not fit for human food, can by careful refining be made suitable for edible purposes, and is largely used for cooking, baking and as salad oil. After the extraction of the oil, the residue of the germ is made into a cake which is of special value for fattening cattle and sheep and is sold under the name "maize germ cake."

The germ eliminated, the corn is finely ground in a wet state, and the starch granules separated from the coarser constituents, which form a valuable cattle food. The milky starch thus obtained is further refined by passing over a long series of inclined "runs" or tables. The starch granules, being heavier than water, fall and settle on the smooth surface of the runs. There is, however, in the liquid, along with the comparatively pure starch granules, a certain quantity of yellow starch matter or corn gluten (with other impurities) which, being lighter than the starch, is kept in suspension, and eventually flows over the tail end of the runs and is collected to be mixed into cattle food. Thus a further separation has been effected, but the pure starch required for cornflour has not yet been obtained. Periodically the flow over the run is stopped, and the settled starch is cut out from the runs into vats, which have a central stirrer. When a sufficient quantity has been collected in a tun, clean fresh water is run in, along with caustic soda liquor, and the stirrer is set in motion, so that by degrees the starch is lifted into suspension. Certain of the nitrogenous elements of the grain, which are intimately mixed with the starch in its present state, are now dissolved away by the caustic liquor. After stirring, the starch is pumped to another tun in the washing house, where it is allowed to settle, the solid starch granules slowly falling to the bottom, and forming a hard compact mass, on the surface of which there settles out a small quantity of softer yellow matter (called "the tops"). This settling takes from two to four days. The "tops" are removed, and the fine residuum washed several times. Next comes drying, and when this is done, the flour is raked down into hoppers, from which it is drawn off into bags. This is now finished cornflour in the "crisp" state, and all that remains to be done is to pulverize it. This is done in a special mill, but even here care has to be taken to eliminate any foreign particles. A careful sieving therefore forms the actual final operation.

CORNFLOWER (*Centaurea Cyanus*), a well-known plant of the family Compositae, called also bluebottle and bachelor's button. It is a native of Europe, a familiar weed in Great Britain, and has become widely naturalized from cultivation in many parts of North America from Quebec to the Pacific coast, where in Washington and California it is a common wayside weed. It is a slender, branching annual, 1 ft. to 2 ft. high, with narrow, more or less toothed or divided leaves and brilliant usually blue flowers, in heads an inch or more across, borne on long leafless stalks. In the United States it is popular for garden planting, being one of the "old-fashioned flowers." It is the national flower of Germany. (*See* Centaurea.)

CORNICE, in architecture, the decorated projection at the top of a wall provided to throw off rain from the wall face or to ornament and finish the eaves. The term is used as well for any projecting element which crowns an architectural feature. A cornice is also specifically the top member of the entablature of a classic order (*q.v.*); it is in this case divided into three parts, a bed mould, corona and cymatium.

CORNICHE, THE, the name of a carriage road built by Napoleon along the Mediterranean slopes of the Maritime Alps, between Nice and Genoa it is famous for its sea and alpine views. The name is applied to-day to the three roads known respectively as the Grand, the Middle and the Little Corniche (*Grande, Moyenne, et Petite Corniche*), of which the first, ascending directly from Nice, reaches within a few miles a height of over 1,700 ft., and passing via the Col d'Eze descends via La Turbie to Mentone, while the Little Corniche follows the coast route through Beaulieu, Monaco, Monte Carlo and Roquebrunne.

CORNIFICIUS, the author of a work on rhetorical figures, and perhaps of a general treatise (*ars,* τέχνη), on the art of rhetoric (Quintilian, *Instit.,* iii. 1. ix. 3.). He has been identified with the author of the four books of *Rhetorica* generally known as *Auctor ad Herennium*. The chief argument in favour of this identity is the fact that many passages quoted by Quintilian from Cornificius are reproduced in the *Rhetorica*. But it seems improbable that the question of authorship will ever be satisfactorily settled. Internal indications point to the date of composition as 86–82 B.C., the period of Marian domination in Rome. The unknown author, as may be inferred from the treatise itself, did not write to make money, but to oblige his relative and friend Herennius. He expresses his contempt for the ordinary school rhetorician. Finally, he admits that rhetoric is not the highest accomplishment, and that philosophy is more deserving of attention.

The first and second books of the *Rhetorica* treat of *inventio* and forensic rhetoric; the third, of *dispositio, pronuntiatio, memoria,* deliberative and demonstrative rhetoric; the fourth, of *elocutio*. The chief aims of the author are conciseness and clearness. The work as a whole is considered very valuable. The question of the relation of Cicero's *De inventione* to the *Rhetorica* is a matter of much dispute.

CORNING is a city in Steuben county, New York, U.S.A., in the southern part of the state, on the Chemung river. It is served by the Erie, the Lackawanna and the New York Central railways. Pop. (1940 federal census) 16,212. Corning is the trading and shipping centre of a dairying and tobacco-growing region, and has important manufacturing industries, with an annual output valued at $12,000,000. The leading products are technical glass, cut and flint glass in many forms, furnaces, stoves and fibre boxes and cartons. There are also large foundries and railroad shops and car factories. There were settlers here as early as 1789. The village was incorporated in 1848 and named after Erastus Corning, the railway builder. It was chartered as a city in 1890.

CORNISH, a breed of poultry apparently developed in England about the middle of the 19th century and first imported into America in 1887. It gained considerable popularity partly because of its excellent fleshing properties and its yellow skin. It has close feathering and a compact, heavily-meated body, the breast being very deep and broad. The cornish lays a brown-shelled egg and is a broody fowl. It has a pea comb. In spite of its excellent fleshing properties, the cornish has never demonstrated that it is a very great layer. There are three varieties, the dark, the white, and the white-laced red, the latter being a novelty. The plumage of the dark cornish is largely lustrous greenish-black and dark red intermixed. The under-colour is dark slate, and the beak, shanks and toes, yellow. The plumage of the white cornish is pure white; the beak, shanks, and toes are yellow, which is also the colour of the skin. The white-laced red cornish has been developed in America quite recently. The plumage is, for the most part, red with a narrow lacing of white on each feather. In both sexes the neck feathers are rich red which, in the male, are laced with silvery white, and in the female, with white. The tail feathers in the male are white, and in the female they are red except that the end of each feather is laced with white. The under colour in both sexes is white, and the skin, beaks, shanks and toes are yellow. (*See* POULTRY AND POULTRY FARMING.)

CORNISH LANGUAGE. This extinct language belonged to the Brythonic group of the Celtic division of the Indo-European family of languages. It is, therefore, akin to Welsh and to Breton—indeed it is suggested that up to 1400–1600 a Cornishman could understand a Breton speaker. It is, however, a characteristic feature of Cornish, even in old forms, to change non-initial *t* and *d* into *s* or *z*. With the Reformation, it decayed as the Prayer Book and the Scriptures circulated in English—so that the people became bilingual, and then lost their original speech, though there is evidence that people who lived into the 19th century were able to converse in it. The modern speech of western Cornwall still contains Celtic words and "since by Pol, Tre and Pen, you may know the Cornish men," from Tamar to Land's End are found personal and place names of Celtic origin.

CORNISH LITERATURE

The earliest extant remains of Cornish consist of proper names, 10th century glosses and a 12th century vocabulary. The names occur among manumissions of serfs in the Bodmin Gospels (*Revue Celtique,* i. 232) and in Domesday Book. Glosses are found in a volume at the Bodleian and also in a treatise on Donatus by Smaragdus, abbot of Saint-Mihiel, which is at the Bibliothèque Nationale in Paris (*Archiv. für celtische Lexicographie,* iii. 249). These remains belong approximately to the 10th century. The vocabulary occurs in a 12th century ms. (Cott. Vesp. A. XIV.) at the British Museum. Prof. Max Förster has shown that this is a translation of Abbot Aelfric's famous Latin-Anglo-Saxon Glossary. Though the language is termed Old Cornish, strictly the forms in the vocabulary correspond to those of Mid. Welsh and Mid. Breton.

The earliest known piece of connected Cornish consists of 41 lines of verse dealing with the subject of marriage. This may be a fragment of drama, and was written about 1400 (*Revue Celtique,* iv. 258). A little later comes the *Passion of Our Lord* or *Mount Calvary,* a versified narrative (259 stanzas) of the events of the Passion based on the Gospel and apocryphal narratives (Stokes, *Trans. of the Philological Society,* 1860–61, appendix). But the bulk of Cornish literature is made up of plays, of which the earliest form a trilogy named *Ordinalia,* the oldest copy of which is a 15th century Oxford manuscript. They were published by Edwin Norris in two volumes under the title of *The Ancient Cornish Drama* (1859). The first play, *Origo Mundi,* begins with the creation and ends with the building of Solomon's temple. The second, *Passio Domini,* gives the history of Christ from the temptation to the crucifixion. The third, *Resurrectio Domini,* continues the second without interruption, and ends with the resurrection and the ascension. It embraces the harrowing of hell, the legend of St. Veronica and Tiberius, and the death of Pilate. In addition to the biblical narrative, apocryphal sources have been extensively drawn upon in the work, as in the *Passion of Our Lord.* The Gospel of Nicodemus is very much in evidence throughout. The plays are of learned origin and are imitations, if not adaptations from English (and possibly French) sources. Practically no originality is displayed (though many of the events are represented as having taken place in well-known Cornish localities), except in the comic or sarcastic parts. There are many signs of linguistic impurity in these plays, and one is fully prepared for the debasement which increasingly occurs in the later works.

The next play to notice is *Ordinale de Vita Sancti Mereadoci, Episcopi et Confessoris,* the ms. of which was written in 1504 and is now Peniarth ms. 105 at the National Library of Wales. It was published under the titles *Beunans Meriasek, The Life of St. Meriasek,* by Stokes in 1872. The play deals with the life and death of Meriasek (in Welsh *Meiriadog,* in Breton *Meriadek*), son of a duke of Brittany, and the legend of St. Silvester and the emperor Constantine, though Meriasek belongs to the 7th century and St. Silvester to the 4th. The construction of the play is unskilful, and, as le Braz has shown, the author drew his materials from Latin and English sources. Something truly Cornish might have been expected in a play based upon an early patron saint of Camborne, but no immediate Cornish traditions appear, the story of Meriasek having been taken from a Breton source. At the end of each of the two parts of the play the minstrels are bidden to pipe and the spectators to dance and carouse. The usual comic element is supplied by Constantine's quack doctor, by torturers, outlaws and crucifiers. The language is more recent than in the dramas published by Norris, and English words are on the increase. The last play is that published by Stokes in 1864 under the titles *Gwreans an Bys, The Creation of the World,* from the oldest ms., which is at the Bodleian and dated 1611. This copy was written by William Jordan of Helston. The play greatly resembles the *Origo Mundi* of Norris's edition, of which whole passages have been borrowed. The language shows considerable signs of decay, English words occur in plenty, and Lucifer and his angels are often made to speak English.

Later original compositions in Cornish are *Nebbaz Gerriau dro tho Carnoack* ("A few words about Cornish") by John Boson (*Journ. of the R. Inst. of Cornwall,* 1879) and *Dzhûan Tshei an hor* ("John of Ram's house"), a folk-tale printed with a Welsh version by Lhuyd in his *Archaeologia Britannica* (1707) and with an English version in Pryce's *Archaeologia Cornu-Britannica* (1790). Andrew Borde's *Booke of the Introduction of Knowledge* (1542) contains some Cornish conversations (ed. by Stokes, *Rev. Celtique,* iv. 262, and Loth, *Arch. fuer Celt. Lex,* i. 224). A number of words and phrases occur in Carew's *Survey of Cornwall.* Lhuyd's preface to his Cornish grammar is written in Cornish, and he also wrote an elegy in Cornish on William of Orange. In addition there are fragments of Cornish consisting of songs, verses, proverbs, epigrams, epitaphs, maxims, letters, conversations, mottoes and translations of passages of Scripture, the Creed, etc. They are enumerated, classified and described by Jenner in his *Handbook.* In recent years there appear signs of a reviving interest being taken by Cornishmen in Cornish as a living language. A few poems and short stories (including translations) have been published. But the general barrenness of Cornish literature is to be regretted all the more when one thinks that it is to the land where Cornish was once spoken that the world probably owes the *Matter of Britain.* (*See* Loth, *Rev. Celtique,* xxxiii. 258–310.)

CORN LAWS. From the very earliest times, States which have attained to any degree of civilization have found it necessary to take measures to ensure a sufficient supply of cereals for the population. In communities which were wholly or mainly agricultural, such measures were only of a temporary nature, resorted to in times of failure of crops or of war. Thus in early Egypt (*c.* 2000 B.C.) steps were taken to store grain in years of plenty, against the prospect of lean years to come (Genesis xxi. 46–57). Similar measures were taken in China at an equally early date. When, however, populations became divided into agricultural and non-agricultural, by the institution of, *e.g.,* sacerdotal or military castes, it became necessary to make permanent provision for the feeding of this non-agricultural element. Thus in imperial Rome, the tribute payable by conquered races frequently took the form of grain to ensure supplies for Rome itself and for the army. The system of tithes similarly arose from the need for supplying the clergy from the produce of the land cultivated by those to whom they ministered.

Up to the 14th century the question was mainly one of providing for those members of a self-supporting community, who, for any reason, were not themselves in a position to produce their own sustenance. With however the rise of industrial and commercial classes, the production of the agricultural section was not sufficient to supply the needs of all, at any rate in years when the yield was in any way below normal, and supplies had to be sought elsewhere. From this arose the need for state intervention in the import and export of corn. At this period communications were in a very primitive stage of development, and intercourse was only possible between comparatively neighbouring communities or states. Thus it frequently happened that years of bad crops were more or less general over the area in which trade normally took place, and the high prices that could be obtained led to corn being sent to accessible parts of a foreign country rather than to less accessible parts of the producing country. This caused steps to be taken to maintain home supplies, by the regulation of imports and exports. These regulations usually took the form of prohibiting export, or only permitting it when prices were sufficiently low to indicate sufficiency, if not satiation, on the home market, and by only allowing imports when the home price reached a high level, thus operating against what is now termed "dumping," and ensuring a fair return to home producers, while in times of shortage, the specified price would be reached, and imports were authorized to alleviate risk of famine.

In modern times, instead of actual prohibition of import or export, it became the practice to impose high, and therefore effectively prohibitive duties, sometimes in conjunction with specified price limits or with a sliding scale dependent on prices in the home market. With the rise of intensive cereal culture in America, Canada, Rumania and elsewhere, protective import duties have been levied in certain countries to prevent the flooding of the home market with cheap grain to the detriment of the domestic producer.

ENGLAND

During four centuries after the Conquest the corn law of England simply was that export of corn was prohibited, save in years of extreme plenty under forms of state licence, and that producers carried their surplus grain into the nearest market town, and sold it there for what it would bring amongst those who wanted it to consume; and the same rule prevailed in the principal countries of the continent of Europe. The prohibition of export discouraged agricultural improvement, and in so much diminished the security and liberality even of domestic supply; while the intolerance of any home dealing or merchandise in corn prevented the growth of a commercial and financial interest strong enough to improve the means of transport by which the plenty of one part of the same country could have come to the aid of the scarcity in another.

English Corn Laws, 1436–1603.—Apart from this general feudal germ of legislation on corn, the history of the British corn laws may be said to have begun with the statute in the reign of Henry VI. (1436), by which exportation was permitted without state licence, when the price of wheat or other corn fell below certain prices. The reason given in the preamble of the statute was that the previous state of the law had compelled farmers to sell their corn at low prices, which was no doubt true, but which also showed the important turn of the tide that had set in. One may readily perceive that the cultivators of the wheat lands in the south-eastern counties of England, for example, who could frequently have sold their produce in that age to Dutch merchants to better advantage than in their own market town, or even in London, but were prohibited to export abroad, and yet had no means of distributing their supplies at home so as to realize the highest medium price in England, must have felt aggrieved, and that their barons and knights of the shire would have a common interest in making a strong effort to rectify the injustice in parliament. This object appears to have been in some measure accomplished by this statute, and 27 years afterwards (1463) a decided step was taken towards securing to agriculturists a monopoly of the home market by a statute prohibitory of importation from abroad. Foreign import was to be permitted only at and above the point of prices where the export of domestic produce was prohibited. The landed interest had now adopted the idea of sustaining and equalizing the value of corn, and promoting their own industry and gains, which for four centuries, under various modifications of plan, and great changes of social and political condition, were to maintain a firm place in the legislation and policy of England. But there were many reasons why this idea when carried into practice should not have the results anticipated from it.

The import of grain from abroad, even in times of dearth and high prices at home, could not be considerable as long as the policy of neighbouring countries was to prohibit export; nor could the export of native corn, even with the Dutch and other European ports open to such supplies, be effective save in limited maritime districts, as long as the internal corn trade was suppressed, not only by want of roads, but by legal interdict. The regulation of liberty of export and import by rates of price, moreover, had the same practical objection as the various sliding scales, bounties, and other legislative expedients down to 1846, viz. that they failed, probably more in that age than in later times, to create a permanent market, and aimed only at a casual trade. When foreign supplies were needed, they were often not to be found, and when there was an excess of corn in the country a profitable outlet was both difficult and uncertain. It would appear, indeed, that during the Wars of the Roses the statutes of Henry VI. and Edward IV. had become obsolete; for a law regulating export prices in identical terms of the law of 1436 was re-enacted in the reign of Mary I. (1554).

In the preceding reign of Edward VI., as well as in the succeeding long reign of Elizabeth, there were unceasing complaints of the decay of tillage, the dearth of corn, and the privations of the labouring classes; and these complaints were met by the same kind of measures—by statutes encouraging tillage, forbidding the enlargement of farms, imposing severer restrictions on storing and buying and selling of grain, and by renewed attempts to regulate export and import according to prices. In 1562 the price at which export might take place was raised to 10*s.* per quarter for wheat, and 6*s.* 8*d.* for barley and malt. This only lasted a few years, and in 1570 the export of wheat and barley was permitted from particular districts on payment of a duty of 1*s.* 8*d.* per quarter, although still liable to prohibition by the Government or local authority, while it was entirely prohibited under the old regulations from other districts. Only at the close of Elizabeth's reign (1603) did a spark of new light appear in a further statute, which removed the futile provisions in favour of tillage and against enlargement of pastoral farms, and rested the whole policy for promoting an equable supply of corn, while encouraging agriculture, on an allowed export of wheat and other grain at a duty of 2*s.* and 1*s.* 4*d.* when the price of wheat was not more than 20*s.*, and of barley and malt 12*s.* per quarter. The import of corn appears to have been much lost sight of from the period of the statute of 1463. The internal state of England, as well as the policy of other countries of Europe, was unfavourable to any regular import of grain, though many parts of the kingdom were often suffering from dearth of corn. It is obvious that this legislation, carried over more than a century and a half, failed of its purpose, and that it neither promoted agriculture nor increased the supply of bread. So great a variance and conflict between the intention of statutes and the actual course of affairs might be deemed inexplicable, but for an explanation which a close economic study of the circumstances of the times affords.

Besides the general reasons of the failure already indicated, there were three special causes in active operation, which, though not seen at the period, have become distinct enough since. (1) A comparatively free export of wool had been permitted in England from time immemorial. It was subject neither to conditions of price nor to duties in the times under consideration, was easier of transport and less liable to damage; while corn, a prime rural product, was subject, as an article of merchandise, to every difficulty, internally and externally, which meddling legislation and popular prejudice could impose. The numerous statutes enjoining tillage and discouraging pastoral farms—or in other words requiring that agriculturists should turn from what was profitable to what was unprofitable—had consequently no substantial effect, save in the many individual instances in which the effect may have been injurious. (2) The value of the standard money of the kingdom had been undergoing great depreciation from two opposite quarters at once. The pound sterling of England was reduced in the weight of pure metal; while, at the same time, the greater abundance of silver, which now began to be experienced in Europe from the discovery of the South American mines, was steadily reducing the intrinsic value of the metal. Hence a general rise of prices remarked by Hume and other historians; and hence also it followed that a price of corn fixed for export or import at one period became always at another period more or less restrictive of export than had been designed. (3) The wages of labour would have followed the advance in the prices of commodities had wages been left free, but they were kept down by statute to the three or four pence per day at which they stood when the pound sterling contained one-fourth more silver and silver itself was much more valuable.

M'Culloch found from a comparison of prices of corn and wages of labour in the reign of Henry VII. and the latter part of the reign of Elizabeth, that in the former period a labourer could earn a quarter of wheat in 20, a quarter of rye in 12, and a quarter of barley in 9 days; whereas, in the latter period, to earn a quarter of wheat required 48, a quarter of rye 32, and a quarter of barley 29 days' labour.

The result was chronic privation and discontent among the common people, by which all the conditions of agriculture and trade in corn were further straitened and barbarized; and the age was marked by an enormous increase of pauperism, and by the introduction of the merciful but wasteful remedy of the Poor Laws.

English Corn Laws 1660–1773.—The corn legislation of Elizabeth remained without change during the reign of James, the civil wars and the Commonwealth. But on the restoration of Charles II. in 1660, the question was resumed, and an act was passed of a more prohibitory character. Export and import of corn, while nominally permitted, were alike subjected to heavy duties—the need of the exchequer being the paramount consideration, while the agriculturists were no doubt pleased with the complete command secured to them in the home market. This act was followed by such high prices of corn, and so little advantage to the revenue, that parliament in 1663 reduced the duties on import to 9% *ad valorem*, while at the same time raising the price at which export ceased to 48*s.*, and reducing the duty on export from 20*s.* to 5*s.* 4*d.* per quarter. In a few years this was found to be too much free-trade for the agricultural liking, and in 1670 prohibitory duties were re-imposed on import when the home price was under 53*s.* 4*d.*, and a duty of 8*s.* between that price and 80*s.*, with the usual make-weight in favour of home supply, that export should be prohibited when the price was 53*s.* 4*d.* and upwards. But complaints of the decline of agriculture continued to be as rife under this act as under the others, till on the accession of William and Mary, the landed interest, taking advantage of the Revolution, as they had taken advantage of the Restoration, to promote their own interests, took the new and surprising step of enacting a bounty on the export of grain. This evil continued to affect the corn laws of the kingdom, varied, on one occasion at least, with the further complication of bounties on import, until the 19th century. The duties on export being abolished, while the heavy duties on import were maintained, this is probably the most one-sided form which the British corn laws ever assumed, but it was attended with none of the advantages expected. The prices of corn fell, instead of rising. There had occurred at that period of the Revolution a depreciation of the money of the realm, analogous in one respect to that which marked the first era of the corn statutes (1436–1551) and forming one of the greatest difficulties which the Government of William had to encounter. The coin of the realm was greatly debased, and as rapidly as the mint sent out money of standard weight and purity, it was melted down and disappeared from the circulation. The influx of silver from South America to Europe had spent its action on prices before the middle of the century; the precious metals had again hardened in value; and for 40 years before the Revolution the price of corn had been steadily falling in money price. The liberty of exporting wool had also now been cut down before the English manufacturers were able to take up the home supply, and agriculturists were consequently forced to extend their tillage. When the current coin of the kingdom became wholly debased by clipping and other knaveries there ensued both irregularity and inflation of nominal prices, and producers and consumers of corn found themselves equally ill at ease. The farmers complained that the home market for their produce was unremunerative and unsatisfactory; the masses of the people complained that their money wages could not purchase the necessaries of life. The state of agriculture could not be prosperous under these conditions. But when the Government of William surmounted this difficulty of the coinage, as they did surmount it, under the guidance of Sir Isaac Newton, with remarkable statesmanship, it necessarily followed that prices, so far from rising, declined, because, for one reason, they were now denominated in a solid metallic value. The rise of prices of corn attending the first years of the export bounty was consequently of very brief duration. The average price of wheat in the Winchester market, which in the ten years 1690–99 was £2 10*s*., fell in the ten years 1716–25 to £1 5*s*. 4*d*. and in the ten years 1746–55 to £1 1*s*. 2¾*d*.

The system of corn law established in the reign of William and Mary was probably the most perfect to be conceived for advancing the agricultural interest in any country. Every stroke of the legislature seemed complete to this end. Yet it wholly failed of its purpose. The price of wheat again rose in 1750–60 and 1760–70 to £1 19*s*. 3¼*d*. and £2 11*s*. 3¾*d*., but many causes had meanwhile been at work. Between the reign of William and Mary and that of George III. the question of bounty on export of grain, had, in the general progress of the country, fallen into the background, while that of the heavy embargoes on import had come to the front. Therefore it is that Burke's Act of 1773, as a deliberate attempt to bring the corn laws into some degree of reason and order, is worthy of special mention. This statute permitted the import of foreign wheat at a nominal duty of 6*d*. when the home price was 48*s*. per quarter, and it stopped both the liberty to export and the bounty on export together when the home price was 44*s*. per quarter. The one blemish of this statute was the stopping export and cutting off bounty on export at the same point of price.

Few questions have been more discussed or more differently interpreted than the elaborate system of corn laws dating from the reign of William and Mary. So careful an observer as Malthus was of opinion that the bounty on export had enlarged the area of subsistence. That it had large operation is sufficiently attested by the fact that, in the years from 1740 to 1751, bounties were paid out of the exchequer to the amount of £1,515,000, and in 1749 alone they amounted to £324,000. But the trade thus forced was of no permanence, and the British exports of corn, which reached a maximum of 1,667,778 quarters in 1749–50, had fallen to 600,000 quarters in 1760 and continued to decrease.

English Corn Laws, 1791–1846.—Burke's Act lasted long enough to introduce a regular import of foreign grain, varying with the abundance or scarcity of the home harvest, yet establishing in the end a systematic preponderance of imports over exports. The period, moreover, was marked by great agricultural improvements, by extensive reclamation of waste lands, and by an increased home produce of wheat, in the 20 years from 1773–93, of nearly 2,000,000 quarters. Nor had the course of prices been unsatisfactory. The average price of British wheat in the 20 years was £2 6*s*. 3*d*. and in only three years of the 20 was the price a fraction under £2. But the ideas in favour of greater freedom of trade were overwhelmed in the extraordinary excitement caused by the French Revolution, and all the old corn law policy was destined to have a sudden revival. The landowners and farmers complained that an import of foreign grain at a nominal duty of 6*d*., when the price of wheat was only 48*s*., deprived them of the ascending scale of prices when it seemed due; and on this instigation an act was passed in 1791, whereby the price at which importation could proceed at the nominal duty of 6*d*. was raised to 54*s*., with a duty of 2*s*. 6*d*. from 54*s*. to 50*s*., and at 50*s*. and under 50*s*. a prohibitory duty of 24*s*. 3*d*. The bounty on export was maintained by this act, but exportation was allowed without bounty till the price reached 46*s*., and the permission accorded by the statute of 1773 to import foreign corn at any price, to be re-exported duty free, was modified by a warehouse duty of 2*s*. 6*d*. in addition to the duties on import payable at the time of sale, when the corn, instead of being re-exported, happened to be sold for home consumption. The legislative vigilance in this statute to prevent foreign bread from reaching the home consumer is remarkable. There were deficient home harvests for some years after 1791, particularly in 1795 and 1797, and parliament was forced to the new expedient of granting high bounties on importation. At this period the country was involved in a great war; all the customary commercial relations were violently disturbed; freight, insurance and other charges on import and export were multiplied fivefold; heavier and heavier taxes were imposed; and the capital resources of the kingdom were poured with a prodigality without precedent into the war channels. The consequence was that the price of corn, as of all other commodities, rose greatly; and the Bank of England having stopped paying in specie in 1797, this raised nominal prices still more under the liberal use of bank paper in loans and discounts, and the difference that began to be established in the actual value of Bank of England notes and their legal par in bullion.

The average price of British wheat rose to £5 19*s*. 6*d*. in 1801. So unusual a value must have led to a large extension of the area under wheat, and to much corn-growing on land that after great outlay was ill prepared for it. In the following years there were agricultural complaints; and in 1804, though in 1803 the average price of wheat had been as high as £2 18*s*. 10*d*., an act was passed, so much more severe than any previous statute, that its object would appear to have been to keep the price of corn somewhere approaching the high range of 1801. A prohibitory duty of 24*s*. 3*d*. was imposed on the import of foreign wheat when the home price was 63*s*. or less; and the price at which the bounty was paid on export was lowered to 40*s*., while the price at which export might proceed without bounty was raised to 54*s*. Judging from the prices that ruled during the remaining period of the French wars, this statute would appear to have been effective for its end, though, under all the varied action of the times on a rise of prices, it would be difficult to assign its proper place in the general effect. The average price of wheat rose to £4 9*s*. 9*d*. in 1805, and the bank paper price in 1812 was as high even as £6 6*s*. 6*d*. The bullion prices from 1809–13 ranged from 86*s*. to 100*s*. 3*d*. But it was foreseen that when the wars ended a serious reaction would ensue, and that the rents of land, and the general condition of agriculture, under the warlike, protective and monetary stimulation they had received, would be imperilled. In the brief peace of 1814 the average bullion price of British wheat fell to 55*s*. 8*d*. All the means of select committees of inquiry on agricultural distress, and new modifications of the corn laws, were again brought into requisition. The first idea broached in parliament was to raise the duties on foreign imports, as well as the prices at which they were to be leviable, and to abolish the bounty on export, while permitting freedom of export whatever the home price might be. The latter part of the scheme was passed into law in the session of 1814; but the irritation of the manufacturing districts against the new scale of import duties was too great to be resisted. In the subsequent session an act was passed, after much opposition, fixing 80*s*. (14*s*. more than during the wars) as the price at which import of wheat was to become free of duty.

This act of 1815 was intended to keep the price of wheat in the British markets at 80*s*. per quarter; but the era of war and great expenditure of money raised by public loans had ended, the ports of the continent were again open to some measure of trade and to the equalizing effect of trade upon prices, the Bank of England and other banks of issue had to begin the uphill course of a resumption of specie payments, the nation had to begin to feel the whole naked weight of the war debt, and the idea of the protectors of a high price for corn was proved by the event to be an utter hallucination. The corn statutes of the next 20 years, though occupying an enormous amount of time and attention in the Houses of Parliament, may be briefly treated, for they are simply a record of the impotence of legislation to maintain the price of a commodity at a high point when all the natural economic causes in operation are opposed to it. In 1822 a statute was passed reducing the limit of prices at which importation could proceed to 70*s*. for wheat, 35*s*. for barley, 25*s*. for oats; but behind the apparent relaxation was a new scale of import duties, by which foreign grain was subjected to heavy three-month duties up to a price of 85*s*.—17*s*. when wheat was 70*s*., 12*s*. when between 70*s*. and 80*s*., and 10*s*. when 85*s*., showing the grasping spirit of the would-be monopolizers of the home supply of corn, and their reluctance to believe in a lower range of value for corn as for all other commodities. This act never operated, for the reason that, with the exception in some few instances of barley, prices never were so high as its projectors had contemplated. The corn trade had passed rapidly beyond reach of the statutes by which it was to be so painfully controlled; and as there were occasional seasons of scarcity, particularly in oats, the King in Council was authorized for several years to override the statutes, and do whatever the public interests might require.

In 1827 Canning introduced a new system of duties, under which there would have been a fixed duty of 1*s.* per quarter when the price of wheat was at or above 70*s.*, and an increased duty of 2*s.* for every shilling the price fell below 69*s.*, but though Canning's resolutions were adopted by a large majority in the House of Commons, his death and the consequent change of ministers involved the failure of his scheme of corn duties. In the following year Charles Grant introduced another scale of import duties on corn, by which the duty was to be 23*s.* when the price was 64*s.*, 16*s.* 8*d.* when the price was 69*s.*, and only 1*s.* when the price was 73*s.* or above 73*s.* per quarter; and this became law the same year. This sliding scale was more objectionable, as a basis of foreign corn trade, than that of Canning, though not following so closely shilling by shilling the variation of prices, because of the abrupt leaps it made in the amount of duties leviable. For example, a merchant who ordered a shipment of foreign wheat when the home price was 70*s.*, and rising to 73*s.*, instead of having a duty of 1*s.* to pay, should on a backward drop of the home price to 69*s.*, have 16*s.* 8*d.* of duty to pay. The result was to introduce wide and incalculable elements of speculation into all transactions in foreign corn. Prices during the greater part of this period were under the range at which import was practically prohibited. The average price of British wheat was 96*s.* 11*d.* in 1817, but from that point there was in succeeding years a rapid and progressive decline, varied only by the results of the domestic harvests, till in 1835 the average price of wheat was 39*s.* 4*d.*, of barley 29*s.* 11*d.* and oats 22*s.* The import of foreign grain in these years consisted principally of a speculative trade, under a privilege of warehousing accorded in the statute of 1773, and extended in subsequent acts, by which the grain might be sold for home consumption on payment of the duties, or re-exported free, as suited the interest of the holders.

The act of 1822 admitted corn of the British possessions in North America under a favoured scale of duties, and in 1825 a temporary act was passed, allowing the import of wheat from these provinces at a fixed duty of 5*s.* per quarter, irrespective of the home price, which, if maintained, would have given some stability to the trade with Canada. The idea of a fixed duty on all foreign grain, however, appears to have grown in favour from about this period. It was included in the programme of import duty reforms of the Whig Government in 1841, and fell with its propounders in the general election of that year. Sir Robert Peel, on succeeding to office, introduced and carried in 1842 a new sliding scale of duties somewhat better adjusted to the current values. But public opinion by this time was changing, and the prime minister, convinced, as he confessed, by the arguments of Cobden and the Anti-Corn-Law League, and stimulated into action by the failure of the potato crop in Ireland, put an effectual end to the history of the corn laws by the famous act of 1846. It was provided under this measure that the maximum duty on foreign wheat was to be immediately reduced to 10*s.* per quarter when the price was under 48*s.*, to 5*s.* on barley when the price was under 26*s.*, to 4*s.* on oats when the price was under 18*s.*, with lower duties as prices rose above these figures; but the conclusive part of the enactment was that in three years—on Feb. 1, 1849—these duties were to cease, and all foreign corn to be admitted at a duty of 1*s.* per quarter, and all foreign meal and flour at a duty of 4½*d.* per cwt.—the same nominal imposts which were conceded to grain and flour of British possessions abroad from the date of the act. In 1869 even these nominal duties were abolished by Robert Lowe in a Customs Duties Act. In 1902 a registration duty of 3*d.* per cwt. was imposed on imported corn, and 5*d.* per cwt. on imported flour, in the expectation that such a duty would broaden the basis of taxation. The duty was, however, repealed the following year. A low duty on imported foreign corn was made an essential part of the tariff reform scheme advocated by Mr. Joseph Chamberlain (*q.v.*) from 1903 onwards, but this scheme never became a practical proposition.

During the World War imports and exports were under strict Government control, and prices for the home market were fixed. In connection with any scheme of tariff reform which might be introduced at a later date by the Conservative Government, that took office in 1924 a pledge was given not to tax foodstuffs.

CORN LAWS IN OTHER COUNTRIES

In Europe generally, the import and export of corn was prohibited until the rise of industrialism in the beginning of the 19th century caused many countries to take steps to maintain their food supplies, either by permitting free import, and thus becoming dependent on imported cereals, or by protective tariffs or prohibition of exports, to encourage home supplies.

France.—Prior to the French Revolution, the movement of corn, even between the various provinces, was subject to restrictions, but in 1789, importation into all parts of France was permitted, free of duty. In 1814 it was proposed to prohibit exports, but owing to the decline in prices, export was permitted when prices fell to a certain low level, in order so far as possible to secure a fair return to the grower by not limiting his market artificially. In 1816, a small import duty was imposed for revenue purposes, but in 1819 a protective duty was levied, consisting of a fixed rate, together with a surtax varying with the prices in the home market; if the price reached a fixed minimum, imports were entirely prohibited. In 1821 the limits at which surtax became payable or prohibition enforced were raised. These conditions remained in force until 1860, although the sliding scale was suspended (1853–59) on account of the high prices reached on the home market. In 1861, the sliding scale was abolished and exports were freed from restriction, while a small duty was imposed on imports. The whole tariff was revised in 1881, while in 1885 duties were imposed on rye, barley and oats, which had been free since 1861, and the duty on wheat flour was increased to fivefold. In 1887 these rates were again increased. The effect of this increased protection was to maintain prices, which in England were falling rapidly, owing to the development of cereal culture in America and elsewhere. When the tariff was revised in 1892 grain duties were unaltered, but in 1894, the duties on wheat and flour were increased. In the 1910 tariff these were unchanged, but on the outbreak of war (1914), these duties were suspended and exports prohibited. The duties on wheat were however re-imposed after the 1915 harvest, and on oats, barley and maize in 1919.

After the war, co-efficients of increase were applied to the basic tariff rates to keep the duties in line with the values, as expressed in paper currency. In Sept. 1927 higher basic rates in currency were imposed, to be again increased in Nov. 1927.

Germany.—Modern German Customs practice may be dated from the formation of the Zollverein (Customs Union), between certain of the German states in 1834. It was not till 1879 however that, in response to the demand from agricultural interests, who were feeling the competition, in both home and foreign markets, of America, Russia, etc., import duties were imposed on corn. These duties were increased from time to time till 1888, while in 1892 a series of commercial treaties were negotiated, by which, in return for concessions on German manufactures, import duties on corn were reduced. The rates thus fixed were not to be altered, by the terms of the several treaties, until the end of 1903, and in that year a new tariff law was enacted. This provided a "general" tariff, applicable to all countries, but the Government was authorized to negotiate commercial treaties, and to make concessions on these "autonomous" rates, by fixing certain rates for specified commodities, imported from the other contracting power. While generally, the Government was left free to make whatever concessions were found necessary to obtain the desired reductions from the other party, the legislation authorizing the tariff laid down for certain cereals, definite limits below which concessions could not be made. The rates finally negotiated were, by the operation of the "most favoured nation" clause, applied to almost all the producing countries: the "general" tariff rates were about 50% higher. By the terms of the act, any excess (per head of population) in the receipts from these and certain other duties on foodstuffs, over the average yield during the period 1898–1903 was to be used for the establishment of widows' and orphans' funds. The negotiation of these treaties took some time, and the tariff did not come into force till March 1, 1906, and remained in force till the outbreak of war. Under this tariff, the exporters of milled cereals received certificates (Einfuhrscheine) permitting them to import, free of duty, grain corresponding to the amount of foreign grain contained in the exported products. During the war, these duties were suspended, but from Sept. 1, 1925, duties were again imposed and were increased from Aug. 1, 1926, but still below the level of the 1903 tariff, although the basic rates of that tariff are the standard, the present rates being temporary reductions. The export of grain was freed from control Oct. 1, 1925.

Denmark.—Exports of grain have been free of duty since 1820, and imports since 1848. This is one of the earliest examples of complete freedom of trade in cereals, and has not been followed by any general decline in home production, as has been claimed by the agricultural interests to be a result of unlimited competition of foreign grain.

Netherlands.—When the kingdom of Netherlands was set up in 1813, the French protectionist system was in vogue. In 1822 and 1825 the grain duties were increased. In 1835 a sliding scale was established, dependent on the price of grain in various home markets. This was repealed in 1847, and moderate import duties imposed. These duties were finally fixed in 1862, while from July 1, 1877, imports of grain have been entirely free of duty. Export duties were abolished in 1847.

Belgium.—The duties in force in the Netherlands were continued when the separation from that country occurred in 1830, and in 1835 a similar sliding scale of duties was imposed, together with a merely nominal export duty. The latter was removed in 1850, since when the export of grain has been free. The import duties were reduced to a nominal level at the same time, and were withdrawn in 1854; they were re-imposed in 1857, and finally withdrawn 1872. (A duty on imported oats was re-imposed in 1895 and is still in force.)

Spain.—Export duties were abandoned in 1820, but the import of cereals was prohibited till 1867, when on account of bad harvests, the ban was suspended. After the revolution of 1868, the prohibition was definitely withdrawn, but moderately high duties were imposed. These duties have varied from time to time; immediately before the war they stood at about the same level as in 1882. During the war import duties were suspended and exports were prohibited. The duties in the 1922 tariff are higher than those prevailing before the war, while different rates for the First and Second Tariffs (the former applicable to countries not having commercial treaties) are imposed, the former being three times the latter. In 1926 the prohibition of exports was raised, but control of imports was continued and imports subjected to sufficient duties to maintain home prices.

Norway.—From July 1, 1927, a state monopoly of grain and grain products has been established. The state buys up the Norwegian crop, and has the sole right to import grain, but licences are issued to persons who prove that they have purchased from the state a corresponding quantity of Norwegian grain. Import duties were modified at the same time.

Italy.—At the formation of the kingdom of Italy in 1861, free trade in cereals was permitted, but in 1866 both import and export duties were imposed; and the latter were abolished in 1867. The import duties were increased in 1887, again in 1888, and finally in 1895; the rates then fixed were unaltered till the outbreak of war (1914), when import duties were suspended and export prohibited. Import duties were re-imposed from Jan. 1, 1926, but export of wheat is still prohibited.

Austria-Hungary.—Export duties on cereals were abolished in 1852, and imports from the German Zollverein were admitted free of duty from 1853 onwards. These constituted the greater proportion of imports. At the end of 1866, cereals from the former Austrian Italy were admitted into Tirol free of duty, while in July 1876 Rumania was accorded the same exemption from duty as the Zollverein. In 1879 all import duties were removed, but in 1883 duties were re-imposed, although the bulk of the supplies came from Rumania and were admitted duty free. In July 1886 this preferential treatment was abrogated. Increased customs duties were imposed in 1892; and further increases were made in the 1906 tariff, even in the conventional rates agreed upon in the series of commercial treaties consequent upon the introduction of these revisions. These rates were adopted by the Succession States after the war, but their application was suspended for some time owing to shortage of foodstuffs.

In the case of *Austria,* duties were again levied from Jan. 1925, based on a sliding scale. New definite duties have been enacted, but had not been put into operation at the end of 1927. In *Hungary,* all restrictions on imports and exports were withdrawn from the beginning of 1925, and import duties were imposed shortly afterwards. In *Czechoslovakia,* cereals were admitted free of duty under the tariff of 1921. In 1925 the sliding scale principle was introduced, while a fixed scale of duties has been levied since July 1926; higher rates are charged on imports from countries which have no treaties with Czechoslovakia. This provision led to the commercial treaty with Hungary negotiated in 1927.

United States.—In view of the large exportable surplus of cereals produced in the United States, import duties are of little importance in price regulation, but are of considerable interest as matter of practical politics. The general tendency of American tariff legislation has been protective, and the agricultural interests have always obtained their share of the protective duties. It may be said that the only source of supply is Canada, and this fact has coloured all the tariff legislation relating to cereals. Under the earliest tariffs (1789 onwards) cereals were not enumerated separately and paid duty at *ad valorem* rates under "unenumerated articles." Specific duties were imposed in 1824, but *ad valorem* rates were again used from 1832 onwards until 1857. Under the reciprocity agreement (1854) imports from Canada were free of duty, but this was abrogated in 1866, and the normal tariff rates again became payable. Increased duties were imposed in 1894; temporary reductions were made in 1890; but in 1897 the 1890 rates were restored. In the 1913 tariff, wheat, maize, rye and flour were made free of duty, but a duty was imposed on Canadian cereals on the ground that Canada imposed a duty on American wheat. On the entry of America into the war in 1917 this was remitted and imports were free of duty until the coming into force of the 1921 emergency tariff which re-imposed duties. The Fordney-McCumber tariff continued these duties, which were at about the same level (specific rates) as in 1890. On the ground that the difference in cost of production in Canada was not equalized by this duty, the rates on wheat and wheat products were increased in March 1924.

British Countries Overseas.—Imports of grain into *Canada* from the United States were free of duty during the continuance of the Reciprocity Treaty of 1855–66, but duties have been payable since.

Import duties are also levied in *Australia* and *New Zealand,* but in the case of Australia, wheat is admitted free under the British Preferential Tariff. In *South Africa* a moderate import duty is levied, which is stated to have materially encouraged home production.

No duty is levied on imports into the Irish Free State, nor into British India. An export duty on rice is imposed by the last named, but none of the British Overseas Dominions imposes such duties.

Export Duties.—Some of the more important producing countries retained export duties on cereals until the war, *i.e.,* Rumania and Bulgaria, and these are still in force, while since 1918, Argentina has levied a variable duty dependent on the price. This was introduced as a temporary measure, but has not yet been withdrawn.

Information as to the actual rates in force in any particular country can be obtained from the Department of Overseas Trade, London, or from similar official trade development organizations in the principal countries, such as the Department of Commerce, Washington. (H. Cr.)

CORNPLANTER (1732–1836), an American Indian chief of the Seneca tribe, was born in Conewaugus, on the Genesee river, in New York, in 1732, the half-breed son of John O'Bail, an Indian trader. In alliance with the French against the English, Cornplanter became the leader of a war-party of the Senecas, and was present at Braddock's defeat near Ft. Duquesne in 1755. During the Revolutionary War he participated in the destruction of frontier settlements in New York and in the valley of Wyoming in Pennsylvania, but later displayed a genuine friendship for the white people. For many years Cornplanter and his able associate, Red Jacket (*q.v.*), were the most influential counsellors of their people. Cornplanter is said to have been one of the first temperance lecturers in America. He died on the Seneca reservation, on Feb. 13, 1836.

CORNPLANTER: *see* AGRICULTURAL MACHINERY AND IMPLEMENTS.

CORN-SALAD or **LAMB'S LETTUCE,** *Valerianella olitoria* (family Valerianaceae), a weedy annual, native of southern Europe, but naturalized in cornfields in central Europe and in various parts of the United States and Canada, and not infrequent in Britain. In France it is used in salads during winter and spring as a substitute for lettuce, but it is less esteemed in England. The sorts principally grown are the round-leaved and the Italian; the last is a distinct species, *V. eriocarpa.*

CORN SYRUP, a product of the partial hydrolysis of corn starch. It is a yellowish liquid which does not easily crystallize and so is valuable in the manufacture of jams, preserves and candy.

CORN TRADE: *see* GRAIN, PRODUCTION and TRADE.

CORNU, MARIE ALFRED (1841–1902), French physicist, was born at Orleans and was professor of experimental physics in the École Polytechnique, Paris, from 1867 until his death. Although he made various excursions into other branches of physical science, undertaking, for example, with J. B. A. Baille about 1870 a repetition of Cavendish's experiment for determining the mean density of the earth, his original work was mainly concerned with optics and spectroscopy. He carried out a classical redetermination of the velocity of light by A. H. L. Fizeau's method, introducing various improvements in the apparatus, which added greatly to the accuracy of the results.

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

CORNU COPIAE, CARVED AND PAINTED, ON FRENCH WOODWORK OF THE XVIIITH CENTURY

CORNU COPIAE or **CORNUCOPIA** ("horn of plenty"), a horn, generally twisted, filled with fruit and flowers, or an ornament representing it. It was used as a symbol of prosperity and abundance, and hence in works of art it is placed in the hands of Plutus, Fortuna and similar divinities.

CORNUS, an ancient town of Sardinia, of Phoenician origin, on the west coast, 18m. from Tharros, and the same from Bosa. At the time of the second Punic War it is spoken of as the principal city of the district, and its capture by the Romans was the last act in the suppression of the rebellion of 215 B.C.; it had served as a place of refuge for fugitives after the defeat of the combined forces of rebels and Carthaginians. The site of the ancient acropolis, covered with debris, may still be made out. A necropolis of the Roman period and Phoenician rock-cut tombs may be seen.

CORNUTUS, LUCIUS ANNAEUS, Stoic philosopher, flourished in the reign of Nero. He was a native of Leptis in Libya, but resided for the most part in Rome. He is best known as the teacher and friend of Persius, whose satires he revised for publication after the poet's death, but handed them over to Caesius Bassus to edit, at the special request of the latter. He was banished by Nero (in 66 or 68) for having indirectly disparaged the emperor's projected history of the Romans in heroic verse (Dio Cassius, lxii. 29), and disappears from history. He was the author of various rhetorical works in both Greek and Latin (Ῥητορικαὶ τέχναι, *De figuris sententiarum*). Another rhetorician, also named Cornutus, who flourished A.D. 200–250 (or in the second half of the 2nd century) was the author of a treatise Τέχνη τοῦ πολιτικοῦ λόγου (ed. J. Graeven, 1890). A philosophical treatise, *Theologiae Graecae compendium,* is still extant. It is a manual of Stoic etymological interpretation of popular mythology (ed. C. Lang, 1881). Simplicius and Porphyry refer to his commentary on the *Categories* of Aristotle, whose philosophy he is said to have defended against an opponent Athenodorus in a treatise Ἀντιγραφὴ πρὸς Ἀθηνόδωρον. Excerpts from his treatise *De enuntiatione vel orthographia* are preserved in Cassiodorus. The so-called *Disticha Cornuti* (ed. Liebl, Straubing, 1888) belong to the late middle ages.

Schanz, *Geschichte der römischen Litteratur,* i. 2 (1901), p. 285; Teuffel-Schwabe, *Hist. of Roman Literature* (Eng. trans.) § 299, 2; P. Schundt, *De Cornuti . . . Compendia* (Dissertationis plutologicae Halenses, vol. xxi.) (1912).

CORNWALL, the south-westernmost county of England, bounded north and north-west by the Atlantic ocean, east by Devonshire, and south and south-west by the English Channel. Area 1,356.5 sq.mi. The most southerly extension is Lizard Point, and the most westerly point of the mainland Land's End, but the county also includes the Scilly Isles (*q.v.*), lying 25 m. W. by S. of Land's End. The form is that of a peninsula 75 m. long and 45 m. broad across the base. It owes its main features to the folding movement of the Armorican system complicated by a series of granite intrusions. The latter form moorland bosses decreasing in height from east to west. Dartmoor in Devon is the largest and highest, Bodmin Moor reaches 1,375 ft. in Brown Willy, Hensbarrow Beacon is under 1,000 ft., Carn Menellis and the St. Just boss are lower; a further granite mass now largely submerged forms the Scilly Isles. The lower-lying regions are mainly of folded slaty rock of Devonian Age, striking largely east to west, with some limestone; in the extreme north-east there are Carboniferous grits and shales. From Tintagel Head northwards to Hartland Point in Devon the distorted strata form steep cliffs because of the rapid maritime erosion that goes on. The veins of ore are chiefly in the slaty rock near the granite masses which themselves give kaolin by decomposition of felspar. A Tertiary, supposedly Pliocene, uplift and tilt apparently gave especially the south flowing streams an additional impetus and led to the cutting of deep valleys in what the uplift had converted from a peneplane into a plateau or a succession of plateaus formed by an uplift with warping. Post-pleistocene sinking has given rise to the sunken estuaries of south Cornwall and the drainage lines are chiefly those between the granite bosses, the Tamar which forms most of the boundary between Devon and Cornwall draining between Dartmoor and Bodmin moor into its great southern estuary. The Camel drains northward to Padstow bay and the Fowey southward into a long estuary between Bodmin moor and Hensbarrow Beacon. The Fal estuary is placed between the Hensbarrow and the Carn Menellis bosses and there is a low line across from Mount's bay to St. Ives bay between Carn Menellis and the St. Just boss. The sinking movement, probably partly at least since the appearance of man in the west, is held to have given rise to many legends of west Britain.

The climate is soft but sunny, though sea-mists are common, especially in spring and autumn. The average temperature for January is 43° at Bude and 43·7° at Falmouth. The vegetation in shelter is correspondingly luxuriant and southern in type. Rainfall is heavy and, though only 32·8 inches per annum at Bude, it reaches 44·4 inches at Falmouth and 50·6 inches at Bodmin.

The wind-swept moorlands and cliffs gave opportunities for early settlement and when the use of metal was beginning to spread, or just prior to this, west Cornwall became important, as its wealth of megalithic monuments shows. They include dolmens such as those of Lanyon, Mulfra, Chûn and Zennor. Monoliths have a wider distribution, those in the parish of St. Buryan being well known. The principal stone circles are the Hurlers, near Liskeard; the Boskednan, Boscawen-ûn, and Tregeseal circles and that called Dawns-un at Boleigh. All these except the Hurlers are in the Land's End district. There are also alinements on the moors near Rough Tor and Brown Willy. It has been thought that this culture is part of an elaborate movement from the Mediterranean, which brought Cornwall and the southwest definitely into touch with Brittany, and this connection was perpetuated in different ways almost until modern times. A few Early Bronze implements have been found but the Beaker movement apparently did not reach Cornwall. The coastal promontories and river estuaries are protected by clusters of earthworks of presumed Iron Age date, but mining operations have destroyed so many that it is impossible to argue from their type and distribution. Roman occupation and Saxon colonization of the lands farther east caused westward pressure and it is to these influences that must be assigned the emigration of Brythonic speaking people into southwest England and from southwest England to Brittany. Remains of Celtic Christianity in Cornwall include crosses of various dates from the 6th century onward, inscribed sepulchral stones, generally of the 7th and 8th centuries, and oratories. These have their parallels in Ireland, as the prehistoric contacts with Ireland and Wales and Brittany were maintained in early Christian times. In all these regions dedications to local saints are a great feature. The oratory buildings are very small and rude, always placed near a spring. The best example is St. Piran's near Perranzabuloe, which long lay buried in sand dunes. St. Piran was a missionary sent from Ireland by St. Patrick in the 5th century, and became the patron saint of the tin-miners.

Cornwall was the last portion of British territory in the south to submit to the Saxon invader. In 815 Egbert directed his efforts towards the subjugation of the West-Welsh of Cornwall, and after eight years' fighting compelled the whole of Dyvnaint to acknowledge his supremacy. Assisted by the Danes the Cornish revolted but were again defeated, probably in 836, at the battle of Hengestesdun, Hingston Down in Stoke-Climsland. Ninety years later Aethelstan banished the West-Welsh from Exeter and made the Tamar the boundary of their territory. The thoroughness of the conquest is evident from the fact that in the days of the Confessor nearly the whole of the land in Cornwall was held by men bearing English names. As the result of the Norman conquest less than one-twelfth of the land (exclusive of that held by the church) remained in English hands. Six-sevenths of the manors were assigned to Robert of Mortain, and became the foundation of the earldom held by the eldest son or near relative of the king. In the 15th century Cornwall strongly supported the Lancastrian cause, and its remoteness from the capital made it a potential field for revolt. This is seen in the support given to the Thomas Flamank rebellion in 1497, to Perkin Warbeck in the same year, and to the Humphry Arundell rebellion, over the religious question, in 1549. During the civil wars Cornwall strongly resisted the new ideas of the English. The king's Cornish troops defeated General Ruthen on Bradoc Down, while General Chudleigh, another parliamentary general, was repulsed near Launceston, and the earl of Stamford at Stratton. The whole county was thereby secured to the king. The subsequent fighting tended in favour of the Royalists, but dissensions hastened their overthrow. The 18th century was remarkable for the fervour shown by Cornishmen in the Methodist movement.

The old Cornish language survives in a few words still in use in the fishing and mining communities, as well as in the names of persons and places, but the last persons who spoke it died towards the end of the 18th century. It belonged to the Cymric or Brythonic division of Celtic, in which Welsh and Breton are also included. Three miracle plays written in Cornish are important relics of the language.

Agriculture.—Oats and mixed corn form the main grain-crops, with acreages of 43,988 and 40,322 respectively in 1939. Cabbage for fodder at 8,039 ac., turnips and swedes at 5,567 ac., and potatoes and mangolds at about 4,500 ac. each, made up the bulk of the root crops. The number of cattle (chiefly of the Devonshire breed) is large, having been 240,301 in 1939, while in the same year 287,398 sheep were kept and 196,042 pigs. The total acreage in the county under crops and grass was 610,635 ac. in 1939. Market-gardening is largely carried on in the neighbourhood of Penzance, where the climate is specially suitable for the growth of early potatoes, broccoli and asparagus, early fruit and flowers for the markets of the great cities, the Scilly Isles sharing in the industry, especially as regards flowers. In the valleys the soil is frequently rich and deep; there are good arable and pasture farms, and the natural oak-wood has been preserved and increased by plantation. In 1941 the National Trust owned 1,425 acres.

Mining.—The wealth of Cornwall, however, lies not so much in the soil, as underground and in the surrounding seas. Hence the favourite Cornish toast, "fish, tin and copper." The tin of Cornwall has been known and worked from the Bronze Age. By ancient charters the "tinners" were exempt from all jurisdiction (save in cases affecting land, life and limb) other than that of the Stannary courts, and peculiar laws were enacted in the Stannary parliaments (*see* STANNARIES). A tax on the tin, after smelting, was paid to the earls and dukes of Cornwall. The smelted blocks had to be coined, that is, stamped with the duchy seal, before they could be sold. In 1838 the dues on coinage were abolished, and a compensation awarded to the duchy instead of them. Cornish miners often directed successful developments of mining in many parts of the world, and much emigration took place in the middle of the 19th century. The industry suffered from periods of depression, as before the accession of Queen Elizabeth, who introduced miners from Germany to resuscitate it; and in modern times the shallow workings, from which tin could be easily "streamed," became practically exhausted. The deeper workings are more costly and foreign competition is greater. There was a slight revival during World War I, but later mining greatly diminished. A rise in the price of tin 1926–28 caused renewed activity especially in the Redruth-Camborne district, but the amount of ore raised in 1937, 3,367 tons, was more than 1,000 tons less than in 1919. The more important mines are at Carn Brea, Illogan and near St. Just in the extreme west, with others near Callington in the southeast. The largest tin-mine is that of Dolcoath near Camborne. Copper is extracted at St. Just and at Carn Brea. No mine seems to have been worked exclusively for copper before 1770. In 1718 John Coster gave a great impulse by draining the deeper mines, and introduced an improved method of dressing ore. In 1851 the mines of Devon and Cornwall were estimated to furnish one-third of the copper raised in Europe. Iron (brown haematite) has been worked near Lostwithiel and elsewhere. The St. Austell district produces china clay and after its extended use for paper filling, and the textile trade, it became a very important commodity, Cornwall exporting 759,704 tons in 1937. Much is exported to the United States. Granite is largely quarried in various districts, as at Luxulian (between St. Austell and Lostwithiel), and in the neighbourhood of Penryn. Fine slate is quarried and largely exported, as from the Delabole quarries near Tintagel. These slates were in great repute in the 16th century and earlier. Serpentine is quarried in the Lizard district. Pitchblende also occurs, and is mined for the extraction of radium.

Fisheries.—The fisheries of Cornwall and Devon are the most important on the southwest coasts. The pilchard is in great measure confined to Cornwall and the neighbourhood of the Scilly Isles. In summer and autumn they are caught by drift nets, while later in the year they are taken off the northern coast by seine nets. The principal fishing stations are on Mount's bay and at St. Ives, but boats are employed all along the coast. The pilchards are cured and packed locally, an old standing export being to Naples and other Italian ports. But the rise in the Italian standard of living now reacts on the market. The chief catches are mackerel and herring, together with sole, plaice and whiting.
