LOVELACE, RICHARD (1618–1658), English poet, was born at Woolwich in 1618. His father, Sir William Lovelace, had served in the Low Countries, received the honour of knighthood from James I, and was killed at Grolle in 1628. His brother, Francis Lovelace, the "Colonel Francis" of *Lucasta,* served on the side of Charles I, and defended Caermarthen in 1644. His mother's family was legal; her grandfather had been chief baron of the exchequer. Richard was educated at the Charterhouse and at Gloucester hall, Oxford. The course of his life gave him more leisure for verse-making than opportunity of soldiering. Before the outbreak of the civil war in 1642 his only active service was in the bloodless expedition which ended in the Pacification of Berwick in 1640. He then inherited the family estates at Bethersden, Canterbury, Chart and Halden in Kent. He was already one of the most distinguished of the courtly poets gathered round Queen Henrietta. When the rupture between king and parliament took place, Lovelace was committed to the Gatehouse at Westminster for presenting to the Commons in 1642 a petition from Kentish royalists in the king's favour. It was then that he wrote his most famous song, "To Althea from Prison." He was liberated, says Wood, on bail of £40,000 (more probably £4,000), and throughout the civil war was a prisoner on parole, with this security in the hands of his enemies. Nevertheless he provided his two brothers with money to raise men for the Royalist army, and befriended many of the king's adherents.

Lovelace was generous to scholars and musicians, and among his associates in London were Henry Lawes and John Gamble, the Cottons, Sir Peter Lely, Andrew Marvell and probably Sir John Suckling. He joined the king at Oxford in 1645, and after the surrender of the city in 1646 he raised a regiment for the service of the French king. He was wounded at the siege of Dunkirk, and with his brother Dudley, who had acted as captain in his brother's command, returned to England in 1648. It is not known whether the brothers took any part in the disturbances in Kent of that year, but both were imprisoned at Petre House in Aldersgate. During this second imprisonment he collected and revised for the press a volume of occasional poems, many if not most of which had previously appeared in various publications.

The volume was published in 1649 under the title of *Lucasta,* his poetical name—contracted from *Lux Casta*—for a lady rashly identified by Wood as Lucy Sacheverell, who, it is said, married another during his absence in France, on a report that he had died of his wounds at Dunkirk. The last ten years of Lovelace's life were passed in obscurity. His fortune had been exhausted in the king's interest, and he is said to have been supported by the generosity of friends. He died in 1658 "in a cellar in Longacre," according to Aubrey, who, however, possibly exaggerates his poverty. A volume of Lovelace's *Posthume Poems* was published in 1659 by his brother Dudley. They are of inferior merit to his own collection.

We have only to compare the version of any poem in *Lucasta* with the form in which it originally appeared to see how fastidious was Lovelace's revision. The expression is often elliptical, the syntax inverted and tortuous, the train of thought intricate and discontinuous. These faults—they are not of course to be found in his two or three popular lyrics, "Going to the Wars," "To Althea from Prison," "The Scrutiny"—are, however, as in the case of his master, Donne, the faults not of haste but of over-elaboration. His thoughts are not the first thoughts of an improvisatore, but thoughts 10 or 20 stages removed from the first, and they are generally as closely packed as they are far-fetched.

His poems were edited by W. C. Hazlitt in 1864. *See* C. H. Hartmann, *The Cavalier Spirit and its influence on the life and work of Richard Lovelace,* 1618–1658 (1925).

LOVELAND, a city of Larimer county, Colorado, U.S.A., 52 mi. N. by W. of Denver, and 33 mi. E. of Estes park and the Rocky Mountain National park, *via* the picturesque cañon of the Big Thompson river. It is on federal highway 285, and is served by the Colorado and Southern and the Great Western railways. The population was 5,065 in 1920 (90% native white), and was 6,145 in 1940 by federal census. Grazing and the cultivation of fruits and sugar-beet are the specialties of the fertile surrounding country. Coal is mined 25 mi. S.E. The city has one of the largest beet-sugar factories in the country, a large flour mill, pea-canning plants and several other manufacturing industries. It was settled about 1869, and incorporated in 1877.

LOVELL, FRANCIS LOVELL, VISCOUNT (1454–?1487), English politician, was a son of John, 8th Baron Lovell. As a young man he served under Richard of Gloucester in the expedition to Scotland in 1480. He had been created a viscount on Jan. 4, 1483, and whilst still Protector Richard made him chief butler. As soon as Richard became king, Lovell was promoted to be lord chamberlain. Lovell helped in the suppression of Buckingham's rebellion, and as one of Richard's most trusted ministers was gibbeted in Collingbourne's couplet with Catesby and Ratcliffe:—

The catte, the ratte and Lovell our dogge
Rulyth all England under a hogge.

He had command of the fleet which was to have stopped Henry Tudor's landing in 1485, but fought for Richard at Bosworth and after the battle fled to sanctuary at Colchester. Thence he escaped next year to organize a revolt in Yorkshire. When that failed he fled to Margaret of Burgundy in Flanders. As a chief leader of the Yorkist party he had a foremost part in Lambert Simnel's enterprise. With John de la Pole, earl of Lincoln, he accompanied the pretender to Ireland and fought for him at Stoke on June 16, 1487. He was seen escaping from the battle, but was never afterward heard of. More than 200 years later, in 1708, the skeleton of a man was found in a secret chamber in the family mansion at Minster Lovell in Oxfordshire. It is supposed that Francis Lovell had hidden himself there and died of starvation.

Collingbourne's couplet is preserved by Fabyan, *Chronicle,* p. 672. For the discovery at Minster Lovell see *Notes and Queries,* 2nd ser. i and 5th ser. x.

LOVER, SAMUEL (1797–1868), Irish novelist, artist, songwriter and musician, was born in Dublin on Feb. 24, 1797. Lover began life as an artist, and was elected in 1828 a member of the Royal Hibernian academy. His love for music showed itself at an early age. At a dinner given to the poet Tom Moore in 1818 Lover sang one of his own songs, which elicited special praise from Moore. One of his best-known portraits was that of Paganini, which was exhibited at the Royal academy. He went to London about 1835, where his gifts rendered him popular in society; and he appeared often at Lady Blessington's evening receptions. There he sang several of his songs, later published as *Songs and Ballads,* 1839. Lover wrote some popular novels, among them *Rory O'More, a National Romance* (1837) and *Handy Andy, an Irish Tale* (1842). In 1844 he began to give entertainments, "Irish Evenings," illustrative of his own works. He died on July 6, 1868.

His *Life* was written in 1874 by Bayle Bernard.

LOVERE, a town of Lombardy, Italy, province of Bergamo, at the north-west end of the Lago d'Iseo, 522 ft. above sea level. Pop. (1936) 4,653 (town), 5,099 (commune). The houses have wooden Swiss roofs with Italian stone arcades; the situation is beautiful, with the lake in front and the semicircle of bold mountains behind. The church of Santa Maria in Valvendra, built in 1474, has frescoes by Floriano Ferramola of Brescia (d. 1528). The Palazzo Tadini contains a gallery of old pictures. Lovere possesses a silk-spinning factory, and the Stablimento Metallurgico Gregorini. Lovere is reached by steamer from Sarnico at the south end of the lake, or from Pisogne at the north, which is a station on the railway from Brescia and Iseo.

LOW, SETH (1850–1916), U.S. municipal and educational administrator, was born in Brooklyn, N.Y., on Jan. 18, 1850. Of New England descent, he displayed on municipal reform and the development of a great university the energy his ancestors had used in conquering the Indians, fighting the British, and building up a fleet of clipper ships in the romantic days of the China trade. After studying at the Polytechnic institute of Brooklyn and at Columbia college, from which he graduated as valedictorian in 1870, he entered his father's tea and silk importing house, but early interested himself in the problem of better government. Twice elected mayor of Brooklyn, he made his terms (1882–85) memorable for efficiency, honesty and strict reliance upon merit. Chosen by his fellow-trustees president of Columbia in 1889, by his broad vision, his business administration and his liberality, he did much to change it from a college to a well-organized university. It was removed to a new site on Morningside Heights, where the central building was the beautiful memorial library given by the president; it added, or became more closely affiliated to, many of the colleges and institutions now within its organization; its curriculum was expanded; it became less local in character. Low resigned to become mayor of greater New York (1901–03), and although defeated for re-election continued to devote himself and his fortune to the service of the public. He was a delegate to The Hague Peace conference in 1899; was prominent as an arbitrator in labour disputes, especially after he became president of the National Civic federation (1907); was president of the New York chamber of commerce (1914), and received many other honours. He died at Bedford Hills, N.Y. on Sept. 17, 1916.

See B. R. C. Low, *Seth Low* (1925), and articles stressing different phases of his career in the *Columbia Alumni News* (vol. 8, Oct. 20, 1916).

LOWBOY, a small table with one or two rows of drawers, so called in contradistinction to the tallboy, or double chest of drawers. Both were favourite pieces of the 18th century, both in England and America; the lowboy was most frequently used as a dressing-table, but sometimes as a side-table. It is usually made of oak, walnut or mahogany, with brass handles and escutcheons. The more elegant examples of the Chippendale period have cabriole legs, claw-and-ball feet and carved knees, and are sometimes sculptured with the favourite shell *mótif* beneath the centre drawer.

LOWDEN, FRANK ORREN (1861–1943), U.S. lawyer, farmer and politician, was born at Sunrise City (Minn.), on Jan. 26, 1861, the son of Lorenzo Orren and Nancy Elizabeth (Breg) Lowden. He was educated at the public schools of Point Pleasant (Ia.), assisting his father with farm work during the summer. At 15 he began teaching in Hardin county (Ia.), while he prepared for college. He graduated from Iowa State university with scholastic honours in 1885 and taught for a year in the high schools of Burlington (Ia.). In July 1886 he began the study of law in Chicago, and at the Union College of Law, from which he graduated, again with honours, in 1887. In 1890 he formed a partnership with Emery S. Walker; in 1892 a second one with William B. Keep. He married Florence, daughter of George M. Pullman of Chicago, on April 29, 1896. In March 1898 he became a member of the firm of Lowden, Estabrook and Davis and continued the practice of law until 1906. After that time he was actively engaged in farming and cattle raising at his home, Sinnissippi Farm, Oregon (Ill.).

He was a delegate to the Republican national convention, 1900–04; a member of the Republican national committee, 1904–12, and a member of the executive committee for the campaigns of 1904 and 1908. He was elected to the 59th congress to fill the unexpired term of R. R. Hitt, on Nov. 6, 1906 and re-elected to the 60th and 61st congresses (1907–11) from the 13th Illinois district.

From 1917 to 1921 he was governor of Illinois. He received 311½ votes for the presidential nomination in the Republican national convention in 1920.

He was president of the Holstein-Friesian Association of America, director of the International Live Stock Exposition, National Dairy association, National Dairy council and other farm organizations, and actively associated with various national welfare movements. He was a lecturer, and contributor to newspapers and magazines on many branches of agriculture, and devoted much time toward the advancement of co-operative marketing of farm products. He was unanimously nominated for vice-president of the United States in the Republican national convention of 1924, and declined the nomination.

He was the author of "Too Much Government," *World's Work,* (Dec. 1926); "Our Governing Machine Halts and Creaks," New York *Times* (Dec. 27, 1925); "The American Farmer's Problem," *Review of Reviews* (July 1927); and a series of articles concerning farm life in Denmark and Sweden, appearing in *The Farmer,* St. Paul (Minn.), Nov.-Dec., 1926, and in numerous standard agricultural publications. He died in Tucson, Ariz., March 20, 1943.

LOWE, SIR HUDSON (1769–1844), English general, was the son of an army surgeon, John Lowe, and was born at Galway on July 28, 1769 and was gazetted ensign in his 12th year. After the outbreak of war with France early in the year 1793, Lowe was almost continuously on active service, holding many important commands, throughout the Napoleonic Wars. Charged with the duties of quartermaster-general of the army in the Netherlands in 1814–15, he was about to take part in the Belgian campaign when he was offered the command of the British troops at Genoa; but while still in the south of France he received (on Aug. 1, 1815) news of his appointment to the position of custodian of Napoleon, who had surrendered to H.M.S. "Bellerophon" off Rochefort. Lowe was to be governor of St. Helena, the place of the ex-emperor's exile.

Friction soon arose between Lowe and his prisoner. The news that rescue expeditions were being planned by the Bonapartists in the United States led to the enforcement of stricter regulations in October 1816, Lowe causing sentries to be posted round Longwood garden at sunset instead of at 9 P.M. He was accused of unnecessary harshness in carrying out his instructions. It may, however, be noted that Lowe recommended that the government allowance of £8,000 a year to the Longwood household should be increased by one-half. After the death of Napoleon in May 1821, Lowe returned to England and received the thanks of George IV. In 1825–30 he commanded the forces in Ceylon, but was not appointed to the governorship when it fell vacant in 1830. In 1842 he became colonel of his old regiment, the 50th; he also received the G.C.M.G. He died in 1844.

Rose, *Napoleonic Studies* (London, 1904); *see* also NAPOLEON I.

LOWELL, ABBOTT LAWRENCE (1856–1943), American educator, was born in Boston, Mass., on Dec. 13, 1856, of an old New England stock in which public service, business enterprise and devotion to civic, intellectual and religious concerns were almost hereditary. He graduated from Harvard college in 1877 with highest honours in mathematics, and Harvard law school in 1880. He practised law 1880–97 in partnership with his cousin, Francis Cabot Lowell, with whom he wrote *The Transfer of Stock in Corporations* (1884). He was a lecturer at Harvard from 1897–99, and became professor of science and government 1900–09. In 1909 he succeeded Charles William Eliot as president of the university. During his 24 years as president, he distinguished himself as administrator, established the Graduate School of Business Administration, and introduced the tutorial system and house plan. Long before retiring from Harvard in 1933 he became a trustee of the Lowell Institute of Boston (1900), president of the American Political Science association for 1909, and of the League to Enforce Peace. President Lowell was a strong supporter of the League of Nations. His books include *Essays on Government* (1889); *Governments and Parties in Continental Europe* (1896; abridged and revised as *The Governments of France, Italy and Germany,* 1914); *Public Opinion in War and Peace* (1923); *Greater European Governments* (1925), and *Public Opinion and Popular Government* (1926). He died in Boston, Mass., Jan. 6, 1943.

LOWELL, AMY (1874–1925), American poet, critic and lecturer, was born on Feb. 9, 1874 in Brookline, Mass., a sister of Abbott L. and Percival Lowell. She came of a line of public-spirited lawyers and men of affairs, who for three generations had been, like herself, lovers and planters of gardens. She received her education from her mother, who was an accomplished musician and linguist, and from private schools. Later she travelled abroad. After her father's death in 1900 she occupied herself with municipal affairs, until "about 1902," she writes, "I discovered that poetry . . . was my natural mode of expression. And from that moment I began to devote myself to it seriously." But she published nothing until 1910, when her first published poem appeared in the *Atlantic Monthly.* Her first volume, *A Dome of Many Coloured Glass,* is dated 1912. Thereafter her books followed each other in rapid succession: *Sword Blades and Poppy Seeds* (1914); *Six French Poets: Studies in Contemporary Literature* (1915); *Men, Women and Ghosts* (1916); *Tendencies in Modern American Poetry* (1917); *Can Grande's Castle* (1918); *Pictures of the Floating World* (1919); *Legends* (1921); *Fir-Flower Tablets* (1921), with Florence Ayscough; *A Critical Fable* (1922); *John Keats* (1925); *What's o'Clock* (1925); *East Wind* (1926) and *Ballads For Sale* (1927). During all this period Miss Lowell contributed critical articles to various magazines and frequently lectured. In 1920 she received the degree of Litt.D. from Baylor university. She had suffered from a serious malady for years, and on the eve of a visit to England, during which she was to have lectured at Oxford, Cambridge, Eton, Edinburgh and elsewhere, it became acute, and she died suddenly on May 12, 1925, at Brookline, Mass.

Miss Lowell, during her later years, was the most striking figure in contemporary American poetry. Her vivid and powerful personality, her intellectual vigour and independence and her zest in life gave her a conspicuous and in some respects a unique position. She was an acknowledged leader of the group in America and England which called itself the Imagists. But through all her radicalism ran a strong conservative strain, and she never abandoned conventional verse forms, nor for some years before her death had she been affiliated with any school. Among her contributions to poetry must be reckoned the perfecting, in her best work, of the technique of "free" verse; her almost unrivalled command of the vocabulary of sensuous impressions; the wide range of the themes to which she has given poetical expression, and the clarity and restrained beauty of many of her shorter poems. Her most important critical work, the result of long and devoted labour, is the biography of Keats, which essays to reinterpret him as "a new generation of poets and critics" regards him.

See biographical and critical accounts exclusive of articles in periodicals, by W. Bryker (1918), H. W. Cook (1923), R. Hunt and R. H. Snow (1921), E. S. Sergeant (1927), C. Wood (1926), S. F. Damon etc.; J. L. Lowes edited *Selected Poems of Amy Lowell* (1928); S. F. Damon, *Amy Lowell* (1935). (J. L. L.)

LOWELL, JAMES RUSSELL (1819–1891), American author and diplomatist, was born at Elmwood, in Cambridge (Mass.), Feb. 22, 1819, the son of Charles and Harriet Lowell. He was brought up near the open country and was early initiated into the reading of poetry and romance—Spenser, Scott, and old ballads. He was a wide reader but a somewhat indifferent student, graduating at Harvard without special honours in 1838. He wrote a number of pieces for the college magazine, and shortly after graduating printed for private circulation his class poem.

After some vacillation he took a course at the Harvard Law School and was admitted to the bar in 1840. He did not care for the law, yet he had little encouragement to trust to writing for self-support. The course of his life was deeply affected by the influence of Maria White, to whom he was betrothed. She was a poet of delicate power, but also possessed a lofty enthusiasm, a high conception of purity and justice, and a practical temper, which led her to concern herself with the temperance and abolition movements. The first-fruit of this passion was a volume of poems, *A Year's Life* (1841), which was inscribed by Lowell in a veiled dedication to his future wife. The betrothal, moreover, stimulated Lowell to new efforts towards self-support, and, though nominally maintaining his law office, he threw his energy into the establishment, with a friend, Robert Carter, of a literary journal, the *Pioneer*. It was to open the way to new ideals in literature and art, and the writers to whom Lowell turned for assistance—Hawthorne, Emerson, Whittier, Poe, Story, and Parsons, none of them then possessing a wide reputation—indicate the acumen of the editor. Lowell himself had already turned his studies in dramatic and early poetic literature to account in another magazine, and continued the series in the *Pioneer*, besides contributing poems; but after the issue of three monthly numbers, beginning in Jan. 1843, the magazine came to an end.

The venture confirmed Lowell in his bent towards literature. At the close of 1843 he published a collection of his poems, and a year later he gathered up certain material which he had printed, sifted and added to it, and produced *Conversations on Some of the Old Poets*. The book reflects Lowell's interest in reform as well as literature, for the conversations relate only partly to the poets and dramatists of the Elizabethan period; a slight suggestion sends the interlocutors off on the discussion of current topics. Just as this book appeared Lowell and Miss White were married. They spent the winter and early spring of 1845 in Philadelphia, where Lowell had a regular engagement as an editorial writer on the *Pennsylvania Freeman*. In the spring of 1845 the Lowells returned to Cambridge and made their home at Elmwood. On the last day of the year their first child, Blanche, was born; but she, like the third, Rose, died in infancy. A second daughter, Mabel, lived to survive her father. His mother's clouded mind and his wife's frail health, together with a narrow income, conspired to make Lowell almost a recluse in these days. Nevertheless he contributed poems to the daily press, called out by the slavery question; he was, early in 1846, a correspondent of the London *Daily News;* and in the spring of 1848 he formed a connection with the *National Anti-Slavery Standard* of New York, by which he agreed to furnish weekly either a poem or a prose article. The poems were most frequently works of art; occasionally they were tracts; but the prose was almost exclusively concerned with the public men and questions of the day, and forms a series of incisive, witty, and sometimes prophetic diatribes. It was a period with him of great mental activity, and is represented by four of his books, which stand as admirable witnesses to the Lowell of 1848, namely, the second series of *Poems,* containing among others "Columbus," "An Indian Summer Reverie," "To the Dandelion," and "The Changeling;" *A Fable for Critics,* in which he characterizes in witty verse and with good-natured satire American contemporary writers, including himself; *The Vision of Sir Launfal,* one of his most popular poems; and finally *The Biglow Papers,* which brought him wide fame. The book was not premeditated; a single poem, called out by the recruiting for the abhorred Mexican War, couched in rustic phrase and sent to the *Boston Courier,* had the inspiriting dash and electrifying rat-tat-tat of this new recruiting sergeant in the little army of anti-slavery reformers. Lowell himself discovered what he had done at the same time that the public did, and he followed the poem with eight others either in the *Courier* or the *Anti-Slavery Standard.* He developed four well-defined characters in the process; and his stinging satire and sly humour are so set forth in the vernacular of New England as to give at once a historic dignity to this form of speech. (Later he wrote an elaborate paper to show the survival in New England of the English of the early 17th century.) He embroidered his verse with an entertaining apparatus of notes and mock criticism. Even his index was spiced with wit. The book, a caustic arraignment of the annexation of Texas and the war with Mexico, made a strong impression, and the political philosophy secreted in its lines became a part of household literature.

The death of Lowell's mother and the fragility of his wife's health led Lowell, with his wife, their daughter Mabel and their infant son Walter, to go to Europe in 1851. The early months of their stay were saddened by the death of Walter in Rome and by the news of the illness of Lowell's father. They returned in Nov. 1852, and Lowell published some recollections of his journey, later collected in *Fireside Travels* (1864). He took some part also in preparing an American edition of the *British Poets,* but the low state of his wife's health kept him in an uneasy condition, and when her death (Oct. 27, 1853) released him from the strain of anxiety, there came with the grief a readjustment of his nature and a new intellectual activity. In the winter of 1855 he delivered a course of lectures on English poets before the Lowell Institute in Boston. This first formal appearance as a critic at once gave him a new standing in the community and was the occasion of his election to the Smith Professorship of Modern Languages in Harvard college, then vacant by the retirement of Longfellow. Lowell accepted the appointment, with the proviso that he should have a year of study abroad. He spent his time mainly in Germany, visiting Italy, and increasing his acquaintance with the French, German, Italian and Spanish tongues. He returned to America in the summer of 1856 and entered upon his college duties, retaining his position for 20 years. In 1856 he married Frances Dunlap, who since his wife's death had had charge of his daughter Mabel.

In the autumn of 1857 the *Atlantic Monthly* was established, and Lowell as its first editor at once gave the magazine the stamp of high literature and of bold speech on public affairs. He held this position only till the spring of 1861, but he continued to make the magazine the vehicle of his poetry (including the second or Civil War series of the *Biglow Papers*) and of some prose. More of his prose, however, especially of a political nature, was contributed to the *North American Review,* in the conduct of which he was associated from 1862 to 1872 with Charles Eliot Norton. Both his collegiate and his editorial duties stimulated his critical powers, and the publication in the two magazines, followed by republication in book form, of a series of studies of great authors gave him an important place as a critic. Shakespeare, Dryden, Lessing, Rousseau, Dante, Spenser, Wordsworth, Milton, Keats, Carlyle, Thoreau, Swinburne, Chaucer, Emerson, Pope, Gray—these are the principal subjects of his prose, and the range of topics indicates the catholicity of his taste. He wrote also a number of essays, such as "My Garden Acquaintance," "A Good Word for Winter," "On a Certain Condescension in Foreigners," which were incursions into the field of nature and society. Although the great bulk of his writing was now in prose, he made after this date some of his most notable ventures in poetry. In 1868 he issued the next collection in *Under the Willows and Other Poems,* but in 1865 he had delivered his "Ode Recited at the Harvard Commemoration," and the successive centennial historical anniversaries drew from him a series of stately odes.

In 1877 Lowell was appointed by President Hayes minister resident at the court of Spain. He had a good knowledge of the Spanish language and literature, and his long-continued studies in history and his quick judgment enabled him speedily to adjust himself to these new relations. Some of his despatches to the home government were published in a posthumous volume, *Impressions of Spain.* In 1880 he was transferred to London as American minister, and he remained there till the close of President Arthur's administration in the spring of 1885. As a man of letters he was already well known in England, and he was in much demand as an orator on public occasions, especially of a literary nature; but he also proved himself a sagacious publicist and made himself a wise interpreter of each country to the other. In 1887 he published *Democracy and Other Addresses,* all of which had been delivered in England. The title-address was an epigrammatic confession of political faith as hopeful as it was wise and keen. The close of his stay in England was saddened by the death of his second wife in 1885. After his return to America he made several visits to England. His public life had made him more of a figure in the world; he was decorated with the highest honours Harvard could pay officially, and with degrees of Oxford, Cambridge, St. Andrews, Edinburgh, and Bologna. He issued *Political Essays* and a volume of poems, *Heartsease and Rue,* in 1888, and occupied himself with revising and rearranging his works, which were published in ten volumes in 1890. The last months of his life were attended by illness, and he died at Elmwood, Aug. 12, 1891. After his death his literary executor, Charles Eliot Norton, besides editing his letters, published his *Latest Literary Essays* (1891), *The Old English Dramatists* (1892), and *Last Poems* (1895).

The spontaneity of Lowell's nature is delightfully disclosed in his personal letters. They are often brilliant, and sometimes very penetrating in their judgment of men and books; but the most constant element is a pervasive humour, and this humour, by turns playful and sentimental, is largely characteristic of his poetry, which sprang from a genial temper, quick in its sympathy with nature and humanity. Through his writings and speech and action Lowell impressed himself deeply upon his generation in America, especially upon the thoughtful and scholarly class, who looked upon him as their representative. He attained a permanent place as one of America's most distinguished critics and a poet of assured power. (H. E. S.)

BIBLIOGRAPHY.—The chief editions of Lowell's *Writings* are: the Riverside edition (1890–92); the Standard Library edition (1891–1902); the Elmwood edition (1904) and, printed from the same plates, the Autograph edition (1904). His *Complete Poetical Works* (1896) were edited by H. E. Scudder. Posthumous volumes are: *The Power of Sound: a Rhymed Lecture* (1896); *Lectures on English Poets* (1897); *Early Prose Writings* (1902); *Anti-Slavery Papers* (1902); *Four Poems* (1906); *The Round Table* (1913). The *Letters of James Russell Lowell* (1894) were edited by C. E. Norton. The chief biographies are by E. E. Hale (1899); H. E. Scudder (1901), and Ferris Greenslet (1905). *A Bibliography of James Russell Lowell* (1906) by G. W. Cooke and the *Bibliography* (1914) by L. S. Livingston are helpful. *See* also J. J. Reilly's *James Russell Lowell as a Critic* (1915) and W. H. Hudson's *Lowell and His Poetry* (1911). Some of the outstanding essays on Lowell may be found in W. D. Howells, *Literary Friends and Acquaintances;* Henry James, *Essays in London;* and Alice Meynell, *The Rhythm of Life and Other Essays.*

LOWELL, JOHN (1743–1802), American jurist, was born in Newburyport (Mass.), on June 17, 1743. He graduated at Harvard in 1760, was admitted to the bar in 1763, represented Newburyport (1776) and Boston (1778) in the Massachusetts assembly, and was a member of the Massachusetts constitutional convention of 1779–80. As a member of the committee appointed to draft a constitution, he secured the insertion of the clause, "all men are born free and equal," which was interpreted by the Supreme Court of the State in 1783 as abolishing slavery in the State. In 1781–83 he was a member of the Continental Congress, which in 1782 made him a judge of the court of appeals for admiralty cases; in 1784 he was a member of the New York-Massachusetts boundary commission; in 1789–1801 he was a judge of the United States district court, Massachusetts; and from 1801 until his death in Roxbury on May 6, 1802, he was a justice of the United States circuit court for the first circuit (Maine, New Hampshire, Massachusetts and Rhode Island).

His son, JOHN LOWELL (1769–1840), graduated at Harvard in 1786, was admitted to the bar in 1790 and retired from active practice in 1803. He opposed French influence and the policies of the Democratic party, writing many spirited pamphlets (some signed "The Boston Rebel," some "The Roxbury Farmer"), including: *The Antigallican* (1797); *Remarks on the Hon. J. Q. Adams's Review of Mr. Ames's Works* (1809); *New England Patriot, being a Candid Comparison of the Principles and Conduct of the Washington and Jefferson Administrations* (1810); *Appeals to the People on the Causes and Consequences of War with Great Britain* (1811), *and Mr. Madison's War* (1812).

Another son of the first John Lowell, FRANCIS CABOT LOWELL (1775–1817), the founder in the United States of cotton manufacturing, was born in Newburyport on April 7, 1775, graduated at Harvard in 1793, became a merchant in Boston, and, during the War of 1812, with his cousin Patrick Tracy Jackson, made use of the knowledge of cotton-spinning gained by him in England and devised a power loom. Experiments were successfully carried on at Waltham in 1814. Lowell worked hard to secure a protective tariff on cotton goods. The city of Lowell (Mass.), was named in his honour. He died in Boston on Aug. 10, 1817.

Francis Cabot Lowell's son, JOHN LOWELL (1799–1836), was born in Boston, travelled in India and the East Indies on business in 1816 and 1817, in 1832 set out on a trip around the world, and on March 4, 1836, died in Bombay. By his will he left $250,000 to establish what is now known as the Lowell institute (*q.v.*).

See the first lecture delivered before the institute, Edward Everett's *A Memoir of Mr. John Lowell, Jr.* (Boston, 1840).

LOWELL, PERCIVAL (1855–1916), American astronomer, was born in Boston, Mass., on March 13, 1855. A member of a brilliant family, he graduated with honours at Harvard in 1876 and after a year of travel returned to Boston where he was active in business. From 1883 to 1893 his energies were chiefly devoted to literature and travel, much of the time in the Far East, which he pictured in *Chosön* (1885), *The Soul of the Far East* (1888), *Noto* (1891) and *Occult Japan* (1895). During part of this period he was counsellor and foreign secretary to the special mission from Korea to the United States. In the '90s, inspired by Schiaparelli's discovery of the *canali* on Mars, he determined to devote his fortune and energy to a study of the planets and after careful scrutiny of desirable sites founded the great observatory which bears his name at Flagstaff, Arizona. The theory which he advanced in his lectures and writings was that the intelligent inhabitants of a dying Mars are struggling to keep alive by a planet-wide system of irrigation from the water of the melting polar snow-caps and that the so-called "canals" are bands of cultivated vegetation dependent on this system of irrigation. His books along this line include *Mars and Its Canals* (1906), *Mars as the Abode of Life* (1908), *The Evolution of Worlds* (1910), *Memoir on a Trans-Neptunian Planet* (1915), and *Memoir on Saturn's Rings* (1915). Although his theory met with opposition, he received numerous scientific honours. He died in Flagstaff, Ariz., on Nov. 12, 1916.

See L. Leonard, *Percival Lowell* (1921); J. A. Peterson, "Percival Lowell—His Life and Work," *Roy. Astr. Soc. Journ.*, vol. xvi. (1922); *Popular Astronomy,* vol. xxv., pp. 219–223 (1917).

LOWELL, a city of Massachusetts, U.S.A., 25 mi. N.W. of Boston, on the Merrimack at the mouth of the Concord; a county seat of Middlesex county, and one of the principal manufacturing centres of the state and the nation. It has an airport, and is served by the Boston and Maine and the New York, New Haven and Hartford railways. The population was 112,759 in 1920 (33·7% foreign-born white) but had fallen to 101,389 in 1940 by the federal census. The city has a beautiful site of 14·1 sq.mi. in a bend on the south bank of the Merrimack, and including some territory on the opposite side of the river. Within its limits are 15·5 mi. of watercourses (rivers, canals and brooks), spanned by 250 bridges. The great textile mills occupy a large tract in the heart of the city, extending for a mile along the river. A monument in front of the city hall commemorates the three Lowell men (Ladd, Whitney and Taylor) who were the first Northerners killed in the Civil War; and a beautiful auditorium seating 4,700 is the memorial to the men and women of the war of 1914–18. The assessed valuation of property in 1940 was $93,642,000. The population has the usual characteristics of a factory centre: a preponderance of women; a high proportion of women and girls at work; and a relatively high, but decreasing, infant mortality. In 1911 the city adopted a commission form of government, but in 1920 it reverted to the mayoralty form.

Lowell is the seat of a state teachers' college, and of the Lowell Textile institute, incorporated in 1895, when the New England mills had begun to feel the effects of the rapid development of the manufacture of the coarser cotton fabrics in the southern states, to promote a wider and more thorough application of the arts and sciences to the production of finer and more varied fabrics.

Cotton fabrics are still Lowell's leading product, but the industries have become increasingly diversified, until the list of articles made by the 400 manufacturing establishments runs through all the letters of the alphabet, from acids, aprons, art gum and ash sifters, to yeast, yarn and "zipper" products.

The aggregate factory output in 1939 was valued at $61,949,-591. Lowell is a shopping centre for the populous adjacent towns of the Merrimack valley.

At the close of the 18th century there was only a small village on the site of the present city of Lowell. A carding mill was built in 1801, and in 1804 the Middlesex canal was completed around the Pawtucket falls, to provide a continuous water thoroughfare from Concord, New Hampshire, to Boston. In 1822 the Merrimack Manufacturing company was incorporated by Patrick Tracy Jackson (1780–1847), Nathan Appleton (1779–1861), Paul Moody (1779–1831), Kirk Boott (1790–1837) and others, to establish cotton mills at this point. They bought the Pawtucket canal, widened and deepened it, constructed a dam, and built a lateral canal to carry the power to the site of their mills. The first cloth was made in 1823. The town was incorporated in 1826, with a population of 2,000, and was named for Francis Cabot Lowell, who in 1814 had introduced the power loom at Waltham and planned the mills there, bringing under one roof all the processes in the converting of cotton into cloth. In 1836, when the town was chartered as a city, it had a population of 18,000 and a property valuation of $5,000,000. Until 1840 the mill hands, except for the English dyers and calico printers, were New England girls, and after 1840 they were only gradually displaced by Irish, French-Canadian, and other immigrants. The corporation provided boarding-houses, and the girls had many improvement circles and literary societies. They published a periodical, *The Lowell Offering,* from 1840 to 1845, edited from 1842 to 1845 by Harriot F. Curtis ("Mina Myrtle"). Among its contributors were Harriet Hanson (b. 1825), who later wrote the valuable records called *Early Factory Labor in New England* (1883) and *Loom and Spindle* (1898); and Lucy Larcom (1824–93), a doffer in the mills, whose mother kept a "corporation" boarding-house, and who described the early life in the mills in *An Idyl of Work* (1875) and *A New England Girlhood* (1889). Dickens visited the city in 1842, and recorded his impressions in the fourth chapter of *American Notes.* A more recent description of conditions is contained in *The Record of a City,* by George F. Kenngott (1912). For the greater part of the 19th century Lowell was the leading producer of cotton fabrics in the United States, and was called "The Spindle City" and "The Manchester of America." By 1850 the population had grown to 33,383, and until 1890 it was the second city of the state in size. Lowell was the birthplace of James McNeill Whistler, whose home has been converted into a museum; and was the home of Humphrey O'Sullivan, the inventor of rubber heels.

LOWELL INSTITUTE, an educational foundation in Boston, Mass. "As the prosperity of my native land, New England, which is sterile and unproductive, must depend hereafter, as it has heretofore depended, first on the moral qualities, and secondly on the intelligence and information of its inhabitants; I am desirous of trying to contribute towards . . ." these objects. Thus John Lowell, Jr., wrote in his will, and provided a fund for public lectures in the city of Boston. He died in 1836. The fund, then, amounted to about $250,000; in 1928 it was over $1,500,000.

He provided for two kinds of lectures, one popular and the other "more erudite and particular"; or, as we should say, more advanced and systematic. The first of these have been given annually for 88 years, many of them by eminent scholars from Europe. The other kind commenced somewhat later, and in one form or another have been regularly maintained. In both cases the Lowell Institute, as the foundation is called, works in conjunction with other institutions; for Lowell, dreading the temptation of costly structures without adequate means of support, provided that no portion of the capital should be used for such buildings. Most of the popular lectures are delivered in a hall of the Massachusetts Institute of Technology; others, of a definitely religious character, in King's Chapel. According to the will, the popular lectures were to be free, while for the more advanced courses a charge for each term of the price of two bushels of wheat was permitted. The courses include: (1) university extension courses, arranged by a committee representing all the institutions of higher learning in and around Boston; (2) a school of engineering, carried on in conjunction with the Massachusetts Institute of Technology, and designed to supply a gap between professional engineers and administrators of industry on the one hand and skilled workmen on the other. At first it was called the School for Industrial Foremen; but as it prepares men for positions well above those of foremen it is now called simply the Lowell Institute school. It fills an important place not covered by any other in the community.

A strange provision was made by the testator for the administration of the fund. He appointed a single trustee, and as visitors the trustees of the library known as the Boston Athenaeum. To them accounts are annually rendered, but they exercise no control over the management. The trustee for the time being he empowered also to designate his successor, enjoining him to choose in preference some competent male descendant of the testator's grandfather, who bears the name of Lowell. As the first incumbent he selected his cousin, John Amory Lowell; and the trusteeships of this kinsman and his son and grandson have now covered nearly a century. Owing to the laws of Massachusetts on exemption from taxation of charitable funds, the trustee of the institute is now by statute a corporation *sole.* (A. L. L.)

LÖWENSTEIN, a town of Germany, in the *Land* of Württemberg on the Löwenstein range, 6 m. from Heilbronn. Pop. (1933) 1,331. It is dominated by the ruined castle of the counts of Löwenstein. The town contains many old houses and a modern palace. Vines are cultivated, and there is a brine spring (Theusserbad).

Löwenstein was founded in 1123 by the counts of Calw, and belonged to the Habsburgs from 1281 to 1441. The county of Löwenstein was purchased by the German king Rudolph I., who presented it to his natural son Albert. In 1441 it was sold to the elector palatine of the Rhine. His descendants inherited the county of Wertheim and other lands by marriage, and then the family divided into two branches. The heads of the two branches, into which the older and Protestant line was afterwards divided, were made princes by the king of Bavaria in 1812 and by the king of Württemberg in 1813; the head of the younger, or Roman Catholic line, was made a prince of the Empire in 1711. The lands of the family were mediatized after the dissolution of the Empire in 1806.

LOWESTOFT, a municipal borough, seaport and watering-place in Suffolk, England, $117\frac{1}{2}$ mi. N.E. from London by the L.N.E.R. Pop. (1938) 44,370. Area 8.8 sq.mi. In 1086 Lowestoft (Lothu Wistoft, Lowistoft, Loistoft) was a hamlet in the demesne of the royal manor of Lothingland. The citizens possessed many privileges, but had no definite burghal rights until 1885. The borough was further extended in 1934. For several centuries before 1740 the fisheries were the cause of constant dispute between Lowestoft and Yarmouth. During the last half of the 18th century the manufacture of china flourished in the town. A weekly market on Wednesdays was granted to John, earl of Richmond, in 1308 together with an eight days' fair, and in 1445 John de la Pole, earl of Suffolk, one of his successors as lord of the manor, received a further grant of the same market and also two yearly fairs, one on the feast of St. Philip and St. James and the other at Michaelmas. The market is still held on

Wednesdays, and in 1792 the Michaelmas fair and another on May day were in existence. Now two yearly fairs for small wares are held on May 13 and Oct. 11. In 1643 Cromwell took Lowestoft. In the war of 1665 the Dutch under Admiral Opdam were defeated off Lowestoft by the English fleet commanded by the duke of York.

It lies on either side of the formerly natural, now artificial outlet of the river Waveney to the North sea, while to the west the river forms Oulton Broad and Lothing lake. The northern bank is the original site. South Lowestoft arose on the completion of harbour improvements, begun in 1844, when the outlet of the Waveney reopened in 1827, was deepened. The old town is situated on a lofty declivity. The church of St. Margaret is Decorated and Perpendicular. South Lowestoft has a fine esplanade, a park (Bellevue) and other adjuncts of a watering-place. Bathing facilities are good. There are two piers enclosing a harbour with a total area of 67 ac., including an inner and outer harbour with a depth of 16 ft. at low water. Extensive improvements have been made for the fishing industry which is very important. Industries include ship and boat building and fitting, and motor engineering, and manufacture of textiles.

LOWIN, JOHN (1576–1659), English actor, was born in London, the son of a carpenter. His name frequently occurs in Henslowe's Diary in 1602, when he was playing at the Rose theatre in the earl of Worcester's company. In 1603 he joined the King's men with whom he remained for many years, until he was superannuated. He played with Shakespeare, Burbage and the others, and owned by 1630 a share and a half of the 20 shares in the Blackfriars theatre. About that time he became one of the managers. He lived in Southwark and later (1623) in Lambeth. Wright says that "Lowin in his latter days kept an inn (the Three Pigeons) at Brentford, where he dyed very old." Two of his favourite parts were Falstaff and Melanteus.

LOWNDES, THOMAS (1692–1748), founder of the Lowndean professorship of astronomy at Cambridge university, England, was born in 1692. In 1725 he was appointed provost marshal of South Carolina, a post he preferred to fill by deputy. In 1727 Lowndes claimed to have taken part in inducing the British government to purchase Carolina, but he surrendered his patent when the transfer of the colony to the crown was completed. His patent was renewed in 1730, but he resigned it in 1733. He then brought various impractical commercial and financial schemes before the government. He died on May 12, 1748. By his will he left his inherited Cheshire properties to the University of Cambridge for the foundation of a chair of astronomy and geometry.

LOWNDES, WILLIAM THOMAS (1798–1843), English bibliographer, was born about 1798, the son of a London bookseller. His principal work, *The Bibliographer's Manual of English Literature*—the first systematic work of the kind—was published in four volumes in 1834. It took Lowndes fourteen years to compile, but, despite its merits, brought him neither fame nor money. Lowndes, reduced to poverty, subsequently became cataloguer to Henry George Bohn, the bookseller and publisher. In 1839 he published the first parts of *The British Librarian*, designed to supplement his early manual, but owing to failing health did not complete the work. Lowndes died on July 31, 1843.

LOW RELIEF: *see* BASSO-RILIEVO.

LOW SUNDAY, the first Sunday after Easter, was also known formerly as Quasimodo Sunday. It is officially termed by the Roman Catholic Church *Dominica in albis* (*depositis*), "Sunday in white garments" (laid aside), in allusion to the white garments anciently worn until this day by those who had been baptized on Easter Eve.

LOW-TEMPERATURE CARBONIZATION. By the low-temperature carbonization of coal is understood its partial coking at temperatures ranging from 500 to 600° C, with the contain oils—obtainable to a much less extent under the high temperatures above those named—as high even as 1,000° C—are sometimes spoken of as "low-temperatures" in this connection.

The late Vivien B. Lewes, in connection with the carbonization of coal regarded—

"Low temperature" as ranging between	400° and 500° C.
"Medium temperature" as ranging between	500° and 900° C.
"High temperature" as above	900° C.

At gas works the coal is carbonized at temperatures ranging between 1,100 and 1,300 degrees C. The original low-temperature process for the manufacture of "coalite" was based on the carbonization of coal at a temperature of 420 degrees C (788° F).

The objects which the low-temperature carbonization of coal aims at securing are mainly the production of—(*a*) a smokeless fuel of high calorific value which can be burned in the domestic hearth or for the raising of steam, and (*b*) the production of certain oils—obtainable to a much less extent under the high temperature carbonization as applied in gas works and in the manufacture of metallurgical coke, in which processes the volatile hydrocarbons are entirely extracted, but only to a small extent in the form of oils, whereas in the semi-coke resulting from low-temperature carbonization upwards to 12% may remain in the coke (*see* COKE, COKING AND HIGH TEMPERATURE CARBONIZATION.)

In order fully to comprehend the difference between low and high temperature carbonization and the character of the respective products obtainable thereunder, it is necessary to study the effects on bituminous coal when treated to a rising temperature in the process of coking. Thus, at 100° C (212° F) the removal of the moisture content of the coal begins and continues up to 260° C (500° F). Intumescence or swelling of the coal takes place at 350° to 400° C. "Intumescence" is a characteristic peculiar to some bituminous coals, being particularly evident in the case of coking coals; steam coals do not intumesce.

In most coals the transformation of a great part of the coal from an insoluble to a soluble condition begins at 232° and continues to 343° C (*i.e.*, such substances as tar are soluble; coke is not): and it is only after such transformation has taken place that the distillation of the oil begins. The extraction of the oils from the coal covers a very short range of temperature. Beyond 426·6° C practically no oil is distilled, but under "oils" are not included tars, pitches, naphthalenes, anthracenes or the phenols, all of which, with similar combinations, are produced beyond this point of temperature. Below 400° C there is very little decomposed tar left in the residual coke, so that, according to Prof. V. B. Lewes, between 400° C and 420° C may be taken as the temperature at which coke forms. The yield of ammonia increases with the more complete gassification of the coal; that is to say, the higher the temperature the more complete the carbonization.

Comparing the results obtained by low-temperature carbonization with those due to high-temperature carbonization—under low-temperature carbonization there is obtained (*a*) a lower volume of gas but a gas which is much richer than that obtained under high-temperature conditions. The calorific value of a "low-temperature" gas as compared with that obtained under high-temperature conditions in gas works with a given coal will be as about 1,000 B.Th.U. to 450 B.Th.U.: (*b*) a higher yield of tar of a lower specific gravity than is obtainable under high-temperature carbonization: (*c*) a low yield of benzene and its homologues, owing to the fact that the tar formed under low-temperature conditions contains a large proportion of paraffin, hydrocarbons and little benzene and toluene: (*d*) a low yield of ammonia compounds: and, (*e*) the tar produced under high-temperature conditions, though rich in the aromatic hydrocarbons (benzene, toluene, etc.), is so poor in the paraffins as to render these practically negligible; consequently, under a process of high-temperature carbonization the light (fuel) oils are in great part lost.

Slow Development.—The development of the low-temperature carbonization industry in Great Britain, America and the continent of Europe has been very slow, in fact it can hardly as yet be termed an industry, though an enormous amount of research work has been carried out in connection therewith, and its literature probably exceeds that bearing on the making of metallurgical coke, which has for a great many years been a prominent branch of industry. The reason is probably due to the fact that whereas in the latter there was ready to hand a market for the coke and for the by-products—sulphate of ammonia, tar, pitch, benzene, etc.—in the case of low-temperature carbonization the markets have in some respects to be created.

In order that low-temperature carbonization processes may be profitable the resultant semi-coke, which constitutes about 70 to 80% of the coal used in the process, must fetch a price at least equivalent to the purchase price of the coal, that is to say, must sell per ton at a higher price than that of the coal purchased, leaving the by-products to pay the cost of working and to provide a profit—a fairly narrow margin. But the British public have been slow to realize the advantages of the semi-coke as a domestic fuel and prefer adhering to the wasteful use of coal to provide them with a cheerful flaming fire instead of paying the higher price for the hotter, smokeless, and almost flameless semi-coke.

Internal and External Heating.—The processes of low-temperature carbonization may be divided into two main classes, namely those dependent on internal heating and those dependent on external heating, the former giving a large production of gas of comparativly low calorific value and consequently a comparatively small production of semi-coke, the latter a comparatively small volume of gas of high calorific value and a large yield of semi-coke. The coal used in most of the processes is in the form of slack, but in others it is in the form of dust. In some of the processes the retort is stationary, in others it rotates; in some the charge is stationary, in others it moves down vertical retorts by gravity, and in others again it moves with the rotation of the retort. In some of the low-temperature processes the through-put, as in the case of the metallurgical coke and the gas-making industries, is intermittent, in others it is continuous.

A process of "double carbonization" *i.e.*, high temperature following on low temperature, has been tried in the United States. In this process, the residual matter from the low-temperature carbonization retort is briquetted and the briquettes subjected to high-temperature carbonization to secure a high yield of ammonia and benzene compounds not available from the low-temperature carbonization. In some few of the processes which have been tested a semi-coke is obtained which is sufficiently hard and compact to allow of its being used in metallurgical processes; but usually it is too soft, though eminently suitable for domestic use both in the open grate, stoves, and for central heating. Of course the make of semi-coke with any given process varies chiefly with the coal used, but may be taken to be from 12·5 to 15cwt. per ton of coal charged. Likewise, the make of tar oil varies in accordance with the chemical composition of the coal. The greater the hydrocarbon content in the coal the greater the yield of tar oil. The make of tar oil, refined oils, tar acids and pitch obtainable therefrom as obtained by the low-temperature treatment in the case of three Yorkshire coals and a mixture of two of them by the Fuel Research Board at their research station near Greenwich and given in the Board's report for the years 1920–21 is of interest. *See* table in previous column.

Washed and refined oils from Tar calculated to gallons per ton of dry coal

Coal, carbonized	Dalton Main 2	Mitchell Main	Ellis-town Main	60% Mitchell Main, 40% Ellistown Main
Original yield of tar	14·00	16·25	12·87	15·51
Fraction 0–170° C				
Original fraction	1·56	2·13	1·22	1·68
Washed spirit	1·39	1·83	1·01	1·49
Washed and refined spirit	1·30	1·63	0·86	1·29
Fraction 170–230° C				
Original fraction	2·90	2·83	2·53	2·78
Washed oil	1·57	1·53	1·11	1·40
Washed and refined oil	1·57	1·46	0·98	1·29
Fraction 230–270° C				
Original fraction	1·85	2·36	1·88	2·24
Washed oil	1·00	1·31	0·84	1·14
Washed and refined oil	0·96	1·23	0·76	1·02
Fraction 270–310° C				
Original fraction	1·66	2·03	2·39	2·39
Washed oil	1·13	1·38	1·39	1·51
Washed and refined oil	1·10	1·25	1·23	1·38
Total of original fraction	7·97	9·35	8·02	9·09
Total washed and refined oil	4·93	5·57	3·83	4·98
Total tar acids, crude	2·49	2·74	3·20	3·07
Total tar acids refined	2·12	2·34	2·58	2·61
Pitch in lb. per ton of dry coal	67·5	75·9	56·9	74·9

The following oils were specially separated from the Dalton Main Tar 2:—

	Sp.gr.,15° C	Per cent by volume of tar	Gals. per ton of dry coal
High naphtha to 160° C	0·829	8·25	1·15
Heavy naphtha 160–200° C	0·870	4·59	0·64
Burning oils 200–270° C.	0·936	11·93	1·67
Gas oil 270–300° C.	0·979	5·46	0·76
Light lubricating oil 300–360° C	1·005	5·10	0·71
Total	..	35·33	4·93

Taking the Mitchell Main Coal the result may be expressed in percentages thus:—

Analysis

Moisture	0·95
Volatile matter less moisture	0·95
Fixed carbon	62·41
Ash	5·21

A high class and very bituminous coal.
Carbonized at 600° C.
Make of *Coke,* 77·88% or 15·58 cwt. per ton of coal carbonized.
Volatiles in Coke, 11·81.
Yield of *Gas,* 3,440 cubic feet; B.T.U. per cu.ft., 1,090.
Therms per ton of coal, 37·56.
Yield of *Tar* (dry), 17·0 gallons per ton of coal.
Yield of *Liquor,* 26·4 gallons per ton of coal.
Ammonia sulphate, lb. per ton of coal, 8·6.
Motor Spirit, 1·63 gallons per ton of coal.

Advantages of Semi-coke.—Great advantages would accrue were the fuel used for raising steam in the production of power and in domestic heating to be the semi-coke procured by the low-temperature distillation of coal instead of the raw coal largely used. The atmosphere of towns would be polluted to a much less degree with consequent improvement in health, and the waste of national resources through the burning of the volatile hydrocarbons contained in coal would be prevented. At least 35 million tons are annually devoted to domestic use, and assuming 15 gallons of fuel oil suitable for naval purposes if there were no fuel to be used for domestic purposes other than low-temperature semi-coke, there would be derivable in the manufacture thereof two million tons of fuel oil per annum for the Navy, which though less than the War requirements is considerably more than the peace requirements; and the motor spirit produced would amount to about 100 million gallons. Incidentally the national output of coal, presuming there to be no saving of fuel effected, would have to be increased by at least 10 million tons per annum.

Reference has already been made to some of the oils of the paraffin group contained in the tar which can be used as fuel oil either for raising steam or for internal combustion or "cracked" to produce petrol and added to the spirit which is derived, chiefly, from stripping the gas, though some of it is available in the tar. This light spirit can, when refined, be used direct in motor cars or as an admixture to petrol; or, as it has "anti-knock" properties, be mixed advantageously with standard petrol. The tar acids—phenols and cresols—are also of value; they can be burned to raise steam, and Dr. Spilker has shown that primary tar distillates of high phenol content can be used successfully in Diesel engines; but they have a use beyond this. Phenol (or carbolic acid) is used in large quantities in the manufacture of fieric acid and other explosives, also in the manufacture of dyes. The cresols (methyl phenols) which are produced in the distillation of coal both by the high-temperature and the low-temperature carbonization processes, are used as a disinfectant, as a sheep dip, for creosoting timber, and in the manufacture of "bakerlite" (an insulating material largely used in electrical transformation and generator construction) and other synthetic resins.

LOWTH, ROBERT (1710–1787), English divine and Orientalist, was born at Winchester on Nov. 27, 1710. He was educated at Winchester college, and New college, Oxford. In 1741 he was appointed professor of poetry at Oxford, where he delivered the *Praelectiones Academicae de Sacra Poesi Hebraeorum* (printed in 1753). Lowth received numerous preferments, and in 1766 was consecrated bishop of St. David's. He was translated to Oxford in the same year, and in 1777 to London. He died at Fulham palace on Nov. 3, 1787. The *Praelectiones,* translated in 1787 by G. Gregory as *Lectures on the Sacred Poetry of the Hebrews,* had a great influence in England and on the continent. Their chief importance lay in the idea of looking at the sacred poetry as poetry, and examining it by the ordinary standards of literary criticism. He described the typical forms of Hebrew poetry as these occur in the Psalms. Lowth defined the principle of parallelism as the fundamental principle in Hebrew poetry in contrast to the principle of metre which is fundamental in European poetry.

LOXODROME, the line on the earth's surface making a constant angle with the meridian.

LOYALISTS or **TORIES,** in America, the name given to the colonists who were loyal to Great Britain during the War of Independence. In New England and the middle colonies loyalism had a religious as well as a political basis. It represented the Anglican as opposed to the Calvinistic influence. With scarcely an exception the Anglican ministers were ardent Loyalists, the writers and pamphleteers were the ministers and teachers of that faith, and virtually all the military or civil leaders were members of that Church. The Loyalists north of Maryland represented the old Tory traditions. In the southern colonies, where Anglicanism predominated, the division did not follow religious lines so closely. In Virginia and South Carolina the Whig leaders were almost without exception members of the established Church. Although many of the wealthy Anglican planters of the tide-water section fought for the mother country, the Tories derived their chief support from the non-Anglican Germans and Scots in the upper country. The natural leaders in these colonies were members of the same Church as the governor and vied with him in their zeal for the support of that Church. Since religion was not an issue, the disputes over questions purely political in character, such as taxation, distribution of land and appointment of officials, were all the more bitter. The settlers on the frontier were snubbed both socially and politically by the low-country aristocracy, and in North Carolina and South Carolina were denied courts of justice and any adequate representation in the colonial assembly. Naturally they refused to follow such leaders in a war in defence of principles in which they had no material interest. The failure of the British officers to realize that conditions in the south differed from those in the north, and the tendency on their part to treat all Dissenters as rebels, were partly responsible for the ultimate loss of their southern campaign. The Scoto-Irish in the south were mostly in sympathy with the American cause.

Taking the 13 colonies as a whole, loyalism drew its strength largely from the following classes: (1) the official class—men holding positions in the civil, military and naval services, and their immediate families and social connections; (2) the professional classes—lawyers, physicians, teachers and ministers; (3) large landed proprietors and their tenants; (4) the wealthy commercial classes in New York, Albany, Philadelphia, Baltimore and Charleston, whose business interests would be affected by war; (5) natural conservatives and numerous political trimmers and opportunists. Before 1776 the Loyalists may be divided into two groups. There was a minority of extremists led by the Anglican ministers and teachers, who favoured an unquestioning obedience to all British legislation. The moderate majority disapproved of the mother country's unwise colonial policy and advocated opposition to it through legally organized bodies. The aggressive attitude of Congress and the adoption of the Declaration of Independence finally forced them into armed opposition. Very few really sanctioned the British policy as a whole, but all felt that it was their first duty to fight for the preservation of the empire and to leave constitutional questions for a later settlement. John Adams's estimate that one-third of all the people in the 13 States in 1776 were Loyalists was perhaps approximately correct. In New England the number was small, perhaps largest in Connecticut and in the district which afterwards became the State of Vermont. New York was the chief stronghold. The "De Lancey party" or the "Episcopalian party" included the majority of the wealthy farmers, merchants and bankers, and practically all communicants of the Anglican Church. New Jersey, Pennsylvania, Delaware, Maryland and Virginia contained large and influential Loyalist minorities; North Carolina was about equally divided; South Carolina probably, and Georgia certainly, had Loyalist majorities. Some of the Loyalists joined the regular British army, others organized guerrilla bands and with their Indian allies inaugurated a reign of terror on the frontier from New York to Georgia. New York alone furnished about 23,500 Loyalist troops. This was more than any other colony supplied, perhaps more than all the others combined. Johnson's "Loyal Greens" and Butler's "Tory Rangers" served under Gen. St. Leger in the Burgoyne campaign of 1777, and the latter took part in the Wyoming and Cherry Valley massacres of 1778. The strength of these Loyalists in arms was weakened in New York by Gen. Sullivan's success at Newtown (now Elmira) in 1779, and broken in the northwest by George Rogers Clark's victories at Kaskaskia and Vincennes in 1778 and 1779, and in the south by the battles of King's Mountain and Cowpens in 1780.

Severe laws were passed against the Loyalists in all the States. They were in general disfranchised and forbidden to hold office or to practise law. Eight of the States formally banished certain prominent Tories, and the remaining five, Connecticut, New Jersey, Delaware, Maryland and Virginia, did practically the same indirectly. Social and commercial ostracism forced many others to flee. Their property was usually confiscated for the support of the American cause. They went to England, to the West Indies, to the Bahamas, to Canada and to New York, Newport, Charleston and other cities under British control. According to a trustworthy estimate 60,000 persons went into exile during the years from 1775 to 1787. The great majority settled in Nova Scotia and in Upper and Lower Canada, where they and their descendants became known as "United Empire Loyalists." Those who remained in the United States suffered for many years, and all the laws against them were not finally repealed until after the War of 1812. The British Government, however, endeavoured to look after the interests of its loyal colonists. During the war a number of the prominent Loyalists were appointed to lucrative positions, and rations were issued to many Loyalists in the cities held by the British. During the peace negotiations at Paris the treatment of the Loyalists presented a difficult problem. In the treaty, as finally ratified, the United States agreed to recommend to the legislatures of the various States that Loyalists should "have free liberty to go to any part or parts of any of the 13 United States, and therein to remain 12 months, unmolested in their endeavours to obtain the restitution of such of their estates, rights and properties as may have been confiscated," that acts and laws in the premises be reconsidered and revised, and that restitution of estates, etc., should be made. It was also provided "that there shall be no future confiscations made, nor any prosecutions commenced against any person" for having taken part in the war; and that those in confinement on such charges should be liberated. Congress made the promised recommendations, but they were unheeded by the various States. Great Britain, in retaliation, refused until 1796 to evacuate the western posts as the treaty prescribed. Immediately after the war parliament appointed a commission to examine the claims of the Loyalists for compensation for services and losses; and to satisfy these claims and to establish Loyalists in Nova Scotia and Canada the British Government expended fully £6,000,000.

See C. H. van Tyne, *The Loyalists in the American Revolution* (1902), which contains much valuable information but does not explain adequately the causes of loyalism. More useful in this respect is the monograph by A. C. Flick, *Loyalism in New York during the American Revolution* (1901); on the biographical side *see* Lorenzo Sabine, *Biographical Sketches of Loyalists of the American Revolution*

(Boston, 1864); on the literary side, M. C. Tyler, *Literary History of the American Revolution, 1763–1783* (1897); on the economic side, I. S. Harrell, *Loyalism in Virginia* (Durham, N.C., 1926). *See* also J. H. Sterk, *The Loyalists of Massachusetts and the Other Side of the Revolution* (Boston, 1907); Arthur Johnson, *Myths and Facts of the American Revolution* (Toronto, 1908); McLaughlin and Hart (Eds.), *Cyclopaedia of American Government,* vol. ii. (1914); W. H. Siebert, *The Loyalists of Pennsylvania* (Columbus, O., 1920).

LOYALTY ISLANDS (Fr. *Îles Loyalty* or *Loyauté*), a group in the South Pacific Ocean belonging to France, about 60 m. E. of New Caledonia, with a total land area of about 800 sq.m. There are three large islands Uea or Uvéa (the northernmost), Lifu (Lifou) the largest island, with an area of 650 sq.m., Maré or Nengone, and several small islands. They are coral islands of comparatively recent elevation, and in no place rise more than 250 ft. above the level of the sea.

The Loyalty islanders are Melanesians; the several islands have each its separate language, and in Uea one tribe uses a Samoan and another a New Hebridean form of speech. The Loyalty group was discovered at the beginning of the 19th century, and Dumont d'Urville laid down the several islands in his chart. Christianity was introduced into Maré by native teachers from Rarotonga and Samoa. Enough of the rocky surface is covered with a thin coating of soil to enable the natives to grow yams, taro, bananas, etc. Fresh water, rising and falling with the tide, is found in caverns in Lifu, and by sinking to sea-level a supply may be obtained in any part of the island. Coconuts are the chief product; copra and rubber the chief exports.

LOYOLA, ST. IGNATIUS OF [Inigo Lopez de Loyola], (1491–1556), founder of the Society of Jesus, was born in 1491, at the castle of Loyola in the province of Guipuzcoa, Spain. At an early age he was sent as a page to the court of Ferdinand and Isabella; afterwards, until his 26th year, he took service with the duke of Najera, and followed the career of arms. He already gave indications of that courage, constancy, prudence and political ability which marked his after life.

The turning point in his career came in 1521 when he was wounded during the French attack on Pampeluna, the capital of Navarre. During convalescence the reading of a Castilian translation of *The Life of Christ* by Ludolphus of Saxony, and the popular *Flowers of the Saints,* led to an intense mental struggle. Sometimes he would pass hours thinking of a certain illustrious lady, devising means of seeing her and of winning her favour; at other times the spiritual aspirations suggested by the books got the upper hand. During the struggle he began to note his psychological state; and this was the first time that he exercised his reason on spiritual things; the experience thus painfully gained he found of great use afterwards in directing others. One night while he lay awake, he tells us, he saw the likeness of the Blessed Virgin with her divine Son; and immediately a loathing seized him for the former deeds of his life, especially for carnal desires; and he asserts that for the future he never yielded to any such desires. His conversion was now complete, and as soon as he regained strength he went to the great Benedictine abbey of Montserrato, where he made his confession.

He found in use for the pilgrims a translation of the *Spiritual Exercises* of the former abbot, Garcia de Cisneros (d. 1510); and this book evidently gave him the first idea of his more famous work under the same title. Giving away his rich clothes to a beggar, he placed on the Lady altar his sword and dagger, and spent the night before them. In the morning he received the Holy Eucharist and left for a cavern near Manresa. Seven hours a day he spent in prayer and three times a day he scourged his emaciated body. One day, almost overcome with scruples, he was tempted to end his miseries by suicide. At another time, for the same reason, he kept an absolute fast for a week. But he assisted others who came to him for spiritual advice; and seeing the fruit reaped from helping his neighbour, he gave up the extreme severities and began to take more care of his person, so as not needlessly to offend those whom he might influence for good. Having recovered from a severe illness, Ignatius set out in 1523 on his long-planned pilgrimage to Jerusalem via Barcelona, Rome and Venice. On his arrival in September, the Franciscans in charge of the holy places threatened him with excommunication if he remained, for not only had they great difficulty in supporting themselves, but they dreaded an outbreak from the fanatical Turks.

Returning to Barcelona in 1524, he began to learn Latin, and after two years went to Alcalá to begin philosophy. There he gave to some companions his *Spiritual Exercises* in the form they had then taken and certain instructions in Christian doctrine. These discourses brought upon him ecclesiastical suspicion and he was prohibited from instructing others until he had spent four years in study. He incurred similar suspicion at the University of Salamanca, to which he had gone in 1527. By February of the following year he had become a student of the University of Paris. During the term he earned his livelihood by begging, and during his vacations, travelled in Flanders. At Bruges he met the famous Spanish scholar, Juan Luis Vives. In the summer of 1530 he went to London.

At the end of 1529 he came into contact with the men who were to become the first fathers of the Society of Jesus. He won over the Savoyard Pierre Favre (Faber), whose room he shared, and the Navarrese Francis Xavier, who taught philosophy in the college of St. Barbara. Afterwards he met the young Castilian, Diego Laynez, who had heard of him at Alcalá and found him out in Paris. With Laynez came two other young men, the Toledan Alfonso Salmeron and the Portuguese Simon Rodriguez. Nicholas Bobadilla, a poor Spaniard who had finished his studies, was the next to join him. The little company of seven determined to consecrate their union by vows. On Aug. 15, 1534, the Feast of the Assumption, they assembled in the crypt of the church of St. Mary on Montmartre, and Faber, the only one who was a priest, said Mass. They then took the vows of poverty and chastity, and pledged themselves to go to the Holy Land as missionaries or for the purpose of tending the sick; or if this design should prove impracticable, to go to Rome and place themselves at the disposal of the pope for any purpose. But, there was on this occasion no foundation of any society; the vows were individual obligations. A provision was made that if, after waiting a year at Venice, they were unable to go to Jerusalem, they should betake themselves to Rome.

After taking the master's degree in March 1535, ill health required Ignatius to return to Spain a few months later. When he arrived near Loyola he would not go to the castle, but lived at the public hospice at Azpeitia, and began his usual life of teaching Christian doctrine and reforming morals. He then made his way to Venice, where he arrived during the last days of 1535. Here he waited for a year until his companions could join him, and meanwhile occupied himself in his usual good works, gaining several more companions. He was again accused of heresy, and it was said that he had escaped from the Inquisition in Spain and had been burnt in effigy at Paris, but these charges he was able to meet successfully. His companions arrived at Venice in Jan. 1537, and being sent by their leader to Rome, secured abundant alms for their proposed voyage to Palestine from Paul III. who also gave licence for those not yet priests to be ordained by any bishop on the title of poverty. Ignatius and the others had been ordained at Venice in June 1537. Ignatius waited for 18 months before saying Mass, which he did for the first time on Dec. 25, 1538, in the church of Santa Maria Maggiore in Rome.

The year of waiting passed away without any chance of going to the Holy Land. Consequently it was decided that he, Laynez and Faber should go to Rome to place the little band at the disposal of the pope. It was now that the Society began to take some visible form. A common rule was devised and a name adopted. Ignatius declared that having assembled in the name of Jesus, the association should henceforth bear the name of the "Company of Jesus." The word used shows Loyola's military ideal of the duties and methods of the nascent society.

On the road to Rome a famous vision took place. In a certain church near Rome, whilst in prayer, he was aware of a change in his soul; and so openly did he see God the Father associating him with Christ who said "Ego vobis Romae propitius ero," that he could not dare to doubt the reality of his vision. The pope appointed Faber to teach Scripture, and Laynez theology, in the university of the Sapienza. Ignatius was to carry on his spiritual work, which became so strenuous that he was obliged to call his other companions to Rome.

The "Spiritual Exercises."—His life is now mainly identified with the growth of his Society (*see* JESUS, SOCIETY OF), for which he obtained, after difficulty, official recognition from Paul III on Sept. 27, 1540. He was unanimously elected the first general in April 1541; and on the 22nd of that month received the first vows of the Society in the church of San Paolo *fuori le mura*. He was now chiefly occupied with the completion of the *Spiritual Exercises* and the drawing up of the *Constitutions*, which received their final form after his death. For the latter *see* the article JESUS, SOCIETY OF. *The Book of the Spiritual Exercises* has been one of the world-moving books. In its strict conception it is only an application of the Gospel precepts to the individual soul, written to arouse conviction of sin, of justice and of judgment. While taking the title, the idea of division into three periods during which purity of soul, enlightenment and union are to be worked for, and the subjects of most of the meditations from the *Exercitatorio de la vida spiritual* (1500) of Abbot Garcia de Cisneros, Ignatius skilfully adapted it to his own requirements. With his military instinct and views of obedience, Ignatius intervenes between the soul and God with a director who gives the exercises to the person who receives them. The *Spiritual Exercises* have proved their value over and over again, and have received the sincerest form of flattery in countless imitations. The original parts of the book are to be found principally in the meditations; these are *The Reign of Christ,* wherein Christ as an earthly king calls his subjects to war: and *Two Standards,* one of Christ and the other of Lucifer. The practical results of the experiences of Ignatius in the early stages of his conversion, appear in his various methods of prayer; methods of making an election; his series of rules for the discernment of spirits; rules for the distribution of alms and the treatment of scruples; and tests of orthodoxy.

The exercises are divided into four series of meditations technically called "weeks," each of which may last as long as the director considers necessary. The first week is the foundation, and has to do with the consideration of the end of man, sin, death, judgment and hell. After the soul has been purified from sin, the second week treats of the kingdom of Christ, and is meant to lead the soul to make an election of the service of God. The third and fourth weeks are intended to confirm the soul in the new way, to teach how difficulties can be overcome, to inflame it with the love of God and to help it to persevere. Most of the latest critics give 1548 as the date when the book received its final touches. Ignatius wrote originally in Spanish, but the book was twice translated into Latin during his lifetime.

In 1547 Ignatius tried to resign the generalship of his Society and again in 1550, but the fathers unanimously opposed the project. One of his last trials was to see in 1556 the new pope Paul IV., wishing to reform certain points in the Society that Ignatius considered vital. He said: "If this misfortune were to fall upon me, provided it happened without any fault of mine, even if the Society were to melt away like salt in water, I believe that a quarter of an hour's recollection in God would be sufficient to console me and to re-establish peace within me." He never dreamed of putting his Society before the church nor of identifying the two.

In 1556 Ignatius grew very weak and resigned the active government to three fathers, Polanco, Madrid and Natal. Fever laid hold of him, and he died somewhat suddenly at Rome on July 31, 1556, without receiving the last sacraments. He was beatified in 1609 by Paul V. and canonized in 1622 by Gregory XV. His body lies under the altar in the north transept of the Gesù in Rome.

The character of Ignatius was naturally impetuous and enthusiastic, but became marked with great self-control as he gradually brought his will under his reason. He developed a sovereign prudence which nicely adjusted means to the end in view. He impressed on his followers the doctrine that in all things the end was to be considered, but he never countenanced so perverted an idea as that the end justified the means, for with his spiritual light and zeal for God's glory he saw clearly that means in themselves unjust were opposed to the very end he held in view. As a ruler he displayed the same common sense. Obedience he made one of his great instruments, yet he never intended it to be a galling yoke. His doctrine on the subject is found in the well-known letter to the Portuguese Jesuits in 1553, and if this be read carefully together with the *Constitutions* his meaning is clear.

There was in his temperament a peculiar mixture of conservatism and a keen sense of the requirements of the day. In intellectual matters he was not in advance of his contemporaries. While he did not reject any approved learning, he abhorred any intellectual culture that lessened piety. Bartoli, the official biographer of Ignatius, says that he would not permit any innovation in the studies; and that, were he to live 500 years, he would always repeat "no novelties" in theology, in philosophy or in logic—not even in grammar. Ignatius felt that the revival of learning had led many away from Christ; intellectual culture must be used as a means of bringing them back.

BIBLIOGRAPHY.—The principal source for the life of St. Ignatius is the *Monumenta Ignatiana* (15 vols., Madrid, 1903–19). The other volumes of the *Monumenta Historica Societatis Jesu* also have considerable importance in this connection, especially *Vita Ignatii Loiolae* (6 vols., 1894–98). The autobiography of St. Ignatius written down by L. Gonçalves da Camara (*Monumenta Ignatiana,* Series IV, vol. I, 31–98) was translated into English by E. M. Rix, 1900 and J. F. X. O'Conor, 1900. The *Vida* (1594, English translation 1606) by P. de Ribadeneira is the work of an associate. *See* also D. Bartoli, *Della vita e dell' istituto di S. Ignatio* (1650, 1659); H. Joli, *St. Ignace de Loyola* (1899); Francis Thompson, *Saint Ignatius Loyola* (ed. J. H. Pollen, 1909); J. H. Pollen, *St. Ignatius Loyola* (1922); Stewart Rose, *Saint Ignatius Loyola and the Early Jesuits* (1891); Astrain, *A Short Life of St. Ignatius* (trans. by Hull, 1928); Sedgwick, *Ignatius Loyola: An Attempt at an Impartial Biography* (1923); Van Dyke, *Ignatius Loyola, The Founder of the Jesuits* (1926); A. Huonder, *Ignatius von Loyola, Beiträge zu seinem Charakterbild* (1932) (in this work very extensive use is made of the *Monumenta Ignatiana*); P. Dudon, *St. Ignace de Loyola* (1934); P. Leturia, *El gentil hombre Iñigo Lopez de Loyola en su siglo* (1938) is fundamental for the early life of the saint.

The literature connected with the *Spiritual Exercises* is also large. The *Monumenta Ignatiana* has a volume *Exercitia spiritualia* (Madrid, 1919). The *editio princeps* is that of Rome, 1548. J. P. Roothaan published *Exercitia spiritualia S. P. Ignatii de Loyola cum versione litterali ex autographo hispanico* (1841). *See* also Watrigant, *Genèse des Exercices de S. Ignace de Loyola* (1897); Codina, *Origenes de los Ejercicios Espirituales de S. Ignacio de Loyola* (1926); *Collection de la Bibliothèque des Exercises de S. Ignace; The Spiritual Exercises of Saint Ignatius of Loyola* (Spanish and English, with commentary by J. Rickaby, 1915); *The Spiritual Exercises* (Eng. trans. with commentary by W. H. Longridge, 1919). The *Constitutiones* were published in Latin and Spanish at Madrid in 1892. *Monumenta Constitutionum praevia* (Rome, 1934); *Textus hispanus* (1936); *Textus Latinus* (1938).

LOYSON, CHARLES (1827–1912), better known as Père Hyacinthe, French preacher, was born at Orléans March 10, 1827, and entered the Carmélite order. He drew large crowds to his Advent sermons in Notre-Dame between 1865 and 1869, but his orthodoxy fell under suspicion, and in 1870 he associated himself with Döllinger (*q.v.*) in his protest against papal infallibility. Being excommunicated he removed first to Geneva and then to London. He married an English lady, Emily Jane Merriman, and settled in Paris in 1877, where he founded an Old Catholic Church. He died in Paris Feb. 9, 1912.

LOZENGE, a figure with four equal sides, having two acute and two obtuse angles, frequently used as a bearing in heraldry or as a shield on which the arms of a widow or spinster are emblazoned. The diamond-shaped facets of a precious stone when cut and the diamond panes of a casement window are called *lozenges*. In the 14th century the "lozenge pattern" was a favourite design for decoration. The word is also applied to a small tablet containing medical drugs, etc. In the reign of James I. of Scotland (1406–37) a Scottish gold coin having a lozenge-shaped shield with the arms of Scotland on the obverse side was called a "lozenge-lion." The origin of the word is obscure, *cf.* Span. *losa,* a stone slab laid on a grave.

LOZÈRE, a department of south-eastern France belonging to the central plateau, composed of almost the whole of Gévaudan and of some portions of the old dioceses of Uzès and Alais, districts all formerly included in the province of Languedoc. Pop.

(1936) 98,480. Area, 2,000 sq.mi. It is bounded N. by Cantal and Haute-Loire, E. by Ardèche and Gard, S. by Gard and Aveyron and W. by Aveyron and Cantal. The north of this mountainous department includes the granitic mountains of La Margeride, reaching 5,098 ft. and wooded on their lower slopes, and the volcanic range of Aubrac (4,826 ft.), both orientated north-north-west and south-south-east. South of these the Lot crosses the department on its way from the Cévennes in the south-east. The south-west of the department is occupied by the arid, calcareous Jurassic plateau (3,000 to 3,300 ft.) called the *causse* de Sauveterre and the *causse* de Méjan, the two *causses* being separated by the beautiful Tarn gorge. On the Mediterranean versant there are 76 in. of rain; in the Garonne basin 46 and in that of the Loire only 28. Sheep- and cattle-rearing and cheese-making are the chief occupations. Bees are kept, and, among the Cévennes, silkworms. Large quantities of chestnuts are exported from the Cévennes, where they form an important article of diet. In the valley of the Lot wheat and fruit are the chief products; elsewhere rye is the chief cereal, and oats, barley, meslin and potatoes are also grown. There is much terrace cultivation. Silver, lead, copper and antimony are found. Saw-milling, wool-spinning, the manufacture of wooden shoes and of woollen goods are carried on. Of mineral springs, those of Bagnols-les-Bains are most frequented. The line of the P.L.M. company from Paris to Nîmes traverses the eastern edge of the department, which is also served by the Midi railway with the line from Neussargues to Béziers via Marvéjols. The arrondissements are Mende and Florac; the cantons number 24, the communes 198. Lozère forms the diocese of Mende and part of the ecclesiastical province of Albi. It falls within the region of the XVI. army corps (Montpellier), the *académie* (educational division) of Montpellier and the appeal court of Nîmes. Mende (*q.v.*) is its most important town. There are many dolmens in the department.

LUANG-PRABANG, Lao state in northwest French Indo-China. Population (1936) 197,000, area 21,467 sq.mi., of which about one-third was ceded to Thailand in 1941. Luang-Prabang town has less than 10,000 population, but is the site of an important airfield. At the head of Mekong river navigation, it has a small trade in rice, silk, wax, sticklac and a wide variety of timbers, gums, resins and other forest products. The Chinese and Shans carry on most of the trade. The Mekong is much less important as a trade artery than other large oriental rivers, for as many as eight transshipments between Saigon and Luang-Prabang are made necessary by the rapids, at low water. The French projected a highway from Saigon to Luang-Prabang, and in 1943 the Japanese broadcast claims to having completed the 1,049-mi. project. For centuries Luang-Prabang was the centre of a great kingdom, covering much of Laos (*q.v.*) and some of Thailand. Thai-Annamite rivalry in the 18th and 19th centuries established the sovereignty of the former, although the king of Luang-Prabang was not deposed. The French took the two-thirds of Luang-Prabang on the Mekong's east bank in 1893, and the remainder in 1904. In 1941 the Thai won back the western part in a border war, re-establishing the Mekong as boundary. (J. R. A.)

LUBAO, a municipality (with 35 *barrios* or districts) in the S.W. part of the province of Pampanga, Luzon, Philippine islands, about 30 mi. N.W. of Manila. Pop. (1939) 29,154. It lies along the Manila-Dagupan railway and has water communication with Manila by tidal streams and Manila bay. It lies in a low fertile plain suitable for the growing of rice and sugar. Thatch and alcohol are made from the nipa palms found in the swamps. Of the inhabitants aged 6 to 19 inclusive, 36.5% in 1939 attended school.

LÜBBEN, a town of Germany, in the Prussian province of Brandenburg, on the Spree, 47 mi. S.S.E. of Berlin. Pop. (1939) 10,778. It is the chief town of the Spreewald, and has saw-mills and is famous for its *gurken,* or small pickling cucumbers.

LUBBER'S POINT, a pointer on a line inside the bowl of a magnetic compass which is used as a reference mark in computing the angle between the ship's course and the geographical meridian. (*See* COMPASS: *The Compass Card.*)

LUBBOCK, a city of northwestern Texas, U.S.A., is the hub city of 15 counties immediately surrounding and commonly known as the south plains of Texas. It is on federal highways 62, 82, 84 and 87 and state highway 290, and is served by the Panhandle Santa Fe railway and Fort Worth and Denver City railway. Altitude is 3,251 ft. County seat of Lubbock county. The population in 1930 was 20,520 (90·7% native white), and in 1940 it was 31,853 by the federal census. It is the geographical, trading, financial, industrial, commercial and educational centre of the South Plains area. Lubbock is the concentration point for all South Plains' cotton and is the third largest inland cotton market in the world. Around 500,000 bales are ginned annually in the territory. Other crops are grain sorghums, sudan grass, corn, wheat, dairy and poultry products. Lubbock manufactures around 4,700,000 lb. of butter annually. Texas Technological college opened for students on Oct. 1, 1925, has an enrolment of 3,797 students and is the third largest college in Texas. The city has a commission-manager form of government.

LÜBECK, a city and former state of Germany. The *province* of Lübeck, north of the *state,* is a constituent part of the *Land* of Oldenburg (*q.v.*). Lübeck is situated on an arm of the Baltic between Holstein and Mecklenburg-Strelitz. It consists of the city of Lübeck, the town of Travemünde, villages and the country districts, embraces 115 sq.mi. of territory, and had a population in 1939 of 153,630, of which more than 100,000 were included in the city and its suburbs. The territory, lying in the Baltic lowlands, is watered by the Trave and its tributaries, the Wakenitz and the Stecknitz.

The constitution of the former state was republican, and by the constitution of 1925 consisted of two assemblies: (1) The House of Burgesses (Bürgerschaft) consisting of 80 members elected by free suffrage. This was the supreme authority and elected (2) the Senate executive which consisted of 12 members. Lübeck was incorporated in the Prussian province of Schleswig in 1937.

At the first rise of the town justice was administered by the *Vogt* (*advocatus*) of the count of Holstein. Simultaneously with its incorporation by Henry the Lion, duke of Saxony, there appears a magistracy of six, chosen probably by the *Vogt* from the *Schöffen.* By the middle of the 13th century the number of magistrates had increased, ranging from 20 to 40 and upwards. In the face of so much self-government the *Vogt* presently disappeared. There were three classes of inhabitants, full freemen, half freemen and guests or foreigners. People of Slav origin being considered unfree, all intermarriage with them tainted the blood; hence nearly all surnames point to Saxon, especially Westphalian, and even Flemish descent. The magistracy was for two centuries almost exclusively in the hands of the merchant aristocracy, who formed companies such as the *Bergen-fahrer, Novgorod-fahrer, Riga-fahrer* and *Stockholm-fahrer*. Tradesmen and handicraftsmen who had settled in the town, though not eligible for the council, shared to a certain extent in the self-government through the aldermen of each corporation or gild, of which some appear as early as the statutes of 1240. Naturally, there arose much jealousy between the gilds and the aristocratic ruling companies.

After an attempt to upset the merchants had been suppressed in 1384, the gilds succeeded in 1408. In 1416, however, owing to the pressure brought to bear by the Hansa, by the emperor Sigismund and by Eric, king of Denmark, there was a restoration. The aristocratic government was again expelled under the dictatorship of Jürgen Wullenweber (*c.* 1492–1537), till the old order was re-established in 1535. In the constitution of 1669, under pressure of debt, the great companies yielded a specified share in the financial administration to the leading gilds of tradesmen. From 1813 the popular representatives had some share in the management of the finances. But the reform committee of 1814, whose object was to obtain an extension of the franchise, had made little progress, when the events of 1848 led to the establishment of a representative assembly of 120 members, elected by universal suffrage, which obtained a place beside the senatorial government. After 1937 Lübeck was governed by the nazi *Gauleiter* of Schleswig-Holstein, Heinrich Lohse.

The City.—Lübeck, the capital of the territory, was formerly the head of the Hanseatic League. It lies between the rivers Trave and Wakenitz, 10 m. S.W. of the mouth of the former in the bay of Lübeck, 40 m. by rail N.E. of Hamburg, at the junction of lines to Eutin, Büchen, Travemünde and Kleinen (in Mecklenburg-Schwerin) and consists of an inner town and three suburbs. Its five chief churches are Gothic. Of them, the *Marienkirche* (13th century), is one of the finest specimens of early Gothic in Germany. The cathedral, or *Domkirche,* founded in 1173, contains some curious sarcophagi and a fine Memling altar-piece. The *Rathaus* (town hall), dating from various epochs during the middle ages, is famous for its staircase, the vaulted wine cellar of the city council beneath and wood carving. There should also be mentioned the *Schiffershaus;* the mediaeval gates (*Holstentor, Burgtor*); and the Hospital of the Holy Ghost.

Its position as the first German emporium of the west end of the Baltic has been impaired by Hamburg and Bremen since the construction of the North Sea and Baltic Canal, and by the growth of Stettin. In order to counterbalance their rivalry, the quays have been extended, a canal was opened in 1900 between the Trave and the Elbe, and the river up to the wharves has been deepened to 25 feet. The river is kept open in winter by ice-breakers. A harbour was made in 1899–1900 on the Wakenitz Canal for boats engaged in inland traffic. Lübeck trades principally with the Baltic states and Scandinavia. In 1938 the tonnage of incoming ships was 1,132,000 and of outgoing 1,130,000, the number of ships being respectively 4,955 and 4,927. The chief imports are coal, grain, timber, copper, steel and wine, and the exports are artificial manures, gypsum and manufactured goods.

HISTORY

Old Lübeck, which stood on the left bank of the Trave where it is joined by the river Schwartau, was destroyed in 1138. Five years later Count Adolphus II. of Holstein founded new Lübeck, a few miles farther up, on the peninsula Buku, where the Trave is joined on the right by the Wakenitz. An excellent harbour, sheltered against pirates, it became almost at once a competitor for the commerce of the Baltic. Henry the Lion, duke of Saxony, who, about 1157, had forced his vassal, the count of Holstein, to give up Lübeck to him, issued the first charter to the citizens and constituted them a free Saxon community. The population grew rapidly in wealth and influence by land and sea, so that, when Henry was attainted by Frederick I., who came in person to besiege Lübeck in 1181, the emperor, "in consideration of its revenues and its situation on the frontier of the Empire," fixed by charter (Sept. 19, 1188) the limits, and enlarged the liberties, of the free town. By the end of the next century the statutes of Lübeck had been adopted by most Baltic towns with a German population: it was the court of appeal for nearly all these cities and even for the German settlement in Novgorod. From the beginning of the 14th century Lübeck presided over a league of cities, including Wisbeck, Rostock, Stralsund and Greifswald. Lübeck was the leading spirit in the nominally federal armament directed against Waldemar IV., the destroyer of Visby, which captured Copenhagen and enforced the peace of Stralsund (May 24, 1370); the burgomaster of Lübeck, Brun Warendorp, commanding the combined naval and land forces and dying on the field of battle. The seal of the city was in 1368 adopted as the common seal of the confederate towns. Though the power of the Hanseatic league was hemmed in at the end of the 15th century by the rise of the power of Burgundy, of Poland and Russia, and of Scandinavia, Lübeck was able to carry on war against Denmark (1501–12) and Sweden (1536–70) and under its democratic burgomaster, Jürgen Wullenweber, was in 1534 and 1535 a powerful force in the north of Europe.

From this time the power of Lübeck began to decline. The herring, a great source of early wealth, had begun to forsake the Baltic as early as 1425. The last Hanseatic diet was held in 1630. Signs of some small recovery began to appear at the end of the 18th century, but the Danes occupied the town in 1801; in 1803 it was sacked by the French and in 1810 annexed to Napoleon's empire. It was declared a free and Hanse town of the German Confederation, after his fall, by the Act of Vienna (June 9, 1815). Lübeck joined the North German Confederation in 1866; its history thenceforward was relatively uneventful until World War II. On March 28, 1942, because of its important naval stores, oil tanks, submarine shipyards and training school, and numerous factories, it was subjected to a heavy British air raid. The effect was catastrophic.

Bombs and fires reduced 40% of the city—about 200 ac.—to rubble and ashes.

King, *Chronicles of Three Free Cities, Hamburg, Bremen and Lübeck* (1914); F. Entres, *Geschichte der freien und Hansestadt Lübeck* (Lübeck, 1926). Thomas Mann's novel, *Buddenbrooks,* gives an excellent picture of Lübeck life in the 19th century.

LUBLIN, a province of Poland, bounded N. by Bialystok, E. by Volhynia and Polesie (the Bug forming the boundary), S. by Lemberg, and W. by Kielce (the Vistula separating the two). Area, 12,027 sq.mi. The surface is an undulating plain of Cretaceous deposits, 800 to 900 ft. in altitude, and reaching in one place 1,050 ft. It is largely covered with forests of oak, beech and lime, intersected by ravines and thinly inhabited. A marshy lowland extends between the Vistula and the Wieprz. The government is drained by the Vistula and the Bug, and by their tributaries, the Wieprz, Liwiec and Tanev. Parts of the province, being of black earth, are fertile, but other parts are sandy. Agriculture is in good condition. Many Germans settled in the government before immigration was stopped in 1887; in 1897 they numbered about 26,000. Rye, oats, wheat, barley and potatoes are the chief crops, rye and wheat being exported. Flax, hemp, buckwheat, peas, millet and beetroot are also cultivated. Horses are carefully bred. In 1931 the population was 2,467,000. Industrial establishments consist chiefly of distilleries, sugarworks, steam flour mills, tanneries, sawmills and factories of bentwood furniture. The province is divided into 19 districts, the chief towns of which are Lublin, capital of the province (112,522 in 1931; 122,000 est. in 1939), Siedlce (36,927) and Chelm.

The province was overrun by German troops in the early stages of World War II.

LUBLIN, a town of Poland, capital of the province of the same name, 109 mi. by rail S.E. of Warsaw, on a small tributary of the Wieprz. Pop. (1931) 112,522; (est. 1939) 122,000. It is one of the centres of the manufacture of thread-yarn, linen and hempen goods and woollen stuffs; there is also trade in grain and cattle. It has an old citadel, a university, several palaces of Polish nobles and many interesting churches, and is the see of a Roman Catholic bishop. The cathedral dates from the 16th century. Of the former fortifications nothing remains except the four gates, one dating from 1342.

Lublin was in existence in the 10th century, and has a church which is said to have been built in 986. During the time the Jagellon dynasty ruled over Lithuania and Poland it was the most important city between the Vistula and the Dnieper, having 40,000 inhabitants (70,000 according to other authorities) and all the trade with Podolia, Volhynia and red Russia. Indeed, the present town is surrounded with ruins, which prove that it formerly covered a much larger area. But it was frequently destroyed by the Tatars (*e.g.,* 1240) and Cossacks (*e.g.,* 1477). In 1568–69 the union of Poland and Lithuania was decided there. In 1702 another convention was held in Lublin, in favour of Augustus II and against Charles XII of Sweden, who carried the town by assault.

In 1831 Lublin was taken by the Russians. Returned to Poland in 1918, it was taken by Germany in 1939.

LUBRICANTS. The lubricants are of three classes; solid, semi-solid and liquid. Various forms of graphites or plumbago and soapstone constitute the first class. The second class is composed mainly of the animal fats and of greases that are made of a combination of fats and oils thickened either with a calcium soap or a sodium soap, or with a combination of the two. The third class consists of a great variety of oils that are derived from the animal, vegetable and mineral kingdoms. Animals as well as vegetables secrete a fatty matter which serves as a reserve supply of food for the growing organisms. The fat is generally present in the form of small globules suspended in the cell liquids.

In animals, the fat is in layers and the oil from this fat is rendered by heating or by boiling with water. The most abundant supply of vegetable oil is found in the seeds or the fruits. The oil is rendered by pressing out ("expression") or by solvents such as ether or petroleum naphtha. (*See* OILS, FATS AND WAXES.)

The lubricants are obtained from the minerals through the distillation of brown coal or peat, of shale and of bituminous coal; although lubricants have not been produced to any great extent from these sources. The greatest amounts are obtained from crude petroleum found in many parts of the world and these are the lubricants that are being used to-day on the greatest proportion of the world's machinery. The petroleum lubricants are recovered by distillation of the crude in steam stills or vacuum stills. The lubricants all have a characteristic greasy touch and an individual taste and smell, all subject to some variation through methods of manufacture. The manner in which the lubricant is made also has certain influences upon its greasiness, its cohesion or power of holding together so that it will drag between wedge-like surfaces, and its ability to cling to metal.

PHYSICAL CHARACTERISTICS

All fluid lubricants have certain physical characteristics that can be determined in the laboratory, such as specific gravity, which is the weight of the oil as compared to the weight of a similar amount of distilled water. The flash and the fire points denote the temperature at which vapours are emitted that form a lean mixture with the air and can be ignited to produce a flash. At a higher temperature more vapour is emitted and the mixture burns steadily. The cloud test represents the temperature at which wax begins to form in the paraffin oils. The pour test is determined by the temperature at which the oil ceases to flow. The "fluidity" of the oil at various temperatures is the measure of its viscosity. (*See* VISCOSITY.) The carbon residue (Conradson) test indicates the percentage of residue left after the oil has been completely burned. Saponification and emulsification values, acidity, colour and many other tests are also made.

The foregoing tests have been standardized by the American Society for Testing Materials (*see* A.S.T.M. *Transactions*) and have been adopted by the U.S. Government, by all refiners and by the industries. (*See* the *U.S. Government Master Specifications for Lubricants and Liquid Fuels.*) In the practical work of lubrication, the viscosity, the carbon residue and the tests that indicate the ability of a lubricant to withstand physical change are the most important.

Viscosity.—The fixed lubricants, that is, the animal or vegetable oils, have a viscosity curve that is a characteristic of the oil and indicates its source. The mineral oils can be made of any desired body or viscosity at any temperature by methods of distillation or by blending the heavy-bodied with the light-bodied lubricants. Viscosity is a necessary feature of an oil's ability to support loads; it is also a measure of its internal friction and an indication of its film thickness. The amount of frictional resistance to the motion of machinery is entirely dependent upon the viscosity of the lubricant and its suitability for the conditions under which it has to work. The heat generated in a bearing, if it all could be collected and measured, would be found to be the precise measure of the power lost in overcoming the solid friction of the dry surfaces moving on each other or of the fluid friction of the lubricant between such surfaces. This heat, as it develops, flows out through the metal and is radiated to the air, its rate of flow being dependent upon the construction of the bearing and the kind and location of the machine. (*See* BEARINGS; INTERNAL COMBUSTION ENGINES.)

All oils change in viscosity with the application of heat though not all of them to the same degree at lower temperatures because of the nature of the crudes from which the mineral oils are made, as well as some of the methods of manufacture. The viscosity also increases with the increase of bearing pressure. The varying viscosity of the oils through the effect of heat and pressure is the most important item to be considered in making applications of the lubricants to practical operations. Every bearing requires a certain amount of time to work to a steady temperature above that of the surrounding atmosphere; after that it will remain in equilibrium for that speed and load condition, varying only with the temperature of the surrounding air. The lubricant, when cold, may be of exactly the proper viscosity to keep the surfaces apart. However, the heat generated within the oil itself through fluid friction may be sufficient to lower the viscosity so that actual striking of the high points of the surfaces will take place. It is necessary therefore to use a heavier oil than that theoretically required, depending upon the heat of operation to bring it to the desired viscosity for the machine condition. The frictional resistance of the machine will be high when starting, but the operation will be safe and free from wear at running temperatures. When the heat generated in a bearing equals the heat radiated, the body of the oil remains steady and the power required for the operation is likewise steady.

METHOD OF APPLICATION

The manner of applying the lubricant is an influencing factor; intermittent lubrication, with its flooded and its dry periods, causes considerable losses. Supplying the lubricant to the film at frequent intervals by drop oilers can prevent most solid friction, but the heat is not carried away by the oil to the same extent as obtains in bath lubrication where the heat is conveyed to a reservoir where it can be dissipated over a larger surface.

Effect of Heating and Cooling.—In the case of marine turbine installations where but one oil is used in the circulating force-feed oiling system, it may be necessary to have certain parts of the equipment, such as the reduction gears, lubricated with a higher viscosity oil. This can be done by putting an oil cooler in a by-pass of the system; the oil from this cooler would then be higher in viscosity than the main body of the oil. Heaters and coolers can be put in the system for the purpose of keeping all of the oil at the required viscosity, or a heater can be put in a by-pass to secure as thin an oil as required for some particular high speed condition.

The Hot Bearing.—Undue heating in a bearing is caused by a film of lubricant interrupted by dirt or some unusual stress. The high points of the bearing surfaces then strike and set up local heating. When this continues abrasion takes place, the oil becoming black on account of metal particles and finally charring. As heating continues the film of lubricant becomes thinner, the metal expands and finally the film and surfaces rupture. This situation can be prevented by supplying large quantities of cool oil, which will carry the heat away, allowing the bearing conditions to become normal. The circulating system, either for gravity or for force feed, does this automatically. As the oil heats it flows faster from the bearing and this carries more heat away. The increased flow of cool oil into the bearing reduces the temperature of the metal and keeps the surfaces apart until they are back to normal when the oil feed slows up due to pipe friction induced by the higher viscosity of the cooler oil.

Reduction in Power.—When the lubricant in use in a spindle base is too high in viscosity, the machine starts with difficulty; the spindle will not turn its proper number of revolutions per minute because the belt slippage is excessive. When such an oil has reached its heat and viscosity equilibrium, the fluid friction and power consumption will still be too great and the temperature of the base will be high in consequence. When a condition such as this exists, changing the oil to one more suitable will cause a considerable reduction in the power necessary to operate the machine. At the same time the reduced resistance in the spindle base reduces its temperature and allows the spindle to rotate at a faster speed which may mean greater production. If a lubricant that is too thin is used, the conditions are those approaching solid friction; excessive power is consumed, wear is continuous and the heat produced expands the metals until they seize.

Automotive Engines.—An unbalanced condition exists in regard to the lubricants used in these engines that has never occurred before with the lubrication of any other class of machinery. These engines use petroleum gasolene or petrol for power and certain parts of this fuel find their way to the crankcase of the engines, where they combine with the lubricant.

Certain other parts of the lubricant are thrown up against the hot surfaces, and reach temperatures at which they "crack." This results in carbon being deposited after the liberation of gas and lighter distillates. These also combine with the lubricant. This combined dilution makes the lubricant so low in viscosity that it is consumed at a greater rate than new oil and does not amply protect the surfaces. In consequence of this condition, it has become the custom to use very heavy lubricants for these small high-speed engines, oils that formerly would be selected only for the lubrication of the slowest speeds, highest temperatures and greatest weights in any mechanical machine. These oils place a heavy burden on the engine for the first hours of operation and until they become diluted with fuels, after which the viscosity is under no control whatever. The dirt and dust in the air entering the engine, mixes with the burned oil on top of the cylinders and in the combustion space and forms "carbon" and coke, which has to be removed at stated intervals. Some of this dirt also finds its way to the crankcase where it mixes with the lubricating oil. When the lubricating oil is thin through dilution the abrasives add greatly to the wear of the surfaces.

Air-cleaners and oil-filters are being adopted to correct the dirt situation. Nothing of a permanent nature has so far been accomplished in preventing or removing the fuel dilution and, as a consequence, uncontrolled lubrication of over 25,000,000 automotive engines in the United States is being carried on with unusually heavy lubricating oils contaminated with from 5 to 45% of fuel in the winter and a somewhat less percentage in the summer.

The consumption of oil in the automotive engine is influenced by the engine speed and by the volatility of the oil. With a low priced 6 cylinder car, at 30 m. per hour, a gallon lasted 2,000 miles; at 50 m. per hour the consumption increased to a gallon in 460 m. for a "non-volatile oil" and 320 m. for one more volatile. (Mougey, *National Petroleum News,* Nov. 9, 1927.) Consumption of oil in any automotive engine is also dependent upon the viscosity of the oil while operating in the engine. This is the result of the viscosity of the oil as manufactured, which is subject to control, plus the effect of the heat of the engine, the friction of the oil and plus the mixture of any lighter petroleum products that may dilute the oil. ("Liberty Aero Oil," *Journal American Society of Naval Engineers,* Feb. 1920.)

Modern force-feed systems for the application of the lubricants are very severe in their treatment of all lubricants that are not particularly adapted for the continuous lubrication of the machines to which these systems are attached. Lubricants can be so well made that they will undergo but slight change in such systems, while other lubricants will show the results of much wear. The officers attached to the U.S. naval experimental station at Annapolis, Md., have been making chemical, physical, practical and service tests of lubricants for many years. From the data so assembled a method has developed of grading the lubricants on the basis of the changes that have taken place during use under actual operating conditions, or preferably under conditions which simulate operating conditions as to pressures and temperatures but from which all chance for dilution and contamination is removed. In determining the acceptability of force-feed and motor oils a "work value" formula is used to secure comparisons between the viscosities, neutralization numbers, precipitation numbers and carbon residues on the same oil when new and after 100 hours endurance test. Lubricants that change the least are given the highest value. The lubricants are then graded as to value by applying the following formula:

$$\text{Service cost per gallon} = \frac{\text{Cost per gallon}}{\text{Average work values}}.$$

The lowest service cost per gallon is considered the low bidder. ("Purchase on a Work Factor Basis," p. 697, *Journal of American Society of Naval Engineers,* Nov. 1928.) The methods developed are for the purpose of allowing purchases of lubricants and other materials upon a work factor basis instead of a price basis and the general adoption of this plan by the industries will stimulate the production and use of the finest lubricants for the most modern methods of application to present day machinery. (W. F. P.)

LUBRICATION. An object which slides or rolls upon another generates friction. Unless a solid or a liquid lubricant is placed between the surfaces to hold them apart and allow them to slide on each other with minimum effort, friction ultimately causes abrasion and the destruction of the objects. In nature, the framework of animals comprises many joints which are so perfect mechanically and so well lubricated with a liquid lubricant that they operate for an entire lifetime with an effectiveness that has never been approached in man-made mechanisms. This is due to the suitability of the lubricant provided, which is kept pure and is not allowed to become contaminated. Nature furnishes the greasy lubricant needed to prevent the hair on all animals from cracking and breaking on account of wear, which would thus destroy its usefulness for protection and adornment. Nature does not use the same lubricant for the eyelids as for other parts of the body; she wisely selects and then properly applies what is suitable for each condition of use.

In machines made of parts that move upon each other, lubrication is a necessity; otherwise, the operation could not be continued without destruction of the parts. The degree of lubrication required is entirely dependent upon the degree of development of the machine.

HISTORICAL DEVELOPMENT

In ancient times, the machinery that was needed for the lifting of water or of weights, or for the conveying of loads, consisted of simple pulleys, windlasses and the sleds which afterward were developed and became carts and wagons equipped with wheels and axles. These appliances were made of wood. The bearings were rough and, if lubricated at all, in all probability they were packed with fat taken from the bodies of animals. That lubrication was understood to the degree that certain mechanical conditions require heavy lubricants, while others need lighter-bodied oils, is shown by the following incidents.

The chariot found in the tomb of Yuaa and Thuiu, about 1400 B.C., still had some of the original lubricant on the axle. This was analyzed by Lucas, the official chemist of the Cairo museum, and was described in a report on this tomb by Quibell in *Catalogue Général des Antiquités egyptiennes du Musée du Cairo.* The sample was small, its total weight being 0·59 of a grain. It contained road dirt such as quartz sand, compounds of aluminium, iron and lime. The lubricant was sticky and slightly greasy. It had a melting point of 49·5° C (121·1° F), which suggests its having been mutton or beef tallow, either of which would have proved suitable for axle lubrication in such a warm country.

According to a list prepared by Pliny (A.D. 23–79), the "ancients" of his time had available and in use for various purposes the oils from about the same number and kind of seeds and plants as we have at present. They were also well acquainted with several products from petroleum and had available the fats and oils from animals. Primitive forms of machinery always have been lubricated with occasional applications of whatever lubricant was available, and conditions in this respect have not changed materially since the first simple machines were made.

For many centuries after the beginning of the Christian era these conditions prevailed.

The Age of Steam.—The first of the commercial steam engines that operated early industrial plants were lubricated with melted beef tallow that was fed by means of a tallow cup attached to the steam chest. Tallow was placed in a discarded tea-pot, which was then placed on the steam chest to keep the tallow in liquid form. The oil was supplied at intermittent periods. The guides and main bearings were oiled with castor oil or lard oil. Large open bearings throughout the plant, especially in the case of iron-rolling mills, were packed with beef or mutton tallow, or a side of pork. Hard tallow was mixed with red lead and used to lubricate the gears. Lard oil was the accepted lubricant for the machine-shop engine bearings, line shafting and tools. Lard oil was also used in the lamps and torches, as a cutting oil, and for belt dressing. It was a very practical general-purpose oil and met with much favour in the early machine shops.

Sperm oil and olive oil were used on the machines in the textile industry, as well as upon the leather belts and in the lamps for illumination. Looms also were lubricated with these oils, because they would easily wash out of the finished goods without having stained them. All of these oils were well suited for the mechanical conditions prevailing.

Petroleum.—Petroleum has been known from the earliest times, its antiquity being indicated by the use of bitumen in the cementing of tools by men of the Neolithic, or late Stone age. Herodotus (484–424 B.C.) indicated the ancient method of manufacture of petroleum to produce bitumen and a lighter oil.

Dr. James Young, in 1847 (*Translations* of the Royal Scottish Society of Arts, 1865) found petroleum in Derbyshire, England, from which he obtained a heavy lubricating oil by destructive distillation. The opening of the Pennsylvania oil fields, after Drake, in 1859, had demonstrated that petroleum oil could be secured by sinking wells, provided a new source of crude supply to the American refiners operating under Dr. Young's patents; and refinery practice was adapted to the use of petroleum from which to produce the burning oils then so much in demand. Lubricants were made as a by-product and were being introduced in the manufacturing countries of the world in competition with the established lubricants.

With the primitive and early forms of machinery the lubricant was always applied by hand, the oils being used on the surfaces but once, then dropping on the floor or flying out as mist to be deposited upon the window panes or other cool parts of the machines or buildings which they covered like moist varnish. Oiling by hand is referred to as intermittent lubrication where there is a profuse supply of the lubricant on the surfaces that gradually wears off until the bearing becomes quite dry before the next application. With the flooded bearing, lubrication follows the laws of fluid friction. When the bearings become dry and the surfaces come into contact with each other, the condition changes to that of solid friction, and its attendant dangers of abrasion and stoppage. (*See* FRICTION.)

Beauchamp Tower (see *Proceedings* of the Institution of Mechanical Engineers, Nov. 1883) found that bath lubrication would give the best degree of lubrication when using lard oil, rape-seed oil and sperm oil, as well as a mineral oil and a mineral grease. His first report contained the following data:

Method of lubrication	Coefficient of friction	Comparative friction
Oil-bath	0·00139	1·00
Siphon lubricator	0·00980	7·06
Pad under journal	0·00900	6·48

From this important basic research work Osborne Reynolds (*Philosophical Transactions,* 1886) established the fact mathematically that a well lubricated journal, rotating at a fair speed, becomes automatically separated from its bearing by a film of oil, under pressure, and that the frictional resistance is then due entirely to the viscosity of the oil. John Goodman, reviewing the results of Tower and other tests of oil on the friction machines of Thurston and Stroudley stated (*Transactions,* Institute of Civil Engineers, 1886) that the coefficient of friction with the surfaces efficiently lubricated is one-tenth that for dry or scantily lubricated surfaces.

This combined work of these eminent engineers established rules for the construction of machine bearings and for their efficient lubrication, the result being that machine builders had before them the following knowledge regarding the evolution of the method of applying the lubricants.

(1) *Hand-oiling.*—The poorest results in regard to lubrication were attributed to this primitive method, in which the oil is applied at irregular intervals and where the bearing is alternately flooded and then dry.

(2) *Pad-lubrication.*—This method gave better results. The pad was located under the journal, opposite the point of greatest pressure; it carried the lubricant to the bearing surfaces continuously by capillary attraction.

(3) *Siphon Wick-feed or Drop-oilers.*—Slightly better results were obtained because these oilers supplied oil to the film in small amount at frequent intervals.

(4) *Bath Lubrication.*—The best results were obtained with bath lubrication, only one-tenth the power being required as compared to hand oiling.

With the rapid introduction of the improved methods of lubrication and of machine bearing design, suggested by the foregoing basic work, the limit of the economic use of the animal and vegetable oils had about been reached. Further advances in machine construction and operation were possible only through the rapid development and use of the mineral lubricants, because these do not oxidize and form free fatty acids, gums and compounds, and, in consequence, can be used satisfactorily in continous lubricating systems for long periods of time without undergoing detrimental changes. Finally, as the mineral oils came into successful use, there was created a branch of mechanical research engineering now known as lubrication engineering.

With the improvements in machinery and in the art of the application of the lubricants, marked improvements in the methods of refining the lubricants have naturally followed. New laboratory methods for determining and standardizing the features of the lubricant that modern requirements demand have been established.

As a result of the intensive study given to the subject of application two further general improvements since Tower's work have been made in the methods of applying the lubricants.

(5) *Gravity-feed Circulating System.*—In this method, the oil is carried in a tank higher than the bearing, to which it flows in a slightly restricted stream, and is then splashed around the parts in the crankcase. Bearings are continuously flooded with cool oil. Better results are obtained than with bath lubrication.

(6) *Force-feed Lubrication System.*—In this system, profuse quantities of lubricant are fed under pressures that can be made as high as may be desired to assure the complete flooding of the surfaces. Coolers, heaters, filters and various other refinements have been added to this system of lubrication that have brought it to the highest engineering level.

These successive steps in the development of oiling equipment and in lubricants, from the primitive to the present highly developed stages, have shown progressively increased general economy one over the other. It follows that here is a method of classifying the status of the lubrication of various groups of transportation, farm and industrial machinery.

The great fields of lubrication are as follows:—

Farming Machinery.—Aside from general automotive machinery, this field includes practically all general equipment in the primitive or first (1) class for lubrication.

Steam Railroads.—Comprising locomotives using solid lubricants (1); packed or pad lubrication (2); siphon or drop-oilers (3); with some modern roller-bearings.

Electric Railways.—Including power-house machinery, modern equipment in (5) or (6) classifications; motors and axles on cars using pad or packed lubrication (2); ring-oiling bearings (4); some roller and ball-bearings.

Marine Machinery.—Steam engines, in the primitive or (1) for all hand-oiling; wick or drop-oilers (3); Diesel engines (6).

Heavy Machinery.—Steel and iron mills. A combination of (1) primitive and bath or ring-oilers in the (4). Circulating and force-feed systems for production machines in rolling and paper mills (6); with some power equipment in (5).

Medium-weight Machinery.—General manufacturing plants. Ring and bath lubrication (4). Very little (1) and (2) lubrication, and that difficult to displace.

Light Machinery.—Textile mills constituting the best-lubricated industrial machinery. Bath and ring lubrication (4); power-plants (5).

Automotive.—All types. Bath systems (4); gravity-feed (5); force-feed (6); and various combinations except that provisions are not always made for removing dirt and fuel contaminations from the lubricant.

LUBU, a tribe inhabiting central Celebes, partly tree-dwelling in habit, nomad, but cultivating a little rice and maize. Medicine-men act as chiefs, combining spiritual and temporal functions. (*See* Ratzel, *History of Mankind.*)

LUCAN (MARCUS ANNAEUS LUCANUS) (A.D. 39–65), Latin poet, born at Corduba (Cordova), son of M. A. Mela and grandson of the elder, nephew of the younger, Seneca (Mart. i., 61, 7, "Of the two Senecas and the one Lucan eloquent Corduba tells"), was brought as an infant to Rome, where he was carefully educated, among his teachers being the Stoic Cornutus and among his fellow-pupils under that preceptor the Satirist Persius (Sueton. *Vit. Pers.*). While still young he visited Athens, whence he was recalled by Nero, who bestowed upon him a quaestorship (Sueton. *Vit. Lucan*). His friendship with Nero did not last, and in A.D. 65 he was "almost the standard-bearer" (*paene signifer,* Sueton. *l.c.*) in Piso's conspiracy to murder Nero, moved thereto, it is said, by literary jealousy, Nero having forbidden him to give public recitations of his poetry (Tac. *Ann.,* xv., 49). When the conspiracy was discovered, he attempted on a promise of immunity to save himself by denouncing his mother Acilia (Tac. *Ann.,* xv., 86), but was compelled to commit suicide by opening a vein, April 30, A.D. 65. Tacitus, *Ann.,* xv., 70, says, "Thereafter he (Nero) ordered the death of Annaeus Lucanus. As his blood flowed, when he perceived that his feet and hands were growing cold and life ebbing gradually from his extremities, while his breast was still warm and retained intelligence, remembering a poem composed by himself" (*Pharsal.,* iii., 635–646, and ix., 808–815, have been suggested), "in which he had told of a wounded soldier dying by the same form of death, he repeated the lines, and that was his last utterance."

Lucan wrote a variety of works (Stat. *Silv.* ii., 7 [*Lucan's Birthday*], 54 *seq.*), in prose as well as verse (Stat. *ibid.,* 22, "Et vinctae pede vocis et solutae"). With the exception of a few fragments his works are lost save the single poem on which his fame now rests. This is called in the mss. *Bellum Civile* or *De Bello Civili,* and such a title is supported by a poem of his contemporary Petronius as well as by Joannes Lydus (6th cent. A.D.), *De Magistratibus,* iii., 46, who writes: "the Roman Lucan in the 2nd Bk. of his Civil War (τῶν ἐμφυλίων) says" and then refers to Lucan ii., 610 f. (*cf. ibid.* ἐμφυλίου συγγραφῆς). The name *Pharsalia,* by which it is generally known, seems to be an inference from Lucan's words in ix., 985, *Pharsalia nostra Vivet et a nullo tenebris damnabimur aevo.* The poem, an epic (heroic hexameters) in ten books, which was left unfinished at his death, carries the story of the civil war between Caesar and Pompey down to the arrival of Caesar in Egypt after Pompey's death. Corresponding with the change in the relations of Lucan and Nero there is a marked change of tone as the poem proceeds. At first friendly to the empire—Bk. i., 33–66, is a fulsome eulogy of Nero—it becomes increasingly anti-imperial. The poet is clearly on the side of Pompey and the Senate, whose cause is held to be one (v., 12, "For who would call so many axes drawn in justice, so many *fasces,* a camp? The venerable order taught the peoples that it was not the party of Magnus, but that Magnus was their partisan"). and is identified with the liberty of the Roman people (vii., 578, "He [Caesar] forbids their hands to assail the common people and points out the Senate; he knows what is the blood of empire, what the vitals of the state, whence he is to attack Rome, where stands to be stricken the ultimate liberty of the world").

"Lucan," says Quintilian (x., 1., 90), "is ardent and passionate, brilliant in epigram, and, to speak frankly, a model rather for the orator than for the poet." His rhetorical quality pleased the taste of his time (Martial, xiv., 194, puts in Lucan's mouth the epigram: "There are those who say I am not a poet; but the bookseller who sells me thinks I am"). as that taste was pleased also by the learned allusion, the recondite expression for the simple thing, of which Lucan is so full, *e.g.,* v. 3, "Now had midwinter sprinkled the snows on Haemus and the daughter of Atlas setting on chill Olympus, and the day was at hand which gives new names to the Calendar and first worships Janus who leads the seasons" merely indicates the end of the year. Nothing is harder than to determine the legitimate and the illegitimate use of the learned allusion, but at any rate in this kind Lucan was neither better nor worse than his neighbours and his employment of it was as monotonous as his metre. It is quite otherwise with his gift of epigram and memorable phrase: *Nil actum credens cum quid superesset agendum* (ii., 657); *Victrix causa deis placuit sed victa Catoni* (i., 128); *Stat magni nominis umbra* (i., 135).

(A. W. MA.)

LUCANIA, formerly Basilicata, a territorial division of southern Italy, comprising the provinces of Matera and Potenza, part of the ancient Lucania. It is bounded on the north by the province of Foggia, northeast by those of Bari and Lecce, east by the Gulf of Taranto (for a distance of 24 mi.), south by the province of Cosenza, and west by the Mediterranean and the provinces of Salerno and Avellino. Area 3,855 sq.mi. The province is mountainous, with Mt. Pollino (7,325 ft.), the highest peak in the southern Apennines, on the boundary of Cosenza, while Mt. Vulture (4,365 ft.) at the northwestern extremity, is an extinct volcano. The mountains descend by a gradual slope to the coastal plane of the Gulf of Taranto. Five rivers, the Bradano (anc. Bradanus), Basento (Casuentus), Cavone or Salandrella, Agri (Aciris) and the Sinni (Siris) run southeast or east into the gulf. The railway from Naples to Taranto and Brindisi passes through Potenza and meets the east coast line from Taranto to Reggio di Calabria at Metaponto. Branch lines from this road run elsewhere through Lucania. The mountains are still to some extent clothed with forests; in places the soil is fertile, especially along the Gulf of Taranto. Olive oil is the most important product. Pop. (1936) 543,262. There are no large towns.

The ancient Lucania extended from the Tyrrhenian sea on the west to the Gulf of Tarentum on the east. To the north it adjoined Campania, Samnium and Apulia and to the south it was separated by a narrow isthmus from the district of Brutii. It thus comprised almost all the area of the modern Lucania together with the greater part of the province of Salerno and a part of Cosenza. As in the modern province, almost the whole of ancient Lucania was occupied by the Apennines. Two important rivers of the ancient province, the Crathis (mod. Crati), forming its southern limit and the Silarus (Sele), constituting its northern boundary, are not included in the smaller modern Lucania.

Lucania was so-called from the Lucani (Lucanians) who conquered it about the middle of the 5th century B.C. Before that it was included under the general name of Oenotria, applied by the Greeks to southernmost Italy. The mountainous interior was occupied by Oenotrians and Chones, while on the coasts on both sides were powerful Greek colonies which doubtless exercised a protectorate over the interior (*see* MAGNA GRAECIA). The Lucanians were a southern branch of the Samnite or Sabelline race, who spoke Oscan (*q.v.*) After much inter-tribal conflict we find them fighting the Tarentines and Alexander, king of Epirus, who was called in by that people to their assistance, 326 B.C. In 298 B.C. they made alliance with Rome, and Roman influence was extended by the colonies of Venusia (291 B.C.), Paestum (273), and above all Tarentum (272). On the landing of Pyrrhus in Italy (281 B.C.) they were among the first to declare in his favour, and found themselves exposed to the resentment of Rome when the departure of Pyrrhus left his allies at the mercy of the Romans. After several campaigns they were reduced to subjection (272 B.C.). They sided with Hannibal during the Second Punic

War (216 B.C.), and their territory during several campaigns was ravaged by both armies. The country never recovered from these disasters, and under the Roman government fell into decay, to which the Social War, in which the Lucanians took part with the Samnites against Rome (90–88 B.C.) gave the finishing stroke.

For administrative purposes under the Roman empire, Lucania was always united with the district of the Bruttii. The two together constituted the third region of Augustus.

The towns on the east coast were—Metapontum, a few miles south of the Bradanus; Heraclea, at the mouth of the Aciris; and Siris, on the river of the same name. Close to its southern frontier stood Sybaris, destroyed in 510 B.C., but subsequently replaced by Thurii. On the west coast stood Posidonia, known under the Romans as Paestum; below came Elea or Velia, Pyxus, called by the Romans Buxentum, and Laus, near the frontier of the province towards Bruttium. Of the towns of the interior the most considerable was Potentia, still called Potenza. To the north, near the frontier of Apulia, was Bantia; while due south from Potentia was Grumentum, and still farther in that direction were Nerulum and Muranum. In the upland valley of the Tanagrus, a tributary of the Silarus, were Atina, Forum Popilii and Consilinum; Eburi (Eboli) and Volceii (Buccino), though to the north of the Silarus, were also included in Lucania. The Via Popillia traversed the district from north to south, entering it at the northwest extremity; the Via Herculia, coming southwards from the Via Appia and passing through Potentia and Grumentum joined the Via Popillia near the southwest of the district: while another nameless road followed the east coast. (T. A.; X.)

LUCARIS, CYRILLOS (1572–1637), Greek prelate and theologian, was a native of Crete. In youth he travelled, studying at Venice and Padua, and at Geneva coming under the influence of the reformed faith as represented by Calvin. In 1602 he was elected patriarch of Alexandria, and in 1621 patriarch of Constantinople. He was the first great name in the Orthodox Eastern Church since 1453, and dominates its history in the 17th century. The great aim of his life was to reform the church on Calvinistic lines, and to this end he sent many young Greek theologians to the universities of Switzerland, Holland and England. In 1629 he published his famous *Confessio,* Calvinistic in doctrine, but as far as possible accommodated to the language and creeds of the Orthodox Church. It appeared the same year in two Latin editions, four French, one German and one English, and in the Eastern Church started a controversy which culminated in 1691 in the convocation by Dositheos, patriarch of Jerusalem, of a synod by which the Calvinistic doctrines were condemned. Lucaris was several times temporarily deposed and banished at the instigation of his orthodox opponents and of the Jesuits, who were his bitterest enemies. Finally, when Sultan Murad was about to set out for the Persian War, the patriarch was accused of a design to stir up the Cossacks, and to avoid trouble during his absence the sultan had him killed by the Janissaries (June 1637).

See the article "Lukaris" by Ph. Meyer in Herzog-Hauck, *Realencyklop.* (3rd ed., Leipzig, 1902), which gives further authorities.

LUCARNE, a French architectural term for a dormer window; in English usage, applied to the dormer windows of spires.

LUCAS, SIR CHARLES (d. 1648), English soldier, was the son of Sir Thomas Lucas of Colchester, Essex. As a young man he saw service in the Netherlands under the command of his brother, and in the "Bishops' War" he commanded a troop of horse in King Charles I.'s army. At the outbreak of the Civil War Lucas took the king's side, and at the first cavalry fight, Powick Bridge, he was wounded. Early in 1643 he raised a regiment of horse, with which he defeated Middleton at Padbury on July 1. In 1644 he was made lieutenant-general of Newcastle's Northern army. At Marston Moor Lucas swept Fairfax's Yorkshire horse before him, but later in the day he was taken prisoner. Exchanged during the winter, he defended Berkeley Castle for a short time against Rainsborough, but was soon in the field again. As lieutenant-general of all the horse he accompanied Lord Astley in the last campaign of the first war, and, taken prisoner at Stow-on-the-Wold, he engaged not to bear arms against parliament in the future. This parole he broke at Colchester which fell to Fairfax's army on Aug. 27, 1648. Lucas and Sir George Lisle were immediately tried by court martial and sentenced to death. They were shot the same evening in the Castle of Colchester.

See Lloyd, *Memoirs of Excellent Personages* (1669); and Earl de Grey, *A Memoir of the Life of Sir Charles Lucas* (1845).

LUCAS, CHARLES (1713–71), Irish physician and politician, was an apothecary in Dublin. He issued in 1748–49 a series of political addresses; the House of Commons voted him an enemy to the country, and issued a proclamation for his arrest. Lucas escaped to the continent, and qualified in medicine at Leiden in 1752. In 1753 he started practice in London. He was elected member for the city of Dublin in 1761, his colleague in the representation being the recorder, Henry Grattan's father. On the appointment of Lord Halifax as lord lieutenant in the same year Lucas wrote him a long letter (Sept. 19, 1761, mss. Irish State Paper office) setting forth the grievances which Ireland had suffered in the past. His contributions to the press, and his *Addresses to the Lord Mayor* and other political pamphlets made him one of the most popular writers in Ireland. He died on Nov. 4, 1771.

See R. R. Madden, *Hist. of Irish Periodical Literature from the End of the 17th to the Middle of the 19th Century* (2 vols., 1867); Francis Hardy, *Memoirs of the Earl of Charlemont* (2 vols., 1812); W. E. H. Lecky, *History of Ireland in the Eighteenth Century,* vols. i. and ii. (1892).

LUCAS, EDWARD VERRALL (1868–1938), British man of letters, was born at Brighton and educated at University college, London. He then started journalism, working first on a Sussex newspaper, then in London with *The Globe,* and became a frequent contributor to *Punch* and later its assistant editor. He acted for many years as publisher's reader to the firm of Methuen, and became head of this company after the death of its founder (1925). He is best known as a light essayist. His edition of the *Letters of Charles and Mary Lamb* (1903–05) and his *Life of Lamb* (1905) showed how congenial was his talent with that of Elia. He wrote many charming books of travel impressions, among these being *A Wanderer in Holland* (1905), *A Wanderer in London* (1906) and *A Wanderer in Paris* (1909), and his books on art showed powers of wide appreciation, as in *The British School* (1913), *Vermeer of Delft* (1922), *John Constable* (1924), *Vermeer the Magical* (1929).

LUCAS, JOHN SEYMOUR (1849–1923), English painter, was born in London, and was a student in the Royal Academy Schools. He was elected A.R.A. in 1886 and R.A. in 1898, and was a constant exhibitor of pictures of historical and domestic incidents, notably of the Tudor and Stuart periods. One of his most important works is a panel in the Royal Exchange, presented by the corporation of London, representing William the Conqueror granting the first charter to the city; and one of his earlier pictures, "After Culloden: Rebel Hunting," is in the National Gallery of British Art. He died at Southwold on May 8, 1923.

LUCAS VAN LEYDEN (*c.* 1494–1533), Dutch painter, was born at Leiden, where his father Huig Jacobsz gave him the first lessons in art. He then entered the painting-room of Cornelis Engelbrechtszen of Leiden. According to van Mander he was born in 1494, and painted at the age of 12 a "Legend of St. Hubert," for which he was paid a dozen florins. He was only 14 when he finished a plate representing Mohammed taking the life of Sergius, the monk, and at 15 he produced a series of nine plates for a "Passion," a "Temptation of St. Anthony," and a "Conversion of St. Paul." The list of his engravings in 1510 includes subjects as various as a celebrated "Ecce Homo," "Adam and Eve expelled from Paradise," a herdsman and a milkmaid with three cows and a "Woman with a Dog."

In Dürer's diary kept during his travels in the Low Countries, we find that at Antwerp he met Lucas, who asked him to dinner. He exchanged the Dutchman's prints for his own and drew his portrait (British Museum). The effect of this contact with the great German artist is traceable in Lucas' drawings. In 1527 he made a tour of the Netherlands, giving dinners to the painters of the gilds of Middleburg, Ghent, Malines and Antwerp. The journey ruined his health; after a long illness he died in 1533.

After Dürer, Lucas was the most important engraver of his time. Existing engravings ascribed to him number 172. He also designed a number of woodcuts, and some 20 pictures by him are in public and private collections. Early works are "The Chess Players" in the Berlin museum; the "Death of John the Baptist" in the Johnson collection, Philadelphia. These are works of a beginner. Then follow the paintings in a more fluent style:—"St. Jerome" and "The Virgin Enthroned" in Berlin; the "Card Players" at Wilton House and a portrait in the National Gallery.

In 1522 he painted the "Virgin and Child with the Magdalen and a Kneeling Donor," now in the gallery of Munich. His manner was then akin to that of Mabuse. The "Last Judgment" in the town-gallery of Leiden is composed on the traditional lines yet some of the heads are painted with great delicacy and modelled with exquisite feeling. His last important work was a triptych now at the Hermitage at Leningrad (St. Petersburg), executed, according to van Mander, in 1531, representing the "Blind Man of Jericho healed by Jesus Christ." Here may be observed great finish and warm flesh-tints with a gaudy scale of colours. It has been said that Lucas van Leyden was the greatest of the Dutch artists who laid the foundation of the 17th century Dutch painting.

See Sir Martin Conway, *The Van Eycks and their Followers* (1921); M. Freidländer, *Lucas van Leyden* (1924); and *Van Eyck bis Brueghel* (1921).

LUCCA, town and archiepiscopal see of Tuscany, Italy, (anc. *Luca*), capital of the province of Lucca, 13 m. by rail N.E. of Pisa. Pop. (1936) 32,896 (town), 82,302 (commune). It is 62 ft. above sea-level, in the fertile valley of the Serchio, and looks out for the most part on a horizon of hills and mountains. The fortifications, pierced by four gates, begun in 1504 and completed in 1645, are still well-preserved and picturesque, with projecting bastions planted with trees.

The city is well-built and has numerous churches, mainly of well-marked basilican type, having richly decorated exteriors, fine apsidal ends and quadrangular campaniles, in some cases with battlemented summits, and windows increasing in number as they ascend. They follow Pisan style. The cathedral of St. Martin was begun in 1060 by Bishop Anselm (later Pope Alexander II.); but the apse with its tall columnar arcades and the campanile are probably the only remnants of the early edifice, nave and transepts having been rebuilt in Gothic style (14th cent.), while the west front is by Guidetto (identified with Guido Bigarelli of Como) (1204) and "consists of a vast portico of three magnificent arches, and above them three ranges of open galleries." The ground plan is a Latin cross, the nave being 273 ft. in length and 84 ft. in width, and the transepts 144 ft. in length. In the nave is a little octagonal shrine for the most precious of the relics of Lucca, a cedar-wood crucifix, carved, according to legend, by Nicodemus, and miraculously conveyed to Lucca in 782. The Sacred Countenance (*Volto Santo*) of the Saviour is shown thrice a year. The chapel was built in 1484 by Matteo Civitali, a local sculptor (1436–1501). The cathedral contains several other works by him—the tomb of P. da Noceto, and the altar of S. Regulus as well as the tomb of Ilaria del Caretto by Jacopo della Quercia of Siena. In the cathedral choir is good stained glass of 1485. The church of St. Michael, founded in the 8th century, and built of marble within and without, has a magnificent western façade (12th–13th cent. like that of the cathedral)—an architectural screen rising much above the roof of the church. The interior is good but rather bare. The basilican church of S. Martino at Arliano near Lucca belongs to the first half of the 8th century. S. Frediano or Frigidian dates originally from the 7th century, but was built in Romanesque style in 1112–1147, though the interior, originally with four aisles and nave, shows traces of the earliest structure; the front occupies the site of the ancient apse; in one of its chapels is the tomb of Santa Zita, patroness of servants and of Lucca itself. In S. Francesco, a fine Gothic church, is the tomb of Castruccio Castracane (d. 1328). San Giovanni (originally of the 12th century), S. Cristoforo, S. Giusto, San Romano (rebuilt in the 17th century, by Vincenzo Buonamici), and Santa Maria Forisportam (of the 12th century) also deserve mention.

Among secular buildings are the old ducal palace, begun in 1578 by Ammanati, and now the residence of the prefect and seat of the provincial officers and the public picture gallery; the early Renaissance Palazzo Pretorio, or former residence of the podestà, now the seat of the civil and correctional courts; the palace, erected in the 15th century by a member of the Guinigi family, of brick, in Italian Gothic, the 16th-century palace of the marquis Guidiccioni, now a depository for the archives, the earliest documents going back to A.D. 790. The Palazzo Mansi contains a collection of Dutch pictures. There are several other fine late 16th-century palaces. The principal market-place in the city has taken possession of the arena of the ancient amphitheatre, the outer arches of which can still be seen in surrounding buildings. The whole building, belonging probably to the early Empire, measured 135 by 105 yd., and the arena $87\frac{1}{2}$ by 58 yards. The outline of the ancient theatre can be traced in the Piazza delle Grazie, and some substructure walls are preserved. The ancient forum was on the site of the Piazza S. Michele. Remains of the city walls have also been found. The rectangular disposition of the streets in the centre of the town is a survival of Roman times. The archiepiscopal library and archives are also important, while the treasury contains some fine goldsmith's work, including the 14th-century Croce dei Pisani, made by the Pisans for the cathedral.

The river Serchio affords water-power for numerous factories. The most important industries are the manufacture of jute goods (carried on at Ponte a Moriano in the Serchio valley, 6 m. N. of Lucca), tobacco, silks and cottons. The silk manufacture was introduced about the close of the 11th century, and in the early 16th formed the means of subsistence for 30,000 of its inhabitants. The bulk of the population is engaged in agriculture. The water supply is maintained from the Pisan mountains by an aqueduct built in 1823–32 with 459 arches.

The ancient Luca, commanding the valley of the Serchio, is first mentioned as the place to which Sempronius retired in 218 B.C. before Hannibal, after his defeat at the Trebia (*q.v.*). It was here that Julius Caesar in 56 B.C. held his famous conference with Pompey and Crassus, Luca then being still in Liguria, not in Etruria. In the Augustan division of Italy Luca was assigned to the 7th region (Etruria); it was a meeting-point of roads—to Florentia (*see* CLODIA, VIA), Parma, Luna and Pisae. Though plundered and deprived of part of its territory by Odoacer, Luca appears as an important city and fortress at the time of Narses, who besieged it for three months in A.D. 553, and under the Lombards it was the residence of a duke or marquis and had the privilege of a mint. The dukes gradually extended their power over all Tuscany, but after the death of the famous Matilda the city began to constitute itself an independent community, and in 1160 it obtained from Welf VI., duke of Bavaria and marquis of Tuscany, the lordship of all the country for 5 m. round, on payment of an annual tribute. Occupied by the troops of Louis of Bavaria, sold to a rich Genoese Gherardino Spinola, seized by John, king of Bohemia, pawned to the Rossi of Parma, by them ceded to Martino della Scala of Verona, sold to the Florentines, surrendered to the Pisans, nominally liberated by the emperor Charles IV. and governed by his vicar, Lucca managed, at first as a democracy, and after 1628 as an oligarchy, to maintain "its independence alongside of Venice and Genoa, and painted the word Libertas on its banner till the French Revolution." In 1546 Francesco Burlamacchi, made a noble attempt to give political cohesion to Italy, but perished on the scaffold (1548); his statue by Ulisse Cambi was erected on the Piazza San Michele in 1863. As a principality formed in 1805 by Napoleon in favour of his sister Elisa and her husband Felice Baciocchi, Lucca was for a few years wonderfully prosperous. It was occupied by the Neapolitans in 1814; from 1817 to 1847 it was governed as a duchy by Maria Luisa, queen of Etruria, and her son Charles Louis; and it afterwards formed one of the divisions of Tuscany.

(T. A.)

LUCCA, BAGNI DI (Baths of Lucca), commune, Tuscany, Italy, province of Lucca, containing a number of famous watering-places in the valley of the Lima, a tributary of the Serchio. Pop. (1936) 1,116 (town), 12,064 (commune). Ponte a Serraglio (16 mi. north of Lucca by rail) is the principal village, but there are warm springs and baths also at Villa, Bagni Caldi, etc. The springs do not seem to have been known to the Romans. The temperature of the water varies from 98° to 130°; in all cases it gives off carbonic acid gas and contains lime, magnesium and sodium products. In the valley of the Serchio, 3 mi. below Ponte a Serraglio, is the mediaeval Ponte del Diavolo (1322), with its lofty central arch.

LUCCEIUS, LUCIUS, Roman orator and historian, friend and correspondent of Cicero. Disgusted at his failure to become consul in 60, he retired from public life and devoted himself to writing a history of the social and civil wars. Cicero wrote to him asking him to write a history of his (Cicero's) consulship and offering to supply the material.

Nothing remains of any such work or of his history. In the civil war he took the side of Pompey but was pardoned by Caesar and returned to Rome.

See Cicero's *Letters* (ed. Tyrrell and Purser), especially *Ad Fam.* v. 12; and Orelli, *Onomasticon Tullianum.*

LUCCHESI, ANDREA (1741–*c.* 1800), Italian musician and composer, was born in Motta, Venice, on May 28, 1741. In his youth he studied under Paolucci, Seratelli and Cocchi. In 1771 he went to Bonn, Germany, and in 1774 he succeeded the grandfather of Ludwig van Beethoven as conductor of the court orchestra. Under him Beethoven, then only a boy, played the viola in the orchestra. Lucchesi composed eight operas, two symphonies, six sonatas for violin and cembalo, four piano quartets and some church music.

LUCCHESINI, GIROLAMO (1751–1825), Prussian diplomatist, was born at Lucca on May 7, 1751, the eldest son of Marquis Lucchesini. In 1779 he entered the service of Frederick the Great in Berlin. Frederick William II sent him in 1787 to Rome to obtain the papal sanction for the appointment of a coadjutor to the bishop of Mainz, with a view to strengthening the German Fürstenbund.

In 1788 he was sent to Warsaw and brought about a rapprochement with Prussia and a diminution of Russian influence at Warsaw. Frederick William was at that time intriguing with Turkey, then at war with Austria and Russia. Lucchesini was to rouse Polish feeling against Russia and to secure for Prussia the concourse of Poland in the event of war with Austria and Russia. He concluded a Prusso-Polish alliance in March, 1790, and in the autumn of that year was sent to Sistova, where the terms of peace between Austria and Turkey were being discussed. Before he returned to Warsaw his treaty was a dead letter, and Prussia was contemplating the second partition of Poland. Lucchesini was recalled and was employed on the Rhine in liquidating the intervention in the French Revolution.

In 1793 he was appointed ambassador to Vienna, with the ostensible object of securing financial assistance for the Rhenish campaign. His anti-Austrian bias made him extremely unpopular with the Austrian court, which began asking for his recall in 1795. The request was granted in 1797.

In 1800 he was sent by Frederick William III on a special mission to Paris. Napoleon too sought his recall but eventually (in 1802) accepted him as regular ambassador. He consistently sought friendly relations between France and Prussia but was unsuccessful and was superseded as ambassador just before the outbreak of war between the two countries in 1806. After the Prussian defeat at Jena he tried to negotiate terms of peace, but his first draft was refused by Napoleon and his second by Frederick William.

He was dismissed from the Prussian service and joined the court of Elisa, grand duchess of Tuscany and after Napoleon's fall devoted himself to writing.

He died on October 20, 1825.

He published in 1819 three volumes, *Sulle cause et gli effetti della confederazione rhenana,* at Florence. His memoirs remained in ms. His dispatches were edited by Bailleu in *Preussen und Frankreich* (Leipzig, 1887, *Publikationen aus den preussischen Staatsarchiven*).

LUCE, CLARE BOOTHE (1903–), U.S. playwright and member of Congress, was born in New York, N.Y., April 10, 1903. She was associate editor of the magazine *Vogue* in 1930 and associate editor and managing editor of the magazine *Vanity Fair* from 1930 to 1934. In 1935 she married Henry R. Luce, magazine publisher. She wrote a number of plays, including *The Women* (1937) and *Kiss the Boys Goodbye* (1938), satires on two phases of American life, and *Margin for Error* (1939), an anti-nazi play. She was also the author of two books, *Stuffed Shirts* (1933) and *Europe in the Spring* (1940). On Nov. 3, 1942, she was elected Republican congresswoman from the 4th district of the state of Connecticut.

LUCE, JOHN (1870–1932), British admiral, was born Feb. 4, 1870, in England.

In the Battle of Falkland Islands in World War I, he commanded the light cruiser H.M.S. "Glasgow," which, with the help of another British ship, sank the German cruiser "Leipzig." From 1921 to 1924, he was admiral superintendent of the Malta dockyard. In 1925 he was retired and in 1930–31 he served as high sheriff of Wiltshire.

He died Sept. 22, 1932.

LUCE, STEPHEN BLEECKER (1827–1917), U.S. naval officer, was born in Albany, N.Y., on March 25, 1827. When he was only 14 years old he received his appointment as midshipman from New York.

The next 19 years of his life, until 1860, were spent largely on ship or at naval stations in all parts of the world. In 1860, by this time a lieutenant, he was made assistant to the commandant of the naval academy.

In 1862 he was promoted to lieutenant commander and made head of the department of seamanship at the academy. During the Civil War he went on sea duty again, commanding the monitor "Nantucket" and the "Pontiac," both of the North Atlantic squadron, and he commanded the "Pontiac" when it gave naval support on the Savannah river to the crossing of General Slocum's division into South Carolina.

After the Civil War, he remained on active sea duty most of the time until 1884. For many years before that time, he had been concerned with the problem of education of naval officers, which he felt was inadequate, especially in the more advanced branches. In 1884 his campaign for improvement of the educational system came to a successful conclusion with the foundation of the Naval War college, the first school of its kind in the world. Luce, by now a commodore, was first president.

The Naval War college came to have an influence not only on American naval officers but on those of many other countries; England, Japan, Germany and France later founded schools based on Luce's ideas. In 1886, Luce was commissioned a rear admiral and went on active duty in the North Atlantic, where he remained until his retirement in 1889.

He died July 28, 1917.

LUCENA, a municipality (with administrative centre and 15 *barrios* or districts) and capital of Tayabas (the second largest province in Luzon), Philippine Islands, located near Tayabas bay along the route of the Manila-Hondagua railway line, and 133 mi. from Manila. Pop. (1939) 21,675, of whom 11,278 were males and 17 whites.

Lumbering is an important industry, and a planing and sawmill are there. Good automobile roads lead to other towns, and Lucena is a commercial centre. The inhabitants represent various Malay strains and some of the aboriginal negritos are found in the adjacent region. Tagalog and Bikol are the leading vernaculars, but other dialects are used. Of the inhabitants aged 6 to 19 inclusive, 47.5% in 1939 attended school; 74.3% of the population 10 years old and over was literate.

LUCENA, a town of Spain, in the province of Córdova, 37 mi. S.S.E. of Córdova, on the Madrid-Algeciras railway. Pop. (1940) 22,659 (mun., 32,687). Lucena is situated on the Cascajar, a minor tributary of the Genil. The parish church dates from the beginning of the 16th century.

The chief industries are the manufacture of matches, brandy and pottery, especially the large earthenware jars (*tinajas*) used throughout Spain for the storage of oil and wine. There is considerable trade in agricultural produce, and the horse fair is famous throughout Andalusia. Lucena was taken from the Moors early in the 14th century. King Boabdil of Granada was taken prisoner in 1483 in the attempt to recapture it.

LUCERA, town and episcopal see, Apulia, Italy, province of Foggia $12\frac{1}{2}$ mi. W.N.W. of the town of Foggia by rail. Pop. (1936) 17,472 (town), 18,447 (commune). It is upon a lofty plateau, the highest point of which (823 ft.), projecting west, was the ancient citadel, which is occupied by the immense and well-preserved castle of Frederick II (1233), who lived there in oriental splendour. It was later enlarged by Charles I of Anjou. It is the largest mediaeval fortress in Apulia, and within it was the palace, the treasury, the mint, the harem and a menagerie of wild beasts. The cathedral, originally Romanesque but restored after 1300, is in the Gothic style. The interior was restored in 1882. The town occupies the site of the ancient Luceria, the key of the whole country. According to tradition the temple of Minerva, founded by Diomede, contained the Trojan Palladium, but in history it is first heard of as on the Roman side in the Samnite Wars (321 B.C.), and in 315 or 314 B.C. a Latin colony was sent there. It is mentioned in subsequent military history, and its position on the road from Beneventum, via Aecae (mod. Troja) to Sipontum, gave it some importance.

Its wool was also renowned. It contains no ancient remains above ground, though mosaic pavements have been found and there are traces of the foundations of an amphitheatre outside the town on the east. The town hall contains a statue of Venus, a mosaic and some inscriptions.

In 663 it was destroyed by Constans II and was only restored in 1223 by Frederick II, who transported 20,000 Saracens thither from Sicily. They were at first allowed religious freedom, but many were slaughtered and the rest became Christians under compulsion in 1300. Up to 1806 Lucera was the capital of the provinces of Basilicata and Molise.

See A. Haseloff, *Bauten der Hohenstaufen in Unteritalien,* i (Leipzig, 1914), 97 *sqq.*

LUCERNE (Ger. *Luzern*), a canton of Switzerland. Its total area is 575 sq.mi., of which about 90% is classed as "productive" (forests covering nearly one-fifth of the total). It contains no glaciers or eternal snows, its highest points being the Brienzer Rothhorn (7,714 ft.) and Pilatus (6,995 ft.), the Rothstock summit (5,453 ft.) and the Kaltbad inn, both on the Rigi. The northern portion of the Lake of Lucerne, the lakes of Sempach and Baldegg and small portions of those of Hallwil and of Zug are in the canton.

Its chief river is the Reuss, which flows through it for a short distance only, receiving the Kleine Emme that flows down through the Entlebuch. In the northern part the Wigger, the Suhr and the Wynen streams flow through shallow valleys, separated by low hills. The canton is fairly well supplied with railways. (For the city of Lucerne, *see* LUZERN.)

In 1941 the population numbered 206,400 of which the great majority were German-speaking Roman Catholics. Its capital is Luzern; the other towns are Kriens, Willisau, Ruswil, Littau, Emmen and Escholzmatt.

The density of the population is 360 per sq.mi. The peasants, outside the chief centres for foreign visitors, have retained many local customs.

The canton ranks officially third in the Swiss confederation, next after Zürich and Berne. It was formerly in the diocese of Constance and is now in that of Basle. It contains 5 administrative districts and 107 communes. By existing cantonal constitution, the legislature or *Grossrath* is elected on a proportional basis by universal suffrage, while the executive is elected by a popular vote.

The canton every three years elects nine members to the Conseil National and sends two members to the Conseil des États (federal council). Citizens have the right of "initiative" as to constitutional amendments or legislative projects.

The canton is composed of the various districts which the town acquired, the dates being those at which the particular region was finally secured—Weggis (1380), Rothenburg, Kriens, Horw, Sempach and Hochdorf (all in 1394), Wolhusen and the Entlebuch (1405), the so-called "Habsburger region" to the N.E. of the town of Luzern (1406), Willisau (1407), Sursee and Beromünster (1415), Malters (1477) and Littau (1481), while in 1803, in exchange for Hitzkirch, Merenschwand (held since 1397) was given up.

LUCERNE, LAKE OF, the name usually given by foreigners to the principal lake of central Switzerland. In French it is called the *Lac des Quatre Cantons,* and in German the *Vierwaldstättersee,* the cantons being Lucerne, Unterwalden, Uri and Schwyz. It is named after Lucerne, at the west end, where the Reuss issues from the lake, after having entered it at Flüelen at the east end; the Muota enters the lake at Brunnen (north) and two mountain streams, the Engelberg and the Sarnen Aa, at Buochs and Alpnachstad respectively (south). The lake is most beautifully situated between steep limestone mountains, the best known being the Rigi (north) and Pilatus (southwest), and great promontories thrust themselves into its waters, such as Horw (south), Bürgenstock (south), Meggenhorn (north) and Seelisberg (south), giving it a romantic irregularity. It occupies an old terminal basin of a glacier and along its shores are evidence of damming by moraines.

It is composed of four main basins (with two side basins), which represent four different valleys, orographically distinct, and connected only by narrow and tortuous channels. There is, first, the most easterly basin, the Bay of Uri, extending from Flüelen (south) to Brunnen (north). At Brunnen the delta of the Muota forces the lake west, so that it forms the Bay of Gersau or the Gulf of Buochs, from the promontory of Seelisberg (east) to that of Bürgenstock (west). Another narrow strait between the two "Noses" (*Nasen*) leads west to the Basin of Weggis, between the Rigi (north) and the Bürgenstock promontory (south). This bay forms the eastern arm of the "Cross of Lucerne," the western arm being the Bay of Lucerne, the northern arm the Bay of Küssnacht and the southern arm that of Hergiswil, prolonged southwestward by the Bay of Alpnach, with which it is joined by a narrow channel, spanned by the Acher iron bridge. The Bay of Uri offers the sternest scenery, and at Brunnen the Everlasting league of 1315 was made, while the legendary place of meeting of the founders of Swiss freedom was the meadow of the Rütli (purchased by the Confederation in 1859), and the site of Tell's leap is marked by the Chapel of Tell (east).

In the Bay of Gersau is the village of Gersau (north), an independent republic (1390–1798), and now in Schwyz (1818 onward). In the next basin to the west is Weggis (north), and on the northern shore of the lake is Vitznau, whence a rack railway leads up to the top of the Rigi ($4\frac{1}{4}$ mi.), while on the southern shore of the lake is Kehrsiten, with electric railway to the Bürgenstock promontory. The town of Lucerne is connected with Flüelen by the St. Gotthard railway. On the promontory between Lucerne and Küssnacht stands the castle of New Habsburg, while from Küssnacht a motor road leads through the "Hollow Way" (*Hohle Gasse*), the scene of the legendary murder of Gessler by William Tell.

The western shore of the southern arm is traversed from Horw to Alpnachstad by the Brünig railway ($5\frac{1}{2}$ mi.), which continues toward Sarnen (Obwalden) and the Bernese Oberland, and southwest from Alpnachstad, whence a rack railway leads northwest up Pilatus ($2\frac{3}{4}$ mi.).

Lucerne is the only town of importance, but several spots serve as ports for neighbouring villages (Brunnen for Schwyz, Flüelen for Altdorf, Stanstad for Stans, Alpnachstad for Sarnen). Most of the villages are summer resorts (Gersau also in winter), especially Hertenstein, Weggis, Gersau, Brunnen, Beckenried and Hergiswil, while hotels have been built on heights above, as well as on the Rigi, Pilatus and the Stanserhorn. The area of the lake is about $44\frac{1}{2}$ sq.mi., it is about 24 mi. long, its greatest width only 2 mi. and its greatest depth 702 ft., while the surface of the water is 1,434 ft. above sea level.

Parts of the lake are in the cantons of Lucerne ($15\frac{1}{2}$ sq.mi.), Nidwalden (13 sq.mi.), Uri ($7\frac{1}{2}$ sq.mi.), Schwyz ($7\frac{1}{2}$ sq.mi.) and 1 sq.mi. in Obwalden.

LUCERNE, PURPLE MEDICK or **ALFALFA:** *see* ALFALFA.

LUCHAIRE, ACHILLE (1846–1908), French historian, was born in Paris on Oct. 24, 1846, and died on Nov. 4, 1908. In 1879 he became a professor at Bordeaux and in 1889 professor of mediaeval history at the Sorbonne; in 1895 he became a member of the Académie des sciences morales et politiques. The most important of Achille Luchaire's works are *Histoire des institutions monarchiques de la France sous les premiers Capétiens* (1883 and again 1891); *Manuel des institutions françaises: période des Capétiens directs* (1892); *Louis VI. le Gros, annales de sa vie et de son règne* (1890); *Etude sur les actes de Louis VII.* (1885); *Innocent III.* (6 vols., 1904–08); and contributions to Lavisse's great history of France.

His son JULIEN (b. 1876) became an official of the department of education, and in 1926 director of the Institute of International Intellectual Co-operation in Paris, in connection with the League of Nations.

LUCHU: *see* RYŪKYŪ ARCHIPELAGO.

LUCIA (or LUCY), **ST.,** virgin and martyr of Syracuse, whose name figures in the canon of the mass, and whose festival is celebrated on Dec. 13. According to the legend, she lived in the reign of Diocletian. Lucia was threatened with outrage, but it was found that no force which could be applied was able to move her from the spot on which she stood; even boiling oil and burning pitch had no power to hurt her, until at last she was slain with the sword. The most important documents concerning St. Lucy are the mention in the *Martyrologium Hieronymianum* and the ancient inscription discovered at Syracuse.

See O. Caietanus, *Vitae sanctorum Siculorum,* i. 114–121 (Palermo, 1657); Ioannes de Ioanne, *Acta sincera sanctae Luciae* (Palermo, 1758); *Analecta Bollandiana,* xxii. 492; Cahier, *Caractéristiques des saints,* i. 105 (1867).

LUCIAN (d. 312), Christian martyr, was born, like the famous heathen writer of the same name, at Samosata. His parents, who were Christians, died when he was twelve. In his youth he studied under Macarius of Edessa, and after receiving baptism he adopted a strictly ascetic life. Settling at Antioch when Malchion was master of the Greek school he became a presbyter, and is regarded as the founder of the theological school of Antioch. He is represented as the connecting link between Paul of Samosata and Arius. Indeed, on the deposition of the former (A.D. 268) he was excluded from ecclesiastical fellowship by three successive bishops of Antioch, while Arius seems to have been among his pupils (Theodoret, *Hist. Eccl.* i. 3, 4). He was, however, restored before the outbreak of persecution, and the reputation won by his high character and learning was confirmed by his courageous martyrdom.

Lucian was carried to Nicomedia before Maximin Daza, and persisting in his faith perished on Jan. 7, 312, under torture and hunger, which he refused to satisfy with food offered to idols. His defence is preserved by Rufinus (ix. 6; on Eusebius, *Hist. Eccl.* ix. 9). His remains were conveyed to Drepanum in Bithynia, and under Constantine the town was founded anew in his honour with the name of Helenopolis, and exempted from taxes by the emperor (A.D. 327) (see *Chron. Pasch.,* Bonn ed., p. 527). Here in 387, on the anniversary of his death, Chrysostom delivered the panegyrical homily from which, with notices in Eusebius, Theodoret and the other ecclesiastical historians, the life by Jerome (*Vir. Ill.* cap. 77), but especially from the account by S. Metaphrastes (cited at length in Bernhardy's notes to Suidas, *s.v.* *νοθεύει*), the facts above given are derived. See also, for the celebration of his day in the Syriac churches, Wright, *Cat. of Syr. MSS.* p. 283.

Jerome says that Lucian wrote *Libelli de fide* and several letters, but only a short fragment of one epistle remains (*Chron. Pasch.,* ed. Dindorf, i. 516). The authorship of a confession of faith ascribed to Lucian and put forth at the semi-Arian synod of Antioch (A.D. 341) is questioned. Lucian's most important literary labour was his edition of the Greek Old Testament corrected by the Hebrew text, which, according to Jerome (*Adv. Ruf.* ii. 77), was in current use from Constantinople to Antioch. That the edition of Lucian is represented by the text used by Chrysostom and Theodoret, as well as by certain extant mss., such as the Arundelian of the British Museum, was proved by F. Field (*Prol. ad Origenis Hexapla,* cap. ix.).

See generally, A. Harnack's art. in Hauck-Herzog, *Realencyk.* vol. xi., and for "remains" Routh, *Rel. Sac.* iv. 3–17.

LUCIAN (Λουκιανός) (*c.* A.D. 125–*c.* 190), Greek sophist and satirist, was born at Samosata (*Hist.* 24), the chief town of Commagene in Syria, on the west bank of the Euphrates (*Pisc.* 19). The precise dates of his birth and death are uncertain, and the little that is known of his life is derived from his own works, supplemented by the notice in Suidas: "Lucian of Samosata, surnamed 'the blasphemer,' because in his dialogues he alleges that the things told of the gods are absurd. . . . He was at first an advocate in Antioch, but, having ill success in that, he turned to the composition of discourses, and his writings are innumerable. He is said to have been killed by dogs, he having been rabid against the truth. For in his 'Life of Peregrinus' he attacks Christianity and, wicked man, blasphemes against Christ himself. Wherefore for his madness he suffered meet punishment in this life, and hereafter with Satan he will be inheritor of the everlasting fire." First apprenticed to his uncle, a sculptor (*Somn.* 2), he soon abandoned sculpture for the study of rhetoric, in particular forensic oratory. After practising as an advocate in Antioch he adopted the profession of a sophistic rhetorician, and in this capacity he travelled widely, visiting various parts of Asia Minor, Macedonia, Greece, Italy and Gaul (*Alex.* 57, *Bis accus.* 27, *Apol.* 15, *De electo* 2). In Rome he made the acquaintance of the Platonist Nigrinus, as he describes in the dialogue of that name. About A.D. 165 he settled in Athens, where he made his home for the next 20 years. Here he devoted himself to writing dialogues of a satiric character. Towards the end of his life he accepted an official post in Egypt, defending himself in the *Apologia* against the charge of inconsistency to which he thus exposed himself, he having in his earlier *De mercede conductis* denounced the practice of serving for hire. In this post he seems to have died, but nothing is known as to the date or circumstances.

Under the name of Lucian we have some 79 prose works, and, in addition, two mock tragedies (the theme being gout) and a collection of 53 epigrams. Neither of the tragedies, *Tragodopodagra* and *Ocypus,* is now considered genuine (the latter having apparently been written by the 4th century rhetorician, Acacius, the correspondent of Libanius), nor is much confidence to be placed in the authenticity of the epigrams, which in any case contain nothing notable, save perhaps No. 17 Ἕξ *ὧραι μόχθοις ἱκανώταται, αἱ δὲ μετ' αὐτὰς γράμμασι δεικνύμεναι "ζῆθι" λέγουσι βροτοῖς, i.e.,* Six hours are enough for work; the next four, expressed in letters (ζ', η', θ', ι'), say to men "Live" (in the emphatic sense of "enjoy life" as in Martial's *sera nimis vita est crastina: vive hodie*).

Several of the prose writings are considered spurious on grounds of varying certainty—*Lucius or the Ass, Nero Macrobii, Philopatris* (written in the 10th century), *Halcyon, De sacrificiis, De Syria dea, De astrologia, De parasito, De saltatione, Calumniae non temere credendum, Hippias, Charidemus, Demosthenis encomium, Amores.* The chronological order of his writings is uncertain, but in general the rhetorical works may be regarded as mainly belonging to his earlier period, the satirical dialogues as the work of his maturity, written for the most part during his residence in Athens.

1. **Rhetorical Declamations.**—As typical of these may be named the *Tyrannicide* (a man goes to slay a tyrant but, finding not him but his son, slays the latter, leaving his sword in the wound. The tyrant finds his son slain, takes the sword, and kills himself. The man claims the reward of a tyrannicide); *Phalaris* I. and II. (in I., Phalaris, sending the brazen bull to Delphi, transmits therewith a defence of his own life and conduct; in II., a Delphian priest advises acceptance of the offering); *The Disinherited,* *Ἀποκηρυττόμενος* (a disinherited son learns medicine and, curing his father's madness, is received again into his family, but refusing to cure his step-mother is again disinherited. He pleads against this sentence); *Praise of the Fly; The Trial of the Vowels* (an action is brought by the letter sigma [s] against

tau [τ] for the encroachments of the latter in the case of Attic ττ for σσ, etc., the vowels forming the jury).

2. **Literary Criticism.**—Representative of this type are the *Teacher of Orators,* ironical advice how to become a successful rhetorician by means of claptrap and impudence; *Pseudo-sophist,* a dialogue in which the interlocutors are Lucinus (*i.e.,* Lucian) and a Solecist, and the discussion is of certain solecisms and the distinction of similar words and phrases; *Lexiphanes,* in which the interlocutors are Lucinus and Lexiphanes. The latter recites a *Symposium* composed by himself and packed with far-fetched phraseology and recondite words. Meeting a doctor he receives an emetic, which cures his distemper by causing him to disgorge a flood of abstruse vocables. There are interesting references to the *Altar* of Dosiades and the *Alexandra* of Lycophron. But the best specimen of his literary criticism is contained in the essay *How History Should be Written,* which belongs probably to an early period of his residence in Athens, and which contains sound, if not particularly profound, criticism. The description of the ideal orator (*Hist.* 41) may be quoted: "I would have the historian to be fearless and incorruptible, independent, a lover of frankness and truth, one who, as the comic poet says, will call a fig a fig and a spade a spade; indulging neither hate nor affection, unsparing and unpitying, not shy nor shamefast, an impartial judge, benevolent towards both sides but giving neither more than its due; knowing in his writing no land and no city, bowing to no authority and, acknowledging no king, not considering what this man or that will think, but stating facts as they occurred." His remarks on the style appropriate to the historian are also admirable.

3. **Biographical Works.**—These include *On the Dream,* which is autobiographical; the *Life of Demonax,* an account of Demonax of Cyprus, a cynic philosopher whose society Lucian enjoyed at Athens (*Vit.* Demon. 1); *Alexander, or the False Prophet,* an indictment of the Paphlagonian religious impostor of that name—written after A.D. 180, since in sec. 48 θεὸς Μάρκος, i.e., *divus Marcus,* implies that M. Aurelius (died March 17, 180) was already dead; *On the Death of Peregrinus,* written about 166, an account of the death of Peregrinus (Proteus) of Parium, who, after professing Christianity, became a cynic and finally committed suicide by publicly burning himself at Harpina near Olympia in A.D. 165, Lucian being an eye-witness (*Peregr.* 2). The references to Christianity in this dialogue (11 *seq.*) and in the *Alexander* (25 and 38) are of interest, particularly the references to Christ, "that great man who was crucified in Palestine because he introduced this religion into life" (*Peregr.* 11), to the unsparing devotion of the Christians, and to their beliefs: "for these unhappy men have persuaded themselves that they will be immortal and live for ever; wherefore they despise death and willingly sacrifice themselves. Further, their first lawgiver has persuaded them that they are all brothers one of another, when once they renounce the gods of the Greeks and worship that crucified sophist and live in accordance with his laws" (*Peregr.* 13).

4. **Romances.**—*Lucius* or the *Ass* seems not to be genuine. The story is that of one Lucius who, visiting Thessaly, sees his hostess transform herself by a drug into a bird. Trying the same experiment, but using the wrong drug, he turns himself into an ass and goes through various adventures before he is able to procure roses (the antidote to the drug), which he eats and regains human form. The same theme seems to have been used by Lucius of Patrae in the 1st century A.D. (Phot. cod. 129) as it was again by Apuleius in his *Metamorphoses* in the 2nd century. The *True History,* in two books, is a novel of adventure, describing the marvellous experiences of certain voyagers who, setting sail from the Pillars of Hercules, are caught up into the air, fight for the men of the moon against the men of the sun over the colonization of the morning star, are swallowed, ship and all, by a huge sea-monster, from which they at last escape and voyage to the islands of the blest, etc. The writer warns the reader at the start: "I write of things which I have neither seen nor suffered nor learned from another, things which are not and never could have been, and therefore my readers should by no means believe them" (*V.H.* i. 4).

5. **Satirical Dialogues.**—The satirical dialogues may be taken as the most mature and characteristic work of Lucian. In the *Twice Accused* Lucian is arraigned by Rhetoric on a charge of desertion (κάκωσις). Rhetoric tells how she found him quite a youth, "still a barbarian in speech and all but dressed in the Assyrian fashion, wandering about Ionia and not knowing what to do with himself," and how she educated him in the art of speaking and made him famous, travelling with him not merely in Ionia and Greece but even so far afield as Italy and Gaul (*Bis accus.* 27). Lucian in his reply admits the benefits which he received from Rhetoric, but he pleads that it was only when he found her abandoning the Demosthenic style of oratory for a more meretricious fashion, "decking herself and wearing her hair in the manner of a courtesan, using paint and pencilling her eyes," that he resolved to desert her for Dialogue: "In any case it was well for me, a man of some 40 years of age, to be done with those tumults and lawsuits and to leave 'gentlemen of the jury' alone; to escape from tirades against tyrants and praise of princes, and to go to the Academy or the Lyceum and walk with this most excellent Dialogue, conversing quietly and requiring no praise or applause" (*Bis accus.* 32). On the other hand, Dialogue arraigns Lucian in an action for insult (ὕβρις), complaining that whereas he (Dialogue) had previously held high discourse of the gods and nature and the universe, soaring high above the clouds, where Zeus drives his winged car, Lucian had dragged him down to earth and broken his wings, robbing him of his mask of tragedy and wisdom and substituting for it a mask of another sort, comic and satyric and almost ridiculous, associating him with jest and lampoon and cynicism and Eupolis and Aristophanes, "scoffers at serious things and mockers of what is well ordered," and finally Menippus, "a terrible dog who bit while he laughed" (*Bis accus.* 33). Lucian in reply substantially admits the accusation, but pleads that by abandoning the subtleties of philosophy and introducing comic relief he had caused Dialogue to "walk upon the earth after the manner of men" and thus to become more generally attractive.

In the *Nigrinus* Lucian makes that philosopher describe himself as "sitting as it were aloft in a crowded theatre surveying the actions of men, some capable of affording amusement and laughter, others calculated to try the firmest heart" (*Nigrin.* 18). If the function of the chorus in Greek tragedy as the κηδευτὴς ἄπρακτος (an interested party who takes no part in the action) is comparable to that of the Wedding Guest, Lucian in his rôle of the laughing philosopher may be compared to the Casual Spectator, for whom in his detachment and unconcern all the world's a stage and all the men and women merely players. This is a notion to which Lucian again and again recurs, e.g., *Menippus* 16: "You have often seen, I imagine, on the stage those tragic actors who, according to the exigencies of the play, appear now as Creon and now as Priam or Agamemnon, and the same person, who a little before had with great dignity represented Cecrops or Erechtheus, comes forth at the bidding of the poet as a menial; and, when the drama is ended, each doffs his gold-bespangled dress and lays aside his mask and stepping down from his still-boots walks about, a poor and humble man, no longer Agamemnon the son of Atreus, or Creon the son of Menoeceus, but Polus son of Charicles of Sunium, or Satyrus son of Theogeiton of Marathon." This detached and external point of view is obtained in the *Menippus* by a descent to Hades; and so, too, in the *Dialogues of the Dead* (with which may be classed the *Cataplus*) the theme is the contemplation of the fugitive vanities of human life from the point of view of those for whom "what comes after life" (τὰ μετὰ τὸν βίον, *Mort. Dialog.* i. 1) is no longer a matter of speculation but a present reality. In the *Icaromenippus,* on the other hand, the vantage-ground is got by an ascent to Heaven; in the *Charon* by piling upon Ossa Pelion, then Oeta, then Parnassus, whence Charon with his guide Hermes contemplates a series of celebrities, and, beholding the futility of human endeavour, is moved to cry "O foolish men! Wherefore are ye so busied about these things? Cease from your labours, for ye will not live for ever. None of those earthly dignities is abiding, and a man can carry none of them with him when he dies, but must depart naked, while his house and lands and gold will own one master after another" (*Charon* 20). In the *Anacharsis* we have Greek institutions as they present themselves to the eye of a barbarian, and a justification of them against his criticisms.

Besides the dialogues already referred to may be mentioned the *Hermotimus* (written when Lucian was 40 years of age, *Herm.* 13), the upshot of which is that all philosophy is vanity; the *Ship,* emphasizing the vanity of human wishes; the *Symposium,* describing a riotous banquet at which the philosophers behave rather worse than others; the *Sale of Lives,* in which the lives of various philosophers are auctioned at market value; the *Timon,* in which the Athenian misanthrope (whose tower was seen by Pausanias, i. 30) is restored to wealth to find himself once more the centre of a crowd of flatterers.

The English writer whom Lucian most recalls is Swift, who, as he probably took the idea of *Gulliver's Travels* from the *True History,* may have found the inspiration for the *Letter of Advice to a Young Poet* in the *Teacher of Orators.* In ease and lucidity of style Lucian's Greek (founded on the best Attic models and only in some minute details aberrant from them) is not inferior; and if he suggests less of the *saeva indignatio* of the conventional satirist, that may well mean not any lack of personal conviction and moral earnestness but a stricter fidelity to what he conceived to be the function of the satirist—*ridentem dicere verum.*

LUCIFER (d. 371), bishop of Cagliari (hence called *Caralitanus*), an ardent supporter of the cause of Athanasius. After the unfavourable result of the synod of Arles in 353 he volunteered to endeavour to obtain a new and impartial council. He was accordingly sent by Pope Liberius, with Pancratius the presbyter and Hilarius the deacon, but could not prevent the condemnation of Athanasius, which was renewed at Milan in 355. For his own persistent adherence to the orthodox creed he was banished to Germanicia in Commagene; he afterwards lived at Eleutheropolis in Palestine, and finally in the upper Thebaid. His exile came to an end with the publication of Julian's edict in 362. From 363 until his death in 371 he lived at Cagliari in a state of voluntary separation from ecclesiastical fellowship with his former friends Eusebius of Vercelli, Athanasius and the rest, on account of their mild decision at the synod of Alexandria in 362 with reference to the treatment of those who had unwillingly Arianized under the persecutions of Constantius. The sect which Lucifer thus founded did not continue long after his death. It is doubtful whether it ever formulated any distinctive doctrine; certainly it developed none of any importance. The memory of Lucifer is still cherished in Sardinia; but, although popularly regarded there as a saint, he has never been canonized.

Bibliography.—The controversial writings of Lucifer, dating from his exile, are chiefly remarkable for their passionate zeal, and for the boldness and violence of the language addressed to the reigning emperor. Their quotations of Scripture are of considerable value to the critical student of the Latin text before Jerome. They were first collected and edited by Tilius (Paris, 1568); the best edition is that of W. Hartel in the Vienna *Corpus, Script. Eccl. Lat.* (1886). *See* also G. Krüger, *Lucifer Bischof von Cagliari und das Schisma der Luciferianer* (Leipzig, 1886); F. G. Kenyon, *Textual Criticism,* pp. 181, 221.

LUCIFER, meaning "light-bringer," is a name given to the planet Venus when it appears above the eastern horizon before sunrise. It is used in Isaiah xiv. 12 (A.V.; but R.V. "day-star") to translate the Hebrew epithet "shining one," applied to the king of Babylon, fallen from his high estate to Sheol. The Fathers interpreted the words of Jesus, Luke x. 18, "I beheld Satan fallen as lightning from heaven," as a reference to this passage in Isaiah, so that Lucifer came to be regarded as the name of Satan before his fall. It is so used by Milton in *Paradise Lost,* and the idea underlies the proverbial phrase "as proud as Lucifer."

LUCILIUS, GAIUS (*c.* 180–103 B.C.), the earliest Roman satirist, of whose writings only fragments remain, was born at Suessa Aurunca in Campania. The dates assigned by Jerome for his birth and death are 148 and 103 or 102 B.C. But it is impossible to reconcile the first of these dates with other facts recorded of him, and the date given by Jerome must be due to an error, the true date being about 180 B.C. He served under Scipio at the siege of Numantia in 134, was an intimate friend of Scipio and Laelius, and devoted some of his satires to the praises of Scipio. He spent the greater part of his life at Rome, and died, according to Jerome, at Naples. Lucilius belonged to the equestrian order, a fact indicated by Horace's notice of himself as "infra Lucili censum." His satires are another expression of the revolutionary forces behind the Gracchan movement.

He may be regarded as the inventor of poetical satire, as he was the first to give to the formless Roman *satura* that distinctive character of critical comment on manners, politics and literature which the word satire still denotes. Unlike other forms of Roman literature, it owes nothing to Greek, being a legitimate development of a native form of entertainment, originally of a dramatic nature. In his style and his choice of subject Lucilius was equally original. His early work was directed to ridiculing the conventional language of epic and tragic poetry, and he used the style of familiar speech, even to the point of frequently employing Greek, which was then beginning to be fashionable in educated circles, while for his subjects he abandoned the hackneyed ground of Greek and Roman mythology, and treated of the politics and wars, the business and pleasure, the scandals and vices of his own day. These he handled, not in Juvenal's spirit of rhetorical stoicism, but, like Horace, from the standpoint of a man of the world, and the associate of men of affairs. But he differed from Horace in being a thoroughly good hater, and also in a savage outspokenness of attack characteristic of the public life of his age.

The fragments of Lucilius number about 1,100, mostly unconnected lines, most of them preserved by late grammarians, as illustrative of peculiar verbal usages. He was, for his time, a voluminous as well as a very discursive writer. He left behind him 30 books of satires, mostly written in hexameters, but, so far as an opinion can be formed from a number of unconnected fragments, he seems to have written the trochaic tetrameter with a smoothness, clearness and simplicity which he never attained in handling the hexameter. The longer fragments produce the impression of great discursiveness and carelessness, but at the same time of considerable force.

Editions by F. D. Gerlach (1846), L. Müller (1872), C. Lachmann (1876, posthumous), F. Marx (1905); *see* also L. Müller, *Leben und Werke des Lucilius* (1876); "Luciliana," by H. A. J. Munro, in the *Journal of Philology,* vii. (1877); Mommsen, *Hist. of Rome,* bk. 4 ch. xiii.; "Luciliana," by A. E. Housman, in *Classical Quarterly* (April, 1907); C. Cichorius, *Untersuchungen zu Lucilius* (1908). (W. Y. S.; X.)

LUCILIUS JUNIOR, a friend and correspondent of the younger Seneca, probably the author of *Aetna,* a poem on the origin of volcanic activity. As the author appears to have known and made use of the *Quaestiones Naturales* of Seneca (written A.D. 65), and no mention is made of the great eruption of Vesuvius (A.D. 79), the time of its composition seems to lie between these two dates. *See* Aetna.

LUCINA, the Roman goddess or spirit who brings children to birth (*ad lucem, cf.* Fr. *mettre un enfant au jour*). It is commonly found as an epithet of Juno, as Terence, *Andria,* 473; occasionally of other goddesses, as Diana (Hor., *Carm. Saec.,* 15), but not in pure Roman cult.

LUCIUS, the name of three popes.

Lucius I., pope for eight months (253–254), spent a short period of his pontificate in exile. He is referred to in several letters of Cyprian (see *Epist.* lxviii. 5) as agreeing with his predecessor Cornelius in preferring the milder treatment of the lapsed penitent. He is commemorated on March 4. (L. D.)

Lucius II. (Gherardo Caccianemici dal Orso), pope from March 12, 1144, to Feb. 15, 1145, a Bolognese, successively canon at his native city, cardinal priest of Sta Croce in Gerusalemme, treasurer of the Roman Church, papal legate in Germany for Honorius II., chancellor and librarian under Innocent II., was the successor of Celestine II. His stormy pontificate was marked by the erection of a revolutionary republic at Rome which sought to deprive the pope of his temporal power, and by the recognition of papal suzerainty over Portugal. He was succeeded by Eugenius III.

His letters are in J. P. Migne, *Patrol. Lat.* vol. 179. A single unreliable writer, Godfrey of Viterbo (in J. M. Watterich, *Pontif. Roman. Vitae*), is authority for the statement that Lucius II. perished in an attempt to storm the Capitol. *See* Jaffé-Wattenbach, *Regesta pontif. Roman.* (1885–88); J. Langen, *Geschichte der römischen Kirche von Gregor VII. bis Innocenz III.* (Bonn, 1893); F. Gregorovius, *Rome in the Middle Ages,* vol. 4, trans. by Mrs. G. W. Hamilton (1896).

LUCIUS III. (Ubaldo Allucingoli), pope from Sept. 1, 1181, to Nov. 25, 1185, a native of Lucca and a Cistercian monk, named cardinal-priest of Sta Prassede by Innocent II. and cardinal-bishop of Ostia and Velletri by Adrian IV., succeeded Alexander III. He lived at Rome from Nov. 1181 to March 1182, but dissensions in the city compelled him to pass the remainder of his pontificate in exile, mainly at Velletri, Anagni and Verona. He disputed with the emperor Frederick I. the disposal of the territories of the Countess Matilda. In Nov. 1184 he held a synod at Verona which condemned the Cathari, Paterines, Waldensians and Arnoldists, and anathematized all heretics and their abettors. Lucius died in the midst of preparations for a crusade in answer to appeals of Baldwin IV. of Jerusalem. His successor was Urban III.

His letters are in J. P. Migne, *Patrol. Lat.* vol. 201. Consult J. M. Watterich, *Pontif. Roman. Vitae,* vol. 2 (Leipzig, 1862); and Jaffé-Wattenbach, *Regesta Pontif. Roman.* (1885–88). *See* J. Langen, *Geschichte der römischen Kirche von Gregor VII. bis Innocenz III.* (Bonn, 1893); P. Scheffer-Boichorst, "Zu den mathildinischen Schenkungen," in *Mittheilungen des österreichen Instituts* (1888).

(C. H. H.)

ŁUCK or **LUTSK,** a town of Poland, in the province of Volhynia, on the Styr, 51 mi. by rail N.W. of Kovel. Pop. 35,700. In the 11th century it was known as Luchesk, and was the chief town of an independent principality. In the 15th century it was the seat of a bishop and became wealthy, but during the wars between Russia and Poland in the second half of the 16th century, and especially after the extermination of its 40,000 inhabitants, it lost its importance. In 1791 it was taken by Russia. Among its buildings is a 16th-century castle. Luck is the seat of a Roman Catholic bishop. It was occupied by the Russians in 1939 and fell to the Germans in 1941.

ŁUCK or **LUTSK, BATTLES OF.** Under this heading are described the Russian attacks on their south-western front, which extended from the Pinsk marshes to the northern frontier of Rumania, during the summer and autumn of 1916. These attacks are generally known as "the Brusilov offensive." The original break-through of the Austrian front occurred near the town of Łuck (Lutsk), in Volhynia, on the river Styr, which thus gives its name to the whole series of operations.

The general situation in May 1916 was such that despite the failure of the attacks in March which it had launched, the Russian supreme command had set to work to prepare a large scale offensive on the front west of Molodeczno as its contribution to the great general Allied offensive which was to open on all fronts on July 1. Since the great offensive of the Central Powers against Russia had come to an end in the autumn of 1915, their forces on the Eastern front had been considerably reduced. The Germans had taken troops for their Verdun offensive, and the Austrians during the spring had withdrawn formations for an offensive against Italy. The Russians, on the other hand, had recovered rapidly from their disasters of the previous year; the ranks were full and munitions more plentiful than they had been formerly.

Preparation of Brusilov's Offensive.—Gen. Brusilov succeeded Ivanov as Commander-in-Chief of the south-western front in March. He was a cavalry soldier and had commanded the 8th Army since the commencement of the war with conspicuous success. He received instructions to prepare attacks on the south-western front to distract the enemy's attention from the main Russian effort at Molodeczno. The four armies under Brusilov were: the 8th (Kaledin) from the Kowel-Kiev railway near Rafalowka to about Kremenets, 11 divisions and four cavalry divisions; the 11th (Sakharov) from Kremenets to near Tarnupol, eight divisions and one cavalry division; the 7th (Shcherbachev) from near Tarnupol to Potok, seven divisions and $3\frac{1}{2}$ cavalry divisions; and the 9th (Lechitski) from Potok to the Rumanian frontier, ten divisions and three cavalry divisions. There was one corps (two divisions) in reserve.

The Austrian 4th Army (Archduke Joseph Ferdinand), from near Rafalowka to Dubno, with $10\frac{1}{2}$ divisions and one cavalry division, and the 2nd Army (Böhm-Ermolli), from Dubno to near Kremenets, with eight infantry and two cavalry divisions, were opposed to Kaledin; the German Southern Army (von Bothmer) with one German and nine Austrian divisions and two cavalry divisions, held a long front, corresponding approximately with those held by the Russian 11th and 7th Armies; while the Austrian 7th Army (Pflanzer-Baltin), with $8\frac{1}{2}$ divisions and four cavalry divisions, opposed Lechitski. In the actual number of divisions there was little disparity between the total forces at the disposal of either side; the Russians had 38 divisions and 12 cavalry divisions to the Austro-German 37 divisions and nine cavalry divisions; but the Russian divisions were larger. The Austrian front had been strongly fortified and organized, and in spite of the removal of some of their most reliable divisions and much heavy artillery to the Italian front the Austrians were confident of being able to hold their ground.

About the middle of April, Brusilov had ordered each of his army commanders to select a sector of attack and to make preparations with the resources at his disposal within his own army to penetrate the enemy's front in that sector. Preparations were to be complete before the middle of May. These attacks were designed simply as aids to the main Russian offensive in the north, timed for July 1. On May 14, however, the Austrians began an offensive in the Trentino against Italy. The Italians appealed to the Russians to relieve the pressure by attacking the Austrians on their front. Brusilov accordingly launched his attacks on all four army fronts on June 4, without any expectation of a decisive break-through or arrangements for exploitation of success on a large scale.

The Break-through at Łuck.—The sector of attack chosen by Kaledin, commander of the 8th Army, centred on the village of Olika, east of Łuck. The bombardment began on June 4 and the assault was made by the 40th and 8th Corps early on June 5. The 40th Corps carried three lines of enemy trenches and penetrated over two miles, and the 8th Corps, though less successful, made considerable progress. The advance continued on June 6 and on June 7 reached Łuck. By this time a wide gap had been made between the Austrian 4th Army and the 2nd Army farther south, and a great opportunity for the numerous Russian cavalry seemed to have come. But of the four cavalry divisions allotted to Kaledin's army, two had been used to hold trenches so as to enable infantry to be concentrated for the assault and one was despatched by Brusilov in a fruitless raid along the railway towards Kowel through marshes entirely unsuited for cavalry action. The one remaining division could accomplish little. Meanwhile the left wing of the 8th Army occupied Dubno on June 9; on June 10 the front of the army lay along the line of the rivers Styr and Ikwa, from Rozyszcze through Łuck to Dubno.

Attacks of the 11th, 7th and 9th Armies.—The attack of the 11th Army north-west of Tarnupol was a failure. Shcherbachev's 7th Army attacked in a sector on its extreme left near the village of Jaziowec. After two days' bombardment the infantry assaulted early on June 6 and carried the enemy positions; next day the Austrians were driven behind the Strypa. The Russians crossed the river on the 8th and gained further ground during the next two days. Counter-attacks then arrested their advance for the time being. Lechitski's 9th Army attacked some 20m. north of Czernowitz, near the village of Okna, with complete success. By June 10 the front was broken and the Austrians retreated in disorder behind the Prut. Czernowitz was captured on June 17.

Consequences of Brusilov's Success.—Thus by the middle of June the Austro-German front south of the Pinsk marshes was completely broken on both flanks, and two armies, the 4th and 7th, were in full retreat. In the centre Böhm-Ermolli's and von Bothmer's armies still held, though their outer flanks had been driven in. On three-quarters of the whole Russian south-western front their armies were moving forward. These entirely unexpected results of an offensive undertaken purely as a demonstration reacted instantly on the whole strategy both of the Russians and of the Central Powers. On the Russian side the new situation demanded the immediate transfer of the principal reserves from the north, where they had been grouped for the Molodeczno offensive, if Brusilov's success in the south were to be exploited. The decision was taken promptly enough: the Molodeczno offensive was abandoned. Lesh's 3rd Army astride the Pripet was added to Brusilov's command and troops were hurried south as rapidly as the capacity of the railways would permit. Unfortunately for the Russians the poverty and the low efficiency of their communications gave the enemy time to concentrate sufficient reinforcements to restore their front before the full weight of the Russian reserves could give a fresh impetus to the advance.

For the Germans the sudden reverse came at a difficult time, for they were fully engaged at Verdun and were expecting a Franco-British offensive at an early date; obviously, too, events might have a decisive influence on the attitude of Rumania. Reinforcements were at once collected to restore the situation; to close the principal gap it was decided to stage a counter-attack on a large scale on both sides of the Kowel-Rowne railway. This attack was entrusted to von Linsingen, the German commander of the Austro-German army holding the area of the Pinsk marshes opposite the Russian 3rd Army. He was reinforced by three German divisions from the northern part of the Eastern front, four from France and two Austrian divisions from the Trentino. During the whole of the latter half of June, as these reinforcements arrived, he counter-attacked persistently towards Łuck and to the north and south of it. These attacks, though they brought the Austro-German forces little gain of ground, had at least the effect of limiting Kaledin's break-through. On July 4 the left of Lesh's 3rd Army, in conjunction with Kaledin's right, launched an attack in the bend of the Styr east of Kowel and drove von Linsingen's army back to the Stochód river. This put an end to the Austro-German counter-attacks, and there were no further important operations on this part of the front till the end of July.

Meantime, Lechitski in the south with the Russian 9th Army was completing the conquest of the Bukovina. After the capture of Czernowitz, part of the Austrian 7th Army retreated precipitately south to the Carpathians, pursued by the left wing of Lechitski's army, which occupied Kimpolung on June 24. His right wing, advancing between the Dniester and the Prut, won a victory on June 28 and occupied Kolomyja on the following day. At the beginning of July the Austrians in the south received reinforcements and made a series of counter-attacks opposite Kimpolung and Delatyn. These were defeated, and Lechitski's right wing occupied Delatyn on July 10. His army was now, however, enormously extended and had to halt to await reinforcements.

Reorganization of Command by the Central Powers.—The German command, which had since the beginning of June sent 16 divisions to the front south of the Pinsk marshes, naturally claimed an increased influence on the direction of operations on this front. Very shortly after the first break-through at Łuck they had insisted on the removal of the Archduke Joseph Ferdinand from his command of the 4th Army and on the extension of von Linsingen's sphere of command southwards to the northern frontier of Galicia. The greater portion of Pflanzer-Baltin's 7th Army had also been transferred to von Bothmer commanding the German Southern Army. It was now proposed to appoint Hindenburg to the supreme command of the Eastern front as far south as Lemberg; the remainder of the front, on both sides of the Dniester and in the Carpathians, was to be under the Austrian heir apparent, the Archduke Charles, with the German Gen. von Seeckt as his chief of staff.

This arrangement was eventually brought into force early in August. The Archduke Charles had originally come from the Italian front at the beginning of July to command a 12th Army, which was to be formed from troops on the spot and fresh reinforcements, and was to deliver a counter-attack on a large scale on both sides of the Dniester in a south-easterly direction. But as the incoming reinforcements had always to be thrown into the battle as soon as they arrived, the formation of the 12th Army and the proposed counter-offensive never took place. Instead, the 3rd Army command from Tirol took over the troops between the Carpathians and the Dniester. The Archduke's command thus comprised the 7th, 3rd and Southern armies.

Concurrently during the latter half of July, while the Russian 8th and 9th Armies on the flanks paused to await reinforcements, Brusilov ordered Sakharov's 11th Army, which had extended its front northwards to beyond Dubno, to take the offensive. It attacked near Boromel, south-west of Łuck, on July 16, and drove the enemy back across the Lipa. Sakharov then moved south on Brody, which he captured with 40,000 prisoners on July 28—a fine victory. Meanwhile Shcherbachev's 7th Army, in spite of repeated attacks north-west of Buczacz towards Monasterzyska, had failed to make much impression on von Bothmer's Southern Army. Lechitski, however, at the end of July gained some ground towards Stanislau.

Attack on Kowel.—Towards the end of July the Russian Guard Army (1st and 2nd Guard Corps, 1st Corps, 30th Corps, Guard Cav. Corps) detrained from the north and took up a front between the 3rd and 8th Armies. The Guard had not been in action since the previous September and had been carefully trained and kept in hand for a great occasion. It was now decided to use it to force the line of the Stochód river and capture Kowel. It is difficult to understand why this line of advance was chosen for a supreme effort. The terrain is mainly marsh and advance is usually possible only on narrow causeways. The attacks, which commenced on July 28 and were continued up to Aug. 10, resulted in a complete and costly failure. The Guard Army lost 55,000 men for a trifling gain of unimportant ground. Brusilov thereafter abandoned the direct advance on Kowel, but continued up till the middle of October attempts to enlarge the Łuck salient in the direction of Włodzimierz Wolynski. All these attempts ended in failure.

In the south the Russian Army commander, Lechitski, attacked again south of the Dniester on Aug. 7 and drove back Kövess' 3rd Army. He occupied Stanislau on Aug. 10 and Nadwórna on Aug. 12. On this latter date the 7th Army occupied Monasterzyska. Under the threat from this flank and pressure from Sakharov's army south of Brody, von Bothmer now at last gave up the original line which he had held throughout all the turmoil and withdrew towards Brzezany.

Austro-German counter-attacks in the Carpathians in the first half of August had little success. On Aug. 20 the Russians reorganized their front so as to allow Lechitski's 9th Army to have as its only task the forcing of the Carpathian passes between Delatyn and Kimpolung in order to protect the right flank of the Rumanians, who joined the Allies on Aug. 27. In spite of severe fighting throughout September little progress was made on this front. Nor was any appreciable advance made elsewhere on the south-western front in spite of repeated assaults. In October the defeat of the Rumanians necessitated the transfer of troops to that theatre and the abandonment of further offensive operations. The summer which had opened so brilliantly ended in disappointment and failure.

Results of the Offensive.—Although Brusilov had recaptured practically the whole of the Bukovina and large portions of Eastern Galicia and Volhynia and had taken some 350,000 prisoners and over 400 guns, the cost had been exceedingly heavy. The casualties on the south-western front were over 1,000,000. These losses and those suffered in the abortive attacks on the Northern and Western fronts in 1916, at Lake Naroch, Baranowicze and Riga, were in the end the principal cause of the rapid infection of the army with anti-war propaganda when the Revolution came. Hailed by her Allies as proof of the complete regeneration of the Russian army, Brusilov's offensive was really its death-knell.

LUCKA, EMIL (1877–), Austrian author and philosopher, born in Vienna on May 11, 1877, and came to the forefront of Austrian literature in 1912. His novels and shorter tales are as rich in thought as in invention, their plots being laid either in the Middle Ages as, in *Isolde Weisshand* (1912), *Heiligenrast* (1917), *Der Weltkreis* (1919), *Fredegund* (1921); or in Vienna society, as in *Das Brausen der Berge* (1918), or in the Austrian Alps, as in *Am Sternbrunnen* (1926). In the *Drei Stufen der Erotik* (1913) Lucka gives a magnificent representation of the development of love throughout the ages; in *Grenzen der Seele* a psychology of Genius; and in *Urgut der Menschheit* (1924), he discusses the problem of how the primeval myths may be revived to meet the needs of modern civilization.

LÜCKE, FRIEDRICH (1791–1855), German theologian, was born on the 24th of August 1791, near Magdeburg, where his father was a merchant. He studied theology at Halle and Göttingen. After holding various academic posts he became in 1827 professor of theology at Göttingen, where he remained until his death on Feb. 4, 1855.

Lücke, who was one of the most learned, many-sided and influential of the so-called "mediation" school of evangelical theologians (*Vermittelungstheologie*) is chiefly remembered by his *Kommentar über die Schriften d. Evangelisten Johannes* (4 vols., 1820–1832, 3rd ed. 1856).

See Sander, *Friedrich Lücke* (1890).

LUCKENWALDE, a town in the Prussian province of Brandenburg, Germany, on the Nuthe, 30 mi. S. of Berlin, on the line to Dresden and Leipzig. Pop. (1939) 28,801. The site of Luckenwalde was occupied in the 12th century by a Cistercian monastery, but the place did not become important till the reign of Frederick the Great though it became a town in 1430. Its cloth and hat manufactories are among the most extensive in Prussia. Among its other industries are brewing, and the making of metal and bronze goods, paper and pianos.

LUCKNOW (lŭk′now), a city, district and division of British India. The city was the capital of Oudh from 1775 until merged in the United Provinces in 1901. Pop. (1941) 387,177. It lies mainly on the right bank of the winding river Gumti. East of the city the Civil Lines stretch for a distance of over 2 mi.; and then comes a fine, well laid-out cantonment with a substantial civil population and accommodation for troops of all arms. It is the headquarters of the 8th division of the Indian Army.

Lucknow is a place of parks, gardens and imposing monuments, though most of the latter are of inferior architecture and material. It shares with Allahabad the position of the headquarters of the government of the United Provinces, and has a residence for the Governor; it is also the seat of the Chief Court of Oudh, and of the provincial legislature. It has a university of its own, with the Canning College, and a number of others. The Medical College is the finest in north India, and the adjoining hospital was erected on the most modern design at a cost of over £250,000. The Colvin School is intended for the education, on British public-school lines, of the sons of the taluqdars or large landlords of Oudh; and a picturesque building, known as La Martinière, takes Anglo-Indian boys and is partly supported by an endowment left by General Claude Martin in 1800. There are several important industrial establishments, chiefly paper mills, printing presses and metal works; but the city as a whole swarms with the decayed families of the hangers-on of the overgrown court of the old Oudh kingdom. The chief indigenous industries are gold and silver brocades, muslins, embroidery, brass and copper ware, pottery and moulding in clay, and vessels and ornaments in beaten silver. Lucknow being an important railway centre, there are large workshops; and it was one of the first of the towns in Upper India to be supplied with electricity.

The Residency.—Among the events of the Mutiny of 1857 the defence of the Lucknow Residency comes, in historic interest, only second to the tragedy of Cawnpore. The name "residency" is now applied not only to the residency itself, but to the whole of the outbuildings and entrenchments in which Sir Henry Lawrence concentrated his small force. These entrenchments covered almost 60 acres of ground, and consisted of a number of detached houses, public edifices, outhouses and casual buildings, netted together, and welded by ditches, parapets, stockades and batteries into one connected whole. On the summit of the plateau stands the shell of the residency proper, the official residence of the chief commissioner, a lofty building three storeys high, with a fine portico. Near the residency comes the banqueting hall, and beyond the Baillie Guardgate lie the ruins of the surgeon's house, where Sir Henry Lawrence died of a shell-wound, and where the ladies of the garrison were sheltered in underground rooms. Round the line of the entrenchments are pillars marked with the name of the various "posts" into which the garrison was distributed. The most dangerous of these was the Cawnpore battery post, where the stockade was directly exposed to the enemy's fire. The mutineers had rifles fixed in rests in the house opposite, and swept the road that led through the residency enclosure at this point. Close to the residency is the Lawrence Memorial, an artificial mound 30 ft. high crowned by a marble cross.

Other Monuments.—Among the other buildings of interest in Lucknow is the Imambara, which is one of the largest rooms in the world (162 by 54 ft.), having an arched roof without supports. This room was built by the Nawab Asaf-ud-dowlah in 1784, to afford relief to the famine-stricken people. The many monuments of his reign include his country palace of Bibiapur, outside the city. Among later buildings are the two palaces of Chhattar Manzil, erected for the wives of Ghazi-ud-din Haidar (1814) and now used as a club; the remains of the Farhat Baksh, dating from the previous reign, and adjoining the greater Chhattar Manzil; the observatory (now a bank) of Nasir-ud-din Haidar (1827); the imambara or mausoleum and the unfinished great mosque (Jama Masjid) of Mohammed Ali Shah (1837), and the huge debased Kaisar Bagh, the palace of Wajid Ali Shah (1847–1856), now divided up into residences for the chief taluqdars.

The DISTRICT OF LUCKNOW lies on both sides of the river Gumti, and has an area of 976 sq.mi. Its general aspect is that of an open champaign, well studded with villages, finely wooded and in parts most fertile and highly cultivated. In the vicinity of rivers, however, stretch extensive barren sandy tracts (*bhúr*), and there are many wastes of saline efflorescence (*usár*). The country is an almost dead level, the average slope, which is from northwest to southeast, being less than a foot per mile. The principal rivers are the Gumti and the Sai with their tributaries. The population in 1941 was 949,728.

The DIVISION OF LUCKNOW contains the western half of the old province of Oudh. It comprises the six districts of Lucknow, Unao, Sitapur, Rae Bareli, Hardoi and Kheri. Its area is 12,002 sq.mi. and its population in 1941 was 6,530,932.

LUÇON, a town of western France, in the department of Vendée, 23 mi. S.E. of La Roche-sur-Yon, on the railway from Nantes to Bordeaux, and on the canal of Luçon (9 mi. long), which affords communication with the sea in the Bay of Aiguillon. Pop. (1936) 6,802. Between Luçon and the sea stretch marshy plains, the bed of the former gulf, partly drained by numerous canals, and in the reclaimed parts yielding excellent pasturage, while in other parts are productive salt-marshes, and ponds for the rearing of mussels and other shell-fish. Luçon is the seat of a bishopric, established in 1317, and held by Richelieu from 1607 to 1624. The cathedral, 12th-century and later, was originally an abbey church. The cloisters are of the late 15th century. Near by is the bishop's palace, possessing a large theological library. There is an ecclesiastical seminary here.

LUCRE, money which is the object of greed (Lat. *lucrum,* gain). In the adjective "lucrative," profitable, there is, however, no sense of disparagement. In Scots law the term "lucrative succession" (*lucrativa acquisitio*) denotes the taking by an heir, during the lifetime of his ancestor, of a free grant of any part of the heritable property.

LUCRETIA, a Roman lady, wife of Lucius Tarquinius Collatinus, distinguished for her beauty and domestic virtues. Having been outraged by Sextus Tarquinius, one of the sons of Tarquinius Superbus, she informed her father and her husband, and, having exacted an oath of vengeance from them, stabbed herself to death. Lucius Junius Brutus, her husband's cousin, put himself at the head of the people, drove out the Tarquins, and established a republic (traditional date, 509 B.C.). The accounts of this tradition present many points of divergence.

LUCRETILIS MONS, a mountain in Sabine territory, mentioned by Horace as visible from his farm, generally (and rightly) identified with Monte Gennaro, a limestone peak 4,160 ft. high. Excavations on the site of Horace's farm have led to the discovery of the building itself, with baths added at a later date.

LUCRETIUS [TITUS LUCRETIUS CARUS] (*c.* 98–55 B.C.), one of the greatest of Roman poets, is biographically one of the most obscure. All that we know of his life is contained in the following notices: 1. Jerome's *Chronica Eusebii* has under the year 94 B.C. the entry: "Titus Lucretius the poet is born. Afterwards he was rendered insane by a love potion and, after writing, in the intervals of insanity, some books, which Cicero afterwards emended, he killed himself by his own hand in the 43rd year of his age." 2. Donatus, *Vita Vergilii,* 6, says that Lucretius died on the day that Virgil assumed the *toga virilis,* and that the consuls for the year were the same as in the year of Virgil's birth, *i.e.,* M. Licinius Crassus and Cn. Pompeius Magnus, consuls in 70 and in 55 B.C. 3. Cicero *Ad Quintum fratrem* II. IX. [XI.], a letter written in Feb. 54 B.C., says "The poems of Lucretius are as you say in your letter—they show many gleams of genius, yet also much art. But more of this when you come."

The statement of Donatus coupled with Cicero's letter seems to make it pretty certain that Lucretius died in 55 B.C. To bring Jerome's statement into harmony with Donatus we must alter either "94" or, what is far more probable, "43rd." The statement that Cicero "emended" the poems need mean no more than that he, as we should say, "saw them through the press," and in view of the interest which Cicero had in the poems, as shown by the letter to his brother, that seems natural enough. The statements of Jerome have been questioned or disbelieved on the grounds of their intrinsic improbability. They have been regarded as a fiction invented later by the enemies of Epicureanism with the view of discrediting the most powerful work ever produced by any disciple of that sect.

The story of insanity which might easily arise from such a chance phrase as *docti furor arduus Lucreti* (Statius, *Silv.* ii. 7, 76), is incapable either of proof or disproof, and is irrelevant.

His great didactic epic *De Rerum Natura* (On the Nature of Things) takes its title from the Greek Περὶ Φύσεως (*De Natura*) which was the title of didactic epics by Xenophanes of Colophon, Parmenides of Elea, Empedocles of Agrigentum, as also of the chief prose work of Epicurus, whose teaching it is the purpose of the poem of Lucretius to expound. In briefest outline the doctrine of Epicurus, based on the atomic theory of Democritus of Abdera, is as follows. 1. Nothing is created out of nothing (Epicur. *Ad Herod.* 38, Lucr. i. 159–214). The universe does not change (Epicur. *Ad Herod.* 39, Lucr. i. 670, ii. 297 *sqq.* 304 *sqq.*). The universe is infinite (Epicur. *Ad Herod.* 41, Lucr. i. 958 *sqq.*). The universe is made up of bodies (σώματα, *corpora*) and space or void (τόπος, κενόν, χώρα, ἀναφὴς φύσις: *locus, inane, spatium, intactile: cf.* Lucr. i. 454, *Tactus corporibus cunctis, intactus inani:* Epicur. *Ad Herod.* 39–40, Lucr. i. 419 *sqq.*). The existence of bodies is witnessed by the senses, the existence of space is a necessary postulate to explain the possibility of motion and to account for the difference in the specific gravity of different solid bodies: Lucr. i. 422, *Corpus enim per se communis dedicat esse Sensus; . . . Tum porro locus et spatium, quod inane vocamus, Si nullum foret, haud usquam sita corpora possent Esse neque omnino quoquam diversa meare.* The bodies (ἄτομα, *primordia*), which are of different shapes (Lucr. ii. 478 *seq.*), are and always have been unceasingly in motion (Epicur. *Ad Herod.* 42–43, Lucr. ii. 80–332), all moving with equal velocity, and it is by their collisions, due to an inherent swerve (παρέγκλισις, *clinamen,* Lucr. ii. 216–293) that so-called solid bodies are formed.

2. The soul also is made up of material atoms which are inconceivably fine (Epicur. *Ad Herod.* 63, Lucr. iii. 177), and is diffused over all the body from which it cannot exist apart (Epicur. *Ad Herod.* 64–65, Lucr. iii. 119–358). Lucretius, iii. 94–135, distinguished between the *anima* or vital principle, which is distributed over all the body and is the origin of sensation, and the *animus,* or mind, which is situated in the breast. The same distinction had been made by Democritus and appears also in Plutarch *Adv. Colot.* 20. In any case at death the soul is resolved into its primitive atoms and, therefore, death does not concern us (Epicur. *Ad Menoec,* 124–127, Lucr. iii. 830, *Nil igitur mors est ad nos neque pertinet hilum Quandoquidem natura animi mortalis habetur*).

3. Knowledge comes to us through the senses, whose evidence we must accept as unimpeachable (Epicur. *Ad Herod.* 62, Κύριαι Δόξαι 25–26. Lucr. i. 423, *Sensus cui nisi prima fides fundata valebit, Haud erit occultis de rebus quo referentes Confirmare animi quicquam ratione queamus*). All solid bodies are continually giving off fine films (εἴδωλα, τύποι ὁμοιοσχήμονες, *simulacra*), which are the exact likeness of the bodies themselves (Epicur. *Ad Herod.* 46–48, Lucr. iv. 51 *sqq.* 110 *sqq.* 196 *sqq.*). These fine films, moving with infinite speed, are conveyed to the soul by the various organs of sense. Hence arise the perceptions of sight (*Ad Herod.* 46–47, Lucr. iv. 46 *sqq.*), hearing (*Ad Herod.* 52, Lucr. iv. 563 *sqq.*), smell (*Ad Herod.* 53, Lucr. ii. 414 *sqq.* iv. 673 *sqq.*), taste (Lucr. iv. 615 *sqq.*).

4. The gods exist and they too are material, but compounded of inconceivably fine atoms. They live apart, immortal, and of perfect felicity, and take no concern in the affairs of men. Our knowledge of the gods is not derived from the senses in the same way as our other knowledge, but comes by immediate intuition. (*Ad Herod.* 49, Lucr. iv. 724 *sqq.* v. 1167 *sqq.*) This doctrine raises considerable difficulties. (*Cf.* R. Philippson, *Zur Epikureischen Götterlehre, Hermes* 51 [1916], pp. 568 *sqq.*)

The sequence of topics in Lucretius is as follows. Books i.–ii. expound the doctrine of the atoms and the void. Book iii. is concerned with showing that the soul is material and does not survive the body. Book iv. sets forth the theory of sensuous perception. Book v. gives an account of the origin of the world, of life, and of human society. Book vi. discusses various meteorological phenomena and thus corresponds largely to the Letter of Epicurus *To Pythocles.* It concludes with an account of the plague at Athens. From certain indications in the poem which point to two redactions of different dates it has been suggested that in the original scheme of the work the order of the present books was i., ii., v., vi., iv., iii. That the division into books goes back to Lucretius himself is indicated by the fact that each book begins with a highly polished exordium, which is independent of the general argument.

Apart from its philosophic and poetical interest, the poem presents several striking features, one of the most notable being the generally archaic character of the language, *e.g.,* the use of the genitive of the 1st Declension in *ai* (disyllable) for *ae* (diphthong). Doubtless one motive for this was the metrical convenience of *-ai* for forming the final spondee of the hexameter: thus of 166 cases of the genitive in *-ai,* no fewer than 107 occur at the end of the hexameter. Metrical convenience too determines the use of the infinitive passive in *-ier* or *-i;* of the ablative singular of the 3rd Declension in *-e* or *-i;* and the same motive leads to the use of such forms as *indugredi* for *ingredi, induperator* for *imperator, alid* for *aliud, sis* for *suis,* and for treating final *-s* as metrically negligible when metrically inconvenient, e.g., *fontibu' magnis,* i. 412, *Ancu' reliquit,* iii. 1025. Other archaisms are *Mavors* for *Mars, sanguen* (i. 837) for *sanguis, aevus* (ii. 561) for *aevum; cornum* (ii. 388) for *cornu, caelus* (ii. 1097) for *caelum.* In the great majority of cases the archaic form is probably chosen for metrical convenience, but in some cases—*ollis* for *illis, moenera* for *munera, reddundus* for *reddendus,* etc.—we seem to have deliberate archaism.

It is to be remembered that Lucretius had a very difficult task to perform—to expound a philosophical argument in a language which had not yet developed a philosophic vocabulary and, moreover, to expound it in hexameter verse. He was himself acutely aware of the difficulty: i. 136 *sqq., cf.* i. 830. The consequence is that he is compelled either to transliterate a Greek word, e.g., *homoeomeria* or to invent new words, e.g., *adactus, variantia, differitas, formatura, tactilis, intactilis* (= ἀναφής), *mactabilis, conciliatus.* It is probably due to the same cause that he uses compound adjectives with a facility and freedom which reminds us of Greek poetry—*falcifer, florifer, squamiger, spumiger, fluctivagus, velivolus, horrisonus.* Doubtless based on Greek models is his extensive use of periphrastic expressions such as *fida canum vis* (vi. 1222 *cf.* Virg. A. iv. 132, *odora canum vis*), *concharum genus* (ii. 374), *equorum duellica proles* (ii. 661), *silvestria saecla ferarum* (v. 967), and many others. Memmiades (i. 26) = Memmius seems in the same way to be copied from the Greek use of Οἰδιπόδης (Hom. *Od.* xi. 271, *Il.* xxiii. 679) = Οἰδίπους.

Another characteristic which gives an archaic aspect to his poetry is the frequent use of alliterations, often with very happy effect, *e.g.,* i. 72, *Ergo vivida vis animi pervicit et extra Processit longe flammantia moenia mundi,* v. 1004. A peculiar form of alliteration is the combination of words derived from the same root, e.g., *anxius angor* (iii. 993), *vel violenta viri vis* (v. 961). Less notable is the repetition of the same word in a different case, e.g., *Viva videns vivo sepeliri viscera busto.*

His management of the hexameter metre is still somewhat tentative and unequal. As compared with the Virgilian hexameter, we note in particular the frequency of monosyllabic endings, e.g., *solis uti lux* (iv. 198), *per Veneris res* (v. 848), and the use in any place in the line of words forming two feet, e.g., *religionibus* (i. 109), *principiorum* (i. 244), *praecipitavit* (i. 251). In the matter of prosody he allows himself the utmost freedom. The same word is scanned now with one quantity, now with another, *e.g., Crassaque conveniant līquidis et lĭquida crassis* (iv. 1251); *līquoris* in v. 14, but *lĭquor* in i. 453; in i. 142 *suādet* is a disyllable, but in iv. 1157 *sŭādent* is a trisyllable; in vi. 963 *dissoluit* is a trisyllable, in vi. 446 a quadrisyllable. Similarly the scansion varies in words like *diei, fidei, rei, illius, totius.* Thus *totīus* vi. 679, *totĭus* vi. 682; *rei* is a monosyllable in iii. 916, but a disyllable in ii. 112, ii. 548, vi. 919. Again *suo* is a monosyllable in i. 1022, v. 420, but elsewhere a disyllable. Such examples might be multiplied indefinitely. More remarkable perhaps are such unusual scansions as *glŏmere* (i. 360), *văcillans* (iii. 504), *Brittannis* (vi. 1106), *coruptum* (vi. 1135).

Unusual vocabulary, unusual prosody, awkward elision or hiatus, unnatural order of words (*e.g.,* ii. 791 *Nec quae nigra cluent de nigris sed variis ex*) combine to give an uncouth aspect to the more argumentative portions of the poem. And it is to be remembered that the *De Rerum Natura* is a didactic poem in the strict sense, a poem, that is to say, in which the teaching, the argument, is the chief thing, and the poetical form is rather introduced to commend the argument than the argument used as subsidiary to the poetical effect as, *e.g.,* in the *Georgics* of Virgil. Lucretius several times uses language which implies that he uses the poetical form to veil the asperity of his subject matter, *e.g.,* i. 933.

The truest analogue to Lucretius's poem would probably be *Paradise Lost.* Milton is in general more akin perhaps in genius to Lucretius than any other poet that could be named. If the sheer poetic gift of Milton is the higher, as doubtless it is, yet he has a singular affinity with Lucretius in his combination of moral earnestness with a lively sense of the beauty of external nature, animate and inanimate. And in Lucretius, as in *Paradise Lost,* the sublimest passages of pure poetry are strictly germane to the argument of which they are the crown and complement.

In his greatest passages, such as the invocation to Venus which forms the prelude to the whole poem (i. 1–40), the preludes to Books ii., iii., iv. and v., the remonstrance with the man who is afraid of death (iii. 892 *sqq.*), the progress of the seasons (v. 735 *sqq.*), the eulogy of Epicurus (i. 62 *sqq.*), the sacrifice of Iphigeneia (i. 80 *sqq.*), the cow sorrowing for her butchered calf (ii. 352 *sqq.*), and the like, he reaches heights hardly attained by any other Roman poet. Even the archaic tinge of style and diction seems but to lend such passages an austere dignity. If we seek further to inquire what is the secret of his power, we would find it not in any gift of memorable phrase—though he has memorable phrases enough—*Medio de fonte leporum surgit amari aliquid* (iv. 1125), *Suave mari magno* (ii. 1), *Tantum religio potuit suadere malorum* (i. 101)—but in his vivid imagination and consequent power of sympathy. It is this warm sympathy which gives strength and meaning and persuasiveness to his message—that the natural needs of man in this life are few (ii. 20–33) and that death is not to be feared since it is for man the last end of all (iii. 910 *sqq.*). Did he preach this doctrine of the nothingness of death from a detached point of view, as of one who could himself and would have others "leave the warm precincts of the cheerful day Nor cast one longing lingering look behind," then his message would fall on deaf or unwilling ears among men of common human sympathies and emotions. It is precisely here that we find the secret of his power. Better aware than other men of the beauty of this earth—bird, beast and flower, river and sea, mountain and sky; more than ordinarily alive to the joys of this life; feeling in all their fulness the nearness and dearness of family ties (iii. 892, *Iam iam non domus accipiet te laeta, nec uxor Optima nec dulces occurrent oscula nati Praeripere et tacita pectus dulcedine tangent*), he would, not in contempt but in a large pity, persuade men that the cloud of mortality which overhangs them, darkening them even now with the anticipation of its terrors, holds at least no other evil than that it terminates this present life, and that there is only a dreamless sleep beyond the grave. Hence it is that he preaches the negation of immortality with all the fervour with which the Christian teacher preaches the immortal hope.

LUCRINUS LACUS [LUCRINE LAKE], in Campania, Italy, about ½ m. N. of Lake Avernus, and only separated from the sea (Gulf of Pozzuoli) by a narrow strip of land, traversed by the coast road, Via Herculanea, which runs on an embankment traditionally attributed to Heracles in Strabo's time, and the modern railway. Its size was reduced by the rise of the Montenuovo crater in 1538. Its greatest depth is about 15 ft. In Roman days its fisheries were important and were let out by the state to contractors. Its oyster-beds were, as at the present day, renowned; their foundation is attributed to Sergius Orata, about 100 B.C. It was also in favour as a resort for pleasure excursions from Baiae, and its banks were covered with villas, of which the best known was Cicero's Cuman villa (also called the Academia), on the east bank. The remnants of this villa, with the village of Tripergola, disappeared in 1538. In 1922 almost all the fish in the lake were killed by exhalations of steam and sulphuretted hydrogen from vents on the east bank.

See O. E. Schmidt, *Ciceros Villen* (Leipzig, 1899), 42–50.

LUCULLUS, LUCIUS LICINIUS, surnamed Ponticus, (*c.* 110–56 B.C.), Roman general, was the son of Lucius Licinius Lucullus and a sister of Metellus Numidicus. He joined the party of Sulla early in life, and after service in the Social war (90) went with Sulla as quaestor to Greece and Asia in 88. While Sulla besieged Athens Lucullus raised a fleet and drove Mithradates out of the Mediterranean, winning a great victory off Tenedos. Lucullus was praetor in 77, with the province of Africa to follow, and consul in 74. In the allotment of provinces he drew Cisalpine Gaul, but contrived to exchange it for Cilicia, while his colleague Cotta took Bithynia, the two provinces between them involving the joint command against Mithradates (*q.v.* for further information about this campaign). Lucullus' first season was mainly occupied in relieving Cyzicus, besieged by Mithradates, who had heavily beaten Cotta. Most of 73 and 72 were taken up in clearing the sea and the coast of Pontus, but an expedition up country to Cabeirus led to a major success, and Mithradates fled to Tigranes in Armenia. Lucullus left the final reduction of the Pontic kingdom to his lieutenants while he attended to the administration of Asia, which the combined exactions of Sulla and the *publicani* had left in a desperate condition. By drastically limiting interest rates he cleared the province of debt; but his reforms left a legacy of unpopularity for him at Rome, where the capitalist interests set themselves to destroy his reputation. Similarly his strict discipline and his moderation after victory made for trouble with the army.

In 70 B.C. Lucullus sent to Tigranes to demand the surrender of Mithradates. Tigranes refused, and Lucullus, with a small force, crossed the Euphrates and struck direct for Tigranocerta, the new capital (69). Tigranes fled, and returned with a vast army to raise the siege, but was defeated. Lucullus captured the city and dispersed its inhabitants, and wintered on the Tigris. The rest of his campaign is anti-climax. Mithradates and Lucullus were both negotiating with Parthia; Lucullus attempted to force Parthia's hand, but his troops refused to go on, so he turned north for Artaxata, won another victory, and again his troops mutinied. So he returned, took Nisibis and wintered there. The next year (67) things were worse; it was now known that he was to be superseded; he could exert no authority; he could only watch Mithradates regaining Pontus and Tigranes overrunning Cappadocia. It was left for Pompey to reap where Lucullus had sown.

On his return to Rome he was attacked by the popular party, who succeeded in delaying, though they could not prevent his triumph. He was very rich, and politics were not attractive. He retired into that elegant leisure, that luxury refined by good taste and tempered by philosophy, for which he has become proverbial. He is one of the interlocutors in Cicero's *Academica,* he had a great library, and wrote a history in Greek. His occasional interventions in public affairs were not very successful.

See Plutarch, *Lucullus;* Appian, *Mithridatic War; C.I.L.* i, 292; many allusions in Cicero; G. Boissier, *Cicero and his friends* (Eng. trans., 1897); W. Drumann, *Geschichte Roms* (1899); and authorities under MITHRADATES VI, of Pontus.

LUCUS FERONIAE, an ancient shrine in Etruria. It was visited both by Latins and Sabines even in the time of Tullus Hostilius and was plundered by Hannibal in 211 B.C. It was in the territory of Capena (*q.v.*); but in imperial times became an independent community receiving a colony of Octavian's veterans (*Colonia Iulia felix Lucoferensis*) and possessing an amphitheatre. It is probably to be placed at Nazzano, which was reached by the Via Tiberina.

LUCY, SIR HENRY (1845–1924), British journalist, was born at Crosby, near Liverpool, on Dec. 5, 1845. Educated in Liverpool, he began life in a Liverpool merchant's office, but soon became a reporter for a Shrewsbury periodical. In 1870 he joined the staff of *The Pall Mall Gazette,* London, and in 1873 became parliamentary reporter to *The Daily News,* with which paper he had a long connection in various capacities. In 1881 he also joined the staff of *Punch* and won a great reputation as the contributor of its parliamentary sketch signed "Toby M. P." He was knighted in 1909 and retired from parliamentary work in 1916. He published his autobiography, *Sixty Years in the Wilderness,* in 1909, and *The Diary of a Journalist* in 1920. He died on Feb. 20, 1924.

LUCY, RICHARD DE (d. 1179), called the "loyal," chief justiciar of England, appears in the latter part of Stephen's reign as sheriff and justiciar of the county of Essex. He became, on the accession of Henry II., chief justiciar conjointly with Robert de Beaumont, earl of Leicester; and after the death of the latter (1168) held the office alone for 12 years. The chief servant and intimate of the king, he was among the first of the royal party to incur excommunication in the Becket controversy. In 1173 he played an important part in suppressing the rebellion of the English barons, and commanded the royalists at the battle of Fornham. He resigned the justiciarship in 1179, though pressed by the king to continue in office, and retired to Lesnes abbey in Kent, which he had founded and where he died. Lucy's son, Godfrey de Lucy (d. 1204), was bishop of Winchester from 1189 to his death in Sept. 1204; he took a prominent part in public affairs during the reigns of Henry II., Richard I. and John.

See J. H. Round, *Geoffrey de Mandeville* (1892); Sir J. H. Ramsay, *Angevin Empire* (1903); and W. Stubbs, *Constitutional History,* vol. i.

LUCY, SIR THOMAS (1532–1600), the English Warwickshire squire who is traditionally associated with the youth of William Shakespeare, was born on April 24, 1532, the son of William Lucy, and was descended, according to Dugdale, from Thurstane de Charlecote, whose son Walter received the village of Charlecote from Henry de Montfort about 1190. Walter is said to have married into the Anglo-Norman family of Lucy, and his son adopted the mother's surname. Three of Sir Thomas Lucy's ancestors had been sheriffs of Warwickshire and Leicestershire, and on his father's death in 1552 he inherited Sherborne and Hampton Lucy in addition to Charlecote, which was rebuilt for him by John of Padua, known as John Thorpe, about 1558. By his marriage with Joyce Acton he inherited Sutton Park in Worcestershire, and became in 1586 high sheriff of the county. He was knighted in 1565. He is said to have been under the tutorship of John Foxe, who is supposed to have imbued his pupil with the Puritan principles which he displayed as knight of the shire for Warwick in the parliament of 1571 and as sheriff of the county, but, as Mrs. Carmichael Stopes points out, Foxe only left Oxford in 1545, and in 1547 went up to London, so that the connection must have been short.

Lucy often appeared at Stratford-on-Avon as justice of the peace and as commissioner of musters for the county. As justice of the peace he showed great zeal against the Catholics, and took his share in the arrest of Edward Arden in 1583. In 1585 he introduced into parliament a bill for the better preservation of game and grain, and his reputation as a preserver of game gives some colour to the Shakespearian tradition connected with his name. Nicholas Rowe, writing in 1710, told a story that Lucy prosecuted Shakespeare for deer-stealing from Charlecote Park in 1585, and that Shakespeare aggravated the offence by writing a ballad on his prosecutor. The trouble arising from this incident is said to have driven Shakespeare from Stratford to London. The tale was corroborated by Archdeacon Davies of Sapperton, Gloucestershire, who died in 1708. The story is not necessarily falsified by the fact that there was no deer park at Charlecote at the time, since there was a warren, and the term warren legally covers a preserve for other animals than hares or rabbits, roe-deer among others.

Shakespeare is generally supposed to have caricatured the local magnate of Stratford in his portrait of Justice Shallow, who made his first appearance in the second part of *Henry IV.,* and a second in the *Merry Wives of Windsor.* There are many considerations which make it unlikely that Shallow represents Lucy, the chief being the noteworthy difference in their circumstances. Lucy died at Charlecote on July 7, 1600.

For a detailed account of Sir Thomas Lucy, with his son and grandson of the same name, *see* Mrs. C. Carmichael Stopes, *Shakespeare's Warwickshire Contemporaries* (2nd ed., 1907). *Cf.* also an article by Mrs. Stopes in the *Fortnightly Review* (Feb. 1903), entitled "Sir Thomas Lucy not the Original of Justice Shallow," and J. O. Halliwell-Phillipps, *Observations on the Charlecote Traditions* (Brighton, 1887).

LUDDITES, the name given to organized bands of English rioters for the destruction of machinery, who made their first appearance in Nottingham and the neighbouring districts towards the end of 1811. The "Ludds" or Luddites were generally masked, and operated at night. Their leader, real or imaginary, was known as "General Ludd" from a probably mythical "Ned Ludd" of whom various stories were current. Great distress had been caused by the dismissal of handicraftsmen in the areas in which textile machinery was introduced; and even those handicraftsmen who did not lose their employment suffered considerable worsening of conditions owing to competition. The riots began with the destruction of stocking and lace frames, and, continuing through the winter and the following spring, spread into Yorkshire, Lancashire, Derbyshire and Leicestershire. The riots were directed not merely against reductions of wages but also against the poor quality goods (especially stockings) produced by the new machines. The rioters were supported by local public opinion, and they abstained from bloodshed or violence against living beings, until in 1812 a band of them was shot down by soldiers on the request of a threatened employer, Horsfall, who was afterwards murdered. They were met by severe repressive legislation, introduced by Lord Liverpool's government, a notable feature in the opposition to which was Lord Byron's speech in the House of Lords. The organization was temporarily broken up by a mass-trial at York in 1813, which resulted in many hangings and transportations: somewhere among the victims was probably the real "King Ludd," for the elaborate organization suddenly collapsed. In 1816 similar rioting was resumed, caused by the depression which followed the peace of 1815 and aggravated by one of the worst of recorded harvests. In that year, although the centre of the rioting was again in Nottingham, it extended over almost the whole kingdom. The rioters were also thoroughly organized. While part of the band destroyed the machinery, sentinels were posted to give warning of the approach of the military. Vigorous repressive measures, and, especially, reviving prosperity, brought the movement to an end.

Bibliography.—*See* G. Pellew, *Life and Correspondence of H. Addington, 1st Viscount Sidmouth* (1847); the *Annual Register* for 1811, 1812 and 1816; J. L. and B. Hammond *The Skilled Labourer* (1919). E. Toller, *The Machine Wreckers* (1923) is a dramatic presentation of the story. *Ben o' Bills* by D. E. E. Sykes (Huddersfield, n.d.) is a "novel" in which is concealed much genuine history written from the Luddite point of view. *See* also the Home office papers in the Record Office.

LUDENDORFF, ERICH (1865–1937), German soldier, was born at Kruszevnia, in the province of Posen, April 9, 1865. When 18 years old, he entered the Prussian army. In 1894 he joined the general staff, and, except for an interval of two years as company commander, remained on it from 1894 to 1913, under Count Schlieffen and the younger General von Moltke. As chief of the *Aufmarschabteilung* since 1908 he played a prominent part in the mobilization preparations. The last great increase in the strength of the army in 1913 was largely due to his initiative and energy. During the year preceding the outbreak of the World War he commanded first the 39th Fusilier Regiment at Düsseldorf, and afterwards an infantry brigade at Strasbourg.

At the outbreak of the World War Ludendorff was quartermaster general of the II. Army. His voluntary assumption in the beginning of August of a decisive *rôle* at the capture of the fortress of Liége gave him his first great opportunity. He took over the command of the 14th brigade of infantry, in the place of General von Wussow who was killed, and, breaking through the ring of fortifications at its head, seized the interior of the town. He was rewarded on Aug. 22 by being made chief of staff to Hindenburg in the VIII. Army which was fighting in East Prussia.

Campaigns in East Prussia.—The battle of Tannenberg revealed his powers of generalship, for he there demonstrated the justice of the theory of annihilation. The victory of Tannenberg over the Russian army of the Narew was more than another Cannae. For in this case there was not, as in former days, merely one enemy to be dealt with. On the contrary, the attempt was made to envelop the greatly superior main body of Russians in the presence of a second enemy force threatening the rear. And the attempt proved successful. In the subsequent operations which led to the first battle on the Masurian lakes and to the heavy defeat of the Russian army of the Niemen, the enemy's right wing was supported on the lake, and so only an envelopment of the southern wing was possible. The operations, therefore, took the form of an attack on the enemy's front and on his exposed flank.

The strategic success lay in the liberation of East Prussia from the enemy. The German Army of the East became available for the immediate support of the Austro-Hungarian ally, by this time in dire straits. This support was rendered in the brilliant October campaign of the newly-formed IX. German army directed through Southern Poland upon the Vistula. Its purpose—to facilitate the Austrian efforts in Galicia by drawing off upon the IX. Army the strongest possible body of Russian troops—was attained in a degree entailing grave danger to the outnumbered Germans themselves. The menace of envelopment by a vastly superior enemy, pouring up from the direction of Warsaw, was parried and beaten off by Ludendorff by means of an exceedingly gallant defensive action, carried out during withdrawal. In November after a rapid regrouping of the main German forces, an advance was made from the Wreschen-Thorn line against the right flank of the main body of the Russians, lying in West Poland. In the absence of sufficient strength a simultaneous frontal attack was impossible. But even so, the success achieved in the battle of Lódź was great. The Russians were definitely relegated to the defensive—and, in the pursuit which followed, were flung back behind the Bzura and the Rawka.

During the fighting in Masuria in Feb. 1915 Ludendorff achieved the destruction of another Russian army in the region of the Upper Bobr. This was followed by a period of relative inactivity on the German eastern front lasting for several months. Not before the middle of July 1915 did the army group of Hindenburg resume the war of movement. By an attack directed upon and beyond the Lower Narew it relieved, by means of a converging offensive, the army group of Mackensen which had advanced from Galicia into Southern Poland between the Vistula and the Bug. In the ensuing operations the Russian army was driven out of the Vistula positions and out of the whole of Poland towards the East. After a brief resistance the fortresses of Warsaw, Nowogeorgiewsk (Modlin) and Kovno fell. But no decisive issue was reached, because General von Falkenhayn, chief of the German general staff, rejected the proposal of Hindenburg and Ludendorff, which was to advance with the German left wing in a northerly direction through Kovno and Vilna upon Minsk, thereby cutting the Russian railway communications, to the north of Polesia. Had the operations been conducted in accordance with the views of Hindenburg and Ludendorff, the Russian army might have been dealt a mortal blow in the summer of 1915. Later, in September, the attempt was made on the German left wing, but with inadequate forces, to embarrass the retreat of the section of the Russian army withdrawing northwards from Polesia past Vilna; but the moment for success on a grand scale had gone.

After the victorious conclusion of the Balkan campaign in the winter of 1915–16 Ludendorff contemplated a great offensive into the heart of the Ukraine, with the object of breaking the back of the economic resistance of Greater Russia, which was already cut off from the sea. The offensive necessitated the occupation of Rumania; but General von Falkenhayn rejected this scheme, and chose Verdun instead of Kiev as the objective for operations. Accordingly in the year 1916 the eastern front of the allied Central Powers was assigned the duty of protecting the rear of the offensive movement in France. This task was amply fulfilled on the northern wing but on the southern wing, held by the Austrians, the front completely collapsed in June and July at Luck and in Galicia. The balance in the East was restored with difficulty by the intervention of the German command.

On Aug. 29 Field-Marshal von Hindenburg assumed the office of chief of the general staff of the armies in the field, in the place of Falkenhayn, and Ludendorff became first quartermaster general. In contrast with their predecessor's point of view, the two men still promised themselves triumph, but a triumph which could only result from a more vigorous conduct of the war by drawing upon the whole available strength of the country in wealth and population. The methods adopted for the utilization of these resources were expressed in the so-called "Hindenburg programme" of war industries and in the so-called law of auxiliary services; and here Ludendorff could only co-operate by means of suggestions and demands. In his own sphere too, he found that, owing to the almost desperate military situation inherited from his predecessor, he was not at first able to put into practice Schlieffen's doctrine of annihilation. The result of the offensive against Rumania was that this new enemy was overthrown in the winter of 1916. This victory was of inestimable value to the Central Powers, for new sources of economic power were thereby opened up.

Submarine Warfare.—After the defeat of the Rumanian army there remained but one further task. This was the frustration of the attacks of the enemy in the west, greatly superior in numbers and material. The restoration of the balance of strength thus aimed at was to enable the Central Powers later to deliver an offensive with decisive effect. A favourable diversion of this kind, however, could only be counted upon, if, during the strategical defence on land, England could be reduced to desperate straits. An intensified U-boat warfare in the blockade area round England was therefore adopted, a weapon, recourse to which had hitherto always been postponed on the score of political considerations. The disadvantage of this course was that it would give the United States a pretext for war on the side of the Entente; but regarding this as inevitable, Ludendorff hoped to render England disposed for peace before the Americans should be in a position to throw considerable forces into Europe.

Unrestricted U-boat warfare did not altogether fulfil expectations. The technical perfection of the enemy's defensive weapons and the ample scale upon which they had been completed contributed to this in a very material degree. On the other hand, without the adoption of unrestricted U-boat warfare the strategy of the Central Powers would have been altogether unable to hold the balance on land in suspense until, after Russia's collapse in the spring of 1918, there dawned a well-founded prospect of forcing a decision in France before the American forces on land became effective.

In the spring of 1917 in the western theatre of war Ludendorff was enabled, by a timely withdrawal to the Siegfried position and by the elasticity of his defensive tactics, to impose a check upon the Allied attack carried out with a gigantic expenditure of men and material. Subsequently he had another opportunity of vindicating his theory of annihilation in the warfare on land. Under the blows dealt by the German hammer at Tarnopol, Riga, Dagö and Ösel, Russia fell. The reckoning with Italy followed in the autumn of 1917, but the situation in the west, particularly in Flanders where the fighting raged with undiminished fury, rendered it impossible for Ludendorff to secure a decisive victory.

The Offensive of 1918.—The German resolution to take the offensive in the spring of 1918 was rendered imperative by the general position. The psychological condition of the army peremptorily demanded that the *rôle* of anvil should be exchanged for that of hammer. Conditions at home called for a potent remedy against the threefold poison instilled by the hunger blockade, enemy propaganda and revolutionary agitation. Germany's hard pressed allies had for long rested their sole hopes of delivery on the efforts of Germany. Ludendorff saw only one road by which a tolerable peace, in harmony with the honour of the German people, could be reached, the road of military victory. This again could be attained solely by means of an offensive which should be decisive, and in taking this course he hazarded everything. A series of small attacks with limited objectives or a powerfully conducted defence would in favourable circumstances only have secured a temporary advantage, but could not prevent the enemy from finally giving full effect to his superior strength in a battle of annihilation. It is questionable whether the choice of direction for the offensive on French territory can be defended. Many critics would have preferred an offensive in Italy, but apart from the natural difficulties, even the destruction of the Italian army could at best only have preceded the main decisive operations on French soil.

It has been questioned whether Ludendorff assembled adequate forces for the spring offensive of 1918. In March, at the beginning of this offensive, the Germans disposed of 193 divisions and three brigades in the Franco-Belgian theatre of war. The estimates of the forces commanded by the Entente in France and Belgium at the beginning of the spring offensive vary between 167 and 180 divisions. The Germans, therefore, enjoyed a slight superiority in the number of divisions. The original intention that a section of the Austro-Hungarian forces should take part in the decisive encounter in France was finally thwarted by the opposition of the Habsburg emperor. Ludendorff accordingly chose the expedient of indirect assistance to be rendered by a relieving offensive carried out by the Austro-Hungarian army in Upper Italy. This offensive, however, was undertaken much too late for the objective in view, in the middle of June, and, moreover, ended with a severe reverse. The occupation of Rumania called imperatively for four divisions and a greater number of Landsturm formations. The invasion of the Ukraine, carried out in February and March, demanded about 20 weak divisions, including eight divisions of Landwehr and three of cavalry. It is disputable whether it would have been wiser to abandon the enterprise in the Ukraine. The secretary of State of the *Kriegsernährungsamt* urged with the utmost emphasis that the economic resources of the Ukraine should be thrown open to Germany. Failing this, the Austrians' system of food supplies would collapse. The delivery of meat was important for Germany, too, and the delivery of horses was, above all, a matter of the greatest urgency.

On political and military grounds Ludendorff had resolved to deal the first decisive blow in the west against the English. For this purpose he chose the southern flank, on both sides of St. Quentin, as tactically the least defensible, with the intention of forcing his way through at this point and by advancing north of the Somme towards the northwest, to roll up the whole front gradually and press the English towards the sea. The southern wing of the German offensive was to guard his flank against a relieving attack on the part of the French. This strategy became subject to certain changes in consequence of the unexpected magnitude of the initial success of the German southern wing, which continued the offensive across the Somme and the Crozat canal against the French, in order to effect a cleavage between the English and French at and beyond Amiens. This end was not completely attained, and the result of the first offensive, though great from the tactical standpoint was strategically nugatory. A second attack on the Lys front, against the English and Portuguese, was made in the middle of April and was designed to gain possession of the commanding heights north of Bailleul and to cut off the Ypres salient; its result, however, was indecisive.

During the following months, in spite of successive brilliant diversive attacks carried out against the French front, no further headway was made in forcing a decisive engagement in Flanders; and the heavy toll of the spring offensives could not be made good rapidly enough. And yet, prior to the last great attempt to break through on both sides of Reims in July 1918, there still remained a prospect of final victory for the German arms. The goal had nearly been reached—which was a proof that the strategy adopted might have succeeded and was, therefore, the right strategy. But the fortune of war was against Ludendorff. His plans were revealed by treachery to the enemy, at a time when everything depended on secrecy and surprise. The great successes hitherto achieved had led to a wide extension of the German front, calling for the employment of disproportionately large forces and offering in its many angles and salients dangerous surfaces to the enemy's attacks. These factors now made their disastrous influence felt.

But the final cause of Ludendorff's inability to resume the initiative lay in the absence of a free command of reserves, due to the drying up of the sources of supply at home. When the German command fell back on the defensive before hostile attacks, Ludendorff realised that there was nothing to be done except to hold out until diplomacy succeeded in securing a tolerable peace, or to perish with honour. On Oct. 26, however, he was overthrown by the cabinet of Prince Max of Baden. The collapse of Germany's allies, combined with difficulties at home, rendered hopeless any further resistance by the army in the field now thrown upon its own resources.

General Ludendorff was above all a man of action, and one who rated formation of character and the attributes of leadership more highly than the acquisition of comprehensive learning. His resolution, his almost super-human and invincible powers of work and action, his understanding of the moral factors in warfare, inspired the German army with boundless confidence in his leadership and qualified it for mighty exploits. If like Hannibal and Lee he failed in the final issue, it was through no fault in generalship, but was partly due to slowness in realising that his weapon had grown blunt and that the population at home was no longer capable of the effort of endurance and the indispensable will to victory. His powers of leadership reflected his character; brain, heart and will were all unsparingly enlisted in the service of one aim, the honour of his country. Along this path he was impelled to travel, whether it led to victory or defeat. (W. Fo.)

Ludendorff's complete collapse at the end of the war was one of the tragic sensations of the time. After demanding an unconditional armistice, when the armistice was actually concluded, he abandoned his country and fled to Sweden. In the spring of 1919 he returned, to become, with his former chief of staff, Colonel Bauer, the focus of all extreme reactionary conspiracies. With Bauer he was the initiator and organizer of the "Kapp Putsch" of March 1920, although he remained in the background and avoided responsibility, nevertheless, his *rôle* was known, and he retired to the more conservative atmosphere of Munich to engage in fresh intrigues which showed a complete lack of any sense of political reality. In 1923 he emerged into the open in connection with the attempted coup of Adolf Hitler, the National Socialist leader. After wavering between the rival conspiracies of Hitler and von Kahr, Ludendorff joined the former in an attempt to establish an anti-Marxist dictatorship in Germany. The coup (Nov. 8, 1923) proved an ignominious fiasco, but Ludendorff's past reputation saved him from its consequences. In May 1924 he entered the Reichstag as a National Socialist, and in 1925 stood for president of the Reich, securing slightly over 1% of the votes cast. In the same year he retired from the presidency of his small party and began to take a less prominent part in politics. He died in Munich, Dec. 20, 1937. Ludendorff published several books on the World War, the most important of which are: *Meine Kriegserinnerungen 1914–18* (Eng. trans. *My War Memories*) (1919); *Urkunden der obersten Heeresleitung uber ihre Tätigkeit 1916–18* (1920); *Kriegführung und Politik* (1922); *Das Friedens und Waffenstillstandsangebd.* (1919). Among his polemical writings may be mentioned *Vernichtung der Freimaurerei durch Enthüllung ihrer Geheimnisse* (1927).

See H. Delbreck, *Ludendorffs Selbstporträt* (10th ed., 1922). (C. A. M.)

LÜDENSCHEID, a town in the Prussian province of Westphalia, Germany, 19 mi. by rail S.S.E. of Hagen. Pop. (1939) 43,185. From the counts of Altena it passed to the counts of the Mark, with which district it was ceded to Brandenburg early in the 17th century. It is the seat of various hardware manufactures, among them metal-plated and tin-plated goods, buckles, fancy nails and brooches, and has iron-foundries and machine shops.

LUDERITZ, a town in South-West Africa on bay of same name (26° 40′ S., 15° 5′ E.). Pop. (1936) 2,560, of which 846 are whites, 881 natives and 830 coloured. Luderitz grew out of a trading station, which was established in 1883. It is the chief centre of the diamond diggings. The hinterland is desert; the mean annual rainfall is 0.64 in. A railway leads inland, and links up with the South African system at De Aar. The town has to bring its water from Garub, 65 mi. away by train. The local fishing grounds are extraordinarily rich, and, since the British occupation, fish canning factories have been opened. Calling ships have to anchor in the bay, and cargo must be transhipped to or from lighters. Neighbouring islands yield about 8,000 tons a year of guano.

LUDHIANA, a town and district of British India, in the Punjab. The town is 8 mi. from the present left bank of the Sutlej, 228 mi. by rail N.W. of Delhi. Pop. (1941) 111,639. It is an important centre of trade in grain, and has manufactures of shawls, etc., by Kashmiri weavers, and of scarves, turbans, furniture and carriages. There is an American Presbyterian mission and a medical school for women, founded in 1894.

The District of Ludhiana lies south of the river Sutlej, and north of the native states of Patiala, Jind, Nabha and Maler Kotla. Area 1,399 sq.mi. The district consists for the most part of a broad plain, without hills or rivers, stretching northward from the state borders to the ancient bed of the Sutlej. A branch of the Sirhind canal irrigates a large part of the southwestern area. The population in 1941 was 818,615. The principal crops are wheat, millets, pulse, maize and sugar cane. The district is crossed by the main line of the North-Western railway from Delhi to Lahore, with two branches.

During the Mussulman epoch, the history of the district is bound up with that of the Rais of Rajkot, a family of converted Rajputs, who received the country as a fief under the Sayyid dynasty about 1445. The town of Ludhiana was founded in 1480 by two of the Lodi race (then ruling at Delhi), from whom it derives its name. The Lodis continued in possession until 1620, when it again fell into the hands of the Rais of Rajkot. Throughout the palmy days of the Mogul empire the Rajkot family held sway, but the Sikhs took advantage of the troubled period which accompanied the Mogul decadence to establish their supremacy south of the Sutlej. In 1806 Ranjit Singh crossed the Sutlej and reduced the obstinate Mohammedan family, and distributed their territory amongst his co-religionists. Since the British occupation of the Punjab, Ludhiana has grown in wealth and population.

LUDINGTON, city, western Michigan, U.S.A., on Lake Michigan, at the mouth of the Pere Marquette river; the county seat of Mason county. It is on Federal highways 10 and 31, and is served by the Pere Marquette railroad, lake steamers and car ferries, and motor coach lines running north, south and east. The population was 8,898 in 1930 and 8,701 in 1940 by the federal census. The harbour is open throughout the year, and its total traffic in 1940 amounted to 1,827,830 tons, most of which was carried by the Pere Marquette railroad company's car ferries, operating to Wisconsin points on Lake Michigan. The city is headquarters for the CCC in Michigan, and has factories making watchcases, game boards, furniture, men's sports clothes, highway and railway maintenance and construction equipment and various other articles. Within a few miles are many popular summer resorts. Ludington was settled about 1859 and was chartered as a city in 1873. It was first called Père Marquette, in memory of the Jesuit missionary, whose death occurred here in 1675, but in 1871 it was renamed after James Ludington, a local lumberman.

LUDLOW, EDMUND (*c.* 1617–1692), English parliamentarian, son of Sir Henry Ludlow of Maiden Bradley, Wiltshire. He went to Trinity college, Oxford, and was admitted to the Inner Temple in 1638. When the Great Rebellion broke out, he engaged as a volunteer in the life guard of Lord Essex and served through successive campaigns until 1646, when he was elected M.P. for Wilts in the room of his father and attached himself to the republican party. He was one of the chief promoters of Pride's Purge in 1648, was one of the king's judges, and signed the warrant for his execution. In February he joined the council of state. In January 1651 Ludlow was sent into Ireland as lieutenant-general of horse, holding also a civil commission. Ireton, the deputy of Ireland, died on Nov. 26, 1651; Ludlow then held the chief command, and had practically completed the conquest of the island when he resigned his authority to Fleetwood in October 1652. On returning to England in October 1655 he was arrested, as he refused to acknowledge Cromwell's authority as Protector, but he was allowed to retire to Essex. Ludlow sat in Richard's parliament of 1659, but opposed the continuance of the Protectorate. He was a member of the restored Rump, and of its council of state and of the committee of safety after its second expulsion, and a commissioner for the nomination of officers in the army. In July he was sent to Ireland as a commander-in-chief. He came back to England in January 1660, and was met by an impeachment presented against him to the restored parliament. Ludlow surrendered to the speaker on June 20, but, finding that his life was not assured, although he was not named for capital punishment, he escaped to Switzerland, where he lived at Vevey. After 30 years he came to England but was forced to return to Vevey, where he died in 1692.

His *Memoirs*, extending to the year 1672, were published in 1698–99 at Vevey and have been often reprinted; a new edition, with notes and illustrative material and introductory memoir, was issued by C. H. Firth in 1894. *See* C. H. Firth's article in *Dict. Nat. Biog.*; Guizot's *Monk's Contemporaries*; A. Stein's *Briefe Englischer Flüchtlinge in der Schweiz*; E. Ludlow, *The Adventures of Edmund Ludlow* (2 vols., Edinburgh, 1917).

LUDLOW, municipal borough in the Ludlow parliamentary division of Shropshire, England, on the river Teme below its confluence with the Corve, near the Hereford border. Pop. (1938)

5,677. Area, 1.5 sq.mi. On the peninsula the castle, founded about 1085 by Roger de Lacy, occupies a commanding position. Interesting features are the late Norman circular chapel, the Decorated Gothic state rooms and Perpendicular and Tudor details.

Ludlow is supposed to have existed under the name of Dinan in pre-Saxon days. Eyton identifies it with one of the "Ludes" mentioned in the Domesday survey. Its position on the Welsh border, particularly in relation to routes north and south and into Wales past Bishop's Castle (*q.v.*) ensured it an important place in the military and commercial life of the middle ages. Ludlow was a borough by prescription in the 13th century, but the burgesses owe most of their privileges to their allegiance to the house of York. Of the confirmation of early charters the last, dated 1665, continued in force until the Municipal Corporations act of 1835. The market rights are claimed by the corporation under the charters of Edward IV (1461) and Edward VI (1552). The Council of the Marches, established by the first of these monarchs, held its court at Ludlow from the reign of Henry VII onwards until 1689.

Of the town walls one gateway and a part abutting on the castle remain. Thanks to its strong position, Ludlow was the last Shropshire fortress to yield to the parliamentary forces in 1646. The town has many beautiful half-timbered buildings. The parish church of St. Lawrence is of great size with a lofty central tower and a fine east window with 15th century glass. Ludlow once rivalled Shrewsbury in the dressing and sale of cloth, and as a market for Welsh woollen fabrics. It was also famous for its smiths' work. It is a market for Hereford cattle but there are few industries except those connected with agriculture and the sale of "dhu (black) stone" from the Clee hills.

See *Victoria County History, Shropshire;* Thomas Wright, *The History of Ludlow and its Neighbourhood* (1826).

LUDLOW, a city of Kenton county, Ky., U.S.A., on the Ohio river, opposite Cincinnati; served by the Southern railway. It is a residential suburb, with a population of 6,185 in 1940.

LUDOLF or **LEUTHOLF, HIOB** (1624–1704), German orientalist, was born at Erfurt on June 15, 1624. After studying philology at the Erfurt academy and at Leyden, he travelled. In Italy he is said to have become acquainted with one Gregorius, an Abyssinian scholar, who taught him the Ethiopian language. In 1652 he entered the service of the duke of Saxe-Gotha, retiring in 1678 to Frankfurt-on-Main. In 1683 he visited England to promote a scheme for trading with Abyssinia, but failed. In 1690 he was appointed president of the *Collegium imperiale historicum.* He died at Frankfurt on April 8, 1704.

The works of Ludolf, who is said to have been acquainted with 25 languages, include *Sciagraphia historiae aethiopicae* (Jena, 1676); and the *Historia aethiopica* (Frankfurt, 1681), which has been translated into English, French and Dutch, and which was supplemented by a *Commentarius* (1691) and by *Appendices* (1693–94).

See C. Juncker, *Commentarius de vita et scriptis Jobi Ludolfi* (Frankfurt, 1710); L. Diestel, *Geschichte des alten Testaments in der christlichen Kirche* (Jena, 1868); and J. Flemming, "Hiob Ludolf," *Beiträge zur Assyriologie* (Leipzig, 1890–91).

LUDWIG, EMIL (1881–), German author and playwright, was born in Breslau on Jan. 25, 1881, of a Jewish family named Cohn. As a young man he practised law, and also had some practical commercial experience; but from a very early age was engaged in literary productions, mainly dramatic, in prose and verse. A number of these works were staged; they include *Ein Friedloser, Ein Untergang, Napoleon, Die Borgia, Tristan und Isolde, Atalanta* and *Ariadne* (ballet). Ludwig spent some time in England shortly before World War I studying modern tendencies, and during the war was employed as the foreign correspondent of a Berlin paper in the chief political centres of German-speaking Europe. During this period he wrote novels (*Manfred und Helena; Diana*) and sketches (*An die Laterne*), besides more dramatic pieces (*e.g., Friedrich Kronprinz von Preussen*). He now began to indulge his real bent for "humanizing" historical biography in a series of biographies, in which the main emphasis was laid on the psychological motive, represented in a vivid and flamboyant style. His subjects were Goethe (1920 and 1923), Wagner, Bismarck (a trilogy: *Volk und Krone* and *Die Entlassung,* 1922, *Genie und Charakter,* 1923); *Napoleon* (1924); *Wilhelm II* (1925), and Christ (*Menschensohn*) (1928). Of these the works on the emperor William and Bismarck were written with considerable inside political knowledge and in a stimulating and controversial fashion, and aroused great interest, especially in England, where a series of his works were translated (*Wilhelm II* and *Bismarck,* 1926; *Napoleon* and *Goethe* [the latter containing only half of the original German edition], 1927; *The Son of Man,* 1928). The works on Napoleon, and still more that on Christ, revealed, on the other hand, an unhistorical manner, not redeemed by their psychological insight. From 1906–40 Ludwig lived almost continuously in Switzerland, becoming a citizen of that country. In 1940 he went to the United States. His later works include *The Nile* (1936), *Roosevelt: A Study in Fortune and Power* (1938), *Bolivar* (1942) and *The Mediterranean* (1942).

LUDWIG, KARL FRIEDRICH WILHELM (1816–1895), German physiologist, was born at Witzenhausen, near Cassel, on Dec. 29, 1816. He studied medicine at Erlangen and at Marburg, where he taught anatomy and physiology until 1849. He then became professor at Zurich. In 1855 he went to Vienna in the same capacity and ten years later was appointed to the newly created chair of physiology at Leipzig. By the new apparatus and methods that he introduced into the service of physiology, Ludwig exercised a great influence on the progress of that science. He adapted the kymograph invented by Thomas Young for the obtaining of a written record of the variations in arterial pressure and of the movements of respiration. For his researches on the gases in the blood he designed the mercurial blood-pump, which also aided him in his work on the gases of the lymph, the gaseous interchanges in living muscle, the significance of oxidized material in the blood, etc. In regard to secretion, he showed that the secretory glands, such as the submaxillary, are more than mere filters, and that their secretory action is attended by chemical and thermal changes both in themselves and in the blood passing through them. He demonstrated the existence of a new class of secretory nerves that control this action, and showed that if the nerves are appropriately stimulated the salivary glands continue to secrete, even though the animal be decapitated. This was but one phase of his rejection of the assumption of the vitalist that the phenomena of life depend on laws and forces different from those operating in inorganic nature, a rejection which was expressed in his *Text-book of Human Physiology* (1852–56).

LUDWIG, OTTO (1813–1865), German dramatist, novelist and critic, was born at Eisfeld, Thuringia, on Feb. 11, 1813. He attracted the attention of the duke of Meiningen by an opera, *Die Köhlerin,* and Ludwig was sent to Leipzig in 1839 to continue his musical studies under Mendelssohn; but he turned exclusively to literary studies, and wrote several stories and dramas, *Der Erbförster* (1850) attracting immediate attention as a masterly study of bourgeois life and conditions. This was followed by *Die Makkabäer* (1852), in which the realistic method of *Der Erbförster* was transferred to a biblical *milieu,* which allowed more brilliant colouring and a freer play of the imagination. With these tragedies, to which may be added *Die Rechte des Herzens* and *Das Fräulein von Scuderi,* the comedy *Hans Frey,* and an unfinished tragedy on the subject of Agnes Bernauer, Ludwig ranks immediately after Hebbel as Germany's most notable dramatic poet at the middle of the 19th century. His *Shakespeare-Studien* was published in 1891. He died at Dresden on Feb. 25, 1865.

Ludwig wrote some excellent short stories and a powerful novel, *Zwischen Himmel und Erde* (1855); his *Gesammelte Schriften* were published by A. Stern and E. Schmidt in 6 vols. (1891–92); critical ed. by P. Merker (6 vols. 1912–27).

See A. Stern, *Otto Ludwig, ein Dichterleben* (1891; 2nd ed., 1906); A. Sauer, *Otto Ludwig* (1893); F. Lueder, *Die Epischen Werke Otto Ludwigs und ihr Verhältnis zu Charles Dickens* (Leipzig, 1910); Bruns, *Hebbel und Otto Ludwig* (1913); G. Raphael, *Otto Ludwig, Ses Théories et ses oeuvres romanesques* (1920).

LUDWIGSBURG, a town in the *Land* of Württemberg, Germany, 9 mi. N. of Stuttgart and $1\frac{1}{2}$ mi. from the river Neckar. Pop. (1939) 43,540. It was founded at the beginning of the 18th century by the duke of Württemberg, and was enlarged and improved by Duke Charles Eugene. Constructed as the adjunct of a palace, the town has straight streets and spacious squares. The former royal palace which stands in a park and contains a portrait gallery and the burial vault of the rulers of Württemberg is now a museum. The industries include the manufacture of organs and pianos, of celluloid, watch cases, cotton, woollen and linen goods, chemicals, iron and wire goods, and brewing and brick-making. From 1758 to 1824 the town was famous for the production of a special kind of porcelain.

LUDWIGSHAFEN, a town of Germany, in the Bavarian Palatinate, on the Rhine, immediately opposite Mannheim. Pop. (1885) 21,042, (1939) 143,417. Founded in 1843 by Louis I., king of Bavaria, Ludwigshafen was not made a town until 1859. It has trade in iron, timber, coal and agricultural products, fostered by a harbour opened in 1897 which is also a free port; and also large factories for making aniline dyes, soda, cellulose, tobacco, carriages, artificial manure, flour and malt; there are saw-mills, iron foundries and breweries. During World War II it was severely bombed by the British R.A.F.

LUDWIGSLUST, a town of Germany, situated in the *Land* of Mecklenburg, 22 mi. by rail S. by E. of Schwerin. Pop. (1939) 10,733. The castle was built by the duke of Mecklenburg-Schwerin, Frederick II, in 1772–76. Chemicals are manufactured.

LUEGER, KARL (1844–1910), Austrian administrator, burgomaster of Vienna, was born on Oct. 24, 1844, the son of an usher, and, studying under the greatest material difficulties, succeeded in qualifying as an advocate (1874). He was at first a partisan of the Democratic party, then a leader of the Christian Socialists, an anti-Semite and advocate in the courts for artisans and "small men." He was a deputy to the Austrian parliament in 1885 and 1891. He overthrew the German-Liberal municipal government of Vienna, and was elected burgomaster in 1895, but the emperor did not confirm the appointment, and Vienna was placed under the governorship of a state commission. In the new elections Lueger allowed another member of his party to be set up as dummy burgomaster, while he himself in form became vice-burgomaster. In 1897, however, when the "people's candidate," Lueger, was again elected burgomaster, the emperor confirmed his election and repeatedly honoured him. He held the post for ten years. He was a zealous Catholic, and wished to "capture the university" for the Church; he would have neither Social Democrats nor Pan-Germans nor Jews in the municipal administration. He secured good treatment for Czech immigrants, and established Viennese municipal electrical stations, gasworks and tramways, independent of the English gas and tramway companies. He planned to make Vienna one of the most beautiful of garden cities. He died on March 10, 1910 in Vienna.

See Tomola, *Unser Bürgermeister, Dr. Karl Lueger* (Vienna, 1904); and Stauracz, *Dr. Karl Lueger, zehn Jahre Bürgermeister* (1907).

LUFFA or LOOFAH, the name given to the fruit of *Luffa cylindrica,* an herbaceous plant of the family Cucurbitaceae (*q.v.*). The vascular tissues of the pericarp form a kind of loose felt which supplies the well-known bath loofah.

LUFKIN, a city of eastern Texas, U.S.A., 118 mi. N.E. of Houston, near the Angelina river; the county seat of Angelina county. It is served by the St. Louis Southwestern, the Southern Pacific and several short railways. The population in 1940 was 9,567 by the federal census. Lufkin is in an agricultural and lumbering region. The city is surrounded by 2,656 sq.mi. of virgin pine forests which make it a centre for many lumber industries. Some of the largest saw mills in the south are located in this area and numbered about 275 in 1940. A large paper mill was completed to convert the forest trees into pulp for the manufacture of newsprint. Aside from the manufacture of wood products, there are factories engaged in making oil well equipment and cotton gins. The large forest area is under governmental protection and is policed by members of the fire-fighting field station which is maintained in Lufkin. The forest is a favourite recreation centre. An experimental station in the vicinity is engaged in forestry research and conservation. The town was settled about 1875 and was incorporated as a city in 1890. It has a commission and city-manager form of government.

LUGANO, the most populous and thriving town in the Swiss canton of Ticino on the lake of Lugano at an altitude of 906 ft. Pop. (1941) 17,025, almost all Italian-speaking. To the south is Monte Salvatore (3,004 ft.), on the southeast (across the lake) Monte Generoso (5,591 ft.) and to the east Monte Bré (3,061 ft.). All three are accessible by railways. By rail Lugano is 124 mi. from Lucerne and 51½ mi. from Milan. Situated on the main St. Gotthard railway line, Lugano is much frequented by visitors (largely German) in spring and in autumn. Though politically Swiss since 1512, Lugano is Italian in appearance and character. The railway station is connected with the quays by a funicular railway. The principal church, San Lorenzo, in part dates back earlier than the 15th century. This church is now the cathedral church of the bishop of Lugano, a see with jurisdiction over the Italian parts of Switzerland. The church of Santa Maria degli Angioli, built about 1499, and till 1848 occupied by Franciscans, contains several frescoes painted 1529–30 by Bernardino Luini. During the struggle of 1848–66 to expel the Austrians from Lombardy, Lugano served as headquarters for Mazzini. Books and tracts intended for distribution in Italy were produced there and at Capolago and the Austrian police were powerless to prevent their circulation.

LUGANO, LAKE OF, lying between Lago Maggiore and the Lake of Como, N. Italy (anc. *Lacus Ceresius*). The great promontory of Monte Salvatore (3,004 ft.) nearly cuts off the western arm from the main lake. The area is 19½ sq.mi., greatest length about 22 mi., greatest width 2 mi. and greatest depth 945 ft., surface 885 ft. above sea-level. Between Melide (south of the town of Lugano) and Bissone (on the east shore) the lake is so shallow that a great stone dam has been built across for the St. Gotthard railway line and the carriage road. The chief town is Lugano (at its north end), which by the St. Gotthard line is 19 mi. from Bellinzona and 9 mi. from Capolago, the station at the southeastern extremity of the lake, which is but 8 mi. by rail from Como. At the southwestern extremity a railway leads southwest from Porto Ceresio to Varese (9 mi.). Porlezza, at the east end of the lake, is 8 mi. by rail from Menaggio on the Lake of Como, while Ponte Tresa, at the west end of the lake, is about the same distance by electric railway from Luino on Lago Maggiore. Of the total area of the lake, about 7½ sq.mi. are in the Swiss canton of Ticino (Tessin), formed in 1803 out of the conquests made by the Swiss from the Milanese in 1512. The remainder of the area is in Italy to which also belongs the small enclave of Campione, almost opposite the town of Lugano. The lake lies among the outer spurs of the Alps that divide the Ticino (Tessin) basin from that of the Adda, where the calcareous strata have been disturbed by the intrusion of porphyry and other igneous rocks. It is fed by numerous torrents issuing from short glens in the surrounding mountains, while it is drained by the Tresa, an unimportant stream flowing into Lago Maggiore.

The first steamer was placed on the lake in 1856.

(W. A. B. C.)

LUGANSK: *see* VOROSHILOVGRAD.

LUGARD, FREDERICK JOHN DEALTRY LUGARD (1ST BARON) cr. 1928 (1858–1945), British administrator, son of the Rev. F. G. Lugard, was born on Jan. 22, 1858. He entered the army in 1878 and served in the Afghan War (1879–80), in the Sudan campaign (1884–85) and in Burma (1886–87). In May 1888 he took command of an expedition organized by the British settlers in Nyasaland against the Arab slave traders on Lake Nyasa, and was severely wounded. In April 1889 he was engaged by the Imperial British East Africa company. In their service he explored the Sabaki river region, and elaborated a scheme for the emancipation of the slaves in the Zanzibar mainland. In 1890 he was sent by the company to Uganda, where he secured British predominance and put an end to the civil disturbances, though not without severe fighting, chiefly notable for an unprovoked attack by the "French" on the "British" faction. While administering Uganda he journeyed round Ruwenzori to Albert Edward Nyanza, mapping a large area of the country. He also visited Albert Nyanza, and brought away some thousands of Sudanese who had been left there by Emin Pasha and H. M. Stanley.

In 1892 Lugard returned to England, where he opposed the abandonment of Uganda by Great Britain, contemplated by the fourth Gladstone administration. In 1894 Lugard was despatched by the Royal Niger Company to Bornu, where, distancing his French and German rivals, he secured treaties with the kings and chiefs acknowledging the sovereignty of the British company. In 1896–97 he took charge of an expedition to Lake Ngami on behalf of the British West Charterland Company. He was recalled by the British government and sent to West Africa, to raise a native force to protect British interests in the hinterland of Lagos and Nigeria against French aggression. In Aug. 1897 he raised the West African Frontier Force, and commanded it until the end of December 1899. The differences with France were then composed, and, the Royal Niger Company having surrendered its charter, Lugard was chosen as high commissioner of Northern Nigeria. The part of Northern Nigeria under effective control was small, and Lugard's task in organizing this territory was impeded by the refusal of the sultan of Sokoto and many other Fula princes to fulfil their treaty obligations. In 1903 a successful campaign against the emir of Kano and the sultan of Sokoto facilitated the extension of British control over the whole protectorate, and when in Sept. 1906 he resigned his commissionership, the whole country was being peacefully administered under the supervision of British residents. (*See* NIGERIA.) In April 1907 he was appointed governor of Hong-Kong. He was appointed in March 1912 Governor of both Northern and Southern Nigeria, with instructions to amalgamate the two administrations. The amalgamation became effective on Jan. 1, 1914, Sir Frederick being given the personal title of governor-general. He guided the affairs of Nigeria throughout World War I, retiring in 1919, and was made a privy councillor in 1920. In 1922 he published *The Dual Mandate,* a book dealing with the duties of European Powers in tropical Africa. From November of that year until 1936 he was a member of the permanent mandates commission of the League of Nations. (*See* MANDATE; NIGERIA.)

Lugard was created K.C.M.G. in 1901 and G.C.M.G. in 1911. He became a colonel in 1905, and held the local rank of brigadier-general. He married in 1902 Flora Louise Shaw (daughter of Major-General George Shaw, C.B., R.A.), who for some years had been a distinguished writer on colonial subjects for *The Times.* Lord Lugard, then Captain Lugard, published in 1893 *The Rise of our East African Empire* (partly auto-biographical), and was the author of various valuable reports on Northern Nigeria issued by the Colonial Office. Throughout his African administrations Lugard sought to ameliorate the condition of the native races, especially by the exclusion of alcoholic liquors, and by the suppression of slave raiding and slavery. He was created a baron in 1928. He died April 11, 1945, at Surrey.

LUGGER, a small vessel with light rigging carrying two or three masts and a lug-sail, and with or without topsails. It is used chiefly as a fishing vessel.

LUGO, a maritime province of northwestern Spain, formed in 1833 of districts taken from the old province of Galicia, and bounded north by the Atlantic, east by Oviedo and León, south by Orense, and west by Pontevedra and Corunna. Pop. (1940) 512,735; area, 3,815 sq.mi. The coast, which extends for about 40 mi. from the estuary of Rivadeo to Cape de Vares, is extremely rugged and inaccessible, and few of the inlets, except those of Rivadeo and Vivero, admit large vessels. The province, especially in the north and east, is mountainous, being traversed by the Cantabrian chain and its offshoots; the sierra which separates it from Leon attains in places a height of 6,000 ft. A large part of the area is drained by the Miño. This river, formed by the meeting of many smaller streams in the northern half of the province, follows a southerly direction until joined by the Sil, which for a considerable distance forms the southern boundary. Of the rivers flowing north into the Atlantic, the most important are the Navia, which has its lower course through Oviedo; the Eo, for some distance the boundary between the two provinces; the Masma, the Oro and the Landrove.

The principal agricultural wealth is on the Miño and Sil, where rye, maize, wheat, flax, hemp and a little silk are produced. Agriculture is in a very backward condition, mainly owing to the extreme division of land that prevails throughout Galicia. Iron is found at Caurel and Incio, arsenic at Castroverde and Cervantes, argentiferous lead at Riotorto. There are also quarries of granite, marble and various kinds of slate and building stone. There are manufactures of leather, preserves, coarse woollen and linen stuffs, timber and osier work.

Lugo, the capital (pop., 1940, 21,115) and the towns (1940 pop.) of Chantada (1,552), Fonsagrada (887), Mondoñedo (2,901), Monforte (11,168), Villalba (2,546) and Vivero (3,529) are described in separate articles. The province was taken by Nationalists in the civil war of 1936–39.

LUGO, capital of the above Spanish province, on the river Miño and on the railway from Corunna to Madrid. Pop. (1940) 21,115 (mun., 42,805). Lugo (*Lucus Augusti*) was a flourishing city under Roman rule (*c.* 19 B.C.–A.D. 409) and was made by Augustus the seat of a *conventus iuridicus* (assize). Its sulphur baths were then well known. It was sacked by barbarians in the 5th century, and suffered greatly in the Moorish wars of the 8th century. Franco's forces captured it in the civil war of 1936–39.

Lugo is an episcopal see, and was formerly the capital of Galicia. Suburbs have grown up round the original town, the form of which, nearly quadrangular, is defined by a massive Roman wall 30 to 40 ft. high and 20 ft. thick, with projecting semicircular towers which numbered 85 as late as 1809, when parts of the fortifications were destroyed by the French. The wall now serves as a promenade. The Gothic cathedral, on the south side of the town, dates from the 12th century, but was modernized in the 18th. The principal industries are tanning and the manufacture of linen and woollen cloth. About 1 m. S., on the left bank of the Miño, are the famous hot sulphur baths of Lugo.

LUG-SAIL: *see* RIGGING.

LUGUDUNUM, an old Celtic place-name (fort or hill of the god Lugos or Lug) used by the Romans for several towns in ancient Gaul. The most important was the town at the confluence of the Saône and Rhone, now called Lyons (*q.v.*). This place had in Roman times two elements. One was a Roman *colonia* (municipality of Roman citizens, self-governing) on the hill near the present Fourviéres (*Forum vetus*). The other was the Temple of Roma and Augustus, to which the inhabitants of the 64 Gallic cantons in the three Roman provinces of Aquitania, Lugudunensis and Belgica—the so-called Tres Galliae—sent delegates every summer to hold games and otherwise celebrate the worship of the emperor which was supposed to knit the provincials to Rome. The two elements composed the most important town of western Europe in Roman times. Lugudunum controlled the trade of its two rivers, and that which passed from northern Gaul to the Mediterranean or vice versa; it had a mint; it was the capital of all northern Gaul, despite its position in the south, and its wealth was such that, when Rome was burnt in Nero's reign, its inhabitants subscribed largely to the relief of the Eternal City.

LUINI, BERNARDINO (*c.* 1475–*c.* 1532), Italian painter of the Lombard school, the son of Giovanni Lutero of Luino, a village on the Lago Maggiore. Very little is known of Luini's early life and none of his early pictures is dated. They are painted in the style of the Lombard school as represented by Borgognone and Bramantino. To this period belong the "Pietà" in the church of Santa Maria della Passione, Milan; the frescoes painted for the Convent S. Maria d. Vetere now in the Brera, Milan; and the "Virgin with Child and St. John" of the Mond collection, National Gallery, London. In the works of his second period extending from about 1510–20 the influence of Leonardo is apparent. To this period may be assigned the "Virgin and Child" in the Brera, Milan; "Modesty and Vanity" in the collection of Edmond de Rothschild; the large Holy family in the Ambrosiana at Milan; the "Virgin and Child" with two saints in the museum at Budapest; the "Madonna" at the Louvre; and the "St. Catherine" in the Mond collection, National Gallery, London (replica at Leningrad). Leonardo's influence only modified to some extent Luini's own strongly individual style, of which the finest productions are those painted after 1520 in the so-called *maniera bionda.*

During the last decade of his life Luini carried out commissions outside Milan. In 1523 he painted the fine polyptych for the parish church of Legnano; in 1525 he executed the frescoes in the church of S. Maria Miracoli at Saronno, representing the "Marriage of the Virgin," "Christ among the Doctors," the "Presentation in the Temple," and the "Adoration of the Magi." The story goes on that Luini sought asylum in the sanctuary of Saronno after killing a man in self-defence and executed this work at the bidding of the monks. In 1526 he erected three altarpieces for the Cathedral of Como; in 1529 he was at Lugano painting the large fresco of the "Crucifixion" in S. Maria degli Angeli. His last important work was the cycle of frescoes in the Monastero Maggiore, Milan, executed shortly before his death in Milan in 1531 or 1532.

Vasari calls Luini "an exceedingly delicate and very pleasing master." A dignified serenity is the most marked characteristic of his works. Their beauty depends as much upon the loving and dreamy expression in the faces as upon the refinement of form. This quality of expression imbues his sacred pictures with a peculiarly religious grace. Besides the works mentioned above the following are notable. "Christ Teaching" (in the National Gallery, London) a fine work of the late period, for which a drawing is in the Albertina at Vienna. Of "Salome with the Head of John the Baptist" various versions exist—in the Louvre, the Prado, the Uffizi, the Museo Borromeo in Milan, the Vienna museum, and with Prince Ascoli at Naples. In the Castello at Milan are a series of medallion portraits of members of the Sporza family; in the Ambrosiana, a fresco representing the "Crowning with Thorns"; in the Poldi Pezzoli collection, the "Marriage of St. Catherine" and three other pictures. The Brera in Milan has the "Virgin Enthroned with Saints" (dated 1521) from the church of S. Maria in Brera; and the "Virgin and Child and the Rose-Hedge"; also the frescoes from the old church of La Pace with scenes of the life of the Virgin; and the fresco decoration of the Casa Pelucca near Monza. This series is classic in conception. The "Girls playing at Forfeits" and the "Three Angels depositing St. Catherine in her Sepulchre" are gracefully composed. Portions of this same series are in the Louvre. Here too are frescoes taken from the Oratorio di Greco Milanese. In the Certosa di Paria is a fresco of "Madonna and Child," and one of "St. Sebastian and St. Christopher."

See Dr. G. C. Williamson, *B. Luini* (1900); Luca Beltrami, *B. Luini e l'Opera sua a Lugano* (Lugano, 1910); *Luini 1512–1532. Materiale di stüdio raccolto a cura di Luca Beltrami* (Milan, 1911).

(I. A. R.)

LUKE, the traditional author of the third Gospel and the Book of Acts, and the most literary among the writers of the New Testament. He was of non-Jewish origin (Col. iv. 11, 14), a fact of great interest in relation to his writings. His name, a pet form of Lucanus (*cf.* Silas for Silvanus, Acts xv. 40, 1 Thess. i. 1)—or, as some think, of Lucius—taken together with his profession of physician (Col. iv. 14), suggests that he was the son of a Greek freedman of some Roman family; and as Julius Caesar gave Roman citizenship to all physicians in Rome (Sueton. *Jul.* 42), Luke may have inherited this status. Such a man would have the attitude to things Roman which appears in the works attributed to Luke. He seems to have remained in constant attendance on Paul, as physician as well as friend (Col. iv. 14; 2 Tim. iv. 11). That Luke was once an adherent of the synagogue—one of those "worshippers" of God to whom Acts often alludes—is probable also from its warm reference to Barnabas (xi. 23 *seq.*) and its feeling for the Jewish Christian or Hellenistic type of piety, as distinct from specific Paulinism.

The statement of the Muratorian Canon (*c.* 190) that Paul took Luke for his companion *quasi ut juris studiosum*—whether we take *ut juris* as = *itineris* and render "as devoted to travel" or not—is inference from biblical data. Origen expresses the belief that Luke was the "brother" of 2 Cor. viii. 18, "whose praise in the Gospel" (= his Gospel) was "throughout all the churches." Though the basis of this identification be a mistake, yet it is quite likely in fact: Luke seems almost the only non-Macedonian (as demanded by 2 Cor. ix. 2–4) of Paul's circle available at the time (*see* Acts xx. 4). If an ancient prologue to the Lucan writings (extant only in Latin) really goes back in part to Marcion or his circle, it may preserve a genuine tradition in stating that Luke died in Bithynia at the age of seventy-four. Fiction usually took the form of martyrdom, as in a later tradition touching his end. The same prologue, and indeed all early tradition, connects him originally with Antioch (*see* Euseb. *Hist. Eccl.* iii. 4, 6, possibly after Julius Africanus in the first half of the 3rd century).

That he was actually a native of Antioch is doubtful: but internal evidence suits the view that he practised his profession in Antioch, where (or in Tarsus) he probably first met Paul. The detailed information in Acts as to the Gospel in Antioch (xi. 19 ff., xiii. 1 ff., xiv. 26–xv. 35) suggests Luke's connection with that church. The Bezan reading in Acts xi. 27, "when *we* were assembled," may imply local memory of this.

But while Luke probably met Paul in Antioch, and thence started with him on his wider missionary enterprise, partly as his medical attendant (*cf.* Gal. iv. 13), Acts shows also some special feeling for the north-eastern part of the Aegean. Ramsay and others fancy that Luke's home was Philippi, and that in fact he may have been the "certain Macedonian" seen in vision by Paul at Troas, inviting help for his countrymen (xvi. 9 f.). But this is as precarious as the view that, because "we" ceases at Philippi in xvi. 17, and then re-emerges in xx. 6, Luke must have resided there during all the interval. The use and disuse of the first person plural, identifying Paul and his party, has probably a more psychological meaning (*see* Acts of the Apostles). The local connection in question may have been subsequent to that with Antioch, dating from Luke's work with Paul in the eastern provinces of Asia Minor, and being resumed after Paul's martyrdom. This accords at once with Harnack's argument that Luke wrote Acts in Asia, and with the early tradition, above cited, that he died in Bithynia.

The later traditions about Luke's life are based on fanciful inference or misunderstanding, *e.g.*, that he was one of the Seventy (4th century).

A good deal can still be gathered by study of his writings as to the manner of man he was. He was the one man of letters among the N.T. writers (*see* Cadbury, *The Making of Luke—Acts*). But further, it was a beautiful soul from which came "the most beautiful book" ever written, as Renan styled his Gospel. The selection of stories which he gives us—especially in the section peculiar to himself (ix. 51–xviii. 14)—reflects his own character as well as that of the source he mainly follows. His was indeed a *religio medici* in its pity for frail and suffering humanity, and in its sympathy with the triumph of the Divine "healing art" upon the bodies and souls of men (*cf.* Harnack, *The Acts*, Excursus, iii.). His was also a humane spirit, so tender that it saw further than almost any save the Master himself into the soul of womanhood. In this, as in his joyousness, united with a feeling for the poor and suffering, he was an early St. Francis of Assisi.

Characteristic of his soul, as of his Gospel, was its universalism—its sensitiveness to the fact, so emphasized by St. Paul, that in Christ a common call was issued to Jew and Gentile alike.

(J. V. B.; X.)

LUKE, GOSPEL OF, a narrative dealing with the life of Jesus of Nazareth, included in the list of books used by the Christian church as a New Testament. In this canon it came to occupy the third place among the Gospels. It is, however, only the first volume of a longer work written by the same author and addressed to the same patron, Theophilus (Luke i. 3, Acts i. 1). Another New Testament book, the Acts of the Apostles, is the succeeding volume. Since much of the contents of this gospel (as well as nearly all of Acts) is not preserved in other writings, this writer is for us the most important historian of the beginnings of the Christian movement. His distinctive qualities of mind and style give his work additional interest and attractiveness. Because other gospels are extant, dealing with the same figure of history and with many of the same events and teachings, any consideration of the Gospel according to Luke inevitably suggests comparison with them.

Contents.—The first long sentence is a preface, introductory, probably, to the whole book, setting forth the reasons for writing. The first book which follows consists of narrative episodes loosely strung together, and of utterances of Jesus (and some others) sometimes more and sometimes less associated with the narrative context. Few main divisions are suggested by the author, but on the basis of the geography and contents of the other gospels, subdivision of the text is often attempted by modern scholars. The author himself used for purposes of division (or connection) at most such summary statements as appear at i. 80; ii. 40, 52; iii. 18; iv. 14–15, 37, 44; xiii. 22; xxi. 37, 38 and the like in Acts. At i. 5; iii. 1–2; viii. 1–3 and perhaps elsewhere it is natural to suspect that the words are introductory, not merely to a single incident, but to a larger series.

Some of the more significant sections are:

(i.) Prediction and birth of John the Baptist and of Jesus (i. 5–ii. 40). These are parallel narratives alternating between the experiences in the two families with special emphasis on the predictions of future greatness. There is a poetic character in the words of rejoicing of Zacharias (the *Benedictus*), of Mary (the *Magnificat*), of the angels (the *Gloria in Excelsis*) and of Simeon (the *Nunc Dimittis*). These songs and also the narrative are Semitic in style and reminiscent in wording of the Old Testament. The account is completely independent of our other ancient account of Jesus' birth in Matthew i.–ii.

(ii.) Jesus' precocity as shown in the Temple when twelve years old (ii. 41–51). This is closely bound with the preceding and is not recorded elsewhere.

(iii.) Genealogy from "Jesus the son of Joseph as was supposed" to "Adam the son of God" (iii. 23–38), independent of and apparently at variance with the genealogy from Abraham to Joseph in Matt. i. 2–15.

(iv.) Address in the synagogue at Nazareth (iv. 16–30), comparable to a scene in Mark vi. 1–6—Matt. xiii. 54–58, but notable in giving the text and contents of Jesus' address and the murderous effect on the hearers.

(v.) Call of four fishermen as disciples (v. 1–11), comparable to a scene in Mark i. 16–20—Matt. iv. 18–22, but relating a remarkable catch of fishes as in John xxi.

(vi.) An address (vi. 20–vii. 1) briefer than Matthew's Sermon on the Mount (Matt. v., vi., vii.) but with beginning, middle and end of identical contents. In both gospels there follows the like concluding sentence and the same miracle, viz., the cure made, *in absentia,* on the request of a centurion in Capernaum (vii. 2–10).

(vii.) Raising from the bier the deceased only son of a widow at Nain (vii. 11–17).

(viii.) Discussion by Jesus about John the Baptist (vii. 18–35), also found in Matthew.

(ix.) Anointing of Jesus by a sinful woman in the house of Simon, a Pharisee; and discussion including the parable of two debtors, vii. 36–50. The incident is independent of the anointing (by Mary according to John) as told in the three other gospels, though in both cases there was an alabaster cruse and the house owner had the same name ("Simon the leper," Mark xiv. 3).

(x.) Incidents connected with the welcome of Jesus on his journey, (ix. 51–x. 42), including the mission and return of seventy messengers sent ahead in pairs (comparable to the mission of the twelve related by Mark, Matthew and even Luke). The rejection in one village by the Samaritans and the reception in another by Martha.

(xi.) Talk with a lawyer about the duty of love to God and neighbour (compare a like incident in Mark xii. 28–31 and Matt. xxii. 34–40) and illustration of neighbourliness in parable of the good Samaritan.

Out of the long and interesting section that follows, full of various teachings of Jesus recorded not at all in Mark and only about half of them in Matthew, may be mentioned as peculiar to Luke:

(i.) Cures and consequent conversations: on the sabbath a bent woman (xiii. 10–17) and a dropsical man (xiv. 1–6); near Samaria ten lepers of whom one, a Samaritan, gave thanks (xvii. 19).

(ii.) Parables, dealing (*a*) with wealth: the Rich Fool (xii. 13–21); the unjust steward (xvi. 1–8); the rich man and Lazarus (xvi. 19–31); parable of the pounds (xix. 11–27), cf. Matthew's parable of the talents; (*b*) with humility and prayer: the obedient servant (xvii. 7–10); the widow and the unjust judge (xviii. 1–5); the Pharisee and the publican (xviii. 9–14); (*c*) with the recovery of the lost: the sheep (also in Matt.), the coin, the prodigal son (xv.); the fruitless fig tree (xiii. 6–9).

(iii.) Incidents associated with local rulers or current history: the Galileans slain by Pilate; those injured by fall of tower of Siloam (xiii. 1–5); reply to warning about Herod (xiii. 31–33).

From the later part of the gospel may be mentioned as peculiar to Luke the story of Zacchaeus at Jericho (xix. 1–10) and the disclosure of the risen Jesus to two disciples walking to Emmaus (xxiv. 13–35). Many details in the familiar and continuous series of events from Jesus' entry into Jerusalem until after his death are peculiar to Luke.

The remaining contents of Luke show considerable overlapping with Matthew and Mark. The passages most closely parallel with Mark occur in Luke in the same order as in Mark, and are usually continuous, as iv. 31–43; v. 12–vi. 19; viii. 4–ix. 50; xviii. 15–43; xix. 29–xxiv. 11, the last section with some notable additions and variations. Most of this material occurs also in Matthew in nearly the same order. There are besides a considerable number of passages which Luke shares with Matthew alone, but in these agreement of order is less frequent.

In nearly every case of agreement of subject matter mentioned there is a considerable though varying agreement in wording. These likenesses are generally believed to be due to some literary relationship between the three gospels, and the question to be solved is called the Synoptic problem. The solution that has come into most general favour is (1) that Mark was written first and was employed as a source by both Matthew and Luke, and (2) that further material appearing alike in Matthew and Luke was derived by them ultimately from a common written source. (*See* GOSPEL.)

The Sources of Luke.—The sources are thus disclosed in part by comparison with the other gospels. One of them was our Gospel of Mark. Possibly the form of Mark used by Luke differed in more than slight detail from our Mark. For example, since Luke followed and used nearly everything in our Mark except Mark vi. 47 to viii. 26, it may be conjectured that the copy of Mark which he used did not contain those seventy-three verses. But it is also possible that he omitted them. He habitually copies out Mark in blocks. In this instance he may have omitted, consciously or by accident, a solid block of Mark's material.

Some other omissions by Luke of Mark's material are best explained by supposing that of certain episodes in Mark he had an alternative version which he preferred and substituted, not always inserting it in exactly the same place. In the early part of his gospel he uses just such alternative accounts of the temptation of Jesus, of the call of four fishermen, of the visit to Nazareth, and of the anointing by a woman. His whole account of Jesus' trial and death is sufficiently independent of Mark to permit of the suggestion that Luke is here following an independent source for the whole series of events.

In any case the material which he shares with Matthew alone of the evangelists is derived from a written source other than Mark. This is generally agreed, and the common material is referred to by scholars as Q, a symbol derived from the German *Quelle* (source). But in what form or scope this material came to Luke is unknown. It has been usual to regard this source as a collection mainly of the sayings of Jesus as found in both Luke and Matthew, and to attribute to a third source most of the matter peculiar to Luke. The second source is often conjectured to be the *Logia* of Jesus, a work which Papias (*c.* A.D. 140) says Matthew wrote in Hebrew. The third or special Lucan source is believed by some to have been a written source with a certain homogeneity of language and interests. Another hypothesis is that practically all the material in Luke not found in Mark was already collected into a kind of gospel or Proto-Luke when at last it was combined with Mark by the simple method of inserting blocks of Mark into it.

No variations of style, nor any explanation from the author, helps to establish the relative probability of these theories. Except where close verbal parallels exist it is even possible that the evangelist is quoting oral traditions from memory. In his preface he refers to earlier information, both oral and written, but does not indicate which he uses. When he copies the gospel of Mark he paraphrases it so freely that his own style rather than Mark's remains the more conspicuous. It has been claimed that the Semitic style of the birth stories implies a written source—some would say a source written in a Semitic language like Hebrew or Aramaic, or even in poetry. The phenomena could be explained, however, if a written source in Greek or unwritten traditions were used by Luke and cast or kept by him in an appropriate Greek Biblical style.

Characteristics.—The Greek style of the work shares with other New Testament writings the flavour of the vernacular speech of the time, but is more literary than that of Mark which Luke repeatedly improves in passages where Mark is being employed as a source. The use of the formal preface, of the elaborate dating in iii. 1–2, and other facts, suggest that the author is more akin to the *litterateur*. He sometimes avoids foreign words, whether Latin or Aramaic, found in his sources, conforming thereby to the better approved habits of style. There is a secular character to his work, and there are references in the gospel to the wider Roman world and its officials, as is the case more abundantly in Acts.

Certain artistic qualities in the work are felt by the observant reader. Renan calls this gospel the most beautiful book in the world. Scenes are portrayed with imagination and with feeling, and are joined together with some effort at connection. The parables told in Luke are among the most effective stories recorded in the Bible. Several passages in the gospel are marked by real pathos, *e.g.*, the "only" children at vii. 12; viii. 42; ix. 38; while elsewhere the spirit of joy is prominent. The qualities of tenderness and sympathy are emphasized. There is also frequent reference to suspense and to final enthusiasm.

How far the traits of the gospel are due to the author and how far to the lost sources cannot now be known. Only in changes in sections derived from Mark is the author's own responsibility provable. It may be, however, partly his own choice of materials and editorial treatment that explain the following apparent emphases in his subject matter: Prayer; repentance and forgiveness; the Holy Spirit (and more conspicuously in Acts); the prominence of women in the narrative and in the parables; praise of poverty and of almsgiving, and warning against wealth; illustration from figures of money or property; comparisons of foreigners, Samaritans, publicans, and the like with self-righteous Jews to the disadvantage of the latter. Equally distinctive emphases in matters of theology can hardly be discovered. The author is a Christian and shares the general early Christian standpoint.

Origin of the Gospel.—That the gospel and Acts are from the same author has been mentioned. This is generally agreed and is confirmed by such marks of stylistic identity in the two volumes as one would expect in works from the same author. The origin of each book is therefore a question that can scarcely be discussed in full separately (*see* ACTS OF THE APOSTLES).

That the author was Luke, the associate named by Paul (Col. iv. 12 "the beloved physician," Philemon 24, a "fellow worker"), is a tradition that can be traced back for each volume before 200 A.D. In favour of this tradition is not so much the antiquity or continuity of the tradition, as the fact that a person so obscure in the records of the church would be less likely to have attributed to him the authorship of such important and well regarded writings than would one of the twelve apostles. The contents of the volumes may be said neither to confirm nor to weaken this tradition, though a series of interesting arguments pro and con have been put forward.

In favour of the tradition are urged the passages in Acts (xvi. 10–17, xx. 5–16, xxi. 1–18, xxvii. 1–xxviii. 16) in which the first person plural is used. That the author of the work was himself a companion of Paul is a natural conclusion from this use of "we." Of course, the companion's name is not thereby revealed, but Luke is not excluded, as he is nowhere mentioned in Acts in the third person. Other critics hold that these "we" sections come not from the author of Luke and Acts, but from a written source that he incorporated. In that case Luke might be the author of the source, but probably not of the whole work.

Against this alternative is urged the consideration that (except for the "we") the style of the autobiographical sections in Acts is identical with that of the rest of the work. This is felt to indicate identity of authorship. If, however, we may judge from his use of Mark, this evangelist regularly recast his sources in his own style and may possibly have done so with a "we" source, though why, when otherwise rewording it, he should retain the first person, is not evident.

A favourite argument in defence of Lucan authorship, for some years, was derived from the alleged medical expressions and interests displayed in the two writings. Few of the expressions cited, if any, are really technical, and the actual amount of matter connected with the medical profession is not so extensive as to exclude lay authorship.

Whether the author's narrative and his religious viewpoint are such as to imply first-hand contact with Paul or not, has been hotly debated. There are apparent contradictions between his earlier narratives about Paul and the biographical allusions in Paul's own letters. On the other hand, there are lifelike touches in his accounts of Paul, whether written in the first person or the third, and some striking agreements with details in the Pauline epistles. It would be rash to say of the discrepancies that no one who subsequently knew Paul could have written them, and equally rash to say of the agreements that no one except an actual associate of Paul could have written them.

So, although no conclusive internal evidence condemns the tradition of Lucan origin as erroneous, the possibility may be left open that the attribution of these writings to Luke was an early conjecture made when the real origin of the work was unknown. Luke i. 1 may have seemed to early readers to exclude all the apostles from the writing of the gospel, while 2 Tim. iv. 11 may have seemed to exclude all the other companions of Paul from the writing of the conclusion of Acts. Since, however, the "we" appeared to indicate that the work as a whole came from some such companion, the total inference from the scriptures would fix on Luke. Elaborate conjectures on such matters were not uncommon in the second century, and when once made often became unchallenged tradition.

Of the place and date at which the author wrote, little can be said with certainty. The gospel was written before Acts, though perhaps not much before. The Acts was written after the "two years" of Paul in Rome with which it closes, *i.e.*, about A.D. 60–62. Some have supposed that it was written immediately after and for that reason stops abruptly with a statement of the *status quo*. But nothing prevents a later date for both volumes. If the prophecy of Luke xxi. was affected by the actual fulfilment in the year A.D. 70, both volumes are at least as late as that. Neither volume shows any certain knowledge of the works of Josephus, though this has been asserted, or of Paul's letters. The gospel, as has been said, is dependent on and therefore subsequent to both Mark and other material shared by Matthew, but the exact date of neither of these predecessors is known.

Nothing certainly is known of Theophilus, to whom both gospel and Acts are addressed, but the author's purpose in writing is stated in the preface and can be read between the lines of the whole book. In like manner the contents of the books disclose more of the author's character and personality than would his name, date, or place of residence, if we knew them.

BIBLIOGRAPHY.—*See* the books mentioned under ACTS OF THE APOSTLES, and GOSPEL. For commentaries on Luke *see* those by A. Plummer (1896, in *International Critical Commentary*); W. F. Adeney (1901 in *Century Bible,* popular); J. Wellhausen (1904); M. J. Lagrange (1921, in French, Roman Catholic); T. Zahn (1913, in German, conservative); E. Klostermann (*Handbuch z. N.T.* 1919); B. S. Easton (1926, exegetical and critical); A. Loisy, *Les Évangiles Synoptiques* (1907). LUKEMAN, HENRY AUGUSTUS (1871–1935), American sculptor, was born at Richmond, Va., on Jan. 28, 1871. He studied at the National Academy of Design, New York city, and was a pupil of Launt Thompson and Daniel Chester French, perfecting his knowledge of anatomy by a year's study at Bellevue hospital. In 1894 he spent a year in Paris studying under Falquière at the École des Beaux-Arts, and on his return to the United States settled in New York city. His work includes portraits, busts, statues, memorials and bas-reliefs, among the best known being "Mann, the Law Giver of India" for the Appellate Court building, New York city; the statue of President McKinley at Adams, Mass.; "Genoa," the figure of Columbus on the United States customs house, New York city (1905); the Soldiers' Monument at Somerville, Mass. (1908); the group "Women of the Confederacy," at Raleigh, N.C. (1912); the Soldiers' Memorial, Red Hook park, Brooklyn, N.Y. (1920); the equestrian statue of Francis Asbury, Washington, D.C. (1921). He was appointed in 1925 to succeed Gutzon Borglum as sculptor in charge of the Stone mountain memorial near Atlanta. (*See* ATLANTA, GEORGIA.)

LULEÅ, a seaport of Sweden, capital of the district (*län*) of Norrbotten, on the Sandö peninsula at the mouth of the Lule river. Pop. (1943) 15,139. Luleå as founded by Gustavus Adolphus was 7 mi. higher up the river, but was moved to the present site in 1649. It is connected at Boden (22 mi. N.) by rail from Stockholm to Gellivara and Narvik on Ofoten Fjord in Norway. It ships iron ore mined at Gellivara, 127 mi. N. by W., and there are smelting works at Karlsvik. Timber is exported, being floated down the River Lule. As a rule the port is closed by ice from November to the end of May. The town was almost entirely burned in 1887.

LULEAN, an independent linguistic stock of South American Indians, so called from the Lules, the most important tribe. They lived on the western border of the Argentine Chaco, on the Salado river in the provinces of Santiago del Estero and Tucuman. They were a semi-agricultural folk of simple culture, and known only from brief references by the 18th-century writers. There is considerable uncertainty as to just what tribes are to be included in the stock, the data available being very meagre and conflicting. The Vilela, on the Vermejo, who were near neighbours of the Lule, are, however, certainly members of the stock.

See D. G. Brinton, "The Linguistic Cartography of the Chaco Region" (*Proc. Amer. Philos. Soc.*, vol. xxxvii.); L. Kersten, "Die Indianerstämme des Gran Chaco, etc." (*Internat. Archiv. für Ethnographie,* vol. xvii., pp. 1–75).

LULE BURGAS, BATTLE OF. This was the principal battle of the BALKAN WARS OF 1912–1913, under which heading it is described. Arising out of the advance of the Bulgarian armies into Thrace it lasted from Oct. 28–30, 1912, and ended with the defeat of the Turkish field forces and their retirement to the Chatalja Lines, covering the approaches to Constantinople.

LULL (or LULLY), **RAIMON** (or RAYMOND) (*c.* 1235–1315), Catalan author, mystic and missionary, was born in Palma (Majorca). Married at an early age to Blanca Picany, he led a dissipated life till his conversion (1266), when he resolved to devote himself to evangelical work among the heathen, to write an exposure of infidel errors, and to promote the teaching of foreign tongues in seminaries. He dedicated nine years to the study of Arabic, and in 1275 showed such signs of mental exaltation that, at the request of his wife and family, an official was appointed to administer his estate. He withdrew to Randa, there wrote his *Ars major* and *Ars generalis,* visited Montpellier, and persuaded the king of Majorca to build a Franciscan monastery at Miramar. There for ten years he acted as professor of Arabic and philosophy, and composed many controversial treatises. After a fruitless visit to Rome in 1285–86, he journeyed to Paris, residing in that city from 1287 to 1289, and expounding his bewildering theories to auditors who regarded him as half insane. In 1289 he went to Montpellier, wrote his *Ars veritatis inventiva,* and removed to Genoa where he translated this treatise into Arabic. In 1291, after many timorous doubts and hesitations for which he bitterly blamed himself, Lull sailed for Tunis, where he publicly preached Christianity for a year; he was finally imprisoned and expelled. In Jan. 1293 he reached Naples, where his efforts to interest Clement V. and Boniface VIII. in his favourite project of establishing missionary colleges were unavailing. In 1300 he sailed to Cyprus to seek support for his plan of teaching oriental languages in universities and monasteries. He was rebuffed once more, but continued his campaign with undiminished energy. Between 1302 and 1305 he wrote treatises at Genoa, lectured at Paris, visited Lyons in the vain hope of enlisting the sympathies of Pope Clement V., crossed over to Bougie in Africa, preached the gospel, and was imprisoned there for six months. On being released he lectured with increasing effect at Paris, attended the General Council at Vienne in 1311, and there witnessed the nominal adoption of his cherished proposals. Though close on 80 years of age, Lull's ardour was unabated. He carried on his propaganda at Majorca, Paris, Montpellier and Messina, and in 1314 he crossed over once more to Bougie. Here he again resumed his crusade against Mohammedanism and raised the fanatical spirit of the inhabitants, was stoned outside the city walls and died of his wounds.

The circumstances of Lull's death caused him to be regarded as a martyr, local patriotism helped to magnify his merits, and his fantastic doctrines found many enthusiastic partisans. The *doctor illuminatus* was venerated throughout Catalonia and afterwards throughout Spain as a saint, a thinker and a poet; but his doctrines were disapproved by the powerful Dominican order, and in 1376 they were formally condemned in a papal bull issued at the instance of the inquisitor, Nicolas Emeric. The authenticity of this document was warmly disputed by Lull's followers, and the bull was annulled by Martin V. in 1417. The controversy was renewed in 1503 and again in 1578; but the general support of the Jesuits and the staunch fidelity of the Majorcans saved Lull from condemnation.

The speculations of Lull are now obsolete outside Majorca where his philosophy still flourishes, but his more purely literary writings are extremely curious and interesting. In *Blanquerna* (1283), a novel which describes a new Utopia, Lull renews the Platonic tradition and anticipates the methods of Sir Thomas More, Campanella and Harrington, and in the *Libre de Maravelles* (1286) he adopts the oriental apologue from *Kalilah and Dimnah.* And as a poet Lull takes a prominent position in the history of Catalan literature; such pieces as *El Desconort* (1295) and *Lo Cant de Ramon* (1299) combine in a rare degree simple beauty of expression with sublimity of thought and impassioned sincerity.

See José R. de Luanco, *Ramon Lull, considerado como alquimista* (Barcelona, 1870), and *La Alquimia en España* (Barcelona, 1889–97).

(J. F.-K.)

LULLY or **LULLI, JEAN-BAPTISTE** (1639–1687), French composer, of Italian birth, was born in Florence on Nov. 29, 1639. Through the duc de Guise he entered the service of Madame de Montpensier as scullery-boy. He then studied the theory of music under Métra and entered the court orchestra, being appointed director in 1652, and court composer in 1653. The influence of his music produced a radical revolution in the style of the dances of the court itself. Instead of the slow and stately movements which had prevailed until then, he introduced lively ballets of rapid rhythm. The music for his ballets was arranged as orchestral suites, a new form which was cultivated in Germany as well as in France. In December 1661 he was naturalized as a Frenchman, his original name being Giovanni Battista Lulli. For fifteen years (1672–87) Lully was the director of the Paris opera. While directing a *Te Deum* on the 8th of January 1687 with a rather long baton he injured his foot so seriously that a cancerous growth resulted which caused his death on the 22nd of March. Lully was the founder of French opera, forsaking the Italian method of separate recitative and aria for a dramatic consolidation of the two and a quickened action of the story. Moreover, he laid more stress on rhythm and less on melody. He improved the composition of the orchestra, into which he introduced several new instruments. Lully was a friend of Molière, for some of whose best plays he composed illustrative music. Of his church music his *Miserere,* written for the funeral of the minister Séguier, is a work of genius; and on his death-bed he wrote *Bisogna morire, peccatore.*

A modern edition of the most important of his operas *Alceste* (1674), *Armide* (1686) will be found in the *Chefs d'oeuvre classiques de l'opéra français.*

See E. Radet, *Lully, homme d'affaires, propriétaire et musicien* (1891); Romain Rolland, *Musiciens d'autrefois* (1908); L. de la Laurencie, *Lulli* (1911); J. B. de Lully, *Lully et l'opera français* (1925).

LUMBAGO, a term in medicine applied to a painful ailment affecting the muscles of the lower part of the back, generally regarded as of rheumatic origin. An attack of lumbago may occur alone or be associated with rheumatism in other parts of the body. It usually comes on suddenly as severe pain in the small of the back, greatly aggravated on movement, especially in attempting to rise from the recumbent posture and in drawing a deep breath, coughing or sneezing. The absence of any great constitutional disturbance beyond the pain renders the diagnosis a matter of no great difficulty. Lumbago seems to be brought on by exposure to cold and damp. Sometimes it follows a strain of the muscles of the loins. The attack is in general of short duration, but occasionally it continues for a long time as a feeling of soreness and stiffness on movement. The treatment includes that for rheumatic affections in general (*see* RHEUMATISM) and the application of local remedies to allay the pain.

LUMBERING, a term applied to the harvesting of the products of the forest, and their conversion into various shapes and sizes for further commercial use. Lumbering deals with the growing, manufacture and distribution of lumber and lumber products. One of the first great obstacles encountered by the early American settlers was the forest, and other than supplying logs for the shelter then needed, the forests were deemed useless. Trees were felled primarily to clear the ground, and the logs were referred to as "lumber," according to the original meaning of the word. Later, when small amounts of "lumber" were shipped to England —sometimes as mere ballast—the British sailors are said to have referred to the bothersome material as "just so much lumber." For clarity, the definition of lumber is restricted to include only those products of the saw and planing-mills not further manufactured than by sawing, re-sawing and passing lengthwise through a standard planing machine, cross-cut to length, and matched. These are classified as follows: (1) Yard lumber—intended for general building and construction purposes; (2) shop or factory lumber—intended for further manufacture; (3) structural lumber—2in. or more in thickness and width, intended for use where working stresses are required. (*See* American Lumber Standards, Dept. of Commerce, Simplified Practice Recommendation R 16-39.)

Lumbering, one of the leading American industries, involves much more than the mere manufacture of lumber. Millwork products, such as sash, doors, frames, blinds, etc.; veneers, shingles, lath, poles, posts, piling, cross ties, flooring, box shooks, etc., all are produced by the lumber industry. Pulp wood, consumed by the paper industry; bark for tanning, medicines, mattings, etc.; resinous products such as turpentine, rosin, tar, pitch, etc.; chemical products such as wood alcohol, pyroligneous acid, charcoal, creosote, etc., are directly dependent upon the lumber industry, and in many cases these various secondary industries incorporate lumbering into their operations as an integral part.

Development of Lumbering.—The forests, the principal source of materials for shelter, in early American times provided lumber for the houses, stockades for refuge against the savages and fuel, all in bountiful measure. For safety from hostile Indians, great tracts had to be cleared and in those clearings communities developed. Before the people could move inland from the Atlantic coast, the forests had to be penetrated and trails blazed and roads made. Thus lumbering was the first industry in the United States. Spars and ship timbers were shipped even before tobacco and other agricultural products were exported. The first sawmills were located at Jamestown, Va., in 1625, and Berwick, Me., in 1631. These early mills were operated by water-power and produced only a few hundred board feet of lumber a day. They were an unimportant factor until the advent of steam about 200 years later. Timbers were hewn, shingles were split and boards were sawed by hand. The development of the American lumber industry can be traced concurrently with the expansion of agriculture. Likewise, the shifting of lumber centres from New England to the north, south and west closely parallels the industrial development of America. For years Maine led in lumber production and supplied home and foreign markets with white pine spars, staves, shipbuilding lumber. Virginia and the Carolinas produced large quantities of oak and other Southern States yellow pine and rosin. By 1840 the lumber production of the United States approximated 8,000,000,000 board feet. The centre of the industry had shifted to the State of New York, which was then producing 20% of the lumber manufactured. In 1859 Pennsylvania took the lead, but ten years later gave way to Michigan, which led in lumber production until about 1899, when, according to U.S. Government statistics, Wisconsin ranked first. Minnesota also came into prominence about the same time; but the peak of lumber production in the Lake States was reached in 1892. Since 1895, southern yellow pine has supplied from 20 to 40% of the total lumber production of the country and more lumber has been produced in the South and Southeast than in any other one section of the country. The Pacific coast States, and principally Washington and Oregon, came into prominence as a lumber-producing region about 1900. From 1905 to 1922 (except 1920) Washington and Louisiana were the leading lumber-producing States. In 1920 and from 1923 to 1937, Washington and Oregon led in the order named. In 1938 lumber production in Oregon was largest for the first time on record.

Production and Consumption.—The average annual production of lumber in the United States for the five-year period, 1923–28, was approximately 37,000,000,000 bd.ft., of which 31,000,000,000 was softwood, and 6,000,000,000 was hardwood. In the five-year period, 1933–38, it averaged 21,200,000,000 bd.ft. of which 17,700,000,000 bd.ft. was softwood, and 3,500,000,000 hardwood. In 1937 it reached a total of 26,000,000,000ft., about 40% of which was produced in the South, including the Carolinas, and approximately 42% in the Pacific North-west and California. About 83% of the total production consists of softwoods, the leading species being southern pine and Douglas fir. Oak, gum, and maple are the principal hardwoods (*see* U.S. Bureau of Census). The United States is the world's largest lumber-producing country. It is also the largest consumer of lumber, using between 65% and 70% of its annual production for building and all other construction. About 8% of the total supply is consumed by the railroads for ties, timber, and planking, and 24% by manufacturers other than those remanufacturing lumber into building materials. In addition to the lumber and lumber products previously mentioned, approximately 3,620,000,000 cu.ft. of wood are removed annually for fuel from the commercial forests of the United States. The paper industry consumed approximately 10,400,000 cords of pulpwood in 1937. About 1,500,000 cords of pulpwood and 2,394,600 tons of wood pulp were imported in 1937 (U.S. Department of Commerce).

In 1937 there were 7,647 establishments which reported production of lumber and timber products only, valued at $5,000 or more. These establishments employed 323,928 wage-earners; paid wages amounting to $275,033,684; used materials, supplies, and fuel costing $345,800,156; produced products valued at $848,481,316. In the lumber and allied products industries (forest products industries) in 1937, there were 18,012 establishments, employing approximately 754,000 persons, earning wages and salaries totalling about $764,000,000, and producing products valued at $2,440,000,000.

TABLE I.—*Value of Exports and Imports of Wood and Paper*

	1929		1937	
	Exports ($)	Imports ($)	Exports ($)	Imports ($)
Total lumber and logs*	125,924,782	71,866,896	61,369,397	35,163,269
Wood manufactures	40,938,366	10,837,568	20,255,266	7,258,000
Total wood and manufactures	166,863,148	82,704,464	81,624,663	42,421,269
Paper base stock	5,078,346	118,132,740	23,642,334	117,852,433**
Paper and manufactures	37,189,486	163,365,011	31,065,538	137,070,553
Total wood and paper	209,130,980	364,202,215	136,332,535	297,344,255

*Includes railroad ties, lath, shingles, also poles, piling, firewood, etc.
**Includes pulpwood $12,393,457; wood and other pulp, $98,297,822; rags and other paper stock, $7,161,154.

Value of products included cost of materials, fuel, supplies, etc., of $1,174,000,000 and value added by manufacture of $1,266,000,000 (Bureau of Census). In 1929, 3,250,000 railway cars were loaded with lumber and lumber products. In 1937 these carloadings were 1,828,000. Water shipments through the Panama canal in the fiscal year 1937 were 2,750,000 long tons. Exports of lumber and sawn timber in 1937 were 1,413,850,000 feet. Lumber imports in 1937 totalled 687,000,000 bd.ft., of which softwoods amounted to 572,500,000ft. and hardwoods (including sawed cabinet woods) to 114,100,000 feet. Spruce is the leading species imported. About 90% of all softwood imports are from Canada.

Biennial census figures for 1937 show forest products (including remanufactures) as fifth on a list of 15 general industrial groups in number of wage-earners and tenth in value of products. In the States of Washington, Oregon, Mississippi, Louisiana, Arkansas, Florida, Kentucky, Montana, Idaho, and New Mexico, lumber production (logging and sawmill operations) was the leading industry in 1937, based on average number of wage-earners. Lumber products in 1937 was the second most important industry, based on number of wage-earners, in Alabama, Arizona, California, South Carolina, Texas, and Wyoming (U.S. Bureau of Census).

Lumber is also an important industry in many other States, giving rise to valuable local manufactures.

Timber Available for Lumbering Operation.—In considering the quantity of timber available in the United States for lumbering operations, we are confronted with several considerations of varying character such as changes in the standards of lumber mill utilization, growth of small trees to saw log size, conditions of markets for other wood products which may at any time divert saw timber into other uses such as pulp, poles, piling, shakes, and ties, because of the higher prices offered for such uses. The tendency in many parts of the country is to increase the minimum size of trees cut in lumber manufacture by the practice of selective logging. We cannot forecast the portion of available timber to be used for lumbering; we can only indicate the quantities that probably will be so used if conditions continue to follow the present trends.

In Tables II. and III., classification has been made into regions by character of forest growth. The South extends from Maryland and the Ohio river to mid-Texas. The Mountain region is Kentucky, Tennessee, West Virginia and parts of Virginia, and North Carolina. Piedmont and Coastal Plain include all other South to Louisiana and Arkansas. The West coast is western Washington and Oregon. Interior is eastern portion of these States with Idaho and Montana.

These tables are from a comprehensive survey on the timber situation recently completed by the U.S. Forest Service.

Recent developments in technique have made it possible to produce satisfactory pulp from species not previously useful for this purpose. A large newsprint industry is being established in the South, utilizing southern yellow pine. It is estimated that

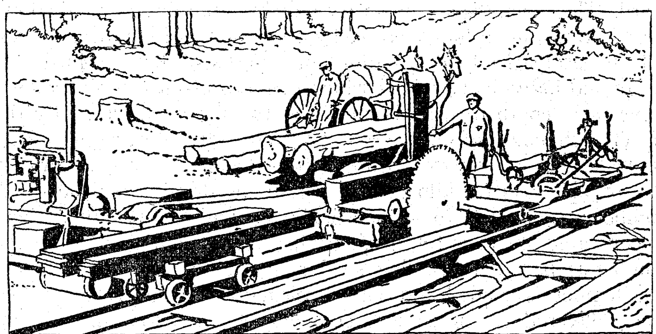
75% of the rayon is manufactured from wood pulp. Increasing demand has made it practicable to utilize trees of saw-timber size for pulpwood. It is difficult to estimate the quantity of timber which actually will be made into lumber products and the quantity that will be devoted to other uses.

The estimated depletion of timber is estimated by the U.S. Forest Service as 13,463,000,000 cu.ft., the year 1936 being quoted as a typical year. Of this total, the timber cut for commodities was 11,400,000,000 cu.ft., of which 6,610,000,000 cu.ft. were softwoods and 4,790,000,000 cu.ft., hardwoods. Of the total, 5,367,500,000 cu.ft. is lumber; 3,620,000,000 fuelwood; 705,924,000 pulpwood; 681,250,000 hewed ties and fence posts. Fire and other destructive agencies, as insects and disease, account for loss of about 2,000,000,000 cu.ft. a year, about 70% of which is softwood. The present stand, plus growth, less depletion and losses may be said to give an indication of the life of the lumber industry. But a rapidly increasing interest in reforestation and practice in timber management have been developing and the growth factor has been changed by increased productivity of forest crops and the growth and drain equation has been approximating a balance. With vigilance in preventing forest fires and depreciation and losses from insects and other natural causes, the lumber industry has a long life in prospect.

METHODS OF MANUFACTURE

In the early days of American history and also the history of the American lumber industry, the manufacture of lumber was a comparatively simple and inexpensive and likewise crude process. The trees were felled as needed, hand sawed and shaped into rough planks and timbers by manual labour for nearby immediate use. Later on, as the country developed, a greater demand for lumber resulted and more efficient lumbering methods were needed and were created. Furthermore, as population and industry expanded westward, the forests moved farther and farther away from the centres of consumption, and each new lumber district presented somewhat different problems in logging, manufacture and distribution due to topography and species of wood found—all of which had a marked influence upon the development of modern lumbering methods.

Logging.—The work in the forest preparatory to that of the sawmill, logging, has been one of the most interesting features



BY COURTESY OF THE SIMONDS SAW AND STEEL COMPANY

SLICING LOGS INTO BOARDS WITH A MACHINE-OPERATED CIRCULAR SAW

of the American lumber industry. In the early days and until recent years in many localities, the lumbermen depended almost wholly upon natural forces in the logging operations. In the North-eastern and Northern States the fall and winter seasons were devoted to the felling of the trees. The logs were hauled out on snow sleds, either to sawmills close by or to concentration points on the banks of streams, where, in the latter case, the logs were rolled into the water as soon as the ice was gone, and floated down stream to mills or market centres. In the South the lumbermen had to resort to other means of transporting the logs from the forests to the mills, due to a lack of swift-flowing streams and snow for sledding. Oxen and high-wheel carts were the principal means of log transportation for years and in some districts in the South-east they still are used. In the mountainous country, both in the East and West, chutes and flumes were used. Later came the use of wire cables stretched across valleys and canyons. The logs were hung from a pulley; then, by gravity, travelled to the lower end of the cable. Although these relatively primitive methods of transportation are still used in hauling logs from places where they are cut to the "log landing," in some areas they have been supplanted by tractors. At the "landing," they are loaded on trucks or railroad cars for transportation to the mill. Many of the larger companies have built their own railroads or truck roads long distances from the woods to the sawmill. There are approximately 30,000 mi. of logging railroads in the United States and probably an even greater mileage of truck roads. The development of truck hauling of logs has made accessible large areas of timber which had not previously been practicable to reach and has extended the life of many mills for years after the expiration of the expected cutting period. The early logging camps were very crudely built. They consisted of as few buildings as possible. The logging men or "lumberjacks" lived in rough shacks or bunk houses. Conditions were unsanitary and even as late as the 20th century many logging camps were more primitive than the first communities in Massachusetts and Virginia. Recreation consisted of "swapping" stories, fighting and drinking. Only at the end of the season did the lumberjack have an opportunity to mingle with civilization in some town a hundred or more miles away. But conditions changed. There are fewer lumber camps and more lumber towns. The average lumberjack can raise a family as well in the forest as he can in the city because he has, right at hand, schools, churches, stores, modern sanitary conditions and amusements.

The methods of felling trees and converting them into logs are generally the same. First, the standing tree is undercut with an axe on the side of fall. A cross-cut saw, handled by two men—one at each end—is employed opposite the undercut. Where the ground is flat, the men cut from the ground; but where the ground is rough or sloping and irregular, and particularly on the west coast, the undercutting and sawing is done from a platform or spring-board. After felling, branches are trimmed off and the tree is sawed or "bucked" into log lengths, usually 16 ft. except in the North-west, where much longer lengths are handled (24 to 40 ft. are common and in the most modern operations 49 to 65 ft. are the most favoured units of length). Certain other districts also cut logs to lengths greater than 16 ft. After bucking, the logs are dragged or "skidded" to concentration points by horses, oxen or power, but as previously explained, steam or electric power has supplanted, in many instances, the horses and oxen. Where steel cables are employed over valleys and canyons, the method is called "high-lead" skidding. Other methods are known as overhead skidding—where the logs are hoisted up over the brush and ground for some distance, and ground-line skidding which is the dragging of the log over the ground by means of a cable. In the North-west a "spar" tree frequently is employed in the skidding operations. This tree is selected for its height and favourable location with regard to the surrounding trees to be felled. A man known as a "high-climber," ascends the tree, aided by climbing spurs affixed to his shoes and a rope around the tree. He is equipped with a saw and axe and as he ascends he cuts off interfering branches until he reaches the desired height which usually is about 175 to 200 ft., and some 30 to 50 ft. from the tree top. Then he saws off the top, waits until the swaying caused by the top's rebound has stopped, and descends. Another man, known as a "rigger," next ascends, carrying equipment for rigging. Finally the spar is rigged at the top with cable and pulleys and a loading boom is affixed some 20 ft. above the ground. A cable with grab hooks on the end is carried to the log to be skidded

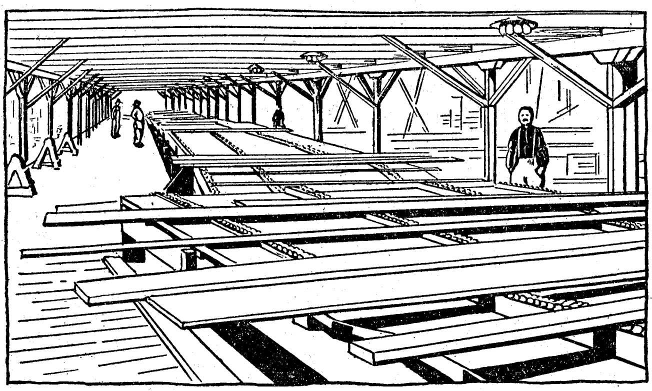
CUTTING PINE BOARDS INTO THE PROPER LENGTH FOR SHIPPING

and then, by means of a steam or electric skidder the log is dragged within distance of the loading boom which raises the log off the ground and loads it direct onto a nearby car or stacks it for future loading. When the logs reach the mill centres, they are stored in log ponds which usually cover a number of acres. Here they are kept until ready for manufacture. The ponds facilitate assorting and cleaning, and also prevent deterioration which would occur if the logs were left dry for any appreciable length of time.

Sawmill Practice.—The first sawmills in the United States, as noted, were built at Jamestown, Va., and Berwick, Me., and were modelled after the European type of mill, employing water-power and a single sash-saw.

Production was small until steam power supplanted water-power about the year 1850. About the same time the single sash-saw gave way to the circular saw and the latter was widely used until about 1890, at which time the band saw became popular in the larger mills. For the next 20 years lumber production increased rapidly. Many new inventions and more efficient methods of operation brought the lumber industry to the front with almost astonishing rapidity. Most modern sawmills employ the same general type of machinery and follow somewhat similar plant layouts. Band-saws of varying types such as single-cutting, double-cutting, vertical and horizontal band-resaws and gang-saws are common in the larger mills. Many labour-saving devices are employed. Various types of conveyors and other machinery permit the log to enter the mill and pass out as manufactured lumber with very little handling or moving by hand.



BY COURTESY OF THE PACIFIC LUMBER COMPANY
THE SORTING TABLE, WHERE LUMBER IS GRADED ACCORDING TO DURABILITY AND PERFECTION OF GRAIN

The modern methods of lumber manufacture are so intricate and so efficient as a rule, that the term "sawmill" has given way to that of "lumber manufacturing plant." The largest lumber manufacturing plant in the world in 1928 at Longview, Wash., consisted of two groups, each a complete unit consisting of more than 30 buildings. The two units combined have a total of 78 ac. under roof, and the total plant site covers 1,737 acres. Storage and cutting ponds cover 125 acres. The power-plant, which supplies electricity for both the lumber manufacturing plants and the logging operations some 30 m. away has a present capacity output of 24,000 kilowatts, and can be increased to 36,000 kilowatts whenever necessary. The power-plant derives its fuel from sawmill waste. The daily output of the two lumber manufacturing units is approximately 2,000,000 bd. ft. of Douglas fir.

Mill Process.—The following method of lumber manufacturing is prevalent, with variations to fit certain local requirements. The logs enter the head mill from the pond over an inclined chute or "log slip." They are transported by an endless spiked conveyor known as a jack ladder or jack chain. As they ascend the slip they are sprayed with water to remove grit and dirt that might otherwise dull the saws. From the slip the jack ladder carries the log under a large circular saw known as the deck saw and which is used if the log is to be shortened; otherwise the log is "kicked" off onto the log deck by steam-driven steel arms. From the log deck the log rolls onto the log carriage. A steam or air "nigger" (mechanically operated steel arms) helps to place the log in the proper position. The carriage is a long, flat platform which is made to travel back and forth rapidly on a track, keeping the log against a band or "head" saw which squares it and reduces it into flitches or cants. The log is turned from time to time on the carriage by means of the steam or air operated "nigger." If the log is to be used as a timber, it is squared and edged and then passed immediately to the rear of the mill where the timber dock usually is located. If to be converted into lumber, the flitches or cants enter the remanufacturing plant directly behind the head mill, where they pass to the gang-saws and edgers and then to the trimmers.

From the remanufacturing plant the lumber passes through sorters and to explain this step the following description is given of a large modern lumber manufacturing plant in the North-west. Joining immediately on the end of the remanufacturing mill are three sorters. The first is a 2 in. yard sorter where nothing is handled except 2 in. common lumber, all lengths and widths, which will be segregated into various packages as to grades, widths and lengths. These packages are then delivered by a monorail hoist to cars which are drawn by storage battery locomotives to the green yard. The second is a 1 in. sorter on which nothing is handled except 1 in. common lumber to the yard. The third is a drop sorter, which automatically drops different lengths of lumber into separate and individual pockets which deliver onto a chain that conveys each length to what is known as the Whaley sorter. By the latter each length of lumber is segregated to five different stacking units. Thus, all lengths, widths and thicknesses are separately put on kiln cars for kiln drying. From the drop sorter the rough lumber is delivered to automatically controlled dry kilns where superheated steam is the usual drying agent. From the kilns the lumber is passed to cooling sheds; thence to dry sorters where the lumber is graded and sorted, picked up by overhead cranes and delivered to an endless conveyor which runs through unstacker sheds into rough lumber storage sheds and on to the planing-mill.

Not all lumber passes from the kilns to the planing-mill, a very important and necessary part of a lumber manufacturing plant. Some of it is placed in stock. Other packages pass on to the planing-mill where the lumber is surfaced as plain boards and "dimension" or worked into "ceiling," "flooring," "siding," "moulding," "partition," "casing," etc. From the planing-mill the lumber is conveyed to the "dressed lumber" sheds to be stored or to the loading sheds, ready for shipment. Waste resulting from the various steps of manufacture is converted into "short length" lumber wherever possible; some of it goes into the manufacture of paper and pulp board, and some is ground up for fuel. Wood is the principal source of fuel for power in lumber operations. The larger slabs and edgings may be converted into lath and small wooden items.

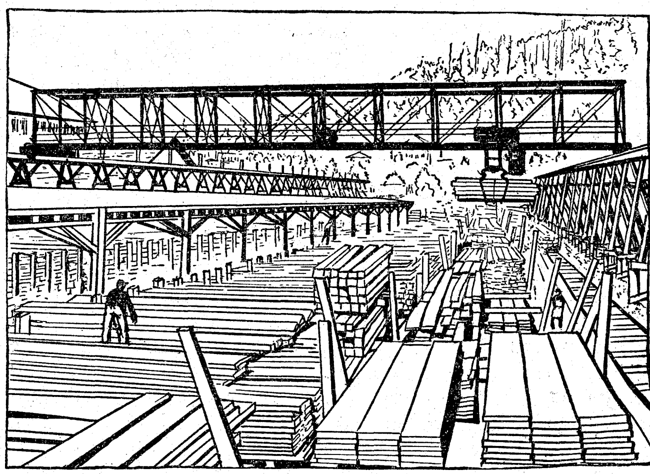
other industrial purposes. In all probability, the future will see lumbering having just as much effect, if not more, upon the economic development of America as it has had in the past. The consumption may not increase with such rapidity, nor are there new virgin forests to be worked, but neither does any other present major industry promise to develop as rapidly in the future as in the past, for the industrial zones of the United States are more



BY COURTESY OF THE PACIFIC LUMBER COMPANY
AN ELECTRIC CRANE TRANSPORTING LUMBER TO THE SHIPPING YARD

or less permanently fixed and established. A steady increase in the demand for lumber will keep pace with the increase of population and development of industry. In the past lumber has been "mined." In the future timber crops will be harvested.

By proper reforestation methods and programs, America should always be able to grow sufficient lumber to meet her needs. Since the beginning of time, new forests have arisen on the old, and wherever a forest area consists of old-growth, matured-timber growth is approximately balanced by decay. Like all other crops, trees must be harvested to permit proper regrowth. In the future, lumber will come from forests regrown under scientific management—sometimes from seedlings and sometimes from hand planting. This means that not only will present-producing forests continue to be productive, but also part, if not all, of the 76,738,000ac. of forest land, non-productive in 1936, will be brought back in time to a state of production. The future will see a more efficient use of lumber. Much good lumber goes to waste because of the public's expensive habits. Nearly one-third of the lumber used by the building industry is finally consumed in lengths under 8 ft.; 10% more is under 9 ft.; or a total of 43·6% of all lumber consumed in building is in lengths under 9 ft. Yet, it has been customary to buy lumber in lengths of 14, 16, 18 and 20 ft.

Trees cannot be changed; but we will change our lumber-buying habits. We are already using more and more of the "short lengths" cut at the mills because it is less expensive and, in many cases, better suited for general building requirements. The Government, industry and the public are co-operating to bring about these things. Since 1918 the lumber industry, in co-operation with consuming industries and the U.S. Government, has done much to standardize its product through the creation of the American lumber standards and has been engaged in a program for developing the marketing of American standard, trade-marked, grade-marked lumber.

BIBLIOGRAPHY.—*Lumber Production, 1869–1934* (U.S. Forest Service and Census Bureau, 1936); *Lumber Distribution and Consumption, 1936* (U.S. Forest Service, 1938); *Lumber Industry Facts* (National Lumber Manufacturers Association, 1939). (R. A. Lo.; G. J. L.)

LUMBERJACK, one engaged in felling and preparing timber for the mill; usually applied to the woodsmen or lumbermen working in lumber camps in the northern United States and Canada. The lumberjack's work may be any one of the processes involved, from the chopping of the tree in the forest to the delivery of the logs at the mill. The lumberjack may also have to cut roads through the forest or even build railways where there is no way of floating the logs. He must be a good judge of the quality of timber, and be able to estimate closely the number of board feet in a log. Most important of all, he must have physical strength in order to stand the heavy work, long hours and extreme cold, the thermometer often falling as low as 40 or 50° below zero in the more northern districts.

LUMBINĪ, the grove in which, according to Buddhist legend, the Buddha was born. There are two references to the name in the Pāli scriptures, the first in the narrative poem prefixed to the Nalaka-sutta in the Sutta-nipāta, where it is related how the gods rejoicing in the sky inform the sage Asita that "the Bodhisatta, the incomparable jewel, has been born for weal and happiness in the world of men, in a village of the Sakyas, in the Lumbinī country" (*janapade Lumbineyye*). The other reference is in the Kathāvatthu, one of the latest works in the Canon. The detailed story of the birth as known to Pāli Buddhism first occurs in the introduction to the commentary on the *Jātaka.* This account says that Queen Mahāmāyā, when her time was come, desired to go to her parents' home at Devadaha. On the way she alighted to sport in the Lumbinī grove, her pains came upon her, and there the future Buddha was born. The earliest canonical accounts of the birth are not in the Pāli Canon, but in the Sanskrit scriptures of two other schools, the Mahāvastu (ii., 18), and the Lalitavistara (ch. 7). Neither of these works can be put earlier than the 3rd or 4th century A.D., but the discovery of an inscription of Asoka makes it probable that the whole legend was established at least as early as the 3rd century B.C. The inscription was found in 1896, a few miles within the border of Nepal and some miles east of the site which had already been identified as Kapilavatthu, the city of Buddha's family. It contains one doubtful word, but the inscription has always been accepted as genuine, and it is clear that it records that "Piyadasi [*i.e.,* Asoka], after he had been consecrated 20 years, came in person and worshipped, because here was born Buddha Śākyamuni. He both caused a stone [horse?] to be made, and caused a pillar to be set up, because here the Lord was born. He made the village of Lummini free of taxes and paying (only) one-eighth part [of the crop]." This makes the dates 245 B.C., according to the accepted chronology of Asoka's reign. There is a shrine at the place, now known to the Nepalese officials and hillmen as Rupadei. Führer's statement that it is locally called Rummindei has never been verified. The shrine contains a bas-relief representing the birth of the Buddha. The legends with their fantastic details are not historical documents, but the archaeological evidence which has accumulated increases the probability that they have originated in a historical event.

LUMHOLTZ, CARL (1851–1922), Norwegian explorer and naturalist, was born in 1851 at Faaberg in Gudbrandsalen. After graduating in theology at the university of Oslo (then Christiania) in 1876, he was sent by the university to Australia, where he spent four years (1880–84) in collecting zoological materials and anthropological data of various kinds. In 1890 he went on behalf of the American Museum of Natural History to Mexico, accompanied by the Swede Hartmann, and there he succeeded in tracing and communicating with the Tarahumare Indians of Sierra Madre —descendants of the Aztecs. A unique collection, containing over 1,700 photos, was the result of this expedition, which, with two later visits to Mexico, was described in his *Blandt Mexicos Indianere* (Christiania 1902–03), later translated into English and Spanish; *New Trails in Mexico* (1912) deals more especially with the second of these expeditions. During the World War Lumholtz went to India, and in 1915–17 to Borneo. From Borneo he brought home a large zoological collection and valuable anthropometrical measurements, with new information on the language and customs of the Dyaks, recorded in *Through Central Borneo, Two Years' Travel in the Land of the Head Hunters* (2 vols., New

York, 1920). He died in the Saranac Lake Sanatorium, New York, on May 5, 1922.

LUMINOUS PAINT. The commercial sulphides of calcium, barium and strontium, after exposure to light, possess the property of appearing luminous ("phosphoresce") in the dark, and are used in the manufacture of luminous paints. The feeble light emitted by these substances gradually diminishes in intensity, but on re-exposing these compounds to light their luminosity is again restored. This singular property has been long known, and calcium sulphide was formerly termed Canton's phosphorus, and barium sulphide Bononian (or Bolognian) phosphorus. The introduction of minute traces of other elements such as bismuth, lead, cadmium, manganese, etc., modify the colour of the phosphorescent glow so that by this means sulphides emitting various phosphorescent colours, such as violet, orange, green, blue, etc., may be obtained. These various phosphorescent sulphides are converted into paint form by mixing with suitable mediums, such as solutions of gum arabic or gum dammar varnishes.

Radio-active luminous paints, which are largely used for painting watches, compasses, etc., differ from the formerly known phosphorescent substances in the fact that they do not require any prior exposure to light. The action is in this case produced permanently by the rays emitted by the radio-active substances such as mesothorium and radiothorium, used in their preparation.

(J. G. Be.)

LUMMIS, CHARLES FLETCHER (1859–1928), American author, was born at Lynn, Mass., on March 1, 1859, and educated at Harvard. After several years as newspaper editor in Ohio he tramped by a roundabout route to Los Angeles, Calif., where he became city editor of the *Los Angeles Daily Times.* A stroke of paralysis in 1886 forced him to suspend his editorial work and for a number of years he spent much of his time travelling over the South-west on horseback. For five years he lived in the Indian pueblo of Isleta, N.M., learning the Indian languages and customs. In 1892 he accompanied the historian, Adolph F. Bandelier, on a scientific expedition to Peru and Bolivia. He was the founder and editor of *Out West Magazine,* 1894–1909, and librarian of the Los Angeles public library, 1905–10. He was founder and president of the Landmarks club of California and was active in securing the preservation of a number of South-western missions. He was one of the incorporators of the Archaeological Institute of America and founder of the Southwest museum. He made phonograph records of 550 old Spanish songs of the South-west and 425 Indian songs. His writings did much to make the many interesting phenomena of the South-west more widely known. He died at Los Angeles, Calif., on Nov. 25, 1928.

Besides many articles, stories and poems in various magazines he published *A Tramp Across the Continent* (1892); *Some Strange Corners of Our Country* (1892); *The Spanish Pioneers* (1893); *The Land of Poco Tiempo* (1893); *The Man who Married the Moon, and Other Pueblo Indian Folk-stories* (1894); *The Awakening of a Nation* (1898); *Mesa, Cañon and Pueblo* (1925); *Spanish Songs of Old California* (1925–28).

LUMP-SUCKER or **LUMP-FISH** (*Cyclopterus lumpus*), a marine fish, of the small family Cyclopteridae. The lump-suckers have the ventral fins united into a circular concave sucker which enables them to attach themselves firmly to rocks or stones. The body is short and thick, with a thick, scaleless skin, covered with rough tubercles. The first dorsal fin is a mere lump on the back. The lump-sucker inhabits the coasts of both sides of the north Atlantic; it is not rare on the British coasts, but becomes more common farther north. In the spring the fish approaches the shores to spawn, clearing out a hollow on a stony bottom in which it deposits an immense quantity of pink-coloured ova. The male guards the spawn very assiduously until the young are hatched. A lump-sucker may weigh as much as 20 lb. The male is only one-half or one-third the size of the female, and during the breeding season becomes bright blue, with red below. The bones are soft, and contain little inorganic matter.

LUMSDEN, SIR HARRY BURNETT (1821–1896), Anglo-Indian soldier, son of Colonel Thomas Lumsden, C.B., was born on Nov. 12, 1821. He joined the 59th Bengal Native Infantry in 1838, was present at the forcing of the Khyber Pass in 1842, and went through the first and second Sikh wars, being wounded at Sobraon. Having become assistant to Sir Henry Lawrence at Lahore in 1846, he was appointed in 1847 to raise the Corps of Guides. The regiment was located at Mardan on the Peshawar border, and became one of the most famous in the Indian army. For the equipment of this corps, Lumsden originated the *khaki* uniform. In 1857 he was sent on a mission to Kandahar and was in Afghanistan throughout the Mutiny. He took part in the Waziri Expedition of 1860, was in command of the Hyderabad Contingent from 1862, and left India in 1869. He became lieutenant-general in 1875, and died on Aug. 12, 1896.

See Sir Peter Lumsden and George Elsmie, *Lumsden of the Guides* (1899).

LUNA, ALVARO DE (d. 1453), constable of Castile, grand master of Santiago, and favourite of King John II. of Castile, was the natural son of Alvaro de Luna, a Castilian noble. Sent to court as a page by his uncle, Pedro de Luna, archbishop of Toledo, in 1410, he early acquired an ascendancy over the young prince. When Ferdinand, John's uncle, was elected king of Aragon, and the regency remained in the hands of the king's mother, Constance, daughter of John of Gaunt, Alvaro became a very important person. He was a master of all the accomplishments the king admired—a fine horseman, a skilful lance and a writer of court verse. Until he lost the king's protection he was the central figure of the Castilian history of the time. His story is in the main one of expulsion from the court by victorious factions, and of his return when his conquerors fell out among themselves. Expelled in 1427, he was recalled to court in 1428; in 1431 he sought to employ the turbulent nobles in a war for the conquest of Granada. Some successes were gained, but a consistent policy was impossible with a rebellious aristocracy and a king of indolent character. In 1445 the Infantes de Aragon, Alvaro's main enemies, were beaten at Olmedo, and the favourite, who had been constable of Castile and count of Santesteban since 1423, became grand master of Santiago by election of the knights. His fall was due to Isabella of Portugal, the king's second wife, who urged her husband to free himself from slavery to his favourite. In 1453 Alvaro was arrested, and, after a mere parody of justice, executed at Valladolid on June 2, 1453.

See *Cronica de don Alvaro de Luna* (1784), mainly panegyrical; *Cronica del . . . Rey Don Juan el segundo* (Valencia, 1779); Quintana, *Vidas de Españoles célebres* (1807, etc.).

LUNA (mod. *Luni*), ancient city, Etruria, Italy, 4½ m. south-east of Sarzana. It was the frontier town of Etruria, on the left bank of the river Macra, the imperial boundary between Etruria and Liguria. When the Romans first appeared, however, the Ligurians were in possession of the territory as far as Pisa. It derived its importance mainly from its harbour, the Gulf of Spezia, and not merely the estuary of the Macra as some have supposed. The town was apparently not established until 177 B.C., though the harbour is mentioned by Ennius, who sailed hence for Sardinia in 205 B.C. under Manlius Torquatus. It was traversed by the coast road (Via Aurelia), and was renowned for marble from Carrara, which bore the name of Luna marble. Pliny speaks of the quarries as only recently discovered in his day. Good wine was also produced. There are some remains of a theatre and an amphitheatre. The town was destroyed by the Arabs in 1016, and the episcopal see transferred to Sarzana in 1204.

LUNACHARSKY, ANATOLY VASILIEVICH (1875–1933), Russian politician, author and dramatist, was born in Poltava of well-to-do parents. He joined the revolutionary movement when at college in Kiev, and afterwards studied natural science and economics at Zurich. He began his revolutionary activities in Russia in 1892 and was deported to Vologda in 1898, where he remained for three years, achieving a reputation as a brilliant writer and lecturer on Socialism. In 1903 Lunacharsky joined the Bolshevik wing of the social democratic party. He met Lenin in the following year, and joined the editorial staff of the Bolshevik *Vpered* (Forward). He was chiefly concerned with social democratic propaganda and with lectures and political meetings for Russian students and political refugees abroad.

During the revolution of 1905 Lunacharsky was imprisoned, and when the reaction set in he left Russia for Italy. Together with Gorky and Bogdanov, a well-known social democrat, he formed the so-called "left-wing" of Bolshevism (opposed to Lenin on theoretical points), and was one of the promoters of the social democratic party schools at Capri and Bologna.

During the World War Lunacharsky maintained a determined internationalist attitude, and disseminated violent anti-war propaganda in Paris and Switzerland, renewing closer contact with the Lenin group after a temporary estrangement. In March 1917 he joined Lenin and Trotsky in Russia in their revolutionary opposition to the provisional government. He was arrested after the Bolshevik rising in July; but was subsequently liberated and elected vice-president of the Petrograd municipal board. In the initial stages of the November revolution and during the civil war, Lunacharsky was one of the ablest speakers of the party, and acted as emissary of the military revolutionary council to the various war fronts. As people's commissar for public instruction, 1917–29, in the new Government, Lunacharsky ensured the preservation of works of culture and art during the civil war. He promoted mass instruction, while his especial concern for the welfare of the theatre furthered the development of the Russian stage.

Lunacharsky wrote 14 plays (published in 2 vol.), of which several were produced with conspicuous success in Russia and in Berlin. "Vasilisa the Wise," "Faust and the City" and "The Magi" were translated into English by Leonard Magnus and published under the title of *Three Plays* (1923). He was appointed ambassador to Spain in 1933. He died Dec. 26, 1933.

LUNACY: *see* INSANITY.

LUNATION, the period of return of the moon (*luna*) to the same position relative to the sun; for example, from full moon to full moon. Its duration is 29·5305884 days.

LUNAWADA, a native state in India, in the Rewa Kantha agency, Bombay. Area, 419 sq.mi.; pop. (1941) 105,318. The chief, whose title is maharana, is a Rajput of high lineage. The capital is Lunawada town, said to have been founded in 1434; pop. (1941) 12,811.

LUND, TROELS FREDERIK (1840–1921), Danish historian, was born in Copenhagen on Sept. 5, 1840. He studied at Copenhagen, and was employed in the state archives department from 1870–75. His first important work, *Historiske Skitser* (1876), was followed by *Danmarks og Norges Historie i Slutningen af det xvi. Aarhundreds,* 14 vols., 1879–1901, a history of daily life in Denmark and Norway at the close of the 16th century. Troels Lund was the pioneer of the remarkable generation of young historians in northern Europe about 1880. He concentrates his attention on the life, death, employments, pleasures and prejudices of the ordinary men and women of the age with which he deals, using to illustrate his theme a vast body of documents. Lund was appointed historiographer-royal to the king of Denmark and comptroller of the Order of the Dannebrog. He published in 1909 *Lye Tanker i det xvi. Aarhundreds.* In 1911–12 appeared his historical tales, *Tider og Tanker*. He died on Feb. 12, 1921.

See Knud Fabricius, *Troels Lund* (1921).

LUND, a city of Sweden, the seat of a bishop, in the district (*län*) of Malmöhus, 10 mi. N.E. of Malmö by rail. Pop. (1943) 28,480. Lund (*Londinum Gothorum*), the "Lunda at Eyrarsund" of Egil's Saga, was of importance in Egil's time (*c.* 920). It appears that, if not actually a seaport, it was at least nearer the Sound than now. In the middle of the 11th century it was made a bishopric, and in 1103 the seat of an archbishop who received primatial rank over all Scandinavia in 1163, but in 1536 Lund was reduced to a bishopric. Close to the town, at the hill of Sliparabacke, the Danish kings used to receive the homage of the princes of Skåne. A university was founded here in 1668 by Charles XI., with faculties of law, medicine, theology and philosophy. Its library of books and mss. is entitled to receive a copy of every work printed in Sweden. The folk-museum near the university with its reconstructed old houses is important. The Romanesque cathedral was founded about the middle of the 10th century. The crypt under the raised transept and choir is one of the largest in the world. The chief industries are sugar-refining, iron and brick works, and the manufacture of furniture and gloves.

LUNDY, BENJAMIN (1789–1839), American philanthropist, prominent in the anti-slavery conflict, was born at Hardwick, N.J., on Jan. 4, 1789. From 1808–12 he lived at Wheeling, Va., (now W.Va.), an important headquarters of the inter-state slave trade. Here he first became deeply impressed with the iniquity of the institution of slavery. In 1815 he organized an anti-slavery association, known as the "Union Humane Society," with a membership of more than 500 men. In 1821 he founded at Mount Pleasant, O., an anti-slavery paper, the *Genius of Universal Emancipation.* From Sept. 1829 until March 1830 Lundy was assisted in the editorship of the paper by William Lloyd Garrison (*q.v.*). Lundy travelled extensively on behalf of the cause, visiting Haiti twice, in 1825 and 1829, the Wilberforce colony of freedmen and refugee slaves in Canada in 1830–31; and Texas in 1832, and again in 1833. These visits were made, in part, to find a suitable place outside of the United States to which emancipated slaves might be sent. Between 1820 and 1830, Lundy says he travelled "more than 5,000m. on foot and 20,000m. in other ways, visited 19 States of the Union, and held more than 200 public meetings." He was bitterly denounced for his anti-slavery agitation, and in Jan. 1827 was assaulted and seriously injured by a slave-trader, Austin Woolfolk. In 1836–38 Lundy edited in Philadelphia a new anti-slavery weekly, *The National Enquirer.* This paper under the editorship of Lundy's successor, John G. Whittier, became *The Pennsylvania Freeman.* Lundy died Aug. 22, 1839.

See *The Life, Travels and Opinions of Benjamin Lundy* (Philadelphia, 1847), compiled (by Thomas Earle) "under the direction and on behalf of his children."

LUNDY, ROBERT (*fl.* 1689), governor of Londonderry. He had seen service in the foreign wars before 1688, when he was at Dublin with the rank of lieutenant-colonel in the regiment of Lord Mountjoy. Mountjoy and his regiment were well received in the north, and the citizens of Derry permitted him to leave within their walls a small Protestant garrison under the command of Lundy, who assumed the title of governor. Lundy declared himself an adherent of William; and he obtained from him a commission confirming his appointment as governor. But from the moment Londonderry was menaced by the troops of King James, Lundy paralysed the defence of the city. On April 14, English ships appeared in the Foyle with reinforcements for Lundy under Colonel Cunningham. Lundy dissuaded Cunningham from landing his regiments, representing that a defence of Londonderry was hopeless; and that he himself intended to withdraw secretly from the city. At the same time he sent to the enemy's headquarters a promise to surrender the city at the first summons. When the enemy appeared before the walls Lundy gave orders that there should be no firing. But the people flew to arms under the direction of Major Henry Baker and Captain Adam Murray, who organized the famous defence in conjunction with the Rev. George Walker (*q.v.*). Lundy made his escape by the connivance of Walker and Murray. He was apprehended in Scotland and sent to the Tower of London. He was excluded from the Act of Indemnity in 1690, but his subsequent fate is unknown.

See Rev. George Walker, *A True Account of the Siege of Londonderry* (1689); J. Mackenzie, *Narrative of the Siege of Londonderry* (1690); Rev. John Graham, *A History of the Siege of Derry and Defence of Enniskillen, 1688–89* (Dublin, 1829); John Hempton, *The Siege and History of Londonderry* (Londonderry, 1861); Lord Macaulay, *History of England,* vol. iii. (Albany edition of complete works, 1898).

LUNDY, an island, at the entrance to the Bristol channel, 12 m. N.W. of Hartland point on the north coast of Devonshire, England. The nearest ports are Clovelly and Bideford. The island is 3 m. from north to south, a mean breadth of ½ m. but nearly 1 m. wide in the south. Area 1,150 acres. The component rock is a hard granite, except at the south, where slate occurs. An extreme elevation of about 450 ft. is found in the southern half, and the greater part of the coast is cliff-bound and very beautiful. The landing, at the south-east, is sheltered by the small Rat island, where the once common black rat survives. There are prehistoric remains on Lundy, and the foundations of an ancient chapel of St. Helen. There are also ruins, and the still inhabited keep of

Marisco castle occupying a strong precipitous site on the south-east. In the 17th century the island became a hiding place for French privateers. It has some cultivable land and heath pasture, and had a population in 1931 of 21. A daily air service from Barnstaple was inaugurated in 1934.

LÜNEBURG, a town in the Prussian province of Hanover, Germany, near a small hill named the Kalkberg, on the navigable Ilmenau, 14 mi. above its confluence with the Elbe and 30 mi. by rail S.E. of Hamburg. Pop. (1939) 38,578.

Lüneburg existed in the days of Charlemagne, and gained importance after the erection of a convent and a castle on the Kalkberg in the 10th century. After the destruction of Bardowiek, then the chief commercial centre of North Germany, in 1189, Lüneburg inherited much of its trade and subsequently became one of the principal towns of the Hanseatic League. Having belonged to the duchy of Saxony it was the capital of the duchy of Brunswick-Lüneburg from 1235 to 1369; later it belonged to one or other of the branches of the family of Brunswick. The reformed doctrines were introduced into the town in 1530 and it suffered heavily during the Thirty Years' War. It reached the height of its prosperity in the 15th century, and in the 17th century it was the depot for much of the merchandise exported from Saxony and Bavaria to the mouth of the Elbe; after a period of decay the 19th century witnessed a revival of its prosperity. In 1813 the German war of liberation was begun by an engagement with the French near Lüneburg.

The finest of its squares are the market-place and the so-called Sand. The churches of St. John, with five aisles; of St. Michael, containing the tombs of the former princes of Lüneburg, and of St. Nicolas, are Gothic edifices of the 14th and 15th centuries. The town-hall dates from the 13th century. It contains a magnificent hall—the Fürstensaal—decorated with wood-carving and stained-glass windows.

The gypsum and lime quarries of the Kalkberg afford the materials for cement works. Other industries are the making of beer, spirits, chemicals, ironware, carpets and haircloth.

LUNEBURGER HEIDE, a district of Germany, in the province of Hanover, lying between the Aller and the Elbe and intersected by the railways Harburg-Hanover and Bremen-Stendal. Its main character is that of a broad saddle-back, running for 55 m. from south-east to north-west (mean elevation about 250 ft. and greatest height, Wilseder Berg, 561 ft.). The soil is quartz sand and is chiefly covered with heather and brushwood. In the north, and in the deep valleys there are extensive forests of oak, birch and beech, and in the south, of fir and larch. Though the climate is raw and good soil rare, the heath is not unfertile. Its main products are sheep—the celebrated Heidschnucken breed—potatoes, bilberries, cranberries and honey. The district is also remarkable for numerous megaliths, popularly called Hun graves.

SPECIMENS OF LUNETTES

LUNETTE, a crescent-shaped or semi-circular object. In architecture, the term is applied to any semi-circular shape or panel which is decorated, and especially to those which occur under semi-circular arches or vaults. By extension, the term is used of small vaults intersecting a larger vault at right angles, especially if used for lighting the larger vault, as in the clerestories of St. Paul's cathedral in London and St. Peter's in Rome. Oval or circular openings through any vault are also sometimes known as lunettes.

LUNÉVILLE, an industrial and garrison town of north-eastern France, capital of an arrondissement in the department of Meurthe-et-Moselle, 21 m. E.S.E. of Nancy on the railway to Strasbourg. Pop. (1936) 23,125. The name of Lunéville (*Lunae villa*) is perhaps derived from an ancient cult of Diana, the moon goddess, a sacred fountain and medals with the effigy of this goddess having been found at Léormont, some 2 m. E. of the town. Lunéville belonged to Austrasia, and after various changes, fell in 1344 to the house of Lorraine. A walled town in the middle ages, it suffered in the Thirty Years' War and in the campaigns of Louis XIV. from war, plague and famine. The town flourished again under Dukes Leopold and Stanislas, on the death of the latter of whom at Lunéville, Lorraine was united to France (1766). The treaty of Lunéville between France and Austria (1801) gave the left bank of the Rhine to France. The town stands on the right bank of the Meurthe between it and the Vezouze, a little above their confluence. Its 18th century château, the favourite residence of Duke Leopold of Lorraine, is now a cavalry barracks, and the gardens form a public promenade. Lunéville is an important cavalry station with a large riding school. The 18th-century church of St. Jacques has two domed towers. The town is the seat of a sub-prefect. The principal industries of Lunéville include cotton-spinning and the manufacture of railway material, motor vehicles, porcelain, toys, hosiery, embroidery, straw-hats and gloves. Trade is in grain, wine, tobacco, hops, cotton goods, etc.

LUNG, in anatomy, the name of each of the pair of organs of respiration in man and other air-breathing animals, the organs in fishes with the corresponding function being the *branchiae* or gills. (*See* RESPIRATORY SYSTEM, ANATOMY OF; HEART AND LUNG, SURGERY OF.)

LUNG, one of the four symbolical creatures of Chinese legend. It is a dragon with a scaly snake-like body, long claws, horns, a bristly face, and its back-bone armed with spikes.

LUNGCHOW, a town of 13,600 inhabitants in the province of Kwangsi, South China (22° 22′ N. and 106° 45′ E.), near the frontier of Tonkin. It is important as a military frontier station. It was opened to foreign trade in 1889 in the hope of building a railway from Tonkin to Kwangsi, but the Tonkin railway terminated at the frontier, so that the trade remained insignificant. After the fall of Canton in 1938 and the strengthening of the Japanese sea blockade efforts were made to complete the railway to Hengyang and a brief tremendous trade increase resulted over railway and motor roads. Comparative figures for imports are $49,295 (U.S.) (1936) and $18,932,188 (U.S.) (1939); for exports $172,493 (U.S.) (1936) and $29,801,109 (U.S.) (1939). With the surrender of French Indo-China this connection ceased. In 1940 the Japanese attacked Lungchow from the south China coast and occupied it temporarily. But the Chinese recaptured the city in the same year and the retreating Japanese fought their way into French Indo-China in contravention of the terms of the newly concluded Franco-Japanese agreement.

LUNGE, GEORG (1839–1923), German chemist, was born at Breslau on Sept. 15, 1839. He studied at Heidelberg (under R. W. Bunsen [*q.v.*]) and Breslau, graduating at the latter university in 1859. Turning his attention to technical chemistry, he became chemist at several works both in Germany and England, and in 1876 he was appointed professor of technical chemistry at Zurich polytechnic, a post which he resigned in 1907. Lunge's original contributions cover a very wide field, dealing both with technical processes and analysis. His treatises *Coal Tar and Ammonia* (5th ed. 1909; 1st ed. 1867), *Destillation des Steinkohlentheers* and *Sulphuric Acid and Alkali* (1st. ed. 1878, 4th ed. 1909) are standard works; a completely re-written English edition of the latter work was published between 1923 and 1925. He was also part author of the well-known Lunge-Berl *Chemische Unter-*

suchungs-Methoden (7th ed: 1921–1924). He died on Jan. 3, 1923.

LUNG-FISH, a name given to the fishes of the order Dipneusti (double-breathers), with gills and with the air-bladder closely resembling the lung of higher vertebrates, and used for breathing air. *Neoceratodus* of Queensland only occasionally comes to the surface to breathe air. The Lepidosirenidae, including *Protopterus* of Africa and *Lepidosiren* of South America, inhabit swamps and marshes, and rise to breathe air at frequent intervals; in the dry season, when the swamps dry up, the fishes curl up and sleep at the bottom of a burrow, the entrance to which is closed with a plug of mud, with one or more openings for the admission of air. It may be noted that fishes of other groups have the air-bladder primitive and lung-like in structure, and use it for breathing air, particularly the African *Polypterus*. (*See* FISHES.)

LUPERCALIA, a very ancient Roman festival. Its rites were under the superintendence of a corporation of priests called *Luperci* (possibly "wolf-averters," *lupus*+*arceo*: so Vaniček), whose institution is attributed either to Evander or to Romulus and Remus. But the festival itself, which was held on Feb. 15 contains no reference to these late fictions. It began with the sacrifice by the Luperci (or the flamen Dialis) of goats and a dog; after which two of the Luperci were led to the altar, their foreheads were touched with a bloody knife, and the blood wiped off with wool dipped in milk; then the ritual required that the two young men should laugh.

The sacrificial feast followed, after which the Luperci cut thongs from the skins of the victims and ran in two bands round the walls of the old Palatine city. A blow from the thong cured sterility in women. The celebration of the festival went on until A.D. 494, when it was changed by Gelasius into the feast of the Purification. The Luperci were divided into two colleges, called *Quinctiliani* (or *Quinctiales*) and *Fabiani,* from the gens Quinctilia (or Quinctia) and Fabia; at the head of each of these colleges was a magister. In 44 B.C. a third college, Luperci Iulii, was instituted in honour of Julius Caesar, the first magister of which was Mark Antony. In imperial times the members were usually of equestrian standing.

So far, no really convincing explanation of the ceremonies has been put forward. The ritual is apparently in honour of no god; Lupercus, whom our authorities sometimes name, seems a mere invention, Faunus is a guess of the moderns. Two elements may be distinguished: (1) The Luperci trace a magic circle around the old settlement to keep off harm (from wolves); (2) They are called *creppi,* he-goats, and "doctored" to fill them with good magic. They thus are charged with and can convey fertility. But much remains obscure.

See W. Warde Fowler, *Roman Festivals* (1899), p. 390 *et seq.*

LUPIN or **LUPINE,** any plant of the genus *Lupinus,* which comprises about 200 species of annual and perennial herbaceous plants of the family Leguminosae. Species with digitate leaves range in America from British Columbia to northern Chile, while a few occur in the Mediterranean regions. A few others with single leaflets are found in Brazil and eastern North America. The leaves are remarkable for "sleeping" in three different ways. From being in the form of a horizontal star by day, the leaflets either fall and form a hollow cone with their bases upwards (*L. pilosus*), or rise and the cone is inverted (*L. luteus*), or else the shorter leaflets fall and the longer rise, and so together form a vertical star as in many species; the advantage in every case being apparently a protection of the surfaces of the leaflets from radiation. The flowers are of the usual "papilionaceous" or pea-like form, blue, white, purple or yellow, in long terminal spikes. The stamens are monadelphous and bear dimorphic anthers. The species of which earliest mention is made is probably *L. Termis,* which was cultivated by the ancient Egyptians. It is wild in some parts of the Mediterranean area and is extensively cultivated in Egypt. Its seeds are eaten by the poor after being steeped in water to remove their bitterness. The lupine of the ancient Greeks and Romans was probably *L. albus,* which is still extensively cultivated in Mediterranean countries for forage, for soil enrichment, and for its round flat seeds, which form an article of food. Yellow lupine (*L. luteus*) and blue lupine (*L. angustifolius*) are also cultivated in Europe as farm crops for green manuring. *L. texensis,* the state flower of Texas, is the bluebonnet.

LUPU, NICHOLAS (1876–), Rumanian politician, was born at Arsura (Rumania) on Nov. 8, 1876. He started his career as a country doctor and entered politics in 1905. He played an important part during the peasant revolt in 1907 when, as prefect of the Falciu district, he succeeded in pacifying the peasants without having recourse to violent measures. In 1913 he was elected deputy and in 1919 he entered the Vaida-Voevod Coalition cabinet as minister of the interior, representing, together with Mihalache, the Peasant (Tsaranist) party, of which Dr. Lupu became one of the principal leaders. During World War I, Dr. Lupu visited Russia, France, England, Italy and the United States and carried on an active propaganda campaign on behalf of Rumania. During the succeeding period of Liberal Government, Lupu necessarily remained in the background.

LUPUS, PUBLIUS RUTILIUS, Roman rhetorician, flourished during the reign of Tiberius. He was the author of a treatise on the figures of speech (Σχήματα λέξεως), abridged from a similar work by the rhetorician Gorgias of Athens. In its present form it is incomplete. The work is valuable chiefly as containing a number of examples from the lost works of Greek rhetoricians. The author has been identified with the Lupus mentioned in the Ovidian catalogue of poets (*Ex Ponto,* iv. 16), and was perhaps the son of Publius Rutilius Lupus, a supporter of Pompey.

See editions by D. Ruhnken (1768), F. Jacob (1837), C. Halm in *Rhetores latini minores* (1863); *see* also monographs by G. Dzialas (1860 and 1869), C. Schmidt (1865), J. Draheim (1874), Thilo Krieg (1896).

LUPUS, a disease of the skin occurring in two varieties. *Lupus vulgaris,* tuberculosis of the skin, is caused by *B. tuberculosis* and is characterized by the formation in the skin or mucous membrane of small nodules consisting of inflammatory cells liable to coalescence, retrograde change, ulceration and destruction of the tissues, and, if it heals, to the subsequent formation of permanent white scars. It is most commonly seen in early life, and in women, and occurs chiefly on the face, about the nose, cheeks or ears. But it may also affect the body or limbs. It first shows itself as small, slightly prominent, nodules covered with thin crusts or scabs. The disease may be superficial, in which case both the ulceration and the resulting scar are slight (*lupus non exedens*); or the ulcerative process may be deep and extensive, destroying a large portion of the palate, nose or cheek, and leaving much disfigurement (*lupus exedens*). Formerly scraping with a sharp spoon, application of caustics or carbonic acid snow were employed but now treatment by ultra-violet light, Finsen rays, or X-rays is used with better results. Prolonged X-ray treatment, however, has in several instances been followed some years later by cancer in the irradiated area. The other and less serious variety, *lupus erythematosus,* occurs on the nose and adjacent portions of the cheeks in the form of red patches covered with thin scales, underneath which are seen the widened openings of the sebaceous ducts. With a longitudinal patch on the nose and spreading symmetrical patches on each cheek the appearance is usually that of a large butterfly. It is slow in disappearing, but does not leave a scar. As medicines, cod-liver oil, iron and arsenic are useful in both varieties.

LUQMĀN or **LOKMAN,** the name of two, if not of three, persons famous in Arabian tradition. The first was of the family of ʽAd, and is said to have built the great dike of Mārib and to have received the gift of life as long as that of seven vultures, each of which lived 80 years. The name of the second Luqmān, called "Luqmān the Sage," occurs in the Koran (31, 11). Two accounts of him are found. According to Masʽūdī (i. 110) he was a Nubian freedman who lived in the time of David. According to some commentators on the Koran he was the son of Bāʽūrā, one of the sons of Job's sister or maternal aunt. Derenbourg in his *Fables de Loqmân le sage* (1850) identifies Bāʽūrā with Beoi, and believes the name *Luqmān* to be a translation of *Balaam.* The grave of

Luqmān was shown on the east coast of the lake of Tiberias, also in Yemen.

The so-called *Fables of Luqmān* are known to have existed in the 13th century, but are not mentioned by any Arabian writer. They were edited by Erpenius (Leyden, 1615) and have been reprinted many times. For the relation of these to similar literature in other lands, *see* J. Jacobs's edition of Caxton's *Fables of Aesop*, vol. i. (1889).

LURAY CAVERN, a large cave in Page county, Va., U.S.A., 39° 35′ N. and 78° 17′ W., near the village of Luray, on the Norfolk and Western railway. The valley, here 10m. wide, extends from the Blue Ridge to the Massanutton mountain. The ridges lie in vast folds and wrinkles; and elevations in the valley are often found to be pierced by erosion. Cave Hill, 300ft. above the water-level, had long been an object of local interest on account of its pits and oval hollows or sink-holes, through one of which, on Aug. 13, 1878, Andrew J. Campbell and others entered, thus discovering the cavern now described.

The Luray cavern does not date beyond the Tertiary period, though carved from the Silurian limestone. At some period, long subsequent to its original excavation, and after many large stalactites had grown, it was completely filled with glacial mud charged with acid, whereby the dripstone was eroded into singularly grotesque shapes. After the mud had been mostly removed by flowing water, these eroded forms remained amid the new growths. To this contrast may be ascribed some of the most striking scenes in the cave. The many and extraordinary monuments of aqueous energy include massive columns wrenched from their places in the ceiling and prostrate on the floor; the Hollow Column, 40ft. high and 30ft. in diameter, standing erect, but pierced by a tubular passage from top to bottom; the Leaning Column nearly as large, undermined and tilting like the campanile of Pisa; the Organ, a cluster of stalactites in the chamber known as the Cathedral; besides a vast bed of disintegrated carbonates left by the whirling flood in its retreat through the great space called the Elfin Ramble.

The stalactitic display is one of the most remarkable in the world. The old material is yellow, brown or red; and its wavy surface often shows layers like the gnarled grain of costly woods. The new stalactites growing from the old, and made of hard carbonates that had already once been used, are usually white as snow, though often pink, blue or amber-coloured. The Empress Column is a stalagmite 35ft. high, rose-coloured, and elaborately draped. The double column, named from Professors Henry and Baird, is made of two fluted pillars side by side, the one 25 and the other 60ft. high, a mass of snowy alabaster. Several stalactites in the Giant Hall exceed 50ft. in length. The smaller pendants are innumerable; in the canopy above the Imperial Spring it is estimated that 40,000 are visible at once.

The "cascades" are wonderful formations like foaming cataracts caught in mid-air and transformed into milk-white or amber alabaster. The Chalcedony cascade displays a variety of colours. Brand's cascade, the finest of all, is 40ft. high and 30ft. wide, and is unsullied and wax-like white, each ripple and braided rill seeming to have been polished. The Swords of the Titans are monstrous blades, eight in number, 50ft. long, 3 to 8ft. wide, hollow, 1 to 2ft. thick, but drawn down to an extremely thin edge, and filling the cavern with tones like tolling bells when struck heavily by the hand. Their origin and also that of certain so-called scarfs and blankets is from carbonates deposited by water trickling down a sloping and corrugated surface. Sixteen of these alabaster scarfs hang side by side in Hovey's Balcony, three white and fine, 13 striated like agate with every shade of brown, and all perfectly translucent. Down the edge of each a tiny rill glistens like silver, and this is the ever-plying shuttle that weaves the fairy fabric.

Streams and true springs are absent, but there are hundreds of basins, varying from 1 to 50ft. in diameter, and from 6in. to 15ft. in depth. The water in them is exquisitely pure, except as it is impregnated by the carbonate of lime, which often forms concretions, called according to their size, pearls, eggs and snowballs. A large one is known as the cannon ball. On fracture these spherical growths are found to be radiated in structure.

The waters of this cavern appear to be entirely destitute of life; and the existing fauna comprises only a few bats, rats, mice, spiders, flies and small centipedes. When the cave was first entered, the floor was covered with thousands of tracks of raccoons, wolves and bears—most of them probably made long ago, as impressions made in the tenacious clay that composes most of the cavern floor would remain unchanged for centuries. Layers of excrementitious matter appear, also many small bones, and a few large ones, all of existing species. The traces of human occupation are pieces of charcoal, flints, moccasin tracks and a skeleton embedded in stalagmite in a chasm, estimated, from the present rate of stalagmitic growth, to have lain there for not more than 500 years. Temperature is uniformly 54° F, coinciding with that of Mammoth Cave, Ky. The air is very pure, and the avenues are not uncomfortably damp. The parts open to the public are lighted by electricity. (H. C. Hy.)

LURGAN, a market-town and urban district of Co. Armagh, Northern Ireland, 20 mi. S.W. of Belfast by rail. Pop. (1937) 13,766. Area, 1.3 sq.mi. Lurgan is famed for its diapers, and the linen trade is of the first importance. A grant of the town was made to William Brownlow by James I. In 1619 it consisted of 42 houses, all inhabited by English settlers. It was burned by the insurgents in 1641, and again by the troops of James II. After its restoration in 1690 a patent for a market and fair was obtained. Shankill church is the largest parish church in Ireland. Brownlow house, a former seat of the Lords Lurgan, is a modern Elizabethan structure now owned by the Orange Lodge.

LURIA, ISAAC BEN SOLOMON (1534–1572), Jewish mystic, was born in Jerusalem. From his German descent he was surnamed *Ashkenazi* (the German). In 1559 Luria was living in Cairo and trading as a spice merchant with his headquarters in Alexandria. He had come to Egypt as a boy after his father's death, and was brought up by his wealthy maternal uncle Mordecai Francis. At seventeen a copy of the Kabbalistic "Bible"—the *Zohar* of Moses de Leon (*q.v.*) came into his hands. In order to meditate on the mystic lore he withdrew to a hut by the Nile, returning home for the Sabbath. Elijah, who had been his godfather in his babyhood, now paid him frequent visits, initiating him into sublime truths. By night Luria's soul ascended to heaven and conversed with celestial teachers who had once been men of renown on earth. In 1566 at earliest Luria removed to Safed, where there was a large circle of Talmudists. He died at Safed in 1572. But these years were momentous for Judaism. He founded a school of mystics who powerfully affected Judaism after the master's death. The Holy Spirit, we are told, rested on him, drawn to him by the usual means of the mystics—self-flogging, ablutions and penance. He had wonderful gifts of insight, and spoke to the birds. Miracles abounded. More soberly true is the statement that he went on long walks with enthusiastic disciples, whom he taught without books. Luria himself wrote no mystical works; what we know of his doctrines and habits comes chiefly from his Boswell, Hayim Vital.

There was little of originality in Luria's doctrines; the theory of emanations, the double belief in the process of the Divine Essence as it were self-concentrating (*Zimzum*) and on the other hand as expanding throughout creation; the philosophical "scepticism" which regards God as unknowable but capable of direct intuition by feeling—these were all common elements of mystical thought. Luria was an inspirer of saintly conduct rather than an innovator in theories. Not beliefs, he said, but believers need rebirth. He or his school introduced innumerable ritual customs, some of them beautiful enough.

See S. Schecher, *Studies in Judaism,* second series, pp. 251 *seq.*; *Jewish Encyclopedia,* viii. 210; E. Worman in *Revue des Études Juives,* lvii. 281.

LURISTAN, in the more restricted sense, is a province of Iran, in the wider sense, the "Land of the Lurs," namely that part of western Iran which is bounded by 'Iraq on the west and extends for about 400 mi. northwest-southeast from Kirmanshah to Fars with a breadth of 100 to 140 mi. It is chiefly mountainous, being intersected by numerous ranges running northwest-southeast. The central range has many summits, rising to 13,000 ft. and more, and in it are the sources of Iran's most important rivers. Between the higher ranges are many fertile plains and low hilly districts, well watered. The Lurs are thought to be aboriginal Persians with a mixture of Arab blood. Their language is a dialect of Persian. Outwardly they are Mussulmans of the Shiah sect, but most of them show little veneration for either Prophet or Koran. The northern part of Luristan is inhabited by the Feili Lurs, and these are divided into the Pishkuh (cis-montane) Lurs in the east and Pushtkuh (ultra-montane) Lurs in the west adjoining 'Iraq. They number about 350,000. Little Luristan was governed by a race of independent princes of the Khurshidi dynasty, called atabegs, from 1155 to the beginning of the 17th century when the last atabeg, Shah Verdi Khan, was removed by Shah Abbas I, and the government of the province given to Husain Khan, the chief of a rival tribe, with the title of vali. The descendants of Husain Khan have retained the title but now govern only the Pusht-i-kuh Lurs. The southern part of Luristan was formerly known as Lur-i-Buzurg (great Luristan) and is composed of the Bakhtiari district of the province and the districts of the Manasani and Kuhgalu which belong to Fars. The Bakhtiaris number about 200,000, the others 40,000. Great Luristan was an independent state under the Fazlevieh atabegs from 1160 until 1424, and its capital was Idaj, now only mounds and ruins at Malamir 60 mi. S.E. of Shushtar.

Luristan acquired widespread fame in 1929–32, when then and in immediate subsequent years local diggers discovered powerfully designed, technically competent bronzes: vessels, implements, personal adornments and particularly, horse trappings; covering a period from 2600 B.C. to A.D. 800, the majority of the finest pieces datable by cuneiform inscriptions between the 12th and the 19th century B.C. Two archaeological expeditions by the Iranian institute under the direction of Erich Schmidt and a survey by Sir Aurel Stein provide authentic information about the finds.

LUSATIA (LAUSITZ), a name applied to two neighbouring districts in Germany, between the Elbe and the Oder, viz., "Upper" and "Lower" Lusatia. Lusatia in the middle ages comprised what is now known as "Lower" Lusatia; it is only in the 15th century that the "district of the six towns" (*"Sechsstädteland"*)—now "Upper" Lusatia—came to be included, that is to say, the towns: Bautzen, Görlitz, Zittau, Löbau, Lauban and Kamenz. The territory, named after a Slav tribe, the Lusitzi, was incorporated into the Holy Roman empire of the German nation by the margrave Gero in 938, sold in 1303 to the margraves of Brandenburg of the Askanian line, the oldest dynasty in Europe.

In 1368 the territory fell to the crown of Bohemia on the ground that it had been granted by the emperor Frederick I. to Ladislav in 1160. Thenceforth it was administered by governors appointed by the kings of Bohemia. During the Hussite wars, at the beginning of the 15th century, the people remained loyal to the Roman Catholic Church. After many changes, due to the fact that the territory was "mortgaged" by its penurious rulers, the people recognized the sovereignty of Matthias Corvinus, king of Hungary, for 23 years (1467–90), but returned to the allegiance to the crown of Bohemia in 1490. By the treaty of Prague (1635) both Upper and Lower Lusatia became part of the dominions of the elector of Saxony and (apart from temporary subdivisions among dynasts of this princely house) remained in their possession until the congress of Vienna (1815) when the territory, in bulk, became incorporated within the kingdom of Prussia.

In the reconstituted Germany after 1918, Lusatia remained a part of Prussia, save for the communes of Zittau, Bautzen, Löbau, and Kamenz, which, as before, are incorporated in Saxony.

(W. L. B.)

LUSCHAN, FELIX VON (1854–1924), Austrian anthropologist and ethnographer, was born on Aug. 11, 1854, in Vienna. He studied medicine in Vienna, anthropology in Paris, became demonstrator in physiology at the university at Vienna, and in 1878 organised the Austro-Hungarian section for anthropology and ethnology at the World Exhibition in Paris. As a military doctor in Bosnia, he studied anthropology and archaeology, and in 1880 travelled in Dalmatia, Montenegro and Albania. During the following 10 years he was often in Asia Minor and Egypt, and in 1883 excavated the ruins of Sendschirli in Northern Syria on behalf of the Berlin Oriental Committee. After a brief period as lecturer in anthropology in Vienna, he became directorial assistant at the Ethnological Museum in Berlin, of which he was director from 1904 until his death, on Feb. 7, 1924.

His works include: *Beiträge zur Völkerkunde der deutschen Schutzgebiete* (1897); *Die Ausgrabungen von Sendschirli*, 2 pts. (1893, 1898); *Beiträge zur Ethnographie von Neu-Guinea* (1899); *Beiträge zur Anthropologie von Kreta; Rassen und Völker* (1908); *Völker, Rassen und Sprachen* (1922).

LUSHAI HILLS, a mountainous district of Assam, south of Cachar, on the border between Assam and Burma. Area, 8,142 sq.mi.; pop. (1941), 152,786. The hills are for the most part covered with dense forest or bamboo jungle, in which there are clearings for cultivation. They are sparsely inhabited by the Lushais and cognate tribes. The earliest known inhabitants were Kukis, and the Lushais were not heard of until 1840 when they invaded the district from the north. Their first attack upon British territory took place in 1849, and after that date their warlike spirit and predatory habits made them one of the most troublesome tribes on the north-east frontier of India; but military operations in 1890 resulted in the pacification of the northern Lushais, and in 1892 of the eastern Lushais. The final submission of the chiefs of the southern Lushai hills, who were under the control of the Government of Bengal, was not secured till 1895. The latter hills were in 1898 transferred to Assam and amalgamated with the northern hills in one district. The limits of the district have more recently been extended by the inclusion of 900 sq.m. between the south of the Lushai hills and the Chin hills in Burma. The headquarters are at Aijal, 3,500 ft. above sea-level, where a battalion of the Assam Rifles is stationed.

The villages are, as a rule, perched on the tops of ridges or spurs. Each is ruled by a chief or headman, in whose house live the orphans and poor of the village. In another house all the young unmarried men and strangers sleep. Dogs, said to be similar to those eaten by the Chinese, are used both for sacrifices and for food. Between 1911 and 1931 mass conversions to Christianity took place among the Lushais, due to the efforts of the Welsh Presbyterian Mission at Aijal, and of the London Baptist Mission at Lungleh. The number of Christians consequently rose from 2,000 to 59,000 or nearly one-half of the total population.

LUSIGNAN, the name of a family which sprang from Poitou and long held the kingdom of Cyprus (1192–1475). A Hugh de Lusignan appears in the ill-fated crusade of 1100–1101; another Hugh, the Brown, came as a pilgrim to the Holy Land in 1164, and was taken prisoner by Nureddin. In the last quarter of the 12th century the two brothers Amalric and Guy, sons of Hugh the Brown, played a part in the history of the Latin East. About 1180 Amalric was constable of the kingdom of Jerusalem. His brother Guy married in 1180 Sibylla, the widowed heiress of the kingdom. Guy acted as regent in 1183, but he had little success, and was deprived of all right of succession. In 1186, however, on the death of Baldwin V., he became King of Jerusalem in spite of the opposition of Raymund of Tripoli. Next year he suffered a crushing defeat at the battle of Hittin, and was taken prisoner by Saladin. Released on parole in 1188, he at once broke his parole, and began the siege of Acre Difficulties, however, had arisen with Conrad of Montferrat; and after Sibylla's death, Conrad won fresh support and was generally recognized as king in 1192. Though Conrad was almost immediately assassinated, the crown did not return to Guy, but went to Henry of Champagne, who married the widowed Isabella. Guy bought from the Templars the island of Cyprus, and there he reigned for the last two years of his life (1192–1194). He is judged harshly by contemporary writers, as *simplex* and *insufficiens,* but Dodu (in his *Histoire des institutions du royaume de Jérusalem*) suggests that Guy was depreciated because the kingdom had been lost in his reign, in much the same way as Godfrey of Bouillon was exalted because Jerusalem had just been won at his accession.

Guy was succeeded in Cyprus by his brother Amalric, who acquired the title of king of Cyprus from the emperor Henry VI., and became king of Jerusalem in 1197 by his marriage to Isabella, after the death of Henry of Champagne. (*See* AMALRIC II.) Amalric was the founder of a dynasty of kings of Cyprus, which lasted till 1475, while after 1269 his descendants regularly enjoyed the title of kings of Jerusalem For the history of the Lusignan kings *see* CYPRUS. The most famous were Hugh III. (the Great) (1267–85) to whom, apparently St. Thomas dedicated his *De Regimine Principum;* Hugh IV. (1324–59), to whom Boccaccio dedicated one of his works, and who set on foot an alliance with the pope, Venice and the Hospitallers, which resulted in the capture of Smyrna (1344); and Peter I. (1359–69). Peter and his chancellor de Mezières represent the last flicker of the crusading spirit. (*See* CRUSADES.)

Before the extinction of the line in 1475, it had placed a branch on the throne of Armenia. Five short-lived kings of the house ruled in Armenia after 1342, "Latin exiles," as Stubbs says, "in the midst of several strange populations all alike hostile." The kingdom of Armenia fell before the sultan of Egypt, who took prisoner its last king Leo V. in 1375, though the kings of Cyprus afterwards continued to bear the title; the kingdom of Cyprus itself continued to exist under the house of Lusignan for 100 years longer. The mother of the last king, James III. (who died when he was two years old) was a Venetian lady, Catarina Cornaro. She had been made a daughter of the republic at the time of her marriage to the king of Cyprus; and on the death of her child the republic first acted as guardian for its daughter, and then, in 1489, obtained from her the cession of the island.

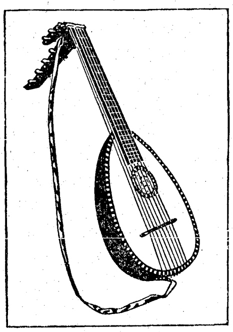
LUSSIN, an island of the Quarnero group, transferred at the post-war settlement in 1918, with the closely adjacent island of Cherso, to Italy. *See* CHERSO.

LUSTRATION, a term that includes all the methods of purification and expiation among the Greeks and Romans. Among the Greeks two ideas prevailed; that human nature must purify itself (*κάθαρσις*) from guilt before it is fit to enter into communion with God or even to associate with men, and that guilt must be expiated voluntarily (*ἱλασμός*) by certain processes which God has revealed. The methods of purification consist in ceremonies performed with water, fire, air or earth, or with a branch of a sacred tree, especially of the laurel, and also in sacrifice and other ceremonial. The torch and sulphur (*τὸ θεῖον*) were also powerful purifying agents. Purification by air was most frequent in the Dionysiac mysteries; puppets suspended and swinging in the air (*oscilla*) formed one way of using the lustrative power of the air. Rubbing with sand and salt was another method. The sacrifice chiefly used for purification by the Greeks was a pig; among the Romans it was always, except in the Lupercalia, a pig, a sheep and a bull (*suovetaurilia*). On extraordinary occasions lustrations were performed for a whole city. So Athens was purified by Epimenides after the Cylonian massacre, and Delos in the Peloponnesian War (426 B.C.) to stop the plague and appease the wrath of Apollo. In Rome, besides such annual ceremonies as the *Ambarvalia, Lupercalia, Cerealia, Paganalia,* etc., there was a lustration of the fleet before it sailed, and of the army before it marched.

Sandys, *Companion to Latin Studies,* with bibliography (1925) and the articles by A. Bouché-Leclercq in Daremberg and Saglio, *Dictionnaire des Antiquités,* and by W. Warde Fowler in Smith's *Dictionary of Greek and Roman Antiquities* (3rd ed., 1891).

LUTE, an ancient, stringed musical instrument, derived in form as well as name from the Arabs. The complete family consisted of the pandura, tanbur or mandoline as treble, the lute as alto or tenor, the barbiton or theorbo as bass, and the chitarrone as double bass. The Arab instrument, with convex sound-body, pointing to the resonance board or membrane having been originally placed upon a gourd, was strung with silk and played with a plectrum of shell or quill. It was adopted by the Arabs from Persia. Instruments with vaulted backs are all undoubtedly of Eastern origin; the distinct type, resembling the longitudinal section of a pear, is more specially traced in ancient India, Persia and the countries influenced by their civilization.



BY COURTESY OF DIRECTOR OF VICTORIA AND ALBERT MUSEUM

THE LUTE

As long as the strings were plucked by fingers or plectrum the large pear-shaped instrument may be identified as a forbear of the lute. When the bow, obtained from Persia, was applied to the instrument by the Arabs, a fresh family was formed which was afterwards known in Europe as rebab and later rebec. The lute family is separated from the guitars, also of Eastern origin, by the formation of the sound-body which is in all lutes pear-shaped and joined directly to the sound-board without the sides or ribs necessary to the structure of the flat-backed guitar and cither. Observing this distinction, the little Neapolitan mandoline of 2ft. long is included in the lute family no less than the large double-necked Roman chitarrone, which was not infrequently 6ft. long. Mandolines are partly strung with wire, and are played with a plectrum, indispensable for metal or short stiff strings. Perhaps the earliest lyres were so played, but the large lutes and theorbos strung with catgut have been invariably touched by the fingers only.

The lute was in general use during the 16th and 17th centuries. In the 18th it declined though J. S. Bach wrote a partita for it. Peri, Caccini and Monteverde used theorbos to accompany their newly devised recitative, the invention of which in Florence, from the impulse of the Renaissance, is well known. Handel wrote a part for a theorbo in *Esther* (1720); but after that date it appears no more in orchestral scores, though it remained in private use until nearly the end of the century.

LUTECIUM, a rare metallic element of the rare-earth group, was discovered by Urbain and independently by Von Welsbach; the latter named the element cassiopeium. (Symbol Lu, atomic number 71, atomic weight 175·0.) Lutecium occurs along with ytterbium, erbium, etc., in the minerals gadolinite, euxenite, xenotime, etc. It is separated from the other members of the group by the fractional crystallization of the bromates; lutecium bromate being the most soluble passes into the mother-liquor. Like ytterbium it forms a white oxide and colourless salts giving no absorption spectrum. In general its salts are more soluble than those of ytterbium; the magnetic susceptibility is less than that of the latter, and in addition it possesses a characteristic spark spectrum. (*See* RARE EARTHS.) (C. J.)

LUTHER, HANS (1879–), German statesman, was born in Berlin, on March 10, 1879, and studied law in Berlin, Kiel and Geneva. He then entered the local administration service. At first he was stationed in Charlottenburg, and from 1907–13, in the Magistrat in Magdeburg under the former minister of finance, Lenze. In 1913 he was elected secretary to the German and Prussian "Städtetag." On July 5, 1918, he was elected burgomaster of Essen in the Ruhr district. There he gained the reputation of being one of the best local administrative officials in the west of Germany. On Dec. 2, 1922, he entered the Cuno cabinet, and became minister of food and agriculture. He retained his post in Essen and, when the French marched into the Ruhr in Jan. 1923, he returned to Essen immediately. There he was the hero of a famous episode. The general commanding the troops marching into Essen wished to speak with the burgomaster at the door of the Rathaus (town hall). Dr. Luther sent a message that he was only to be seen in his office. The order was repeated twice, but at last the general was obliged to give way.

After Cuno ceased to be chancellor, Luther retained his office in the Stresemann cabinet. In Stresemann's second cabinet, he became minister of finance. As minister of finance, he performed signal services in stabilising the German currency, and in balancing the budget of the Reich. Dr. Luther kept his office in the Marx ministry which followed, and had a share in the preparations for the Conference of London and the conclusion of the Dawes agreement. In the autumn of 1924 he concluded the Dawes loan for Germany. He has himself given an account of his work in restoring the finances of Germany (*Feste Mark—solide Wirtschaft,* 1924). After the elections in Dec. 1924, Marx, in spite of many endeavours, was not able to form a new cabinet and Luther took over the task in the middle of Jan. 1925. A cabinet was formed under him, which was the first since the revolution of 1918 to include members of the German National party. Luther carried through a great taxation reform, completed the revaluation legislation, and made a provisional customs tariff which made it possible to commence negotiations for commercial agreements with some prospect of success for German economic life. This economic legislation was accompanied by the Locarno policy initiated by Stresemann with the essential agreement of Luther, who, as chancellor, was responsible for the conduct of policy as a whole.

At the Conference of Locarno, the German delegation which initialled the clauses of the treaty was led by Luther as chancellor. After his return from Locarno, the German National party left the Government. In spite of this, the cabinet found a majority for the policy of Locarno, and on Dec. 1, 1925, signed the Rhine Pact and the Arbitration Treaties in London, after which it resigned. After tedious Government crises, Luther again received the mandate to form a cabinet. As the Social Democrats forsook the chancellor, there was nothing left but to form a cabinet out of the moderate bourgeois parties. Dr. Luther was not a party politician, and often proclaimed his independence. While in charge of the affairs of the Reich he distinguished himself by extraordinary energy and sober clarity of political judgment, and the German people indubitably made important progress towards reconstruction under his leadership. On May 13, 1926, he resigned his office as chancellor. (*See* GERMANY.) (F. KLE.)

LUTHER, MARTIN (1483–1546), the great German religious reformer, was born on Nov. 10, 1483, at Eisleben, in the county of Mansfeld, whither his parents, Hans Luther and Margaret Ziegler, who belonged to the free peasant class, had migrated from Möhra in Thuringia. Six months later they removed to the town of Mansfeld, the centre of the iron ore mining and smelting industry, in which his father found employment as a miner. Within the next decade Hans Luther became the lessee of several smelting furnaces and one of the four elected members of the town council. For some years he had a hard struggle to maintain his growing family, and Luther in later years speaks of the poverty of his childhood. The atmosphere of the home was a pious one, and there is no ground for the tale that his father was a Hussite and was disaffected to the traditional Church. Luther was reared in the current religious beliefs and popular superstitions, which the parents taught their children. Both were strict disciplinarians, and Luther later complained of the harshness of his upbringing, whilst recognizing that his parents meant well by it and cherishing a deep affection and gratitude towards them. The harsh discipline prevailed in the local Latin school, to which he was sent in his seventh year and in which he passed through a graduated course in Latin grammar and syntax, as set forth in the text-books of Donatus and Alexander de Ville Dieu, in select passages from some of the classical authors, and in religious instruction and singing. According to Mathesius he was a diligent and apt pupil, and he evidently profited from this early training, in spite of his later drastic criticism of the schools and schoolmasters of the pre-Reformation period. In his 14th year (1497), he was sent to Magdeburg to continue his education, and in accordance with the practice of the time earned his bread by singing in the streets. His teachers at Magdeburg were members of the Brotherhood of the Common Life, which devoted itself specially to education and was distinguished by its practical reforming spirit. On the conclusion of the school year he removed to Eisenach, where he attracted the interest of an opulent burgher, Kuntz Cotta, and his wife, who received him into their home and relieved him from the necessity of singing for his bread in the streets. He was fortunate, too, in finding in the Rector Trebonius and his assistant Wigand efficient teachers of the higher courses in Latin grammar, composition, rhetoric, and poetry, in which he easily out-distanced his fellow pupils. At the close of this training, which extended over three years, he entered the University of Erfurt in the spring of 1501. At this period the fame of Erfurt exceeded that of all the German universities. The curriculum for the bachelor of arts degree, which he took in the autumn of 1502, included grammar, logic, rhetoric, physics, and philosophy. Two years further study were required for the master's degree, the course including, besides higher instruction in the subjects already studied, mathematics, metaphysics, and ethics. At the age of 22 his ability and proficiency secured him the second place in a list of 17 candidates who passed the master's examination in the winter of 1505.

As the result of these four years of intensive study he had acquired a firm grasp of the current scholastic philosophy, and had developed a marked dialectic skill. He was the ornament of a circle of fellow-students, who met to discuss philosophy, and to whose intercourse his musical gifts contributed an additional charm. Among his teachers were Trutvetter and Ulsingen who professed the Nominalist philosophy as expounded by William of Occam, the great English Franciscan of the 14th century. Under their influence Luther became an enthusiastic adherent of the Occamist or "modern" school of thought as against the various forms of Realism represented by Thomas Aquinas and Duns Scotus. He speaks of Occam as "my master," and refers to his school as "my sect," and he retained his predilection for the philosophic teaching of the great schoolman even after he came to differ from his distinctive theology. He owed allegiance, too, to the authority of Aristotle, whose logic and philosophy dominated all the schools, including that of Occam. Whilst thus absorbed in the conventional scholastic study, he does not seem to have been influenced at this period to any appreciable extent by the humanist movement, which only later took a firm hold of the university, though he found both pleasure and benefit in reading some of the Latin authors, including Cicero, Virgil, and Livy.

The Augustinian Friar.—At the desire of his father, rather than from personal inclination, he entered on the study of law in May 1505. Two months later (July 17) he suddenly renounced the world and entered the monastery of the Augustinian Eremites at Erfurt. There is a difference of opinion among his biographers whether his resolution to become a monk was the result of a sudden impulse, or the climax of a gradually maturing predilection for the monastic life, due in part to certain influences, religious and psychic, working on his high-strung temperament. On the whole the evidence tends to show that his decision was unpremeditated. He himself ascribes it to the fear of sudden death during a thunderstorm, which overtook him, on the road near Erfurt, whilst returning from his home at Mansfeld, when he was prostrated by a flash of lightning and vowed to become a monk. It was in pursuance of this vow that, to the distress and bitter chagrin of his father and the astonishment and regret of his friends, he immured himself in the Erfurt monastery. In any case he regarded his involuntary vow as a call from Heaven, and its fulfilment as an imperative act of obedience to God. It had thus a religious significance which he could not ignore, and he devoted himself to his new vocation with consuming thoroughness.

The Erfurt Augustinians belonged to the strict section of the order, in contrast to the Conventuals or laxer section. After a year's novitiate Luther took the vows of obedience, poverty and chastity, and submitted to the drudgery which was an essential part of his training. Under his preceptor, Nathin, he then went through a course of theological instruction in preparation for his ordination as priest, which took place in 1507. Thereafter he continued his theological studies for the degrees of biblical bachelor and master of the sentences (*Sententiarius*), or dogmatic theology, as expounded in the Sentences of Lombardus, attending the lectures of the theological faculty of the university as well as the theological school of the monastery. In accordance with the prescribed course, he studied the Bible, the Sentences, and the works of Occam, and his disciples D'Ailly and Biel, and dipped into those of St. Bernard, Duns Scotus, and Augustine. He continued these studies at Wittenberg, where he spent a year from the autumn of 1508 to that of 1509 as lecturer on Aristotle's *Ethics*, and where he enjoyed the personal intercourse of John Staupitz, professor of theology and vicar-general of his order. On his return to Erfurt he obtained the degree of *sententiarius,* and began to lecture on the Sentences. The books which he read in his preparation of these lectures were discovered in the library at Zwickau in 1889, and contain on the margins a large number of notes (given in vol. ix. of the Weimar edition of his works) in his own handwriting, which throw light on his theological and philosophical thought and standpoint at this stage of his development. Whilst displaying a critical, enquiring mind, they show no material departure from the scholastic method and the scholastic theology in its Occamist form, though some modern theologians like Seeberg find evidence in them of a distinctive divergence from his theology. At most they reveal a growing predilection for the teaching of Augustine.

This lectureship he filled till the late autumn of 1511, when, at the instance of Staupitz, he was transferred to the monastery at Wittenberg, of which he was ere long appointed sub-prior at a meeting of his order at Cologne in the following year. In Oct. 1512 he took the degree of doctor of theology of the university and became the successor of Staupitz as professor of biblical literature. Towards the end of 1510 he had paid a short visit to Rome on business connected with his order, and though his visit was that of the devout pilgrim, he appears to have been painfully impressed by the secularized ecclesiasticism and the low moral standard of the Holy City. There is, however, no evidence for the oft-repeated statement that the discovery of his distinctive doctrine of justification by faith came to him as he climbed on his knees the steps of the Scala Sancta at the Lateran church.

Conversion.—It was only during the winter of 1512–13 that this decisive illumination dawned on his mind as he meditated in the Black Monastery at Wittenberg on Romans i. 16–17, and suddenly attained a new apprehension of this doctrine. Despite the most punctilious performance of the minutiae of the rule of his order, the most rigorous asceticism, he had hitherto failed to find peace of conscience, the assurance of acceptance in the sight of God, and he had been periodically harassed by doubts on the score of his personal salvation. Hence the long spiritual struggle in the quest for a gracious God, which had clouded his early years as a monk and which Denifle unwarrantably contests as a later fabrication invented by him to justify his apostasy from the Church. Luther's testimony as to the reality of this spiritual ordeal cannot be thus invalidated, even if we make due allowance for the later tendency to exaggerate it under the influence of his changed religious standpoint.

The root of this struggle to find a gracious God lay in his personal temperament, his lofty religious and moral ideal and in the religious, the practical, and the theological teaching of the mediaeval Church. In temperament he was high-strung, emotional, impressionable, and liable to fits of depression which took at times an acute form. He had a sensitive conscience and a keen sense of sin, which the meticulous observance of the rule of his order only tended to intensify. To him sin and the sinful tendency (concupiscence) were terrible realities in keeping with his exalted conception of God as perfect righteousness and the retributive character of this righteousness (*justitia Dei*), which impels Him to judge and condemn the sinner, and which was emphasized in the teaching and practice of the mediaeval Church. How to attain to the ideal divine righteousness and thus enter into a proper relation of acceptance and fellowship with God, and thereby also ensure salvation from the Divine retribution for sin, was the problem that obsessed him and led to this recurring spiritual conflict (*Anfechtungen*). In the sacrament of penance the Church sought to ensure the penitent sinner against this retribution by imposing penitential works in satisfaction for sins. Luther, however, could not be sure of the sufficiency either of his contrition or of his penitential satisfaction in spite of official absolution. The Church further sought to ensure the sinner against the Divine judgment by its doctrine of merits, based on the relative freedom of the will to do the good whereby, with the aid of God's grace, he could conciliate the Divine favour on the day of judgment. Here again Luther, conscious of the weakness of the will to attain the absolute good which alone could avail in the sight of a perfectly righteous God, failed to find the assurance of salvation in this teaching. In addition he was distressed over the doctrine of predestination, which had for him not only a speculative, but a religious significance. How could he be sure that he was among the number of the elect whom God had predestined and chosen, according to the Occamist teaching, by an act of his absolute, arbitrary will.

The vicar-general, Staupitz, during his sojourn at Wittenberg in 1508–09, as well as his preceptor and his confessor in the Erfurt monastery, did their best to help him, and to them he owed at least a relative appeasement of his spiritual distress. He owed something, too, to the sermons of St. Bernard, to which an old monk directed him, and to the writings of Gerson. But his full deliverance came to him only in the winter of 1512–13, when, as the result of long and intense meditation on Romans i. 16–17 he grasped the truth that the righteousness of God in this passage is not to be understood of his retributive justice (*justitia activa*), by which he judges the sinner according to his merits, but in the sense of the righteousness which he mercifully gives or imputes to the sinner (*justitia passiva*), and which the sinner receives by faith, and is thereby justified in His sight and made capable of entering into a filial relation to Him, living the divine life in active obedience to the will of a merciful God. Justification is thus due solely to the mercy or grace of God and the merit of Christ appropriated by faith, not to human works or merits which, being vitiated by sin, can in no way avail to avert the retributive justice of God, or bring the soul into a feasible and assured relation to Him.

This conception is already reflected in his lectures on the Psalms (1513–15), and is elaborated in those on the Epistle to the Romans (1515–16) in which the influence of Augustine and also the mystic teaching of Tauler and the "German Theology" (*Theologia Deutsch*) on the one hand, and the reaction from the scholastic theology are alike apparent, though he still makes use of the scholastic method and terminology. As the result of this elaboration of his new religious conception on the basis of this fundamental doctrine, he could justly claim to be the exponent of a "new theology," though he was still unconscious of any material divergence from the received teaching of the Church, whilst boldly attacking the philosophy of Aristotle and the scholastic theology which was based on it (98 Theses against the scholastic theology, Sept. 1517, which one of his students defended in a public disputation for the degree of biblical bachelor).

The 95 Theses.—In the lectures on Romans he already appears as the practical reformer, and in the year 1517 he emerged in this capacity from the academic sphere with his epoch-making challenge to the work of reformation in his 95 Theses against the abuse of indulgence, which he posted up on Oct. 31, in the door of the Castle church at Wittenberg. The practice of indulgence had grown out of the penitential system of the ancient Church, which punished grave sins by temporary exclusion from the fellowship of the Christian community. In course of time it became customary to mitigate this discipline by permitting the delinquent to make satisfaction, in part at least, in the form of a money contribution. In the later middle age it was extended by the popes as a means of inciting the faithful to participate in the crusades against the infidel (the Cross Indulgence). Those taking part in the holy war or contributing for this purpose were thereby guaranteed the relaxation of penance due for their sins, or even the plenary remission of sin. The practice brought large sums into the papal treasury. With the decline of the crusading spirit, it was extended by Pope Boniface VIII. in connection with the celebrations of the jubilee year 1300. The revenue brought in by this jubilee indulgence was increased by the subsequent expedient of reducing the jubilee years from 100 to 50, or even 25 years and thereby establishing more frequent jubilee celebrations. Indulgences were also issued in connection with other projects such as the rebuilding of St. Peter's at Rome, and by the beginning of the 16th century, the practice had become a regular financial expedient for increasing the papal revenue. In 1447 the efficacy of indulgence was extended by Pope Calixtus III. to souls in purgatory.

The practice was based on the doctrine of the "Treasure of the Church," consisting of the infinite merits of Christ and the superfluous merits of the saints, which was elaborated by Thomas Aquinas and officially sanctioned by Pope Clement VI. in 1343. According to this doctrine, the pope could draw on this inexhaustible source for the benefit of the faithful, whose own merits were insufficient. Theoretically confession and contrition were incumbent on those desiring the benefit of an indulgence. It was further assumed that it could not take away the guilt and eternal punishment of sin, which was only obtainable in the sacrament of penance through the absolution of the priest. It could only ensure the remission of the temporal punishment of actual sins to which the sinner was still liable in this life and in purgatory, and the attainment of this benefit pre-supposed contrition and confession for these sins on the part of the applicant. In the case of the buying of an indulgence in behalf of souls in purgatory, however, contrition and confession on the part of the purchaser were not deemed essential. The practice was liable to great abuse, inasmuch as the indulgence preachers, in their striving to raise as much money as possible for the specific object of any given indulgence, did not always make the conditions and limitations underlying it clear to their hearers. There was besides difference of opinion among the doctors of the Church on both the doctrine and the practice, especially on the question of the application of indulgence to souls in purgatory, as well as widespread dissatisfaction over its abuse.

On both doctrinal and practical grounds Luther felt impelled to attack the system in connection with the Indulgence of 1515–17, which was issued by Pope Leo X. professedly for the rebuilding of St. Peter's. In reality its object was to enable Albrecht of Brandenburg, Archbishop of Mainz, who also held the sees of Magdeburg and Halberstadt, to pay the large debt which he had incurred to the banking house of the Fuggers of Augsburg in payment of the papal dispensation, plus the usual fees, to enable him to acquire the additional office. John Tetzel and other preachers, to whom the archbishop entrusted the business of selling the indulgence, were doing a brisk trade in these pardons when Luther, who discovered in the confessional their misleading teaching on the subject and its nefarious moral and spiritual effects, intervened by posting up his 95 Theses and sending a copy, with a strongly worded letter of protest, to the archbishop. In these theses he distinguished between true repentance and mere penance for sin, maintained that the pope could only remit penalties imposed by his own authority or that of canon law, that God alone can remit the guilt of sin, which is obtained only in the sacrament of penance, not by papal indulgence, and that in the sacrament, pope and priest have only a declaratory power of remission, which is due to the grace of God in Christ as proclaimed in the Gospel—the true "Treasure of the Church." He further denied that the remission of canonical penalties through the papal indulgence applies to souls in purgatory, and, whilst recognizing the principle of indulgence in a strictly limited sense, vigorously denounced the false teaching and the pernicious activity of the indulgence preachers, and asserted the right of every penitent Christian to remission apart from this mercenary traffic in pardons.

The proposed disputation did not actually take place. But the theses were widely circulated, both in the original Latin and in a German translation, and before the end of the year were being eagerly read and discussed throughout the empire, and even beyond its bounds. The attack provoked a counter attack on the part of Tetzel and the Dominican Order, of which he was a member, in the form of a series of anti-theses in defence of the traditional doctrine, which, though ascribed to Tetzel, were drawn up by Wimpina, professor of theology in the University of Frankfurt-on-the-Oder. In a couple of effusions under his own name, Tetzel roundly accused Luther of heresy and schism; and a more formidable opponent, John Maier of Eck, otherwise known as Dr. Eck, professor of theology at Ingolstadt, repeated the charge in a communication to the bishop of Eichstadt, entitled "Obelisks," which, though not printed, was circulated in manuscript. Both Tetzel and Eck maintained that the 95 Theses were an attack on the papal power as well as on a received institution of the Church. Luther replied to Wimpina and Tetzel in a "Sermon on Indulgence and Grace"; to Eck in a series of "Asterisks," in which he stoutly rebutted the charge of heresy. At a congregation of his Order at Heidelberg (April 1518) he expounded and defended his distinctive theology, and amplified his theses in a work entitled *Resolutiones,* which shows a distinct advance in their standpoint, and explicitly emphasizes his fundamental doctrine of justification by faith as the criterion of faith and practice. This work he sent to the pope as a vindication of his action and a confutation of the charges of his opponents, coupled with a respectful and submissive, but outspoken letter (May 1518).

Citation to Rome.—By this time the pope, to whom the archbishop had sent the theses, and who was at first disposed to regard the controversy as a mere monks' quarrel, had decided to take action. As the result of an official examination of Luther's Theses by Prierias, the master of the palace, Leo cited him to appear at Rome within 60 days as a heretic and a rebel against ecclesiastical authority. The citation was forwarded to the learned Dominican, Thomas di Vio, otherwise known as Cardinal Cajetan, the papal legate in Germany. Through the intervention of the elector Frederick of Saxony and for political reasons connected with the prospective election of a successor to the emperor Maximilian I., the pope ultimately consented to forego the citation and to refer the case to the legate, who was empowered to receive Luther's submission. In accordance with this decision he appeared before Cajetan at Augsburg in Oct. 1518. During the interview the legate insisted on unconditional retractation, and Luther stoutly refused to retract unless he was proved from Scripture to be in error, and, appealing from the cardinal to the pope, he secretly left Augsburg. He published an account of the proceedings (*Acta Augustana*), and in November appealed from the pope to a general council.

The issue of a papal decretal on the subject of indulgences left no doubt that Luther's standpoint was irreconcilable with the official doctrine and practice. The attempt of Miltitz, whom the pope sent as his nuncio to Germany to confer the Golden Rose on the Saxon elector, to bring about an accommodation proved fruitless. At a conference at Altenburg in Jan. 1519 Luther went the length of agreeing to refrain from further discussion and to refer the case to the arbitration of a German bishop, on condition that his opponents also observed silence. Miltitz also, in his eagerness to play a rôle in the case which was not warranted by his commission, sent a misleading report to the pope, representing that Luther was not only prepared to refrain from further agitation, but to retract his errors. In reply the pope invited him in a friendly spirit to Rome for this purpose (March 29, 1519). This missive, which never came into Luther's hands, was based on a complete misunderstanding of his real position. What he had refused to Cajetan he was not prepared, at the instance of a busybody like Miltitz, to concede to the pope himself, though at the instigation of the elector he wrote an *Instruction to the People,* in which, whilst emphasizing the abuses in the institutions of the Church, he still recognized the papal supremacy and the duty of obedience to the Roman Church.

Controversy with Eck.—The death of the emperor Maximilian on Jan. 11, 1519, and the long negotiations relative to the election of his successor, brought a lengthy pause in the further consideration of his case as far as the Roman Curia was concerned. Meanwhile the condition of the truce between him and his opponents was broken by the intervention of Eck, who challenged him to a debate at Leipzig on the subject of the papal power. Luther accepted the challenge and in preparation for the disputation made an intensive study of the constitution of the ancient Church and the later claims of the bishop of Rome to its headship, as expressed in the papal decretals. Thus carefully prepared, he encountered his formidable antagonist in the famous disputation which took place in July 1519 and forms another landmark in the development of his reforming teaching. In the course of it he controverted the divine right of the papacy, asserted the supreme authority of Scripture, maintained that John Hus had been unjustly condemned by the council of Constance, and questioned the infallibility of a general council. Eck, who was a practised debater, had skilfully led him into these compromising admissions and claimed the victory. He had at all events shown that he was at variance with the received teaching of the Church, not merely in the comparatively minor subject of indulgences, but on fundamental doctrines. Though both parties had at the outset agreed to refer the contest to the judgment of the universities of Paris and Erfurt, both continued it in a number of controversial writings, to which new adversaries—Alveld, Emser, Dungersheim, Hoogstraten—contributed on the side of Eck, and Melanchthon, Occolampadius, Bucer, Hutten and others on the side of Luther. Luther himself, as well as Eck, added an important quota in the *Resolutiones Lutherianae,* a sermon on the sacrament of the altar, and a treatise on good works, which only widened the breach between him and his opponents.

Bull of Condemnation.—Ultimately Eck betook himself to Rome to prosecute the suit against Luther which the Curia had determined to resume and bring to a final issue. As the result of the re-examination of his case by a series of commissions appointed by the pope in the spring of 1520, the bull *Exsurge Domine,* condemning 41 errors in his teaching, was formulated, and after discussion in the consistory, was issued in June. It granted to the heretic an interval of 60 days after its publication in Germany for the purpose of retracting and returning to the Church. Failing compliance, he and his adherents were to be excommunicated, arrested and punished as notorious and pertinacious heretics. Excommunication was also denounced against all, of whatever rank, who should refuse to comply with the provisions of the bull, which Eck and Aleander were commissioned, as papal nuncios, to publish throughout the empire.

The Bull of Condemnation only fanned the pugnacious spirit of the reformer. At first he professed to see in it a fabrication of Eck, and denounced it in two defiant philippics, *Eck's New Bulls and Lies,* and *Against the Execrable Bull of Antichrist.* Then, recognizing its authenticity, he renewed his appeal to a general council, and finally, on Dec. 10, 1520, publicly consigned it, with a copy of the canon law and other documents, to the flames. During the previous summer and early autumn he had sent forth his three great reform treatises—the *Address to the German Nobility, The Babylonic Captivity of the Church* and *The Freedom of a Christian Man.* In the first he arraigned in passionate language the abuses rampant in the Church, and appealed to the secular power to undertake the work of reformation on the ground of its divine institution, its Christian character, and its ethical functions which entitle it to summon a general council to rectify what is amiss in the Church, and even to undertake this clamant duty in case the Church refuses to reform itself. In the second he attacked the mediaeval sacramental system, reduced the number of the sacraments from seven to three, and asserted the right of the individual Christian to emancipate himself from priestly bondage. In the third he expounded anew in simple, non-controversial terms his fundamental doctrine of justification, which involves alike the freedom of the individual from the work-righteousness of mediaeval religion and the obligation of self-discipline and service for others as the indispensable fruit of justifying faith.

The Diet of Worms.—In Jan. 1521, the pope, in consequence of Luther's refusal to retract and submit to the authority of the Church, launched a Bull of Excommunication against him (*Decet Romanum*), and called on the emperor Charles V., the successor of Maximilian, to execute it forthwith. Instead of complying, the emperor, in deference to the intervention of the Saxon elector and the will of the majority of the diet, which met at Worms at the end of January and continued its sittings till May, decided to summon him to appear for examination before the diet under the imperial safe conduct, whilst promulgating an edict against his writings at the instigation of the papal nuncio Aleander. On April 16, Luther entered Worms. On his appearance before the assembly on the following day he acknowledged the authorship of the books on the table, the titles of which were recited by a secretary. But, in answer to the question whether he was prepared to recant any part of them, he asked for time for consideration on the ground of the importance of the issue involved. He was granted an interval of 24 hours. Late on the morrow, the 18th, he was asked by the official of the archbishop of Treves, Dr. John von der Ecken, who acted as interrogator, whether he was now prepared to defend all the books which he had recognized as his. In reply he proceeded to show why he should not be asked straight away to recant, and requested to be convinced of his errors from Scripture. If thus convinced he would forthwith revoke and be the first to throw his books into the fire. In a long harangue the official rebuked his audacity in arrogating a knowledge of the Scriptures against all the doctors of the Church, and concluded by demanding a definite and straightforward answer to the question whether he would retract his errors or not. Then came the fateful words uttered in firm and clear tones: "Unless I am convinced by the testimony of Scripture or by an evident reason (*ratione evidente*)—for I confide neither in the pope nor in a council alone, since it is certain that they have often erred and contradicted themselves—I am held fast by the Scriptures adduced by me, and my conscience is taken captive by God's Word, and I neither can nor will revoke anything, seeing that it is not safe or right to act against conscience. God help me. Amen." On retiring from the excited assembly he was greeted by the emperor's Spanish guards with the cry "To the fire with him!" whilst he and his adherents passed on with uplifted hands after the old German fashion of celebrating a victory. "I am through," he cried joyfully on reaching his lodging and receiving the congratulation of his friends. He persisted in his refusal before a committee appointed by the diet to bring about a feasible accommodation, and was commanded by the emperor to leave Worms on April 26. On May 4 he was intercepted by a party of horsemen in the Thuringian forest, in accordance with a previous arrangement of the elector of Saxony and two of his trusty councillors, and was furtively lodged in the electoral castle of the Wartburg, overlooking Eisenach. On May 26, after the close of the diet on the previous day, the emperor, having received the assurance of the papal support in his war against Francis I. of France, formally signed the Edict of Worms placing him and his adherents under the ban of the empire and instituting a rigorous censorship of the press. It professed to be issued "with the unanimous consent and will" of the estates of the empire. In reality it had been submitted on the previous evening to only a fraction of the members after the formal closing of the diet, and did not represent the mind of the German people. As the result of these four years of strenuous conflict, the breach between Rome and Luther was complete and irretrievable, and the indomitable, heroic monk had won the sympathy and support of a large proportion of his countrymen on material and economic as well as religious grounds.

The Wartburg.—Luther remained at the Wartburg under the pseudonym of "Knight George" till the spring of 1522. He continued and extended the attack on Rome in a series of controversial writings, including those on auricular confession, on the abrogation of private Mass, and on monastic vows, and kept in touch with his colleagues and friends by a voluminous correspondence. He began and completed the translation of the Greek New Testament which, after revision with the co-operation of Melanchthon, was published in Sept. 1522. It is a monument of his linguistic ability in moulding the vernacular into a fitting medium of the language and thought of the Greek original. He challenged the resumption of the indulgence traffic under the auspices of the archbishop of Mainz at Halle, and so potent had his influence become that the archbishop was fain humbly to apologize and put a stop to the business. He wrote a series of sermons (Postille) for the instruction of the people in the new evangelism, which afford an insight into his distinctive power and style as a preacher. Early in Dec. 1521 he paid an incognito visit to Wittenberg and enjoyed for a few days the renewed personal intercourse with his colleagues. He expressed his satisfaction with all that he had seen and heard in spite of the popular demonstrations against the old religion which had resulted in student riots, but which he did not take very seriously. On the other hand, the spirit of religious and social unrest among the people, which he had observed by the way, impelled him to issue a *Warning Against Tumult and Revolt,* in which he inculcated his characteristic doctrine of submission to constituted secular authority in the matter of religious innovations, the necessity of leaving the Word of God to work gradually the transformation of traditional beliefs and institutions, and the inadmissibility of irresponsible violence in the work of reformation.

This passive attitude did not commend itself to the more militant reformers at Wittenberg like Carlstadt and Zwilling, who in the winter of 1521–22 introduced communion in both kinds, demanded the removal of images from the churches and championed the marriage of the clergy. In this forward policy they had the support of the university theological faculty and the town council, and the town council embodied it in an ordinance regulating on evangelical lines the religious and social life of the community. But it encountered the opposition of the elector on political grounds, and the *impasse* which supervened led Luther to leave the Wartburg at the beginning of March 1522 and resume his public activity at Wittenberg.

The Reformed Worship.—Though he approved on principle of communion in both kinds and the marriage of the clergy, he was a striking combination of the conservative and the revolutionary, and was disposed to consider the expediency of actual changes before making them, and of avoiding precipitate measures which the weaker brethren were not prepared to approve. In a series of eight consecutive sermons during the first week after his arrival, he won over his hearers to his own policy of the gradual institution of an evangelical order in place of the old usages, and modified the ordinance in this direction. It was not till the following year that he deemed the time ripe for a more incisive reform of worship and usages and the reorganization of the church at Wittenberg and elsewhere in accordance therewith, though these changes were to be made without constraint of conscience. Hence the *Formula Missae,* or reformed communion service, which he drew up for Wittenberg, and the order of worship for the church at Leisnig which served as a model for other reformed churches.

At the same time he carried on a brisk campaign against his Romanist opponents, whose antagonism these innovations tended to intensify. These controversial writings included an onslaught on the hierarchy, *Against the Falsely called Ecclesiastical Estate of the Pope and the Bishops,* and a reply to King Henry VIII., who had written an anti-Lutheran *Defence of the Seven Sacraments* (*Assertio Septem Sacramentorum adversus Martinum Lutherum*). He added a *Vindication of Married Life* as a divine and natural institution on behalf of the marriage of the clergy. In 1525 he himself followed the example of the increasing number of married ex-priests, monks, and nuns by contracting a union with Catherine von Bora, who had renounced the conventual life, and bore him a family of three sons and two daughters, and proved a worthy helpmate throughout the remaining 20 years of his wedded life.

As the result of this propagandist activity and the co-operation of a growing band of preachers, drawn largely from the ranks of the secular and regular clergy, the evangelical movement ere long attained such formidable dimensions that it was practically impossible to enforce the edict of Worms throughout a large part of the empire. The diet which met at Nuremberg during the winter of 1522–23 refused to support the demand of pope Adrian VI., the successor of Leo X., for its execution, declined to suppress the evangelical preachers, and, whilst authorizing the punishment of married priests and apostate monks, insisted on the convocation within a year in some German city of a free Christian council in which the laity should have a voice. "Luther's doctrine," reported the archduke Ferdinand to his brother, Charles V., "has taken such deep root that among a thousand persons there is not one who is not to some extent touched by it." A second diet, which assembled in the same city during the winter of 1524, proved less recalcitrant under the manipulation of Campeggio, the legate of Adrian's successor, Clement VII. But it would only undertake to enforce the edict against Luther "as far as possible," and renewed the demand for the convocation of a free council in Germany. In reply Luther launched a strongly-worded philippic (*Two Contradictory Mandates concerning Luther*) in which he unsparingly aspersed the emperor as well as the majority of the diet.

The Peasant Revolt.—Towards the close of 1524 the influence of the evangelical movement on the mass of the people received a startling exemplification in the rising of the peasants which followed the miscarried attempt of Franz von Sickingen and Ulrich von Hutten to vindicate by force the rights of the lesser nobility against the princes in the previous year. In his tract *On the Civil Power* (1523), Luther, in contrast to his attitude to the State on the *Address to the German Nobility* three years previously, sharply distinguished between the political and spiritual spheres, and, whilst denouncing the misgovernment of the princes, inculcated anew the duty of the subject to submit to the civil power and the established order in the State and to suffer, not actively repel, injustice. Some of the evangelical preachers were, however, less restrained, and actively sympathized with the demand of the peasants for social emancipation and the radical modification of the feudal system to this end. Moreover, Thomas Münzer, the leader of the extreme wing of the evangelical party, advocated a social and religious revolution by forcible methods, and Carlstadt, who had by this time been estranged from Luther, though less violent, also actively espoused the cause of the peasants. On theological grounds Luther was repelled by these extremists, who professed a more subjective type of religious thought, based not exclusively on the Word of God, but on the illumination of the individual believer in direct communion with God (the "inner light"). Their association with the social movement contributed to prejudice him against it, though he had pleaded for a more equitable treatment of the common man in the spirit of the Gospel. At the same time his own revolt against the traditional Church, his resounding appeals for its drastic reformation, and on behalf of the rights of the individual mind and conscience enlightened by the Word of God, his doctrine of justification by faith alone, and especially of the spiritual priesthood of all believers, contained democratic implications which the mass of the people were not slow to apply in the service of a social as well as a religious reformation, and of a far-reaching transformation of the prevailing order in the State and society as well as the Church. This popular movement found expression in the *Twelve Articles* of the Swabian peasants which were evidently drawn up under the influence of evangelical preachers like Schappeler and Hubmaier, if not actually composed by them, demanded the abolition of serfdom and the preaching of the pure Gospel, and were widely adopted. The leaders of the peasants submitted these articles, which were couched in a moderate spirit, for Luther's judgment, and whilst deprecating the resort to force, he expressed sympathy with the reasonable grievances of the common man, and counselled both sides to seek an accommodation (*An Exhortation to Peace in Response to the*

Twelve Articles of the Swabian Peasants, April, 1525). When, however, the peasant bands in southern, western, and central Germany discarded his advice and took arms to enforce this programme of social reforms, he took the side of the princes and lords and issued a sanguinary and ill-judged appeal to a war of extermination against the rebels (*Against the Murderous and Thieving Peasant Bands,* May, 1525). Not only was the rising ruthlessly suppressed; the princes and lords sullied their victory by a savage retribution, of which many thousands of their subjects became the victims, and which both dashed the hope of achieving the legitimate social aspirations of the masses in connection with the religious reformation, and embittered the common man against the reformer, whom they denounced as the accomplice of their oppressors.

Organization of Reform.—In this year Luther was deprived by death of his potent protector, the elector Frederick. His successor, the elector John, was, however, a confirmed adherent, and his cause had won the ardent support of the landgrave Philip of Hesse, Albert of Brandenburg, grand master of the Teutonic order, and other princes, as well as a large number of cities, and its princely supporters were beginning to league themselves in its defence. On the other hand, the archduke Ferdinand of Austria, the two dukes of Bavaria, the elector of Brandenburg, and Duke George of Saxony had combined to stem the progress of the movement, and the persecution of his adherents had already begun in Romanist territories. In the diet which met at Spires in 1526 the Lutheran princes, in conjunction with the moderate Roman Catholics, were strong enough to carry a resolution to suspend the edict of Worms pending the meeting of a general, or at least a national, council; and meanwhile so to act in the matter of the edict as its members should answer to God and the emperor.

The evangelical princes interpreted the decision as entitling them to organize the evangelical Church within their territories, and for this purpose Melanchthon, by direction of the elector John, drew up, and Luther revised, a church ordinance (*Kirchenordnung*) which formed alike a confession of faith, a directory of public worship, a scheme of educational reform, and contained the germ of the later consistorial form of Church government, which consigned the ecclesiastical administration to a body of State officials or consistory, composed of theologians and jurists, under the supremacy of the territorial prince. At the second diet of Spires in 1529 the emperor Charles, through his commissioners, succeeded in reversing the decision of the previous diet. On this occasion the extreme Catholics were in the majority and carried a resolution enforcing the diet of Worms in Catholic territories and disallowing further religious innovations in the Lutheran States, whilst prohibiting the profession of the Zwinglian and Anabaptist forms of the reformed faith. Against these decisions the Lutheran minority appealed and protested and this Appellation and Protestation was signed by 14 cities as well as by the elector of Saxony, the landgrave of Hesse and four other princes. Hence the name Protestant as a designation of the evangelical party.

The Zwinglian Controversy.—This reverse to the Lutheran reformation was aggravated by the dissension between Luther and the Swiss theologians on the doctrine of the Lord's Supper. Whilst rejecting the mediaeval doctrine of transsubstantiation, Luther firmly believed in the bodily presence of Christ in the bread and wine (consubstantiation). Zwingli, the reformer of Zurich, and the south German theologians, on the other hand, accepted only a spiritual presence in the elements, and a bitter controversy had been proceeding for some years over this question before the landgrave Philip, in the hope of uniting the warring parties, summoned the leaders to a conference at Marburg in October 1529. During the three days' debate Luther doggedly argued in support of the literal interpretation of the words, "This is my body" (*Hoc est meum Corpus*) against Zwingli and his Swiss and South German colleagues Occolampadius, Bucer and Capito, who contended in favour of the figurative sense of the words. They further adduced the impossibility of the presence in the elements of Christ's body, which had ascended into Heaven, against Luther's contention on behalf of its ubiquity in virtue of Christ's divine nature which was not subject to any human limitations. Neither party would give way on these two fundamental points, and the debate ended in a complete deadlock. Luther refused to extend the right hand of fellowship to Zwingli, who was prepared to agree to differ for the sake of unity. Despite this *impasse* the landgrave, after the formal close of the debate in the afternoon of Oct. 3, made a final effort to secure unanimity. He besought both parties to consider in private the possibility of finding a formula which they could subscribe. In response Luther drew up a formula which, while asserting that "the body of Christ is truly, *i.e.,* essentially and substantially" present in the sacrament, waived further discussion on the question as to the mode of its presence. This was undoubtedly a considerable concession on Luther's part, and Bucer was at first disposed to accept it as a satisfactory solution. Zwingli and Occolampadius, on the other hand, could not bring themselves to subscribe this Lutheran formula in the course of the private discussion of the following day, and held to their view that Christ is present only in a spiritual sense. The next best thing in the interest of the landgrave's policy of a comprehensive evangelical union was to give expression to their agreement on the other doctrines of the reformed faith, and Luther joined with his opponents in subscribing the Marburg Articles which he drew up for this purpose. The Marburg conference was thus not a total failure. The inability to see eye to eye on the sacramental question resulted, however, in an unfortunate estrangement between the Lutheran and the Swiss and south German Churches for the time being at least, and frustrated the project of a great evangelical alliance in defence of the Reformation to meet the menace of the impending imperial attempt to suppress it.

The movement had by this time lost the support of Erasmus and the older humanists, whilst retaining the adhesion of the younger votaries of the new learning like Melanchthon and Bucer. Up to the diet of Worms Erasmus had exerted his influence to shield Luther from the hostility of his scholastic opponents of Cologne, Louvain and other centres of the scholastic theology, who were also his own enemies. He used his influence with the German princes to secure him a fair hearing, and denounced the obscurantism and intolerance of the heresy hunters. Luther who had a deep sense of the value of the new learning for the evangelical movement had cultivated his friendship, whilst disapproving of his theological standpoint. After the diet of Worms and the actual initiation of the Reformed Church, Erasmus, in his fear of revolution, became more critical, and at length, yielding to the solicitations of powerful patrons, entered the lists against his theological teaching in a controversial work on Free Will (*De Libero Arbitrio,* 1524). Luther replied with a counter attack in the Unfree Will (*De Servo Arbitrio,* 1525), and though both observed a relative moderation of style in these writings, the breach between them in the theological sphere was henceforth irretrievable.

The Augsburg Confession.—As an outlaw Luther was not present at the diet of Augsburg in 1530, at which the emperor appeared in person, and to which Melanchthon presented a confession of the Lutheran faith (the Confession of Augsburg). But he energetically intervened by his letters to the elector John and to his pliant colleague who, in the course of the long negotiations, was in danger of conceding more than he was prepared to approve. He thus stiffened their opposition to the final ultimatum of the emperor to agree to a material modification of its teaching in a Romanist sense. Thus strengthened, the elector left the diet in the face of the imperial demand for surrender to his Romanist policy; and Luther at last overcame his scruples on the score of active resistance to the imperial authority in defence of the evangelical cause. He not only consented to the defensive Protestant League of Schmalkald, which the elector and the landgrave cemented, but published a manifesto asserting the right of such resistance to authority oppressively exercised over conscience and the Gospel. (*Warning to the Germans,* October 1530, and *Declaration* of November 1530.) In consequence of this combination and the menace of a Turkish invasion by the sultan Solyman, Charles was fain to agree to an accommodation in the religious peace of Nuremberg (1532).

In further negotiations with Bucer and the South German theologians on the sacramental question, Luther relaxed somewhat in his exclusive dogmatism on the subject, and agreed to the Wittenberg Concord (1536). Though the agreement did not include the Zwinglians, he meantime maintained friendly relations with Bullinger, Zwingli's successor at Zürich, and was impressed by the mediating view of Calvin, though he never came into direct contact with the Genevan reformer. Towards the anabaptist movement, on the other hand, he adopted an attitude of uncompromising antagonism. These sectaries, who took their rise at Zurich in 1525, and rapidly spread their views from Switzerland over the Empire, continued the more radical tendency of Münzer, whose revolutionary teaching was adopted by the more extreme section and eventuated in the fantastic and fanatic attempt to establish the reign of the saints at Münster in Westphalia. The more moderate section led by Hubmaier, Hetzer, and Denck, all of them men of scholarly attainments, eschewed revolutionary violence, and advocated adult baptism as the exclusive scriptural practice, and a more literal revival of primitive Christianity as they understood it. To Luther both sections were alike obnoxious as subverters of religious and social order, and he ultimately belied his own principle of freedom of conscience by supporting the persecution to which both sections were alike subjected in Protestant as well as Roman Catholic territories, and in joining Melanchthon in pronouncing for the infliction of the death penalty for persistent profession of Anabaptist error (1536).

Last Years.—In spite of the increasing ill-health from which he suffered during the last ten years of his life, he continued to toil at the task of maintaining and vindicating the Reformation. Whilst compromising it by his secret, though reluctant sanction of the bigamous marriage of the landgrave, Philip (1540), which ere long leaked out and was not rendered less scandalous by his honest, but warped attempt to justify it, Luther continued the warfare against the papacy as anti-Christian in a closing series of controversial works. He staunchly opposed the policy of Paul III. to effect a reunion with Rome through a general council, which the pope at last agreed to convene. Such a reunion could only be achieved at the price of sacrificing the essential principles of the Reformation as a revival of the teaching and the institutions of the New Testament and the early Church, which he claimed to have vindicated against the corrupt and secularized Roman distortion of them. He maintained a sceptical, though less uncompromising attitude towards the attempt of the emperor, for political reasons, to bring about a feasible accommodation (*The Wittenberg Reformation,* Jan. 1545). His more constructive contribution to the movement during these declining years is the revision, with the assistance of his colleagues, of his translation of the Old Testament, which he had completed between 1523 and 1532, as well as that of the New Testament. By the year of his death the number of editions of this Luther Bible, or parts of it, had risen to 377, exclusive of the Low German versions of it. Had he contributed nothing else besides this literary and religious treasure to the Reformation, he would amply deserve the title of the greatest religious benefactor of his people in modern times. He added to the value of this service by his commentaries on the books of the Bible, which entitle him to a high place among biblical exegetes, and which were the fruit of his expositions of Holy Writ in the classroom. Next to the influence of his translation of the Bible, may be placed that of the hymns with which he enriched the reformed worship, and the two catechisms which he composed in 1529 for instruction in the distinctive doctrines of the Christian faith.

He did not live to experience the force of the blow to his cause which the emperor was at last preparing to deliver. He died on Feb. 18, 1546, at Eisleben, where he had been born 63 years before. He had paid a visit to his birthplace to arbitrate in a dispute between Counts Albrecht and Gebhard of Mansfeld. He successfully accomplished his mission, and preached several times to crowded congregations. But the exposure to the inclement weather during the journey thither, and the protracted negotiations, proved too great a strain for his infirm body, and in the early morning of the 18th he passed quietly away. His last word was an emphatic "yes" to the question of Jonas whether he remained steadfast in the doctrine which he had taught. Count Albrecht would fain have laid him to rest in his native Eisleben. But the elector, John Frederick, insisted on the transference of his body to Wittenberg, where his life work had been done, and there, on Feb. 22, it was interred in the Castle church, in the presence of his stricken widow and children and a great concourse of notables, disciples and burghers.

The impression produced by his personality and his work on his closest associates is reflected at first hand in the funeral sermon preached by Bugenhagen and the funeral oration delivered by Melanchthon to this great assembly. A man, said Bugenhagen, who never feared anyone, however great and mighty, in much the same words as the regent, Morton, used at the grave of John Knox. Though to some he appeared too sharp and bitter in reproof and denunciation, this was his due prerogative as a prophet, as it was of Christ himself in his conflict with the scribes and the Pharisees. In his rôle as a prophet sent by God, he rediscovered and vindicated the Gospel and delivered the Church from the corruption and tyranny of Rome. The preacher could only liken him to the angel of the Apocalypse who flew in midheaven with the everlasting Gospel to proclaim to the dwellers on earth, and the effects of his prophetic mission could only be described in the words of the second angel, "Fallen, fallen is Babylon the great!" Dead in the body, Luther would live in his work in accordance with his own prophecy, *Pestis eram vivus, moriens tua mors ero Papa* ("In life I was thy pestilence; dying, I will be thy death, O Pope").

For Melanchthon, Luther was the unique praeceptor. He belonged to the long line of God-inspired teachers and leaders who from the days of the patriarchs onwards had successively preserved and renewed the Church. In this succession he was worthy to stand beside Isaiah, John the Baptist, Paul, Augustine. He was the great renovator, not the innovator of the Church, which he had striven to purify from error and abuse. Strife and division had ever been an inevitable concomitant of the working of the Divine Spirit at such crises in its history, and the responsibility for this division lay with those who refused to hear the truth. Melanchthon assumes that what Luther taught in his long struggle with his opponents was the true doctrine, of which he gave a rapid summary. He combined in the highest degree the gifts of the great Christian teacher and the active reformer. As in the days of Nehemiah the builders of Jerusalem rebuilt the walls with the one hand and held the sword in the other; so Luther had maintained the struggle with the enemies of the true doctrine, and had at the same time, by his writings and his translations of the Scriptures, brought enlightenment and comfort to a multitude of burdened consciences. For this double work pious Christian hearts would be eternally grateful to him and thank God for him. Melanchthon, who had sometimes to suffer under his masterfulness and his vehemence, indicated, indeed, that there might be truth in the complaint of some—and these good-hearted people—that Luther was too hard and rough in his controversial writings. In the face of such a charge he reminded his hearers of the reputed saying of Erasmus, "God in these last times, in which great and terrible diseases have prevailed, has given the world also a sharp physician." As God placed His Word in the mouth of Jeremiah to tear up and break down, to plant and to build, so in the case of Luther. Certain it was that, in defending his teaching, he was acting solely in obedience to his conscience, not merely from quarrelsome and malevolent motives. All who knew him must bear him this testimony. They would, too, readily testify to his amiability, his kindliness, his goodness in private intercourse. "His heart was true and without falseness, his utterance friendly and kindly, and his striving ever to observe the Apostles' command, 'Whatsoever things are true, etc.'" Undeniable, too, his deep piety, his striving to exercise himself in the Christian virtues and in all good and useful studies and arts, his continence and freedom from vice, his readiness to conciliate and arrange the quarrels of others, his hatred of intrigue and trimming, his singleness of purpose, his constant recourse to prayer in the midst of the trial and stress of affairs, his unfailing courage in reliance on God's help as his immovable rock, his rare intellectual acumen and quickness in dealing with difficult situations and problems, his power of observation and ability to read character, his devotion to study, his wide knowledge, his aptness to apply it in his writings and lectures, and his wonderful gift of language.

The picture is, in the circumstances, naturally drawn from the angle of a poignant sense of loss. Nevertheless, the words addressed by one who had been Luther's close associate as disciple, co-worker and friend for nearly 30 years to an audience which had known him in daily intercourse for a longer period, leave on the reader the impression of having been uttered in complete sincerity and truth.

See also REFORMATION. (J. M.)

LUTHERANS, the general title given to those Christians who have adopted the principles of Martin Luther in his opposition to the Roman Church, to the followers of Calvin, and to the sectaries of the times of the Reformation. Their distinctive name is the *Evangelical*, as opposed to the *Reformed* church. Their dogmatic symbols are usually said to include nine separate creeds which together form the *Book of Concord* (*q.v.*). Three belong to the Early Christian church—the *Apostles' Creed*, the *Nicene Creed* (in its Western form, *i.e.*, with the *filioque*), and the so-called *Athanasian Creed;* six come from the 16th century—the *Augsburg Confession*, the *Apology for the Augsburg Confession*, the *Schmalkald Articles*, Luther's two *Catechisms* and the *Formula of Concord*. But only the three early creeds and the Augsburg Confession are recognized by all Lutherans. Luther's Catechisms, especially the shorter of the two, have been almost universally accepted, but the Formula of Concord was and is expressly rejected by many Lutheran churches. The Augsburg Confession and Luther's Short Catechism may therefore be said to contain the distinctive principles which all Lutherans are bound to maintain, but, as the principal controversies of the Lutheran church all arose after the publication of the Augsburg Confession and among those who had accepted it, it does not contain all that is distinctively Lutheran. Its universal acceptance is perhaps due to the fact that it exists in two forms (the *variata* and the *invariata*) which vary slightly in the way in which they state the doctrine of the sacrament of the Supper. The *variata* edition was signed by Calvin, in the meaning, he said, of its author Melanchthon.

After Luther's death the more rigid Lutherans declared it to be their duty to preserve the *status religionis in Germania per Lutherum instauratus*, and to watch over the *depositum Jesu Christi* which he had committed to their charge. As Luther was a much greater preacher than a systematic thinker, it was not easy to say exactly what this deposit was, and controversies resulted among the Lutheran theologians of the 16th century. (*a*) The Antinomian controversy was the earliest (1537–1560). It arose from differences about the precise meaning of the word "law" in Luther's distinction between law and gospel. Luther limited the meaning of the word to mean a definite command accompanied by threats, which counts on terror to produce obedience. He declared that Christ was not under the dominion of the law in this sense of the word, and that believers enter the Christian life only when they transcend a rule of life which counts on selfish motives for obedience. But law may mean ethical rule, and the Antinomians so understood it, and interpreted Luther's declaration to mean that believers are not under the dominion of the moral law. (*b*) The Arminian controversy in the Reformed church, the Jansenist controversy in the Roman Catholic church, had their parallel in disputes among the Lutherans lasting from 1550 to 1580. In the end it was generally agreed that sin had not totally destroyed man's ethical nature, and that grace changed what was morally insensitive into what was morally sensitive, so that there could be a co-operation between God's grace and man's will ("synergism"). (*c*) The controversy raised by Andreas Osiander was more important. He felt that Luther had omitted to make adequate answer to an important practical question, how Christ's death on the cross could be brought into such actual connection with every individual believer as to be the ground of his actual justification. It was answered that the principal effect of Christ's work on the cross was to change the attitude of God towards the whole human race, and that, in consequence, when men come into being and have faith, they can take advantage of the change of attitude effected by the past historical work of Christ. The Reformed church, on the other hand, constructed their special doctrine of the limited reference in the atonement. (*d*) The other controversies concerned mainly the doctrine of the sacrament of the Supper, and Luther's theory of Consubstantiation. This required a doctrine of *Ubiquity*, or the omnipresence of the body of Christ extended in space, and therefore of its presence in the communion elements. Calvin had taught that the true way to regard substance was to think of its power (*vis*), and that the presence of a substance was the immediate application of its power. The presence of the body of Christ in the sacramental elements did not need a presence extended in space. Melanchthon and many Lutherans accepted the theory of Calvin, and alleged that Luther before his death had approved of it. Whereupon the more rigid Lutherans accused their brethren of Crypto-Calvinism, and began controversies which dealt with that charge and with a defence of the idea of ubiquity. The University of Jena, led by Matthias Flacius, was the headquarters of the stricter Lutherans, while Wittenberg and Leipzig were the centres of the Philippists or followers of Melanchthon.

Conferences only increased the differences. The Lutheran church seemed in danger of falling to pieces. In the end, the greater proportion adopted the *Book of Concord* (1577). Its recognition was mainly due to the efforts of Augustus, elector of Saxony. The churches within Germany which refused the *Book of Concord* became for the most part Calvinistic or Reformed. They published as was the fashion among the Reformed churches, separate creeds for themselves, but almost all accepted the *Heidelberg Catechism.* These differences in the German Protestant churches of the second half of the 16th century are reflected in the great American Lutheran church. The church exists in three separate organizations. The General Synod of the Evangelical Church of the United States, organized in 1820, has no other creed than the *Augsburg Confession,* so liberally interpreted as not to exclude Calvinists. The Synodical Conference of North America, organized in 1872, compels its pastors to subscribe to the whole of the nine creeds contained in the Book of Concord. The General Council, a secession from the General Synod, was organized in 1867, and accepts the "unaltered" (*invariata*) *Augsburg Confession* in its original sense, and the other Lutheran symbols as explanatory of the Augsburg Confession.

The divided state of German Protestantism, resulting from these theological differences, contributed in no small degree to the disasters of the Thirty Years' War, and various attempts were made to unite the two confessions. Conferences were held at Leipzig (1631), Thorn (1645), Cassel (1661); but without success. At length the union of the two churches was effected by the force of the civil authorities in Prussia (1817), in Nassau (1817), in Hesse (1823), in Anhalt-Dessau (1827) and elsewhere. These unions for the most part aimed, not at incorporating the two churches in doctrine and in worship, but at bringing churches or congregations professing different confessions under one government and discipline. They permitted each congregation to use at pleasure the *Augsburg Confession* or the *Heidelberg Catechism.* The enforced union in Prussia was combined with the publication of a new liturgy intended for common use. This led to secessions from the state church. These seceders were at first treated with great harshness, but have won their way to toleration, and form the Lutheran Free churches of Germany.

The liturgies of the Lutheran churches exhibit the same diversities in details as appear in their constitutions. It may be said in general that while Luther insisted that public worship ought to be conducted in a language understood by the people, and that all ideas and actions which were superstitious and obscured the primary truth of the priesthood of all believers should be expurged, he wished to retain as much as possible of the public service of the mediaeval church. The external features of the mediaeval churches were retained; but the minor altars, the *tabernacula* to contain the Host, and the light permanently burning before the altar, were done away with. The ecclesiastical year with its fasts and festivals was retained in large measure. In 1526 Luther published the *German Mass and order of Divine Service,* which, without being slavishly copied, served as a model for Lutheran communities. It retained the altar, vestments and lights, but explained that they were not essential and might be dispensed with. The peril attending the misuse of pictures in churches was recognized, but it was believed to be more than counterbalanced by the instruction given through them when their presence was not abused. In short Luther contented himself with setting forth general principles of divine service, leaving them to be applied as his followers thought best. The consequence was that there is no uniform Lutheran liturgy.

The divergences in ritual and organization, the principle underlying all the various ecclesiastical unions, viz., to combine two different confessions under one common government, and, resulting from it, the possibility of changing from one confession to another, have all combined to free the state churches from any rigid interpretation of their theological formulas. A liberal and a conservative theology (rationalist and orthodox) exist side by side within the churches, and while the latter clings to the theology of the 16th century, the former ventures to raise doubts about the truth of such a common and simple standard as the Apostles' Creed. The extreme divergence in doctrinal position is fostered by the fact that the theology taught in the universities is in a great measure divorced from the practical religious life of the people, and the theological opinions uttered in the theological literature of the country cannot be held to express the thoughts of the members of the churches. Up to the beginning of the Great War, the relation of the Lutheran Church to the state was essentially as follows. In each state the sovereign was held to be the *summus episcopus.* He appointed a minister of public worship, and through him nominated the members of the governing body, the *Oberkirchenrath* or *Consistorium* or *Directorium.* This council dealt with the property, patronage and all other ecclesiastical matters. But each parish elected its own council for parochial affairs, which had a legal status and dealt with such matters as the ecclesiastical assessments. Delegates from these parish councils formed the *Landessynode.* In cases that call for consultation together, the *Consistorium* and the Synod appoint committees to confer. The income of the state churches was derived from four sources. The state made an annual provision for the stipends of the clergy, for the maintenance of fabrics and for other ecclesiastical needs. The endowments for church purposes, of which there were many, and which were destined to the support of foreign missions, clerical pensions, supply of books to the clergy, etc., were administered by the supreme council. The voluntary contributions of the people were all absorbed in the common income of the national churches and were administered by the supreme council. Each parish was legally entitled to levy ecclesiastical assessments for defined purposes.

German Lutherans.—The reorganization of the German Empire aimed at the separation of Church and state. Since an immediate complete separation would be disastrous to the churches and not to the best interest of the state, the churches were guaranteed diminishing state support, with the ultimate purpose of divorcing them entirely from the state governments. By this arrangement the churches have, in part, the character of voluntary associations and, in part, that of state controlled institutions. Two problems have presented especial difficulties. The one is the problem of aim and purpose. Is the Church to continue, under new forms of administration, to be the one recognized institution of religion for that state (*Volkskirche*), or is it to be an institution for the promulgation of a single doctrinal type of Christianity (*Bekenntniskirche*)? The second problem concerns the relation of the Church to the state schools. No fully satisfactory solution of either problem has been reached as yet, though the idea of the *Volkskirche* seems, for the present, to have the stronger following, and the general trend is toward a separation of the Church from the schools. The acute economic depression of 1922–4 affected most disastrously those elements of the laity from which the greatest measure of church support was to be expected, and it subjected the clergy to severe privations. All the activities of the churches were impaired, and the great voluntary associations for Christian work—the societies for foreign and inner missions—were practically paralyzed. Substantial financial support was furnished during this crisis by Lutherans of foreign countries, especially of America, and with the beginning of economic recovery the normal church activities were, by 1926, gradually being resumed.

The endeavour of the more extreme Nazis to control and "Paganize" religion has led to a sharp conflict between the totalitarian state and the Confessional Churches in Germany. On August 24, 1936, an outspoken manifesto against official "insults" was read from pulpits with the question "whether the Christian faith is to retain its right to exist or not." The pastors demanded an end to parades that interfere with public worship and to the ban on religious meetings in buildings other than churches.

Central European Countries.—The formation of the new national states of Poland, Latvia, Estonia, Czechoslovakia, Yugoslavia and Hungary has been followed by a new organization of the Lutheran churches in those countries. The same tendencies that were operative in Germany have shown themselves in these lands. The churches have tended to organize with a large measure of self-support and self-government. Where entire independence of the state has not been feasible it has been apparent as the ultimate aim. An episcopal form of spiritual oversight has also been introduced into most of these churches.

Russia and Rumania.—In 1924 the Lutherans of Russia were permitted for the first time in their history, to organize as a Russian Church with a synod and two bishops. In Rumania, on the other hand, the disestablishment of the Transylvanian Lutheran Church has caused severe, if temporary, hardships.

On questions of doctrine the same divergences continue to exist. The more conservative element has been organized since 1868 in the General Lutheran Conference (*Allgemeine evangelisch-lutherische Konferenz*), an international society for the maintenance of confessional Lutheran teaching. In 1922 the conference united with the American National Lutheran Council in the calling of the First Lutheran World Convention, held at Eisenach, Germany, in Aug. 1923. The members of the convention came from 20 different countries, including the United States and Canada, and effected a new international organization, with an executive committee of six members, charged especially to secure co-operation among the Lutherans of the world in works of mercy, foreign missions and care for migratory Lutherans, and "in cases of emergency to speak for the whole Lutheran Church." The Lutheran Alliance is a society of ultra-conservative Lutherans, the members of which are drawn chiefly from the free churches of Germany.

UNITED STATES AND CANADA

In 1927, the Lutheran Church in the United States and Canada had 2,707,183 communicant members divided among 21 ecclesiastical bodies. The largest of these were the United Lutheran Church (908,190), the Missouri Synod (675,956), the Norwegian Lutheran Church (303,368), the Augustana Synod (225,346), the Iowa Synod (141,889), the Joint Synod of Ohio (169,155), the Joint Wisconsin Synod (145,115), the Lutheran Free Church (22,737), the United Danish Church in America (19,013) and the Suomi Synod (20,659). The Synodical Conference, a consultative federation, comprising the Missouri Synod, the Joint Wisconsin Synod and two smaller bodies, formed a single well-defined group with a membership of 839,843. The names of many of these bodies point to one of the reasons for their separate existence. At their organization nearly all of them were expressions of the church consciousness of groups of immigrants from the Lutheran countries of Europe, and they continue to perpetuate, to a greater or smaller degree, the religious tradition of the countries of their origin. With the slackening of north European immigration toward the end of the 19th century the nationalistic traits tended to become less marked, and the process of Americanization was greatly hastened by the World War. Since 1914 the foreign languages have been rapidly replaced in the services by English and the separated bodies have been drawing closer together.

Organization.—In 1918 the United Lutheran Church was formed by the union of the General Synod, the General Council and the United Synod in the South. These three bodies represented a single line of American tradition reaching back to colonial days. Most of their synods owed their foundation, directly or indirectly, to the work of Henry Melchior Mühlenberg, the great colonial missionary (d. 1787). They had had doctrinal differences, but these were regarded as too small to keep them longer apart. The Augustana Synod, a body of Lutherans of Swedish origin, did not enter the union, though it had been a part of the General Council. In 1917 three bodies of Norwegian Lutherans united to form the Norwegian Lutheran Church in America. Since 1921 discussions have been in progress looking towards the union of other separated bodies. The National Lutheran Commission for Soldiers' and Sailors' Welfare was organized in 1917 to minister to the spiritual welfare of the 400,000 Lutheran men in the army and navy of the United States. Its membership included all the larger bodies except the Missouri and Wisconsin Synods. It was dissolved in 1921. The National Lutheran Council was organized in 1918 by the same bodies that had previously organized the commission. Its purpose was to provide an agency for certain kinds of co-operative work. Its most important task has been to extend aid to the Lutheran churches of Europe during their period of reconstruction. Between 1918 and 1925 it distributed among the Lutherans of 20 different countries more than $6,500,000 in money and goods. For about two decades the Luther League of America, founded in 1888, existed as a general organization of young peoples' societies, crossing synodical lines. In later years, however, it ceased to be inter-synodical.

Doctrines.—Doctrinally, the Lutherans of America are pronounced conservatives. All of them subscribe to the Augsburg Confession and the Small Catechism, and most of them accept the whole body of the 16th century Lutheran confessions. Their doctrinal differences have been, at times, acute, but have usually concerned the theological interpretation of the confessions. Their form of government is theoretically congregational, but the whole tendency in the larger bodies is towards a rather highly centralized synodical administration. The most conservative type of American Lutheranism is represented by the Synodical Conference. Its theological standards are those of 17th century orthodoxy; it strongly opposes any recognition of or co-operation with other churches, and it is vigorously hostile to the membership of its pastors and people in secret societies. The United Lutheran Church, though insistent upon the enforcement of confessional standards, is less rigid both in theology and practice.

LUTON, market town, municipal borough, in the Luton parliamentary division, Bedfordshire, England, 30 mi. N. of London on the L.M.S. and L.N.E. railways. Pop. (est. 1938) 90,840. Area 13.6 sq.mi. It lies on the Chiltern hills. St. Mary's church is mainly Decorated, but some portions and the font are Early English. Luton is the principal seat in England of the manufacture of hats and other straw goods from straw-plait. The industry originated with the colony of straw-plaiters transplanted by James I from Scotland. The town was extended in 1933 and 1939. It has foundries, motor car works, dyeing and chemical works and manufactures vacuum cleaners, etc. Town planning schemes are in operation and there is a municipal aerodrome.

LUTSK: *see* LUCK.

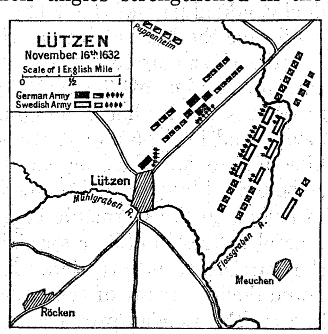
LUTTERWORTH, a town of Leicestershire, England; 90 mi. N.N.W. from London by rail. Pop. (1931) 2,395. The church of St. Mary is mainly Decorated and Perpendicular; here are preserved relics of John Wycliffe, who was rector 1374–84.

LUTTRELL, HENRY (*c.* 1765–1851), English wit and writer of society verse, was the illegitimate son of Henry Lawes Luttrell, 2nd earl of Carhampton. In 1820 he published his *Advice to Julia,* of which a second edition, altered and amplified, appeared in 1823 as *Letters to Julia in Rhyme.* This poem, suggested by the ode to Lydia in the first book of Horace's *Odes,* was his most important work. His more serious literary contemporaries nicknamed it "Letters of a Dandy to a Dolly." In 1827 in *Crockford House* he wrote a satire on the high play then in vogue. Byron characterized him as "the best sayer of good things, and the most epigrammatic conversationist I ever met"; Sir Walter Scott wrote of him as "the great London wit," and Lady Blessington described him as the one talker "who always makes me think." Luttrell died in London on Dec. 19, 1851.

LÜTTRINGHAUSEN, a town in the Prussian Rhine province, Germany, 6 mi. S.E. of Elberfeld by rail. Pop. was 13,673. It has various iron and other metal industries, and cloth and calico mills. It was incorporated with Remscheid (*q.v.*) in 1929.

LUTYENS, SIR EDWIN LANDSEER (1869–1944), British architect, was born in London on March 29, 1869. After a brief training in the South Kensington schools and in architects' offices, he received his first commission at the age of 19. He afterwards designed a number of country houses, in which he gradually developed an individuality of design which was, however, tempered by a reticence which dissociated his work from any attempts at "originality." Much of his domestic work was done in connection with the restoration of old houses, notably Lindisfarne castle, Holy Island (1903–12). He also executed much civic work, being responsible for the *Country Life* offices in London and for the British sections at the exhibitions in Paris (1900) and Rome (1911). The garden suburb at Hampstead, London, has many good examples of his treatment of small houses. It was as the architect of the New Delhi (*see* DELHI) that the culmination of his professional career was reached. He also designed the Cenotaph in Whitehall, London, and the British embassy in Washington, D.C. He was head of the committee of the Royal academy in charge of the reconstruction of London after World War II. Sir Edwin, who was knighted in 1918, became A.R.A. in 1913, R.A. in 1920 and P.R.A. in 1938. He was created K.C.I.E. in 1930. He died Jan. 1, 1944, in London.

LÜTZEN, a town in Prussian Saxony, in the circle of Merseburg (pop. in 1933, 4,977), chiefly famous as the scene of a great battle fought on Nov. 6–16, 1632, between the Swedes, under King Gustavus Adolphus, and the Imperialists, under Wallenstein. After being foiled in his prolonged effort to bring Wallenstein to battle at Nuremburg (*see* THIRTY YEARS' WAR), Gustavus moved south to the Danube. But instead of being drawn by this threat to Bavaria, Wallenstein advanced into Saxony in pursuance of his aim of detaching the Elector from the Swedish Alliance. The menace led Gustavus to march rapidly north, pausing at Nuremburg, 60m. south of his rival at Leipzig, to await reinforcements. As Gustavus had thrown up entrenchments Wallenstein, assuming that no immediate attack was likely, allowed Pappenheim to take a large detachment in order to lay siege to a small castle near Halle. When Gustavus heard of Pappenheim's departure he determined to strike while his enemy was thus weakened. His approach was, however, signalled to Wallenstein, who sent Pappenheim an urgent summons. Fortunately also for him, his posts at Weissenfels and Rippach prevented Gustavus from fighting his main battle the same evening, and the Swedes went into camp near Rippach, a little more than an hour's march from Lützen. In the mist of the early morning Wallenstein's army was formed in line of battle along the Leipzig road with its right on Lützen. Its left was not carried out as far as Flossgraben in order to leave room on that flank for Pappenheim. His infantry was arranged in five huge oblongs, four of which (in lozenge formation) formed the centre and one the right wing at Lützen. These "battalias" had their angles strengthened in the old-fashioned way that had prevailed since Marignano (*q.v.*), with small outstanding bodies of musketeers, so that they resembled rectangular forts with bastions. On either side of this centre was the cavalry in two long lines, while in front of the centre and close to the right at Lützen were the two batteries of heavy artillery. Lützen was set on fire as a precaution. Skirmishers lined the bank and the ditch of the Leipzig road. The total strength of the Imperial army was about 12,000 foot and 8,000 horse.



Gustavus's hopes of an early decision were frustrated by the fog, which delayed the approach and deployment of the Swedes, and it was 8 A.M. before all was ready. The royal army was in two lines and a small reserve in rear. The infantry in the centre was arrayed in the small and handy battalions then peculiar to Gustavus's army, the horse on either wing extended from opposite Lützen to some distance beyond Wallenstein's left, which Pappenheim was to extend on his arrival. By the accident of the terrain, or perhaps, following the experience of Breitenfeld (*q.v.*), by design, the right of the Swedes was somewhat nearer to the enemy than the left. In front, near the centre, were the heavy guns and each infantry battalion had its own light artillery. The force of infantry and cavalry on either side was about equal, the Swedes had perhaps rather less cavalry and rather more infantry, but their artillery was superior to Wallenstein's. Not till 11 A.M. was it possible to open fire, for want of a visible target, but about noon, after a preliminary cannonade, Gustavus gave the signal to advance.

The king himself commanded the right wing, which had to wait till small bodies of infantry detached for the purpose had driven in the Imperialist skirmish line, and had then to cross a ditch leading the horses. They were not charged by the Imperialists at this moment, for Pappenheim had not yet arrived, and the usual cavalry tactics of the day were founded on the pistol and not on the sword and the charging horse. Gaining at last room to form, the Swedes charged and routed the first line of the Imperial cavalry but were stopped by the heavy squadrons of cuirassiers in second line, and at that moment Gustavus galloped away to the centre where events had taken a serious turn. The Swedish centre (infantry) had forced their way across the Leipzig road and engaged Wallenstein's living forts at close quarters. The "Blue" brigade—Gustavus's infantry wore distinctive colours—overran the battery of heavy guns, and the "Swedish" (so called as being the only brigade containing no foreign elements in the army) and "Yellow" brigades engaged the left face of the Imperialist "lozenge" with success. But a gap opened between the right of the infantry and the left of the cavalry and Wallenstein's second-line squadrons pressed into it. It was this which brought Gustavus from the extreme right, and he was killed here in leading a counter-charge.

On the extreme left, meanwhile, the "Green" brigade had come to close-quarters with Wallenstein's infantry and guns about Lützen, and the heavy artillery had gone forward to close range between the "Green" and the "Yellow" infantry. But the news of Gustavus's death spread and the fire of the assault died out. Wallenstein recaptured his guns and drove the Swedes back.

But the fiery Duke Bernhard of Saxe-Weimar took up the command and ordered a fresh advance. He was too good a soldier to waste his reserves and only brought up a few units of the second line to help the disordered brigades of the first. Again the Imperialists were driven in and their guns recaptured, this time all along the line. About three in the afternoon the Swedes were slowly bearing back Wallenstein's stubborn infantry when Pappenheim appeared. The famous cavalry leader had brought on his mounted men ahead of the infantry and asking, "Where is the king of Sweden?" charged at once in direction of the enemy's right. Wallenstein thus gained time to re-establish his order, and once more the now exhausted brigades of the Swedish first line were driven over the road. But Pappenheim fell in the moment of victory, and his death disheartened the Imperialists, whereas the fall of Gustavus had filled the Swedes with furious energy. For the last time, Bernhard, wounded as he was, forced the Swedish army to the attack. The three infantry brigades of his second line had only been engaged in part, and, as usual, the last closed reserve, resolutely handled, carried the day. Wallenstein's army made good its retreat under cover of darkness, and the Swedes slept on the battlefield. Robbed of their leader they failed to gain the strategic profit of their victory. Of the losses on either side no accurate statement can be given, but the Swedish "Green" and "Yellow" brigades are said to have lost five-sixths of their numbers. Near the spot where Gustavus fell a granite boulder was placed in position on the day after the battle. A canopy of cast-iron was erected over this *Schwedenstein* in 1832, and close by, a chapel, built by Oskar Ekman, a citizen of Gothenburg (d. 1907), was dedicated on Nov. 6, 1907.

Lützen is famous also as the scene of a victory of Napoleon over the Russians and Prussians on May 2, 1813. (*See* NAPOLEONIC CAMPAIGNS.) This battle is often called *Gross Görschen.*

LÜTZOW, ADOLF, FREIHERR VON (1782–1834), Prussian lieutenant-general, was born in Berlin on May 18, 1782, and entered the army in 1795. At the outbreak of the "war of liberation," he received permission from Scharnhorst to organize a "free corps" consisting of infantry, cavalry and Tirolese marksmen, for operating in the French rear and rallying the smaller governments into the ranks of the allies. At Kitzen (near Leipzig) the whole corps, warned too late of the armistice of Poischwitz, was caught on the French side of the line of demarcation and, as a fighting force, annihilated. Lützow cut his way out with the survivors, and recruited and reorganized the corps, which fought at Gadebusch (where Körner fell), Göhrde (where Lützow was wounded), and at the siege of Jülich. At Ligny Lützow led the 6th Uhlans to the charge, but they were broken by the French cavalry, and he was captured, escaping, however, on the day of Waterloo. He died at Berlin on Dec. 6, 1834. One of the last acts of his life for which Lützow is remembered is his challenge (which was ignored) to Blücher, who had been ridden down in the rout of the 6th Uhlans at Ligny, and had made, in his official report, comments thereon, which their colonel considered disparaging.

See K. von Lützow, *Adolf Lützows Freikorps* (1884); Fr. von Jagwitz, *Geschichte des Lützow'schen Freikorps* (1892).

LUXEMBOURG, FRANÇOIS HENRI DE MONTMORENCY-BOUTEVILLE, Duke of (1628–1695), marshal of France, the comrade and successor of the great Condé, was born at Paris on Jan. 8, 1628. He was the son of the comte de Montmorency-Bouteville, and was brought up by his aunt, Charlotte de Montmorency, princess of Condé, with her son, the duc d'Enghien. The young Montmorency (or Bouteville as he was then called) shared his cousin's successes and reverses throughout the troubles of the Fronde. He returned to France in 1659 and was pardoned, and Condé arranged his marriage to the greatest heiress in France, Madeleine de Luxembourg-Piney, princesse de Tingry and heiress of the Luxembourg dukedom (1661), after which he was created duc de Luxembourg and peer of France. At the opening of the War of Devolution (1667–68), Condé, and consequently Luxembourg, had no command, but during the second campaign he served as Condé's lieutenant-general in the conquest of Franche Comté. In 1672 he held a high command against the Dutch. He defeated the prince of Orange at Woerden and ravaged Holland, and in 1673 made his famous retreat from Utrecht to Maestricht with only 20,000 men in face of 70,000, an exploit which placed him in the first rank of generals. In 1674 he was made captain of the *gardes du corps,* and in 1675 marshal of France. In 1676 he commanded the army of the Rhine, but failed to keep the duke of Lorraine out of Philipsburg; in 1677 he stormed Valenciennes; and in 1678 he defeated the prince of Orange, who attacked him at St. Denis after the signature of the peace of Nijmwegen. Luxembourg spent some months of 1680 in the Bastille, but on his release took up his post at court as *capitaine des gardes.*

When the war of 1690 broke out, the king and Louvois gave Luxembourg command of the army of Flanders. On July 1, 1690, he won a victory over the prince of Waldeck at Fleurus. In 1691 he commanded the army which covered the king's siege of Mons and defeated William III. of England at Leuze on Sept. 18, 1691. Again in the next campaign he covered the king's siege of Namur, and defeated William at Steenkirk (*q.v.*) on June 5, 1692; and on July 29, 1693, he won his greatest victory over his old adversary at Neerwinden, after which he was called *le tapissier de Nôtre Dame* from the number of captured colours that he sent to the cathedral. He was received with enthusiasm at Paris by all but the king, who looked coldly on a relative and adherent of the Condés. In the campaign of 1694, Luxembourg did little in Flanders, except that he conducted a famous march from Vignamont to Tournay in face of the enemy. He died on January 4, 1695. As a general he was Condé's grandest pupil. Though slothful like Condé in the management of a campaign, at the moment of battle he seemed seized with happy inspirations, against which no ardour of William's and no steadiness of Dutch or English soldiers could stand. He left four sons, the youngest of whom was a marshal of France as Maréchal de Montmorency.

See, besides the various memoirs and histories of the time, Beaurain's *Histoire militaire du duc de Luxembourg* (Hague and Paris, 1756); *Mémoires pour servir à l'histoire du maréchal duc de Luxembourg* (Hague and Paris, 1758); Courcelles, *Dictionnaire des généraux français,* vol. viii. (Paris, 1823). *See* Ségur *La jeunesse du maréchal de Luxembourg, 1628–68* (1900); *Le maréchal de Luxembourg et le prince d'Orange, 1668–98* (1902) and *Les dernières années du maréchal de Luxembourg* (1904), also Canonge, *Le maréchal duc de Luxembourg* (1924).

LUXEMBOURG, grand-duchy of Europe, which consists mainly of the upper basins of the Sauer and its feeder the Alzette, draining and dissecting the south-east flank of the Ardennes. A province of the same name forms the Ardennes highland in the kingdom of Belgium, and the two together, with certain other small areas, form the historic Luxembourg.

History.—Under the Romans the district was included in the province of *Belgica prima,* afterwards forming part of the Frankish kingdom of Austrasia and of the empire of Charlemagne. Luxembourg's recorded history dates back to 963, when Sigefroi, count of Ardennes, an offspring of Charlemagne, founded the actual capital. Sigefroi, the first sovereign ruler of the little country, was a contemporary of Otto the Great, who founded, in 962, the first German empire, and of Hughes Capet, creator of modern France. About 1060 it came under the rule of Conrad (d. 1086), who took the title of count of Luxembourg. His descendants ruled the county, first in the male and then in the female line, until the death of Sigismund (1437), the fourth and last emperor of the house of Luxembourg. Among the early rulers of Luxembourg, the outstanding figure is that of Countess Ermesinde, who reigned in the first half of the 13th century. She granted charters of franchise to the most important towns of the country—the charter of the city of Luxembourg dates from 1244. In 1354 Charles IV, the second emperor of this house, made the county into a duchy. Through the marriage of Sigismund's daughter, Elizabeth, with the German king, Albert II, Luxembourg passed for the first time to the house of Habsburg, but was seized in 1443 by Philip III the Good, duke of Burgundy, who based his claim upon a bargain concluded with Sigismund's niece Elizabeth (d. 1451). Regained by the Habsburgs in 1477 when Mary, daughter and heiress of duke Charles the Bold, married the German king Maximilian I, the duchy passed to Philip II of Spain in 1555. At the peace of the Pyrenees (1659), a section on the southwestern border, with the towns of Thionville and Montmédy, was ceded to France.

In 1684 the French conquered the fortress of Luxembourg, but 13 years later, by the peace of Ryswick, Louis XIV was compelled to return it with Belgium to Spain. By the treaty of Utrecht (1713) Luxembourg and Belgium passed from Spanish sovereignty to Austrian. In 1795 the troops of the French republic occupied Luxembourg, which was retained by France, as the Departement des Forêts, until the end of the Napoleonic wars.

The Congress of Vienna (1814–15) erected it into a grand duchy, added part of the duchy of Bouillon to it, but on the other hand gave the Luxembourg territories situated east of the Moselle and the river Our to Prussia. This grand duchy was assigned to William I, king of the Netherlands, in return for the German territories of the house of Orange-Nassau, which Napoleon had confiscated in 1806 and which were given by the congress to the king of Prussia. Thus the Netherlands and Luxembourg were only to be united by personal union. Furthermore the grand duchy was to belong to the Germanic confederation, its capital was to be a federal fortress and by a special arrangement with king William I the garrison was Prussian. Nevertheless William I ruled the grand duchy as part of the kingdom of the Netherlands. So, when in 1830 the Belgian provinces separated from Holland, the grand duchy revolted also and put itself under Belgian authority, with the exception of the town of Luxembourg, which, owing to the presence of the Prussian garrison, remained under the rule of William I. In Nov. 1831, the powers divided the grand duchy in two parts, of which the larger western part, with a Walloon and French-speaking population, was to be included as a province in the new kingdom of Belgium, and the smaller eastern part should be retained by William I as grand duke of Luxembourg. The grand duchy, thus reduced to less than half of its former area, remained in the Germanic confederation with the Prussian garrison in her capital. But William I refused to accept this arrangement. Consequently the whole of Luxembourg remained in the possession of the Belgians until 1839, when the treaty of April 19, concluded at the conference of London, enforced the partition of 1831, and recognized Luxembourg as a sovereign and independent state under the guarantee of the European powers. The king of the Netherlands retained the grand-ducal crown.

In 1842 the grand duchy, which had no common frontier with Holland and was therefore economically wholly isolated, entered the German Zollverein under the special control of Prussia. As the Germanic confederation had dissolved (1866), the town of Luxembourg had ceased to be a federal fortress, but Prussia maintained her garrison in spite of French protests. When King William III of the Netherlands offered to sell his rights over the grand duchy to Napoleon III war between France and Germany was in sight. The question was referred to a conference of the powers in London. The treaty of London (May 11, 1867) decided that the Prussian garrison must be withdrawn and the fortress dismantled. At the same time the great powers guaranteed collectively the neutrality of the grand duchy which, while remaining a member of the Zollverein, formed now an independent state.

Personal union with Holland ceased at the death of William III in 1890. The king having no male descendant, while his daughter Wilhelmina could succeed to the throne of Holland, the grand duchy, according to the family pact of the house of Nassau, passed to the last agnate of that house, Adolphus, whose duchy of Nassau had been annexed by Prussia in the German war of 1866. Adolphus died in 1905 and was succeeded by his son William, whose eldest daughter, Marie-Adelaide, ascended the throne in 1912. On Aug. 2, 1914, the German armies invaded the grand duchy, on the pretext that it was necessary to protect the German control and working of the Luxembourg railways against a French invasion. On Aug. 4 Herr von Bethmann-Hollweg admitted to the reichstag that the violation of Luxembourg neutrality was wrong, and promised reparation. The Luxembourg government and the sovereign protested against this violation, but the grand duchy remained in German occupation for the duration of the war.

The grand duchess, Marie-Adelaide, abdicated (Jan. 10, 1919) in order to save the independence of the grand duchy, and was succeeded by her sister, Princess Charlotte. Marie-Adelaide died in 1924. By the referendum of Sept. 28, 1919, the Luxembourg people pronounced for the maintenance of the monarchy with Charlotte as grand duchess. On May 10, 1940, German troops again overran the duchy. The Allied offensives in 1944 and 1945 liberated Luxembourg from German rule and the duchy's independence was restored. (*See* World War II.)

Population.—The population is 296,913 (Dec. 31, 1935), the great majority being Roman Catholics. The chief towns are: the capital, Luxembourg, with 57,740 inhabitants, the three towns in the mining district, Esch-Alzette (27,517), Differdange (15,945) and Dudelange (13,572), and the old town of Echternach (3,280) famous for its "dancing procession."

The common language is called *letzeburgesch*. Based upon old Teutonic origins, it has extensively borrowed from the Celtic, Roman and French tongues. German and French roots have been phonetically altered throughout the centuries. This was declared the official language in 1939.

Constitution.—Luxembourg is a constitutional monarchy with the crown hereditary in the house of Nassau. The actual sovereign is the grand duchess Charlotte (born Jan. 23, 1896), who married on Nov. 6, 1919, Prince Felix of Bourbon-Parma. The heir to the throne is Prince Jean (born Jan. 5, 1921).

By a law of May 15, 1919, the constitution of the grand duchy was revised in a more democratic direction. The powers of the sovereign were limited, universal suffrage, with proportional representation, was instituted, and the franchise was conferred on women. But the most interesting innovation was the creation by the law of April 4, 1924, of five chambers for traders and industrialists, agriculturists, artisans, private employees and workmen, election to the chambers being by electors in these occupations above the age of 21. These chambers have the power to create and maintain institutions, the right to propose bills which must be submitted to the chamber of deputies, and they have a right to be consulted before laws affecting their professional interests are passed by the chamber of deputies.

Customs Union with Belgium.—After the evacuation of the country by the German troops in Nov. 1918, Luxembourg denounced its membership of the German Zollverein, and from Jan. 1, 1919, it constituted an autonomous customs territory, while, by virtue of articles 41 and 268 of the treaty of Versailles, it enjoyed the right of exporting to Germany for five years, duty free, goods equivalent in quantity to its average prewar export to Germany.

By the referendum of Sept. 28, 1919, the Luxembourg people pronounced by 60,133 votes for an economic union with France against 22,242 votes for an economic union with Belgium. Association with France would have helped the agrarian interest, while the vinegrowers stood to gain from association with Belgium. After the occupation of Frankfurt, carried out jointly by French and Belgian troops (April 8, 1920), the French government made a declaration renouncing the negotiation of a customs union with Luxembourg in favour of Belgium. Relations with Belgium had been strained as a result of the plebiscite, but the new negotiations between Belgium and Luxembourg culminated in a convention (July 25, 1921) establishing an economic union between the two countries which came into force on May 1, 1922, to last for 50 years. By this treaty customs frontiers between the two countries were destroyed, and Luxembourg customs assimilated to those of Belgium, though the Luxembourg customs administration is retained. The total customs, plus the product of certain internal excise duties, are divided after a small deduction used to encourage Luxembourg cereal growing, in the proportion of 28 to 1. The state paper currency was reduced to 25,000,000 francs.

Railways.—Luxembourg has two systems of railways: the Guillaume-Luxembourg and the Prince-Henri railways. While the latter company works its lines itself, the lines of the Guillaume-Luxembourg company, which form the main part of the railways and are also of strategical importance, were, after the armistice of Nov. 1918, provisionally run by the Alsace-Lorraine railways, which belong to the French state. According to the customs convention between Luxembourg and Belgium, the Belgian state should share in working both Luxembourg railways, the two systems of normal gauge being united. After long negotiations a convention between the Luxembourg and the Belgian governments was signed at Brussels on May 13, 1924. Under its terms the entire railway system of Luxembourg was to have been administered by the Prince-Henri railway under the control of the Grand Ducal government, conjointly in so far as questions of interest to Belgium are concerned, particularly as regards transit, with the Belgian government. But this convention was rejected by the Luxembourg chamber of deputies on Jan. 20, 1925. In 1939 there were approximately 350 mi. of standard and secondary gauge railways.

Agriculture, Industry and Trade.—Although the soil of the grand duchy is not very fertile, agriculture is prosperous. The distribution of land is: 305,712 ac. arable land, 202,268 ac. forests, 67,555 ac. meadows and 3,829 ac. vineyards.

The main industry of the country is the iron industry, based on the iron ores, called minette, found in the south. In 1938 Luxembourg produced 5,666,900 short tons of iron ore—an average annual output. There were, in 1938, 35 blast furnaces with more than 20,000 workers, which produced 1,709,700 tons of pig-iron with a value of $23,800,000 (U.S.). The seven steel foundries of the grand duchy produced, in 1938, 1,584,100 short tons of steel valued at $27,294,000 (U.S.). German capital, which before World War I dominated the iron works of the grand duchy, was replaced later by Luxembourg, Belgian and French capital. Besides the factories which they own in Luxembourg, the Luxembourg metallurgical companies own or control mines, collieries, blast furnaces, steel works and factories for iron and steel manufacture in France, Belgium, Germany and in Brazil. Besides the ancient industries of sole leather, slates, metal constructions, china, explosives, gloves, drapery, woven wear, brewing and tobacco, long established in Luxembourg, new industries have grown up, and have made considerable way. These are the cement industry, the manufacture of sparkling wines, fancy leather and brushes.

Finance.—The monetary unit is the franc, whose parity was fixed in 1935 at 1.25 Belgian francs. In 1913 the public consolidated debt of the grand duchy was about 10,000,000 gold francs. In 1925 this debt had risen, in consequence of the charges which the state had to assume during the war to assure the feeding of the population and to meet the deficits in the budget, to 196,000,000 francs, plus a loan of 175,000,000 francs issued in Belgium in 1922 and intended for the exchange of notes of the Luxembourg state for notes of the National Bank of Belgium. By 1939 the consolidated debt was 625,000,000 francs ($25,000,000 U.S.). Estimated revenue for 1939 amounted to 355,230,000 francs ($14,209,000 U.S.), and estimated expenditure 353,440,000 francs ($14,137,600 U.S.).

The House of Luxembourg was descended from Count Conrad (d. 1086), and its fortunes were advanced through the election of Count Henry IV as German king in 1308 and his coronation as emperor under the title of Henry VII. Henry's son was John, king of Bohemia, who fell on the field of Crécy (1346), and John's eldest son was the emperor Charles IV, while another famous member of the family was Baldwin, archbishop of Treves (1285–1354), who took an active part in imperial affairs. Two of the sons of Charles IV, Wenceslaus and Sigismund, succeeded in turn to the imperial throne, and one of his nephews, Jobst, margrave of Moravia, was chosen German king in opposition to Sigismund in 1410. The French branch of the family was descended from Waleran (d. 1288), lord of Ligny and Roussy, a younger son of Count Henry II. Waleran's great-grandson was Guy (d. 1371), who married Matilda, sister and heiress of Guy V, count of Saint-Pol (d. 1360), and was created count of Ligny in 1367. Guy's son, Waleran (d. 1417), who became constable of France in 1412, had been carried as a prisoner to England, and had married Matilda, daughter of Thomas Holland, earl of Kent (d. 1360) and half-sister of King Richard II. To avenge Richard's death he made a raid on the Isle of Wight, and then took part in the civil wars in France. He left no sons, and was succeeded by his nephew, Peter, count of Brienne (d. 1433), who, like his brother Louis (d. 1443), cardinal archbishop of Rouen and chancellor of France, was found on the side of the English in their struggle against France. Another of Peter's brothers, John (d. 1440), a stout supporter of England, was made governor of Paris by Henry V. He sold Joan of Arc to the English. Peter's son and successor, Louis, fought at first for England, but about 1440 he entered the service of France and obtained the office of constable. King Louis XI accused him of treachery, and he took refuge with Charles the Bold, duke of Burgundy; but the duke handed him over to the king and he was beheaded in 1475. The elder branch of his descendants became extinct in the male line in 1482, and was merged through the female line in the house of Bourbon-Vendôme. Louis' third son, Anthony (d. 1510), founded the family of Luxembourg-Brienne, the senior branch of which became extinct in 1608. A junior branch, however, was the family of the duke of Luxembourg-Piney, whose last representative, Margaret-Charlotte (d. 1680), married firstly Léon d'Albert de Luynes (d. 1630) and secondly Charles Henry de Clermont-Tonnerre (d. 1674). Her daughter by her second husband, Madeleine Charlotte, married Francis Henry de Montmorenci (d. 1695) and de Luynes, and subsequently members of the family of Montmorenci claimed the title of duke of Luxembourg. The Luxembourg palace in Paris owes its name to the fact that it was built on a site belonging to the duke of Luxembourg-Piney.

LUXEMBOURG, province of southeast Belgium, formed of the high wooded Ardennes. Area 1,705 sq.mi.; pop. (est. 1939) 218,643. The upper Ourthe and lower Semoise valleys are much visited. The extreme south, often called Belgian Lorraine, has mines of minette (iron ore) and there, to the south of the high Ardennes, cultivation also prospers. On the higher ground are forest industries and slate quarrying at Vielsalm, Herbeumont, Bertrix, Martelange, etc. The chief towns are Arlon (the capital), Virton, Marche, and Bastogne. There are 5 administrative *arrondissements*, 20 cantons and 233 communes.

LUXEMBOURG or Lutzelburg (*i.e.*, the little fortress or town), the capital of the grand duchy of the same name (*see* above), situated on the Alzette, a tributary of the Sûre. Pop. (1935) 57,740. It is situated on cliffs which overhang the river, and the principal portion of the town with the palace and public buildings covers a central plateau. The more densely populated parishes of Clausen, Pfaffenthal and Grund lie in the valley. The fortress, considered the strongest in Europe after Gibraltar, was dismantled in 1867. Two viaducts carry the railway and the approach from the railway station to the town. The Alzette is lined with tanneries, breweries and distilleries. The Hôtel de Ville contains a collection of antiquities. The church of Notre Dame was built in 1613, and that of St. Michael dates in part from 1320. There are two annual fete days, one in honour of Our Lady of Luxembourg, patroness of the city, held on the Sunday before Ascension Day, and the other the annual fair or *Schobermesse* (tent fair), instituted in 1340 by Count John of Luxembourg, king of Bohemia, and held on Aug. 24.

LUXEMBURG, ROSA (1870–1919), German revolutionary, known as "rote Rosa," was born at Zamość, Russian Poland, on Dec. 25, 1870. An active worker among Polish socialists, she migrated about 1895 to Germany, where she married a German workman in order to acquire German nationality. In 1898 she edited the Saxon *Arbeiterzeitung*, but shortly afterwards joined the staff of the *Leipziger Volkszeitung*. She took part in the Russian revolution of 1905, and on her return to Germany founded with Karl Liebknecht the Spartacus league. In 1914 she was sentenced to a year's imprisonment for inciting to insubordination and throughout World War I remained in preventive custody. After the revolution she edited, with Liebknecht, the communist paper, *Rote Fahne*. They were arrested on Jan. 15, 1919, on the charge of instigating the street fighting in Berlin which had taken place a few days earlier. While being conveyed to the Moabit prison they were brutally attacked by army officers. Liebknecht was murdered and Rosa Luxemburg died a few hours later from injuries received. Her body was thrown into the canal, and only found some days later.

Bibliography.—Her works include *Die Akkumulation des Kapitals* (1913); *Die Krise der Sozialdemocratie* (1919) under the pseudonym "Junius"; *Briefe aus dem Gefängnis* (1920) and *Briefe an Karl und Luise Kautsky, 1896–1918*. *See* also G. Zinoviev, *Karl Liebknecht et Rosa Luxemburg* (1919); C. P. A. F. Liebknecht, *The Murder of Karl Liebknecht and Rosa Luxemburg* (1924).

LUXEUIL-LES-BAINS, a town of eastern France, in the department of Haute-Saône, 18 mi. N.E. of Vesoul. Pop. (1936) 5,590. It lies in a region of forests on the right bank of the Breuchin. Luxeuil was the Roman *Lixovium* and contained many fine buildings at the time of its destruction by Attila in 451. In 590 St. Columban there founded a monastery. In the 8th century it was destroyed by the Saracens; afterward rebuilt, monastery and town were devastated by the Normans in the 9th century and pillaged several times later. The abbey schools were celebrated in the middle ages; the abbey was suppressed at the Revolution. The 14th-century abbey-church contains a curious 17th-century organ loft in the form of an immense bracket supported by a colossal figure of Hercules. The abbot's palace (16th and 18th centuries) serves as presbytery and *hôtel de ville*. A cloister of the 15th century remains. There are several mansions and houses dating from various periods from the 14th to the 16th century. The Maison Carrée, once the town hall, is an interesting specimen of 15th-century architecture. The Maison de la Baille and the Maison François I are of the Renaissance period. Luxeuil is renowned for its mineral springs, some ferruginous, and some alkaline; their temperatures range from 70° to 158°. The water is employed for drinking and for baths. The bathing establishment contains a museum of Gallo-Roman antiquities and there are also remains of Roman baths and aqueducts to be seen in or near it. Copper founding, the spinning and weaving of cotton, lacemaking, dyeing and the distilling of kirsch are carried on.

LUXOR, more properly El-Aksur, "The Castles" (plur. of kasr), a town of Upper Egypt, on the east bank of the Nile, 450 mi. above Cairo by river and 418 mi. by rail. It is the centre for visitors to the ruins of and about Thebes, and has several fine hotels. There are Anglican and Roman Catholic churches, and a hospital opened in 1891. The district is the seat of an extensive manufacture of forged antiques.

The temple of Luxor is one of the greatest of the monuments of Thebes (*q.v.*). It stands near the river bank on the S.W. side of the town and measures nearly 300 yd. from back to front. There may have been an earlier temple here, but the present structure, dedicated to the Theban triad of Amen, Mut and Khansu, was erected by Amenhotep III. The great colonnade, which is its most striking feature, was apparently intended for the nave of a hypostyle hall like that of Karnak, but had to be hastily finished without the aisles. After the heresy of Amenhotep IV (Akhenaton), the decoration of this incomplete work was taken in hand by Tutenkhamon and Horemheb. The axis of the temple ran from southwest to northeast; a long paved road bordered by recumbent rams led from the façade to the temples of Karnak in a somewhat more easterly direction, and Rameses II adopted the line of this avenue in adding an extensive court to the work of Amenhotep, producing a curious change of axis. He embellished the walls and pylons of his court with scenes from his victories over Hittites and Syrians, and placed a number of colossal statues within it. In front of the pylon Rameses set up colossi and a pair of obelisks (one of which was taken to Paris in 1831 and re-erected in the Place de la Concorde). Alexander the Great rebuilt the sanctuary. The chief religious festival of Thebes was that of "Southern Opi," the ancient name of Luxor. The sacred barks of the divinities preserved in the sanctuary of Karnak were then conveyed in procession by water to Luxor and back again; a representation of the festal scenes is given on the walls of the great colonnade. The Christians built churches within the temple, and a mosque used to cover its western end. Clearance and restoration was begun by the Service des Antiquités in 1885, and has been vigorously pursued since. The principal street of Luxor follows the line of the ancient avenue.

LUXORIUS, Roman writer of epigrams, lived in Africa during the reigns of the Vandal kings Thrasamund, Hilderic and Gelimer (A.D. 496–534). He speaks of his poor circumstances, but, from the superscription *clarissimus* and *spectabilis* in one ms., he seems to have held a high official position. About a hundred epigrams by him in various metres (the elegiac predominating) have been preserved. They are after the manner of Martial, and deal chiefly with the games of the circus and works of art. Luxorius also wrote on grammatical subjects (*see* R. Ellis in *Journal of Philology,* viii, 1879). The epigrams are contained in the *Anthologia Latina,* edited by F. Bücheler and A. Riese (1894).

LUXURY. The word luxury is derived from the Latin *luxus,* which may be translated "superfluous abundance." As generally used, it implies the notion of a relatively large consumption of wealth for unessential pleasures. But there is no absolute definition of luxury, for the conception is essentially relative to both time and person. It is a commonplace of history that the superfluities of one generation may become the necessaries of a subsequent period; there is no hard and fast line which can be drawn between luxuries, comforts and necessaries. The private bath was one of the greatest luxuries of the Roman empire; in the 19th century its use was largely confined to the wealthy; to-day it may be ranked amongst the necessaries of life. Looked at from one important standpoint, luxury might be defined as any expenditure which is in excess of the normal and customary standard of living of the class to which the individual concerned belongs.

The problem of luxury is one which involves economic, social and ethical considerations.

The Economic Aspect.—Viewed from the economic standpoint luxury has undoubtedly played a great rôle in the history of economic development. W. Sombart in his *Luxus und Kapitalismus* has shown that the luxurious expenditure of the papacy and of the courts in the middle ages had a not unimportant share in the growth of modern capitalism. The rentals of distant estates were concentrated at some central spot; wealth was accumulated there; a relatively large market was created for the products of certain industries; and the necessary conditions for the development of capitalist enterprise were fulfilled.

In France, the classic land of luxury, the continual drain of wealth from the countryside to Paris and Versailles, combined as it was with a vicious system of taxation and the burdensome restrictions of feudal tenure, produced, on the one hand, a considerable amount of industrial activity, carefully fostered by the mercantilist policy of Jean Colbert and his successors; but, on the other hand, it led eventually to the disruption of the old social order amidst the turmoil of the French Revolution. It is one of the paradoxes of history that a precisely opposite view and method of life—that of the Puritans, with their strong moral condemnation of luxury and their emphasis on the value of hard work and abstinence from all unnecessary consumption—should have contributed even more notably to the growth of capital and to the expansion of industry and commerce.

In other directions, also, luxury has made its influence felt. Thus in Italy, the rise of the merchant princes gave a new direction to the whole course of art, for the mediaeval church ceased to be the chief patron of the artist, who now had to conform in his work to the standards and tastes of those who provided the market for his products. The simple piety of the primitives gave place to the sumptuous paganism of the Renaissance period, and that in turn to the elaborate ornamentation and decorative inventiveness which was perhaps at its best in the metal work of Benvenuto Cellini, until at length the over-refinements of a decadent social life killed all artistic inspiration.

Luxury is the inevitable concomitant of the growth of wealth, which brings with it the increase and the differentiation of wants. The fact that the fundamental needs of mankind for a minimum of food, clothing and protection from the weather are relatively soon satisfied gives rise to a demand for greater variety and finer qualities as soon as income rises above the bare subsistence level. This demand, which is especially strong among the feminine portion of the human race, has, in the past, been a great stimulus to economic progress, for it has provided an enormously strong incentive to work and effort.

The attitude of the great majority of people towards the luxurious expenditure of the rich is a mixture of envy, often devoid of any feeling of resentment, and of approval based on popular economic reasoning. It is a very widespread belief that such expenditure is good for trade because it makes money circulate and therefore increases employment. The classical economists, down to and including Alfred Marshall, had no hesitation in declaring that this reasoning was based on a fallacy. They agreed that the maintenance of racing stables or private yachts, the purchase of magnificent furs or jewellery, does give employment to those engaged in the trades concerned, and that the localities in which these trades are situated benefit from such expenditure. But they argued that the fallacy of such reasoning lay in ignoring the fact that the aggregate real resources of producing power in a country are limited at any one time. A large amount of capital and labour is required to make and equip yachts and racing stables, and this capital and labour is withdrawn from other uses to which it would be put. If the wealth consumed extravagantly was saved and invested, the volume of capital would be increased, the rate of interest would tend to fall and there would be a larger demand for labour to co-operate in the production of goods consumed by other sections of the community. If, in a capitalist society, there was a sudden change in the standards of expenditure of the wealthy classes such that all expenditure commonly recognized as luxurious was regarded with strong social disapprobation, these persons would find themselves impelled to save on a much larger scale than formerly, and a great deal more capital would be available for production. But as the ultimate aim of production is consumption the net effect of the change of policy in regard to expenditure would be to transfer additional spending power to all the less wealthy members of the community. The latter would benefit by higher money wages, owing to the greater demand for their services, and from the still higher *real* wages, owing to the fall in the rate of interest and to the larger production of the type of commodities which they consume. Some proportion of this increased wealth would be consumed by the poorer classes in the form of luxuries, as we have defined this term above, or in an increased enjoyment of the quasi commodity, leisure. The ultimate consequences of such a change would depend, firstly, upon the economic and social effects of this transfer of real income to the poorer classes and, secondly, upon the willingness of the wealthier classes to continue to work as hard and efficiently as formerly to produce incomes which they do not themselves enjoy by consumption, and the spending power of which they in fact transfer to other people. Thus far the classical view of the economic effects of luxurious expenditure. More recently, however, and particularly under the influence of the ideas put forward by Lord Keynes, a fresh turn has been given to the discussion.

When closely examined the classical view is found to depend for its validity upon the assumption of full employment of the community's available resources. If there are idle resources and if the saving portion of the community prefer to hold their savings in the form of money rather than in the form of investing them in some income-yielding use (other than the purchase of old securities), then any additional expenditure on the part of any section of the community will increase the volume of employment and make the total national income larger than it would otherwise have been. While it is true on the one hand that the country as a whole cannot save what it cannot invest, any given level of investment and saving may fall short of occupying fully all the resources of the economy. Under these conditions a decision by an individual to save rather than to spend part of his income may merely have the effect of inflicting an equivalent loss on other individuals. The saver will, it is true, hold a larger command over the community's wealth than before, whether in the form of money, or in the form of securities which have had to be sold by other members of the community in order to finance their losses, but the total savings of the community have not been increased, but rather diminished, because of the resultant fall in the national output and income. It still remains true that the community will normally benefit more by an expansion of investment rather than by an increase of luxurious expenditure; but if the savings would otherwise run to waste in an increase of "hoarding," then a rise in what is called the "propensity to consume" will increase the total volume of employment and output, and will not, as in the classical case, be at the expense of an equivalent amount of investment which would otherwise have been made. In this way the popular argument has partially come into its own again in relation to short period analysis and to certain phases of the trade cycle when there is a shortage of effective demand.

The Social Aspect.—The slow process of disruption of feudalism, which is not yet completed in England, has substituted for the old hereditary, semicaste, organically knit order of a society a new plutocratic social system, amorphous and anarchic in structure, its values based on and expressed in terms of money, its relationships governed by a financial nexus. Formerly wealth had its duties and responsibilities, which were widely, if not universally, recognized, but the industrial revolution (*q.v.*) has tended for a while to divorce wealth from responsibility, and though a new social consciousness is springing up, nowhere more clearly than in the United States of America, it has not yet penetrated very deeply. As a result there has grown up in modern times in every class an enormous amount of purely ostentatious expenditure—the outcome of the desire for distinction which is one of the most deep-rooted characteristics of human nature. Until new standards arise—and there is evidence that they are being formed—distinction in the modern world is most easily afforded by the opportunities which wealth provides for display.

As T. B. Veblen has shown in his *Theory of the Leisure Class*, the evils of bad standards of expenditure are not confined to the wealthy classes from which they spring; they propagate and perpetuate themselves by example and imitation right down the social scale from top to bottom; what is called "snobbishness" is a very potent social force, but it is one which may as easily work for the good as for the harm of humanity. It has been well said that mankind is nowhere more vulgar than in the way in which it spends its incomes. No amount of time, effort or thought is grudged to the acquiring of wealth, but when we come to consume it we dissipate the fruits of our labours often with small gain to ourselves and with unforeseen and undesired repercussions on the welfare of the community as a whole. What R. H. Tawney has termed—in a notable book bearing this title, *The Acquisitive Society*—is the outcome of false social values, inspired by the all-pervading impulse to acquire riches to the elimination, or at least repression, of other higher ideals. While the churches wrangle over doctrine, they largely ignore the great problem of the art of spending which is so large a part of the art of living.

The Moral Aspect.—Moralists of all ages have attacked luxury on ethical grounds—the Stoics, because it ran counter to their ideals of simplicity of life; the early Christian Fathers, because they exalted asceticism and poverty into an ideal; the Puritans, because they feared lest the distractions and temptations of luxury might imperil the immortal soul and endanger its chances of salvation; the Socialists, because they hold unnatural and immoral the coexistence of luxury on the one side and poverty on the other.

In recent times the tendency has been increasingly for the moral judgment of luxury to be associated with the general problem of the unequal distribution of wealth—a view which, as is pointed out above, overlooks the fact that luxury is not confined to the richer sections of the community. The rigid condemnation of all luxury on moral grounds is untenable, if only for the reasons that there is no absolute measuring rod by means of which the ultimate social ethical value of expenditure can be tested, and that economic progress and changing standards of life so quickly alter contemporary notions of the types of expenditure that may be included under the category of luxuries. But a great deal of luxury is undoubtedly a waste of life, not least because of the ill effects it may have upon the individuals themselves, but also because the resulting satisfaction is frequently out of all proportion to the expenditure. As Prof. Pigou has pointed out in his *Economics of Welfare:* "It is at least arguable, that, after a point, as growing wealth gives a man command over more and more luxuries the satisfaction that he gains from each one is, as it were, taken out of relaxed interest in the others, so that the satisfaction which he derives on the whole is not substantially increased."

Consumption has its ethical as well as its economic aspects, and there are heavy moral responsibilities involved in the exercise by the individual of his right of disposal over the wealth which economic forces and social laws have placed in his hands.

LUXURY TAXES. The imposition of taxes on articles which are deemed to be luxuries may spring from one of two motives, or frequently, from a combination of both. In the first place, the tax may be intended to restrict the expenditure of money in certain directions. Here it forms a part of sumptuary legislation designed to repress the ostentation and extravagance of private persons. When the legislator had failed by direct prohibition to stamp out a certain type of expenditure that was deemed to be injurious, there remained the alternative of levying a heavy tax upon it. The success of the tax from this point of view could be measured by the smallness of the revenue derived from it, assuming that it was not possible to evade it. In England from the 14th to the 16th centuries there is a long history of sumptuary legislation, never properly enforced, directed chiefly against the wearing of rich clothes of foreign materials, the purchase of which tended to create an adverse balance of trade and thus ran counter to one of the cardinal principles of mercantilist policy. Most English laws of this nature were repealed in 1603. Economic writers in the 17th century considered that the consumption of luxuries was good for trade, and the growth of the finer types of manufacture of silk and woollen goods inside England removed a good deal of the force of the argument which had been based on the fact that such could only be procured from abroad. In the 18th century laws were passed against the wearing of French lawns and laces, partly to protect English manufactures and partly as a weapon of offence against the French. Adam Smith objected to sumptuary laws for a curious but characteristic reason: "It is the highest impertinence and presumption in kings and ministers, to pretend to watch over the economy of private people and to restrain their expense, either by sumptuary laws or by prohibiting the importation of foreign luxuries. They are themselves always and without any exception the greatest spendthrifts in the society. If their own extravagance does not ruin the State, that of their subjects never will."

In the second place, luxury taxes are imposed for revenue purposes as a method of taxation of the rich or as a tax on that part of the expenditure of all classes that is regarded either as socially undesirable or as a superfluity over and above all necessary expenditure and therefore a specially appropriate object of taxation.

In the late 18th and early part of the 19th centuries duties were levied in England on a number of articles. Hair-powder, silver plate, clocks, watches, horses, carriages, men-servants, dogs, armorial-bearings, playing-cards—all these have, for longer or shorter periods, contributed their quota to the revenue and, in the case of the last five objects mentioned, the taxation has continued to the present day. On the continent of Europe many of the same articles were taxed, but billiard tables also appear in many countries to have made specially strong appeal to the imagination of finance ministers. It is obvious from the above list that this form of taxation, as a source of revenue, suffers from the defect of being very unproductive. The rate of taxation is generally low, because otherwise the great elasticity of demand, which is a characteristic of most real luxuries, would result in the tax stifling consumption altogether. Relatively to its yield it is also costly to collect and irritating to the taxpayer. A form of luxury taxation that has been suggested, and which has the high authority of Marshall, is that heavy duties might be imposed on certain kinds of ostentatious expenditure, where the demand for the articles in question arises chiefly from the fact that they are rare and expensive and that their possession is a sign of great wealth. Heavy taxation of such objects as large diamonds or other precious stones or rare furs would merely serve to enhance their costliness and therefore the social distinction to be derived by their owners.

In modern times there has been a strong tendency for Governments to place taxes on certain classes of expenditure which fall rather within the category of what Marshall has termed "conventional necessaries" than of what are ordinarily regarded as luxuries. Most expenditure upon alcohol, tobacco, articles of silk, entertainments, private motor-cars, etc., is clearly superfluous in the sense that a large part of it is in excess of what is required for economic efficiency and personal well-being. No man need consume any specific quantity of these things, and any contribution that he may make to the revenue by purchasing them is the result of his own voluntary act. He can avoid taxation by refraining from consuming the taxed articles. Nevertheless, in actual fact these articles are purchased on an enormous scale and, as objects of taxation, they have the great advantage from the point of view of the chancellor of the Exchequer of having, within limits, an inelastic demand and thus of bearing heavy rates of tax without an undue contraction of demand. In appearance the familiar strictures on the taxation of necessaries are observed, but in reality many people pay an altogether undue proportion of their incomes to the Exchequer, owing to their insistence on purchasing articles, much of the price of which is composed of tax; just as before the World War it was a familiar grievance in Ireland that the Irish people as a whole paid an excessive proportion in relation to their wealth of taxes to the British Government, owing to the very high level of the whisky duty.

The problem of the relation between the revenue and the sumptuary aspects of a tax on consumption is nowhere more clearly seen than in the case of taxes on alcohol. Every chancellor of the Exchequer, as a member of the Government, will lay stress on the beneficial effects of high taxation in reducing the quantity of alcohol consumed and in lessening the evils of drunkenness. But in his capacity as finance minister he is continually looking at the quantity of revenue to be derived and carefully estimating that rate of tax which will bring in the largest total receipts. The advocates of temperance reform would probably seek his support in vain if they were to urge the raising of the duties to such a level as to diminish seriously their aggregate yield to the Exchequer. The case of alcohol illustrates some of the difficulties which may arise in a financial system which depends to any important extent upon taxes on articles of a luxury character. Luxuries are notoriously subject to changes in fashion, or taste, or public opinion. An alteration in the attitude of English people towards the consumption of alcoholic beverages, which led to a large decrease in such consumption, would create a most serious budget deficit.

In considering the proper position of luxury taxes in the general tax system of a country like England, it may be pointed out that an income tax can only make very partial allowances for variations in necessary expenditure, and there is therefore a strong case for supplementing the progressive rates of direct taxation with rather high taxes on the kind of luxuries which can only be bought by those whose incomes are much in excess of all normal and necessary requirements. (C. W. G.)

The United States.—The early colonial governments followed the examples of European states and taxed those things which from traditional or arbitrary points of view were regarded as luxurious, such as billiard tables, pleasure vehicles and even window glass. "Luxury" taxation is a dubious term, for as modern economists illustrate, luxuries and necessities tend rapidly to obliterate their lines of demarcation.

The modern type of luxury tax, in the form of sales or turnover or excise taxes, began in the U.S. in the Civil War; a heavy, comprehensive system of excise taxes on "non-essentials" being adopted in 1862, the rates being increased again in 1864. These excise taxes supplied over half the Civil War tax receipts; the income tax playing a minor role. The War Revenue Act of 1917 laid new taxes on a wide range of "non-essential" commodities, many of which were promptly dubbed "nuisance" taxes. Some, like the tax on soda fountain drinks, were not only costly to collect but were frequently evaded. When the Revenue Act of 1921 was adopted, the objectionable "nuisance taxes" (on soda fountain drinks, transportation tickets, etc.) were repealed.

The impact of the 1929–35 depression was such that new luxury taxation became inevitable, not only through Federal excise taxes but through state sales taxes. The Revenue Bill of 1932 taxed admissions and laid manufacturers' excise taxes on cosmetics, furs, jewelry, sporting goods, cameras, yachts, motor boats, firearms, radios, phonographs, automobiles, mechanical refrigerators, chewing gum and candy, beverages, malt, oil, gasoline, telephone and telegraph messages, matches, pipe lines, safety deposit boxes. Earlier luxury taxes included tobacco, liquor, club-dues, playing-cards, sale of produce, oleomargarine, stock transfers, etc. Important exemptions were made—garden and farm products, food items, newspapers, periodicals.

Resistance to adoption of a general turnover or sales tax has had the natural effect, under pressure of war or depression, of raising the taxation rates on luxuries. The usual 1 or 2% rate rises to 10% or 15%. However, the history of taxation shows that only taxes on articles of wide consumption enjoying inelastic demand may be depended upon to yield large tax revenues at low collection cost. Collection of luxury turnover taxes is notoriously difficult, and they yield low revenue; taxation tending strongly to limit consumption. Ideal items of so-called luxury taxation consequently are alcoholic beverages, tobacco, coffee, tea, sugar, gasoline; but the general public will not admit that these are in a real sense luxuries. It is also a realistic tax fact that ordinary taxable articles change hands many times from producer to consumer and the tax at a low rate may total almost as much as the tax on "luxuries" at the high rate.

The policy of selected taxes is nevertheless adapted to American ideas and experience. A major part of Federal revenues ever since the Civil War has come from selective excise taxes. The issue at stake has been, and is now, whether a general sales tax may be avoided by means of the selected taxes. The remarkable rise of state sales taxes (most of which have been selective because of exemptions) during the 1929–35 depression seemed during 1934–35 to point to replacement of state sales taxes with Federal sales taxes, but revulsion against state sales taxes set in in 1935 and averted this tendency. Manufacturers' selected excise taxes prevent pyramiding in the process of producer-consumer distribution. (J. G. F.)

LUYNES, CHARLES D'ALBERT (1578–1621), 1ST DUKE OF, was brought up at court and attended the dauphin, who later became Louis XIII. He was high in Louis's favour, and used his influence to intrigue against the queen-mother Marie de Medici and her favourite Concini. Luynes, with Vitry, captain of the guard, arranged the plot that ended in Concini's assassination (1617) and secured all the latter's possessions in Italy and France. He was appointed captain of the Bastille and lieutenant-general of Normandy, and married Marie de Rohan, daughter of the duke of Montbazon. In 1619 he negotiated the treaty of Angoulême by which Marie de Medici was accorded complete liberty. He was made governor of Picardy in 1619; suppressed an uprising of nobles in 1620; and in 1621 was appointed constable of France. Luynes undertook an expedition against the Protestants, but died at Longueville in Guienne, on Dec. 15, 1621.

See *Recueil des pièces les plus curieuses qui ont esté faites pendant le règne du connestable M. de Luynes* (2nd ed., 1624) and B. Zeller, *Études critiques sur le règne de Louis XIII.: le connétable de Luynes, Montauban et la Valteline* (Paris, 1879).

LUZAN CLARAMUNT DE SUELVES Y GURREA, IGNACIO (1702–1754), Spanish critic and poet, was educated in Italy where, as a pupil of Vico, he read assiduously. He returned to Spain and there published *La Poética, ó Reglas de la poesía en general y de sus principales especies* (1737), a recast of his thesis (1728) for the academy of Palermo.

Luzan was the most powerful exponent of Franco-Italian theories in Spain, and his *Poética* is an admirable example of destructive criticism. The defects of Lope de Vega and Calderon are indicated with vigilant severity, but on the constructive side Luzan is notably weak, for he merely proposes to substitute one exhausted convention for another. The doctrine of the dramatic unities had not the saving virtues which he ascribed to it, and, though he succeeded in banishing the older dramatists from the boards, he and his school failed to produce a single piece of more than mediocre merit.

LUZERN (Fr. LUCERNE), the capital of the Swiss canton of the same name. It is one of the principal tourist centres of Switzerland, being situated on the St. Gotthard railway line, by which it is 59 mi. from Basel and 180 mi. from Milan. The nucleus of the town was the monastery, founded about 750 on the right bank of the Reuss by the abbey of Murbach in Alsace, of which it long remained a "cell." It is first mentioned in a charter of 840 under the name of "Luciaria," and the form "Lucerrun" is first found in 1252.

The germs of a municipal constitution appear in 1252, and in 1291 the Habsburgs purchased Lucerne from Murbach, an act that led a few weeks later to the foundation of the Swiss Confederation, of which Lucerne became the fourth member (the first town to be included) in 1332. It finally got rid of Habsburg domination after the victory of Sempach (1386). That victory led also to the gradual acquisition of territory ruled by and from the town. At the time of the Reformation Lucerne clung to the old faith, of which ever since it has been the great stronghold in Switzerland, and the papal nuncio resided here from 1601 to 1873. In the 16th century, as elsewhere in Switzerland, the town government fell into the hands of an aristocratic oligarchy, whose power, though shaken by the peasant revolt (1653), lasted until 1798. Under the Helvetic republic (1798–1803) Lucerne was the seat of the central government, under the act of Mediation (1803–14) one of the six "Directorial" cantons and from 1815 to 1848 one of the three ruling cantons.

The patrician government was swept away by the cantonal constitution of 1831, but in 1841 they regained power, called in the Jesuits (1844) and so brought about the Sonderbund War (1847) in which they were defeated. The Radicals lost power in the canton in 1871, after which date the Conservatives became predominant in the canton, though in the town the Radicals were in the majority. Its prosperity has always been bound up with the St. Gotthard pass, so that the successive improvements effected on that route (mule path in the 13th century, carriage road 1820–30, and railway tunnel in 1882) have had much effect on its growth. Railways also connect Luzern with Meiringen, Bern, Zug, Geten and Lenzburg.

Luzern is situated on the banks of the river Reuss, just as it issues from the Lake of Lucerne, while to the south-west rises the range of Pilatus, balanced on the east by the ridge of the Rigi. To its north still stand nine of the towers that defended the old town wall.

The Reuss is still crossed by two old wooden bridges, the upper being the Kapellbrücke (adorned by many paintings illustrating the history of Switzerland and the town and clinging to the Wasserthurm) and the lower the Mühlenbrücke (with paintings of the Dance of Death). The old Hofbrücke (on the site of the Schweizerhof quay) was removed in 1852.

The principal building is the twin-towered Hofkirche (dedicated to St. Leger or Leodegar) which, though in its present form it dates only from 1633–35, originally formed part of a Benedictine monastery. It has a 17th century organ. The 16th century town-hall (Rathhaus) now houses the cantonal museum. Both the cantonal and the town libraries are rich in old books. The Lion monument, designed by Thorwaldsen, dedicated in 1821, and consisting of a dying lion hewn out of the living sandstone, commemorates the officers and men of the Swiss Guard, who were slain while defending the Tuileries in Paris in 1792. In the immediate neighbourhood is the Glacier garden, a series of potholes worn in the sandstone rock bed of an ancient glacier.

In 1799 the population numbered but 4,337, but had doubled by 1840. Since then the rise has been rapid and continuous: 29,255 (1900); 47,066 (1930); 54,841 (1941). The majority are German-speaking (in 1930 there were 1,041 Italian-speaking and 1,340 French-speaking persons) and Roman Catholics (in 1930 there were 10,630 Protestants and 469 Jews). (For canton of Luzern, *see* LUCERNE).

LUZERNE, an anthracite-mining borough of Luzerne county, Pennsylvania, U.S.A., on the west bank of the Susquehanna river, immediately north of Kingston; served by the Lackawanna railroad. Pop. was 6,950 in 1930 and 7,082 in 1940, federal census.

LUZON, the main and most northerly island of importance in the Philippine archipelago. It extends from 18° 39′ N. to 12° 32′ N. and from 119° 44′ E. to 124° 12′ E. Running generally north and south, it is of irregular outline, with extreme dimensions 460 mi. by 140 mi., and a coastline of 2,242 mi.

The more important mountain ranges are the Cordillera Central in the north, the Sierra Madre following most of the east coast and the Zambales range near the west coast. Mt. Pulog, 9,606 ft. is the highest peak. Isolated volcanic cones, as Mt. Mayon, 7,946 ft., occur in the south. The Cagayan valley, in the north, and the 100-mi. long central Luzon plain are the chief lowland areas. The Gulf of Lingayen and the Manila bay, both indentations of the South China sea, bound this plain on the north and south. It is the heart of Luzon and is densely populated.

The Laguna de Bay (344 sq.mi.) and Taal (94 sq.mi.) both near Manila, are the chief fresh water lakes. Both are shallow. The Cagayan, 220 mi. long and draining more than 9,000 sq.mi. is the largest river. The Pasig, at the mouth of which, on Manila bay, Manila is built, is of commercial importance.

Harbours in the north are few, mostly poor and undeveloped. The southern two-thirds of the island has many good anchorages and harbours. The artificial Manila harbour, of 1,200 acres area, has wharfage facilities for the largest commercial vessels. Other ports are Olongapo on Subic bay, Batangas and Legaspi.

Luzon has an area of 40,420 sq.mi. and a population of 7,374,798 (1939 census of the Philippines).

It is a seagirt segment of the great ring of highlands that circles the Pacific, with great depths of sea along the Pacific side of the ring. Volcanoes, active, quiescent and dead occur in the southern half of the island. Together with the other Philippines, it is an unsubmerged mountain mass on the edge of the Asiatic continental platform. Folding, faulting and volcanic action have formed it. Periods of greatest formative activity were pre-Tertiary, late Miocene, early Pleistocene, with great uplift continuing into recent periods. Plutonic and older extrusives characterize most of the main mountain masses, except in the Bicol peninsula, where there is a considerable belt of younger volcanics. Alluvial and littoral deposits comprise the Cagayan and central Luzon valleys. There is an extensive tuff area south of Manila bay. Tertiary sediments are widespread in the Cordillera Central and the Bondoc peninsula.

The western and greater part of Luzon has a pronounced wet season—dry season type of climate, with heavy rains from May to October. The Pacific coast and most of the Bicol peninsula have rains the year round with a pronounced maximum rainfall in winter. The greater part of the Cordillera Central has rains most of the year, with no excessive maximum period. The Cagayan valley and southern Tayabas have a short dry season of one to three months, with rains the rest of the year. Of some 140 typhoons causing a barometric pressure of less than 745 mm. over the period 1903–38, the tracks of at least 75 crossed Luzon. These generally occur from June to October.

Temperatures are generally high, but tempered by the effect of the surrounding sea. In the mountains of the north, as at Baguio, Europeans find the temperature very agreeable. Mean temperature runs between 25.4° C. and 28.6° C., with absolute extremes during a period of 53 years of 14.5° C. and 38.6° C. Yearly rainfall varies according to the four types of climate from 82.18 in. at Manila to 175.98 in. at Lucban.

The flora of Luzon is rich, generally Malaysian in character. Some Himalayan types are found in the high mountains of the north. Many species are endemic. The difference between the occurrence of native forms in primary forests and in settled and secondary-growth areas of the lowlands would indicate considerable introduction of growths common to the great Indo-Malaysian region. Coastal vegetation is virtually the same as that of the other Asiatic tropics.

Forests, except for the pine regions (*Pinus insularis*) of the northern mountains, are of very mixed character. The dominant species at lower altitudes are *Dipterocarps*. Higher representatives of oaks, rhododendrons and other temperate species appear. Orchids are very numerous, as are ferns and mosses. Forests of any great extent or potential commercial importance are restricted to the more or less inaccessible reaches of the Sierra Madre on the Pacific coast, some areas of the Bicol peninsula and the Zambales range. Reforestation has become of sufficient need for 21 of the 25 reforestation projects in the whole archipelago to be assigned to Luzon, as of 1939. To control further deforestation, extensive forest reserves were established in the Cordillera Central.

The vegetative cover usually seen in the settled area, apart from field crops, consists of fruit trees and other cultivated utilitarian plants, as bamboo and the "acacia" (*Enterolobium saman*), the common shade and ornamental tree lining the roads and plazas of the villages. Because of the rains and nature of the soil this cover is usually of sufficient abundance and density to create the standard impression of tropical luxuriance. Among the fine or useful woods still available are molave (*Vitex parviflora*), narra (*Pterocarpus indicus*, the *padauk* of Burma and the Andamans), tindalo (*Pahudia rhomboidea*), Yakal (*Shorea* sp.), lumbayao (*Sarrietia javanica*), apitong (*Dipterocarpus grandiflorus*) and almon (*Shorea eximia*). Rattans, tanbarks, firewood, charcoal, fibres, resins, gums, oils, herbs and orchids are other forest products. The coconut palm in southern Luzon contributes heavily to the Philippines' position as the world's leading coconut products producer. Other valuable palms are the buri (*Corypha elata*) for a delicious sugar and fibre for hat-weaving, and the nipa (*Nipa fruticans*), producing alcohol, vinegar and the standard thatch-roofing of the houses of the common people.

Luzon has a great variety of food plants, native and introduced, about 500 species altogether. Of prime importance are rice, corn, coconuts, sugar-cane, yams, bananas, vegetables. Of other than food value, are abaka or Manila hemp and tobacco. Pre-eminent among fruits is the delicious carabao mango, not exceeded in quality by any other mango; some of the banana varieties have a delicate and aromatic flavor.

While the Philippines are considered an extension of the Indo-Malaysian subregion, there is much specialization in the fauna of those of them lying east of the Palawan group, thus including Luzon. Mammals are scarce, except for shrews, rats, mice and bats.

The birds show strong relationships with those of Borneo, some with Celebes and New Guinea. Many of the species are endemic. Nearly 1,000 species of birds are found in the Philippines; the exact proportion of these occurring in Luzon, or peculiar to it, is not certain. The common fowl and domesticated ducks are abundant. Turkeys, guinea fowl, etc., have been introduced.

There are many reptiles. Pythons, cobras and other poisonous species occur, but fatalities from their bites are not common.

Mosquitoes, some conveying intensely malignant malaria, butterflies, moths, beetles and ants, are the more obvious insects. They show affinity with those of other Indo-Malaysian areas.

Fish of more than 1,000 species, fresh-water and especially marine, are plentiful, and are the chief animal, protein food of the people, rather than animal flesh. At least three-quarters of the species are edible. Of the total catch of 89,213.4 short tons of fish reported marketed in the 1939 census for the whole country, 51,214.3 tons represent the Luzon production. About $25,000,000 is invested in Luzon fishponds, chiefly along the shores of Manila bay, where milkfish, or *bangus* (*Chanos chanos*) are raised, producing for market 13,503.1 tons of fish valued at $3,000,000 annually.

Marine invertebrates occur in greater variety than in any other equal area.

Gold, silver with it, iron, copper, chromium, manganese, coal and salt are found in appreciable quantity. Most of the Philippine gold and silver production of 1940, amounting to $39,218,991, came from the Luzon centres of Baguio and Camarines Norte. Oil seeps are found in the Bondoc peninsula. Drilling has been carried on, but no production has occurred.

The people are of the general southeast Asiatic type, short-statured, straight and dark-haired, dark-eyed, light brown in colour, well-proportioned and graceful and modified by centuries of infiltration of Chinese and Spanish blood, and by contact with governing occidental cultures into the quite distinctive Filipino nationality. The ethnologist can easily trace the various stocks in their physical make-up, but except for a few isolated "tribes" in the mountains of the north the population is culturally homogeneous, and has a strong common national feeling. The influence of a common and widespread school system and the extension of uniform government was rapidly reducing what differences remained at the outbreak of the war with Japan.

Despite a generally common culture, strong linguistic divisions still survive. Of these, Tagalog is the leading native language. It is well-developed, flexible, has an extensive vocabulary and is capable of further growth to express modern ideas of science and learning. It has been adopted by the Philippine government as the base for the development of a "national" language. Upon the attainment of complete independence of the Philippines, it is to become an official language, along with English and Spanish. Other important native dialects are Ilocano, Bicol, Pampango and Pangasinan.

Manufacturing is largely confined to Manila and vicinity, but household industries are widespread, as, for example, along the Ilocos coast, where nearly every settlement has its artisan specialty. Agriculture is the occupation of most of the people, with many in mining, fishing and manufacturing. Retail trade is largely in the hands of Chinese, and wholesale import and export in the hands of Americans and Europeans. Filipino participation in trade and industry more extensively has not yet measured up to the desire for it.

Important towns, other than Manila (pop. 623,492, 1939 census) and its suburbs of Quezon City, Caloocan and Pasay, are Vigan, Dagupan, Baguio City, Cavite City, Batangas, San Pablo City and Legaspi.

General living standards are simple. Rice is the staff of life for rich and poor, with fish as the commonest animal protein; pork is also common, with beef, carabao, chicken and goat as next most common foods. Fruit and vegetables are plentiful, and imported groceries are available in most large towns. A large part of the population consists of peasant farmers, usually cultivating not more than a hectare of land. Implements are few and simple, and much dependence is placed on work animals rather than on machines. The carabao, or water-buffalo, is the favoured draft animal, although steers are much used on higher land. Land distribution is very inequitable, and has been at the bottom of armed uprisings and intense agrarian unrest in the decade just prior to the outbreak of World War II. The central Luzon plain is the scene of most of these problems which had not been solved by any means at the outbreak of the war with Japan. Many of the agrarian dissidents joined the Japanese invaders, serving as spies and fifth columnists.

In religion, 5,977,333 of the people profess Roman Catholicism; 891,000 belong to the Aglipayan church (a native sect claiming to draw most of its tenets and practices from the Roman Catholic church); 223,195 are Protestants; and 261,853 are pagans (native animists). Christian missionary activity is strong among the pagans.

Those holding citizenship of other countries number 77,996 Chinese, 8,109 Japanese, 7,165 United States, 3,349 Spanish, 981 German, 834 British, 713 British Indian and 192 Swiss, with numerous other countries represented. More than half of all aliens live in Manila.

The Manila railroad, entirely on Luzon, owned and operated by the Philippine government, is the most important in the whole country. It operates a system of 665.5 mi. between San Fernando, La Union, on the South China sea and Legaspi, on the Pacific ocean in southern Luzon. Length of the main line is 451.4 mi.

Administratively, Luzon is divided into the following provinces:

Abra	Camarines Norte	Laguna	Pangasinan
Albay	Camarines Sur	La Union	Rizal
Bataan	Cavite	Mountain	Sorsogon
Batangas	Ilocos Norte	Nueva Ecija	Tarlac
Bulacan	Ilocos Sur	Nueva Vizcaya	Tayabas
Cagayan	Isabela	Pampanga	Zambales

and the following chartered cities:

Baguio	Manila	San Pablo
Cavite	Quezon	Tagaytay

The provinces are administered by elective Provincial Boards, headed by a Provincial Governor. They are further subdivided into 577 municipalities. A municipality is usually a collection of villages or *barrios,* with their farmlands, grouped around a larger or central village, called the *poblacion,* as the seat of administration. It is controlled by an elective municipal council, headed by an elective municipal mayor. The chartered cities have special forms of government, partly elective, partly appointive.

As of March 1940, the extensive and well-supported public schools and colleges on Luzon had an enrolment of 999,308 students. Of this number 58,551 were secondary, and 9,068 collegiate. Private schools had 82,687; 37,041 and 21,175 (estimated), respectively, as of the same date. Virtually all instruction, from the kindergarten on up, was given in English. Manila was the educational metropolis of the whole country, fully 80% of all collegiate enrolment being in its institutions or in those of its immediate vicinity.

As of June 1940, the following roads (in kilometres) were in existence:

	First-class	*Second-class*	*Third-class*	*Total*
Whole country	11,881.9	7,393	3,795.1	23,070
Luzon	6,153.2	3,371.7	2,141.7	11,666.6
The heart of Luzon*	2,904.4	1,238.4	1,235.2	5,378

*The nine provinces of central and southern Luzon, centring on and including Manila, with a total area less than one-fourth that of the whole island. This is the area of greatest concentration of population. It has been twice fought over in World War II and has suffered great devastation.

As of 1940, 39,654 motor vehicles were registered in Luzon, 32,788 of them being in the "heart area." Luzon had 72.6% of all motor registrations for the whole country, illustrating graphically its prime importance.

Postal, telegraph, telephone and radio-communication systems were well-developed. Manila had trans-Pacific cable and radio connections with other countries.

Manila is by far the premier port, not only for Luzon, but for the whole archipelago. During the fiscal year ending June 30, 1940, exports to the value of $53,538,625 and imports worth $132,015,980 passed through it. Similar figures for the other Luzon ports of entry are: Legaspi, $4,453,010 and $250,039; Aparri, none and $258; Jose Panganiban (Mambulao) $2,523,618 and $790,943. Nearly 75% of all foreign trade was with the United States, nearly 6% with Japan and 2½% with Great Britain, the next two.

Chief exports were sugar, Manila hemp, coconut products, base metal ores, lumber, embroidery and tobacco. Chief imports were iron and steel and manufactures thereof, cotton goods, mineral oils, tobacco products, automobiles, paper, meat and dairy products, silk and rayon, chemicals and drugs and wheat flour.

Bibliography.—1939 Census of the Philippines; Smith, *Geology and Mineral Resources of the Philippine Islands* (Bureau of Science, Manila, 1924); various reports and publications of the Philippine government. (R. R. E.)

LUZ-SAINT-SAUVEUR, a town of south-western France in the department of Hautes-Pyrénées, 21 mi. S. of Lourdes by rail. Pop. (1936) 848.

Luz stands on the Bastan 2,240 ft. above sea-level. The church of the Templars was built in the 12th and 13th centuries and fortified later. Crenelated ramparts surround it, and the tower north of the apse resembles a keep; the north door is Romanesque.

The village of St. Sauveur a little above Luz on the left bank of the gorge of the Gavè de Pau is a pleasant summer resort, visited for warm sulphurous springs. Discovered in the 16th century, the waters came into vogue after 1820. Twelve miles to the south is the village of Gavarnie, above which is the magnificent rock amphitheatre or *cirque* or Gavarnie.

LUZZATTI, LUIGI (1841–1927), Italian economist and financier, was born of Jewish parents at Venice on March 11, 1841. He studied law at Padua, was driven into exile by the Austrian police for a short time, became professor of constitutional law at Padua (1867), at Perugia (1894), and finally at Rome (1898).

Luzzatti popularized in Italy the economic ideas of Schultze-Delitzsch, worked for the establishment of a commercial college at Venice, and contributed to the spread of people's banks on a basis of limited liability throughout the country.

An enthusiast for all forms of co-operation, Luzzatti founded the first co-operative store in Italy. In 1869 he was appointed by Minghetti under secretary of state to the ministry of agriculture and commerce, in which capacity he abolished government control over commercial companies and promoted a state inquiry into the conditions of industry.

Though theoretically a free trader, he helped to create the Italian protective system. In 1877 he participated in the commercial negotiations with France, in 1878 compiled the Italian customs tariff and subsequently took a leading part in the negotiations of all the commercial treaties between Italy and other countries.

He was minister of the treasury in four cabinets between 1891 and 1909. During his last term of service at the treasury he achieved the conversion of the Italian 5% debt (reduced to 4% by the tax) to 3¾% to be eventually lowered to 3½%; although the actual conversion was not completed until after the fall of the cabinet of which he formed part the merit is entirely his.

Luzzatti was minister of agriculture and commerce in 1909, and in 1909–11 prime minister. He received many honours, including the title of minister of state for life. He died on March 29, 1927.

LUZZATTO, MOSES ḤAYIM (1707–1747), Hebrew dramatist and mystic, was born in Padua 1707, and died at Acre 1747. He attacked Leon of Modena's anti-Kabbalistic treatises, and as a result of his conflict with the Venetian Rabbinate left Italy for Amsterdam, where, like Spinoza, he maintained himself by grinding lenses. Here, in 1740, he wrote his popular religious manual the *Path of the Upright* (*Messilath Yesharim*) and other ethical works. Luzzatto's most lasting work is in Hebrew drama. His best-known compositions are: the *Tower of Victory* (*Migdal 'Oz*) and *Glory to the Upright* (*Layesharim Tehillah*).

See Grätz, *History of the Jews,* v. ch. vii.; I. Abrahams, *Jewish Life in the Middle Ages,* pp. 190, 268; N. Slouschz, *The Renascence of Hebrew Literature,* ch. i.

LVOV, PRINCE GEORGE EUGENIEVICH (1861–1925), Russian statesman, belonged to the old Russian nobility. He spent the greater part of his life in Zemstvo, that is, local government work, being a member of the executive board of the Tula Zemstvo from 1888 and president from 1902–05. In 1905 he was elected member of the first State Duma and joined the right wing of the constitutional democratic (kadet) party. During the Russo-Japanese and World wars he took an active part in the organisation for the relief of sick and wounded soldiers and in the latter war was president of the All-Russian Union of Zemstvos. On March 14, 1917 Lvov was elected prime minister and minister of the interior of the first Russian provisional government. His Government proved a complete failure. A new coalition cabinet was formed on May 16, and Lvov again accepted the leadership of the cabinet and the portfolio of the interior, but he had no real influence in political life, and he resigned from both offices on July 7. (*See* RUSSIA.) After the Bolshevist revolution in November, Lvov was arrested and imprisoned in Ekaterinburg, but he escaped to Siberia and eventually settled down in Paris. He died on March 6, 1925.

LYALL, SIR ALFRED COMYN (1835–1911), Anglo-Indian administrator and writer, was born on Jan. 4, 1835, at Coulsdon, Surrey, and educated at Eton and Haileybury. He entered the Bengal civil service in 1855 and saw service during the Mutiny in the Bulandshakr district, at Meerut, and in Rohil-Khand. Lyall's promotion was rapid; in 1865 he was appointed commissioner of Nagpur, and in 1867 of West Berar. In 1873 he was made home secretary to the Government of India, but a year later was appointed governor-general's agent in Rajputana. He drew up a *Statistical Account or Gazetteer* both of Berar and of Rajputana, which gained some attention as the first work of this kind. In 1878 he became foreign secretary to the Government of India. He resigned in 1881, and was made K.C.B. He was then lieutenant-governor of the North-West Provinces and Oudh (now the United Provinces), where he administered Lord Ripon's local self-government scheme, and carried out many important legislative reforms. On his retirement from the service in 1887 he became a member of the India council in London, where he strongly advocated the development of local self-government. In Feb. 1887 he was made K.C.I.E., and in 1896 G.C.I.E. He became a privy councillor on his retirement from the India Office in 1902. In 1907 he became chairman of the board of Dulwich college and in 1911 was made a trustee of the British Museum. In his essay *Asiatic Studies* (1882 and 1889), dealing mainly with the comparative study of religions, he displays a deep insight into Indian life and character.

His works include: *Verses written in India* (1889); *Rise and Expansion of the British Dominion in India* (1893); *Life of Warren Hastings* (English Men of Letters series, 1889); *Life of the Marquis of Dufferin* (2 vols., 1905); and many articles on Indian questions and on general literature.

LYALL, SIR CHARLES JAMES (1845–1920), K.C.S.I. (1917), English Arabic scholar, was born in London on March 9, 1845, and educated at King's College, London, and Balliol College, Oxford. He served in the Bengal civil service from 1867 to 1889, when he became secretary to the Home Department of the Government of India. He was chief commissioner of Assam in 1894, of the Central Provinces from 1895–1898, and secretary to the judicial public department of the India Office in London (1899–1910). He died in London on Sept. 2, 1920.

He published two volumes of translations of Arabic poetry (1885 and 1894); a translation of two ancient Arabic *Diwans* (1913), articles on Hindustani and Arabic literature in the *Ency. Brit.* 9th and 11th editions.

LYALL, EDNA, the pen-name of ADA ELLEN BAYLY (1857–1903), English novelist, born at Brighton, the daughter of a barrister. At Eastbourne, where most of her life was spent, she was well known for her philanthropic activity. She died on Feb. 8, 1903. Her *Won by Waiting* (1879) had some success. *Donovan* (1882) and *We Two* (1884), in which the persecuted atheist was inevitably identified with Charles Bradlaugh, made her widely popular.

A *Life* by J. N. Escreet appeared in 1904.

LYALLPUR, a district of India, in the Punjab. It was constituted in 1904 to comprise the "Chenab Colony," being in the main the waste portion of the former Jhang district that is now irrigated by the Lower Chenab canal. Area, 3,522 sq.mi.; pop. (1941) 1,396,305. The headquarters are at Lyallpur town (pop. in 1941, 69,930), named after Sir James Lyall who was lieutenant-governor of the Punjab in 1887–92. It contains several factories for ginning and pressing cotton.

LYAUTEY, LOUIS HUBERT GONZALVE (1854–1934), French marshal, was born at Nancy (Meurthe-et-Moselle) on Nov. 17, 1854. Having passed through St. Cyr and the Staff College, he first served as a cavalry officer, and was then appointed in 1894 to the staff of the troops in Indo-China, where he took part, under General Galliéni, in the operations against the pirates of Upper Tongking. He accompanied General Galliéni to Madagascar, where he applied himself to working out and putting into practice new and eminently successful methods of colonial government. Having returned to his regiment as its colonel, he was soon after appointed to the command in the territory of Aïn Sefra, which was being disturbed by incursions from Morocco. He was then placed in command of the Oran division, and was entrusted with the carrying out of international agreements with regard to Morocco. Having restored order on the Algerian-Moroccan frontier, as far as Moulouya and Guis, he took command of the X. Corps at Rennes.

In April 1912, in view of the serious situation at Fez, the Government sent him to Morocco as high commissioner and resident-general to quell disturbances and to consolidate the recently declared protectorate. Immediately on his arrival he relieved Fez and initiated the work of pacification and colonization which was to result in a few years in the creation of a well organized Government on a solid basis. On the declaration of the World War, although formally ordered by the Government to evacuate the interior of Morocco, so as to liberate the greater part of his forces, he maintained his ground for four years against all attacks, while he actually increased the subjugated territory.

In Dec. 1917 General Lyautey was appointed war minister, but resigned after three months in order to return to Morocco. From 1920 to 1924 he continued his work by conquering the Atlas, and by establishing a defensive barrier to the north of Ouergha. As a reward for these services he was made a marshal of France in Feb. 1921. He organized a victorious resistance to the attacks of the Rifi under Abdel Krim, and did not resign the post of résident-général until order was completely restored in 1925. Marshal Lyautey pacified Morocco by the adoption of judicious methods of colonial government, and by constructive work and fine organization a province was built up with a great economic future. (*See* MOROCCO.) He was made a member of the French Academy in 1914, and wrote numerous articles on colonial administration. He died July 27, 1934.

See his *Lettres de Tonkin et de Madagascar, 1894–99* (1920); and a volume of speeches entitled *Paroles d'action, 1900–26* (1927); also Britsch, *Le Maréchal Lyautey* (1921). (M. GU.)

LYCAEUS, a mountain in Arcadia, sacred in Greek belief to Zeus Lycaeus, who was born and brought up on it, and the home of Pelasgus and his son Lycaon, who founded the ritual practised on its summit. (*See* LYCAON.)

LYCANTHROPY. This term, though by derivation strictly applicable only to the taking by men of wolf forms, is applied generally to the belief in the transformation of men into wolves or other carnivorous animals, the forms taken being ordinarily those of the most formidable wild animals of the country—bears in Scandinavia, wolves on the Continent of Europe, jaguars in South America, tigers and leopards or hyenas in Asia or Africa, the latter form being particularly associated with attacks on corpses rather than on living beings. The actual practice of lycanthropy is clearly associated with a form of hysteria and a pathological condition (frequently recorded in pregnant women) manifesting a depraved appetite and an irresistible desire for raw flesh, often that of human beings, frequently accompanied by a belief on the patient's part that he or she is transformed into an animal. In the Malay race such a state is deliberately induced by suggestion in persons subject to a form of extreme suggestibility known as *latah.* Cases of tiger spirits and the like induced to enter human bodies and resulting in similar symptoms must be classed with *latah* forms of the affliction, while the salves, skins, girdles, etc., used by wer-wolves particularly in Europe, to effect transformation are probably to be regarded as material aids to hallucination.

Ideas on lycanthropy have also become confused with beliefs as to the separable soul which often appear in cognate forms. Beliefs in witches and their familiar spirits, in the power of witches to assume other bodily shapes, to alienate their souls or their vital principles, and keep them for safety in some obscure animal or plant in distant places; belief in the general possession of a bush soul, or *nagual,* as in central America; belief in totem ancestors, and in the re-incarnation of the soul in predatory creatures, such as tigers, alligators and sharks (*see* METEMPSYCHOSIS); belief in vampires, belief in possession by evil spirits—all these ideas associated with the experienced facts of lycanthropy have engendered a large number of variable, confused and sometimes fantastic beliefs associated with lycanthropy in various parts of the world.

The lycanthropist was known to the Greeks, who spoke also of kynanthropy, and Marcellus of Sida describes men as usually attacked early in the year, frequenting cemeteries and living like dogs and wolves. The Romans used a more general term *Versipellis* (*cf.* English "turnskin") for lycanthropists; Virgil (Ecl. viii.) ascribes metamorphosis into wolf form to the action of drugs. Pliny gives a story of an hereditary transformation associated with Jupiter Lycaeus; Agriopas describes a man as turned into a wolf after assisting at a human sacrifice to the same god, and Petronius tells a typical wer-wolf story. In Scandinavia and England lycanthropy seems to have been associated with outlawry, and the term *berserker* (*q.v.*) probably implies a man who was not only subject to excesses of bestial fury but who wore garments of bear or wolfskin. In the case of *berserker* the lycanthropic tendency seems to have been involuntary, but in Europe generally it is ascribed to deliberate choice and throughout the middle ages persons were believed to use magical means to transform themselves into wolves. The tradition is not extinct on the continent of Europe, and in the British Isles still lingers (in Somersetshire and Arran, for instance) in the belief in old women who turn themselves into hares. If the hare be hurt a corresponding hurt remains in the human body, which is characteristic of the belief generally. The usual method of effecting the change in Europe was by rubbing with magic salve or by putting on a girdle of wolf—or sometimes of human skin. Involuntary transformation also occurs as the result of enchantment as in Marie de France's poem "Bisclaveret," or of miracles such as that of St. Patrick who changed Veretius, king of Wales, into a wolf. Although in the European form transformation is usual, another type of lycanthropy is described by Rhanaeus as occurring in Courland, in which there is no bodily transformation; the human body remains in a cataleptic trance but in such sympathy with a real wolf attacking cattle that the human limbs move and twitch as the wolf commits his depredations. This form of lycanthropy corresponds precisely with a form taken in Assam. The wer-wolf is called *vrkolak* by Bulgars and Slovaks, and by modern Greeks βρυκόλακας. Here again the body remains cataleptic while the soul enters a wolf. After its return the body is exhausted and aches as after violent exercise. This form is connected in popular belief with vampires, and Serbs give the same name *vlkoslak* to both, thus affording a link between the corresponding wer-tiger and vampire beliefs in Assam, where the vampire's astral body devours persons' livers and causes their death.

Wer-wolves (*loup-garou*) appear to have been particularly active in France during the 16th century, but by the middle of it the true nature of the malady was recognized. In the cases of Roulet tried at Angers in 1598 and of Jean Grenier in 1603 at Bordeaux the accused, though convicted, were treated as insane. The description given of Roulet is not unlike those given of the "wolf children" who turn up from time to time in India, and in the latter case the wer-wolf asserted that he became a lycanthropist under the bidding of a supernatural being who came to him in the forest, an account identical with that given by Sema wer-leopards in Assam. Cases of cannibalism are recorded in Scotland in the 15th century, but the cannibals do not seem to have been even accused of being wer-wolves, though the belief lingered, and Verstegan (*Restitution of Decayed Intelligence,* 1625), says of wer-wolves that they "doe not onely unto the view of others seem as wolves, but to their owne thinking have both the shape and nature of wolves . . . and dispose themselves as very wolves." In Asia Minor we find the belief in Armenia, where sinful women are punished by becoming lycanthropists at the bidding of a spirit who brings them a wolf skin. They eat their own children. Herodotus mentions the Neuri, a Scythian tribe, as lycanthropists who changed into wolf form annually, and associates them with head-hunters; and in Assam we still find head-hunting Nagas subject to lycanthropy individually and believing that there are neighbouring tribes who are wer-tigers communally. The belief in lycanthropy is current in India in connection with both the wolf and the tiger. Both sexes of the Kols of Central India are believed to turn into tigers, and Dalton reports a case of a Kol tried for murder who had followed the tiger, which had devoured his wife, to the house of another Kol named Pusa. This man's own relations said he had long been suspected of such malpractices and abetted the killing of him, and explained that they had known of his devouring an entire goat one night and that he had roared like a tiger while doing so, and that on another occasion he had expressed a longing for a particular bullock, and the same night the bullock was killed by a tiger. The "wolf children" who appear periodically, whether or not they have actually been suckled by wild animals, often display symptoms of a depraved appetite similar to those of lycanthropy. A case occurred in Bhagalpur between 1912 and 1919 in which one Rupa Sao, a shop-keeper, attacked and killed a little girl by biting her throat. He was convicted of murder, but the High Court, on a reference, ordered him to be confined as a lunatic. In Assam some tribes are lycanthropic while their neighbours are not; thus the Garos are, but not the pure Khasi; the Sema Nagas are, but not the Angami Nagas; while among many tribes such as the Kachari there are clans claiming descent from or relationship with tigers (*cf.* CYNOTHERAPY). The Angami regard lycanthropy as due to drinking from a certain well; but the Sema, who are subject to it, both men and women, regard it as involuntary and acquired normally under supernatural influence. The body is not transformed, but falls into a mild cataleptic fit during which the soul is inhabiting the body of a real leopard. Apparently some sympathetic association is set up between the human being and a wild animal, as in the Ao Naga tribe a relationship of this kind is set up without any lycanthropic symptoms on the part of the human being (*see* Mills, *The Ao Nagas,* pp. 250 *seq.*). The Lhota Naga medicine men have leopard familiars, but generally the Naga idea of lycanthropy rather suggests the central American idea of the *Nagual* or bush soul. Wer-tigers are believed in in Burma, where Tamans of the Chindwin valley are reputed to transform themselves into tiger form by rolling on earth on which they have micturated. In Malaya lycanthropy is common and is associated with *latah,* as it appears to be a regular amusement to hypnotize a boy subject to this disorder and to cause him to think he is a civet cat and behave as such, running on all fours and devouring live chickens. Skeat (*Malay Magic,* p. 160–163) mentions the case of one Haji 'Abdăllah caught naked in a tiger trap in Sumatra, but the wer-tigers of the Malay Peninsula are thought invulnerable in their transformed state—a curious exception to the almost universal belief that a wound on the animal causes a corresponding injury on the human form. In the Celebes the Toradja belief approximates to that of the Naga hills, the soul, *lamboyo,* which undergoes transformation, being apparently identical with the *anoana* of the Poso-Alfures (*see* METEMPSYCHOSIS). As in the Naga hills the lycanthropic habit may be acquired by eating food left by a lycanthropist. In Java the practice may be voluntary, acquired by spells, etc., or may be inherited, as in Assam, and this view has no doubt some pathological justification. As by the Khonds of India, the transformation is sought in Java for purposes of revenge, or to guard the crops, as in Yucatan, which possibly brings lycanthropy into connection with fertility cults, as does the use of an animal form and the association with witches in Europe.

In Africa the leopard and the hyaena are the animals usually connected with lycanthropists, who are generally women in Abyssinia, where the lycanthropist is regarded as possessed and belongs as a rule to the blacksmith class. The Bondas, however, claim actual transformation, which is reported to have been witnessed by a European who also claims to have shot hyaenas with gold ear-rings in their ears. In West Africa an intimate relation is created by a blood bond between a man and an animal, and, as in the Naga hills, if the latter die the former will also die, though in the Naga hills it is (significantly) not until he hears of the death of the leopard. The Bori dancing of Nigeria also seems to connect in some respects with the *latah* of Malaya. How strong the instinct of the beast may be can be judged from Tremearne's account of a child of one of the cannibal tribes found in the bush and brought up in an institution where, having heard of the death of another child, he managed to get at the corpse and eat its face (*Tailed Head-Hunters of Nigeria,* p. 184). The societies of "human leopards" and "human alligators" in West Africa appear to be organized manifestations of a depraved taste for human flesh like that displayed in the hyaena forms of lycanthropy combined with ideas akin to those underlying head-hunting (*q.v.*), and ghouls in Syria have also been associated with temporary wolf or hyaena forms. That this propensity is not entirely destroyed by civilization is shown by a case which occurred in 1849 in Paris, when an officer was convicted of digging up and mutilating corpses in cemeteries under pathological conditions suggesting lycanthropy. The outbreaks of cattle-maiming that occur from time to time in Great Britain are probably likewise attributable to a survival of the lycanthropic instinct.

LYCAON, a mythical king of Arcadia. At Mount Lycaeus a very extraordinary ceremony in honour of *Zeus Lukaios* took place; it is alleged (Plato, *Rep.,* viii., 565 D) that a man was sacrificed to him, and his entrails put with those of more usual victims; that anyone who tasted them became a wolf; to which later authors (*see* especially Pausanias, viii., 2, 6, with Frazer's note) add that the man thus transformed belonged to a particular clan, and that he remained a wolf for nine years (a sacred number), after which he might become a man once more if in that time he had not tasted human flesh again. The whole story is unpleasantly suggestive of the Lion and Leopard societies of Africa. In explanation the following story was told. Lycaon, in early days, was an impious and cruel king. Having occasion to entertain Zeus, he, or his sons, set before him human flesh (in some versions, the flesh of Lycaon's own son, Nyctimus). The god was not deceived, and in wrath caused the deluge which in Deucalion's time devastated the earth. It has several times been suggested that behind the figure of Lycaon is concealed some ancient local god, afterwards identified with Zeus; a theory in no way impossible, but which leads us little further, since there is no agreement as to the nature of the supposed god.

LYCAONIA, a region in the interior of Asia Minor, north of Mt. Taurus, bounded on the east by Cappadocia, on the north by Galatia, on the west by Phrygia and Pisidia; to the south it extended to the chain of Mt. Taurus, where it bordered on the country popularly called Cilicia Tracheia. The boundaries of Lycaonia varied greatly at different times. It is mentioned by Xenophon as traversed by Cyrus the younger on his march through Asia. That author describes Iconium as the last city of Phrygia; and in Acts xiv. 5 St. Paul, after leaving Iconium, crossed the frontier and came to Lystra in Lycaonia.

Lycaonia is described by Strabo as a cold region of elevated plains, affording pasture to wild asses and to sheep. Amyntas, king of Galatia, to whom the district was for a time subject, maintained there not less than 300 flocks. It forms part of the interior tableland of Asia Minor, and has an elevation of more than 3,000ft. It suffers from want of water, aggravated in some parts by abundance of salt in the soil, so that the northern portion, extending from near Iconium to the salt lake of Tatta and the frontiers of Galatia, is almost wholly barren. In ancient times great attention was paid to storing and distributing the water, so that much land now barren was formerly cultivated and supported a large number of cities.

The plain is interrupted by some minor groups of mountains, of volcanic character, of which the Kara Dagh in the south rises above 7,000ft.

The Lycaonians were to a great extent independent of the Persian empire, and were like their neighbours, the Isaurians, a wild and lawless race of freebooters; but their country was traversed by one of the great natural lines of high road through Asia Minor, from Sardis and Ephesus to the Cilician gates, and a few considerable towns grew up along or near this line. The most important was Iconium, in the most fertile spot in the country, of which it was always regarded by the Romans as the capital. It was the capital of the Seljuk Turkish empire for several centuries. A little farther north, stood Laodicea (Ladik); and in the south, near the foot of Mt. Taurus, was Laranda, now called Karaman, which has given name to the province of Karamania. Derbe and Lystra, which appear from the Acts of the Apostles to have been considerable towns, were between Iconium and Laranda. Lycaonia was Christianized very early; and its ecclesiastical system was more completely organized during the 4th century than that of any other region of Asia Minor.

After the defeat of Antiochus the Great (*q.v.*), Lycaonia was given by the Romans to Eumenes II., king of Pergamos. About 160 B.C. part of it was added to Galatia; and in 129 B.C. the eastern half (usually called during the following 200 years Lycaonia proper) was given to Cappadocia. Its administration and grouping changed often under the Romans. In A.D. 371 Lycaonia was first formed into a separate province.

The Lycaonians appear to have retained a distinct nationality in the time of Strabo, but their ethnical affinities are unknown. The mention of the Lycaonian language in the Acts of the Apostles (xiv. 11) shows that the native language was spoken by the common people at Lystra as late as A.D. 50.

See Sir W. M. Ramsay, *Historical Geography of Asia Minor* (1890), *Historical Commentary on Galatians* (1899), and *Cities of St. Paul* (1907); M. Delahaye, *Gaianopolis* (1910).

LYCEUM, the name of a gymnasium and garden with covered walks near the temple of Apollo Lyceus at Athens (Gr. Λύκειον). Aristotle taught here, and hence the name was applied to his school of philosophy. The name has been used in many languages for places of instruction, etc. In France the term *lycée* is given to the larger secondary schools which are administered by the State.

LYCEUMS AND CHAUTAUQUAS. Early in 1826 Josiah Holbrook, of Derby, Conn., outlined a plan for a world-wide federation for the advancement of learning, calling it a lyceum, from the place where Aristotle lectured to the youth of Greece. His plan provided for organizations graduated from the community to an international lyceum, the latter to have 52 vice-presidents chosen from distinguished scholars and men of affairs from all over the world. This international organization was never realized, but a national (U.S.) lyceum was organized in New York city in 1831, and flourished for eight years. It included delegates from at least eight State lyceums which, in turn, embraced scores of county and local lyceums.

That the lyceum answered an existing need is shown by the rapid spread of its local branches. The Millbury, Mass., branch was organized in Nov. 1826. Within two years 100 other branches, and by 1834 nearly 3,000 branches, in practically every State in the Union, had been established. These local lyceums were voluntary associations for self-culture, community instruction and discussion of public questions. Essays, debates, discussions and lectures, all home-talent productions, were presented at weekly meetings. After about a decade the custom of inviting outside lecturers, to whom fees were paid, became established. Lowell, Thoreau, Beecher, Holmes, Greeley and others were among those who frequently addressed the lyceums. Many of Emerson's essays were written for lyceum lectures.

The last convention of the national lyceum, in 1839, was the most largely attended and most enthusiastic held. It formed many ambitious plans, adjourned, and never met again. The cause of this sudden demise is not known. In its eight years of life, it accomplished definite and far-reaching results. It forwarded education in Cuba, Venezuela and Mexico; it inspired many cultural movements, some of which still exist, and all of which made important contributions to American education. The lapse of the national lyceum did not affect the local branches, which flourished until the Civil War. A demand for attractions other than lectures led the bureaux to supply musicians, readers and entertainers.

Parallel with the lyceum movement is the chautauqua, which began at Fair Point (later called Chautauqua), N.Y., where a Methodist Episcopal camp meeting was annually conducted. Rev. (later bishop) John H. Vincent and Lewis Miller successfully undertook to change that camp meeting into an assembly for the study of the Bible and Sunday school methods. The first such assembly was held in 1874. Gradually the purpose expanded until it embraced the whole field of education, with popular entertainments included. Chautauqua institution, at Chautauqua, N.Y., annually conducts a ten-week assembly. This assembly was quickly copied by many communities throughout the land, each operating independently of all others, and each engaging its talent either directly or through the lyceum bureaux, which thus became a connecting link between the two movements. Their programmes were attractive combinations of lectures, music and entertainments (with drama added in later years). Distinguished men and women have contributed through these programmes towards the creation of an American culture and an informed public opinion. The wasteful extravagance resulting from the independent operation of these rapidly multiplying assemblies led to the development, in 1904, of the circuit chautauqua plan. The lyceum bureaux led in this development, organizing chautauqua committees in a circuit of towns to which a standardized programme of lectures, music and entertainment was supplied.

LYCHNIS, a genus of plants of the pink family, Caryophyllaceae (*q.v.*), including numerous species, several of which are cultivated. *L. chalcedonica* (Maltese cross), 3 ft. high, has dense heads of bright scarlet flowers, both single and double. *L. coronata,* 1 to 2 ft. high has clusters of scarlet, crimson, pink and white flowers.

Other garden species are *L. fulgens,* and *L. Haageana. L. Flos-cuculi* is the ragged robin. Several species are native to western North America, including *L. Drummondii,* found from Manitoba to Nebraska and west to the Pacific coast. All are hardy herbaceous perennials.

LYCIA, a district in the south-west of Asia Minor, occupying the coast between Caria and Pamphylia, and extending inland as far as the ridge of Mt. Taurus. It is a rugged, mountainous country, traversed by offshoots of the Taurus range, which terminate in lofty promontories. The coast is indented by a succession of bays—the most marked of which is the Gulf of Macri (anc. *Glaucus Sinus*) in the extreme west. A number of smaller bays and broken, rocky headlands, with a few small islets, constitute the coast-line thence to the south-east promontory of Lycia, known in ancient times as the "Sacred Promontory" (*Hiera Akra*). Though the mountain ranges of Lycia are all offshoots of Mt. Taurus, in ancient times several of them were distinguished by separate names. Such were Daedala in the west, adjoining the Gulf of Macri, Cragus on the sea-coast, west of the valley of the Xanthus, Massicytus (10,000ft.) nearly in the centre of the region, and Solyma in the extreme east above Phaselis (7,800ft.). The steep and rugged pass between Solyma and the sea, called the Climax ("Ladder"), was the only direct communication between Lycia and Pamphylia.

The only considerable rivers are: (1) the Xanthus, which descends from the central mass of Mt. Taurus, and flows through a narrow valley till it reaches the city of the same name, below which it forms a plain of some extent before reaching the sea, and (2) the Limyrus, which enters the sea near Limyra. The small alluvial plains at the mouths of these rivers are the only level ground in Lycia, but the hills that rise thence towards the mountains are covered with a rich arborescent vegetation. The upper valleys and mountain sides afford good pasture for sheep, and the main Taurus range encloses several extensive upland basin-shaped valleys (*vailas*). (*See* Asia Minor.)

According to Artemidorus, the towns that formed the Lycian league were 23 in number; but Pliny states that Lycia once possessed 70 towns, of which only 26 remained in his day. Recent researches have confirmed the fact that the sea-coast and the valleys were studded with towns. On the Gulf of Glaucus stood Telmessus, while a short distance inland were the small towns of Daedala and Cadyanda. At the entrance of the valley of the Xanthus were Patara, Xanthus itself, and, a little higher up, Pinara on the west and Tlos on the east side of the valley. Myra, one of the most important cities of Lycia, occupied the entrance of the valley of the Andriacus; on the coast between this and the mouth of the Xanthus stood Antiphellus, while in the interior, at a short distance, were found Phellus, Cyaneae and Candyba. In the alluvial plain formed by the rivers Arycandus and Limyrus stood Limyra. Arycanda commanded the upper valley of the river of the same name. On the east coast stood Olympus, one of the cities of the league, while Phaselis, a little farther north, which was a much more important place, never belonged to the Lycian league and appears always to have maintained an independent position.

History.—The name of the Lycians, *Lukki,* is first met with in the Tel el-Amarna tablets (1400 B.C.), and in the list of the nations from the eastern Mediterranean who invaded Egypt in the reign of Mineptah, the successor of Rameses II. At that time they seem to have occupied the Cilician coast. Their occupation of Lycia was probably later and, since the Lycian inscriptions are not found far inland, we may conclude that they entered the country from the sea. According to Herodotus (i. 173; vii. 92), the original inhabitants of the country were the Milyans and Solymi, the Lycians being invaders from Crete. In this tradition there is a reminiscence of the fact that the Lycians had been sea-rovers before their settlement in Lycia. The Lycian Sarpedon was believed to have taken part in the Trojan war. The Lydians failed to subdue Lycia, but after the fall of the Lydian empire it was conquered by Harpagus, the general of Cyrus (i. 171). While acknowledging the suzerainty of Persia, however, the Lycians remained practically independent, and for a time joined the Delian league (*q.v.*). They were incorporated into the empire of Alexander, but, even after their conquest by the Romans, preserved their federal institutions as late as the time of Augustus. Under Claudius, Lycia was annexed to the Roman empire and united with Pamphylia; Theodosius made it a separate province.

Antiquities.—Few parts of Asia Minor were less known in modern times than Lycia up to the 19th century. Visits of Sir Charles Fellows to the country in 1838 and 1840 were followed by an expedition sent by the British Government in 1842 to transport to England the valuable monuments now in the British Museum. The monuments thus brought to light are among the most interesting of those discovered in Asia Minor, and prove the existence of a distinct native architecture, especially in the rock-cut tombs. But the theatres found in almost every town, some of them of very large size, are sufficient to attest the influence of Greek civilization; and this is confirmed by the sculptures, which are for the most part Greek.

Numerous inscriptions have been discovered in the native language of the country, written in an alphabet peculiar to Lycia. A few of these inscriptions are bilingual, in Greek and Lycian, and the clue thus afforded to their interpretation has been followed up. (*See* Asianic Languages.)

The alphabet was derived from the Doric alphabet of Rhodes, but ten other characters were added to it to express sounds not found in Greek. The attempts to connect the language with the Indo-European family have been unsuccessful. Most of the inscriptions are sepulchral; by far the longest and most important is that on an obelisk found at Xanthus.

Lycian art was modelled on that of the Greeks. The rock-cut tomb usually represented the house of the living, with an elaborate façade, but in one or two instances, notably that of the so-called Harpy-tomb, the façade is surmounted by a tall, square tower, in the upper part of which is the sepulchral chamber. Lycian sculpture followed closely the development of Greek sculpture, and many of the sculptures with which the tombs are adorned are of a high order of merit. The exquisite bas-reliefs on a Lycian sarcophagus now in the museum of Constantinople are among the finest surviving examples of classical art. The bas-reliefs were usually coloured. For the coinage, *see* Numismatics: *Asiatic Coins.*

(1901); *see* also articles Xanthus and Myra.

LYCK or **LYK,** a town in East Prussia, Germany, 112 mi. by rail S.E. of Königsberg, and close to the frontier of Poland, on a lake and river of the same name. Pop. (1939) 16,667. It is the chief town of the region known as Masuria. On an island in the lake is a castle formerly belonging to the Teutonic order, and dating from 1273, now used as a prison. There are brick works, tanneries, saw-mills, flour mills, manufactures of machinery and trade in grain and cattle.

LYCOPHRON, Greek poet and grammarian, was born at Chalcis in Euboea. He flourished at Alexandria in the time of Ptolemy Philadelphus (285–247 B.C.), for whom he arranged the comedies in the Alexandrian library. As a result he wrote a treatise *On Comedy.* His own work was mostly in tragedy; Suïdas gives 20 titles, but only a few fragments survive. One poem, the *Alexandra* or *Cassandra,* in iambics, has been preserved. The poem, in which Cassandra prophesies the future of Troy and later events, is a masterpiece of erudition, full of archaisms and obscurities, and poetically quite worthless. It was very popular in the Byzantine period, and annotated by the Tzetzes brothers. The fragments of his tragic verse are very much superior to this.

C. von Holzinger (with translation, introduction and notes, 1895). Translations by F. Dehèque (1853) and Viscount Royston (1806). *See* also Wilamowitz-Möllendorff, *De Lycophronis Alexandra* (1884); J. Konze, *De Dictione Lycophronis* (1870). The commentaries of the brothers Tzetzes have been edited by C. O. Müller (1811).

LYCOPODIUM, the principal genus of the Lycopodiaceae, a family of the Fern-allies (*see* Pteridophyta). They are flowerless herbs, with an erect, prostrate or creeping widely-branched stem, with small simple leaves which thickly cover the stem and branches. The fertile leaves are arranged in strobili, and bear spore-cases (sporangia) in their axils, containing spores of one kind only. The prothallium developed from the spore is a subterranean mass of tissue of considerable size, and bears the male and female organs (*antheridia* and *archegonia*). There are about 200 species widely distributed in temperate and tropical climates; five occur in Britain on heaths and moors, chiefly in mountainous districts, and are known as club-mosses. The commonest species, *L. clavatum,* is also known as stag-horn moss. Its spores are known as "lycopodium powder," which, owing to the resinous nature of the spores and its fine state of subdivision, is highly inflammable and has been used in fireworks and for "flash-light" purposes.

If the hand is covered with the powder, it cannot be wetted when plunged into water.

Some 20 species are found in North America, being most abundant in cool, wooded regions of the Eastern United States and Canada, though 9 species are reported from the Rocky Mountain region and 8 species from the coast district of Washington.

LYCOSURA, a city of Arcadia (mod. *Palaeokastro* or *Siderokastro*), reputed to be the most ancient in Greece, and founded by Lycaon, son of Pelasgus. Its famous temple of Despoena contained the colossal group made by Damophon of Messene, of Despoena and Demeter seated, with Artemis and the Titan Anytus standing beside them. The temple and considerable remains of the sculpture were found in 1889.

See Πρακτικὰ τῆς Ἀρχ. Ἑταιρίας (1896); G. Dickens, *Annual of British School at Athens,* xii. and xiii.

LYCURGUS (Gr. Λυκοῦργος), in Greek history, the reputed founder of the Spartan Constitution. Plutarch opens his biography of Lycurgus with these words: "About Lycurgus, the lawgiver, it is not possible to make a single statement that is not called in question. His genealogy, his travels, his death, above all, his legislative and constitutional activity have been variously recorded, and there is the greatest difference of opinion as to his date." Nor has modern historical criticism arrived at any certain results. Many scholars, indeed, suppose him to be in reality a god or hero, appealing to the existence of a temple and cult of Lycurgus at Sparta as early as the time of Herodotus (i. 66) (cf. *Camb. Ancient Hist.,* vol. iii.). If this be so, he is probably to be connected with the cult of Apollo Lycius or with that of Zeus Lycaeus. But the majority of modern historians agree in accepting Lycurgus as an historical person, however widely they may differ about his work.

According to the Spartan tradition preserved by Herodotus, Lycurgus was a member of the Agiad house, son of Agis I. and brother of Echestratus. On the death of the latter he became regent and guardian of his nephew, Labotas (Leobotes), who was still a minor. Other accounts give him a different origin, and make him regent for Charillus. According to Herodotus he introduced his reforms immediately on becoming regent, but the story which afterwards became generally accepted represented him as occupying for some time the position of regent, then spending several years in travels, and on his return to Sparta carrying through his legislation when Charillus was king. He is said to have visited Crete, Egypt and Ionia, and some versions even took him to Spain, Libya and India. In any case details of his life are almost certainly mythical. Herodotus derives his constitutional ideas from Crete, but there is a 5th century tradition ascribing them to the initiative of Delphi.

The Reforms.—Herodotus says that Lycurgus changed "all the customs," that he created the military organization and instituted the ephorate and the council of elders. To him, further, are attributed the foundation of the apolla (the citizen assembly), the prohibition of gold and silver currency, the partition of the land (γῆς ἀναδασμός) into equal lots, and, in general, the characteristic Spartan training (ἀγωγή). Some of these statements are certainly false. The council of elders and assembly are not peculiar to Sparta, the ephorate is not generally allowed to be his, and the partition of land never seems to have taken place at Sparta at all—it is probably an attempt to give traditional sanction to the ideals of Agis and Cleomenes in the 3rd century. We may conclude that Lycurgus did not create any of the main elements of the Spartan Constitution, though he may have regulated their powers and defined their position. But tradition represented him as finding Sparta the prey of disunion, weakness and lawlessness, and leaving her united, strong and subject to the most stable Government which the Greek world had ever seen. Probably Grote comes near to the truth when he says that Lycurgus "is the founder of a warlike brotherhood rather than the lawgiver of a political community." To him we may attribute the unification of the several component parts of the State, the strict military organization and training which soon made the Spartan hoplite the best soldier in Greece, and above all the elaborate and rigid system of education which rested upon, and in turn proved the strongest support of, that subordination of the individual to the State which, perhaps, has had no parallel in the history of the world.

Lycurgus's legislation is very variously dated, and it is not possible either to harmonize the traditions or to decide with confidence between them. Tradition substantially agrees in placing him in the 9th century.

Bibliography.—Our chief ancient authorities, besides Plutarch's biography, are: Herodotus i. 65; Xenophon, *Respublica Lacedaemoniorum;* Ephorus *ap.* Strabo x. 481, 482; Aristotle, *Politics,* ii.; Pausanias iii. and v. 4; and scattered passages in Plato, Isocrates, Polybius, Diodorus, Polyaenus, etc. Of modern works the most important are: E. Meyer, "Lykurgos von Sparta," in *Forschungen zur alten Geschichte* (Halle, 1892), i. 211 *sqq.;* A. Kopstadt, *De rerum Laconicarum constitutionis Lycurgeae origine et indole* (Greifswald, 1849); H. Kessler, *Plutarch's Leben des Lykurgos;* the general Greek histories, and the works on the Spartan Constitution cited under Sparta.

LYCURGUS (*c.* 396–325 B.C.), son of Lycophron, one of the "ten" Attic orators. He shared with Demosthenes and Hypereides the leadership of the opposition to Philip. He left the care of external relations to his colleagues, and devoted himself to internal organization and finance. He managed the finances of Athens for twelve successive years (338–326), at first directly as treasurer of the revenues (ὁ ἐπὶ τῇ διοικήσει) for four years, and in two succeeding terms, when the actual office was forbidden him by law, through his son and a nominal official chosen from his party. Part of one of the deeds in which he rendered account of his term of office is still preserved in an inscription. During this time he raised the public income from 600 to 1,200 talents yearly. He increased the navy, repaired the dockyards, and completed an arsenal, the σκευοθήκη designed by the architect Philo. He also reconstructed the great Dionysiac theatre and the gymnasium in the Lyceum, and built the Panathenaic stadium on the Ilissus. He proposed a law that statues of the three great tragedians should be erected in the theatre, and that their works should be carefully edited and preserved among the state archives. Alexander the Great demanded his surrender, but the people refused to give him up. He died while president of the theatre of Dionysus, and was buried on the road leading to the Academy at the expense of the state. (*See* Hicks, *Greek Historical Inscriptions,* no. 145.)

Lycurgus was a man of action; his orations, of which fifteen were published, were criticized by the ancients for their awkward arrangement, harshness of style, and the tendency to digressions about mythology and history, although their noble spirit and lofty morality were highly praised. The one extant example, *Against Leocrates,* fully bears out this criticism. After the battle of Charroneia (338), in spite of the decree which forbade emigration under pain of death, Leocrates had fled from Athens and on his return was impeached by Lycurgus but acquitted.

Bibliography.—The speech has been frequently edited. Editio princeps (Aldine, 1513); F. G. Kiessling (1847) with M. H. E. Meier's commentary on pseudo-Plutarch's *Life of Lycurgus* and the fragments of his speeches; C. Rehdantz (1876); T. Thalheim (1880); C. Scheibe (1885); E. Blass (ed. major, 1889), with bibliography of editions and articles (ed. minor, 1902); E. Sofer (Leipzig, 1905), with notes and introd. There is an index to Andocides, Lycurgus and Deinarchus by L. L. Forman (Oxford, 1897). The exhaustive treatise by F. Dürrbach, *L'Orateur Lycurgue* (1890), contains a list of the most important review articles on the financial and naval administration of Lycurgus and on his public works; *see* also C. Droege, *De Lycurgo publicarum pecuniarum administratore* (Minden, 1880). Several fragments of his various laws have been preserved in inscriptions (*Corpus inscriptionum atticarum,* ii. 162, 163, 173, 176, 180). And *see* authorities under Demosthenes.

LYCURGUS, "The Logothete" (1772–1851), Greek leader in the War of Independence, was born in the island of Samos. He was educated at Constantinople and accompanied Constantine Ypsilanti when he was appointed hospodar of Wallachia and served Ypsilanti's successor, Alexander Soutzos, as treasurer and chancellor (Logothete). In 1802 he returned to Samos. When the War of Independence began he induced his countrymen to declare Samos independent, and was chosen ruler. His share in the War of Independence is chiefly memorable because he provoked the massacre of Chios in 1822. He was afterwards deposed by the Samians, but recovered some influence and had a share in the defence of Samos against the Turks in 1824. When the island was left under the authority of Turkey by the protocol of the 3rd of February 1830, he helped to obtain autonomy for the Samians. He retired to Greece and died on May 22, 1851.

See G. Finlay, *History of the Greek Revolution* (London, 1861).

LYDD, a market town and municipal borough in the Ashford parliamentary division of Kent, England, 71½ mi. E.S.E. of London by S.R. Pop. (1938) 2,947. Area, 18.6 sq.mi. Lydd (Hlide, Lide, Lyde) after the Conquest became a seaport of some consequence and although it now stands nearly 3 mi. inland, a number of its inhabitants are still fishermen. In 774 land in Lydd was granted by Offa to the monks of Christ Church, Canterbury. At some time before the reign of Edward I Lydd was made a member of the Cinque Port of Romney, and in 1290 was granted the same liberties and free customs as the Cinque Ports on condition of supplying the crown with one ship. This charter was confirmed by Edward III in 1365. Lydd is called a borough in the Hundred Rolls. Its incorporation under a bailiff, of which there is evidence in the 15th century, may have been due to the archbishop or to the court of Shepway, but it was not incorporated by the crown until 1855, when the last bailiff was elected the first mayor. In 1494 a grant was made of a yearly fair on July 12 and two days following. A fair was held under this grant until 1874. The church of All Saints has a Perpendicular tower with rich vaulting within. The neighbourhood affords pasture for large flocks of sheep. On the land known as the Rypes, in the neighbourhood, there is a military camp, with artillery and rifle ranges; hence the name given to the explosive "lyddite."

LYDEKKER, RICHARD (1849–1915), F.R.S. (1894), English naturalist and geologist, was born in London on July 25, 1849, and educated at Trinity college, Cambridge. From 1874 to 1882 he was on the staff of the geological survey of India. He died at Harpenden on April 16, 1915.

His works include *Catalogues* (10 vols. 1891) of the fossil mammals, reptiles and birds in the British Museum; *A Manual of Palaeontology* (with H. A. Nicholson, 2 vols., 1889); *Phases of Animal Life* (1892); *The Royal Natural History* (with W. H. Fowler, 8 vols., 1893–96); *The Great and Small Game of India, Burma and Tibet* (1900).

LYDENBURG, a town in the Transvaal, 25° 10′ S., 30° 40′ E., altitude 4,860 feet. Pop. (1936) 3,846 (2,051 white). The surrounding district is devoted largely to sheep farming; and cotton, tobacco and wheat are being grown. Gold is produced in the neighbourhood. The town was founded by Boers in 1846. Ten years later they separated from their brethren, and proclaimed an independent republic, which was, however, incorporated in the South

African republic of 1860. The first successful gold field in the Transvaal was opened here, but it was not until 1910, that railway communication was established.

LYDFORD or **LIDFORD,** a village of Devonshire, England, 27 mi. N. of Plymouth by rail. Pop. of parish (1931) 2,218. The village stands on the small river Lyd, which traverses a deep narrow chasm, crossed by a bridge of single span; and at a little distance a tributary stream forms a cascade with a fall of 150 feet.

Lydford was one of the four Saxon boroughs of Devon, and possessed a mint in the days of Aethelred the Unready. It first appears in recorded history in 997, when the Danes made a plundering expedition up the Tamar and Tavy as far as "Hlidaforda." In the reign of Edward the Confessor it ranked after Exeter, but the Domesday Survey relates that forty houses had been laid waste since the Conquest, and the town never recovered its former prosperity. The history from the 13th century centres round the castle, first mentioned in 1216, and shortly afterwards fixed as the prison of the stannaries and the meeting-place of the Forest Courts of Dartmoor. A guild at Lideford is mentioned in 1180, and the pipe roll of 1195 records a grant for the re-establishment of the market. In 1238 the borough was bestowed by Henry III. on Richard, earl of Cornwall, who in 1268 obtained a grant of a Wednesday market and a three days' fair at the feast of St. Petrock. The borough was never incorporated by charter, and only once, in 1300, returned members to parliament. In the 18th century the castle was restored and again used as a prison and as the meeting-place of the Manor and borough courts.

LYDGATE, JOHN (*c.* 1373–*c.* 1450), English poet, was born at the village of Lydgate near Newmarket. Probably he was educated at the school attached to the Benedictine abbey at Bury St. Edmunds, and in his *Testament* he has drawn a lively picture of himself as a typical orchard-robbing boy, who had scant relish for matins, fought, and threw creed and paternoster at the cock. He was ordained sub-deacon in 1389, deacon in 1393, and priest in 1397. Lydgate passed as a portent of learning, and, according to Bale, he pursued his studies not only at both the English universities but in France and Italy. Certainly he knew France, and he visited Paris in an official capacity in 1426. It is improbable that he lived many years after 1446, when John Baret, treasurer of Bury, signed an extant receipt for a pension which he shared with Lydgate, and which continued to be paid till 1449. If it be true, as Bishop Alcock of Ely affirms, that Lydgate wrote a poem on the loss of France and Gascony, he must have lived two years longer, which would indicate the year 1451, or thereabouts, as the date of his death.

In 1434 Lydgate retired from the priorate of Hatfield Broadoak (or Hatfield Regis), to which he had been appointed in June 1423. After 1390—but whilst he was still a young man—he made the acquaintance of Geoffrey Chaucer, with whose son Thomas he was intimate. This friendship appears to have decided Lydgate's career, and in his *Troy-book* and elsewhere are reverent and touching tributes to his "master." The themes of his more ambitious poems can be traced to Chaucerian sources.

Lydgate is a most voluminous writer. The *Falls of Princes* alone comprises 7,000 stanzas; and his authentic compositions reach the enormous total of 140,000. As the result the bulk of his composition is wholly or comparatively rough-hewn. That he was capable of finished work is shown by two allegorical poems—the *Complaint of the Black Knight* and the *Temple of Glass* (once attributed to Hawes), in which he reveals himself as a not unworthy successor of Chaucer. For a couple of centuries Lydgate's reputation equalled, if it did not surpass, that of his master. This was in a sense only natural, since he was the real founder of the school which ruled English letters during the long interval between Chaucer and Spenser. One of the most obvious defects of this school is excessive attachment to polysyllabic terms. John Metham is amply justified in his censure—

> Eke John Lydgate, sometime monk of Bury,
> His books indited with terms of rhetoric
> And half-changed Latin, with conceits of poetry.

But Lydgate is lucid in style; and his writings are read more easily than Chaucer's. In spite of that, Lydgate is characteristically mediaeval—mediaeval in his prolixity, his platitude, his want of judgment and his want of taste; mediaeval also in his pessimism, his Mariolatry and his horror of death.

Dr. Schick's preface to the *Temple of Glass* embodies practically all that is known or conjectured concerning this author, including the chronological order of his works. With the exception of the *Damage and Destruction in Realms*—an account of Julius Caesar, his wars and his death—they are all in verse and extremely multifarious—narrative, devotional hagiological, philosophical and scientific, allegorical and moral, historical, satirical and occasional. The *Troy-book,* undertaken at the command of Henry V., then prince of Wales, dates from 1412–1420; the *Story of Thebes* from 1420–1422; and the *Falls of Princes* towards 1430. His last work was *Secreta Secretorum* or *Secrets of Old Philosophers,* rhymed extracts from a pseudo-Aristotelian treatise. Lydgate certainly possessed extraordinary versatility, which enabled him to turn from elaborate epics to quite popular poems like the *Mumming at Hertford, A Ditty of Women's Horns* and *London Lickpenny.*

See publications of the Early English Text Society, especially the *Temple of Glass,* edited by Dr. Schick; Koeppel's *Lydgate's Story of Thebes, eine Quellenuntersuchung* (Munich, 1884), and the same scholar's *Laurents de Premierfait und John Lydgates Bearbeitungen von Boccaccios De Casibus Illustrium Virorum* (Munich, 1885); Warton's *History of English Poetry;* Ritson's *Bibliotheca Anglo-Poetica;* Furnivall's *Political Poems* (E.E.T.S.); and Sidney Lee's article in the *Dict. Nat. Biog.*

LYDIA, a district of Asia Minor, the boundaries of which are difficult to fix, partly because they varied at different epochs. The name is found (*c.* 660 B.C.) under the form of *Luddi* in the inscriptions of the Assyrian king Assur-banipal. In Homer we read only of Maeonians (*Il.* ii. 865, etc.), and the place of the Lydian capital Sardis is taken by Hydē (*Il.* xx. 385). According to Herodotus (i.7), the Meiones (called Maeones by other writers) were named Lydians after Lydus, the son of Attis, in the mythical epoch which preceded the rise of the Heraclid dynasty. In historical times the Maeones were a tribe inhabiting the district of the upper Hermus. The Lydians must have been an allied tribe which bordered upon them to the north-west, and occupied the plain of Sardis or Magnesia. They were cut off from the sea by the Greeks, who were in possession, not only of the Bay of Smyrna, but also of the country north of Sipylus. Northwards the Lydians extended at least as far as the Gygaean lake and the Sardenē range. The plateau of the Bin Bir Tepē, on the southern shore of the Gygaean lake, was the chief burial-place of the inhabitants of Sardis, and is thickly studded with tumuli, among which is the "tomb of Alyattes" (260ft. high). Next to Sardis the chief city was Magnesia (*q.v.*) ad Sipylum in the neighbourhood of which is the famous seated figure of "Niobe" (*Il.* xxiv. 614–7), cut out of the rock, and probably intended to represent the goddess Cybele, to which the Greeks attached their legend of Niobe. Under the Heraclid dynasty the limits of Lydia must have been already extended, since the authority of Gyges reached as far as the Troad. The successes of Alyattes and of Croesus finally changed the Lydian kingdom into a Lydian empire, and all Asia Minor westward of the Halys, except Lycia, owned the supremacy of Sardis. Lydia never again shrank to its original dimensions. After the Persian conquest the Maeander was regarded as its southern boundary, and in the Roman period it comprised the country between Mysia and Caria on the one side and Phrygia and the Aegean on the other.

Lydia proper was exceedingly fertile. The hill-sides were clothed with vine and fir, and the rich broad plain of Hermus produced large quantities of corn and saffron. The climate of the plain was soft but healthy. The Pactolus, which flowed through the centre of Sardis, into the Hermus, was believed to be full of golden sand. Maeonia on the east contained the curious barren plateau known to the Greeks as the *Katakekaumenē* ("Burnt country"), once a centre of volcanic disturbance. The Gygaean lake (where remains of pile dwellings have been found) still abounds with carp.

Race and Religion.—The Lydian race was probably a mixed one, consisting of aborigines and Aryan immigrants. It was characterized by industry and a commercial spirit. The religion of the Lydians resembled that of the other civilized nations of Asia Minor. It was a nature worship, which at times became wild and sensuous. By the side of the supreme god Medeus stood the sun-god Attis, as in Phrygia the chief object of the popular cult. He was at once the son and bridegroom of Cybele (*q.v.*), or Cybebe, the mother of the gods, whose image was adored on the cliffs of Sipylus (Paus. iii. 22). At Ephesus, where she was adored under the form of a meteoric stone, she was identified with the Greek Artemis (*see* also GREAT MOTHER OF THE GODS). The priestesses by whom she was served are depicted as armed with the double-headed axe, and the dances they performed in her honour with shield and bow gave rise to the myths which saw in them the Amazons (*q.v.*) a nation of woman-warriors. The pre-Hellenic cities of the coast—Smyrna, Samorna, (Ephesus), Myrina, Cyme, Priene and Pitane,—were all of Amazonian origin, and the first three of them have the same name as the Amazon Myrina, whose tomb was pointed out in the Troad. The prostitution whereby the Lydian girls gained their dowries (Herod. i. 93) was a religious exercise, as among the Semites, which marked their devotion to the goddess Cybele.

Lydian Dynasties.—According to the native historian Xanthus (460 B.C.) three dynasties ruled in succession over Lydia. The first, that of the Attiads, is mythical. To this mythical age belongs the colony which, according to Herodotus (i.94), Tyrsenus, the son of Attis, led to Etruria. Xanthus, however, puts Torrhebus in the place of Tyrsenus, and makes him the eponym of a district in Lydia. The second dynasty was also of divine origin, but the names which head it prove its connection with the distant East. The Hittites, an Oriental people, deeply imbued with the elements of Babylonian culture, had overrun Asia Minor and established themselves on the shores of the Aegean before the reign of the Egyptian king Rameses II. Their subject allies include the Mysians and the Dardani of the Troad, while the Hittites have left memorials in Lydia. G. Dennis discovered an inscription in Hittite hieroglyphics attached to the figure of "Niobe" on Sipylus. We learn from Eusebius that Sardis was first captured by the Cimmerii 1078 B.C.; and since it was four centuries later before the real Cimmerii (*q.v.*) appeared on the horizon of history, we may perhaps find in the statement a tradition of the Hittite conquest. As the authority of the Hittite satraps at Sardis began to decay the Heraclid dynasty arose. After lasting five hundred and five years, the dynasty came to an end in the person of Sadyattes. The name Candaules, given him by Herodotus (i.7), meant "dog strangler," and was a title of the Lydian Hermes. Gyges (*q.v.*) put him to death and established the dynasty of the Mermnads, 687 B.C. Gyges initiated a new policy, that of making Lydia a maritime power; but towards the middle of his reign the kingdom was overrun by the Cimmerii (*q.v.*). The lower town of Sardis was taken, and Gyges sent tribute to Assur-banipal, as well as two Cimmerian chieftains he had himself captured in battle. A few years later Gyges joined in the revolt against Assyria; the Cimmerian hordes returned, Gyges was slain in battle (652 B.C.), and Ardys his son and successor returned to his allegiance to Nineveh. Alyattes, the grandson of Ardys, finally succeeded in extirpating the Cimmerii, as well as in taking Smyrna, and thus providing his kingdom with a port. The trade and wealth of Lydia rapidly increased, and the Greek towns fell one after the other before the attacks of the Lydian kings. Alyattes's long reign of 57 years saw the foundation of the Lydian empire. All Asia Minor west of the Halys acknowledged his sway. The Greek cities were allowed to retain their own institutions and government on condition of paying taxes and dues to the Lydian monarch, and the proceeds of their commerce thus flowed into the imperial exchequer. The result was that the king of Lydia became the richest prince of his age. Alyattes was succeeded by Croesus (*q.v.*), who had probably already for some years shared the royal power. He reigned alone only 15 years, Cyrus (*q.v.*) the Persian after an indecisive battle on the Halys, marching upon Sardis, and capturing both acropolis and monarch (546 B.C.).

Persian Conquest.—The revolt of the Lydians under Pactyas, whom Cyrus had appointed to collect the taxes, caused the Persian king to disarm them. Sardis now became the western capital of the Persian empire, and its burning by the Athenians was one of the contributing causes of the Persian War. After Alexander the Great's death, Lydia passed to Antigonus; then Achaeus made himself king at Sardis, but was defeated and put to death by Antiochus. The country was presented by the Romans to Eumenes, and subsequently formed part of the proconsular province of Asia. By the time of Strabo (xiii. 631) its old language was entirely supplanted by Greek. (*See* ASIANIC LANGUAGES.)

The Lydian empire may be described as the industrial power of the ancient world. The Lydians were credited with introducing or inventing the game of dice and also coined money. The oldest known coins are the electrum coins of the earlier Mermnads (Madden, *Coins of the Jews,* pp. 19–21), stamped on one side with a lion's head or the figure of a king with bow and quiver; these were replaced by Croesus with a coinage of pure gold and silver. The electrum coins of Lydia were of two kinds, one weighing 168·4 grains for the inland trade, and another of 224 grains for the trade with Ionia. The standard was the silver mina of Carchemish which contained 8,656 grains. Originally derived from Babylonia, this standard was passed on to Asia Minor during the Hittite conquest, but was eventually superseded by the Phoenician mina of 11,225 grains (*see* also NUMISMATICS). The inns, which the Lydians were said to have been the first to establish, were connected with their attention to commercial pursuits (Herod. i.94). Their literature has wholly perished. They were celebrated for their music and gymnastic exercises, and their art formed a link between that of Asia Minor and that of Greece. Lydian sculpture was probably similar to that of the Phrygians. Phallic emblems, for averting evil, were plentiful; the summit of the tomb of Alyattes is crowned with an enormous one of stone, about 9 ft. in diameter.

The tumulus itself is 281 yds. in diameter and about half a mile in circumference. It has been partially excavated, and a sepulchral chamber discovered in the middle, composed of large well-cut and highly polished blocks of marble. The stone basement which, according to Herodotus, formerly surrounded the mound has disappeared.

Keil and A. von Premerstein, *Bericht über eine Reise in Lydien* (1908); *Cambridge Ancient History,* vol. iii (with useful bibliography).

LYDUS ("THE LYDIAN"), **JOANNES LAURENTIUS,** Byzantine writer on antiquarian subjects, was born in A.D. 490. From an early age until his dismissal in 552 he held high court and state offices. The date of his death is not known, but he probably did not survive Justinian (d. 565). Of his literary works there survive: (1) *De Ostentis* (Περὶ διοσημειῶν), on the origin and progress of the art of divination; (2) *De Magistratibus reipublicae Romanae* (Περὶ ἀρχῶν τῆς Ῥωμαίων πολιτείας); (3) *De Mensibus* (Περὶ μηνῶν), a history of the different festivals of the year.

The chief value of these books consists in the fact that the author made use of the works (now lost) of old Roman writers on similar subjects.

Editions of (1) by C. Wachsmuth (1897), of (2) and (3) by R. Wünsch (1898–1903); *see* also Christ-Schmid, *Geschichte der Gr. Lit.;* and Klotz in Pauly-Wissowa, *Realencyclopädie.*

LYE, the name given to the solution of alkaline salts obtained by leaching or lixiviating wood ashes with water; to solutions of a caustic alkali (sodium or potassium hydroxide); or, more generally to any strong alkaline solution especially one used as a detergent.

In the United States it is the trade name for sodium hydroxide. (*See* ALKALI; ALKALI MANUFACTURE.)

LYELL, SIR CHARLES (1797–1875), British geologist, son of Charles Lyell of Kinnordy, Forfarshire, was born on Nov. 14, 1797, on the family estate in Scotland. His father (1767–1849) was known both as a botanist and as the translator of the *Vita Nuova* and the *Convito* of Dante: the plant *Lyellia* was named after him. As a boy Lyell had a strong inclination for natural history, especially entomology. In 1816 he entered Exeter college, Oxford, where the lectures of Dr. Buckland first attracted him to geology. After graduating he entered Lincoln's Inn, and in 1825 he was called to the bar, and went on the western circuit for two years. In 1819 he had been elected a fellow of the Linnean and Geological societies, communicating his first paper, "On a Recent Formation of Freshwater Limestone in Forfarshire," to the latter society in 1822, and acting as one of the honorary secretaries in 1823. In that year he went to France, and in 1824 made a geological tour in Scotland in company with Dr. Buckland. In 1826 he was elected F.R.S., and in 1827 he finally abandoned law for geology.

He had already begun to plan his chief work, *The Principles of Geology* (3 vols., 1830–33). With Murchison he wrote joint papers on the volcanic district of Auvergne and the Tertiary formations of Aix-en-Provence. He then studied the marine remains of the Italian Tertiary strata, and conceived the idea of dividing this geological system into three or four groups, characterized by the proportion of recent to extinct species of shells. To these groups, after consulting Dr. Whewell as to the best nomenclature, he gave the names now universally adopted—Eocene (*dawn of recent*), Miocene (*less of recent*), and Pliocene (*more of recent*); and with the assistance of G. P. Deshayes he drew up a table of shells in illustration of this classification. Between 1830 and 1876 12 editions of *The Principles of Geology* were published, each so much enriched as to form a complete history of the progress of geology during that interval.

In 1838 Lyell published the *Elements of Geology*, which became a standard work on stratigraphical and palaeontological geology. This book, which was based on lectures, went through six editions in Lyell's lifetime. In his third great work, *The Antiquity of Man* (1863), he gave a general survey of the arguments for man's early appearance on the earth, derived from the discoveries of flint implements in post-Pliocene strata in the Somme valley and elsewhere; he discussed also the deposits of the Glacial epoch, and in the same volume he first gave in his adhesion to Darwin's theory of the origin of species.

In 1833 Lyell married Mary (1809–1873), eldest daughter of Leonard Horner, who was thenceforward associated with him in all his work.

In 1834 Lyell went to Denmark and Sweden, the result of which was his Bakerian lecture to the Royal Society "On the Proofs of the gradual Rising of Land in certain Parts of Sweden." He also brought before the Geological Society a paper "On the Cretaceous and Tertiary Strata of Seeland and Möen." In 1835 he became president of the Geological Society. In 1837 he was again in Norway and Denmark, and in 1841 travelled through the United States, Canada and Nova Scotia. This last journey, together with a second one to America in 1845, resulted not only in papers, but also in two works not exclusively geological, *Travels in North America* (1845) and *A Second Visit to the United States* (1849). He estimated the rate of recession of the falls of Niagara, the annual average accumulation of alluvial matter in the delta of the Mississippi, and studied those vegetable accumulations in the "Great Dismal Swamp" of Virginia, which he afterwards used in illustrating the formation of beds of coal. He also studied the coal-formations in Nova Scotia, and discovered, in company with Dr. (afterwards Sir J. W.) Dawson (*q.v.*) of Montreal, the earliest known landshell, *Pupa vetusta*, in the hollow stem of a Sigillaria. On a visit to Madeira and Teneriffe he accumulated evidence on the age and deposition of lava-beds and the formation of volcanic cones. He revisited Sicily in 1858, and his observations upon the structure of Etna refuted the theory of "craters of elevation" upheld by Von Buch and Élie de Beaumont. (See *Phil. Trans.*, 1859.)

Lyell was knighted in 1848 and created a baronet in 1864, in which year he was president of the British Association at Bath.

In later life he became blind. He died on Feb. 22, 1875, and was buried in Westminster Abbey.

The Lyell Medal, established in 1875 under the will of Sir Charles Lyell, is to be awarded annually (or from time to time) by the council of the Geological society. The medallist may be of any country or either sex. Not less than one-third of the annual interest of a sum of £2,000 is to be awarded with the medal; the remaining interest, known as the Lyell Geological Fund, is to be given in one or more portions at the discretion of the council for the encouragement of geological science.

See *Life, Letters and Journals of Sir Charles Lyell, Bart.*, edited by his sister-in-law, Mrs. Lyell (2 vols., 1881); *Charles Lyell and Modern Geology*, by T. G. Bonney (1895).

LYLY, LILLY or **LYLIE, JOHN** (1553?–1606), English writer, the famous author of *Euphues*, was born in Kent in 1553 or 1554. At the age of 16, according to Wood, he became a student of Magdalen college, Oxford, where in due time he proceeded to his bachelor's and master's degrees (1573 and 1575). In 1574 he applied, in vain, to Lord Burghley "for the queen's letters to Magdalen college to admit him fellow." After he left Oxford, where he had already the reputation of "a noted wit," Lyly seems to have attached himself to the service of Lord Delawarr, and in 1580 to that of Burghley's son-in-law, Edward, earl of Oxford. Two years later we possess a letter of Lyly, dated July 1582, in which the writer protests against some accusation of dishonesty which had brought him into trouble with his patron, and demands a personal interview for the purpose of clearing his character. He obtained, probably through Oxford, a lease at Blackfriars for a theatrical undertaking, which apparently failed, for he was in prison for debt in 1583, when Oxford seems to have helped him out.

In 1578 he wrote *Euphues, or the Anatomy of Wit*, which was licensed to Gabriel Cawood on Dec. 2, 1578, and published in the spring of 1579. In the same year the author was incorporated M.A. at Cambridge, and possibly saw his hopes of court advancement dashed by the appointment in July of Edmund Tylney to the office of master of the revels, a post at which, as he reminds the queen some years later, he had all along been encouraged to "aim his courses." *Euphues and his England* appeared in 1580. For a time Lyly was the most successful and fashionable of English writers. He was hailed as the author of "a new English," as a "raffineur de l'Anglois"; and, as Edmund Blount, the editor of his plays, tells us in 1632, "that beautie in court which could not parley Euphuism was as little regarded as she which nowe there speakes not French."

After the publication of *Euphues*, however, Lyly seems to have entirely deserted the novel form, which passed into the hands of his imitators, and to have thrown himself almost exclusively into play-writing, probably with a view to the mastership of revels whenever a vacancy should occur. Their lively dialogue, classical colour and frequent allusions to persons and events of the day maintained that popularity with the court which *Euphues* had won.

In 1589 Lyly published a tract in the Martin Marprelate controversy, called *Pappe with an hatchet, alias a figge for my Godsonne; Or Crack me this nut; Or a Countrie Cuffe, etc.* About the same time we may probably date his first petition to Queen Elizabeth. The two petitions, transcripts of which are extant among the Harleian mss., are undated, but in the first of them he speaks of having been ten years hanging about the court in hope of preferment, and in the second he extends the period to 13 years. It may be conjectured that the ten years date from 1579, when Edmund Tylney was appointed master of the revels with a tacit understanding that Lyly was to have the reversion of the post. But in 1589 or 1590 the mastership of the revels was as far off as ever—Tylney in fact held the post for 31 years—and that Lyly's petition brought him no compensation in other directions may be inferred from the second petition of 1593. "Thirteen yeres your highnes servant but yet nothing. Twenty freinds that though they saye they will be sure, I finde them sure to be slowe. A thousand hopes, but all nothing; a hundred promises but yet nothing. Thus casting up the inventory of my friends, hopes, promises and tymes, the *summa totalis* amounteth to just nothing." Edmund Blount says vaguely that Elizabeth "graced and rewarded" him, but of this there is no other evidence. After 1590 his works steadily declined in influence and reputation; other stars were in possession of the horizon; he seems to have received some reward in the last years of Elizabeth's reign, possibly out of the Essex forfeitures. He was buried in London at St. Bartholomew the Less on Nov. 30, 1606. He had married, in 1583, Beatrice Browne, of Mexborough, York, and had two sons and a daughter.

Comedies.—In 1632 Edmund Blount published "Six Court Comedies," including *Endymion* (1591), *Sappho and Phao* (1584), *Alexander and Campaspe* (1584), *Midas* (1592), *Mother Bombie* (1594) and *Gallathea* (1592). To these should be added the *Woman in the Moone* (Lyly's earliest play, to judge from a passage in the prologue and therefore earlier than 1584, the date of *Alexander and Campaspe*), and *Love's Metamorphosis,* first printed in 1601. Of these, all but the last are in prose. *A Warning for Faire Women* (1599) and *The Maid's Metamorphosis* (1600) have been attributed to Lyly, but on altogether insufficient grounds. The first editions of all these plays were issued between 1584 and 1601, and the majority of them between 1584 and 1592, in what were Lyly's most successful and popular years. Lyly's dialogue shows a great advance in rapidity and resource upon anything which had gone before it; it represents a great step forward in English dramatic art. His nimbleness, and the wit which struggles with his pedantry, found their full development in the dialogue of *Twelfth Night, As You Like It* and *Much Ado about Nothing,* just as "Marlowe's mighty line" led up to and was eclipsed by the majesty and music of Shakespearian passion. One or two of the songs introduced into his plays show a real lyrical gift. These, however, only appear in a posthumous edition, and critics are not unanimous in ascribing them to Lyly. His classical and mythological plots, flavourless and dull as they would be to a modern audience, were interesting enough to the court, who saw in Midas Philip II., Elizabeth in Cynthia and perhaps Leicester's unwelcome marriage with Lady Sheffield in the love affair between Endymion and Tellus which brings the former under Cynthia's displeasure. Gabriel Harvey dreaded lest Lyly should make a play upon their quarrel; Meres, as is well known, places him among "the best for comedy"; and Ben Jonson names him among those foremost rivals who were "outshone" and outsung by Shakespeare.

Euphues.—It was not, however, as a dramatist, but as the author of *Euphues,* that Lyly made his immediate mark upon the Elizabethan world. His plays amused the court circle, but the "new English" of his novel introduced a new sense of form in English prose style, and in English speech. Its exaggerations compelled attention, and in time disappeared; but the conscious preoccupation with the order and selection of words in prose bore solid fruit. The plot of *Euphues* is extremely simple. The hero, whose name may very possibly have been suggested by a passage in Ascham's *Schoolmaster,* is introduced to us as still in bondage to the follies of youth, "preferring fancy before friends, and this present humour before honour to come." His travels bring him to Naples (London), where he falls in love with Lucilla, the governor's light-minded daughter. Lucilla is already pledged to Euphues's friend Philautus, but Euphues's passion betrays his friendship, and the old lover finds himself thrown over by both friend and mistress. Euphues himself, however, is very soon forsaken for a more attractive suitor. He and Philautus make up their quarrel, and Euphues writes his friend "a cooling card," to be "applied to all lovers," which is so severe upon women that Lyly feels it necessary to balance it by a sort of apology addressed "to the grave matrons and honest maidens of Italy" (England). Euphues then leaves Naples (London) for his native Athens (Oxford), where he gives himself up to study, of which the first fruits are two long treatises—the first, "Euphues and his Ephoebus," a disquisition on the art of education addressed to parents, and the second, "Euphues and Atheos," a discussion of the first principles of religion. The remainder of the book is filled up with correspondence between Euphues and his friends. The first *Euphues* is therefore an attack on the "Italianate" society of London, and on the fickleness of woman. The book aroused violent protests both in Oxford and London, which Lyly hastened to meet by the publication of *Euphues and his England,* in which criticism is exchanged for flattery. England is all that is good; Englishwomen are chaste and virtuous, and Englishmen mirrors of chivalry.

In *Euphues and his England* Euphues and Philautus travel from Naples to England. They arrive at Dover, halt for the night at Fidus's house at Canterbury, and then proceed to London, where they make acquaintance with Surius, a young English gentleman of great birth and noble blood; Psellus, an Italian nobleman reputed "great in magick"; Martius, an elderly Englishman; Camilla, a beautiful English girl of insignificant family; Lady Flavia and her niece Fraunces. After endless correspondence and conversation on all kinds of topics, Euphues is recalled to Athens, and from there corresponds with his friends. "Euphues' Glasse for Europe" is a flattering description of England sent to Livia at Naples. It is the most interesting portion of the book, and throws light upon one or two points of Lyly's own biography.

Such is a brief outline of the book which for a time set the fashion for English prose. Two editions of each part appeared within the first year after publication, and 13 editions of both are enumerated up to 1636, after which, with the exception of a modernized version in 1718, *Euphues* was never reprinted until 1868, when Dr. Arber took it in hand. The long disquisitions on love, religion, exile, women or education, on court life and country pleasures, handled all the most favourite topics in the secularized speculation of the time; the foreign background and travel talk pleased a society of which Lyly himself said "trafic and travel hath woven the nature of all nations into ours and made this land like arras full of device which was broadcloth full of workmanship"; and, although Lyly steered clear in it of the worst classical pedantries of the day, the book was steeped in classical learning, and based upon classical material. A large proportion of its matter indeed was drawn from classical sources, but he always gave to his borrowed material a colouring which is peculiarly his own, the note which is described as eupheuistic.

It was not the matter of *Euphues,* however, so much as the style which made it famous. (*See* EUPHUISM.) The source of Lyly's peculiar style has been traced to the influence of Don Antonio de Guevara (*q.v.*), whose *Libro Aureo de Marco Aurelio* (1529) was translated by Lord Berners (1531), and, as *The Dial for Princes,* by North (1557). The sententious and antithetical style of *The Dial for Princes* is substantially that of *Euphues,* though Guevara on the whole handles it better than his imitator.

Lyly was not the first to appropriate and develop the Guevaristic style. The earliest book in which it was fully adopted was *A petite Pallace of Pettie his Pleasure* (1576) by George Pettie. Lyly, however, carried the style to its highest point, and made it the dominant literary fashion. His principal followers in it were Greene, Lodge and Nash, his principal opponent Sir Philip Sidney; the Arcadia in fact supplanted *Euphues,* and the Euphuistic taste proper may be said to have died out about 1590 after a reign of some 12 years. According to Landmann, Shakespeare's *Love's Labour Lost* is a caricature of the Italianate and pedantic fashions of the day, not of the peculiar style of *Euphues.* The only certain allusion in Shakespeare to the characteristics of Lyly's famous book is to be found in *Henry IV.,* where Falstaff, playing the part of the king, says to Prince Hal, "Harry, I do not only marvel where thou spendest thy time, but also how thou art accompanied; for, though the camomile the more it is trodden on the faster it grows, yet youth the more it is wasted the sooner it wears." Here the pompous antithesis is evidently meant to caricature the peculiar Euphuistic sentence of court parlance.

LYME REGIS, a municipal borough and watering-place, Western parliamentary division, Dorsetshire, England, 151 mi. S.W. of London by the Southern railway. Pop. (1938) 2,715. Area, 2 sq.mi. It is situated at the mouth of a narrow valley opening upon a fine precipitous coast-line, and there is a sandy shore affording excellent bathing. The church of St. Michael and All Angels is mainly Perpendicular, but the tower (formerly central) and the portion west of it are Norman. A guildhall and assembly rooms are the chief public buildings. The principal industries are stone-quarrying and the manufacture of cement. A curved pier, known as the Cobb, is first mentioned in 1328. The harbour, with a small coasting trade, is under the authority of the corporation.

In 774 Cynewulf, king of the West Saxons, granted land here to the church of Sherborne. In 1086 three manors of Lyme are mentioned. The town was first known as Lyme Regis in 1316. Lyme ranked as a port in 1234, and Edward I in 1284 granted to the town a charter making it a free borough, with a merchant gild. In the following January the bailiffs were given privileges implying considerable foreign trade; the importance of the port is also evident from the demand of two ships for the king's service in 1311. It received another grant from Edward III (1332). In 1591 Elizabeth incorporated Lyme, and further charters were obtained from James I, Charles II and William III. Lyme returned two members to parliament from 1295 to 1832 when the representation was reduced to one. The borough was disfranchised in 1867. The fairs granted in 1553 for the 1st of February and the 20th of September are now held on altered dates. Trade with France began as early as 1284. In 1685 Lyme was the scene of the landing of James, duke of Monmouth, in his attempt upon the throne.

LYMINGTON, a municipal borough and seaport in Hampshire, England, 98 mi. S.W. of London by the S.R. Pop. (1938) 17,910. Area, 23.7 sq.mi. There was a Roman camp nearby, but there is no evidence that a town existed here until after the Conquest. Its importance began when it was granted to Richard de Redvers, earl of Devon, in the reign of Henry I. No charter has been found, but a judgment given under a writ of *quo warranto* in 1578 confirms to the burgesses freedom from toll, passage and pontage, the tolls and stallage of the quay and the right to hold two fairs—privileges which they claimed under charters of Baldwin de Redvers and Isabel de Fortibus, countess of Albemarle, in the 13th century, and Edward Courtenay, earl of Devon, in 1405. The town was governed by the mayor and burgesses until the corporation was reformed in 1835. A writ for the election of a member to parliament was issued in the reign of Edward III., but no return was made. From 1585 two members were regularly returned; the number was reduced to one in 1867, and in 1885 the representation was merged in that of the county. Fairs on May 13 and 14 and Oct. 2 and 3, dating from the 13th century, are still held. The Saturday market probably dates from the same century. Lymington was made a port in the reign of Henry I., and its large shipping trade led to frequent disputes with Southampton as to the levying of duties. The case was tried in 1329 and decided against Lymington, but in 1750 the judgment was reversed, and since then the petty customs have been regularly paid. From an early date and for many centuries salt was the staple manufacture of Lymington. The rise of the mineral salt-works of Cheshire led to its decline in the 18th century, and later the renewed importance of Southampton completed its decay. It lies on the estuary of the Lymington, which opens into the Solent. The church of St. Thomas the Apostle, an irregular structure, dates from the reign of Henry VI., but has been frequently restored. The harbour contains five berths, and ships drawing 11 ft. may be berthed at high tide. There is some coasting trade, and yacht-building is carried on. Regular passenger steamers serve Yarmouth in the Isle of Wight. In summer the town is frequented for sea-bathing.

LYMPH, ITS FORMATION AND MOVEMENT. In order to gain an insight into the significance of lymph it is necessary to consider the whole question of fluid circulation in the tissues. The most convenient point at which to commence such a review is the blood. The function of this medium is to transport oxygen and nutritive materials to tissues requiring them and to remove certain waste products such as carbon dioxide. Blood is conveyed in a totally closed circulatory system, the nearest point of approach to the actual tissue cells being in the capillary area. The materials conveyed by the blood have to be transferred from the interior of this capillary system through a wall of thin endothelium to fluid surrounding the cells and in intimate contact with them. This fluid, which is known as tissue fluid, acts as a middleman, conveying substances from the fluid of the blood directly to the cells of the organ.

With the important exceptions of the central nervous system the skeletal muscle bundles and spleen pulp, all tissues and organs are supplied with another set of capillary vessels in intimate contact with the tissue fluid, but, as in the case of the capillary blood vessels, separated from it by a continuous wall of thin endothelium. These vessels are the lymphatic capillaries. They begin as blind extremities and unite, usually with a very extensive anastomosis, to form plexuses of larger vessels with thicker walls. These in turn are drained by the lymphatic trunks which usually course with the main blood vessels of the part. The main trunks coming from the hind limbs and abdominal organs are united into one large vessel, the receptaculum chyli from which the thoracic duct passes up on the left side of the oesophagus to drain into the venous system on the left side of the neck. A smaller duct drains the right side of the head and neck and right upper limb, emptying into the veins in an analogous position on that side.

The lymph vessels coming from organs or limbs pass through lymphatic glands at some part of their course. This whole network of vessels and glands is known as the lymphatic system. Early work on this system gave rise to the view that the lymph capillaries were in direct communication with the tissue spaces. Lymph therefore was simply tissue fluid which had passed through openings in the walls of the smallest lymphatic vessels. Later work substituted the opinion that lymph capillaries were totally closed by endothelial plates in the same way as blood capillaries. This view, which has been restated and strengthened by the observations of Sabin, is that now generally held to be correct.

One is therefore left with the conception that the tissue of an organ consists of a collection of cells completely surrounded by a fluid medium—the tissue fluid. As a channel for the supply of nutriment there are blood capillaries. As a channel of exit only

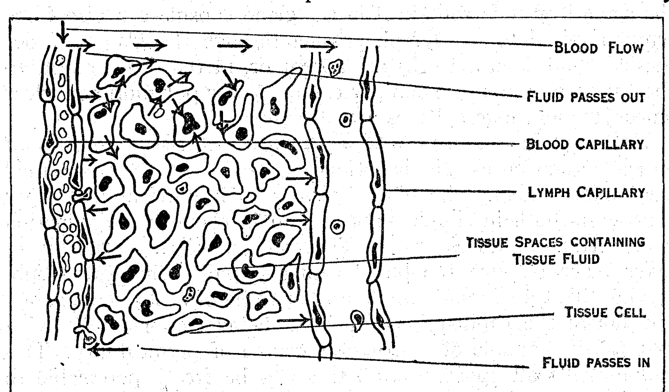

DIAGRAM SHOWING FLUID EXCHANGES TAKING PLACE IN ACTIVE TISSUE
The arrows indicate the direction of flow of the fluid, which comes from the blood vessel and passes between the tissue cells to enter the lymph capillary, to form lymph. Arrows on the tissue cells show that fluid exchange is occurring between them and the surrounding tissue fluid

there are the lymph capillaries, and, as we shall see, the blood vessels also subserve the same function. The fluid, therefore, which is derived from the tissue fluid, after passage through the endothelial wall of the lymphatic, is lymph. Obviously its composition relative to tissue fluid depends on the properties of the lymphatic endothelium.

It is with the composition, mode of production, function and propulsion of this fluid that we have to deal.

Composition.—Lymph can be collected by allowing the fluid to drop into a vessel from a canula—a small glass or metal tube

—inserted into one of the larger trunks passing from an organ or limb. Mixed lymph, *i.e.*, lymph from all parts intermingled, is collected from a canula inserted into the thoracic duct in the neck. Mixed lymph when collected from a fasting animal is colourless or yellowish. Its specific gravity varies from 1015 to 1025. The lymph so collected readily clots, but the clot is not so firm as that of blood. The total solids vary from 3·6 to 5·7%. The proteins consist of fibrinogen, paraglobulin and serum albumin. The salts are similar to those of the liquor sanguinis and are present in the same proportions. According to some, however, salts such as sodium chloride may be present in greater concentration than in blood plasma. The electrical conductivity of lymph has also been found to vary in the inverse way to that of blood in certain circumstances.

If the lymph is collected from an animal fed some time previously with a fatty meal it has a milky appearance due to the presence of innumerable fine drops of fat about ·5 to ·75μ in diameter. This fat is absorbed by the lymphatics of the small intestine, which because of their white appearance during digestion are called lacteals.

If, however, lymph is collected separately from various organs and limbs it is found to differ very considerably in its protein content. Thus lymph collected from the liver is very little inferior in protein content to that of blood, while that of leg lymph is considerably less. These two examples represent the extremes of difference, samples from other organs falling between these values.

The Amount of Lymph.—In the dog as much as 0·6 litres, in the cow about 2 litres of lymph per 10 kilos of body weight is eliminated by the thoracic duct in 24 hours. Direct measurements have not been made on man but probably 4 to 5 litres —equal to the whole blood volume—passes through the duct in a day.

Formed Elements.—The formed elements of lymph consist almost entirely of lymphocytes which are added to it in its passage through the lymphatic glands, and from the lymphatic tissue such as is present in the spleen, intestine and tonsils. The actual number present at any time is very variable, in a cat usually 10,-000–20,000 per c.mm. in the lymph from the intestine. It has been found that mechanical pressure on lymphatic glands is capable of increasing this number very considerably, so that the lymphocytosis in the blood after exercise can be explained on this basis alone. Nevertheless there is some evidence that contraction of the smooth muscle contained in the gland capsule can also force lymphocytes into the lymph passing through the gland. Under normal conditions red cells are absent or, in the dog, present to the extent of 1,000 to 2,000 per c.mm. A few polymorphonuclear leucocytes and macrophages are also found.

Mode of Production and Function.—A tissue consists of an agglomeration of cells in intimate contact with the tissue fluid surrounding them. The blood conveys to it nutrient and other substances both in simple solution and in chemical combination with certain of its elements. The transfer of these substances takes place through the blood capillary wall. The forces subserving this transference would appear to be of a physical character though the capillary endothelium, being composed of living material, is capable of altering its degree of permeability. This endothelial wall appears at all times to be freely permeable to dissolved salts, but its permeability to proteins is a variable factor. The physiological conditions under which this permeability alters are not known, but under pathological conditions, such as are produced by mechanical injury, the proteins may pass freely through the injured endothelium.

Transference of Fluid.—The forces producing a transference of fluid and dissolved substances from the interior of the capillary to the tissue spaces are blood pressure, diffusion and osmosis. The hydrostatic pressure existing in a blood capillary over that in the extravascular tissue spaces causes a filtration through the endothelial wall of fluid having the same composition in salts as blood but varying in protein content. At the same time diffusible substances at a greater concentration in the blood tend to pass to a region of less concentration in the tissues. The third force, that of osmosis, also comes into play owing to the fact that water is capable of passing through the capillary membrane more quickly than salts,—thus if a hypertonic solution of sodium chloride is injected intravenously there is a passage of water from the tissue to the blood which is greatly increased in volume, with a concomitant desiccation of the tissues. At the same time salt passes more slowly into the tissues till a new equilibrium is reached. In the reverse direction an increased molecular concentration in the tissues is capable of drawing fluid from the blood. These factors are sufficient to account for a passage of fluid and dissolved substances from the blood to the tissues. The products of tissue metabolism, however, have to be removed together with excess water and salts, the former of which has been the vehicle for the conveyance of nutriment.

Return of Fluid—Two Courses.—Two courses are open for the return of fluid. It may go back directly into the blood vessels or pass into the lymphatics. That substances can be absorbed directly into the blood vessels has been quite conclusively demonstrated. The explanation of the forces involved in their passage was supplied by Starling. He showed that the proteins of blood plasma possess an osmotic pressure of between 25 and 30 mm. Hg. It is estimated that the hydrostatic pressure of the blood at the arterial end of a capillary is above this figure, while at the venous end it is below. At the arterial end, therefore, the excess of hydrostatic pressure causes the fluid to pass from the capillary to the tissue spaces. At the venous end the excess of osmotic pressure produces the reverse phenomenon and fluid passes from the tissue spaces into the capillary.

This conception has recently been very beautifully confirmed in the frog by Landis who has directly measured the intracapillary pressure and found, when compared with the osmotic pressure of the proteins, to bear out the above relationship. One can thus understand that a constant interchange between blood and tissue fluid can take place without the production of a drop of lymph. Indeed this is the case in a limb at rest. In the muscular tissue of this part the blood capillaries are relatively impermeable so that a considerable colloid osmotic pressure is available for the work of resorption.

Function of the Lymphatics.—If, however, the limb is thrown into action the arterioles and capillaries of the part dilate and the hydrostatic pressure in them consequently increases. That is to say the length of capillary over which resorption can occur by virtue of the excess of osmotic over hydrostatic pressure is lessened so that fluid tends to accumulate in the tissue spaces. As will be shown later this is not the only cause of accumulation of fluid, but it is under these conditions that a flow of lymph occurs.

In the liver the blood capillaries are extremely permeable, so that very little osmotic pressure is available for the resorption of fluid. This excess fluid which cannot return to the blood vessels passes into the lymphatics and is continuously drained away in that fashion. It would appear then that the lymphatics are a system for draining the tissues of excess fluid and so preventing them from becoming oedematous and waterlogged.

Metabolism and Lymph Flow.—Apart from the forgoing explanation the following considerations are of great importance. An organ or tissue in activity is breaking down larger into a greater number of smaller molecules, that is, the metabolic processes result in the production of a fluid possessing greater osmotic pressure than the fluid of the resting tissue. This increase of osmotic pressure attracts water from the blood, and so increases the amount of fluid in the tissue.

The effects of metabolism on lymph flow can be very well seen in the case of the submaxillary gland. During the secretion of saliva, consequent on stimulation of the chorda tympani nerve there is a great increase of the lymph flow from the gland. If now the secretory apparatus is paralysed by atropine so that stimulation of the chorda tympani no longer evokes a secretion of saliva, there is no increase in lymph outflow, though the dilator action of the nerve on the blood vessels remains unimpaired. Obviously the activity of the salivary secretory cells is the determining factor of the increased lymph output.

It is to be emphasized that tissue metabolism is of the utmost importance in the production of lymph not only quantitatively but qualitatively. In consequence much recent work has been an attempt to gain a clearer insight into intermediate tissue metabolism from a study of lymph coming from various parts. From this work it has been found that hormones such as adrenalin and insulin have considerable influence not only on the quantity of lymph produced by a part, but also on its composition with regard to proteins and salts.

The tissue cells at all times do not hold the same amount of water—in different physiological conditions different quantities are found. For example it seems probable that a change in hydrogen ion concentration is capable of altering the water balance of a tissue, and in all probability alterations in the concentration of other ions also have a like influence. Such fluctuations alter the lymph flow.

Heidenhain's Researches and Theories.—The views presented are at the present time not universally accepted as expressing the whole truth. Heidenhain, in a long series of researches, endeavoured to establish the view that lymph production depended on a secretory activity on the part of the endothelial cells of the lymphatic capillaries. That is, lymph would be a secretion and would not reflect the composition of tissue fluid. Some of the main arguments adduced by Heidenhain depended on observations of substances which produced an increased lymph flow—lymphagogues—when injected intravenously.

He divided the lymphagogues into two groups. Those of the first are proteins or protein degradation products, for example, extract of mussels, crabs, strawberries, and peptone. Those of the second group are of a salt character, for example sodium chloride, which are possessed of considerable osmotic qualities. The injection of lymphagogues of the first order produces an increased flow of lymph, mainly from the liver. It has been pointed out that substances of this nature when pricked into the skin cause wheals. Recent work has shown conclusively that the fluid content of these wheals is derived from the blood through a capillary wall which has become more permeable.

It has therefore been argued that this type of lymphagogue injures the blood capillary endothelium and leads to an increased filtration of fluid and thence of lymph. It should be noted that such substances as peptone stimulate the liver cells so that this may be an added factor in the increased lymph production. Heidenhain, on the other hand, maintained that these substances specifically excited the lymph capillary endothelium to secrete lymph.

The action of the second type of lymphagogue has been correlated with the great osmotic activities of these substances. Injected salts at first attract considerable quantities of water into the blood stream. This increase of the circulating blood volume increases the intracapillary pressure which tends to force fluid back into the tissue spaces. The flow of lymph depends on the relative activities of these two factors. With this class of lymphagogue the flow is also in conditions of rest, mainly from the liver and intestines.

It has been shown that after injections of large quantities of saline solutions the muscles increase their water content very considerably, but there is no flow of lymph from the limb under such conditions. This has been held to refute the filtration-osmosis theory of lymph production and to make essential the conception of active secretion by the lymphatic endothelium. A point, however, which has not been considered is that skeletal muscle is not supplied with lined lymphatic vessels. These only exist in the perimysium—the tissue surrounding the muscle bundles. Thus it is clear that muscle can take up large quantities of fluid which are not in actual contact with absorbing lymphatics, whereas organs such as the liver and intestines possess an extremely rich lymphatic capillary system.

It has also been urged that as injected salt accumulates to a greater extent in lungs and skin than in muscle, therefore a purely osmotic conception of its transfer is inadmissible. While this is true, our ignorance of the phenomena and laws governing salt distribution in the body cells does not make it necessary to deny potency to forces demonstrably present. Attempts have been made to show that injections of small quantities of salt solution have a stimulant action on tissue cells, leading to increase of the water exchange and general metabolism of an organ and so to increase of the lymph outflow.

Permeability of Lymphatic Capillaries.—It appears to be established that the lymphatic capillaries are made up of a complete membrane of endothelial cells. The degree of permeability of this endothelial wall has to be considered. The data so far accumulated on this subject are inadequate to give a complete picture but it is certain that in some parts, for example the lymphatics of the peritoneal surface of the diaphragm, there are vessels remarkably permeable to solid particles of considerable dimensions. Their permeability to fluids seems to be without limit. The fluid and particles in this region pass between the junctions of the cells lining the peritoneum and lymphatics. The central lymphatics of the intestinal villus also has a very considerable permeability as is shown by the fact that particles of fat ·5 to ·75μ in diameter as well as red blood corpuscles under certain circumstances, are capable of entering them.

That at least some portion of the lymphatic tree in every tissue has a like grade of permeability is made probable by the fact that bacteria and similar sized particles are readily taken up to be arrested in the nearest lymphatic gland. Whether the whole capillary system is equally permeable has not yet been ascertained. If it is, the endothelial wall of the lymphatic has little influence, apart from any "secretory" power, in the matter of selective filtration through its walls. An interesting observation dealing with the permeability of lymphatic vessels to diffusible substances has been made by T. Lewis. If histamine or adrenalin is inserted into the skin by puncture, some of the substance is taken up by the lymphatics nearby. They both however again pass out through the lymphatic wall as is shown by the fact that the course of the latter is traced out in the one case by a reddish line of dilated capillaries and venules, and in the other by a white line due to a contraction of these vessels.

These observations suggest the following conclusions:—Substances may first be absorbed from the tissues by the lymphatics and then, during their passage down these channels, pass out again into the surrounding tissue fluid to be re-absorbed by the blood vessels. Consequently the composition of lymph collected from a lymphatic trunk does not necessarily represent that from a lymph capillary.

Absorption of Hormones.—It has been shown by Hicks that the active principle of the thyroid gland is absorbed in part at least, by the lymphatics of that organ.

It is probable that the less diffusible chemical products of other organs of internal secretion are also absorbed in the same way, but only in the case of the thyroid gland is such evidence forthcoming.

To sum up concisely the views generally held as to the mechanism of lymph formation, it may be said that the physical forces of osmosis and filtration are largely responsible for the interchange of fluid and salts between blood, tissue and lymph. The metabolic activities of the tissue cells are also an important factor in determining both the quality and quantity of lymph outflow.

The permeability of the blood capillary wall partly controls the composition of the tissue fluid and lymph resulting therefrom: the influence of lymphatic permeability is not known. The balance of evidence is against endowing the lymphatic endothelium with specific secretory properties.

The Propulsion of Lymph.—The propulsion of blood and lymph is effected by very different agencies. The blood vascular system forms a completely closed circle through which fluid is pumped by the heart continuously in one direction. The lymphatic system begins as blind ended capillaries which unite, finally to pour their contents into the venous system. Thus there is no circulation of lymph in the same sense as there is of blood, but there is movement of lymph from the periphery, represented by the lymph capillaries, to the centre represented by the venous system. The factors involved in this propulsion have to be examined. The forces concerned may be grouped into those of extrinsic and of intrinsic origin.

Extrinsic Forces.—Of the greatest importance from a mechanical point of view is the fact that all the larger and most of the smaller trunks are liberally supplied with valves. These usually consist of two folds of endothelium, though occasionally more cusps are encountered. They are set so as to prevent flow towards the periphery. They have long cusps which are particularly efficient in preventing reflux and it is by virtue of their presence that muscular contraction or massage forms one of the chief propulsive agents. When a muscle contracts it squeezes the lymphatic vessels, thus tending to empty them in the direction permitted by the valves. That this mechanism is of very great importance can be seen if the lymph flow from a canula inserted into a lymphatic of a limb be examined. In a condition of rest no lymph flows from the canula, but if the limb is massaged or the muscles stimulated to contract actively, there is a considerable flow.

Blood Pressure.—From organs such as the liver and intestine there is a continuous flow of lymph at all times. That from the liver is obviously independent of muscular contraction. It has been shown that the flow from these organs is in close relationship with the blood pressure in their capillaries, the continuous outflow of lymph being due to a transmission of this pressure by way of the tissue fluid. In the case of the intestine the pressure in the main efferent lymphatic may be as much as 7 to 10 cm. of water. It is noteworthy that liver and intestinal lymph is by far the richest of any in protein, from which it is argued that the blood capillaries of these regions are very permeable, thus offering the best conditions for a transference of the hydrostatic pressure within them via tissue fluid to the lymphatics. In the limbs where the lymph has a low protein content, due to a relative impermeability of the blood capillaries, the driving power of the blood pressure is minimal.

Pressure in Tissue Spaces.—It follows that any increase of pressure in the tissue fluid causes more of the latter to be thrust through the lymph capillary wall, thus massage, apart from its action on the main valved trunks, forces fluid from the tissue spaces into the lymph capillaries. This can be especially well seen in the case of the lymphatics of the diaphragm, where it has been shown that increased intra-abdominal pressure from massage or active movements has a very considerable effect in forcing both fluid and particles into the lymph capillaries.

An objection to these views has been raised on the ground that it is difficult to see how pressure of tissue fluid can be transferred to lymph capillaries. These vessels should collapse if the pressure of the fluid outside them were greater than that inside. An observation, however, made long ago by Gaskell enables one to see how this relationship can occur. He noticed in the epiglottis that fine fibres of an elastic nature passed from the lymph vessels into the surrounding tissue, so that if the latter became swollen with fluid, these fibres were pulled on and helped to keep open the lumen of the vessel to which they were attached.

Arterial Pulsation.—In some situations the lymph vessels form sheaths round the arteries. In these it is obvious that arterial pulsation will have a tendency to propel the lymph forwards. The beating of the aorta assists in this forward movement by rhythmical compression of the thoracic duct where it passes behind that artery. The influence of this factor can be seen especially well in the flow from a thoracic duct canula in an animal which is breathing very slowly.

Respiration.—If the lymph rising into a thoracic duct canula is observed it is seen to issue most rapidly during expiration. During inspiration the external pressure on the thoracic duct is lessened and so the pressure within it becomes less than that in the vessels of the abdomen. There is thus a tendency for the lymph to flow from the abdomen into the thoracic duct. At the same time as this suction action occurs, the diaphragm is contracting and descending to increase the intra-abdominal pressure so that lymph is also actively pushed from the abdominal vessels into the thoracic duct.

Thus, during inspiration the thoracic duct is completely filled. During expiration the reverse phenomenon occurs, the pressure on the walls of the distended thoracic duct is increased, and, owing to the presence of valves, the lymph is forced out from the duct into the canula, or, in conditions of normal life, into the venous system. According to Lee, normal respiration is capable of raising the pressure in the thoracic duct to about 11 mm.Hg. while excessive breathing will raise it to as much as 26 mm.Hg.

Intrinsic Forces.—The foregoing description of the forces involved applies to mammals such as man or dog. In some types of animal, however, such as fish, amphibia, reptiles and birds special contractile sacs have been developed which have the function of actively propelling the lymph into the venous system by means of rhythmical beats. These "lymph hearts" have disappeared from mammals, but two species, the rat and guinea pig, and according to some the mouse, possess mesenteric lymphatic vessels which are rhythmically contractile throughout their course and actively propel the lymph forward. In the guinea pig rhythmically contracting vessels have also been seen on the pleural surface of the diaphragm. Similar vessels in several species have been examined, but under the conditions of experiments have not been seen contracting rhythmically. Nevertheless, these vessels are actively contractile to certain stimuli and are supplied with nerves, the stimulation of which causes contraction and, according to some, dilatation as well. Dogiel states that the innervation extends even to the lymph capillaries.

From the foregoing observations one concludes that the contraction of the vessel walls themselves is a factor in the propulsion of lymph. That such contraction does occur at some time seems to be undeniable, but the requisite physiological conditions have so far escaped detection.

LYMPHATIC SYSTEM. In anatomy, the lymphatic system comprises the *lymphoid* or *adenoid* tissue so plentifully distributed about the body, especially in the course of the alimentary canal (*see* Connective Tissues), *lymph spaces, lymphatic vessels* of which the lacteals are modifications, *lymphatic glands, haemolymph glands,* and the *thoracic* and *right lymphatic ducts* by which the lymph (*q.v.*) finally reaches the veins.

Lymph Spaces.—These are mere spaces lying outside the capillaries and between them and the cells of the tissues they nourish. Usually, they have no special lining, though sometimes there is a layer of endothelial cells like those of the lymphatic and blood vessels. Most of these spaces are very small, but the *sub-epicranial space* of the scalp, the *capsule of Tenon* in the orbit, and the *retropharyngeal space* in the neck, are large adaptations to allow free movement. Opening from these spaces, and also communicating with the serous membranes by small openings (stomata) are the *lymph capillaries* (*see* Vascular System), which converge to the *lymphatic vessels.* These resemble veins in having an internal layer of endothelium, a middle unstriped muscular coat, and an external coat of fibrous tissue, though in the smaller vessels the middle coat is wanting. They have numerous endothelial valves, formed of two crescentic segments allowing the lymph to pass toward the root of the neck. When the vessels are engorged these valves are marked by a constriction, and so the lymphatics have a beaded appearance. The vessels divide and anastomose freely, and do not, like the veins, increase in calibre as they approach their destination. It is usual to divide the lymphatic vessels into a superficial and a deep set; speaking generally, the superficial ones are found near the course of the superficial veins, while the deeper ones accompany the arteries. The *lacteals,* so called from the milky appearance of their contents during digestion, are lymphatic vessels which carry the chyle from the intestine; they begin in lymphatic spaces in the villi and round the solitary and agminated glands, and pass into the mesentery, where they enter into *mesenteric glands* before reaching the *receptaculum chyli.*

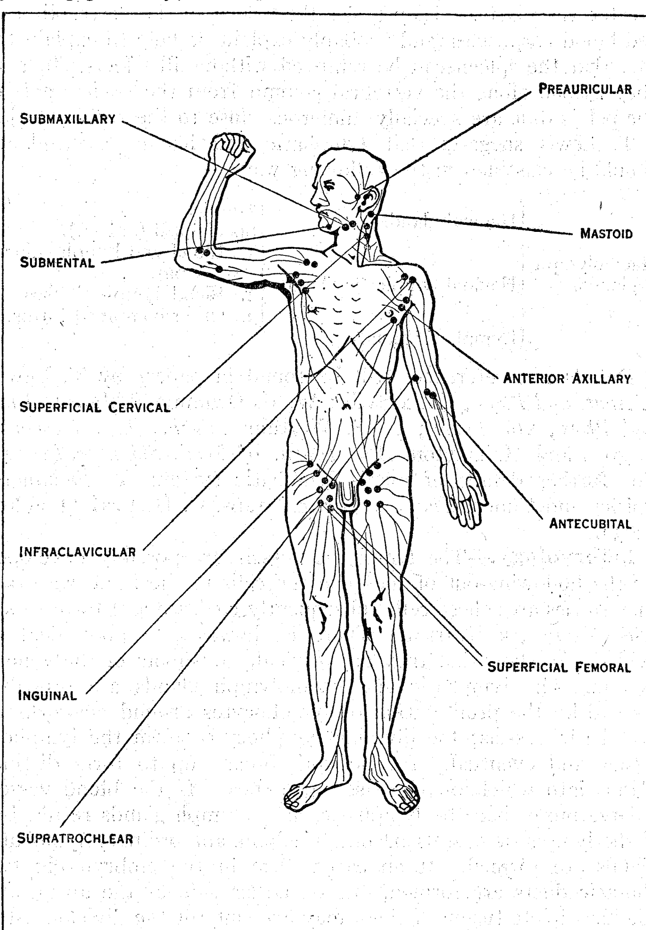

FIG. 1.—DIAGRAM SHOWING THE SUPERFICIAL LYMPHATIC VESSELS AND GLANDS
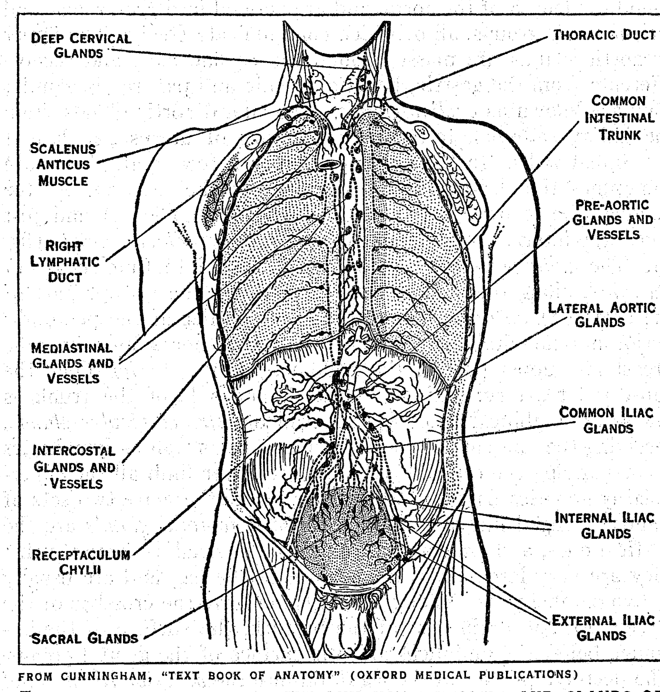
The glands are indicated by black circles with the group names alongside

Lymphatic Glands.—The lymphatic glands are pink bodies situated in the course of the lymphatic vessels, to which they act as filters. They are generally oval in shape and about the size of a bean, but sometimes, especially in the groin, they form irregular flattened masses 2in. long, while, at other times, they are so small as almost to escape notice. They are usually found in groups.

Each gland has a fibrous capsule from which trabeculae pass toward the centre, where they break up and interlace, forming a network, producing a cortical and medullary region for each gland; the intervals are nearly filled by lymphocytes, but close to the trabeculae is a lymph path or sinus, which is only lined by endothelial cells and crossed by the reticular stroma of the gland. In this region foreign particles carried in the lymph are held. Thus the bronchial glands of city dwellers where there is much soot in the air are black from carbon strained off in its passage from the lungs, while the axillary glands of a tattooed arm are blue. The blood-vessels enter at the *hilum,* and are distributed along the trabeculae. In addition the lymphatic glands are probably one of the sources from which the leucocytes are derived.

The exact position of the various groups of glands is very important from a medical point of view, but here it is only possible to give a brief sketch which will be helped by reference to the accompanying diagram. In the head and neck are found *occipital* and *mastoid glands* (fig. 1), which drain the back of the scalp; *internal maxillary glands,* in the zygomatic fossa, draining the orbit, palate, nose and membranes of the brain; *preauricular glands,* embedded in the parotid, draining the side of the scalp, pinna, tympanum and lower eyelid, and *buccal glands,* draining the cheek region. In the neck are the *superficial cervical glands* along the course of the external jugular vein, draining the surface of the neck; the *submaxillary glands,* lying just above the salivary gland of the same name and draining the front of the face and scalp; the *submental glands,* beneath the chin, draining the lower lip, as well as sometimes the upper, and the front of the tongue; the *retropharyngeal glands,* draining the naso-pharynx and tympanum; the *pretracheal glands,* draining the trachea and lower part of the thyroid body; and the *deep cervical glands,* which are by far the most important and form a great mass close to the internal jugular vein; they receive afferent vessels from most of the glands already mentioned and so are liable to be affected in any trouble of the head or neck, especially of the deeper parts. Into them the lymphatics of the brain pass directly. The lower part of this mass is sometimes distinguished as a separate group called the *supra-clavicular glands,* which drain the back of the neck and receive afferents from the occipital and axillary glands. The efferents from the deep cervical glands join to form a common vessel known as the *jugular lymphatic trunk,* and this usually opens into the thoracic duct on the left side and the right lymphatic duct on the right.

In the thorax are found *intercostal glands* (fig. 2), near the vertebral column draining the back of the thoracic walls and pleura; *internal mammary glands,* draining the front of the same parts as well as the inner part of the breast and the upper part of the abdominal wall; *diaphragmatic glands,* draining that structure and the convex surface of the liver; *anterior, middle, posterior* and *superior mediastinal glands,* draining the contents of those cavities. The *bronchial glands,* draining the lungs, have already been referred to.



FROM CUNNINGHAM, "TEXT BOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 2.—DIAGRAM OF THE DEEP LYMPHATIC VESSELS AND GLANDS OF THE THORAX AND ABDOMEN
Afferent vessels are indicated by continuous lines, and the interglandular vessels by dotted lines. The main lymphatic trunk, the thoracic duct, is shown at its junction with the left subclavian vein

In the abdomen and pelvis the glands are usually grouped round the large arteries and are divided into visceral and parietal. Among the visceral are the *gastric glands,* draining the stomach (these are divided into *coronary, subpyloric* and *retropyloric* groups); the *splenic glands* at the hilum of the spleen, draining that organ, the tail of the pancreas and the fundus of the stomach; the *hepatic glands* in the small omentum, draining the lower surface and deep parts of the liver; the *pancreatic glands,* behind the lesser sac of the peritoneum, draining the head and body of the pancreas; the *superior mesenteric glands,* from one to two hundred in number, lying in the mesentery and receiving the lacteals; the *ileo-caecal glands,* draining the caecum, one of which is known as the *appendicular* gland and drains the vermiform appendix and right ovary; the *colic glands* along the right and middle colic arteries, draining the ascending and transverse colon; the *inferior mesenteric glands* in the course of that artery, draining the descending iliac and pelvic colons; the *rectal* glands, behind the rectum, draining its upper part.

Among the parietal glands are the *external iliac glands,* divided into a lateral and mesial set (fig. 2), and receiving the inguinal efferent vessels and lymphatics from the bladder, prostate, cervix uteri, upper part of the vagina, glans penis vel clitoridis and urethra. The *supra* and *infra-umbilical glands* receive the deep lymphatics of the abdominal wall, the former communicating with the liver, the latter with the bladder. From the latter, vessels pass to the epigastric gland lying in front of the termination of the external iliac artery. The *internal iliac glands* (fig. 2) are situated close to the branches of this artery and drain the rectum, vagina, prostate, urethra, buttock and perinaeum. *Common iliac glands* lie around that artery and receive afferents from the external and internal iliac glands as well as a few from the pelvic viscera. (For further details of the pelvic glands *see* "Seventh Report of the Committee of Collective Investigation," *Journ. Anat. and Phys.,* xxxii. 164.) The *aortic glands* are grouped all round the length of the aorta, and are divided into *pre-, retro-* and *lateral aortic* groups, all of which communicate freely. The upper preaortic glands are massed round the coeliac axis, and receive afferents from the gastric, hepatic, splenic and pancreatic glands; they are known as *coeliac glands.* The lateral aortic glands drain the kidney, adrenal, testis, ovary, fundus of uterus and lateral abdominal walls. In the upper extremity a few small glands are sometimes found near the deep arteries of the forearm. At the bend of the elbow are the *ante-cubital glands* (fig. 1) and just above the internal condyle, one or two *supra-trochlear glands* (fig. 1). The *axillary glands* (fig. 1) are divided into four sets: (1) *External,* along the axillary vessels, draining the greater part of the arm; (2) *anterior,* behind the lower border of the pectoralis major muscle, draining the surface of the thorax including the breast and upper part of the abdomen; (3) *posterior* along the subscapular artery, draining the back and side of the trunk as low as the umbilical zone; (4) superior or *infra-clavicular glands,* receiving the efferents of the former groups as well as lymphatics accompanying the cephalic vein. In the lower limb all the superficial lymphatics pass up to the groin, where there are two sets of glands arranged like a T. The *superficial femoral glands* are the vertical ones, and are grouped round the internal saphenous vein; they are very large, drain the surface of the leg, and are usually in two parallel rows. The *inguinal glands* form the crossbar of the T (fig. 1), and drain part of the buttock, the surface of the abdomen below the umbilicus and the surface of the genital organs. The deep lymphatics of the leg drain into the *anterior tibial gland* on that artery, the *popliteal glands* in that space, and the *deep femoral glands* surrounding the common femoral vein.

Lymphatic Ducts.—The *thoracic duct* begins as an irregular dilatation known as the *receptaculum chyli,* opposite the first and second lumbar vertebrae, which receives all the abdominal lymphatics as well as those of the lower intercostal spaces. The duct runs up on the right of the aorta through the posterior mediastinum and then traverses the superior mediastinum to the left of the oesophagus. At the root of the neck it receives the lymphatics of the left arm and left side of the neck and opens into the beginning of the left innominate vein, usually by more than one opening.

The *right lymphatic duct* collects the lymphatics from the right side of the neck and thorax, the right arm, right lung, right side of the heart and upper surface of the liver; it is often represented by several ducts which open separately into the right innominate vein.

Haemolymph glands are structures which have only been noticed since 1884. They differ from lymphatic glands in their much greater vascularity. They assist the spleen in the destruction of red blood corpuscles, and probably explain or help to explain the fact that the spleen can be removed without ill effects. In man they extend along the vertebral column from the coeliac axis to the pelvis, but are specially numerous close to the renal arteries.

T. Lewis suggests that lymphatic and haemolymph glands should be classified in the following way:—

Haemolymph glands.	Haemal glands.	Simple.
		Specialized (Spleen).
	Haemal lymphatic glands.	1. Blood and lymph sinuses separate.
		2. Blood lymph sinuses.
		3. Other combined forms.
	Lymphatic glands.	

Details and references will be found in papers by T. Lewis, *J. Anat. and Phys.,* vol. xxxviii.; W. B. Drummond, *Journ. Anat. and Phys.,* vol. xxxiv.; A. S. Warthin, *Journ. Med. Research* (1901), and H. Dayton, *Am. Journ. of Med. Sciences* (1904). For further details of man's lymphatic system *see* Delamere, Poirier and Cuneo, *The Lymphatics,* trans. C. H. Leaf (London, 1903).

Embryology.—The lymphatic vessels are possibly developed by the hollowing-out of mesenchyme cells in the same way that the arteries are; these cells subsequently coalesce and form tubes. (*See* VASCULAR SYSTEM.) There is, however, a good deal of evidence to show that they are originally offshoots of the venous system. The lymphatic and haemolymph glands are probably formed by the proliferation of lymphocytes around networks of lymphatic vessels; the dividing lymphocytes form the lymphoid tissue, and eventually the network breaks up to form distinct glands into which blood vessels penetrate. If the blood vessels enlarge more than the lymphatic, haemolymph glands result, but if the lymphatic vessels become predominant ordinary lymphatic glands are formed. At an early stage in the embryo pig two thoracic ducts are formed, one on either side of the aorta, and the incomplete fusion of these may account for the division often found in man's duct. In the embryo pig, too, there have been found two pairs of lymph hearts for a short period.

See A. S. Warthin, *Journ. Med. Research,* vol. vii.; F. R. Sabin, *Am. Journ. of Anat.* (1902); J. P. McMurrich, *Development of the Human Body* (London, 1923), and Quain's *Anatomy,* vol. i. (London, 1908).

Comparative Anatomy.—A lymphatic system is recognized in all the Craniata, and in the lower forms (fishes and Amphibia); it consists chiefly of lymph spaces and sinuses in communication with the coelom. In fishes, for instance, there is a large *subvertebral lymph sinus* surrounding the aorta and another within the spinal canal. In Amphibia the subvertebral sinus is also found, and in the Anura (frogs and toads) there is a great *subcutaneous lymph sinus. Lymph hearts* are muscular dilatations of vessels and are found in fishes, amphibians, reptiles and bird embryos, and drive the lymph into the veins; they are not known in adult mammals.

In birds the thoracic duct is first recognized, and opens into both right and left precaval veins, as it always does in some mammals. In birds, however, some of the lymphatics open into the sacral veins, and it is doubtful whether true lymphatic glands ever occur. In birds and mammals lymphatic vessels become more definite and numerous and are provided with valves.

Haemolymph glands are present in mammals and birds, but have not been seen lower in the scale, though S. Vincent and S. Harrison point out the resemblance of the structure of the head kidney of certain Teleostean fishes to them (*Journ. Anat. and Phys.,* vol. xxxi.).

For further details *see* R. Wiedersheim, *Comparative Anat. of Vertebrates* (London, 1907). (F. G. P.)

LYMPHATIC SYSTEM, DISEASES OF. *Lymphadenitis* or inflammatory infection of the lymphatic glands is a condition characterized by hyperaemia of and exudation into the gland, which becomes redder, firmer and larger than usual. Three varieties may be distinguished: simple, suppurative and tuberculous. The cause is always the absorption of some toxic or infective material from the periphery. This may take place in several of the acute infectious diseases, notably in scarlet fever, mumps, diphtheria and German measles, or may be the result of poisoned wounds. The lymphatic glands are also affected in constitutional diseases such as syphilis. Simple lymphadenitis usually subsides of its own accord, but if toxins are produced in the inflamed area the enlargement is obvious and painful, while if pyogenic organisms are absorbed the inflammation progresses to suppuration.

Tuberculous lymphadenitis (scrofula) is due to the infection of the lymph glands by Koch's tubercle bacillus. This was formerly known as "King's Evil," as it was believed that the touch of the royal hand had power to cure it. It occurs most commonly in children and young adults. Some local focus of irritation is usually present. The ways in which the tubercle bacillus enters the body are much disputed, but catarrh of the mucous membranes is regarded as a predisposing factor, and the tonsils as a probable channel of infection. Any lymphoid tissue in the body may be the seat of tuberculous disease, but the glands of the neck are the most commonly involved. The course of the disease is slow and may extend over a period of years. The earliest manifestation is an enlargement of the gland and local formation of minute tubercles. It is possible in this stage for spontaneous healing to take place, but usually the disease progresses to caseation. Occasionally this stage may end in calcification, the gland shrinking and becoming hard; but frequently suppuration follows from liquefaction of the caseating material. Foci of pus occur throughout the gland, causing destruction of the tissue, so that the gland may become a single abscess cavity. If left to itself the abscess sooner or later bursts at one or several points, leaving ulcerated openings through which a variable amount of pus escapes. Temporary healing may take place, to be again followed by further breaking down of the gland. This condition, if untreated, may persist for years and may finally give rise to a general tuberculosis. The treatment consists mainly in improving the general health with good diet, sunlight or ultra-violet radiation, fresh air (particularly sea air), cod-liver oil and iron, and the removal of all sources of local irritation such as enlarged tonsils, adenoids, etc. Suppuration and extension of the disease may require operative measures, and removal of the glands *en masse* can now be done so as to leave only a slight scar.

In *Tabes mesenterica* (tuberculosis of the mesenteric glands), usually occurring in children, the glands of the mesentery and retroperitoneum become enlarged, and either caseate or occasionally suppurate. The disease may be primary or may be secondary to tuberculous disease of the intestines or to pulmonary phthisis. The patients are pale, wasted and anaemic, and the abdomen may be enormously enlarged. There is usually moderate fever, and thin watery diarrhoea. The caseating glands may liquefy and give rise to an inflammatory attack which may simulate appendicitis. Limited masses are amenable to surgical treatment and may be removed, while in the earlier stages constitutional treatment gives good results. Tuberculous peritonitis frequently supervenes on this condition.

Lymphadenoma (Hodgkin's disease), first fully described by Hodgkin in 1832, is characterized by a progressive enlargement of the lymphatic glands all over the body, and generally starts in the glands of the neck. The majority of cases occur in young adults, and preponderate in the male sex. The first symptom is usually enlargement of a gland in the neck, with generally progressive growth of the glands in the submaxillary region and axilla. The inguinal glands are early involved, and after a time the internal lymph glands follow. The enlargements are at first painless, but in the later stages symptoms are caused by pressure on the surrounding organs, and when the disease starts in the deeper structures the first symptoms may be pain in the chest and cough, pain in the abdomen, pain and oedema in the legs. The glands may increase until they are as large as eggs, and later may become firmly adherent one to another, forming large lobulated tumours. Increase of growth in this manner in the neck may cause obstructive dyspnoea and even death. In the majority of cases the spleen enlarges, and in rare instances lymphoid tumours may be found on its surface. Anaemia is common and is secondary in character; slight irregular fever is present, and soon a great and progressive emaciation takes place. The cases are of two types, the acute cases in which the enlargements take place rapidly and death may occur in two to three months, and the chronic cases in which the disease may remain apparently stationary. In acute lymphadenoma the prognosis is very unfavourable. Recovery sometimes takes place in the chronic type of the disease. Early surgical intervention has in some cases been followed by success. The application of X-rays is a valuable, though usually but temporary, method of treatment, superficial glands undergoing a rapid diminution in size. Of drugs arsenic is of the most service, and mercurial inunction has been recommended. It is probable that certain cases have been included under lymphadenoma which are in reality tuberculous.

Status lymphaticus (lymphatism) is a condition found in children and some adults, characterized by an enlargement of the lymphoid tissues throughout the body and more particularly by enlargement of the thymus gland. There is a special lowering of the patient's powers of resistance, and it has been said to account for a number of cases of sudden death. In all cases of status lymphaticus the thymus has been found enlarged. At birth the gland (according to Bovaird and Nicoll) weighs about 6 grammes, and does not increase after birth. In lymphatism it may weigh from 10 to 50 grammes. The clinical features are indefinite, and the condition frequently passes unrecognized during life. In most cases there is no hint of danger until the fatal syncope sets in, which may be after any slight exertion or shock, the patient becoming suddenly faint, gasping and cyanosed, and the heart stopping altogether before the respirations have ceased. The most trifling causes have brought on fatal issues, such as a wet pack (Escherich) or a hypodermic injection, or even a sudden plunge into water though the head is not immersed. The greater number of deaths occur during the administration of anaesthetics, which seem peculiarly dangerous to these subjects. When an attack of syncope takes place no treatment is of any avail.

Lymphangitis. In cases where the infective agent is very virulent there may be seen thin red lines in the skin tracking from the focus of infection towards the nearest group of lymphatic glands. These lines indicate the superficial lymphatics and the advancing edge travels often with great rapidity, reaching, for example, from the hand to the bend of the elbow in a few hours. The existence of lymphangitis is a sign of grave importance. (For the secondary invasion of lymphatic glands in cancer, *see* CANCER.)

LYNBROOK, village of Nassau county, New York, U.S.A., on south shore of Long Island, served by the Long Island railroad. It is a residential suburb and summer resort, with a population in 1940 of 14,557. The village was incorporated in 1911.

LYNCHBURG, a city of Virginia, U.S.A., within 15 mi. of the geological centre of Virginia, on the James river, 112 mi. W. by S. of Richmond, within the boundaries of Campbell county, but independent of it politically. It is on federal highways 29, 460 and 501; has an airport; and is served by the Chesapeake and Ohio, the Norfolk and Western and the Southern railways. The population was 30,070 in 1920 (28% Negroes); and was 44,541 in 1940 by the federal census. The city's terraced hills command fine views of mountain, river and valley scenery, reaching to the Blue Ridge, 20 mi. to the west, where the Blue Ridge parkway, an extension of the Skyline drive, is located. An elaborate viaduct of concrete adds to the beauty of river and valley. On elevated ground overlooking the river is the campus of Randolph-Macon Woman's college, one of the Randolph-Macon system of institutions (*see* ASHLAND, VA.). Lynchburg is the seat also of Lynchburg college (Christian; established 1903), Virginia Episcopal school, for boys, and the Virginia theological seminary and college for Negroes (Baptist). Twelve mi. north is Sweet Briar college for women (chartered 1901). Lynchburg is one of the largest markets in the U.S.A. for dark leaf tobacco, and it has numerous factories, with an output in 1940 estimated at $40,000,000. The boot and shoe industry, introduced in 1900, is the most important. The assessed valuation of property in 1940 was $41,841,000. The city was named after John Lynch, who inherited a large property there, and in 1757 established a ferry across the James. The settlement was established as a village by Act of Assembly in 1786, was incorporated as a town in 1805, and became a city in 1852. Since 1920 it has had a council-manager form of government. During the Civil War it was an important base of supplies for the Confederate army, and in June 1864, Union forces made an unsuccessful attempt to get possession. Appomattox Court House, where Lee surrendered to Grant, is 20 mi. east of the city.

LYNCH LAW, a term loosely applied to various forms of executing rough popular justice, or what is thought to be justice, for the punishment of offenders by a summary procedure, ignoring, or even contrary to, the strict forms of law. The origin of the name is obscure; different writers have attempted to trace it to Ireland, to England, to South Carolina and to Virginia. (*See* "The Real Judge Lynch," in the *Atlantic Monthly,* vol. lxxxviii., Boston, 1901.)

The practice has been common in all countries when unsettled conditions existed, or in threatened anarchy. In Europe early examples of such a practice are found in the proceedings of the Vehmgerichte in mediaeval Germany, and of Lydford law, gibbet law or Halifax law, Cowper justice and Jeddart justice in the thinly settled border districts of Great Britain. In later years it is found mainly in Russia, in south-eastern Europe and in the United States. Under the term "lynch law" in the 18th, 19th and 20th centuries it has come to be considered peculiarly American.

Within the United States the population expanded westward faster than well-developed civil institutions could follow, and on the frontier there were always desperadoes who lived by preying on the better classes. To suppress these outlaws resort was often made to lynch law. There was little necessity for it until the settlement crossed the Allegheny mountains, but the following instances of lynching in the East may be mentioned: (1) the mistreatment of Indians in New England and the middle Colonies in disregard of laws protecting them; (2) the custom found in various Colonies of administering summary justice to wife-beaters, idlers and other obnoxious persons; (3) the acts of the regulators of North Carolina, 1767–71; (4) the popular tribunals of the Revolutionary period, when the disaffection toward Great Britain weakened the authority of the civil governments and the war replaced them by popular governments, at a time when the hostilities between "patriots" and "tories" were an incentive to extra-legal violence. The entire United States thus had a heritage of extra-legal methods which, long after the Revolution, persisted in the drastic methods used in dealing with agitators among the negroes in the South and with the outlaws on the westward moving frontier.

The Watauga settlements and the "State" of Franklin furnished examples of lynch law procedure taking the place of government. Men trained in the rough school of the wilderness came to have more regard for quick, personal justice than for abstract justice and statutes; they were educated to defend themselves, to look to no law for protection or regulation. Consequently, they became impatient of legal forms and technicalities and appeal to statute law was discouraged. Thus were formed the habits of thought and action of the Western pioneers. Lynch law, not civil law, cleared the Western forests, valleys and mountain passes of horse and cattle thieves, and other outlaws. This was especially true of the States of the far West. H. H. Bancroft, the historian of *Popular Tribunals,* wrote in 1887 that "thus far in the history of these Pacific States far more has been done toward righting wrongs and administering justice outside the pale of law than within it." However, the lack of regard for law, fostered by the conditions described, led to a survival of the lynching habit after the necessity for it passed away. In parts of the Southern States, certain of the conditions of the West have prevailed since emancipation and reconstruction gave the former slaves freedom and temporary political supremacy and increased the friction between the races. The numerous protective societies of whites, 1865–76, culminating in the Ku Klux and White League movement, may be described as an application of lynch law. After reconstruction, with the increase of negro crimes, came an increase of lynchings, due to prejudice, to the fact that for some time after reconstruction the governments were weak, especially in the districts where the blacks outnumbered the whites, to the fact that negroes nearly always shield criminals of their own race against the whites, and to the occurrence of the crime of rape by negro men upon white women.

The *New York World* has collected statistics of lynching since 1885 and some interesting facts may be deduced from these tables. During the 41 years from 1885 to 1926, inclusive, the total number of persons lynched in the United States was 4,250, of whom 3,205 were negroes and 1,045 were whites; the annual number has been gradually decreasing during the last 30 years. The East is almost free from lynchings; of those in the West, most were white; of those lynched in the South, the larger numbers were blacks. Lynchings occur mostly during periods of idleness of the lower classes; in the summer more are lynched for crimes against the person and in the winter, especially in the West, for crimes against property; the principal causes for lynchings in the South are murder and rape; in the West, for murder and offences against property. Lynching decreases and disappears in a region as the population grows denser and civil institutions grow stronger; as better communications and good police make it harder to commit crime; and as public sentiment is educated to demand legal rather than illegal and irregular infliction of punishment for even the most horrible of crimes.

LYNDHURST, JOHN SINGLETON COPLEY, Baron (1772–1863), lord chancellor of England, was born at Boston, Massachusetts, on May 21, 1772. He was the son of John Singleton Copley, the painter. He was educated at a private school and Cambridge university, where he was second wrangler and fellow of Trinity. Called to the bar at Lincoln's Inn in 1804, he gained a considerable practice. In 1817 he was one of the counsel for Dr. J. Watson, tried for his share in the Spa Fields riot. On this occasion Copley so distinguished himself as to attract the attention of Castlereagh and other Tory leaders, under whose patronage he entered parliament as member for Yarmouth in the Isle of Wight. He afterwards sat for Ashburton, 1818–1826, and for Cambridge university 1826–1827. He was solicitor-general in 1819, attorney-general in 1824, master of the rolls in 1826 and lord chancellor in 1827, with the title of Lord Lyndhurst. Before being taken up by the Tories, Copley was a man of the most advanced views, a republican and Jacobin; and his accession to the Tories excited a good deal of comment, which he bore with the greatest good humour. He gave a brilliant and eloquent but by no means rancorous support to all the reactionary measures of his chief.

As solicitor-general he took a prominent part in the trial of Queen Caroline. To the great Liberal measures which marked the end of the reign of George IV. and the beginning of that of William IV. he gave a vigorous opposition. He was lord chief baron of the exchequer from 1831 to 1834. During the Melbourne administration from 1835 to 1841 he figured conspicuously as an obstructionist in the House of Lords. In these years it was a frequent practice with him, before each prorogation of parliament, to entertain the House with a "review of the session," in which he mercilessly attacked the Whig government. His former adversary Lord Brougham, disgusted at his treatment by the Whig leaders, soon became his most powerful ally in opposition; and the two dominated the House of Lords. Throughout all the Tory governments from 1827 Lyndhurst held the chancellorship

(1827–30 and 1834–35); and in the Peel Administration (1841–46) he resumed that office for the last time. As Peel never had much confidence in Lyndhurst, the latter did not exert so great an influence in the cabinet as his position and experience entitled him to do. But he continued a loyal member of the party. He died in London on Oct. 12, 1863.

Of Lord Lyndhurst as a judge opinions have differed; there is authority, including Selborne himself, for the view that he was not a just chancery judge. His heart was not in the business. But the qualities of a just chancellor in those days were of a very special order, and in the House of Lords he was more at home, though the estimate must stand that he was "a judge for the parties rather than a judge for the lawyers." His greatest moment in the House of Lords was his success in averting what would have been a disastrous precedent, the attempt of lay members to vote in an appeal to the House of Lords, theoretically permissible, but a violation of a strict Constitutional understanding (O'Connell's case Sept. 4, 1844). It may be added that the one element of the court of chancery that comes out of *Jarndyce* v. *Jarndyce* with any credit is the chancellor—Lyndhurst.

See *Lives of the Lord Chancellors of England,* vol. viii. (Lords Lyndhurst and Brougham), by Lord Campbell (1869). Campbell was a personal friend, but a political opponent. Brougham's *Memoirs; Greville Memoirs; Life of Lord Lyndhurst* (1883) by Sir Theodore Martin; J. B. Atlay, *The Victorian Chancellors* (1906).

LYNDSAY, SIR DAVID (*c.* 1490–*c.* 1555), Scottish poet, was the son of David Lyndsay of the Mount, near Cupar-Fife, and of Garmylton, near Haddington. He probably studied at St. Andrews university, on the books of which appears an entry "Da Lindesay" for the session 1508–09. He was engaged at court, first as an equerry, then as an "usher" to the young Prince James, afterwards James V. In 1522 he married Janet Douglas, a court seamstress, and seven years later was appointed Lyon King of Arms, and knighted. He was several times engaged in diplomatic business (twice on embassies abroad—to the Netherlands and France), and he was, in virtue of his heraldic office, a general master of ceremonies. After the death of James V., in 1542, he continued to sit in Parliament as commissioner for Cupar-Fife; and in 1548 he was member of a mission to Denmark which obtained certain privileges for Scottish merchants. There is reason to believe that he died in or about 1555.

Most of Lyndsay's literary work was written during the period of prosperity at court. His muse was occasional and satirical. He enjoyed a freedom of speech which is without parallel even in more secure times. He chastised all classes, from his royal master to the most simple. There is no evidence that he abjured Catholicism; yet his leading purpose was the exposure of its errors and abuses. His aid was readily accepted by the reforming party, and by their use of his work he shared with their leaders throughout many generations a reputation which is almost exclusively political and ecclesiastical.

Lyndsay's longer poems are *The Dreme* (1,134 lines), *The Testament and Complaynt of the Papynago* (1,190 lines), *The Testament of Squyer Meldrum* (1,859 lines), *Ane Dialog betwix Experience and ane Courteour of the Miserabyll Estait of the World* (6,333 lines), and *Ane Pleasant Satyre of the Thrie Estaitis* (over 4,000 lines). Lyndsay, the last of the Makars, used the forms of Chaucer, but his spirit is the revolutionary spirit of the Reformation. His nearest approach to Chaucer is in *The Testament of Squyer Meldrum,* which recalls the sketch of the "young squire"; but the reminiscence is verbal rather than spiritual. In *The Dreme,* the allegorical tradition survives only in the form. "Remembrance" conducts the poet over the old-world itinerary, but only to lead him to speculation on Scotland's woes and to an "Exhortatioun to the Kingis Grace" to bring relief. The tenor is well expressed in the motto from the Vulgate—*Prophetias nolite spernere. Omnia autem probate: quod bonum est tenete.*

This didactic habit is freely exercised in the long *Dialog* (sometimes called the *Monarche*), a universal history of the mediaeval type, in which the falls of princes by corruption supply an object lesson to the unreformed church of his day. The *Satyre* is more direct in its attack on ecclesiastical abuse; and its dramatic form permits more lively treatment. This piece is of great historical interest, being the only extant example of a complete Scottish morality. It is in respect of literary quality Lyndsay's best work, and in dramatic construction and delineation of character it holds a high place in this *genre.* The farcical interludes (in places too coarse for modern taste) supply many touches of genuine comedy; and throughout the play there are passages, as in the speeches of Veritie in the First Part and of Dame Chastitie in the "Interlude of the Sowtar and the Taylor," in which word and line are happily conceived. The *Testament of the Papyngo* (popinjay), drawn in the familiar mediaeval manner, is another tract for the time, full of admonition to court and clergy.

Of his shorter pieces, *The Complaynt and Publict Confessions of the Kingis Auld Hound, callit Bagsche, directit to Bawtie, the Kingis best belovit Dog, and his companyeonis,* and the *Answer to the Kingis Flyting* have a like pulpit resonance. The former is interesting as a forerunner of Burns's device in the "Twa Dogs." The *Deploratioun of the Deith of Queen Magdalene* is in the extravagant style of commemoration illustrated in Dunbar's Elegy on the Lord Aubigny. The *Justing betwix James Watsoun and Jhone Barbour* is a contribution to the popular taste for boisterous fun, in spirit, if not in form, akin to the *Christis Kirk on the Grene* series; and indirectly, with Dunbar's *Turnament* and *Of ane Blak-Moir,* a burlesque of the courtly tourney. Lyndsay approaches Dunbar in his satire *The Supplicatioun in contemptioun of syde taillis* ("wide" trains of the ladies), which recalls the older poet's realistic lines on the filthy condition of the city streets. In Lyndsay's *Descriptioun of Pedder Coffeis* (pedlars) we have an early example of the studies in vulgar life which are so plentiful in later Scottish literature. In *Kitteis Confessioun* he returns, but in more sprightly mood, to his attack on the church.

In Lyndsay we have the first literary expression in Scotland of the Renaissance. His interest lies on the theological side of the revival; he is in no sense a humanist, and he is indifferent to the artistic claims of the movement. Still he appeals to the principle which is fundamental to all. He demands first-hand impression. He feels that men must get their lesson direct, not from intermediaries who understand the originals no more "than they do the ravyng of the rukis." Hence his persistent plea for the vernacular, nowhere more directly put than in the *Dialog,* in the "Exclamatioun to the Redar, toucheyng the wrytting of the vulgare and maternall language." Though he is concerned only in the theological and ecclesiastical application of this, he undoubtedly stimulated the use of the vernacular in a Scotland which in all literary matters beyond the concern of the irresponsible poet still used the *lingua franca* of Europe.

A complete edition of Lyndsay's poetical works was published by David Laing in 3 vols. in 1879. This was anticipated during the process of preparation by a cheaper edition (slightly expurgated) by the same editor in 1871 (2 vols.). The E.E.T.S. issued the first part of a complete edition in 1865 (ed. J. Small). Five parts have appeared, four edited by J. Small, the fifth by J. A. H. Murray. For the bibliography *see* Laing's 3 vol. edition, *u.s.* iii., pp. 222 *et seq.,* and the E.E.T.S. edition *passim. See* also the editions by Pinkerton (1792), Sibbald (1803), and Chalmers (1806); and the critical accounts in Henderson's *Scottish Vernacular Literature* (1898), Gregory Smith's *Transition Period* (1900), and J. H. Millar's *Literary History of Scotland* (1903). A professional work prepared by Lyndsay in the Lyon Office, entitled the *Register of Scottish Arms* (now preserved in ms. in the Advocates' library), was printed in 1821 and reprinted in 1878. It remains the most authoritative document on Scottish heraldry.

(G. G. S.)

LYNEDOCH, THOMAS GRAHAM, 1ST BARON (1748–1843), British general, was the son of Thomas Graeme, laird of Balgowan, and was born on Oct. 19, 1748. Graham was travelling in the Mediterranean when he fell in with Lord Hood's fleet on its way to Toulon. He joined it as a volunteer, served on Lord Mulgrave's staff during the British occupation of Toulon, and returned, after the failure of the expedition, to Scotland, where he organized a regiment of infantry, the 90th Foot, Perthshire Volunteers (now 2nd Battalion Scottish Rifles). Graham's men were the first regiment in the army to be equipped and trained wholly as light infantry, though they were not officially recognized as such for many years. In the same year (1794) Graham became member of Parliament, in the Whig interests, for the county of Perth. He saw some active service in 1795 in "conjunct expeditions" of the army and navy, and in 1796, being then a brevet colonel, he was appointed British commissioner at the headquarters of the Austrian army in Italy. He then served in further "conjunct" operations in the Mediterranean. He sat for Perthshire in parliament until the year 1807. Graham was with Moore in Sweden in 1808 and also in Spain from 1808 to 1809, and he was present at Moore's death at the battle of Corunna. In 1809 he became a major-general, and after taking part in the disastrous Walcheren expedition he was promoted lieutenant-general and sent to Cadiz (1810).

In 1811, acting in conjunction with the Spanish army under General la Peña (*see* PENINSULAR WAR), he took the offensive, and won the brilliant action of Barossa (March 5). The victory was made barren of result by the timidity of the Spanish generals, who nevertheless claimed more than their share of the credit. One of the Spanish officers he called out, fought and disarmed, and after refusing with contempt the offer of a Spanish dukedom, he resigned his command in the south and joined Wellington in Portugal. His seniority as lieutenant-general made him second in command of Wellington's army. He took part in the siege of Ciudad Rodrigo, and commanded a wing of the army in the siege of Badajoz and the advance to Salamanca. In July 1812, his eyesight becoming seriously impaired, he went home, but rejoined in time to lead the detached wing of the army in the wide-ranging manoeuvre which culminated in the battle of Vittoria. Graham captured San Sebastian (Sept. 9, 1813). He then went home, but in 1814 accepted the command of a corps to be despatched against Antwerp. His assault on Bergen op Zoom was, however, disastrously repulsed (Feb. 3, 1814).

At the peace Graham was created Baron Lynedoch of Balgowan in the peerage of the United Kingdom, but refused the offered pension of £200 a year. In 1813 he proposed the formation of a military club in London, and though Lord St. Vincent considered such an assemblage of officers to be unconstitutional, Wellington supported it and the officers of the army and navy at large received the idea with enthusiasm. Lynedoch's portrait, by Sir T. Lawrence, is in possession of this club, the (Senior) United Service. In his latter years he resumed the habits of his youth, travelling all over Europe, hunting with the Pytchley so long as he was able to sit his horse, actively concerned in politics and voting consistently for liberal measures. At the age of ninety-two he hastened from Switzerland to Edinburgh to receive Queen Victoria when she visited Scotland after her marriage. He died in London on Dec. 18, 1843.

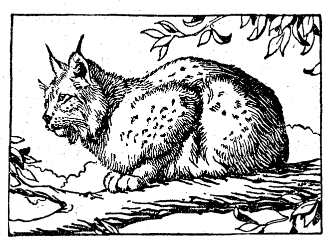
See biographies by John Murray Graham (2nd ed., Edinburgh, 1877) and Captain A. M. Delavoye (London, 1880); also the latter's *History of the 90th (Perthshire Volunteers)* (London, 1880), *Philipparts' Royal Military Calendar* (1820), ii. 147, and *Gentleman's Magazine*, new series, xxi. 197.

LYNN, city of Essex county, Massachusetts, U.S.A., on north shore of Massachusetts bay, 10m. N.E. of Boston. It is served by the Boston and Maine and the Eastern Massachusetts Street railways. The population (about 25% foreign-born) was 98,123 in 1940. The land area of 10.4 sq.mi. includes 2,500 ac. in parks and 3·5m. of fine beaches. High Rock, in the centre of the city, 190ft. above sea level, is surmounted by an observation tower 85ft. high, commanding magnificent views. The commerce of the harbour (436,780 tons in 1940) consists chiefly of incoming coal. From its earliest days Lynn has been a manufacturing centre. The manufacture of boots and shoes, its most important, and for many generations its most distinctive industry, was introduced in 1636. In 1939 the output of 87 shoe factories and allied plants making lasts, leather and findings, was valued at $15,267,262. There are two large plants of the General Electric company, established in 1883, which employ 12,000 persons; and some 400 smaller establishments, making 95 different kinds of commodities. The total factory output in 1939 was valued at $86,893,553; the assessed valuation of property was $132,781,015; and banking transactions in 1940 totalled $231,324,000. The mayoralty form of government was restored in 1918, displacing a commission form which had been in operation since 1910. Lynn was founded in 1629, organized as a village in 1631, and incorporated as a city in 1850. It was called Saugus at first, but was renamed in 1637 from Lynn Regis, Norfolk, the home of the pastor. The first smelting works in New England were established here in 1643. The boot and shoe industry developed steadily through the 17th and 18th centuries. The women's shoes made here had become famous by 1764, and in 1795 the output was 300,000 pairs. In 1900 and in 1905 Lynn ranked second among the cities of the United States in the value of the boots and shoes manufactured, but in 1923 it had dropped to sixth place, due to the dispersal of the industry and the rise of new centres in the middle west. Meanwhile various new industries were taking root, and Lynn has become a city of diversified products.

LYNTON and LYNMOUTH, seaside villages in Devonshire, England, on the Bristol channel; 17 mi. E. of Ilfracombe. Both are summer resorts. Lynmouth is at the mouth of the East and West Lyn rivers, whilst Lynton is on the cliff top 430 ft. above. The industries are fishing and a small coasting trade. Not far off are the Doone valley, made famous by R. D. Blackmore's novel *Lorna Doone,* part of the valley of the East Lyn (owned by the National Trust), here called Badgworthy water, and Watersmeet, where two streams, the East and West Lyn, join. The legend of the Doones, a 17th century band of outlaws, dates only from the early 19th century. Lynton is an urban district; pop. (est. 1938) 1,808. Area, 12 sq.mi.

LYNX, a genus of mammals of the family Felidae (*see* CARNIVORA). Amongst other fabulous properties attributed to this animal by the ancients was that of extraordinary powers of vision, whence the epithet "lynx-eyed."

Lynxes are found in the north temperate regions of both the Old and New World; they are smaller than leopards, and larger than true wild cats, with long limbs, short stumpy tail, ears tufted at the tip, and pupil of the eye linear when contracted. Their fur is generally long and soft, and always longish upon the cheeks. Their colour is light brown or grey, with generally darker spots. Their food consists of any mammals or birds which they can overpower. In Canada, the number of lynxes is governed each year by the number of hares, their chief diet, produced the previous year. They frequent rocky places and forests, being active climbers, and passing much of their time among the branches of the trees. Their skins are of considerable value in the fur trade. The northern lynx (*L. lynx*) of Scandinavia, Russia, northern Asia, and till lately of central Europe inhabited Britain during the Pleistocene age. The pardine lynx (*L. l. pardinus*) from southern Europe is very handsome, rufous above and white beneath. Several lynxes are found in North America; the most northerly is the Canadian lynx (*L. canadensis*); the bay lynx (*L. rufus*), with a rufous coat, ranges from southern Canada south to Mexico and lower California, represented by various races in this area.



THE NORTHERN LYNX (LYNX LYNX)

LYON, MARY MASON (1797–1849), American educator, was born on Feb. 28, 1797, on a farm near Buckland, Mass. She began to teach when she was 17, and in 1817, with earnings from spinning and weaving, she went to Sanderson academy, Ashfield, where the other pupils failed to keep within reciting distance of her. She supported herself there and at the other academies she attended by teaching, her desire to acquire and impart learning seeming insatiable. Her success as a teacher and administrator and the demand for the young women she trained were the beginning of her plan for "a permanent institution consecrated to the training of young women for usefulness . . . designed to furnish every advantage which the state of education in this country will allow . . . to put within reach of students of moderate means such opportunities that none can find better." She was aided in this effort by Edward Hitchcock, the geologist, with whom she had studied. This assistance, reinforced by her own enthusiasm and practical common sense secured for her plan the necessary financial support. In 1835 a site was selected near the village of South Hadley and Mt. Holyoke. In 1836 the school was incorporated as Mt. Holyoke Female seminary; and on Nov. 8, 1837, it opened with Mary Lyon as principal and Miss Eunice Caldwell as assistant, afterwards well known as Mrs. J. P. Cowles of Ipswich academy. Miss Lyon died at Mt. Holyoke on March 5, 1849, having served nearly 12 years as principal of the seminary, on a salary of $200 a year. Her work at Holyoke was an important step in the higher education of women in the United States.

See Edward Hitchcock, *Life and Labors of Mary Lyon* (1851); Beth B. Gilchrist, *Life of Mary Lyon* (1910); E. C. Adams and W. D. Foster, *Heroines of Modern Progress* (1913); Gamaliel Bradford, *Portraits of American Women* (Boston, 1919).

LYON, NATHANIEL (1818–1861), U.S. soldier, was born in Ashford, Conn., on July 14, 1818, and graduated at West point in 1841. He was engaged in the Seminole War and the war with Mexico. In 1851, while serving in California, he was promoted to captain, and two years later was ordered to the east, when he became an ardent opponent of "States' Rights" and slavery. He was stationed in Kansas and in Missouri on the eve of the Civil War. Lyon took an active part in organizing the Union party in Missouri, though greatly hampered at first by the federal government which feared to provoke hostilities and afterward by the military commander of the department, Gen. W. S. Harney. On Harney's temporary removal in April 1861, Lyon promptly assumed the command, mustered the Missouri contingent into the United States' service, and broke up the militia camp at St. Louis established by the secessionist governor of Missouri, Claiborne F. Jackson. In all this Lyon had co-operated closely with Francis P. Blair, Jr., who now obtained from President Lincoln the definitive removal of Harney and the assignment of Lyon to command the department of the west, with the rank of brigadier general. On Lyon's refusal to accede to the secessionists' proposal that the state should be neutral, hostilities opened in earnest, and Lyon, having cleared Missouri of small hostile bands in the central part of the state, turned to the southern districts, where a Confederate army was advancing from the Arkansas border. The two forces came to action at Wilson's Creek on Aug. 10, 1861. The Union forces, heavily outnumbered, were defeated, and Lyon himself was killed. He bequeathed almost all he possessed, some $30,000, to the war funds of the national government.

See A. Woodward, *Memoir of General Nathaniel Lyon* (Hartford, 1862); James Peckham, *Life of Lyon* (1866); T. L. Snead, *The Fight for Missouri* (1886). Also *Last Political Writings of General Nathaniel Lyon* (1862).

LYONNAIS, formerly a province of France, bounded on the north by Beaujolais, on the south and west by the Forez mountains, on the east by the Saône and the Rhone, which divided it from Bresse, Dombes and Dauphiné. In modern times it has formed the department of the Rhone. The history of Lyonnais is the history of its capital, Lyons (*q.v.*).

See P. Clerjon, *Histoire de Lyons* (1829–40), articles in the *Revue Lyonnaise* since 1881, and in the *Revue du Lyonnais* (1835–48).

LYONNESSE, LYONESSE, LEONNOYS or **LEONAIS,** a legendary country off the south coast of Cornwall, England. Lyonnesse is the scene of many incidents in the Arthurian romances, and especially in the romances of Tristran and Iseult. It also plays an important part in Cornish tradition and folklore. Early English chronicles, such as the *Chronicon e chronicis* of Florence of Worcester (d. 1118), described minutely and without a suggestion of disbelief the flourishing state of Lyonnesse, and its sudden disappearance beneath the sea. The legend may be a greatly exaggerated version of some actual subsidence of inhabited land. There is also a very ancient local tradition, apparently independent of the story of Lyonnesse, that the Scilly Islands formed part of the Cornish mainland within historical times.

See *Florentii Wigorniensis monachi Chronicon ex chronicis,* etc., ed. B. Thorpe (1848–49); also an article on "Lyonesse," dealing with the severance of the Scilly Islands, by O. G. S. Crawford, in *Antiquity* (March, 1927).

LYONS, EDMUND LYONS, Baron (1790–1858), British admiral, was born at Burton, near Christchurch, Hants., on Nov. 21, 1790. He entered the navy and served in the Mediterranean and afterward in the East Indies. In 1826 he commanded the "Blonde" frigate at the blockade of Navarino, and took part with the French in the capture of Kasteo Morea. From 1840 until 1853 Lyons was employed on the diplomatic service, being successively minister to Greece, Switzerland and Sweden. In the Crimean War he was second in command of the British fleet in the Black sea under Admiral Dundas, whom he succeeded in the chief command in 1854. His constant vigilance, his multifarious activity, and his suggestions and counsels were much more advantageous to the allied cause than his specific exploits. In 1855 he was created vice-admiral; in June 1856 he was raised to the peerage. He died on Nov. 23, 1858.

See Adam S. Eardley-Wilmot, R.N., *Life of Lord Lyons* (1898).

LYONS, SIR JOSEPH (1848–1917), British business man, was born in London on Sept. 29, 1848, and educated at a Jewish school. In early life he studied painting and exhibited at the Royal Institute, but by 1886 he had turned to business enterprises, in conjunction with the brothers Isidore (d. 1920) and Montague Gluckstein. This led to the foundation of the catering firm of J. Lyons and Co., Ltd., of which he became chairman. He began by catering at public exhibitions, and next opened tea shops in London, the first in 1894. Twenty years later these numbered more than 200 and provided cheap food for the large class of clerical workers and junior members of professions. Later he opened several restaurants of a more ambitious nature, as well as hotels, on the no-tipping principle. He was knighted in 1911, and died in London on June 22, 1917.

LYONS, RICHARD BICKERTON PEMELL LYONS, 1st Earl (1817–1887), British diplomatist, son of Baron Lyons, was born at Lymington on April 26, 1817. He entered the diplomatic service, and in 1859–64 was British minister at Washington, where, after the outbreak of the Civil War, the negotiations connected with the arrest of the Confederate envoys on board the British mail steamer "Trent" devolved upon him. After a brief service at Constantinople, he succeeded Lord Cowley in 1867 at the Paris embassy, where he remained for 20 years. In the war of 1870 he used his best efforts as a mediator, and accompanied the provisional government to Tours. He died on Dec. 5, 1887, whereupon the title became extinct.

See Lord Newton, *Lord Lyons. A Record of British Diplomacy* (2 vols., 1913).

LYONS (French Lyon) (lī'ons, Fr. lē-ōn), a famous city of eastern France, capital of the department of Rhône, lying 315 mi. S.S.E. of Paris, and 218 mi. N. by W. of Marseilles on the P.L.M. railway. Pop. (1936) 562,038. Lyons stands at the confluence of the Rhône and the Saône at an altitude of 540 to 1,000 ft. above sea level. The rivers, both flowing south, are separated on the north by the hill on which lies the populous working quarter of Croix-Rousse, then by the narrow tongue of land ending in the Perrache quarter, so called because it was reclaimed from the rivers in the 18th century by the sculptor Perrache. The peninsula thus formed is more than 3 mi. long and from 650 to 1,000 yd. broad, and is traversed lengthwise by the finest streets of the city, containing many of the chief buildings, the docks of the Saône, etc. Where it enters Lyons the Saône has on its right the faubourg of Vaise and on its left that of Serin, whence the ascent is made to the top of the hill of Croix-Rousse. Farther on, its right bank is bordered by the scarped heights of Fourvière, St. Irénée, Ste. Foy and St. Just, leaving room only for the quays and one or two narrow streets; this is the oldest part of the city. The river sweeps in a semicircle around this eminence (410 ft. above it) which is occupied by convents, hospitals and seminaries, and has at its summit the famous church of Notre-Dame de Fourvière, a centre of pilgrimage.

The Rhône, less confined than the Saône, flows swiftly in a wide channel, broken when the water is low in spring by pebbly islets. On the right hand it skirts first St. Clair, sloping upwards to Croix-Rousse, and then the districts of Terreaux, Bellecour and Perrache; on the left it has a low-lying plain, occupied by the quarters of Brotteaux and Guillotière, and the Parc de la Tête d'Or with a lake, zoological collection and very fine botanical and pharmaceutical gardens. It is defended from the Rhône by the Quai de la Tête d'Or. Brotteaux is a modern residential quarter. Guillotière to the south consists largely of workmen's dwellings, bordering wide, airy thoroughfares. To the east extend the manufacturing suburbs of Villeurbanne and Montchat, and extension into the plain of Dauphiné, southeast of the Rhône, is likely to continue.

The Rhône and the Saône are bordered by fine quays and crossed by 24 bridges—11 over the Rhône, 12 over the Saône, and 1 at the confluence. The Pont de la Guillotière over the Rhône preserves a portion of its mediaeval predecessor. The name, Notre-Dame de Fourvière, originally applied to a small chapel of the 9th century on the site of the old forum (*forum vetus*) from which it takes its name. It has often been rebuilt, the chief feature being a modern Romanesque tower surmounted by a cupola and statue of the Virgin. In 1872 a basilica was begun at its side in token of the gratitude of the city for having escaped occupation by the German troops; it was finished in 1894. Marble and mosaic have been lavishly used in the ornamentation of the interior and of the crypt. Round the apse runs a gallery with a fine view, from which, according to an old custom, a benediction is pronounced upon the town annually on Sept. 8.

The cathedral of St. Jean at the foot of the hill of Fourvière was begun in the 12th century, to the end of which the transept and choir belong; the gable and flanking towers of the west front were completed in 1480. A triple portal surmounted by a line of arcades and a rose window gives entrance to the church. Two additional towers, that to the north containing one of the largest bells in France, rise at the extremities of the transept. The nave and choir contain fine stained glass of the 13th and 14th centuries as well as good modern glass. The chapel of St. Louis or of Bourbon, to the right of the nave, is a masterpiece of Flamboyant Gothic. To the right and left of the altar stand two crosses preserved since the council of 1274 as a symbol of the union then agreed upon between the Greek and Latin churches. Adjoining St. Jean is the ancient Manécanterie or singers' house, much mutilated and frequently restored, but still preserving graceful Romanesque arcades along its front. St. Martin d'Ainay, on the peninsula, dates from the beginning of the 6th century and was subsequently attached to a Benedictine abbey. It was rebuilt in the 10th and 11th centuries and restored in modern times, and has a nave with four aisles, a transept and a choir with three semicircular apses. One tower is in the middle of the west front, another at the crossing; the four columns supporting the latter are said to have come from an altar to Augustus. A 12th century mosaic, a high altar with mosaic work and a beautifully carved confessional are among the works of art in the interior. St. Nizier, the first cathedral, is 15th century Gothic with a 16th century porch; its crypt is very ancient and in it St. Pothinus officiated.

The *hôtel de ville* (17th century) on the Place des Terreaux, the space filled in when the Perrache was reclaimed, has a good east façade. The south side of the square is occupied by the Palais des Arts, a 17th century Benedictine convent now accommodating the school of fine arts, the museums of painting and sculpture, archaeology and natural history, and the library of science, arts and industry. The museums have a very important collection of antiquities, rich in Gallo-Roman inscriptions, including the bronze tablets discovered in 1528, on which is engraved a portion of a speech delivered in A.D. 48, by the emperor Claudius, advocating the admission of citizens of Gallia Comata to the Roman senate. The "Ascension," a masterpiece of Perugino, is the chief treasure of the art collection. A special gallery contains the works of artists of Lyons, among whom are numbered Antoine Berjon, Meissonier, Paul Chenavard, Puvis de Chavannes. The Bourse (exchange) in the Rue de la République is a fine building and includes the *Musée historique des Tissus,* in which the history of the weaving industry is illustrated by nearly 400,000 examples. In the buildings of the *lycée* on the right bank of the Rhône are the municipal library and a collection of globes, among them the great terrestrial globe made at Lyons in 1701, indicating the great African lakes.

The Hôtel Dieu, the traditional founder of which was King Childebert (early 6th century) is housed in an 18th century building; its façade, fronting the west quay of the Rhône for more than 1,000 ft., was begun according to the designs of Soufflot, architect of the Panthéon at Paris. A fountain in the Place des Terreaux has a leaden group by Bartholdi representing the rivers on their way to the ocean.

Remains of Roman baths, tombs and a theatre are found in the St. Just quarter on the right bank of the Saône. Three ancient aqueducts on the Fourvière level, from Montromant, Mont d'Or and Mont Pilat, can still be traced. Magnificent remains of the latter work may be seen at St. Irénée and Chaponost. Traces also exist along the Rhône of a subterranean canal conveying the water of the river to a *naumachia* (lake for mimic sea fights). Agrippa made Lyons the starting point of the principal Roman roads throughout Gaul; and it remains an important road centre owing to its position on the natural highway from north to southeastern France. The Saône above the town and the Rhône below have large barge and steamboat traffic. The main P.L.M. railway line runs first through the station at Vaise, on the right bank of the Saône, and thence to that of Perrache, the chief station in the city. The line to Geneva has its station in the Brotteaux quarter, and the line of the eastern Lyonnais to St. Genix d'Aoste has a terminus at Guillotière; both these lines link up with the P.L.M. main line. The railway to Montbrison starts from the terminus of St. Paul in Fourvière and that to Bourg, Trévoux and the Dombes region from the station of Croix-Rousse. A less important line to Vaugneray and Mornant has a terminus at St. Just. Cable tramways (*ficelles*) run to the summits of the eminences of Croix-Rousse, Fourvière and St. Just.

Lyons has been one of the chief fortresses of France. It is the headquarters of the 14th army corps, the seat of an archbishop who holds the title of primate of the Gauls and also that of archbishop of Vienne, and of a prefect, a court of appeal, a court of assizes, tribunals of commerce and of first instance, and of two boards of trade arbitrators (*conseils de prud'hommes*). It is the centre of an *académie* (educational division) and has a university with faculties of law, letters, science and medicine and pharmacy. There are also Catholic faculties (*facultés libres*) of law, theology, science and letters, a school of fine arts founded in the 18th century to train competent designers for the textile manufactures, which has also done much for painting and sculpture; an army medical school, schools of drawing, agriculture, music, commerce (*école supérieure de commerce*), weaving, tanning, watchmaking and applied chemistry, and the *écoles La Martinière* for free instruction in science and art as applied to industry. The veterinary school, instituted in 1761, was the first of its kind in Europe; its laboratory for the study of comparative physiology is admirably equipped. Besides the *Académie des Sciences, Belles Lettres et Arts* (founded in 1700), Lyons possesses societies of agriculture, natural history, geography, horticulture, etc.

Derived from Italy, the silk industry rapidly developed, thanks to the monopoly granted to the city in 1450 by Charles VII and to the patronage of Francis I, Henry II and Henry IV. From time to time new kinds of fabrics were invented—silk stuffs woofed with wool or with gold and silver threads, shawls, watered silks, poplins, velvets, satinades, moirés, etc. In the beginning of the 19th century J. M. Jacquard introduced his famous loom by which a single workman was enabled to produce elaborate fabrics as easily as the plainest web, and by changing the "cartoons" to make the most different textures on the same looms. In the 17th century Lyons had 9,000 to 12,000 silk looms. After the revocation of the edict of Nantes the number sank to 3,000 or 4,000; but it rose again about 1801 to 12,000. In the mid 19th century silk weaving began to desert Lyons for the surrounding districts. The city remains the business centre for the trade and carries on accessory processes. The synthetic fibre industry also developed very largely around Lyons. Much natural silk is imported from the east and some from Italy. About one quarter of the city's population is engaged in the industry. The dyeing industry and the manufacture of chemicals have both developed considerably to meet the requirements of the silk trade. Large quantities of mineral and vegetable colouring matters are produced and there is besides a large output of glue, gelatine, superphosphates and phosphorus, all made from bones and hides, of picric, tartaric, sulphuric and hydrochloric acids, sulphates of iron and copper, and pharmaceutical and other chemical products.

Lyons does a large trade in metals, iron, steel and copper, and utilizes them in the manufacture of iron buildings, framework, bridges, machinery, railway material, scales, metal cables, pins and needles, copper-founding and the making of clocks and bronzes. Gold and silver-working is of importance, especially for embroidery and articles used in religious ceremonies. Other industries are those of printing, the manufacture of glass goods, of tobacco (by the State), the preparation of hides and skins (occupying 20,000 workmen), those connected with the miller's trade, the manufacture of various forms of dried flour-paste (macaroni, vermicelli, etc.), brewing, hat-making, the manufacture of chocolate, and the pork-butcher's industry. Apart from the dealings in silk and silk goods, trade is in cloth, coal and charcoal, metals and metal goods, wine and spirits, cheese and chestnuts. Four miles south-west of Lyons is Oullins (pop., 1936, 16,734) which has the important works of the P.L.M. railway.

Lyons is the seat of the Crédit Lyonnais, one of the chief banks of France; also of coal and metallurgical companies and gas companies, home and foreign.

HISTORY

The earliest Gallic people who occupied the territory at the confluence of the Rhône and the Saône were the Segusians. In 59 B.C. some Greek refugees from the banks of the Hérault, having obtained permission of the natives to establish themselves beside the Croix-Rousse, called their new town by the Gallic name Lugudunum (*q.v.*) or Lugdunum; and in 43 B.C. Lucius Munatius Plancus brought a Roman colony to Fourvière from Vienne. This settlement soon acquired importance, and was made by Agrippa the starting-point of four great roads. Augustus, besides building aqueducts, temples and a theatre, gave it a senate and made it the seat of an annual assembly of deputies from the sixty cities of Gallia Comata. At the same time the place became the Gallic centre for the worship of Rome and the emperor. Under the emperors the colony of Forum Vetus and the municipium of Lugdunum were united, receiving the *jus senatus*. The town was burnt in A.D. 59 and afterwards rebuilt in a much finer style with money given by Nero; it was also adorned by Trajan, Adrian and Antoninus.

After having been ravaged by the barbarians and abandoned by the empire, Lyons in 478 became capital of the kingdom of the Burgundians. It afterwards fell into the hands of the Franks, and suffered severely from the Saracens, but revived under Charlemagne, and after the death of Charles the Bald became part of the kingdom of Provence. From 1032 it was a fief of the emperor of Germany. Subsequently the authority over the town was a subject of dispute between the archbishops of Lyons and the counts of Forez; but the supremacy of the French kings was established under Philip the Fair in 1312. The citizens were constituted into a commune ruled by freely elected consuls (1320). In the 13th century two ecclesiastical councils were held at Lyons—one in 1245, presided over by Innocent IV., at which the emperor Frederick II. was deposed; the second, the oecumenical, under the presidency of Gregory X., in 1274, at which five hundred bishops met. Pope Clement V. was crowned here in 1305, and his successor, John XXII., elected in 1316. The Protestants obtained possession of the place in 1562; their acts of violence were fiercely avenged in 1572 after the St. Bartholomew massacre. Under Henry III. Lyons sided with the League; but it pronounced in favour of Henry IV. The executions of Henri d'Effiat, marquis of Cinq-Mars, and of François de Thou, who had plotted to overthrow Richelieu, took place on the Place des Terreaux in 1642. In 1793 the Royalists and Girondists, powerful in the city, rose against the Convention, but were compelled to yield to the army of the republic under General Kellermann after enduring a siege of seven weeks (October 10). Terrible chastisement ensued: the name of "Lyon" was changed to that of "Ville-affranchie"; the demolition of its buildings was set about on a wholesale scale; and vast numbers of the proscribed, whom the scaffold had spared, were butchered with grape shot. The town resumed its old name after the fall of Robespierre, and the terrorists in their turn were drowned in large numbers in the Rhone. Napoleon rebuilt the Place Bellecour, reopened the churches, and made the bridge of Tilsit over the Saône between Bellecour and the cathedral. In 1814 and 1815 Lyons was occupied by the Austrians. In 1831, 1834, 1849, 1870 and 1871 it was the scene of violent industrial or political disturbances. In 1840 and 1856 disastrous floods laid waste portions of the city. International exhibitions were held there in 1872 and 1894, the latter occasion being marked by the assassination of President Carnot. An annual international fair was established in 1916 at Lyons. A permanent exhibition building on the banks of the Rhone was erected and space for exhibitors was reserved on both sides of the road on the left bank of the river and in the square near the railway station.

Poland and soviet Russia were represented at the exhibition for the first time in 1923.

The Wilson bridge over the Rhone was opened in 1918.

LYONS, COUNCILS OF. The first Council of Lyons met at the summons of Pope Innocent IV in June and July of 1245 to deliberate on the conflict between Church and emperor, on the assistance to be granted to the Holy Land and the eastern empire, on measures of protection against the Tatars and on the suppression of heresy. Among these tasks the most important, in the eyes of the pope, was that the Council should lend him effectual aid in his labours to overthrow the emperor Frederick II. The condemnation of the emperor was a foregone conclusion and the objections of the emperor's representative, Thaddeus of Suessa, that the accused had not been regularly cited, that the pope was plaintiff and judge in one, and that therefore the whole process was anomalous, achieved as little success as his appeal to the future pontiff and to a truly oecumenical council. On July 17 the verdict was pronounced by Innocent IV, excommunicating Frederick and dethroning him on the grounds of perjury, sacrilege, heresy and felony.

All oaths of fealty sworn to him were pronounced null and void, and the German princes were commanded to proceed with the election of a new sovereign.

See J. D. Mansi, *Collectio conciliorum* (1759, etc.) tom. xxiii; C. G. Hefele, *Conciliengeschichte,* 2nd ed., vol. v, pp. 1,105–26 (1886); Fr. W. Schirrmacher, *Kaiser Friederich der Zweite* (Göttingen, 1859–65); A. Folz, *Kaiser Friedrich II. u. Papst Innocenz IV.* (Strasbourg, 1905).

The second Council of Lyons met from May 7 to July 17, 1274, under the presidency of Pope Gregory X. Its chief result was the regulation that future elections to the papacy should be held by the college of cardinals in conclave (*q.v.*). It is also important through the appearance of representatives of the eastern emperor Michael VIII, who acknowledged the supremacy of the pope over the eastern Church.

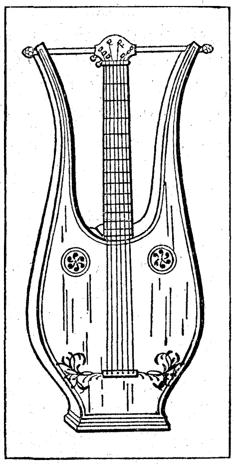
LYRA ("the Harp"), in astronomy, a constellation in the northern hemisphere. It contains Vega, the brightest star in the northern hemisphere and the fourth brightest star in the sky. The name Vega is a remnant of an Arabic phrase meaning "falling eagle"; Altair (in Aquila) is a similar remnant of "flying eagle." The star β Lyrae is an eclipsing variable with a period of 12.92 days; the system presents some abnormal features, perhaps owing to the very low densities of the two components. ϵ Lyrae is a double double; a binocular or even the unaided eye shows two stars which can only be loosely connected, and a small telescope resolves each of these into two components. The Ring nebula in Lyra (Messier 57) is the brightest example of this class of nebula.

LYRE, an ancient stringed musical instrument. The recitations of the Greeks were accompanied by it. Yet the lyre was not of Greek origin; no root in the language has been discovered for *λύρα,* although the special names bestowed upon varieties of the instrument are Hellenic. We have to seek in Asia the birthplace of the genus, and to infer its introduction into Greece through Thrace or Lydia. Notwithstanding the Hermes tradition of the invention of the lyre in Egypt, the Egyptians seem to have adopted it from Assyria or Babylonia.

The frame of the lyre consisted of a hollow body or sound-chest (*ἠχεῖον*). From this sound-chest were raised two arms (*πήχεις*), which were sometimes hollow and were bent both outward and forward. They were connected near the top by a cross-bar or yoke (*ζυγόν, ζύγωμα* or, from its having once been a reed, *κάλαμος*). Another crossbar (*μάλας, ὑπολύριον*), fixed on the sound-chest, formed the bridge which transmitted the vibrations of the strings. The deepest note was the farthest from the player; but, as the strings did not differ much in length more weight may have been gained for the deeper notes by thicker strings, as in the violin and similar modern instruments, or their tensions may have been slacker. The strings were of gut (*χορδή,* whence chord). They were stretched between the yoke and bridge, or to a tail-piece below the bridge. There were two ways of tuning, one was to fasten the strings to pegs which might be turned (*κόλλαβοι, κόλλοπες*); the other was to change the place of the string upon the crossbar; probably both expedients were simultaneously employed. The number of strings varied at different epochs, and possibly in different localities—four, seven and ten having been favourite numbers. They were used without a finger-board, no Greek description or representation having ever been met with that can be construed as referring to one. Nor was a bow possible, the flat sound-board being an insuperable impediment. The plectrum, however, was in constant use: it was held in the right hand to set the upper strings in vibration; at other times it hung from the lyre by a ribbon. The fingers of the left hand touched the lower strings (*ψάλλειν*).



FROM HENRY BODDINGTON, "CATALOGUE OF MUSICAL INSTRUMENTS"

THE CLASSICAL LYRE

With Greek authors the lyre has several distinct names; but it is difficult to connect these with anything like certainty with the different varieties of the instrument. Chelys (*χέλυς,* tortoise) may mean the smallest lyre, which, borne by one arm or supported by the knees, offered in the sound-chest a decided resemblance to that familiar animal. That there was a difference between lyre and cithara (*κιθάρα*) is certain, Plato and other writers separating them, while Hermes and Apollo had an altar at Olympia in common because the former had invented the lyre and the latter the cithara. Further, this difference has persisted ever since among the two distinct families of instruments descended from them. Thus in the lyre the sound-chest consisted of a vaulted back, in imitation of the tortoise, over which was directly glued a flat sound-board of wood or parchment. In the cithara (*q.v.*) the sound-chest was shallower, and the back and front were invariably connected by sides or ribs. These two methods of constructing the sound-chests of stringed instruments are essentially different; and to one or the other category every subsequent stringed instrument with a neck may be referred.

GREEK MUSE PLAYING THE LYRE

From a plaster cast modelled after an ancient bas-relief found in Icaria (Attica)

There is no evidence as to what the stringing of the Greek lyre was in the heroic age. Plutarch says that Olympus and Terpander used but three strings to accompany their recitation. As the four strings led to seven and eight by doubling the tetrachord, so the trichord is connected with the hexachord, or six-stringed lyre depicted on so many archaic vases. Before the Greek civilization had assumed its historic form, there was likely to have been great freedom and independence of different localities in the matter of lyre stringing. We may regard the Olympus scale, however, as consisting of two tetrachords, eliding one interval in each, for the tetrachord, or series of four notes, was very early adopted as the fundamental principle of Greek music, and its origin in the lyre itself appears sure. The basis of the tetrachord is the employment of the thumb and first three fingers of the left hand to twang as many strings, the little finger not being used on account of natural weakness. As a succession of three whole tones would form the disagreeable and untunable interval of a tritonus, two whole tones and a half-tone were tuned, fixing the tetrachord in the constant interval of the perfect fourth. This succession of four notes being in the grasp of the hand was called *συλλαβή,* just as in language a group of letters incapable of further reduction is called syllable. In the combination of two syllables or tetrachords the prototype of our modern diatonic scales resulted.

LYRE-BIRD, the name for Australian birds of the genus *Menura,* allied to the scrub-birds (*q.v.*). Somewhat smaller than a pheasant, the common species (*M. superba*) is remarkable for the three kinds of feathers composing the tail of the cock, giving the latter the appearance of an ancient lyre. It is very shy, inhabiting the thickest "bush." The cock displays on small hillocks, which he scratches up, and has a fine song. The food consists of insects, myriapods and snails. The nest is on or near the ground, closely woven of roots and fibres and lined with feathers. A single purplish-grey egg, blotched with purplish brown, is laid. The young bird is clad in dark down. *M. superba* inhabits New South Wales, south Queensland and Victoria. There are two other species, *M. victoriae,* having much the same range as the last, and *M. alberti,* which is more northerly. The plumage of all three is brown.

THE LYRE-BIRD (MENURA SUPERBA)

LYRICAL POETRY, a general term for all poetry which is, or can be supposed to be, susceptible of being sung to the accompaniment of a musical instrument. In the earliest times it may be said that all poetry was of its essence lyrical. The primaeval oracles were chanted in verse, and the Orphic and Bacchic Mysteries, which were celebrated at Eleusis and elsewhere, combined, it is certain, metre with music. Homer and Hesiod are each of them represented with a lyre, yet, if any poetry can be described as non-lyrical, it is surely the archaic hexameter of the *Iliad* and the *Erga.* These poems were styled epic, in direct contra-distinction to the lyric of Pindar and Bacchylides, but inexactly, since it is plain that they were recited, with a plain accompaniment on a stringed instrument. However, the distinction between epical and lyrical, between *τὰ ἔπη,* what was said, and *τὰ μέλη,* what was sung, is accepted, and neither Homer nor Hesiod is among the lyrists. It is, however, as Hegel insists, the personal thought, or passion, or inspiration, which gives its character to lyrical poetry, while the metrical form is also to be taken into consideration. Since, as a rule, the lyric is short, its lines attain unusual speed and direction. It may be said that the lyric is a direct, arrow-like flight, a spontaneous flash of emotion which makes its own music.

There was an early distinction, soon accentuated in Greece, between the poetry chanted by a choir of singers, and the song which expressed the sentiments of a single poet. The latter, the *μέλος* or song proper, had reached a height of technical perfection in "the Isles of Greece, where burning Sappho loved and sung," as early as the 7th century B.C. That poetess, and her contemporary Alcaeus, divide the laurels of the pure Greek song of Dorian inspiration. By their side, and later, flourished the great poets who set words to music for choirs, Alcman, Arion, Stesichorus, Simonides and Ibycus, who lead us at the close of the 5th century to Bacchylides and Pindar, in whom the tradition of the dithyrambic odes reached its highest splendour of development. The practice of Pindar and Sappho, we may say, has directed the course of lyrical poetry ever since, and will, unquestionably, continue to do so. They discovered how, with the maximum of art, to pour forth strains of personal magic and music, whether in a public or a private way. The ecstasy, the uplifted magnificence, of lyrical poetry could go no higher than it did in the unmatched harmonies of these old Greek poets, but it could fill a much wider field and be expressed with vastly greater variety. This was proved even in their own age. The gnomic verses of Theognis were certainly sung; so were the satires of Archilochus and the romantic reveries of Mimnermus.

At the Renaissance, when the traditions of ancient life were taken up eagerly, and hastily comprehended, it was thought proper to divide poetry into a diversity of classes. The earliest English critic who enters into a discussion of the laws of prosody, William Webbe, lays it down, in 1586, that in verse "the most usual kinds are four, the heroic, elegiac, iambic and lyric." Similar confusion of terms was common among the critics of the 15th and 16th centuries, and led to considerable error. It is plain that a border ballad is heroic, and may yet be lyrical; here the word "heroic" stands for "epic." It is plain that whether a poem is lyrical or not had nothing to do with the question whether it is composed in an "iambic" measure. Finally, it is undoubted that the early Greek "elegies" were sung to an accompaniment on the flute. Thus a poem may be heroic, iambic, or elegiac, and at the same time, in all senses of the word, lyrical.

More difficulty is met with in the case of the sonnet, for although no piece of verse, when it is inspired by subjective passion, fits more closely with Hegel's definition of what lyrical poetry should be, yet the rhythmical complication of the sonnet, and its rigorous uniformity, seem particularly ill-fitted to interpretation on a lyre. When F. M. degli Azzi put the book of Genesis (1700) into sonnets, and Isaac de Benserade the *Metamorphoses* of Ovid (1676) into rondeaux, these eccentric and laborious versifiers produced what was epical rather than lyrical poetry, if poetry it was at all. But the sonnet as Shakespeare, Wordsworth and even Petrarch used it was a cry from the heart, a subjective confession, and although there is perhaps no evidence that a sonnet was ever set to music with success, yet there is no reason why that might not be done without destroying its sonnet-character.

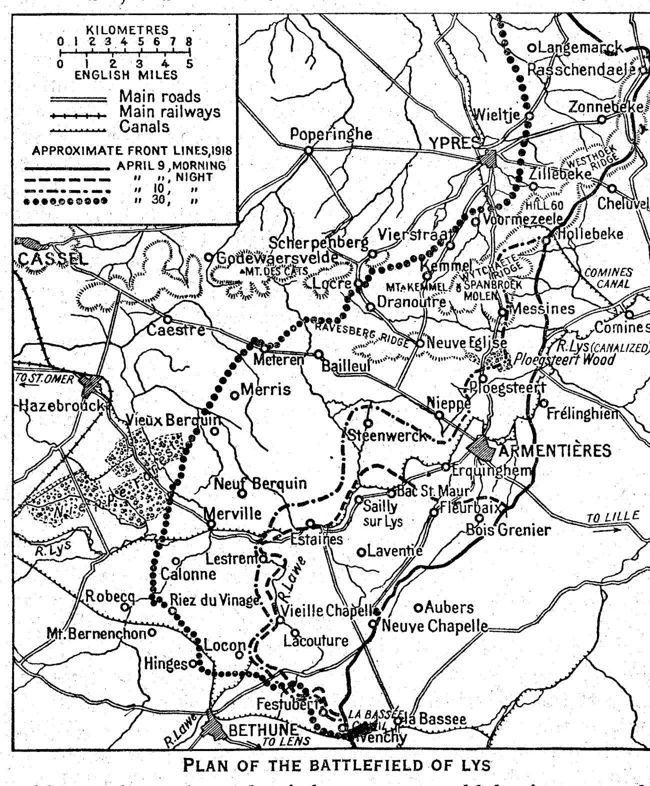
Jouffroy was perhaps the first aesthetician to see quite clearly that lyrical poetry is, really, nothing more than another name for poetry itself, that it includes all the personal and enthusiastic part of what lives and breathes in the art of verse, so that the divisions of pedantic criticism are of no real avail to us in its consideration. We recognize a narrative or epical poetry; we recognize drama; in both of these, when the individual inspiration is strong, there is much that trembles on the verge of the lyrical. But outside what is pure epic and pure drama, all, or almost all, is lyrical. Complexity of form, rhythmical and stanzaic, takes in most lyrics much of the place which was taken in antiquity by such music as Terpander is supposed to have supplied. In a perfect lyric by a modern writer the instrument is the metrical form, to which the words have to adapt themselves. There is perhaps no writer who has ever lived in whose work this phenomenon may be more fruitfully studied than it may be in the songs and lyrics of Shelley. The temper of such pieces as "Arethusa" and "The Cloud" is indicated by a form hardly more ambitious than a guitar; "Hellas" is full of passages which suggest the harp; in his songs Shelley touches the lute or viola da gamba, while in the great odes to the "West Wind" and to "Liberty" we listen to a verse-form which reminds us by its volume of the organ itself. On the whole subject of the nature of lyric poetry no commentary can be more useful to the student than an examination of the lyrics of Shelley in relation to those of the song-writers of ancient Greece.

See Hegel, *Die Phänomenologie des Geistes* (1807); T. S. Jouffroy, *Cours d'esthétique* (1843); W. Christ, *Metrik der Griechen und Römer* (2nd ed. 1879); John Drinkwater, *The Lyric* (1916).

LYS, BATTLE OF THE. In the general scheme of the great German offensive of 1918, the idea of breaking through the British-Portuguese front in French Flanders was considered by the German High Command. Although this scheme became secondary to the great offensive further south, the preparations for it were carried out, firstly in order to mislead the British and Allied headquarters, and secondly that the Germans might be able to revert quickly to it in case the Somme offensive should come to a standstill.

When on March 30 it became obvious that no further progress was possible in the southern battle area, the German Supreme Command decided to put into effect the Flanders attack, the preparations for which were nearly complete. Although they did not anticipate that they would be able to force a decision in this area, there were certain definite advantages to be obtained from a successful blow in the direction of St. Omer-Hazebrouck and the local situation favoured, in their opinion, the prospect of success. This was to be the second blow struck against the British army, a great proportion of which had already been employed on the southern front.

The abnormally dry weather gave good grounds for hope that the Lys valley would be practicable, a state of affairs which was not the case till much later in the spring in a normal year. The only lateral lines of communication in this sector of the British zone, other than the coast railway, ran through St. Pol-Lillers-Hazebrouck, and if the use of this could be denied to the British,



PLAN OF THE BATTLEFIELD OF LYS

problems of supply and reinforcement would be immeasurably complicated. It was above all important, in the view of the German Supreme Command, to retain the initiative, and to strike a second blow before the French could organize a counter-attack against the somewhat vulnerable southern flank of the salient which had been created by the success of the Somme offensive.

Plan of Attack.—The general plan of attack was that the main blow should be struck by Quast's VI. Army on the front between Armentières and the La Bassée canal, in the direction of Hazebrouck. If the VI. Army's attack met with sufficient success, the IV. Army under Arnim was to advance north of Armentières, which was to be made to fall by envelopment, with the eventual object of securing the heights stretching from Kemmel to Mt. des Cats, south of the Ypres-Poperinghe road. If this were achieved the British and Belgian positions in the Ypres salient and on the Yser would be threatened from the rear. The extension of the attack southwards was a secondary consideration, but it was hoped that at least the destruction of the important mining area south of Bethune might be achieved.

The forces available for the operation of the German VI. Army were four corps, from north to south, the Bavarian II. and German XIX., LV. and IV., to which were allotted nine divisions in the first line and five in corps reserve. Three more divisions were retained in army reserve. The subsidiary attack of the German IV. Army was to be delivered by the X. and XVIII. Res. Corps, with three divisions in the first and one in the second line.

The initial blow fell on the left of the I. and right of the II. British Armies, under Sir Henry Horne and Sir Herbert Plumer, the point of junction between which was, on April 9, the Lys, east of Armentières. The XI. Corps (British 55th and Portuguese 2nd Divs.) and the XV. Corps (40th and 34th Divs.) held the front from the La Bassée canal to the Lys, while the IX. Corps (25th, 19th and 9th Divs.) continued the line from the Lys to the Ypres-Comines canal. With the exception of the 55th, all these British divisions had already taken part in the southern battle and had been rapidly made up with reinforcements from home. Three more battle-worn divisions were in corps reserve. The 1st Portuguese division had been withdrawn from the line on April 5 and the 2nd was also to be relieved on April 9, but, pending their relief, it had taken over the whole corps sector.

The Battle Opens.—At about 4 A.M. on April 9 the battle opened with an intense bombardment of the whole front from Lens to Armentières, with both gas and high-explosive shell. The front trenches were subjected to a rain of high explosive, while battery positions, cross roads, headquarters and railheads far in rear were treated with both gas and high explosive. Armentières itself and the British position south of the La Bassée canal were deluged with mustard gas. The foggy morning made observation difficult, and, according to German accounts, the counter-bombardment was ineffective. Between 8 and 9 A.M. nine German divisions were launched against the two British and one Portuguese divisions. In the centre the weight of the attack of the German XIX. and LV. Corps overwhelmed the Portuguese 2nd Div., and both corps advanced steadily towards their objectives. The right of the Bavarian II. Corps was held firmly by the 40th Div., but the left of the Bavarians succeeded in advancing past the right flank of that division. On the British right the 55th Div. held stoutly on to Givenchy and north of that place withdrew slowly from the outpost position to the main line of resistance which ran just east of Festubert.

All available British reserves were hurried up; the reserve brigade of the 55th Div. was employed to form a defensive flank facing north, from Festubert to the Lawe. The 11th Cyclist Bn. and King Edward's Horse were rushed up to Lacouture and Vieille-Chapelle, and by their heroic resistance effectually prevented any extension of the break through to the south. The 51st and 50th Divs. were moved up from the back areas to the river Lawe and the neighbourhood of Estaires respectively. Meanwhile the 55th Div. continued to hold its position at Givenchy and Festubert throughout the day and in counter-attacks against elements of the enemy, which had penetrated into their position, captured over 750 prisoners. The magnificent fight put up by this division completely broke the attack of the Prussian IV. Corps.

On the northern flank of the battle, the Bavarian II. Corps succeeded eventually in occupying the forward posts of the right battalion of the 40th Div., and gradually worked their way northwards. By noon the division was forced back by pressure in front and flank to a position facing south from Bois Grenier through Fleurbaix to Sailly-sur-Lys. Owing to the rapid advance of the German centre the 50th Div. was unable to gain touch with the 40th, the right flank of which withdrew across the Lys at Bac St. Maur early in the afternoon. The remainder of this division, reinforced by troops of the 34th Div., successfully maintained their line covering the approaches to Erquinghem and Armentières from the south, till the evening.

The Saxon XIX. Corps had rapidly followed up the right of the 40th Div. and about 3 P.M. succeeded in passing small bodies of troops across the Lys at Bac St. Maur. During the night the Germans established themselves firmly on the north bank, in the gap between the 40th and 50th British Divisions.

On April 10 the attacks were renewed all along the line. Practically no progress was made by the IV. Corps on the left. It was only just before nightfall that the LV. Corps succeeded in gaining a footing on the west bank of the Lawe between Lestrem and Vieille-Chapelle. At Estaires the 50th Div. defended itself with great gallantry and inflicted very heavy casualties on the enemy in the street fighting which continued all day. It was only at nightfall that this division was forced to withdraw to a prepared position north and west of the town. East of Estaires the German Corps, which had now got up artillery in support of its infantry and machine guns, pushed back the thin British line to a position north of Steenwerck, where the arrival of reinforcements for a time effectually held up the German advance.

Extension of the Attack.—Meanwhile, after an intense preliminary bombardment of the British positions between Frélinghien and Hill 60 north of the Ypres-Comines canal, the German IV. Army about 5.30 A.M. attacked the British VIII. Corps. The outposts of the 25th and 19th Divs. were driven in and under cover of mist the German X. and XVIII. Res. Corps worked their way up the valleys of the Warnave and Douve rivers on the flanks of the British positions in Ploegsteert Wood and Messines. By midday the village of Ploegsteert, the south-east corner of the wood and Messines had been captured. During the afternoon the German attack succeeded in capturing the outpost position as far north as the Ypres-Comines canal, but was held up on the crest of the Wytschaete ridge and in front of Hollebeke by the 9th Division. The South African brigade of the same division retook Messines during the afternoon. This further success of the Germans, combined with the progress made by the right flank of the German VI. Army, gravely imperilled the situation of the 34th Div. which was holding the original line east of Armentières and had not been attacked. A withdrawal to the north bank of the Lys was therefore decided on, and was completed by 9:30 P.M. when the Lys bridges were destroyed.

On April 11 the attack was continued. The German IV. Corps again failed to make any progress between Givenchy and the Lawe river. North of Locon the British 51st and 50th Divs., weakened by continuous fighting, were slowly pushed back by the German LV. and XIX. Corps. The British divisions fought with the greatest gallantry, but bodies of German infantry worked their way through gaps in the attenuated line and by nightfall they had reached Neuf-Berquin and were in occupation of Merville. Further east progress was checked by a counter-attack of the 31st Div., which had arrived from the southern battlefield, but the Bavarian II. Corps pushed forward through Nieppe to Steenwerck. Slight progress was made by the German IV. Army between Nieppe and Messines.

Renewed Attacks.—During April 12 the arrival of reinforcements, mostly from the southern battle front, began to have its effect. The right flank of the British still held firm, but the German LV. Corps, attacking before dawn in the mist, broke through the left centre of the 51st Div., and reached Riez du Vinage, where their progress was checked by two batteries of artillery. The British 3rd Div. had come into action about Locon, which village was lost to the German LV. Corps, but the German advance was checked. The right flank of the same German Corps was checked in Calonne by the 61st Div., which, like the 3rd, had arrived from the Somme battle area.

Meantime the Bavarian II. and German XIX. Corps attacked between Vieux Berquin and Steenwerck. In spite of the gallant defence put up by the 29th and 31st Divs. they succeeded in forming a gap south-west of Bailleul, which enabled them to penetrate to and seize Merris. This gap was eventually blocked by a brigade of the 33rd Div. reinforced by a party of cyclists, a pioneer battalion and every available man from the local schools and reinforcement camps. Further north the 25th, 34th and 49th Divs. maintained their positions against all attacks.

During April 12 headquarters of Prince Rupert's group of armies issued orders for the continuance of the attack by the inner wings of the two armies, with the dual objectives of Hazebrouck and the range of hills north of Bailleul. The VI. Army was also to prepare to continue the pressure of their left wing towards Bethune. On April 13 the German attacks north of the Lys were continued with great vigour. On the left, elements of the LV. Corps, which had penetrated into the outskirts of the Nieppe forest, were driven back by the British 5th Div., which finally checked the German advance in this area. In the centre the German XIX. Corps continued to attack the 29th and 31st British Divs., now greatly diminished in strength by continuous fighting. Except at Vieux Berquin, which was captured by the Germans, who brought up guns to point blank range, those divisions carried out their instructions to hold their positions at all costs and cover the detrainment of the Australian 1st Division. The arrival of the Australians in the evening definitely closed the approach to Hazebrouck. Further north a succession of heavy attacks was repulsed.

Early on the morning of April 14 the British troops withdrew without interference to a new line in front of the Ravelsburg heights between Bailleul and Neuve Eglise. The latter village, after intense fighting all day, was finally captured by the Germans by midnight. Elsewhere all attacks were repulsed, and the British 4th Div., coming up, recaptured Riez Du Vinage. On April 15 the German attacks were renewed. By this time their troops had been reinforced by the Guard Res. Corps on the left wing of the IV. Army. The IX. Res. Corps had come in on the right of the IV. Corps, and the Bavarian III. Corps had replaced the Bavarian II. Corps. Heavy attacks developed during the day culminated in the capture of Bailleul and the Ravelsburg Ridge.

British Withdrawal.—On the night of April 15–16 a withdrawal of the British troops from the Ypres salient to a line east of Ypres through St. Julien and along the Westhoek and Wytschaete ridges was completed without interference. This move had been commenced on the night of the 12–13 by direction of British G.H.Q. in order to set free additional troops, and to forestall any plans the Germans might be entertaining for the extension of the battle front to the north. The withdrawal was well timed, as the Germans were preparing an offensive from the Houthulst forest, and the preparations were almost complete when the British withdrawal took place.

On April 16 strong local attacks were made at various points on the Meteren-Wytschaete front, all of which were repulsed by the 25th, 34th and 49th Divs., except on the extreme flanks, where both villages, after intense fighting, eventually fell into German hands. On the following day determined efforts to take Mt. Kemmel and to advance on the Meteren-Merris front were repulsed, and the Belgian army achieved a notable success in defeating a powerful assault against their right flank about the Ypres-Staden railway.

Meantime the Germans had been preparing to renew the attack on the British right flank, and on the 18th, after a very intense bombardment, the IV. and IX. Res. Corps advanced to the assault of the British positions about Givenchy-Festubert and Mt. Bernenchon-Hinges. On the British right they penetrated at certain points, but were thrown back by the 1st Div. which had relieved the 55th. Everywhere else they failed to obtain even an initial success. For nearly a week the battle died down. In the left centre of the British front French troops, which had been brought up from the south, relieved some of the wearied British divisions, and by the morning of the 21st had taken over the sector between Meteren and Spanbroekmolen.

New German Plan.—During this pause the German Higher Command readjusted their plan. On the 18th the Army Group suggested that the main operations should be abandoned, and it was finally decided on the 20th that further operations should be limited to the capture of Mt. Kemmel on the north, and the villages of Givenchy and Festubert on the south. No success whatever was obtained on the southern flank, but the attacks about Mt. Kemmel led to further bitter fighting.

At 3.30 A.M. on April 25 an intense bombardment was opened on the French and British positions extending from Bailleul to the Ypres-Comines canal. The main object of the attack was the capture of Kemmel hill by direct assault on the French, combined with an attack on the British right south of Wytschaete, intended to separate it from the French. The attack was entrusted to the XVIII. Res., Alpine and X. Res. Corps, to which were allotted nine divisions, five of which were fresh. Between 6 and 7 A.M. the German infantry advanced, supported by large numbers of squadrons of battle planes and bombers. After intense fighting they succeeded by 10 A.M. in wresting Kemmel hill and village from the French, detachments of whom, however, though surrounded, held out till late in the day. The weight of the initial attack on the British front fell on the 9th Div., who inflicted very heavy casualties on their enemy but by midday were forced back to Vierstraat. Further north the 21st Div., after a gallant resistance, was in the afternoon compelled to withdraw to a line Hill 60-Vormezeele.

On April 26, 27 and 28 local fighting continued without substantial alteration in the situation. During the night of April 26–27 the salient east of Ypres was further reduced by a withdrawal without interference to the line Pilkem-Zillebeke-Lake-Voormezeele.

The German final effort took place on April 29. The action started with a bombardment of exceptional intensity at 3.10 A.M. At 5 A.M. powerful attacks commenced against the French and British troops from west of Dranoutre to Voormezeele. After very heavy fighting the Germans gained a temporary success north of Locre, but were driven back by the French troops holding the sector. On the British front the positions held by the 21st, 49th and 25th Divs. were again and again attacked unavailingly by German infantry.

Results of the Battle.—Thus ended the battle of the Lys. The second great German offensive had succeeded in penetrating the British front on a front of about 20 m. to an extreme depth of about 12 miles. A large number of towns and villages had been taken and nearly 30,000 Allied prisoners and 450 guns had been captured. But the attack had failed to gain its main objects. The lateral railway communication between St. Pol and Hazebrouck was still intact. Except for the detached hill of Kemmel, the high ground dominating the Poperinghe-Ypres road still remained in Allied hands. A pronounced salient had been formed in the German front which was to cost them dear in the succeeding months. On the other hand, the British had been forced to abandon the almost equally pronounced salient east of Ypres, and with it all the ground which had been gained at so great a cost in the battle of Passchendaele the previous year. The losses on both sides had been very heavy. To achieve these results the Germans had employed 42 divisions, of which 33 were fresh; 25 British divisions were employed, of which only eight had not been engaged in the battle of the Somme.

LYSANDER (Gr. *Λύσανδρος*), son of Aristocritus, Spartan admiral and diplomatist. Aelian (*Var. Hist.* xii. 43) and Phylarchus (*ap.* Athen. vi. 271 e) say that he was a *mothax, i.e.,* the son of a helot mother (*see* HELOTS), but this tradition is at least doubtful; according to Plutarch he was a Heraclid, though not of either royal family. He first appears as admiral of the Spartan navy in 407 B.C. The story of his influence with Cyrus the younger, his naval victory off Notium, his quarrel with his successor Callicratidas in 406, his appointment as ἐπιστολεύς in 405, his decisive victory at Aegospotami, and his share in the siege and capitulation of Athens belong to the history of the Peloponnesian War (*q.v.*). By 404 he was the most powerful man in the Greek world and set about completing the task of building up a Spartan empire in which he should be supreme in fact if not in name. Everywhere democracies were replaced by oligarchies, directed by bodies of ten men (δεκαρχίαι) under the control of Spartan governors (harmosts, ἁρμοσταί).

But Lysander's boundless influence and ambition, and the superhuman honours paid him, roused the jealousy of the kings and the ephors, and, on being accused by the Persian satrap Pharnabazus, he was recalled to Sparta. Soon afterwards he was sent to Athens with an army to aid the oligarchs and established the Council of Thirty on the same model as the other oligarchies he had set up throughout Greece; but Pausanias, one of the kings, followed him and brought about a restoration of democracy. On the death of Agis II., Lysander secured the succession of Agesilaus (*q.v.*), whom he hoped to find amenable to his influence. But in this he was disappointed. Though chosen to accompany the king to Asia as one of his 30 advisers (σύμβουλοι), he was kept inactive and his influence was broken by studied affronts, and finally he was sent at his own request as envoy to the Hellespont. He soon returned to Sparta to mature plans for overthrowing the hereditary kingship and substituting an elective monarchy open to all Heraclids, or even, according to another version, to all Spartiates. But his alleged attempts to bribe the oracles were fruitless, and his schemes were cut short by the outbreak of war with Thebes in 395. Lysander invaded Boeotia from the west, receiving the submission of Orchomenus and sacking Lebadea, but the enemy intercepted his despatch to Pausanias, who had meanwhile entered Boeotia from the south, containing plans for a joint attack upon Haliartus. The town was at once strongly garrisoned, and when Lysander marched against it he was defeated and slain. He was buried in the territory of Panopeus, the nearest Phocian city.

An able commander and an adroit diplomatist, Lysander was fired by the ambition to make Sparta supreme in Greece and himself in Sparta. To this end he shrank from no treachery or cruelty; yet, like Agesilaus, he was totally free from the characteristic Spartan vice of avarice, and died, as he had lived, a poor man.

LYSANIAS, tetrarch of Abilene (*see* ABILA) in the time of John the Baptist (Luke iii. 1). The only Lysanias mentioned in profane history as exercising authority in this district was executed in 36 B.C. by Mark Antony. He was the son of Ptolemy Mennaeus, the ruler of an independent state, of which Abilene formed only a small portion. According to Josephus (*Ant.* xix. 5, 1) the emperor Claudius in A.D. 42 confirmed Agrippa I. in the possession of "Abila of Lysanias" already bestowed upon him by Caligula. It is argued that this cannot refer to the Lysanias executed by Mark Antony, since his paternal inheritance must have been of far greater extent. It is therefore assumed by some authorities that the Lysanias in Luke (A.D. 28–29) is a younger Lysanias, tetrarch of Abilene only, one of the districts into which the original kingdom was split up after the death of Lysanias I. This younger Lysanias may have been a son of the latter, and identical with, or the father of, the Claudian Lysanias. On the other hand, Josephus knows nothing of a younger Lysanias, and it is suggested by others that he really does refer to Lysanias I.

LYSIAS (459?–380? B.C.), Attic orator, was born, according to Dionysius of Halicarnassus and the author of the life ascribed to Plutarch, in 459 B.C., a date obtained from the founding of Thurii in 444 B.C.; tradition says that Lysias went there at the age of 15. Cephalus, his father, was a native of Syracuse, and on the invitation of Pericles had settled at Athens. The opening scene of Plato's *Republic* is laid at the house of his eldest son, Polemarchus, in Peiraeus. The family were obviously well known to Plato.

At Thurii, a new foundation on the Tarentine gulf, Lysias began his studies in rhetoric under Tisias, according to tradition. The destruction of the Athenian expedition in 413 led to an anti-Athenian outburst, and the expulsion of Lysias and Polemarchus, who returned to Athens. There they settled as favoured aliens (ἰσοτελεῖς), Polemarchus in Athens itself and Lysias in Peiraeus, near their shield factory, a large concern employing 120 slaves. The attack of the Thirty Tyrants on the resident aliens in 404 was fatal to Polemarchus, and Lysias only just escaped from imprisonment by a large bribe. He took refuge in Megara; from there he gave assistance to the exiles, and in the restoration in 403 Thrasybulus moved to bestow the citizenship on him, a measure defeated on a technical objection. The recent disturbances had probably reduced Lysias to comparative poverty, and the rest of his life was spent in composing speeches for the law courts. Little is known of his personal life. He made his only personal appearance in 403, when he indicted Eratosthenes, one of the Tyrants. There is a tradition that he delivered his own *Olympiacus* at the festival of 388, to which Dionysius of Syracuse had sent a magnificent embassy. The speech is an appeal to Greece to deliver Sicily from Dionysius' tyranny. The latest speech we can date (*For Pherenicus*) belongs to 381 or 380. Lysias probably died in or soon after 380 B.C.

Lysias was a man of kindly and genial nature, warm in friendship, loyal to country, with a keen perception of character, and a fine though strictly controlled sense of humour. The literary tact which is so remarkable in the extant speeches is that of a singularly flexible intelligence, always obedient to an instinct of gracefulness. He owes his distinctive place to the power of concealing his art. It was obviously desirable that a speech written for delivery by a client should be suitable to his age, station and circumstances. Lysias was the first to make this adaptation really artistic. His skill can be best appreciated if we turn from the easy flow of his graceful language to the majestic emphasis of Antiphon, or to the self-revealing art of Isaeus. Translated into terms of ancient criticism, he became the model of the "plain style" (ἰσχνὸς χαρακτήρ, *genus tenue*). Greek rhetoric began in the "grand" style; then Lysias set an exquisite pattern of the "plain"; and Demosthenes might be considered as having effected an almost ideal compromise.

The vocabulary of Lysias is pure and simple. Most of the rhetorical "figures" are sparingly used—except such as consist in the parallelism or opposition of clauses, due to the still surviving influence of the Sicilian school. Lysias excels in vivid description; he has also a happy knack of marking the speaker's character by light touches. He has equal command over the "periodic" style (κατεστραμμένη λέξις) and the non-periodic or "continuous" (εἰρομένη, διαλελυμένη). His disposition of his subject-matter is always simple. The speech has usually four parts—introduction (προοίμιον), narrative of facts (διήγησις), proofs (πίστεις) and conclusion (ἐπίλογος). It is in the introduction and the narrative that Lysias is seen at his best. In his greatest extant speech —that *Against Eratosthenes*—and also in the fragmentary *Olympiacus,* he has pathos and fire; but these were not characteristic qualities of his work. In Cicero's estimate of the various Greek orators (*De Orat.* iii. 7, 28) the quality in which Lysias is supreme is *subtilitas* (refinement). Nor was it oratory alone to which Lysias rendered service; his work had an important effect on all subsequent Greek prose, by showing how perfect elegance could be joined to plainness. And his style has an additional charm for modern readers, because it is employed in describing scenes from the everyday life of Athens.

In literary and historical interest, the first place among his extant speeches belongs to that *Against Eratosthenes* (403 B.C.), one of the Thirty Tyrants, whom Lysias arraigns as the murderer of his brother Polemarchus. The speech is an eloquent and vivid picture of the reign of terror which the Thirty established at Athens; the concluding appeal, to both parties among the citizens, is specially powerful. Next in importance is the speech *Against Agoratus* (399 B.C.), one of our chief authorities for the internal history of Athens during the months which immediately followed the defeat at Aegospotami. The *Olympiacus* (388 B.C.) is a brilliant fragment, expressing the spirit of the festival at Olympia, and exhorting Greeks to unite against their common foes. The *Plea for the Constitution* (403 B.C.) is interesting for the manner in which it argues that the wellbeing of Athens—now stripped of empire—is bound up with the maintenance of democratic principles. The speech *For Mantitheus* (392 B.C.) is a graceful and animated portrait of a young Athenian ἱππεύς, making a spirited defence of his honour against the charge of disloyalty. The defence *For the Invalid* is a humorous character-sketch. The speech *Against Pancleon* illustrates the intimate relations between Athens and Plataea, while it gives us some picturesque glimpses of Athenian town life. The defence of the person who had been charged with destroying a *moria,* or sacred olive, places us amidst the country life of Attica. And the speech *Against Theomnestus* deserves attention for its curious evidence of the way in which the ordinary vocabulary of Athens had changed between 600 and 400 B.C.

Thirty-four speeches (three fragmentary) have come down under the name of Lysias; 127 more, now lost, are known from smaller fragments or from titles. The ἐρωτικός in Plato's *Phaedrus,* pp. 230 E-234 has generally been regarded as Plato's own work; however, the certainty of this conclusion will be doubted by those who observe (1) the elaborate preparations made in the dialogue for a recital of the ἐρωτικός which shall be *verbally exact* and (2) the closeness of the criticism made upon it. If the satirist were merely analysing his own composition, such criticism would have little point. Lysias is the earliest writer who is known to have composed ἐρωτικοί; it is as representing both rhetoric and a false ἔρως that he is the object of attack in the *Phaedrus.*

All mss. of Lysias yet collated have been derived, as H. Sauppe first showed, from the Codex Palatinus X. (Heidelberg). The next most valuable ms. is the Laurentianus C (15th century), which I. Bekker chiefly followed. Speaking generally, we may say that these two mss. are the only two which carry much weight where the text is seriously corrupt. In *Oratt.* i.–ix. Bekker occasionally consulted 11 other mss., most of which contain only the above nine speeches: viz., Marciani F, G, I, K (Venice); Laurentiani D, E (Florence); Vaticani M, N; Parisini U, V; Urbinas O.

Editio princeps, Aldus (Venice, 1513); by I. Bekker (1823) and W. S. Dobson (1828) in *Oratores Attici;* C. Scheibe (1852) and T. Thalheim (1901, Teubner series, bibl.); C. G. Cobet (4th ed., by J. J. Hartman, 1905); with variorum notes, by J. J. Reiske (1772). Editions of select speeches by J. H. Bremi (1845); R. Rauchenstein (1848, revised by C. Fuhr, 1880–81); H. Frohberger (1866–71); H. van Herwerden (1863); A. Weidner (1888); E. S. Shuckburgh (1882); A. Westermann and W. Binder (1887–90); G. P. Bristol (1892), M. H. Morgan (1895), C. D. Adams (1905), all three published in America. There is a special lexicon to Lysias by D. H. Holmes (Bonn, 1895). *See* also Jebb, *Attic Orators* (1893) and *Selections from the Attic Orators* (2nd ed., 1888) and F. Blass, *Die Attische Beredsamkeit* (2nd ed., 1887–98); W. L. Devries, *Ethopoiia. A rhetorical study of the types of character in the orations of Lysias* (Baltimore, 1892). (R. C. J.; X.)

LYSIMACHUS (*c.* 355–281 B.C.), Macedonian general, son of Agathocles, was a citizen of Pella in Macedonia. During Alexander's Persian campaigns he was one of his immediate bodyguard and distinguished himself in India. After Alexander's death he was appointed to the government of Thrace and the Chersonese. For a long time he was chiefly occupied with fighting against the Odrysian king Seuthes. In 315 he joined Cassander, Ptolemy and Seleucus against Antigonus, who, however, diverted his attention by stirring up Thracian and Scythian tribes against him. In 309, he founded Lysimachia in a commanding situation on the neck connecting the Chersonese with the mainland. He followed the example of Antigonus in taking the title of king. In 302 when the second alliance between Cassander, Ptolemy and Seleucus was made, Lysimachus, reinforced by troops from Cassander, entered Asia Minor, where he met with little resistance. On the approach of Antigonus he retired into winter quarters near Heraclea, marrying its widowed queen Amastris, a Persian princess. Seleucus joined him in 301, and at the battle of Ipsus Antigonus was slain. His dominions were divided among the victors, Lysimachus receiving the greater part of Asia Minor.

Feeling that Seleucus was becoming dangerously great, he now allied himself with Ptolemy, marrying his daughter Arsinoë. Amastris, who had divorced herself from him, returned to Heraclea. When Antigonus's son Demetrius renewed hostilities (297), during his absence in Greece, Lysimachus seized his towns in Asia Minor, but in 294 concluded a peace whereby Demetrius was recognized as ruler of Macedonia. He tried to carry his power beyond the Danube, but was defeated and taken prisoner by the Getae, who, however, set him free on amicable terms. In 288 Lysimachus and Pyrrhus invaded Macedonia, and drove Demetrius out of the country. Pyrrhus was at first allowed to remain in possession of Macedonia with the title of king, but in 285 he was expelled by Lysimachus.

Domestic troubles embittered the last years of Lysimachus's life. Amastris had been murdered by her two sons; Lysimachus treacherously put them to death. On his return Arsinoë asked the gift of Heraclea, and he granted her request, though he had promised to free the city. In 284 Arsinoë, desirous of gaining the succession for her sons in preference to Agathocles (the eldest son of Lysimachus), intrigued against him with the help of her brother Ptolemy Ceraunus; they accused him of conspiring with Seleucus to seize the throne, and he was put to death. This atrocious deed of Lysimachus aroused great indignation. Many of the cities of Asia revolted, and his most trusted friends deserted him. The widow of Agathocles fled to Seleucus, who at once invaded the territory of Lysimachus in Asia. Lysimachus crossed the Hellespont, and in 281 a decisive battle took place at the plain of Corus (Corupedion) in Lydia. Lysimachus was killed; after some days his body, watched by a faithful dog, was found on the field, and given up to his son Alexander, by whom it was interred at Lysimachia.

LYSIPPUS, Greek sculptor, was head of the school of Argos and Sicyon in the time of Philip and Alexander of Macedon. He worked only in bronze. His works are said to have numbered 1,500, some of them colossal. He modified the canon of Polycleitus towards a slenderer type, and introduced an element of impressionism. Pliny (*N.H.* 34, 61) and other writers mention many of his statues. Among the gods he seems to have produced new and striking types of Zeus (probably of the Otricoli class), of Poseidon (compare the Poseidon of the Lateran, standing with raised foot), of the Sun-god and others. He made several statues of Hercules, stressing the motif of weariness exemplified in the later Farnese Hercules. Lysippus made many statues of Alexander the Great, and he became the court sculptor of the king, from whom and from whose generals he received many commissions. The extant portraits of Alexander vary greatly, and it is impossible to determine which among them go back to Lysippus. The remarkable head from Alexandria (*see* GREEK ART) has as good a claim as any.

As head of the great athletic school of the Peloponnese Lysippus naturally sculptured many athletes; a figure by him of a man scraping himself with a strigil was a great favourite of the Romans in the time of Tiberius (Pliny, *N.H.* 34, 61); and this has been usually regarded as the original copied in the Apoxyomenus of the Vatican (*see* GREEK ART). (P. G.)

See Collignon, *Lysippe* (Paris, 1905); P. Gardner, in *Jour. Hell. St.* (1905).

LYSIS OF TARENTUM (d. *c.* 390 B.C.), Greek philosopher. The friend and companion of Pythagoras, he has been credited with many of the works usually attributed to Pythagoras himself. Diogenes Laertius viii. 6 gives him three, and Mullach even assigns to him the *Golden Verses.* But it is generally held that these verses are a collection of lines by many authors.

LYSISTRATUS, a Greek sculptor of the 4th century B.C., brother of Lysippus of Sicyon. We are told by Pliny (*Nat. Hist.* 35, 153) that he followed a strongly realistic line, being the first sculptor to take impressions of human faces in plaster.

LYTE, HENRY FRANCIS (1793–1847), English divine and hymn-writer, was born near Kelso on June 1, 1793, and was educated at Enniskillen school and at Trinity college, Dublin. He took orders in 1815, and eventually settled, in 1823, in the parish of Brixham. He died at Nice on Nov. 20, 1847.

Lyte is remembered for his *Poems. chiefly Religious* (1833) and

The Spirit of the Psalms (1834). His best known hymns are "Abide with me!"; "Jesus, I my cross have taken"; "Praise, my soul, the King of Heaven." *See* his *Remains* (1850) with memoir.

LYTHAM ST. ANNES, a municipal borough and watering place in the parliamentary borough of Blackpool, Lancashire, England, on N. of Ribble estuary, $13\frac{1}{2}$ mi. west of Preston on the L.M.S.R. Pop. (est. 1938) 25,540. Area, 9.07 sq.mi. There are five public parks and an extensive promenade. The town was incorporated in 1922. A Benedictine cell was founded at Lytham in the 12th century, by Richard FitzRoger, lord of the manor.

LYTTELTON, ALFRED (1857–1913), British politician, was born Feb. 7, 1857, the youngest child and eighth son of the 4th Lord Lyttelton. His mother, daughter of Sir Stephen Glynne and sister of Mrs. W. E. Gladstone, died six months after his birth. All the eight boys were brought up to be keen cricketers, the cricket ground at Hagley, Worcs., their home, being close to the house; all went to Eton, and six were in the Eton eleven.

Alfred was the most famous cricketer of them all. Indeed for nearly all ball games he had an extraordinary aptitude. He excelled in football of three kinds, and in fives, racquets and especially tennis—holding the amateur championship for tennis from 1882 to 1896. At cricket he was equally good as a bat and as a wicket keeper. He went to Trinity college, Cambridge, and was called to the bar in 1881. In 1895 he became M.P. for Warwick and Leamington as a Liberal Unionist, retaining the seat till 1906, when he was defeated. After a few months' interval, he was returned for a London constituency, St. George's, Hanover Square.

He was appointed, in 1900, chairman of a commission to enquire into the various concessions which President Kruger and the Volksraad had granted in the Transvaal. In pursuance of the investigation he spent the autumn of 1900 in South Africa, and Lord Milner hoped to secure him as his successor. But it was as Colonial Secretary, in the Conservative Government of Balfour, in 1903, that his South African experience was utilised. He incurred much odium by sanctioning the scheme for importing Chinese coolies into South Africa in order to remedy the shortage of native labour and to restart the mines and thereby the whole economic machinery of South Africa.

He died on July 5, 1913, after an injury in a local cricket match.

See E. S. Lyttelton, *Alfred Lyttelton* (1923).

LYTTELTON, GEORGE LYTTELTON, 1ST BARON (1709–1773), English statesman and man of letters, born at Hagley, Worcestershire, was a descendant of the great jurist Sir Thomas Littleton (*q.v.*). He was the eldest son of Sir Thomas Lyttelton, 4th bart., (d. 1751). Lyttelton was educated at Eton and Oxford, and in 1728 set out on the grand tour, spending considerable periods at Paris and Rome. On his return to England he sat in parliament for Okehampton, Devonshire. From 1744 to 1754 he held the office of a lord commissioner of the treasury. In 1755 he succeeded Legge as chancellor of the exchequer, but in 1756 he quitted office, being raised to the peerage as Baron Lyttelton, of Frankley, in the county of Worcester. In the political crisis of 1765, before the formation of the Rockingham administration, it was suggested that he might be placed at the head of the treasury, but he declined. The closing years of his life were devoted chiefly to literary pursuits. He died on Aug. 22, 1773.

His *Works* were published by his nephew, G. E. Ayscough, in 1774. *See* Sir R. Phillimore's *Memoirs and Correspondence of Lord Lyttelton* (2 vols., 1845).

LYTTELTON, a borough of New Zealand, the port of Christchurch on the east coast of South Island, on an inlet on the north-western side of Banks Peninsula. Pop. (1936) 3,264. It is surrounded by abrupt hills rising to 1,600 ft., through which a railway communicates with Christchurch (8 m. north-west) by a tunnel $1\frac{3}{4}$ m. long. Great breakwaters protect the inner harbour, which has an area of 105 ac., with a low-tide depth of 20 to 33 feet. There is a graving dock accessible for vessels of 462 ft.×54 ft. beam. The produce of the rich agricultural district of Canterbury is exported, frozen or preserved. Lyttelton was the original settlement in this district (1850).

LYTTON, EDWARD GEORGE EARLE LYTTON, BULWER-LYTTON, 1ST BARON (1803–1873), English novelist and politician, the youngest son of General William Earle Bulwer of Heydon Hall and Wood Dalling, Norfolk, was born in London on May 25, 1803. He had two brothers, William (1799–1877) and Henry (1801–72), afterwards Lord Dalling (*q.v.*). Bulwer's father died when the boy was four years old. His mother, Elizabeth Barbara, daughter of Richard Warburton Lytton of Knebworth, Hertfordshire, after her husband's death settled in London. Bulwer was educated at private schools and at Trinity college and Trinity hall, Cambridge. Before he went to Cambridge he had published a volume of verse, and had fallen in love. The lady married another, to Bulwer's lasting grief. After leaving Cambridge he published some volumes of juvenilia which he afterward ignored.

Meanwhile he had begun to take his place in society, being already known as a dandy of considerable pretensions, who had acted as second in a duel and experienced the fashionable round of flirtation and intrigue. He purchased a commission in the army, only to sell it again without undergoing any service, and in Aug. 1827 married, in opposition to his mother's wishes, Rosina Doyle Wheeler (1802–82), an Irish beauty, niece and adopted daughter of General Sir John Doyle. She was a brilliant but passionate girl, and upon his marriage with her, Bulwer's mother withdrew the allowance she had hitherto made him. In the year of his marriage he published *Falkland,* and in 1828 *Pelham,* a novel for which he had gathered material during a visit to Paris in 1825. This intimate study of the dandyism of the age, was immediately popular, and gossip was busy in identifying the characters of the romance with the leading men of the time. In the same year he published *The Disowned,* following it up with *Devereux* (1829), *Paul Clifford* (1830), *Eugene Aram* (1832) and *Godolphin* (1833). All these novels were designed with a didactic purpose, somewhat upon the German model. To embody the leading features of a period, to show how a criminal may be reformed by the development of his own character, to explain the secrets of failure and success in life, these were the avowed objects of his art. Meanwhile he became a follower of Bentham, and in 1831 was elected member for St. Ives, Huntingdon. In 1836 he and his wife were legally separated. Three years later his wife published a novel called *Cheveley, or the Man of Honour,* in which Bulwer was bitterly caricatured, and in June 1858, when her husband was standing as parliamentary candidate for Hertfordshire, she appeared at the hustings and indignantly denounced him. She was placed under restraint as insane, but liberated a few weeks later. For years she continued her attacks upon her husband's character, and outlived him by nine years, dying at Upper Sydenham in March 1882.

After representing St. Ives, Bulwer was returned for Lincoln in 1832, and sat in parliament for that city for nine years. He spoke in favour of the Reform Bill, and secured the reduction of the newspaper stamp duties. His pamphlet, issued when the Whigs were dismissed from office in 1834, entitled "A Letter to a Late Cabinet Minister on the Crisis," led to an offer from Lord Melbourne of a lordship of the Admiralty, which he declined. He continued to write indefatigably. *Godolphin* was followed by *The Pilgrims of the Rhine* (1834), *The Last Days of Pompeii* (1834), and *Rienzi* (1835). These books were received with enthusiasm, and *Ernest Maltravers* (1837) and *Alice, or the Mysteries* (1838) were hardly less successful. In 1831 he became editor of the *New Monthly,* which, however, he resigned in the following year, but in 1841, the year in which he published *Night and Morning,* he started the *Monthly Chronicle,* a semi-scientific magazine, for which he wrote *Zicci,* an unfinished first draft afterwards expanded into *Zanoni* (1842). Simultaneously he was writing plays. In 1838 he produced *The Lady of Lyons,* a play which Macready made a great success at Covent Garden: in 1839 *Richelieu* and *The Sea Captain,* and in 1840 *Money.* All, except *The Sea Captain,* were successful, and this solitary failure he revived in 1869 under the title of *The Rightful Heir.* Of the others it may be said that, though they abound in examples of strained sentiment and false taste, they have nevertheless a certain theatrical *flair,* which has enabled them to survive a whole library of stage literature of greater sincerity and truer feeling. *The Lady of Lyons* and *Money* have long held the stage, and the latter has provided a good part for many comedians.

In 1838 Bulwer was created a baronet, and on succeeding to the Knebworth estate in 1843 added Lytton to his surname, under the terms of his mother's will. From 1841 to 1852 he had no seat in parliament, and spent much of his time in continental travel. His later historical romances are *The Last of the Barons* (1843), *Lucretia, or the Children of the Night* (1847), and *Harold, the last of the Saxon Kings* (1848). In the intervals between these he had produced a volume of poems in 1842, another of translations from Schiller in 1844, and a satire called *The New Timon* in 1846, in which Tennyson, who had just received a civil list pension, was bitterly lampooned. His most ambitious work in metre, a romantic epic entitled *King Arthur,* had no success. His best work in the novel was still to come. His historical novels are much better than it has been the fashion to think. In *The Caxtons* (1849) he turned to English society, and in *My Novel* (1853) and *Kenelm Chillingly* (1873) he gave an unrivalled picture of English society in the mid-Victorian era. Other late works are *A Strange Story* (1862), *The Coming Race* (1871) and *The Parisians* (1873).

In 1852 he entered the political field anew, and in the Conservative interest. He had differed from the policy of Lord John Russell over the corn laws, and now separated finally from the Liberals. He stood for Hertfordshire and was elected, holding the seat till 1866, when he was raised to the peerage as Baron Lytton of Knebworth. His eloquence gave him the ear of the House of Commons, and he often spoke with influence and authority. In 1858 he was appointed secretary for the colonies. In the House of Lords he was comparatively inactive.

See T. H. S. Escott, *Edward Bulwer, 1st Baron Lytton of Knebworth* (1910).

LYTTON, EDWARD ROBERT BULWER-LYTTON, 1ST EARL OF (1831–1891), English diplomatist and poet, was the only son of the 1st Baron Lytton. He was born in Hertford street, Mayfair, on Nov. 8, 1831. Robert Lytton went to Harrow in 1845, and then spent a year at Bonn with an English tutor. In 1850 he entered the diplomatic service as unpaid *attaché* to his uncle, Sir Henry Bulwer, who was then minister at Washington. His advance in the diplomatic service was continuous, his successive appointments being: as second secretary—1852, Florence; 1854, Paris; 1857, The Hague; 1859, Vienna; as first secretary or secretary of legation—1863, Copenhagen; 1864, Athens; 1865, Lisbon; 1868, Madrid; 1868, Vienna; 1873, Paris; as minister—1875, Lisbon. In 1887 he was appointed to succeed Lord Lyons as ambassador at Paris, and held that office until his death in 1891. In 1864, immediately before taking up his appointment at Athens, he married Edith, daughter of Edward Villiers, brother of the earl of Clarendon, and in 1873, upon the death of his father, he succeeded to the peerage and the estate of Knebworth in Hertfordshire.

Early in 1875 Lord Lytton declined an offer of appointment as governor of Madras, and in November of that year, at a critical moment, he was nominated governor-general of India by Disraeli. In Central Asia the advance of Russia had continued so steadily and so rapidly that Shere Ali, the amir of Afghanistan, had determined to seek safety as the vassal of the tsar. Lytton went out to India with express instructions from the British Government to recover the friendship of the amir if possible, and if not so to arrange matters on the north-west frontier as to be able to be indifferent to his hostility. For 18 months Lytton and his council made every effort to conciliate the friendship of the amir, but a Russian agent was established at Kabul, while the mission of Sir Neville Chamberlain was forcibly denied entrance into the amir's dominions. War began in Nov. 1878, and by the close of that year the forces prepared by Lytton for that purpose had achieved their task with extraordinary accuracy and economy. Shere Ali fled from Kabul, and once more it fell to the Indian Government to make provision for the future of Afghanistan. By the treaty of Gandamak in May 1879 Yakub Khan, a son of Shere Ali, was recognized as amir, the main conditions agreed upon being that the districts of Kuram, Pishin and Sibi should be "assigned" to British administration, and the Khyber and other passes be under British control; that there should be a permanent British Resident at Kabul, and that the amir should be subsidized in an amount to be afterwards determined upon. Considerable risk was run in trusting so much, and especially the safety of a British envoy, to the power and the goodwill of Yakub Khan. Sir Louis Cavagnari, the British envoy entered Kabul at the end of July, and was, with his staff, massacred in the rising which took place on Sept. 3. The war of 1879–80 immediately began, with the occupation of Kandahar by Stewart and the advance upon Kabul by Roberts, and the military operations which followed were not concluded when Lytton resigned his office in April 1880. (*See* INDIA: *History.*) Lytton resigned at the same time as the Beaconsfield Ministry, and his Afghan policy was revised by his successor.

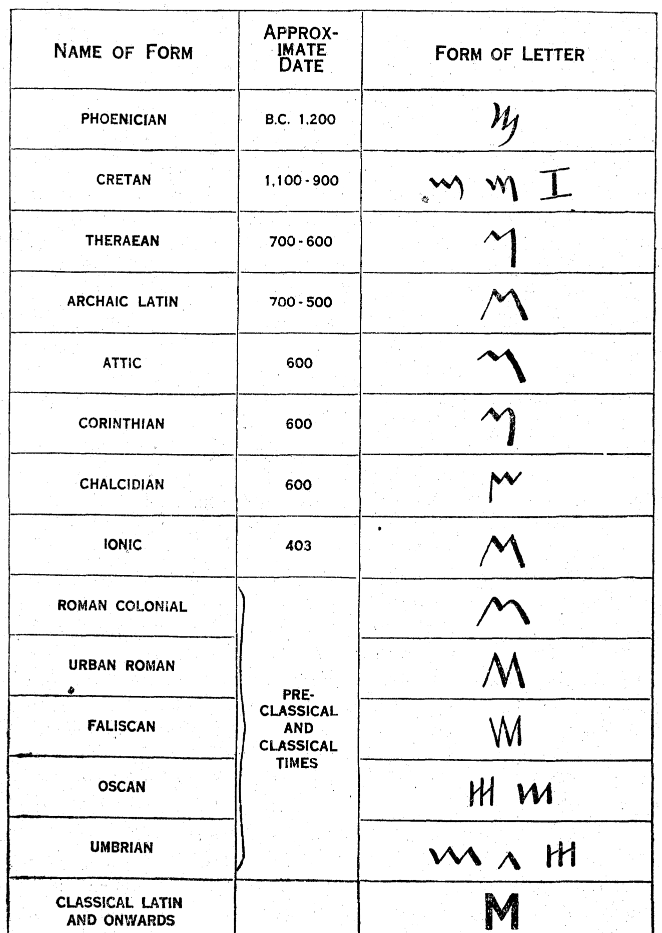
The two most considerable events of Lytton's viceroyalty, besides the Afghan wars, were the assumption by Queen Victoria of the title of empress of India (Jan. 1, 1877), and the famine which prevailed in various parts of India in 1876–78. He satisfied himself that periodical famines must be expected in Indian history, and that constant preparation during years of comparative prosperity was the only condition whereby their destructiveness could be modified. Accordingly he obtained the appointment of the famine commission of 1878, to enquire, upon lines laid down by him, into available means of mitigation. Their report, made in 1880, is the foundation of the later system of irrigation, development of communications, and "famine insurance." The equalization and reduction of the salt duty were effected, and the abolition of the cotton duty commenced, during Lytton's term of office, and the system of Indian finance profoundly modified by decentralization and the regulation of provincial responsibility, in all which matters Lytton enthusiastically supported Sir John Strachey, the financial member of his council.

Upon Lytton's resignation in 1880 an earldom was conferred upon him in recognition of his services as viceroy. He lived at Knebworth until 1887, in which year he was appointed to succeed Lord Lyons as ambassador at Paris. He died at Paris on Nov. 24, 1891. He was succeeded by his son (b. 1876) as 2nd earl.

Lytton is known as a poet under the pen-name of Owen Meredith. He wrote: *Clytemnestra, and other Poems* (1855); *The Wanderer* (1858); *Lucile* (1860); *Serbski Pesme, or National Songs of Servia* (1861); *Tannhäuser* (in collaboration with Julian Fane, 1861); *Chronicles and Characters* (1867); *Orval, or the Fool of Time* (1868); *Fables in Song* (2 vols., 1874); *Glenaveril, or The Metamorphoses* (1885); *After Paradise, or the Legends of Exile, and other Poems* (1887); *Marah* (1892); *King Poppy* (1892). The two last-mentioned volumes were published posthumously. A few previously unpublished pieces are included in a volume of *Selections* published, with an introduction by Lady Betty Balfour, in 1894. Besides his volumes of poetry, Lytton published in 1883 two volumes of a biography of his father.

The *Personal and Literary Letters of Robert, 1st Earl of Lytton,* were edited by Lady Betty Balfour (1906). For his viceroyalty *see* Lady Betty Balfour, *Lord Lytton's Indian Administration* (1899).

THE letter M corresponds to the Semitic (*mem*) and to the Greek (*mu*). Early Greek forms from Thera, Attica and Corinth closely resemble the early North Semitic, . The Lydian alphabet also had the form . These forms differ only in the direction of the writing. The Etruscan form was similar, but with an additional stroke, . The Ionic alphabet had the form and the Chalcidian . From the latter Latin took it in the form , from which the modern form derives. Curious forms occurred in the various Italic alphabets. Umbrian had or , Oscan , Faliscan . The rounded form appeared in the uncial writing of the fifth or sixth centuries A.D., . The cursive hands of the sixth century showed and on this was based the Carolingian . The modern minuscule does not differ essentially from the majuscule letter. The sound represented by the letter has been from the beginning the labial nasal. The nasals of all sounds are



THE DEVELOPMENT OF THE LETTER "M" FROM THE EARLIEST TIMES TO THE PRESENT DAY

least liable to change, a fact that is reflected in the consistent history of the letter. (B. F. C. A.)

MAASDORP, SIR ANDRIES FERDINAND STOCKENSTROM (1847–1931), was born at Malmesbury, Cape Colony, on Jan. 14, 1847, and educated at Graaff Reinet college, Cape Colony, and University college, London. He was called to the bar in 1871. He returned to Cape Colony, and from 1874 to 1878 was a member of the legislative assembly of Cape Colony, and from 1878 to 1897 solicitor-general. From 1900 he was a member of the Special Treason Court, until 1902, when he was appointed chief justice of the Orange River Colony (Orange Free State Province) division of the supreme court of South Africa. He resigned in 1919.

MAASIN, a municipality on the southwest coast of the province and island of Leyte, Philippine Islands, at the mouth of the Maasin river, 414 mi. from Manila. Pop. (1939) 29,264 of whom 14,745 were males and 9 whites. Maasin is a port for the export, by way of Cebu, of abacá (Manila hemp) and copra. The river valleys also produce cotton, pepper, tobacco, palay (rice), maize (corn) and tropical fruits. There are domestic manufactures of native cloth and pottery. Cebuano is the vernacular. Of the inhabitants aged 6 to 19 inclusive, 28·2% in 1939 attended school, and 55·6% of the population 10 years old and over was literate.

MAASSLUIS, a river port of Holland, on the New Waterway, 10 mi. by rail W. of Rotterdam; occupied by Germany in 1940. Pop. (1940) 9,244. It rose into importance as a fishing harbour towards the end of the 16th century, and its prosperity increased after the opening of the New Waterway (the Maas ship canal) from Rotterdam to the sea. Its industries are fishing, shipping and sailmaking. The fort erected in 1572 by Philip of Marnix, count of St. Aldegonde, was captured by the Spanish in 1573.

MAASTRICHT, a frontier town and the capital of the province of Limburg, Holland, on the left bank of the Maas at the influx of the Geer, 19 mi. by rail N.N.E. of Liége in Belgium, is the seat of a court. Pop. (1939) 67,609. Maastricht was originally the *traiectus superior* (upper ford) of the Romans, and was the seat of a bishop from 382 to 721. Having formed part of the Frankish realm, it was ruled after 1204 jointly by the dukes of Brabant and the prince-bishops of Liége. In 1579 it was besieged, taken and plundered by the Spaniards under the duke of Parma. It was taken by the French in 1673, 1748 and 1794. A small portion of the town, known as Wyk, lies on the right bank of the river. A stone bridge connecting the two replaced a wooden structure as early as 1280, and was rebuilt in 1683. Formerly a strong fortress, its ramparts were dismantled in 1871–78. The town-hall, completed in 1683, contains pictures and tapestry. The old town-hall (Oud Stadhuis), a Gothic building of the 15th century, is a museum of antiquities. The church of St. Servatius, founded by Bishop Monulphus in the 6th century, is the oldest church in Holland; according to one account it was rebuilt and enlarged as early as the time of Charlemagne. The late Romanesque church of Our Lady has two ancient crypts and a 13th century choir, but the nave suffered severely from a restoration in 1764. The original church of St. Martin (in Wyk) occupied the supposed site of an old heathen temple. The Protestant St. Janskerk, a Gothic building of the 13th and 15th centuries, with a fine tower, was formerly the baptistery of the cathedral. The town did not reap the full advantages of its situation till the opening of the railways between 1853 and 1865. At first a trade was carried on in wine, colonial wares, alcoholic liquors and salt; there are now manufactures of china, glass and crystal, also breweries, tobacco and cigar factories, and a trade in corn and butter.

A short distance south of Maastricht are the great sandstone quarries of Pietersberg, which were worked from the time of the Romans till the end of the 19th century, resulting in subterranean labyrinths covering an area of 15 mi. by 9 mi. In the time of the Spanish wars these underground passages served to hide the peasants and their cattle. At 5 mi. distance are the mediaeval castles of Amstenrade, Neubourg and Mheer. Maastricht was assaulted by the Germans, May 11, 1940—the second day of the invasion of the Low Countries.

MABILLON, JOHN (1632–1707), Benedictine monk of the Congregation of St. Maur (*see* MAURISTS), was the son of a peasant near Reims. In 1653 he became a monk in the abbey of St. Remi at Reims. In 1664 he was placed at St. Germain-des-Prés in Paris, the great literary workshop of the Maurists, where he lived and worked for twenty years, at first under d'Achery, with whom he edited the nine folio volumes of *Acta* of the Benedictine Saints. In Mabillon's Prefaces (reprinted separately) these lives were for the first time made to illustrate the ecclesiastical and civil history of the early middle ages. Mabillon's masterpiece was the *De re diplomatica* (1681; and a supplement, 1704) in which were first laid down the principles for determining the authenticity and date of mediaeval charters and manuscripts. It practically created the science of Latin palaeography. In 1685–86 Mabillon visited the libraries of Italy, to purchase mss. and books for the King's Library. On his return to Paris he was called upon to defend against de Rancé, the abbot of La Trappe, the legitimacy for monks of the kind of studies to which the Maurists devoted themselves: this called forth Mabillon's *Traité des études monastiques* and his *Réflexions sur la réponse de M. l'abbé de la Trappe* (1691–92), works embodying the ideas and programme of the Maurists for ecclesiastical studies.

Mabillon produced in all some twenty folio volumes and as many of lesser size, nearly all works of monumental erudition. He died on Dec. 26, 1707, in the midst of the production of the colossal Benedictine Annals.

The chief authority for his life is the *Abrégé de la vie de D.J.M.* (also in Latin), by Ruinart (1709). *See* also Tassin, *Hist. littéraire de la congr. de St. Maur* (1770), pp. 205–269. Of modern biographies the best are those of de Broglie (2 vols., 1888) and Bäumer (1892)—the former to be especially recommended. A brief sketch by E. C. Butler may be found in the *Downside Review* (1893). (E. C. B.)

MABINOGION (plural of Welsh *mabinogi*, from *mabinog*, a bard's apprentice), the title given to the collection of 11 Welsh prose tales (from the 14th-century Red Book of Hergest) published (1838) by Lady Charlotte Guest, newly tr'd. by T. P. Ellis and J. Lloyd, *The Mabinogion* (1929). (*See* WELSH LANGUAGE AND LITERATURE.)

MABUSE, JAN (*c.* 1472–*c.* 1534), the name adopted (from his birthplace, Maubeuge) by the Flemish painter Jan Gossaert, or Jenni Gossart, as he called himself when he matriculated in the gild of St. Luke, at Antwerp, in 1503. His most important early work extant is the "Adoration of the Kings" in the National Gallery, formerly at Castle Howard. Here he throws together some thirty figures on an architectural background, carefully elaborated and Romanesque in style. He surprises us by pompous costume. His figures, like pieces on a chess-board, are often rigid and conventional. The landscape which shows through the ruined architecture is adorned with towers and steeples in minute fashion. The picture is signed IENNINE GOS . . . and was probably painted for the Abbey of St. Adrian, Grammont. It is the work of a man trained in the old Flemish traditions. That he was an admirer of Van Eyck is shown by his picture in Madrid of "Jesus, the Virgin, and the Baptist," in Gothic framework. One of Mabuse's most distinguished works, the little triptych at Palermo was probably also painted at this early period. Carondelet, who was Mabuse's patron, was archbishop of Palermo and chancellor of Flanders, and he probably transferred the picture to Sicily. It is a wonderful piece of pictorial elaboration, containing features taken from Dürer. Another early work is the moonlight scene representing "The Agony in the Garden" in the Berlin Museum.

After a residence of a few years at Antwerp, Mabuse took service with Philip, bastard of Philip the Good, at that time lord of Somerdyk and admiral of Zeeland. One of his pictures had already become celebrated—a Descent from the Cross (50 figures), on the high altar of the monastery of St. Michael of Tongerloo. Philip of Burgundy ordered Mabuse to execute a replica for the church of Middelburg; and the value which was then set on the picture is apparent from the fact that Dürer came expressly to Middelburg (1521) to see it; and he noted in his diary that it was not so good in design as in execution. In 1568 the altar-piece perished by fire. In 1508 Mabuse accompanied Philip of Burgundy on his Italian mission; and by this accident an important revolution was effected in the art of the Netherlands. He not only brought home a new style, but he also introduced the fashion of travelling to Italy; and from that time till the age of Rubens and Van Dyck it was considered proper that all Flemish painters should visit the peninsula.

In the summer of 1509 Philip returned to the Netherlands, and, retiring to his seat of Suytburg in Zeeland, surrendered himself to the pleasures of planning decorations for his castle and ordering pictures of Mabuse and Jacopo de Barbari. Being in constant communication with the court of Margaret of Austria at Malines, he gave the artists in his employ fair chances of promotion. Barbari was made court painter to the regent, whilst Mabuse received less important commissions. Records prove that Mabuse painted a portrait of Leonora of Portugal, and other small pieces, for Charles V. in 1516. But his only signed pictures of this period are the Neptune and Amphitrite of 1516 at Berlin, the composition of which is taken from Dürer's famous engraving, and the Madonna, with a portrait of Jean Carondelet of 1517, at the Louvre, in both of which we clearly discern that Vasari only spoke by hearsay of the progress made by Mabuse in "the true method of producing pictures full of nude figures and poesies," for the types are ugly, though drawn delicately and modelled elaborately. Of similar type is the Hercules and Deianira dated 1517, in the Cook Collection at Richmond. In later forms of the same subject—the Adam and Eve at Hampton Court, or the other version of the same subject at Berlin—we observe more nudity, combined with realism.

Happily, Mabuse was capable of higher efforts. His St. Luke painting the portrait of the Virgin in Sanct Veit at Prague, and a variety of the same subject in the Vienna Museum, prove that travel had left many of Mabuse's fundamental peculiarities unaltered. His figures still retain the character of stone; his architecture, now in Italian Renaissance style, is as rich and varied, his tones are as strong as ever. But bright contrasts of gaudy tints are replaced by soberer greys; and a cold haze pervades the surfaces. In this form the Madonnas of Munich (1527) and Vienna, in the collection of Max Wassermann, Paris, and of E. Simon, Berlin, are fair specimens of his skill.

As early as 1523, when Christian II. of Denmark came to Belgium, he asked Mabuse to paint the likenesses of his dwarfs. In 1528 he requested the artist to furnish to Jean de Hare the design for his queen Isabella's tomb in the abbey of St. Pierre near Ghent. It was no doubt at this time that Mabuse completed the portraits of John, Dorothy and Christine, children of Christian II., of which replicas are at Hampton Court, at Wilton House, and at Longford Castle. It is as a portrait painter that Mabuse can be seen to the best advantage. His portraits of Carondelet in the collection of M. von Guttmann in Vienna, and L. Hirsch in London; of Marquise de Vere in the Gardner collection at Boston and others in the galleries of Copenhagen, London, Paris, Berlin, in the Cook collection, Richmond, in the Pratt collection, New York, are remarkable for their strength and plasticity. In his later portraits the rendering of the hands becomes remarkably expressive of the sitter's personality. Carondelet's portrait in Vienna formed part of a diptych. The opposite wing is now in the Tournay museum and carries a half-length of St. Donatian. This diptych is one of the most powerful works of Mabuse.

When Philip of Burgundy became bishop of Utrecht, and settled at Duerstede, near Wyck, in 1517, he was accompanied by Mabuse, who helped to decorate the new palace of his master. At Philip's death, in 1524, Mabuse designed and erected his tomb in the church of Wyck. He finally retired to Middelburg, where he took service with Philip's brother, Adolph, lord of Veeren.

MAC, a Gaelic word meaning "son," and the distinguishing prefix in a large number of Scots and Irish personal names; frequently contracted to Mc and M' in the written form. Its use in forming Celtic patronymics is ancient in both Scots and Irish records, and may be compared with Welsh Ap (originally *mab* or *map,* the Brythonic equivalent of *mac*), Irish O' in such names as O'Donnell (Scots MacDonald and MacDonnell), and Anglo-Norman Fitz, etc. In the 8th century the Pictish king Angus MacFergus (Aonghas MacFhearghuis) prepared the way for the union of Picts and Scots, and in the following century Kenneth MacAlpin became the founder of the first dynasty to rule over a united Scotland; while Shakespeare's *Macbeth* has rendered familiar the name of MacAlpin's descendant two centuries later on the Scottish throne. The advent of the Norsemen, and their colonization of the Outer Isles from the Shetlands to the Isle of Man and Northern Ireland, accounts for a number of Celticized names of old Norse origin which now also make their appearance, such as the Gaelic *mac Amhlaibh, mac Mhanuis, mac Iamhair,* etc., from O. Norse Olaf or Olave, Magnus or Manus, Ivar or Ingvar, Thorketill, Lochlann, etc., whence the more familiar forms of Macaulay, MacManus, MacIvor, MacCorquodale, Maclachan are derived. Association of the prefix with English names, such as M'Ritchie, M'Dicken, M'Cutcheon, M'Watt (*i.e.*, Richardson, Dickinson, Hutchinson, Walter's son) is uncommon and always late in origin.

The Celtic names so formed are both fewer in number and more regular in structure than the wide diversity of forms and spellings that have been derived from them. Ferguson, Farquharson, Duncanson are more correctly rendered in the original "Fergus' son," or Fergusson, etc. (though using a prefix in place of a suffix). From *mac Aonghais,* son of Angus, come M'Ainsh, M'Innes, M'Quinness (Ir. M'Guinness), M'Neish; from *mac Coinneach,* son of Kenneth, M'Kinnie, M'Kenzie, M'Kenna, M'Whinnie; from *mac Eachainn,* son of Hector, come M'Kechnie, M'Geachie, M'Kichan; while Meikleham from M'Ilquham shows a still further process of change by ellipsis. (*Cf.* Welsh Map-Richard and Map-Rhys, which become Ap-Ritchard, Ap-Rhys, and finally Pritchard, Price and Bryce.) The conversion of the Gaelic inflected *mh* and *bh* into its equivalent sound of *v* is also common, as M'Vanish son of Manus, from MacMhanuis; M'Tavish, son of Thomas, from MacTamhais, etc. (*Cf.* Scott's Vic Ian Vor in *Waverley,* i.e., *Mhic Iain Mhór,* Son of Big John.)

Among the elements that enter into these name processes, besides the simple personal names, such as MacGregor, MacFarlane, MacAlister, from Gregory, Bartholomew (Gael. *Parlain*), Alexander (Gael. *Alasdair*), are names of crafts, rank, personal description, etc., such as Macduff from Gaelic *dubh,* dark, whence also M'Duffie, M'Phee, M'Fie; M'Dougall and M'Dowall from *dubh ghal* or Dugald, the dark stranger, MacFarquhar from *fhear char,* the dear man; MacKinnon, the fair born, and MacIntyre (*Mac an t-saoir*), son of the carpenter, besides a number of names of religious origin, such as M'Kellar, M'Nab, M'Gillespie, M'Taggart (*Mac an t-sagairt*), son of the prior, abbot, bishop, priest (another form of which is M'Millan, the bald or tonsured). Names incorporating initial Gil, Il, Le, etc., are derivatives from *gille* or *ghill',* a lad or servant, which is common to names of religious origin and in naming after saints, as M'Gilchrist (*Mac gille Chriosd*), M'Ilhose or Maclehose, M'Gillivray or M'Ilwraith, M'Lean, M'Clure, son of the servant of Christ, of Jesus, of judgment (bhràith), of John, and of the Book (*Leabhair*) or Bible. MacIntosh (*Mac an tòisch*), son of the chief, is an instance of a name of rank. In Celtic Scotland the *tòiseach* was the head of a district under the *maormaers* or stewards of the great provinces, who later became earls, while *tòiseach* is frequently translated thane in English, though without the English sense. Under the clan system which reached its greatest development later, it may be more exactly rendered the chief of the clan in a particular district. It is also owing to this community system that the use of the patronymic to decide relationship, at first of father and son, and by extension all children or descendants, became part of the social heritage and structure of the Scots, and took the place of the feudal relationships which spread elsewhere.

MACABEBE, a municipality (with administrative centre and 18 *barrios* or districts) of the province of Pampanga, Luzon, Philippine Islands, on the Pampanga river, about 10 mi. above its mouth and about 25 mi. N.W. from Manila. Pop. (1939) 20,149. Macabebe was long a recruiting ground for the Spanish *guardia civil* and later for the Philippine scouts which formed an adjunct of the United States army in the archipelago. The inhabitants are traders who travel. Agriculture is also a leading industry, the principal crops being palay (rice) and sugar. Alcohol is distilled from the nipa palm and abacá (Manila hemp) and cotton fabrics are woven into cloth. Pampango is the vernacular. Of the inhabitants aged 6 to 19 inclusive, 40·8% in 1939 attended school; 58·8% of the population 10 years old and over was literate.

MACABRE, a term applied to a certain type of artistic or literary composition, characterized by a grim and ghastly humour, with an insistence on the details and trappings of death. Such a quality, deliberately adopted, is hardly to be found in ancient Greek and Latin writers, though there are traces of it in Apuleius and the author of the *Satyricon.* The outstanding instances in English literature are John Webster and Cyril Tourneur, with E. A. Poe and R. L. Stevenson. The word has gained its significance from its use in French, *la danse macabre,* for that allegorical representation, in painting, sculpture and tapestry, of the ever-present and universal power of death, known in English as the "Dance of Death," and in German as *Totentanz.* The typical form which the allegory takes is that of a series of pictures, sculptured or painted, in which Death appears, either as a dancing skeleton or as a shrunken corpse wrapped in grave-clothes to persons representing every age and condition of life, and leads them all in a dance to the grave. Of the numerous examples painted or sculptured on the walls of cloisters or church-yards through mediaeval Europe few remain except in woodcuts and engravings. Thus the famous series at Basel, originally at the Klingenthal, a nunnery in Little Basel, dated from the beginning of the 14th century. In the middle of the 15th century this was moved to the churchyard of the Predigerkloster at Basel, and was restored, probably by Hans Kluber, in 1568; the fall of the wall in 1805 reduced it to fragments, and only drawings of it remain. A Dance of Death in its simplest form still survives in the Marienkirche at Lübeck in a 15th century painting on the walls of a chapel. Here there are 24 figures in couples, between each is a dancing Death linking the groups by outstretched hands, the whole ring being led by a Death playing on a pipe. At Dresden there is a sculptured life-size series in the old Neustädter Kirchhoff, removed here from the palace of Duke George, in 1701, after a fire. At Rouen in the *aitre* (atrium) or cloister of S. Maclou there also remains a sculptured *danse macabre.* There was a celebrated fresco of the subject in the cloister of Old St. Paul's in London, and another in the now destroyed Hungerford chapel at Salisbury, of which a single woodcut, "Death and the Gallant," alone remains. Of the many engraved reproductions, the most celebrated is the series drawn by Holbein. Here the long ring of connected dancing couples is necessarily abandoned, and the Dance of Death becomes rather a series of *imagines mortis.*

Concerning the origin of this allegory in painting and sculpture there has been much dispute. It certainly seems to be as early as the 14th century, and has often been attributed to the overpowering consciousness of the presence of death due to the Black Death and the miseries of the Hundred Years' War. It has also been attributed to a form of the Morality, a dramatic dialogue between Death and his victims in every station of life, ending in a dance off the stage (see Du Cange, *Gloss., s.v.* "Machabaeorum chora"). The origin of the peculiar form the allegory has taken has also been found, somewhat needlessly and remotely, in the dancing skeletons on late Roman sarcophagi and mural paintings at Cumae or Pompeii, and a false connection has been traced with the "Triumph of Death," attributed to Orcagna, in the Campo Santo at Pisa.

The etymology of the word *macabre* is itself most obscure. According to Gaston Paris (*Romania,* xxiv., 131; 1895) it first occurs in the form *macabré* in Jean le Fèvre's *Respit de la mort* (1376), "Je lis de Macabré la danse," and he takes this accented form to be the true one, and traces it in the name of the first painter of the subject. The more usual explanation is based on the Latin name, *Machabaeorum chora.* The seven tortured brothers, with their mother and Eleazar (2 Macc. vi. vii.) were prominent figures on this hypothesis in the supposed dramatic dialogues. Other connections have been suggested, as for example with St. Macarius or Macaire, the hermit, who, according to Vasari, is to be identified with the figure pointing to the decaying corpses in the Pisan "Triumph of Death," or with an Arabic word *magbarah*, "cemetery."

McADAM, JOHN LOUDON (1756–1836), Scottish inventor, who gave his name to the system of road-making known as "macadamizing," was born at Ayr, Scotland, on Sept. 21, 1756. In 1770 he went to New York, entering the counting-house of a merchant uncle. He returned to Scotland with a considerable fortune in 1783, and purchased an estate at Sauhrie, Ayrshire. The highways of Great Britain were at this time in a very bad condition, and McAdam, who was a road trustee in his district, at once began to consider how to effect reforms. At his own expense he began at Sauhrie, despite much opposition, a series of experiments in road-making. In 1798 he removed to Falmouth, where he had received a Government appointment, and continued his experiments there. His general conclusion was that roads should be constructed of broken stone (*see* ROADS AND STREETS). In 1815, having been appointed surveyor-general of the Bristol roads, he was able to put his theories into practice. In 1819 he published a *Practical Essay on the Scientific Repair and Preservation of Roads*, followed, in 1820, by the *Present State of Road-making*. In 1827 he was appointed by the Government general surveyor of roads. He died at Moffat, Dumfriesshire, on Nov. 26, 1836.

McADOO, WILLIAM GIBBS (1863–1941), American lawyer and politician, was born near Marietta, Ga., Oct. 31, 1863. He entered the University of Tennessee but did not finish his course. In 1882 he became clerk in the U.S. circuit court of Chattanooga, read law and three years later was admitted to the bar. He began practice in Chattanooga, but in 1892 removed to New York city. There he became interested in the problem of passenger transportation. In 1902 he formed the New York and New Jersey railroad company, which took over the abandoned Hudson river tunnel from Hoboken to New York, and in March, 1904, this tunnel was completed. In 1909 the tunnel under the Hudson river to downtown New York also was finished. He was a strong supporter of Woodrow Wilson for president, and on the latter's election he was appointed, in 1913, secretary of the Treasury. In this position he contributed largely to the working-out of the new Federal Reserve banks system.

After America's entrance into the War he was called upon to raise very large sums of money. He was successful in floating four Liberty Loans between May, 1917, and Oct., 1918, amounting in all to more than $18,000,000,000. He also secured the creation of a bureau of War Risk insurance for shipping, later extended to include life insurance for soldiers and sailors in the World War. When the railways were taken over by the Federal Government in 1917 he was appointed director-general. He favoured the League of Nations, woman suffrage and the prohibition amendment. He resigned the secretaryship of the Treasury in Dec., 1918, and the directorship of railways the following January. He then resumed the practice of law first in New York and later at Los Angeles. At the Democratic National Convention of 1920 and again at that of 1924 he was a prominent candidate for nomination for the presidency. On the first ballot on both occasions he received the highest number of votes but failed in each instance to win the nomination. He was elected United States Senator from California for the term 1933–39. He died Feb. 1, 1941.

McADOO, an anthracite-mining borough of Schuylkill county, Pennsylvania, U.S.A., on the Lehigh Valley and the Pennsylvania railways, 5 mi. S. of Hazleton. Pop. (1920) 4,674 (28% foreign-born white); in 1940 it was 5,127.

MACAIRE, a French *chanson de geste*. *Macaire* (12th century) and *La Reine Sibille* (14th century) are two versions of the story of the false accusation brought against the queen of Charlemagne, called Blanchefleur in *Macaire* and Sibille in the later poem. *Macaire* is only preserved in the Franco-Venetian *geste* of Charlemagne (Bibl. St. Mark ms. fr. xiii.). *La Reine Sibille* only exists in fragments, but the tale is given in the chronicle of Alberic Trium Fontium and in a prose version. *Macaire* combines two legends: that of the unjustly repudiated wife and that of the dog who detects the murderer of his master. (For the former motive *see* GENEVIÈVE OF BRABANT.) The second is found in Plutarch, *Script. moral.*, where a dog, like Aubri's hound, stayed three days without food by the body of its master, and subsequently attacked the murderers, thus leading to their discovery. The duel between Macaire and the dog is paralleled by an interpolation by Giraldus Cambrensis in a ms. of the *Hexameron* of St. Ambrose. Aubri's hound received the name of the "dog of Montargis," because a representation of the story was painted on a chimney-piece in the château of Montargis in the 15th century. The tale was early divorced from Carolingian tradition, and Jean de la Taille, in his *Discours notable des duels* (1607), places the incident under Charles V.

(2nd ed., 1880); G. Paris, *Hist. poét. de Charlemagne* (1865); M. J. G. Isola, *Storie nerbonesi*, vol. i. (Bologna, 1877); F. Wolf, *Über die beiden . . . Volksbücher von der K. Sibille u. Huon de Bordeaux* (Vienna, 1857); and *Über die neuesten Leistungen der Franzosen* (Vienna, 1833).

McALESTER, a city of Oklahoma, U.S.A., 110 mi. S.E. of Oklahoma City, on federal highway 69; county seat of Pittsburg county. It is served by the Missouri-Kansas-Texas, the Pittsburg County and the Rock Island railways. Pop. 11,804 in 1930; (1940) 12,401 (89% native white and 11% Negroes), by federal census. It is the trade centre for an agricultural and coal-mining region; does a large wholesale and jobbing business; and has railway shops and other manufacturing industries. Its cotton gins and compresses handle 30,000 bales in a normal year, and the county mines much coal. There is a beautiful Masonic temple in the city. The state penitentiary is near, and headquarters for United States army officers and officials of the Bureau of Indian Affairs. The water supply is impounded in three lakes, one of which (5 mi. from the city) is one of the largest in the state (2,400 ac.) and a popular resort for fishing and camping. Settlement began in 1885. In 1906 the city of South McAlester (incorporated 1899) and the town of McAlester were consolidated, and in 1919 a commission-manager form of government was adopted.

McALLEN, a city of Hidalgo county, Texas, U.S.A., in the southeastern part of the state, 7 mi. from the International bridge over the Rio Grande at Reynosa (Mexico), on federal highway 83 and state highway 336, the "main street" of the region, which runs from Brownsville (60 mi. S.E.) to the western boundary of the county (20 mi. W.) through most of the important towns of the lower Rio Grande valley. It is served by the Missouri Pacific and the Southern Pacific railway systems. Pop. (1920) 5,331 (50% foreign-born white, largely from Mexico), 11,877 in 1940 by the federal census. A two-acre central plaza, palm-lined streets, poinsettias, ebonies and other semitropical trees and shrubs add charm to a well-planned city. It is the trading and shipping centre for an irrigated district devoted to citrus culture, especially grapefruit. When the city was chartered in 1911 most of the site was a desert of mesquite and cactus. McAllen is one of the two most important gateways to interior Mexico on the U.S. border. It leads the south as a combined vegetable and fruit canning centre. Bank deposits in 1941 totalled $2,200,978.

MACALPINE (or MACCABEUS), **JOHN** (d. 1557), Protestant theologian, was from 1532 to 1534 prior of the Dominican convent of Perth; but having in the latter year been summoned with Alexander Ales (*q.v.*) and others to answer for heresy before the bishop of Ross, he fled to England, where he was granted letters of denization on April 7, 1537, and married Agnes Macheson, a fellow-exile for religion; her sister Elizabeth became the wife of Miles Coverdale. The reaction of 1539 made England a doubtful refuge, and on Nov. 25, 1540 Macalpine matriculated at the university of Wittenberg. In 1542, being now known as Maccabeus, he became professor of theology at the university of

Copenhagen. Here he took a prominent part in building up the Lutheran Church of Denmark. A joint exposure by Plade and Macalpine of Osiander's errors was published in 1552 and reprinted at Leipzig and Copenhagen in 1768; and Macalpine was one of the four translators of Luther's German Bible into Danish. He died at Copenhagen on Dec. 6, 1557.

See *Dict. Nat. Biog.* and authorities there cited.

MACAO, a Portuguese colony on the coast of South China, on the west side of the entrance to the Canton river, opposite to and some 35 miles distant from Hong Kong island. It comprises the peninsula of Macao and the small islands of Taipa and Colôane: the area of the whole colony being about five square miles. On the peninsula, which is about three miles long and a mile broad, is situated the picturesque city of Macao, extending up a hill-side to overlook a fine bay. Its multi-coloured buildings reveal a quaint combination of Oriental and European features. The mean monthly temperature reaches 84° F. in July, but in no month falls below 60° F. Its tropical climate, with an annual rainfall of 60 in., is relieved by southwest sea breezes. This, with the 124 good schools, as well as the unrestricted gaiety, has attracted many well-to-do Chinese and European residents.

Direct trade by sea between Europe and China began through Portuguese enterprise as early as 1516. Macao was established in 1557 and is the oldest European outpost in the trade with China. It was an early centre of Jesuit missionary activity and in 1580 the bishopric of Macao, which includes also Timor (East Indies) and the Christians of Malacca and Singapore, was created; in 1680 the first governor was appointed, but the Portuguese remained largely under the control of the Chinese with whom there were constant disputes concerning the extent of Portuguese jurisdiction. A rental was paid for the peninsula until 1849, when the Portuguese abolished the Chinese customs house and declared the independence of the port. It was not however, until 1887 that China formally recognized Portuguese sovereign rights in a treaty whereby China confirmed the perpetual occupation and government of Macao and its dependencies by Portugal, which in turn undertook never to alienate Macao and its dependencies without the consent of China, and to co-operate in the work of the opium revenue at Macao on the same lines as Great Britain at Hong Kong. This did not put an end to disputes, and the delimitation of the colonial boundaries is still an unsettled question.

During the 18th century Macao was the chief centre in the Sino-European trade, but the rapid development of Hong Kong (ceded to Great Britain in 1842) was responsible for its decline as also was the rapid silting of Macao harbour. As a free port it remained a distribution centre for rice, fish, lumber, silk, piece goods and oil; but it also had an unenviable reputation for opium smuggling and gambling. The League of Nations' efforts reduced its opium trade value from $1,500,000 (U.S.) to about $200,000 (U.S.) before 1939. In 1939, after the capture of Canton and the closure of the Hong Kong-Kowloon border, Macao enjoyed briefly the available import and export trade of South China. The Lappa Customs figures are: Imports, 1938, $784,359 (U.S.), 1939, $3,184,288 (U.S.); Exports, 1938, $1,503,074 (U.S.), 1939 $2,384,425 (U.S.). In 1938, 6,406 vessels cleared the port, a total of more than 3,100,000 tons. Its fishing industry employed about 1,800 junks and 40,000 people, and distributed annually more than $750,000 (U.S.) worth of fish to neighbouring cities of the Canton delta. The great bulk of the fish exported is salted, and Macao's position as the second fish port in China is in large measure due to the imports of foreign salt, which is much cheaper than Chinese government-taxed salt. The chief manufactures are those of cement, preserves, fire-crackers, vegetable oil, and also metalworking.

In 1920 a definite scheme for harbour improvement was launched and a contract placed with the Netherlands Harbour Works. The construction of an artificial deepwater harbour began in 1923; and this entailed the dredging of a four-mile channel to the open sea. These harbour works were completed in 1926, having cost $10,000,000, and have led to the reclamation of 130 acres of land surface.

Pop. (1920) 83,894 (3,816 Portuguese); (1940) 374,737 (8,898 Portuguese). The so-called Macanese are descended from the original 1,000 Portuguese families, now with a dominance of Chinese blood through intermarriage. Revenue is derived from ground rents, industrial taxes, gambling and opium monopolies, and the 1942 budget was 46,798,761 escudos. The city, with its famous $1\frac{1}{2}$-mi. long Praia Grande, comprises a Chinese and a non-Chinese ward under separate administration. In March 1940, the Japanese army demanded Portuguese recognition of the near-by "puppet" government at Chungshan, the evacuation of Portuguese troops from the islands of Lappa and Wantsai, and the right of house-to-house search in Macao, etc. In Aug. 1943 Japanese troops seized the British steamer *Sian* in Macao, killing some 20 guards. In September they demanded the installation of Japanese "advisers" under the alternative of military occupation.

MACAQUE, a name for the monkeys of the mainly Asiatic genus *Macaca,* of which one species, the Barbary ape, inhabits North Africa and the rock of Gibraltar. Displaying great variation in the length of the tail, macaques are heavily built monkeys, with longer muzzles than their compatriots the langurs (*see* PRIMATES), and large naked callosities on the buttocks. They range over India and Ceylon, thence northward to Tibet, and eastwards to China, Japan, Formosa, and the Malay region. Mention of the more important species is made in the article PRIMATES. Like most monkeys, macaques go about in troops, each headed by an old male. They feed on seeds, fruits, insects, lizards, etc.; and several of the species are mainly terrestrial.

MACARA, SIR CHARLES WRIGHT (1845–1929), 1st Bart. (cr. 1911), English business man, was born on Jan. 11, 1845, at Strathmiglo, Fifeshire, and educated privately and at Edinburgh. From 1892 for 34 years he acted as chairman of the Manchester and district cotton employers' association, and was partly responsible for the Brooklands agreement which ended the strike of 1892. He has acted as president of various associations connected with the cotton trade, taking an active part in their work, and the establishment of the Industrial Council by the government in 1911 was largely due to his efforts. From 1912 to 1916 he was president of the Employers' Parliamentary Association, and in September 1922 was appointed chairman of the provisional emergency cotton committee, set up to consider the action to be taken in view of the state of the cotton trade. He died Jan. 2, 1929.

His many publications on social and industrial questions include: *Social and Industrial Reform* (1918); *Recollections* (1921); *Getting the World to Work* (1922); *Trade Stability and how to obtain it* (1925); *Modern Industrial Tendencies* (1926).

MACARONI, a preparation of a glutinous wheat originally peculiar to Italy, where it is an article of food of national importance (from dialectic Ital. *maccare,* to bruise or crush). The same substance in different forms is also known as *vermicelli, pasta* or Italian pastes, *spaghetti, taglioni, fanti,* etc. These substances are prepared from the hard, semi-translucent varieties of wheat which are largely cultivated in the south of Europe, Algeria and other warm regions, and distinguished by the Italians as *grano duro* or *grano da semolino.* These wheats are much richer in gluten and other nitrogenous compounds than the soft or tender wheats of more northern regions, and their preparations are more easily preserved. The various preparations are met with as fine thin threads (vermicelli), thin sticks and pipes (spaghetti, macaroni), small lozenges, stars, discs, ellipses, etc. (pastes). These various forms are prepared in a uniform manner from a granular product of hard wheat, which, under the name of semolina or middlings, is a commercial article.

The semolina is thoroughly mixed with boiling water and incorporated in a kneading machine, such as is used in bakeries, into a stiff paste or dough. It is then further kneaded by passing frequently between rollers or under edge runners, till a homogeneous mass has been produced which is placed in a strong steam-jacketed cylinder, the lower end of which is closed with a thick disc pierced with openings corresponding with the diameter or section of the article to be made. Into this cylinder an accurately fitting plunger or piston is introduced and subjected to very great pressure, which causes the stiff dough to squeeze out through the openings in the disc in continuous threads, sticks or pipes, as the case may be. Vermicelli is cut off in short bundles and laid on trays to dry, while macaroni is dried by hanging it in longer lengths over wooden rods in stoves or heated apartments through which currents of air are driven. It is only genuine macaroni, rich in gluten, which can be dried in this manner; spurious fabrications will not bear their own weight, and must, therefore, be laid out flat to be dried. In making pastes the cylinder is closed with a disc pierced with holes having the sectional form of the pastes, and a set of knives revolving close against the external surface of the disc cuts off the paste in thin sections as it exudes from each opening.

True macaroni can be distinguished by observing the flattened mark of the rod over which it has been dried within the bend of the tubes; it has a soft yellowish colour, is rough in texture, elastic and hard, and breaks with a smooth glassy fracture. In boiling it swells up to double its original size without becoming pasty or adhesive. It can be kept any length of time without alteration or deterioration.

MACARONICS, burlesque poetry, in which modern words with Latin endings are introduced into Latin verse, so as to produce a ridiculous effect. Sometimes Greek is used instead of Latin. The founder of the practice was Teofilo Folengo (1491–1544), whose mock-heroic *Liber Macaronicus* appeared in 1517. Folengo (*q.v.*) was a Benedictine monk, who escaped from his monastery and lived a dissolute life, supporting himself by his absurd verses, which he described as an attempt to produce in literature something like macaroni, a gross, rude and rustic mixture of flour, cheese and butter. His poem is a burlesque epic, containing an extraordinary medley of chivalrous feats, ridiculous and squalid adventures and satirical allegory. Its effect upon Rabelais was so extraordinary that no examination of *Pantagruel* can be complete without a reference to it. It was imitated in Italy by a number of minor poets; and in France Antonius de Arena published at Avignon in 1573 a burlesque account of Charles V.'s disastrous campaign in Provence. Folengo in Italy and Arena in France are regarded as the macaronic classics. Great popularity was achieved later by an anonymous macaronic, entitled *Funestissimus trepassus Micheli Morini,* who died by falling off the branch of an elm-tree:—

> De branche in brancham degringolat, et faciens pouf
> Ex ormo cadit, et clunes obvertit Olympo.

Molière employed macaronic verse in the ceremonial scene with the doctors in *Le Malade imaginaire*. Works in macaronic prose are rarer. An *Anti-Clopinus* by Antony Hotman may be mentioned and the *Epistolae obscurorum virorum* (1515).

The use of true macaronics has never been frequent in Great Britain, where the only prominent example of it is the *Polemo-Middinia* ascribed to William Drummond (*q.v.*). This describes a quarrel between two villages on the Firth of Forth, and Drummond shows great ingenuity in the tacking on of Latin terminations to his Lowland Scots vernacular.

See Ch. Nodier, *Du Langage factice appelé macaronique* (1834); F. W. Genthe, *Geschichte der Macaronischen Poesie* (Leipzig, Halle, 1836).

MACAROON, a small sweet cake made of egg white, pulverized or castor sugar, and either almonds or coconut. If nuts are used they are crushed or pounded to a paste, the sugar and paste worked together and the egg white added very gradually until the mixture is perfectly smooth and stiff enough to hold its own. The glaze that characterizes the macaroon is secured by brushing the top lightly with a little cold water.

MacARTHUR, ARTHUR (1845–1912), American general, was born at Springfield, Mass., on June 2, 1845. He served throughout the Civil War in the 24th Wisconsin Infantry, being advanced from lieutenant to major and lieutenant-colonel and in 1865, when but 20 years of age, he became colonel of the regiment. He was mentioned for "gallant and meritorious service" in the battles of Perryville, Stone River, Missionary Ridge, Dandridge, Franklin and in the Atlanta campaign, and received a Congressional Medal for bravery at Missionary Ridge. After the war he joined the regular army and from 1866 to 1886 was stationed in the South-west and participated in several Indian campaigns. When the Spanish-American War broke out he was commissioned brigadier-general of volunteers and sent to the Philippine Islands. He captured the town of Malate, which prepared the way for the taking of Manila. For this and other services he was commissioned major-general of volunteers. In 1899, under the direction of Gen. Otis, he commanded a division against Aguinaldo. Later in the year he was made commander of the department of Northern Luzon and succeeded Otis as governor-general. In 1901 he was made a major-general of the regular army and returned to the United States, where he commanded successively the departments of Colorado, the East, the Lakes, California and the Pacific. In 1905 during the Russo-Japanese War he was a special observer with the Japanese army. He retired, a lieut.-general, in 1909 and died at Milwaukee, Wis., on Sept. 5, 1912.

MacARTHUR, DOUGLAS (1880–), U.S. army officer, was born Jan. 26, 1880, in Little Rock barracks, Ark., the son of Lt. Gen. Arthur MacArthur (*q.v.*), and was graduated as first in his class from West Point in 1903. In World War I he advanced to brigadier general, led the 84th infantry brigade in the St. Mihiel salient, Sept. 1918 and was subsequently made commander of the 42nd (Rainbow) division. He was gassed and wounded in action. When he was made a major general in Jan. 1925, he was youngest of that rank in the U.S. army. He commanded the department of the Philippines, 1928–30, and was appointed U.S. chief of staff with rank of full general by President Hoover Nov. 21, 1930. In Oct. 1935, he retired as chief of staff to become military adviser to the Philippine government. On June 19, 1936, he was appointed field marshal of the Philippine army. He retired Dec. 31, 1937, but President Manuel Quezon retained him as head of all Filipino military and constabulary forces. President Roosevelt nominated MacArthur lieutenant general in command of U.S. and commonwealth forces in the Philippines, after the Philippine army was reincorporated into U.S. forces July 26, 1941. Following Japan's attack on the Philippines in Dec. 1941, MacArthur was renamed full general by Roosevelt. After slowing the Japanese advance on Manila, he executed a planned retreat into Bataan peninsula, where he beat off the assaults of an army many times the size of his own. At the direction of President Roosevelt he arrived in Australia March 17, 1942, to command the forces of the United Nations there.

MACARTHUR, MARY REID (1880–1921), British politician, was born Aug. 31, 1880, in Glasgow. In 1906 she founded a new general trade union for women—the National Federation of Women Workers. In 1914 she became secretary of the Central Committee for the Employment of Women. In 1911 she married W. C. Anderson, who was chairman of the Labour party in 1914 and M.P. for Attercliffe (Sheffield) from 1915–18. She died Jan. 1, 1921. *See* M. A. Hamilton, *Mary Macarthur* (1925).

MACARTNEY, GEORGE MACARTNEY, EARL (1737–1806), was born at Lissanoure, Antrim, Ireland, May 14, 1737. He was appointed envoy extraordinary to Russia in 1764. On his return he entered parliament, and became chief secretary for Ireland (1769–72). In 1775 he became governor of the Caribbee Islands (being created an Irish baron in 1776), and in 1780 governor of Madras, but he declined the governor-generalship of India, and returned to England in 1786. After being created Earl Macartney in the Irish peerage (1792), he was appointed the first envoy of Britain to China. Macartney was raised to the English peerage as a baron in 1796, and in the end of the same year was appointed governor of the newly acquired territory of the Cape of Good Hope. He died at Chiswick, Middlesex, on May 31, 1806, the title becoming extinct.

An account of Macartney's embassy to China, by Sir George Staunton, published in 1797, has been frequently reprinted. *See* J. Barrow, *Life and Writings of Lord Macartney* (1807); H. Macartney Robbins *Our First Ambassador to China* (1908).

MACASSAR, the chief port in the island of Celebes, Dutch East Indies, and capital of the Government of Celebes and its dependencies. (Also spelled Makassar; native *Mangkasar.*) The first Dutch settlement here was in 1607; it was known then as Vlaardingen. In 1618 the colonists were massacred, but in 1667 the power of the sultan of Macassar was shattered by the Dutch, who established themselves very firmly at Macassar, seizing the old fort built in the time of a Portuguese settlement, which was styled Fort Rotterdam, and the place was granted a coat-of-arms. After that time it was in Dutch occupation, until the Japanese seized it in 1942, and served as a useful base in the Dutch operations against the sultans of states in Celebes. It had always been a port of some importance, though retarded from natural growth by lack of harbour and wharf facilities. In this direction a very great change took place after 1925, and Macassar became a first-class port. Between the shore and a ridge of coral reefs, half a mile out, there is a safe anchorage in deep water; and for wharfage purposes a caisson quay, 1,340 metres in length, was built out into the sea, available at depths of from 9 to 10 metres at low tide. For the protection of the quay, a breakwater was constructed over the coral islands and the banks in front of the roadstead. Behind the quay, at the south end, there is a harbour for lighters, with a length of 280 metres, and there are storesheds for coal and petroleum. Figures for vessels entering the port in 1939 were 6,750,000 cu.m. net, with 1,011 steam and motor vessels and 7,382 sailing boats. The value of the imports was 15,970,000 guilders; of the exports, 16,495,000 guilders. Macassar deals with the trade of Celebes (excluding Menado), the Moluccas, New Guinea and the eastern islands of the Lesser Sunda group. The main commodities exported are copra, gums and resins, coffee and rattan; minor ones are kapok, ebony, maize, spices, hides and skins. It is normally the great centre for distribution of imports from Europe, America, India and the far east and destined for Celebes, the Moluccas, Lesser Sundas and New Guinea, which are transhipped here, and it is in steamer communication with the leading ports of the world and all the ports of the archipelago, with the latter mainly by means of the service of the Dutch Royal Packet Navigation company.

Macassar town, pop. (1930) 84,855 (3,447 Europeans and Eurasians, and 15,963 foreign Asiatics, many of them Chinese, some Arabs), is picturesque, seen from the sea. Parallel roads run from the harbour along by the sea, through old Macassar and China-town, to the old Fort Rotterdam, facing which there is a large green square around which are grouped official buildings, business premises, a large club, the residence of the governor and, on the square, a monument in memory of the officers and men who fell in the last expedition to South Celebes. The newer part of the town is well laid out. In the neighbourhood, which is very picturesque—the forest-clad hills of Maros and the beautiful water-fall of Bantimurung are not far distant—is the grave of Dipa Negoro, leader of the Java rebellion of 1825, who was exiled and died here. A steam tramway runs from Macassar to Takalar (47 kilometres), and good roads link up the capital with the hinterland. The port was invaded and occupied by the Japanese in Feb. 1942. (E. E. L.; X.)

The natives, the Mangkassaras, are a branch of the Malay race similar to if not identical with the Bugis (*q.v.*) of Sumatra.

MACAULAY, THOMAS BABINGTON MACAULAY, BARON (1800–1859), English historian, essayist and politician, was born at Rothley Temple, Leicestershire, on Oct. 25, 1800. His father Zachary Macaulay (1768–1838), had been governor of Sierra Leone, and was in 1800 secretary to the chartered company which had founded that colony; an ardent philanthropist, he was one of the group who worked for the abolition of the slave trade, and he edited the abolitionist organ, the *Christian Observer,* for many years. Before Thomas was eight years of age he had written a *Compendium of Universal History,* and a romance in the style of Scott, in three cantos, called *The Battle of Cheviot.* A little later he composed a long poem on the history of Olaus Magnus, and a vast pile of blank verse entitled *Fingal, a Poem in Twelve Books.* Young Macaulay was sent to a private school, then, in October 1818, he went to Trinity college, Cambridge, where he afterwards became a fellow. He gained in 1824 a college prize for an essay on the character of William III. He also won a prize for Latin declamation and a Craven scholarship, and wrote the prize poems of 1819 and 1821.

In 1826 Macaulay was called to the bar and joined the northern circuit. But he spent many more hours under the gallery of the house of commons than in the court. His first public speech, made at an anti-slavery meeting in 1824, was described by the *Edinburgh Review* as "a display of eloquence of rare and matured excellence." In Aug. 1825 began Macaulay's connection with the *Edinburgh Review,* which was at this time an organ of the growing opinion which leant towards reform, and a literary tribunal from which there was no appeal. His essay on Milton (Aug. 1825), so crude that the author afterwards said that "it contained scarcely a paragraph such as his matured judgment approved," established at once his great literary reputation. The sudden blaze of popularity kindled by this single essay, is partly to be explained by the dearth of literary criticism in England at that epoch. For, though a higher note had already been sounded by Hazlitt and Coleridge, the public mind was still satisfied with the feeble appreciations of the *Retrospective Review,* or the dashing and damnatory improvisation of Wilson in *Blackwood* or Jeffrey in the *Edinburgh.* Still it seems surprising that a social success so signal should have been the consequence of a single article. The explanation is that the writer of the article on Milton was also a brilliant talker. At the university Macaulay had been pre-eminent for inexhaustible talk and genial companionship among a circle of such brilliant young men as Charles Austin, Romilly, Praed and Villiers. He now displayed these gifts on a wider stage. He was courted and admired by the most distinguished personages of the day. He was admitted at Holland House, where Lady Holland listened to him with deference, and scolded him with a circumspection which was in itself a compliment. Samuel Rogers spoke of him with friendliness and to him with affection.

Macaulay now began to aspire to a political career. But commercial disaster fell on the house of Babington and Macaulay, and the son saw himself compelled to work for his livelihood. His Trinity fellowship of £300 a year expired in 1831; he could make at most £200 a year by writing; and a commissionership of bankruptcy, which was given him by Lord Lyndhurst in 1828 was swept away in 1830. Macaulay was reduced to such straits that he had to sell his Cambridge gold medal. In Feb. 1830 he entered the House of Commons for the "pocket borough" of Calne, offered to him by Lord Lansdowne. The offer was accompanied by the express assurance that the patron had no wish to interfere with Macaulay's freedom of voting. Macaulay made his maiden speech on April 5, 1830, on the second reading of the bill for the Removal of Jewish Disabilities. In June the king died and parliament was dissolved; the revolution took place in Paris. Macaulay, who was again returned for Calne, visited Paris, eagerly enjoying a first taste of foreign travel. On March 1, 1831 the Reform Bill was introduced, and on the second night of the debate Macaulay made the first of his reform speeches, of which Sir Robert Peel said that "portions were as beautiful as anything I have ever heard or read." On the triumph of Earl Grey's cabinet, and the passing of the Reform Act in June 1832, Macaulay, whose eloquence had signalized every stage of the conflict, became one of the commissioners of the board of control, and applied himself to the study of Indian affairs. Giving his days to India and his nights to the House of Commons, he could only devote a few hours to literary composition by rising at five in the morning. Between Sept. 1831 and Dec. 1833 he furnished the *Edinburgh Review* with eight important articles, besides writing his ballad on the Armada.

In the first Reform parliament, Jan. 1833, Macaulay took his seat as one of the two members for the new borough of Leeds. He replied to O'Connell in the debate on the address, meeting the great agitator with high, but not intemperate, defiance. In July he defended the Government of India bill in a speech of great power, and he was instrumental in getting the bill through committee without unnecessary friction. When the abolition of slavery came before the house as a practical question, Macaulay had the prospect of having to surrender office or to vote for a modified abolition, viz., twelve years' apprenticeship, which was proposed by the ministry, but condemned by the abolitionists. He placed his resignation in Lord Althorp's hands, and spoke against the ministerial proposal. But the sense of the house was so strongly expressed as unfavourable that, finding they would be beaten if they persisted, the ministry gave way, and reduced apprenticeship to seven years, a compromise which the abolition party accepted; and Macaulay remained at the board of control. He then (1834) accepted a seat in the supreme council of India, created by the new India Act. The salary of the office was fixed at £10,000, out of which he calculated to be able to save £30,000 in five years.

Macaulay's appointment to India occurred at the critical moment when the government of the company was being superseded by government by the Crown. At this juncture there was more need of statesmanship directed by general liberal principles than of a practical knowledge of the details of Indian administration. The part he took in India has been described as "the application of sound liberal principles to a government which had till then been jealous, close and repressive." He vindicated the liberty of the press; he maintained the equality of Europeans and natives before the law; and as president of the committee of public instruction he inaugurated the system of national education. Macaulay was appointed president of a commission to inquire into Indian jurisprudence. The draft of a penal code which he submitted became the basis of the Indian criminal code.

In 1838 Macaulay and his sister Hannah, who had married Charles Trevelyan in 1834, returned to England. He at once entered parliament as member for Edinburgh. In 1839 he became secretary for war, with a seat in the cabinet in Lord Melbourne's ministry. His acceptance of office diverted him for a time from prosecuting the plan he had already formed of a great historical work. But in less than two years the Melbourne ministry fell. In 1842 appeared his *Lays of Ancient Rome*, and in the next year he collected and published his *Essays*. He returned to office in 1846, in Lord John Russell's administration, as paymaster-general. In the sessions of 1846–1847 he spoke only five times, and at the general election of July 1847 he lost his seat for Edinburgh. The balance of Macaulay's faculties had now passed to the side of literature. At an earlier date he had relished crowds and the excitement of ever new faces; as years went forward, and absorption in the work of composition took off the edge of his spirits, he recoiled from publicity.

He retired into private life with a sense of relief. He gradually withdrew from general society, but he still enjoyed close and constant intercourse with a circle of the most eminent men that London then contained. At that time social breakfasts were in vogue. Macaulay himself preferred this to any other form of entertainment. Of these brilliant reunions nothing has been preserved beyond the names of the men who formed them—Rogers, Hallam, Sydney Smith, Lord Carlisle, Lord Stanhope, Nassau Senior, Charles Greville, Milman, Panizzi, G. C. Lewis, Van de Weyer. His biographer thus describes Macaulay's appearance and bearing in conversation: "Sitting bolt upright, his hands resting on the arms of his chair, or folded over the handle of his walking-stick, knitting his eyebrows if the subject was one which had to be thought out as he went along, or brightening from the forehead downwards when a burst of humour was coming, his massive features and honest glance suited well with the manly sagacious sentiments which he set forth in his sonorous voice and in his racy and intelligible language. To get at his meaning people had never the need to think twice, and they certainly had seldom the time."

In these years he was working with unflagging industry at the composition of his *History*. His composition was slow, his corrections both of matter and style endless; he spared no pains to ascertain the facts. He sacrificed to the prosecution of his task a political career, House of Commons fame, the allurements of society. The first two volumes of the *History of England* appeared in Dec. 1848. The success was in every way complete beyond expectation. The sale of edition after edition, both in England and the United States, was enormous.

In 1852, when his party returned to office, he refused a seat in the cabinet, but the city of Edinburgh returned him at the head of the poll at the general election in July of that year. He had hardly accepted the summons to return to parliamentary life before fatal weakness betrayed itself in deranged action of the heart; from this time forward till his death his strength continued steadily to sink. He was oppressed by the thought that the great work to which he had devoted himself would remain a fragment. Once again, in June 1853, he spoke in parliament, and with effect, against the exclusion of the master of the rolls from the House of Commons, and at a later date in defence of competition for the Indian civil service. But he was aware that he made these efforts at the cost of more valuable work.

In Nov. 1855 vols. iii. and iv. of the *History* appeared and obtained a vast circulation. Within a generation of its first appearance upwards of 140,000 copies of the *History* were printed and sold in the United Kingdom alone; and in the United States the sales were on a correspondingly large scale. The *History* was translated into German, Polish, Danish, Swedish, Hungarian, Russian, Bohemian, Italian, French, Dutch and Spanish. Flattering marks of respect were heaped upon the author by foreign academies. His pecuniary profits were (for that time) on a scale commensurate with the reputation of the book: the cheque he received for £20,000 has become a landmark in literary history.

In May 1856 he quitted the Albany, in which he had passed fifteen happy years, and went to live at Holly Lodge, Campden Hill, then, before it was enlarged, a tiny bachelor's dwelling, but with a lawn whose unbroken slope of verdure gave it the air of a considerable country house. In the following year (1857) he was raised to the peerage by the title of Baron Macaulay of Rothley. But his health was every year visibly failing. In the House of Lords he never spoke. Gradually he had to acquiesce in the conviction that his physical energies would not carry him through the reign of Anne; and, though he brought down the narrative to the death of William III., the last half-volume wants the finish and completeness of the earlier portions. He died on Dec. 28, 1859. On Jan. 9, 1860 he was buried in Westminster Abbey.

Lord Macaulay never married. A man of warm domestic affections, he found their satisfaction in the attachment and close sympathy of his sister Hannah, the wife of Sir Charles Trevelyan. Her children were to him as his own. Macaulay was a steadfast friend, and no act inconsistent with the strictest honour and integrity was ever imputed to him. When a poor man, and when salary was of consequence to him, he twice resigned office rather than make compliances for which he would not have been severely blamed. In 1847, when his seat in parliament was at stake, he would not be persuaded to humour, to temporize, even to conciliate. He had a keen relish for the good things of life, and desired fortune as the means of obtaining them; but there was nothing mercenary or selfish in his nature. When he had raised himself to opulence, he gave away with an open hand, not seldom rashly. His very last act was to write a letter to a poor curate enclosing a cheque for £25. The purity of his morals was not associated with any tendency to cant.

The life of Macaulay was eminently happy. Till the closing years (1857–1859), he enjoyed life with the full zest of healthy faculty, happy in social intercourse, happy in the solitude of his study, and equally divided between the two. For the last fifteen years of his life he lived for literature. His writings were remunerative to him far beyond the ordinary measure, yet he never wrote for money. He lived in his historical researches; his whole heart and interest were unreservedly given to the men and the times of whom he read and wrote. His command of literature was imperial. Beginning with a good classical foundation, he made himself familiar with the imaginative, and then with the historical, remains of Greece and Rome. He went on to add the literature of his own country, of France, of Italy, of Spain. He learnt Dutch enough for the purposes of his history. He read German, but for literature of the northern nations he had no taste, and of the erudite labours of the Germans he had little knowledge and formed an inadequate estimate. The range of his survey of human things had other limitations more considerable still. All philosophical speculation was alien to his mind; nor did he seem aware of the degree in which such speculation had influenced the progress of humanity. A large—the largest—part of ecclesiastical history lay outside his historical view. Of art he confessed himself ignorant, and even refused a request to furnish a critique on Swift's poetry to the *Edinburgh Review.* He declared that Lessing's *Laocoon,* or Goethe's criticism on Hamlet, "filled" him "with wonder and despair."

Of the marvellous discoveries of science which were succeeding each other day by day he took no note; his pages contain no reference to them. It has been told already how he recoiled from the mathematical studies of his university. These deductions made, the circuit of his knowledge still remains very wide—as extensive perhaps as any human brain is competent to embrace. His literary outfit was as complete as has ever been possessed by any English writer; and, if it wants the illumination of philosophy, it has an equivalent resource in a practical acquaintance with affairs, with administration, with the interior of cabinets, and the humour of popular assemblies. Nor was the knowledge merely stored in his memory; it was always at his command. Whatever his subject, he pours over it his stream of illustration, drawn from the records of all ages and countries. His *Essays* are not merely instructive as history; they are, like Milton's blank verse, freighted with the spoils of all the ages. As an historian Macaulay has not escaped the charge of partisanship. He was a Whig; and in writing the history of the rise and triumph of Whig principles in the latter half of the 17th century he identified himself with the cause. But the charge of partiality, as urged against Macaulay, means more than that he wrote the history of the Whig revolution from the point of view of those who made it. When he is describing the merits of friends and the faults of enemies his pen knows no moderation. He has a constant tendency to glaring colours, to strong effects, and will always be striking violent blows. He is not merely exuberant but excessive. There is an overweening confidence about his tone; he expresses himself in trenchant phrases, which are like challenges to an opponent to stand up and deny them. His propositions have no qualifications. Uninstructed readers like this assurance, as they like a physician who has no doubt about their case. But a sense of distrust grows upon the more circumspect reader as he follows page after page of Macaulay's categorical affirmations about matters which our own experience of life teaches us to be of a contingent nature. We inevitably think of a saying attributed to Lord Melbourne: "I wish I were as cocksure of any one thing as Macaulay is of everything." Macaulay's was the mind of the advocate, not of the philosopher; it was the mind of Bossuet, which admits no doubts or reserves itself and tolerates none in others, and as such was disqualified from that equitable balancing of evidence which is the primary function of the historian. (M. Pa.; X.)

Macaulay's whole works were collected in 1866 by his sister, Lady Trevelyan, in 8 vols. The first four volumes are occupied by the *History;* the next three contain the *Essays,* and the *Lives* which he contributed to the *Encyclopædia Britannica.* In vol. viii. are collected his *Speeches,* the *Lays of Ancient Rome,* and some miscellaneous pieces. The "life" by Dean Milman, printed in vol. viii. of the edition of 1858–1862, is prefixed to the "People's Edition" (4 vols., 1863–1864). Messrs. Longmans, Green & Co. published a complete edition, the "Albany," in 12 vols., in 1898. There are numerous editions of the *Critical and Historical Essays,* separately and collectively; they were edited in 1903 by F. C. Montagu.

The Life and Letters of Lord Macaulay (2 vols., 1876), by his nephew, Sir George Otto Trevelyan, is one of the best biographies in the English language. His long correspondence with T. F. Ellis, which was utilized by Trevelyan in preparing the life, but only in part, was presented by Ellis's grandson to Trinity college, Cambridge, together with some unpublished poems and translations. The life (1882) in the "English Men of Letters" series was written by J. Cotter Morison. For further criticism, *see* Hepworth Dixon, in his *Life of Penn* (1841); John Paget, *The New Examen: Inquiry into Macaulay's History* (1861) and *Paradoxes and Puzzles* (1874); Walter Bagehot, in the *National Review* (Jan. 1856), reprinted in his *Literary Studies* (1879); James Spedding, *Evenings with a Reviewer* (1881), discussing his essay on Bacon; Sir L. Stephen, *Hours in a Library,* vol. ii. (1892); Lord Morley, *Critical Miscellanies* (1877), vol. ii.; Lord Avebury, *Essays and Addresses* (1903); Thum, *Anmerkungen zu Macaulay's History of England* (Heilbronn, 1882). A bibliography of German criticism of Macaulay is given in G. Körting's *Grd. der engl. Literatur* (4th ed., Münster, 1905).

MACAW, any of about 18 species of very large, very long-tailed, magnificent parrots (*q.v.*) confined to Central and South America, and having brilliant, contrasted colours, naked space around the eye and a powerful hooked beak used to crack very hard palm nuts. They are named for eating the violet-perfumed oil-nuts of the macaw palm (*Acrocomia*) of Brazil. They fly well, have loud, harsh, screaming voices and are popular in zoological gardens. They are gregarious but monogamous. They lay two white eggs in hollow trees. They constitute two genera in the subfamily Psittacinae.

Most species belong to the genus *Ara,* with naked lores, the important species taking their names from their principal colours. The blue and yellow macaw (*A. ararauna*), eastern Panama to east-central Brazil and northern Paraguay, is blue with yellow-orange underparts; the red, blue and yellow macaw (*A. macao*), 33 in., tropical Mexico to tropical Brazil, is scarlet with blue and yellow on the wings; the red, blue and green macaw (*A. chloroptera*), eastern Panama to the Argentine Chaco and Misiones, is darker red with green instead of yellow on the wing; the green macaw (*A. militaris*), 27 in., tropical Mexico to tropical Bolivia, has blue back, rump, wings and tail. Several species, all extinct, once inhabited Cuba and the Isle of Pines, Martinique, Guadalupe and Jamaica. The little light-green *A. severa,* 17.5 in., lives in northern South America; *A. spixii,* 22 in., of eastern Brazil, is nearly uniform blue. Several other species, nearly uniform cobalt, hyacinthine or greenish blue, belong to the genus *Anodorhynchus,* with feathered lores. The hyacinthine macaw (*A. hyacinthinus*), nearly 3 ft., about ponds in dense forests of interior Brazil, lays its two eggs in a hole excavated in a bank; the green-blue macaw (*A. glaucus*) is found in Paraguay, Uruguay and southeastern Brazil, but the home of the rare Lear's macaw (*A. leari*) of Brazil has not been located. (G. F. Ss.)

MACBETH, king of Scotland (d. 1058), was the son of Findlaech, *mormaer* or hereditary ruler of Moreb (Moray and Ross), who had been murdered by his nephews in 1020. He probably became mormaer on the death of Malcolm, one of the murderers, in 1029, and he may have been one of the chiefs (the Maclbaethe of the *Saxon Chronicle*) who submitted to Canute in 1031.

Marianus records that in 1040 Duncan, the grandson and successor of Malcolm king of Scotland, was slain by Macbeth. Duncan had shortly before been defeated by Thorfinn, the Norwegian earl of Orkney and Caithness, and it was perhaps this event which tempted Macbeth to seize the throne. As far as is known he had no claim to the crown except through his wife Gruach, who appears to have been a member of the royal family. Macbeth was a generous benefactor to the church, and according to S. Berchan, his reign was a time of prosperity. More than one attempt was made by members of the Scottish royal family to recover the throne; in 1045 by Crinan, the lay abbot of Dunkeld, son-in-law of Malcolm II, and in 1054 by Duncan's son Malcolm with the assistance of Siward, earl of Northumbria, himself a connection of the ousted dynasty. In 1057 Malcolm and Siward again invaded Scotland and defeated Macbeth, who was slain at Lumphanan. Macbeth is chiefly famous as the central figure of Shakespeare's great tragedy.

See W. F. Skene, *Chronicles of the Picts and Scots* (1867) and *Celtic Scotland* (1876); Sir J. Rhys, *Celtic Britain* (1904).

MACBETH, ROBERT WALKER (1848–1910), British painter, was born at Glasgow on Sept. 30, 1848. He studied art at the Royal Scottish Academy, and in 1871 came to London where he was for some time on the staff of the *Graphic.* Both as painter and etcher he was very popular. He died at Golders Green on Nov. 1, 1910. Among his best-known works are "Dunster Castle" (1895); "The End of a Good Day" (1897); and "Naval Manoeuvres" (1899).

McBRIDE, SIR RICHARD, K.C.M.G., 1912 (1870–1917), Canadian politician, was born at New Westminster on Dec. 15, 1870, and was educated first in that city and later at Dalhousie university, Halifax, Nova Scotia. He was called to the Canadian bar in 1892, and entered the British Columbian parliament as member for Dewdney in 1898. In 1900 he became minister of mines and in 1902 leader of the Opposition. In June 1903 he became prime minister for the province and retained that position until 1915, when he became agent-general for British Columbia in London. He died in London on Aug. 6, 1917.

MACCABEES, the name (in the plural) of a distinguished Jewish family dominant in Jerusalem in the 2nd century B.C. According to 1 Macc. ii. 4, the name Maccabaeus (Gr. Μακκαβαῖος, Heb. מַקָּבִי) was originally the distinctive surname of Judas, third son of the Jewish priest Mattathias, who struck the first blow for religious liberty during the persecution under Antiochus IV. (Epiphanes). Subsequently, however, it obtained a wider significance, having been applied first to the kinsmen of Judas, then to his adherents, and ultimately to all champions of religion in the Greek period. It is now customary to apply it only to the sons and descendants of Mattathias. As, however, according to Josephus (*Ant.* xii. 6.1), this brave priest's great-great-grandfather was called *Hasmon,* the family is more correctly designated by the name of the Hasmonaeans or Asmoneans. If Maccabee (*maqqābi*) is the original form of the name, the most probable derivation is from the Aramaic *maqqābā* (Heb. מַקֶּבֶת Judg. iv. 21, etc.)="hammer." The surname "hammerer" might have been applied to Judas either as a distinctive title pure and simple or symbolically as in the parallel case of Edward I., "Scotorum *malleus.*"

The Maccabaean revolt was caused by the attempt of Antiochus IV. (Epiphanes), king of Syria (175–164 B.C.), to force Hellenism upon Judaea (*see* SELEUCID DYNASTY; HELLENISM). In Dec. 168 sacrifice was offered to Zeus upon an idol altar ("the abomination of desolation," Dan. x. 27) erected over the great altar of burnt-offering. The issue of an important edict ordaining the erection of heathen altars in every township of Palestine, and the appointment of officers to deal with recusants, brought matters to a crisis. At Modin, Mattathias, an aged priest, not only refused to offer the first sacrifice, but slew an apostate Jew who was about to step into the breach. Having thus given the signal for rebellion, he then with his five sons took to the mountains. Many, including the Hasīdīm (=the pious), who had constituted themselves champions of the Law, thereupon flocked to his standard, and set themselves to revive Jewish rites and to uproot Paganism from the land. In 166 Mattathias died, after charging his sons to give their lives for their ancestral faith, and nominating Judas Maccabaeus as their leader in the holy campaign.

The military genius of Judas made this the most stirring chapter in Israelitish history. In quick succession he overthrew the Syrian generals Apollonius, Seron and Gorgias, and after the regent Lysias had shared the same fate at his hands he restored the Temple worship (165). These exploits dismayed his opponents and kindled the enthusiasm of his friends. When, however, Lysias returned in force to renew the contest, Judas had to fall back upon the Temple mount, and escaped defeat only because the Syrian leader was obliged to hasten back to Antioch in order to prevent a rival from seizing the regency. Under these circumstances Lysias unexpectedly guaranteed to the Jews their religious freedom (162). But though they had thus gained their end, the struggle did not cease; it merely assumed a new phase. The Hasīdīm indeed were satisfied, and declined to fight longer, but the Maccabees determined not to desist until their nation was politically as well as religiously free. In 161 Judas defeated Nicanor at Adasa, but within a few weeks thereafter, in a heroic struggle against superior numbers under Bacchides at Elasa, he was himself cut off. If in his brother Jonathan the cause which Judas had espoused did not possess so brilliant a soldier, it had in him an astute diplomatist who knew how to exploit the internal troubles of Syria. With all his cunning, Jonathan walked into a trap at Ptolemais, was made prisoner and ultimately slain (143). The leadership now devolved upon Simon, the last survivor of the sons of Mattathias, who succeeded in negotiating a treaty whereby the political independence of Judaea was at length secured in May 142. In the following year he was by popular decree invested with absolute powers, being appointed leader, high priest and ethnarch. As these offices were declared hereditary in his family, he became the founder of the Hasmonaean dynasty. The first year of his reign (Seleucid year 170=143–142 B.C.) was made the beginning of a new era, and the issue of a Jewish coinage betokened the independence of his sovereignty. Under Simon's administration the country enjoyed signal prosperity, but in 135 he and two of his sons were murdered by Ptolemy his son-in-law, who had an eye on the supreme power. Simon's third son, John Hyrcanus, warned in time, succeeded in asserting his rights as hereditary head of the state. The Maccabaean struggle thus gave fresh life to the Jewish nation.

After the death of Antiochus VII. Sidetes in 128 left him a free hand, Hyrcanus (135-105) soon carved out for himself a large and prosperous kingdom, which, however, was rent by internal discord owing to the antagonism developed between the rival parties of the Pharisees and Sadducees. Hyrcanus was succeeded by his son Aristobulus, whose reign of but one year was followed by that of his brother, the warlike Alexander Jannaeus (104–78). The new king's Sadducean proclivities rendered him odious to the populace, which rose in revolt, but only to bring upon itself a savage revenge. The accession of his widow Salome Alexandra (78-69) witnessed a complete reversal of the policy pursued by Jannaeus, for she chose to rule in accordance with the ideals of the Pharisees. Her elder son, Hyrcanus II., a pliable weakling, was appointed high priest; her younger son, the energetic Aristobulus, who chafed at his exclusion from office, seized some 20 strongholds and with an army bore down upon Jerusalem. At this crisis Alexandra died, and Hyrcanus agreed to retire in favour of his masterful brother. A new and disturbing element now entered into Jewish politics in the person of the Idumaean Antipater, who for selfish ends deliberately made mischief between the brothers. An appeal to M. Aemilius Scaurus, who in 65 came into Syria at the legate of Pompey, led to the interference of the Romans, the siege of Jerusalem by Pompey and the vassalage of the Jews (*q.v.*). Repeated but fruitless attempts were made by the Hasmonaeans and their patriotic supporters to throw off the Roman yoke. At length, in 40, the Parthians set up as king Antigonus, sole surviving son of Aristobulus. Through the execution of Antigonus by M. Antonius (Mark Antony) in 37 B.C. the Hasmonaean dynasty became extinct.

BIBLIOGRAPHY.—1 and 2 Macc. and Josephus are the main sources for the Maccabaean history. Besides the numerous modern histories of Israel (*e.g.* those by Dérenbourg, Ewald, Stanley, Stade, Renan, Schürer, Kent, Wellhausen, Guthe), *see* also Madden, *Coins of the Jews* (1881), H. Weiss's *Judas Makkabaeus* (1897), and the articles in the *Ency. Bib.*, Hastings's *Dict. Bible,* the *Jewish Encyclopedia.* Among more popular sketches are Moss's *From Malachi to Matthew* (1893); Streane's *The Age of the Maccabees* (1898); Morrison's *The Jews under Roman Rule;* W. Fairweather's *From the Exile to the Advent* (1901); E. R. Bevan's *Jerusalem under the High Priests* (1904); C. M. Grant's *Between the Testaments* (1918); also articles JEWS; SELEUCID DYNASTY. (W. F.)

MACCABEES, BOOKS OF, the name given to several Apocryphal books of the Old Testament. The Vulgate contains two books of Maccabees which were declared canonical by the council of Trent (1546) and found a place among the Apocrypha of the English Bible. Three other books of this name are extant. Book iii. is included in the Septuagint but not in the Vulgate. Book iv. is embraced in the Alexandrian, Sinaitic and other mss. of the Septuagint, as well as in some mss. of Josephus. A "Fifth" book is contained in the Ambrosian Peshitta, but it seems to be merely a Syriac reproduction of the sixth book of Josephus's history of the *Jewish War.* None of the books of Maccabees are contained in the Vatican (B); all of them are found in a Syriac recension.

1 Maccabees was originally written in Hebrew, but is preserved only in a Greek translation. It probably dates from about the beginning of the 1st century B.C. As it supplies a detailed and accurate record of the 40 years from the accession of Antiochus Epiphanes to the death of Simon (175–135 B.C.), without doubt the most stirring chapter in Jewish history, the book is one of the most precious historical sources we possess. In its careful chronology, based upon the Seleucid era, in the minuteness of its geographical knowledge, in the frankness with which it records defeat as well as victory, in the restraint with which it speaks of the enemies of the Jews, in its command of details, it bears on its face the stamp of genuineness. Although written in the style of the historical books of the Old Testament the work is characterized by a religious reticence which avoids even the use of the divine name, and by the virtual absence of the Messianic hope. The observance of the law is strongly urged, and the cessation of prophecy deplored (iv. 46; xiv. 41). There is no allusion either to the immortality of the soul or to the resurrection of the dead. Many scholars are of opinion that the unknown author was a Sadducee, but all that can be said with certainty is that he was a Palestinian Jew devotedly attached to the national cause.

2 Maccabees, the epitome of a larger work in five books by one Jason of Cyrene, deals with the same history as its predecessor, except that it begins at a point one year earlier (176 B.C.), and stops short at the death of Nicanor (161 B.C.), thus covering a period of only 15 years. Originally written in excellent Greek, from a pronouncedly Pharisaic standpoint, it was possibly directed against the Hasmonaean dynasty. It shows no sympathy with the priestly class. Both in trustworthiness and in style it is inferior to 1 Maccabees. In spite of its obvious defects, however, it forms a useful supplement to the first book. The writer's interests are religious rather than historical. The eschatology of 2 Maccabees is singularly advanced, for it combines the doctrine of a resurrection with that of immortality. It is worthy of note that the Roman Church finds support in this book for its teaching with reference to prayers for the dead and purgatory (xii. 43 *seq.*). An allusion to Jeremiah as "he who prayeth much for the people and the holy city" (xv. 14) it likewise appeals to as favouring its views respecting the intercession of the saints. Neither of Jason's work nor of the epitomizer's can the precise date be determined. The changed relations with Rome (viii. 10, 36) prove, however, that the latter was written later than 1 Maccabees; and it is equally clear that it was composed before the destruction of Jerusalem A.D. 70.

3 Maccabees, although purporting to be an historical narrative, is really an animated, if somewhat vapid, piece of fiction written in Greek somewhere between 100 B.C. and A.D. 70, and apparently preserved only in part. It has no connection with the Hasmonaeans, but is a story of the deliverance experienced by the Egyptian Jews from impending martyrdom at the hands of Ptolemy IV. Philopator, who reigned in the century previous to the Maccabaean rising (222–205 B.C.). The title is of later origin and rendered possible only by the generalization of the name Maccabees so as to embrace all who suffered for the ancestral faith. The purpose of the writer was evidently to cheer his Egyptian brethren during some persecution at Alexandria. Although the book was favourably regarded in the Syrian it was apparently unknown to the Latin Church. Among the Jews it was virtually ignored.

4 Maccabees differs essentially from the other books of this name. While it does not itself aim at being a history, it makes striking use of Jewish history for purposes of edification. It bears, moreover, a distinctly philosophical character, and takes the form of a "tractate" or discourse, addressed to Jews only, upon "the supremacy of pious reason over the passions." The material is well arranged and systematically handled.

The book is written in a cultured, if somewhat rhetorical, Greek style, and unmistakably coloured by the Stoic philosophy. The four cardinal virtues are represented as forms of wisdom, which again is inseparable from the Mosaic law. That the writer owes no slavish adherence to any philosophical system is plain from his independent treatment of the affections. Although influenced by Hellenism, he is a loyal Jew, earnestly desirous that all who profess the same faith should adhere to it in spite of either Greek allurements or barbaric persecution. It is not to reason as such, but only to *pious* reason (*i.e.,* to reason enlightened and controlled by the divine law), that he attributes lordship over the passions. While in his zeal for legalism he virtually adopts the standpoint of Pharisaism, he is at one with Jewish Hellenism in substituting belief in the soul's immortality for the doctrine of a bodily resurrection. The name of the author is unknown. He was, however, clearly a Hellenistic Jew, probably resident in Alexandria or Asia Minor. The date of composition cannot be definitely fixed. Most likely it is a product of the Herodian period.

5 Maccabees. On this *see* above.

BIBLIOGRAPHY.—C. J. Ball's *Variorum Apocrypha* will be found specially useful by those who cannot conveniently consult the original Greek. Among commentaries see those of C. L. W. Grimm (1853–1857), E. C. Bissell on 1, 2 and 3 Macc. in Lange-Schaff's commentary, 1880 (the whole Apocrypha being embraced in one volume, and much of the material being transferred from Grimm); G. Rawlinson on 1 and 2 Macc. in the *Speaker's Commentary* (1888; much useful matter, but marred by too frequent inaccuracy); Zöckler, on 1, 2 and 3 Macc. (1891; slight and unsatisfactory); W. Fairweather and J. S. Black on 1 Macc., in the *Cambridge Bible for Schools* (1897); E. Kautzsch on 1 and 3 Macc., Kamphausen on 2 Macc., Deissmann on 4 Macc. in *Die Apok. u. Pseudepigr. des Alt. Test.* (1898 ed. by E. Kautzsch, a most serviceable work for the student of apocryphal literature) and Oesterley (1M.), Moffatt (2M.) and Emmet (3M.) in *Apocrypha and Pseudepigrapha* (ed. Charles). Brief but useful introductions to all the four books of Maccabees are given in E. Schürer's *Geschichte des Jüdischen Volkes im Zeitalter Jesu Christi* (Eng. tr. of earlier edition, 1886–1890).

See also R. H. Charles, *Between the Old and New Testaments,* pp. 198–202, 218 seq. (1914), and A. A. Bevan in *Journ. Theol. Stud.,* Jan. 1929. (W. F.)

MacCARTHY, DENIS FLORENCE (1817–1882), Irish poet, was born in Dublin on May 26, 1817, and educated there, and at Maynooth. His earlier verses appeared in *The Dublin Satirist,* and in 1843 he became a regular contributor of political verse to the recently founded *Nation.* He also took an active part in the Irish political associations. In 1846 he edited *The Poets and Dramatists of Ireland* and the *Book of Irish Ballads.* His collected *Ballads, Poems and Lyrics* (1850), including translations from nearly all the modern languages, took immensely with his countrymen on account of their patriotic ring. In 1853 he began a number of translations from the Spanish of Calderon's dramas, which won him a medal from the Royal Spanish Academy. He was granted a civil list pension for his literary services. He died in Ireland on April 7, 1882. His works include *The Bellfounder* (1857); *Under-glimpses* (1857); and *The Early Life of Shelley* (1871).

M'CARTHY, JUSTIN (1830–1912), Irish politician, historian and novelist, was born in Cork on Nov. 22, 1830, and was educated there. He worked on the staff of the *Northern Daily Times* (1853–59); the *Morning Star* (1860–68), being its editor for four years; and the *Daily News* (1870, etc.). He represented Co. Longford in parliament as a Liberal and Home Ruler from 1879 to 1885; North Longford, 1885–86; Londonderry, 1886–92; and North Longford from 1892 to 1900. He was chairman of the Anti-Parnellites from the fall of C. S. Parnell in 1890 until Jan. 1896; but his nationalism was of a temperate and orderly kind, and though his personal distinction singled him out for the chairmanship during the party dissensions of this period, he was in no active sense the political leader. His real bent was towards literature. His earliest publications were novels, some of which, such as *A Fair Saxon* (1873), *Dear Lady Disdain* (1875), *Miss Misanthrope* (1878), *Donna Quixote* (1879), were excellent. His most important work is his *History of Our Own Times* (vols. i.–iv., 1879–80; vol. v., 1897), which treats of the period between Queen Victoria's accession and her diamond jubilee. He also began a *History of the Four Georges* (1884–1901), of which the latter half was written by his son, Justin Huntly M'Carthy (1860–1936), the author of various clever novels, plays, poetical pieces and short histories. Justin M'Carthy died at Folkestone on April 24, 1912. His publications include biographies of Sir Robert Peel (1891), Pope Leo XIII. (1896) and W. E. Gladstone (1898); *Modern England* (1898); *The Reign of Queen Anne* (1902) and *Reminiscences* (2 vols., 1899).

McCLELLAN, GEORGE BRINTON (1826–1885), American soldier, was born at Philadelphia, Pa., on Dec. 3, 1826. He was educated at the University of Pennsylvania preparatory school, and in July, 1846, graduated from West Point with such high rank that he was attached to the corps of engineers. In September of that year he was despatched to Mexico, where he served under Gen. Winfield Scott and was breveted for gallantry. At the close of the Mexican War he was assigned to West Point as instructor in practical engineering, and in 1851 superintended the construction of Ft. Delaware. In 1852 he served in the Red river expedition, and in 1853–54 was on duty in Washington Territory and Oregon as an engineer officer.

In the spring of 1855 he was directed to visit Europe, with two other officers, and to report upon the art of war. The commission witnessed the siege of Sevastopol, in the Crimea, and visited many countries and military establishments. Upon its return, McClellan not only furnished an able report under the title *Armies of Europe* (republished 1862), but also designed (1856) a saddle which was adopted by the army, and afterwards known as "the McClellan." In Jan. 1857, when captain in the 1st cavalry, he resigned his commission and accepted the position of chief engineer of the Illinois Central railroad. He was later made vice president, and subsequently president, of the Ohio and Mississippi Railroad Company. In May 1860 he married Ellen Mary Marcy, and established his residence at Cincinnati, O., where he was living at the outbreak of the Civil War. Offering his services to the Union, he was commissioned major-general of Ohio Volunteers on April 23, 1861, and on May 4, was made major-general in the army of the United States. He was placed in command of the department of the Ohio, and acting upon his own initiative, on May 26, despatched a small force across the Ohio river at Philippi. He dispersed the Confederates early in June, and, following this success by a rapid advance, secured control of so much territory for the Union cause, that the State of West Virginia was separated from the Old Dominion, of which it had been a component part. This was the first successful campaign in the war between the States, and gave him such immediate popularity that he was dubbed "Little Mac: the Young Napoleon."

On July 22, McClellan was directed to turn over his command to the next in rank and to proceed to Washington, where he arrived July 26, 1861. He was there informed by President Lincoln that he had been placed in charge of the troops at the capital, and was directed speedily to bring order out of chaos. This he did, and the spirit of demoralization which obsessed the Federals after the disastrous defeat at First Bull Run quickly disappeared. With the assistance of his engineers, he soon had a ring of earthen fortifications and redoubts thrown about the city, and by drill and disciplinary measures whipped the raw levies into excellent shape before the spring of 1862. Then the so-called army of the Potomac was transported to Fortress Monroe by steamer, and began an advance upon Richmond by way of the peninsula which lies between the York and James rivers.

The Confederates delayed the march at Big Bethel, Yorktown, and Williamsburg, and although, by May 31, McClellan's forces were within seven miles of the Confederate capital, they were in a very bad strategical position, because the Chickahominy river—with its treacherous swamp land—divided the two wings of the army. To McClellan's great disappointment, the President had detained Gen. McDowell with 40,000 men to cover Washington, which made his numbers about equal to those of the Confederates. Gen. Banks in the Shenandoah valley was watching "Stonewall" Jackson's remarkable "foot cavalry," but by defeating Banks and threatening Washington, Jackson kept McDowell's division from re-enforcing McClellan. Jackson himself joined the Confederates defending their capital. Meanwhile, President Lincoln called Maj.-Gen. John Pope from the West, placing him in command of the combined armies of Banks and Frémont in the valley, and McDowell at Fredericksburg. These forces were advanced towards the Rappahannock.

McClellan was checked at the battle of Seven Pines, or Fair Oaks, where Gen. Johnston, who directed the Confederates, was wounded, and Gen. Robert E. Lee took command of the army. Seeing the advantage of attacking a portion of McClellan's divided detachments, the new commander (with the assistance of Jackson's corps) precipitated a furious assault upon the Union right wing. Then followed the terrible "Seven Days'" fighting, in which McClellan was compelled to retreat (June 26 to July 1) to the James river; ending the backward movement and change of base (from White House on the Pamunkey to Harrison's Landing on the James) at Malvern Hill, under the protection of the Union gunboats. By a petulant telegram (June 28) the defeated commander incurred the everlasting displeasure of the secretary of War, and by an ill-advised letter to the president from Harrison's Bar, engendered a similar feeling among the members of the cabinet. Yet, after his army had been transported to Alexandria and sent to the aid of Pope, who was signally defeated at Cedar mountain and Second Bull Run, so great was the need of his assistance that he was called to Washington by Gen. Halleck (military adviser of the President) and verbally ordered to take charge of all the troops retreating to the city. In this President Lincoln concurred.

The Federals were soon well in hand, but there was immediate work for them to do, as Lee had crossed the Potomac, invaded Maryland and seized Hagerstown and Fredericksburg. McClellan put the Union forces in motion towards the invaders, and on Sept. 13, 1862, had the good fortune to come into possession of an order issued by the Confederate chieftain which had been found by a private of the 27th Indiana Volunteers, wrapped securely around three cigars. This fully disclosed his plans. An immediate and rapid advance was ordered; the Confederates were driven through the Blue Ridge at Turner's and Fox's gaps and pursued to Antietam creek, near Sharpsburg, Md., where they offered battle. Although the Confederate army consisted of but 41,500 men, and the Union force was approximately 81,176, McClellan not only fought the battle in detail, engaging not more than two of his six corps simultaneously, but he even held two corps out of the battle almost entirely. On the 18th the Union troops were not permitted to attack, and on the next day Lee safely retreated across the Potomac at Shepherdstown. McClellan's unwillingness to risk battle in spite of superior numbers, coupled with his great delay in following the retreating Confederates so exasperated the authorities in Washington with his conduct of the campaign that he was subsequently removed from the position of commander-in-chief of the army of the Potomac (Nov. 5 1862). Major-Gen. Burnside was appointed to succeed him, and he was never afterwards tendered a command.

In 1864, McClellan became the Democratic presidential candidate upon a platform which denounced the war as a failure and proposed negotiations with the South for peace, but, as a patriotic soldier, he repudiated the platform although accepting the nomination. At the polls Abraham Lincoln was overwhelmingly reelected president, as a result of which McClellan soon sailed for Europe, after resigning his commission in the army. Upon his return, the former leader took up his residence in New York city, where (1868–69) he was engaged in superintending the construction of an experimental floating battery. In 1871–72 he was engineer-in-chief of the City of New York's department of docks. Removing to Orange, N.J. (1877–81), he was elected governor of New Jersey upon the Democratic ticket. Although offered a second nomination, he refused it, and spent his later years in travelling abroad and preparing his memoirs. He died suddenly of heart disease, on Oct. 29, 1885, at Mayfield, Orange, New Jersey. Bronze equestrian statues at Philadelphia and Washington have been erected to this popular but unfortunate general, who always held the affectionate regard of the enlisted men.

BIBLIOGRAPHY.—Besides *McClellan's Own Story,* published posthumously by W. C. Prime in 1887, Gen. McClellan was the author of *Exploration of the Red River of Louisiana in the year 1852* (1853); *Report on the Several Pacific Railroad Explorations* (1855); *European Cavalry* (1861); *Regulations and Instructions for the Field Service of the U.S. Cavalry in time of war* (1861); *Armies of Europe* (1862); *Manual of Bayonet Exercise* (1862); *Letter to President Lincoln* (1862); *Letter to the Secretary of War* (1862); *Complete Report of the Organization and Campaigns of the Army of the Potomac* (1864); *Letter of Acceptance and West Point Oration* (1864); and *McClellan's Mexican War Diary,* not published until 1917. He wrote also a series of articles on the Russo-Turkish War for *The North American Review. See* memoir in the preface of *McClellan's Own Story;* Wakenfield Addey, *Little Mac and How he became a Great General* (1864); P. S. Michie, *General McClellan* in the "Great Commanders" series (1901); J. H. Campbell, *A Vindication of the Military Career of General McClellan* (1916); Capt. T. G. Frothingham, "The Peninsula Campaign" and "The Crisis of the Civil War: Antietam," in *Proceedings of the Massachusetts Historical Society,* vol. lvi. and lvii.

(C. H. L. J.)

McCLERNAND, JOHN ALEXANDER (1812–1900), American soldier and lawyer, was born in Breckinridge county, Ky., on May 30, 1812. He was admitted to the bar in Shawneetown, Ill., in 1832; in the same year served as a volunteer in the Black Hawk War, and in 1835 founded the *Shawneetown Democrat,* which he thereafter edited. As a Democrat he served in 1843–51 and in 1859–61 as a representative in Congress, where in his first term he vigorously opposed the Wilmot Proviso, but in his second term was a strong unionist. He resigned from Congress, raised in Illinois the "McClernand brigade," and was commissioned (May 17, 1861) brigadier-general of volunteers. He was second in command at the battle of Belmont (Missouri) in Nov. 1861, and commanded the right wing at Ft. Donelson. In March 1862 he became a major-general of volunteers, and at Shiloh he commanded a division. Early in January, 1863, at Milliken's Bend, McClernand, who had been placed in command of one of the four corps of Grant's army, superseded Sherman as the leader of the force that was to move down the Mississippi against Vicksburg. On Jan. 11 he took Arkansas Post. During the rest of the Vicksburg campaign there was much friction between McClernand and his colleagues; he undoubtedly intrigued for the removal of Grant; it was Grant's opinion that at Champion's Hill (May 16) he was dilatory; and on June 18 he was relieved of his command. President Lincoln, who saw the importance of conciliating a leader of the Illinois War-Democrats, restored him to his command in 1864, but McClernand resigned in November of that year. He died in Springfield, Ill., on Sept. 20, 1900.

MACCLESFIELD, CHARLES GERARD, 1st Earl of (*c.* 1618–1694), of an old Lancashire family, commanded a brigade at Edgehill, and, distinguishing himself at Newbury (1643) and Newark (1644) he was given chief command in Wales. His severity made him unpopular and he was removed the following year, but was retained in command of the king's guard during the march from Wales to Oxford, and thence to Hereford and Chester. In 1645 he was created Baron Gerard of Brandon, Suffolk, but soon after was dismissed for his protest against the supersession of Sir R. Willis. After Charles' capitulation at Oxford (1646) he went abroad, where he remained until the Restoration. In 1660 he returned at the head of the Life Guards; his estates were restored and he received a pension. Gerard was created earl of Macclesfield and Viscount Brandon in 1679, but his relations with Monmouth led to an order for his arrest in 1684. He escaped abroad, but returned with William III. in 1688 as commander of his body guard. He was made a privy councillor and president of the council of Welsh marches, 1689. He died on Jan. 7, 1694.

His eldest son, Charles, 2nd earl of Macclesfield, (*c.* 1659–1701), born in France, was naturalized in England. He was concerned in the intrigues of Monmouth, and in 1685 was sentenced to death after the Rye House plot, but was pardoned. In 1698 Macclesfield was divorced from his wife Anna, daughter of Sir Richard Mason of Sutton, by act of parliament, the first occasion on which a divorce was so granted without a previous decree of an ecclesiastical court. The countess was the mother of two children, known by the name of Savage, whose reputed father was Richard Savage, 4th Earl Rivers (d. 1712). The poet Richard Savage (*q.v.*), claimed that he was the younger of these children.

In 1721 the title of earl of Macclesfield was revived in favour of Thomas Parker (*c.* 1666–1732), who became a barrister. In 1710 he took part in the proceedings against Sacheverell, and was appointed lord chief justice, and in 1718 he became lord chancellor. Corruption was alleged and in 1725 he was impeached, found guilty and heavily fined. He died in 1732.

Macclesfield's only son, George (*c.* 1697–1764), was celebrated as an astronomer and prominent in introducing the new style of dates (1752). He was president of the Royal Society and died on March 17, 1764.

See Lord Clarendon, *History of the Rebellion,* edit. by W. D. Macray; E. B. G. Warburton, *Memoirs of Prince Rupert and the Cavaliers* (3 vols., 1849); *State Papers of John Thurloe* (7 vols., 1742); J. R. Phillips, *Memoirs of the Civil War in Wales and the Marches, 1642–49* (2 vols., 1874); and the duke of Manchester, *Court and Society from Elizabeth to Anne* (2 vols., 1864). For Lord Chancellor Macclesfield, *see* Lord Campbell, *Lives of the Lord Chancellors and Keepers of the Great Seal* (1845–69).

MACCLESFIELD, market town, municipal borough, Macclesfield parliamentary division, Cheshire, England, 166 mi. N.W. of London, on the L.M.S. and L.N.E. railways. Pop. (est. 1938) 36,350. Area 6.97 sq.mi. It stands on the river Bollin in a deep gorge with heights up to 1,000 ft. on the east. The bleak upland country retains its ancient name of Macclesfield forest. The church of St. Michael was founded in 1278, and in 1740 was partly rebuilt and enlarged. Connected with the church are two chapels, of which Rivers chapel belonged to a college of secular priests founded in 1501. The free grammar school, founded in 1502, was refounded in 1552. The old buildings were sold in 1750 and new buildings opened in 1856. There are also technical and art schools. The county lunatic asylum is here. Originally the trade of Macclesfield was principally in twist and silk buttons, but this developed into the manufacture of all kinds of silk. Also there are manufactures of upholsterers' trimmings and extensive breweries; while stone quarries, as well as coal-mines, are worked in the neighbourhood. Recreation grounds include Victoria park, South park and Peel park, in which are preserved the old market cross and stocks. Water communication is provided by the Macclesfield canal. The populous suburb of Sutton, extending S.S.E. of the town, is partly included in the borough.

Before 1066, Macclesfield (Makesfeld, Mackerfeld, Macclesfeld, Meulefeld, Maxfield) was held by Edwin, earl of Mercia, and in the Domesday Survey it is in the lands of the earl of Chester. The names Jordangate, Chestergate and Wallgate bear witness to 13th century fortifications. In the 15th century Henry Stafford, duke of Buckingham, had a fortified manor-house here; its traces remain. The earliest of the many charters, granted by Edward, prince of Wales, in 1261, constituted Macclesfield a free borough with a merchant guild. In 1684 Charles II issued a new charter, which continued until the Municipal Reform act, 1835. The earliest mention of a market is in 1617. In the charter of 1666 a market is included among the privileges confirmed to the borough. The charter of Elizabeth (1564) granted an annual fair in June and Charles II (1684) granted fairs in April and September. Except for January, April and September fairs are now held monthly, the chief being "Barnaby" in June, when the town keeps a week's holiday. Macclesfield borough sent two members to parliament in 1832 for the first time. In 1880 it was disfranchised, and in 1885 was merged in the county division of Macclesfield. The manufacture of silk-covered buttons began in the 16th century, and flourished until the early 18th. The first silk mill was erected about the year 1755, and silk manufacture on a large scale was introduced about 1790. The manufacture of cotton began in Macclesfield about 1785.

M'CLINTOCK, SIR FRANCIS LEOPOLD (1819–1907), British naval officer and Arctic explorer, was born at Dundalk, Ireland, on July 8, 1819. During the year 1848 he joined the Arctic expedition under Sir James Ross in search of Sir John Franklin's ships, as second lieutenant of the "Enterprise." In the second search expedition (1850) he was first lieutenant of the "Assistance," and in the third (1854) he commanded the "Intrepid." The direction which the search should follow had at last been learnt from the Eskimo, and M'Clintock accepted the command of the expedition on board the "Fox," fitted out by Lady Franklin in 1857, which succeeded in its object in 1859 (*see* Franklin, Sir John). Later he sounded the North Atlantic for the electric cable. He was one of the principal advisers in the preparations for the Antarctic voyage of the "Discovery" under Captain Scott. He died on Nov. 17, 1907.

See Sir C. R. Markham, *Life of Admiral Sir Leopold M'Clintock* (1909); and his own *Voyage of the "Fox" in the Arctic Seas* (1859).

McCLINTOCK, JOHN (1814–1870), American Methodist Episcopal theologian and educator of Scottish-Irish descent, was born in Philadelphia, Pa., on Oct. 27, 1814. Because of his father's financial embarrassment he worked before going to college and kept up his senior studies at the University of Pennsylvania while doing active pastoral work. After his graduation in 1835 he taught in Dickinson college for 12 years. He edited *The Methodist Quarterly Review* (1848–56), and in 1867, at the wish of Daniel Drew, was president of the newly established Drew Theological seminary at Madison, N.J., where he died on March 4, 1870. An able preacher, orator and teacher, and a remarkably versatile scholar, McClintock by his editorial and educational work probably did more than any other man to raise the intellectual level of American Methodism. He put into practice the scholarly methods of the new German theology of the day—not alone by his translation with Charles E. Blumenthal of Neander's *Life of Christ* (1847), and of Bungener's *History of* *the Council of Trent* (1855), but by his own noteworthy project, McClintock and Strong's *Cyclopaedia of Biblical, Theological and Ecclesiastical Literature* (1867–81; supplement, 1885–87). Among McClintock's other publications are *Sketches of Eminent Methodist Ministers* (1853), *Living Words* (1871) and *Lectures on Theological Encyclopaedia and Methodology* (1873). *See* G. R. Crooks, *Life and Letters of the Rev. Dr. John McClintock* (1876).

McCLOSKEY, JOHN (1810–1885), U.S. cardinal, was born in Brooklyn, N.Y., on March 20, 1810. He graduated at Mt. St. Mary's college, Emmitsburg, Md., in 1827, studied theology there, was ordained a priest in 1834, and in 1837, after two years in the college of the Propaganda at Rome, became rector of St. Joseph's, New York city. In 1844 he was consecrated bishop of Axieren *in partibus,* and was made coadjutor to Bishop Hughes of New York, with the right of succession; in 1847 he became bishop of the newly created see of Albany; and in 1864 he succeeded to the archdiocese of New York, then including New York, New Jersey and New England. In April 1875 he was invested as a cardinal, with the title of Sancta Maria supra Minervam, being the first U.S. citizen to receive this dignity. He attended the conclave of 1878, but was too late to vote for the new pope. He died in New York city on Oct. 10, 1885.

See J. M. Farley, "Life of Cardinal McCloskey," U.S. Cath. Hist. Soc. *Records and Studies* (vol. i–ii, 1899–1901); J. J. Walsh, *Our American Cardinals* (1926).

M'CLURE, SIR ROBERT JOHN LE MESURIER (1807–1873), English Arctic explorer, born at Wexford, Ireland, on Jan. 28, 1807, the posthumous son of one of Abercrombie's captains, served as mate of the "Terror" in the expedition (1836–37) commanded by Captain (afterward Sir) George Back. He joined the Franklin search expedition (1848–49) under Sir J. C. Ross as first lieutenant of the "Enterprise," and on the return of this expedition was given the command of the "Investigator" in the new search expedition (1850–54) which was sent out by way of Bering strait to co-operate with another from the northwest. In this voyage he completed (1850) the work connected with the discovery of a northwest passage.

See Admiral Sherard Osborn, *The Discovery of a North-West Passage* (1856); and his own *Voyages* (2 vols. 1884).

McCOMB, a city of Pike county, Mississippi, U.S.A., on federal highway 51 and the Illinois Central railway system, 60 mi. S.E. of Natchez. Pop. (1920) 7,775 (22% Negroes); 9,898 in 1940 by the federal census. It is a shipping point for cotton, corn, garden truck and cattle, and has railway shops, textile and lumber mills. The city was incorporated in 1872.

McCONNELL, FRANCIS JOHN (1871–), U.S. Methodist bishop, was born at Trinway, Ohio, Aug. 18, 1871. He graduated at Ohio Wesleyan university and later studied at Boston university, receiving the degrees of S.T.B. and Ph.D. In 1895 he entered the Methodist ministry and was pastor successively at Chelmsford, Newton Upper Falls, Ipswich and Cambridge, all in Massachusetts, and in 1903–09 at the New York Avenue Methodist church in Brooklyn. From 1909 to 1912 he was president of De Pauw university. He was elected bishop in 1912 and served for a number of years in Mexico and afterward in the Pittsburgh district. In the latter region he entered actively into a study of industrial conditions and problems. As chairman of the Commission of Inquiry appointed by the Interchurch World Movement organization he pushed the investigation resulting in the *Report on the Steel Strike of 1919* which was influential in abolishing the 12-hour day and seven-day week in the steel industry. He is the author of many magazine articles and books, among the latter being *Personal Christianity* (1914); *Democratic Christianity* (1919); *The Preacher and the People* (1922); *The Christlike God* (1927); and *Christianity and Coercion* (1933).

McCOOK, ALEXANDER McDOWELL (1831–1903), U.S. soldier, was born in Columbiana county, O., on April 22, 1831. He graduated at the U.S. military academy in 1852, served against the Apaches and Utes in New Mexico in 1853–57, and in April 1861 became colonel of Ohio volunteers. He served in the first battle of Bull Run; commanded a brigade in Kentucky in the winter of 1861, a division in Tennessee and Mississippi early in 1862, and the 1st corps in Kentucky in October of the same year; was in command of Nashville in November and December of that year; and was then engaged in Tennessee until after the battle of Chickamauga. He retired in 1895, a major-general.

His father, Daniel McCook (1798–1863), killed at Buffington's island during Gen. John H. Morgan's raid in Ohio, and seven of his eight brothers (three of whom were killed in battle) all served in the Civil War; this family and that of John McCook (1806–1865), Daniel's brother, who served as a volunteer surgeon in the Civil War, are known as the "fighting McCooks"—four of John's sons served in the army and one in the navy.

His brother, Henry Christopher McCook (1837–1911), was a pastor, but he is best known as an entomologist. He wrote *The Mound-making Ants of the Alleghanies* (1877); *The Natural History of the Agricultural Ants of Texas* (1879); *Tenants of an Old Farm* (1884); *American Spiders and their Spinning-work* (1889–93); *Nature's Craftsmen* (1907); *Ant Communities* (1909).

McCOOK, a city of southern Nebraska, U.S.A., on the Republican river, federal highways 6, 34 and 183, and the Burlington (railway) route, 280 mi. W.S.W. of Omaha; the county seat of Redwillow county, and the trade centre for the surrounding farming and stock-raising country. The population was 4,303 in 1920 (91% native white) and was 6,212 in 1940 by the federal census. The city was founded in 1883 and incorporated in 1886.

McCORD, LOUISE SUSANNA CHEVES (1810–1879), U.S. author, daughter of Langdon Cheves and Mary Elizabeth Dulles Cheves, was born Dec. 3, 1810, in Charleston, S.C. A member of a colonial family, her ancestry was Scotch, Irish and Huguenot. In her early years in South Carolina Louise McCord studied French and music for young girls. Her education was continued at Grimshaw's school in Philadelphia. Before her formal presentation to society in Philadelphia and Washington, D.C., native linguists were employed to perfect her in the languages. Later, under tutors selected for her brothers, she studied mathematics and kindred branches.

In association with her father and his intimate circle of public men of the state, Miss Cheves became deeply interested in the history of the U.S. Her attitude toward slavery was that the Negro was being civilized in his contact with the white Christian races of the United States. She contributed political and other essays to the *Southern Quarterly Review* in 1853 and, in 1848, published a translation of Frederic Bastiat's *Sophismes Economiques,* which influenced all of her views. Other literary efforts included a volume of poems, *My Dream,* and a five-act, blank verse drama, *Gaius Gracchus.* In 1840 Louise Cheves was married to David James McCord, a lawyer of distinction. After his death she spent two years abroad and, on her return, made her home in Columbia, S.C. During the Civil War Mrs. McCord was active in relief work; on the death of her son, Capt. Langdon Cheves McCord, in the 2nd battle of Manassas, she gave much of her time to nursing sick soldiers and other hospital work. After the Civil War Mrs. McCord removed to Charleston, S.C., where she died in Nov. 1879. She was buried with honours in Magnolia cemetery of that city.

See C. A. Mauchope, *The Writers of South Carolina* (1910); *Library of Southern Literature* (vol. viii, 1907); *Dictionary of American Biography* (vol. xi). (E. Row.)

MacCORMAC, SIR WILLIAM, Bart. (1836–1901), Irish surgeon, was born at Belfast on Jan. 17, 1836. He studied at Belfast, Dublin and Paris. After practice in Belfast and war service in France (1870) and Serbia (1876) he became (1881) assistant surgeon at St. Thomas's hospital, London. He was one of the first to apply Listerian methods in surgery and was a pioneer in operating for intraperitoneal rupture of the bladder (1886). He was president of the Royal College of Surgeons no less than five times. In 1897 he was surgeon-in-ordinary to the prince of Wales. In 1899 he was Hunterian orator. He died at Bath on Dec. 4, 1901.

McCORMACK, JOHN (1884–1945), tenor, was born at Athlone, Eire, on June 14, 1884. At the age of nine he faced his first audience when he sang at the Marists Brothers school. He was educated at Summerhill college, Co. Sligo. He won the prize at the Irish music festival, *Feis Ceoil,* and went to the U.S. on a short singing tour, returning to Dublin to sing before going to Italy where he studied under Sabatini. At his second attempt Cleofonte Campanini gave him his opportunity at Covent Garden, where he made his début in *Cavalleria Rusticana,* Oct. 15, 1907, his success the following year leading to presentation to King Edward and Queen Alexandra. Oscar Hammerstein engaged him for the Manhattan Opera house where he made his New York début in *Traviata,* Nov. 10, 1909. He afterward sang with the Chicago-Philadelphia Opera company, the Chicago Grand Opera company and the Metropolitan Opera company. In 1911 he toured Australia with Melba in Italian opera. After two further operatic seasons in the U.S., 1912, and Australia, 1913, he turned to the concert stage where he achieved extraordinary popularity as a ballad singer. He became a citizen of the United States in 1919. In 1921 he was made Knight commander of the orders of St. Gregory the Great and of the Holy Sepulchre by Pope Benedict XV, and in 1928 he was made a count in the papal peerage. McCormack died Sept. 16, 1945, in Dublin.

McCORMICK, CYRUS HALL (1809–1884), U.S. inventor of grain-harvesting machinery, was born in Rockbridge Co. (Va.), U.S.A., on Feb. 15, 1809. His father was a farmer who had invented numerous labour-saving devices for farm-work, but after repeated efforts had failed in his attempts to construct a successful grain-cutting machine. In 1831, Cyrus, then 22 years old, took up the problem, and after careful study constructed a machine which was successfully employed in the late harvest of 1831 and patented in 1834. The McCormick reaper, after further improvements, proved a complete success; and in 1847 the inventor removed to Chicago, where he manufactured his machines. He died in Chicago on May 13, 1884.

See Herbert N. Casson, *Cyrus Hall McCormick: his Life and Work* (1909).

McCORMICK, ROBERT RUTHERFORD (1880–), American editor, was born in Chicago (Ill.), July 30, 1880. Graduating from Yale university in 1903, he studied law at Northwestern university and was admitted to the Illinois bar in 1907. He was active in Chicago civic circles from 1904 to 1910. In 1910 he became associated with his cousin, Joseph Medill Patterson, as co-editor and publisher of the *Chicago Tribune,* being president of the Chicago Tribune company. Under their direction the *Tribune* enormously increased its circulation and advertising. The beautiful Tribune tower, built after extended architectural competition, symbolizes the paper's success. After service in World War I, McCormick and his cousin, in 1921, started the illustrated *Daily News* in New York.

McCOSH, JAMES (1811–1894), Scottish philosophical writer, born of a Covenanting family in Ayrshire, on April 1, 1811, became a minister, and took part in the Free Church movement of 1843. He was professor at Queen's college, Belfast (1852–68), and president of the college of New Jersey, Princeton (1868–88). He died on Nov. 16, 1894.

His chief works are: *Method of Divine Government, Physical and Moral* (Edinburgh, 1850, frequently republished in New York); *The Typical Forms and Special Ends in Creation* (Edinburgh, 1855; new editions, New York, 1867–80); *Intuitions of the Mind inductively investigated* (1860; 3rd rev. ed., 1872); *An Examination of Mr. J. S. Mill's Philosophy* (1866; enlarged 1871, several eds.).

McCOY, SIR FREDERICK (1823–99), C.M.G. (1886), K.C.M.G. (1891), British palaeontologist, the son of Dr. Simon McCoy, was born in Dublin in 1823, and was educated for the medical profession. In collaboration with Sedgwick he prepared *A Synopsis of the Classification of the British Palaeozoic Rocks, with a Systematic Description of the British Palaeozoic Fossils in the Geological Museum of the University of Cambridge* (1855). After four years in Belfast he became professor of natural science in the University of Melbourne, where he lectured for upwards of thirty years. He established the National museum of Natural History and Geology in Melbourne, of which he was director; and becoming associated with the geological survey of Victoria as palaeontologist, he issued a series of decades entitled *Prodromus of the Palaeontology of Victoria.* He also issued the *Prodromus of the Zoology of Victoria.* He was elected F.R.S. in 1880. He died in Melbourne on May 16, 1899.

M'CRIE, THOMAS (1772–1835), Scottish historian and divine, was born at Duns in Berwickshire in Nov. 1772. He studied in Edinburgh university, and in 1796 he was ordained minister of the Second Associate Congregation, Edinburgh. In 1806, M'Crie seceded from the "general associate synod," and formed the "constitutional associate presbytery," afterwards merged in the "original seceders." He was deposed by the associate synod, and his congregation withdrew with him and built another place of worship in which he officiated until his death. M'Crie studied the history, constitution and polity of the churches of the Reformation, and published *The Life of John Knox, containing Illustrations of the History of the Reformation in Scotland* (1811), which exercised an important influence on public opinion at the time. He died on Aug. 5, 1835.

MACCULLOCH, HORATIO (1805–1867), Scottish landscape painter, was born in Glasgow. He studied for a year under John Knox, a Glasgow landscape-painter, was then engaged at Cumnock to paint the ornamental lids of snuff-boxes, and afterwards went to Edinburgh where Lizars, the engraver, employed him to colour book illustrations. At Glasgow he was employed to paint several large pictures for the decoration of a public hall in St. George's place. MacCulloch's works form an interesting link between the old world of Scottish landscape and the new. From 1829 he exhibited regularly in the Royal Scottish academy's exhibition till his death on June 24, 1867.

A volume of photographs from his landscapes, with a biographical notice by Alexander Fraser was published in Edinburgh in 1872.

McCULLOCH, HUGH (1808–1895), U.S. financier, was born at Kennebunk (Me.) Dec. 7, 1808. He was educated at Bowdoin college, studied law in Boston, and in 1833 began practice at Ft. Wayne (Indiana). He was cashier and manager of the Ft. Wayne branch of the old state bank of Indiana from 1835 to 1857, and president of the new state bank from 1857 to 1863. He was selected by Secretary Chase as comptroller of the currency in 1863 to put the new National Banking act of 1862 into operation. He was appointed secretary of the treasury by President Lincoln in 1865, and was continued in office by President Johnson until the close of his administration in 1869. In accordance with his suggestion, an act was passed (March 12, 1866), authorizing the withdrawal from circulation of greenbacks as a preliminary to the resumption of specie payments, but it met with strong opposition and was repealed on Feb. 4, 1868, after only $48,000,000 had been withdrawn. McCulloch went to England, and spent six years (1870–76) as a member of the banking firm of Jay Cooke, McCulloch and Co. From Oct. 1884 until the close of President Arthur's term of office in March 1885 he was again secretary of the treasury.

He died at his home near Washington (D.C.) May 24, 1895.

M'CULLOCH, SIR JAMES (1819–1893), Australian statesman, was born in Glasgow. He went to Melbourne to open a branch of Dennistoun Brothers. In 1854 he was nominated to the legislative council, and was returned for Wimmera in the legislative assembly. In 1857–58 he was minister of trade and customs, and in 1859–60, treasurer. On the defeat of the third O'Shanassy ministry in June 1862 he became premier and chief secretary. M'Culloch's ministry was involved in a struggle with the council, over the ministerial policy of protection. A tariff was tacked to an appropriation bill, which the council rejected three times. M'Culloch had the support of Australia, and of the governor, Sir Charles Darling, who was recalled by the home government for partisanship. A long and bitter struggle between the two chambers over a grant of £20,000 to Lady Darling, which was also tacked to an appropriation bill, ended in 1868 when M'Culloch, who had resigned, resumed office with different colleagues. He resigned in 1869, when he was knighted, but formed a third ministry in 1870. In June 1871 he resigned again and held the office of agent-general for Victoria in London until 1873, was created K.C.M.G. in 1874 and, returning to the colony, formed his fourth ministry in 1875. After his defeat in 1877 he returned to England, where he died at Ewell, Surrey, on Jan. 30, 1893.

MACCULLOCH, JOHN (1773–1835), Scottish geologist, was born in Guernsey. Graduating at Edinburgh in 1793 as M.D. he became chemist to the Board of Ordnance in 1803, and in 1814 was appointed geologist to the trigonometrical survey. Two years later he became president of the Geological society, and in 1820 was elected F.R.S. His chief work was carried out in Scotland, where he examined the structure of the range of western islands. His geological map of Scotland was published soon after his death on Aug. 21, 1835.

M'CULLOCH, JOHN RAMSAY (1789–1864), British economist and statistician, was born at Whithorn, Wigtownshire, on March 1, 1789. In 1818–19 he edited the *Scotsman.* His articles on economic questions in that paper and in various reviews, and the publication of his *Principles of Political Economy* (1825) led to his appointment in 1828 as professor of political economy at London university. He held this office until 1832, and in 1838 became comptroller of H.M. Stationery Office, where he introduced useful reforms. M'Culloch died in London on Nov. 11, 1864. He was intimate with John Stuart Mill and his circle, but remained a Whig pure and simple. His *Dictionary of Commerce and Commercial Navigation* (1832) and his *Statistical Account of the British Empire* (1837) are monumental.

McCULLOUGH, JOHN EDWARD (1837–1885), American actor, was born in Coleraine, Ireland, on Nov. 2, 1837. He went to America at the age of 16, and made his first appearance on the stage at the Arch street theatre, Philadelphia, in 1857. In support of Edwin Forrest and Edwin Booth he played second rôles in Shakespearian and other tragedies, and Forrest left him by will all his prompt books. Virginius was his greatest success, although even in this part and as Othello he was coldly received in England (1881). In 1884 he broke down physically and mentally, and he died in an asylum at Philadelphia on Nov. 8, 1885.

MACCUNN, HAMISH (1868–1916), Scottish musical composer, was born at Greenock, the son of a shipowner, and was educated at the Royal College of Music. His first success was with the overture *Land of the Mountain and Flood* in 1887 at the Crystal Palace, and this was followed by other compositions, with a characteristic Scottish colouring. From 1888 to 1894 he was a professor at the Royal College of Music. His opera *Jeanie Deans* was produced at Edinburgh in 1894. He was for some years conductor to the Carl Rosa Opera company, and subsequently to other companies. His opera *Diarmid* was produced at Covent Garden in 1897, and his other music includes cantatas, overtures, part-songs, instrumental pieces and songs, all markedly Scottish in type. He died in London on Aug. 2, 1916.

MACDONALD, ALEXANDRE (1765–1840), duke of Taranto and marshal of France, was born at Sedan on Nov. 17, 1765, of an old Jacobite family, and was related to Flora Macdonald. In 1785 he joined the legion supporting the revolutionary party in Holland against the Prussians, and then received a commission in the French army. He supported the Revolution, and was appointed aide-de-camp to General Dumouriez. He refused to desert to the Austrians with Dumouriez, and was rewarded with the rank of general of brigade. He took part in Pichegru's invasion of Holland (1795), served as general of division on the Rhine and in Italy (1797), became first French governor of Rome, and later reconstituted the kingdom of Naples as the Parthenopaean Republic. His resistance against Suvarov's attack in northern Italy gained him the position of governor of Versailles, where he acquiesced in the events of the 18th Brumaire. In 1800 he received the command of the army in Switzerland, and his march (1800–01) over the Splügen Pass, is as noteworthy as Bonaparte's famous passage of the St. Bernard before Marengo. After some years as French plenipotentiary in Denmark, he became (1809) military adviser to Eugène Beauharnais, viceroy of Italy. For his share in the victory over the Austrians at Wagram Napoleon made him marshal of France and duke of Taranto. After serving in Spain (1810) and Russia (1812), he invaded Silesia in 1813, and was defeated by Blücher at Katzbach (*see* NAPOLEONIC CAMPAIGNS). Napoleon presented him with the sabre of Murad Bey for his fidelity, and directed him to submit to the new régime. At the Restoration he was made a peer of France, and became chancellor of the Legion of Honour (1815–31) and major-general of the royal bodyguard (1816). From 1830 his life was spent in retirement at Courcelles-le-Roi (Seine-et-Oise), where, greatly respected, he died on Sept. 7, 1840.

See Mathieu Dumas *Evènements militaires;* Ségur, *Lettre sur la campagne du Général Macdonald dans les Grisons en 1800 et 1801* (1802), and *Eloge* (1842); his memoirs were published in 1892 (Eng. trans. *Recollections of Marshal Macdonald*).

MACDONALD, SIR CLAUDE MAXWELL (1852–1915), British soldier and diplomatist, was born on June 12, 1852, the son of Major-General J. D. Macdonald. He was educated at Uppingham and Sandhurst, and in 1872 entered the army (74th Highlanders). He took part in the Egyptian campaign of 1882, and was appointed military attaché to Sir Evelyn Baring (afterwards earl of Cromer), serving in the Suakin expedition of 1884–85. He left the post of military attaché in 1887, and after a year as consul-general at Zanzibar went to the Niger Territories for the Foreign Office. In 1891 he became first commissioner and consul-general in the Oil Rivers Protectorate, where he successfully established a stable government, and was responsible for many administrative reforms. Macdonald retired from the army in 1896, and was appointed British minister at Peking, and during the critical period which followed secured for England the leases of Wei-Hai-Wei and of the Hong-Kong extension. He also obtained many other useful concessions, including the opening of the West river to trade, and the non-alienation of the Yangtze region. During the Boxer rising of 1900 he organized the defence of the legations. In Oct. 1900 Macdonald was appointed the first British ambassador to Tokyo, and gave valuable service to the British government during the Russo-Japanese War. He was admitted to the privy council in 1906 in recognition of his work in connection with the Anglo-Japanese agreement of Aug. 1905 (ended in 1921). He died in London on Sept. 10, 1915.

MACDONALD, FLORA (1722–1790), Jacobite heroine, was the daughter of Ranald Macdonald of Milton, in the island of South Uist (Hebrides). In June 1746 Prince Charles Edward (*q.v.*) took refuge, after the battle of Culloden, in Benbecula in the Hebrides, where she was living, and his companion, Captain O'Neill, sought her help. She obtained a pass to the mainland for herself, a manservant, an Irish spinning maid, Betty Burke, and a boat's crew of six men. The prince was disguised as Betty Burke. The party landed at Portree and escaped. The boatmen's talk afterwards brought suspicion on Flora and she was arrested and imprisoned in the Tower. She was afterwards allowed to live outside under the guard of a gaoler, and when the Act of Indemnity was passed in 1747 she was left at liberty. In 1750 she married Allen Macdonald of Kingsburgh and they emigrated to America (1773). He served the British government in the War of Independence, and was taken prisoner. His wife returned home in 1779, and died on March 5, 1790.

See A. C. Ewald, *Life and Times of Prince Charles Edward* (1886); A. MacGregor, *The Life of Flora Macdonald* (1882, later ed. 1901); W. Foly, *Flora Macdonald in Uist* (1886). The so-called *Autobiography* of Flora Macdonald (1870) is not authentic.

MACDONALD, GEORGE (1824–1905), Scottish novelist and poet, was born at Huntly, Aberdeenshire, the son of a farmer, and a direct descendant of a family that suffered in the massacre of Glencoe. Macdonald's youth was passed in Huntly, in an atmosphere strongly impregnated with Calvinism. He took his degree at Aberdeen university, and then studied at Highbury college, in London, for the Congregational ministry. After some years in the Congregational ministry at Arundel and in Manchester, and a short visit to Algiers, he settled in London and adopted the profession of literature. He wrote: *Within and Without* (1856), a dramatic poem; *Poems* (1857), and the "faerie romance" *Phantastes* (1858). His first conspicuous success was achieved in 1862 with *David Elginbrod,* the forerunner of a number of popular novels, which include *Alec Forbes of Howglen* (1865), *Annals of a Quiet Neighbourhood* (1866), *Robert Falconer* (1868), *Malcolm* (1875), *The Marquis of Lossie* (1877) and *Donal Grant* (1883). He also wrote some stories for the young and several volumes of sermons. In 1877 he was given a civil list pension. He died on Sept. 18, 1905. His verse is homely and direct, and marked by religious fervour. As a portrayer of Scottish peasant-life he was the precursor of a large school.

MACDONALD, SIR HECTOR ARCHIBALD (1852–1903), British soldier, was born of humble parentage at Muir of Allan-Grange, Ross-shire, Scotland. In 1870 he enlisted in the 92nd (Gordon) Highlanders, and distinguished himself in the Afghan War of 1879, in the first Boer War of 1880–81, and at Majuba. In 1885 he served under Sir Evelyn Wood in the reorganization of the Egyptian army, and took part in the Nile Expedition of that year. In 1889 he received the D.S.O. for his conduct at Toski. Seven years later he commanded a brigade of the Egyptian army in the Dongola Expedition, and after his achievements in the final battle of Omdurman (1898) was promoted colonel and made an aide-de-camp to the queen. He became popularly known as "Fighting Mac." In 1899 he was promoted major-general, and appointed to a command in India. In December 1899 he was called to South Africa to command the Highland Brigade, and in 1901 he was made a K.C.B. In 1902 he commanded the troops in Ceylon, but on March 25, 1903, he committed suicide in Paris.

MACDONALD, JAMES RAMSAY (1866–1937), British politician, was born on Oct. 12, 1866, at Lossiemouth, a little fishing village on the Moray Firth. His father was a labourer, his first home a "but and a ben." At Drainie board school he received an elementary education and continued as a pupil teacher. Coming to London at 18, he worked at 12/6d. a week as a clerk. He continued his own education by evening classes, laboratory work and incessant reading. A breakdown in health ended his scientific career, and sent him to journalism.

MacDonald's experience and reading made him a convinced socialist. He joined, in 1894, the Independent Labour Party, founded by Keir Hardie, and in 1895 stood, unsuccessfully, for Southampton. As a member of the London county council he completed his training for public service, and, after his marriage, in 1896, with Margaret Ethel Gladstone, niece of Lord Kelvin, made frequent journeys abroad. In 1897 he paid his first visit to Canada and the United States; in 1902 he went to South Africa; in 1906, travelled through the Pacific to Australia and New Zealand; in 1910, visited India, whither he returned in 1913 and 1914 as a member of the royal commission on the civil service. He also attended the (Second) Socialist International.

Three main stages may be noted in his political career: the creation of the Labour Party, the World War and the Labour Government. In the 'nineties, the great trade unions still stood aloof from politics, or were satisfied with a vague alliance with the Liberal Party. The propaganda of the Independent Labour Party, with which he was prominently associated, was directed to convincing the unions of the need of a political party for labour; in 1899 the Trades Union Congress was induced to set up a committee to consider parliamentary action. Out of this came the Labour Representation committee, of which MacDonald was secretary. Thanks largely to his energy, patience and tenacity, the hostility of some unions and the apathy of others was broken down and a Labour party came into being in 1900. After the return of 29 M.P.s, run by the Labour Representation committee in 1906, the battle was won; the party became an effective force. But it was only in 1918 that MacDonald's ideas were fully realized. The party was reorganized and thrown open to all classes, and in 1928 had over 3,500,000 members.

Elected as M.P. for Leicester in 1906, by 1911 he was leader of the Labour Party in the House of Commons. A constructive critic of Grey's foreign policy, he opposed, on Aug. 4, 1914, the view that there was an "obligation of honour" to go to war. The speech was an agreed one, but the majority of the party broke away. He had already refused suggestions of office; he now resigned his leadership. He was denounced in public and private, and had to face the fact that his views were not accepted by the nation at war. In 1918 he lost his seat at Leicester, and in 1921 failed to get in for East Woolwich.

Although out of the House of Commons till late in 1922, his influence on opinion steadily grew. By 1922, the party took his view of the Peace treaties, and resisted the tendencies that split nearly every Labour Party abroad. In 1912, he had opposed the demand for the substitution of industrial ("direct") for parliamentary action in his book *Syndicalism;* in 1919, when, under the stimulus of Russian events, this demand reappeared as the Communist doctrine of violent revolution, he wrote *Parliament and Revolution* and *Parliament and Democracy,* in which he gave a definite and logical lead against the tactics of violence and championed parliamentary democracy. The 1922 election registered his moral ascendancy. Labour, with 140 members, was the second party in the state, and he himself, returned for Aberavon, was chosen by his colleagues leader of the opposition.

After the sudden election of 1923, he came back with 192 followers. With the authorization of the National Labour Party and the Trades Union congress MacDonald declared that Labour would take office, if given the chance, in order to render national service. On Jan. 21, 1924, he accordingly moved a vote of no confidence in the Unionists, which was carried with Liberal support. Next day the king called upon him to form a Government. The first Labour cabinet was announced on Jan. 24, and on Feb. 12 the new prime minister set out its general programme in the House of Commons. In this, the first item was the settlement of a disturbed Europe; with this supreme object in view, he added the post of foreign secretary to his premiership.

The unsettled state of Europe, aggravated through the occupation of the Ruhr, was a primary cause of distress and unemployment in Britain. British prestige had fallen low: relations between Britain and France were bad, between France and Germany threatening. The reparations question blocked the way. In letters to Poincaré, published on Feb. 4 and March 3, MacDonald, with firm friendliness, set out the British point of view, and had soon created a new atmosphere, one of confidence and hope. When, on April 13, the experts committee on reparations issued a unanimous report, he at once accepted it on the part of Britain as a basis for settlement. In May, Poincaré was replaced by the Radical Herriot, who in June came over to London to discuss the European position with MacDonald. Friendship with Italy had been assisted by the handling of Jubaland.

On July 16, 1924, an allied conference assembled in London, over which he presided, for the specific purpose of putting the experts' report into operation. Within a fortnight, agreement had been reached and the German delegates called in. On Aug. 16 the London Settlement, the first negotiated agreement since the war, was initialled. By mutual consent, the experts' plan was put in effect, and the reparation problem thus lifted out of the political sphere. France, at the same time, agreed to evacuate the Ruhr within a year and certain towns at once. Negotiations for an Anglo-German commercial treaty, since signed, were initialled. In September MacDonald and Herriot attended the fifth assembly of the League of Nations at Geneva, and there submitted a plan, the Protocol, for the elimination of private war and the submission of all disputes to arbitration, after general mutual disarmament.

In the House of Commons, meantime, the difficulties of the government's minority position were growing. Philip Snowden's budget met with general approval; a housing act was passed, and the machinery for the relief of unemployment improved. But when MacDonald sought to complete his peace work by making treaties with Russia, whose *de jure* recognition had been an early act as foreign secretary, the Liberals broke away. In October the Government was defeated on a motion, calling for a select committee, on their dropping of the prosecution of J. R. Campbell, editor of the Communist *Workers' Weekly.* In the general election, then declared, the press was exceedingly hostile, and Labour was identified with Bolshevism. Polling took place on Oct. 29; as a result the Conservatives came back with a great majority. The Labour vote went up by over a million, but its representation was reduced to 150. On Nov. 4 MacDonald resigned, and resumed his leadership of the opposition. His party, in conference in 1925, confirmed his leadership.

The confidence of the Party was justified by the results of the general election of May 1929. The final results gave Labour 290 seats as against 259 Conservative, 57 Liberals and 9 Independents. Baldwin resigned and the King sent for MacDonald. His cabinet included: Sankey (lord chancellor), Parmoor (lord president), J. H. Thomas (Privy seal and deputy leader in House of Commons), P. Snowden (exchequer), A. Henderson (foreign affairs), J. R. Clynes (home office), Sidney Webb (Lord Passfield) (colonies and dominions), Shaw (war), Wedgwood Benn (India), Thomson (air), A. V. Alexander (admiralty), W. Graham (board of trade), C. P. Trevelyan (education), A. Greenwood (health), Noel-Buxton (agriculture), Margaret Bondfield (labour), G. Lansbury (first Comm. of Works), W. Adamson (Scotland) and O. Mosley (Duchy of Lancaster).

A year later, in June 1930, Mr. Thomas was transferred to the Dominions Office which in view of the approaching Imperial Conference was separated from the Colonies: Mr. Hartshorn becoming Lord Privy Seal, and Dr. Addison Minister of Agriculture.

MacDonald at once resumed the peace work begun in 1924. The Optional Clause was signed in Sept. 1929 and the evacuation of the Rhineland secured, while normal relations with Russia were resumed. His visit to the U.S.A. paved the way for the Naval Treaty of April 1930, carrying out limitation of all categories, as between Britain, the U.S. and Japan, and reaching agreement on many points also with France and Italy. Work at home—a new Pensions Act, a new Unemployment Insurance Act, a Coal Mines Bill—was overshadowed by the mounting unemployment figures due to the world-wide slump. To help in dealing with this great issue MacDonald appointed an Economic Advisory Committee, and, in the summer of 1930, invited the "emergency" co-operation of the other parties.

MacDonald's contribution to British political history cannot be measured unless it is noted that he made the Labour Party, which he assisted to create, the vehicle of a new political philosophy. His socialism has modified opinion over a wider range than that of professed adherents.

On the formation of the National Government in 1931, when most of his socialistic colleagues resigned, MacDonald remained prime minister, retaining this office after the general election of that year. He presided over the Lausanne Conference, 1932, and the World Economic Conference, 1933. In June 1935, for reasons of health, he resigned the premiership to Stanley Baldwin, but remained in the cabinet as lord president of the council. He died Nov. 9, 1937 in mid-Atlantic enroute to South America for a rest.

MacDonald's views on socialism can best be studied in his books. Among them the more important are: *Socialism and Society* (1905); *Socialism and Government* (1909); *The Awakening of India* (1911); *The Socialist Movement* (1911); *Syndicalism* (1912); *The Social Unrest* (1913); *National Defence* (1917); *Parliament and Revolution* (1919); *Parliament and Democracy* (1919); *The Government of India* (1919); *A Policy for the Labour Party* (1920); and *Socialism, Critical and Constructive* (1921). In addition, his biography of his wife, *Margaret Ethel MacDonald* (1912); and a volume of essays and travel pictures, *Wanderings and Excursions* (1925) may also be mentioned. *See* C. W. Mullins, *The Patriotism of Ramsay MacDonald and Others* (1916); L. N. Le Roux, *J. Ramsay MacDonald, Sa vie, son oeuvre et sa pensée* (1919); "Iconoclast" (M. A. Hamilton) *The Man of Tomorrow, J. Ramsay MacDonald* (1923); *J. Ramsay MacDonald, 1923–25* (1925); H. Tracey, *From Doughty Street to Downing Street. The Rt. Hon. J. Ramsay MacDonald, M.P.* (1924); J. Bardoux, *J. Ramsay MacDonald* (1924); G. Glasgow, *MacDonald as Diplomatist* (1924); U. D. C. *The Diplomacy of Ramsay MacDonald* (1925). (M. A. H.)

MACDONALD, SIR JOHN ALEXANDER (1815–1891), first premier of the dominion of Canada, was born in Glasgow on Jan. 11, 1815, the third child of Hugh Macdonald (d. 1841), a native of Sutherlandshire. The family emigrated to Canada in 1820, settling first at Kingston, Ontario. At the age of fifteen Macdonald entered a law office; he was called to the bar in 1836, and began practice in Kingston, with immediate success.

In 1844 Macdonald was elected to the provincial assembly as Conservative member for Kingston. A sentence in his first address to the electors strikes the dominant note of his public career: "I therefore need scarcely state my firm belief that the prosperity of Canada depends upon its permanent connection with the mother country, and that I shall resist to the utmost any attempt (from whatever quarter it may come) which may tend to weaken that union." In 1847 he was made receiver-general with a seat in the executive council.

One of the first acts of the Reform government which succeeded that of which Macdonald was a member was to pass the Rebellion Losses Bill. In the controversy on the British connection which followed that event, Macdonald helped to found a British-American league, having for its object the confederation of all the provinces, the strengthening of the connection with the mother country, and the adoption of a national commercial policy. He remained in opposition from 1848 till 1854, holding together under difficult circumstances an unpopular party with which he was not entirely in sympathy. The two great political issues of the time were the secularization of the clergy reserves in Ontario, and the abolition of seigniorial tenure in Quebec. Both of these reforms Macdonald long opposed, but when successive elections had proved that they were supported by public opinion, he brought about a coalition of Conservatives and moderate reformers for the purpose of carrying them. Out of this coalition was gradually developed the Liberal-conservative party, of which until his death Macdonald continued to be the most considerable figure, and which for more than forty years largely moulded the history of Canada. From 1854 to 1857 he was attorney-general of Upper Canada, and then, on the retirement of Colonel Taché, he became prime minister.

At this critical period of Canadian history a proposal was made for a coalition of parties in order to carry out a broad scheme of British-American confederation. Macdonald, at the head of a representative delegation from Ontario and Quebec, met the public men of the maritime provinces in conference at Charlottetown in 1864, and the outline of confederation then agreed upon was filled out in detail at a conference held at Quebec soon afterwards. The actual framing of the British North America Act, into which the resolutions of these two conferences were consolidated, was carried out at the Westminster Palace Hotel in London, during December 1866 and January 1867, by delegates from all the provinces working in co-operation with the law officers of the Crown, under the presidency of Lord Carnarvon, then secretary of state for the colonies. Macdonald took the leading part in all these discussions, and he thus naturally became the first premier of the Dominion. He was made a K.C.B. in recognition of his services to the empire.

The difficulties of organizing the new Dominion, the questions arising from diverse claims and the various conditions of the country, called for infinite tact and resource on the part of the premier. Federal rights were to be safeguarded against the provincial governments, always jealous of their privileges. The pledge made at confederation with regard to the building of the Intercolonial railway to connect the maritime provinces with those of the St. Lawrence was fulfilled. The North-West Territories were secured as a part of confederated Canada by the purchase of the rights of the Hudson's Bay Company, and the establishment of Manitoba as a province in 1870. Canada's interests were protected during the negotiations which ended in the Treaty of Washington in 1871, and in which Macdonald took a leading part as one of the British delegates. In this year British Columbia entered the confederation, one of the provisions of union being that a transcontinental railroad should be built within ten years. This was declared by the opposition to be impossible. It was possible only to a leader of indomitable will. Charges of bribery against the government in connection with the contract for the building of this line led to the resignation of the cabinet in 1874, and for four years Macdonald was in opposition.

During the summer of 1876 he travelled through Ontario addressing the people on the subject of a commercial system looking to the protection of native industries. This was the celebrated "National Policy," which had been in his thoughts as long ago as the formation of the British-American League in 1850. The government of Alexander Mackenzie refused to consider a protection policy, and determined to adhere to Free Trade, with a tariff for revenue only. On these strongly defined issues the two parties appealed to the people in 1878. The Liberal party was almost swept away, and Macdonald, on his return to power, put his policy into effect with a thoroughness that commanded the admiration even of his opponents, who, after long resistance, adopted it on their accession to office in 1896. He also undertook the immediate construction of the Canadian Pacific railway, which had been postponed by the former government. The line was begun in 1880, and finished in November 1885—an achievement which Macdonald ranked among his greatest triumphs.

During the remaining years of his life his efforts at administration were directed mainly towards the organization and development of the great North-West. From 1878 until his death in 1891 Macdonald retained his position as premier of Canada, and his history is practically that of Canada (*q.v.*). For forty-six years of a stormy political life he remained true to the cardinal policy that he had announced to the electors of Kingston in 1844. "A British subject I was born; a British subject I will die," says his last political manifesto to the people of the Dominion. At his advanced age the anxiety and excitement of the contested election of 1891 proved too great. On May 29, he suffered a stroke of paralysis and died on June 6.

A condensed biography by G. R. Parkin forms one of the "Makers of Canada" series (Toronto, 1907; new ed., 1909). *See* also Sir J. Pope, *The Day of Sir John Macdonald* (Toronto, 1915).

MACDONALD, JOHN SANDFIELD (1812–1872), Canadian statesman, was born at St. Raphael, Glengarry county, Ontario, on Dec. 12, 1812. He was admitted to the bar in 1840, and settled in Cornwall. In 1841 he was elected to the Canadian parliament for Glengarry, which seat he held for 16 years. In 1842 he joined the Reformers in the cry for constitutional government, and from 1852 to 1854 was Speaker of the house. He was always uncertain in his party allegiance, and often attacked George Brown, the Liberal leader. In 1862 he was called on by Lord Monck, the governor-general, to form a ministry, which by manifold shifts held office till Feb. 1864. In the debates on federation he opposed the measure, but on its passage was in 1867 entrusted by the Conservatives with the task of organizing the provincial Government of Ontario. He ruled the province with economy and efficiency, but was defeated in Dec. 1871 by the Liberals, resigned the premiership, and died on June 1, 1872.

MACDONELL, SIR JOHN (1846–1921), British jurist, was born at Brechin, Forfarshire, on Aug. 11, 1846, and was educated at the universities of Aberdeen and Edinburgh. In 1901 he was made Quain professor of comparative law in the University of London and he was president of the society of public teachers of law (1912–13), a member of several royal commissions, and editor, for many years, of *The Journal of Comparative Legislation and International Law*. In 1913 he was elected a fellow of the British Academy and in 1914 was created K.C.B. Besides editing the *State Trials* (1887), the *Civil Judicial Statistics* (from 1894) and the *Criminal Judicial Statistics* (from 1900), he published works on the subjects of capture at sea and the law of master and servant, and was the author of many papers on international law. He was also for 40 years a leader writer on *The Times*, London. He died in London on March 17, 1921.

MACDONNELL or **MACDONELL, ALESTAIR** (*i.e.,* ALEXANDER), **RUADH** (*c.* 1725–1761), chief of Glengarry, a Scottish Jacobite. The family was a branch of the clan Macdonald. Alestair ran away when a boy and entered the Royal Scots, a regiment in the French service, being sent to Scotland as a Jacobite agent in 1744. He was in France in Jan. 1745 when Prince Charles Edward landed in Scotland. Later in the year he was captured at sea while bringing help to the prince, and imprisoned for 22 months in the Tower. He then went abroad, but in 1749 he was again in London, and is believed to have acted as spy to the British Government, under the name of Pickle, enabling a close watch to be kept on the prince and on the Jacobite conspiracies. He died on Dec. 23, 1761.

See Andrew Lang, *Pickle the Spy* (1897), and *The Companions of Pickle* (1898).

MacDONNELL, ANTONY PATRICK (1844–1925), Indian and Irish administrator, was born in Co. Mayo on March 7, 1844, and educated at Athlone and at Queen's college, Galway. He entered the Indian Civil Service in 1864, and was sent to Bengal in 1865. His book, *Food Grain Supply and Famine Relief in Bihar and Bengal,* dealt with his experiences during the Bengal famine of 1873. He held successively the posts of secretary to the Bengal Government, home secretary, acting chief commissioner of Burma, chief commissioner of the Central Provinces (1890), member of the Government of India, and lieutenant-governor of the united provinces of Agra and Oudh. His particular interest was in the agrarian policy of India, and he was responsible for many reforms in the legislation affecting native tenants and cultivators. His six years' administration of the Central Provinces proved him to be a capable administrator, but his determined methods led to many misunderstandings with his subordinates. He experienced difficulties with the natives also on his introduction of Nagri (Hindi) script in place of Urdu in the courts, and Muslim political agitation has been traced to this cause. In 1897 MacDonnell personally organized the relief measures during the serious famine, and in 1901, just before the end of his term of office, he was made president of the Famine commission, and drew up the report which has become a standard authority. In Jan. 1903 he became member of the Indian Council, and of the privy council.

MacDonnell was then made under-secretary for Ireland, but with special powers over administration. His tenure of office at first appeared successful, but Wyndham, the chief secretary, was forced to resign on the question of Lord Dunraven's Devolution Act, of which MacDonnell was one of the principal authors. MacDonnell remained in office until 1908, but his special powers were annulled. On his resignation he was raised to the peerage as Lord MacDonnell of Swinford. In the House of Lords he took an active part for many years in the discussion of Irish and Indian problems, and in Aug. 1920 he attended the Irish Peace Conference in Dublin. He died on June 9, 1925, the peerage becoming extinct.

MACDONNELL, ARTHUR ANTHONY (1854–1930), English Sanskrit scholar, was born on May 11, 1854, and educated at Göttingen and at Corpus Christi college, Oxford. From 1880 to 1900 he was Taylorian teacher of German at Oxford, and from 1888 to 1899 deputy professor of Sanskrit. In 1922 he was appointed Stephanos Nirmalendu Ghosh lecturer on Comparative Religion at Calcutta.

His numerous publications include: critical editions of the *Sarvānukramani* and the *Anuvakānukramanī,* with Shadgurucishya's commentary (1886); *A History of Sanskrit Literature* (1900); the *Brihaddevata,* the first translation and critical edition (2 vols. 1904); Sanskrit and Vedic Grammars, and numerous articles.

MACDONNELL, SORLEY BOY (*c.* 1505–1590), Scoto-Irish chieftain, son of Alexander Macdonnell, lord of Islay and Kintyre (Cantire), was born at Ballycastle, Co. Antrim. From an ancestor who had married Margaret Bisset, heiress of the district on the Antrim coast known as the Glynns (or Glens), he inherited a claim to the lordship of that territory; and he was one of the most powerful of the Scottish settlers in Ulster whom the English Government tried to bring into subjection. He took an active part in the tribal warfare between his own clan and the MacQuillins, and by defeating the latter at Glenshesk in 1558, acquired the lordship of the Route. He was now too powerful to be neglected by Elizabeth and her ministers, who were also being troubled by his great contemporary, Shane O'Neill. Elizabeth aimed at fomenting the rivalry between the two men, and came to terms sometimes with the one and sometimes with the other. Shane O'Neill defeated Sorley Boy near Coleraine in 1564; in 1565 he invaded the Glynns, and at Ballycastle won a decisive victory, in which James Macdonnell and Sorley Boy were taken prisoners. James soon afterwards died, but Sorley Boy remained O'Neill's captive till 1567, when Shane was murdered by the Macdonnells at Cushendun (*see* O'NEILL). After the massacre of his family by the English in 1575, Sorley Boy made a successful raid on Carrickfergus and re-established his power in the Glynns and the Route. His position was further strengthened by an alliance with Turlough Luineach O'Neill, and by a formidable immigration of followers from the Scottish islands. In 1585 he regained possession of Dunluce castle. Sir John Perrot reluctantly opened negotiations with Sorley Boy, who in 1586 made submission to Elizabeth's representative. He obtained a grant to himself and his heirs of all the Route country between the rivers Bann and Bush, with certain other lands to the east, and was made constable of Dunluce castle. For the rest of his life he gave no trouble to the English Government.

See G. Hill, *An Historical Account of the Macdonnells of Antrim* (1873); R. Bagwell, *Ireland under the Tudors* (3 vols., 1885–90); *Calendar of State Papers: Carew MSS.* i., ii. (6 vols., 1867–73); D. Gregory, *History of the Western Highlands and Isles of Scotland 1493–1625* (1881); Sir J. T. Gilbert, *History of the Viceroys of Ireland* (1865).

MACDONOUGH (măk-dŏn′ō), **THOMAS** (1783–1825), American sailor, born in Delaware, his father being an officer of the Continental Army, entered the U.S. Navy, 1800. During his long service as a lieutenant he took part in the bombardment of Tripoli, and on a subsequent occasion showed great firmness in resisting the seizure of a seaman as an alleged deserter from the British Navy, his ship at the time lying under the guns of Gibraltar. When war with England broke out, in 1812, he was ordered to cruise in the lakes between Canada and the United States, with his headquarters on Lake Champlain. He was instrumental in saving New York and Vermont from invasion by his brilliant victory of Lake Champlain gained on Sept. 11, 1814, with a flotilla of 14 vessels carrying 86 guns, over Capt. George Downie's 16 vessels and 92 guns. For this important achievement New York and Vermont granted him estates, and Congress gave him a gold medal.

MacDOWELL, EDWARD ALEXANDER (1861–1908), American musical composer, was born in New York city on Dec. 18, 1861. His parents, who were Irish, had emigrated to America from Belfast shortly before the boy's birth. He had a varied education in music, first under Spanish-American teachers, and then in Europe, at Paris (Debussy being a fellow pupil), Stuttgart, Wiesbaden and Weimar, where he was chiefly influenced by Joachim, Raff and Liszt. From 1879 to 1887 he lived in Germany, teaching and studying, and also appearing as solo pianist at important concerts. In 1884 he married Marian Nevins, of New York. He returned to America in 1888, and settled in Boston until 1896 when he was made professor of music at Columbia university, New York. This post he resigned in 1904, and in 1905 overwork and insomnia resulted in a complete cerebral collapse. He died on Jan. 24, 1908. MacDowell's work gives him perhaps the highest place among American composers. Deeply influenced by modern French models and by German romanticism, full of poetry and "atmosphere," and founded on the "programme" idea of composition, it is essentially creative in the spirit of a searcher after delicate truths of artistic expression. His employment of touches of American folk-song, suggested by Indian themes, is characteristic. This is notably the case with his orchestral *Indian Suite* (1896) and *Woodland Sketches* for the piano.

See Lawrence Gilman, *Edward MacDowell* (1906).

McDOWELL, IRVIN (1818–1885), American soldier, was born in Columbus, O., on Oct. 15, 1818. He was educated in France, and graduated at the U.S. military academy in 1838. From 1841 to 1845 he was instructor, and later adjutant, at West Point. He won the brevet of captain in the Mexican War at the battle of Buena Vista, and served as adjutant-general, chiefly at Washington, until 1861, being promoted major in 1856. While occupied in mustering volunteers at the capital, he was made brigadier-general in May, 1861, and placed in command during the premature Virginian campaign of July, which ended in the defeat at Bull Run. Under McClellan he became a corps commander and major-general of volunteers (March 1862). When the Peninsular campaign began McDowell's corps was detained against McClellan's wishes, sent away to join in the fruitless chase of "Stonewall" Jackson in the Shenandoah valley, and eventually came under the command of Gen. Pope, taking part in the disastrous campaign of Second Bull Run. Involved in Pope's disgrace, McDowell was relieved of duty in the field (Sept. 1862), and served on the Pacific coast 1864–68. He became, on Meade's death in 1872, major-general of regulars, and commanded various divisions until his retirement in 1882. As a commander he was uniformly unfortunate. Undoubtedly he was a faithful, unselfish and energetic soldier, and in patriotic sympathy with the administration. It was his misfortune to be associated with the first great disaster to the Union cause, and finally to be involved in the catastrophe of Pope's campaign. That he was perhaps too ready to accept great risks at the instance of his superiors is the only just criticism to which his military character was open. He died in San Francisco on May 4, 1885.

See James Kendall Hosmer, *The Appeal to Arms, 1861–63,* in "American Nation" series, vol. xx. (1907).

MACDUFF, small burgh and seaport, Banffshire, Scotland, on the Deveron, 1 mi. E. of Banff and 50¼ mi. N.W. of Aberdeen by the L.N.E.R. Pop. (est. 1938) 3,283. The site was formerly occupied by the fishing village of Doune, but after its purchase by the 1st earl of Fife, about 1732, the name was altered to Macduff by the 2nd earl. In honour of its constitution as a burgh in 1783 he rebuilt the market cross in front of the parish church. Behind it is a World War I memorial in the shape of a tower 70 ft. high. The harbour is safer and more accessible than that of Banff. The inhabitants are chiefly employed in the herring fishery. Grain and fish are exported and coal imported. A stone bridge across the Deveron connects with Banff. Good bathing, a bracing climate and a mineral well attract numerous visitors.

McDUFFIE, GEORGE (*c.* 1788–1851), an American statesman, of South Carolina, was the son of John and Jane McDuffie, energetic, intelligent and unspoiled Scots who had migrated to Georgia after the Revolution. George was born about 1788 or 1790 (authorities differ) near Augusta. In 1804 Calhoun and Wilson, of Augusta, employed him as a clerk; and in 1810 William Calhoun, brother of James and John C. Calhoun (*q.v.*) took him into his family and sent him to Willington academy. George McDuffie justified the expectations of his patron. He graduated from South Carolina college in 1813, was called to the bar in 1814, and after a brief period of preliminary experience in law and politics entered into a partnership with Col. Eldred Simkins, of Edgefield, who possessed a good library and large practice. He secured election to the State Legislature in 1818, and to Congress in 1821.

In the national House of Representatives he won distinction and served continuously on important committees until 1834. While the Calhoun influence was strong upon him, George McDuffie maintained a vigorous intellectual independence which displayed itself in facile writing, strong debating, and an intense, rapid and fiery but logical oratory; also, in his gradual change from liberal construction to strict construction he was in advance of his contemporaries. In the end he was a free trader after the heart of Thomas Cooper, a believer in the right of revolution like Patrick Henry, supporting nullification on revolutionary rather than on constitutional grounds, and an opponent of internal improvements. But he was the leader of "the bank interest" in the house. In 1834 he denounced the Jackson administration, retired from Congress, and served as governor of South Carolina, 1834–36, with marked effectiveness, giving particular attention to the compilation of the statute laws of the State and to the reorganization of South Carolina college. He did something to promote Southern "direct trade with Europe," and while in England in the spring of 1839 was invited by J. B. Smith to participate in free trade activities of the Anti-Corn Law League, but this he declined.

In Dec. 1842 George McDuffie was elected to the U.S. Senate, where he helped to bring about the annexation of Texas, the "amicable adjustment" of the Oregon question with Great Britain and the passage of the low Walker tariff of 1846, displacing the high Whig tariff of 1842 almost in conjunction with the repeal of the British corn laws. Indeed, his bust was sent with Calhoun's to the Free Trade Hall at Manchester during this period of intimate relations between the free traders of both countries. McDuffie's public services practically ended with these adjustments in Anglo-American relations; for an old wound in the spine received in a duel in 1822 compelled him to resign his seat in the

Senate, Aug. 17, 1846. He died at Cherry Hill, in the Sumter district of South Carolina, on March 11, 1851. He had married in 1829, but his wife had died within a year, leaving him an only daughter, Mary, who became the wife of Gen. Wade Hampton.

There is no biography of George McDuffie, but *see* J. B. O'Neall, *Bench and Bar of South Carolina,* ii. (1859), 463–468; and D. F. Houston, *Nullification in South Carolina* (1896), *passim* which still contains the best sketches and estimates available. (T. P. Ma.)

MACE, originally a weapon of offence, made of iron, steel or latten, capable of breaking through the strongest armour. The mace was carried in battle by mediaeval bishops (Odo of Bayeux is represented on the Bayeux tapestry as wielding one) instead of the sword, so as to conform to the canonical rule which forbade priests to shed blood. The earliest *ceremonial* maces, as they afterwards became, though at first intended to protect the king's person, were those borne by the serjeants-at-arms, a royal body-guard established in France by Philip II., and in England probably by Richard I. By the 14th century a tendency towards a more decorative serjeant's mace, encased with precious metals, is noticeable. The history of the civic mace (carried by the serjeants-at-mace) begins about the middle of the 13th century, though no examples of that period are in existence to-day. Ornamented civic maces were considered an infringement of one of the privileges of the king's serjeants, who, according to the Commons' petition in 1344, were alone deemed worthy of having maces enriched with costly metals. This privilege was, however, granted to the serjeants of London, and later to those of York (in 1396), Norwich (in 1403–4) and Chester (in 1506). Maces covered with silver are known to have been used at Exeter in 1387–8; two were bought at Norwich in 1435, and others for Launceston in 1467–8. Several other cities and towns had silver maces in the next century, and in the 16th they were almost universally used. As the custom of having serjeants' maces ceased (about 1650), the large maces, borne before the mayor or bailiffs, came into general use. Thomas Maundy was the chief maker of maces during the Commonwealth. He made the mace for the House of Commons in 1649, which is the one at present in use there, the original head having been replaced by one with regal symbols at the Restoration. There are two maces in the House of Lords, the earliest dating from the reign of William III. The eight large and massive silver-gilt maces of the serjeants-at-arms, kept in the jewel-house at the Tower of London, are also of the type which was almost universally adopted, with slight differences, at the Restoration. The civic maces of the 18th century follow this type, with some modifications in shape and ornamentation. The historic silver maces of the 18th century include the one of 1753 at Norfolk, Virginia, and that of 1756 of the State of South Carolina, both in the United States of America.

Among other maces, more correctly described as staves, in use at the present time, are those carried before ecclesiastical dignitaries and clergy in cathedrals and parish churches and the maces of the universities. At Oxford there are three of the second half of the 16th century and six of 1723–24, while at Cambridge there are three of 1626 and one of 1628, but altered at the Commonwealth and again at the Restoration. The silver mace with crystal globe of the lord high treasurer of Scotland, at Holyrood palace, was made about 1690. The remarkable mace or sceptre of the lord mayor of London is of crystal and gold and set with pearls; the head dates from the 15th century, while the mounts of the shaft are early mediaeval.

MACEDO, JOSE AGOSTINHO DE (1761–1831), Portuguese poet and prose writer, was born at Beja of plebeian family, and became professed as an Augustinian in 1778, but owing to his turbulent character he spent a great part of his time in prison, and was constantly being transferred from one convent to another. In 1792 he was unfrocked, but by the aid of powerful friends he obtained a papal brief which gave him the status of a secular priest. In a short time he was recognized as the leading pulpit orator of the day, and in 1802 he became one of the royal preachers. Macedo was the first Portuguese writer of didactic and descriptive poetry, the best example of which is his notable transcendental poem *Meditation* (1813). In 1814 he produced *Oriente,* an insipid epic dealing with the same subject as the *Lusiads*—Gama's discovery of the sea route to India. Macedo founded and wrote for a large number of journals, and the tone and temper of these and his political pamphlets induced his leading biographer to name him the "chief libeller" of Portugal. His overweening ambition led to his famous conflict with Bocage (*q.v.*), whose poem *Pena de Talião* was perhaps the hardest blow Macedo ever received. His malignity reached its height in a satirical poem in six cantos, *Os Burros* (1812–14), in which he pilloried by name men and women of all grades of society, living and dead, with the utmost licence of expression. The odes on Wellington and the emperor Alexander show true inspiration, and the poems in his *Lyra anacreontica,* addressed to his mistress, have merit.

See *Memorias para la vida intima de José Agostinho de Macedo* (ed. Th. Braga, 1899); *Cartas e opusculos* (1900); *Censuras á diversas obras* (1901).

MACEDONIA, a stretch of territory in the Balkan peninsula which till the outbreak of the Balkan wars was included in European Turkey. Since Macedonia has never been a political or administrative unit in modern times it is impossible to assign precise boundaries. About its general position there is no doubt. Between the western edge of the Rhodope upland, that is broadly the western frontier of Bulgaria, and the hills which stretch from the Šar mountains southwards to the Pindus range lies an area in which extensive depression has occurred. To the south, in the Gulf of Salonika, the sinking of the land has been sufficient to submerge it below sea-level, but north of the Gulf the depression has been partial and incomplete. At no very distant date, geologically speaking, it was sufficient to lead to the flooding of large tracts by fresh water, giving rise to extensive lakes. Some of these lakes remain, but the rivers, particularly the Vardar and its affluents, have been able to cut down the bounding sills sufficiently to drain many of these earlier lakes, and leave in their place level, fertile basins.

The zone of depression is not confined to the area directly north of the Gulf of Salonika but is continued to the east in the area between the Rhodope upland and the Aegean, where it includes the basin of Seres in the lower Struma valley, the basins of Drama and Kavalla further east, and others. The eastern limit, that is the boundary between Macedonia and Thrace in this coastal strip, is usually taken as the River Mesta, though some writers extend Macedonia as far eastward as the lower course of the river Maritza.

The northern frontier of Macedonia is the Crna Gora, the western the mountains on the Albanian frontier beginning with the Šar Planina and continuing S. of L. Prespa to Mt. Grammos. Here the boundary may be said to swing south-east along the right bank of the river Vistritza to reach the sea at Mt. Olympus. To the east of the Crna Gora the boundary is the edge of the Rhodope upland, or more precisely it is formed successively by the Osogov, Maleš and Pirin Mts., with a somewhat artificial eastern limit on the lower course of the Mesta. On the Aegean coast the Khalkidike peninsula with its three prongs is included.

The area so limited is not, however, a unit, but falls into an eastern and western section. The division line is a belt of mountain country having as important elements the Nidže Planina to the south-east of Bitolj (Monastir), which includes the peak of Kajmakčalan on the present Serbian-Greek frontier, and the Babuna Mts. to the north. To the west of this mountain tract the basins cover a smaller area than the surrounding mountains, so that the impression produced is that of a hill country. The basins also lie at a comparatively high level, that of Lake Prespa at about 3,000 ft., and since the climate approaches the continental type, with summer rains and often copious winter snowfall, the chief crops are cereals, while the extensive pastures support large flocks. The fish of the lakes also afford an accessory food-supply. Among the chief basins are the Ohrid (Okhrida) and Prespa, which retain the original lakes; that of Pelagonia containing the town of

Bitolj, which has been drained by the Upper Černa; that of Morichovo along the lower Černa; that of Debar on the Black Drim, and so on.

The eastern section presents striking contrasts. Here the basins are at a lower level, their floors sinking as the Aegean is approached. A whole series, from the basin of Skoplje and the Ovče Polje ("sheep field") in the north to the Campania of Salonika in the south are strung along the River Vardar, and are traversed by an important line of communication. Even those grouped round the distinct river system of the Struma have direct and open communication with the Vardar series, this ease of communication marking a contrast with the relative isolation of the western basins, sunk in the hill country.

Because depression has been greatest near the Aegean, Mediterranean influences penetrate towards the interior here, affecting both the climate and the crops. Thus irrigation is often necessary for summer crops, and has been practised for a prolonged period. The prevailing cereals of the west give place to a much greater variety of products, including the vine, the mulberry for silk production, and fruit-trees, especially the fig, as well as crops like cotton, tobacco, poppy, red peppers, maize, rice, and a great number of vegetables.

The Political Problem.—The foregoing facts form the basis of the problem of Macedonia; for Macedonia is rather a political problem than a geographical entity. But to them must be added a note on Salonika, at once the chief city of Macedonia and yet not, strictly speaking, Macedonian; for it owes its importance to causes wider than purely local ones. Under the Turks a mainly Jewish population handled here the import and export trade of a large part of the peninsula. As the Turk retreated, however, the town became an object of desire to Serbia and Bulgaria, both seeking outlets to open water, and to Greece, jealous of the control of Aegean trade. All three also, after the annexation of Bosnia and Hercegovina, feared a further advance on the part of Austria-Hungary.

In Turkish, as in Byzantine times, the high basins of the west, and much more the lower and more productive ones of the Vardar-Struma region, made Macedonia a highly-valued possession. Since the great highway which follows the Vardar valley is continued along the seaboard through Thrace to Constantinople, it was a relatively easy matter to hold it, so long as military power was unimpaired. Further, the fact that some of the main routes of the peninsula pass through Macedonia made it essential that any empire based on Constantinople should hold the region, altogether apart from its productivity. It is sufficient to note that Albania, Bosnia, Hercegovina and Old Serbia could only be reached from the Turkish capital through Macedonia.

In Turkish times the Christian cultivators of the basins felt the full weight of Turkish misrule, all the more because escape was impossible, the over-lords being widely spread along the lines of the highways. The question of the actual composition of the population was a difficult one, even before it was complicated by propaganda on the part of the nationalities concerned, and forced or voluntary movements. There was, and still is in places, a considerable Muslim element, not necessarily ethnically Turkish, but sharing in the privileges of the ruling race. Since the mountainous country in the west was no barrier to the Albanians, who appear to prefer hilly areas, and since further the Turkish administration showed little desire to interfere either with Albanian raiding or Albanian settlement at the expense of the Macedonian peasants, there was a considerable Albanian element.

The nomadic Vlachs, moving with their flocks from the high pastures in the warmer season to the low-lying ones near the Aegean in the colder one, found in Macedonia a region peculiarly fitted to their mode of life. Neither here nor elsewhere in the peninsula, however, do they enter to any extent into the nationality problem, being easily assimilated, and having no contiguous homeland to serve as a centre of propaganda. Even in Turkish times there appears to have been a considerable infiltration of Greek peasants from the south, especially in those areas which approximate in climate, natural vegetation and cultivated crops the Greek lands proper. Here also, as elsewhere, the Greeks tended to be town dwellers, owing to their instinct for trade. The mass of the peasant cultivators are generally believed to have always been Bulgarian or modified Bulgarian. A true Serb element was probably never large, but the memories of mediaeval Serbia and of the heroic if unavailing stand made by the Serbs against the first advance of the Turks gave Serbia a sentimental claim, and the Serbs also assert that the greater part of the population is modified Slav rather than truly Bulgarian.

Division.—Absence of physical unity in Macedonia, and of focal point, combined with its value to Turkey, made it impossible that the Macedonians could free themselves as did Serbia, Greece and Bulgaria. When Turkish power crumbled unexpectedly under a combined attack it was inevitable that the victors should quarrel over the spoil in Macedonia. The Balkan wars, followed by World War I, led to a division of the area between Greece and Serbia, to the exclusion of Bulgaria. The Serbo-Greek frontier ran from the southeast end of Lake Prespa in a northeasterly direction to the neighbourhood of Lake Dojran where it met the frontier between Greece and Bulgaria. Thus southern Macedonia became Greek, and northern Macedonia Serbian. In Greek Macedonia the interchange of populations between Turkey and Greece resulted in increased homogeneity, and the necessity for settling the large number of immigrants led Greece to make great efforts to develop the resources of the region. In Serbian Macedonia the number of true Serbs was apparently small, and though the Muslims there continued to emigrate to Asia Minor, the characteristic unrest of the area prior to World War II did not die down, so that the Macedonian problem was not wholly solved.

Bitolj, the largest town, had a population of 80,000 in 1912, which fell to 45,000 in 1914, and at the last census before World War II was only 33,024 (March 31, 1931). The attempts to Slavize the Bulgarian element in Serbian Macedonia apparently led to a recrudescence of anti-Serb feeling, but it has to be remembered that Serbia was now merged in the much greater kingdom of Yugoslavia, which had serious problems to face elsewhere, and had comparatively little energy to spare for Macedonia. Serbian Macedonia also was of far less importance to Yugoslavia than was Greek Macedonia to the new Greece.

As a result of the German conquest of Yugoslavia and Greece in 1941, Bulgarian troops occupied the whole of Macedonia and incorporated it into Bulgaria.

HISTORY

Early History.—(For the history of ancient Macedonia, *see* Macedonian Empire.) Soon after its conquest by the Romans, Macedonia was constituted a province (146 B.C.); on the partition of the Roman empire, it was assigned to the eastern branch. The original Thraco-Illyrian inhabitants were largely, though not wholly, Latinized or Graecized; Latin was chiefly spoken in the north, Greek near the coast, where Greek colonies were numerous. Invasions of Goths, Huns, Vandals and Avars, from the 4th century on, left no permanent mark on the country, beyond devastating it; but the Slavs, who entered the Balkans in the 5th and 6th centuries, colonized nearly all Macedonia, a few spots only remaining Greek. It was invaded by the Bulgars under their tsar, Krum (802–814) and became part of the first Bulgarian empire under Symeon (893–927), with the exception of Salonika and the seaboard; but in 963, on the decay of the Bulgarian empire, the Slavs of Macedonia, under the comes Nikola, revolted and made themselves independent. The third ruler of Nikola's dynasty, Tsar Samuel, founded a second "Bulgarian" empire, which extended over much of the Balkans with its capital at Prespa; but on his death, in 1014, Macedonia, which had been partially Bulgarized, came again under Byzantium. Various Asiatic elements were now introduced into the population; Turkish immigrants, afterwards known as Vardariotes, the first of their race to appear in Macedonia, had been settled near Salonika in the 9th century; colonies of Petchenegs, Uz and Cumans (all three Turkish tribes of kindred origin) were established in the succeeding centuries. About this period appeared the first traces of the Albanians, who were probably descendants of Thracian tribes; and of the Vlachs (*q.v.*), who are mentioned in the 9th, more frequently the 10th century, and in the 12th founded the State of "Great Walachia" in Thessaly. In 1185 William of Sicily captured and sacked Salonika. After the capture of Constantinople in 1204, the Latin kingdom of Thessalonica was bestowed on Boniface of Montferrat, who held it until expelled in 1223 by Theodore Angelus, despot of Epirus, who styled himself emperor of Thessalonica, and ruled over almost all Macedonia. He was defeated in 1230 by the Bulgarian tsar, Ivan Asen II (*see* ASEN), who reincorporated northern and central Macedonia in the second Bulgarian or Bulgaro-Vlach empire; the remainder of Macedonia being absorbed in the Nicean (Byzantine) empire in 1246. The power of Bulgaria declined rapidly on the extinction of the direct line of Asenidae. Northwestern Macedonia came again under the despotate of Epirus. Meanwhile the Serbian state was growing strong. Stephen Uroš II Milutin took Skoplje, made it his capital, and conquered northwest Macedonia; and Stephen Dušan (1331–55) conquered all Macedonia, except Salonika, with Thessaly, Epirus and parts of Bulgaria. Northern Macedonia was known henceforward as "Old Serbia."

Macedonia Under the Turks.—Most of Macedonia came under Turkish rule in 1371; Prilep in 1373, Serres in 1385. After the final defeat of the Balkan Slavs at Kossovo, its fate was sealed. Salonika was taken in 1387, and again in 1391–1407. It was finally taken, after a seven years' Venetian occupation, in 1430, and its inhabitants massacred. The towns in the Struma valley were yielded to the Turks by John VII. Palaeologos in 1424. Large tracts of land were distributed among the Ottoman chiefs; a system of feudal tenure was developed by Mohammed II (1451–81), each fief furnishing a certain number of armed warriors. The Christian peasant owners remained on the lands assigned to the Muslim feudal lords, to whom they paid a tithe. The condition of the subject population was deplorable from the first, and became worse during the period of anarchy which coincided with the decadence of the central power in the 17th and 18th centuries despite efforts to improve it by the grand viziers Mohammed and Mustafa Koprülü. The country was policed by the janissaries (*q.v.*). Numbers of the peasant proprietors were ultimately reduced to serfdom, working as labourers on the farms of the Muslim beys. Towards the end of the 18th century many of the local governors became practically independent; western Macedonia fell under the sway of Ali Pasha of Iannina; at Serres, Ismail Bey maintained an army of 10,000 men and exercised a beneficent despotism. The reforms embodied in the Hatt-i-Sherif of Gulhané (1839) and in the Hatt-i-humayun (1856), in both of which the perfect equality of races and religions was proclaimed, remained a dead letter; the first "Law of the Vilayets" (1864), reforming the local administration, brought no relief, while depriving the Christian communities of certain rights which they had hitherto possessed. Under the Turkish sway, the ethnological conditions of Macedonia were still further complicated. Large colonies of true Turks were settled in it. The Albanians spread eastward and northeastward and occupied much land in western Macedonia; the Serb element, which had been strengthened under tsar Dušan, was weakened by the great northward migrations of 1691 and 1740. The national consciousness of Serbs and Bulgarians alike suffered a heavy blow when the patriarchates of Okhrida and Peć, which had been the chief centres of their intellectual life, were abolished in 1767 and their dioceses subordinated to the oecumenical patriarch in Constantinople with the result that the spiritual control of the Christian peoples of the Balkans became vested solely in the Phanariot Greeks. Among other racial elements which now became prominent in Macedonia should be mentioned the Spaniole Jews of Salonika; while smaller colonies of Armenians, gypsies and Circassians were to be found.

Racial Propaganda.—In the 19th century the national consciousness of the Christian races of the Balkans began to reawaken. Serbia, after her liberation, paid little attention to Macedonia, being from the first more interested in her relations with the southern Slavs of Bosnia and Austro-Hungary. The Bulgarian national movement, however, though later in date, extended from the first over Macedonia. In their endeavour to shake off the spiritual yoke of the Phanariots, some of the Bulgar leaders even secured the recognition by the pope of a Catholic Uniate Church of Bulgaria; but the plan broke down owing to Russian opposition. Russia, on the other hand, supported the Bulgarian agitation in favour of a national orthodox exarchate; and an exarch was, in fact, appointed by firman of Feb. 28, 1870, with jurisdiction over 15 dioceses, including Niš, Pirot and Veles. Other districts might be subject to the exarch should two-thirds of the inhabitants so desire. Many of the Macedonian dioceses declared for the exarchate, others refraining, either for national reasons or from religious scruples, the oecumenical patriarch having excommunicated the exarch and all his flock without delay. Only in 1891 did the Porte, at the instance of Stambulov, issue the exequatur for Bulgarian bishops at Okhrida and Skoplje. Veles and Nevrokop followed in 1894, Monastir, Strumnitsa and Debar in 1898.

In pursuance of her then policy, Russia dictated the inclusion of all Macedonia, except Salonika and the Chalkidic peninsula, under the treaty of San Stefano (1878). The treaty of Berlin, however, left Macedonia under Turkish rule, but provided for the introduction of reforms analogous to those contained in the Cretan Organic statute of 1868. A rival project put forward by the Porte itself, the "Law of the Vilayets," was never adopted. Meanwhile the deplorable misgovernment under Abdul Hamid evoked a ceaseless agitation in the country, supported by the neighbouring states, partly out of sympathy, but increasingly with the object of securing at least parts of Macedonia for themselves.

The first and most energetic of these movements was the Bulgarian. Based at first on the activities of its bishops, reinforced soon after by the establishment of "commercial agents" at Salonika, Skoplje, Monastir and Serres, it made rapid progress among the Slavonic population, both among that which truly felt itself Bulgarian and among others who welcomed this, the sole protection which they could receive from any Slavonic power. In 1893 Bulgaria had 554 schools in Macedonia, with 30,267 pupils; in 1900, 785 schools, including 5 gymnasia and 58 secondary schools, with 39,892 pupils. This movement was entirely legal; but in 1893 various secret revolutionary societies were set on foot in Macedonia, and similar bodies organized as legal corporations in Bulgaria in 1894. The fall of Stambulov in that year and the reconciliation of Bulgaria with Russia encouraged the revolutionaries in the belief that Russia would attempt to restore the frontiers of San Stefano. In 1895 the "Supreme Macedo-Adrianopolitan Committee" was formed in Sofia and forthwith dispatched armed bands into northern Macedonia, one of which, under Boris Sarafov, temporarily occupied Melnik, but was soon expelled. Dissensions among the leaders paralyzed activities after this first failure for some five years. Meanwhile the local Macedonian societies were welded by Gruev and Delchev into the formidable "Internal Macedonian Revolutionary Organization," or I.M.R.O., which maintained an *imperium in imperio* in Macedonia with its own police, courts and civil administration. Avoiding co-operation with the revolutionaries, this organization proclaimed the ideal of "Macedonia for the Macedonians," for which it tried to win the sympathies of the other nationalities. These had, however, now initiated their own movements. The oldest was the Vlach, whose first serious champion was the priest Apostol Margarites, founder of a gymnasium at Monastir in 1866. Subsequently some 40 Rumanian national schools were started in Macedonia, being financed from Bucharest. A *millet* for the establishment of a Rumanian bishopric at Monastir was granted by the Porte on May 23, 1905. The Greek religious and educational movement was, of course, already well organized; but the progress of the Bulgarian movement was viewed with alarm, and in 1896 the Ethnike Hetairia (*see* GREECE) sent numerous bands into southern Macedonia with the aim of bringing about a war with Turkey. During the Graeco-Turkish War (*q.v.*), Macedonia remained quiet, Bulgaria and Serbia refraining from intervention under pressure from the powers. The Greek reverses benefited the Bulgarian movement; but on discovering a hidden Bulgarian arms depot, the Turks changed their attitude. Serbia realized her mission in Macedonia comparatively late, but a very vigorous and successful propaganda opened about 1890 in northern Macedonia, and in 1902 the Serbs, after a prolonged conflict with the Greeks, secured the appointment of a Serb, Mgr. Firmilian, to the archbishopric of Skoplje. The unrest increased steadily. In 1902 an effort was made to provoke a rising round Monastir by two Bulgars, Col. Yankov and Gen. Tsontchev.

European Intervention.—The state of Macedonia now necessitated European intervention. The Austrian and Russian governments drew up a plan of reforms. The Porte promulgated a rival plan in Nov. 1902, but on Feb. 21, 1903, Austria and Russia presented identical notes demanding the introduction of their reforms, which included the employment of "foreign specialists" to reorganize the *gendarmerie*. The Bulgarian government, under pressure from Russia, now suppressed the Bulgar committees, arrested the leaders, and confiscated the funds; but the Internal Organization was unreachable and pursued its plans for an insurrection. On Aug. 2 a general revolt broke out in the Monastir district, with sporadic risings elsewhere. It was suppressed by the end of September. The Austrian and Russian governments now drew up a fresh plan of reforms (the "Mürzsteg plan") which, however, by its program of a future readjustment of frontier on ethnological lines, proved a direct stimulus to murder and propaganda by the Christian populations. European officers were put in charge of the local authorities and the reorganization of the *gendarmerie*. Little was effected. In 1905 the powers, after a naval demonstration outside the Dardanelles, forced Turkey to agree to the establishment of an international financial commission; but again small progress was made, while band activity increased. Austria having disagreed with Russia, Great Britain now joined Russia in drawing up the "Reval program" of 1908 for fresh reforms. Immediately afterwards, the Young Turk revolt broke out in the Monastir district. Anticipating the voluntary introduction of reforms by the new Turkish government the powers suspended the Reval program and withdrew their military officers from Macedonia.

Unfortunately, the hopes placed in the Young Turks soon proved delusive. The state of Macedonia grew worse than ever. Indeed, an additional complication was introduced in the shape of an Albanian national movement. This had been impossible under the earlier Turkish regime, and even now the Albanian Muslims, who had more to fear from their Christian neighbours than from their Turkish co-religionists, were inclined to side with the latter in the frequent conflicts; a fact which resulted in their national aspirations afterwards receiving less than justice.

The Balkan Wars and World War I, 1912–18.—The treaties drawn up between Bulgaria and Serbia in 1912 provided for the partition of Macedonia, assigning to Bulgaria "the territory east of the Rhodope mountains and the river Struma" and to Serbia that "north and west of the Sar mountains." In the first and second Balkan Wars of 1912–13, Macedonia was the theatre of heavy fighting. The result of them was that Bulgaria, now at variance with her former allies, received only a small rectification of her frontier in the northeast of Macedonia. The Greek frontier stretched from the Mesta, thus including the rich tobacco plantations of Kavalla, to Kenali near Monastir, which became Serbian. In the west a new state of Albania was created.

The result of the disappearance of the Turk from Macedonia was thus to turn the animosity of the Christian Balkan States (to include Albania) against each other—an animosity enhanced by the savagery committed by all parties during the fighting and even behind the battle fronts. The task of reorganizing and repairing the work of Turkish neglect, which had extended over five centuries, was also an extremely difficult one for nations hampered, as the Serbs and Greeks were, by lack of experience and financial stringency. Little progress had been made either towards restoring the economic prosperity of the country, or in assuaging the discontent of the large sections of the population which felt themselves Bulgarian or Albanian, when World War I broke out in 1914. On Oct. 14, 1915, Bulgaria entered the war on the side of the Central Powers in the hope of gaining a large part of Macedonia. She speedily captured Štip, Radovište, Veles and Skoplje, and compelled the evacuation of Monastir. Allied troops which had landed at Salonika on Oct. 5 made small initial progress, and in May 1916 Bulgaria occupied all eastern Macedonia. Afterwards, the Allies, later assisted by Greek troops, were able to advance, and in 1918 to carry through a successful offensive, an armistice being signed on Sept. 29, 1918.

The peace settlement of 1919 left the Graeco-Serb frontier of 1913 unchanged, but gave both of these states, especially Greece, considerable accessions of territory at the expense of Bulgaria, while Greece also secured western Thrace. Provisions were made for the protection of racial minorities, but no active measures taken to ensure their enforcement.

Macedonia Under Greek and Yugoslav Rule.—The problems presented by Greek and Serb Macedonia proved very different. After the disastrous campaign undertaken by Greece in Asia Minor in 1922, some 1,500,000 Greek refugees entered Greece from Asia Minor and eastern Thrace. A scheme for the settlement of these refugees was undertaken by the League of Nations in 1923–24, a Refugee Loan of £10,000,000 being issued under the auspices of the League, while an international commission undertook the work of settlement. A large proportion of the refugees were settled in western Thrace and Macedonia with amazingly good results. A large stable peasant population was established, new villages founded, agriculture improved, waste areas drained and made fertile, and in spite of initial difficulties it seemed likely that Greek Macedonia would soon be raised to a pitch of prosperity such as it had, perhaps, never known. Treaties for the exchange of population were arranged with the neighbouring states, with the result that after a short time the racial question almost disappeared, over 90% of the population being Greek.

A number of Turks and Bulgars also left Yugoslav Macedonia (now known as South Serbia); but no general exchange was arranged for the Slavonic population, which was claimed by the Yugoslavs as Serb. While here, too, material prosperity increased, the efforts made by the Yugoslav officials to Serbize the population, their severe repression of Bulgar national feeling and their refusal to allow Bulgar schools, soon led to tension. The old Internal Organization was revived under Todor Alexandrov (*q.v.*) in 1920. This body became more formidable than ever, its leaders conducting a campaign of terrorism in Macedonia from their fastnesses in the mountains round Petritch in Bulgaria. It was so formidable a force in Bulgaria itself, where it enjoyed general sympathy, that the Bulgar governments were generally powerless against it; thus after Stambolisky (*q.v.*) had attempted to make terms with Yugoslavia, Alexandrov declared "irrevocable hostility" against his government, which was soon after overthrown and Stambolisky murdered (1923). A long series of incidents took place on the Yugoslav and Greek frontiers, keeping the Balkans in perpetual unrest. In 1924, however, the organization split over the question whether Russian help should be accepted. Alexandrov was murdered on Aug. 31, 1924, and an internecine feud commenced, in which many of the leaders lost their lives. Although the Revolutionary Organization gradually lost a good deal of sympathy, even in Bulgaria, its activities, after a period of quiescence, revived, band warfare being replaced, in 1927, by bomb outrages and the state of Macedonia, the most disturbing factor in the Balkans, was as far off peace as ever. One single disturbing factor was removed; the nomad Vlachs, whose livelihood was threatened by the more stable conditions, were received in large numbers by Rumania and settled there. In 1928 the principal issue of Macedonia agitation—an autonomous Macedonia or union with Bulgaria—again flared up in new violence. The leader of the pro-Bulgarian party, General Alexander Nicholoff Protogueroff, was killed. The large majority of Macedonians was for an independent Macedonia or an autonomous part of a Balkan federation and for a democratic-civilian leadership against a military pro-Bulgarian federation. The Macedonian agitation continued to play a large part in Bulgarian domestic policy. With the Bulgarian-Yugoslav *rapprochement* in the '30s the Macedonian agitation was controlled by Bulgaria. But the events of April

1941 gave Bulgaria the opportunity to annex the whole of Macedonia. At the same time the leaders of the Macedonian revolutionary movement were amnestied in Bulgaria.

MACEDONIAN ARMY. The army created by Philip of Macedon, the military instrument used by his son Alexander the Great in the conquest of the Persian empire, though based on the old Doric hoplite phalanx, was so superior to it that the genius of the great Macedonian cannot be appreciated without a comparison with the older organization.

The Early Greek Army.—The phalanx was the natural tactical formation for a military citizen levy, that is, a body of men whose training and tactics had to be of the simplest nature. Battles always took place on level ground, and normally in narrow valleys where the only manoeuvre possible was a forward or backward movement to drive the enemy out of the valley or into his city, or village, situated in it. Generally speaking, sieges were but holding operations carried out in order to enable the valley to be ravaged, for the economic attack was the main object of early Greek warfare. Except in Thessaly and Macedonia, cavalry was practically unknown until after the Persian wars, and though the bow was an old and respected weapon, used on occasion, as in the Plataea campaign (479 B.C.), it was not suited to a raw citizen force, since a bowman required a far more intensive training than a hoplite.

The phalanx formed a compact tactical body of files of men in varying depth. A file of eight men seems to have constituted the normal number, but frequently this was varied according to the personal predilection of the general from two to as many as twenty-five. In a phalanx of eight deep only two ranks were engaged, the rear ranks constituting a reserve for the replacement of casualties; also their object was to exercise physical and moral pressure on the leading two. The phalanx was based on two principles, producing opposite effects—depth which gave weight, and length which allowed for outflanking. Normally, depth was preferred to length because of the difficulty of moving a long line forward, especially if the ground was rough or at all broken.

The difficulty of harmonizing these two principles is clearly seen in the formation made use of by Miltiades in the battle of Marathon, 490 B.C. He was faced by the Persian army, which not only was numerically superior to his own but which possessed a strong cavalry force. The battlefield was a narrow plain flanked by two streams, but his phalanx if maintained eight ranks deep would have provided too narrow a front for him to rest its flanks on these obstacles. He, therefore, weakened the centre by thinning it to probably four ranks, leaving the flanks at their normal depth. When the two armies clinched, the Grecian centre was driven in but not broken; the result of this was a double envelopment of the Persians, and their defeat.

All hoplites wore armour, for it was recognized that a man without armour was not equal to one wearing it. This armour consisted of a large oval shield, helmet, breastplate and greaves, weighing 57 lb. The offensive weapons were a strong Doric spear from 6 to 10ft. in length, and a sword. The total weight carried by the hoplite was 72 lb., an impossible load for either long or rapid marches; consequently we find that each hoplite was accompanied by a slave who acted as shield-bearer, and who took part in the engagement as a lightly armed soldier; he was also a forager and a pillager.

The weak points of the phalanx were its flanks. Should the enemy succeed in attacking a flank whilst the front was engaged, the phalanx was lost. The flanking files were not only incapable of resisting an attack, but if forced to halt and face the enemy they immediately compelled the entire phalanx to stand still. When phalanx met phalanx this defect was not serious; but when, as in the Persian wars, the Greeks were confronted by cavalry

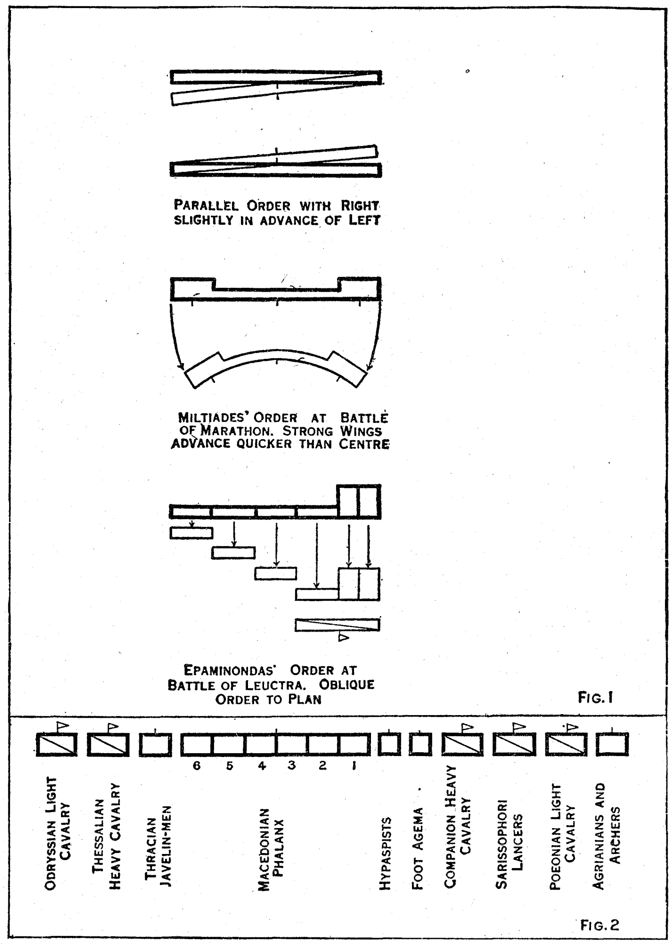

FIG. 1 SHOWS THE BATTLE ORDER OF THE GREEK PHALANXES WHILE FIG. 2 IS THE TYPICAL LINE OF BATTLE ADOPTED BY BOTH PHILIP OF MACEDON AND ALEXANDER

the danger of a charge against an exposed flank became obvious, and the result of this was a slow but noticeable interest taken in the cavalry arm. In the normal battle between hoplites, it generally happened that both sides tended to bear somewhat to their right; since each man felt that his right side was the less protected, consequently he tried to approach the enemy from the right. The tactical consequence of this was the development of an oblique order of attack, the value of which was first fully grasped by Epaminondas, and made use of by him at the battles of Leuctra (371 B.C.) and Mantineia (362 B.C.). This famous general was a true artist of war, since he understood how to combine infantry and cavalry according to the value of the ground fought over. So great was his discovery of refusing one wing and concentrating his main blow in the other, that his tactics formed not only the model for Alexander but for Frederick the Great as well.

Organization of the Macedonian Army.—The tactical conception as expounded by Epaminondas was adopted and developed by Philip of Macedon. Macedonia consisted mainly of plains, and had but a small urban population. The majority of the peasants were shepherds and too poor to maintain hoplite armour, consequently their spearmen, or peltasts, were lightly and indifferently equipped; they carried a light round shield, a tunic of leather or quilted linen, several javelins and a sword. These men when required formed the national levy, but the main arm relied upon by the kings of Macedonia was a body of mounted nobles. From these two elements Philip set to work to refashion his army.

Philip, when a hostage in Thebes, the city of Epaminondas, had learnt to appreciate the strength and weakness of trained mercenaries; their discipline was magnificent but they were lacking in patriotism. On his return to his kingdom, he determined to model his troops on what was then a new idea, namely, a highly-trained and disciplined standing army. This force being patriotic and disciplined would possess both the virtue of the old militiaman and the skill of the trained mercenary. As he already possessed the best cavalry in Greece, if he could now raise an efficient force of infantry, and combine these two arms scientifically, he would create for himself an instrument more powerful than that of any city or state in Greece. The system he worked on is not fully known, but much of it can be discovered from an analysis of the army commanded by his son, for it was only towards the close of Alexander's reign that changes in Philip's organization were made. First Philip took the Spartan phalanx as his model, but in place of looking upon it as an offensive force, he organized it as a stable base from which offensive action could be developed by his cavalry. This protective base he armed with a pike called the sarissa, which was in length double, or nearly double, that of the Spartan weapon, which at this time was about 10½ft. long. This lengthening of the pike may be compared to increasing the range of a modern rifle, for it meant that the enemy armed with the short pike would be outranged. It is true that the sarissa was a clumsy offensive weapon, but, as far as can be gathered, Philip never intended it as such; what, apparently, he aimed at was the establishment on the battlefield of an impenetrable wall of spikes, a mobile fortress upon which his cavalry could pivot and manoeuvre. This protective tactical base was organized into six divisions, each consisting of about 5,000 men. Each of these men, as in the Spartan phalanx, was allowed one or more servants who were lightly armed and could be employed for forays, raids and operations in hilly country.

To the phalanx Philip attached two cavalry wings, mobile arms which could hit out from it; the right wing was in idea offensive, and the left defensive. The main strength of the right lay in the Macedonian cavalry—the Companions—and of the left in the Thessalian cavalry, the second best cavalry in the army. As both these forces of cavalry were mainly for shock action, Philip added to each wing bodies of light cavalry; normally, the Sarissophori, or Lancers, and the Paeonians were allotted to the right wing, and the Odryssian cavalry to the left. Between the cavalry of the right wing and the right of the phalanx Philip inserted a "joint" of highly trained and armoured infantry known as the Hypaspists, of which a picked body constituted the Agema, or Royal Foot Guards, just as a selected regiment of the Companion cavalry, the cavalry Agema, were the Royal Horse Guards. This armoured infantry carried the short pike and were not protective troops like those of the phalanx, the Pezetaeri, but mobile offensive troops which normally, when the cavalry of the right wing charged forward, simultaneously protected the cavalry's left flank and the right flank of the phalanx. Should the charge of the heavy cavalry succeed, the Hypaspists, under cover of the cavalry on their right flank and the phalanx on their left, could take advantage of the enemy's disorder and work into his shattered front. The only point of weakness remaining was the right, or outer, flank of the right wing cavalry, which Philip protected by a body of skilled light infantry, the Agrianians, archers and the Thracian javelin-men.

A comparison between the Macedonian organizations and those of the Spartans and, later on, the Thebans under Epaminondas, shows clearly the genius of Philip. In the Spartan phalanx tactics were little more than push of pike, in which drill and courage generally won the day. In Epaminondas's battle order is seen clearly the idea of concentration of force against a weak point, but the blow is still delivered by infantry and is consequently slow, the Theban cavalry being no more than a protective force to the decisive infantry attack. In Philip's order organization is scientific. First, the moral element is not only based on discipline but on patriotism; secondly, the protective element is fully developed in the armoured and sarissa-armed Pezetaeri and the light infantry; thirdly, the offensive element is represented by the Hypaspists; and fourthly, the mobile element by the cavalry. Nor was this all, for these elements were so combined as to form a single co-operative organization, probably the most wonderful ever devised by a single man, and one much more scientifically perfect than any existing to-day. In the attack, the tactical base is the phalanx, for it can engage the enemy and hold him, and whilst the left wing guards the left flank of the phalanx the right wing can punch out from it with terrific force. The Hypaspists assault, and do not merely hold; the heavy cavalry charge, and do not merely wash round the enemy, and they can do so because their outer flank is well protected by light infantry, who are secured against being ridden over by light cavalry who not only are ever ready to support them, but who, by swarming round the enemy's left wing and rear, pin down his initiative. By means of this superb organization Alexander won victory after victory. Not only was he never defeated, but whether he fought on the plains or in the mountains, his army proved itself equally adaptable to the work it was asked to carry out. That it never failed him is the greatest possible proof of the organizing genius of his father.

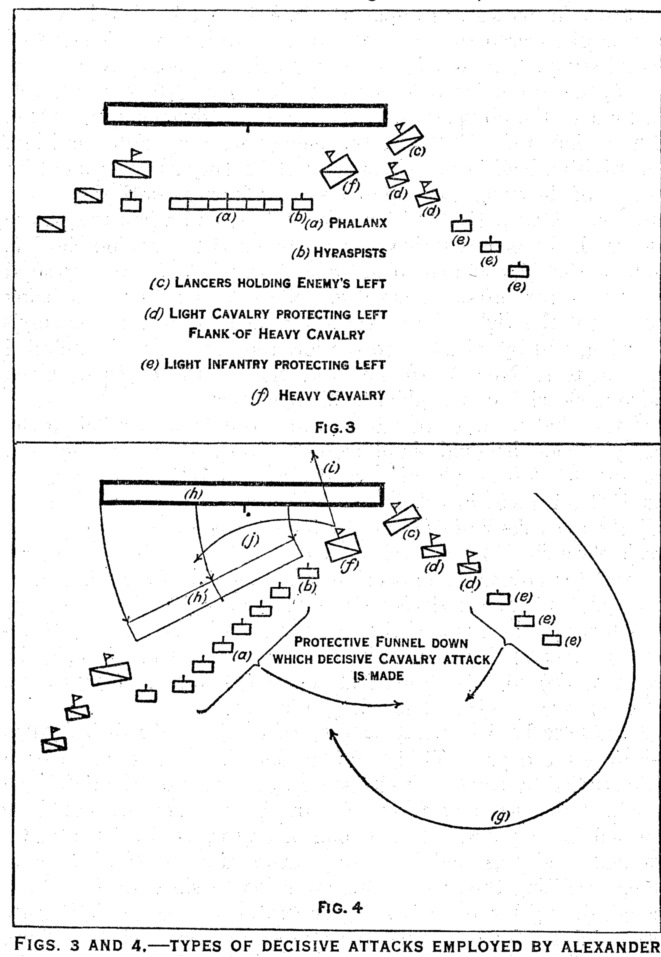
The Tactics of Alexander the Great.—The tactics developed from Philip's organization by Alexander were multiform, especially in his lesser campaigns. In his great battles, however, may be discovered two tactical constants which are deserving of careful study. The first is the rear attack on the enemy, and the second, the protection of this attack. The rear attack was developed out of the oblique order. The phalanx advancing in echelon with its left refused struck the enemy with its right division. This division held in its grip such of the enemy as confronted it; the rest of the enemy, unopposed, moved forward until they came into contact with the divisions on its left, and when they were also fixed, the enemy's right wing attempted to envelop the left flank of the Macedonian phalanx, but was held off by repeated charges of the left-wing cavalry. Whilst this action was being fought out the right-wing cavalry smashed through the enemy's left wing, and by wheeling to the left took the enemy's obliqued front in rear. Now as to the protection of the decisive attack which is closely connected with this operation.

If the phalanx were to advance in a solid line parallel to the enemy's front, it could simultaneously fix the enemy's front and protect the left flank of the decisive attack. (*See* fig. 3). But if it advances in echelon (*a*) (*see* fig. 4) it can protect not only the inner flank of (*f*) but also its rear should an enemy attack break through (*g*) the archers and javelin-men (*e*). Similarly (*d*) and (*e*) advancing in echelon with their left forward, protect the right flank of the decisive attack. The rapid advance of (*f*) pulls forward the right of the phalanx and the left of (*e*) forming a protective funnel for the charge and probably forcing the enemy at (*h*) to (*h′*). Should attack of (*f*) towards (*i*) succeed, (*f*) can move by (*j*) and attack (*h′*) in rear.

The Siege Train and Artillery of the Macedonian Army.—Before the days of Philip of Macedon siege warfare had been little studied by the Greek city states, consequently the defensive remained the stronger form of war. Until fortresses could be stormed there was small likelihood of any centralization of government, and this had been the outstanding curse of Greece. Philip, realizing this, turned his attention to siege warfare, and, though during his reign his siege operations were not uniformly successful, no fortress, even the immensely strong city of Tyre, successfully withstood the engineering ability of his son. In the Macedonian army there was established a special corps of engineers equipped with all the necessary machinery for carrying out sieges, and for crossing rivers. At the siege of Tyre, movable towers, rams and floating battery were used, and in India a pontoon train was added to the army so that the Indus, Jhelum and other rivers could rapidly be crossed. Though siege artillery had long been known in the east, Philip introduced field artillery in the form of wagon-carried catapults and ballistae, of which Alexander made frequent use in his mountain campaigns and in river-crossing operations. It was quite as much due to the Macedonian siege train as to the field army that Alexander was able to overthrow the Persian empire, for all its more important cities were strongly fortified.

Command and Administration of the Macedonian Army.—Though little information is forthcoming on the interior economy of the Macedonian army, it is known that its command rested absolutely in the hands of Philip, and after him in those of Alexander. This was an enormous advantage, since in most of the Greek states generals were elected yearly, and frequently more than one was placed in supreme command. Philip is reported to have said: "I envy the good luck of the Athenians; each year they are able to find ten men fit to command their armies, whilst I have only been able to find Parmenio to lead mine." Lack of unity of command was the ruin of Athens.

When Alexander ascended the throne of Macedon, in every sense, he was commander-in-chief. Under him came two deputy chiefs—Parmenio and Antipater. The first represented the military and the second the civil government, for whilst Parmenio accompanied Alexander to Asia, Antipater was left at home as viceroy. In battle Alexander commanded the right wing and Parmenio the left. For his personal staff Alexander had seven aides-de-camp, or *Somatophylaxes,* who were frequently appointed to command special detachments. Of his administrative directors and officers next to nothing is known, but those services



FIGS. 3 AND 4.—TYPES OF DECISIVE ATTACKS EMPLOYED BY ALEXANDER THE GREAT

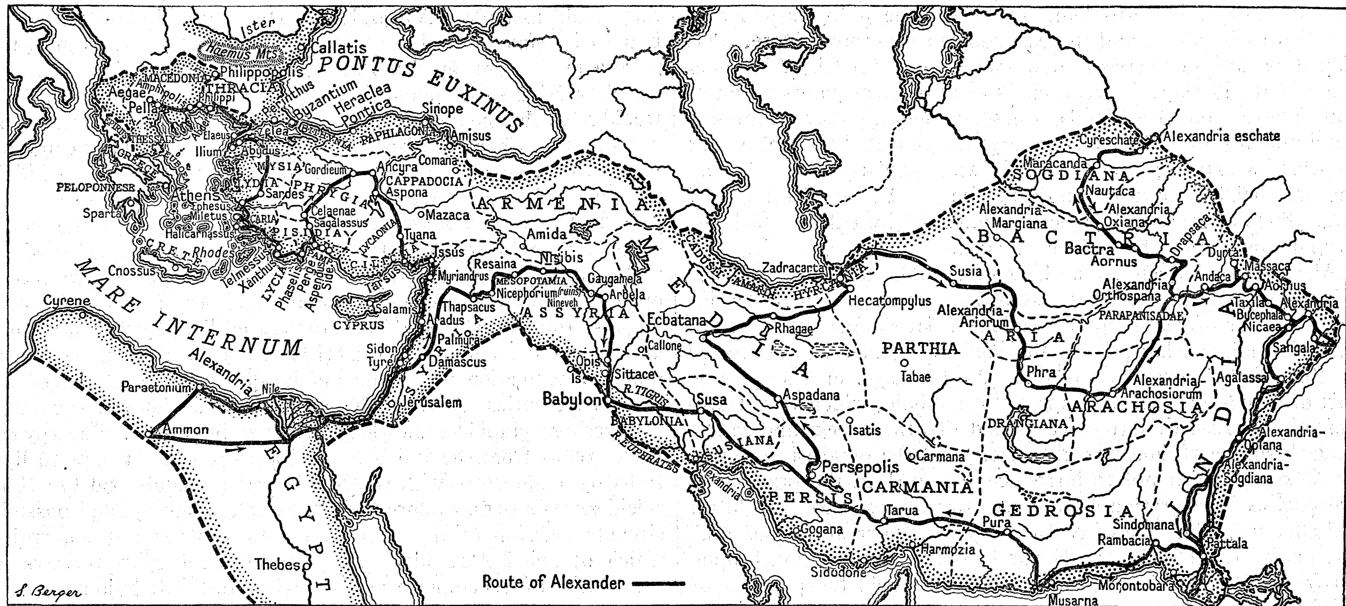
which to-day would fall under the quartermaster-general's and adjutant-general's departments, and the ordnance and medical services, must have been highly organized, otherwise it would have been impossible for him to maintain the army in Asia. To do so demanded most careful supply work and security of the lines of communication, for whilst he was in Babylonia, Persia and India, thousands of recruits were sent out to him as well as great quantities of arms and armour. To despatch reinforcements and stores across land from Greece to the Indus and beyond would require even to-day the highest administrative ability, and without these reinforcements Alexander could not have continued his conquests. Eventually, when he reached the Sutlej, the abandonment of a further advance was probably due as much to the immense time it took to supply and reinforce his army as to any other cause.

The Decline of the Macedonian Army.—The decline of the Macedonian military organization took place during the latter campaigns of Alexander, the main reason being that Greece was unable to supply him with a sufficiency of recruits. He consequently had largely to rely on Asiatics whose tactics were mainly based on projectile weapons—the javelin and the arrow. Arrian informs us that shortly before his death he reorganized his army, creating a phalanx 16 men deep, the first three ranks and the last consisting of Macedonians armed with the sarissa, and the 12 middle ranks of Persians armed with bows and javelins. This organization would appear to be a latter-day invention as are most of the tactics and drill attributed to the Macedonians by Aelian, Arrian and Vegetius.

During the wars of the Diadochi, though generalship was frequently of a high order, and strategical combinations were far more intricate than in the days of Philip and Alexander, the decline, and eventually the decay, of the Macedonian army was rapid and pronounced, until under Ptolemy II. (309–246 B.C.) we find a return to the old horde system, for according to Appian this monarch possessed an army of 200,000 infantry, 40,000 cavalry, 300 elephants and 2,000 war chariots, and a fleet of 1,500 warships and 2,000 transports. Efficiency and organization had once again been replaced by numbers and mass. There were three immediate reasons for this decline. The first was the sudden loss of Alexander's genius; the second, the imitation of his actions without understanding them, and the third the immense influx of gold from Persia. The first two have been patent to military history, the third was exceptional, and is, consequently, of particular interest.

The influence of gold on the art of war of this period was a twofold one: first, it placed mercenary service more than ever on a commercial footing; and, secondly, through the stimulus it gave to science and industry, projectile weapons began to replace shock. From the death of Alexander onwards for some 50 years the money he intended to spend on the reconstruction of his empire was expended on war, in which mercenaries were sold and bought, frequently on the battlefields themselves, as if they were commodities. Though this did not necessarily destroy the discipline of the soldiers, leadership rapidly deteriorated, and the heroism of Alexander, which was the soul of his generalship, was replaced by a more intellectual form of command, the leader of men evolving into the diplomatic commander of armies. When the campaigns of such a man as Eumenes are examined, the change is astonishing. He is as crafty as a fox, in fact is an epitome of his age. Not only does he have to keep his plans secret from his men, but even the enemy they are to battle with. Witness the artfulness of Seleucus at the battle of Ipsus; he rides round his enemy, but he does not charge home; he can charge, but he refrains from doing so until he has won over the deserters. What is seen in all these subtler actions is the replacement of the old physical attack by the moral attack but without changing the physical means. Blows give way to suggestions, and are aimed at the brain rather than the body. It is an occult transformation of military power, but once the clue is found, the change is clearly discernible, and becomes more and more so until, under Hannibal, it is developed to so high a pitch that his presence in any quarter of Italy paralyses Roman action.

The other influence of gold was the founding of great cities such as Alexandria, in which was collected the intellect of the age. Gold-power was transformed into brain-power, and, as these were warring times, warfare became more and more mechanized, muscle being supplemented by machinery. It has often been asserted by historians that the introduction of war engines caused a decadence in the art of war. This is only a half-truth, for the decline of the Macedonian system was due not to the introduction of elephants and artillery, but to generalship which took little notice of them, and which attempted to use men against



MAP OF THE MACEDONIAN EMPIRE AND THE ROUTE OF ALEXANDER THE GREAT OF MACEDONIA IN HIS SERIES OF MILITARY VICTORIES (334–323 B.C.)

them in the same manner as before their adoption. Valour was thus destroyed, not by invention but by stupidity. It was because so many generals of this epoch did not understand the influence of new weapons on tactics and *moral* that a decadence set in, and not because these weapons were more powerful than the older ones. Intelligence was the foundation of Philip's military system, and lack of it destroyed it rather than such weapons as the Polybolos of Dionysius, an arrow-throwing "machine-gun," or the cross-bow of Ctesibius, which was geared by pistons working in cylinders filled with compressed air. (J. F. C. F.)

MACEDONIAN EMPIRE, the name generally given to the empire founded by Alexander the Great of Macedon in the countries now represented by Greece and European Turkey, Asia Minor, Egypt, Syria, Persia and eastwards as far as northern India. The present article falls naturally into two main divisions—I. The reign of Alexander. II. The period of his successors, the "Diadochi" and their dynasties.

I. THE REIGN OF ALEXANDER

At the beginning of the 4th century B.C. two types of political association confronted each other in the lands of the Eastern Mediterranean—the Persian monarchy with its huge agglomeration of subject peoples, and the Greek city-state. Each had a different principle of strength. The Persian monarchy was strong in its size, in the mere amount of men and treasure it could dispose of under a single hand; the Greek state was strong in its *moral,* in the energy and discipline of its soldiery. But the smallness of the single city-states and their unwillingness to combine prevented this superiority in quality from telling destructively upon the bulk of the Persian empire. The future belonged to any power that could combine the advantages of both systems, could make a state larger than the Greek city, and animated by a spirit equal to that of the Greek soldier. This was achieved by the kings of Macedonia. The work, begun by his predecessors, of consolidating the kingdom internally and making its army a fighting-machine of high power was completed by the genius of Philip II. (359–336 B.C.), who at the same time by war and diplomacy brought the Greek states of the Balkan peninsula generally to recognize his single predominance. At the synod of Corinth (337) Philip was solemnly declared the captain-general (*στρατηγὸς αὐτοκράτωρ*) of the Hellenes against the king of Persia, and in 334 his son and successor Alexander delivered his attack at the head of an army composed both of Macedonians and contingents from the allied Greek states. Before this force the Persian monarchy went down, and when Alexander died eleven years later (323) a Macedonian empire which covered all the territory of the old Persian empire, and even more, was a realized fact.

System of Government.—The conquered empire presented Alexander with a system of government ready-made, which it was natural for the new masters to take over. For the Asiatic provinces and Egypt, the old Persian name of *satrapy* (*see* SATRAP) was still retained. The governors appointed by Alexander were, in the west of the empire, exclusively Macedonians; in the east, members of the old Persian nobility were still among the satraps at Alexander's death.

Alexander had at first trusted Persian grandees more freely in this capacity, till the ingrained oriental tradition of misgovernment so declared itself that to three more provinces at least Macedonians had been appointed before his death. In the case of certain provinces, possibly in the empire generally, Alexander established a double control. The financial administration was entrusted to separate officials; we hear of such in Lydia, Babylonia and notably in Egypt. Higher financial controllers seem to have been over groups of provinces, and Harpalus over the whole finances of the empire, with his seat in Babylon. Again, the garrisons in the chief cities, such as Sardis, Babylon, Memphis, Pelusium and Susa, were under commands distinct from those of the provinces. The old Greek cities of the motherland were not formally subjects of the empire, but sovereign states, which assembled at Corinth as members of a great alliance, in which the Macedonian king was included as a member and held the office of captain-general. Of course, in fact, the power of the king was so vastly superior that the Greek cities were in reality subject to his dictation, even in so intimate a matter as the readmission of their exiles, and might be obliged to receive his garrisons. Within the empire itself, the various communities were allowed, subject to the interference of the king or his officials, to manage their own affairs. Alexander is said to have granted the Lydians to be "free" and "to use the laws of the ancient Lydians," whatever exactly these expressions may mean. So too in Egypt, the native monarchs were left as the local authorities. Especially to the gods of the conquered peoples Alexander showed respect. In Egypt and in Babylon he appeared as the restorer of the native religions to honour after the unsympathetic rule of the Persians. The temple of Marduk in Babylon which had fallen began to rise again at his command. It is possible, but not probable, that he offered sacrifice to Yahweh in Jerusalem. In Persia, the native aristocracy retained their power, and the Macedonian governor adopted Persian dress and manners. A new factor introduced by Alexander was the foundation of Greek cities at all critical points of intercourse in the conquered lands. These, no doubt, possessed municipal autonomy with the ordinary organization of the Greek state; to what extent they were formally and regularly controlled by the provincial authorities we do not know. The empire included large tracts of mountain or desert, inhabited by tribes, which the Persian government had never subdued.

Alexander, who set out as king of the Macedonians and captain-general of the Hellenes, assumed after the death of Darius the character of the oriental great king. He adopted the Persian garb, including a head-dress, the *diadema,* which was suggested by that of the Achaemenian king. We hear also of a sceptre as part of his insignia. The pomps and ceremonies which were traditional in the East were to be continued. To the Greeks and Macedonians such a régime was abhorrent, and the opposition roused by Alexander's attempt to introduce among them the practice of *proskunesis* (prostration before the royal presence) was bitter and effectual. The title of *chiliarch,* "commander of a thousand," *i.e.,* of the royal body-guard, was conferred by Alexander upon his friend Hephaestion. The Greek Chares held the position of chief usher. Another Greek, Eumenes of Cardia, was chief secretary. The figure of the eunuch, so long characteristic of the oriental court, was as prominent as ever.

Alexander, however, who impressed his contemporaries by his sexual continence, kept no harem. The number of his wives did not go beyond two, and the second, the daughter of Darius, he did not take till a year before his death. In closest contact with the king's person were the seven, or latterly eight, body-guards, Macedonians of high rank, including Ptolemy and Lysimachus, the future kings of Egypt and Thrace. The institution, which the Macedonian court before Alexander had borrowed from Persia, of a corps of pages composed of the young sons of the nobility, continued to hold an important place in the system of the court and in Alexander's campaigns.

Macedonian Army.—The army of Alexander was an instrument which he inherited from his father Philip. (*See* MACEDONIAN ARMY.)

Later modifications in the army system were closely connected with Alexander's general policy, in which the fusion of Greeks and Asiatics held a prominent place. He had himself, as we have seen, assumed to some extent the guise of a Persian king. The most striking declaration of his ideals was the marriage feast at Susa in 324, when a large number of the Macedonian nobles were induced to marry Persian princesses, and the rank and file were encouraged to take Eastern wives. Among the schemes registered in the state papers was one for transplanting large bodies of Asiatics into Europe and Europeans into Asia, for blending the peoples of the empire by intermarriage into a single whole.

Divine Honours.—High above all the medley of kindreds and tongues, untrammelled by national traditions, invested with the glory of achievements in which the old bounds of the possible seemed to fall away, stood in 324 the man Alexander. Was he a man? The question was explicitly suggested by the report that the Egyptian priest in the oasis had hailed him as the son of Ammon. The Egyptians had ascribed deity to their kings, and were ready enough to add Alexander to the list. It is also not unlikely that the Persian kings had received some form of divine worship. (L. Taylor, *Journ. Hellenic Studies,* 1927, p. 153, ff.) From the Greeks he certainly received such honours. It has been supposed that in offering such worship the Greeks showed the effect of "Oriental" influence, but certainly we have not to look outside the Greek circle of ideas to explain it. As early as Aeschylus (*Supp.* 991) the proffering of divine honours was a form of expression for intense feelings of reverence or gratitude towards men which naturally suggested itself—as a figure of speech in Aeschylus, but the figure had been translated into action before Alexander not in the well-known case of Lysander only (*cf.* the case of Dion, Plut. *Dio.* 29). Among educated Greeks rationalistic views of the old mythology had become so current that they could assimilate Alexander to Dionysus without supposing him to be supernatural, and to this temper the divine honours were a mere form, an elaborate sort of flattery. Did Alexander merely receive such honours? Or did he claim them himself? It would seem that he did. We have well-authenticated utterances of Attic orators when the question of the cult of Alexander came up for debate, which seem to prove that an intimation of the king's pleasure had been conveyed to Athens.

Commerce and Discovery.—A new life entered the lands conquered by Alexander. Human intercourse was quickened to a degree not before known. Commercial enterprise now found open roads between the Aegean and India; the new Greek cities made stations in what had been for the earlier Greek traders unknown lands; an immense quantity of precious metal had been put into circulation which the Persian kings had kept locked up in their treasuries. At the same time Alexander himself sought to win fresh geographical knowledge, to open new ways. The voyage of Nearchus from the Indus to the Euphrates was meant to link India by a waterway with the Mediterranean lands. So too Heracleides was sent to explore the Caspian; the survey, and possible circumnavigation of the Arabian coasts was the last enterprise which occupied Alexander. The improvement of waterways in the interior of the empire was not neglected, the Babylonian canal system was repaired, the obstructions in the Tigris removed. The reports of the *βηματισταί* Baeton and Diognetus, who accompanied Alexander's army, gave a more exact knowledge of the geographical conformation of the empire. Greek natural science was enriched with a mass of new material from the observations of the philosophers who went with Alexander; on the other hand, attempts were made to acclimatize the plants of the motherland in the foreign soil.

The accession of Alexander brought about a change in the monetary system of the kingdom. With the conquest of Asia, Alexander conceived the plan of issuing a uniform coinage for the empire. Gold had fallen from the diffusion of the Persian treasure, and Alexander struck coins in both gold and silver on the Attic standard, leaving their relation to adjust itself by the state of the market. This imperial coinage was designed to break down the monetary predominance of Athens.

II. AFTER ALEXANDER

The external fortunes of the Macedonian empire after Alexander's death must be briefly traced before its inner developments be touched upon.[1] There was, at first, when Alexander suddenly died in 323, no overt disruption of the empire. The dispute between the Macedonian infantry and the cavalry (*i.e.,* the commonalty and the nobles) was as to the person who should be chosen to be the king, although it is true that either candidate, the half-witted son of Philip II., Philip Arrhidaeus, or the posthumous son of Alexander by Roxana, opened the prospect of a long regency exercised by one or more of the Macedonian lords. The compromise, by which both the candidates should be kings together, was, of course, succeeded by a struggle for power among those who wished to rule in their name. During a period of confused warfare, which lasted, with intervals, for forty years, the family of Alexander was wholly destroyed; the endeavour of Antigonus, satrap of Phrygia, and of his son Demetrius, to establish a new imperial dynasty, was frustrated by the former's defeat and death at the battle of Ipsus (301 B.C.); and a similar and all but successful attempt by Seleucus, governor of Syria, ended in his assassination (280 B.C.)

About 275 B.C. a horde of Celtic warriors from the Danube lands who had crossed over into Asia Minor after a series of devastating forays in Macedonia and Greece, took possession of the central plateau and there formed a federation of tribal kingdoms known as Galatia. In Cappadocia two Persian houses, relics of the old aristocracy of Achaemenian days, had carved out principalities, one of which became the kingdom of Pontus and the other the kingdom of Cappadocia (in the narrower sense); the former regarding Mithradates (281–266) as its founder, the latter being the creation of the second Ariarathes (?302–?281). Ar-

[1]For details *see* separate articles on the chief generals.

menia, never effectively conquered by the Macedonians, was left in the hands of native princes, tributary only when the Seleucid court was strong enough to compel. In India, Seleucus had in 302 ceded large districts on the west of the Indus to Chandragupta, who had arisen to found a native empire which annexed the Macedonian provinces in the Punjab.

Whilst the Antigonid kingdom remained practically whole till the Roman conquest ended it in 168 B.C., and the house of Ptolemy ruled in Egypt till the death of Cleopatra in 30 B.C., the Seleucid empire perished by a slow process of disruption. The eastern provinces of Iran went in 240 or thereabouts, when the Greek Diodotus made himself an independent king of Bactria (*q.v.*) and Sogdiana, and Tiridates, brother of Arsaces, a "Scythian" chieftain, conquered Parthia (so Arrian, but *see* PARTHIA). Armenia was finally lost in 190, when Artaxias founded a new native dynasty there. Native princes probably ruled in Persia before 166 (*see* PERSIA). In southern Syria which had been won by the house of Seleucus from the house of Ptolemy in 198, the independent Jewish principality was set up in 143. About the same time Media was totally relinquished to the Parthians. Babylonia was Parthian from 129. In 64 the last shadow of Seleucid rule vanished, when Syria was made a Roman province by Pompey. From this time Rome formally entered upon the heritage of Alexander as far as the Euphrates, but many of the dynasties which had arisen in the days of Macedonian supremacy were allowed to go on for a time as client states.

Restoration of Despotism.—The Macedonians of Alexander were not mistaken in seeing an essential transformation of their national monarchy when Alexander adopted the guise of an oriental great king. Transplanted into this foreign soil, the monarchy became an absolute despotism, unchecked by a proud territorial nobility and a hardy peasantry on familiar terms with their king. The principle which Seleucus is reported to have enunciated, that the king's command was the supreme law, was literally the principle of the new Hellenistic monarchies in the East. But the rights belonging to the Macedonian army as Alexander inherited it did not altogether disappear. Like the old Roman people, the Macedonian people under arms had acted especially in the transference of the royal authority, conferring or confirming the right of the new chief, and in cases of the capital trials of Macedonians. In the latter respect the army came regularly into function under Alexander, and in the wars which followed his death; and in Macedonia, although the power of life and death came *de facto* into the hands of the Antigonid king, the old right of the army to act as judge was not legally abrogated. The right of the army to confer the royal power was still symbolized in the popular acclamation required on the accession of a new king, and at Alexandria in troubled times we hear of "the people" making its will effective in filling the throne, although it is here hard to distinguish mob-rule from the exercise of a legitimate function. Where it is a case of delegating some part of the supreme authority, as when Seleucus I. made his son Antiochus king for the eastern provinces, we find the army convoked to ratify the appointment. So too the people is spoken of as appointing the guardians of a king during his minority. Nor was the power of the army a fiction. The Hellenistic monarchies rested, as all government in the last resort must, upon the loyalty of those who wielded the brute force of the state, and however unlimited the powers of the king might be in theory, he could not alienate the goodwill of the army with impunity. The right of primogeniture in succession was recognized as a general principle; a woman, however, might succeed only so long as there were no male agnates.

The practice by which the king associated a son with himself, as secondary king, dates from the very beginning of the kingdom of the successors; Antigonus on assuming the diadem in 306 caused Demetrius also to bear the title of king. In the Seleucid kingdom the territorial expanse of the realm made the creation of a distinct subordinate government for part of it a measure of practical convenience. The king's government was carried on by officials appointed by him and responsible to him alone. Government at the same time, as an oriental despotism understands it, often has little in view but the gathering in of the tribute and compulsion of the subjects to personal service in the army or in royal works, and if satisfied in these respects will leave much independence to the local authorities. In the loosely-knit Seleucid realm it is plain that a great deal more independence was left to the various communities—cities or native tribes—than in Egypt, where the conditions made a bureaucratic system so easy to carry through. In their outlying possessions the Ptolemies may have suffered as much local independence as the Seleucids; the internal government of Jerusalem, for instance, was left to the high priests. In so far as the older Greek cities fell within their sphere of power, the successors of Alexander were forced to the same ambiguous policy as Alexander had been, between recognizing the cities' unabated claim to sovereign independence and the necessity of attaching them securely. In Asia Minor, the "enslavement" and liberation of cities alternated with the circumstances of the hour, while the kings all through professed themselves the champions of Hellenic freedom, and were ready on occasion to display munificence toward the city temples or in public works, such as might reconcile republicans to a position of dependence. Antiochus III. went so far as to write on one occasion to the subject Greek cities that if any royal mandate clashed with the civic laws it was to be disregarded. How anxious the Pergamene kings, with their ardent Hellenism, were to avoid offence is shown by the elaborate forms by which, in their own capital, they sought to give their real control the appearance of popular freedom. A similar problem confronted the Antigonid dynasty in the cities of Greece itself, for to maintain a predominant influence in Greece was a ground-principle of their policy. Demetrius had presented himself in 307 as the liberator, and driven the Macedonian garrison from the Peiraeus; but his own garrisons held Athens thirteen years later, when he was king of Macedonia, and the Antigonid dynasty clung to the points of vantage in Greece, especially Chalcis and Corinth, till their garrisons were finally expelled by the Romans in the name of Hellenic liberty.

Commerce.—The new movement of commerce initiated by the conquest of Alexander continued under his successors, though the break-up of the Macedonian empire in Asia in the 3rd century and the distractions of the Seleucid court must have withheld many advantages from the Greek merchants which a strong central government might have afforded them. It was along the great trade-routes between India and the West that the main stream of riches flowed then as in later centuries. One of these routes was by sea to south-west Arabia (Yemen), and thence up the Red sea to Alexandria. This was the route controlled and developed by the Ptolemaic kings. Between Yemen and India the traffic till Roman times was mainly in the hands of Arabians or Indians; between Alexandria and Yemen it was carried by Greeks. The west coast of the Red sea was dotted with commercial stations of royal foundation from Arsinoë north of Suez to Arsinoë in the south near the straits of Bab-el-Mandeb. From Berenice on the Red sea a land-route struck across to the Nile at Coptos; this route the kings furnished with watering stations. That there might also be a waterway between Alexandria and the Red sea, they cut a canal between the Delta and the northern Arsinoë. It was Alexandria into which this stream of traffic poured and made it the commercial metropolis of the world. We hear of direct diplomatic intercourse between the courts of Alexandria and Pataliputra, *i.e.*, Patna. An alternative route went from the Indian ports to the Persian gulf, and thence found the Mediterranean by caravan across Arabia from the country of Gerrha to Gaza; and to control it was no doubt a motive in the long struggle of the Ptolemaic and Seleucid houses for Palestine, as well as in the attempt of Antiochus III. to subjugate the Gerrheans. Or from the Persian gulf wares might be taken up the Euphrates and carried across to Antioch; this route lay altogether in the Seleucid sphere. With Iran Antioch was connected most directly by the road which crossed the Euphrates at the Zeugma and went through Edessa and Antioch-Nisibis to the Tigris. The trade from India which went down the Oxus and then to the Caspian does not seem to have been considerable. From Antioch to the Aegean the land high-road went across Asia Minor by the Cilician gates and the Phrygian Apamea.

Finance.—Of the financial organization of the Macedonian kingdoms we know practically nothing, except the case of Egypt. Here the papyri and ostraca have put a large material at our disposal; but the circumstances in Egypt[1] were too peculiar for us to generalize upon these data as to the Seleucid and Antigonid realms. That the Seleucid kings drew in a principal part of their revenues from tribute levied upon the various native races, distributed in their village communities as tillers of the soil goes without saying. In districts left in the hands of native chiefs these chiefs would themselves exploit their villages and pay the Seleucid court tribute. To exact tribute from Greek cities was invidious, but Seleucid kings often did so. Sometimes, no doubt, this tribute was demanded under a fairer name, as the contribution of an ally, like the *Γαλατικά* levied by Antiochus I. The royal domains, again, and royal monopolies, such as salt-mines, were a source of revenue. As to indirect taxes, like customs and harbour dues, while their existence is a matter of course, their scale, nature and amount is quite unknown to us. Whatever the financial system of the Antigonid and Seleucid kingdoms may have been, it is clear that they were far from enjoying the affluence of the Ptolemaic. During the first Seleucid reigns indeed the revenues of Asia may have filled its treasuries, but Antiochus III. already at his accession found them depleted, and from his reign financial embarrassment, coupled with extravagant expenditure, was here the usual condition of things. Perseus, the last of the Antigonid house, amassed a substantial treasure for the expenses of the supreme struggle with Rome, but it was by means of almost miserly economies.

Special officials were naturally attached to the service of the finances. Over the whole department in the Seleucid realm there presided a single chief. How far the financial administration was removed from the competence of the provincial governors, as it seems to have been in Alexander's system, we cannot say. Seleucus at any rate, as satrap of Babylonia, controlled the finances of the province and so, in the Ptolemaic system, did the governor of Cyprus.

With the exception of Ptolemaic Egypt, the Macedonian kingdoms followed in their coinage that of Alexander. Money was for a long while largely struck with Alexander's own image and superscription; the gold and silver coined in the names of Antigonid and Seleucid kings and by the minor principalities of Asia, kept to the Attic standard which Alexander had established. Only in Egypt Ptolemy I. adopted, at first the Rhodian, and afterwards the Phoenician, standard, and on this latter standard the Ptolemaic money was struck during the subsequent centuries. Money was also struck in their own name by the cities in the several dynasties' spheres of power, but in most cases only bronze or small silver for local use.

Court Customs.—In language and manners the courts of Alexander's successors were Greek. Even the Macedonian dialect, which it was considered proper for the kings to use on occasion, was often forgotten. The oriental features which Alexander had introduced were not copied. There was no *proskunesis* (or certainly not in the case of Greeks and Macedonians), and the king did not wear an oriental dress. The symbol of royalty, it is true, the *diadem,* was suggested by the head-band of the old Persian kings but, whereas, that had been an imposing erection, the Hellenistic diadem was a simple riband. The king's state dress was the same in principle as that worn by the Macedonian or Thessalian horsemen, as the uniform of his own cavalry officers. Its features were the broad-rimmed hat, the cloak, and the high-laced boots. There were other traces in the Hellenistic courts of the old Macedonian tradition besides in dress. One was the honour given to prowess in the chase. Another was the fashion for the king to hold wassail with his courtiers, in which he unbent to an extent scandalous to the Greeks, dancing or indulging in routs and practical jokes.

The prominent part taken by the women of the royal house was a Macedonian characteristic. The history of these kingdoms furnishes a long list of queens and princesses who were ambitious and masterful politicians, of which the great Cleopatra is the last and the most famous. The kings after Alexander, with the exception of Demetrius Poliorcetes and Pyrrhus, are not found to have more than one legitimate wife at a time, although they show unstinted freedom in divorce and the number of their mistresses. The custom of marriages between brothers and sisters, agreeable to old Persian as to old Egyptian ethics, was instituted in Egypt by the second Ptolemy when he married his full sister Arsinoë Philadelphus. It was henceforth common, though not invariable, among the Ptolemies. At the Seleucid court there seems to be an instance of it in 195, when the heir-apparent, Antiochus, married his sister Laodice. The style of "sister" was given in both courts to the queen, even when she was not the king's sister in reality. The "friends" of the king are often mentioned. It is usual for him to confer with a council of his "friends" before important decisions, administrative, military or judicial. They form a definite body about the king's person, admission into which depends upon his favour alone, and is accorded, not only to his subjects, but to aliens, such as the Greek refugee politicians (*e.g.,* Hegesianax, Athen. iv. 155b; Hannibal and the Aetolian Thoas take part in the councils of Antiochus III.). The friends (at any rate under the later Seleucid and Ptolemaic reigns) were distinguished by a special dress and badge of gold analogous to the stars and crosses of modern orders. The dress was of crimson; this and the badges were the king's gift, and except by royal grant neither crimson nor gold might, apparently, be worn at court. The order of friends was organized in a hierarchy of ranks, which were multiplied as time went on. As to Macedonia, whatever may have been the constitution of the court, it is implied that it offered in its externals a sober plainness in comparison with the vain display and ceremonious frivolities of Antioch and Alexandria. The position of a friend did not carry with it necessarily any functions; it was in itself purely honorary. The ministers and high officials were, on the other hand, regularly invested with one or other of the ranks specified. The chief of these ministers is denoted *επὶ τῶν πραγμάτων* and he corresponds to the *vizier* of the later East. All departments of government are under his supervision, and he regularly holds the highest rank of a kinsman. When the king is a minor, he acts as guardian or regent. Over different departments of state we find a state secretary. Under each of these great heads of departments was a host of lower officials, those, for instance, who held to the province a relation analogous to that of the head of the department of the realm. Beside the officials concerned with the work of government we have those of the royal household: (1) the chief-physician; (2) the chief-huntsman; (3) the maître d' hôtel; (4) the lord of the queen's bedchamber. As in the older oriental courts, the high positions were often filled by eunuchs.

It was customary, as in Persia and in old Macedonia, for the great men of the realm to send their children to court to be brought up with the children of the royal house. Those who had been so brought up with the king were styled his *σύντροφοι.* As under Alexander, so under his successors, we find a corps of *βασιλικοὶ παῖδες.* They appear as a corps, 600 strong, in a triumphal procession at Antioch.

Hellenism.—All the Hellenistic courts felt it a great part of prestige to be filled with the light of Hellenic culture. A distinguished philosopher or man of letters would find them bidding for his presence, and most of the great names are associated with one or other of the contemporary kings. Antigonus Gonatas, bluff soldier-spirit that he was, heard the Stoic philosophers gladly, and, though he failed to induce Zeno to come to Macedonia, persuaded Zeno's disciple, Persaeus of Citium, to enter his service. Nor was it philosophers only who made his court illustrious, but poets like Aratus. The Ptolemaic court, with the museum attached to it, is so prominent in the literary and scientific history of the age that it is unnecessary to give a list of the philosophers, the men of letters and science, who at one time or other ate at King Ptolemy's table. One may notice that the first Ptolemy himself made a contribution of some value to historical literature in his account of Alexander's campaigns; the fourth Ptolemy not only instituted a cult of Homer but himself published tragedies;

[1]For Ptolemaic Egypt, *see* PTOLEMIES and EGYPT.

and even Ptolemy Euergetes II. issued a book of memoirs. The Pergamene court was in no degree behind the Ptolemaic in its literary and artistic zeal. The notable school of sculpture connected with it is treated elsewhere (*see* GREEK ART); to its literary school we probably owe in great part the preservation of the masterpieces of Attic prose, and two of its kings (Eumenes I. and Attalus III.) were themselves authors. The Seleucid court did not rival either of the last named in brilliance of culture; and yet some names of distinction were associated with it. Under Antiochus I. Aratus carried out a recension of the *Odyssey,* and Berossus composed a Babylonian history in Greek. Under Antiochus III. Euphorion was made keeper of the library at Antioch. Antiochus IV., of course, the enthusiastic Hellenist, filled Antioch with Greek artists and gave a royal welcome to Athenian philosophers. Even in the degenerate days of the dynasty, Antiochus Grypus, who had been brought up at Athens, aspired to shine as a poet. The values recognized in the great Hellenistic courts and the Greek world generally imposed their authority upon the dynasties of barbarian origin. The Cappadocian court admitted the full stream of Hellenistic culture under Ariarathes V. One of the kings called Nicomedes in Bithynia offered immense sums to acquire the Aphrodite of Praxiteles from the Cnidians, and to a king Nicomedes the geographical poem of the Pseudo-Scymnus is dedicated. Even Iranian kings in the last century B.C. found pleasure in composing, or listening to, Greek tragedies, and Herod the Great kept Greek men of letters beside him and had spasmodic ambitions to make his mark as an orator or author.

Deification.—The offering of divine honours to the king which we saw begin under Alexander, became stereotyped in the institutions of the succeeding Hellenistic kingdoms. Alexander himself was after his death the object of various local cults, like that which centred in the shrine near Erythrae. His successors in the first years after his death recognized him officially as a divinity, except Antipater, and coins began to be issued with his image. At Alexandria the state cult of him seems to have been instituted by the second Ptolemy, when his body was laid in the *Sema.* The successors themselves received divine honours. Such worship might be the spontaneous homage of a particular Greek community, like that offered to Antigonus by Scepsis in 311, to Antigonus and Demetrius by Athens in 307, to Ptolemy I. by the Rhodians in 304, or by Cassandreia to Cassander, as the city's founder; or it might be organised and maintained by royal authority. The first proved instance of a cult of the latter kind is that instituted at Alexandria by the second Ptolemy for his father soon after the latter's death in 283–282, in which later 279–278, he associated his mother Berenice also, the two being worshipped together as θεοὶ σωτῆρες. Antiochus I. followed the Ptolemaic precedent by instituting at Seleucia-in-Pieria a cult for his father as Seleucus Zeus Nicator. So far we can point to no instance of a cult of the living sovereign (though the cities might institute such locally) being established by the court for the realm. This step was taken in Egypt after the death of Arsinoë Philadelphus (271), when she and her still-living brother-husband, Ptolemy II. began to be worshipped together as θεοὶ ἀδελφοί. After this the cult of the reigning king and queen was regularly maintained in Greek Egypt, side by side with that of the dead Ptolemies. Under Antiochus II. (261–246) a document shows us a cult of the reigning king in full working for the Seleucid realm, with a high priest in each province, appointed by the king himself; the document declares that the Queen Laodice is now to be associated with the king. The official surname of Antiochus II., *Theos,* suggests that he himself had here been the innovator. Thenceforward, in the Hellenistic kingdoms of the East the worship of the living sovereign became the rule, although it appears to have been regarded as given in anticipation of an apotheosis which did not become actual till death. In the Pergamene kingdom at any rate, though the living king was worshipped with sacrifice, the title θεός was only given to those who were dead. The Antigonid dynasty, simpler and saner in its manners, had no official cult of this sort. The divine honours offered on occasion by the Greek cities were the independent acts of the cities.

Army.—The armies of Alexander's successors were still in the main principles of their organization similar to the army with which Alexander had conquered Asia. During the years immediately after Alexander the very Macedonians who had fought under Alexander were ranged against each other under the banners of the several chiefs. The most noted corps of veterans, Argyraspides, played a great part in the first wars of the successors, and covered themselves with infamy by their betrayal of Eumenes. As the soldiers of Alexander died off, fresh levies of home-born Macedonians could be raised only by the chief who held the motherland. The other chiefs had to supply themselves with Macedonians from the numerous colonies planted before the break-up of the empire in Asia or Egypt, and from such Macedonians they continued for the next two centuries to form their phalanx. The breed—at least if the statement which Livy puts into the mouth of a Roman general can be relied on—degenerated greatly under Asiatic and Egyptian skies; but still old names like that of *pezetairoi* attached to the phalangites, and they still wielded the national *sarissa.* The latter weapon in the interval between Alexander and the time of Polybius had been increased to a length of 21ft., a proportion inconsistent with any degree of mobility; once more indeed the phalanx of the 2nd century seems to have become a body effective by sheer weight only and disordered by unevenness of ground. The Antigonid kings were never able from Macedonian levies to put in the field a phalanx of more than 20,000 at the utmost; Antigonus Doson took with him to Greece (in 222) one of 10,000 only. The phalanx of Antiochus III. at Raphia numbered 20,000, and Ptolemy Philopator was able at the same time to form one of 25,000 men. The royal footguards were still described in Macedonia in 171 as the *agema.* So too the old name of "Companions" was kept up in the Seleucid kingdom for the Macedonian cavalry, and divisions of rank in it were still indicated by the terms *agema* and royal squadron. The Antigonid and Seleucid courts had much valuable material at hand for their armies in the barbarian races under their sway. The Balkan hill-peoples of Illyrian or Thracian stock, the hill-peoples of Asia Minor and Iran, the chivalry of Media and Bactria, the mounted bowmen of the Caspian steppes, the camel-riders of the Arabian desert, could all be turned to account. Iranian troops seem to have been employed on a large scale by the earlier Seleucids. At Raphia, Antiochus III. had 10,000 men drawn from the provinces, armed and drilled as Macedonians, and another corps of Iranians numbering 5,000 under a native commander. The experiment of arming the native Egyptians on a large scale does not seem to have been made before the campaign of 217, when Ptolemy IV. formed corps of the Macedonian pattern from Egyptians and Libyans. From this time native rebellions in Egypt are recurrent. To the troops drawn from their own dominions the mercenaries which the kings procured from abroad were an important supplement. These were mainly the bands of Greek *condottieri,* and even for their home-born troops Greek officers of renown were often engaged. The other class of mercenaries were Gauls, and from the time of the Gallic invasion of Asia Minor in 279 Gauls or Galatians were a regular constituent in all armies. They were a weapon apt to be dangerous to the employer, but the terror they inspired was such that every potentate sought to get hold of them. The elephants which Alexander brought back from India were used in the armies of his successors, and in 302 Seleucus procured a new supply. Thenceforward elephants, either brought fresh from India or bred in the royal stables at Apamea, regularly figured in the Seleucid armies. The Ptolemies supplied themselves with this arm from the southern coasts of the Red sea, where they established stations for the capture and shipping of elephants. Scythed chariots such as had figured in the old Persian armies were still used by the Greek masters of Asia, at any rate till the battle of Magnesia. The Hellenistic armies were distinguished by their external magnificence. They made a greater display of brilliant metal and gorgeous colour than the Roman armies, for instance. The description given by Justin of the army which Antiochus Sidetes took to the East in 130 B.C., boot-nails and bridles of gold, gives an idea of their standard of splendour.

During the 3rd century B.C. Egypt was the greatest sea power of the eastern Mediterranean, and maintained a large fleet. Its control of the Aegean was, however, contested not without success by the Antigonids, who won the two great sea-fights of Cos (*c.* 256) and Andros (227), and wrested the overlordship of the Cyclades from the Ptolemies. Of the numbers and constitution of the Antigonid fleet we know nothing. At the Seleucid court in 222 the admiral appears as a person of high consideration; in his war with Rome Antiochus III. had 107 decked battleships on the sea at one time.

Macedonian Rule.—To their native subjects the Seleucid and Ptolemaic kings were always foreigners. It was considered wonderful in the last Cleopatra that she learnt to speak Egyptian. Natives were employed, as we have seen, in the army, and Iranians are found under the Seleucids holding high commands. Native cults the Hellenistic kings thought it good policy to patronize. Antiochus I. began rebuilding the temple of Nebo at Borsippa. Antiochus III. bestowed favours on the temple at Jerusalem. Even if the documents in Joseph *Arch.* xii. §§138 *seq.* are spurious, their general views of the relation of Antiochus III. and Jerusalem is probably true.

The Macedonian kingdoms, strained by continual wars, increasingly divided against themselves, falling often under the sway of prodigals and debauchees, were far from realizing the Hellenic idea of sound government as against the crude barbaric despotisms of the older East. Yet, in spite of all corruption, ideas of the intelligent development of the subject lands, visions of the Hellenic king, as the Greek thinkers had come to picture him, haunted the Macedonian rulers, and perhaps fitfully, in the intervals of war or carousal, prompted some degree of action. Treatises "concerning kingship" were produced as a regular thing by philosophers, and kings who claimed the fine flower of Hellenism could not but peruse them. Strabo regards the loss of the eastern provinces to the Parthians as their passage under a government of lower type, beyond the sphere of Hellenic *ἐπιμέλεια.*

In the organization of the administrative machinery of these kingdoms, the higher power of the Hellene to adapt and combine had been operative; they were organisms of a richer, more complex type than the East had hitherto known. It was thus that when Rome became a world-empire, it found to some extent the forms of government ready made, and took over from the Hellenistic monarchies a tradition which it handed on to the later world.

For the events which brought the Macedonian empire into being *see* ALEXANDER III., THE GREAT. For detailed accounts of the separate dynasties into which it was divided after Alexander's death, *see* SELEUCID DYNASTY, ANTIGONUS, PERGAMUM, etc., and for its effect on the spread of Hellenic culture *see* HELLENISM.

MACEDONIUS, (1) bishop of Constantinople in succession to Eusebius of Nicomedia, was elected by the Arian bishops in 341, while the orthodox party elected Paul, whom Eusebius had superseded. Paul was banished; and Macedonius was recognized as patriarch in 342. Compelled by the intervention of Constans in 348 to resign the patriarchate in favour of his former opponent, he was reinstalled in 350. He then took vengeance on his opponents by a general persecution of the adherents of the Nicene Creed. In 359, on the division of the Arian party into Acacians (or pure Arians) and semi-Arians or Homoiousians, Macedonius adhered to the latter, and in consequence was expelled from his see by the council of Constantinople in 360. He now became avowed leader of the sect of Pneumatomachi, Macedonians or Marathonians, whose distinctive tenet was that the Holy Spirit is but a being similar to the angels, subordinate to and in the service of the Father and the Son, the relation between whom did not admit of a third. He did not long survive his deposition.

See the Church Histories of Socrates and Sozomen; Art. in *Dict. Chr. Biog.;* F. Loofs in Herzog-Hauck's *Realencyk.;* H. M. Gwatkin, *Arianism.*

MACEDONIUS, (2) bishop of Constantinople (*fl.* 510), a strict Chalcedonian who vainly opposed the fanaticism of the monophysite Severus and was deposed in 513.

MACEIÓ or **MACAYÓ,** a city and port of Brazil and capital of the State of Alagoas, about 125 mi. S.S.W. of Pernambuco, in lat. 9° 39′ 35″ S., long. 35° 44′ 36″ W. of Greenwich. Population (1940) of the city 85,949 and of the total municipal area 91,358. The city stands at the foot of low bluffs, about a mile from the shore line. The water-side village of Jaraguá, the port of Maceió, is practically a suburb of the city. South of the port is the shallow entrance to the Lagoa do Norte, or Lagoa Mundaú, a saltwater lake extending inland for some miles. Maceió is attractively situated in the midst of large plantations of coconut and *dendé* palms, though the broad sandy beach in front and the open sunburned plain behind give a barren character to its surroundings. The heat is moderated by the south-east trade winds, and the city is considered healthful. The public buildings are mostly constructed of broken stone and mortar, plastered outside and covered with red tiles, but the common dwellings are generally constructed of *tapia*—rough trellis-work walls filled in with mud. The lighthouse, situated on a small hill near the middle of the town, is a conspicuous landmark. A light tramway connects the city and port, and a railway—the Great Western—connects the two with various interior towns and with Pernambuco. The port is formed by a stone reef running parallel with and a half-mile from the shore line, within which vessels of light draft find a safe anchorage, except from southerly gales. Ocean-going steamers anchor outside the reef. The exports consist principally of sugar, cotton and rum (*aguardiente*). Maceió dates from 1815 when a small settlement there was created a "villa." In 1839 it became the provincial capital and was made a city by the provincial assembly.

McENTEE, JERVIS (1828–1891), American artist, was born at Rondout, New York, July 14, 1828, and was a pupil of Frederick E. Church. He was made an associate of the National Academy of Design, New York, in 1860, and a full academician in 1861. In 1869 he visited Europe, painting much in Italy. He was identified with the Hudson River school, and excelled in pictures of autumn scenery. He died at Rondout (N.Y.), Jan. 27, 1891.

MACER, AEMILIUS, of Verona, Roman didactic poet, author of two poems, one on birds (*Ornithogonia*), the other on the antidotes against the poison of serpents (*Theriaca*), imitated from the Greek poet Nicander of Colophon. According to Jerome, he died in 16 B.C. It is possible that he wrote also a botanical work. The extant hexameter poem *De viribus* (or *virtutibus*) *herbarum,* ascribed to Macer, is a mediaeval production by Odo Magdunensis, a French physician.

See R. Unger, *De Macro Nicandri imitatore* (Friedland, 1845).

MACERATA, city of the Marches, Italy, chief town of the province of Macerata and a bishop's see, 44 mi. by rail south of Ancona. Pop. (1936), 14,460 (town), 26,708 (commune). Crowning a hill 1,020 ft. above sea level, with a picturesque mass of buildings enclosed by walls and towers, Macerata looks out over the Adriatic. Besides the university (1290) with about 125 students in 1939, Macerata has a communal library founded by Leo XII., containing a small but choice collection of early pictures, and in the municipal buildings, a collection of antiquities from Helvia Ricina. Close by is the elegant Loggia dei Mercanti, by Giuliano da Maiano (1485–91). There is an enormous amphitheatre for *pallone,* a favourite ball game.

The first mention of the *castellum* of Macerata is in a document of 1022; and in 1138 it was formed into a commune. Nicholas IV. (1287–1292) made it the seat of the governors of the Marches. It was enclosed in the 13th century by a line of walls more than $2\frac{1}{2}$ m. in circuit. It remained faithful to the popes, and was rewarded by many privileges. Though in 1797 the inhabitants opened their gates to the French, two years afterwards, the city was stormed and pillaged. The bishopric of Macerata dates from the suppression of the see of Recanati (1320).

MACEWEN, SIR WILLIAM (1848–1924), Scottish surgeon, was born on June 22, 1848, at Rothesay, and educated at Glasgow university. In 1892 he was made regius professor of surgery in the university. In 1922 he was president of the British Medical association. Macewen was a firm supporter of the methods of Lister, and experimented on the disinfecting of drainage tubes and absorbable ligatures. He advanced the practice of bone grafting and became famous for his operative treatment of *genu valgum.* His paper on the surgery of the brain and spinal cord marked him as a pioneer of modern cerebral surgery. He died on March 22, 1924. His best known works are *Osteotomy* (1880), *Atlas of Head Sections* (1893), *Pyogenic Diseases of the Brain and Spinal Cord* (1893), *The Growth of Bone* (1912); and "Brain Surgery" in *Brit. Med. Journal* (1922).

See obituary notices in the *Lancet* and *Brit. Medical Journal* for March 29, 1924.

MACFARREN, SIR GEORGE ALEXANDER (1813–1887), English composer, was born in London on March 2, 1813, and entered the Royal Academy of Music in 1829. His *Chevy Chase* overture was written as early as 1836, and in a single night. In 1837 Macfarren was appointed a professor at the academy, and wrote his *Romeo and Juliet* overture. In 1838 he brought out *The Devil's Opera,* one of his best works. In 1845 he became conductor at Covent Garden. A gradual failure of his eyesight led to total blindness in 1865. He succeeded Sterndale Bennett as principal of the Royal Academy of Music in Feb. 1875, and in March became professor of music in Cambridge university. His theoretical works, such as the *Rudiments of Harmony,* and the treatise on counterpiont, will probably be remembered longer than many of his compositions, which included a number of oratorios. He was knighted in 1883, and died suddenly in London on Oct. 31, 1887.

An excellent memoir by H. C. Banister appeared in 1891.

McGEE, THOMAS D'ARCY (1825–1868), Irish-Canadian politician and writer, second son of James McGee, a coastguard, was born at Carlingford, Co. Louth, on April 13, 1825. He early showed a remarkable aptitude for oratory. At the age of 17 he emigrated to the United States, and by his writing and public speaking in Boston attracted the attention of O'Connell. Before he was 20 he returned to London to become parliamentary correspondent of the *Freeman's Journal,* and shortly afterward London correspondent of the *Nation,* to which he also contributed a number of poems. In 1846 he became one of the moving spirits in the "Young Ireland" party, and contributed two volumes to the "Library of Ireland." On the failure of the movement in 1848 McGee escaped in the disguise of a priest to the United States where between 1848 and 1853 he established two newspapers, the *New York Nation* and the *American Celt.*

In 1857 McGee, driven from the United States by the scurrilous attacks of the extreme Irish revolutionaries, took up his abode in Canada, and was admitted to the bar of the province of Lower Canada in 1861. At the general election in 1858 he was returned to parliament as the member for Montreal, and for four years he was regarded as a powerful factor in the house. On the formation of the Sandfield-Macdonald-Sicotte administration in 1862 he accepted the office of president of the council. When the cabinet was reconstructed a year later the Irish were left without representation, and McGee sought re-election as a member of the opposite party. In 1864 he was appointed minister of agriculture in the administration of Sir E. P. Taché, and he served the country in that capacity until his death. He actively supported the policy of federation and was elected a member of the first Dominion parliament in 1867. On April 7, 1868, he was shot by an assassin as he was about to enter his house at Ottawa. His utterances against the Fenian invasion are believed to have been the cause of the crime for which P. J. Whelan was executed.

McGee's principal works are: *A Popular History of Ireland* (3 vols., 1862–69); *Irish Writers of the Seventeenth Century* (Dublin, 1846); *Historical Sketches of O'Connell and his Friends* (Boston, 1844); *Memoirs of the Life and Conquests of Art McMurrogh, King of Leinster* (Dublin, 1847); *Memoir of C. G. Duffy* (Dublin, 1849); *A History of the Irish Settlers in North America* (Boston, 1851); *History of the Attempts to establish the Protestant Reformation in Ireland* (Boston, 1853); *Life of Edward Maginn, Coadjutor Bishop of Derry* (New York, 1857); *Catholic History of North America* (Boston, 1854); *Canadian Ballads and Occasional Pieces* (New York, 1858); *Notes on Federal Governments Past and Present* (Montreal, 1865); *Speeches and Addresses, chiefly on the Subject of the British American Union* (1865); *Poems,* edited by Mrs. M. A. Sadleir with introductory memoir (New York, 1869). *See* Fennings Taylor, *The Hon. Thomas D'Arcy McGee* (Montreal, 1867); J. K. Foran, *Thomas D'Arcy McGee as an Empire Builder* (Ottawa, 1904); H. J. O'C. French, *A Sketch of the Life of the Hon. T. D. McGee* (Montreal).

McGILLIVRAY, ALEXANDER (c. 1739–1793), American Indian chief, was born near the site of the present Wetumpka, in Alabama. His father was a Scotch merchant and his mother the daughter of a French officer and an Indian "princess." Through his father's relatives in South Carolina, McGillivray received a good education, but at the age of 17 he returned to the Muscogee Indians, who elected him chief. During the Revolutionary War, as a colonel in the British army, he incited his followers to attack the western frontiers of Georgia and the Carolinas. Georgia confiscated some of his property, and after the peace of 1783 McGillivray remained hostile. Though still retaining his British commission, he accepted one from Spain, and during the remainder of his life used his influence to prevent American settlement in the southwest. So important was he considered that in 1790 President Washington sent an agent who induced him to visit New York. Here he was persuaded to make peace in consideration of a brigadier-general's commission and payment for the property confiscated by Georgia; and with the warriors who accompanied him he signed a formal treaty of peace and friendship. He then went back to the Indian country, but remained hostile to the Americans until his death. He was one of the ablest Indian leaders of America and at one time wielded great power —having 5,000 to 10,000 armed followers. Before he died he saw that he was fighting in a losing cause, and, changing his policy, endeavoured to provide for the training of the Muscogees in the white man's civilization. McGillivray was polished in manners, of cultivated intellect, was a shrewd merchant, and a successful speculator; but he had many savage traits, being noted for his treachery, craftiness and love of barbaric display.

See Harry Lincoln Sayler, *American Romance in the South* (1908).

MACGILLIVRAY, WILLIAM (1796–1852), Scottish naturalist, was born on Jan. 25, 1796, at Aberdeen, where he studied medicine at King's college. In 1823 he became assistant professor of natural history in Edinburgh and in 1831 curator of the museum of the Royal College of Surgeons, a post which he resigned in 1841 to become professor of natural history and botany in Marischal college, Aberdeen. He died at Aberdeen on Sept. 4, 1852.

Macgillivray's larger works, which exhibit his industry and extensive knowledge, include biographies of A. von Humboldt, and of zoologists from Aristotle to Linnaeus, a *History of British Quadrupeds,* a *History of the Molluscous Animals of Aberdeen, Banff and Kincardine,* a *Manual of British Ornithology,* and an excellent *History of British Birds* (5 vols. 1837–52). His *Natural History of Deeside* was posthumously published by command of Queen Victoria (1850).

McGILL UNIVERSITY: *see* UNIVERSITIES.

MacGOWAN, KENNETH (1888–), U.S. author was born in Winthrop, Mass., on Nov. 30, 1888. He was graduated at Harvard in 1911 and between 1910 and 1924 wrote dramatic criticism for various newspapers and magazines, including the Boston *Transcript,* the Philadelphia *Public Ledger,* the New York *Tribune,* the New York *Globe, Vogue* and the *Theatre Arts Monthly.* He was also editor of the last named publication from 1919–25. He was director of the Provincetown Players in 1924, of the Greenwich Village theatre, New York city, in 1925 and of the Actors' theatre in 1927. He became associated with RKO-Radio Pictures in 1932, was associate producer with that concern from 1933–35 and served in the same capacity for the Twentieth Century-Fox Film corporation after 1935. His published works include *The Theatre of Tomorrow* (1921); *Continental Stagecraft* (with Robert Edmond Jones, 1922); *Masks and Demons* (with Herman Rosse, 1923); *Footlights Across America* (1929).

MacGREGOR, JOHN ["ROB ROY"] (1825–1892), Scottish canoeist, traveller and philanthropist, son of General Sir Duncan MacGregor, K.C.B., was born at Gravesend on Jan. 24, 1825. He was educated at Trinity college, Dublin, and

Trinity college, Cambridge, and was called to the bar in 1851. He travelled in Europe, Egypt, Palestine, Russia, Algeria and America. MacGregor was the pioneer of British canoeing. In 1865 he started on a long canoeing cruise in his "Rob Roy" canoe, making a prolonged water tour through Europe, a record of which he published in 1866 as *A Thousand Miles in the Rob Roy Canoe*. He made similar voyages in later years in Norway, Sweden and Denmark, the North sea and Palestine. Another voyage, in the English channel and on French waters, was made in a yawl. He died at Boscombe, July 16, 1892.

McGUFFEY, WILLIAM HOLMES (1800–1873), U.S. educator, was born in western Pennsylvania, three miles from West Alexandria, on Sept. 23, 1800. The immediate ancestors of William Holmes McGuffey migrated to America in 1774. The parents of William were Scotch-Irish who moved westward from their early home in eastern Pennsylvania to the newly opened lands in western Pennsylvania soon after the conquest of these lands from the Indians. In 1802 McGuffey's parents moved into the primeval forests of the Ohio Territory four miles north of the present city of Youngstown.

With little home and school instruction he mastered the school arts and began teaching in the subscription rural schools of Ohio when he was 13 years of age in a community near the present city of East Liverpool. During spare time and vacations through his 11 years of teaching in Ohio and Kentucky he continued his education intermittently under private tutors, in Greersburg academy and in Washington college. He entered Washington college in 1819 and received from this institution his A.B. degree with honours in 1826.

McGuffey came to Miami university, Oxford, O., as instructor in ancient languages in Nov. 1825, and during his 11 years at Miami took great interest in public education. He assisted the teachers of the elementary schools of the community in teaching methods and in new improved school texts, especially readers, establishing in his own home a model school of the neighbourhood children.

In 1835 he contracted with Truman and Smith of Cincinnati to compile four school readers, two of which were published in 1836 and the third and fourth in 1837. These readers became all but the universal readers in the expanding common schools of the great empire of the Mississippi and the south. By 1925, 122,000,000 McGuffey textbooks had been sold.

From 1836 to 1839 he was president of Cincinnati college and from 1839 to 1843 president of Ohio university, Athens, O. McGuffey was one of the three founders of the common school system of Ohio. In 1845 he was elected to the chair of mental and moral philosophy in the University of Virginia, Charlottesville, which position he eminently filled until his death, May 4, 1873.

In 1827 he married Harriet Spinning of Dayton, to which union were born five children, three boys and two girls. The girls alone reached maturity, married and reared families. Upon the death of his first wife, McGuffey married Laura Howard, the daughter of Dr. Howard, dean of the medical school of the University of Virginia. One daughter, who died at the age of four, was born of this union.

MACH, ERNST (1838–1916), Austrian physicist and psychologist, was born on Feb. 18, 1838, at Turas in Moravia, and studied at Vienna. He was professor of mathematics at Gratz (1864–67), of physics at Prague (1867–95), and of physics at Vienna (1895–1901). In 1879 and 1880 as *Rector Magnificus* he fought against the introduction of Czech instead of German in the Prague university. In 1901 he was made a member of the Austrian house of peers. He died on Feb. 9, 1916. In philosophy he began with a strong predilection for the physical side of psychology, and at an early age he came to the conclusion that all existence is sensation, and, after a lapse into noumenalism under the influence of Fechner's *Psychophysics,* finally adopted a universal physical phenomenalism. The ego he considers not an entity sharply distinguished from the non-ego, but merely, as it were, a medium of continuity of sensory impressions. His whole theory appears to be vitiated by the confusion of physics and psychology.

Mach's works include: *Die Mechanik in ihrer Entwickelung* (Leipzig, 1883; rev. ed., 1908; Eng. trans., T. J. McCormack, 1902); *Beiträge zur Analyse d. Empfindungen* (Jena, 1886; 5th ed., 1906, entitled *Die Analyse d. Empfindungen*); *Leitfaden d. Physik für Studierende* (Prague, 1881, in collaboration); *Populärwissenschaftliche Vorlesungen* (3rd ed., Leipzig, 1903); *Die Prinzipien d. Wärmelehre* (2nd ed., 1900); *Erkenntnis und Irrtum* (Leipzig, 1905).

MACHADO, BERNADINO (1851–1944), Portuguese statesman, was born at Rio de Janeiro on July 28, 1851. An ardent patriot, a man of unfailing courtesy, unchallenged character and courage, he became a professor at Coimbra university and entered parliament in 1882. In 1893 he held office for a few months as minister of public works. Four years later he espoused openly the cause of republicanism, and his election in March 1906 as Republican deputy for Lisbon was made the occasion of a Republican demonstration which resulted in the downfall of the government. After the revolution in Oct. 1910, Machado became minister of foreign affairs in the provisional government of the republic. He became premier on Feb. 4, 1914, and held office until Dec. 13. Under his guidance and despite German intrigue Portugal proclaimed on Aug. 7 her loyalty to the British Alliance, and on Nov. 23, committed herself to participation in military operations. On Aug. 6, 1915, Machado succeeded Dr. Theophilo Braga as president. On Dec. 15, 1917, he was banished by the insurgents. On March 2, 1921, he became premier of a coalition ministry, but in consequence of a military *coup d'etat* he resigned on May 20. He served as president again from Dec. 1925–June 1926 when a revolution removed him from power. On Feb. 25, 1927, charged with complicity in an abortive insurrection, he was ordered to leave Portugal. He returned after an amnesty was granted to him and other political exiles in May 1936 and died in Oporto, April 29, 1944. (J. Sw.; X.)

MACHAIRODUS, the typical genus of the extinct Machairodontinae or sabre-tooth tigers.. In this group, usually regarded as a subfamily of the Felidae, the upper canines were enlarged into long daggerlike tusks, while the lower canines are quite small and like incisor teeth. The form and processes of the skull and jaws were much modified in adaptation to the purposes for which these tusks were used, to stab and slash with widely gaping jaws. These animals were adapted to prey upon large thick-skinned short-necked herbivora.

Machairodus, properly speaking, applies to the later Tertiary sabre-tooths typified by the species found in the Lower Pliocene of Eppelsheim, Germany, and elsewhere in the later Tertiary faunas of Europe, Asia, Africa and America. The name was formerly in general use for the larger and more specialized sabre-tooths found in the Pleistocene, better separated as a distinct genus *Smilodon.* This genus ranged throughout North and South America with allies in Europe. The largest species, *Smilodon neogaeus* from South America, equalled the European bear in size, with limbs and feet shorter than in the lion but more massive and with larger claws, the tail quite short and small. The tusk is 1 in. wide and projects 5 to 6 in. from its socket. Many skeletons of a smaller species (*S. californicus*) have been obtained from the asphalt beds of La Brea, Los Angeles, Calif. (W. D. M.; X.)

MACHAR, JAN SVATOPLUK (1864–), Czech poet, was born at Kolin on Feb. 29, 1864. His early works, such as *Confiteor,* consist of sentimental verses written under the influence of Lermontov, Heine and De Musset. He turned his attention to social and political satire. *Magdalena* (1894), *Warriors of God* (1895–96), *Golgotha* (1901), *In the Glow of the Hellenic Sun* (1906) and *The Poison from Judaea* are titles which indicate Machar's sceptical and anticlerical point of view. He traced the chief personalities in history, from the earliest times to the Napoleonic era and beyond. In prose, as in poetry, Machar is incisive. *The Jail* (1918) graphically describes his imprisonment by Austria during World War I.

MACHAULT D'ARNOUVILLE, JEAN BAPTISTE DE (1701–1794), French statesman, was the son of a lieutenant of police. After two years as intendant of Hainaut, he succeeded

Orry de Fulvy as controller-general of the finances in Dec. 1745. In order to reorganize the finances after the War of the Austrian Succession, he proposed to replace the old tax of a tenth, which was evaded by many of the clergy and nobility, by a universal tax of a twentieth, but failed to carry the measure in face of opposition though retaining his office until July 1754, when he became minister of marine. He gained the ill-will of Madame de Pompadour by opposing the alliance with Austria, and she obtained his disgrace on Feb. 1, 1757. In 1794 he was arrested as a suspect, and died in prison at the age of 93.

MACHAUT or **MACHAULT, GUILLAUME DE** (*c.* 1300–1377), French poet and musician, was born in the village of Machault near Réthel in Champagne, and died at Reims in April 1377. Machaut tells us that he served for 30 years as secretary to the adventurous John of Luxembourg, king of Bohemia, while holding, at the same time, various ecclesiastical positions at Verdun (1332), Arras (1333) and Reims. He followed John of Bohemia to Russia and Poland, and, though of peaceful tastes himself, saw 20 battles and 100 tourneys. When John was killed at Crécy in 1346 Machaut was received at the court of Normandy, and on the accession of John the Good to the throne of France (1350) he received an office which enabled him to devote himself thenceforth to music and poetry. Machaut wrote about 1348 in honour of Charles III., king of Navarre, a long poem much admired by contemporaries, *Le Jugement du roi de Navarre.* When Charles was thrown into prison by his father-in-law, King John, Machaut addressed him a *Confort d'ami* to console him for his enforced separation from his young wife, then aged 15. This was followed about 1370 by a poem of 9,000 lines entitled *La Prise d' Alexandrie,* one of the last chronicles cast in this form. Its hero was Pierre de Lusignan, king of Cyprus. Machaut is best known for the strange book telling of the love affair of his old age with a young and noble lady long supposed to be Agnes of Navarre, sister of Charles the Bad; Paulin Paris in his edition of the *Voir dit* (*Historie vraie*) identified her as Perronne d'Armentières, a noble lady of Champagne. In 1362, when Machaut must have been at least 62 years of age, he received a rondeau from Perronne, who was then 18, and wished to play Laura to his Petrarch. The romance ended with Perronne's marriage and Machaut's desire to remain her *doux ami.* Its subject and length are deterrent to modern readers. Machaut with Deschamps marks a distinct transition. The *trouvères* had been impersonal. It is difficult to gather any details of their personal history from their work. Machaut and Deschamps wrote of their own affairs, and the next step in development was to be the self-analysis of Villon. Machaut was also a musician. He composed a number of motets, songs and ballads, also a mass supposed to have been sung at the coronation of Charles V. This was translated into modern notation by Perne, who read a notice on it before the Institute of France in 1817.

E. Hoepffner, in editing Machaut's works, rightly says that they exercised a powerful and lasting influence on the literary development of the 14th century. As a lyric poet, if he did not actually create the fixed forms, such as the ballade, chant-royal, virelai, rondeau and lay, which prevailed up to the 16th century, it was he who ensured their triumph. And he inaugurated the new lyrical art. It is true that he was profoundly influenced by the *Roman de la Rose,* but he introduced a personal, individual note hitherto lacking. Machaut was undoubtedly the master of a new school. Froissart and Deschamps, Christine de Pisan, Oton de Cranson, even Chaucer, all studied and imitated him. In the second half of the 15th century, he was forgotten, and was not rediscovered till the 18th century, by Lebeuf and the abbé Rive.

Machaut's *Oeuvres choisies* were edited by P. Tarbé (Reims and Paris, 1849). There are good modern editions of his longer poems in his *Oeuvres* (edit. E. Hoepffner, 3 vols., 1908, 1911, 1921); and of his *Poésies lyriques* (edit. V. Chichmaref, 1909). *See* also F. G. Fétis, *Biog. universelle des musiciens . . .* (1862), and E. Travers, *Instruments de musique au XIV^{e} siècle d'après Guillaume de Machaut* (1882).

MACHIAVELLI, NICCOLÒ (1469–1527), Italian statesman and writer, was born at Florence on May 3, 1469. His ancestry claimed blood relationship with the lords of Montespertoli, a fief situated between Val di Pesa and Val d'Elsa, at no great distance from the city. Niccolò's father, Bernardo (b. 1428), followed the profession of a jurist. He held landed property worth something like £250 a year in English money. His son, though not wealthy, was never wholly dependent upon official income.

Of Niccolò's early years and education little is known. His works show wide reading in the Latin and Italian classics, but it is almost certain that he had not mastered the Greek language. To the defects of Machiavelli's education we may, in part at least, ascribe the peculiar vigour of his style and his speculative originality. He is free from the scholastic trifling and learned frivolity which tainted the rhetorical culture of his century. He made the world of men and things his study, learned to write his mother-tongue with idiomatic conciseness, and nourished his imagination on the masterpieces of the Romans.

Official Life.—The year of Charles VIII.'s invasion and of the Medici's expulsion from Florence (1494) saw Machiavelli's first entrance into public life. He was appointed clerk in the second chancery of the commune under his old master, the grammarian, Marcello Virgilio Adriani. Early in 1498 Adriani became chancellor of the republic, and Machiavelli succeeded as second chancellor and secretary. This post he retained for 14 years—until 1512. The masters he had to serve were the *dieci di libertà e pace,* who, though subordinate to the *signoria,* exercised a separate control over the departments of war and the interior. They sent their own ambassadors to foreign powers, transacted business with the cities of the Florentine domain, and controlled the military establishment of the commonwealth. Machiavelli was fully occupied in the correspondence of his bureau, in diplomatic missions, and in the organization of a Florentine militia. The first of his many missions to petty courts of Italy was in 1499, when he negotiated the continuance of a loan to Catherine Sforza, countess of Forlì and Imola. In 1500 Machiavelli travelled into France, to deal with Louis XII. about the affairs of Pisa. These embassies were the school in which Machiavelli formed his political opinions, and gathered views regarding the state of Europe and the relative strength of nations. They introduced him to the subtleties of Italian diplomacy, and extended his observation over races very different from the Italians. He acquired principles and settled ways of thinking which later he expressed in writing.

In 1502 Machiavelli married Marietta Corsini, with whom, in spite of his own infidelities, he lived on good terms; she bore him several children, and survived him twenty-six years. In the same year Piero Soderini was chosen gonfalonier for life, in accordance with certain changes in the constitution of the state, which were intended to bring Florence closer to the Venetian type of government. Machiavelli suggested military reforms which Soderini adopted, and finally was involved in ruin by his fall.

In October 1502 he was sent, much against his will, as envoy to the camp of Cesare Borgia, in Romagna, and it was Machiavelli's duty to wait upon and watch him. He witnessed the intrigues which culminated in Cesare's murder of his disaffected captains. From Machiavelli's official letters, and from his tract upon the *Modo che tenne il duca Valentino per ammazzar Vitellozzo Vitelli,* we are able to appreciate the relations between the two men, and the growth in Machiavelli's mind of a political ideal based upon his study of the duke's character. Machiavelli conceived the strongest admiration for Cesare's combination of audacity with diplomatic prudence, for his adroit use of cruelty and fraud, for his self-reliance, avoidance of half-measures, employment of native troops, and firm administration in conquered provinces. More than once, in letters to his friend Vettori, no less than in the pages of the *Principe,* Machiavelli expressed his belief that Cesare Borgia's methods of conquest, the cementing of a new state out of scattered elements, and the dealing with false friends or doubtful allies, was worthy of commendation and imitation. Cesare Borgia became idealized in his reflective but imaginative mind. That Machiavelli separated the actual Cesare Borgia, whom he afterwards saw ruined and contemptible at Rome, from his radiant Duca Valentino, is probable.

Military Studies.—On his return to Florence early in January 1503, Machiavelli turned his mind to the existing conditions of military service in Italy. He was familiar with the disadvantages of the use of professional captains of adventure and mercenary troops. The bad faith of the condottiere Paolo Vitelli (beheaded at Florence in 1499) had deeply impressed him. In the war with Pisa he had observed the insubordination and untrustworthiness of soldiers gathered from the dregs of different districts, serving under irresponsible commanders. From Livy he learned to admire the Roman system of employing armies raised from the body of the citizens; and Cesare Borgia's method of gradually substituting the troops of his own duchy for aliens and mercenaries showed him that the plan was feasible. He now determined, with the support of Soderini, to furnish Florence with a national militia. Early in 1503 Machiavelli drew up for Soderini a speech, *Discorso sulla provisione del danaro,* in which the necessity of liberal expenditure on defence was expounded upon principles of sound political philosophy. Between this date and the last month of 1506 Machiavelli worked out memorials on the subject for his office, and suggested the outlines of a new military organization. On Dec. 6, 1506, his plan was approved by the *signoria,* and a special ministry, called the *nove di ordinanza e milizia,* was appointed with Machiavelli as secretary. The country districts of the Florentine dominion were now divided into departments, and levies of foot soldiers were made in order to secure a standing militia. A commander-in-chief was found in Don Micheletto, Cesare Borgia's cut-throat and assassin. The appointment illustrates a radical infirmity in Machiavelli's genius. His scheme in itself was inspired by principles of political wisdom and by the purest patriotism. But he failed to perceive that such a ruffian as Micheletto could not inspire the troops of Florence with patriotism and a healthy moral tone. Here, as elsewhere, he was insensible to ethical considerations.

Meanwhile Alexander VI. had died suddenly of fever, and Julius II. had ascended the papal chair. The duke of Valentinois had been checked in mid-career of conquest. The collapse of the Borgias threw Central Italy into confusion; and Machiavelli had, in 1505, to visit the Baglioni at Perugia and the Petrucci at Siena. In the following year he accompanied Julius upon his march through Perugia into the province of Emilia, to subdue the rebellious cities of the Church. Upon these embassies Machiavelli represented the Florentine *dieci.* Meanwhile the war for the recovery of Pisa dragged on. Machiavelli had to attend the camp and provide for levies amid his many other occupations. Yet in the autumn of 1504 he began his *Decennali,* or *Annals of Italy,* a poem composed in rough terza rima. About the same time he composed a comedy *Le Maschere,* now lost, on the model of Aristophanes.

At the end of 1507 European affairs diverted Machiavelli from his duties in organizing the new militia. Maximilian was arranging for his coronation in Rome, and was levying subsidies from the imperial burghs. The Florentines thought his demands excessive, and Machiavelli was sent to his court in December. He travelled by Geneva, through Switzerland, to Bozen (Bolzano), where he found the emperor. This journey enabled him to study the Swiss and the Germans in their homes; his report on it is among his most effective political studies, remarkable for his concentrated effort to realize the exact political weight of the German nation, and to penetrate the causes of its strength and weakness. He attempts to grasp the national character as a whole, and to deduce practical conclusions. The same qualities are noticeable in his *Ritratti delle cose di Francia,* which he drew up after an embassy to Louis XII. at Blois in 1510. These French notes are more scattered than the German report. But they reveal the same imaginative penetration into the very essence of national existence.

Machiavelli returned from Germany in June 1508. Chiefly through his exertions the Pisan war was terminated by the surrender of Pisa in June 1509. Meanwhile the league of Cambrai had disturbed the peace of Italy, and Florence found herself in a perilous position between Spain and France. Soderini's government grew weaker. The Medicean party lifted up its head. To the league of Cambrai succeeded the Holy League. The battle of Ravenna was fought, and the French retired from Italy. The cardinal Giovanni de' Medici, who was present at the battle of Ravenna, brought a Spanish army into Tuscany. Prato was sacked in the August of 1512. Florence, in extreme terror, deposed the gonfalonier Soderini, and opened her gates to the Medici.

Fall of Machiavelli.—The government on which Machiavelli depended had fallen, never to rise again. The national militia in which he placed unbounded confidence had proved inefficient to protect Florence. His political and personal enemies regarded him with jealousy as the ex-gonfalonier's right-hand man. He showed no repugnance to a change of masters, and began to make overtures to the Medici. The *nove della milizia* were, however, dissolved; and on Nov. 7, 1512, Machiavelli was deprived of his appointments. He was exiled from Florence and confined to the dominion for one year, and on Nov. 17 was prohibited from setting foot in the Palazzo Pubblico. He was implicated in the conspiracy of Pier Paolo Boscoli in February 1513, though he had no share in it, because his name was found upon a memorandum dropped by Boscoli. He was racked, and only released upon Giovanni de' Medici's election to the papacy in March 1513. When he left his dungeon he retired to a farm near San Casciano. His political career, now at an end, left him with only disappointment and annoyance. Losing his emoluments, he could barely support his family.

He had lived a continuously active life. Much as he enjoyed the study of the Latin and Italian classics, literature was not his business; nor had he looked on writing as more than an occasional amusement. He was now driven in upon his books for the employment of a restless temperament; and to this irksomeness of enforced leisure may be ascribed the production of the *Principe,* the *Discorsi,* the *Arte della guerra,* the comedies, and the *Historie fiorentine.* His letters to Vettori paint a man of vigorous intellect and feverish activity, dividing his time between studies and vulgar dissipation. It is very difficult to understand the spirit in which the author of the *Principe* sat down to exchange obscenities with the author of the *Sommario della storia d'Italia.* This coarseness of taste did not blunt his intellectual sagacity. His letters on public affairs in Italy and Europe, especially those which he meant Vettori to communicate to the Medici at Rome, are marked by extraordinary fineness of perception, and philosophical breadth.

Il Principe.—In retirement at his villa near Percussina, a hamlet of San Casciano, Machiavelli completed the *Principe* before the end of 1513. This famous book is an analysis of the methods whereby an ambitious man may rise to sovereign power. It appears to have grown out of the *Discorsi sopra la prima deca di Tito Livio,* begun at an earlier date, but only finished later.

Cast in the form of comments on the history of Livy, the *Discorsi* are really an inquiry into the genesis and maintenance of states. The *Principe* is an offshoot from the main theme of the *Discorsi,* setting forth Machiavelli's views at large and in detail upon the nature of principalities, the method of cementing them, and the qualities of a successful autocrat. Being more limited in subject and more independent as a work of literary art, this essay detaches itself from the main body of the *Discorsi,* and has attracted far more attention. In the *Principe* its author had more than a speculative aim in view, and brought it forth to serve a special crisis. Machiavelli judged the case of Italy so desperate that salvation could only be expected from the intervention of a powerful despot. The unification of Italy in a state protected by a national army was the cherished dream of his life; and the peroration of the *Principe* shows that he meant this treatise to have a direct bearing on the problem, though the book was by no means exclusively directed to that end. Together with the *Discorsi,* the *Principe* contains the speculative fruits of his experience and observation combined with his deductions from Roman history. The two works form a coherent body of opinion, not systematically expressed, it is true, but based on the same principles, involving the same conclusions, and directed to the same philosophical end. That end is the analysis of the conception of the state, studied under two main types, republican and monarchical. Up to the date of Machiavelli, modern political philosophy had always presupposed an ideal. Mediaeval speculation took the Church and the Empire for granted, as divinely appointed institutions. Thinkers differed only as Guelfs and Ghibellines, as leaning on the one side to papal, on the other to imperial supremacy. No new substantial philosophy of any kind had emerged from humanism; the political lucubrations of the scholars of the Renaissance were, like their ethical treatises, for the most part rhetorical. Still the humanists created a new medium for the speculative faculty. Simultaneously with the revival, Italy had passed into the "age of despots." The yoke of the Empire had been shaken off. The Church had taken rank among Italian tyrannies. Principalities and sovereign cities claimed autocratic jurisdiction. These separate despotisms owned no common social tie, were founded on no common *ius* or right, but were connected in a network of conflicting interests and changeful diplomatic combinations. A keen and positive political intelligence emerged in the Italian race. The reports of Venetian and Florentine ambassadors at this epoch contain the first germs of an attempt to study politics from the point of view of science.

At this moment Machiavelli intervenes. He was aware that the strongholds of mediaeval thought must be abandoned, and that the ruins of mediaeval institutions furnished no basis for solid political edifices. His originality consists in having extended the positive intelligence of his century from the sphere of contemporary politics and special interests to man at large regarded as a political being. He founded the science of politics for the modern world, by concentrating thought upon its fundamental principles. He began to study men, not in the isolation of one century, but as a whole in history. He drew his conclusions from the nature of mankind itself, "ascribing all things to natural causes or to fortune." In this way he restored a method which had been neglected since the days of Aristotle. Machiavelli's conception of the modern state marked the close of the middle ages, and anticipated the next phase of European development. His prince prefigured the monarchs of the 16th and 17th centuries, the monarchs whose motto was *L'état c'est moi!* His doctrine of a national militia foreshadowed conscription. The remedies which he suggested for Italian decadence, in the perorations of the *Principe* and the *Arte della guerra,* have since been applied in the unification of Italy. Machiavelli saw clearly the ruin of his country, and burned to save Italy and set her in her place among the powerful nations; his very limitations and mistakes were due to an absorbing passion for the state of which he dreamed. Concentrating his attention on the one necessity for organizing a powerful coherent nation, Machiavelli forgot that men are more than political beings. He neglected religion, or regarded it as part of the state machinery. He judged private virtue to be the basis of all healthy national existence; but in the realm of politics he subordinated morals to political expediency. He held that the people, as distinguished from the nobles and the clergy, were the pith and fibre of nations; yet this same people had to become wax in the hands of the politician —their commerce and their comforts, the arts which give a dignity to life and the pleasures which make life liveable, neglected—their very liberty subordinated to the one tyrannical conception. To this point the segregation of politics from every other factor which goes to constitute humanity had brought him; and this makes us feel his world a wilderness. Yet isolation of the subject matter of this science was essential at the outset, just as the science of economics had first to make a rigid severance of wealth from other units. Only gradually have we recognized that political economy has unavoidable points of contact with ethics.

Machiavelli thought of dedicating the *Principe* to one of the Medicean princes, but without result. The Medici, as yet at all events, could not employ Machiavelli, and had not in themselves the stuff to found Italian kingdoms.

Other Works.—Machiavelli, meanwhile, was reading his *Discorsi* to a select audience in the Rucellai gardens. Towards the year 1519 both Leo X. and his cousin, the cardinal Giulio de' Medici, thought it necessary to give Florence at least a semblance of self-government. They applied to several politicians, among others to Machiavelli, for advice in the emergency. The result was a treatise in which he deduced practical conclusions from the past history and present temper of the city, blending these with his favourite principles of government in general. He earnestly admonished Leo, for his own sake and for Florence, to found a permanent and free state system for the republic. The year 1520 yielded the *Arte della guerra* and the *Vita di Castruccio.*

The first of these is a methodical treatise, setting forth Machiavelli's views on military matters, digesting his theories respecting the superiority of national troops, the inefficiency of fortresses, the necessity of relying upon infantry in war, and the comparative insignificance of artillery. The peroration contains a noble appeal to the Italian liberator of his dreams, and a parallel from Macedonian history, which, read by the light of this century, sounds like a prophecy of Piedmont.

The *Vita di Castruccio* was composed at Lucca, whither Machiavelli had been sent on a mission. Dealing freely with the outline of Castruccio's career, as he had previously dealt with Cesare Borgia, he sketched his own ideal of the successful prince. Cesare Borgia had entered into the *Principe* as a representative figure rather than an actual personage; so now conversely the theories of the *Principe* assumed the outward form of Castruccio.

In the same year, 1520, Machiavelli received a commission from the officers of the *Studio pubblico* to write a history of Florence. He left a portion of it finished, with a dedication to Clement VII., when he died in 1527. The *Historie fiorentine* is not so much a chronicle of Florentine affairs, from the commencement of modern history to the death of Lorenzo de' Medici in 1492, as a critique of that chronicle from the point of view adopted by Machiavelli in his former writings. But the *History of Florence* is not a mere political pamphlet. It is the first attempt in any literature to trace the vicissitudes of a people's life in their logical sequence, deducing each successive phase from passions or necessities inherent in preceding circumstances, reasoning upon them from general principles, and inferring corollaries for the conduct of the future. In form it is modelled upon Livy. The style of the whole book is nervous, vivid, free from artifice and rhetoric. Machiavelli had formed for himself a prose style, equalled by no one but by Guicciardini in his minor works; it is an athlete's style, all bone and sinew, without superfluous flesh or ornament.

It would seem that from the date of Machiavelli's discourse to Leo on the government of Florence the Medici had taken him into consideration and he was employed on one or two missions of little importance. But his public career was virtually closed. A translation of the *Andria* and three original comedies from his pen are extant, the precise dates of which are uncertain, though the greatest of them, *Mandragola,* was first printed at Rome in 1524. It is the ripest and most powerful play in the Italian language.

The plot is improbable and unpleasing. But the wit, humour, vivacity and satire of the piece bring before us the old life of Florence in a succession of brilliant scenes. If Machiavelli had any moral object when he composed the *Mandragola,* it was to paint in glaring colours the corruption of Italian society. It shows how a bold adventurer, aided by the profligacy of a parasite, the avarice and hypocrisy of a confessor, and a mother's complaisant familiarity with vice, achieves the triumph of making a gulled husband bring his own unwilling but too yielding wife to shame. The whole comedy is a study of stupidity and baseness acted on by roguery. The force of healthy instincts is underestimated.

He composed a second comedy, *Clizia,* which is even homelier and closer to the life of Florence than its predecessor. It contains incomparable studies of the Florentine housewife and her husband, a grave business-like citizen, who falls into the senile folly of a base intrigue. There remains a short piece without title, the *Commedia in prosa,* which, if it be Machiavelli's, as internal evidence of style sufficiently argues, might be accepted as a study for both the *Clizia* and the *Mandragola.*

The little novel of *Belfagor* is a good-humoured satire upon marriage, the devil being forced to admit that hell itself is preferable to his wife's company. The story has a mediaeval origin, and it was almost simultaneously treated in Italian by Machiavelli, Straparola and Giovanni Brevio.

Last Years.—In the spring of 1526 Machiavelli was employed by Clement VII. to inspect the fortifications of Florence. In the summer of the same year he received orders to attend Francesco Guicciardini, the pope's commissary of war in Lombardy. Guicciardini sent him in August to Cremona, to transact business with the Venetian *Provveditori.* Later on in the autumn we find him once more with Guicciardini at Bologna. Thus the two great Italian historians of the 16th century, who had been friends for several years, were brought into intimacy.

After another visit to Guicciardini in the spring of 1527, Machiavelli was sent by him to Civita Vecchia. But what seemed like a new diplomatic opportunity ended. He died in Florence on June 20, 1527, receiving the last offices of the Church.

In person Machiavelli was of middle height, black-haired, with rather a small head, very bright eyes and slightly aquiline nose. His thin, close lips often broke into a smile of sarcasm. His activity was almost feverish. When unemployed in work or study he was not averse to the society of boon companions, gave himself readily to transient amours, and corresponded in a tone of cynical bad taste. At the same time he lived on terms of intimacy with worthy men. Varchi says that "in his conversation he was pleasant, obliging to his intimates, the friend of virtuous persons." The contradictions of which such a character was capable are seen in his correspondence with Vettori. It would be unfair to charge what is repulsive in their letters wholly on the habits of the times, for the published correspondence of similar men at the same epoch offers little that is so disagreeable.

Bibliography.—Among the many editions of Machiavelli's works the one in 8 vols., dated Italia, 1813, may be mentioned (new ed., 1833). Also "Le più belle pagine di Niccolò Machiavelli" in *Le più belle pagine degli scrittori italiani*, ser. vol. 24 (ed. G. Prezzolini, Milan 1925). The best biography is the standard work of P. Villari, *Niccolò Machiavelli e i suoi tempi* 3 vol. (Florence 1877–82. 3rd ed., 1913–14. Eng. trans. by L. Villari, 2 vol. 1878); in vol. 2 there is an exhaustive criticism of the various authors who have written on Machiavelli. *See* also: F. Nitti, *Machiavelli nella vita e nelle dottrine* (Naples 1876); O. Tommasini, *La vita e gli scritti di Niccolò Machiavelli* (Turin 1883); *Il Principe* (with notes by L. A. Burd 1891); Lord Morley, *Machiavelli* (Romanes lecture, Oxford 1897); L. A. Burd, "Florence: Machiavelli" in Camb. Mod. Hist. vol. I., *The Renaissance* (with bibl. 1902); V. Turri, *Machiavelli* (1902); J. G. Fichte, *Machiavelli* (1918); F. Ercole, *La Politica di Machiavelli* (1926); J. Schubert, *Machiavelli und die politischen Probleme unserer Zeit* (1927); M. MACHICOLATION, an opening between a wall and a parapet, formed by corbelling out the latter, so defenders might hurl missiles down upon assailants.

Machicolation (Château of Pierrefonds, 1390)

MACHINE, any apparatus for the application or modification of force to a specific purpose. The term "simple machine" is applied to the six so-called mechanical powers—the lever, wedge, wheel and axle, pulley, screw and inclined plane.

MACHINE BELTING: *see* Belting For Power Transmission.

MACHINE GUN: *see* Gun, Machine.

MACHINE KNIVES are a large group of cutting tools which operate by a linear or a circular action. Among the smallest are the cutters in woodworking machines to produce mouldings, and the largest are shear knives for paper, fabrics and steel plates. The edges are keen and honed up finely, and the knife must be well supported in the machine to cut truly and preserve the edge in good condition. Knives in revolving heads and drums for moulding and planing wood require careful balance in order to eliminate vibration and produce good surfaces. A balancing scale is employed to test the uniformity of weight of each of a set of blades. When a knife has linear cutting action it is often set at an angle or "shear," so as to operate gradually instead of all along the edge at once. Paper, leather, tobacco, veneer and metal are among the substances cut with a linear or slicing movement. Some of the wood planing machines combine high-speed rotary knives and fixed knives in the outfit, the wood being fed through and receiving an extra finish from the fixed knives.

MACHINE PHOTOGRAVURE: *see* Photogravure (Machine).

MACHINE-TOOLS. These lie at the basis of all modern industrial production, for they are not only necessary for the manufacture of every class of engine and kind of mechanism but every manufactured product, whether fabrics or textiles, metal goods, soap, foodstuffs, building materials, scientific instruments, etc., must be made either on a machine-tool, or on a machine which is constructed with their help. Little can be done by purely

Fig. 1.—A turret lathe for bar work up to 4½ inches in diameter

casting or forging processes; there is nearly always need to finish certain surfaces truly and smoothly to size in order to produce accurate fitting, or to enable the parts of a mechanism to work.

Machine-tools correct the inaccuracies in cast, forged, or rolled metal articles due to warping and other causes.

The term machine-tool strictly includes wood-working machinery, and there are many resemblances between some of these and metal-working machines. As a rule, however, the latter hold the pieces of work with powerful clamps, vices, chucks and fixtures, while wood can be presented to the cutters with far less trouble, direct by hand, or against guides, or with feeding rollers.

The necessity for firmly holding or driving a casting, forging, or a piece of bar or plate while the machine-tool is cutting it affects the design in many ways, and there are comparatively few machines which can dispense with mechanical holding devices. These are chiefly simple grinding or polishing machines (the operator pressing the articles against the wheels by hand) and punching and shearing machines (the plate resting on a bed and being steadied and moved about as required to make the cuts). Most other machines either take the object between point centres (lathes and grinding-machines) or grip it against jaws or flat surfaces.

In wood-working machinery the tools are very keen for soft woods, rather less so for hard woods, but thin edges such as these are quite unsuited for use against metal. Metal-working machine-tools therefore use tools and cutters with more obtuse angles, and the speed of cutting has to be set so that these will not be destroyed rapidly. For example, brass and similar alloys can be cut at high speed without injury to the tools, but the same rate on iron and steel would abrade and burn the tools. The use of a lubricating and cooling medium such as oil, soapy water or an emulsion greatly relieves the tools and enables a higher speed to be attained than by dry working; and there are special steels which will perform very severe duties without failure, even on hard materials such as chilled rolls and railway wheel tyres, which latter develop very hard spots by running on the rails; stellite will cut at an astonishing rate compared with the performance of a steel tool. This question of capacity affects the running of a machine-tool for definite periods on similar work, for if a tool edge requires frequent regrinding the machine cannot run automatically for many hours or days without attention. Consequently the tool must be made of a suitable steel and so designed that it will resist wear for the required length of service, and the speed of the machine must be regulated to suit the class of metal being machined.

A large group of machine-tools, the grinding-machines, do not use metal tools, but operate with high-speed wheels of emery, corundum, carborundum and other abrasives. The kind or condition of metal makes no difference to these wheels—they grind off the hardest steel without difficulty—but there are many limitations to their use; thick cuts possible with steel tools cannot be taken off castings or forgings with these, and surfaces of certain shapes cannot be readily dealt with. But the grinding wheel often acts as a finishing agent after forms have been roughed out on some other sort of machine-tool; highly accurate results, sometimes to within one ten-thousandth part of an inch and finer still in making gauges, can be attained by their use. After pieces have been hardened also the grinding-machine is the only means of further correction, and all sorts of tools and cutters which have been hardened or tempered need their use for final truing up and subsequent sharpening at intervals. The demands of the motor industry for immense quantities of relatively small hardened parts have led to the design of new types of machines which either handle these rapidly in succession, or grind a large number at one pass of a wheel all to similar thickness.

Early Machine-tools.—The lathe is the parent of all machine-tools, and some of its elements are curiously traceable in many kinds of machines, including fresh types not known a quarter of a century ago.

Machines derived from the lathe model include the boring, drilling, milling, sawing and grinding machines; the planing machine was a new departure rendered necessary by the introduction of flat surfaces in steam-engines and machines. These at first were made slowly and laboriously with hammer and chisel and file, but on the *planer* they were readily and accurately surfaced by passing under a tool. Then for smaller articles the *shaper* was invented, the object remaining fixed on a table while the tool was reciprocated by a ram above; the *slotting-machine* is practically a vertical type of shaper, the tool going up and down and cutting along edges according to how the table feeds the work; the *broaching-machine,* a recent type, effects its cut in one instead of many strokes (as in the preceding machines), the broach being a long tool furnished with teeth increasing in cutting depth, so that a hole or slot is cut a trifle deeper by each tooth in the traverse of the broach through the hole. This method is quick and highly accurate, besides being suited for shapes that are awkward to plane, shape, slot or mill.

Drilling and Boring Machines.—All drilling and boring was at first—and much of it still is—effected in the lathe; but the upright drilling-machine, in which the object to be treated can be held in a more convenient position while the drill descends on it, was soon developed. Horizontal boring machines, too, were built with slight differences from the lathe; these gradually extending to alterations which radically changed the appearance, though the revolving spindle remained, and the essential differences are greater adjustability to suit different sizes of work and improved means for holding the latter. The speed range of the spindle of a drilling or a boring machine is often more extensive than that of a lathe, the light sensitive drills for small holes running up to 12,000 revolutions or more per minute, with means for going at slower speeds for larger drills or extra hard metal; such a speed is necessary to secure the full advantage of the high-speed steel drills. A great enhancement of output is obtained in automobile factories, engine works, valve and fitting factories and others by using multi-spindle machines. Instead of putting one drill through the metal at a pass of the spindle, the latter is duplicated, or multiplied into often scores of spindles, each holding a drill, so that all the holes wanted in the face of the work are drilled simultaneously.

Milling-machines.—Milling was originally also performed in the lathe, the rotating cutter being driven by the spindle while the piece of metal was fed under it by the slide-rest; and from that principle dozens of different kinds of milling-machines utilizing cutters of various shapes that can finish flat surfaces, curves, slots and every conceivable shape required in metal construction from the tiniest to the most massive, have been evolved. Wood is also milled on machines of a somewhat different type, and forms in either wood or metal which would be slow and tedious to produce on certain other machine-tools and difficult by hand methods alone, can be milled in a brief time with great accuracy. As in most instances the milling-cutter imparts its shape or part shape upon the metal, the intricate outlines are as easy to cut as the plain flat ones; hence a cutter or set of cutters mounted together will mill flats, bevels, curves and slots along a casting or forging all in perfect relationship and turn out hundreds or thousands of pieces alike. As in drilling, two or more spindles may be fitted on a machine, and the work be milled on each flank, or at top and sides, or underneath. Cylinder blocks, crank-cases and various parts of engines and machines are bolted on a long table to feed past such cutters, so that when the table has completed its feed from 6 to 20 units have received treatment. The quantity will be greatly increased if a double row is laid down the table, the cutters milling on one side only of each piece. Mass production in the motor-car and other factories has extended so much that even the halting of a machine for the purpose of removing milled units and putting on others to be done has been partly abolished.

Sawing Machines.—Like the milling-machines these have a rotary drive to a many-toothed tool, but in the sawing-machines the latter is comparatively narrow and the feed only has to cause a penetration partly or completely through the object. The cutting serves to make slots as well as severance, while in wood-working certain kinds of saws perform quite a range of cutting of various outlines. Reciprocating saws are an adaptation of the hand saw, accurately guided, and with control of the object. Files are also worked in machines so increasing accuracy and output.

Grinding-machines.—All grinding was formerly done in the lathe, and its chief purpose was to correct the bearing portions of spindles which had been hardened and had warped slightly in the process. There is still a large amount of grinding of small hardened components in the fine instrument-makers' lathes, but in general engineering practice the grinding-machines are distinct designs, more suited for running the wheels at the requisite great speeds without vibration, and with special provisions for pre-

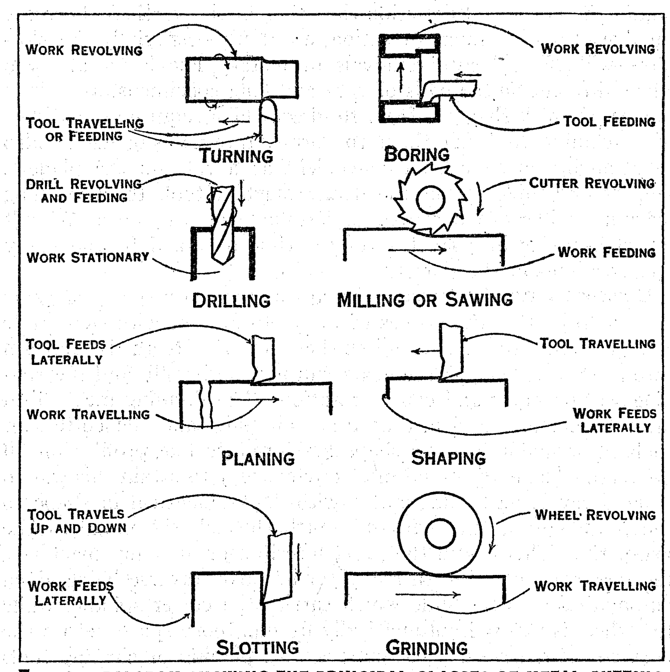

FIG. 2.—DIAGRAM SHOWING THE PRINCIPAL CLASSES OF METAL-CUTTING DONE BY MACHINE-TOOLS

venting damage to bearings and slides from the grit and from the water used in cooling the work. For a good while only finishing was attempted, the major portion of the work being done on the lathe, a trifle only being left for the wheel to remove; mechanical improvements have altered this, and now the grinder can deal with rough castings, forgings and rolled bars and will take off all the metal necessary to reach the finished size. Parts of stoves, doors, dampers and other boiler details, forgings for cars and engines, and many items for agricultural and domestic machinery are now cast or forged very nearly to the final dimension, and grinding is a quick and economical method of completing the work.

Practically all running parts of good-class machinery, such as shafts, spindles, bushes, washers, ball and roller bearings, gears, nuts, pins and pivots and such-like are finished to a close degree of accuracy by grinding, and mass production is favoured thereby.

Planing, Shaping and Slotting Machines.—Before the possibilities of milling were apparent all heavy and much light cutting was effected on one or other of the reciprocating machines using a tool with a single edge as distinct from a rotary many-toothed cutter. The objections to these machines are that no work is performed on the return stroke as the tool only cuts on the forward stroke, and difficult contours, which are easy to mill with formed cutters, are not so conveniently planed or slotted, nor is the finish usually so good. At one time the milling-machines competed with the reciprocating machines in the speed at which metal could be removed, but the designers of the latter soon remedied this. Stronger construction, higher rates of cutting, and a much faster rate of return on the non-cutting stroke were introduced, and electric driving helped in increasing the speeds for big machines. Further, by arranging switches along the table edge of the large planers the speed could be accelerated suddenly at any spot, and decelerated to the proper cutting rate again the advantage being that the table can rapidly jump any gaps between pieces of work bolted on the table, or openings in the surfaces of work. Economy in planing is best secured by employing a very long table filled with pieces of work all to pass under the tools, instead of a short table carrying only a few articles, or by using a machine that carries several tools, one or two operating along the top of the work, and one at each side.

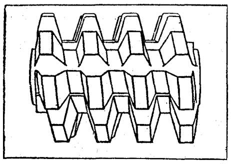

FIG. 3.—A HOB WHICH CUTS TEETH AS THE GEAR REVOLVES

Shapers and slotters are utilized for relatively short cuts, the one in the horizontal direction the other in the vertical; both are capable of a wide range of action, and both—especially the slotters—will effect heavy removals of metal. The latter are well adapted to cut on the ends of rods and long specimens, as well as to slog off thick shavings from forgings which require a good deal of machining to bring them to form. Internal slotting is also easy, an operation not so convenient as a rule on the planers, shapers and millers; but the newer machine-tool, the broaching machine, will at one stroke undertake even the most difficult internal cutting in a fraction of the time occupied by the many reciprocations of the slotter.

Gear-cutting Machines.—In cutting the tooth spaces of gears it is essential that the curves of the teeth are cut with exactitude and that the spacing or pitch between the teeth is uniform throughout. Otherwise the gears will not mesh well, and the running will be noisy and cause vibration. The dividing mechanism must be perfect to ensure accurate pitching, and the cutters or tools must maintain their shape and produce like profiles on all the teeth. The earliest and most obvious way to attain this was to make a revolving milling-cutter with flanks identical in shape to the tooth curves, and with it plough through the metal of the wheel rim. This is still the procedure in a great many machines, the feed and quick return ready for another traverse being given automatically to the slide which carries the cutter spindle, while the wheel is indexed automatically by one tooth space before the next cut commences. Gear-cutters with planing or shaping tools instead of milling-cutters are employed for two reasons. One is that bevel gears can only be cut with correctly shaped teeth by a tool which travels in a path corresponding to the taper of the teeth, from the big to the small end; a cutter with fixed curves obviously cannot produce such a tapered shape. The other reason is that a planing type of machine with its simple flat-edged tools does away with the necessity for a large stock of cutters to suit each size of tooth, and the shape of the tooth is correctly formed or generated by mechanism incorporated in the construction of the machine. For the best workmanship, such as is necessary in automobile and other high-grade gears, the teeth are finished by grinding so as to ensure perfect contact and noiseless running.

Portable Machine-tools.—Machine-tools are ordinarily fixed to a floor, and the work is brought to them; but very big castings or forgings, machinery that has to be repaired, altered or put together *in situ*, etc., often cannot satisfactorily be treated in this way, and in such cases it is usually quicker, easier and cheaper to employ a portable machine that can be bolted to the work, or supported closely to it in position for the cutting. Parts of large engine beds and frames and of electrical machinery and turbines are conveniently drilled, bored, tapped, milled, planed, shaped, slotted or ground by appropriate machines driven with flexible shafts or electric motors. Workshops dealing with such large objects have *floor-plates*, huge cast-iron beds with tee-slots into which bolts may be set about anywhere over the surface. The casting to be machined is bolted on the plate, and the portable machines are appropriately bolted alongside, several being used simultaneously on the various faces. Repair operations in mills and factories and on board ship often demand the services of a portable machine-tool which is attached to a framing, or clamped upon a shaft or wheel, to drill holes or ream them, or to mill off surfaces or cut keyways; such work could be done with hand tools, but as time is usually a vital factor in repairs and breakdown cases, a hand or power-driven portable machine-tool is preferable. Many tools are not really attached, but are held and controlled by the hands, as explained under PNEUMATIC TOOLS, but there is usually some sort of support by the tool, otherwise the operator would not be able to guide the cutting action.

Plate and Sheet-metal Working Tools.—Although a certain amount of cutting is done in the machine-shop on plates as well as castings and forgings, the great bulk of such machining is relegated to special departments. The thicker iron and steel sheets and plates for boilers, bridges, buildings, ships, cranes and other constructions are sheared, planed, drilled, punched, reamed and tapped in machines of specialized type, giving capacity for the fast working necessary in view of the enormous mass of detail involved. Multiple working is adopted as far as possible, *i.e.*, a number of holes are punched or drilled simultaneously, some sheets requiring scores or even hundreds to be put through.

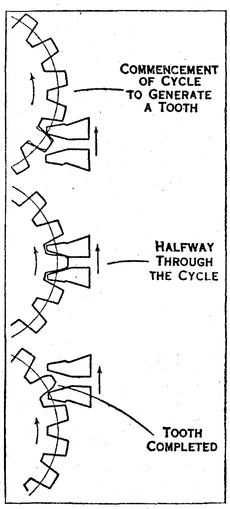

FIG. 4.—GENERATION OF BOTH FLANKS OF A BEVEL-GEAR TOOTH BY DUPLEX TOOLS

Sheet-metal working on the lighter side is done in shearing and punching machines of much lighter construction than those of the planing- and boiler-shop, and there is a whole range of presses using punches and dies for blanking or finishing all sorts of metal articles. Some machines perform more or less elaborate operations, including bending, folding, assembling and riveting, and are formative in the main.

The wood-working machine-tools are characterized by high speeds, keenness, and the rapidity with which the wood is fed for cutting. A simple kind of vice or clamp may be employed, corrugated rollers, or just a guide plate or fence to keep the position right. As with metal-working machines, the tools for making holes and the various knives, bits and cutters are used in multiple whenever practicable. A problem which is more insistent than with some of the metal cutting operations is the disposal of the masses of shavings which accumulate in a few moments; pneumatic suction pipes effect their removal.

Methods of Measurement.—It is in practice always essential to machine off a definite amount of metal to bring the piece of work to a dimension determined on the shop drawings and in many instances a second cut is necessary for accurate finishing, the machine taking a heavy cut nearly to the indicated size and then a light one to make a smooth and accurate surface. If the attempt is made to take off the whole of the cut at one traverse, accuracy is not so likely to result, for the tools, cutters and the machine parts tend to spring under the stress, and slight deviations occur in the movements resulting in vibration and minor

MODERN TYPES OF MACHINE-TOOLS IN OPERATION

1. Precision horizontal boring machine. Head carrying the spindle moves on upright column; work can be moved on bed (right) in either direction
2. Large boring mill. This machine was designed for finishing large hydraulic and electrical equipment parts. The work in place in the mill is a turbine casting weighing 197,900 pounds. Mill has swing of 32ft. 3in., table diameter is 24 feet. Operators' platforms on either side at top
3. Automatic grinding machine, which measures opening in piece to be worked and "works" or grinds the piece accurately to the size desired
4. A simple motor-driven lathe turning out 14-in. propeller shaft for an ocean vessel. Shafts must be turned true and balanced perfectly
5. Large combination drilling, boring and milling machine—milling element (left), drilling element (centre), boring element (right)
6. Horizontal milling machine, milling aluminium aeroplane struts. Various cutter speeds and feeds may be selected by operator at front or rear working position
7. A diamond-face grinder surfacing the mating pieces of machine parts. One piece (right) is being held to bed of machine by magnetic clutch
8. Large radial drill. Centre post holds drilling element (right) which reaches to any part of duplex base. Operator regulates drill pressure
9. Cylindrical grinder mounted on rocker-end shafts. Machine shown has automatic hydraulic feed, regulating speed and depth of cut

SIMPLE AND AUTOMATIC LATHES, PLANING AND MILLING MACHINES

1. Centre driven lathe for turning both ends of automobile axle tube at once. Tube is driven from the centre of lathe, held by chuck shown at top centre of picture. Three cutting tools at left, one at right
2. Planing machine at work on section of a large turbine. Shaft (right) holds piece in place while planer (upper left) machines surfaces
3. Large milling machine channeling two main side rods for locomotive at 5½″ per minute feed. Circular milling heads or cutters are seen near centre of main shaft, rods in horizontal position on the bed
4. Automatic gear planer cutting tooth sides of a herringbone pinion having a continuous tooth and no clearance in centre. Machine also uses a cutter resembling a gear. Pinion seen on shaft at right
5. Hydraulic automatic lathe with 22-in. maximum length between centres and 16¾-in. maximum swing
6. Gear cutter (centre) of large lathe at work on ring or drive gear (right) for the differential of an automobile. Tools which perform cutting operation are fastened by bolts to rim of cutter wheel

irregularities on the surfaces. But a finishing tool with only very light duty to perform is not subject to these faults, and it can be kept sharp and in the best condition of edge to give a fine finish. Some lathes and other machines rough and finish with the same tool, others with tools of rather different shapes, while a few (such as milling-machines) pass the articles under distinct roughing and finishing cutters in the course of the one feed traverse. Or roughing is given to the lathe or planer or miller, and finishing to the grinding-machine. There is in some high-class products an interval between the two operations, such as for motor-car cylinders and parts of scientific machines, when the rough skin of the casting has been taken off the whole thing may alter its form to a small degree owing to the release of surface tension. By leaving the pieces time to "season" after roughing there is avoidance of warping taking place after the fine finishing process.

It is necessary to allow a predetermined amount for roughing, and in repeat orders all the sizes are marked on the drawings, so that the tool-maker and setter and the operator know just what to do. Sometimes there is no necessity for measuring while the cuts are in progress, in other instances frequent checking has to be made. The familiar hinged leg calipers have been mostly displaced in up-to-date factories in favour of more precise instruments.

Methods of adjusting edged tools vary; they may either be set tentatively and then tested and re-tested against the actual work, or they may be set by means of a thickness block or gauge which brings the cutter to exact position. Careful measurement or gauging of components turned out in large quantities is requisite at frequent intervals, so as to be sure that none of the numerous tools (as in an automatic screw machine) have altered, slipped, or become blunted. The tendency is always towards reduction of hand measurements in favour of automatic indication of sizes; of grinding-machines especially is this true, a magnifying arm or an electric indicator showing when the work reaches a specified size.

(F. H.)

UNITED STATES

Beginning with the demand of the builders of steam engines for machines that would bore cylinders more nearly round than the early, crude machines, machine tools have been developed in the United States to a remarkable degree. The demands of builders of automobiles has made possible the spending of great sums for specially developed machines. Where tolerances of a few thousandths of an inch were formerly permitted, the practice in 1928 holds the accuracy well within a thousandth or even two or three ten-thousandths of an inch.

The lathe was in 1928, for example, largely used in roughing work to be finished by grinding; milling had supplanted planing in many cases, and was in turn, being supplanted by grinding in some fields. The vertical milling machine was at the same time doing much work formerly done on the slotter, and, for finishing such internal surfaces as automobile cylinder bores, the honing process has almost entirely supplanted the internal grinder. Many of the newer designs of machines had their beginning before 1918, but in most cases the final development that has given them such a permanent place in modern metal working industries, came within the decade 1918–28. Hydraulic feed was built into machines at least 30 years ago, but its successful introduction into machine tool use is quite recent, as an accepted method of securing a positive and easily regulated feed. The drilling machine, one of the oldest of machine tools, has undergone many changes. This main development has been in high speed sensitive machines, in heavy duty vertical machines, and in the radial type, in which much of the mechanism has been transferred from the base of the column to the head, and all of the controls are now under the operator's hands, without moving from his working position. The "way-drilling" machine, in which spindles are arranged to drill holes in three, four or five sides at once, and at any angle, has been developed to handle much intricate work at a rapid rate.

In all machine tools the use of the cone pulleys and shifting belts as a means of securing different speeds has practically disappeared, except in the sensitive drilling machine. Change gear boxes have become common in most classes of work. The two main developments in sensitive drilling machines have been the replacement of plain bearings by ball-bearings, and the careful balancing of the spindles, including the chuck, or drill holding device. This balancing makes for smoother and steadier running at the higher speeds and also greatly lengthens the life of the machine by reducing the load imposed on the bearings. Heavy-duty machines were developed largely to meet the demand for rapid drilling or boring of large holes such as formed a large part of big gun ammunition and for automobile cylinders. Heavy thrust bearings are usually ball—and both ball- and roller-bearings have come to be a part of the design in these machines. Nor are they confined to single spindle machines but are found with four, six or eight in the case of automobile shops. This is also one of the fields to be invaded by hydraulic feed. In no field however has the advance been more marked than in radial drilling machines. Not only have sizes and weights increased but there are great refinements in design that make it of particular interest. Among the new features is the centralizing of all control on the head. This includes the locking of the arm on the column, the raising and lowering of the arm and the changing of spindle speeds and feeds, all without manual labour. Roller-bearing spindles and ball- and roller-bearings in the gear shafts, hardened gears of alloy steels, and special oiling systems cover the main features of the newer machines. Multiple spindle and standard drilling machines have both been improved, the bearings of the former being limited by the closeness of spindles. There is also a growing tendency to use multiple spindle drilling heads with fixed spindles on single spindle drilling machines. By this method the same machine can be used on different jobs by merely changing the drilling heads instead of by re-setting the spindles on a multi-spindle machine.

Engine Lathe.—The engine lathe, formerly one of the most important machines, finds its greatest usefulness in 1928 in rough turning work. Even for this work the turret lathe, with its modern simplified tooling, has still further reduced the field for the engine lathe. The result of this tooling has been to have the turret lathe selected for work where as few as six duplicate pieces are to be made. This is one of the most drastic changes that has taken place in machine methods. Both engine and turret lathe work is commonly finished by grinding. In the meantime however the engine lathe has been developed into a heavy-duty, geared head machine, with all changes of speeds controlled by suitable levers that are easily accessible.

The first development away from the engine lathe was to replace the tail-stock, or back centre, with a turret for holding several tools which could be presented to work held in a chuck, one after the other. This only affected chucking work and not work held between centres. The multiple tooling permitted several operations to be performed in quick succession, at one setting of the work. These have been developed in many forms and in the semi-automatic or full automatic form; they now produce intricate pieces with great accuracy and speed. Hand-operated turret lathes have standardized the tools used so that they can now be used on a large variety of work and only require a minimum of time to set them up for a particular job. Semi-automatic machines, in which the tools are fed to the work automatically after the piece has been put in place, are in common use. The automatic feeds are secured by cams, gears and screws, or, in some cases, by hydraulic pressure. Semi-automatic machines of the lathe family are used in nearly all metal manufacturing. Another and later development retains the tail stock and is used for "centre work," the tool carriage being provided with multiple tools and the feeding movements, both longitudinally and as it affects diameter, automatically controlled.

Turret Lathes and Station Machines.—Modifications of turret lathes have also been made in which several work spindles are indexed from one position to another so as to present different tools to the work in the proper succession. An excellent example of the station type machine is the Bullard Mult-au-matic, which is in reality a multi-spindle, multi-tooled vertical lathe, or a number of lathes. This machine has six vertical work spindles, each carrying a table, or horizontal face plate as in the vertical boring mill. Above and in vertical alinement with these spindles are five tool slides each carrying tool heads. The sixth place is vacant so that the work can be loaded and unloaded at this point. When the empty spindle has been loaded and the indexing takes place, all six spindles move one-sixth of the circle. Each spindle stops during the indexing but resumes speed as soon as it is in the new position. Its speed varies with the operation being performed at the particular station, being slow for large diameters or broad cuts and fast where the work and tools permit.

Planers and Shapers.—Although the use of planers and shapers have not increased as with some other types of machine tools, they have been greatly improved. Planer beds have been made heavier, stiffer and longer; the planer table no longer overruns the bed, but is fully supported at all parts of even the longest stroke. Driving gears are wider and heavier, and are of steel instead of cast iron, and in some cases have helical or herringbone teeth. Shafts and shaft bearings are also much heavier and forced lubrication supplies all the driving mechanism with oil. Reversing electric motors that eliminate the use of shifting belts are now in common use. Another innovation is the application of individual motors to various functions such as raising and lowering the cross rail and side heads, and of moving the tool heads or saddles on the cross rail. A more common method however is to secure power from the main drive but to control each movement from either end of the cross rail, by individual control handles. They are so arranged that all movements can be made by power and at high speed if desired. The open side type of planer handles a wide variety of work that cannot be done on the regular type planer.

Milling Machines.—The old knee type machine has, to a great extent, given way to other designs. In a type known as the manufacturing design, a heavy bed supports a long deep table while on both sides is a massive column each with a heavy spindle driven by hardened and ground steel gearing. The spindle sleeve or quill, moves in or out and supports the cutters with a minimum of overhang. In addition, the heavy overarms can be used to provide additional bearings for the cutter arbours and so counteract the tendency to spring under a heavy cut. The planer type machine, which resembles the planer in general appearance, has the cross-rail carrying milling cutters instead of a head for single point tools. Side milling heads are also used, the total number of milling heads frequently reaching ten or more on a single machine. As each milling head represents a surface that can be machined at a single pass of the work, the capacity of such machines can easily be estimated. A particularly interesting development of the milling machine is the drum, or rotary type. This is a continuous operation machine, the drum carrying the work past a number of milling cutters.

Automatic Die Cutting Machine.—Another and special form of milling machine has been built to handle the increased use of dies for forging, stamping, etc. Until about 1921, machines for cutting dies required the use of models made of such materials as bronze, cast iron or electrotypes. These were of two distinct types: reducing machines in which the model is larger than the die required, and duplicating machines in which the model is the same size as the die. Both these types are still in use, but they have their limitations. To meet the demand for a machine on which models made of softer materials could be used, the full electric controlled machine was devised in 1921. This machine is, in its essentials, a milling machine. The movement of the cutting tool is positive, and under control of a tracer or finger which follows the surface of the model by means of an electrical mechanism. The main bed carries a column sliding thereon, and operated by a lead screw driven through suitable gearing by a pair of oppositely rotating magnetic clutches. On the column is the saddle, operated vertically by a vertical lead screw, which is driven by a similar mechanism as the main column. Mounted on this saddle is the cutter head designed to slide in a transverse direction and operated by a lead screw, again in the same manner as the other two motions. The cutter head carries the cutter spindle and driving gears, also the motor supplying power to the cutting tool. On the front part is a long bracket extending vertically for the support of the tracer. The tracer operates the three slides of the machine in such a manner as to cause the cutting tool to follow the same path over the die as the tracer point follows over the model—thereby reproducing the exact shape of the model in the cast iron or steel die block. The model is usually made of wood, plaster, cement or other convenient material. The pressure of the tracer point on the model is only a few ounces, but the cutter by means of the lead screws and power driven magnetic clutches, is forced to cut the material of the die. This machine has played an important part in the mass production of automobiles and other articles manufactured on a large scale by greatly reducing the time necessary to produce a set of tools for body-work on forging parts, etc., and also cutting materially the cost of the same. Since the machine will follow the outline of a male or female thin sheet metal template with unusual fidelity, it is also a very efficient profiler. It may also be conveniently used for jig boring operations.

Gear Cutting Machinery.—When the need for better gears than could be made by casting became apparent, both the milling machine and the planer or shaper were utilized in machining the teeth. The accuracy of the teeth depended upon the proper shaping of the teeth of the cutting tool, and the spacing on the accuracy of the indexing mechanism used. Both of these conditions still affect the accuracies of gears, more in some types of machines than in others, but with improved methods and materials, extremely accurate work is now produced by these methods. The designing of machines that could generate the teeth shape of the desired curve was first accomplished on the planer type of machine and later by the hobbing or continuous milling process. Both of these have grown to be standard methods and several types of machines are now in daily use. Machines of this kind are completely automatic after the gear blank is put in place. Two tools are used, one cutting on each side of the tooth. Both the cutting, feeding and indexing are automatic, the machine stopping when the gear is completed and ringing a bell to call the operator. Here the shape of the tooth is governed by a hardened steel form that guides the tools as they feed into the work and shape the tooth.

An entirely different type of planing gear machine is known as the gear shaper. This uses a cutter in the form of a gear. This cutter is very carefully made, the shape being finally formed after hardening, by a fine grinding wheel that generates the shape of the tooth. In this machine one of the gears is the cutter and both cutter and gear block roll slightly between each stroke of the ram.

Another type of gear cutting machine employs a similar principle. This machine in which the cutter bars are horizontal instead of vertical has two cutters at work, one on each side of the gear blank. By this method it is possible to cut the double helix or herring-bone gears, with no clearance space in the centre. Both the cutter bars and the gear blank move in unison through the proper number of degrees to give the desired angle to the helix of the teeth in the gears. The cutter bar moves from side to side, planing first one side and then the other, and leaving a perfect joint or mating point, at the centre. The proper twist is given the cutter bar by a cam on the cutter bar. Gear teeth with a single helix or straight across the gear blank, commonly known as spur gears, can be easily cut on this machine.

Still another method of cutting gears by the planer-generating process is known as the Maag system. Instead of using a cutter that is practically a hardened gear, this system uses a hardened rack which moves past the gear being cut at the same rate the gear blank is revolved. Many gears are still cut by the milling process, which includes both the formed milling cutter that is fed straight across the face of the gear (and is also used for helical gears to a limited extent), and also the hobbing, or continuous generating process. Here the milling cutter is replaced by what is called a "hob" or continuous milling cutter in the shape of a screw. By setting the cutter at the angle of the thread, and revolving the gear blank at the proper speed, the hob can be fed across the face of the gear blank and generate teeth in accordance with the form of the teeth of the hob, which conform closely to that of a rack.

Grinding Machines.—The development of centreless grinding machines and of the use of wide grinding wheels, together with the growth of the ring wheel type and automatic sizing grinders, are perhaps most noticeable improvements in the field of grinding machines since 1918. The whole machine field has been affected by the growth of grinding. Much flat work that was originally done on the planer was first taken over by the milling machine and later by the grinding machine. Such work as flat irons, mating surfaces of motor blocks, transmission cases, and the like, are usually surfaced on grinding machines of disk type, or with ring wheels. The disk machines generally use disks made of heavy paper and coated with abrasive. These formerly had plain surfaces but are now frequently embossed to give a cushioned effect and to present a series of small grinding surfaces instead of a large solid surface. The depressions serve to hold and carry away the metal particles removed by the abrasive. Various types of fixtures are used to hold the work frequently passing it between two disks and so finishing two sides at once. These disks are on both vertical and horizontal spindles, the latter utilizing the weight of the work to aid in securing the necessary pressure against the abrasive. Grinders using the ring type of wheel have been so developed that they rival the milling-machine and planer as to the amount of metal removed per hour. While much of the work done in this way is a roughing operation, some types of machines are also used for final finishing operations. This type of machine, using magnetic or other chucks, frequently holds many pieces of work at once. In some cases the work is placed in holders as the table revolves, the magnets becoming active before the work reaches the grinding wheel. After passing out from under the wheel, the magnets become inactive and the work can be removed by hand or is forced out of the chuck by what is known as a plough. The magnetic chuck has aided in the development of plane surface grinding. It provides a method of holding work that is either too thin to be held by clamping, or of such shape as readily to be sprung out of shape either by clamps or by the wheel pressure.

Still another method of grinding that has been developed in recent years involves the use of broad faced wheels, up to approximately 12 in. in width, and there is no reason to believe that this is the limit. In cylindrical work, under the name of the plunge-cut grinder, the wheel is fed straight into the work instead of being traversed along the length of the piece as by the older method. A new development in fine grinding is known as superfinishing, developed by D. A. Wallace of the Chrysler Corp. It resembles honing but must have at least three motions between the abrasive blocks and the work. It uses abrasives up to 500 fine. It removes minute high spots on bearing surfaces that might puncture the oil film and cause wear. It produces surfaces with scratches not exceeding 6-millionths of an inch deep.

Even more interesting than the plunge-cut development is the growth of the centreless grinding. Beginning with the grinding of small round pins, with more or less errors as to roundness and size, centreless grinding is now being used to secure extreme accuracy. Starting with a grinding wheel and two stationary rests, which supported the work as it revolved, one rest was abandoned in favour of a second abrasive wheel. This second wheel runs at a slower speed than the main, or grinding wheel, and is known as the feed wheel. Its main object is to insure that the work shall revolve at all times, which overcomes the occasional stoppage and the consequent flattening of the work which sometimes occurred in the older machines. One of the economical features of the centreless grinding machine is the continuous feed that can be secured by setting the feed wheel, or even a stationary rest, at a slight angle to the grinding wheel. All that is necessary is to place the work in an inclined trough leading to the opening between the wheels, and the work automatically feeds into and through the machine. In some cases two machines are placed in tandem, the first acting as a rougher while the second finishes the work. While centreless grinding is primarily for grinding straight work that can pass between the wheels continuously, the method is also used on work of different diameters or with shoulders and tapers. For this work the wheels are set parallel and the work fed between the wheels at right angles to the axis of the wheel spindles. While not as fast as the straight through feed, it is usually more rapid than work ground between centres. Centreless grinding now includes internal work with automatic sizing for both types of machines by mechanical, electrical, and pneumatic control. The latter uses an air jet that builds up back pressure and stops the feed when the correct size is reached.

Broaching.—Broaching, which is the forcing of a special cutter through an opening or beside a piece of metal in order to enlarge a hole or shape the exterior, continues to play an important part in machine work. In some cases the finishing of surfaces in this way is applied to large sizes. A broach may be likened to a special chisel, with teeth spaced at frequent intervals and of such shape as to produce the desired surface in the work. Broaching is confined to internal work in most cases, being originally used for holes that were not round. Present day practice, however, uses broaching very largely as a method of producing round holes accurately and economically. Broaches are made in both the "pull" and "push" types. The former uses a long broach and frequently finishes a hole with a single pull of the broach. Push broaches on the other hand are usually rather short and several are required to cut the hole to the desired shape or size. The number of broaches depends largely upon the length of the piece to be broached, the metal used and the accuracy required. The length is determined by the amount of metal that can be cut successfully by each tooth of the broach, as on this depends the number of teeth required. Where great accuracy is required the amount cut per tooth is very small: as the broach reaches the maximum size, it is frequently necessary to use two or more of the long pull broaches. Outside broaching, which is the finishing of the outside surfaces of machine parts by forcing a broach past them while the work is rigidly held and the broach firmly guided, is used in some cases. Gear teeth have been cut in this way and similar work is also handled. The application of outside broaching is however, comparatively limited. Broaching machines are made in both horizontal and vertical types, the former usually for the pull broach and the vertical for the shorter push broach. Broaching is now replacing milling to some extent in the machining of outside surfaces such as automobile cylinder blocks, for straddle milling, and other surfaces where the quantity warrants the first cost of machines and broaches.

Illustrations relating to machine tool practice are shown in Plates I. and II. (F. H. C.)

See Tool, and also Automatic Machines, Tool Steel, Grinding-Machines, Presses and Presswork, Lathe, Milling-Machines, Planing-Machines, Punching and Shearing Machines, Sawing Machines, Steam-Hammer, Woodworking Machinery, etc.

MACHINERY AND PRODUCTION. The influence of machinery on production and human welfare is well illustrated by comparing the highly industrialized countries, which to-day represent the greatest advance in civilization, with those vast regions of other continents which, although rich in natural resources, are harbouring hundreds of millions of population living close to the starvation line. The substitution of power driven machinery for manual labour began in the early 19th century in England and gradually spread throughout most Occidental countries. It gained momentum in the United States during the closing decades of the 19th century and the first quarter of the 20th century, but proceeded with particular rapidity during the decade following the World War. Labour scarcity caused by the war and artificially continued since the war through restrictions placed on immigration was a powerful factor in this development in the United States. The mechanization of industry has probably been carried farther in the United States than elsewhere. The comprehensive records of manufacturing activity in the census enumerations since 1849 bear testimony to the contribution that machinery has made to production, and the evidence in the first three decades of the present century is particularly clear cut and conclusive. The record since the crash of 1929 is not so unequivocal.

In the period 1899 to 1929 the more rapid growth of manufacturing output than of the workers engaged in its production, when associated with the more rapid growth of horsepower installed in manufacturing plants indicated the growing role of machinery in manufacturing processes.

If the common measure of manufacturing output, its value, is used to display the manufacturing development, it must be adjusted to price changes. The change from a reported product of $11,407,000,000 in 1899 to one of $69,901,000,000 in 1929 embodies not only a large increase in the volume of production but also the upward movement of prices in the war period.

The influence of price change is still more apparent when the production of goods valued at $61,737,000,000 in 1919 is contrasted with an output valued at $23,837,000,000 in 1914, only five years before.

In order to eliminate the confusion arising from the changing purchasing value of the dollar, indices have been computed that show the growth in volume of the physical production of manufactures. Together with other indices of change, they are shown for the successive census enumerations in the period 1899 to 1937, in the table.

Indexes of Population and Manufacturing Development
(1899=100)

Census Year	Population	Production		Wage Earners	Man-Hours	Horse-Power	Production (Quantity)	
		Value	Quantity				Per Wage Earner	Per Man Hour
Indexes								
1904	110	127	122	114	111	133	107	109
1909	121	178	159	137	132	186	116	121
1914	131	209	170	146	137	224	116	124
1919	140	541	214	191	169	294	112	127
1921	145	381	169	147	118	...	115	143
1923	149	528	263	186	161	332	141	163
1925	154	550	274	178	151	359	154	181
1927	158	546	274	177	148	390	155	184
1929	162	613	311	188	159	431	165	195
1931	166	360	206	139	101	...	148	203
1933	168	275	191	129	86	...	148	223
1935	170	403	227	157	102	...	145	222
1937	173	544	275	188	128	...	146	216
Percentage Change Specified Periods								
1899–1914	+31	+109	+70	+46	+37	+124	+16	+24
1914–1929	+24	+193	+83	+28	+17	+ 93	+42	+57
1929–1937	+ 6	− 13	−12	+ 1	−20	...	−12	+10

Characteristic features of modern manufacturing development appeared in the 15-year period ending in 1914. Price changes during the period advanced the value of the product more than would have been accounted for by the increase in quantity. Wage earners increased somewhat more than did population, but considerably less than the volume of production. In consequence, the output per worker increased. There was some diminution in the work week and total man-hours increased less than did the number of wage earners. The output per man-hour therefore increased more than the output per worker.

In these ratios the influence of machinery is shown indirectly. It is shown directly in the greater increase of the horse-power installed in manufacturing establishments than of other factors here recorded.

The World War had an influence on the returns for 1919 that, combined later with the depression of 1921, disturbed the orderly course of development observed in the previous 15-year period. The most conspicuous features of the 1919 record were the great increase in value of product, through inflated prices, and the conspicuous increase in the physical output. The latter was brought about by an abnormal increase in the number of workers, which since the work week was not increased over 1914, but rather fell slightly, resulted in a smaller increase in man-hours.

While between 1914 and 1919 there was a slight decline in the output per worker, there was a slight increase in the output per man-hour. In other words, the great influx of untrained workers that characterized the year 1919 did not entirely counteract the normal tendency for an increase of output for a given application of manual labour which results from the gradual improvement of mechanical processes and their increasingly wide utilization in manufacturing operations. The continued expansion of horse-power in the period 1914 to 1919 shows why with a labour force of less skill and experience in 1919 than in 1914, the output per man-hour was maintained.

Attention is called to the unusual labour force in 1919 because the smaller numbers reported at subsequent enumerations have been widely used as a triumphant demonstration that technological progress has resulted in decreased employment.

A more correct view of the influence of machinery on production and employment results from a comparison of the 15 years from 1914 to 1929 with the preceding 15-year period. The increase both in wage earners and the general population was less, but the manufacturing wage earners gained a little on population. Most conspicuous was the greater increase in manufacturing production, combined with a slower increase than in the preceding period in wage earners, man-hours and horse-power.

This substantial advance in the volume of manufacturing output is reflected in a marked advance in the output per worker and a still greater advance in the output per man-hour. That these results were attained with a smaller increase of horse-power installed would appear to indicate the significance of other factors not previously considered.

The two possible explanations are an improvement in the efficiency of the individual worker and an improvement in organization and management. The vogue in the '20s of what were then designated as systems of scientific management seems to point to the last named as the probable cause of an increased productivity in the manufacturing process.

The period since 1929 witnessed in the first instance a marked decline in physical production, with a subsequent recovery that brought its volume in 1937 to a point only 12% below that of 1929. In like manner the number of wage earners fell off to a point that in 1933 was lower than in 1909.

Thanks to a marked reduction in the hours of work as well as to the increase in physical output, the number of wage earners in 1937 was practically the same as in 1929. However, each of them gave less time to his work and the aggregate man-hours were one-fifth less than eight years before.

No record was kept in this period of the horse-power installed, and what happened in the field of technological invention and its application is largely a matter of conjecture.

Reports of technological achievement in particular fields were rife, but the lower level of machine tool production did not indicate any expansion.

Indeed, it was highly probable that the efficiency of industry's mechanical equipment was not being maintained. There was on the contrary much evidence of impairment. In the early days of the depression, when production was much curtailed, it seems likely that there was a selection of the existing equipment that increased the average efficiency of this factor, just as there was a selection in the working force that retained the most capable workers in their positions. In consonance with this view it may be noted the index of output per man-hour continued to increase and reached its highest point in 1933.

To attribute such a change to increasing mechanization seems to mistake certain fundamental conditions. With the recovery noted in the years 1933 and 1935, the workers increased in number. This meant, other things being equal, (1) a lowering of the average capacity of the worker, and (2) an increased use of existing equipment bringing into operation its less effective elements. Under these conditions a lower output per worker and per man-hour after 1933 is clearly explicable.

The net result of the entire period 1929 to 1937 was a lowering of the output per worker and an increase of the output per man-hour. In such changes machinery has played a part that is far less important than in previous years.

The general effect of the introduction of machinery in increasing the volume of product for a given application of human effort is unquestioned. Equally unquestioned is the correlative effect of reducing the amount of human effort necessary to produce a given volume of output.

There have been times when this latter effect has been widely held as a menace to human welfare. The fears of social distress as a result of improved technical processes have until now proved themselves illusory.

Those fears rest on an apprehension that changes will take place suddenly and throw numbers out of employment. They miss the fact that economic changes occur slowly, that there is a gradual adaptation to them.

They miss the fact that if as a result of machinery the same goods can be made with less labour, it is equally true that the same labour can produce more goods. Thus far the introduction of machinery has vastly increased the output of manufactures and has shortened the customary hours of labour.

It has not, by and large, reduced the number of persons required to do the world's work. (R. P. F.)

MACHYNLLETH, market town, urban district and focus for the Dyfi (Dovey) valley in western Montgomeryshire (*q.v.*), Wales. Pop. (est. 1938) 1,807. Area, 1.9 sq.mi. A local tradition tells of a small Roman station on or near the site (Maglona). The town has long been a salmon fishing centre and formerly had some trade by water through Derwenlas, 2 mi. below the town, up to which point the river was formerly navigable. In 1291 the prince of upper Powys obtained from the crown a charter legally establishing and protecting the Wednesday markets and the two annual fairs. The old municipality came to an end in the reign of Charles I, though urban powers were regained in 1891. Owen Glendower's "Parliament house," now a town institute, is said to be the scene of the attempt to hold a freely elected parliament in Wales, in 1402. Plas Machynlleth is a feature of the town.

MACÍAS (O NAMORADO) (fl. 1360–1390), Galician *trovador*, represented by five poems in the *Cancionero de Baena*. According to tradition, Macías was enamoured of a great lady and murdered by her jealous husband. His legend became a favourite subject with Spanish writers, inspiring—among others—Lope de Vega in *Porfiar hasta morir* and Larra in *Macías*.

See H. A. Rennert, *Macias, o Namorado; a Galician trobador* (Philadelphia, 1900).

MACINTOSH, CHARLES (1766–1843), F.R.S., 1823, Scottish chemist, was born on Dec. 29, 1766 at Glasgow. His experiments with one of the by-products of tar, naphtha, led to his invention of the waterproof fabrics which bear his name, the essence of his patent being the cementing of two thicknesses of india-rubber together by means of naphtha. He was also responsible for important improvements in the manufacture of dyes, bleaching powder and steel. He died July 5, 1843.

See George Macintosh, *Memoir of C. Macintosh* (1847).

MACIP, VICENTE JUAN (*c.* 1523–1579), often called Juan de Juanes, head of the Valencian school of painters, and known as "the Spanish Raphael," was born in the province of Valencia in 1523 or 1524. He was probably the pupil of his father, Juan Vicente Macip, a follower of Fra Bartolommeo. The greater part of his professional life was spent in the city of Valencia, where most of the extant examples of his work are to be found. Most of his work relates to religious subjects, and is characterized by dignity of conception, accuracy of drawing, truth and beauty of colour. They combine the minute finish of the Flemish with the forms of the Italian Renaissance, but they are essentially Spanish in their expression of ardent mysticism. His chief religious paintings are "The Last Supper" and five pictures from the life of St. Stephen. He also painted some portraits, the finest of which is that of Luis de Castelvi. He died at Bocairente (near Jativa) Dec. 21, 1579.

MACKAY, CHARLES (1814–1889), Scottish writer, was born at Perth on March 27, 1814. As editor of the Glasgow *Argus*, he made his reputation in 1846 with the publication of *Voices from the Crowd*. He wrote songs, including "Cheer Boys Cheer," some of which were set to music by Henry Russell and Sir Henry Bishop (published 1855). Also, he wrote *Memoirs of Extraordinary Public Delusions* (1841) and edited *A Thousand and One Gems of English Poetry* (1867). He died in London on Dec. 24, 1889. Marie Corelli (*q.v.*) was his daughter. His son, Eric Mackay (1851–99), wrote *Love Letters of a Violinist* (1886).

MACKAY, CLARENCE HUNGERFORD (1874–1938), American capitalist, was born at San Francisco, Calif., on April 17, 1874. He was president of the Mackay companies, organized in 1903, which owned all the capital stock of the Commercial Cable company and a majority of the stock of various cable, telegraph and telephone companies in the United States, Canada and Europe, including the Postal Telegraph Cable company. As a war measure President Wilson took over the wires of the two companies on Aug. 1, 1918, and placed them under the control of Postmaster-General Burleson. Mackay opposed many of the postmaster-general's policies, and was removed from control, but was reinstated after the return of the wires to the owners in 1919. In 1931 Pope Pius XI made him a Knight of Malta, the highest Catholic lay honour. He died in New York city, Nov. 13, 1938.

McKAY, DONALD (1810–1880), American ship-builder, was born in Shelburne, N.S., on Sept. 4, 1810. After a boyhood spent amid maritime surroundings, he emigrated to New York city. There he worked in ship-yards and after an apprenticeship of ten years, became a master ship-wright. He then removed to Newburyport, Mass., where he established his own yard, and in 1840 built the "Delia Walker" for John Currier, which resulted in their forming a partnership. They built three ships, among them the packet-ship "Courier," in 1842, the first ship designed by McKay. Attracting the favourable attention of Enoch Train, founder of the Train line of packet-ships, he opened a ship-yard in East Boston in 1845, at the foot of Border street, where he became one of the greatest ship-builders of his time. Though he was not the originator of the clipper hull, his "Flying Cloud," 1851, was one of the most notable of clipper ships, sailing from New York city to San Francisco via Cape Horn in 89 days. He died at Hamilton, Mass., on Sept. 20, 1880.

See A. H. Clark, *The Clipper Ship Era* (1910); R. C. McKay, *Donald McKay and The Ships He Built* (Boston, 1925); O. Thorndike Howe and F. C. Matthews, *American Clipper Ships, 1833–1858* (Salem, 1926–27).

MACKAY, HUGH (*c.* 1640–1692), Scottish general, was born in Scourie, Sutherlandshire. He entered Douglas's (Dumbarton's) regiment of the English army (now the Royal Scots) in 1660, and accompanied it to France when it was lent by Charles II. to Louis XIV. In 1669 he was in the Venetian service at Candia, and in 1672 he was back with his old regiment, taking part in the invasion of Holland. Convinced that he was fighting in an unjust cause, he resigned his commission to take a captaincy in a Scottish regiment in the Dutch service. In 1685 he returned with the Scots brigade to England to assist in the suppression of the Monmouth rebellion. He went back to Holland and when the Prince of Orange started on his expedition to England, Mackay's division led the invading corps. As major-general commanding in chief in Scotland, he was called upon to deal with the formidable insurrection headed by Graham of Claverhouse, Viscount Dundee. In the battle of Killiecrankie Mackay was severely defeated, but Dundee was killed, and the English commander subdued the Highlands in one summer. He was killed at the battle of Steinkirk. Mackay invented the ring bayonet.

See H. Mackay, *Memoirs of the War carried on in Scotland and Ireland, 1689, 1691*, Publ. by the Maitland Club (Edinburgh, 1833); J. Mackay, *Life of Lieut. General H. Mackay of Scoury* (Edinburgh, 1836); J. W. Fortescue, *History of the British Army*, vol. i. (1899, 2nd ed., 12 vols., 1910–27), also Mackay's papers (Bannatyne Club, 1883).

MACKAY, JOHN WILLIAM (1831–1902), American capitalist, was born in Dublin, Ireland, Nov. 28, 1831. His parents brought him in 1840 to New York city; in 1851 he went to California and in 1859 to Virginia city, Nevada, where he formed with James G. Fair, James C. Flood and William S. O'Brien the firm which in 1873 discovered the Great Bonanza vein, more than 1,200ft. deep, in the Comstock lode. In 1884, with James Gordon Bennett, Mackay formed the Commercial Cable company—largely to fight Jay Gould and the Western Union Telegraph company—and laid two transatlantic cables. In connection with the Commercial Cable company he formed the Postal Telegraph company. Mackay died July 20, 1902, in London. He endowed the Roman Catholic orphan asylum in Virginia city, Nevada. In June 1908 a school of mines was presented to the University of Nevada, as a memorial to him, by his widow and his son, Clarence H. Mackay.

MACKAY, a seaport on the north-eastern coast of Queensland, Australia, some 600 miles N. of Brisbane. The lowlands, which stretch inland (west) and along the coast (north and south) of Mackay, and which are shut in by rough highlands (Clarke and Leichhardt Ranges on the north; Mount Dalrymple, 4,265 ft.), afford a rich agricultural area. The climate is hot and humid (av. ann. temps, 86°–54° F; av. ann. rainfall, 69 in., with variations 32–101 in.) and sugar, besides tropical fruits (pineapples, bananas, etc.), are grown. Dairying is making headway and, in the little-developed hinterlands, cattle do well and minerals occur. There are nine mills which crush some 400,000 tons of cane annually. A system of railway lines—with privately-owned tramlines as "feeders" from the cane-fields—serve the area, while the main Great Northern Coast Line connects Mackay with Brisbane and other coast towns. The harbour is poor, but is visited by coastwise and overseas shipping. Pop. (1933) 10,665.

MACKAYE, PERCY (1875–), U.S. poet and dramatist, son of Steele Mackaye (*q.v.*) was born in New York city March 16, 1875. After graduating from Harvard in 1897 he travelled and studied abroad (1898–1900). He taught and lectured in a number of schools and colleges in the U.S. He created new forms in native drama and literature and instigated national movements for community theatres, folk-plays and poetry.

His many works include—in poetry: *Poems* (collected, 1916); *Dogtown Common* (1921); *William Vaughan Moody—Twenty Years After* (1930); *The Far Familiar* (1937); *My Lady Dear, Arise! . . . Songs and Sonnets in Remembrance of Marion Morse Mackaye* (1940)—plays: *The Canterbury Pilgrims* (1903); *Jeanne d'Arc* (1906); *Sappho and Phaon* (1907); *The Scarecrow* (1908); *Yankee Fantasies* (1912); *Washington* (1918); *This Fine-Pretty World* (1924); *The Sphinx* (1929)—operas: *The Immigrants* (1915)—masques: *Saint Louis* (1914); *Caliban* (1916); *Wakefield* (1932)—essays: *The Civic Theatre* (1912)—folk-stories: *Tall Tales of the Kentucky Mountains* (1926); *The Gobbler of God* (1928); *Kentucky Mountain Fantasies* (1928)—biography: *Epoch; the Life of Steele MacKaye, Genius of the Theatre* (1927).

MACKAYE, STEELE (1842–1894), American dramatist, actor, inventor, was born in Buffalo, N.Y., on June 6, 1842, son of Col. James Morrison MacKaye (1805–88), author of *The Birth and Death of Nations,* president of the American Telegraph company, and a "special commissioner" for President Lincoln. In youth, Steele MacKaye studied painting with Hunt, Inness and Troyon. A pupil of Delsarte and Régnier, of the Théâtre Français, he was the first American to act *Hamlet* in London (1873), collaborating there in plays with Tom Taylor and Charles Reade. At Harvard, Cornell and elsewhere, he lectured on aesthetic philosophy. In New York he founded the St. James, Madison Square and Lyceum theatres. He wrote 30 plays, including *Hazel Kirke* (performed many thousand times), *Paul Kauvar, Money Mad,* etc., acting in them in 17 different rôles. He organized the first school of expression, originating "harmonic gymnastics"; initiated overhead lighting (1874); invented the first moving "double" stage (1879) and folding theatre-chairs, patenting over 100 theatrical inventions. At the World's Fair, Chicago (1892–93), he projected the world's largest theatre, his Spectatorium (seating 12,000, with 25 moving stages) revolutionizing stage production and anticipating cinemas in his vast "spectatorio" of Columbus, *The World-Finder,* for which Dvořák composed the New World symphony. He died at Timpas, Colo., on Feb. 25, 1894.

MACKE, AUGUST (1887–1914), German painter, was born on Jan. 3, 1887, at Meschede, Westphalia. His youth was spent in Cologne and Bonn, and he studied art from 1904, at the Düsseldorf Academy and later in Berlin with Louis Korinth. He was influenced particularly in his earlier work by the older Impressionists: Cezanne, Matisse, Renoir, Picasso; and the Cubists. He also visited Paris, Holland and Italy. The period of his independent creation embraces the years 1909–14. With Kandinski, Jawlenski and Marc, he was one of the most important representatives of the "Blaue Reiter," the group of painters from which Expressionism in Germany originated. His art combines the tradition of French painting, its sense of the grace of movement and atmosphere in landscape painting, with the cosmic sentiment of German art, without losing itself in the subtle and problematical. A journey to Tunis in the spring of 1914 inspired some of his most beautiful pictures. He was killed in World War I at Perthes-les-Hurlus, Champagne, on Sept. 26, 1914.

See Walter Cohen, *August Macke* (Leipzig, 1922).

McKEESPORT, a city of Allegheny county, Pennsylvania, U.S.A., on the Monongahela river at the mouth of the Youghiogheny, 15 mi. S.E. of Pittsburgh. It has two airports north of the city, and is served by the Baltimore and Ohio, the Pittsburgh and Lake Erie and the Pennsylvania railways. Pop. 46,781 in 1920 (25% foreign-born white); 54,632 in 1930; 55,355 in 1940 by the federal census. The city is compactly built on a site of 4.8 sq.mi., rising from the rivers to hills occupied by the newer residential districts. It has 5.5 mi. of navigable river front, coal mines at its very door, natural gas from West Virginia and southwestern Pennsylvania, 8 public parks, 23 schools, 73 churches, an assessed valuation (1941) of $55,039,025 and a commission form of government. It is an important industrial unit of the greater Pittsburgh district, making iron and steel, pipe and tubing, tin plate, boilers, radiators, sheet metal and other metal products. The first white settler here was David McKee, who established a ferry in 1769. His son John, because of severe losses during the Whisky Insurrection, laid out the homestead in 200 town lots, which were sold by lottery on April 1, 1795.

Coal mining began in 1830, and not long after that the building of barges developed on a large scale. During the '50s the town was an important boat-building centre. The first iron works was established in 1851. In 1878, and again in 1919, natural gas was struck within the city limits, but the supply was soon exhausted. In each case a brief period of speculation and hectic drilling followed. McKeesport was incorporated as a borough in 1842 and chartered as a city in 1890.

McKEES ROCKS, a borough of Allegheny county, Pennsylvania, U.S.A., on the Ohio river; it is situated at the mouth of Chartiers creek, opposite Pittsburgh, and is served by the Pittsburgh and Lake Erie railroad and also by two others for freight. Pop. (1920) 16,713 (32% foreign-born white); 17,021 in 1940 by the federal census. It is a coal-mining centre, and has railroad shops and important manufactures, especially iron, steel, springs, tin and enamelled ware. The factory output in 1937 was valued at $17,458,783. Natural gas is available from wells in the vicinity. There is a prehistoric mound in the borough.

Settlement there dates from 1830, and the borough was incorporated in 1892.

McKENNA, REGINALD (1863–1943), British politician and financier, was born in London on July 6, 1863, and educated at King's college. He went up to Trinity Hall, Cambridge, as a scholar and graduated as senior optime in 1885. He also gained distinction as an oarsman, rowing in the university boat race in 1887. He was called to the bar in that year, and in 1895 was elected Liberal member for North Monmouthshire. When his party returned to power in Dec. 1905, he became financial secretary to the treasury. In 1907 he was promoted to the presidency of the Board of Education, but was no better able than his predecessor, Birrell, to draft a bill which would satisfy the Nonconformists and yet pass the House of Lords. His tenure of the office was brief, as, on Asquith's succeeding to the premiership in the spring of 1908, he was transferred to the Admiralty.

He entered on his new duties at a time when the country was profoundly stirred by the rapid increase of the German fleet, and was in doubt whether the preparations of the Admiralty were on a sufficiently extensive scale. McKenna, supported by the prime minister and Edward Grey, persuaded his other colleagues to agree to the building of four battleships of dreadnought type in 1909, and to ask for power, if necessary, to prepare for the construction of four more a year later. This contingent program was also carried.

From the Admiralty McKenna went in the autumn of 1911 to the Home Office, and, as home secretary, had charge of the Welsh Disestablishment bill. In the first Coalition ministry in 1915 he was made chancellor of the exchequer, and a still more difficult task was imposed on him—to find the money to carry on the World War. By a 4½% war loan a subscription of nearly £600,000,000 was obtained. In the autumn he introduced a supplementary war budget, providing for over £100,000,000 by new taxation. Income tax was raised 40%, and the abatement and exemption limits lowered; the rates of supertax were seriously heightened; all the old duties on sugar, tea, tobacco, cocoa, coffee, motor spirit and patent medicines were almost doubled; the import of luxuries such as motor cars, cinema films, clocks and musical instruments was restrained by an *ad valorem* duty of 33⅓%; and an excess profits tax of 50% was imposed. Other methods of financing the war which he adopted were war savings certificates, which realized over £40,000,000 in their first year; 5% exchequer bonds, replaced after a year for a short time by 6% exchequer bonds: but for current expenses he relied mainly on the sale of treasury bills. In his 1916 budget he raised taxation still further. Income tax was increased to 5s. in the £ and excess profits tax to 60%; there were further increases on sugar, cocoa and coffee; higher duties were imposed on motor vehicles; there were new taxes on amusements, railway tickets, matches and mineral waters.

McKenna went out of office with Asquith in Dec. 1916, and, in 1919, he accepted the chairmanship of the Midland Bank, Limited, a position he retained until his death Sept. 6, 1943, in London. He wrote *Post-War Banking Policy* (1928). (G. E. B.)

MACKENNAL, ALEXANDER (1835–1904), English Nonconformist divine, was born at Truro in Cornwall, on Jan. 14, 1835, the son of Patrick Mackennal, a Scot, who had settled in Cornwall. In 1848 the family removed to London, and at sixteen he went to Glasgow University. He entered the Congregational Ministry in 1856, and from 1877 to his death was pastor of the Congregational Church at Bowdon, Cheshire. In 1886 he was chairman of the Congregational Union. In 1892 Mackennal became associated with a movement for free church federation which grew out of a series of meetings held to discuss the question of home reunion. When the Lambeth articles put forward as a basis of union were discussed, it was evident that all the free churches were agreed in accepting the three articles dealing with the Bible, the Creed and the Sacraments as a basis of discussion, and were also agreed in rejecting the fourth article, which put the historic episcopate on the same level as the other three. Out of this grew the Free Church Federation, which secures a measure of co-operation between the Protestant Evangelical churches throughout England. Mackennal was a lifelong advocate of international peace, and made a remarkable declaration as to the Christian standard of national action when the Free Church Federation met at Leeds during the South African War in 1900. He died at Highgate, London, on June 23, 1904.

See D. Macfadyen, *Life and Letters of Alexander Mackennal* (1905).

MACKENSEN, A. L. F. AUGUST VON (1849–1945), German fieldmarshal, was born in Haus Leiptnitz, Saxony, on Dec. 6, 1849. Educated at Torgau and the University of Halle, he entered the Second Death's Head Hussars as a cadet in 1869. He saw service in the Franco-Prussian War, and in 1882 was promoted to the Great General Staff. He accompanied the German Emperor on his journey to Palestine. In 1908 he was given command of the XVII. Army Corps on the Vistula. At the outbreak of World War I he was placed in charge of the IX. Army on the Eastern Front, where he conducted successful operations against the Russians at Kutno, Łódź and Lowicz. In April 1915 he became leader of the German forces in western Galicia and was largely responsible for the German break-through at Gorlice. On June 20, 1915, he was made a fieldmarshal and in Aug. and Sept. of that year had further successes at Brest-Litovsk and Pinsk. In Oct. and Nov. 1916, as commander of the army sent against Serbia, he practically overran that country; and in 1916, with the composite army which invaded Rumania, he subjugated the Dobruja and by the middle of Jan. 1917 had to all intents and purposes occupied the country. At the Armistice, he was interned by the French at Neusatz, till Dec. 1919. He retired from the army in 1920 and was made a state counsellor in 1933. He died Nov. 8, 1945, at Celle, Germany.

See W. Renner, *Feldmarschall von Mackensen* (1915); M. Luyken *Generalfeldmarschall von Mackensen, Von Bukarest bis Salonika* (1920).

MACKENZIE, SIR ALEXANDER (*c.* 1764–1820), Canadian explorer, was born at Stornoway, Island of Lewis. Emigrating to North America at an early age, he was for several years engaged in the fur trade at Fort Chippewyan, at the head of Lake Athabasca. His first journey (1789) was from Fort Chippewyan along the Great Slave Lake, and down the river which now bears his name to the Arctic Ocean; and his second, made in 1792 and 1793, from Fort Chippewyan across the Rocky Mountains to the Pacific coast near Cape Menzies. He died at Mulinearn, near Pitlochry, on March 12, 1820.

See his *Voyages on the River St. Lawrence and through the Continent of North America to the Frozen and Pacific Oceans* (1801).

MACKENZIE, ALEXANDER (1822–1892), Canadian statesman, was born in Perthshire, Scotland, on Jan. 28, 1822. He emigrated to Canada in 1842, and later worked in Ontario as a stone-mason, later becoming a builder and contractor at Sarnia with his brother. In 1852 his interest in questions of reform led to his becoming the editor of the *Lambton Shield,* a local Liberal paper. In 1861 he became a member of the Canadian parliament, where he at once made his mark and was closely connected with the liberal leader, George Brown. He was elected for Lambton to the first Dominion house of commons in 1867, and soon became the leader of the liberal opposition; from 1871 to 1872 he also sat in the Ontario provincial assembly, and held the position of provincial treasurer. In 1873 on the defeat of Sir John Macdonald's ministry Mackenzie formed a new Government, taking the portfolio of public works and becoming the first liberal premier of Canada. He remained in power till 1878, when industrial depression enabled Macdonald to return to office on a protectionist programme. In 1875 Mackenzie paid a visit to Great Britain, and was received at Windsor by Queen Victoria; he declined knighthood. In 1880 he resigned the leadership of the opposition owing to failing health, but he retained a seat in parliament till his death at Toronto on April 17, 1892. While perhaps too cautious to be the ideal leader of a young and vigourous community, his grasp of detail, industry, and integrity won him the respect even of his opponents.

See W. Buckingham and the Hon. George W. Ross, *Alexander Mackenzie, His Life and Times* (Toronto, 1892); G. Stewart, *Canada under the Administration of the Earl of Dufferin* (Toronto, 1878).

MACKENZIE, SIR ALEXANDER CAMPBELL (1847–1935), British composer, son of an eminent Edinburgh violinist and conductor, was born on Aug. 22, 1847. Mackenzie studied at the Sondershausen conservatorium under Ulrich and Stein, and in 1861 entered the ducal orchestra as a violinist. At this time he made Liszt's acquaintance. On his return home he spent three years at the Royal Academy of Music. He took part in Chappell's quartette concerts, and started a set of classical concerts. He was appointed precentor of St. George's Church in 1870, and conductor of the Scottish vocal music association in 1873. The most important compositions of this period of Mackenzie's life were the Quartette in E flat for piano and strings, Op. 11, and an overture, *Cervantes,* which owed its first performance to the encouragement and help of von Bülow. On the advice of this great pianist, he settled in Florence in order to compose. The cantatas *The Bride* (Worcester, 1881) and *Jason* (Bristol, 1882) belong to this time, as well as his first opera, *Colomba* (1883), commissioned for the Carl Rosa Company. Mackenzie's second opera, *The Troubadour,* was produced by the same company in 1886; and his third dramatic work was *His Majesty,* an excellent comic opera (Savoy Theatre, 1897). In 1888 he succeeded Macfarren as principal of the Royal Academy of Music. This post he held until 1924, and the importance of his influence over the younger generation of English musicians was very great. From 1892 to 1899 Mackenzie conducted the Philharmonic Concerts, and was knighted in the year 1894. In the two "Scottish Rhapsodies" for orchestra, in the music to *The Little Minister,* and in a beautiful fantasia for pianoforte and orchestra on Scottish themes, he has seized the essential, not the accidental features of his native music.

Mackenzie's works include *The Rose of Sharon* (Norwich festival, 1884); three Scottish Rhapsodies: No. 1 (Glasgow, 1880); No. 2, "Burns" (Glasgow, 1881); No. 3, "Tam O'Shanter" (Int. Music Congress, London, 1911); the Pibroch suite for violin (Leeds, 1889), etc. *See* his *A Musician's Narrative* (1927).

MACKENZIE, EDWARD MONTAGUE COMPTON (1883–), British novelist, son of Edward Compton, was born at West Hartlepool on Jan. 17, 1883, and educated at St. Paul's school, London, and Magdalen college, Oxford. He saw a good deal of stage life before embarking on his literary career which began with *Poems* (1907) and a picturesque "period" novel, *The Passionate Elopement* (1911). *Kensington Rhymes* and the novel *Carnival* followed in 1912, and the long novel *Sinister Street* (2 vols., 1913–14) was characteristic of the quasi-autobiographical novels of childhood and youth which were then attracting some of the younger novelists. War experiences yielded *Extremes Meet* and other accounts of the secret service. His work is characterized by a coloured style, picaresque action and humorous character study, and, in some of his best work, a sympathetic portrayal of religious sensibility. This last is to be seen in the trilogy *The Altar Steps* (1922), *The Parson's Progress* (1923) and *The Heavenly Ladder* (1924). Other works are *Guy and Pauline* (1915), *Sylvia Scarlett* (1918), *Coral* (1925), *Vestal Fire* (1927), *Extraordinary Women* (1928) and *The Windsor Tapestry* (1938).

MACKENZIE, SIR GEORGE (1636–1691), of Rosehaugh, Scottish lawyer, the grandson of Kenneth, first Lord Mackenzie of Kintail. He was born at Dundee in 1636, educated at the grammar school there, at Aberdeen, at St. Andrews and Bourges. He was called to the bar in 1659. He succeeded Sir John Nisbet as king's advocate in August 1677, and in the discharge of this office became implicated in all the worst acts of the Scottish administration of Charles II., earning for himself an unenviable distinction as "the bloody Mackenzie." His refusal to concur in the measures for dispensing with the penal laws against Catholics led to his removal from office in 1686, but he was reinstated in February 1688. At the Revolution, being a member of convention, he was one of the minority of five in the division on the forfeiture of the crown. King William was urged to declare him incapacitated for holding any public office, but refused. When the death of Dundee (July 1689) had finally destroyed the hopes of his party in Scotland, Mackenzie went to Oxford, where he did literary work. He died at Westminster on May 8, 1691.

While still a young man Sir George Mackenzie appears to have aspired to eminence in the domain of pure literature, his earliest publication having been *Aretina, or a Serious Romance* (anon., 1661); it was followed, also anonymously, by *Religio Stoici, a Short Discourse upon Several Divine and Moral Subjects* (1663); *A Moral Essay, preferring Solitude to Public Employment* (1665); and one or two other disquisitions of a similar nature. His most important legal works are entitled *A Discourse upon the Laws and Customs of Scotland in Matters Criminal* (1674); *Observations upon the Laws and Customs of Nations as to Precedency, with the Science of Heraldry* (1680); *Institutions of the Law of Scotland* (1684); and *Observations upon the Acts of Parliament* (1686); of these the last-named is the most important, the *Institutions* being completely overshadowed by the similar work of his great contemporary Stair. In his *Jus Regium: or the Just and Solid Foundations of Monarchy in general, and more especially of the Monarchy of Scotland, maintained* (1684), Mackenzie appears as an uncompromising advocate of the highest doctrines of prerogative. His *Vindication of the Government of Scotland during the reign of Charles II.* (1691) is valuable as a piece of contemporary history. The collected *Works* were published at Edinburgh (2 vols. fol.) in 1716–22; and *Memoirs of the Affairs of Scotland from the Restoration of King Charles II.*, from previously unpublished mss., in 1821.

See A. Lang, *Sir George Mackenzie of Rosehaugh* (1909).

MACKENZIE, HENRY (1745–1831), Scottish novelist and miscellaneous writer, the "Man of Feeling," born at Edinburgh, was educated at the high school and the university of his native town, and was then articled to George Inglis of Redhall, who was attorney for the crown in the management of exchequer business. In 1765 he was sent to London to prosecute his legal studies, and on his return to Edinburgh became partner with Inglis, whom he afterwards succeeded as attorney for the crown. His first and most famous work, *The Man of Feeling*, was published anonymously in 1771, and met with instant success. The "Man of Feeling" is a weak creature, dominated by a futile benevolence, who goes up to London and falls into the hands of people who exploit his innocence. One Eccles of Bath claimed the authorship of this book, bringing in support of his pretensions a ms. with many ingenious erasures. Mackenzie's name was then officially announced, but Eccles appears to have induced some people to believe in him. The first of his dramatic pieces, *The Prince of Tunis*, was produced in Edinburgh in 1773 with a certain measure of success. The others were failures. At Edinburgh Mackenzie belonged to a literary club, at the meetings of which papers in the manner of the *Spectator* were read. Mackenzie conducted two critical journals: *The Mirror* (1779–80) and *The Lounger* (1785–87). His critical work was good. He was the first critic to recognize the genius of Burns; he hailed the early works of Scott; and he was a faithful friend to many men of letters. His nickname, the "man of feeling," by no means represents the man of critical acumen and practical commonsense. *Waverley* was dedicated to him. No one now reads *The Man of Feeling*, but his commonplace book *Anecdotes and Egotisms of Henry Mackenzie* (edit. H. W. Thompson, 1928) is an interesting record.

Mackenzie was an ardent Tory, and wrote many tracts opposing the doctrines of the French Revolution. Most of these remained anonymous, but he acknowledged his *Review of the Principal Proceedings of the Parliament of 1784*, a defence of the policy of William Pitt, written at the desire of Henry Dundas. He was rewarded (1804) by the office of comptroller of the taxes for Scotland. In 1776 Mackenzie married Penuel, daughter of Sir Ludovick Grant of Grant. He was, in his later years, a notable figure in the social life of Edinburgh. He died on Jan. 14, 1831.

In 1807 *The Works of Henry Mackenzie* were published surreptitiously, and he then himself superintended the publication of his *Works* (8 vols. 1808).

See the *Prefatory Memoir*, by Sir Walter Scott, to an edition of his novels in Ballantyne's *Novelist's Library* (vol. v., 1823).

McKENZIE, SIR JOHN (1838–1901), New Zealand statesman, was born at Ard-Ross, Scotland, in 1838, the son of a crofter. He emigrated to Otago, New Zealand, in 1860. Beginning as a shepherd, he rose to be farm manager at Puketapu near Palmerston South. In 1865 he was clerk to the local road board and school committee; in 1871 he entered the provincial council of Otago; and on Dec. 11, 1881 was elected member of the House of Representatives, in which he sat till 1900. In 1891 he held the portfolio of lands, immigration and agriculture. He died on Aug. 6, 1901.

MACKENZIE, SIR MORELL (1837–1892), British physician, son of Stephen Mackenzie, surgeon (d. 1851), was born at Leytonstone, Essex, on July 7, 1837. He studied at the London hospital, at Paris, Vienna and Pesth, where he learnt the use of the newly-invented laryngoscope under J. N. Czermak. In 1862 he took his degree and became a specialist in diseases of the throat. In 1863 he helped to found the Throat hospital in King street, Golden square, and became a leading authority.

In May 1887 he was summoned to attend the German Crown Prince Frederick, whose illness was difficult to diagnose. The summoning of the English specialist was attributed to the Empress Frederick, but she was not responsible, still less, as stated in Germany, Queen Victoria (*see* Correspondence in *The Times*, Jan.-Feb. 1928). The German physicians who had attended the prince since the beginning of March (Karl Gerhardt, and subsequently Tobold, E. von Bergmann, and others) had diagnosed his disease on May 18 as cancer of the throat; but Morell Mackenzie insisted (basing his opinion on a microscopical examination by R. Virchow of a portion of the tissue) that the disease was not demonstrably cancerous, that an operation for the extirpation of the larynx (planned for the 21st May) was unjustifiable, and that the growth might well be a benign one and therefore curable by other treatment. Morell Mackenzie's opinion was followed; he was knighted in September 1887 for his services, and decorated with the Grand Cross of the Hohenzollern Order. In November, however, it was ultimately admitted that the disease really was cancer; though Mackenzie, with very questionable judgment, more than hinted that it had become malignant since his first examination, in consequence of the irritating effect of the treatment by the German doctors. The crown prince (*see* FREDERICK III.) became emperor on March 9, 1888, and died on June 15. A violent quarrel raged between Sir Morell Mackenzie and the German medical world. The German doctors published an account of the illness, to which Mackenzie replied by a work entitled *The Fatal Illness of Frederick the Noble* (1888), the publication of which caused him to be censured by the Royal College of Surgeons. Morell Mackenzie died on Feb. 3, 1892, leaving several books on laryngoscopy and diseases of the throat.

MACKENZIE, WILLIAM LYON (1795–1861), Canadian politician, was born near Dundee, Scotland, on March 12, 1795. In April 1820 he emigrated with his mother to Canada. There he became a general merchant, first at York, then at Dundas, and later at Queenston. The discontented condition of Upper Canada drew him into politics, and on May 18, 1824 he published at Queenston the first number of the *Colonial Advocate,* in which the ruling oligarchy was attacked with great asperity, and which roused great anger among the social and political set at York (Toronto), which was headed by John Beverley Robinson. In Nov. 1824 Mackenzie removed to Toronto, but he had little capital; his paper appeared irregularly, and was on the point of suspending publication when his office was attacked and his type thrown into the bay by a number of the supporters of his opponents. In an action against the chief rioters he was awarded £625 and costs, which enabled him to set up a much larger plant, and the *Colonial Advocate* ran till Nov. 4, 1834.

In 1828 he was elected member of parliament for York, but was expelled on the technical ground that he had published in his newspaper the proceedings of the house without authorization. Five times he was expelled and five times re-elected by his constituents, till at last the Government refused to issue a writ, and for three years York was without one of its representatives. In May 1832 he visited England, where he was well received by the colonial office. Largely as the result of his representations, many important reforms were ordered by Lord Goderich, afterwards earl of Ripon, the colonial secretary. While in England, he published *Sketches of Canada and the United States,* a statement of Canadian grievances. On his return in March 1834 he was elected mayor of Toronto. In Oct. 1834 he was elected member of parliament for York, and took his seat in Jan. 1835, the Reformers being now in the majority. A committee on grievances was appointed, and as chairman Mackenzie presented the admirable *Seventh Report on Grievances,* advocating responsible government.

In the general election of June 1836 the Tory party won a complete victory, Mackenzie and almost all the prominent Reformers being defeated at the polls. This totally unexpected defeat greatly embittered him. On July 4, 1836, he began the publication of the *Constitution,* which openly advocated a republican form of government. Later in the year he was appointed "agent and corresponding secretary" of the extreme wing of the Reform party. He was also in correspondence with Papineau and the other leaders of the Reformers in Lower Canada, who were already planning a rising. Early in Dec. 1837 Mackenzie gathered a mob of his followers at Gallows Hill, Toronto, with the intention of seizing the lieutenant-governor and setting up a provisional Government. The total failure of the revolt forced Mackenzie to fly to the United States with a price on his head. In the town of Buffalo he collected a disorderly rabble, who seized and fortified Navy island, in the river between the two countries, and for some weeks troubled the Canadian frontier. After the failure of this attempt he was put to the most pitiful shifts to make a living. In June 1839 he was tried in the United States for a breach of the neutrality laws, and sentenced to 18 months' imprisonment, of which he served over eleven. While in gaol at Rochester he published the *Carolina Almanac,* the tone of which may be judged from its references to "Victoria Guelph, the bloody queen of England," and to the cabinet as "Victoria Melbourne's bloody divan." He returned to Canada under the Amnesty Act 1849.

In 1851 he was elected to parliament for Haldimand, defeating George Brown. He at once allied himself with the Radicals (the "Clear Grits"), and became one of Brown's lieutenants. He was still miserably poor, but refused all offers to accept a government position. In 1858 he resigned his seat in the house, owing to incipient softening of the brain, of which he died on Aug. 29, 1861.

Turbulent, ungovernable, vain, often the dupe of schemers, Mackenzie united with much that was laughable not a little that was heroic. He could neither be bribed, bullied, nor cajoled. In 1832 he refused from Lord Goderich a position of great influence in Canada and an income of £1,500. He was a born agitator, and the evils against which he struggled were real and grave.

The *Life and Times* by his son-in-law, Charles Lindsey (Toronto, 2 vols., 1862), is moderate and fair, though tending to smooth over his anti-British gasconade while in the United States. An abridgment of this work was edited by G. G. S. Lindsey for the "Makers of Canada" series (1909). In *The Story of the Upper Canadian Rebellion* by J. C. Dent (2 vols., Toronto, 1885), a bitter attack is made on him, which drew a savage reply from another son-in-law, John King, K.C., called *The Other Side of the Story.* The best short account of his career is given by J. C. Dent in *The Canadian Portrait Gallery,* vol. ii. (Toronto, 1881). (W. L. G.)

MACKENZIE, a river of the Northwest Territories, Canada, discharging the waters of the Great Slave Lake into the Arctic Ocean. It was discovered and first navigated by Sir Alexander Mackenzie in 1789. It has an average width of 1 m., an average fall of 6 in. to the mile; an approximate discharge, at a medium stage, of 500,000 cu. ft. per second; and a total length, including its great tributary, the Peace, of 2,514 mi. The latter rises as the Finlay in British Columbia, joins the Parsnip, and is then called the Peace. It next unites with the discharge from Lake Athabasca and, as the Slave river, it proceeds to the Great Slave Lake. The Mackenzie enters the Arctic Ocean near 135° W. and 68° 50′ N., after flowing for 70 to 80 m. through a flat delta, not yet fully surveyed. With its continuation, Slave river, it is navigable from the Arctic ocean to Fort Smith, a distance of over 1,200 m., and between the latter and the head of Lesser Slave Lake, a further distance of 625 m., there is only one obstruction to navigation, the Grand Rapids near Fort McMurray on the Athabasca river. The Peace is navigable from its junction with Slave river for about 220 m. to Vermilion Falls. The Mackenzie is navigable from about the 10th of June to the 20th of October, and Great Slave Lake from about the 1st of July to the end of October.

MACKEREL (*Scomber scombrus*), the typical fish of the family Scombridae, which are swift carnivorous pelagic fishes found in tropical and temperate seas, of fusiform shape, generally bluish above and silvery below, with small, thin scales, pointed head and rather large mouth, spinous dorsal fin of slender spines that are depressible in a groove, soft dorsal and anal, followed by a series of detached rays, or finlets, and with slender caudal peduncle and widely forked caudal fin. The flesh is oily, generally red. These are energetic fishes in which the temperature is generally several degrees higher than that of the water.

THE GREAT ALBACORE MACKEREL

The albacores, bonitoes and tunnies are large oceanic fishes. *Scombromorus* and *Acanthocybium* are important tropical genera, longer and more compressed than other Scombridae, and with strong trenchant teeth. The mackerel genus, *Scomber,* is distinguished by feeble teeth and by the maxillary being sheathed by the praeorbital; it includes about 10 species from tropical and temperate seas. *Scomber scombrus* is a valuable food-fish found in the Mediterranean and on both sides of the north Atlantic; it reaches a length of about 18 inches. It swims in large schools, which approach the coasts in the spring; after spawning in the summer they return to the ocean. The principal British fishery is in the western part of the Channel. The air-bladder is absent in *S. scombrus,* but a small one is present in *S. colias,* termed Spanish mackerel in England and chub mackerel in America; this is a smaller and less valuable fish than the common mackerel and more southerly in its distribution, but reaches Britain occasionally.

YELLOW MACKEREL OR CREVALLY (CARANX CRYSOS)

McKIM, CHARLES FOLLEN (1847–1909), American architect, was born in Chester county, Pennsylvania, on Aug. 24, 1847. His father, James Miller McKim (1810–74), a Presbyterian minister, was a prominent abolitionist and one of the founders (1865) of the New York *Nation.* The son studied at Harvard (1866–67) and at Paris in the École des Beaux Arts (1867–70).

In 1872 he became an architect in New York city, entering the office of H. H. Richardson. In 1877 he formed a partnership with William Rutherford Mead (b. 1846), the firm becoming in 1879 McKim, Mead & White, when Stanford White (q.v.) (1853–1906) became a partner. McKim was one of the founders of the American Academy in Rome; received a gold medal at the Paris exposition of 1900; in 1903, for his services in the promotion of architecture, received the King's Medal of the Royal Institute of British Architects; and in 1907 became a National Academician. He died at St. James, Long Island, N. Y., Sept. 14 1909. McKim's name is especially associated with the University Club in New York and the Boston Public Library.

See Charles Moore, *Life and Times of Charles Follen McKim* (1929).

MACKINAC ISLAND, a city of Mackinac county, Michigan, U.S.A., on Mackinac island in the northwest extremity of Lake Huron. It is connected by steamers with St. Ignace (6 mi. W.) and Mackinaw City (7 mi. S.W.), on both sides of the Straits of Mackinac, and is served by the principal steamship lines on the Great Lakes. Pop. (1940) 508. The island (3 mi. by 2 mi.) is a beautiful summer resort, rich in Indian lore and historic interest. White limestone cliffs line the shores and the interior is covered with forests. No automobiles are allowed. The city is an old fishing and trading village, with large modern hotels, club-houses and summer homes. Fort Mackinac and its surroundings are included in a State park. The island was occupied at various times by the Chippewas, the Hurons, and the Ottawas. The French established a post in 1670 (abandoned 1701) at Point St. Ignace, on the north side of the strait, and in 1712 built a fort on the south side, surrendered to the British in 1761 and held by them until 1796. In July, 1812, a British force surprised the American garrison, which did not yet know that war had been declared. In August, 1814, Colonel George Croghan (1791–1849) made an unsuccessful attempt to retake the island. It was restored to the United States in July, 1815, and the fort was maintained by the Federal government until 1895, when it was ceded to the State. From 1820–40 the village was a chief post of the American Fur Company.

McKINLEY, WILLIAM (1843–1901), twenty-fifth president of the United States, was born in Niles, Trumbull county, O., on Jan. 29, 1843. His ancestors on the paternal side were Scotch-Irish who lived at Dervock, Co. Antrim, and spelled the family name "McKinlay." His great-great-grandfather settled in York county, Pa., about 1743, and from Chester county, Pa., his great-grandfather, David McKinley, who served as a private during the War of Independence, moved to Ohio in 1814. David's son James had gone in 1809 to Columbiana county, O. His son William McKinley (b. 1807), like his father an iron manufacturer, was married in 1829 to Nancy Campbell Allison, and to them were born nine children, of whom William, the president, was the seventh. In 1852 the family removed to Poland, Mahoning county, where the younger William was placed at school. At 17 he entered the junior class of Allegheny college, at Meadville, Pa.; but he studied beyond his strength, and returned to Poland, where for a time he taught in a neighbouring country school. When the Civil War broke out in 1861 he enlisted as a private. He saw service in West Virginia, at South Mountain, and at Antietam, and was promoted second lieutenant in 1862, and first lieutenant early in Feb. 1864. For his services at Winchester in 1864 he was promoted captain. He was on the staff of Gen. George Crook at the battles of Opequan, Fisher's hill and Cedar creek in the Shenandoah valley, and in 1865 he was breveted major of volunteers for gallant and meritorious services. He also served on the staff of Gen. Rutherford B. Hayes.

After the war McKinley returned to Poland, and bent all his energy upon the study of law. He completed his preparation at the Albany (N.Y.) law school,was admitted to the bar at Warren, O., in March 1867, and began practice in Canton, O., which place became his permanent home. He identified himself immediately with the Republican Party, and took part in the campaign work on behalf of Grant's presidential candidature in 1868. In 1875 he first became known as an able campaign speaker by his speeches on behalf of Rutherford B. Hayes, the Republican candidate for governor of Ohio. In 1876 McKinley was elected to the national House of Representatives. Conditions both in Ohio and in Congress had placed him, and were to keep him for twenty years, in an attitude of aggressive and uncompromising partisanship. His Congressional district was naturally Democratic, and its boundaries were changed by Democratic legislatures for the purpose of causing his defeat. But he overcame what had threatened to be adverse majorities at all elections from 1876 to 1890, with the single exception of 1882. McKinley reflected the strong sentiment of his manufacturing constituency in behalf of a high protective tariff, and he soon became known in Congress (where he particularly attracted the attention of James G. Blaine) as one of the most diligent students of industrial policy and questions affecting national taxation. In 1878 he took part in the debates over the Wood tariff bill, and in the same year he voted for the Bland-Allison silver bill. In Dec. 1880 he was appointed a member of the ways and means committee, succeeding James A. Garfield, who had been elected president in the preceding month, and to whose friendship, as to that of Rutherford B. Hayes, McKinley owed much in his earlier years in Congress. He was prominent in the debate which resulted in the defeat of the Democratic Morrison tariff bill in 1884, and in the defeat of the Mills bill for the revision of the tariff in 1887–1888. In 1889 he became chairman of the ways and means committee and Republican leader in the House of Representatives, after having been defeated by Thomas B. Reed for speaker of the House. On April 16, 1890, he introduced the tariff measure known commonly as the McKinley bill, which passed the House in May, passed the Senate in September, and was approved by the president on Oct. 1, 1890. The McKinley bill reduced revenues by its high and in many cases almost prohibitive duties; it attempted to protect many "infant" industries such as the manufacture of tin-plate; under its provision for reciprocal trade agreements (a favourite project of James G. Blaine) reciprocity treaties were made with Germany, France, Italy and Belgium. Abroad there was bitter opposition to it and reprisals were threatened by several European States. In the United States the McKinley tariff bill was one of the main causes of the Democratic victory in the Congressional elections of 1890, in which McKinley himself was defeated. In 1891 he was elected governor of Ohio, and in 1893 was re-elected, so gaining experience in executive as distinguished from legislative work.

McKinley had been prominent in national politics even before the passage of the tariff measure bearing his name. In 1888 in the national Republican convention in Chicago he was chairman of the platform committee and was leader of the delegation from Ohio, which had been instructed for John Sherman; after James G. Blaine withdrew his name there was a movement to nominate McKinley, but he passionately refused to be a candidate, considering that his acquiescence would be a breach of faith toward Sherman. In 1892 McKinley was the permanent president of the national Republican convention which met in Minneapolis and which renominated Benjamin Harrison on the first ballot, on which James G. Blaine received $182\frac{5}{6}$ votes, and McKinley, 182 votes. In 1896 he seemed for many reasons the most "available" candidate of his party for the presidency: he had no personal enemies in the party; he had carried the crucial state of Ohio by a large majority in 1893; his attitude on the coinage question had never been so pronounced as to make him unpopular either with the radical silver wing or with the conservative "gold-standard" members of the party. The campaign for his nomination was conducted with great adroitness by his friend, Marcus A. Hanna, and in the national Republican convention held in St. Louis in June he was nominated for the presidency on the first ballot. The convention adopted a tariff plank drafted by McKinley, and, of far greater immediate importance, a plank, which declared that the Republican Party was "opposed to the free coinage of silver, except by international agreement with the leading commercial nations of the world, which we pledge ourselves to promote, and until such agreement can be obtained the existing gold standard must be preserved." This "gold standard" plank drove out of the Republican Party the Silver Republicans of the West, headed by Senator Henry M. Teller of Colorado.

The national Democratic convention declared for the immediate opening of the mints to the free and unlimited coinage of silver at the ratio with gold of 16 to 1; and it nominated for the presidency William Jennings Bryan of Nebraska. There was a secession from the Democratic Party of conservatives who called themselves the National Democratic Party, who were commonly called Gold Democrats, and who nominated John M. Palmer (1817–1900) of Illinois for president. In this re-alignment of parties McKinley, who had expected to make the campaign on the issue of a high protective tariff, was diverted to the defence of the gold standard as the main issue. The campaign was enthusiastic: the Republican candidate was called the "advance agent of prosperity"; "Bill McKinley and the McKinley Bill" became a campaign cry; the panic of 1893 was charged to the repeal of the McKinley tariff measure; and "business men" throughout the states were enlisted in the cause of "sound money" to support McKinley, who was elected in November by a popular vote of 7,106,779 to 6,502,925 for Bryan, and by an electoral vote of 271 to 176. (*See* UNITED STATES: *History*.) Following his inauguration the president summoned Congress to assemble in an extra session. His message urged revision of the tariff and revenue, and the Dingley tariff bill was accordingly passed through both houses, and was approved by the president on July 24.

The ensuing regular session of Congress was occupied chiefly with the situation in Cuba. President McKinley showed himself singularly patient and self-controlled in the midst of the popular clamour for intervention by the United States in behalf of the Cubans; but finally, on March 23, 1898, he presented an ultimatum to the Spanish government, and on April 25, on his recommendation, Congress declared war upon Spain. During the war itself he devoted himself with great energy to the mastery of military details; but there was bitter criticism of the war department resulting in the resignation of the secretary of war, Russell A. Alger (*q.v.*). The peace treaty, signed at Paris, Dec. 10, was ratified by the United States Senate on Feb. 6, 1899; and in accordance with its terms Porto Rico, the Philippine archipelago, and Guam were transferred by Spain to the United States, and Cuba came under American jurisdiction pending the establishment there of an independent government. Two days before the ratification of the peace treaty, a conflict took place between armed Filipinos under the leadership of Emilio Aguinaldo and the American forces that were in possession of Manila. The warfare waged by these Filipinos against the United States, while having for the most part a desultory and guerrilla character, was of a very protracted and troublesome nature. Sovereignty over the Filipinos having been accepted by virtue of the ratification of the Paris treaty, President McKinley was not at liberty to do otherwise than assert the authority of the United States and use every endeavour to suppress the insurrection. But there was bitter protest against this "imperialism," both within the party by such men as George F. Hoar, Eugene Hale, Thomas B. Reed and Carl Schurz, and from the leaders of the Democratic Party. In the foreign relations of the United States, as directed by President McKinley, the most significant change was the cordial understanding established with the British Government. Other important foreign events during McKinley's administration were: the annexation of the Hawaiian islands (*see* HAWAII) in August 1898, and the formation of the Territory of Hawaii in April 1900; the cessation in 1899 of the tripartite (German, British and French) government of the Samoan islands, and the annexation by the United States of those of the islands east of 171°, including the harbour of Pago-Pago; the participation of American troops in the march of the allies on Pekin in August 1900, and the part played by McKinley's secretary of state, John Hay, in securing a guarantee of the integrity of the Chinese empire. In 1900 McKinley was unanimously renominated by the national Republican convention which met in Philadelphia in June, and which nominated Theodore Roosevelt, governor of New York, for the vice-presidency. The Republican convention demanded the maintenance of the gold standard, and pointed to the exceptional prosperity of the country resulting from the fulfilment of some of the most important of the pledges given by the Republican Party four years earlier. However, the tendency towards the concentration of capital in great industrial corporations had been active to an extent previously undreamt of, with incidental consequences that had aroused much apprehension; and the Democrats accused President McKinley and the Republican Party of having fostered the "trusts." But the campaign against McKinley and the Republican Party was not only "anti-trust" but "anti-imperialistic." William Jennings Bryan, renominated by the Democratic Party on a free silver platform, declared that imperialism was the "paramount issue" and made a second vigorous campaign. As the result of the polling in November, 292 Republican presidential electors and 155 Democratic electors were chosen. The Republican popular vote was 7,207,923, and the Democratic 6,358,133.

In the term of Congress immediately following the presidential election arrangements were perfected for the termination of the American military occupation of Cuba and the inauguration of a Cuban republic. In the Philippines advanced steps had been taken in the substitution of civil government for military occupation, and a governor-general, Judge William H. Taft, had been appointed and sent to Manila. Prosperity at home was great, and foreign relations were free from complications. After an arduous term, the president had reached a period that promised to give him comparative repose and freedom from care. In these circumstances, President McKinley, accompanied by the greater part of his cabinet, set forth in the early summer on a tour to visit the Pacific coast. The route chosen was through the Southern states, where many stops were made, and where the president delivered brief addresses. The heartiness of the welcome accorded him seemed to mark the disappearance of the sectional feeling that had survived the Civil War. After his return he visited the city of Buffalo, New York, in order to attend the Pan-American exposition and deliver a public address. This address (Sept. 5, 1901) was a public utterance designed by McKinley to affect American opinion and public policy, and apparently to show that he had modified his views upon the tariff. It declared that henceforth the progress of the nations must be through harmony and co-operation and it maintained that the time had come for wide-reaching modifications in the tariff policy of the United States through commercial reciprocity arrangements with various nations. On the following day, Sept. 6, 1901, a great reception was held for President McKinley in one of the public buildings of the exposition. Advantage of this opportunity was taken by a young man of Polish parentage, by name Leon Czolgosz, to shoot at the president with a revolver at close range. One of the two bullets fired penetrated the abdomen. After the world had been assured that the patient was doing well and would recover, he collapsed and died on the 14th. The assassin, who professed to hold the views of that branch of anarchists who believe in the assassination of rulers, was promptly seized, convicted and executed. McKinley's funeral took place at Canton, O., on Sept. 19, the occasion being remarkable for the public manifestations of mourning.

Though he had not the personal magnetism of James G. Blaine, whom he succeeded as a leader of the Republican Party, McKinley had great personal suavity and dignity, and was thoroughly well liked by his party colleagues. As a politician he was always more the people's representative than their leader, and that he "kept his ear to the ground" was the source of much of his power and at the same time was his greatest weakness. His apparently inconsistent record on the coinage question becomes consistent if considered in the same way, as the expression of the gradually changing views of his constituency. He was an able but far from brilliant campaign speaker. His greatest administrative gift was a fine intuition in choosing men to serve him. His *Speeches and Addresses* were printed in 2 vols. (1893 and 1901).

Dennis, *Adventures in American Diplomacy*, 1896–1906 (1928).

McKINLEY, MOUNT, a peak of the Alaska range in south-central Alaska in lat. 63° 63′ 56·8″ N. and long. 151° 00′ 41″ W. It is the culminating point of North America (20,300 ft. above sea-level) and rises higher above the surrounding country than any other mountain in the world. Its crest gives rise to numerous glaciers of gigantic size, and it is claimed that the entire surface, above 19,000 ft., is a field of snow and ice. Under favourable conditions, its summit affords a panorama of an area over 200 m. in diameter. The mountain was named in 1896 by W. A. Dickey in honour of William McKinley and its apex was first attained on June 7, 1913 by Hudson Stuck, H. P. Karstens, Robert Tatum and a half-breed boy named Walter Harper, in an expedition of three months' duration. The previous year Browne, Parker and LeVoy were driven back by a fierce blizzard when just short of the summit. The North peak, some 20,000 ft. in elevation, was ascended in 1910 by Pete Anderson and Billy Taylor, Alaskan prospectors of the Lloyd expedition. The Mt. McKinley national park was created on Feb. 26, 1917, with an area as changed on Mar. 19, 1932, of 3,030 sq.mi.

See A. H. Brooks, *The Mt. McKinley Region, Alaska* (1911), which is professional paper No. 70 of the U.S. Geological Survey; Hudson Stuck, *The Ascent of Denali* (1914); and E. S. Balch, *Mount McKinley and Mountain Climber's Proofs* (1914).

McKINNEY, a city of northeastern Texas, U.S.A., on Federal highway 75, 32 mi. N. by E. of Dallas; the county seat of Collin county. It is served by the Texas Electric railway and the Southern Pacific lines. The population was 7,307 in 1930 (8% Negroes) and was 8,555 in 1940 by the federal census. It has a large trade in purebred livestock, cotton, grain, onions, alfalfa hay and other agricultural products; also cotton textiles, dairy products and cotton-seed products. Since 1915 the city has had government by commission. It owes its name to Collin McKinney, a land surveyor and pioneer settler, one of the 56 signers of the Texas Declaration of Independence. McKinney was founded in 1844, became the county seat in 1848, and was chartered as a city in 1874.

MACKINTOSH, SIR JAMES (1765–1832), Scottish publicist, was born at Aldourie on Oct. 24, 1765, and was educated at Aberdeen and at Edinburgh, where he took his degree in medicine in 1787. In 1788 he removed to London, and becoming interested in politics, in 1791 published his *Vindiciae Gallicae,* a reply to Burke's *Reflections on the French Revolution.* It was the only worthy answer to Burke that appeared, and won him a European reputation and many friends, including Burke himself. Its success finally led him to take up the legal profession. He was called to the bar in 1795. In 1797 his wife died, and next year he married Catherine Allen, sister-in-law of Josiah and John Wedgwood, through whom he introduced Coleridge to the *Morning Post.*

His greatest legal successes were his lectures (1799) at Lincoln's Inn on the law of nature and nations, and his defence (1803) of Jean Gabriel Peltier, a French refugee, tried at the instance of the French government for a libel against the first consul. In 1803 he was knighted, and received the post of recorder at Bombay, but he returned to England in 1812. He entered parliament in the Whig interest as member for Nairn, and he sat for that county, and afterwards for Knaresborough, till his death. He opposed the reactionary measures of the Tory government, supported and afterwards succeeded Romilly in his efforts for reforming the criminal code, and took a leading part both in Catholic emancipation and in the Reform Bill. From 1818 to 1824 he was professor of law and general politics in the East India Company's College at Haileybury. His *Dissertation on the Progress of Ethical Philosophy,* prefixed to the 7th edition of the *Encyclopædia Britannica,* and published in 1831, was severely attacked in 1835 by James Mill in his *Fragment on Mackintosh.* About the same time he wrote for the *Cabinet Cyclopaedia* a "History of England from the Earliest Times to the Final Establishment of the Reformation." His more elaborate *History of the Revolution* was published after his death. Already a privy councillor, Mackintosh was appointed commissioner for the affairs of India under the Whig administration of 1830. He died on May 30, 1832.

The *History of the Revolution in England,* breaking off where William of Orange is about to intervene, is chiefly interesting because of Macaulay's essay on it and its author.

A *Life,* by his son R. J. Mackintosh, was published in 1836.

MACKLIN, CHARLES (1697?–1797), Irish actor and playwright, whose real name was McLaughlin, had an adventurous youth before coming to Bristol, where he made his first appearance as Richmond in *Richard III.* At the end of 1753 Macklin bade farewell to the stage to open a tavern, near the theatre, where he personally supervised the serving of dinner. The tavern failed and Macklin returned to the stage, and played for a number of years in London and Dublin. His quick temper got him into constant trouble. In a foolish quarrel over a wig in 1735 he killed a fellow actor in the green-room at Drury Lane, and he was constantly at law over his various contracts and quarrels. The bitterest of these arose on account of his appearing as Macbeth at Covent Garden in 1772, when the audience demanded William Smith in the part. A few nights later the audience refused to hear Macklin as Shylock, and Macklin was discharged in order to avoid a riot. The courts awarded the actor £600 and costs, but Macklin magnanimously elected instead that the defendants should take £100 in tickets at three benefits—for himself, his daughter and the management. He died on July 11, 1797, and his last years were provided for by a subscription edition of two of his best plays, *The Man of the World* and *Love in a Maze.* His wife, dying about 1758, was an excellent actress.

See Edward A. Parry, *Charles Macklin* (1891).

MACK VON LEIBERICH, KARL, Freiherr (1752–1828), Austrian soldier, was born at Nenslingen, Bavaria, on Aug. 25, 1752. In 1770 he joined an Austrian cavalry regiment, becoming an officer seven years later. During the brief war of the Bavarian Succession he served on the staff of Count Kinsky, and subsequently under the commander-in-chief Field Marshal Count Lacy. He was promoted first lieutenant in 1778, and captain on the quartermaster-general's staff in 1783. In 1785 Mack married Katherine Gabrieul, and was ennobled under the name of Mack von Leiberich. In the Turkish war he was employed on the headquarters staff, becoming in 1788 major and personal aide-de-camp to the emperor, and in 1789 lieutenant-colonel. He distinguished himself greatly in the storming of Belgrade. Shortly after this, disagreements between Mack and Loudon, led to the former's demanding a court-martial and leaving the front. He was, however, given a colonelcy (1789) and the order of Maria Theresa, and in 1790 Loudon and Mack, having become reconciled, were again on the field together. During these campaigns Mack received a severe injury to his head, from which he never fully recovered. In 1793 he was made quartermaster-general (chief of staff) to Prince Josias of Saxe-Coburg, commanding in the Netherlands. He enhanced his reputation by the ensuing campaign, receiving a wound at Famars. In 1797 he was promoted lieutenant field marshal, and in 1798 accepted command of the Neapolitan army. Forced to take refuge from his own men, he escaped to the French camp, and was sent to Paris, whence he escaped in disguise two years later. He was not employed for some years, but in 1804 was made quartermaster-general of the army, with instructions to prepare for a war with France. He attempted hastily to reform the army, and in 1805 became the real commander (under titular commander-in-chief Archduke Ferdinand) of the army which opposed Napoleon in Bavaria, but his position was ill-defined and his authority treated with slight respect by his colleagues. (*See* Napoleonic Campaigns.)

See Schweigerd, *Oesterreichs Helden* (Vienna, 1854); Würzbach, *Biogr. Lexikon d. Kaiserthums Oesterr.* (Vienna, 1867); Ritter von Rittersberg, *Biogr. d. ausgezeichneten Feldherren d. oest. Armee* (Prague, 1828); Raumer's *Hist. Taschenbuch* (1873) defends Mack.

McLANE, LOUIS (1786–1857), American lawyer, business executive, political leader and diplomat, was descended from Scottish grandparents of the Isle of Man who had moved to Philadelphia in 1731. His immediate family had settled in the three lower counties of Delaware, where Allan McLane, his father, had entered business with Robert Morris in 1773. He began the practice of law in 1807, served in Congress, 1817–27, and in the Senate, 1827–29. He first inclined toward Federalism, but by

1823 he had formed with Martin Van Buren a group of William H. Crawford Democrats and later supported Andrew Jackson when Crawford's ill-health forced him out of politics. As an able representative of the Middle Atlantic States free-trader exporting and carrying-trade interests, he was well qualified to negotiate for the opening of the British West Indian trade, which was the main business of the London post under the new Jackson Administration. His appointment was the signal for a great protectionist outcry against the "Wilmington conspiracy" to bargain away the advantages of the tariff of 1828. The Government allowed him to follow his own course in the negotiations, with the result that within ten months after he had presented his credentials, an agreement was reached which ended an irritation of nearly 50 years. The cabinet, as the British were privately informed, favoured a reduction of the American tariff; but this was not secured until the southern free-traders organized the nullification movement and brought about the adoption of the Compromise tariff of 1833, which McLane, who had returned in the meantime to the United States as secretary of the treasury, had influenced by formulating the administration tariff proposals. Then came a turning-point in his career. He refused to join Van Buren in approving Jackson's proposal to remove deposits from the bank without the authority of Congress and was transferred to the Department of State. He resigned the next year, 1834, breaking with Van Buren. From 1834–37 he was president of the Morris Canal and Banking Company (New York), and from 1837–47 president of the Baltimore and Ohio Railroad. In 1845, when the Democrats returned to office without Van Buren and when Anglo-American relations were strained over the Oregon question, McLane accepted from President Polk an appointment to return to England "upon condition that if he could induce the British Government to reconsider the rejection of the offer of '49 he, the President, would consult the Senate as to the propriety of accepting this compromise." Whatever may have been McLane's real influence upon Lord Aberdeen, he had the satisfaction of seeing another great difference between the two countries "amicably" settled, and this time in conjunction with the triumph of free trade—the repeal of the British Corn Laws and the substitution of the low Walker tariff of 1846 for the high Whig tariff of 1842.

Bibliography.—There is no biography of Louis McLane, but *see* R. M. McLane's *Reminiscences, 1827–97;* Fitzpatrick (ed.), *Autobiography of Martin Van Buren;* Bassett (ed.), *The Andrew Jackson Papers;* Quaife (ed.), *Polk's Diary; The Aberdeen Papers* (ms.); *The Peel Papers* (ms.); *The C. R. Vaughan Papers* (ms.); and Benns, *The American Struggle for the British West India Carrying Trade.*

MACLAREN, CHARLES (1782–1866), Scottish editor, was born at Ormiston, Haddingtonshire, on Oct. 7, 1782, the son of a farmer and cattle-dealer. He was almost entirely self-educated, and became a clerk in Edinburgh. In 1817 he established the *Scotsman* newspaper in Edinburgh and at first acted as its editor. Offered a post as clerk in the custom house, he resigned his editorial position, resuming it again from 1820 to 1845. He was editor of the 6th edition of the *Encyclopædia Britannica* in 1820. From 1864–66 he was president of the Geological Society of Edinburgh, where he died on Sept. 10, 1866.

MACLAURIN, COLIN (1698–1746), Scottish mathematician, was the son of a clergyman, and born at Kilmodan, Argyllshire. He was educated at the University of Glasgow.

At nineteen he was elected professor of mathematics in Marischal college, Aberdeen, two years later he was admitted F.R.S. and made the acquaintance of Sir Isaac Newton. In 1719 he published his *Geometria organica, sive descriptio linearum curvarum universalis.* In it Maclaurin developed several theorems due to Newton, and introduced the method of generating conics which bears his name, and showed that many curves of the third and fourth degrees can be described by the intersection of two movable angles. In 1721 he wrote a supplement to the *Geometria organica,* which he afterwards published, with extensions, in the *Philosophical Transactions* for 1735. This paper is principally based on the following general theorem, which is a remarkable extension of Pascal's hexagram: "If a polygon move so that each of its sides passes through a fixed point, and if all its summits except one describe curves of the degrees m, n, p, etc., respectively, then the free summit moves on a curve of the degree $2mnp$ . . . which reduces to mnp . . . when the fixed points all lie on a right line." In 1722 Maclaurin travelled as tutor and companion to the eldest son of Lord Polwarth, and after a short stay in Paris resided for some time in Lorraine, where he wrote an essay on the percussion of bodies, which obtained the prize of the French Academy of Sciences for the year 1724. In 1725 he was made professor of mathematics in the university of Edinburgh on the recommendation of Newton.

In 1740 Maclaurin divided with Leonhard Euler and Daniel Bernoulli the prize offered by the French Academy of Sciences for an essay on tides. His *Treatise on Fluxions* (1742), written in reply to George Berkeley contains his essay on the tides. In this he showed that figures of equilibrium for a homogeneous rotating fluid mass are the ellipsoids of revolution, now known as Maclaurin's ellipsoids. Maclaurin was the first to introduce into mechanics, in this discussion, the important conception of *level surfaces.* He also gave in his *Fluxions,* for the first time, the correct theory for distinguishing between maxima and minima in general, and pointed out the importance of the distinction in the theory of the multiple points of curves. As a result of Maclaurin's suggestion, the newly formed (1731) Medical Society of Edinburgh was enlarged into the Philosophical Society (1739), and later (in 1783) into the Royal Society of Edinburgh. Of Newton's British successors, Maclaurin alone ranked equal with continental mathematicians of his day.

In 1745, when the rebels were marching on Edinburgh, Maclaurin took a prominent part in preparing trenches and barricades for its defence. As soon as the rebel army got possession of Edinburgh Maclaurin fled to England, to avoid making submission to the Pretender. He died on June 14, 1746, at Edinburgh.

After Maclaurin's death his *Account of Newton's philosophical discoveries* was published by Patrick Murdoch, and also his *Algebra* in 1748. As an appendix to the latter appeared his *De linearum geometricarum proprietatibus generalibus tractatus,* an elegant treatise.

MACLAURIN'S THEOREM: *see* Taylor's Theorem.

MACLEAN, SIR DONALD (1864–1932), British politician, the eldest son of John Maclean of Kilmoluag, Tiree, Scotland, was admitted a solicitor in 1887. After three unsuccessful contests, he entered the House of Commons in 1906 as Liberal member for Bath. He failed to hold his seat at the general election of Jan. 1910, but in December of that year he was elected for Peebles and Selkirk, which he represented until 1918. He was member for Peebles and South Midlothian from 1918 to 1922, when he lost his seat. In the absence of Asquith from the House of Commons, he became chairman of the Parliamentary Liberal party (1919–22). He was deputy chairman, House of Commons, 1911–18, and chairman of the London Appeal Tribunal, 1916–18. During the World War he was chairman of the Enemy Debt treasury commission and of the House of Commons military appeal tribunal. He was sworn of the privy council in 1916, and created K.B.E. in 1917. He died June 15, 1932.

McLEAN, JOHN (1785–1861), American jurist, was born in Morris county, N.J., on March 11, 1785. His father, a farmer, removed to Virginia in 1789, later to Kentucky and finally to Ohio. The boy's schooling was irregular, but he went to Cincinnati to study law in the office of Arthur St. Clair, and in 1807 was admitted to the bar. In 1812 he was elected U.S. representative from the district which included Cincinnati, and in 1814 was re-elected. In 1816 he was appointed a judge in the supreme court of Ohio, which position he resigned in 1822 to become commissioner of the General Land Office under President Monroe. Monroe in 1823 appointed him postmaster-general, in which office he continued throughout the administrations of John Quincy Adams. His conduct of this office was notable for its efficiency and economy, and for the strict non-partisan treatment of postmasters and other employees. President Jackson continued McLean in office, but McLean refused to accept the president's views on patronage, and resigned. Jackson thereupon appointed him an associate justice of the Supreme Court, which position he held from 1830 until his death in 1861. His career on the bench was long and distinguished, his most famous decision, perhaps, being the dissenting opinion in the Dred Scott case. In 1848 he was considered as a presidential candidate at the Free Soil convention in Buffalo, and in 1856 he was the chief opponent of J. C. Frémont at the first Republican convention, receiving 196 votes. He received a number of votes in the Chicago convention which nominated Lincoln. His death occurred at Cincinnati on April 4, 1861.

MACLEOD (mąk-lowd′), **HENRY DUNNING** (1821–1902), Scottish economist, was born in Edinburgh, and educated at Eton, Edinburgh University, and Trinity College, Cambridge, graduating in 1843. He travelled in Europe, and in 1849 was called to the English bar. He was employed in Scotland on the work of poor-law reform, and devoted himself to the study of economics. Between 1868 and 1870 he was employed by the government in codifying the law of bills of exchange. He died on July 16, 1902. He was the first British economist to elucidate the real nature of credit, the rôle of the banks in the creation of credit, and the effect of the discount rate on the volume of bank loans.

His most important works are: *Theory and Practice of Banking* (1858); *Elements of Political Economy* (1858); *Dictionary of Political Economy* (1863), 1st vol. and *Principles of Economist Philosophy* (1873).

MACLEOD, JOHN JAMES RICKARD (1876–1935), British physiologist, was born on Sept 6, 1876, near Dunkeld, Scotland, and was educated at Aberdeen grammar school, Marischal college, Aberdeen, and Leipzig university. From 1899 to 1902 he was demonstrator in physiology and then lecturer in biochemistry at the London Hospital, holding also from 1901–03 the Mackinnon research scholarship of the Royal Society; and from 1903 to 1918 he was professor of physiology at the Western reserve university, Cleveland (Ohio), subsequently becoming professor of physiology, director of the physiological laboratory and associate dean of the Faculty of Medicine in the University of Toronto in Canada. His most important work was on the nature of the control of the metabolism of carbo-hydrates in the animal body, and, together with Dr. Banting, with whom he shared the Nobel prize for medicine in 1923, he achieved fame as one of the discoverers of insulin (*q.v.*). He was elected F. R. S. in 1923, and received the Cameron prize of Edinburgh university. He was president of the Royal Canadian Institute in 1925. (*See* PHYSIOLOGY).

His publications include *Practical Physiology* (1903); *Recent Advances in Physiology,* edited by Leonard Hill (1905); *Diabetes, its Physiological Pathology* (1913); *Fundamentals of Physiology* (1916); *Physiology and Biochemistry in Modern Medicine* (5th ed. 1926), and numerous papers on insulin, etc., published in *The Journal of Physiology* and *The American Journal of Physiology.*

MACLEOD, NORMAN (1812–1872), Scottish divine, son of Rev. Norman Macleod (1783–1862), and grandson of Rev. Norman Macleod, minister of Morven, Argyllshire, was born at Campbeltown on June 3, 1812. In 1827 he became a student at Glasgow university, and in 1831 went to Edinburgh to study divinity under Dr. Thomas Chalmers. On March 18, 1838, he became parish minister at Loudoun, Ayrshire. At this time the troubles in the Scottish Church were already gathering to a head. (*See* FREE CHURCH OF SCOTLAND.) Macleod took a middle course in the non-intrusion controversy, holding that the fitness of those who were presented to parishes should be judged by the presbyteries—the principle of Lord Aberdeen's Bill. On the secession of 1843 he became pastor of Dalkeith. He was one of the founders of the Evangelical Alliance, and from 1849 edited the *Christian Instructor* (Edinburgh). In 1851 he was called to the Barony church, Glasgow, where he remained until his death (June 16, 1872). Macleod instituted temperance refreshment rooms, a congregational penny savings bank, and held services specially for the poor. In 1860 he was appointed editor of the new monthly magazine *Good Words,* to which he was a large contributor. By far his best work was the spontaneous and delightful *Reminiscences of a Highland Parish* (1867). Macleod was moderator of the church assembly in 1869. In recognition of his wide sympathy and high ideals, Queen Victoria gave two memorial windows to Crathie Church.

See *Memoir of Norman Macleod,* by his brother, Donald Macleod (1876).

MACLISE, DANIEL (1806–1870), Irish painter, was born at Cork, the son of a Highland soldier. For two years he worked in a bank before going to study in the Cork school of art. In 1825 he happened to see Sir Walter Scott, who was travelling in Ireland, in a bookseller's shop, and he made a surreptitious sketch of the great man, which he afterwards lithographed. The sketch was exceedingly popular, and the artist received many commissions for portraits. He refused to accept help for the purpose of study but, by economy, saved enough to enable him to leave for London. There he made a lucky hit by a sketch of the younger Kean, which, like his portrait of Scott, was lithographed and published. He entered the Academy schools in 1828, and carried off the highest honours. In 1829 he exhibited for the first time in the Royal Academy. Later he painted chiefly subject and historical pictures, with occasional portraits. In 1835 the "Chivalric Vow of the Ladies and the Peacock" procured his election as associate of the Academy, of which he became full member in 1840.

He designed the illustrations for several of Dickens's Christmas books, and between 1830 and 1836 contributed to *Fraser's Magazine,* under the pseudonym of Alfred Croquis, a remarkable series of portraits of the literary and other celebrities of the time, afterwards published as the *Maclise Portrait Gallery* (1871). In 1858 Maclise commenced work on the "Meeting of Wellington and Blücher," on the walls of Westminster Palace. It was begun in fresco, a process which proved unmanageable. Maclise then studied in Berlin the new method of "water-glass" painting, and carried out the subject and its companion, the "Death of Nelson," in that medium. He died on April 25, 1870.

A memoir of Maclise, by his friend W. J. O'Driscoll, was published in 1871.

MACLURE, WILLIAM (1763–1840), American geologist, was born at Ayr in Scotland in 1763. Maclure has become known as the father of American geology, because of his publication of a geological map of America in 1809 which, with the exception of Guettard's mineralogical *Map of Louisiana and Canada,* was the earliest attempt at a geological map of America, and antedates William Smith's geological map of England by six years. The map, together with a memoir entitled *Observations on the Geology of the United States Explanatory of a Geological Map* was the result of his voluntary and unaided labours.

Maclure was a liberal patron of science for many years, and from 1817 was president of the Philadelphia Academy of Natural Science to which institution he subsequently donated his valuable private library and about $20,000 in money. He died at San Angel, Mexico, in 1840.

A complete bibl. is in the *Bulletin of the Geol. Soc. of America,* vol. 10 (1898). *See* S. G. Morton, "Memoir of William Maclure," *Amer. Journ. of Sci.,* vol. xlvii. (1844), p. 1; George P. Merrill, *First Hundred Years of American Geology,* pp. 31–37 (1924); and the *Bulletin of the Geol. Soc. of Amer.,* vol. x., p. 83 (1899).

M'MAHON, SIR ARTHUR HENRY (1862–), K.C. I.E. (1906), G.C.M.G. (1916), British soldier and administrator, was born on Nov. 28, 1862, the son of General C. A. M'Mahon, F.R.S. He was educated at Haileybury and entered Sandhurst. In 1883 he joined the army, and later, having joined the Indian political department, was in 1901 appointed revenue and judicial commissioner in Baluchistan. After holding several administrative posts, he was from 1911 to 1914 foreign secretary to the Government of India. In 1913–14 he was British Plenipotentiary for the treaty regarding Tibet, between England, China and Tibet. In 1914 he became first high commissioner for Egypt under the British protectorate. In 1919 he was British commissioner on the Middle East International Commission (Peace Conference).

MacMAHON, MARIE EDMÉ PATRICE MAURICE DE, duke of Magenta (1808–1893), French marshal and president of the French republic, was born on July 13, 1808, at the château of Sully, near Autun. He was descended from an Irish family which went into exile with James II. Educated at the military school of St. Cyr, in 1827 he entered the army, and served in the first French campaign in Algeria. He gained distinction in the expedition to Antwerp in 1832. In 1833 he returned to Algeria. He led daring cavalry raids across plains infested with Bedouin, and distinguished himself at the siege of Constantine in 1837. He was almost constantly in Algeria until 1854. MacMahon commanded a division in the Crimean War, and in September 1855 he conducted the assault upon the Malakoff works, which led to the fall of Sevastopol. Declining the highest command in France, he was once more sent out, at his own request, to Algeria, where he completely defeated the Kabyles. After his return to France he voted as a senator against the unconstitutional law for general safety, brought forward in consequence of Orsini's abortive attempt on the emperor's life. MacMahon distinguished himself in the Italian campaign of 1859. Partly by good luck and partly by pushing forward without orders at a critical moment at the battle of Magenta, he secured victory. For this MacMahon received his marshal's baton and was created duke of Magenta. In 1861 he represented France at the coronation of William I. of Prussia, and in 1864 he was nominated governor-general of Algeria. MacMahon's administration was unsuccessful and when the ill-fated Ollivier cabinet was formed, the emperor abandoned his Algerian schemes and MacMahon was recalled.

In 1870 MacMahon was appointed to the command of the Alsace army detachment (*see* FRANCO-GERMAN WAR). On Aug. 6, MacMahon fought the battle of Wörth (*q.v.*). He was compelled to fall back upon Saverne, and thence to Toul. The emperor then gave him supreme command of the new levies which he was mustering at Châlons, and he was directed to effect a junction with Bazaine. This operation he undertook against his will. He had an army of 120,000 men, with 324 guns; but large numbers of the troops were disorganized and demoralized. Early on Sept. 1, the decisive battle of Sedan began. MacMahon was dangerously wounded in the thigh, whereupon General Ducrot, and soon afterwards General de Wimpffen, took command. MacMahon shared the captivity of his comrades, and was interned at Wiesbaden.

In March 1871 MacMahon was appointed by Thiers commander-in-chief of the army of Versailles; in that capacity he suppressed the Communist insurrection, and successfully conducted the second siege of Paris. On the resignation of Thiers on May 24, 1873, MacMahon was elected president of the Republic by an almost unanimous vote. On Nov. 5, 1873, General Changarnier presented a motion in the Assembly to confirm MacMahon's powers for a period of ten years, and to provide for a commission of thirty to draw up a form of constitutional law. The president consented, but in a message to the Assembly he declared in favour of a confirmation of his own powers for seven years, and expressed his determination to use all his influence in the maintenance of Conservative principles. After prolonged debates the Septennate was adopted on Nov. 19 by 378 votes to 310. There was no *coup d'état* in favour of "Henri V.," as had been expected, and the president resolved to abide by "existing institutions." One of his earliest acts was to receive the finding of the court-martial upon his old comrade in arms, Marshal Bazaine, whose death sentence he commuted to one of twenty years' imprisonment in a fortress.

The president was popular in the rural districts of France, but in Paris and other large cities the Republican party were alienated by press prosecutions and the attempted suppression of Republican ideas. Matters were at a comparative deadlock in the National Assembly, until the accession of some Orleanists to the Moderate Republican party in 1875 made it possible to pass various constitutional laws. In May 1877 the constitutional crisis became acute. A peremptory letter of censure from MacMahon to Jules Simon caused the resignation of the ministry. The duc de Broglie formed a cabinet, but Gambetta carried a resolution in the Chamber of Deputies in favour of parliamentary government. The president declined to yield, and being supported by the Senate, he dissolved the Chamber, by decree, on June 25. The prosecution of Gambetta followed for a speech at Lille, in which he had said, "the marshal must, if the elections be against him, *se soumettre ou se démettre*." In a manifesto respecting the elections, the president declared: "I cannot obey the injunctions of the demagogy; I can neither become the instrument of Radicalism nor abandon the post in which the constitution has placed me."

But the elections in October resulted in the return of 335 Republicans and only 198 anti-Republicans, the latter including 30 MacMahonists, 89 Bonapartists, 41 Legitimists, and 38 Orleanists. As a last resort the president called to power an extra-parliamentary cabinet under General Rochebouet, but the Republican majority refused to vote supplies, and after a brief interval MacMahon had to accept a new Republican ministry under Dufaure. The prolonged crisis terminated on Dec. 14, 1877, and no further constitutional difficulties arose in 1878. But as the senatorial elections, held early in 1879, gave the Republicans an effective working majority in the Upper Chamber, they now called for the removal of the most conspicuous anti-Republicans among the generals and officials. MacMahon resigned the presidency on Jan. 30, 1879, and Jules Grévy was elected as his successor.

MacMahon now retired into private life. He died at Paris on Oct. 17, 1893. A fine, tall, soldierly man, of a thoroughly Irish type, in private life MacMahon was universally esteemed as generous and honourable; as a soldier he was brave and able, without decided military genius; as a politician he was patriotic and well-intentioned, but with no real statecraft.

See Grandin, *Le Maréchal MacMahon* (2 vols., 1893); G. Hanotaux, *La France contemporaine* (vol. 2, 1905).

MACMANUS, TERENCE BELLEW (1823–1860), Irish rebel, was born at Tempo, Fermanagh. He joined the '82 Club in 1844, took part in the W. S. O'Brien outbreak of 1848, and was arrested in Cork and sentenced to death. The sentence was transmuted to transportation to Tasmania. MacManus escaped to America. He died in San Francisco in 1860. His body was brought back to Ireland and the interment at Glasnevin was the occasion of a great Fenian demonstration.

McMASTER, JOHN BACH (1852–1932), American historian, was born in Brooklyn, N.Y., on June 29, 1852. He graduated from the College of the City of New York in 1872, worked as civil engineer in 1873–77, was instructor in civil engineering at Princeton university in 1877–83, and from 1883 until 1920 was professor of American history in the University of Pennsylvania. His earliest writings were on engineering subjects; but he is best known for his *History of the People of the United States, from the Revolution to the Civil War* (1883–1913), a work which was a pioneer in the task of interpreting the American nation to itself and in the use of social rather than purely political materials. It was supplemented by *A History of the People of the United States during Lincoln's Administration* (1927). Among McMaster's other books are *With the Fathers* (1896); *A Brief History of the United States* (1907, rev. enl. ed. 1918 and 1924); and *The Life and Times of Stephen Girard, Mariner and Merchant* (1918). McMaster died May 22, 1932.

MACMILLAN, the name of a family of English publishers. The founders of the firm were two Scotsmen, Daniel Macmillan (1813–57) and his younger brother Alexander (1818–96). Daniel was a native of the Isle of Arran, and Alexander was born in Irvine on Oct. 3, 1818. Daniel was for some time assistant to the bookseller Johnson at Cambridge, but entered the employ of Messrs. Seeley in London in 1837; in 1843 he began business in Aldersgate street, and in the same year the two brothers purchased the business of Newby in Cambridge. They began to publish educational works in 1844. In 1845 they became the proprietors of the more important business of Stevenson, in Cambridge, the firm being styled Macmillan, Barclay and Macmillan. In 1850 Barclay retired and the firm resumed the name of Macmillan and Co. Daniel Macmillan died at Cambridge on June 27, 1857. In that year an impetus was given to the business by the publication of Kingsley's *Two Years Ago.* A branch office was opened in 1858 in Henrietta street, London, and in 1897 the buildings in St. Martin's street were opened. Alexander Macmillan died in Jan. 1896. In little over half a century he had built up one of the most important publishing houses in the world. Macmillan published the works of Kingsley, Huxley, Maurice, Tennyson, Lightfoot, Westcott, J. R. Green, Lord Roberts, Lewis Carroll, and of many other well-known authors. In 1898 they took over the house of R. Bentley and Son, and in 1893 the firm was converted into a limited liability company, its chairman being Frederick Macmillan (b. 1851), who was knighted in 1909. The American firm of the Macmillan Company, of which he was also a director, is a separate business.

See Thomas Hughes, *Memoir of Daniel Macmillan* (1882); *A Bibliographical Catalogue of Macmillan and Co's Publications from 1843 to 1889* (1891), with portraits of the brothers Daniel and Alexander after Lowes Dickinson and Hubert Herkomer; also articles in *Le Livre* (Sept. 1886), *Publishers' Circular* (Jan. 14, 1893), the *Bookman* (May 1901), etc.

MACMONNIES, FREDERICK WILLIAM (1863–1937), American sculptor and painter, was born at Brooklyn (N.Y.), on Sept. 20, 1863. At the age of 16 he was received as an apprentice in the studio of Augustus St. Gaudens, the sculptor, where he remained for five years. In 1884 he went to Paris and thence to Munich, where he painted for some months. Returning to Paris the next year he became the most prominent pupil of Falguière. His "Diana" brought him a mention at the Salon of 1889. Three life-sized figures of angels for the church of St. Paul, New York, were followed by his "Nathan Hale," in the City Hall park, New York, and a portrait of James S. T. Stranahan, for Brooklyn. This last brought him a "second medal" in the Salon of 1891, the first time an American sculptor had been so honoured. In 1893 he was chosen to design and carry out the Columbian fountain for the Chicago World's Fair, which placed him instantly in the front rank of his profession. His largest work is a decoration for the memorial arch to soldiers and sailors, at Prospect park, Brooklyn, where he has also a large "Horse Tamer," a work of much distinction. A "Winged Victory" at the U.S. military academy at West Point (N.Y.), is of importance; "Bacchante," an extraordinary combination of realism and imagination, rejected by the Boston public library, is now at the Metropolitan Museum of Art, New York. His group, "Civic Virtue" for the City Hall fountain, New York, caused much discussion (1919). He was also well known as a portrait-painter.

MACNAGHTEN, SIR WILLIAM HAY, BART. (1793–1841), Anglo-Indian diplomatist, was the second son of Sir Francis Macnaghten, Bart., judge of the supreme courts of Madras and Calcutta. He went out to Madras in 1809, and was transferred to the Bengal Civil Service in 1816. In 1830 he became secretary to Lord William Bentinck; and in 1837 the trusted adviser of the governor-general, Lord Auckland, with whose policy of supporting Shah Shuja against Dost Mohammed, the reigning amir of Kabul, Macnaghten was closely identified. As political agent at Kabul he came into conflict with the military authorities and subsequently with his subordinate Sir Alexander Burnes. Macnaghten attempted to placate the Afghan chiefs with heavy subsidies, but when the drain on the Indian exchequer became too great, and the allowances were reduced, this policy led to an outbreak. Burnes was murdered on Nov. 2, 1841; and owing to the incapacity of the aged General Elphinstone the British army in Kabul degenerated into a leaderless mob. Macnaghten tried to save the situation by negotiating with the Afghan chiefs and, independently of them, with Dost Mohammed's son, Akbar Khan, by whom he was assassinated on Dec. 23, 1841. Retreating through the Kurd Kabul, the British suffered massacre.

MacNALLY, LEONARD (1752–1820), Irish informer, was born in Dublin, the son of a merchant. In 1776 he was called to the Irish, and in 1783 to the English bar. He supported himself for some time in London by writing plays and editing the *Public Ledger*. Returning to Dublin, he entered upon a systematic course of informing against the members of the revolutionary party, for whom his house had become the resort. He also betrayed to the Government prosecutors political clients whom he defended eloquently in the courts. He made a fine defence for Robert Emmet and cheered him in his last hours, although before appearing in court he had sold, for £200, the contents of his brief to the lawyers for the Crown. After living as a Protestant all his life, on his deathbed he received absolution from a Catholic priest. He died on Feb. 13, 1820.

MacNEIL, HERMON ATKINS (1866–), American sculptor, was born at Chelsea (Mass.). He was an instructor in industrial art at Cornell university in 1886–89, and was then a pupil of Henri M. Chapu and Falguière in Paris. Returning to America, he aided Philip Martiny in the preparation of sketch models for the Columbian exposition. In 1896 he won the Rinehart scholarship, passing four years (1896–1900) in Rome. In 1906 he became a National Academician. His first important work was "The Moqui Runner," which was followed by "A Primitive Chant," and "The Sun Vow," all figures of the North American Indian. A "Fountain of Liberty," for the St. Louis exposition, and other Indian themes came later; his "Agnese" and his "Beatrice," two fine busts of women, also deserve mention. His principal work is the sculpture for a large memorial arch at Columbus (O.), in honour of President McKinley. He executed the frieze for the Missouri State capitol, and the war memorial for Flushing, Long Island. In 1909 he won the commission for a soldiers' and sailors' monument in Albany, N.Y., and in 1923 the Saltus gold medal. His wife, Carol Brooks MacNeil (1871–1944), was also a sculptor of distinction.

McNEILE, HUGH (1795–1879), Anglican divine, was born at Ballycastle, Co. Antrim, on July 15, 1795, and graduated at Trinity college, Dublin, in 1810. He came under the influence of Edward Irving but was soon alienated by the latter's increasing extravagance. In 1834 he became incumbent of St. Jude's, Liverpool, where for 30 years he had great political as well as ecclesiastical influence, maintaining that "God, when he made the minister did not unmake the citizen." In 1835 McNeile entered on a long contest with the Liverpool corporation, which proposed to secularize its elementary schools by the introduction of the Irish national system. McNeile led a fierce agitation against the threatened withdrawal of the Bible as the basis of denominational religious teaching; before the new system could be introduced every child was provided for in new Church of England schools established by public subscriptions. McNeile was a zealous opponent of the Tractarian movement, and a conspicuous leader of the evangelical party. In 1840 he published *Lectures on the Church of England*, and in 1846 (the year after Newman's secession to Rome), *The Church and the Churches*, maintaining the evangelical doctrine of the "invisible Church" in opposition to the teaching of Newman and Pusey. In 1860 he was appointed a canon of Chester, and in 1868 dean of Ripon.

See J. A. Picton, *Memorials of Liverpool*, vol. i. (1873); Sir Edward Russell, "The Religious Life of Liverpool," in the *Sunday Magazine* (June 1905); Charles Bullock, *Hugh McNeile and Reformation Truth* (1882).

MACNEILL, JOHN GORDON SWIFT (1849–1926), Irish historian, and an authority on parliamentary procedure, was born in Dublin on March 11, 1849, and educated at Trinity college, Dublin, and Christ Church, Oxford. In 1875 he was called to the Irish Bar. He became professor of constitutional and criminal law at King's Inn, Dublin, and from 1909 was professor in the National university of Ireland. In 1887 he entered politics as the Nationalist representative of South Donegal, until the party was defeated by Sinn Fein in 1918. He was an accepted authority on parliamentary procedure and history. His books include *The Irish Parliament; What it was and what it did* (1885); *English interference with Irish industries* (1886); *How the Union was carried* (1887); *Titled Corruption* (1894); *Constitutional and Parliamentary History of Ireland* (1917); *Studies in the Constitution of the Irish Free State* (1925). In 1925 he published reminiscences, and quotes a remark of Lord Fisher which is indicative of his political career: "Mr. MacNeill you are a damned good fighter! I wish to God I had you with me in the Navy!" MacNeill died in Dublin on Aug. 24, 1926.

MACOMB, a city of western Illinois, U.S.A., 190 m. S.W. of Chicago; the county seat of McDonough county. It is on federal highway 67 and state highway 10 and is served by the Burlington Route. Pop. (1930) 8,509 (96% native white); 8,764 (1940). It is the seat of the Western Illinois State Teachers college (established 1899). Clay, oil and coal are found in the vicinity, and the city manufactures beverages, cheese, tooth powder, poultry equipment, electric clocks and mixers, stokers, thermos jugs, bomb fins, pottery, electric insulators and other articles. Macomb became the county seat in 1830, and a city in 1856.

MACOMER, a village of Sardinia, province of Nuoro, 95 mi. N.N.W. of Cagliari by rail. Pop. (1936), 4,950 (town), 5,588 (commune). It is 1,890 ft. above sea-level on the southern ascent to the central plateau (Campeda); and it is the junction of narrow-gauge lines branching from the main line eastwards to Nuoro and westwards to Bosa. The old parish church of S. Pantaleone has three Roman mile-stones in front of it, belonging to the Roman high-road from Carales to Turris Libisonis. The *nuraghe* of S. Barbara is fine. The Allies bombed Macomer in World War II.

MACON, NATHANIEL (1758–1837), American political leader, was born at Macon Manor, North Carolina, Dec. 17, 1758. He studied at the College of New Jersey (now Princeton university) from 1774 to 1776, when the institution was closed on account of the outbreak of the Revolutionary War. In 1777–80 he studied law at Bute Court-house, North Carolina, and in 1781–85 served in the North Carolina senate. In 1791–1815 he was a member of the national House of Representatives, and in 1815–28 of the United States Senate. Macon's point of view was always local rather than national. He was essentially a North Carolinian first, and an American afterwards; and throughout his career he was an aggressive advocate of State sovereignty and an adherent of the doctrines of the "Old Republicans." In Congress he denounced Hamilton's financial policy, opposed the Jay Treaty (1795) and the Alien and Sedition acts, and advocated a continuance of the French alliance of 1778. His party came into power in 1801, and he was Speaker of the house in 1801–07. At first he was in accord with Jefferson's administration; he approved the Louisiana Purchase, and as early as 1803 advocated the purchase of Florida. For a number of years, however, he was politically allied with John Randolph in a group of about 10 independents, called the "Quids," who strongly criticized Jefferson and opposed the presidential candidature of Madison. By 1809, however, Macon was again in accord with his party, and during the next two years he was one of the most influential of its leaders. In Dec. 1809 he introduced resolutions recommending the complete exclusion of foreign war vessels from United States ports and the suppression of illegal trade carried on by foreign merchants under the American flag. The substance of these resolutions was embodied in a bill which became law on May 1, 1810. This measure provided for the repeal of the Non-Intercourse Act of 1809, authorized the president, "in case either Great Britain or France shall before the 3rd day of March next so revoke or modify her edicts as that they shall cease to violate the neutral commerce of the United States," to revive non-intercourse against the other, and prohibited British and French vessels of war from entering American waters. In 1812 Macon voted for the declaration of war against Great Britain. He opposed the Bank Act of 1816, the "internal improvements" policy of Calhoun (in the early part of his career) and Clay, and the Missouri Compromise. In 1824 Macon received the electoral vote of Virginia for the vice-presidency, and in 1826–28 was president pro tempore of the Senate. He died at Buck Springs, N.C., on June 29, 1837.

See William E. Dodd, *The Life of Nathaniel Macon* (Raleigh, N.C., 1903); E. M. Wilson, *The Congressional Career of Nathaniel Macon* (Chapel Hill, N.C., 1900).

MÂCON, a town of east-central France, capital of the department of Saône-et-Loire, 45 m. N. of Lyons on the Paris-Lyon railway. Pop. (1936) 18,178. Mâcon (*Matisco*) was an important town of the Aedui, but under the Romans it was supplanted by Autun and Lyons. It suffered at the hands of the Germans, Burgundians, Vandals, Huns, Hungarians and even of the Carolingian kings. In the feudal period it was an important countship sold in 1228 to the king of France, but at times in the possession of the dukes of Burgundy until the ownership of the French Crown was established in the time of Louis XI. In the 16th century Mâcon became a stronghold of the Huguenots, but afterwards fell to the League, and only yielded to Henry IV. in 1594. The bishopric, created by King Childebert, was suppressed in 1790.

Mâcon is situated on the Saône facing the plain of the Bresse; a bridge of 12 arches connects it with the suburb of St. Laurent on the opposite bank. The modern Romanesque church of St. Pierre is a large three-naved basilica. Of the old cathedral of St. Vincent (12th and 13th centuries), destroyed at the Revolution, nothing remains but the Romanesque narthex, now used as a chapel, the façade and its two flanking towers. The hôtel de ville contains a library, a theatre and picture-gallery. Macon is the seat of a prefecture, and has tribunals of first instance and of commerce, and a chamber of commerce. Copper-founding is an important industry, also printing; manufactures include casks, mats, esparto articles, powders, rope and utensils for the wine-trade. The town has a large trade in wine of the district, known as Mâcon. The railways from Paris to Marseilles and from Mont Cenis to Geneva, with a branch from Moulins here are joined.

MACON, a city of central Georgia, U.S.A., the county seat of Bibb county; on federal highways 41, 80 and 129. It has a municipal airport and is served by the Central of Georgia; the Georgia; the Macon, Dublin and Savannah; Georgia, Southern and Florida; and the Southern railways. Population in 1930 was 53,829 (42·7% were Negroes); and it was 57,865 by the federal census of 1940. Macon is a city of wide streets, many trees, stately old mansions and attractive new residence districts on the hills, several beautiful public buildings (including the municipal auditorium, opened in 1925), 500 ac. of parks and playgrounds, and a municipal stadium seating 12,000 spectators. It is the seat of Wesleyan college (1836), the first college in the world chartered to confer academic degrees on women, which occupies a large $3,000,000 plant on a campus of 170 ac., 5 mi. N. of the city; Mercer university (Baptist), established as Mercer institute in 1833, at Penfield; the Georgia Academy for the Blind (1852); and several other institutions. The Ocmulgee National monument near the city is of great archaeological interest. Macon is the centre of the peach industry of Georgia, is a large cotton market, and handles increasing amounts of pecans, peanuts and cattle each year. Other principal products are brick and tile, lumber and textiles.

Immense beds of kaolin are nearby.

Macon has a large wholesale trade and a variety of manufacturing industries. Some of the largest greenhouses in the south are at Macon.

Bank debits for 1940 totalled $207,300,972. The assessed valuation for 1940 was $38,000,000. Macon (named after Nathaniel Macon, *q.v.*) was surveyed in 1823 by order of the Georgia legislature to be the judicial seat of Bibb county, and was chartered in 1824. It quickly became an important river port and trading centre, shipping 69,000 bales of cotton by water in 1834. In 1850 the population was 5,720; in 1860, 8,247. During the Civil War it was the seat of a Confederate commissariat and Treasury depository, and was not occupied by Federal troops until April 20, 1865.

Macon was the birthplace of Sidney Lanier.

MACPHERSON, SIR DAVID LEWIS (1818–1896), Canadian financier and politician, was born at Castle Leathers, near Inverness, Scotland, on Sept. 12, 1818. In 1835 he emigrated to Canada, settling in Montreal, where he built up a large fortune by "forwarding" merchandise. In 1853 he removed to Toronto, and obtained the contract for building a line of railway from Toronto to Sarnia, a project from which sprang the Grand Trunk railway. In 1864 he was elected to the Canadian parliament as member of the Legislative Council for Saugeen, and on the formation of the Dominion, in 1867, was nominated to the senate. He published a number of pamphlets on economic subjects, of which the best-known is *Banking and Currency* (1869). In 1880 he was appointed Speaker of the senate, and from Oct. 1883 till 1885 was minister of the interior in the Conservative cabinet. In 1884 he was knighted. He died on Aug. 6, 1896.

MACPHERSON, JAMES (1736–1796), Scottish "translator" of the Ossianic poems, was born at Ruthven, Inverness, on Oct. 27, 1736. He studied at King's college, Aberdeen (1753), at Marischal college and in Edinburgh. He is said to have written over 4,000 lines of verse while a student, but though some of this was published, notably *The Highlander* (1758), he afterwards tried to suppress it. On leaving college he taught in the school of his native place. At Moffat he met John Home, the author of *Douglas,* who encouraged him to publish translations from the Gaelic, as *Fragments of Ancient Poetry collected in the Highlands of Scotland* (Edinburgh, 1760). Dr. Hugh Blair, who was a firm believer in the authenticity of the poems, got up a subscription to allow Macpherson to pursue his Gaelic researches. In the autumn he set out to visit western Inverness, the islands of Skye, North and South Uist and Benbecula. He obtained mss. which he translated with the assistance of Captain Morrison and the Rev. A. Gallie. Later in the year he made an expedition to Mull, when he obtained other mss. In 1761 he announced the discovery of an epic on the subject of Fingal, and in December he published *Fingal, an Ancient Epic Poem in Six Books, together with Several Other Poems composed by Ossian, the Son of Fingal, translated from the Gaelic Language,* written in the musical measured prose of which he had made use in his earlier volume. *Temora* followed in 1763, and a collected edition, *The Works of Ossian,* in 1765.

The genuineness of these so-called translations from the works of a 3rd-century bard was immediately challenged in England, and Samuel Johnson, after some local investigation, asserted (*Journey to the Western Islands of Scotland,* 1775) that Macpherson had only found fragments of ancient poems and stories, which he had woven into a romance of his own composition. Macpherson never produced his originals, which he refused to publish on the ground of the expense. In 1764 he was made secretary to General Johnstone at Pensacola, West Florida, and when he returned, two years later, to England, after a quarrel with Johnstone, he was allowed to retain his salary as a pension. He wrote several historical works, the most important of which was *Original Papers, containing the Secret History of Great Britain from the Restoration to the Accession of the House of Hanover; to which are prefixed Extracts from the Life of James II., as written by himself* (1775). He enjoyed a salary for defending Lord North's government, and held the lucrative post of London agent to Mohammed Ali, nabob of Arcot. He entered parliament in 1780, and at his estate, Belville, Inverness, he died, Feb. 17, 1796.

After Macpherson's death, Malcolm Laing, in an appendix to his *History of Scotland* (1800), propounded the view that the so-called Ossianic poems were altogether modern in origin, and that Macpherson's authorities were practically non-existent. For a discussion of this question *see* SCOTTISH LITERATURE: *In Gaelic.* Apart from the doubtful morality of Macpherson's transactions he was a great writer. He did not transcribe actual Celtic poems, but he appreciated natural beauty and his art, with its tenderness, did more than any single work to bring about the romantic movement in European, and especially in German, literature. It was translated into many European languages, and Herder and Goethe (in his earlier period) were among its admirers. Cesarotti's Italian translation was one of Napoleon's favourite books.

BIBLIOGRAPHY.—For Macpherson's life, see *The Life and Letters of James Macpherson* . . . (1894, new ed., 1906), by T. Bailey Saunders who has laboured to redeem his character from the suspicions generally current with English readers. The antiquity of the Ossianic poems was defended in the introduction by Archibald Clerk to his edition of the *Poems of Ossian* (1870). Materials for arriving at a decision by comparison with undoubtedly genuine fragments of the Ossianic legend are available in *The Book of the Dean of Lismore,* Gaelic verses, collected by J. McGregor, dean of Lismore, in the early 16th century (ed. T. McLauchlan, 1862); the *Leabhar na Feinne* (1871) of F. J. Campbell, who also discusses the subject in *Popular Tales of the Western Highlands,* iv. (1893). *See* also L. C. Stern, "Die ossianische Heldenlieder" in *Zeitschrift für vergleichende Litteratur-geschichte* (1895; Eng. trans. by J. L. Robertson in *Trans. Gael. Soc. of Inverness,* xxii., 1897–1898); Sir J. Sinclair, *A Dissertation on the Authenticity of the Poems of Ossian* (1806); *Transactions of the Ossianic Society* (Dublin, 1854–61); *Cours de littérature celtique,* by Arbois de Jubainville, editor of the *Revue celtique* (1883, etc.); A. Nutt, *Ossian and the Ossianic Literature* (1899), with a valuable bibliographical appendix; J. S. Smart, *James Macpherson: an Episode in Literature* (1905), *Fragments of Ancient Poetry* was reprinted in 1917.

McPHERSON, JAMES BIRDSEYE (1828–1864), American soldier, was born at Sandusky, O., on Nov. 14, 1828. He entered West Point at the age of 21, and graduated (1853) at the head of his class, which included Sheridan, Schofield and Hood. He was employed at the military academy as instructor of practical military engineering (1853). A year later he was sent to engineer duty at New York, and in 1857 he was sent as superintending engineer to San Francisco, becoming first lieutenant in 1858. He was promoted captain during the first year of the Civil War, and towards the close of 1861 became lieutenant-colonel and aide-de-camp to Gen. Halleck, who in the spring of 1862 sent him to Gen. Grant as chief engineer. He remained with Grant during the Shiloh campaign, and acted as engineer adviser to Halleck during the siege operations against Corinth in the summer of 1862. In October he distinguished himself in command of an infantry brigade at the battle of Corinth, and on the 8th of this month was made major-general of volunteers and commander of a division. In the second advance on Vicksburg (1863) McPherson commanded the XVII. corps, fought at Port Gibson, Raymond and Jackson, and after the fall of Vicksburg was strongly recommended by Grant for the rank of brigadier-general in the regular army, to which he was promoted on Aug. 1, 1863. He commanded at Vicksburg until the following spring. He was about to go on leave of absence when he received his nomination to the command of the Army of the Tennessee, Grant's and Sherman's old army, which was to take part under Sherman's supreme command in the campaign against Atlanta (1864). This nomination was made by Sherman and entirely approved by Grant. McPherson commanded his army at the actions of Resaca, Dallas, Kenesaw Mountain and the battles about Atlanta. On July 22, when the Confederates under his old classmate Hood made a sudden and violent attack on the lines held by the Army of the Tennessee, McPherson rode up, in the woods, to the enemy's firing line and was killed. Grant is reported to have said "The country has lost one of its best soldiers and I have lost my best friend."

See Amos A. Fries, "Major General James Birdseye McPherson," *U.S. Engin. Dept.,* vol. vii, p. 378–82 (1915).

MACPHERSON, SIR WILLIAM GRANT (1858–1927), British doctor, soldier, and writer, was born on Jan. 27, 1858, at Kilmuir, Ross-shire, and was one of the original pupils at Fettes college in 1870. Completing his education at Edinburgh, Tübingen and Leipzig, he accompanied Sir C. Euan Smith's mission to Fez in 1892, and Sir A. Nicolson's mission to Morocco in 1896. In 1902 he served in South Africa, and after further experience in Cuba, Panama, the Russo-Japanese War and Malta he was appointed to the staff college at Quetta. During the World War, he was director of medical services to the I. Army serving in Macedonia. He was created K.C.M.G. in 1918. He contributed greatly to the efficiency of the British medical services during the World War, and afterwards edited the *Official Medical History of the War.* He died on Oct. 15, 1927, in London.

McPHERSON, a city in the central part of Kansas, U.S.A., on Federal highways 50N and 81, and served by the Missouri Pacific, the Rock Island, the Santa Fe and the Union Pacific railways. It is the county seat of McPherson county; an important shipping point for corn, wheat and other agricultural products; and the seat of McPherson college (Church of the Brethren; 1887). The population was 7,194 in 1940.

MACQUARIE, a British island in the South Pacific Ocean, in 54° 49′ S. and 159° 49′ E. It has an area of 170 sq.m., and is covered with a grassy vegetation, with some trees or shrubs in the sheltered places which afford food to a parrot of the genus *Cyanorhamphus,* allied to those of the Auckland Islands. Although it has no settled population, Macquarie is constantly visited by seal hunters.

MACRAUCHENIA, a long-necked, long-limbed, three-toed South American ungulate, typifying the Litopterna (*q.v.*).

MACREADY, WILLIAM CHARLES (1793–1873), English actor, was born in London on March 3, 1793, and educated at Rugby. On June 7, 1810 he appeared as Romeo at Birmingham. On Sept. 16, 1816, Macready made his first London appearance at Covent Garden as Orestes in *The Distressed Mother,* a translation of Racine's *Andromaque* by Ambrose Philips. Macready's choice of characters was at first confined chiefly to the romantic drama. In 1818 he won a permanent success in Isaac Pocock's (1782–1835) adaptation of Scott's *Rob Roy.* He showed his capacity in high tragedy by his impersonation of Richard III. at Covent Garden (Oct. 25, 1819).

Transferring his services to Drury Lane, he gradually rose in public favour, his most conspicuous success being in the title-rôle of Sheridan Knowles's *William Tell* (May 11, 1825). In 1826 he completed a successful engagement in America, and in 1828 in Paris. On Dec. 15, 1830, he appeared at Drury Lane as Werner, a powerful impersonation. In 1833 he played in *Antony and Cleopatra,* in Byron's *Sardanapalus,* and in *King Lear.*

After entering on the management of Covent Garden in 1837 he introduced Robert Browning's *Strafford,* and in the following year Bulwer's *Lady of Lyons* and *Richelieu,* the principal characters in which were among his most effective parts. On June 10, 1838, he gave a memorable performance of *Henry V.,* for which Stanfield prepared sketches; the mounting was superintended by Bulwer, Dickens, Forster, Maclise, W. J. Fox and other friends. The first production of Bulwer's *Money* took place under the artistic direction of Count d'Orsay Dec. 8, 1840, Macready playing the part of Alfred Evelyn. Both in his management of Covent Garden, which he resigned in 1839, and of Drury Lane, which he held from 1841 to 1843, he found little support for his efforts to elevate the stage. In 1843–44 he visited the United States; his last visit to that country, in 1849, was marred by a riot at the Astor opera house, New York, arising from the jealousy of the actor Edwin Forrest, and resulting in the death of 17 persons, who were shot by the military called out to quell the disturbance. Macready took leave of the stage in a farewell performance of *Macbeth* at Drury Lane on Feb. 26, 1851. The remainder of his life was spent in happy retirement, and he died at Cheltenham on April 27, 1873. He had married, in 1823, Catherine Frances Atkins (d. 1852). Of a numerous family of children only one son and one daughter survived. In 1860 he married Cecile Louise Frederica Spencer (1827–1908), by whom he had a son.

Macready's performances always displayed fine artistic perceptions developed to a high degree of perfection by very comprehensive culture, and even his least successful personations had the interest resulting from thorough intellectual study. He belonged to the school of Kean rather than of Kemble; but, if his tastes were better disciplined and in some respects more refined than those of Kean, his natural temperament did not permit him to give proper effect to the great tragic parts of Shakespeare, *King Lear* perhaps excepted, which afforded scope for his pathos and tenderness, the qualities in which he specially excelled. With the exception of a voice of good compass and capable of very varied expression, Macready had no especial physical gifts for acting, but the defects of his face and figure cannot be said to have materially affected his success.

Bibliography.—*Macready's Reminiscences, and selections from his diaries and letters* 2 vol. (ed. Sir F. Pollock, 1875; new ed., 1876); *The Diaries of William Charles Macready* 2 vol. (ed. W. Toynbee, 1912); *see* also W. Archer, *William Charles Macready* (1890); Sir T. Martin, *Monographs: Garrick, Macready,* etc. (1906).

MACROBIUS, AMBROSIUS THEODOSIUS, Roman grammarian and philosopher, flourished during the reigns of Honorius and Arcadius (395–423). He himself states that he was not a Roman, but there is no certain evidence about his descent. He is generally supposed to have been praetorian praefect in Spain (399), proconsul of Africa (410), and lord chamberlain (442). But the tenure of high office at that date was limited to Christians, and there is no evidence in the writings of Macrobius that he was a Christian. The identification is thus doubtful.

The most important of his works is the *Saturnalia,* containing an account of the discussions held at the house of Vettius Praetextatus (*c.* 325–385) during the Saturnalia. It was written by the author for the benefit of his son Eustathius, and contains a great variety of curious historical, mythological, critical and grammatical disquisitions. There is but little attempt to give any dramatic character to the dialogue; in each book some one of the personages takes the leading part, and the remarks of the others serve only as occasions for calling forth fresh displays of erudition. The first book contains a history and discussion of the Roman calendar, and an attempt to derive all forms of worship from that of the sun. Most of the second book, which begins with a collection of *bons mots,* is lost. The next four books are devoted to Virgil, and the seventh book consists largely of the discussion of various physiological questions. The work has little original merit and its value lies in the quotations from earlier writers; the main authorities are Gellius, Seneca the philosopher, Plutarch (*Quaestiones conviviales*), Athenaeus and the commentaries of Servius (excluded by some) and others on Virgil. We have also two books of a commentary on the *Somnium Scipionis* narrated by Cicero in his *De republica.* The moral elevation of the fragment of Cicero thus preserved to us gave the work a popularity in the middle ages to which its own merits have little claim. Of a third work, *De differentiis et societatibus graeci latinique verbi,* we only possess an abstract.

See editions by L. von Jan (1848–52, with bibliography of previous editions and commentary) and F. Eyssenhardt (1893, Teubner text); on the sources of the *Saturnalia see* H. Linke (1880) and G. Wissowa (1880). The grammatical treatise will be found in Jan's edition and H. Keil's *Grammatici latini,* v.; *see* also G. F. Schömann, *Commentatio macrobiana* (1871) and T. Whittaker, *Macrobius* (Cambridge, 1923).

MACROOM, a town of co. Cork, Eire, on the River Sullane, $24\frac{1}{2}$ mi. W. of Cork. Pop. (1936) 2,382. Macroom possesses a modernized castle, founded either by King John or by Norman invaders. Trade is in corn, leather-work and dairy produce. The town is a centre for salmon and trout fishing.

MACTARIS, 22 m. S.E. of Le Sers, which is 103 m. S.W. of Tunis by rail, an ancient town of North Africa, in which the influence of Punic civilization lasted until A.D. 200, when it became a Roman colony. It has a fine arch of triumph of Trajan (A.D. 116), another triumphal arch; a temple of Apollo and Diana; an aqueduct, of which 12 arches are still standing, and (perhaps) the thermae which it supplied, and the remains of two mausolea.

MacVEAGH, WAYNE (1833–1917), American lawyer and diplomat, was born near Phoenixville, Chester county (Pa.) on April 19, 1833. He graduated at Yale in 1853, was admitted to the bar in 1856, and was district attorney of Chester county in 1859–64. He held commands in militia forces raised to meet threatened Confederate invasions of Pennsylvania (1862–63). He became a leader in the Republican party, and was a prominent opponent of his father-in-law, Simon Cameron, in the fight within the party in 1871. MacVeagh was minister to Turkey in 1870–71; was a member of the State constitutional convention of 1872–73; was chairman of the "MacVeagh Commission," sent in 1877 by President Hayes to Louisiana, which secured the settlement of the contest between the two existing state governments and thus made possible the withdrawal of Federal troops from the state; and was attorney-general of the United States in 1881 under President Garfield, but resigned immediately after Garfield's death. In 1892 he supported Grover Cleveland, the Democratic nominee for the presidency, and from 1893 to 1897 was ambassador to Italy. He returned to the Republican party in 1896. In 1903 he was chief counsel of the United States before The Hague tribunal in the case of Germany, Great Britain and Italy against Venezuela. He died at Washington, Jan. 11, 1917.

MACWHIRTER, JOHN (1839–1911), British landscape painter, was born near Edinburgh on March 27, 1839. He was elected member of the Royal Scottish Academy in 1867, A.R.A. in 1879 and R.A. in 1893. His "June on the Austrian Tyrol" was bought in 1892 out of the Chantrey bequest. He died in London on Jan. 28, 1911.

MADÁCH, IMRE (1823–1864), Hungarian dramatist, was born at Alsó-Sztregova. He took part in the great revolution of 1848–49 and was imprisoned; on his return to his small estate in the county of Nógrád, he found that his family life had meanwhile been wrecked. This increased his natural tendency to melancholy, and he withdrew from public life till 1861, devoting his time mainly to the composition of his chief work, *Az ember tragoediája* ("The Tragedy of Man"), which begins with the Garden of Eden and ends with an ice-bound earth. In this drama of the life and the downfall of the human race, Adam and Eve and Lucifer maintain the continuity of the piece. John Arany, then at the height of his fame as a poet, at once recognized the great merits of that peculiar drama, and Madách enjoyed a short spell of fame before his untimely death of heart-disease in 1864. The diction of the drama is elevated and pure, and although not meant for the stage, it has proved effective when performed.

See M. Polagyi, *Madách und seine Werke* (1900); G. Bocnovich, *Madách, seine Leben und Werke* (1914). *See* also articles by Charles Szász (1862), Augustus Greguss (1872), B. Alexander (1871), M. Palágyi (1890), and others.

MADAGASCAR, an island in the Indian ocean, after Greenland, New Guinea, and Borneo, the largest island in the world, about 400 km. distant, on an average, from the south-east coast of Africa, from which it is separated by the Mozambique channel. Since 1896 Madagascar has been a French colony. It is 995 m. in length from north to south, and about 250 m. in average breadth, although, near the centre, it is nearly 360 m. across; its area is 228,589 square miles. It lies mainly between 44° and 50° E. Its northernmost point, Cape Ambro, in 12° S., inclines 16° to the E. from the longitude of Cape St. Mary, the southernmost point, in 25° 35′ S., so that the main axis of the island runs from north-north-east to south-south-west. There is a central plateau, roughly quadrilateral in shape, from 3,000 to 5,000 ft. in altitude, around which are extensive plains at a much less elevation above the sea, and most developed on the western and north-east sides. But this lower region is broken up by masses of hills, with several elevated plateaux, especially in the south-west and south.

Geology.—Madagascar was probably joined to Africa, possibly until Triassic times, thus forming part of the Gondwana continent, but the splitting off is very ancient, and bordering islands, such as the Seychelles, etc., allow of the conclusion that the island belonged to a continent called by the geologists Lemuria, from the lemurs which still inhabit the island, and stretching as far as India. The sinking which brought about the disappearance of this continent gave rise to violent volcanic eruptions, which explain the abundance of basalts in the Amber mountains and in the Ankàratra mountains, 2,000 sq.m. of which are lava covered. These ancient volcanoes are found along a line, following a line of fracture, in the east centre of the island, but they are present also in the western side. Itàsy is a more recent Tertiary volcano. Thermal springs, "Ranu-mafana" (warm water), such as those of Antsirabé are numerous, and slight earthquakes are frequent.

The subsoil of the island is formed of crystalline schists and of gneiss and associated rocks, metamorphic and other; granites, porphyries, etc. Iron is very abundant and is used for native industry, as is gold, which is found throughout the zone of crystalline rocks, especially in the eastern part of the island. Other metals exist in small quantities, such as graphites and numerous precious stones, etc.

Two-thirds of the surface soil of the island is made up of laterites, which cover the high plateaux; compact and dry, they are not very fertile. The western part of the island is formed of stratified sedimentary rocks. The plateaux of Antankara are formed of limestones, sandstones and clays of Jurassic to Tertiary origin. The Jurassic limestones form, in places, karst areas.

The lake alluvium of the depressions and the alluvium of the coastal plains are very fertile, and an arborescent vegetation grows on all the Tertiary sedimentary outcrops.

Palaeontology.—Bones of 12 species of struthious birds have been found in a sub-fossil state. They belonged to two genera, *Aepyornis* and *Mullerornis,* which varied in size from that of a bustard to birds much exceeding an ostrich, and rivalling the recently extinct moa of New Zealand, the largest species being about 10 ft. in height. One species of these great wingless birds laid an egg which is the largest known, being 12½ in. by 9½ inches. Associated with these remains there have been found those of many other birds, some of these being much larger than any now inhabiting Madagascar. In the same beds remains of two or three species of hippopotamus have been found, about two-thirds the size of the living South African species; also the bones and carapace, etc., of gigantic tortoises, and the bones of crocodile, now extinct on the coast and rivers, but still living in the two chief lakes; also the remains of a river-hog, of a species of swine and of a slender-legged form of zebu-ox. Near the south-west coast the skull of a large lemuroid animal was discovered in 1893, much longer than that of any living lemur, the animal being probably three times the size of any previously known Madagascar lemuroid. Later still, the bones of two other lemuroids have been discovered, one of them indicating an animal much larger than a man. Many of these birds and animals were probably contemporaneous with the earliest human inhabitants of Madagascar. The remains of two species of Edentata have been found, as well as those of several species of small Rodents, also of a Carnivore (*Cryptoprocta*), a larger variety of the species still living in the island.

In deposits of the Jurassic the bones of some enormous terrestrial lizards have been brought to light, belonging to Sauropodous dinosaurs of the genera *Bothriospondylus* and *Titanosaurus,* and to a Theropod of the genus *Megalosaurus.* In the beds of the Lower Oolite portions of the skull of a reptile resembling the gavial of the Ganges had been previously discovered, from which a new genus called *Steneosaurus* has been founded. Since the French occupation (1895) considerable additions have been made to our knowledge of the fossil fauna of Madagascar, from researches made both on the west and south-west coasts (at Bèlo and Ambòlisatrana), and in the interior (at Antsìrabè), especially in the rich deposits near Tsàrazàza (Ampàsambazimba), to the north-west of Lake Itàsy. From these various localities the sub-fossil remains of 13 or 14 extinct species of lemuroid animals have been obtained, and have been classified under five new genera: viz., *Megaladapis* (3 sp.), *Palaeopropithecus* (3 sp.), *Archaeolemur* (2 sp.), *Bradylemur* (1 sp.) and *Hadropithecus* (1 sp.), together with three new species of lemur. Of these, the *Archaeolemurs* seem to have combined the characteristics of lemuroid animals with those of the monkeys, while *Hadropithecus* is pronounced to be the nearest known link with them. About 280 species of Madagascar invertebrate fossils are known, including Molluscs, Foraminifera, Echinoderms, etc.

Physical Features.—Madagascar has few indentations, considering its great extent of shore-line. The east coast is almost a straight line, with dunes, lagoons and alluvial plains; Tamatave, the chief port on this side of the island, being only protected by coral reefs. The only indentations are the Bays of Antongil, of Port Louquez, and, at almost the extreme northern point of the island, Diégo-Suarez bay, one of the finest harbours in the world. The north-western side of Madagascar, on which the mountains often reach the sea, is broken up by a number of inlets, some of them land-locked and of considerable size. South of Cape St. Andrew, the north-west angle of the island, the low, flat coastline is unbroken until the estuary of the river Onilàhy, or St. Augustine bay, is reached. The south coast, though higher, has neither bays nor capes.

The largest coastal islands are Ste. Marie, near the eastern coast, a narrow island about 35 m. long, and Nossi-bé (*q.v.*), opposite Ampasindàva bay on the north-west coast. Except the Minnow group, north of Nossi-bé, the rest are merely rocky islets, chiefly of coral.

On the east the plains vary from 10 to 50 m. in breadth, but on the west they exceed, in some localities, 100 miles. From these coast-plains the ground rises by successive ranges of hills to the high interior plateau. This elevated region, the edge of which is formed on all sides by cliffs several hundreds of metres in height, is broken in all directions by mountains, from which the crystalline rocks show most frequently as huge bosses, and in certain regions present very varied and picturesque outlines. The highest mountain mass, east-centrally situated, is the ancient extinct volcano, Ankàratra, three of the highest points varying in elevation from 7,284 to 8,635 ft. above the sea, and from 4,000 to 5,000 ft. above the general level of the surrounding country. The loftiest of these is named Tsi-àfa-jàvona, *i.e.,* "That which the mists cannot climb." The highest point in the island is Ambòro, about 9,490 ft., in the northern province of Antankara. The other massifs are, on the north the Tsaratànana, on the south-east that of Iratsy and Horembé, rugged and bare, on the south the Vohimainty, dominated by the volcano Antandroy, etc. One of the finest of the Madagascar mountains is an isolated volcanic mass near the northern point of the island called Ambòhitra. The east slope of Madagascar is the edge of a fault, and slopes steeply to the Indian ocean, heights of more than 1,500 metres fringing depths of 4,000 to 5,000 metres. The western side, on the other hand, slopes gradually towards the Mozambique channel, the depth of which is more than 3,000 metres. The plateau is dissected by transverse valleys, which have served as migration routes. Between the mountain heights stretch fertile plains of lake alluvium, such as the Imèrina and the Plain of Bétsiléo, the rice-fields of which have given rise to towns like Antanànarìvo. Longitudinal valleys like those of the Ankay and of Lake Alàotra are equally fertile.

There are no arid districts, except in the extreme south-west and towards the southern point of the island. The general surface of the interior highland consists of bare rolling moor-like country, with a great amount of red, clay-like soil, while the valleys have a rich humus of bluish-black alluvium.

The chief rivers flow to the west and north-west sides of the island. The eastern streams are all less in size, except the Mangòro, in valley of Ankay, which flows parallel with the coast. They become navigable at best only when they have left the plateau, from which they often fall in cataracts, as in the case of the Ikòpa; and all are more or less closed at their outlets by sand-bars. The well-watered eastern slope is rich in short torrents, with many waterfalls. The most important are the Mangòro and the Mànanàra, formed by three large rivers from the plateau. On the more gradual western slope the rivers, although broken by rapids at their descent from the plateau, are longer and more important, but they often end in deltas. The largest river is the Bètsibòka, which receives on its left the Ikòpa, on which stands Antanànarìvo. The Bètsibòka is navigable for 70 km., and in the rainy season steamers go up the Ikòpa as far as Mevatanana. To the north, the Sofia has a fertile, well-populated valley, to the south the Tsiribihina, the Onitahy and the Mangòky are considerable streams.

On the eastern coast, the mouths of the rivers form lagoons, bordered by a series of spits, and often of considerable extent. By cutting about 30 m. of canal to connect them, a continuous waterway could be formed for 270 m. along the coast. This has already been done for about 55 m. between Ivòndrona and Andòvorànto, a service of small steamers forming part of the communication between the coast and the capital. Besides these lagoons there are some very extensive lakes in a recent geological epoch. Of the largest of these, the Alàotra lake, in the Antsihànaka plain, is the relic; it is about 25 m. long. Next comes Kinkòny, near Maròambitsy bay (north-west coast), about 16 m. long, and then Itàsy, in western Imèrina, about half as large. There is also a salt lake, Tsimànampetsòtsa (south-west coast), about as large as Alàotra, and numerous crater lakes, and lakes behind a lava-dam.

Climate.—Madagascar has, on the whole, a tropical climate, but climatic differences result from differences of altitude and slope, the contrasts being in a longitudinal sense, between the west and east coasts. There are two clearly-marked seasons, one warm and rainy, from November to April, the other dry and cool, from April to November. The influence of the south-east trade winds is felt over the whole island, but, whilst it brings rain in a fairly constant manner to the east coast (3 metres to 3 metres 50, and 164 rainy days), on the west the wet and the dry seasons are very distinct, the type of climate being governed by the alternation between the trade-wind and the monsoon. (Average rainfall at Majunga 1 metre 50 from October to April). Cyclones are fairly frequent on the east coast from January to March. Temperature for the whole island varies between $55\frac{1}{2}°$ F and 95°. (Tamatave, February 80°, July 68°; Majunga 70° and $89\frac{1}{2}°$.) The south and south-west coasts have a sub-desertic climate, with an annual rainfall of 350 millimetres. The east coast is particularly unhealthy, because of its marshes. The west coast has great variations of temperature, but the centre is suitable to Europeans, because of its mild and healthy climate.

Fauna.—The plateau is too bare to have much animal life, but the forests and coastal plains are well stocked. Many species have a limited range, and there are no large mammalia, but the island is headquarters of *Lemuroidea*, no fewer than 39 species of which are found in its forests and wooded plains. Some of these creatures are highly specialized, while the curious aye-aye (*Daubentonia madagascariensis*), has a genus and family by itself. Other peculiar animals are 23 species of the *Centetidae*, a family of the Insectivora almost confined to Madagascar. There are several small civets (*Viverridae*); the largest, also forming a genus and family by itself, is *Cryptoprocta ferox*, 3 ft. long, but like an enormous weasel. The mammals show Asiatic rather than African affinities. The island contains 25 species of bats, mostly of African, but some of Indian, affinities. African humped cattle were introduced several hundred years ago, and now exist in large herds all over the country. The fat-tailed sheep, goats and swine have also been naturalized, as well as all kinds of domestic poultry.

The avi-fauna, although wanting the largest birds as well as the most brilliantly-coloured, comprises 260 species, half of which are endemic; many belong to peculiar genera, and some are so isolated that new families have had to be formed for their reception.

The island contains two or three small species of boa; crocodiles abound in the rivers and lakes; and numerous species of lizard, chameleon and tree-frog inhabit the woods. Madagascar may be considered as one of the headquarters of the *Chamaeleontidae*, with 25 of the 50 known species, some with spines and horns. There are several peculiar tortoises, but the gigantic species are now found alive only on the little island of Aldabra, to the north. The insect life comprises many brilliantly-coloured beetles, butterflies (about 800 species of which are known), moths, locusts, spiders and flies, and also noxious spiders, with scorpions and centipedes. The river fishes belong chiefly to the family *Chromididae;* many of them are of brilliant and bizarre appearance, with strongly contrasted colours in bands and spots.

As a whole, the Madagascar fauna is marked by a strong individuality, which would appear to be the result of long isolation from the other zoological "regions." The fauna of Madagascar corroborates, according to its palaeontological evidence, the hypotheses put forward by the geologists.

Flora.—A belt of forest follows the coast-line, and is denser on the east than on the west, where it is often reduced to scattered clumps of trees on savannah-like plains; while in the south-west, where the rainfall is very scanty, the vegetation is largely of fleshy-leaved and spiny plants—aloes and cacti (the latter introduced), with several species of Euphorbia, as well as lianas, one of which (*Intisy*) yields india-rubber. The abundant epiphytes, the tree-mosses, the filmy ferns and the viviparous character of many of the ferns, show clearly how abundant the rainfall is in the east. Forest occupies only 13·5% of the total surface, or about 8 million hectares. This contains many hard-wooded and valuable timber trees, including species of *Weinmannia* (*Lalòna*), *Elaeocarpus* (*Voànana*), *Dalbergia* (*Vòambòana*), *Nuxia* (*Vàlanìrana*), *Podocarpus*, a pine, the sole species in the island (*Hètatra*), *Tambourissa* (*Ambòra*), *Neobaronia* (*Hàrahàra*), *Ocotea* (*Varòngy*) and probably ebony, *Diospyros* sp., etc. The following trees are characteristic of Madagascar vegetation, some of them being endemic, and others very prominent features in the landscape; the traveller's tree (*Urania speciosa*), with its enormous fan at the top of a tall trunk, and affording a supply of pure cool water, every part of the tree being of some service in building; the Raphia (*rofia*) palm (*Sagus ruffia*); the tall fir-like *Casuarina equisetifolia* or beefwood tree, very prominent on the eastern coast, as well as several species of screw-pine (*Pandanus*); the Madagascar spice (*Ravintsara madagascariensis*), a large forest tree, with fragrant fruit, leaves and bark; a beautiful-leaved species of *Calophyllum*; and the Tangèna (*Tanghinia venenifiua*), formerly employed as a poison ordeal. On the lagoons and lower reaches of the rivers the Viha (*Typhonodorum lindleyanum*), an arum endemic to Madagascar, grows in great profusion to a height of 12 or 13 ft., and has a white spathe more than a foot in length; and on the western coast dense thickets of mangrove line the creeks and rivers. In the interior rivers is found the curious and beautiful lace-leaf plant (*Ouvirandra fenestralis*), with an edible tuberous root. On the western side of the island, the baobab, the tamarind, the ròtra (*Eugenia* sp.), the rofia palm, and several species of fan-palm (*Hyphaene*) and of

Ficus are prominent; and the mango (introduced) grows to a large tree. In the generally bare interior highlands, large trees, species of *Ficus,* often mark the position of the old towns; and some of these, as Ambòhimànga, Vòhilèna, etc., are surrounded by remnants of the original forests, which formerly covered large portions of the interior. The most prominent tree in the central province is now the Cape-lilac (*Melia azederach*), introduced about 1825; and, since the French conquest, several species of eucalyptus have been planted in vast numbers by the road sides. In the eastern forests, palms, bamboos, lianas and tree-ferns, as well as species of *Dracaena,* are found.

There are many fine flowering trees, such as *Poinciana regia,* presenting a mass of scarlet flowers; *Colvillia racemosa,* with yellow flowers; *Astrapaea Wallichii,* striking attention from its abundant flowers; and species of *Cryptostegia,* a purple-flowered creeper, and *Strongylodon,* another creeper with cream-coloured blossoms. On the east coast two orchids, species of *Angraecum,* with large white waxy flowers, attract the attention of every traveller during June and July by their abundance and beauty. Some 320 species of fern have been collected, and there are large numbers of spiny and prickly plants, as well as numerous grasses, reeds and rushes, many of them of great service in the native manufactures of mats, hats, baskets, etc.

To sum up, one may group these different species into four types of plant associations: (1) The *prairie,* the most widespread, covering most of the central plateau; (2) the *savoka,* formed where the forest is replaced by rice-cultivation and a kind of brushwood, on soil which may serve to grow tropical plants, coffee, cocoa, etc.; (3) the *forest,* discussed above; (4) the *scrub-vegetation* of the scouts, analogous to the South African bush. The number of endemic genera now known is 148. Of the 3,178 species of plants whose localities have been determined, 35% are peculiar to the eastern region, 27·5% to the central, and 22% to the western. One natural order, Chlaenaceae, is strictly confined to Madagascar. A small proportion of the species are Asian, but not African; and the flora of the mountains corresponds closely with that of the great ranges of the tropical zone of Africa. The general plan of the flora follows thoroughly the same lines as that of the tropical regions of the Old World.

Among the food-giving plants are rice—the staff of life, to the majority of the Malagasy—in many varieties, maize, millet, manioc, yams, sweet potatoes, arrowroot, which is largely used by the western tribes—as well as numerous vegetables, many of them of foreign introduction. The majority of the fruits have been introduced.

Inhabitants.—The population (1936) was 3,797,796, including 25,255 French and 14,343 foreigners. The average density is 16.6 persons per square mile; the centre and the east are the most populous regions. The natives, collectively known as Malagasy, are divided into a considerable number of tribes, each having its distinct customs. The majority of the inhabitants are probably derived, the lighter portion of them from the Malayo-Polynesian stock, and the darker races from the Melanesian, who reached the island with the aid of the equatorial winds and currents. The population shares a number of characters with the peoples of the Indian and Pacific archipelagoes, physical appearance, mental habits, customs, and, above all, language. Their traditions also point in the same direction. There is an Arab element, introduced especially in the 9th century, on both the north-west and south-east coasts; and it appears that most of the families of the ruling classes in those parts of the island are descended from Arabs, who married native women. Numerous Africans were brought into Madagascar as slaves; they are the Makao of the west and the Masombiky of the interior. The Hòva became the dominant tribe from the beginning of the 19th century; they appear to be the latest immigrants, and are the lightest in colour; they are of Mongoloid type and also the most civilized of all the tribes of the island.

Unity of language is the true link uniting all the Malagasy, in spite of marked differences of dialect. Van der Tuuk, Marre de Marin and W. E. Cousins have shown conclusively the close relationships between the language of the Malagasy and those of the Malayo-Polynesian regions; similar connections exist, especially in grammatical construction, between the Malagasy and the Melanesian languages. English missionaries were the first to establish a grammar for the Malagasy language, there being no written symbols. Malagasy, nevertheless, is very full in many of its verbal and other forms, while it also exhibits some curious deficiencies. It is an agglutinative language, very soft and musical, full of vowels and liquids, and free from all harsh gutturals. Native oratory abounds in figures, metaphors and parables; and a great many folk-tales, songs, legends and proverbs give ample evidence of mental ability and imaginative powers.

Native society in Imèrina among the Hòva was formerly divided into three great classes: the Andriana, or nobles; the Hòva, freemen or commoners; and the Andevo, or slaves; but these last became free by a proclamation issued in 1896. The Andriana are, strictly speaking, royal clans, being descendants of Malayan chiefs. They form a very select caste, possessing many privileges, such as special terms of salutation, the use of the smaller scarlet umbrella (the larger one was the mark of royal rank), the right to build a particular kind of tomb, etc. The Hòva, or commoners, form the mass of the population of Imèrina. This is a special and restricted sense of the word Hòva, which, in its widest sense, is a tribal name, including all ranks of people in Imèrina. They are composed of a large number of tribes, who usually intermarry strictly among themselves, as indeed do families, so that property and land may be kept together. The third great division was the slave population, which since 1896 has become merged in the mass of the people. The Mozambiques, or African slaves, who had been brought from the African coast by Arab dhows, were in 1877 formally set free by an agreement with the British Government. The Hòva have stronger social institutions than the other Malagasy tribes, organized States more strongly administered by hereditary chiefs, who impose their authority upon the whole country. The Hòva are temperate, hard-working, vigorously disciplined, with a profound love for their country.

Royalty and chieftainship in Madagascar had many peculiar customs. It had a semi-sacred character; the chief was, in heathen tribes, while living, the high priest for his people, and after death, was worshipped as a god; in its modern development among the Hòva sovereigns it gathered round it much state and ceremony. There were curious examples of the taboo, particularly seen in everything having to do with the burial of a monarch, and the foregoing description of native society is applicable, with local modifications, to most of the Malagasy tribes. But on the island becoming a French colony in 1896, royalty was formally abolished.

The chief employment of the Malagasy is agriculture. In the cultivation of rice they show very great ingenuity, the *kètsa* grounds, where the rice is sown before transplanting, being formed either on the margins of the streams or in the hollows of the hills, in a series of terraces, to which water is often conducted from a considerable distance. In this agricultural engineering no people surpass the Bétsiléo. No plough is used, all work being done by a long-handled spade; and oxen are only employed to tread out the soft mud preparatory to transplanting. The manioc root is also largely consumed, together with several other roots and vegetables; but little animal foods (save fish and freshwater *Crustacea*) is taken by the mass of the people, except at festival times. Large herds of fine humped cattle are found almost all over the island.

The central and eastern peoples have considerable manual dexterity. The women spin and weave, and manufacture a variety of strong and durable cloths of silk, cotton and hemp, and of ròfia palm, aloe and banana fibre, of elegant patterns, and often with much taste in colour. They also make, from straw and papyrus peel, strong and beautiful mats and baskets, some of much fineness and delicacy, and also hats resembling those of Panama. The people of the south and south-east make large use of soft rush matting for covering, and they also prepare a rough cloth of bark. Their non-employment of skins for clothing is a marked distinction between the Malagasy and the South African races, and their use of vegetable fibres an equally strong link between them and the Polynesian peoples. Although the clothing may, in general, vary a great deal, it is usually very scanty, generally. The men wear a loin-cloth or *salàka,* and the women a *kitàmby* or apron folded round the body, from waist to heel, to which a jacket or dress is usually added; both sexes use over these the *làmba,* a large square of cloth folded round the body something like the Roman toga, and which is the characteristic native dress. The Malagasy are skilful in metal-working; they manufacture silver chains of great fineness, and filigree ornaments both of gold and silver. Their iron-work is of excellent quality, and in copper and brass they can produce copies of anything made by Europeans. They display considerable inventive power, and they are exceedingly quick to adopt new ideas from Europeans.

There is a considerable variety in the houses of the different Malagasy tribes. In the interior, the houses generally well kept, are made of dried clay and covered with a roof of branches and thatch. In the houses of the forest dwellers the walls are of bamboo and the houses built on piles; among the coastal tribes the bamboo structure predominates, and in the south this often forms a simple hut into which one has to enter by crawling. Among the Hòva and Bétsiléo the old villages were always built, for security, on the summits of lofty hills, around which were dug several deep fosses, one within the other.

Until lately, polygamy has been common among all the Malagasy tribes. The position of women is much higher in Madagascar than in most heathen countries; and, the fact that from 1828 to 1897 there were (with a few months' exception) only female sovereigns, helped to give women considerable influence in native society. The men and women are on equal footing in sex conventions. The old laws among the Hòva were very barbarous in their punishments, and death in various cruel forms was inflicted for very trifling offences. Drunkenness is very prevalent in many parts of the island; and it can hardly be said of many of the Malagasy that they are very industrious. But they are courageous and loyal to their chiefs and tribe, and for short periods are capable of much strenuous exertion. They are affectionate and firm in their friendships, kind to their children and their aged and infirm relatives, very respectful to old age, most courteous and polite and very hospitable to strangers.

The Malagasy have never had any organized religious system or forms of worship; there are no temples, images or stated seasons of devotion, nor is there a priesthood, properly so-called. Yet they have never been without some distinct recognition of a supreme being, whom they call *Andriamànitra* "The Fragrant One," and *Zànahàry,* "The Creator." Animism, with the double cult of ancestor worship and worship of the spirits of nature, prevails. Among the Hòva, there is also a firm belief in sorcery, in divination, and in trial by ordeal. The chief of these was the celebrated tangèna poison ordeal, by which, until its prohibition by an article in the Anglo-Malagasy treaty of 1865, thousands of persons perished every year. Sacrifices of fowls and sheep are made, at many places, at sacred stones and altars, both in thanksgiving at times of harvest, etc., and as propitiatory offerings. In some of the southern districts it is said that human sacrifices were occasionally offered. The chief festival among the Hòva, and almost confined to them, was that of the New Year, at which time a kind of sacrificial killing of oxen took place, and a ceremonial bathing, from which the festival took its name of Fàndròana (the Bath). This festival is now merged in the French national fête of July 14. Another great festival was at circumcision times. This rite was observed by royal command at intervals of a few years. Since 1868 circumcision has been observed by each family at any time convenient to itself. It is practised by all Malagasy. Funerals were also times of much feasting, and, at the death of people of rank and wealth, numbers of bullocks were and still are killed.

Economic Conditions.—The natives of Madagascar formerly grew only foodstuffs (rice, etc.), but introduced plants include, in the eastern coastal regions, vanilla, cocoa, coffee, spices, the cocoa-tree, rubber, etc., and in the west, sugar cane, cotton, Kapok; the central regions grow the mulberry, fruit trees, vines, tobacco, etc. Cattle-rearing also is important, 7,294,000 cattle, 450,000 pigs, 220,000 sheep and 57,000 goats being reared; this has given rise to development of the dairy industry. Europeans have also undertaken the rearing of ostriches. Development of the natural resources of the island, if somewhat slow, was real. Cultivation is mainly by Malagasy; the number of French settlers on the island is small. In 1924 the white colonists were cultivating 150,000 hectares; natives 1,110,000 hectares. Industries undertaken or developed by Europeans are silk and cotton-weaving and raffia-fibre preparation. Sugar, rice and other factories have been established. Gold mining has been carried on since 1897, but experts, sent from the Transvaal, came to the conclusion that it was not one of the rich goldfields of the world. The mines afford, nevertheless, lucrative employment for some thousands of persons, and the export of gold was 3,365,114 fr. in 1924. Although, as the result of a protective tariff, three-fourths of the trade is with France, about one-seventh is with Great Britain, and much British capital is invested in the island. A feature of the commerce is that exports exceed imports both in quantity and value. The chief imports are cotton goods, wines, machinery, metals, cement, petrol, and flour; nine tenths from France and its dependencies. The figures show the external trade at 646,605,197 fr. in 1924. Imports amounted to 259,033,753 fr. and exports to 387,571,444 francs. The chief exports are raw hides, salt and preserved meat, rice, dried vegetables, tapioca, coffee, etc., as well as graphite and precious stones.

The trade (in francs) of Madagascar has been as follows in five years:—

	1922	1923	1924	1925	1926
Imports	173,831,641	209,818,297	259,033,753	491,854,433	592,611,944
Exports	132,472,491	191,840,781	387,571,444	443,922,818	535,856,989

The chief articles of import and export in 1925 and 1926 were the following:—

Imports	1925	1926	Exports	1925	1926
	Metric tons	Metric tons		Metric tons	Metric tons
Cottons	6,370	4,553	Graphite	14,979	11,453
Wines (gals.)	104,192	76,890	Manioc	42,557	40,746
Machinery	2,568	1,785	Tanning bark	7,674	6,113
Metals	7,518	6,599	Rice	42,327	22,291
Cement	11,930	7,782	Hides	9,620	8,065
Petrol	3,363	4,700	Rafia fibre	6,276	7,622
Flour	2,288	2,259	Mica	267	296

Means of communication were greatly improved by harbour works and the building of roads and railways. By 1925 there were 1,500 m. of first-class roads and 540 m. of railway. The chief railway (240 m. long), joining the port of Tamatave with Antananarivo, was opened in 1918. From this railway a branch line goes northward, and from Antananarivo a railway (107 m. long), opened in 1923, runs south to Antsirabé. There is a road but no railway to Majunga, the chief port on the west coast. A railway is to be built from Fianàrantsòa to the east coast, and motor services run from Antanànarivo and Diégo-Suarez. The equipment of the ports is still primitive. Tonnage entered and cleared (1925) was 4,293,292. Canals have been made and irrigation works carried out.

Revenue is derived mainly from customs and a poll tax; expenditure was largely on the civil service. In 1924 the budget was balanced at 100,000,000 fr.; in effect, taxation and receipts had not increased. It was then realized that if economic progress was not to be checked, a revision of taxation was essential.

Provinces and Towns.—The island may be divided into districts or provinces, which, in the main, indicate tribal divisions, among which may be distinguished, taking them in three main divisions, from north to south: (1) *Eastern:* Antankàrana, occupying the northern peninsula; the country of the Bétsimisàraka, who inhabit a long extent of the coast plains, about 500 m. in length; parallel with this for about a third of it, and between the two lines of forest, is the Bézànozàno country. South again are the districts of the Taimbahòaka, the Taimòro, the Taifàsy and the Taisàka; and at the south-eastern corner are the Tanòsy. (2) *Central:* the districts of Tsimihèty and the Sihànaka; Imèrina, the Hòva province; the Bétsiléo; the Tanàla or foresters; the Bàra; and the emigrant Tanòsy. (3) *Western:* the people from almost the northern to the southern extremities of the island are known as Sàkalàva, but consist of a number of distinct tribes. South of these last are the Màhafàly, with the Tandròy at the extreme south. There are numerous subdivisions of most of the tribes.

The capital, Antanànarìvo (pop. [1937] 124,611), in the highlands of Imèrina, and Tamatàve (pop. 21,456) on the east coast and the chief seaport, are separately described. Majunga (properly Mojangà, pop. 34,683) on the north-west coast, just north of 16° S., and Diégo-Suarez (15,012), are important ports for foreign trade, the latter being also a fortified naval and military station. Other ports and towns are Màhanòro, Mànanjàry (south-east coast, pop. 11,974), Tuléar (south-west coast, pop. 12,004) and Fianàrantsòa (pop. 15,219), the chief towns of the Bétsiléo. There are very few places besides these with as many as 2,000 people.

Government.—The colony is not represented in the French Chambers, nor has it self-government. At the head of the administration is a governor-general, who is assisted by three councils and by the financial delegations, composed of 24 Europeans and 24 natives, who are consulted in the matter of the budget and of public works (Decree of May 7, 1924). In several towns there are *chambres consultatives,* composed of local merchants and planters. The French Government associates itself closely with the natives in the administration of their country. The island is divided into *circles,* placed under military officers, and *provinces,* presided over by a civilian. As far as possible, in local affairs, each of the native races is granted autonomy, the dominion of the Hòva over the other tribes being abolished. Each province has its native governor and minor officials, the governor being generally selected by popular vote. Each village has an organization (the *Fòkon òlona*) resembling that of a commune; at its head is a chief or *mpiadìdy,* who serves for three years.

For Europeans, and in suits between Europeans and natives, the French judicial code is applicable; suits between natives are tried by native tribunals (established 1898) presided over by a European, assisted by two native assessors. These tribunals judge according to native law and usages, except when such customs (*e.g.,* polygamy and slavery) have been expressly abolished. Arbitration councils are available everywhere for the settlement of disputes between native workmen and their employers. Besides teaching establishments based on the French system, there is a well-developed system in three stages for natives; nearly 900 schools are attended by 100,000 pupils.

Bibliography.—The standard work on the island is the *Histoire physique, naturelle et politique de Madagascar* (1875, etc.), in many vols., by Alfred Grandidier (1836–1921), founded on his exploration of Madagascar in 1865–70 and subsequent researches. Besides this great work, Grandidier edited a *Collection des ouvrages anciens concernant Madagascar* (1903, etc.), of which vol. ix. was published in 1920. *See* also James Sibree, *A Naturalist in Madagascar* (1915) and *Fifty Years in Madagascar* (1924); Dandouau, *Géographie de Madagascar* (1922); Julien, *Madagascar et ses dépendances* (1926); Gautier, *Madagascar-Essai de géographie physique;* Perier de la Bathie, *La vegetation malgache;* G. Grandidier, Le Myre de Vilers, Duchesne, Galliéni, *Quarante années de l'histoire de Madagascar, 1880–1920* (1923); Jean Lefranc, "La Prosperité et les Besoins de Madagascar," in *Renseignements Coloniaux* (Dec. 1925); *Guide-Annuaire de Madagascar et Depêndances.* (J. Sib.; M. M. B.)

Native Traditions.—The Malagasy people have contributed not a little to the solution of various ethnographical problems of Oceania. They have preserved from very remote times the forms of important rituals and semi-historical legends in the minds of the priests who have continued through unbroken lines to expound the *mana* mysteries and to impose the tabus. It is, of course, natural that the pure stream of Oceanic tradition should have become somewhat tainted from its close association with the conflicting traditions of the South African mainland and there are traces of Hottentot stories in some Malagasy folklore.

There is one way, however, in which the Malagasy class have been enabled to keep a more rigid record of their traditions, than their Oceanic brothers. They have, or at least certain of them have, for some time used the Arabic script in a peculiarly modified form. In this script but in pure Malagasy speech form, they have preserved their history, many legends and a certain number of ritual songs. This far-flung area of Arabic influence has felt, too, the shaping hand of Arabian civilization, for the written traditions, preserved in Arabic script in the Antaimoro language, are more polished and more neatly turned than those which have come down by purely oral record. A strange paradox, therefore, exists; the purest versions of the common Oceanic records are found side by side with legends bearing a decided African tinge and intermingled with folklore from Bushman and Hottentot sources.

Theories of Migration.—The realization that the Malagasy people are part of the far-flung family of Oceanic speech and tradition (now commonly divided into Polynesian, Melanesian, Indonesian and Micronesian), immediately gave rise to much speculation as to the path by which this division of the family reached its present habitat. Many theories hurriedly enunciated were soon discredited, and evidence drawn from a full consideration of the physical characteristics, language form, ritual practices and migration-stories was used as the basis for research. Even now the field of speculation is not entirely closed. There are still workers in Oceanic studies who are not satisfied with the present state of the theories concerning the true place of the Hòva, Bekimitsara, Sakalave, and the thirty other dialects of Madagascar speech in the Oceanic linguistic family. The full story of the relationships existing between these varied dialects and the languages of the Malay peninsula is to be found in the contributed papers to the *Antananarios Journal* and in the publications of M. Ferrand, for several years Governor-General of the island. *The Journal of the Polynesian Society* (Wellington, N.Z. quarterly) publishes papers concerning the history and languages of the Oceanic peoples. (X.)

HISTORY

From the earliest accounts given of the people of Madagascar by European travellers, as well as from what may be inferred from their present condition, they seem for many centuries to have been divided into a number of tribes, often separated from one another by a wide extent of uninhabited country. Each of these was under its own chief, and was often at war with its neighbours. No one tribe seems to have gained any great ascendancy over the rest until about the middle of the 17th century, when a small but warlike people called Sàkalàva, in the south-west of Madagascar, conquered the western half of the island, as well as some northern and central tribes, and eventually founded two kingdoms which retained their supremacy until the close of the 18th century. About that time the Hòva in the central province of Imèrina began to assert their own position under two warlike and energetic chieftains, Andrianimpòina and his son Radàma; they threw off the Sàkalàva authority, and after several wars obtained a nominal allegiance from them; they also conquered the surrounding tribes, and so made themselves virtual kings of Madagascar. From that time until 1895 Hòva authority was retained over a large part of the central and eastern provinces, but it was only nominal over much of the western side of the island, while in the south-west the people were independent.

Arab Influence.—The connection of the Arabs with the island dates from a remote epoch; and in very early times settlements were formed both on the north-west and south-east coasts. In the south-east the Arabs have become merged in the general mass of the people. It is different, however, in the north-west and west of the island. Here are several large Arab colonies, occupying the ports of Anòrontsànga, Mòjangà, Màrovoày and Mòrondàva, and retaining their distinct nationality. There is also in these districts a Hindu element in the population, for intercourse has also been maintained for some centuries between India and northern Madagascar. In the early days the Arabs had a very powerful influence upon the Malagasy. This is seen in the number of words derived from the Arabic in the native language. Among these are the names of the months and the days of the week, those used in astrology and divination, some forms of salutation, words for dress and bedding, money, musical instruments, books and writings, together with a number of miscellaneous terms.

Early European Intercourse.—Marco Polo has a chapter upon "Madeigascar," but his accounts of it are confused with those of the mainland of Africa. The first European voyager to see the island was a Portuguese named Diogo Diaz, captain of one of the ships of a fleet bound for India. Separated from his companions by a storm near the Cape, he sighted the eastern coast of the island on Aug. 10, 1500. That day being the feast of St. Lawrence, Madagascar was named the "Isle of St. Lawrence," and retained that name on all maps and charts for 100 years. The Portuguese gave names to most of the capes, but made no persistent attempts at colonization. Portuguese missionaries between 1600 and 1619 made strenuous efforts to teach their faith to the tribes on the south-east coast, but there is no record of any converts to reward the zeal and self-denial of the priests. After the Portuguese the Dutch endeavoured, with little success, to form colonies; and in the time of Charles I. proposals were made to form an English "plantation," and for a short time there was a settlement on the south-west coast. In the latter part of the 17th and during most of the 18th century, the French attempted to establish military positions on the east coast. For some time they held the extreme south-east point of the island at Fort Dauphin; but more than once their stations were destroyed and the French were massacred. In 1811 Tamatàve had been occupied by British troops, and the Treaty of Paris of 1814 recognized as British the "French settlements in Madagascar," but, as a matter of fact, France had then no settlements on the mainland, possessing only the island of Ste. Marie on the east coast. The then governor of Mauritius, Sir Robert Farquhar, obtained a cession of Diégo-Suarez bay. But the British claims were not prosecuted by the home Government, and a little later the policy was adopted by Great Britain of supporting the Hòva authority.

Hòva Rule.—The political history of Madagascar as a whole may be said to date from the reign of Radàma I. (1810–1828). He was a man much in advance of his age—shrewd, enterprising and undeterred by difficulty—a kind of Peter the Great of his time. He saw that it was necessary for his people to be educated and civilized if the country was to progress; and making a treaty with the governor of Mauritius to abolish the export of slaves, he received every year in compensation a subsidy of arms, ammunition and uniforms, as well as English training for his troops. He was thus enabled to establish his authority over a large portion of the island. For some years a British agent, Hastie, resided at Radàma's court, and exercised a powerful influence over the king, doing much for the material advance of the country. At the same period (1820) Christian teaching was begun in the capital by the London Missionary Society, and by its missionaries, the language was reduced to a systematic written form, and the art of printing introduced; books were prepared, the Scriptures were translated, numerous schools were formed, and several Christian congregations were gathered together. Useful arts were imported, valuable products were discovered and superstitions were broken.

The bright prospects thus opening up were clouded by the death of Radàma at the age of 36 and the seizure of the royal authority by one of his wives, the princess Rànavàlona. She looked with much suspicion upon the ideas then gaining power among many of her people, and determined to strike a decisive blow at the new teaching. In 1835 the profession of the Christian religion was declared illegal; all worship was to cease, and all religious books were ordered to be given up. By the middle of 1836 all the English missionaries were obliged to leave the island, and for 25 years the most strenuous efforts were made by the queen and her Government to suppress opposition. Of the Christian Malagasy, about 200 suffered death, while many hundreds were punished by fine, degradation, imprisonment and slavery. During the queen's rule there were frequent rebellions, distant provinces were desolated by barbarous wars; for some years all Europeans were excluded, and foreign commerce almost ceased. This last circumstance was partly owing to an ill-managed attack upon Tamatàve in 1846 by a combined British and French force, made to redress the wrongs inflicted upon the foreign traders of that port.

This reign of terror was brought to a close in 1861 by the death of the queen and the accession of her son, Radàma II. The island was reopened to European trade, and missionary efforts were recommenced. A concession he was induced to sign, giving great powers to a French company, as well as the vices and insane follies into which he was led by worthless foreign and native favourites, soon brought both the reign and the life of Radàma II. to an end. He was put to death in his palace (1863) and his wife was placed on the throne. The new sovereign refused to ratify the agreement with the French company, illegally obtained, choosing rather to pay a million francs as compensation. During the five years' reign of Queen Rasohèrina, quiet and steady advances were made in civilization and education, and treaties were concluded with the British, French and United States Governments. Besides the London Missionary Society various other Christian agencies were now at work, including the Jesuits and the Anglicans, the Society of Friends and the Norwegian Lutherans.

At the death of Rasohèrina in 1868, she was succeeded by her cousin, Rànavàlona II. One of the first acts of the new queen was the public recognition of Christianity; and soon afterwards she and her husband, the prime minister, were baptized. This was followed in the succeeding year by the burning of the royal idols and immediately afterwards by the destruction of the idols throughout the central provinces, the people generally putting themselves under Christian instruction.

The Hòva Government, though absolute under such monarchs as Radàma I., bore traces of popular control. New laws were announced at assemblies of the people, whose consent to them was given through the headmen of the different divisions of native society; this custom was no doubt a survival from a time when the popular assent was not a merely formal act. Rànavàlona II., her predecessor and her successor, were successively married to the prime minister, Ràinilaiàrivòny, a man of great ability and sagacity, who, by his position as husband and chief adviser of the sovereign, became virtual ruler of the country. Chiefly owing to his influence, many measures tending to improve the administration were introduced. The Hòva army was estimated at from 30,000 to 40,000 men, several English non-commissioned officers, and later others of higher rank, being engaged to train them in European methods. Revenue was derived from customs duties, first-fruits, fines and confiscation of offenders' property, and a money offering, called *hàsina,* presented on a great variety of occasions both to the sovereign in person and to her representatives; and these were supplemented by "benevolences" (in the mediaeval sense of the word) levied upon the people for occasional State necessities. The Government also claimed the unpaid services of all classes of the community for every kind of public work.

The Hòva Government aspired to have Madagascar recognized as an independent civilized State, and consuls appointed by the British, French and United States Governments were accredited to the Malagasy sovereign. The treaty with Great Britain, concluded in 1865, gave the consuls of that nation jurisdiction over the British subjects in the island. At this period, on the initiative of the 4th earl of Clarendon, then foreign secretary, an understanding was come to between the British and French Governments by which it was agreed that each Power should respect the independence of Madagascar; and the future of the country appeared to be bound up in the general consolidation of the central Hòva authority over the whole island.

Relations with the French.—While Hòva rule would have satisfied British interests in the island, it was otherwise with the French. The tradition of their former settlements in and influence over the island was strong; in 1840 they had taken under their protection the Sàkalàva ruler of the small island of Nossi-bé, off the north-west coast, and in virtue of that act claimed a vague protectorate over the adjacent shores of the mainland. But a treaty, concluded in 1868, while establishing French consular jurisdiction in Madagascar, recognized Rànavàlona II. as queen of Madagascar, and under the Second Empire attempts to establish French political influence were discouraged; a change came under the Third Republic. In 1878 the French consul, Laborde, died, and a dispute arose as to the disposal of his property. The French Government supported the claims of Laborde's heirs, and revived their claim to a protectorate over the Sàkalàva of the north-west coast. A policy of colonial expansion generally, and in Africa in particular, was manifest at this time in France, as in other European countries, and the French claims on the Hòva were pressed with vigour. To settle, if possible, the causes of dispute, two Hòva officers of high rank were sent to France in 1882, but as they were not authorized to cede any territory, their visit accomplished very little. In May 1883 an ultimatum was sent to the Malagasy queen, requiring immediate compliance with the demands of France; and as these were refused by the Hòva Government, Tamatàve was bombarded by a French squadron and then occupied by the marines. After the war had continued in a desultory fashion for many months terms of peace were drawn up. By a treaty signed on Dec. 17, 1885, it was agreed that the foreign relations of Madagascar should be directed by France; that a resident should live at the capital, and that the Bay of Diégo-Suarez, together with surrounding territory, should be ceded to France. The word "protectorate" was carefully excluded from the treaty, although the French intended that this should be its practical issue. It was at the same time agreed that there should be no foreign interference with the internal government of the country, and that the queen should retain her position, with all its honours and dignity. Queen Rànavàlona II. had died at the beginning of the war, on July 13, 1883, and had been succeeded by her niece, Princess Razàfindrahèty, under the title of Rànavàlona III., who maintained the same policy as her predecessor. In 1890 the British Government, in return for concessions in Zanzibar, consented to recognize a French protectorate over Madagascar, but the Malagasy prime minister, Ràinilaiàrivòny, was not disposed to give any advantage to France, and continued to arm and train, with the help of British officers, a large body of native troops. This state of tension and irritation could not last, and at length, towards the close of 1894, the French Government sent an ultimatum to the Malagasy sovereign, demanding such powers as would have made French authority supreme in the island. These demands were refused and war followed. The chief ports were occupied by French troops, and an expeditionary force under Gen. Duchesne was landed on the north-west coast at Mòjangà—commonly, but incorrectly, written Majunga—with the object of breaking the Hòva authority. Owing to the necessity of making a road for the passage of artillery and military stores, many months were spent on the march, and there was considerable loss of life by fever and other disease among the invading troops. But no effectual resistance was made by the Malagasy, and at length, on Sept. 30, 1895, the French forces reached the heights north and east of Antanànarìvo. They bombarded the city, which surrendered in the afternoon, and on the evening of the same day the French entered the capital. The French protectorate now became effective in the central provinces, but the queen was allowed to retain her position. Early in 1896, however, a serious rebellion broke out in several parts of Imèrina. This movement was not only anti-French and anti-foreign, but also anti-Christian. The French troops gradually broke up the power of the rebellion in the central provinces, but as there appeared to be considerable unrest in many other parts of the island, Gen. Gallieni, an officer with a reputation for vigour and ability in the Sudan and Tongking campaigns, was sent out to relieve the then resident-general.

Under French Rule.—Gen. Gallieni had a difficult task. Among the first steps he took were to put the country under martial law, to abolish royalty and all semblance of Hòva government, and to declare Madagascar to be henceforth a colony of France. Queen Rànavàlona III. was exiled to Réunion, and subsequently to Algeria, where she died in 1917. Meanwhile, by 1890, the authority of France was established throughout the island. Gen. Gallieni, whose firm and vigorous administration, and desire to treat the Malagasy justly and kindly, made him liked, retired in 1905, and was succeeded as governor-general by Victor Augagneur, the late mayor of Lyons. The Malagasy, though regretting the loss of independence, conformed fairly readily to the new order under French rule. Justice was administered, on the whole, with fairness and impartiality; but the taxation was heavy, the staff of officials was excessive, and various monopolies interfered with the habits of the people and tended to produce discontent. But the most serious cause for dislike of the Government was the interference by the governor-general, in 1907, with their religious customs, by the suppression of hundreds of their congregational schools, and the closing of numbers of their churches. In July 1910 Augagneur was replaced as governor-general by N. Picquié, who had served with acceptance as deputy governor-general of French Indo-China, and who had a reputation for tact and impartiality. Under him the anti-clerical policy of his predecessor was modified. It may be noted that when Madagascar became a French possession the French Protestant Churches had begun (in 1896) to take part in the evangelizing of their new colony, and about half the area, for long occupied by the London Missionary Society, was transferred to the Paris Society. It is also to be noted that the bulk of the Malagasy Christians are Protestants, probably three-fourths or four-fifths of those (over 500,000) professing Christianity. The anti-clerical policy of the French Government crippled to a large extent, and for many years, the educational work of the missions, both Protestant and Roman Catholic. Certain of the schools, medical and technical, hospitals and other establishments of the missionaries, were taken over by the Government.

From the time of the appointment of Picquié as governor-general, French policy was directed not only to material development and to attracting French settlers to the island, but also to the training of the natives to ways and outlook essentially French. While the Hòva were not neglected, special attention was paid to the Sàkalàva, the Betsimisàraka and other tribes. In accordance with the usual French colonial system the tribes were all placed under direct control of French officials, but large numbers of natives were employed in the French administration, and the few Malagasy who became thoroughly assimilated were given French citizenship (there were about 150 native French citizens in 1924).

Notwithstanding these measures the growth of a sense of Malagasy nationality could be discerned. Dislike of French rule continued strong for many years after the conquest of the island in 1896. This discontent culminated during the World War in the formation of an anti-French secret society, whose members included a large proportion of the native officials. The existence of the society which, it was alleged, plotted the simultaneous "removal" of the Europeans by means of poison, was discovered early in 1916. The society was rigorously suppressed, and hundreds of Malagasy were condemned to hard labour in the Comoro islands. Gradually, conditions on the island improved. Gradually, too, a better class of European official was sent out. The number of French functionaries was, however, still large, and was a drain on the scanty colonial revenue.

Malagasy troops were employed in considerable numbers in France during the World War and subsequently in Morocco and in Syria. They formed, however, inferior fighting material, and the influence of the returned soldiers on their countrymen was not good. Other disturbing factors were the spread of alcoholism and of malaria and pulmonary disease among the people, leading to a marked decrease in the number of Hòva and other races.

A brighter prospect was, however, shown in the marked attention paid by the French to education, and largely by this means the party among the natives attached to the French connection was built up. Education was made compulsory between the ages of 8 and 14, and the primary schools were supplemented by excellent regional schools—where lads were trained to become officials—and at Tananarivo and other towns there were means for higher education, including medical and agricultural schools. Support of the administration is promoted also by decorations, including the Dragon of Annam, the Star of Anjouan and the Étoile Noire, with *Honneurs* (12 classes), and medals like the *mérite agricole, mérite indigène* and *la médaille du travail.*

Marcel Olivier, who became governor-general in Feb. 1924, adopted a policy of decentralization of the administration—greater local autonomy and the employment of more natives and in more responsible posts. While there was no form of popular representation an Economic and Financial Delegation was created in May 1924 as an advisory body. It consisted of 24 Europeans and an equal number of Malagasy, and it did good work. By laying before the delegation his annual programme, Olivier engaged the interest of the Malagasy in practical reforms.

BIBLIOGRAPHY.—As regards the scientific aspects of the country, almost everything of value in previous books and papers is included in the magnificent work (Paris, 1875–1917) in many vols., by Alfred Grandidier (1836–1921), entitled *Histoire naturelle, physique et politique de Madagascar,* and founded on his exploration of Madagascar in 1865–70 and subsequent researches. Several of the volumes consist of coloured lithograph plates illustrating the natural history of the country, as well as atlases of maps from the earliest period. Grandidier also edited a *Collection des ouvrages anciens concernant Madagascar* (9 vols., 1903–20). *See* also J. Sibree, *A Madagascar Bibliography* (Antanànarivo, 1885); G. Grandidier, *Bibliographie de Madagascar* (2 vols., 1905 and 1907); J. S. Gallieni, *Neuf ans à Madagascar* (1908); J. Sibree, *Fifty Years in Madagascar* (1924). Also consult the works cited under Madagascar in the *Annuaire Général* (Paris, yearly) and the *Journal* of the African Society (quarterly).

(J. SIB.; F. R. C.)

MADAN, MARTIN (1726–1790), English writer, was educated at Westminster school, and at Christ Church, Oxford. In 1748 he was called to the bar, and lived a very gay life, until he was influenced by a sermon by John Wesley. He took holy orders, and was appointed chaplain to the Lock hospital, London. He acted from time to time as an itinerant preacher for the Countess of Huntingdon's Connection. In 1780 Madan raised a storm of opposition by the publication of his *Thelyphthora, or A Treatise on Female Ruin,* in which he advocated polygamy as the remedy for the evils of prostitution. The book called forth many angry replies. Retiring to Epsom, Madan produced *A New and Literal Translation of Juvenal and Persius* (1789).

MADAUROS, an ancient city of Numidia (near the modern Mdaourouch, 55 m. N. of Tebessa by rail), which became a Roman colony at the end of the 1st century after Christ. It was the birthplace of Apuleius, and its schools were celebrated. Among its ruins are some large thermae, a fine Roman mausoleum, a large Christian basilica of the Byzantine period, with a nave and two aisles, and a Byzantine fortress built about A.D. 535.

See Joly, *Mdaourouch.*

MADDALONI, a town of Campania, Italy, in the province of Naples, about $3\frac{1}{2}$ m. S.E. of Caserta, with stations on the railways from Caserta to Benevento and from Caserta to Avellino, 200 ft. above sea-level. Pop. (1936) 19,558 (town); 23,336 (commune). It is prettily situated at the base of one of the Tifata hills, the towers of its mediaeval castle and the church of San Michele crowning the heights above. The fine old palace of the Caraffa family, once dukes of Maddaloni, the old college now named after Giordano Bruno, and the institute for the sons of soldiers are the chief points of interest. About $2\frac{1}{2}$ m. east of Valle di Maddaloni, the Ponti della Valle, an aqueduct built by the orders of Charles III. of Naples and his son to convey the water of the Tiburno to Caserta (19 m.), is carried across the valley between Monte Longano and Monte Gargano by a threefold series of noble arches rising to a height of 210 ft. The work was designed by Lodovico Vanvitelli, and constructed, 1753–59.

MADDEN, SIR FREDERIC (1801–1873), English palaeographer, of Irish extraction, was born at Portsmouth on Feb. 16, 1801. In 1826 he entered the British Museum, and in 1828 he became assistant keeper of manuscripts. In 1833 he was knighted, and in 1837 became keeper of manuscripts, retiring in 1866. He edited for the Roxburghe club *Havelok the Dane* (1828), discovered by himself among the Laudian mss. in the Bodleian, *William and the Werwolf* (1832) and the old English versions of the *Gesta Romanorum* (1838). The edition (1850) in parallel columns, of what are known as the "Wycliffite" versions of the Bible, from the original mss., upon which he and Forshall had been engaged for 20 years, was published by the University of Oxford. In 1866–69 he edited the *Historia Minor* of Matthew Paris for the Rolls Series. In 1833 he wrote the text of Henry Shaw's *Illuminated Ornaments of the Middle Ages;* and in 1850 edited the English translation of Silvestre's *Paléographie universelle.* He died on March 8, 1873, bequeathing his journals and other private papers to the Bodleian library.

MADDER or DYERS' MADDER, the root of *Rubia tinctorum* and perhaps also of *R. peregrina,* both European, *R. cordifolia,* a native of the hilly districts of India and of north-east Asia and Java, supplying the Indian madder or *manjit. Rubia* is a genus of about 15 species of the tribe *Galieae* of the family Rubiaceae, and much resembles the familiar lady's bedstraw (*Galium verum*) and the cleavers (*G. aparine*) of hedges and woodlands, having similarly whorled leaves, but the parts of the flowers are in fives and not fours, while the fruit is somewhat fleshy. The only British species is *R. peregrina,* which is found in Wales, the south and west of England, and in east and south Ireland. The use of madder appears to have been known from the earliest times, as cloth dyed with it has been found on the Egyptian mummies. It was used for dyeing the cloaks of the Libyan women in the days of Herodotus (Herod. iv. 189). *R. tinctorum,* a native of western Europe, etc., has been extensively cultivated in south Europe, France, where it is called *garance,* and Holland, and to a small extent in the United States. Large quantities have been imported into England from Smyrna, Trieste, Leghorn, etc. The cultivation, however, has greatly decreased since alizarin, the red colouring principle of madder, was made artificially. Madder was employed medicinally by the ancients and in the middle ages. Its most remarkable physiological effect is that of colouring red the bones of animals fed upon it, as also the claws and beaks of birds. This appears to be due to the chemical affinity of phosphate of lime for the colouring matter. This property has been of much use in enabling physiologists to ascertain the manner in which bones develop, and the functions of the various types of cells found in growing bone.

MADEC, RENÉ-MARIE (1736–1784)—called Medoc in Anglo-Indian writings—French adventurer in India, was born at Quimper in Brittany on Feb. 7, 1736, of poor parents. He went out to India and served under Dupleix and Lally, but being taken prisoner by the British he enlisted in the Bengal army. Deserting with some of his companions shortly before the battle of Buxar (1764), he became military instructor to various native princes, organizing successively the forces of Shuja-ud-Dowlah, nawab of Oudh, and of the Jats and Rohillas. He took service under the emperor Shah Alam in 1772, and when that prince was defeated at Delhi by the Mahrattas, Madec rejoined his own countrymen in Pondicherry, where he took an active part in the defence of the town (1778). After the capitulation of Pondicherry he returned to France with a considerable fortune, and died there in 1784. At one time he worked for a French alliance with the Mogul emperor against the British, but the project came to nothing.

See Émile Barbé, *Le Nabob René Madec* (1894).

MADEIRA or FUNCHAL, a group of islands in the North Atlantic ocean, which belong to Portugal, and consist of two inhabited islands named Madeira and Porto Santo and two groups of uninhabited rocks named the Desertas and Selvagens. Pop. (1930) 211,601; (1940) 250,124; area, 314 sq.mi. Funchal, the capital of the archipelago, is on the south coast of Madeira island, in 32° 37′ 45″ N. and 16° 54′ W. It is about 360 mi. from the coast of Africa, 535 from Lisbon, 1,215 from Plymouth, 240 from Teneriffe, and 480 from Santa Maria, the nearest of the Azores.

Madeira (pop. in 1940, 247,423), the largest island of the group, has a length of 30 mi., an extreme breadth of 12 mi., and a coast-line of 80 or 90 mi. Pico Ruivo, the highest summit, stands in the centre of the island, and has a height of 6,056 ft., while some of the adjacent summits are very little lower. The depth of the ravines, the rugged peaks, often snow-covered, the bold precipices of the coast and the proximity of the sea afford many scenes of picturesque beauty or striking grandeur. The greater part of the interior is uninhabited, though cultivated, for the towns, villages and scattered huts are usually built either at the mouths of ravines or upon the lower slopes that extend from the mountains to the coast. The ridges between the ravines usually terminate in lofty headlands, one of which, called Cabo Girão, has the height of 1,920 ft., and much of the seaboard is bound by precipices of dark basalt. The north coast, having been more exposed to the erosion of the sea, is more precipitous than the south, and presents everywhere a wilder aspect. On the south there is left very little of the indigenous forest which once clothed the whole island. A long, narrow and comparatively low rocky promontory forms the eastern extremity of the island; and here is a tract of calcareous sand, known as the Fossil Bed, containing land shells and numerous bodies resembling the roots of trees, probably produced by infiltration.

Porto Santo is about 25 mi. N.E. of Madeira. Pop. in 1940 2,709. It has a length of $6\frac{1}{3}$ mi. and a width of 3 mi. The capital is Porto Santo, called locally the *villa* or town. At each end of the island are hills, of which Pico do Facho, the highest, reaches the altitude of 1,663 ft. Little but barley is grown, the limited requirements of the inhabitants being supplied from Funchal.

The Desertas lie about 11 m. S.E. of Madeira, and consist of three islands, Ilheo Chão, Bugio and Deserta Grande, together with Sail Rock off the north end of Ilheo Chão. They present lofty precipices to the sea on all sides. Rabbits and goats abound on them. The archil weed grows on the rocks, and is gathered for exportation. The largest islet (Deserta Grande) is $6\frac{1}{2}$ m. long, and attains the height of 1,610 feet.

The Selvagens or *Salvages* are a group of three islands, 156 m. from Madeira, and between Madeira and the Canary islands. The largest island is the Great Piton, 3 m. long, and 1 m. broad.

Geology.—All the islands of the group are of volcanic origin. They are the summits of very lofty mountains which have their bases in an abyssal ocean. The greater part of what is now visible in Madeira is of subaerial formation, consisting of basaltic and trachytic lavas, beds of tuff and other ejectamenta, the result of a long and complicated series of eruptions from innumerable vents.

There are no data for determining when volcanic action began in this locality, but looking at the enormous depth of the surrounding sea it is clear that a vast period of time must have elapsed to allow of a great mountain reaching the surface and then rising several thousand feet, as well as to excavate the deep and wide ravines that everywhere intersect the island. At the present day there are no live craters or smoking crevices, as at the Canaries and Cape Verdes, nor any hot springs, as at the Azores.

The rarity of crateriform cavities in Madeira is remarkable. There exists, however, to the east of Funchal, on a tract 2,000 ft. high, the Lagoa, a small but perfect crater, 500 ft. in diameter, and with a depth of 150 ft.; and there is another, which is a double one, in the district known as Fanal, in the north-west of Madeira, nearly 5,000 ft. above the sea. The basalt, of which much of the outer part of the island is composed, is of a dark colour and a tough texture, with small disseminated crystals of olivine and augite and often forms a rude columnar structure. The basalt yields good building-stone, some of which is quarried.

Climate.—Observations taken at Funchal Observatory (80 ft. above sea-level) in the last twenty years of the 19th century showed that the mean annual temperature is about 65° F. The mean minimum for the coldest part of the year (Oct. to May inclusive) does not fall below 55°, and the average daily variation of temperature in the same period does not exceed 10°. The mean humidity of the air is about 75 (saturation=100). The prevalent winds are from the north or from a few points east or west of north, but these winds are much mitigated on the south coast by the central range of mountains. A hot and dry wind, the *leste* of the natives, occasionally blows from the east-south-east, the direction of the Sahara, and causes the hill region to be hotter than below; but even on the coast the thermometer under its influence sometimes indicates 93°. As the thermometer has never been known to fall as low as 46° at Funchal, frost and snow are there wholly unknown; but snow falls on the mountains once or twice during the winter, but seldom below the altitude of 2,000 ft. Madeira has a high reputation as a health resort for persons suffering from chest diseases and is well-known as a winter resort.

Fauna.—No species of land mammal is indigenous to the Madeiras. The rabbit, black rat, brown rat and mouse have been introduced. The first comers encountered seals, and this amphibious mammal (*Monachus albiventer*) still lingers at the Desertas. Amongst the many species of birds which breed in these islands only one is endemic, that is a wren (*Regulus madeirensis*), but five other species are known elsewhere only at the Canaries. These are the green canary (*Fringilla butyracea*, the parent of the domesticated yellow variety), a chaffinch (*Fringilla tintillon*), a swift (*Cypselus unicolor*), a wood pigeon (*Columba trocaz*) and a petrel (*Thalassidroma Bulwerii*). There is also a local variety of the blackcap, distinguishable from the common kind by the extension in the male of the cap to the shoulder.

The only land reptile is a small lizard (*Lacerta dugesii*), which is destructive to the grape crop. The loggerhead turtle (*Caouana caretta*, Gray) is frequently captured and cooked but the soup is inferior to that made from the green turtle of the West Indies.

Many kinds of fish, such as the mackerel, horse mackerel, groper, mullet, braise, etc., are caught in abundance, and afford a cheap article of diet. Several species of tunny are taken plentifully in spring and summer, one of them sometimes attaining the weight of 300 lb. The only fresh-water fish is the common eel, which is found in one or two of the streams.

A large majority of the land shells are considered to be peculiar. Many of the species are variable in form or colour, and some have an extraordinary number of varieties. About 43 species are found both living and fossil in superficial deposits of calcareous sand in Madeira or Porto Santo. These deposits were assigned by Lyell to the Newer Pliocene period. Some species have not been hitherto discovered alive.

By the persevering researches of T. V. Wollaston the astonishing number of 695 species of beetles at the Madeiras was brought to light as early as 1870. The proportion of endemic kinds is large, and it is remarkable that 200 are either wingless or their wings are so poorly developed that they cannot fly, while 23 of the endemic genera have all their species in this condition. Upward of 100 moths have been collected, the majority being of a European stamp, but probably a fourth are peculiar to the Madeiran group. Among *Neuroptera* a certain number are peculiar.

The bristle-footed worms of the coast have been studied by Professor P. Langerhans, a large number being new to science. There is a white stony coral allied to the red coral of the Mediterranean which would be valuable as an article of trade if it could be obtained in sufficient quantity. Specimens of a rare and handsome red *Paragorgia* are in the British Museum and Liverpool Museum.

Flora.—The vegetation is strongly impressed with a south-European character. Many of the plants in the lower region undoubtedly were introduced and naturalized after the Portuguese colonization. A large number of the remainder are found at the Canaries and the Azores, or in one of these groups, but nowhere else. Lastly, there are about a hundred plants which are peculiarly Madeiran, either as distinct species or as strongly marked varieties. Among the large number of ferns three are endemic species and six others belong to the peculiar flora of the North Atlantic islands. A connection between the flora of Madeira and that of the West Indies and tropical America has been inferred from the presence of six ferns found nowhere in Europe or North Africa, but existing on the islands of the east coast of America or on the Isthmus of Panama. A further relationship to that continent is to be traced by the presence in Madeira of the beautiful ericaceous tree *Clethra arborea*, belonging to a genus which is otherwise wholly American, and of a *Persea*, a tree laurel, also an American genus. The dragon tree (*Dracaena Draco*) is almost extinct. Amongst the trees most worthy of note are four of the laurel order belonging to separate genera, an *Ardisia, Pittosporum, Sideroxylon, Notelaea, Rhamnus* and *Myrica*,—a strange mixture of genera to be found on a small Atlantic island. Two heaths of arborescent growth and a whortleberry cover large tracts on the mountains. In some parts there is a belt of the Spanish chestnut about the height of 1,500 ft. There is no indigenous pine tree as in the Canaries; but large tracts on the hills have been planted with *Pinus pinaster*, from which the fuel of the inhabitants is mainly derived. Several of the native trees and shrubs now grow only in situations which are nearly inaccessible, and some of the indigenous plants are of the greatest rarity. But some plants of foreign origin have spread in a remarkable manner. Among these is the common cactus or prickly pear (*Opuntia Tuna*), which in many spots on the coast is sufficiently abundant to give a character to the landscape. The coast being rocky and the sea unquiet, the species of *Algae* are few and poor.

Agriculture.—A large portion of the land was formerly entailed in the families of the landlords (*morgados*), but entails have been abolished by the legislature, and the land is now absolutely free. An incredible amount of labour has been expended upon the soil, partly in the erection of walls intended to prevent its being washed away by the rains, and to build up the plots of ground in the form of terraces. Watercourses have been constructed for purposes of irrigation, without which at regular intervals the island would not produce a hundredth part of its present yield. These watercourses originate high up in the ravines, are built of masonry or driven through the rock, and wind about for miles until they reach the cultivated land. Some of them are brought by tunnels from the north side of the island through the central crest of hill. Each occupier takes his turn at the running stream for so many hours, day or night, at a time notified to him.

The system of cultivation is primitive. Few of the occupiers own the land they cultivate; but they almost invariably own the walls, cottages and trees, the land alone belonging to the landlord. The tenant practically enjoys fixity of tenure, for the landlord is seldom in a position to pay the price at which the tenant's share is valued. The métayer system regulates almost universally the relations between landlord and tenant, the tenant paying a certain portion of the produce, usually one half or one third. There are few meadows and pastures, the cattle being stall-fed when not feeding on the mountains. Draught labour is performed by oxen.

The two staple products are wine and sugar. The vine was introduced from Cyprus or Crete soon after the discovery of the island by the Portuguese (1420), but it was not actively cultivated until the early part of the 16th century. The wine usually termed Madeira is made from a mixture of black and white grapes, which are also made separately into wines called Tinta and Verdelho, after the names of the grapes. Other wines, known as Bual, Sercial and Malmsey, are made from varieties of grapes bearing the same names. (*See* MADEIRA WINE.) The sugar cane is said to have been brought from Sicily about 1452. A considerable quantity of spirit, consumed on the island, is made by the distillation of the juice or of the molasses left after extracting the sugar.

The common potato, sweet potato and gourds of various kinds are extensively grown, as well as the *Colocasia esculenta,* the *kalo* of the Pacific islanders, the root of which yields an insipid food. Most of the common table vegetables of Europe are plentiful. Besides apples, pears and peaches, all of poor quality, oranges, lemons, guavas, mangoes, loquats, custard-apples, figs, bananas and pineapples are produced. The last two are articles of export.

Population and Administration.—The inhabitants are of Portuguese descent, with probably some intermixture of Moorish and negro blood. Both men and women in the outlying country districts wear the *carapuça,* a small cap made of blue cloth in shape something like a funnel, with the pipe standing upwards. The men have trousers of linen, drawn tight, and terminating at the knees; a coarse shirt covered by a short jacket completes their attire. The population increased 20% in the years 1900–20. Many of the able-bodied males emigrate to Brazil or the United States. The density of population (796.5 per sq.mi. in 1940) is great for an agricultural district containing no large town.

Funchal (pop. 1940, 54,856), headquarters of Madeiran commerce and shipping, is described in a separate article. The other chief towns are Camara de Lobos (4,968), Machico (10,820), Santa Cruz (609), Ponta do Sol (204), Calheta (2,735), São Vicente (6,110), Santa Anna (4,468), and Porto Santo (784), from the census of 1940. Each of these is the capital of a commune (*concelho*), to which it gives its name. Madeira is connected by regular lines of steamships with Great Britain, Germany, Portugal, Cape Colony, Brazil and the United States.

The archipelago is officially styled the district of Funchal; it returns members to the Portuguese Cortes, and is regarded as an integral part of the kingdom. The district is subdivided into the eight communes already enumerated. Funchal is a Roman Catholic bishopric in the archiepiscopal province of Lisbon.

History.—It has been conjectured, but on insufficient evidence, that the Phoenicians discovered Madeira at a very early period. Pliny mentions certain Purple or Mauretanian Islands, the position of which with reference to the Fortunate Islands or Canaries might seem to indicate the Madeiras. There is a romantic story to the effect that two lovers, Robert Machim, à Machin, or Macham, and Anna d'Arfet, fleeing from England to France (*c.* 1370) were driven out of their course by a violent storm and cast on the coast of Madeira at the place subsequently named Machico, in memory of one of them. João Gonçalvez Zarco first sighted Porto Santo in 1418, having been driven thither by a storm while he was exploring the coast of West Africa. Madeira itself was discovered in 1420. It is probable that the whole archipelago had been explored at an earlier date by Genoese adventurers; for an Italian map dated 1351 (the Laurentian portolano) shows the Madeiras quite clearly, and there is some reason to believe that they were known to the Genoese before 1339. When Zarco visited Madeira in 1420 the islands were uninhabited, but Prince Henry the Navigator at once began their colonization, aided by the knights of the Order of Christ. Sanctioned by the pope and by two charters which the king of Portugal granted in 1430 and 1433, the work proceeded apace; much land was deforested and brought into cultivation, and the Madeiran sugar trade soon became important. Slavery was abolished in Madeira in 1775, by order of Pombal. In 1801 British troops, commanded by General Beresford, occupied the island for a few months, and it was again under the British flag from 1807 to 1814. It shared in the civil disturbances at the accession of Dom Miguel, but after 1833 was peaceful.

MADEIRA WINE. The Portuguese introduced viticulture into the island of Madeira in the early part of the fifteenth century, but all the wine which was made in the island from that early date until the latter part of the seventeenth century was merely for local consumption, none being exported; sugar was then the staple commodity grown at Madeira for export. Sugar canes were uprooted and replaced by vines, and the export of wine became the chief source of revenue of Madeira, owing to an ordinance of 15 Car. II. cap. 7 (1663), by which it was enacted that "wines of the growth of Madeiras, the Western Islands or Azores, may be carried from thence to any of the lands, islands, plantations, colonies, territories or places to his Majesty belonging, in Asia, Africa or America, in English built ships." As, at the same time, all exports from France, Spain, Italy and Portugal to any English colonies were strictly prohibited, Madeira and the Azores were thus given the monopoly of the supply of the wine required by all English ships and colonists overseas.

The bulk of the wine shipped from Madeira to the West Indies, North America and India was just plain beverage red wine, vintaged in September, racked in January and shipped for immediate consumption in the following spring and during the ensuing twelve months, or, at most, eighteen months. A smaller quantity of beverage white wine was also made, from the *Verdelho* grape, which was sharp and refreshing as a summer drink, being usually consumed in the summer following the vintage, before having reached the immature age of twelve months. A small quantity of a very dark red wine, known as *tinto* or *tent,* was also made from a black grape called the *Negra Molle,* and was chiefly used for blending with red wines lacking in colour.

In some vineyards, where the soil was particularly suitable, finer species of vines were grown, mostly of the *Vidonia* and *Malvazia* varieties; the grapes they yielded were gathered later than the commoner grapes and they were pressed with greater care. A wine was made from such grapes which was better and richer than any other Madeira wine, but not a fortified wine. It was only when, during the wars of Queen Anne's reign, ships failed to call at Madeira for wine that surplus stocks of wines were distilled into brandy, which later was used to fortify some of the best wines. Gradually, by careful selection, blending, and ageing, the best wines of Madeira reached a degree of excellence in the early nineteenth century, which placed them in the first rank of dessert wines. (*See* WINE.)

MADELEY, market town, Wenlock municipal borough, Wrekin parliamentary division, Shropshire, England, 159 m. N.W. from London on the L.M.S. and G.W. railways. Pop. (1931) 7,532. There are ironworks, ironstone and coal are mined, and potter's clay is raised. The church of St. Michael (1796) replaced a Norman building. The parish includes a portion of Coalbrookdale (*q.v.*), and the towns of Ironbridge and Coalport. IRONBRIDGE, a town picturesquely situated on the Severn, adjoins Madeley on the south-west. It is so called because of a one-span iron bridge (1779) across the river. Probably the first such bridge erected, it attracted great attention at the time. Here are brick and tile works and lime-kilns. There is a station (Ironbridge and Broseley) on the G.W. railway. COALPORT lies also on the Severn, with a station on the G.W. railway. It has large china works, founded at the close of the 18th century.

MADERO, FRANCISCO INDALECIO (1873–1913), Mexican revolutionary leader and president, was born on Oct. 4, 1873, at San Pedro, in the State of Coahuila, Mexico. He was educated at the University of California and spent the years 1889–95 in France. During the first years after his return he devoted himself to the administration of the extensive family estate and mine holdings in northern Mexico, but after 1900 he became more and more active in politics. He organized the Club Democrático Benito Juárez, with branches throughout the country, in an effort to interest and appeal to the independent voter. With the help of these he introduced State conventions culminating in a national convention after the pattern of the United States. In 1905, in the gubernatorial campaign in Coahuila, he came out openly against the Díaz Government, but the Díaz *régime* had the election too well in hand for a successful assault. He was now the acknowledged leader of the independent voters of Mexico, and immediately began preparing for the next presidential election, to be held in 1910. In 1908 he published *La succesión presidencial en 1910,* a clear, reasoned statement of the problems of Mexico, and criticizing the Díaz *régime* for its unconstitutional methods of ruling. The book was immediately suppressed, but gave Madero standing as the chief opponent of Díaz in the coming election. However, after making a number of speeches, he was imprisoned on a charge of libel against the Government until the re-election of Díaz. He then crossed the border and from San Antonio, Texas, on Oct. 5, 1910, issued his call for revolution and announced the plan of San Luis Potosí, a definite political platform with "effective suffrage" and "no re-election" as its main planks. Recrossing into Chihuahua he joined rebel armies already in the field and entered actively into the campaign. Other States joined one by one and, with the capture of Juárez, after seven months of fighting, the Díaz Government sued for peace. Madero showed notable generosity to the vanquished, and his liberal proclamations won him the esteem and support of the populace. After the six months rule of a provisional president, a constitutional election was held and he was elected by a large majority. On Nov. 6, 1911, the new Government was inaugurated. Madero made a sincere effort to rule according to the Constitution, but met practical difficulties almost at once. His ideals, especially concerning the division of land and the suffrage, were too visionary to be carried into execution at once as he had promised. He retained the old Díaz Congress, which began an obstructionist policy, and he lacked the confidence of the army officers, most of whom were also Díaz's men. His interference and indecision with regard to the gubernatorial elections in a number of States brought sharp criticism. An unpopular vice-president had been forced upon the people, alienating a powerful group upon which he had counted for support. He had to contend with revolutions under Zapata in the south and under Orozco and Félix Díaz (nephew of the former president) in the north. Finally on Feb. 9, 1913, a revolution broke out in Mexico City. Desertion of the chief general, Huerta, with the army, caused Madero's overthrow and led to the establishment of the Huerta Government. On Feb. 22, while being taken to prison, Madero met his death, it is generally believed by assassination at the hands of the Huerta guards.

Thompson, "The Maderos of Mexico," *Munsey's Magazine,* vol. xlviii. (1913); R. Martínez, *Madero: su vida y su obra* (1914); S. Márquez, *Los ultimos Dias del Presidente Madero* (1917); R. Estrada; *La revolución y Francisco I. Madero* (1912).

MĀDHAVA ĀCHĀRYA (*fl. c.* 1380), Hindu statesman and philosopher, lived at the court of Vijayanagar (the modern Humpi in the district of Bellary), the vigorous Southern Hindu kingdom that so long withstood Mohammedan influence and aggression. His younger brother Sāyaṇa (d. 1387) was associated with him in the administration and was a famous commentator on the *Rigveda.* Sāyaṇa's commentaries were influenced by and dedicated to Mādhava, who is best known as the author of the *Sarvadarsana Samgraha* (*Compendium of Speculations*). With remarkable mental detachment he was an adherent of 16 distinct systems. Mādhava also wrote a commentary on the *Mīmāmsā Sūtras.* He died as abbot of the monastery of Sringeri.

MADHVAS. *Mādhva,* another distinguished Vedanta teacher and founder of a Vaishnava sect, born in Kanara in A.D. 1197, aimed at a reconciliation of the Saiva and Vaishnava forms of worship. The *Madhvas* or *Madhvacharis* favour Krishna and his consort as their special objects of adoration, whilst images of Siva, Parvati, and their son Ganesa are admitted and worshipped in some of their temples, the most important of which is at Udipi in South Kanara, with eight monasteries connected with it. This shrine contains an image of Krishna, which is said to have been rescued from the wreck of a ship which brought it from Dvaraka, where it was supposed to have been set up of old by no other than Krishna's friend Arjuna, one of the five Pandava princes. Followers of the Madhva creed are but rarely met with in Upper India. Their sectarial mark is like the U of the Sri-Vaishnavas, except that their central line is black instead of red or yellow. Madhva—who after his initiation assumed the name Anandatirtha—composed numerous Sanskrit works, including commentaries on the Brahma sutras (*i.e.,* the Vedanta aphorisms), the Gita, the Rigveda, and many Upanishads. His philosophical theory was a dualistic one, postulating distinctness of nature for the divine and the human soul, and hence independent existence, instead of absorption, after life on earth.

MADI, a Negro race of the Nile valley, occupying both banks of the Bahr-el-Jebel immediately north of Albert Nyanza. Tradition makes them immigrants from the north-west. The women choose their own husbands, are never ill-treated, and take part in tribal deliberations. The Madi build interesting sepulchral monuments. See *Petermann's Mittheilungen* for May 1883.

MADISON, JAMES (1751–1836), 4th president of the United States, was born at Port Conway, in King George county, Virginia, on March 16, 1751. His first ancestor in America may possibly have been Captain Isaac Maddyson, a colonist of 1623 mentioned by John Smith as an excellent Indian fighter. His father, also named James Madison, was the owner of large estates in Orange county, Virginia. In 1769 the son entered the College of New Jersey (now Princeton university). He graduated in 1771, but remained for another year at Princeton studying, apparently for the ministry, under the direction of John Witherspoon (1722–94). In 1772 he returned to Virginia, where he pursued his reading and studies, especially theology and Hebrew, and acted as a tutor to the younger children of the family. In 1775 he became chairman of the committee of public safety for Orange county, and in the spring of 1776 he was chosen a delegate to the new Virginia convention, where he was on the committee which drafted the constitution for the State, and proposed an amendment (not adopted) which declared that "all men are equally entitled to the full and free exercise" of religion. In 1777, largely, it seems, because he refused to treat the electors with rum and punch, after the custom of the time, he was not re-elected, but in November of the same year he was chosen a member of the Privy

Council or Council of State, in which capacity he took a prominent part from Jan. 14, 1778, until the end of 1779, when he was elected a delegate to the Continental Congress.

He was in Congress during the final stages of the Revolutionary War, and in 1780 drafted instructions to Jay, then representing the United States at Madrid, that in negotiations with Spain he should insist upon the free navigation of the Mississippi and upon the principle that the United States succeeded to British rights affirmed by the Treaty of Paris of 1763. When the confederation was almost in a state of collapse because of the failure of the States to respond to requisitions of Congress for supplies for the Federal treasury, Madison was among the first to advocate the granting of additional powers to Congress, and urged that Congress should forbid the States to issue more paper money. In 1781 he favoured an amendment of the Articles of Confederation giving Congress power to enforce its requisitions, and in 1783, in spite of the open opposition of the Virginia legislature, which considered the Virginian delegates wholly subject to its instructions, he advocated that the States should grant to Congress for 25 years authority to levy an import duty, and suggested a scheme to provide for the interest on the debt not raised by the import duty—apportioning it among the States on the basis of population, counting three-fifths of the slaves, a ratio suggested by Madison. To accompany this plan he drew up an able address to the States. In the same year he was a member of the committee which reported on the Virginia proposal as to the terms of cession to the Confederation of the unoccupied Western territory, held by several of the States; the report was a skilful compromise made by Madison, which secured the approval of the rather exigent Virginia legislature.

In Nov. 1783 Madison's term in Congress expired, and he returned to Virginia and took up the study of the law. In the following year he was elected to the house of delegates. As a member of its committee on religion, he opposed the giving of special privileges to the Episcopal (or any other) Church, and contended against a general assessment for the support of the churches of the State. His petition of remonstrance against the proposed assessment, drawn up at the suggestion of George Nicholas (*c.* 1755–99), was widely circulated and procured its defeat. On Dec. 26, 1785, Jefferson's bill for establishing religious freedom in Virginia, which had been introduced by Madison, was passed. In the Virginia house of delegates, as in the Continental Congress, he opposed the further issue of paper money; and he tried to induce the legislature to repeal the law confiscating British debts, but he did not lose sight of the interests of the Confederacy. The boundary between Virginia and Maryland, according to the Baltimore grant, was the south shore of the Potomac, a line to which Virginia had agreed on condition of free navigation of the river and the Chesapeake bay. Virginia now feared that too much had been given up, and desired joint regulation of the navigation and commerce of the river by Maryland and Virginia. On Madison's proposal commissioners from the two States met at Alexandria (*q.v.*) and at Mount Vernon in March 1785. The Maryland legislature approved the Mount Vernon agreement and proposed to invite Pennsylvania and Delaware to join in the arrangement. Madison, seeing an opportunity for more general concert in regard to commerce and trade (and possibly for the increase of the power of Congress), proposed that all the States should be invited to send commissioners to consider commercial questions, and a resolution to that effect was adopted (on Jan. 21, 1786) by the Virginia legislature. This led to the Annapolis convention of 1786, and that in turn led to the Philadelphia convention of 1787. In April 1787 Madison had written a paper, *The Vices of the Political System of the United States,* and from his study of confederacies, ancient and modern, later summed up in numbers 17, 18 and 19 of *The Federalist,* he had concluded that no confederacy could long endure if it acted upon States only and not directly upon individuals. As the time for the convention of 1787 approached he drew up an outline of a new system of government, the basis of the "Virginia plan" presented in the convention by Edmund Jennings Randolph. Madison's scheme, as expressed in a letter to Washington dated April 16, 1787, was that individual sovereignty of States was irreconcilable with aggregate sovereignty, but that the "consolidation of the whole into one simple republic would be as inexpedient as it is unattainable." He considered as a practical middle ground changing the basis of representation in Congress from States to population; giving the national Government "positive and complete authority in all cases which require uniformity"; giving it a negative on all State laws, a power which might best be vested in the Senate, a comparatively permanent body; electing the lower house, and the more numerous, for a short term; providing for a national executive, for extending the national supremacy over the judiciary and the militia, for a council to revise all laws, and for an express statement of the right of coercion; and finally, obtaining the ratification of a new constitutional instrument from the people, and not merely from the legislatures. The "Virginia plan" was the basis of the convention's deliberations which resulted in the constitution favourably voted on by the convention on Sept. 17, 1787. Madison, always an opponent of slavery, disapproved of the compromise (in Art. I. sec. 9 and Art. V.) postponing to 1808 (or later) the prohibition of the importation of slaves. He took a leading part in the debates of the convention, of which he kept careful notes, afterwards published by order of Congress (3 vols., Washington, 1843).

Many minute and wise provisions are due to Madison, and he spoke before the convention more frequently than any delegate except James Wilson and Gouverneur Morris. In spite of the opposition to the Constitution of the Virginia leaders George Mason and E. J. Randolph, Madison induced the State's delegation to stand by the Constitution in the convention. To meet the objections brought against it throughout the country, he joined Alexander Hamilton (*q.v.*) and John Jay in writing *The Federalist,* a series of 85 papers, out of which 20 certainly, and nine others probably, were written by him. In the Virginia convention for ratifying the Constitution (June 1788), when eight States had ratified and it seemed that Virginia's vote would be needed to make the necessary nine (New Hampshire's favourable vote was cast only shortly before that of Virginia), and it appeared that New York would vote against the constitution if Virginia did not ratify it, Madison was called upon to defend that instrument again, and he appeared at his best against its opponents, Patrick Henry, George Mason, James Monroe, Benjamin Harrison, William Grayson and John Tyler. He answered their objections in detail, calmly and with an intellectual power and earnestness that carried the convention. The result was a victory against an originally adverse public opinion and against the eloquence of the opponents of the constitution, for Madison and for his lieutenants, Edmund Pendleton, John Marshall, George Nicholas, Harry Innes and Henry Lee. At the same time Madison's labours in behalf of the constitution alienated from him valuable political support in Virginia. He was defeated by Richard Henry Lee and William Grayson for the United States Senate, but in his own district he was chosen a representative to Congress, defeating James Monroe.

Madison took his seat in the House of Representatives in April 1789, and assumed a leading part in the legislation necessary to the organization of the new Government. He drafted a tariff bill giving certain notable advantages to nations with which the United States had commercial treaties, hoping to force Great Britain into a similar treaty; but his policy of discrimination against England was rejected by Congress. It was his belief that such a system of retaliation would remove the possibility of war arising from commercial quarrels. He introduced resolutions calling for the establishment of three executive departments, foreign affairs, treasury and war, the head of each removable by the president. Most important of all, he proposed nine amendments to the constitution, which were the basis of the Bill of Rights embodied in the first ten amendments. Although a staunch friend of the Constitution, Madison believed that the instrument should be interpreted conservatively. The tide of "strict construction" was setting in strongly in his State, and he was borne along with the flood. It is very probable that Jefferson's influence over Madison, which was greater than Hamilton's, contributed to this result. Madison now opposed Hamilton's measures for the funding of the debt, the assumption of State debts, and the establishment of a national bank, and on other questions he sided more and more with the Opposition, gradually assuming its leadership in the House of Representatives and labouring to confine the powers of the National Government within the narrowest possible limits. Madison objected to the carrying out of the recommendations in Hamilton's famous report on manufactures (Dec. 5, 1791), which favoured a protective tariff. In 1793–96 he strongly criticized the administration for maintaining a neutral position between Great Britain and France, writing for the public press five papers (signed "Helvidius"), attacking the "monarchical prerogative of the executive" as exercised in the proclamation of neutrality in 1793 and denying the president's right to recognize foreign States. He found in Washington's attitude—as in Hamilton's failure to pay an instalment of the moneys due to France—an "Anglified complexion," in direct opposition to the popular sympathy with France and French Republicanism. In 1794 he tried again his commercial weapons, introducing in the House of Representatives resolutions based on Jefferson's report on commerce, advising retaliation against Great Britain and discrimination in commercial and navigation laws in favour of France; and he declared that the friends of Jay's treaty were "a British party systematically aiming at an exclusive connection with the British Government."

In 1797 Madison retired from Congress, but not to a life of inactivity. In 1798 he joined Jefferson in opposing the Alien and Sedition laws, and Madison himself wrote the resolutions of the Virginia legislature declaring that it viewed "the powers of the Federal Government as resulting from the compact to which the States are parties, as limited by the plain sense and intention of the instrument constituting that compact; as no further valid than they are authorized by the grants enumerated in that compact; and that, in case of a deliberate, palpable and dangerous exercise of other powers, not granted by the said compact, the States, who are parties thereto, have the right and are in duty bound to interpose for arresting the progress of the evil, and for maintaining within their respective limits, the authorities, rights and liberties appertaining to them." The Virginia resolutions and the Kentucky resolutions (the latter having been drafted by Jefferson) were met by dissenting resolutions from the New England States, from New York, and from Delaware. In answer to these, Madison, who had become a member of the Virginia legislature in the autumn of 1799, wrote for the committee to which they were referred a report elaborating and sustaining in every point the phraseology of the Virginia resolutions.

Madison became secretary of State upon Jefferson's accession to the presidency in 1801, and it is said that no secretary of State was ever confronted with larger problems or worked more closely with his president to solve them. For the very reason of their close relationship it is difficult to separate their parts in the diplomacy of 1801–09. The great achievement was the purchase of Louisiana, and following it the success with the Barbary pirates. Their failures were their inability to acquire Florida and the hopelessness of the relationship with England and France. During the eight years that he held the portfolio of State, he had continually to defend the neutral rights of the United States against the encroachments of European belligerents; in 1806 he published *An Examination of the British Doctrine which subjects to Capture a Neutral Trade not open in Time of Peace,* a careful argument against the rule of war of 1756 extended by Great Britain in 1793 and 1803.

Jefferson's wish was that Madison should succeed him in the presidency and to this the party acceded. However, a hostile group practically forced the new president to take Robert Smith as his secretary of State. So for two years his foreign policy suffered because the two could not temperamentally co-operate. Jefferson's peace policy—or, more correctly, Madison's peace policy—of commercial restrictions to coerce Great Britain and France he continued to follow until 1812, when he was forced to change these futile commercial weapons for a policy of war, which was very popular with the extreme French wing of his party. After being tricked by France and seemingly unable to gain any concessions from Great Britain he embarked upon war. The country was unprepared for war, and Madison and his cabinet proved unable efficiently to cope with the difficulties. Re-elected in 1812 in spite of formidable opposition, he grew increasingly unpopular as disaster followed the armies; the New England Federalists wished his resignation and even talked secession. In general, Congress was more blamable than either the president or his official family, or the army officers. With the declaration of peace the president again gained a momentary popularity much like that he had won in 1809 by his willingness to fight France.

Retiring from the presidency in 1817, Madison returned to his home, Montpelier, Orange county, Va., which he was to leave in no official capacity save in 1829, when he was a delegate to the State Constitutional Convention and served on several of its committees. Montpelier, like Jefferson's Monticello and Monroe's Oak-Hill, was an expensive bit of "gentleman farming," which with his generous hospitality nearly ruined its owner financially. Madison took an interest in education, in emancipation, and in agricultural questions, to the last. He died at Montpelier on June 28, 1836. Madison married, in 1794, Dorothy Payne Todd (1772–1849), a widow of great social charm. Her plump beauty was often remarked—notably by Washington Irving—in contrast to her husband's delicate and feeble figure and wizened face—for even in his prime he was, as Henry Adams says, "a small man, quiet, somewhat precise in manner, pleasant, fond of conversation, with a certain mixture of ease and dignity in his address."

Henry Clay, contrasting him with Jefferson, said that Jefferson had more genius, Madison more judgment and common sense; that Jefferson was a visionary and a theorist; Madison cool, dispassionate, practical and safe. The broadest and most accurate scholar among the "founders and fathers," he was particularly an expert in constitutional history and theory. In the great causes for which Madison fought in his earlier years—religious freedom and separation of Church and State, the free navigation of the Mississippi, and the adoption of the constitution—he met with success. His greatest and truest fame is as the "father of the Constitution."

Bibliography.—Madison's personality is perplexingly vague; the biographies of him are little more than histories of the period, and the best history of the later period in which he was before the public, Henry Adams's *History of the United States from 1801 to 1817* (1889–90), gives the clearest sketch and best criticism of him. The lives of Madison are: J. Q. Adams's (Boston, 1850); W. C. Rives's (Boston, 1859–69, 3 vols.), covering the period previous to 1797; S. H. Gay's (Boston, 1884) in the "American Statesmen Series"; and Gaillard Hunt's (1902). Madison's *Writings* (1900–06) were edited by Hunt, who also edited *The Journal of the Debates in the Convention which framed the Constitution of the United States, as Recorded by James Madison* (1908). *See* also Mrs. Madison's *Memoirs and Letters* (Boston, 1887) and M. W. Goodwin, *Dolly Madison* (1897). The most authoritative account of Madison's diplomatic activities is contained in vol. iii. of the *American Secretaries of State* (1927).

MADISON, a village of western Illinois, U.S.A., 2 mi. N. of East St. Louis; served by the Illinois Central, the Nickel Plate and the Litchfield, Madison railways. Pop. was 4,996 in 1920 (29% foreign-born white); and 7,782 in 1940 by federal census. It has car works, a creosoting plant, a steel mill and a village-owned and operated bridge connecting St. Louis, Mo. with Madison county, Ill. Madison was founded and incorporated in 1890.

MADISON, a city of southeastern Indiana, U.S.A., on the Ohio river, 90 mi. below Cincinnati, at an altitude of 450 ft.; the county seat of Jefferson county. It is served by the Pennsylvania railroad. The population was 6,530 in 1930 (93% native white) and was 6,923 by federal census in 1940. It is a shipping point of tobacco, grain and fruit; and has a variety of manufacturing industries. In North Madison is a state hospital for the insane. Madison was chartered as a city in 1836.

MADISON, a borough of Morris county, New Jersey, U.S.A., on the Lackawanna railroad, 23 mi. W. of New York city. Pop. (1930), 7,481; and was 7,944 in 1940. It is a residential suburb among the hills, and the seat of Drew university (Methodist), founded in 1866 as Drew Theological seminary, on an endowment by Daniel Drew (1788–1829) and expanded into a university in 1928 through a gift of $1,500,000 from Leonard D. and

Arthur J. Baldwin, of New York city. The cultivation of roses and cut flowers is the principal industry.

MADISON, a city of South Dakota, U.S.A., in the eastern part of the state, 50 mi. N.W. of Sioux Falls; county seat of Lake county. It is on federal highway 81 and state highway 34; is served by the Chicago, Milwaukee, St. Paul and Pacific railroad. Pop. (1940) 5,018. Madison is the trading centre of a farming and stock-raising region which specializes in pure-bred stock. It is the seat of the Eastern State Teachers college (1881).

MADISON, the capital city of Wisconsin, U.S.A., the seat of the state university, and the county seat of Dane county; in the "four-lake region" midway between Lake Michigan and the Mississippi river, in the southern part of the state. It is on federal highways 12, 14, 18, 51 and 151; and is served by the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific, and the Illinois Central railways, and by motor bus lines in all directions. Pop. (1920) 38,378 (87% native white), 67,447 in 1940 by federal census, to which the university adds 12,000, and visitors an average of 2,000 daily. The city is built on the isthmus between Lake Mendota on the northwest (15·2 sq.mi. in area, with a circumference of 25 mi.) and Lake Monona (5·5 sq.mi.) on the southeast. Farther south lie the other lakes (Waubesa and Kegonsa). On a hill at the narrowest part of the isthmus, in a wooded park of 14 ac. stands the State House, a beautiful building (constructed 1904–14). A mile west, along Lake Mendota, are the grounds of the University of Wisconsin (*q.v.*) covering 1,000 acres. Many of the city's parks (540 ac.) are on the shores of one or another of the three lakes, and facilities for all kinds of water sports abound. Madison is the seat of the only U.S. Forest products laboratory in the country. Its seven libraries (state, university and city) contain 1,750,000 volumes. Its six hospitals had in 1940 over 1,200 beds, and the city is an important medical centre. Though primarily an educational and political centre, Madison has a large jobbing and wholesale business, a large retail trade, and diversified manufacturing industries with an output in 1940 valued at $45,000,000. Bank resources in 1940 amounted to $45,000,000. The assessed valuation of property for 1940 was $132,000,000.

A trading post was established on Lake Mendota as early as 1820, but white settlement on the site of Madison did not begin until it had been selected by the territorial legislature (on Dec. 3, 1836, after a protracted and acrimonious debate) to be the seat of government, and had been named after James Madison, who had recently died. Earlier in the year a survey had been made, and a city laid out on paper, by Stevens T. Mason, governor of Michigan, and James Duane Doty, then United States district judge, who had visited the region in 1829 and recorded a tract including most of the land within the city limits. It was Doty's influence that largely determined the choice of the legislature. Building began early in 1837. The village was incorporated in 1846, with a population of 626, and chartered as a city in 1856.

MADISONVILLE, a city of western Kentucky, U.S.A., the county seat of Hopkins county; 40 mi. S. of Evansville (Indiana), on federal highway 41. It is served by the Illinois Central and the Louisville and Nashville railways. Pop. (1920) 5,030 (30% Negroes); 6,908 in 1930; 8,209 in 1940 by federal census. It is the market and trading centre of a coal-mining, lumbering and agricultural region, where dark tobacco is a leading crop.

MADIUN (Dutch, *Madioen*), a residency of the province of East Java, Netherlands Indies. It is bounded N. by Japara-Rembang and Bojonegara, E. by Kediri, W. by Surakarta and S. by the Indian ocean; area, 2,512 sq.mi.; pop. 1,968,547 (3,314 Europeans and Eurasians). It consists of very fertile plains in the north and centre. To the east and west are high volcano groups, including Mt. Liman (8,335 ft.) and Mt. Lawu (10,777 ft.). There are limestone ranges in the south, forming a difficult coast without a harbour. The principal river is the Madiun, which flows from the centre of the residency northwards to join the Solo, and there is a small river in the south, the Pajitan. Madiun, the capital (pop. 41,872, 1,681 Europeans and Eurasians), has large railway workshops and fine irrigation works; it is on the banks of the Madiun river. Other towns are Ponorogo, pop. 21,680, Ngawi, Mejajon, Batong, Magetan and Pajitan. Rice, maize, sugar-cane, cassava, coffee, coca, chinchona, coco-nuts, ground-nuts and the usual native fruits and vegetables are grown, and the principal crops are rice and sugar cane; teak is obtained from the forests. The main railway line from Batavia to Surabaya runs from west to east, touching Madiun. The central districts have good roads, and there is a good road in the south of Pajitan to Ponorogo and Madiun. The people are almost entirely Javanese. Madiun became a Dutch residency after the rebellion of 1825–30; it was occupied by Japan in 1942.

MADOZ, PASCUAL (1806–1870), Spanish statistician, born at Pamplona, May 7, 1806. He joined the Progressists during the first Carlist war (1833–40); was elected deputy to the Cortes of 1836; took part for Espartero, and then against him; was imprisoned in 1843; went into exile, returned, was governor of Barcelona in 1854, and minister of finance in 1855; had a large share in secularizing the Church lands; and after the revolution of 1868 was governor of Madrid. He died at Genoa in 1870.

MADRAS. A presidency of British India—officially styled Fort St. George—occupying, with its dependencies, the entire south of the Indian peninsula. The north boundary is extremely irregular. On the extreme north-east is the Bengal province of Orissa; then the wild highlands of the Central Provinces; next Hyderabad; and, on the north-west, the Bombay districts of Dharwar and North Kanara. Mysore and Coorg lie within the bounds of Madras, and it includes the Laccadive islands, off the Malabar coast, in the Indian ocean. Its area, excluding native states, is 126,166 sq.mi., and its population in 1941 was 49,341,810. The capital is Madras (*q.v.*).

Structural Geography.—The Madras presidency may be considered broadly in three sections: (1) the high interior tableland, (2) the long and broad east coast, (3) the shorter and narrower west coast. The central plateau has a general elevation of 1,000 to 3,000ft. and includes the whole of Mysore and extends over about half a dozen districts of Madras. It is composed essentially of very ancient granitic and gneissic rocks, which shelve sharply down to the coastal lands on either side, forming the eastern and western Ghats (*q.v.*) respectively. In Bellary and Anantapur districts, as well as in Mysore and Hyderabad, several long and narrow strips of a later formation, known as the Dharwar system, are folded or faulted into the gneissic floor. They run from north-north-west to south-south-east and consist of conglomerates, lavas and schists. These beds contain gold, the Kolar goldfield in Mysore being important. The gneissic and Dharwar rocks are overlaid unconformably by the sandstones, limestones, shales, etc., of the Cuddapah and Kurnool series. In the latter series most of the diamonds of southern India are found. Anaimundi mountain (8,837ft.) in Travancore is the highest in southern India. The Nilgiri hills, which join the Ghats, culminate in Dodabetta (8,760ft.). There are also many outlying spurs and tangled masses of hills, of which the Shevaroys, Anamalais and Palnis are the most important.

In the areas let down by faults there are strips of Gondwana beds, and their softer rocks have helped the growth of river valleys. Such a strip is associated with the Godavari valley. The Godavari, Kistna and Cauvery rivers, each with a large tributary system, rise in the western Ghats, cross the peninsula and reach the bay of Bengal over alluvial deltas which extend over long stretches on the east coast. Marine cretaceous deposits are found in three detached areas, near Trichinopoly, Viruddhachalam and Pondicherry. On the west coast are a series of backwaters or lagoons, fringing the sea-board of Kanara, Malabar and Travancore. The largest is the backwater of Cochin, which extends 120m. from north to south. Some of the coastal sandstones may be of late Tertiary age, but fossils of that period are only in a few patches on the west coast, as at Quilon in Travancore.

Climate.—The climate varies in accordance with the height of the mountain chain on the western coast. Where this chain is lofty, as between Malabar and Coimbatore, the rainclouds are checked and give a rainfall of 150 in. on the side of the sea, and only 20 in. on the landward side. Where the range is lower, the rainclouds pass over the hills and carry their moisture to the interior districts. The Nilgiri hills enjoy the climate of the temperate zone, with a moderate rainfall. The Malabar coast has a rainfall of 150in., and the clouds on the western Ghats sometimes obscure the sun for months at a time. Along the eastern coasts and central table-lands the rainfall is low and the heat excessive. At Madras the average rainfall, 50 in., is above the mean.

Minerals.—The mineral wealth is undeveloped. Excellent iron has been smelted by native smiths from time immemorial; but European methods have proved unsuccessful. Coal exists, but is not worked. The manganese of Vizagapatam and mica of Nellore are the only minerals extensively produced. Gold and silver are obtained at Anantapur, magnesite at Salem, barytes at Kurnool, and bauxite on the Malabar coast and at Vizagapatam.

Forests.—Forests cover a total area of nearly 1,300,000 acres. In recent years experimental afforestation has received much attention. In 1927 there were 19,028 sq.m. under State control including teak, ebony, rosewood, sandalwood and redwood.

Fauna.—The wild animals include the elephant, bison, sambur and ibex of the western Ghats and the Nilgiris. Bison are found also in the hill tracts of the northern Circars. In Travancore State the black leopard is not uncommon. The elephant is protected by law from indiscriminate destruction. The cattle are small, but in Nellore and along the Mysore frontier a superior breed is carefully kept up by the wealthier farmers. The best buffaloes are imported from the Bombay district of Dharwar.

Population.—Of the population in 1931, 883 in every thousand were Hindus, 70 Mohammedans, 38 Christians and 9 Animists. The death rate in 1926 was about 23 and the birth rate about 36 per thousand. The most numerous of the hill tribes are the Kondhs and Savaras, two cognate races who inhabit the mountainous tracts of the eastern Ghats. On the Nilgiris the best known aboriginal tribe is the Todas (*q.v.*). The chief Mohammedan tribes are Labbai, Moplah, Sheikh, Sayad, Pathan and Dudecula. The Labbais are the descendants of Hindu converts, and are traders by hereditary occupation, although many now employ themselves as sailors and fishermen. The Moplahs are the descendants of Arab sailors, but have now practically no foreign blood. They are a hard-working, frugal people, but extremely fanatical, and under the influence of religious excitement have often disturbed the public peace. The Christian population is comparatively large and is every year increasing. Broadly speaking, the entire population of Madras belongs to the five linguistic offshoots of the great Dravidian stock, dominant throughout southern India. At an early period, before the dawn of history, these races appear to have accepted some form of the Brahmanical or Buddhist faiths. Many storms of conquest have since swept over the land, and colonies of Mogul and Mahratta origin are to be found here and there. But the evidence of language proves that the ethnical character of the population has remained stable under all these influences, and that the Madras Hindu, Mohammedan, Jain and Christian are of the same stock. Of the five Dravidian languages in British territory Telugu is spoken by 377 persons in every thousand; Tamil by 410; Kanarese by 35 and Malayalam by 75 persons in every thousand. Oriya, spoken by 37 in every thousand, Khond and Savara are employed in Ganjam, Vizagapatam and the Madras Agency. Tulu and Kamkani are used on the west coast.

Agriculture.—Over the greater part of the area of Madras artificial irrigation is impossible, and cultivation is dependent upon the local rainfall, which rarely exceeds 40in. a year, and is irregular. On the Malabar coast alone can the south-west monsoon be trusted to produce steady rain. Other districts, such as Bellary, are also dependent upon this monsoon.

The system of irrigation has been most successful in the case of the three great eastern rivers, the Godavari, Kistna and Cauvery. Each of these is intercepted by an *anicut* or dam at the head of its delta, from which canals diverge on each side for navigation and irrigation. The project of leading the Periyar river through a tunnel on to the plain of Madura has been successful and a scheme for utilization of the Cauvery was in progress in 1927. Seven million acres were irrigated in 1927, three million of them by small works.

The principal food staples are rice, *cholam, cambu, ragi* and *varagu* (four kinds of millet). The most common oil-seed is ground-nut. Sugar is derived from cane and the sap of palms. The fruit trees are coco-nut, areca-nut, jack, tamarind and mango. Other crops are indigo, coffee, rubber, tobacco and tea. Cotton is grown mostly in the ceded districts, in the Guntur highlands and in the southern districts (Tinnevelly, etc.). The larger portion of the coffee-growing area lies within Mysore, Coorg and Travancore States, but the Wynaad and the Nilgiri hills are within Madras. The tea plant was also introduced into the Nilgiri hills about 1840, and is still unimportant, though increasing. Deccan hemp is grown in the northern Circars.

The greater part of the soil in Madras is held by the cultivators direct from the Government under the tenure known as *ryotwari*. Besides these lands, in the hands of the Government, there are also proprietary or *samindari* estates in all parts of the country. Of the total population 71% are engaged in agriculture.

Manufactures.—Madras possesses few staple manufactures, and industry is not in an advanced condition, owing partly to lack of coal. Projects for the supply of hydro-electric power to various places were under consideration in 1927. The chief industries of the presidency are cotton-ginning, coffee-curing, oil-pressing, rice-curing, rope-making, sugar refining, tanning, tile and brick-making, salt and soap manufacture and railway works. Up to the close of the 18th century cotton goods constituted the main article of export. There are now a number of cotton mills, and native looms still hold their own in the local market.

Commerce and Trade.—The continuous seaboard of the Madras presidency, without any natural harbours of the first rank, has tended to create a widely-diffused trade. Madras city conducts nearly one-half of the total sea-borne commerce; next comes Malabar, with Calicut; then Godavari, with its cluster of ports along the fringe of the delta; Tinnevelly, with the harbour at Tuticorin, Tanjore, South Kanara, Ganjam and Vizagapatam. Madras is broadly marked by the larger proportion assigned to coasting trade. The chief staples of the export trade are cotton, and cotton piece goods, ground-nuts, hides and skins, tea and coffee, coir manufactures, rice and oil.

The presidency is well supplied with railways, which naturally have their centre in Madras city, the chief seaport. The broad gauge line of the Madras and Southern Mahratta railway connects with Bombay and Bangalore, and also crosses the peninsula to Calicut and Mangalore on the western coast. The South Indian (narrow-gauge) serves the extreme south, and has several branches. The narrow-gauge line of the Madras and Southern Mahratta railway traverses the Deccan districts; and the East Coast line (broad-gauge), through the northern Circars, has brought Madras into direct communication with Calcutta.

Administration.—In 1937 by the provisions of the Government of India act of 1935, Madras received "provincial autonomy" under a popularly elected ministry formed by the Congress party with C. Rajagopalachariar as premier. The ministry resigned after the outbreak of war in 1939. The number of districts is 24, each under the charge of a collector, with sub-collectors and assistants.

Local administration includes at the bottom union *panchayats* or village committees, whose chief duty is to attend to sanitation. Above them come *taluk* or subdivisional boards. At the head of all are district boards, a portion of whose members are elected by the *taluk* boards. There is a High Court of Justice at Madras, with a chief judge and 11 puisne judges, 25 sessions judges for criminal law and 24 district judges for civil justice.

The chief educational institutions are the Madras university, the Presidency college, Madras Christian college and Pachayyappa's college at Madras; the Government arts colleges at Combaconum and Rajahmundry; the medical college and engineering college at Madras; the college of agriculture at Coimbatore, St. Joseph's college, Trichinopoly; the teachers' college at Saidapet; the school of arts at Madras; and the military orphanage at Ootacamund, in memory of Sir Henry Lawrence. In 1921 the total number of pupils at all institutions was 1,799,850; 98 per thousand over five years of age could read and write.

HISTORY

Until the British conquest the whole of southern India had never acknowledged a single ruler. The Tamil country in the extreme south is traditionally divided between the three kingdoms of Pandya, Chola and Chera. The west coast supplied the nucleus of a monarchy which afterwards extended over the highlands of Mysore, and took its name from the Carnatic. On the north-east the kings of Kalinga at one time ruled over the entire line of seaboard from the Kistna to the Ganges (*see* INDIA). The Mohammedan invader first established himself in the south in the beginning of the 14th century. Ala-ud-din, the second monarch of the Khilji dynasty at Delhi, and his general Malik Kafur conquered the Deccan, and overthrew the kingdoms of Karnataka and Telingana, which were then the most powerful in southern India. But after the withdrawal of the Mussulman armies the native monarchy of Vijayanagar (*q.v.*), arose out of the ruins. In 1565, it was overwhelmed by a combination of the four Mohammedan principalities of the Deccan. At the close of the reign of Aurangzeb, although that emperor nominally extended his sovereignty as far as Cape Comorin, in reality South India had again fallen under a number of rulers who owned no regular allegiance. The nizam of the Deccan, himself an independent sovereign, represented the distant court of Delhi. The most powerful of his feudatories was the nawab of the Carnatic, with his capital at Arcot.

Vasco da Gama cast anchor off Calicut on May 20, 1498, and for a century the Portuguese retained the commerce of India. The Dutch, superseding the Portuguese at the beginning of the 17th century, were quickly followed by the English, who established themselves at Calicut and Cranganore in 1616. The Portuguese eventually retired to Goa, and the Dutch to the Spice Islands. The first English settlement on the east coast was in 1611, at Masulipatam, even then celebrated for its fabrics. Farther south a fort, the nucleus of Madras city, was erected in 1640. Pondicherry was purchased by the French in 1762. The war of the Austrian succession in Europe lit the first flame of hostility on the Coromandel coast. In 1746 Madras was forced to surrender to La Bourdonnais, and Fort St. David remained the only English possession in southern India. By the peace of Aix-la-Chapelle Madras was restored to the English, and English influence was generally able to secure the favour of the rulers of the Carnatic and Tanjore, while the French succeeded in placing their own nominee on the throne at Hyderabad. Clive, whose defence of Arcot in 1751 forms the turning point in Indian history, defeated Dupleix, and in 1760 the crowning victory of Wandewash was won by Colonel (afterwards Sir Eyre) Coote, over Lally. A year later, despite help from Mysore, Pondicherry was captured.

Since the beginning of the 19th century Madras has known no regular war, but occasional disturbances have called for measures of repression. In 1836 the *zamindári* of Gumsur in this remote tract was attached by government for the rebellious conduct of its chief. In 1879 the country round Rampa on the northern frontier was the scene of riots necessitating calling out the troops, but more serious were the "Anti-Shanar riots" of 1899. The Maravans of Tinnevelly and parts of Madura, resenting the pretensions of the Shanans, a toddy-drawing caste, to a higher social and religious status, organized attacks on Shanan villages. In 1763 the tract encircling Madras city, then known as the Jagir now Chingleput district, was ceded to the British by the nawab of Arcot. In 1765 the Northern Circars, out of which the French had recently been driven, were granted to the Company by the Mogul emperor, but at the price of an annual tribute of £90,000 to the nizam of Hyderabad. Full rights of dominion were not acquired till 1823, when the tribute was commuted for a lump payment. In 1792 Tippoo was compelled to cede the Baramahal (now part of Salem district), Malabar and Dindigul subdivision of Madura. In 1799, on the reconstruction of Mysore state after Tippoo's death, Coimbatore and Kanara were appropriated as the British share; and in the same year the Mahratta rajah of Tanjore resigned the administration of his territory, though his descendant retained titular rank till 1855. In 1800 Bellary and Cuddapah were made over by the nizam of Hyderabad to defray the expense of an increased subsidiary force.

In the following year the dominions of the nawab of the Carnatic, extending along the east coast almost continuously from Nellore to Tinnevilly, were resigned into the hands of the British by a puppet who had been put upon the throne for the purpose.

The last titular nawab of the Carnatic died in 1855; but his representative still bears the title of prince of Arcot, and is recognized as the first native nobleman in Madras. In 1839 the nawab of Kurnool was deposed for misgovernment and suspicion of treason, and his territories were annexed.

See INDIA, *History* and HYDER ALI.

See *Madras Manual of Administration,* 3 vols. (Madras, 1885 and 1893); S. Ayyangar, *Forty Years' Progress in Madras* (Madras, 1893); J. P. Rees, *Madras* (Society of Arts, 1901); *Madras Provincial Gazetteer* (2 vols., Calcutta, 1908).

MADRAS, the capital of Madras presidency, and the chief seaport on the eastern coast of India and third city of India, is situated in 13° 4′ N. and 80° 17′ E. The city, with its suburbs, extends nine miles along the sea and nearly four miles inland, intersected by the little river Cooum. Area, 27 sq.mi.; pop. (1941), 777,481, of whom about five-sixths are Hindus.

In the decade from 1911 to 1921 the deaths were over 11% more numerous than the births, owing to the high infantile death rate.

Although at first sight the city presents a disappointing appearance, and has no handsome streets, it has several fine buildings and many spots of historical interest. It is spread over a very wide area, and many parts of it are almost rural in character. Roughly speaking, the city consists of the following divisions: (1) George Town (formerly Black Town, but renamed after the visit of the Prince of Wales in 1906), an ill-built, densely-populated block, about a mile square, is the business part of the town, containing the banks, custom house and high court. The mercantile offices lie along the beach and on the sea-face are the pier and the new harbour. Immediately south of George Town there is (2) an open space which contains Fort St. George, the Marina, a promenade by the seashore, Government house, and several public buildings on the sea-face. (3) West and south of this lung of the city are crowded quarters which bend to the sea again at the old town of Saint Thomé. (4) To the west of George Town are the quarters of Veperi and Pudupet, chiefly inhabited by Eurasians, and the European suburbs of Egmore, Nangambakam and Perambur. (5) South-west and south lie the European quarters of Tanampet and aristocratic Adyar. Notable buildings are the cathedral, general hospital, Government house, Pachayappa's hall, high court and Chepauk palace (now the revenue board). The city has drainage works and a filtered water supply.

Madras possesses no special industries. There are several large cotton mills, engineering, dyeing and cement works, iron foundries and cigar factories. Large sums of money have from time to time been spent upon the harbour, which is entirely artificial. It is screened by breakwaters enclosing 200 ac. of calm water, dredged to a depth of 30 ft., and is thoroughly equipped. A deep water quay was in process of construction in 1926. The sea bottom is unusually flat, reaching a depth of ten fathoms only at about 2 miles from the shore. Madras conducts about 46% of the seashore trade of the presidency. The chief exports are hides and skins, oil seeds, cotton, chrome and magnesite, and the imports timber, coal and oil, grain and machinery. Madras is the centre on which all the great military roads converge, and the terminal station of two lines of railway, the Madras & Southern Mahratta line and the Madras & Tanjore section of the South Indian railway. The municipal corporation, which is the oldest in India, consists of 50 councillors of whom 41 are elected under an annually elected president. The Madras university was constituted in 1857 as an examining body. The chief educational institutions in Madras city are the Presidency college; missionary and native colleges; the medical, engineering, law and veterinary colleges; the teachers' college in Saidapet and the school of arts.

The foundation of Madras dates from 1640, when Francis

Day, chief of the East India Company's settlement at Armagon, obtained a grant of the present site of the city from a native ruler. A fort was constructed, and a gradually increasing population settled around its walls. In 1653 Madras, which had previously been subordinate to the settlement of Bantam in Java, was made an independent presidency. In 1702 Daud Khan, Aurangzeb's general, blockaded the town for a few weeks, and in 1741 the Mahrattas unsuccessfully attacked the place. In 1746 La Bourdonnais bombarded and captured Madras. The settlement was restored to the English two years later by the Treaty of Aix-la-Chapelle, but the government of the presidency did not return to Madras till 1762. In 1758 the French under Lally occupied the Black Town and invested the fort. After two months an English fleet relieved the garrison. Saint Thomé, now part of Madras, founded and fortified by the Portuguese in 1504, was held by the French from 1672 to 1674.

MADRAZO Y KUNT, DON FEDERICO DE (1815–1894), Spanish painter, was born in Rome on the 12th of February 1815. He was the son of the painter Madrazo y Agudo (1781–1859), and received his first instruction from his father, afterwards attending the classes at the Academy of San Fernando. His "Continence of Scipio," secured him admission to the Academy as a member "for merit." While decorating the palace of Vista Alegre he took up portraiture. In 1852 he went to Paris, where he studied under Winterhalter and painted portraits of Baron Taylor and of Ingres. In 1837 he carried out special work for the Gallery at Versailles. Then the artist made a lengthy stay in Rome, where he painted many subjects, sacred and profane. His sojourn in Italy was not without influence upon his subsequent work. He received the Legion of Honour in 1846. He was made a corresponding member of the Paris Academy of Fine Arts on the 10th of December 1853, and in 1873, on the death of Schnorr, the painter, he was chosen foreign member. After his father's death he succeeded him as director of the Prado Gallery and president of the Academy of San Fernando. He originated in Spain the production of art reviews and journals, such as *El Artista, El Renacimiento* and *El Semanario pintoresco*. He died at Madrid on the 11th of June 1894.

His brother, Don Louis De Madrazo, was also known as a painter, chiefly by his "Burial of Saint Cecilia" (1855). Don Federico's best-known pupil was his son, Don Raimundo De Madrazo (1841–1920).

His principal works are "Godfrey de Bouillon proclaimed King of Jerusalem," commissioned for Versailles (1837); "Maria Christina in the Dress of a Nun by the Bedside of Ferdinand III" (1843), "Queen Isabella," "The Duchess of Medina-Coeli," and "The Countess de Vilchès" (1845–47), besides a number of portraits of the Spanish aristocracy, some of which were sent to the exhibition of 1855.

MADRE DE DIOS, a department in eastern Peru, created in 1912, estimated to contain 58,842 sq.mi. It is situated in the *montaña* district east of the cordillera and is bounded north and east by Brazil and Bolivia, and south, west and north by the departments of Puno and Cusco. It occupies part of the headwaters basin of the Madre de Dios river, which flows via the Madeira river into the Amazon. Its population in 1940 was 25,212. Its capital, Puerto Maldonado, is situated on the Tambopata river at its junction with the Madre de Dios. The district, largely unexplored, possesses immense forest resources, including rubber, and gold and silver are known to exist. A railway has been projected from the Cusco line, and if carried to completion, development of the department may be rapid.

MADRID, a province of central Spain, formed in 1833 of districts previously included in New Castile, and bounded on the W. and N. by Ávila and Segovia, E. by Guadalajara, S.E. by Cuenca and S. by Toledo. Population (1940) 1,579,793, of whom 1,088,647 inhabited the city of Madrid; area, 3,090 sq.mi. Madrid belongs to the basin of the Tagus, being separated from that of the Douro by the Sierra de Guadarrama on the northwest and north, and by the Sierra de Gredos on the south-west. Like the rest of Castile, Madrid is chiefly of Tertiary formation; the soil is mostly clayey, but in part sandy. The south-eastern districts are the best watered, and produce in abundance fruit, vegetables, wheat, olives, esparto grass and excellent wine. To the north, there is timber for fuel and building. The royal domains of the Escorial, Aranjuez and El Pardo, and the preserves of the nobility, are wooded and supplied with game. The Sierra de Guadarrama has quarries of granite, lime and gypsum, and is known to contain iron, copper and argentiferous lead. Other industries are chiefly confined to the capital. All the great railways converge in this province, and it contains 221 mi. of line. Besides Madrid, the towns of Aranjuez (21,771), Alcalá de Henares (18,013) and the Escorial are described in separate articles. Other towns with more than 10,000 inhabitants are Puente de Vallecas (55,707), Chamartín (64,480) and Carabanchel Bajo (17,327), Vistalegre-Ventas (18,547), Pueblo-Nuevo-Ventas (17,698).

MADRID, the capital of Spain and of the province of Madrid, on the left bank of the river Manzanares, a right-hand tributary of the Jarama, which flows south into the Tagus. Pop. (1877), 397,816; (1900), 539,835; (1940) 1,088,647. The earliest authentic historical mention of the town (Majrít, Majoritum) occurs in the Arab chronicle, and does not take us farther back than to the first half of the 10th century. The place was finally taken from the Moors by Alphonso VI (1083), and was made a hunting seat by Henry IV, but first rose into importance when Charles V, benefiting by its keen air, made it his occasional residence. Philip II created it his capital and "only court" (*única corte*) in 1560. It is only classed as a town (*villa*), having never received the title of city (*ciudad*). Madrid is the see of an archbishop, the focus of the principal Spanish railways, the headquarters of an army corps, the seat of a university and was formerly the chief residence of the king, the court, and the captain-general of New Castile. It is surpassed in ecclesiastical importance by Toledo and in commerce by Barcelona.

Madrid is built on an elevated and undulating plateau of sand and clay, which is bounded on the north by the Sierra Guadarrama and merges on all other sides into the barren and treeless tableland of New Castile. The highest point in Madrid is 2,372 ft. above sea level. The city is close to the geographical centre of the peninsula, nearly equidistant from the Bay of Biscay, the Mediterranean and the Atlantic. Owing to its high altitude and open situation it is liable to sudden and frequent variations of climate, and the daily range of temperature sometimes exceeds 50°, the total range being from 10° to 110°.

The Inner City.—The form of Madrid proper (exclusive of the modern suburbs) is almost that of a square with the corners rounded off; from east to west it measures rather less than from north to south. Of the 16 city gates only three, the Puerta de Alcalá on the east, the Puerta de Toledo on the south and the Portillo de San Vicente on the west, actually exist. The Manzanares is spanned by six bridges, the Puente de Toledo and Puente de Segovia being the chief.

The Puerta del Sol is the centre of Madrid, the largest of its many plazas, and the place of most traffic. It derived its name from the former east gate of the city, which stood here until 1570, and had on its front a representation of the sun. On its south side stands the Palacio de la Gobernacion, or ministry of the interior, a heavy square building dating from 1768.

The Calle de Alcalá contains the Real Academia de Bellas Artes, founded in 1752 as an academy of art and music; its collection of paintings by Spanish masters includes some of the best-known works of Murillo. The Bank of Spain (1884–91) stands where the Calle de Alcalá meets the Prado; in the oval Plaza de Madrid, at the same point, is a fine 18th-century fountain with a marble group representing the goddess Cybele drawn in a chariot by two lions. The Plaza de las Cortes is so called from the Congreso de los Diputados, or house of commons, on its north side. The Plaza Mayor, built in 1619, a rectangle of about 430 ft. by 330 ft., was formerly the scene of tournaments, bull fights and *autos de fé,* which used to be viewed by the royal family from the balcony of one of the houses called the Panaderia (belonging to the guild of bakers). The house occupied by Cervantes from 1606 until his death in 1616 stands at the point where it meets the Calle de León; in this street is the Real Academia de la Historia, with a valuable library and collections of mss. and plate. In the centre of the Plaza del Oriente is a fine bronze equestrian statue of Philip IV (1621–65); it was designed by Velazquez and cast by Tacca.

Modern Development of the City.—The north and east of the city—the new suburbs—developed past the Retiro park as far as the Bull-ring, and covered all the vast space included between the Retiro, the Bull-ring and the long Paseo de la Castellana. Madrid made very rapid progress during the 20th century. The underground railway (inaugurated in 1924) facilitated the growth of garden cities, as at Carabanchel; a new broad Ronda was built from Atocha to the park of Moncloa; the Manzanares was canalized and land reclaimed along its banks; the Gran Via was completed; the Calle de Alcalá was adorned by the construction of fine banks, a new ministry, and the magnificent general post office at the end of the street; the Paseo de la Castellana was prolonged to beyond Chamartín de la Rosa; and many new parks and fine buildings were constructed prior to the civil war of 1936–39. A large new bull-ring and stadium were opened.

Principal Buildings.—As compared with other capitals Madrid has very few buildings of much architectural interest. The Basilica de Nuestra Señora de Atocha was originally founded in 1523. The collegiate church of San Isidro el Real, in the Calle de Toledo, dates from 1651; it is dedicated to St. Isidore the Labourer (d. 1170), the patron saint of Madrid, whose remains were entombed here. The church of San Francisco el Grande, which contains many interesting monuments, is also known as the National Pantheon. Of secular buildings most important is the former royal palace (Palacio Real), on the west side of the town, on rising ground overhanging the Manzanares. The present edifice was begun under Philip V in 1737 by Sacchetti of Turin, and was finished in 1764. It is in the Tuscan style, and is 470 ft. square and 100 ft. in height, the material being white Colmenar granite. It contains a valuable library and a celebrated collection of tapestries. To the north of the palace are the former royal stables and coach houses, remarkable for their extent; to the south is the armoury (Museo de la Real Armería), containing what is possibly the best collection of the kind in existence. After the Palacio Real may be mentioned the royal picture gallery (Real Museo de Pinturas), adjoining the Salon del Prado; it was built about 1785 as a museum of natural history and academy of sciences. It contains the collections of Charles V, Philip II and Philip IV, and the pictures number upwards of 2,000. They include Titian, Raphael, Tintoretto, El Greco, Ribera, Velazquez, Goya, Vandyck, Rubens and Teniers. An improved grouping of the pictures added greatly to its charm. The Biblioteca Nacional, in the Paseo de Recoletos, was founded in 1866, and completed in 1892. Eastward from the Prado are the Buen Retiro gardens, with ponds and pavilions, and a menagerie. The gardens were formerly the grounds surrounding a royal hunting seat, on the site of which a palace was built for Philip IV in 1633; it was destroyed during the French occupation.

Education, Religion and Charity.—Madrid university developed gradually out of the college of Doña Maria de Aragon, established in 1590 by Alphonso Orozco. Schools of mathematics and natural science were added in the 16th and 17th centuries, and in 1786 the medical and surgical college of San Carlos was opened. In 1836–37 the University of Alcalá de Henares (*q.v.*) was transferred to the capital and the older foundations incorporated with it. The University of Madrid thenceforth became the headquarters of education in central Spain. It has an observatory, and a library containing more than 2,000,000 printed books and mss. It gives instruction, chiefly in law and medicine, but also in literature, philosophy, mathematics and physics. Associated with the university is the preparatory school of San Isidro, founded by Philip IV (1621–65), and reorganized by Charles III in 1770. The modern Residencia de Estudiantes does excellent work. A great new university project, located in one of the suburbs, was started in 1927; uncompleted in 1936, it was the scene of much fighting in the civil war and was practically destroyed.

There are some 100 official primary schools and a large number of private ones, among which the schools conducted by the Jesuits and the Scolapian fathers claim special mention. Madrid also has schools of agriculture, architecture, civil and mining engineering, the fine arts, veterinary science and music. The school of military engineering is at Guadalajara. Besides these special schools there are a self-supporting institute for preparing girls for the higher degrees and for certificates as primary teachers, and an institute for secondary education, conducted chiefly by ecclesiastics. Among the educational institutions may be reckoned the botanical garden, dating from 1781, the libraries of the palace, the university, and San Isidro, and the museum of natural science, exceedingly rich in the mineralogical department. The principal learned society is the royal Spanish academy, founded in 1713 for the cultivation and improvement of the Spanish tongue.

Industries.—The industries of the capital developed extraordinarily after 1890. Among the most important factories are those which make articles of leather. Next come the manufactures of fans, umbrellas, sunshades, chemicals, varnishes, buttons, wax candles, beds, cardboard, porcelain, coarse pottery, matches, baskets, sweets and preserves, gloves, guitars, biscuits, furniture, carpets, corks, cards, carriages, jewellery, drinks of all kinds, plate and plated goods. There are also tanneries, saw and flour mills, glass and porcelain works, soap works, brickfields, paper mills, zinc, bronze, copper and iron foundries.

The Siege of Madrid, 1936–39.—As the capital of Spain, Madrid was the grand prize in the 1936 rebellion, and as soon as the nationalists had united their northern and southern armies in the Badajoz area, a concerted drive was started on Madrid. Four columns were converging on the city by November, and a remark by Gen. Emilio Mola, that he had a "fifth column" of sympathizers inside the city itself, gave a new phrase to world idiom. The fall of Madrid seemed imminent, and the loyalist government was moved to Valencia Nov. 9, 1936. After initial success in the suburbs, the nationalist attack was halted by the tremendous resistance of the untrained Madrid populace. For the remainder of the winter there was a deadlock, with German and Italian forces coming to the aid of the nationalists, and with the loyalists receiving help principally from Russia. In April 1937, a "popular front" defense council, representing the various socialist factions in the city, took over civil government of Madrid, although Gen. José Miaja still remained in military command. The city suffered heavily from bombardments by artillery and from air raids, notably in June 1937, and in November and December of the same year. In 1938 the forces remained deadlocked; bombardment continued, and by July rationing of food was necessary within the city. The opening of a nationalist drive late in Dec. 1938, calculated to cut off Madrid from the east coast, started the final phase of the attack. The loyalist government was driven back to Madrid from Valencia in Feb. 1939. After many riots in the city by factional groups, the capital surrendered to Gen. Francisco Franco March 29, 1939.

MADRIGAL. As a definite musical art-form, the madrigal was known by the middle of the 15th century (*see* ARCADELT). It developed on the same lines as the Motet (*q.v.*) some early examples even combining an ecclesiastical canto fermo in the tenor with secular counterpoint in the other parts. Thus Josquin's *Deploration de Jehan Okenheim* (*see* MUSIC) might be called a madrigal if the term were used for compositions to French texts at all. But by the middle of the 16th century the Italian madrigal had become the highest form of secular music, and the name was appropriated to Italian compositions regardless of the form of the words. Only Yonge's *Musica Transalpina* saved the title for English composers, and this by providing singable English texts for Italian compositions. When Lasso sets Marot's madrigals he calls his compositions "chansons." On the other hand, when Palestrina composes Petrarca's sonnets to the Virgin in memory of

*In modern scores this highly characteristic effect was first correctly transcribed in Dr. Fellowes's complete collection of the English Madrigal School.

Laura, the result appears as a volume of *Madrigali spirituali.* The fame of these made elegiac madrigals, spiritual or secular, as common as livelier kinds.

The term means a polyphony not inferior to that of the motet, and thus distinguishes madrigals from *ballets, villanellas, frottolas* and other fantastic trifles. Masses were often founded on the themes of madrigals, with little more scandal than when they used the themes of motets (*see* MASS; MOTET). Some of Palestrina's masses remained in high favour even though they were avowedly founded on madrigals with almost risqué texts.

In the 17th century the new dramatic style of Monteverdi (*q.v.*) and the eclectic experiments of Schütz put the breaking-strain upon the madrigal. It had already been overworked in the attempt to make music-drama by a choir behind the stage with pantomime in front. Vecchi, a great polyphonist, laughed this to death in his *Amfiparnasso* (*see* OPERA).

Later uses of the term seldom have a definite meaning, though there was a remarkable vitality in the mid-19th century efforts of De Pearsall, in pure madrigal style; while the *Madrigale spirituale* in Stanford's oratorio *Eden* has the beauty of pure scholarship.

(D. F. T.)

MADROÑO (*Arbutus menziesii*), a handsome North American tree of the heath family (*Ericaceae*), called also madrone and laurelwood, native to the coast region from British Columbia to southern California. It is a widely branched tree, growing to a height of 125 ft., with a trunk diameter exceeding 4 ft.; polished crimson to dark brown bark; large, lustrous, dark-green leaves, nearly white beneath; small, heath-like, white flowers in dense clusters, and bright orange-red, berry-like fruit.

MADURA, an island and residency of the Neth. Indies (Dutch *Madoera*), lying off the north-east coast of Java, from which it is separated by a shallow strait less than $1\frac{1}{2}$ miles. It is over 100 miles long and 24 miles wide and has an area of 5,473 sq.km. Pop. 1,962,462 (1051 Europeans and Eurasians). It has an undulating surface, but no mountains, 700 ft. being the greatest elevation in the west and 1,565 ft. that of the east. In the north the hills run down nearly to the sea: in the north-west and south there are extensive alluvial plains, whilst the south coast is fringed with islets, shoals and mud-banks. The geological formation reveals the relation of Madura to northern Java, since it consists largely of the same limestone rocks, of Tertiary formation, with low alluvial tracts: there are hot springs. Off the eastern coast are several islands—Sapudi, and the Kangean group, Kangean Island being 25 miles long and from 3 to 15 wide, with hills reaching 1,500 ft.

The climate, flora and fauna of Madura resemble those of East Java. Vegetation is luxuriant, but the soil is not as fertile as the average soil in Java, and one indication of this is that rice has to be imported to meet the needs of the population. Maize and cassava are the main crops, but rice, coco-nuts, coffee, coca, kapok and most of the usual Malayan fruits and vegetables are grown, and kapok, copra and coconut oil figure largely in exports, also teak, from the extensive forests in the northwest. The island is well adapted for cattle-breeding, which is engaged in extensively, and the wide expanse of coast, well sheltered on the southern side, gives opportunity for a great deal of fishing: the Kangean Islands and Sapudi yield timber, trepang and tortoise-shell. The principal industry is that of salt winning, which is a government monopoly.

The salt is obtained from saline springs and from sea water, and the largest pans are situated at Kalianget. Manufacture is according to European method and gives employment to many. The 1939 yield was 141,208 metric tons (1938: 74,411). Petroleum has been found and is worked on a small scale. The Madurese (Mohammedans), who are keen traders, fishermen and sailors, but not very good craftsmen, are shorter, but more sturdily built than the Javanese; they are also more independent, and quick-tempered, but thrifty and hard-working, and their moral standard is high: they have their own peculiar amusements of bull-racing and bull-fighting; the races, usually held in the month of September, attract huge crowds. The capital and seat of the Resident is Pamekasan, in the central southern part of the island, not far from the coast, pop. 13,403 (269 Europeans and Eurasians), which has modern buildings, including a hotel. Other towns are Sumenep, population 17,824, near which are the tombs of the princes of Sumenep; Bangkalan, population 24,000, with the old palace of the Sultan of Bangkalan, or Madura, and an interesting mosque; Sampang, pop. 12,673; Kamal; and Kalianget. A tram line crosses the island from west to east, from Kamal to Kalianget, connection being maintained with Java by means of a ferry service between Surabaya and Kamal: the line extends to Bangkalan, in the north, and passes through Pamekasan and Sumenep. There are roads along the north and south coasts, and across the centre of the island. There is telegraphic communication with Java, and Pamekasan and Sumenep possess telephone services. Dutch influence was established in Madura late in the 17th century, and the power of the ambitious prince of Madura was circumscribed by the division of the island into three regencies, Madura (or Bangkalan), Pamekasan, and Sumenep, each having its own prince, or sultan. After much native misrule, the regencies were, in 1885, united under a residency attached to Java. Japan took Madura in 1942.

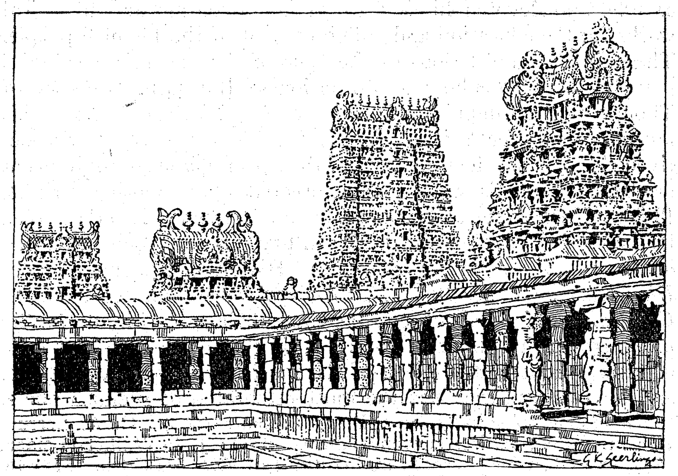
MADURA, a city and district of British India, in the Madras presidency. The city is situated on the right bank of the river Vaigai, and has a station on the South Indian railway 345 m. S.E. of Madras. Pop. (1941), 239,144. There is a government industrial school. Muslin weaving is a special industry,



FROM BENOIT "ARCHITECTURE DE L'ORIENT MEDIEVAL ET MODERNE" (LIBRAIRIE RENOUARD)

THE COURTYARD OF THE LOTUS LAKE, IN THE GREAT TEMPLE AT MADURA

This temple, said to have been built in the 16th century, is noted for its elaborately carved *gopuras*, four of which are seen in the above view

and brass work and wood carving are carried on. The city was the capital of the old Pandyan dynasty, which ruled over this part of India from the 5th century B.C. to the end of the 11th century A.D. Its great temple forms a parallelogram and is surrounded by nine elaborately carved and coloured *gopuras,* of which the largest is 152 ft. high. The temple, which contains a "hall of a thousand pillars" and some of the finest carving in southern India, is said to have been built in the reign of Viswanath, first ruler of the Nayak dynasty. The splendid palace of Tirumala Nayak, which covers a large area, has been restored, and is used for public offices. Also, there are Vasanta, a hall 33 ft. long, and the Tamakam, a pleasure-palace.

The last of the old Pandyan kings is said to have exterminated the Jains and conquered the neighbouring kingdom of Chola; but he was in his turn overthrown by an invader from the north. In 1324 a Moslem army under Malik Kafur occupied Madura, which subsequently became a province of the Hindu empire of Vijayanagar. In the middle of the 16th century the governor Viswanath established the Nayak dynasty, which lasted for a century. The greatest of the line was Tirumala Nayak (reigned 1623–59), who adorned Madura with many public buildings, and extended his empire over adjoining districts. Later Mohammedans again invaded Madura and compelled him to pay them tribute. After his death the kingdom of Madura gradually fell to pieces, being invaded by both Mohammedans and Mahrattas. About 1736 the district fell into the hands of the nawab of the Carnatic, and the line of the Nayaks was extinguished. About 1764 British officers took charge of Madura in trust for the last independent nawab of the Carnatic, whose son finally ceded his rights of sovereignty to the East India company in 1801.

The District of Madura has an area of 4,883 sq.mi. Pop. (1941) 2,446,601. It consists of a section of the plain stretching from the mountains east to the sea, coinciding with the basin of the Vaigai river, and gradually sloping to the south-east. The plain is broken by the outlying spurs of the Ghats, rising 8,000 feet above sea level. They enclose a plateau of about 100 square miles. On it is situated the sanatorium of Kodaikanal, and fruit is grown and coffee-planting carried on. Other crops are millets, rice, other food-grains, oil-seeds and cotton. Tobacco is grown chiefly near Dindigul. The Periyar tunnel through the Travancore hills, conveys the rainfall across the watershed for irrigation.

MADVIG, JOHAN NICOLAI (1804–1886), Danish philologist, was born on the island of Bornholm, on Aug. 7, 1804. He was educated at Frederiksborg and at the University of Copenhagen, where in 1829 he became professor of Latin language and literature. In 1848 Madvig entered parliament and became minister of education, and later (1852), director of public instruction. From 1856 to 1863 he was president of the council and leader of the National Liberal party. His chief work was the study and teaching of Latin and Greek, and the improvement of the classical schools. He died at Copenhagen on Dec. 12, 1886.

Besides his unsurpassed edition of Cicero's *De Finibus* (1839, 3rd ed., 1876), Madvig published *Der römische Stats Forfatning og Forvaltning* (2 vols., 1881–82, Fr. trs., 1882–84); *Livseringringer* (1887); and many works on Latin grammar and Greek syntax. *See* J. E. Sandys, *History of Classical Scholarship,* iii. (2nd ed., 1908).

MAECENAS, GAIUS (Cilnius), Roman patron of letters, was probably born between 74 and 64 B.C., perhaps at Arretium. Expressions in Propertius (ii. 1, 25–30) seem to imply that he had taken some part in the campaigns of Mutina, Philippi and Perusia. He prided himself on his Etruscan lineage, and claimed descent from the princely Cilnii of Arretium. His great wealth may have been in part hereditary, but he owed his position and influence to his close connection with the emperor Augustus. He first appears in history in 40 B.C., when he was employed by Octavian in arranging his marriage with Scribonia, and afterwards in assisting to negotiate the peace of Brundusium and the reconciliation with Antony. It was in 39 B.C. that Horace was introduced to Maecenas, who had before this received Varius and Virgil into his intimacy. In the "Journey to Brundusium," (Horace, *Satires,* i. 5) in 37, Maecenas and Cocceius Nerva are described as having been sent on an important mission, and they were successful in patching up, by the Treaty of Tarentum, a reconciliation between the two claimants for supreme power. During the Sicilian war against Sextus Pompeius in 36, Maecenas was sent back to Rome, and was entrusted with supreme administrative control in the city and in Italy. He was vice-gerent of Octavian during the campaign of Actium, when, with great promptness and secrecy, he crushed the conspiracy of the younger Lepidus; and during the subsequent absences of his chief in the provinces he again held the same position. During the latter years of his life he fell somewhat out of favour with his master. Maecenas died in 8 B.C., leaving the emperor heir to his wealth.

He seems to have been of great use to Augustus in the establishment of the empire, and was credited with having influenced him towards a humane policy. The best summary of his character as a man and a statesman is that of Velleius Paterculus (ii. 88), who describes him as "of sleepless vigilance in critical emergencies, far-seeing and knowing how to act, but in his relaxation from business more luxurious and effeminate than a woman." His character as a munificent patron of literature has made his name a household word. His patronage was exercised with a political object, and he sought to use the genius of the poets of the day to glorify the new régime. The diversion of Virgil and Horace towards themes of public interest may be ascribed to him, and he endeavoured less successfully to do the same thing with Propertius. The great charm of Maecenas in his relation to the men of genius who formed his circle was his simplicity, cordiality and sincerity. He admitted none but men of worth to his intimacy, and when once admitted they were treated like equals. Much of the wisdom of Maecenas probably lives in the *Satires* and *Epistles* of Horace. It has fallen to the lot of no other patron of literature to have his name associated with works of such lasting interest as the *Georgics* of Virgil, the first three books of Horace's *Odes,* and the first book of his *Epistles.*

Maecenas himself wrote in both prose and verse. His prose works on various subjects—*Prometheus, Symposium* (a banquet at which Virgil, Horace and Messalla were present), *De cultu suo* (on his manner of life)—were ridiculed by Augustus, Seneca and Quintilian for their awkward style. Dio Cassius states that Maecenas was the inventor of a system of shorthand.

There is no good modern biography of Maecenas. The best known is that by P. S. Frandsen (1843). *See* "Horace et Mecène" by J. Girard, in *La Révue politique et littéraire* (Dec. 27, 1873); V. Gardthausen, *Augustus und seine Zeit,* i. 762 *seq.;* ii. 432 *seq.* The chief ancient authorities for his life are Horace (*Odes* with Scholia), Dio Cassius, Tacitus (*Annals*), Suetonius (*Augustus*). The fragments have been collected and edited by F. Harder (1889).

MAECIANUS, LUCIUS VOLUSIUS (2nd. cent.), Roman jurist, was the tutor in law of the emperor Marcus Aurelius. When governor of Alexandria he was slain by the soldiers, as having participated in the rebellion of Avidius Cassius (175). Maecianus was the author of works of trusts (*Fideicommissa*), on the *Judicia publica,* and of a collection of the Rhodian laws relating to maritime affairs. His treatise on numerical divisions, weights and measures (*Distributio*) is in part extant.

See Capitolinus, *Antoninus,* 3; Vulcacius Gallicanus, *Avidius Cassius,* 7; edition of the metrological work by F. Hultsch in *Metrologicorum scriptorum reliquiae,* ii. (1866); Mommsen in *Abhandlungen der sächsischen Gesellschaft der Wissenschaften,* iii. (1853).

MAELDUIN or **MAELDUNE, VOYAGE OF,** an early Irish romance. The text exists in an 11th-century redaction, by a certain Aed the Fair, the "chief sage of Ireland," but dates back to the 8th century. It belongs to the group of Irish romance, the *Navigations* (*Imrama*), resembling the classical tales of the wanderings of Jason, of Ulysses and of Aeneas. Maelduin, the foster-son of an Irish queen, learnt on reaching manhood that he was the son of a nun, and that his father, Ailill of the edge of battle, had been slain by a marauder from Leix. He set sail to seek his father's murderer, taking with him, in accordance with the instructions of a sorcerer, 17 men. His three foster-brothers swam after him, and were taken on board. This increase of the fateful number caused Maelduin's vengeance to be deferred for three years and seven months, until the last of the intruders had perished. The travellers visited many strange islands, and met with a long series of adventures, some of which are familiar from other sources. The *Voyage of St. Brendan* (*q.v.*) has very close similarities with the *Maelduin,* of which it is possibly a clerical imitation, with the important addition of the whale-island episode, which it has in common with "Sindbad the Sailor."

Imram Curaig Mailduin, is preserved, in each case imperfectly, in the *Lebor na h Uidre,* a ms. in the Royal Irish academy, Dublin; and in the *Yellow Book of Lecan,* ms. H. 216 in the Trinity college library, Dublin; fragments are in Harleian ms. 5,280 and Egerton ms. 1,782 in the British Museum. There are translations by Patrick Joyce, *Old Celtic Romances* (1879), by Whitley Stokes (a more critical version, printed together with the text) in *Revue celtique,* vols. ix. and x. (1888–89). *See* H. Zimmer, "Brendan's Meerfahrt" in *Zeitschrift für deutsch. Altertum.,* vol. xxxiii. (1889). Tennyson's *Voyage of Maeldune* includes the framework of the romance.

MAELIUS, SPURIUS (d. 439 B.C.), a wealthy Roman plebeian, who during a severe famine bought up a large amount of corn and sold it at a low price to the people. Lucius (or Gaius) Minucius, the patrician *praefectus annonae* (president of the market), thereupon accused him of courting popularity with a view to making himself king. The cry was taken up. Maelius, summoned before the aged Cincinnatus (specially appointed dictator), refused to appear, and was slain by Gaius Servilius Ahala; his house was razed to the ground, his corn distributed amongst the people, and his property confiscated. The open space called Aequimaelium, on which his house had stood, preserved the memory of his death.

See Livy, iv. 13; Cicero, *De senectute* 16, *De amicitia* 8, *De republica,* ii. 27; Florus, i. 26; Dion. Halic. xii. 1.

MAELSTROM, a term originally applied to the Moskenstrom, a strong current running between the islands of Moskenaes and Mosken in the Lofoten Islands off the west coast of Norway. Its power has been much exaggerated though it is dangerous in certain states of wind and tide. The original name occurs on Mercator's *Atlas* of 1595, and it has been used generically for large whirlpools elsewhere. It is probably from Dutch *malen,* to grind, and *stroom,* a stream.

MAENADS, the female attendants of Dionysus (Gr. Μαινάδες, frenzied women); also called Bacchae, Lenae, Thyiades, Clodones and Mimallones.

See A. Legrand in Daremberg and Saglio's *Dictionnaire des antiquités,* and A. Rapp in Roscher's *Lexikon.*

MAERLANT, JACOB VAN (*c.* 1235–*c.* 1300), Flemish poet, was born in the Franc de Burges (tradition says at Damme) between 1230 and 1240. He was sacristan of Maerlant, in the island of Ost-Voorne, and afterwards clerk to the magistrates at Damme. His early works are free translations of French romances. Maerlant's most serious work in the field of romance was his *Ystorien van Troyen* (*c.* 1264), a poem of some forty thousand lines, translated and amplified from the *Roman de Troie* of Benoît de Sainte-More. From this time Maerlant rejected romance as idle, and devoted himself to writing scientific and historical works for the education and enlightenment of the Flemish people. These include translations of the *Secreta Secretorum;* a metrical paraphrase of Josephus; a translation of the natural history of Thomas de Cantimpré; and other works. In 1284 he began his *magnum opus,* the *Spiegel historiael,* a history of the world, derived chiefly from the third part of the *Speculum majus* of Vincent de Beauvais. This work was completed by two other writers, Philipp Utenbroeke and Lodowijk van Velthem. Maerlant died in the closing years of the 13th century, his last poem, *Van den lande van oversee,* dating from 1291. His original poems include: *Die Clausule van der Bible, Der Kerken Clage,* imitated from the *Complaintes* of Rutebeuf, and the three dialogues entitled *Martijn* in which the fundamental questions of theology and ethics were discussed. Maerlant was one of the most learned men of his age, and for two centuries was the most celebrated of Flemish poets.

Verdam.

MAES, NICOLAS (1632–1693), Dutch painter born at Dordrecht, went about 1650 to Amsterdam, where he entered Rembrandt's studio. Before his return to Dordrecht in 1654 Maes painted a few Rembrandtesque genre pictures, with life-size figures and in a deep glowing scheme of colour, like the "Reverie" at the Ryks museum in Amsterdam, the "Card Players" at the National Gallery, and the "Children with a Goat Carriage," in the collection of the late J. P. Morgan, New York. In his best period, from 1655 to 1665, Maes devoted himself to domestic genre on a smaller scale, retaining to a great extent the magic of colour he had learnt from Rembrandt. His favourite subjects were women spinning, or reading the Bible, or preparing a meal. He visited Antwerp between 1660 and 1670, and his Antwerp period coincides with a complete change in style and subject. He devoted himself almost exclusively to portraiture, and abandoned the intimacy and glowing colour harmonies of his earlier work for a careless elegance which suggests the influence of Van Dyck. The change gave rise to the theory of the existence of another Maes, of Brussels. Maes is well represented at the National Gallery by five paintings: "The Cradle," "The Dutch Housewife," "The Idle Servant," "The Card Players," and a man's portrait. At Amsterdam, besides the splendid examples to be found at the Ryks museum, is the "Inquisitive Servant" of the Six collection. At Buckingham Palace is "The Idle Servant," and at Apsley House "Selling Milk" and "The Listener." Other examples are at Berlin, Brussels, Leningrad, The Hague, Frankfort, Hanover and Munich.

See Hofstede DeGroot, *Catalogue of Dutch Painters* (1916).

MAESTRO, a warm north-westerly summer wind chiefly prevalent on the western coast of the Adriatic sea and associated with the eastward movement depressions south of Italy; in winter it is a cool wind contrasting with the sirocco (*q.v.*).

MAETERLINCK, MAURICE (1862–), Belgian-French dramatist and poet, of Flemish extraction, was born at Ghent on Aug. 29, 1862. He was educated at the Collège Sainte-Barbe, and then at the university of Ghent. In 1887 he settled in Paris, where he immediately became acquainted with Villiers de l'Isle-Adam and the leaders of the symbolist school of French poetry. At the death of his father, Maeterlinck returned to Belgium, where he thenceforth mainly resided: in the winter at Ghent, in the summer on an estate at Oostacker. His career as an author began in 1889, when he published a volume of verse, *Serres chaudes,* and a play, *La Princesse Maleine,* the latter originally composed in metre, but afterwards rewritten in prose. In 1890 he published, in Brussels, two more plays, *L'Intruse* and *Les Aveugles;* followed in 1891 by *Les Sept princesses.* His strong leaning to mysticism was now explained, or defined, by a translation of the *Adornment of the Spiritual Marriage* of Ruysbroeck (*q.v.*) which Maeterlinck brought out in 1891. In 1892 appeared *Pelléas et Mélisande,* followed in 1894 by those very curious and powerful little dramas written to be performed by marionettes: *Alladine et Palomides, Intérieur* and *La Morte de Tintagiles.* In 1895 Maeterlinck brought out, under the title of *Annabella,* a translation of Ford's *'Tis Pity She's a Whore,* with a preface. Two philosophical works followed, a study on Novalis (1895) and *Le Trésor des humbles* (1896). In 1896 he returned to drama with *Aglavaine et Sélysette* and to lyric verse with *Douze chansons.* A monograph on the ethics of mysticism, entitled *La Sagesse et la destinée,* was issued, as a kind of commentary on his own dramas, in 1898; and in 1901 Maeterlinck produced a volume of prose, in which philosophy, fancy and natural history were mingled—*La Vie des abeilles.*

The nature of Maeterlinck's early writings, whether in prose or verse, was strictly homogeneous. Whether in philosophy, or drama, or lyric, Maeterlinck was exclusively occupied in revealing, or indicating, the mystery which lies only just out of sight, beneath the surface of ordinary life. In order to produce this effect of the mysterious he aimed at an extreme simplicity of diction, and a symbolism so realistic as to be almost bare. His plays are occupied with the spiritual adventures of souls, and the ordinary facts of time and space have no influence upon the movements of the characters. We know not who these orphan princesses, these blind persons, these pale Arthurian knights, these aged guardians of desolate castles, may be; we are not informed whence they come, nor whither they go; there is nothing concrete or circumstantial about them. Their life is intense and consistent, but it is wholly of a spiritual character; they are mysterious with the mystery of the movements of a soul. In spite of the shadowy action of Maeterlinck's plays, which indeed require some special conditions and contrivances for their performance, they are produced with remarkable success before audiences who cannot be suspected of mysticism, in most of the countries of Europe. His later work, published after he settled in France, presents a marked contrast. Several of his pre-War essays, collected in *The Buried Temple* (1902), *The Double Garden* (1909), *Life and Flowers* (1907), and more particularly his book on *Death* (1912), are inspired by a reaction against his early mystic and fatalistic tendencies. The same contrast applies to the spirit of such plays as *Monna Vanna* (1909) and *Mary Magdalene* (1909), in which the action is concentrated in a few important scenes, more according to the Racinian than to the Shakespearian method.

His interest in Shakespeare is nevertheless shown in his essay on King Lear, *Life and Flowers,* and in the translation of *Macbeth* (1910). *The Blue Bird* (1910), produced in 1911, still increased the popularity of the Belgian writer in English-speaking countries. It was followed by *The Betrothal* (1919), produced in London in 1921. Maeterlinck wrote a war play dealing with the German occupation of Belgium: *The Burgomaster of Stilemonde* (1920) produced in London by Sir J. Martin Harvey. *The Miracle of St. Anthony* and *Mountain Paths* appeared in 1919, and two more plays in a modern setting, *The Cloud that Lifted* and *The Power of the Dead,* in 1923. Most of the works of Maurice Maeterlinck have been translated into English. Maeterlinck was awarded the Nobel Prize for literature in 1911.

See J. Bithell, *Life and Writings of Maurice Maeterlinck* ("Great Writers," 1913); G. F. Sturgis, *The Psychology of Maeterlinck as Shown in his dramas* (1914); M. Clark, *Maurice Maeterlinck, poet and philosopher* (1915); H. Meyer-Benfey, *Das Maeterlinck-Buch* (1923).

MAFEKING, a town in the Cape Province, near the frontier of the Bechuanaland Protectorate; 25° 52′ S., 25° 41′ E.; altitude 4,194 ft. Its pop. (1936) of 4,666 makes it the trade centre for the protectorate and the western Transvaal. It is also the headquarters of the railway system between Kimberley and Bulawayo, and is the chief seat of the administration of the Bechuanaland Protectorate. The native town, a separate entity, situated about a mile away, is the chief place of the Barolong tribe, and has a population of about 3,000. The town was besieged by the Boers from Oct. 12, 1899, to May 17, 1900. (*See* SOUTH AFRICAN WAR, 1899–1902.) In memory of those who died in its defence, the English church was erected and also a memorial before the town hall.

MAFFEI, FRANCESCO SCIPIONE, MARCHESE DI (1675–1755), Italian archaeologist and man of letters, was born at Verona on June 1, 1675. He studied in Parma, at the Jesuit College, and at Rome; and in 1703–04 he took part as a volunteer in the war of succession, fighting on the Bavarian side at Donauwerth. His *Merope,* a tragedy regarded by some critics as the best Italian tragedy before Alfieri, appeared in 1713; *Teatro italiano,* a small collection of works for presentation on the stage, in 1723–25; and *Le Ceremonie,* an original comedy in 1728. From 1718 he became specially interested in the archaeology of his native town, and his investigations resulted in the valuable *Verona illustrata* (1731–1732). Maffei died at Verona on Feb. 11, 1755.

MAFIA. A word of uncertain origin, used to designate a specific form of criminality which arose on the great landed estates (*latifundia*) of Sicily as a result of bad government during a long period of the island's history, and more especially during the disorders consequent on the Napoleonic invasion of South Italy. Lawless conditions led the owners of large estates to place their lands in the charge of energetic ruffians who exercised almost despotic powers over a terrorized peasantry. The contiguity of the estates enabled these men to form an organization which gradually became very extensive and powerful, so much so that in time it turned against the land-owners themselves. The members of the organization were not very numerous, but, bound by close ties of fellowship and capable of any crime, they compelled the land-owners to employ persons of their choice, fixed the compensation they claimed for their services, and the rents and price of the lands and of the crops entrusted to their protection. Their activities sometimes extended to neighbouring towns, they made it practically impossible for lands or crops to be sold at open auction, and effectively hindered efforts likely to interfere with their interests. On the other hand, fierce quarrels of all kinds arose among them leading to terrible acts of revenge; whence the formation of bands of outlaws, at feud among themselves, and all the crimes consequent on outlawry: robbery, rapine, extortion.

A complicated code of traditions regulated the *mafia*, based on so-called *omertà* (from Sicilian *omu*, man), the obligation never, under any circumstances, to apply for justice to the legally constituted authorities, and never to assist in any way in the detection of crime committed against oneself or others. Absolute silence was required and enforced by ruthless reprisals, the right to avenge injuries being reserved to the victims or their families. Like the Camorra (*q.v.*), the Mafia was soon powerful in various social classes. In Sept. 1892, about 150 Mafiusi were arrested at Catania, but the only result was to drive some of the members abroad, with unpleasant results to other countries. In Oct. 1890 David Hennessy, chief of police in New Orleans, was murdered. Subsequent legal inquiry proved the crime to be the work of the Mafia, which had been introduced into the United States 30 years before. In May 1890 a band of Italians living in New Orleans had ambushed another gang of their fellow countrymen belonging to a society called *Stoppaghera*. The severe police measures taken brought the vengeance of the society upon Hennessy. Eleven Italians were indicted on suspicion of being implicated in his murder; but the jury was terrorized and acquitted six. On March 14, 1891, a mob led by well-known New Orleans citizens broke into the gaol where 19 Italians were imprisoned and lynched 11 of them, a fact which brought to an end a long diplomatic incident between the Italian government and the United States.

Since 1860, after the fall of the Bourbon monarchy, the Italian government had endeavoured with varying success to rid Sicily of the Mafia; but in the various Sicilian provinces the police authorities continued to tolerate it.

When the fascist regime came into power, after 1922, Sicily and Piedmont in the north were the regions of Italy most opposed to it. Many opponents of fascism have ascribed this opposition to the decision taken by the fascist regime to use its exceptional powers to capture and bring to trial the leaders of the Mafia. In a series of trials at Palermo and neighbouring Termini Imerese, in 1927, the accused, in batches of as many as 150, were brought before the courts; and their victims gave evidence against them. The leaders received life sentences and heavy punishment was meted out to their accomplices. Unfortunately, the fascist government used this occasion to get rid, at the same time, of honest Sicilians strongly opposed to it. And this fact became an advantage for the legend of the Mafia which, although composed in the recent generations of criminals, did not lack in its distant origins of a certain chivalrous element, since it appeared to many as a force fighting the Spanish misrule and feudal abuses.

See Alongi, *La Maffia* (Turin, 1887); Le Faure, *La Maffia* (1892); C. W. Heckethorn, *Secret Societies of all Ages* (1897); W. Agnew Paton, *Picturesque Sicily* (1898); A. C. Train, *Courts, Criminals and the Camorra* (1912). (O. R. A.; X.)

MAFRA, a town of Portugal, 20 mi. N.W. of Lisbon. Pop. (1940) 3,223. Mafra is remarkable for its monastery, church and palace, built by John V. in 1717–1732, in consequence of a vow to build a convent for the poorest friary of the kingdom—which proved to be a small Franciscan settlement here. The architects, Johann Friedrich Ludwig of Regensburg, and his son Johann Peter, took the Escorial for their model; but the imitation is less successful than the original, though the cost exceeded £4,000,000. The building is in the form of a parallelogram measuring upwards of 800 ft. from north to south and 700 ft. from east to west; it is said to contain 866 rooms, and to be lighted by no fewer than 5,200 windows. The church is sumptuously built of marble, and richly adorned with statues and other objects of art. In each of the twin towers there is a chime of 57 bells.

MAGADHA, an ancient kingdom of India, mentioned in the *Ramayana* and the *Mahābhārata*. It comprised that portion of Behar lying south of the Ganges, with its capital at Pataliputra or Patna. The scene of many incidents in the life of Gautama Buddha, it was a holy land, and was also the seat of the Maurya Empire, founded by Chandragupta, which extended over all India under Asoka, and, later, of the Gupta dynasty.

MAGADIS, an ancient Greek instrument believed to have been of the dulcimer type and provided with bridges so disposed as to facilitate the playing of octaves, whence the term magadizing for the making of this music, *i.e.*, in octaves. *See* HARMONY.

MAGALLANES (Spanish form of *Magellan*), a province of southern Chile extending from 49° S. to Cape Horn and including the mainland from the Argentine frontier to the Pacific coast, the islands extending along that coast, the Fuegian archipelago, and the western half of Tierra del Fuego. Area, 52,271 sq.mi. according to the most recent official definition; population (1940 census) 48,813. It is one of the most inhospitable regions of the world, being exposed to cold westerly storms for most of the year. The islands are barren, but the mainland is covered with forests, practically inaccessible to exploitation because of the inclement climate and the wet spongy soil. The coast is indented with bays and fjords and affords remarkable scenery. There is little animal life on land, but the coast is frequented by the seal and sea-otter and the sheltered waters by countless sea-fowl. The only permanent settlements are at Punta Arenas, population (1940) 29,883, the capital, on the Straits of Magellan, Palomares on Seno Otway, Mina Marta on Seno Skyring, Ultima Esperanza (Last Hope) on the east shore of Worsley sound, and a few other such isolated colonies. All are east of the Andean ranges and partially sheltered from the westerly storms. In this sheltered region there are open plains where sheep are grazed. Sheep ranges have been established also on Tierra del Fuego. There are in all some 50 great sheep farms in this territory, containing several million sheep. Many of these belong to British corporations, and are in charge of Scotch shepherds. Wool to the amount of 20,000,000 lb. is shipped annually and huge quantities of chilled or frozen mutton are sent out from the packing houses in Punta Arenas. Some nomadic tribes of Indians inhabit Tierra del Fuego and the extreme southern end of the mainland, but their numbers are small. Coal is found near Punta Arenas, and there is gold.

MAGAZINE: *see* PERIODICAL.

MAGDALA (more correctly MAKDALA), a natural stronghold in the country of the Wollo Gallas, Ethiopia, about 250 mi. W. of Jibuti on the Gulf of Aden, in 11° 22′ N., 39° 25′ E. The basaltic plateau of which it consists rises 9,110 ft. above the sea. It is about ¾ mi. in length by less than ½ mi. in breadth, and lies more than 1,000 ft. higher than the neighbouring plain of Arogié. Chosen in about 1860 by the emperor Theodore of Ethiopia as his principal stronghold in the south, Magdala owes its fame to the fact that, as the place of imprisonment of the English captives, it became the goal of the great English expedition of 1868, when it had huts for a population of about three thousand.

See Clements Markham, *History of the Abyssinian Expedition* (1869); and H. Rassam, *British Mission to Theodore* (1869).

MAGDALENIAN. The term given to the last great Palaeolithic period, which is represented at La Madeleine, in lower Vézére, France, also in England, at Cheddar and Kent's Cavern.

MAGDEBURG, a city of Germany, capital of the Prussian province of Saxony. It lies mainly on the left bank of the Elbe, 88 m. S.W. from Berlin and at the junction of main lines to Leipzig, Brunswick, Cassel and Hamburg. Pop. (1939) 334,358.

History.—Magdeburg, which was a small trading settlement at the beginning of the 9th century, owes its early prosperity chiefly to Otto the Great, who established a convent here about 937. In 968 it became the seat of an archbishop. Although burnt down in 1188, Magdeburg became a flourishing commercial town during the 13th century, and was an important member of the Hanseatic League. Its bench of jurats (*Schöppenstuhl*) became celebrated, and "Magdeburg law" (*Magdeburger Recht*), securing the administrative independence of municipalities, was widely adopted. During the middle ages the citizens were almost constantly at variance with the archbishops, and by the end of the 15th century had become nearly independent of them. The town embraced the Reformation in 1524, and was thenceforth governed by Protestant titular archbishops. It successfully resisted Wallenstein for seven months in 1629, but was stormed and sacked by Tilly in May 1631. The whole town, with the exception of the cathedral, and about 140 houses, was burned to the ground, and the greater part of its inhabitants were butchered. By the peace of Westphalia (1648) the archbishopric was converted into a secular duchy, to fall to Brandenburg on the death of the last administrator, which happened in 1680. During World War II the city, with its oil tanks, railway connections and factories, was severely damaged by British bombing attacks.

Buildings.—In the Elbe, between the old town and the Friedrichstadt, lies an island whereon stands the citadel; this is united with both banks by bridges. With the exception of the Breite Weg running from north to south, the streets of the town proper are narrow and crooked. The Friedrich Wilhelms Garten stands on the site of the convent of Berge, which was founded in 968 and suppressed in 1809. The most important building in Magdeburg is the cathedral, dedicated to SS Maurice and Catherine, a structure of the 14th century, exhibiting an interesting blending of Romanesque and Gothic architecture. The two western towers were completed about 1520. The Liebfrauenkirche, the oldest church in Magdeburg, is a Romanesque edifice of the 12th and 13th centuries, which was restored in 1890–91. The town hall (Rathaus) was built in 1691 and enlarged in 1866. The Breite Weg and the old market contain gable-ended private houses in the style of the Renaissance. In front of the town hall stands an equestrian statue of Otto the Great, erected about 1290. There are an agricultural college and an observatory.

Industries.—The first place amongst the industries is taken by the ironworks (one being a branch of the Krupp firm, the Grusonwerke), which produce armour and machinery. Of almost equal importance are the sugar refineries and chicory factories. Then come establishments for making tobacco, gloves, chocolate, artificial manure, cement, varnish, chemicals, glass and pottery. There are also distilleries and breweries, and factories for the manufacture of instruments and rubber wares. Magdeburg is the central market in Germany for sugar and chicory, but trades extensively also in cereals, fruit, vegetables, groceries, cattle, horses, wool, cloth, yarn, leather, coal and books. The completion of the Mittelland canal in 1937 made Magdeburg the centre of a 7,000-mi. network of inland waterways extending from the Rhine to East Prussia.

The Archbishopric of Magdeburg was carved out of the bishopric of Halberstadt when it was founded in 968. The doctrines of the reformers made their appearance in the diocese early in the 16th century, and soon Archbishop Sigismund, a son of the elector of Brandenburg, openly accepted Lutheranism. The distinct office of burgrave dates from Charlemagne, although its holder was not at first called by this name, and it soon became one of great importance. The burgrave was the king's representative; he was charged with the administration of the royal estates in a given district, and in general with watching the royal interests therein. In 1294 it was united with the archbishopric and the prelates, except from 1538 to 1579, retained it until the secularization of the see.

The Magdeburg Centuries (*Magdeburger Zenturien*) is the name given to the first general history of the Christian Church written from a Protestant point of view. It was compiled in Magdeburg, and was written in Latin in 1562. The cost of the undertaking was borne by some of the German Protestant princes. As the *Historia ecclesiae Christi* it was first published at Basel in seven volumes (1559–74). It deals with the Church down to 1400, and the earlier part has been translated into German (Jena, 1560–65).

MAGEE, WILLIAM (1766–1831), archbishop of Dublin, was born at Enniskillen, Co. Fermanagh, and educated at Trinity college, Dublin, where he was elected fellow in 1788. He was ordained in 1790. His *Discourses on the Scriptural Doctrines of Atonement and Sacrifice* (1801), a polemic against Unitarian theology, was answered by Lant Carpenter. Magee was appointed professor of mathematics and senior fellow of Trinity in 1800, but in 1812 he resigned, and in 1813 became dean of Cork. In 1819 he was consecrated bishop of Raphoe. In 1822 the archbishop of Dublin was translated to Armagh, and Magee succeeded him at Dublin. Though generally tolerant, he opposed the movement for Catholic Emancipation. He died on Aug. 18, 1831.

See *Works of the Most Reverend William Magee, D.D.* (1842).

MAGEE, WILLIAM CONNOR (1821–1891), British divine, was born at Cork, and educated at Trinity College, Dublin. In 1864 he became dean of Cork and chaplain to the lord lieutenant. His remarkable powers were shown in the defence of the Irish church at the time of the disestablishment proposals of 1868, when his brilliant speeches induced Disraeli to offer him the bishopric of Peterborough. He justified his appointment by his magnificent speech when the Disestablishment Bill reached the House of Lords in 1869. He took up the temperance question, and declared in the House of Lords that he would rather see "England free than England compulsorily sober," an utterance which the extreme advocates of total abstinence misquoted and attacked. He supported the movement for abolishing the recitation of the Athanasian Creed in the public services of the Church of England. Magee took a prominent part in the Ritualist controversy, opposing what he conceived to be romanizing excess in ritual, as well as the endeavour of the opposite party to "put down Ritualism," as Disraeli expressed it, by the operation of the civil law. His incisive way of putting things earned for him the title of the "Militant Bishop." He died on May 5, 1891, about four months after his appointment to the see of York.

See Canon MacDonnell, *Life and Letters* (2 vols. 1896).

MAGELLAN, FERDINAND (*c.* 1480–1521), the first to undertake a voyage around the globe, was born at Sabrosa in the Villa Real district of the Traz-os-Montes province of Portugal. He was a son of Pedro de Magalhães, and belonged to the fourth order of Portuguese nobility (*fidalgos de cota de armas*). He was brought up as a page of Queen Leonor, consort of King John II. "the Perfect."

Service in the Indies.—In 1495 he entered the service of Manuel "the Fortunate," John's successor, and in 1504 enlisted as a volunteer for the Indian voyage of the first Portuguese viceroy in the East, Francisco de Almeida. He sailed on March 25, 1505; was wounded at Cannanore on March 16, 1506; was then sent with Nuno Vaz Pereira to Sofala to build a Portuguese fortress at that place; returned to India early in 1508; and was again wounded at the battle of Diu on Feb. 3, 1509. At Cochin (Aug. 19, 1509) he joined Diogo Lopes de Sequeira on his famous voyage intended for the Spice Islands, when the Portuguese almost fell victims to Malay treachery at Malacca. Before Oct. 10, 1510 he had been rewarded for his many services with the rank of captain. He again distinguished himself at the taking of Malacca by Albuquerque (July–Aug., 1511), and was then sent on by the viceroy with Antonio d'Abreu to explore the Spice Islands (Moluccas). Leaving Malacca at the end of December 1511, this squadron sailed along the north of Java, passed between Java and Madura, left Celebes on their left, coasted by the Gunong Api volcano, touched at Bura, and so reached Amboyna and Banda. At the last-named they found such abundance of spices that they came straight back to Malacca without visiting Ternate, as had been intended.

Fitting Out the Expedition.—Magellan returned to Portugal in 1512. On July 14 of that year he was raised to the rank of *fidalgo escudeiro;* and in 1513 he accompanied a Portuguese expedition against Azamor in Morocco. The city was taken on Aug. 28–29, 1513; but Magellan was subsequently wounded, and lamed for life, in a sortie; he was also accused of trading with the Moors. The accusation was subsequently dropped, but Magellan fell into disfavour with King Manuel, who let him understand that he would have no further employment in his country's service (after May 15, 1514). Magellan formally renounced his nationality, and went to offer his services to the court of Spain. He reached Seville on Oct. 20, 1517, and thence went to Valladolid to see Charles V. With the help of Juan de Aranda, one of the three chief officials of the India House at Seville, and of other friends, especially Diogo Barbosa, a Portuguese like himself, naturalized as a Spaniard, who had acquired great influence in Seville, and whose daughter he now married, he gained the ear of Charles and of the powerful minister, Juan Rodriguez de Fonseca, bishop of Burgos, the persistent enemy of Columbus, the steady supporter of his great successor.

Magellan proposed to reach the Spice Islands of the East Indies by the west; for that purpose he hoped to discover a strait at the extreme south of South America, and is said to have declared himself ready to sail southwards to 75° to realize his project. Ruy

Faleiro the astronomer, another Portuguese exile, aided him in the working out of his plan, and he found an invaluable financial ally in Christopher de Haro, a member of a great Antwerp firm, who owed a grudge to the king of Portugal. On March 22, 1518, Magellan and Faleiro, as joint captains-general, signed an agreement with Charles V., by which one-twentieth of the clear profits were to fall to them; further, the government of any lands discovered was vested in them and their heirs, with the title of *Adelantados*. On Aug. 10, 1519, the fleet of five vessels, under Magellan's command, left Seville and dropped down the Guadalquivir to S. Lucar de Barrameda, at the mouth of the river, where they remained more than five weeks. On Sept. 20, the armada put to sea. Of the vessels which composed it, the "Trinidad" was the flagship, and the "Vittoria" the only one which accomplished the circumnavigation. Antonio Pigafetta of Vicenza, an Italian gentleman who has left the best history of the voyage, went as a volunteer in Magellan's suite. Faleiro stayed behind, having cast his horoscope and found that the venture would be fatal to him. Before starting, Magellan made his will and addressed a memorandum to Charles V., assigning geographical positions connected with the controversy he was intending to settle: viz., the proper drawing of a demarcation-line between the spheres of Spain and Portugal in the East Indies, and the inclusion of the Moluccas within the Spanish sphere.

Passing the Straits.—Steering south-west and calling at Teneriffe (Sept. 26–Oct. 3), Magellan sighted South America at Cape St. Augustine, near Pernambuco on Nov. 29; thence he followed the east coast of the New World down to the La Plata estuary, which he examined in the hope of finding a passage at this point (Jan. 11–Feb. 6, 1520). On March 31, following, he arrived at Port St. Julian (in 49° 20′ S.) where he wintered. Here he crushed a formidable mutiny (April 1–2), and made acquaintance with the natives, whom he called *Patagonians* ("Big Feet"), whose great size and lofty stature are magnified by Pigafetta to gigantic proportions. Leaving Port St. Julian on Aug. 24, 1520, he discovered on Oct. 21, the cape of the Eleven Thousand Virgins, the eastern entrance of the long-sought passage. Through this strait, 360 m. long, often narrow and very tortuous, fringed by snow-clad mountains, he guided his armada for thirty-eight days, weakened by the desertion of one vessel (the "S. Antonio"). On Nov. 21, a council of pilots and captains was held to consider the continuation of the voyage, and on Nov. 28, the fleet rounded Cabo Deseado, the "desired" western terminus of the strait of Magellan. To the south of the passage lay the forbidding land "stark with eternal cold," which from the many fires here observed Magellan named "Tierra del Fuego." The expedition now entered the "Great South Sea," first sighted by Vasco Nuñez de Balboa (*q.v.*), which, from the steady and gentle winds that drove the fleet across the immeasurable expanse, was by Magellan called "Pacific." For ninety-eight days Magellan crossed this sea from Cabo Deseado to the Ladrones. On the whole transit he discovered only two islands, sterile and uninhabited, which he called "St. Paul's" (Jan. 24, 1521) and "Shark Island" (Feb. 3). The explorers had no fresh provisions, little water (and that bad), and putrid biscuit; the ravages of scurvy became terrible. The worst fears of Magellan were realized; ox-hides, sawdust, and rats had to be eaten.

Magellan's Death.—At last, on March 6, 1521, the Ladrones (so named by Magellan from the thievish habits of the natives) came in sight, Guam being probably the first port of call. Here the fleet rested, watered, revictualled and refitted; on March 9 they started again westward; and on March 16 sighted the southern point of Samar Island in the archipelago, since 1542 called the Philippines, but named by Magellan, its first discoverer, after St. Lazarus. On April 7, the squadron arrived at Cebu, south-west of Samar, in the heart of the Philippines; here Magellan contracted a close friendship and alliance with the treacherous native sovereign, who professed Christianity the better to please and utilize his Catholic friends. Undertaking an expedition to conquer, for the Catholic faith and the king of Cebu, the neighbouring island of Mactan, Magellan was killed there in a fight with the islanders (April 27, 1521). The king of Cebu after this got into his power several leaders of the squadron, including Juan Serrano, one of the two admirals elected to replace Magellan, and then murdered them.

The survivors, burning one of the three remaining vessels, left the Philippines, and made their way to the Moluccas (Nov. 6), visiting Borneo on the way (July 9–Sept. 27, 1521). At Tidor a heavy cargo of cloves was taken in; the "Trinidad," becoming leaky, stayed behind with her crew; and the "Vittoria," under Juan Sebastian del Cano, proceeded to Europe alone (Dec. 21, 1521). To double the Cape of Good Hope the "Vittoria" reached between 40° and 41° S. (April 7–16, 1522) and suffered from contrary winds, heavy seas, scurvy and starvation. In the Cape Verde Islands (July 9–15, 1522) 13 of the crew were detained prisoners for a time by the Portuguese. Only 18 men returned with del Cano to Seville in the first vessel that had ever made the tour of the earth. Though Magellan had not quite reached the Spice Islands when he fell at Mactan, his task had then been accomplished. He had already reached and passed the longitude of the Moluccas, where he had already been; the way home from the Philippines by the Indian Ocean and the Cape of Good Hope was perfectly known to the Portuguese, himself included. Magellan's name has never received its due recognition in general history. It ranks with those of Columbus, Marco Polo, and Henry the Navigator. The circumnavigation of the globe is as great an event as the discovery of America. Magellan achieved what Columbus planned—the linking of west Europe with east Asia by direct transit over the western ocean.

Magellan's Straits, the Magellanic clouds (not first observed by him), and Magellan's Land—a name long given to Patagonia and that hypothetical southern continent of which Tierra del Fuego was considered only a portion, and now again bestowed by Chile on her territory in the extreme south—preserve the memory of the first circumnavigator. The largest of the oceans has also kept the flattering name given to it by the man who first crossed it.

Bibliography.—No record of his exploits was left by Magellan himself; and contemporary accounts are less detailed and consistent than could be wished. The best is that of Antonio Pigafetta, a volunteer in the fleet. It is printed in Ramusio, and exists in four early MS. copies, one in Italian and three in French.

Other authorities are: (1) The narrative of an unknown Portuguese in Ramusio's *Navigationi et viaggi;* (2) the *Derrotero* or Log-Book in the Seville Archives, supposed to be the work of Francisco Albo, *contramaestre* of Magellan's flagship, the "Trinidad": this consists mainly of nautical observations; (3) the narrative of the so-called Genoese pilot, written in excellent Portuguese, and printed in vol. iv. of the *Collecão de noticias* of the Lisbon Academy; (4) various *informaciones* and other papers in the Seville Archives, especially bearing on the mutiny; (5) the letter of Maximilian of Transylvania, under-secretary to Charles V., to the cardinal of Salzburg; (6) the references in Correa and Herrera, often based on good information, and adding points of interest to other records. Of these (1)–(3), (5), and an instance of (6) are translated in the Hakluyt Society's volume. Magellan's two wills (i.) executed at Belem on Dec. 17, 1504, on the eve of his departure with Almeida, (ii.) executed at Seville on Aug. 24, 1519, just before starting on his voyage round the world, are both of some value for his life.

See also Lord Stanley of Alderley, *The First Voyage round the World by Magellan, translated from . . . Pigafetta,* etc., Hakluyt Society (London, 1874); Diego de Barros Arana, *Vida e viagems de Fernão de Magalhães,* a trans. of the Spanish life by Fernando de Magalhães Villas Boas (Lisbon, 1881); F. H. H. Guillemard, *Life of Magellan* (London, 1890); *Magellan . . . the original text of the Ambrosian MS.* (of Pigafetta), with English translation, notes, bibliography, etc., by J. A. Robertson (Cleveland, U.S.A., 1906). Before the appearance of this indispensable work, the best edition of Pigafetta had been in vol. iii. part 5 of the *Raccolta di documenti e studî pubblicati nella r. commissione colombiana,* edited by Andrea daî Mosto (Rome, Ministry of Public Instruction, 1894). *See* also O. Koelliker, *Die Umsegelung der Erde durch Magellan* (1908); E. Oberhummer, *F. Maghalães, und die Bedeutung der ersten Erdumsegelung* (1921); A. S. Hildebrand, *Magellan* (1925); Plischke, *F. de Maghalães* (1926).

MAGELLANIC CLOUDS (named after Ferdinand Magellan), two cloud-like condensations of stars in the southern sky. The Large Cloud is in the constellation Dorado at R.A. 5h. 26m., dec. $-69°$; the Small Cloud in Tucana at R.A. oh. 56m., dec. $-73°$. They appear in all respects like detached portions of the Milky Way. They are very remote, being distant 30,000 parsecs from the earth and 12,000 parsecs from one another.

MAGENDIE, FRANÇOIS (1783–1855), French physiologist, was born at Bordeaux and became professor of pathology in the Collège de France. He was an admirable experimenter but weak in deduction. He succeeded in demonstrating the motor functions of the anterior and the sensory functions of the posterior spinal roots. Magendie also investigated the mechanism of deglutition and vomiting, and the cause and methods of blood-flow. He introduced into medical practice bromine, iodine compounds and such alkaloids as strychnine and morphine. Claude Bernard was one of his pupils. In addition to founding the *Journal de physiologie expérimentale* (1821–31), he produced *Précis élémentaire de physiologie* (1816), *Formulaire pour l'emploi . . . de plusieurs nouveaux médicaments* (1821), *Sur les phénomènes physiques de la vie* (1835) and *Sur les functions et les maladies du système nerveux* (1839).

MAGENTA, a town of Lombardy, Italy, province of Milan, 16 mi. W. of it by rail, 364 ft. above sea-level, in the midst of rice-fields. Pop. (1936), 10,470 (town), 13,021 (commune).

Magenta was the scene of a battle on June 4, 1859, between the Franco-Sardinians under Napoleon III. and Austrians commanded by Gyulai. Hearing from a spy that the Austrians were ready to oppose a crossing between Pavia-Piacenza, Napoleon adapted Jomini's plan—flank march from Alessandria to Novara, turning the enemy's right on Novara-Milan road. The Allies reached Novara on June 1. Gyulai retired next day over the Ticino, though Napoleon was unaware of which side of the river the enemy was standing. He therefore ordered a Guard division to occupy Trecate on June 3, sending over MacMahon with a Guard division at Turbigo. Making for Magenta, June 4, he was to draw to his sector strong hostile forces, thereby easing Napoleon's advance over Ticino. The Sardinians were to follow MacMahon, but the roads being blocked, only one division reached him at the close of battle. The I., III. and IV. Corps were left around Novara. The Allies numbered 140,000 men with 291 guns, the Austrians 112,000 with 400 guns. However, only 52,000 French and 60,000 Austrians actually participated in this day's fighting. Early on June 4, Napoleon, ascertaining that the Austrians were across the Ticino, realized that he would be unable to use the bulk of his forces, the roads being everywhere congested. Millinet's Guard division reached San Martino at 10 A.M., heavy fighting ensuing, but he was not to advance over the canal till MacMahon approached. He was supported by a division III. Corps. Both faced the Austrian I. and II. Corps. MacMahon began his march at 9 A.M., capturing Bernate at noon and approaching, later, Buffalora, was brought to a standstill. At Ponte Vecchio severe fighting occurred, troops of the III. and IV. Corps confronting III. and VII. Austrian corps. At 4 P.M. MacMahon advanced again, Buffalora being captured, while the Guards from San Martino also participated. At Ponte Vecchio fierce fighting continued, but only after Magenta fell did Gyulai give orders to evacuate it, seeing the exhausted state of his troops of the right wing. Both opponents bivouacked on the field, the Austrians retreating eastwards in the early hours of the morning.

MAGENTA, an old and well-known dyestuff and one of the first to be produced synthetically; it is also known as rosaniline or fuchsine and is described more fully under the latter heading and under DYES, SYNTHETIC and TRIPHENYLMETHANE.

MAGERSFONTEIN, ACTION OF, Dec. 11, 1899: *see* SOUTH AFRICAN WAR, 1899–1902.

MAGGIORE, LAGO, the largest lake in Lombardy, north Italy (*Lacus Verbanus* of the Romans), area about 83 sq.m., length 40 m., greatest width 5½ m., greatest depth 1,220 ft., surface 636 ft. above sea-level. The Ticino flows through, north to south, on its way to the Po; the Tosa or Toce comes in on the west from the Val d'Ossola below the Simplon Pass, the Tresa enters from L. Lugano on the east. The upper end of the lake (about 16 sq.m.) is in the Swiss canton of Ticino. Locarno, at the northern or Swiss end, is 14 m. by rail south-west of Bellinzona on the St. Gotthard line. There is a railway along the south-eastern shore, from Magadino (10½ m. south-west of Bellinzona) to Sesto Calende (36½ m.), at the southern end of the lake and 20 m. by rail from Novara. The east shore of the lake is reached at Luino by electric railway from Ponte Tresa on the lake of Lugano (8 m.), while the direct Simplon line runs along the west shore of the lake for 15½ m. from near Pallanza past Baveno and Stresa to Arona, which is 23 m. by rail from Novara. On the east shore are Luino and Laveno. On the west shore are (reckoning from north to south) Cannobio, Pallanza, Baveno, Stresa and Arona. Opposite (south-east) Baveno are the famous Borromean islands (*q.v.*), while south-west of Baveno rises the glorious view-point of the Monte Mottarone (4,892 ft.) between Lago Maggiore and the Lake of Orta, which is reached by electric railway.

MAGH, a term applied to immigrants from Burma long settled in the south-east districts of Bengal. Apparently of Taî origin, they entered Bengal from Arakan towards the end of the 18th century. Most of them have come under Bengali influence, but in the south of the Chittagong Hill Tracts, where their culture is comparatively pure, the script and dress are Burmese and the language an Arakanese dialect. Elsewhere the Bengali dress and language prevail. The religion of the Arakanese-speaking Maghs is animistic Buddhism. The race is divided into endogamous clans and there are still strong traces of a political organization under clan chiefs, the most powerful of whom are known as the Bohmong and the Mong Raoja, the former being a lineal descendant of the Mon kings of Pegu. In the hills shifting is still preferred to plough cultivation, but the villages, which contain from 10 to 50 houses, are invariably on the banks of streams. The houses are flimsy structures on bamboo piles and a relic of the communal house for men is sometimes found in the form of a roofed platform built at the end of the village street.

See Hutchinson, *Account of the Chittagong Hill Tracts* (1906).

(J. P. M.)

MAGIC. The magic art is of ancient lineage and wide distribution. Civilization even yet is not entirely devoid of all elements of magical belief and ritual. But for the savage magic is still a living reality, a serious practical means of commanding success in any critical human undertaking.

PRIMITIVE

The importance of the magic art in primitive culture has provoked an extensive theoretical discussion in which such authoritative writers as Tylor, Frazer, Westermarck, Preuss, Hubert and Mauss, Marett, Lehmann, Lowie and Malinowski, have taken a prominent part. Sir James Frazer, in particular, in his great classical treatise *The Golden Bough* has formulated a distinct and coherent theory of magic on which all subsequent studies have largely been built. These various contributions have been reviewed by H. Hubert and Marcel Mauss, and by Dr. R. R. Marett.

As a preliminary, the useful distinction drawn by Sir James Frazer between magic and religion may be noted, its essence being that magic consists in the direct control by man of the forces of nature, while religion relies upon the propitiation of these and other higher powers.

(1.) **The Sociology of Magic.**—Magic, as Frazer has so fully shown, is not merely a type of belief or a piece of man's intellectual apparatus, but an art in which theory and dogma at every step are translated into action. It is always a very practical affair. It has to bring rain to crops or game to the nets, to give stability to a house or lightness to a canoe, to inflict or ward off misfortune, disease or death, to win a loved one, to give skill in war, speed in travelling, beauty at the feast or the dance. It is distinctively a human art, in that it is practised only through man's agency and for his benefit. At the same time it involves a recognition of the supernatural, a belief in the power of magic, wielded by man, to turn aside the normal operation of the forces of the external world. Its roots lie in the diversity of human activities; it is a way of handling the forces of nature, of bending them to man's will, of safeguarding his welfare and shaping his destiny.

Magic invests its practitioners with social power. In nearly all communities the magician is the one person who can be compared with the chief in point of influence, prestige and authority. Magic thus acts as a force of social control. The important practices of the craft tend to be carried on largely by special experts, often constituting a distinct class in the community, and these, desiring to ensure the continuity of their knowledge, and prizing it as a thing of great value, transmit it only to their descendants. So magic is appropriated, forms the subject of well defined claims and privileges, and is handed down through families and clans in exclusive possession. The magic art is also of more purely economic interest, since its practitioners are usually remunerated by those who seek their services, while even the transmission of the lore is often a matter for compensation by a substantial payment. Magic on its traditional side is linked by mythology with the dim past of gods and heroes, with the origins of man, and the beginnings of the tribal culture. Legends of the miraculous deeds of ancestors bear witness to the power of the ritual, while their names are frequently cited in charm and spell.

(2.) **Elements of the Magical Art.**—As Dr. Bronislaw Malinowski clearly shows, every act of magic is characterized by things said, things done, and a person officiating. Hence the spell, the rite and the condition of the performer are fundamentals.

(i.) *The Spell.* The spell, the uttering of words according to a formula, *i.e.,* in a set order, is everywhere regarded as the outstanding part of the magical act. In fact by some peoples the word for spell, as the Maori *karakia* or the Kiriwinian *megwa,* is used also to mean magic as a whole. The virtue of the magic lies primarily in the formula, which is believed to have been handed down from immemorial antiquity. Hence the insistence upon the correct recital of it, lest variation in the text render the magic of no avail. The customary rigidity of the formula does vary in different communities. Thus among the Polynesians any slip, any omission, any alteration of wording deprived the magic of its efficiency, and in the most important sacred ritual was thought to involve the death of the practitioner from supernatural causes. But elsewhere individual changes of wording within the main frame of the formula are permissible. Nevertheless, it is always well defined by tradition, variations are minor and of a customary kind, and no major extemporization is possible. Since the spell is in fact the backbone of magic, its language is naturally correlated with the aim of the ritual. There are constant references to objects or actions, the mention of which is supposed to influence the desired end. A Maori spell to give speed and grace to a canoe, for instance, speaks of the swiftness of a bird on the wing, the lightness of a sea-gull floating on the water, and gives the names of a number of woods noted for their buoyancy. Metaphor and simile are freely used, while onomatopoeic effect is introduced, as speed-noises or the wailing of the sea. References to traditional and mythological events are frequent, ancestral names are recited, and, coupled with the cryptic and archaic language in which the spell is often couched, are apt to render it obscure to any but those trained in this type of magical lore. Thus magic maintains its bond with tradition.

(ii.) *The Rite.* Accompanying the magical formula is a set of actions, the rite, the primary function of which is to convey the spell to the object which it is desired to affect. Thus when a Maori dart-thrower wished to make a good cast he would spit upon the implement and repeat a charm beginning "Fly forward, my dart, like a meteor in the heavens." Like the spell, the rite is definitely prescribed in form and is often in distinct correspondence with the words uttered. Thus movement described in the spell is carried out or imitated by the performer, substances which produce effects analogous to those desired are handled and mentioned. The sprinkling of water on the ground, for instance, is often part of the magic of rain-making, the destruction of an image by fire accompanies a charm to bewitch an enemy with burning pains. Attractive scents are used in love magic, powdered lime is released by Melanesian sailors in danger from flying witches, to make a magic fog which will blind their pursuit. The rite is thus the vehicle of the spell and its equivalent, the translation of the word into action.

(iii.) *Condition of the Performer.* Since magic is of such importance the performer must handle it with care. In all communities he is hedged around by taboos; he must refrain from eating certain foods, from casual sexual indulgence, and from other contaminating things. If he fails to conform, then he nullifies the power of his art; breach of taboo, in fact, is the cause most frequently assigned for failure of magic. The emotional attitude of the magician is also of interest. In the rite of black magic which consists in pointing a bone or dart at a victim, the wizard twists and turns the instrument in the air and assumes a state of excitement and fury as if he actually were performing the deed of stabbing his enemy. Dr. Malinowski stresses the importance to the theory of magic of this simulation of the real act; he sees in fact in the sympathetic emotional condition of the performer, the fundamental basis of the art. Magic, for him, is a ritualized expression of an emotional state of desire, which, baulked of its object, nevertheless is constrained to find outlet in speech and gesture. In the spontaneous outburst of word and act lies the germ of spell and rite, in the illusion of subjective experience—the conviction that such actions have really had their effect—rests the foundation of the belief in magical efficiency.

(3.) **The Essence of Magical Power.**—Dr. Marett ascribes the basic idea of magic to the belief of the native in a vague mysterious power, supernatural and immaterial, animating all things. Hubert and Mauss and Prof. K. Th. Preuss have independently arrived at somewhat the same conclusion. *"Mana,"* it is said, "is the mother-idea of magic." This notion of a mystic impersonal force is held by many primitive peoples, being termed *mana* in parts of the Pacific, *hasina* by the Malagasy, and *wakan, orenda, pokunt* and *manitou* by various American Indian tribes. But examination of its content shows that it is a concept of an extremely general order. The essence of magical power, on the other hand, is very restricted; it is fixed in man, it is bound by human tradition, it is even localized at times in the body of the wizard. It is not, like *mana,* a universal force latent in all things, which man has taken and utilized for his own ends. The real virtue of magic is embodied in the spell, and to a less extent in the rite. Magic is born of the emotional tension of specific situations; it is not the concrete use of a general abstract concept. The idea of *mana* is certainly closely intertwined with the practice of magic, but they are interlacing stems which spring from a different root.

The value of Marett's contribution to the theory of magic lies in his stress on the emotional aspect of the performance, analysing the state of mind of the savage in his magical experiences. By his psychological treatment he counteracted the tendency to an over-intellectualistic study of primitive beliefs. (*See* MANA.)

(4.) **Magic and Primitive Science.**—By Edward Tylor, the great pioneer in anthropology, magic was regarded as developing from the thought-processes of primitive man by mistaken association of ideas, and becoming organized into "an elaborate and systematic pseudo-science." This position has been more explicitly formulated by Sir James Frazer. He advances the view that magic really represents the attempt of man to formulate a body of principles by which the sequence of events throughout the world may be determined. "Magic is a spurious system of natural law as well as a fallacious guide of conduct; it is a false science as well as an abortive art."

The label of "bastard science" affixed by Frazer has not remained unchallenged. Hubert and Mauss, in their study of magic, and Dr. Marett from the psychological side, point out that there are radical differences between the magical and the scientific attitude of man towards his environment. By his analysis of garden magic in Melanesia in conjunction with the actual agricultural operations, Dr. Malinowski shows that the native outlook upon the two is essentially different. Empirical knowledge of soils and plant growth, of wind and weather, is utilized to cope with the known and calculable requirements of the industry; the native is well aware that careful tillage, weeding, repairing of fences and replacement of damaged seed are essential for a good harvest. On the other hand, to secure the right amount of rain and sun, avoid insect pests, or unaccountable failure of the crop, to ward off the ill-luck which sometimes dogs his steps he has recourse to magical aid. So also in canoe-building, fishing, warfare, love-making, the birth of children and matters of health and death, primitive man recognizes both a natural and a supernatural set of conditions, facing the first with rational technique and empirical knowledge, embodied even in rudimentary theoretical laws, the second with the arts of magic. The same duality is to be found in the economic life of the Maori (Raymond Firth) and evidence is accumulating to show that this must be a phenomenon of universal occurrence. Primitive man has his real science, running side by side with his magic. The two are closely bound together in the practical activity, the body of rational knowledge being utilized to deal with the mechanical efficiency of the undertaking, while the ritual of magic deals with the incalculable elements therein, the luck and chance upon which so much of success depends.

It is permissible, then, with Sir James Frazer, to call magic a pseudo-science if the limitations of the term be borne in mind. Magic is akin to primitive science in that it exists to serve very definite, often similar ends, and is possessed of a theory, a system of principles which dictates the manner in which the ritual must be performed. Like science, it has developed a special technique which is handed down from one generation to another. But these resemblances are little more than superficial; the difference is fundamental. Science, even as represented by the rudimentary equipment of the savage, is based on experience, is open to correction by observation and experiment, is ever marked by the thirst for further knowledge and the attempt at a more exact classification and description, a more careful elucidation of the general principles governing the behaviour of the material world. Magic, on the other hand, is governed by tradition, is largely impervious to the lessons of observation, and shows no desire to make profit by experiment. The underlying mental attitude is one of implicit faith, based upon emotional rather than upon rational experience. It is clear, then, that the real roots of science are to be found, not in the magic art of primitive man, but in his rudimentary store of knowledge and his attempts at rational enquiry, stimulated by the practical needs of his technology, into the nature of his physical environment.

(5.) **The Continuity of Belief.**—It is not difficult to see the hollowness of the pretensions on which magic bases its claim to power. The sky will not really give forth thunder and rain in reply to sympathetic rites, animals do not obligingly come to the hunter through a muttered spell, nor can that *more coy game, woman,* be ensnared by the waving of a wand. Why, then, is not the fallacy of this hocus-pocus exposed, and "the whole monstrous farrago," as Tylor called it, discarded as futile? The answer usually advanced is that the false ritual of magic does not exist entirely in its own strength, but associated with it are elements of medical skill or political craft of the practitioner, which sustain its reputation when in need. Again, success is bound to come in a large proportion of cases by the mere laws of chance, aided by the shrewdness of the magician in selecting the opportune moment for the exercise of his art. This is helped by the general inability of the human mind to appreciate negative evidence when strong forces of belief are entrenched on the side of an established institution. One success counts more in retrospect than a dozen failures. More important still is what Dr. Malinowski has termed "the current mythology of magic," that is, the stories of prowess which tend to circulate round every magician of influence, exaggerated tales of wonderful cures, of game attracted, of lovers united, of enemies slain by the craft of his spells. These stories reach back into the mists of antiquity, forming a body of instances which can be drawn upon at any moment to vouch for the efficacy of the art. This halo of myth, of magical miracle, is the strength of the belief in magic, its buckler against the assaults of rational experience. The real basis for the continuity of magic, however, lies even deeper in the sphere of its cultural utility.

(6.) **The Value of Magic to Man.**—Magic is not merely a vain replica of science. Despite the fallacy of its premises and the illusory nature of its claims it possesses a real validity in human life. The magical rites performed in agriculture, for instance, are of undoubted efficacy to the native. By proceeding step by step in close contact with the actual stages of the work, of which it regulates the times and seasons, by imposing taboos, by investing the task with serious import and a supernatural sanction, the magic reinforces order and punctuality within the industry, and acts as a very valuable factor of organization, wielded as it usually is by the expert who has charge of the practical arrangements. Again, the magical ritual enters at the point where man's knowledge and foresight begin to fail, where chance, luck and the incalculable elements of nature begin, where reliance on rational technique can no longer avail. By providing him with a firm belief in his own powers, by promising him control, illusory though it may be, over these all important factors of success, it gives man that much needed psychological backing of confidence and assurance which is so essential to the accomplishment of his desire.

Egyptian.—The processes of Egyptian magic, or *hike* were a spoken formula, which must be exactly as prescribed in order to be efficacious, and an act or gesture, often to be performed at a particular time and under special conditions of place and position. The choice of word and act is based on the doctrine of sympathy and homoeopathy, *i.e.,* the belief that two things which have once been connected may continue to react on each other even when separated, and that like has power to affect like. Thus a burn may be cured by the recitation of the words used by Isis over her son Horus when he was once burnt, and one may cause one's enemy pain by maltreating a wax image of him, indeed the mere knowledge of the Sun-god's name was sufficient to give Isis magical power over him. From similar conceptions arose the belief in protective amulets which assumed such vast importance both for the living and for the dead.

There was no class of professional magicians in Egypt—there is not even a general word for magician. It is not surprising, however, to find that those who exercise the art on a large scale are often priests, and more particularly lector-priests, *i.e.,* those whose business consisted especially in the study and reading of sacred books. At the same time it would seem that magic on a small scale was within the reach of everybody who was prepared to observe the conditions, and to judge from the papyri which have come down to us it must have played a very large part in every day life. It was used not only to escape death, to drive out disease, to avert the evil eye, to cure a snake bite, but also to drive rats from a barn, and to prevent the approach of a storm: there is even a spell to secure the various advantages summed up in the phrase "to be blessed every day."

diagonals, add up alike, this sum being called the *constant.* Strictly speaking the numbers used should be consecutive from 1 up to n^2, where n is the number of cells (or squares) in any side. Such an arrangement of n^2 numbers is called a square of the nth order. Thus fig. 1 complies with all the conditions and is a magic square of the 3rd order. These squares are of very great antiquity and appear to have been known from very ancient times in China and India, where, as at the present time, magic squares were worn engraved on metal or stone as amulets or talismans.

They appear to have been introduced into Europe early in the Christian era though the first known writer on the subject was Emanuel Moschopoulus, a Greek of uncertain date who lived in Constantinople, probably about 1300. His work in manuscript is in the National Library in Paris (ms. No. 2,428). Cornelius Agrippa (1486–1535) constructed squares of the orders 3, 4, 5, 6, 7, 8, 9, which were associated with the seven astrological

"planets," Saturn, Jupiter, Mars, the Sun, Venus, Mercury and the Moon. The magic square of the 4th order shown in fig. 2 is to be seen in Albrecht Dürer's picture of "Melancholy." The date of the work (1514) is indicated in the two central cells of the bottom row, but whether this was intentional or a mere coincidence is not known (see *Notes and Queries*, Feb.–March 1918). In later times the subject has been investigated as a mathematical curiosity and has a large though scattered literature of its own. The three main lines of enquiry are construction, enumeration and classification.

Construction.—It is convenient to deal with these squares in three classes. Those of an odd order, those of a doubly-even order (that is where n is of the form $4m$) and those of a singly-even order (where n is of the form $2\ [2m+1]$). These vary in difficulty in their order. The smallest possible square of an odd order is, of course, that of the 3rd order shown in fig. 1, to which there is that one fundamental solution only. Eight different arrangements may be obtained by merely turning the page round and also turning it round in front of a mirror. These so-called reversals and reflections are not usually counted as different. A square of the odd order may immediately be written down in the manner shown in fig. 3, described first by De la Loubère. Here we start at the central cell in the top row and proceed diagonally upwards to the right. As the 2 is outside the square we bring it to the bottom of the column, thus giving it the position it occupies on the outside square. Having written the 3, the 4 falls outside the square, so we insert it at the opposite end of the row and write in the 5. As the next square is occupied by the 1 we write the 6 beneath the 5 and proceed until the 10 falls outside the square and so on. It will be noted that 16 falling outside the square at a corner is written beneath the 15 as in the case of an occupied square. This can be applied to any square of an odd order, but, like so many methods that have been adopted, it only produces one type of square, though it may be modified to form a limited number of other squares. Thus we may start with the 1 in any cell and always get a square that

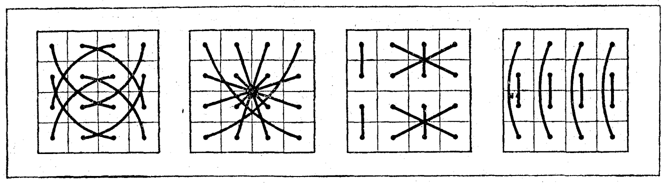
FIGS 7, 8, 9 AND 10.—TYPES OF MAGIC SQUARES OF THE 4TH ORDER

is magic in rows and columns, but not necessarily in the diagonals. Bachet (1612) used a somewhat similar method. Another method devised by De la Hire, may be used for the construction of squares of any order. He employed three subsidiary squares though one of these has been dispensed with by later writers. In fig. 4, the numbers 1, 2, 3, 4, 5, are arranged so that every number appears once and once only in every row and column, and in one diagonal, the other diagonal having repetitions of 3. In fig. 5, the numbers 0, 5, 10, 15, 20, are similarly treated only the repeated 10's are in the other diagonal. These squares superimposed and added produce fig. 6, which is a perfect magic square. Similar methods have been devised for the construction of magic squares and some of these will be found in the books named at the end of this article. But most of the writers on the subject develope their own favourite schemes. It is not difficult to construct squares of particular types but the ideal solution is, of course, a method completely general for squares of every order, that will include every possible arrangement of the order dealt with. Such a solution is probably not discoverable. Magic squares of singly-even orders (such as those where $n=6$, 10, 14, 18, etc.) are generally the most difficult of all to construct and their treatment is largely empirical. Large



FIGS. 11, 12, 13 AND 14.—GRAPHIC SOLUTIONS OF TYPES OF FOURTH ORDER

collections of squares of the higher orders have been compiled by Violle and others, so that examples are easily obtainable.

Classification.—This is a matter of individual taste and may be called the elegant branch of the subject. Taking the case of the 4th order the solutions can all be classified under the four types shown in figs. 7 to 10.

The Nasik square (so named by the Rev. A. H. Frost after the town in India where he lived) is the most perfect type conceivable. Here all the broken diagonals sum to the constant 34. Thus, for example, $15+14+2+3$ and $10+4+7+13$ and $15+5+2+12$. As a consequence its properties are such that if you repeat the square in all directions you may mark off a square 4×4 wherever you please and it will be magic. It should be noted that Nasik squares can be constructed for any doubly-even orders and for any odd orders not divisible by 3. But a Nasik square of a singly-even order is impossible. The number of fundamentally different Nasik squares of the 5th order is sixteen.

In the case of the associated squares every number if added to the number that is equidistant in a straight line from the centre gives 17. Thus $1+16$, $2+15$, $3+14$, etc. Dürer's square (fig. 2) is also associated The simple square is one that fulfils the simple conditions and no more. The semi-Nasik has the property that the opposite short diagonals of two cells together sum to 34. Thus $14+4+11+5=34$. $12+6+13+3=34$. And in this order there are 48 Nasiks, 384 semi-Nasik (which include 48 associated) and 448 simple, making a total of 880. The Nasik square is also sometimes called diabolique and pandiagonal and the semi-Nasik semi-diabolique.

A graphic illustration of each type is shown in figs. 11 to 14, if placed beneath the squares to which they apply. Every Nasik square takes the form of fig. 11 and every associated that of fig. 12, but the graphic forms for the simple and semi-Nasik squares are considerably varied. There are 12 such graphic forms in all of the 4th order, and these are shown in *Amusements in Mathematics*. (*See* bibliography.)

FIG. 15.—A BORDERED SQUARE

Another type of magic square is the bordered, an example of which is shown in fig. 15 where it will be seen that a square of the 3rd order is surrounded by a border so as to form a square of the 5th order. In fig. 16 we have an example of an extension first considered by Frénicle (*c.* 1602–75). Here the borders may be successively stripped off to produce magics of the 9th, 7th, 5th and 3rd orders, and these concentric or progressive squares for odd and even orders respectively may be constructed without any limit whatever.

Composite squares also may be formed in certain cases. If we know how to construct a square of the mth and nth orders we can directly make one of the mnth order as in fig. 17 where m and n are each 3. It will be noted that each subsidiary square is successively constructed in the same order as the smallest one and each successive square is placed in the larger square, again in the same order. A more difficult but very elegant type of square is that of two degrees, as in fig. 18. Here we have a magic square of the 8th order with the constant 260 and every square of four cells summing to 130. If for every number we substitute in its allotted place its square then it will also be entirely magic with the constant 11180. A Nasik square of this kind and order has been constructed.

FIG. 17.—COMPOSITE SQUARE

No square of two degrees is possible for any order smaller than the 8th.

Enumeration.—The very difficult question of enumerating the squares of the different orders has attracted the attention of many mathematicians but very little progress has been made during the last 200 years. Of the 3rd order there is only one fundamental arrangement as stated above. Of the 4th order there are 880 different fundamentals. These were all given by Frénicle in a posthumous work of 1693 and this has been frequently confirmed by later writers. It was shown in the *Queen,* Jan. 15, 1910, how the complete set might be so written out if desired (*see* also Frolow's *Carrés Magiques*).

All told there are 549,504 fourth order magic squares in rows and columns.

34	20	16	62	39	21	9	59

FIG. 18.—A SQUARE OF TWO DEGREES

No enumeration for larger squares has been completed. Particular types of squares, however, have been counted. Thus there are 28,800 Nasik and 174,240 bordered squares of order 5, and 567,705,600 bordered squares of order 6.

Actual formulas counting the so-called uniform step squares of J. Willis of any odd order n have been given by D. N. Lehmer.

The number of magic squares of order n increases very rapidly with n, as does also the difficulty of enumeration.

Extensions and Variations.—Though strictly speaking the magic square should be composed of a natural sequence of numbers from 1 to n^2 this condition is sometimes dispensed with. Any arithmetical progression will serve, as in fig. 19, where the numbers in the series used have a common difference of 2. But squares of the 3rd order may be formed with any nine numbers if we can write them thus:

$$\begin{matrix} 1 & 2 & 3 \\ 7 & 8 & 9 \\ 13 & 14 & 15 \end{matrix}$$

where the horizontal differences are all alike and the vertical differences also all alike but not necessarily the same as the horizontal. The arrangement is shown in fig. 20. This applies equally to the higher orders. Thus fig. 21 is constructed from the numbers

$$\begin{matrix} 1 & 2 & 3 & 4 \\ 6 & 7 & 8 & 9 \\ 11 & 12 & 13 & 14 \\ 16 & 17 & 18 & 19 \end{matrix}$$

and is a Nasik square.

A general solution for squares of the 4th order in which any numbers (all different but not necessarily consecutive) are used was given by Ernest Bergholt in *Nature* for March 26, 1910. Then the question of the construction of magic squares with prime numbers only, and with the smallest possible constants, has been investigated. A summary of results will be found in *The Monist* (Chicago) for Oct. 1913. The formation of squares composed of consecutive composite numbers has also been considered. These can be formed for any order without the use of tables of primes though the method will not always give the smallest possible constant. First write down any consecutive numbers, the smallest being greater than 1, say, for the 3rd order, 2, 3, 4, 5, 6, 7, 8, 9, 10. The only prime factors of these numbers are 2, 3, 5 and 7. Add

the product of these four numbers, 210, to each of the nine numbers. The result is the nine consecutive composite numbers 212 to 220 inclusive with which we can form a magic square. Yet a square with a smaller constant may be formed, as in fig. 22, with the numbers 114 to 122 inclusive. But it would be difficult to find empirically (if possible) a lower solution for the 4th order than we get by the rule, using the numbers 510512 to 510527 inclusive.

Subtracting, multiplying and dividing magic squares have also of late been investigated, and examples of the 3rd order are given in figs. 23, 24 and 25. In fig. 23, a subtracting square, you get a constant 5 by subtracting the first figure in a line from the second and the result from the third. The operation may, of course, be

performed in either direction but in order to avoid negative numbers it is more convenient simply to deduct the middle number from the sum of the two extreme numbers. In fig. 24, which is a multiplying square, the constant 216 is obtained by multiplying together the three numbers in any line. In the dividing square (fig. 25) the constant 6 is obtained by dividing the second number in a line by the first in either direction and the third number by the quotient. But again the process is simplified by dividing the product of the two extreme numbers by the middle number. This question has been dealt with in *Amusements in Mathematics.*

FIG. 26.—ATTEMPT AT THE KNIGHT'S-MOVE SQUARE

Other extensions of the problem such as magic polygons, magic cubes, magic circles and magic stars have also attracted the attention of mathematicians. Attempts have also been made to construct a magic knight's tour. The knight has to be played once to every square of the chessboard in a complete tour, or non-re-entrant path, numbering the squares visited in order, so that when completed the square shall be magic with the constant 260. The nearest approach to a solution is shown in fig. 26 given by C. F. Jaenisch in *Applications de l'Analyse Mathématique au Jeu des Echecs* (St. Petersburg, 1862). Unfortunately it is not a perfect magic square because the diagonals are incorrect, one adding 264 and the other 256—requiring only the transfer of 4 from one diagonal to the other. Probably a perfect solution is impossible but no rigid proof of this has been obtained. Magic squares have been devised for construction with dominoes and playing cards;

also with coins and postage stamps, where one is restricted, of course, by the limitations of issue, coins and stamps of certain convenient values not being in existence. These interesting questions are of a puzzle character and often call for considerable mathematical analysis, though, as a man said of *Paradise Lost*, they "prove nothing" and lead nowhere. They are therefore strictly speaking of no direct mathematical importance.

MAGINN, WILLIAM (1793–1842), Irish poet and journalist, was born at Cork on July 10, 1793. The son of a schoolmaster, he graduated at Trinity college, Dublin, and after his father's death in 1813 succeeded him in the school. He first made his mark as a parodist and a writer of humorous Latin verse in *Blackwood's*. In 1821 he visited Edinburgh, where he made acquaintance with the Blackwood circle. He is credited with having originated the idea of the *Noctes ambrosianae*, of which some of the most brilliant chapters were his. His connection with Blackwood lasted, with a short interval, almost to the end of his life. His best story was "Bob Burke's Duel with Ensign Brady." In 1823 he moved to London. He was employed by John Murray on the short-lived *Representative*, and was for a short time joint-editor of the *Standard*. Maginn was the original of Captain Shandon in Thackeray's *Pendennis*.

MAGISTRATE, in general, one vested with authority to administer the law or one possessing large judicial or executive authority. In this broad sense the word is used in such phrases as "the first magistrate" of a king in a monarchy or "the chief magistrate" of the president of the United States. In countries deriving their legal systems substantially from the Roman law, it signifies more particularly the holder of a judicial office, whereas in England it is annually applied to minor or subordinate judicial officers, whether unpaid, as justices of the peace, or paid, as stipendiary magistrates. (*See* POLICE COURTS and JUSTICE OF THE PEACE. *See* also ROMAN LAW; CONSUL, etc.)

MAGLIABECHI, ANTONIO DA MARCO (1633–1714), Italian bibliophile, was born at Florence on Oct. 28, 1633. appointed librarian to Cosimo III., grand-duke of Tuscany. He followed the trade of a goldsmith until 1673, when he was appointed librarian to Cosimo III., grand-duke of Tuscany. He died on June 27, 1714, bequeathing his large private library of 30,000 vols. to the grand-duke, who gave it to the city.

MAGNA CARTA was issued by King John in June 1215, under compulsion from his barons. From the time of its issue it became a symbol to barons and people alike, and king after king, throughout the middle ages, was expected to confirm it. Its clauses were regarded with veneration long after they were out of date, and men read into them meanings which would have surprised their original drafters. Seventeenth century lawyers, ignorant of the law of the early 13th century, knowing nothing of the conditions of the time, saw in the charter a solemn grant to the people of England of rights which the Stuart kings were withholding. Trial by jury, the principle of *habeas corpus*, the right of parliament to control taxation, all these were thought to have been secured by Magna Carta. Even the great historians of the last century wrote of the charter with more enthusiasm than judgment. Modern criticism has done much to put it in its rightful perspective, but many writers have gone too far in their destructive criticism. It has often been suggested that the charter was drawn up in the interests of the barons alone, and that other clauses were inserted merely to attract support. There is an element of truth in the charge. The barons were naturally more interested in defining their own position than in securing advantages for the boroughs, or freedom of election for the Church. That the king himself, that contemporary chroniclers, that foreign observers, should describe the charter as an agreement between king and baronage was almost inevitable, for the barons supplied the motive force by which the king was brought to terms. Their relations with the king were the shifting sand on which feudal society was built, and the charter of necessity dealt at greater length with them. But an examination of the history of John's reign, of the circumstances leading to the issue of the charter, of the charter itself and the other documents which belong to the period of negotiation, show that those who drafted the charter took pains to secure through it, not only baronial demands, but administrative reforms.

The relations between king and baronage had never been precisely defined. The charter issued by Henry I. at his coronation covered only a small part of the field, and did not name the amount of the relief nor deal with the military service due from the king's tenants. The legal changes of the 12th century meant that the king's court had more power than ever before, while the baronial courts were losing business to it. On the whole the barons favoured the new methods of procedure. They were willing to submit to the firm rule of a king who should keep the understandings that governed their relations with him. So long as their reliefs were reasonable, so long as the king behaved with reason with regard to his rights of marriage, did not take excessive scutages, or insist on too much military service, they would not rebel. They might and did complain of acts of oppression, of the rigidity of the forest laws, but there had been no general antagonism between Henry II. and any class of his subjects. Richard I. prepared the way for the charter by his continual demands for money. His crusade meant a heavy drain at the moment of his accession; his ransom meant another extortion, four years afterwards; and then his war with Philip of France began. But the country was well governed by the civil service created by Henry II.

The Grievances Against John.—John inherited the fruits of his brother's policy. The possessions of his house in France were lost to Philip Augustus. Continual and increasingly heavy scutages, accompanied by fines *ne transfretet* taken from barons who did not accompany the king on his campaigns, irritated the baronial and knightly class, particularly as Normandy seemed permanently lost. The great inquest of service of 1212 increased their unrest by suggesting that the king intended to exact all that was his due, and a scutage at three marks on the knight's fee for the expedition which ended in disaster, in 1214, determined their opposition. The Church was alienated by its treatment during the Interdict, when its property was taken into lay hands and its revenues went to the royal treasury. The quarrel with the Church reacted on the general administration. The last eyre of John's reign was that of 1208; the exactions of local officers, therefore, went uncorrected, and the pleas which should have come before the judges went unheard. This collapse of the judicial administration must have done more than anything else to bring the masses of men over to the baronial side. Royal rights with regard to purveyance (*q.v.*), bridge and castle building had been stretched to the utmost by John's servants, and there existed no machinery to enforce upon royal officials payment for the food, carts, or timber which they took for the king's service. Distrusting his barons, John relied on mercenaries, and rewarded them with positions in the local government of England. They cared only for the king's interests and nothing for the welfare of their shires. Against John many men desired vengeance for personal reasons. William de Braiose was driven into exile, his wife and son starved to death because they knew that John himself had murdered his nephew, Arthur. It was unsafe for contemporary chroniclers to tell too much of the scandals of John's private life. But there seems no doubt that the baronial leader, Robert fitz Walter, wished to avenge his daughter, possibly the daughter that another rebel, Geoffrey, earl of Essex, had married. Many barons had been forced to pay far higher reliefs than had been customary. John had tried to forestall active measures against him by demanding hostages from all prominent barons. The appointment, on the eve of John's departure for his last foreign expedition, of Peter des Roches, bishop of Winchester, to the justiciarship vacated by the death of Geoffrey fitz Peter was a further grievance, for Peter was, before everything, the king's man.

The first sign of revolt had come more than a year earlier. In Sept. 1212, on his way to a Welsh expedition, John was warned both by his daughter, Joan, wife of Llewylyn of Wales, and by the king of Scots, that his barons were planning to betray him to the Welsh. He abandoned the expedition and Robert Fitz Walter and Eustace de Vesci, a prominent Northern baron, left the country. They persuaded the pope that they were suffering for righteousness' sake, and came back with other exiles when John and Innocent were reconciled in 1213. The reconciliation brought to England the new archbishop, Stephen Langton, who returned to his native land with the intention of using his position as chief adviser of the king to compel him to restore good government to the land. John was absolved after swearing on the Gospel that he would love, defend and maintain the Church, restore the good laws of his predecessors, particularly Edward the Confessor, do away with bad laws, judge all men according to the just judgments of his court, and give to every man his rights. The king then prepared to sail to Poitou, leaving the archbishop and justiciar in control of the administration to give effect to his promises. At St. Albans, early in August, they took the first steps towards the restoration of good government. Later in the month, at St. Paul's, the first suggestion that a charter should be demanded seems to have been made by the archbishop, who apparently did not know of the existence of Henry I.'s coronation charter. Langton realized at once that a formal charter was the best way of securing reforms in the administration, and John's observance of them. He took a few of the leading barons aside, read them Henry I.'s charter and suggested that it should be the basis of their programme. He must also have discussed the needs of the country with the justiciar and the other judges. In all probability the actual drafting of some of the clauses of the charter was begun by such men in private talk at this time.

John, in the meantime, had forgotten his promises in his just rage against the northern barons, who should have been awaiting him on the south coast, ready to embark to France. He found all in confusion there and, obliged to put off his expedition, turned north determined on vengeance. The archbishop pursued him, catching him up at Northampton and pointing out that the occasion demanded that the northern barons should be tried in the king's court and not punished till they had been found guilty. Though he resented the archbishop's interference, John gave way. It was this crisis combined with the new idea of a charter that probably gave occasion for a compilation known as "the unknown charter of liberties." Not mentioned by any contemporary, the document was unknown until the last century. There is no evidence that it was anything more than a basis for discussion or an attempt to draft the baronial demands. It contains none of those clauses characteristic of the later charter, which attempt administrative reforms and link Magna Carta rather with the Statutes of Edward I. than with the charters of Henry I. and Stephen.

The Crisis.—By whatever means it was secured, some compromise must have been made, for the king departed on Feb. 2, 1214, on his last expedition to Poitou, and during his absence no active steps were taken against him, although a demand for a scutage of three marks, issued from abroad, roused bitter resentment. When John returned defeated, all parties felt that the time had come to insist on definite guarantees for the future. John met the barons at Bury St. Edmunds on Nov. 4, 1214, and received a definite refusal to pay the scutage. After the king had departed they solemnly swore to withdraw their allegiance from him unless he would confirm their liberties by charter. They agreed to present their demands soon after Christmas, and in the meantime to prepare for war. John tried to win over his ecclesiastical opponents by issuing, on Nov. 21, a charter to the Church, in which he granted freedom of election. On Jan. 6 the barons put before the king at the Tower general demands that a charter should be issued on the lines of Henry I.'s charter, but incorporating administrative reforms which some at least of the barons desired. The archbishop and William Marshall, earl of Pembroke, were anxious for reform without war. Through their mediation John secured a truce till Easter. On Jan. 15, he reissued the charter to the Church, and ordered the sheriffs in every county to take oaths of allegiance to the king. Both sides appealed to the pope and the king took the cross. The pope had a double reason for protecting him; he was both a vassal and a crusader.

In Easter week the barons met at Stamford to force a charter from the king. Contemporary chroniclers emphasize the fact that the backbone of the resistance was a group of northern barons; but to label the baronial resistance as northern is inaccurate, as the contemporary chroniclers themselves imply. In Lincolnshire, Norfolk, Suffolk and Essex it was particularly strong; the great men of Essex and Hertfordshire, the earl of Essex, the earl of Oxford, Robert fitz Walter, were almost to a man against the king, and with them were joined many barons of the second rank and men of rich knightly families from the other three eastern counties. The midland counties supplied such great names as William d'Albigny and John, the constable of Chester and the west, the Fitz Alans, and Fulk fitz Warin. From the south-west came William Malet and William de Montecute. That fewer supporters for the baronial party should come from the south-west, the northern midlands, and the honour of Lancaster was natural, since these were John's own lands. That the opposition should be stronger in the south-east is again to be expected. The men of Essex were more nearly in touch with modern thought, and modern thought was much occupied with the duties of the king. But John's enemies were everywhere. John had, however, certain supporters among the greatest barons in the land. The earl of Chester, almost a sovereign prince himself, could do no other than take the king's side, though one may suspect that he approved the charter, since he issued a comprehensive charter to his own men at some phase in the struggle, a document known as the Magna Carta of Chester. The earl of Pembroke, a man grown old in the service of the royal house, the earl of Salisbury, half brother to the king, the earl of Warrenne, the earl of Arundel, and earl Ferrars were all on the royal side, but Ralf of Coggeshall tells us that even when a baron supported John his knights were generally on the other side.

The archbishop had created a situation which he could not control. The barons were eager for war. The king was determined not to give way unless he were forced, and scornfully refused to consider the schedule that the barons at Stamford sent for his seal by the hands of the archbishop and the marshal. On May 5 the barons renounced their allegiance and chose Robert fitz Walter as leader. The title he took, "Marshal of the army of God and Holy Church," emphasized the righteousness of the cause. Four days later John issued a charter to London, granting the privilege of an annually elected mayor, but it came too late to win support for him. Robert fitz Walter, lord of Baynard's Castle, on the outskirts of the city, dominated city politics. The king's offer, next day, to submit his quarrel with the barons to arbitration was in vain. When the barons entered London, easily quelling any opposition, the king realized that he must come to terms, and on June 15 met them at Runnimede, between Staines and Windsor. The barons came prepared with a document, which survives, as the *Articles of the Barons*. It was sealed on the first day of the conference and became the basis for discussion. The more elaborate charter contained amendments on both sides.

THE CONTENTS OF THE CHARTER

The charter is drawn up in the ordinary form of a contemporary grant of land or privileges. The convenience of modern commentators has necessitated the adoption of a traditional division into clauses, a division often unfortunate in that it suggests a separation where the originators of the charter were clearly following out a line of thought. In summarizing the contents it is impossible to follow the order of the clauses and at the same time give a coherent impression of the contents of the document. The intention of the men who drew up the charter was to state the law as it should be. It is the first detailed statement of feudal law, the first clear agreement between the king and his barons as to the exact demands which the king can make on them and which they can make on their men. Its emphasis on the use of the feudal council inaugurates no new policy, but simply reiterates the recognized, though not always followed, feudal practice. The statements about debt were a serious attempt to deal with one of the most pressing problems of administration and, indeed, of social intercourse, the chronic need of money, felt by all alike, and the consequent impossibility to get anyone to pay his debts. The judicial clauses were drafted with the obvious aim of restoring judicial eyres and improving the efficiency of the royal courts. The much quoted clause about the writ *Precipe* was a natural attempt to curb what was, to the barons, unfair competition with the feudal courts, competition which Glanville himself, though a royal justiciar, had hardly approved. It does not express a desire to go back upon the judicial changes of the last 50 years, but merely a feeling that the baron who had been bearing the burden of the day in the matter of judicial labour ought not to be deprived of the cases which would still be settled in his court unless he failed to do justice. A serious attempt was made in the charter to eliminate the abuses of local government, abuses which had existed in the earliest days of Norman rule, and which successive kings had fought against in vain. During his quarrel with the Church John made no effort to deal with them, and, indeed he had aggravated them by the appointments he had made to local offices. John had been interested in the development of his towns, and the charter confirmed to towns the privileges they had won. All classes of the community expected something from the charter, and the drafters did their best to satisfy the general desire. The charter therefore ranges widely over the whole field of society and administration. But it also contains clauses which reflect the bitterness of the time, clauses that must have irritated the king almost beyond endurance. Since all mercenaries were to leave the land it was but to insult the king to name a few. The determination of the barons to be rid of old grievances, particularly those connected with the forests, to right old wrongs, even those of another generation, almost destroyed the charter itself. But without the spur that the bitterness of personal hatred gave, the charter would never have been won. If the famous clause promising that no freeman shall be taken or imprisoned or disseised or outlawed or exiled . . . without the judgment of his peers or by the law of the land, was the outcome of the memory of John's attack on the northern barons in 1213, it was a guarantee of security against arbitrary rule to all men, whether barons or simple free men.

The Clauses.—The charter may be summarized as follows, the numbers in brackets being the traditional numbers of the clauses.

I. The clause reiterating the grant of free election to the church (1).

II. Clauses which chiefly concerned the barons. (a) *Inheritance:*—Military tenants are to have their inheritances on payment of the ancient relief, £100 for an earl or baron, 100s. for a knight. (b) *Wardship:*—Heirs who have been in wardship are to have their inheritances without relief. The heir in wardship is to be safeguarded from the rapacious guardian, who is to hand over the land well stocked (2–5). The king will not claim prerogative wardship, *i.e.*, if a man holds of the king by other than military tenure and of some other lord by military tenure, the king will not claim the wardship of his heir by reason of the land that is held of him (37). Barons who have founded abbeys are to have the custody of them when they are vacant (46). (c) *Marriage:*—Heirs are to be married without disparagement, the kinsfolk of the heir being consulted. A widow is to have her marriage portion and her inheritance at once on her husband's death, and shall give nothing for it or for her dower. The latter shall be assigned to her within forty days during which she can stay in her husband's house. No widow shall be forced to remarry provided that she gives security not to remarry without her lord's consent (6–8). (d) *Debt:*—Lands or rents are not to be seized for the payment of debt while the debtor has sufficient chattels to pay the debt. The debtor's sureties are not to be distrained so long as the debtor himself can pay. If the sureties are called on they are to hold the debtor's lands till their payment has been made up to them. No interest is to be paid on debts to the Jews while the heir of the debtor is under age. The king will only take the principal if the debt comes into his hands. When anyone dies in debt to the Jews or to other people his wife and children are to be first provided for, and the debt is to be paid out of the residue of his estate (9–11). Debts to the king are to be the first charge on the estate of crown tenants, the residue is to be left to the disposal of his executors in accordance with the will of the dead man. If no debt is owing to the crown the estate may be disposed of according to his will reserving to his wife and children their reasonable shares. If a free man dies intestate, his kin and friends under the direction of the church shall divide his chattels, after the dead man's debts have been paid (26–27). (e) *Service and rules for holding the feudal council:*—No scutage or aid is to be taken without the common council of the kingdom, that is, without the matter being brought before the feudal council of tenants in chief, except for the ransoming of the king's body, the knighting of his eldest son and the first marriage of his eldest daughter. In these cases the aid is to be a reasonable one (12). The archbishops, bishops, abbots, earls and greater barons are to be summoned to the council individually by letter stating the cause of the summons; all those who hold of the king in chief are to be summoned generally through the sheriffs or royal bailiffs. Forty days' notice is to be given and on the appointed day the business is to proceed even if all those summoned are not present (14).

III. Clauses which principally affect subtenants and freemen as well as barons:—All the customs granted to his dependents by the king all men in the kingdom shall observe towards theirs (60). The king will not allow anyone to take an aid from his free men except on the three aforesaid occasions, and the aid then is to be a reasonable one (15). No one is to be forced to do more service for a knight's fee or other free tenement than he ought to do (16). No constable shall compel a knight to give money in lieu of castle guard if the knight wishes to do it in person or through a competent deputy. Service on an expedition shall free a knight from a proportionate amount of castle guard (29). "No freeman shall be taken, or imprisoned, or disseised, or outlawed, or exiled, or in any way destroyed, nor will we go upon him, nor will we send upon him, except by the legal judgment of his peers or by the law of the land" (39). "To no one will we sell, deny, or delay right or justice" (40). All persons are to be free to come and go in time of peace, except outlaws and prisoners (42).

IV. Clauses referring to towns, trade and merchants:—The aids of the city of London are to be governed by the same rule as the baronial aids, and the city is to have its ancient liberties and free customs. All other cities, boroughs, towns and harbours, are to have their liberties and free customs (12–13). There is to be one measure of wine and ale and corn within the realm, namely the London quarter, and one breadth of cloth, and it is to be the same with weights (35). All merchants are to be free to come and go, to stay in the land and to buy and sell, except in time of war. In time of war merchants of enemy countries in England are to be treated as English merchants are treated in the enemy countries (41). All kydells are to be removed from the Thames and the Medway and throughout all England except the sea coasts (33).

V. Clauses reforming judicial and legal matters:—Common pleas are not to follow the court but to be held in some certain place (17). For the taking of inquisitions of Novel disseisin, mort d'ancestor, and darrein presentment two justices are to be sent through the realm four times a year and with four knights of each county chosen by the county are to hold the assizes on the day and in the meeting place of the shire court. If all cannot be taken on the one day, enough knights and freeholders are to remain to conduct the business (18, 19). Amercements are to be in accordance with the measure of the offence. They are not to be so heavy, in the case of grievous crimes, as to deprive any man of his means of livelihood. They are to be assessed by the honest men of the neighbourhood (20). Earls and barons are to be amerced by their peers according to the measure of their offence (21). Clerks shall only be amerced according to the measure of their offence and only the lands which they hold by lay tenure shall be answerable for the amercement (22). The lands of those convicted of felony shall only be held by the king for a year and a day and then shall return to the lord of the fee (32). The writ

REPRODUCTION OF MAGNA CARTA FROM THE ORIGINAL IN LINCOLN CATHEDRAL

Transliteration of the first three-and-a-third lines: Johannes Dei gratia, rex Anglie, dominus Hybernie, dux Normannie et Aquitannie, comes Andegavie, archiepiscopis, episcopis, abbatibus, comitibus, baronibus, justiciariis forestariis, vicecomitibus, prepositis, ministris, et omnibus ballivis, et fidelibus suis, salutem. Sciatis nos, intuitu Dei, et pro salute anime nostre, et omnium antecessorum, et heredum nostrorum, ad honorem Dei, et exaltationem sancte ecclesie, et emendationem regni nostri, per consilium venerabilium patrum nostrorum Stephani Cantuariensis archiepiscopi, totius Anglie primatis et sancte Romane ecclesie cardinalis; Henrici Dublinensis archiepiscopi, Willelmi Londoniensis, Petri Wintoniensis, Joscelini Bathoniensis et Glastoniensis, Hugonis Lincolniensis, Walteri Wygornensis, Willelmi Coventrensis, et Benedicti Roffensis, episcoporum; magistri Pandulfi domini pape subdiaconi et familiaris, fratris Eymerici, magistri militie templi in Anglia, et nobilium virorum Willelmi Mariscalli comitis Penbrok, Willelmi comitis Saresberie, Willelmi comitis Warennie, Willelmi comitis Arundellie, Alani de Galweya constabularii Scottie, Warini filii Geroldi, Petri filii Hereberti, Huberti de Burgo senescalli Pictavie, Hugonis de Nevilla, Mathei filii Hereberti, Thome Basset, Alani Basset, Philippi de Albiniaco, Roberti de Roppelay, Johannis Mariscalli, Johannis filii Hugonis, et aliorum fidelium nostrorum; Imprimis concessise Deo et hac presenti carta nostra confirmasse pro nobis et heredibus nostris in perpetuum:

Translation should read: John, by the grace of God, king of England, lord of Ireland, duke of Normandy and Aquitaine, and Count of Anjou: to the archbishops, bishops, abbots, earls, barons, justices, sheriffs, reeves, ministers, and to all bailiffs, and faithful subjects, greeting. Know that we, by divine impulse, and for the salvation of Our soul, and of the souls of Our ancestors and of Our heirs, and for the honour of God, and the exaltation of Holy Church, and the amendment of Our kingdom, by advice of Our venerable fathers, Stephen, archbishop of Canterbury, primate of all England, and cardinal of the holy Roman Church: Henry, archbishop of Dublin; the bishops William of London; Peter of Winchester; Jocelin of Bath and Glastonbury; Hugh of Lincoln; Walter of Worcester; William of Coventry; Benedict of Rochester; and Master Pandulph, sub-deacon and Counsellor; Brother Eymeric, master of the Temple in England, and the noble William Marescall, earl of Pembroke; William earl of Salisbury; William earl de Warenne; William earl of Arundel; Alan of Galloway, constable of Scotland; Warin Fitzgerald, Peter Fitzherbert; Hubert de Burgh, seneschal of Poitou; Hugh de Neville; Matthew Fitzherbert; Thomas Basset; Allan Basset; Phillip d'Aubigny, Robert of Ropsley, John Marshall, John Fitzhugh, and others Our liegemen; have in the first place granted to God, and by this Our present charter, confirmed on behalf of Ourselves and Our heirs for ever:

called *Precipe* shall not in future be issued to anyone touching any tenement whereby a free man may lose his court (34). Nothing shall henceforth be given for a writ of enquiry touching life or limb, but it shall be granted freely and not denied (36). No one is to be taken or imprisoned upon the appeal of a woman for the death of any other than her husband (54).

vi. Clauses intended to check the abuses of local officers:—No town or individual shall be forced to make bridges or maintain river banks except such as ought to be so maintained by ancient custom and right (23). No sheriff, constable or bailiff is to hold the pleas of the crown (24). All counties, hundreds, wapentakes and ridings are to be at their old farm without any increment, except the king's demesne manors (25). No constable or bailiff is to take a man's corn or other chattels without immediate payment unless the owner allows a respite (29). No sheriff, bailiff or any other person shall take a freeman's horses or carts for carriage duty except with the owner's consent (30). Neither the king nor his bailiffs are to take a man's timber for castle-building or any other royal work without the consent of the owner of the wood (31). No justice, constable, sheriff or bailiff is to be appointed but such as knows the law and is willing to observe it (45). No bailiff upon his own bare word without credible witnesses is to send a man to the ordeal (38).

vii. Forest Clauses:—Men who dwell without the forest are not to come before the justices of the forests on a general summons but only when they are concerned in special cases (44). All forests made by John are to be disafforested and all evil customs of the forests abolished. Justice is to be done with regard to the forests made by Henry II. and Richard I. (47, 48).

viii. Clauses of temporary interest, to correct temporary abuses:—All hostages and charters taken from the English barons are to be returned (49). Welsh grievances are to be considered and Welsh hostages are to be returned (56–68). Scottish hostages are to be returned and justice is to be shown to Alexander, king of Scotland (59). Certain named mercenaries and their followers are to be sent away. All mercenaries are to be dismissed (50, 51). Justice is to be done in the case of wrongful dispossessions by John himself, Henry II. or Richard I. (52). In all cases the king is to have the crusader's respite. Illegal fines and amercements are to be remitted. The 25 barons who were to be responsible for the maintenance were to judge any disputed matters, together with Stephen Langton, archbishop of Canterbury.

ix. The form of security for the maintenance of the provisions of the charter:—The barons were to choose 25 of their number to be the guardians of the charter. If the king or one of his officers did anything contrary to its terms the offence was to be notified at once to 4 of the 25 who were to go to the king or the Justiciar and ask that the matter might be corrected. If it were not corrected within 40 days the 4 barons were to refer the matter to the rest of the 25, who together with the community of the whole land "shall distrain and trouble us in all possible ways by taking our castles, lands and possessions." When redress has been forced upon the king, former relations with him were to be resumed. Anyone who wished could swear to obey the 25. The king would enforce the oath on anyone who refused to take it. On the death of one of the 25 the survivors were to appoint his successor. A majority of them were to decide questions in dispute. The king promised that he would not directly or indirectly do anything by which the concessions might be revoked or diminished.

War Again.—In this last clause lies the weakness of the charter and of the whole baronial position. The legalization of temporary rebellion inevitably affected the tempers of both sides. At the same time, in the opinion of the archbishop and the moderate party, it was likely to secure not peace and good government but prolongation of the time of disorder. The baronial choice fell on some of the worst malcontents. The mayor of London was the only member of the 25 who was of less than baronial rank, no bishops were among them, and the only one of them who had any sympathy with the king's point of view was the count of Aumâle, a thoroughly untrustworthy person. The moderate men secured the appointment of a second committee of 38 men, chosen from all parties, and containing some of the wisest of the king's supporters. The work of this body was to hold the balance between the king and the 25. But despite this arrangement war broke out. The charter as it was issued can have satisfied no one. Some of the Northern barons had even withdrawn before agreement was reached; other barons evidently cared only for those clauses which secured to themselves either general promises or the redress of individual grievances. Stephen Langton, the wiser earls, and the judges saw the clauses by which they hoped to secure a well run administration wrecked by such insistence on personal questions. For the moment the king seemed willing to keep his part of the bargain. The charter was sent into every shire for publication by the sheriff, orders were sent to sheriffs and bailiffs that men should swear allegiance to the 25, and that enquiries should be set on foot as to the evil customs to be abolished. Peter des Roches ceased to be justiciar, and Hubert de Burgh was appointed. Some of the foreign mercenaries were dismissed, and some of the offending sheriffs removed. Enquiries were also set on foot as to claims of individuals against the king. This compliance did not last long. The tyranny of the 25 was not to be borne by one so impatient of control as John. He made ready for war, sending to Aquitaine and Flanders for mercenaries, and to the Pope for spiritual help.

While the king made ready for war the baronial leaders remained in London, making no other preparations than negotiations with the French king for help against John. The Northern barons who had withdrawn from the negotiations for the charter fortified their castles. All over the country the king's lands were attacked and his deer stolen. The administration was disorganized; the business of the Exchequer at a standstill. Stephen Langton and the bishops could do nothing. The Pope annulled the charter and excommunicated the baronial leaders. The archbishop refused to publish the excommunication, little as he approved of the baronial attitude, and left the country with his office in abeyance.

In October a party of barons seized Rochester castle, but John laid siege to it and it fell on St. Andrew's day. No substantial help came from France till January 1216, and Louis, son of Philip Augustus, whom the barons wished to make king, only landed in May. Meanwhile John was isolating the baronial stronghold of London by the fortification of Windsor, Hertford, Berkhampstead and Bedford castles. One company of the royal army occupied itself in reducing East Anglia and Essex. The king in person quelled resistance in the north, and appointed trustworthy men to keep the northern barons in subjection. Had it not been for French help the rebellion would have been over before the summer of 1216. The coming of Louis meant the desertion of many of John's French mercenaries. Louis' momentary success drew to his side some of the greater barons who had hitherto supported John, the earls of Warenne, Arundel and Salisbury, and the count of Aumâle. War was renewed all over the country. Alexander of Scotland raided the north. Lincoln castle was besieged by barons acting in the name of Louis. In Yorkshire the rebel barons rose again, and in Nottinghamshire the castles of Nottingham and Newark were taken by them. But the king's cause was by no means lost. In the north the men appointed by John had little difficulty in upholding his authority. Even in the south Louis made little headway. Although he took Winchester, he could not take the castles of Windsor or Dover. Meanwhile, resentment against French domination began to be felt among the barons. John reorganized his forces in the south-west, drew off the besiegers of Windsor castle and passed into the eastern counties, where he intended to crush resistance as he had done in the north in the previous winter. At Kings Lynn he was seized with dysentery. He crossed the Wash and managed to struggle to Newark, where he died on Oct. 19, 1216. With his death the need for further opposition to royal authority was gone, for the moderate party took control of affairs in the name of the young Henry.

The Reissues of the Charter.—The Charter was at once reissued with certain significant changes. All clauses of a purely temporary nature were omitted, those dealing with mercenaries and the redress of grievances. With them went the promise that only justices, constables, sheriffs and bailiffs who know the law and are willing to observe it shall be appointed (45). Clauses which might affect the royal power to raise money were omitted, those relating to the Jews, the feudal aids, and the farms of the shires. The clause laying down the way in which the barons should be consulted in the feudal council was omitted. These omissions were all matters of policy. It was not the time to haggle over personal grievances, nor could Henry's advisers rightly bind the young king in matters of general policy. The mercenaries were needed to fight Louis. Money was needed from whatever source. The necessity of the moment, too, added a provision that payment for goods for royal castles might be postponed for three weeks. Other changes, slight though they were, showed that those who reissued the charter had sufficient time and interest to consider the advantage of authoritative statements on difficult legal points. The position of the heir in his lord's wardship and the position of a widow with regard to her dower are more precisely defined. The form of security for the maintenance of the charter was omitted, but a clause was inserted promising full consideration of everything that needed correction.

In the reissue of the following year, 1217, the clauses omitted in 1216 were not replaced. The regency council might be using the charter as a political weapon to win men to their side, but they regarded it as above all an administrative measure, a guide to and a check on judges and local officers in the difficult years of reconstruction. The rights of the widow are still more carefully defined. The rules for the taking of assizes are modified. There were three fresh clauses forbidding a freeman to give or sell so much of his land as may hinder the proper performance of his services to his lord; regulating the conduct of the sheriff with regard to the holding of the shire court; and forbidding the practice of giving land to a religious house and receiving it back as its tenant. The delay of 3 weeks in the payment of goods taken for the use of a royal castle in 1216 is extended in 1217 to 40 days, but in 1217 the carts of ladies, knights and parsons are exempt from cartage duties. The provision in the 1215 issue that service with the army exempts from castle guard is limited by the statement that the exemption only applies to fiefs from which service with the army is due. If the clause which declares that the promises made by the king to his tenants shall be observed by his men to theirs is weakened by the saving clause reserving to "all archbishops, bishops, abbots, priors, templars, hospitalers, earls, barons and all other as well ecclesiastical as secular persons their liberties and free customs which they had before," it is, at any rate, made clear that all villeins, not only the king's are protected from excessive amercements. The forest clauses were omitted and issued later in a separate charter. It is to this issue that the name *Magna Carta* became attached in contrast with the charter of the forest. The edition of 1225 contained nothing new, except the statement that the charter is issued of the king's free and spontaneous will and in return for an aid. That later issues of the charter were no more than confirmations of this edition is not surprising. The administrative system was yearly becoming more complicated, the law more intricate. A carefully drawn statute was needed at the end of the century to deal with a matter for which a short clause would have sufficed in 1217.

There still exist four originals of the charter of 1215, two of them in the cathedral churches in which they were originally deposited, Lincoln and Salisbury, the other two in the British Museum. The Lincoln Charter was considered the most perfect and was reproduced in the Statutes of the Realm in 1810. The charter was commented on by Sir Edward Coke in his *Second Institute* published by order of the Long Parliament in 1642, but modern criticism was begun by Blackstone *The Great Charter and the Charter of the Forest* (1759). Richard Thomson's *Essay on the Magna Carta of King John* (1829), was a serious attempt to collect all the information on the circumstances and people connected with the charter. It also contains a useful section on the existing manuscripts, copies and printed editions of the charter. Modern authorities to be consulted are C. Bémont, *Chartes des libertés anglaises* (1892); W. S. McKechnie, *Magna Carta* (1905); Petit-Dutaillis, *Studies supplementary to Stubbs' Constitutional History* ii. (1908); R. L. Poole, *The Publication of Great Charters by the English Kings* in Eng. Hist. Review (1913); *Magna Carta Commemoration Essays* (1915); F. M. Powicke, *Stephen Langton* (1928). (D. M. S.)

MAGNA CARTA DAY ASSOCIATION, INTERNATIONAL, INC. The Association was organized in St. Paul, Minn., in 1907, to emphasize the common political heritage of the English-speaking peoples; their political harmony of thought and purpose; their championship of civil and religious liberty and common devotion to popular government. Magna Carta Day is now widely observed annually, the churches co-operating on Magna Carta Sunday, the third Sunday in every June. The association operates through the distribution of appropriate literature to educational institutions, libraries, the press, churches, State and municipal authorities, also by means of a world-wide correspondence.

MAGNA GRAECIA, the name given (first, apparently, in the 6th century B.C.) to the group of Greek cities (ἡ μεγάλη Ἑλλάς), along the coast of the "toe" of South Italy (or more strictly those only from Tarentum to Locri, along the east coast), while the people were called Italiotes (Ἰταλιῶται). The interior continued in the hands of the Bruttii, the native mountaineers, from whom the district was named in Roman times (Βρεττία also in Greek writers). The Greek colonies, at first trading stations, grew into independent cities. An early trade in copper was carried on between Greece and Temesa (Homer, *Odyssey*, i., 181), chiefly by Euboeans; and Cyme (Cumae) in Campania was founded in the 8th century B.C., when the Euboean Cyme was still a great city. After this the energy of Chalcis went onward to Sicily, and the states of the Corinthian Gulf carried out the colonization of Italy, Rhegium having been founded, it is true, by Chalcis, but after Messana (Zancle), and at the request of the inhabitants of the latter. Sybaris (721) and Crotona (703) were Achaean settlements; Locri Epizephyrii (about 710) was settled by Ozolian Locrians, so that, had it not been for the Dorian colony of Tarentum, the southern coast of Italy would have been entirely Achaean. Tarentum, whatever its origins, early became the only foreign settlement of the Spartans. Ionian Greeks fleeing from foreign invasion founded Siris about 650 B.C., and, much later, Elea (540).

The Italian colonies, planted among friendly peoples, grew much more rapidly than the Sicilian Greek states, which had to contend against Carthage. After the Achaean cities had combined to destroy the Ionic Siris, and had founded Metapontum as a counterpoise to the Dorian Tarentum, there was little strife among the Italiotes. An amphictyonic league, meeting at the temple of Hera on the Lacinian promontory, fostered a feeling of unity. The Pythagorean and Eleatic systems of philosophy had their chief seat in Magna Graecia. They sent competitors to the Olympic games (among them the famous Milo of Croton); and the physicians of Croton early in the 6th century (especially in the person of Democedes) were reputed the best in Greece. In 510 Croton, having defeated the Sybarites in a great battle, totally destroyed their city. In the war between Athens and Syracuse Magna Graecia took comparatively little part; Locri was strongly anti-Athenian, but Rhegium, though the headquarters of the Athenians in 427, remained neutral in 415. Foreign enemies pressed heavily on it. The Lucanians and Bruttians on the north captured one town after another. Dionysius of Syracuse attacked from the south; and after he defeated the Crotoniate league and destroyed Caulonia (389 B.C.), Tarentum (*q.v.*) remained the only powerful city. Repeated expeditions from Sparta and Epirus tried in vain to prop up the decaying Greek states against the Lucanians and Bruttians; and when in 282 the Romans appeared in the Tarentine Gulf the end was close at hand. The aid which Pyrrhus brought did little good to the Tarentines, and his final departure in 274 left them defenceless. Malaria increased as population diminished. Many of the cities disappeared, and hardly any were of great importance under the Roman empire; some, like Tarentum, maintained their existence into modern times. Archaeological investigations of great importance have been made. (T. A.)

MAGNASCO, ALESSANDRO (1667–1749), Italian painter belonging to the period of transition from the Baroque to the Rococo. Magnasco was born at Genoa. He studied painting under Abbiati. In landscape work he broke away from the conventions. He was most distinguished as a genre painter of Italian interiors. He is represented in the galleries of Dresden, Vienna, Berlin, Frankfurt, Florence, Milan, and Warsaw.

MAGNATE, a noble, a man in high position, by birth, wealth or other qualities. The term which is derived from Late Lat.

magnas, a great man, was specifically applied to the members of the Upper House in Hungary, the *Förendihaz* or House of Magnates. Its popular application to a wealthy man is usually satirical.

MAGNES (*c.* 460 B.C.), Athenian writer of the Old Comedy, a native of the deme of Icaria in Attica. His death is alluded to by Aristophanes (*Equites,* 518–523, which was brought out in 424 B.C.), who states that in his old age Magnes had lost the popularity which he had formerly enjoyed. The few titles of his plays that remain, such as the *Frogs,* the *Birds,* the *Gall-flies,* indicate that he anticipated Aristophanes in introducing grotesque costumes for the chorus.

See T. Kock, *Comicorum atticorum fragmenta,* i. (1880); G. H. Bode, *Geschichte der hellenischen Dichtkunst,* iii. pt. 2 (1840).

MAGNESIA, in ancient geography the name of two cities in Asia Minor and of a district in eastern Thessaly, lying between the Vale of Tempe and the Pagasaean Gulf.

(1) MAGNESIA AD MAEANDRUM, a city of Ionia, situated on a small stream flowing into the Maeander, 15 Roman miles from Miletus and rather less from Ephesus. According to tradition it was founded by colonists from the Thessalian tribe of the Magnetes, with whom were associated, according to Strabo, some Cretan settlers. It was thus not properly an Ionic city, and for this reason, apparently, was not included in the Ionian league, though superior in wealth and prosperity to most of the members except Ephesus and Miletus. It was destroyed by the Cimmerii in their irruption into Asia Minor, but was soon after rebuilt, and gradually recovered its former prosperity. It was one of the towns assigned by Artaxerxes to Themistocles for support in his exile. Magnesia continued under the kings of Pergamum to be one of the most flourishing cities in this part of Asia; it resisted Mithridates in 87 B.C., and was rewarded with civic freedom by Sulla; but it appears to have greatly declined under the Roman empire, and its name disappears from history, though on coins of the time of Gordian it still claimed to be the seventh city of Asia.

See K. Haumann, *Magnesia am Maeander* (1904).

(2) MAGNESIA AD SIPYLUM, a city of Lydia about 40 mi. northeast of Smyrna unknown before the battle of 190 B.C. In 197 B.C. the Romans, freed from all danger from Carthage, had forced the submission of Philip V of Macedon (*see* CYNOSCEPHALAE, BATTLE OF), while Antiochus, overrunning Asia Minor, had penetrated into Thrace. The Mediterranean world could not hold two such powerful rivals, and the inevitable clash was hastened by Antiochus's subsequent invasion of Greece. If by his dilatory and limited strategy he lost his opportunity, he roused the Romans, reviving from the war weariness that followed the struggle with Hannibal, to a sense of danger, and, not content with his repulse, they prepared a counter-invasion—all the more because Hannibal was now at the side of Antiochus. The expedition was placed under the consul Lucius Scipio, whose election was due to the promise of his famous brother, Publius Scipio Africanus, to accompany him as his lieutenant. The latter's combination of strategy and diplomacy ensured the expedition's secure and unchecked passage from Greece and across the Dardanelles into Asia Minor. But illness prevented him reaping the tactical fruits, and the decisive battle was fought while he was still on his sick bed. Antiochus with an army computed at 62,000 foot and over 12,000 horse had fallen back behind the Hermus river and there at Magnesia—the modern Minissa—fortified a strong camp. Though the Romans counted only two legions and proportionate allied contingents—some 30,000 in all—an attack was decided upon. "The Romans never despised an enemy so much." However, Antiochus saved them the trouble and came out to offer battle. Even so, they evidently missed the master-hand of Scipio Africanus, and were even in jeopardy for a time. For while they were driving in the enemy's centre, and their cavalry were attacking his left flank, Antiochus himself with his right wing cavalry, crossed the river—left almost unguarded—and fell upon the Romans' left flank. The troops there were dispersed and took refuge in the camp, where only the resolution of the tribune left in charge rallied them and staved off the danger until reinforcements arrived. Foiled here and seeing a heavy concentration developing against him, Antiochus fled from the battlefield, and the remnants of his demoralized army followed him to Sardis. Antiochus, with his subject states making their peace with Rome, was forced, more through Africanus's strategy than his brother's tactics, to sue for a peace which removed him to the eastern side of the Taurus range and left Asia Minor free for Roman exploitation.

MAGNESITE, a mineral consisting of magnesium carbonate, $MgCO_3$, and belonging to the calcite group of rhombohedral carbonates. It is rarely found in crystals or crystalline masses, being usually compact or earthy and intermixed with more or less hydrous magnesium silicate (meerschaum). The compact material has the appearance of unglazed porcelain, and the earthy that of chalk. In colour it is usually dead white, sometimes yellowish. The hardness of the crystallized mineral is 4; specific gravity 3·1. The name magnesite as originally applied by J. C. de Lamétherie in 1797 included several minerals containing magnesium, and at the present day it is used by French writers for meerschaum.

Magnesite is a product of alteration of magnesium silicates, and occurs as veins and patches in serpentine, talc-schist or dolomite-rock. It is extensively mined in the island of Euboea in the Grecian Archipelago, near Salem in Madras, and in California. It is principally used for the manufacture of highly refractory fire-bricks for lining steel furnaces and electric furnaces; also for making plaster, tiles and artificial stone; for the preparation of magnesium salts (Epsom salts, etc.); for whitening paper-pulp and wool; and as a paint.

MAGNESIUM, a metallic chemical element of silvery white appearance, which is familiar in the form of ribbon (symbol Mg, atomic number 12, atomic weight 24·32, isotopes 24, 25, 26). The sulphate or Epsom salts was isolated in 1695 by N. Grew, while in 1707 M. B. Valentin prepared *magnesia alba* from the mother liquors obtained in the manufacture of nitre. Magnesia was confounded with lime until 1755, when J. Black showed that the two substances were entirely different; and in 1808 Davy pointed out that it was the oxide of a metal, which, however, he was not able to isolate. Magnesium is found widely distributed in nature, chiefly in the forms of silicate, carbonate and chloride, and occurring in the minerals olivine, hornblende, talc, asbestos, meerschaum, augite, dolomite, magnesite, carnallite, kieserite and kainite. The metal was prepared (in a state approximating to purity) by A. A. B. Bussy who fused the anhydrous chloride with potassium; H. Sainte Claire Deville's process, which used to be employed commercially, was essentially the same, except that sodium was substituted for potassium and that carnallite, $KCl,MgCl_2$ was used instead of magnesium chloride, the product being further purified by redistillation. Electrolytic methods have entirely superseded the older methods; fused carnallite, $KCl,MgCl_2$, is electrolysed at 760°C. in an iron pot, which acts as the cathode, the anode being a carbon rod surrounded by a porcelain tube to carry off the chlorine.

Magnesium is malleable and ductile. Sp. gr. 1·75. Its alloys with aluminium are known as "magnalium" and are useful for light castings. Magnesium preserves its lustre in dry air, but in moist air it becomes tarnished by the formation of a film of oxide. It melts at 632·7°C. and boils at about 1,100°C. Magnesium and its salts are diamagnetic. It burns brilliantly when heated in air or oxygen, or even in carbon dioxide, emitting a white light and leaving a residue of magnesia, MgO. The light is rich in the violet and ultra-violet rays, and consequently is employed in photography. At high temperatures it acts as a reducing agent. It combines directly with nitrogen, when heated in the gas, to form the nitride Mg_3N_2 (*see* ARGON). It is rapidly dissolved by dilute acids.

Magnesium Oxide, magnesia, MgO, occurs native as the mineral periclase, and is formed when magnesium burns in air; it may also be prepared by the gentle ignition of the hydroxide or carbonate. It is a non-volatile and highly infusible white powder, which slowly absorbs moisture and carbon dioxide from air, and is readily soluble in dilute acids. On account of its refractory nature, it is employed in the manufacture of crucibles, furnace linings, etc. It is also used in making hydraulic cements. *Magnesium hydroxide* $Mg(OH)_2$ occurs native as the minerals brucite and nemalite. It is employed in the manufacture of cements.

When magnesium is heated in fluorine or chlorine or in the vapour of bromine or iodine there is a violent reaction, and the corresponding halide compounds are formed. With the exception of the fluoride, these substances are readily soluble in water and are deliquescent. The fluoride is found native as sellaïte, and the bromide and iodide occur in sea water and in many mineral springs. The most important of the halide salts is the *chloride* which, in the hydrated form, has the formula $MgCl_2,6H_2O$. The hydrated salt loses water on heating, and partially decomposes into hydrochloric acid and magnesium oxychlorides. To obtain the anhydrous salt, the double magnesium ammonium chloride, $MgCl_2,NH_4Cl,6H_2O$, is prepared by adding ammonium chloride to a solution of magnesium chloride. Magnesium oxychloride when heated to redness in a current of air evolves a mixture of hydrochloric acid and chlorine and leaves a residue of magnesia, a reaction which is employed in the Weldon-Pechiney and Mond processes for the manufacture of chlorine.

Magnesium Carbonate, $MgCO_3$.—The normal salt is found native as the mineral magnesite, and in combination with calcium carbonate as dolomite, whilst hydromagnesite is a basic carbonate. It is not possible to prepare the normal carbonate by precipitating magnesium salts with sodium carbonate.

Other Magnesium Salts.—By adding sodium phosphate to magnesium sulphate and allowing the mixture to stand, hexagonal needles of $MgHPO_4,7H_2O$ are deposited. The *normal phosphate,* $Mg_3P_2O_8$, is found in some guanos, and as the mineral wagnerite. It is a white amorphous powder, readily soluble in acids. *Magnesium ammonium phosphate,* $MgNH_4PO_4,6H_2O$, is found as the mineral struvite and in some guanos; it occurs also in urinary calculi and is formed in the putrefaction of urine. *Magnesium nitrate,* $Mg(NO_3)_2 \cdot 6H_2O$, is a colourless, deliquescent, crystalline solid obtained by dissolving magnesium or its carbonate in nitric acid, and concentrating the solution. The crystals melt at 90° C. *Magnesium nitride,* Mg_3N_2, is obtained as a greenish-yellow amorphous mass by passing a current of nitrogen or ammonia over heated magnesium. *Magnesium sulphate,* $MgSO_4$, occurs (with $1H_2O$) as kieserite. A hexahydrate is also known. The heptahydrate is known as Epsom salts (*q.v.*).

Organic Compounds.—The most important organic compounds of magnesium are known as Grignard reagents (*q.v.*). They are of the composition RMgX (where R=an alkyl or aryl group and X=a halogen).

Detection.—In the absence of barium, strontium, calcium and aluminium the magnesium salts may be detected by the colourless crystals formed by adding sodium phosphate (in the presence of ammonia and ammonium chloride) to their solutions. The same reaction is made use of in the quantitative determination of magnesium, the white precipitate of magnesium ammonium phosphate being converted by ignition into magnesium pyrophosphate.

Medicine.—The salts of magnesium may be regarded as the typical *saline purgatives.* Their aperient action is dependent upon the minimum of irritation of the bowel, and is exercised by their abstraction from the blood of water, which passes into the bowel to act as a diluent of the salt. Magnesium salts have a powerful depressant action, especially on nervous tissue.

MAGNETIC ANALYSIS, broadly, the art of determining the constitutional and structural state of ferro-magnetic materials through study of the co-existing magnetic characteristics. In the United States the use of the term is restricted to denote the process of interpreting the magnetic characteristics of ferrous or other magnetic materials in terms of their physical characteristics that have a bearing on their qualifications for a given service.

The practicability of magnetic analysis rests upon the hypothesis that in a ferrous material there is a definite connection between the magnetic and the mechanical properties. Variations in chemical composition, inhomogeneities in structure, the presence of cracks and internal strains, processes of mechanical and thermal treatment, etc., all result in variations in magnetic characteristics which are more or less open to measurement and interpretation. Magnetic analysis predicates a test procedure which is non-destructive and may be applied at any stage in manufacture.

Both direct and alternating current are used as the primary means of magnetization. Various types of indicating means are employed, such as instruments of the deflected pointer type, galvanometers or oscillographs reflecting a light ray, the latter permitting of photographic recording. Magnetization by direct current offers advantages where it is desired to make tests at high inductions, or where the cross-section of the material is large. The alternating current method permits of greater speed in measurement. It also allows of obtaining separate indications representing different summations of permeability and watt loss characteristics, from which more than one property of the article under test may be inferred. Thus far its application in practice has been confined mainly to the examination of relatively small articles.

T. Spooner (*Proc. Am. Soc. Testing Materials,* pt. ii., 26, 1926) has carried out an extended investigation on high speed steel which consolidates much of the information on the subject of testing under alternating magnetization. Fig. 1 shows a series of oscillograms obtained by means of a cathode ray oscillograph of specimens of high speed steel of one composition which have undergone different heat treatments. The ordinates represent the differential of the magnetic flux for individual specimens of stated heat treatment and a standard specimen, both being subjected to the same magnetizing force. The abscissae represent time on a harmonic scale which is varied in phase with respect to the cycle of magnetization, so as to give prominence to that portion of the loop which has been found to carry special significance. Each vertical column, reading downward, shows for a given quenching temperature the changes in form as the drawing temperature is increased.

See *Proc.* Am. Soc. Test. Mat. (1913–27), R. L. Sanford, "Magnetic Analysis," *Trans.* Am. Inst. Elect. Eng. (1929); and bibliography of the Congrès International pour L'essai des Matériaux (Amsterdam, Sept. 1927).

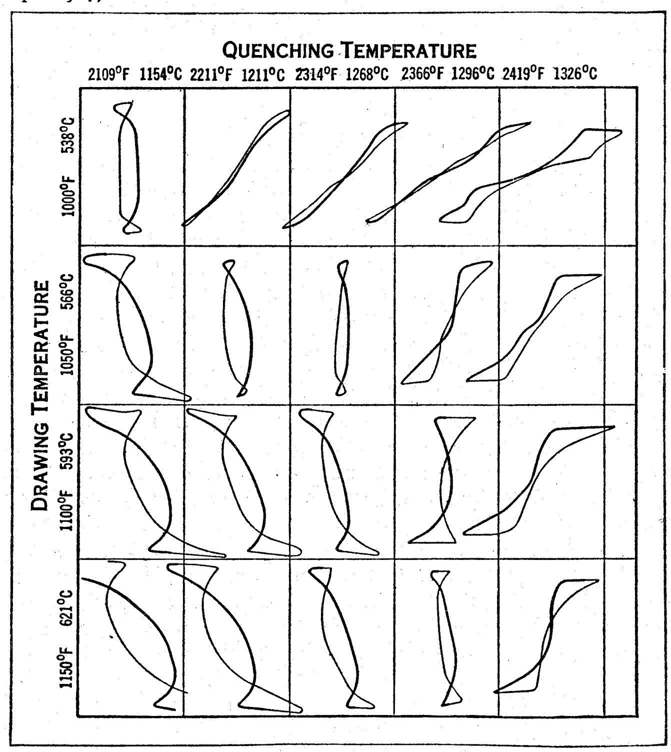

FIG. 1.—CLOSED LOOP OSCILLOGRAMS SHOWING MAGNETIC EFFECTS OF DIFFERENT HEAT TREATMENTS ON HIGH-SPEED STEEL BARS

MAGNETISM. This article is divided into the following sections:

This subject may be divided into three parts: (1) *ferromagnetism,* a property possessed by iron and a few other metals, and characterized by strong attraction of one magnetized body to another; (2) *paramagnetism,* a quality of many substances which causes them to be attracted by the poles of an electromagnet or magnetized body; and (3) *diamagnetism,* by virtue of which materials possessing this property are repelled by an electromagnet. Ferromagnetism is an important branch of paramagnetism, and ferromagnetic bodies are differentiated from other paramagnetic bodies by the magnitude of their reaction with a magnetic field, and in other ways described in detail in the following paragraphs.

For practical purposes, ferromagnetism is much the most important kind of magnetism.

After an historical introduction, ferromagnetic phenomena and materials will be described, and the effect of various factors on magnetic properties discussed. Following this, diamagnetism and paramagnetism and the theory of ferromagnetism will be considered, and finally an account of methods used for measuring magnetic quantities.

1. HISTORY

Centuries before the Christian era the Greeks knew that the mineral lodestone, a magnetic oxide of iron (magnetite, Fe_3O_4), had the ability to attract iron and other pieces of the same mineral. This natural magnet was mentioned by Thales of Miletus (*c.* 624–548 B.C.); and according to Plato, Socrates states in *Ion* that it will support a chain of iron rings, each held to the one above it by magnetic attraction.[1]

The Roman Lucretius Carus states in his *De Rerum Natura,* in the first century B.C., that ". . . iron can be drawn by that stone which the Greeks call Magnet by its native name, because it has its origin in the hereditary bounds of the Magnetes,"[2] the inhabitants of Magnesia, in Thessaly. The Romans knew also of the repulsive action of magnetism, as shown by a quotation from the same passage: "Sometimes, too, iron draws back from this stone; for it is wont to flee from and follow it in turn." No reference to the directive property of the magnet, as used in the compass, is found in old Greek and Roman literature.

To account for magnetic attraction some in this period believed that there were hooks on the surface of the magnet and little rings on the surface of the iron to catch them; others that particles were emitted by the magnet and created an empty space toward which the iron would move. Of all the phenomena of electricity and magnetism, frictional electricity and ferromagnetism are the oldest known to man, and perhaps the least understood today.

Beginning in the period A.D. 1000–1200 the history of magnetism is closely connected with the compass and its use in navigation. According to G. Sarton, the first clear mention in any literature of a magnetic needle for indicating direction appears to have been made by Shen Kua (1030–1093), a Chinese mathematician and instrument maker, who, however, mentions only its use on land.

Soon after 1100, the Chinese Chu Yu reported that in the period 1086–1099 the compass was used for navigation by "foreign" sailors going between Canton and Sumatra. Since the trade in this region was practically a Moslem monopoly it is concluded that they were the first to use the compass for directing ships.

The earliest known European reference to the compass is by Alexander Neckam (1157–1217), an English cyclopaedist. In 1269 Petrus Peregrinus de Maricourt, a French crusader, gave the first detailed description as an instrument of navigation. He wrote of the floating compass as an instrument in common use and described a new pivoted compass in some detail. He fashioned a sphere of lodestone and explored its surface with bits of iron, and applied the term pole to the places in which the magnetic power appeared to be concentrated. He believed that the magnet derived its power from the sky.

After his time little progress was made for almost 300 years. In 1600 William Gilbert of Colchester, England, published his *De Magnete* which summarizes the knowledge of magnetism at the time of Queen Elizabeth, whose court physician he was, and reports some of his own experiments. He mentions the dip and declination of the compass and propounds his own great contribu-

[1] *Ion.* 533 ff.
[2] Book vi, lines 906 ff., translated by T. Jackson (Oxford, 1929).

tion, the discovery that the earth itself is a magnet. He showed that magnetized iron lost its magnetism when heated to a bright red heat and regained it when cooled again to room temperature. His chapter xii, of book v is entitled "Magnetick force is animate, or imitates life; and in many things surpasses human life, while this is bound up in the organick body."[1]

After the time of Gilbert, during the period when Isaac Newton was formulating the law of gravitation and Robert Boyle was investigating the laws of gases, little of importance for magnetism was recorded.

Magnetostatics and the Nature of Magnetism.—In 1785 Charles Augustin Coulomb established with some precision the inverse square law of attraction (and repulsion) between unlike (and like) magnetic poles, a proposition that had been favoured or opposed by many before him. This was made the basis of Poisson's mathematical theory giving the forces between magnetized bodies in terms of their intensities of magnetization. Simon Denis Poisson (1781–1840) assumed magnetization to be a molecular phenomenon, but believed that a molecule became magnetic when the two fluids which it contained became separated. In 1852 Wilhelm Weber proposed that each molecule is a permanent magnet, subject to a frictional force that tends to maintain it in its established orientation. This explained the limit of magnetization (saturation) and gave a rather unsatisfactory explanation of residual magnetization, the magnetization remaining after the removal of the magnetizing field. Later James Clerk Maxwell (1831–79) improved upon Weber's explanation of residual magnetization by suggesting that the molecular magnet had no friction but had more than one fixed position of equilibrium.

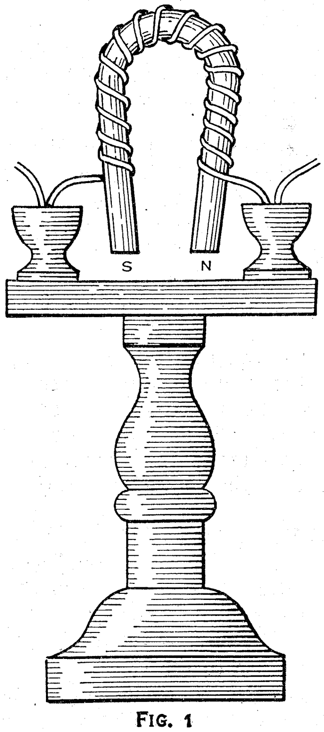

Fig. 1
A drawing of the first electromagnet that could be so called, constructed by William Sturgeon in 1825. The soft iron horseshoe is 5 in. high and is magnetized by the copper wire connected to a battery not shown

Before the time of Weber, Hans Christian Oersted made the important discovery (1820) that an electric current would affect a magnetic needle. Quickly following up this lead, André Marie Ampère investigated experimentally and mathematically the mutual forces between currents and showed (1825) that a current in a circuit is equivalent to a "magnetic shell" of calculable strength. He considered a magnet to be due primarily to electric currents circulating within the molecules, and this concept, though not accepted immediately because there was no way either to prove or to disprove it, stood the test of time and was elaborated only by the advent of electron theory and the modern era.

Electromagnetism. — Using Oersted's discovery, both Ampère and Dominique Arago (1786–1853) magnetized steel needles by placing them in a helix of wire carrying an electric current. This was the prelude to the construction in 1825 of the first electromagnet which could be so-called, by William Sturgeon (1783–1850) of Lancashire (fig. 1). This was made of soft iron bent in the form of a horseshoe and wound with a loose helix of 18 turns of wire, and when excited by a wet battery could lift 20 times its own weight.

Several years later Joseph Henry in the United States built a much improved electromagnet with many turns of wire efficiently applied. While experimenting with this in 1829 he noticed the spark that occurred when the circuit was broken and was led to discovery of self-induction, a treatise on which he published in 1832. The same phenomenon was independently discovered and published several years later by Michael Faraday (1791–1867). This great English experimentalist also shared with Henry the important discovery of electromagnetic induction, the "conversion" of magnetism into electricity. Although Henry is believed to have performed the experiment first and understood its significance, his results were unknown to Faraday who likewise made the crucial experiment and was the first to publish the results and thereby establish priority. Faraday and Henry made the first transformers (fig. 2) and prepared the way for the construction of the dynamo and motor and the age of electricity.

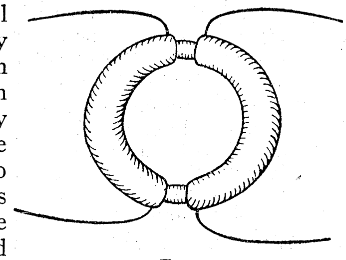

Fig. 2
Faraday's first transformer, with two windings of copper wire on an iron core. Connection of one winding to battery causes momentary flow of electricity in other winding connected to galvanometer

The laws of electricity and magnetism were formulated systematically in mathematical language by Maxwell, and his famous treatise was published in 1873.

Kinds of Magnetism.—The ancients knew the kind of magnetism that we observe in lodestone and iron and call *ferromagnetism.* Nickel and cobalt were discovered in the 18th century and nickel was soon thereafter known to be ferromagnetic while the ferromagnetism of cobalt was proved by Faraday in 1845. In 1846 Faraday observed that a bar of glass was repelled by his electromagnet, and named this property diamagnetism; he did not know that S. J. Brugmans (in 1778) and others had previously observed the same phenomenon in bismuth and antimony. Similarly he used the word paramagnetic for substances that were attracted by an electromagnet, and showed that this was a property of the substance and not the effect of an impurity of iron. He classified all of the substances that he examined—solids, liquids and gases—as para- or diamagnetic. Ferromagnetism is thus one kind of paramagnetism.

Almost 20 years after Faraday's death Pierre Curie (1895) made careful measurements of the effect of temperature on many materials of these three categories and found that diamagnetism is usually independent of temperature whereas paramagnetism usually decreases as the temperature increases.

A connection between ferromagnetism and light was finally established experimentally by J. Kerr who in 1876 observed the rotation of the plane of polarization of light reflected from a magnetized surface. Previously Faraday (1845) had observed a similar rotation in light transmitted by transparent bodies, and later (1896) Pieter Zeeman discovered the broadening of the spectral lines of sodium when the light was emitted in the presence of a magnetic field.

Modern Theory.—One difficulty with Weber's theory was that it gave no satisfactory explanation of residual induction and hysteresis. Maxwell's suggestion of multiple fixed positions for the molecular magnet left unexplained the fact that hysteresis (*see* below) is found when a magnetizing force, after being once applied, is removed and reapplied. J. A. Ewing proposed (1890) that the constraints on the orientations of the molecular magnets were imposed by the magnetic forces of the surrounding molecules, and showed by means of calculations and models that such forces can account qualitatively for the shape of the magnetization curve and the major and minor hysteresis loops. He first used the word *hysteresis*. J. Swinburne predicted on the basis of Ewing's theory that in a rotating magnetic field the hysteresis should disappear, and F. G. Baily's experiment (1896) confirmed this in a striking way (*see* fig. 29 below).

The first important influence of modern concepts on the theory of magnetism came when P. Langevin (1905) used statistical theory to explain the variation of paramagnetic susceptibility with temperature. He assumed each molecule to have a definite magnetic moment that tended to be oriented by the applied field and at the same time disturbed by thermal agitation. In 1907 this was seized upon by P. Weiss who postulated that the molecules are exposed both to the applied field and to a so-called

[1]Translation by the Gilbert Club, S. P. Thompson (ed.) Chiswick Press (London, 1900).

molecular field proportional to the intensity of magnetization, and so developed the first important quantitative theory of ferromagnetism. This molecular field is co-operative in nature, in that it depends on the mutual action of many atoms, and is now attributed to the "exchange forces" derived from quantum theory by W. Heisenberg.

It is a consequence of the Weiss theory that ferromagnetic materials must be spontaneously magnetized, that is, small regions or "domains" of the material are magnetized to saturation even when the specimen as a whole has zero intensity of magnetization; in this latter condition the magnetic moments of the regions are oriented at random. Previously such regions were considered identical with the molecules or atoms of the substance, but Weiss's deduction was later supported by many experiments (*e.g.* those on the Barkhausen effect) and is the basis of the domain theory now used in the interpretation of many magnetic phenomena.

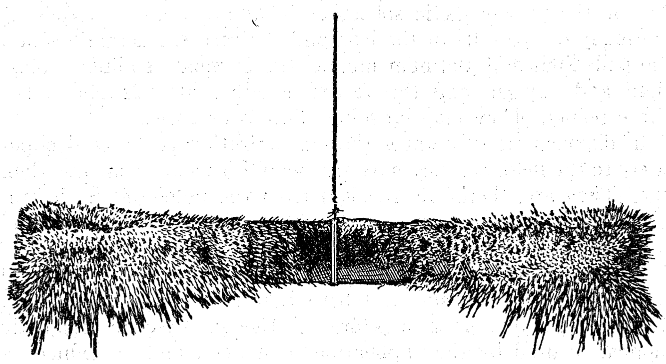

FIG. 3

A magnetized bar attracts iron filings that cling most strongly near the poles of the bar

The quantum theory by its clarification of atomic structure has had a great influence on magnetic theories. W. Pauli in 1920 showed that there is a natural unit of magnetic moment, the Bohr magneton, and in 1926 S. Goudsmit and G. E. Uhlenbeck proposed the spinning electron as the fundamental magnetic particle having a moment of one Bohr magneton. The quantum theory of paramagnetism and ferromagnetism was developed rapidly by the contributions of W. Heisenberg, J. H. Van Vleck, E. C. Stoner, H. Bethe, F. Bloch, J. C. Slater and others. The temperature dependence of saturation magnetization, as calculated by P. Debye (1925) was a notable success of the quantum theory of ferromagnetism. Advances in the theory of diamagnetism have also been made after P. Langevin's pioneering work of 1905.

The advances in useful materials, and in methods of measurement of magnetic quantities, are mentioned in appropriate places in the body of the article.

2. GENERAL DESCRIPTION OF MAGNETISM

The quality of magnetism first apparent to the ancients, and to us today, is the attractive force that exists between a natural magnet (lodestone) or an artificial magnet (a "permanent magnet") and a piece of soft iron. When a magnet is dipped into iron filings they cling to it, especially in certain places called poles that are usually located near the ends of the magnet (fig. 3). Such poles always occur in pairs, and in a magnet used as a compass needle the pole that points to the north is the north-seeking pole, or simply the north pole, and the other the south pole. When a magnet is broken, new poles appear near the break so that each piece contains at least one pole of each kind.

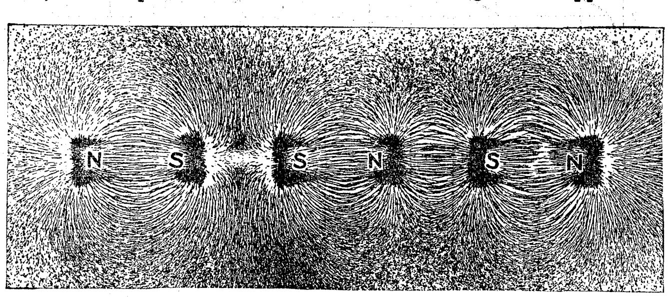

FIG. 4

Iron filings indicate the direction of the magnetic field near a group of bar magnets, show the lines of force emanating from S. poles and converging on N. poles

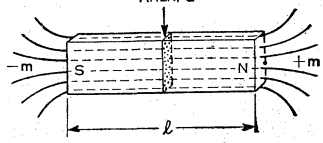

FIG. 5

A pole of strength m and area a corresponds to an intensity of magnetization I=m/a, equal also to magnetic moment per unit volume, ml/v. Lines of induction are endless, pass into the magnet at the S. pole and leave at the N. pole

Magnetic Field.—A magnet will attract a piece of iron even though the two are not in contact, and this action-at-a-distance is said to be due to the magnetic field, or field of force around the magnet. This field may be explored by sprinkling iron filings around a magnet, whereupon they form in lines that converge on the poles and indicate also the direction a small compass needle would take if placed at any point (fig. 4).

Poles exert forces on each other, north and south poles attract each other and like poles repel with a force that varies inversely as the square of the distance between them. A unit pole is a convenient concept defined so that two unit poles of like kind, one centimetre apart, repel each other with a force of one dyne. The strength of the field of force, or simply the magnetic field strength, or magnetizing force, may be defined in terms of magnetic poles: one centimetre from a unit pole the field strength is one oersted. A magnetic field may be produced by a current of electricity as well as by a magnet and the unit of field strength can also be defined in terms of current. A magnetic field has direction as well as strength; the direction is that in which a north pole, subjected to it, tends to move, or that indicated by a small compass placed at the point. The field strength is represented by the symbol H, and the unit defined above is the oersted.

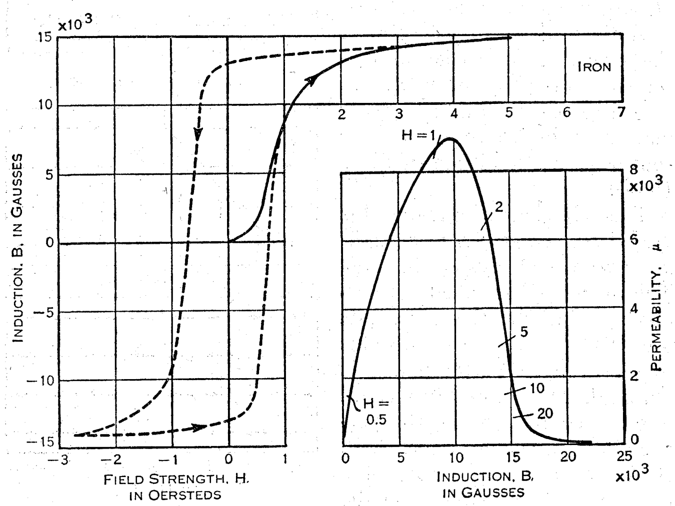

FIG. 6

Properties of materials are described by magnetization curves (solid line) and hysteresis loops (broken line) obtained by plotting I or B against H; they may also be described by permeability curves (μ vs. B)

Intensity of Magnetization and Magnetic Induction.—In order to describe the magnetic properties of materials, one must have a quantitative measure of magnetization. Such a measure is the intensity of magnetization, defined in terms of the number of unit poles in a piece of given cross-sectional area. Suppose that a uniformly magnetized bar, of length l and cross-sectional area a, has m unit north poles at one end and m unit south poles at the other (fig. 5). The intensity of magnetization is then m/a, and is represented by the symbol I. It may be easily shown that I is also the magnetic moment per unit volume; for the magnetic moment is pole strength times interpolar distance ($M=ml$), and $I=M/v$, if v is the volume al.

Maxwell showed that some of the properties of magnetism may be likened to a flow, and conceived endless lines of induction that represent the direction and, by their concentration, the flow at any point. The lines pass from a magnetized material into the air at the north pole, and enter again at a south pole, and pass through the material from the south pole back to the north to form a closed loop.

The total number of lines crossing a given area at right angles is the flux in that area. The flux per unit area is called the flux density, or magnetic induction, and is represented by the symbol, B. The lines of induction are due to both H and I, but in magnetic materials they are due mainly to the magnetization, I. The magnetic induction is defined by the relation

$$B=H+4\Pi I$$

The occurrence of the factor 4Π is due to the fact that a unit pole gives rise to a unit field everywhere on the surface of a sphere of unit radius enclosing the pole, and this sphere has an area of 4Π. The lines of induction may be visualized with the aid of fig. 4 showing the pattern obtained with iron filings.

Magnetization and Permeability Curves.—When a piece of iron is brought near a magnet, or subjected to the magnetic field of an electric current, the magnetization induced in the iron by the field is described by a magnetization curve obtained by plotting the intensity of magnetization, I, or the magnetic induction, B, against the field strength, H. Such curves are of fundamental importance for describing the magnetic properties of materials, and many of them are shown on the following pages. A magnetization curve for iron is shown as the solid line of fig. 6 (left).

The behaviour of a material is also described by its permeability curve and hysteresis loop. The ratio B/H is called the permeability, μ, and this represents the relative increase in flux due to the presence of the magnetic material. The permeability curve is obtained by plotting the permeability, μ, against either I, B, B-H, or H. In any case the curve rises from a point on the μ axis above the origin (the *"initial permeability"*) to a maximum (the *"maximum permeability"*) and falls off rapidly and then more slowly toward a value of one (not zero). When plotted against B-H, the curve ends at a definite point, *i.e.*, when B-H reaches its highest possible value, the saturation (fig. 6).

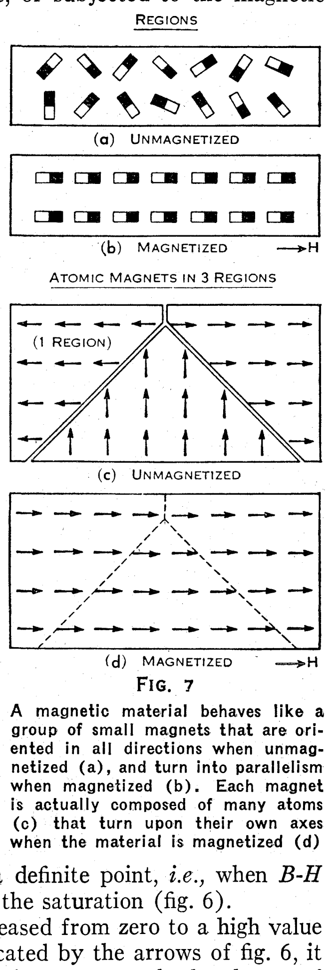

FIG. 7

A magnetic material behaves like a group of small magnets that are oriented in all directions when unmagnetized (a), and turn into parallelism when magnetized (b). Each magnet is actually composed of many atoms (c) that turn upon their own axes when the material is magnetized (d)

If the field strength is first increased from zero to a high value and then decreased again, as indicated by the arrows of fig. 6, it is observed that the original curve is not retraced; the change of induction "lags behind" the change in field and follows the characteristic curve shown by the broken line. This phenomenon was named hysteresis by Ewing, and the characteristic curve is called a hysteresis loop. On this loop, the value of H for which $B=0$ is called the coercive force, H_c, and this is often used as a measure of quality of the material. Sometimes it is desirable to have H_c large, sometimes small; for different materials H_c may be higher than 1,000, or lower than 0.01 oersted. The value of B for which $H=0$ is called the residual induction, B_r.

Ferromagnetism, Paramagnetism and Diamagnetism.—Materials which have magnetic properties similar to iron (*e.g.*, nickel and cobalt and many alloys of these three elements) are ferromagnetic. They have permeabilities of considerable magnitude that vary with the field, they exhibit hysteresis, and they lose these properties rather abruptly when heated to a temperature called the Curie point of the material. All ferromagnetic materials known are solids.

Another class of materials, more numerous, have permeabilities only slightly greater than one, usually between one and 1.001. These do not show hysteresis. The permeability is generally independent of field strength, and as a rule is either independent of temperature or decreases with increasing temperature. These materials, and also the ferromagnetic materials, are paramagnetic. Among the paramagnetic substances that are not ferromagnetic are many of the salts of the iron and the rare earth families and the palladium and platinum metals, the elements sodium, potassium and oxygen, and the ferromagnetic materials above the Curie points. They may be solids, liquids or gases.

In diamagnetic substances the magnetization is directed oppositely to the field, *i.e.* they have permeabilities somewhat less than one. They are, therefore, repelled from the poles of an electromagnet, and move toward a weaker field. Many of the metals and most of the nonmetals are diamagnetic.

Paramagnetic and diamagnetic substances are described more conveniently by their susceptibilities than by their permeabilities. The susceptibility is a measure of the increase in magnetic moment caused by the application of a field, and is defined as

$$k=I/H,$$

or the equivalent,

$$k=\frac{\mu-1}{4\pi}$$

For diamagnetic materials the susceptibility is negative, and for bismuth has a value of −0.000013. For paramagnetic substances like iron the susceptibility may be as high as 500, or higher.

Nature of Magnetism.—A ferromagnetic substance has long been regarded as an assemblage of small permanent magnets (fig. 7(a))—when the material is unmagnetized the magnets are arranged with haphazard orientations, when it is magnetized they are lined up with their axes parallel. The nature of this small magnet, or "domain," has been the subject of much consideration over a period of years, and now it is known that the material is composed of many small regions or domains, each of which consists of many atoms (fig. 7c). Within a domain all of the atoms are aligned parallel, and when the magnetization of the material is changed, the atoms in a domain turn together, while remaining parallel, so that they are aligned more nearly with the magnetic field applied to the material. The domain theory is discussed in more detail later.

The magnetic properties of materials depend mainly on the chemical composition and on the heat treatment they receive after fabrication, and sometimes they are influenced in an im-

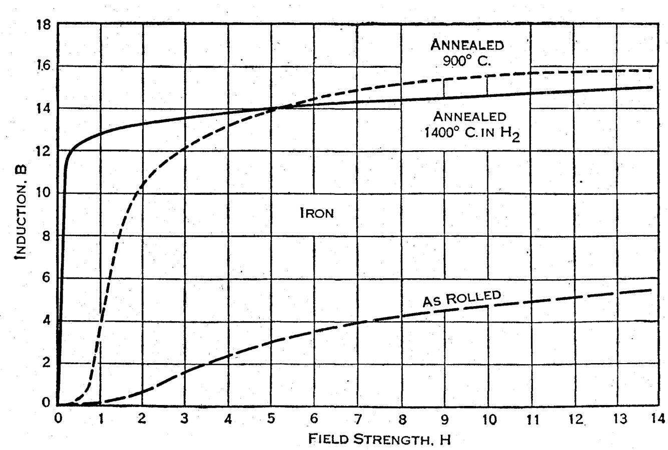

FIG. 8

Magnetization curves of iron in various conditions (P. P. Cioffi). B is expressed in kilogausses

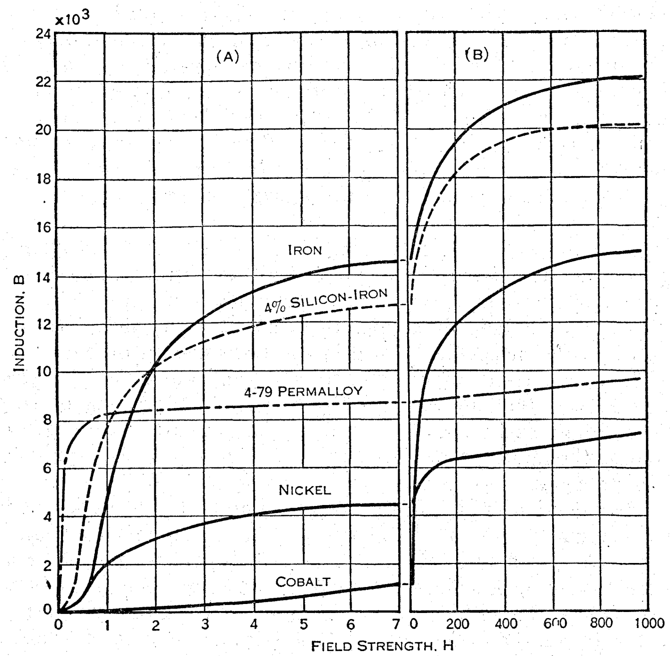

FIG. 9

Magnetization curves of some common materials in the annealed condition in low (A) and high (B) fields

portant way by the kind of fabrication used. Some ferromagnetic properties, such as saturation induction and Curie point, change but slowly with chemical composition, and are usually quite insensitive to methods of fabrication and heat treatment. On the other hand properties like permeability and hysteresis are highly sensitive to small amounts of impurities and to heat treatment—they are extremely "structure sensitive." In some cases the permeability (*e.g.*, of iron) will increase a thousandfold when 0.1% of an impurity is removed by heat treatment, and an equal change in the reverse direction will be caused by bending the material or stretching it so that its form is permanently changed or strained. The susceptibilities of paramagnetic and diamagnetic substances are not usually affected to any considerable extent by fabrication and heat treatment.

3. PERMEABLE MATERIALS

Magnetic materials are essential for the operation of many of the devices and machines used in modern industry. Without them the production, distribution and use of electricity, and also communication by wire and radio, would be seriously limited or even impossible. After the use of iron in the compass became commonplace, the important new uses of magnetic materials were first in the transformer and electric motor and generator, and later in electromagnetic devices such as relays, telephone receivers, loading coils, loud speakers, indicating instruments and many other devices upon which all of our industries depend. It is estimated that several million tons of metal are produced annually for use as magnetic material.

Useful magnetic materials either have high permeability and are magnetized and demagnetized easily, or are permanent magnets and magnetize with difficulty but retain their magnetism tenaciously. The latter will be discussed in the next section headed *Permanent Magnets*.

As stated above, the magnetic properties depend mainly on the chemical composition and heat treatment. Permeable materials are usually processed, or annealed, by heating to some temperature between 800° and 1,400° C., often about 1,000° C., and cooling at any specified rate to room temperature. The permeability will be lowered if they are deformed beyond the elastic limit, consequently materials are made in final size and shape and are then heat treated and assembled directly in apparatus for use or for test, without bending. For each material there is a specific heat treatment that must be used to develop the desired property to the greatest extent. Magnetization curves of iron as rolled, after a conventional anneal, and after a special anneal in which harmful impurities are removed, are shown in fig. 8.

Iron, cobalt and nickel are the common ferromagnetic elements and were the only ones known until 1935 when gadolinium was also shown to be ferromagnetic. The magnetism of iron, as well as steel and lodestone, were known to antiquity, while cobalt and nickel were first investigated about the middle of the 18th century. Most of the ferromagnetic substances are alloys containing one or more of the elements iron, cobalt and nickel; some are

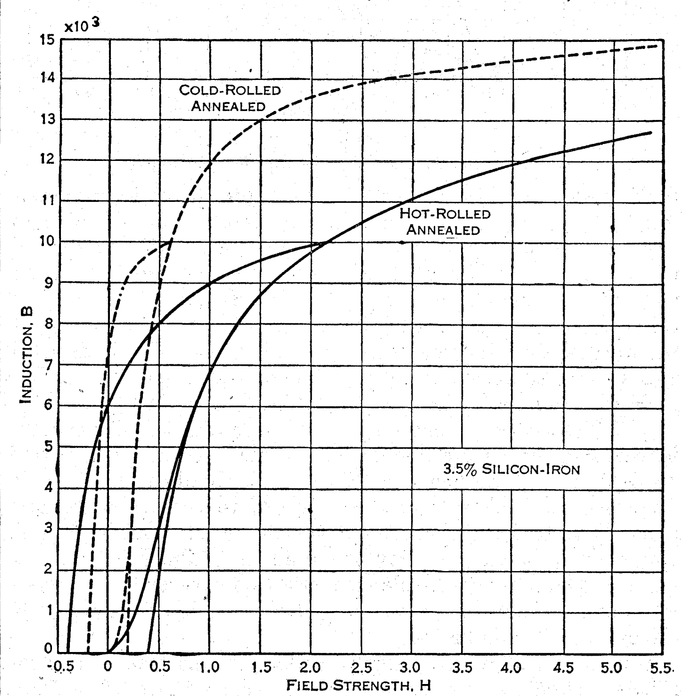

FIG. 10

Permeability of annealed silicon iron is higher and hysteresis lower if sheets have been fabricated by rolling cold

nonmetallic compounds of iron, cobalt, nickel or (rarely) manganese or chromium; and some are alloys containing no iron, cobalt or nickel but composed of manganese and certain other elements such as aluminium and copper (Heusler alloys).

Magnetization curves for iron, cobalt and nickel are shown in fig. 9. In iron one observes the highest magnetization and also the highest permeability. Cobalt has a lower magnetization and

the lowest value of maximum permeability. Of these materials iron is by far the most important and is the only one used to any considerable extent in industry as a magnetic material in elementary form. The most used material of all, however, is an alloy of iron and silicon, sometimes called silicon steel or electrical sheet steel even though it is not a steel in the strict sense of the word because it contains no essential carbon. The iron-nickel alloys are used for many purposes when very high permeability is desired and cost is not too important.

Iron silicon alloys containing a few per cent of silicon were invented by Sir Robert Hadfield, and came into use in the period 1900–10, mainly through the efforts of E. Gumlich in Germany. At present these alloys contain usually 3% to 4% silicon, but any amounts up to 6% silicon are occasionally used. A magnetization curve for a commercial alloy containing 4% silicon is drawn in fig. 9, and on a different scale magnetization curves and hysteresis loops of two kinds of commercial product, each containing 3.5% silicon, are given in fig. 10.

Iron silicon alloys are usually made from pig iron and ferrosilicon melted and refined in the basic open hearth (*see* IRON AND STEEL), or from ingot iron remelted with ferrosilicon in the electric furnace. Ingots are poured and rolled to slabs and the latter rolled either hot or cold to sheets of the required thickness, usually 0.014 in. These are then cut to the appropriate size for use in transformers or other apparatus and are preferably annealed by heating to some temperature lying between 800° and 1,200° C., usually nearer 800° C.; or, they may be annealed before cutting. Iron-silicon sheet or strip that has been fabricated by cold rolling is finding increased use as compared with the hot rolled product (fig. 10) because in the former the crystals composing the material are so oriented that the sheets have an especially high permeability when magnetized in one direction—that in which the material passed through the rolls during fabrication.

Some magnetic and physical characteristics of commercial silicon iron alloys are given in Table I. The watt loss there referred to is the power dissipated in the alloy when it is magnetized to a maximum induction of $B = 15{,}000$ by an alternating field of frequency 60 cycles per second. Such losses (*see* TRANSFORMER) objectionably raise the temperature of a transformer core in operation. They are due partly to hysteresis and partly to eddy currents, the nature of which latter will be discussed further below under *Magnetization in Alternating Fields.*

Iron-nickel Alloys (Permalloys).—These alloys have properties that are unusual and interesting from both a scientific and a commercial point of view. It became generally recognized about 1920 as a result of the work of G. W. Elmen that the alloys containing from 35% to 90% nickel have permeabilities very much greater than those of iron. These alloys were named "permalloys." A magnetization curve and hysteresis loop for 78 permalloy are shown in fig. 11, and curves for iron are given for comparison.

An iron-nickel alloy containing 50% nickel was investigated by T. D. Yensen and named hipernik. As distinguished from 78 permalloy, suitable for transformers transmitting the weak signals of communication apparatus, this alloy has high permeabilities in the higher fields used in the transmission of power.

These commercial alloys, 78 permalloy and hipernik, have the compositions that are scientifically the most interesting of the binary iron-nickel series. This is illustrated in part (a) of fig. 12 showing the induction of the alloys at low, intermediate and high field strengths.

The induction in high fields has a minimum at 30% nickel and a maximum at 45% to 50% nickel. The maximum occurs not only when the field strengths are large but persists and is even more marked in low fields. A second maximum appears for low fields when the nickel content is about 80%, and this corresponds to the commercially useful alloy, 78 permalloy. The high initial permeability (permeability for very low values of B) of 78 permalloy (fig. 12b) is associated with its very low magneto-

striction (see *Stress and Magnetostriction* below).

Even more remarkable magnetic properties are exhibited by iron-nickel alloys given a still different kind of heat treatment. After heating at a higher temperature the material is maintained for a short time at 400° to 600° C. and at the same time a magnetic field of several oersteds is allowed to act on it. After cooling to room temperature the maximum permeability is found to be greatly increased and the coercive force diminished. This effect, often called the "magnetic anneal," depends on the com-

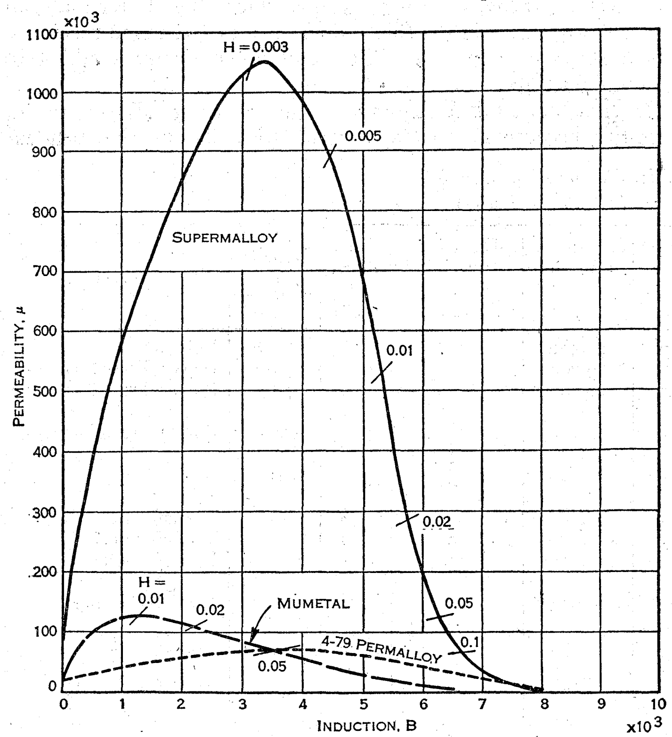

FIG. 14

Comparison of supermalloy with other high-permeability alloys (O. L. Boothby and R. M. Bozorth)

position and is most pronounced when the nickel content is 65% to 70%, as illustrated in fig. 12c. The hysteresis loops of material given the magnetic anneal have the characteristic rectangular shape illustrated in fig. 13. The sides are vertical and the corners often perfectly square, and the coercive force much smaller than

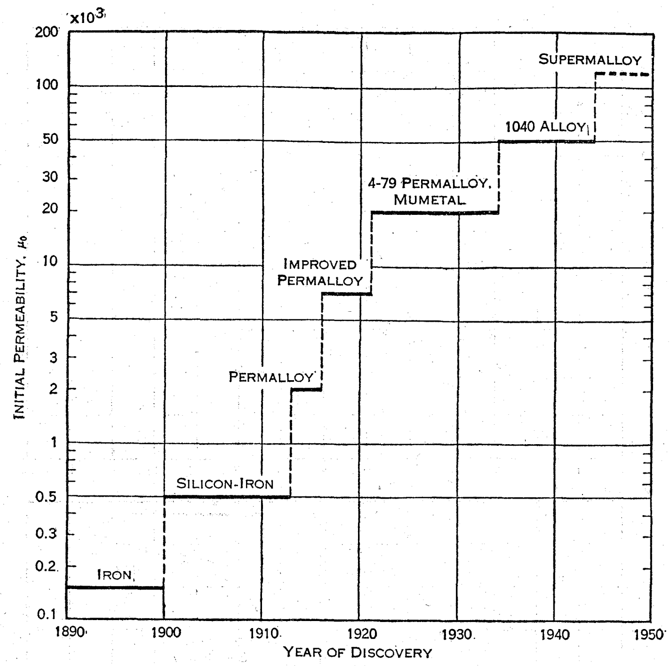

FIG. 15

Initial permeabilities of some useful materials plotted against the year in which they were discovered. Note logarithmic scale

that of the same material heat treated in the absence of a field.

Additions to the Permalloys.—Molybdenum, chromium and copper have been added to permalloy to advantage. The most used alloys of this kind are "4-79 permalloy," containing 4% molybdenum 79% nickel and 17% iron, and "mumetal" containing usually 5% copper, 2% chromium, 75% nickel and 18% iron. These are both used in transformers operating at high frequencies and are meritorious primarily on account of their high

Perminvar (45% Ni, 25% Co, 30% Fe) has remarkably constant permeability in low fields (a). It has extremely low hysteresis at low inductions (b) and a characteristic wasp-waisted hysteresis loop at high inductions, and is affected strongly by magnetic anneal. (G. W. Elmen and G. A. Kelsall)

initial permeabilities, but also because they have higher resistivities and can be prepared with a simple heat treatment. Their permeabilities at various inductions are indicated by the curves of fig. 14. Initial permeabilities of 10,000 to 30,000 are usually attained.

During World War II a great improvement was made in the permalloys by heat treating them in pure hydrogen at 1,200° to 1,300° C. The most useful of these alloys, called "supermalloy" (su-perm′-al-loy) contains 5% molybdenum and 79% nickel, the balance mainly iron. Initial permeabilities as high as 125,000 and maximum permeabilities of more than 1,000,000 can be attained commercially even in thin sheet (fig. 14). The technical progress in magnetic materials may be measured by comparing these magnitudes with the permeabilities of the best materials available in the first decade of this century—silicon steel made at that time had initial and maximum permeabilities about 1/300 those of supermalloy (fig. 15).

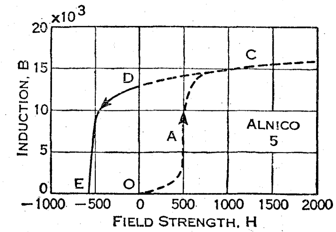

FIG. 18

Magnetization curve (OAC) and demagnetization curve (DE) of Alnico 5 (Alcomax)

Iron-cobalt Alloys.—It is a surprising fact, for which there is no satisfactory explanation, that some alloys of iron and cobalt can attain greater intensities of magnetization than either of these elements alone. The saturation magnetization is highest for the alloys containing 35% to 40% cobalt, and then is 10% to 15% higher than for pure iron. When the field strength is 1,000 or below, the highest inductions are attained in the alloy containing equal proportions of the two elements (fig. 16), except that in fields weaker than two oersteds pure iron has the highest permeability.

As a material the 50% alloy, under the name of "permendur," is a useful component of the magnetic circuits of electromagnets and permanent magnets, where it is used for yokes and pole pieces. Since it is rather brittle and cannot be rolled to thin sheets, 2% vanadium is sometimes added and this permits the fabrication of sheets a few thousandths of an inch thick. The latter material is used in quantity in the thin diaphragms of telephone receivers. Some alloys contain 35% cobalt and other elements added to increase ductility.

Iron-cobalt-nickel Alloys.—Some of these alloys are interesting because they have permeabilities that are independent

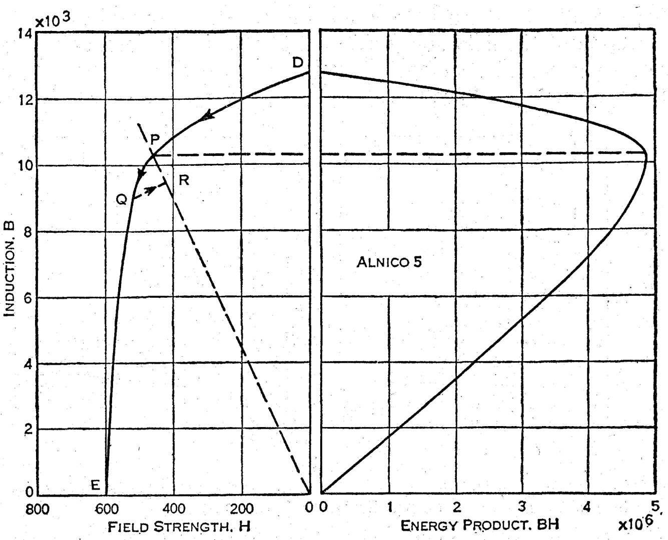

Fig. 19

Demagnetization curve (DE) and corresponding energy product curve (BH vs. B), showing desirable point of operation, P, where energy product is maximum

of field strength over a relatively large range. The same alloys have hysteresis loops of peculiar shape with low residual induction and a constricted middle portion. A representative alloy, called perminvar, contains 30% iron, 25% cobalt and 45% nickel. The constancy of permeability with field strength at low fields is brought out by annealing in the usual way at about 1,000° C. and then heat treating for several hours at a relatively low temperature, 350° to 500° C. The hysteresis loss is then extremely small. A μ *vs.* H curve and a hysteresis loop for an alloy of the above composition, heat treated for 24 hours at 400° C., are shown in fig. 17. This material responds to heat treatment in a magnetic field, and a loop for a specimen so treated is also shown in the figure.

Heusler Alloys.—These alloys, discovered in 1903, are of unusual scientific interest because they contain no ferromagnetic element. A typical Heusler alloy has the composition corresponding approximately to the formula Cu_2MnAl (61% copper, 26% manganese, 13% aluminum). This has a saturation induction (B_s) of about 5,500, almost as high as that of nickel, but its permeability is much lower—about 250 at maximum. In the alloy containing tin (Cu_2MnSn) a saturation of more than 8,000 has been attained. The coercive force is rather high for a permeable material and varies with composition and heat treatment, but may be as low as 4 or 5.

To bring out their best magnetic properties these must be quenched from temperatures up to 800° C. and then aged or heated for some time at a relatively low temperature, often 200° C. This last treatment is necessary for effecting a highly ordered arrangement of the atoms in the crystals, a situation necessary for the development of the magnetic properties.

The atom primarily responsible for the magnetism of the Heusler alloys is manganese, but copper also may contribute to the magnetic moment. The distribution of the other atoms around the manganese is also important, as the effect of atomic ordering shows. Ferromagnetism still occurs when the aluminum or tin is replaced by arsenic, antimony, bismuth or boron, or when copper is replaced by silver. A number of the more important alloys of high permeability are described in Table II.

4. PERMANENT MAGNETS

Permanent magnets, like electromagnets, are used to produce magnetic fields of considerable strength and constancy. Many devices depend on them for operation, *e.g.*, loud speakers, magnetos, meters of many kinds, magnetrons, telephone receivers, and a host of others. In all of these the magnet necessarily contains

*Balance iron.
†Called Koerzit in Germany.
‡Also alloys containing 3, 6, 9 cobalt with variable chromium.
§Also called Comol.
‖Also called Alnico 3. Alnico 1 and 4 contain cobalt.
¶Called Alnico in England and Oerstit in Germany.
**Also called Cunife 1. Cunife 2 and Cunico contain cobalt.
††H for $B = O$.
‡‡Must be cooled in strong magnetic field.
§§Cold rolled in grooved rolls. Higher values in drawn wire, lower in rolled sheet.
‖‖Composition is given for Alnico 12. Nipermag and Alnico 7 contain smaller amounts of titanium.
Q—quenched from centigrade temperature indicated, in oil (or water).
A—cooled in air from indicated temperature.
B—aged or baked, cooling rate not important.
Forged alloys may also be hot rolled or cast to size.
Cast alloys (unless forgeable) must be ground to size.
Cold rolled alloys are usually hot rolled before cold rolling.

an air gap; consequently it always operates under the influence of a demagnetizing field (*see* section on *Measurement of Magnetic Quantities*), such as that existing at the middle of a short bar of magnetized material. Thus the magnet operates not at residual induction but at some lower value of the induction, B.

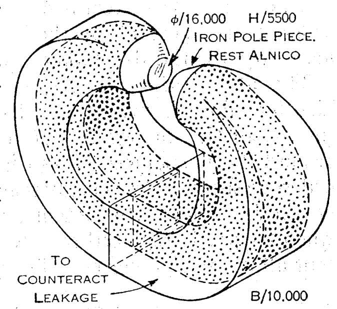

FIG. 21

Practical design of magnet operating at H_g=5500, with B_0=10,000 almost everywhere in material. Unshaded portion is part of magnet necessary to carry "leakage flux" (P. P. Cioffi)

The important curve for evaluating the quality and behaviour of material for permanent magnets is that portion of the hysteresis loop that lies in the second quadrant, between residual induction, B_r, and coercive force, H_c, and is called the demagnetization curve. Magnetization and demagnetization curves for Alnico 5 (Alcomax) are shown in fig. 18. The quality of a permanent magnet is characterized not only by B_r and H_c, but also by the so-called energy product, the product of B and H for various points on the demagnetization curve. The energy product curve (fig. 19), showing this product as dependent on B, has a characteristic shape, and its greatest product, the maximum energy product, is the best single criterion of magnetic quality for these materials. The reason for this, and its importance in the design of permanent magnets, will be discussed after the most-used materials have been described.

Magnet Steels.—From ancient times until about 1930, materials used as magnets were carbon steels. After 1855 alloying elements were added, especially tungsten, to improve the quality. In 1916–17 chromium began to displace tungsten, and cobalt was added up to 40% with very beneficial effect.

A typical chrome steel contains 3.5% chromium and 1.0% carbon. In manufacture, after the material has been melted, cast and hot rolled, it is cut to final size, heated for a short time at 800° to 850° C. and then quenched in oil. Before assembling in apparatus it is often aged by maintaining at 100° C. or above for 24 hours; this improves the constancy of the field it maintains in operation.

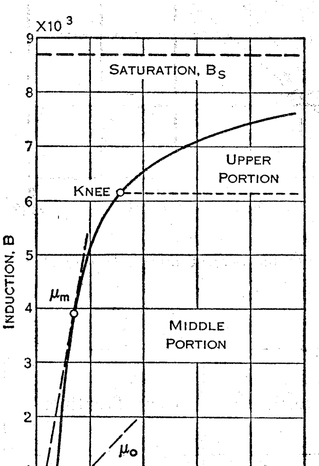

FIG. 22

Three sections of normal magnetization curve separated by "knee" and "instep." μ_m is largest value of B/H, μ_o initial slope of curve

Dispersion - Hardened Alloys.—From the standpoint of magnetic quality the best materials available in 1946 for use in permanent magnets were not steels but dispersion-hardened (precipitation-hardened) alloys containing no essential carbon (*see* ALLOYS). The first materials of this kind to find commercial use were the iron-cobalt-molybdenum and iron-nickel-aluminum alloys (Table III), and others were coming into use constantly. The hardness is caused by the presence of very small particles of one kind highly dispersed in a matrix of another composition.

Important materials used in 1946 for magnets are listed in Table III. This includes data on steels and indicates the mechanical operations required in preparation and the heat treatment used to bring out the best magnetic properties. Demagnetization curves for some of these alloys are reproduced in fig. 20. Special attention is called to the alloy called Alcomax in England and Alnico 5 in the United States. In order to develop its remarkable properties it must be cooled at a definite rate in a strong magnetic field (*c.*, 1,000 oersteds) so directed in the specimen that it is parallel to the field required in use. At right angles to the direction of the field applied during treatment the properties are not so good, the energy product being then only about one-third as high. Although Alnico 5 is not forgeable and must be

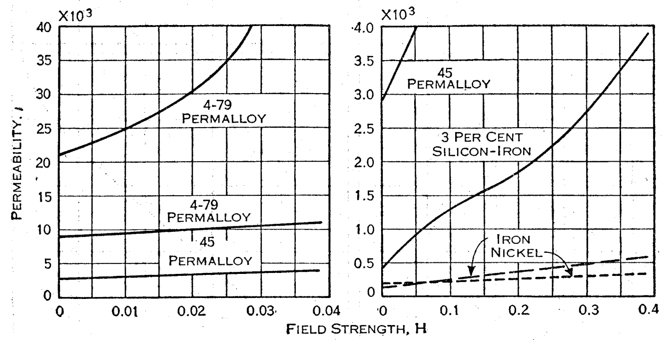

FIG. 23

Curves showing μ vs. H for initial portions of magnetization curves for various materials. Lines are usually straight near axis

cast and ground to final form, its magnetic properties are outstanding and its uses numerous.

Alloys With Special Properties.—In contrast to their usual brittle character, some materials used as permanent magnets have sufficient ductility to permit cold forming. In 1935 it was discovered that an alloy of iron, nickel and copper could be rolled to thin tape and then heat treated to have high coercive force and residual induction (Table III). Later the iron-cobalt-vanadium alloy known as vicalloy was found to have superior quality for the purpose for which these alloys are used—the magnetic recording of speech.

A material of quite different kind is made of powdered oxides of iron and cobalt (Fe_2CoO_4), pressed and heated to sinter, and cooled from 850° C. in a magnetic field of 4,000 oersteds. This usually has a coercive force of about 600 and residual induction of about 4,000. Its properties differ from those of most other materials in that the density is small and the resistivity high.

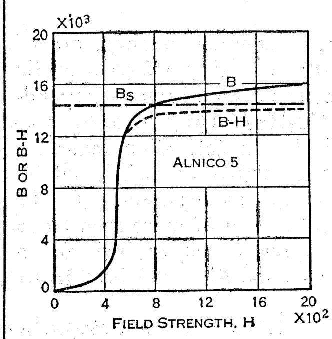

FIG. 24

In high fields B-H approaches asymptotically to limit, B_s (saturation)

Design of Permanent Magnets.—In the design of permanent magnets it is important to use the appropriate material and to shape it so that the minimum amount is used to produce the desired field strength in a given gap. As already pointed out, this result is accomplished when the product of B and H everywhere in the material has its maximum product, $(BH)_m$. The magnet of fig. 21 is designed with that in mind. The material is Alnico 5. The length of the material along the curved path, in relation to the length of the gap, determines the position of the line OP of fig. 19, and this should be placed so that it cuts the demagnetization curve at $B=10{,}000$, corresponding to $(BH)_m$. The cross-sectional area of the magnet is adjusted to take account of leakage; a heavier section is necessary at the lower part because all of the leakage flux must pass through this, and B must at the same time be maintained at its proper value.

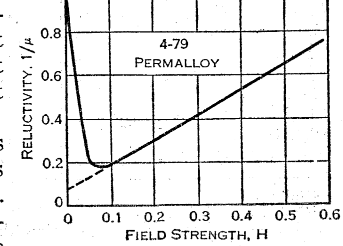

FIG. 25

Reluctivity, reciprocal of permeability, is linear at high field strengths (O. Fröhlich-A. E. Kennelly)

After a permanent magnet is designed and constructed it is magnetized with a high field. After removal of this magnetizing field it is usually desirable to apply momentarily a relatively weak field in the opposite direction, whereupon the magnetic state of the material changes as indicated by the points PQR of fig. 19. This stabilizes the magnet against the effect of stray fields or mechanical shocks or changes in temperature, so that the field in the gap is less likely to change.

5. THE MAGNETIZATION CURVE

Three Portions of Curve.—A typical magnetization curve, showing the relation between B and H in a specimen initially unmagnetized, may be divided into three main parts separated from each other by the "knee" and the "instep" (fig. 22). These three regions are identified with different physical mechanisms of change of magnetization, and also with different engineering uses of the materials.

The initial portion of the curve, the "toe," is not horizontal at the origin but has a definite slope called the initial permeability, μ_o, equal to B/H for $H=O$. For low inductions Lord Rayleigh found that the relation

$$B=\mu_o H+aH^2$$

was obeyed, and when the permeability μ is plotted against the field strength H the points usually lie on a straight line corresponding to the equation

$$\mu=\mu_o+aH.$$

Data for several common materials are shown in fig. 23. The value of H at which the line begins to bend upward, varies over wide limits from one material to another. In some abnormal materials such as the iron-silicon alloy the curve first becomes convex upward before it begins to rise rapidly at higher values of H. Curves of the kind shown in the figure are used to determine the value of μ_o by extrapolating them to $H=0$.

The upper portion of the magnetization curve (fig. 22) bends over and approaches the horizontal line marked B_s. In high fields, however, it is found (fig. 24) that B approaches no definite limit but B-H does approach a limit, called the saturation induction or simply saturation, designated B_s. Since $B\text{-}H=4\pi I$, I approaches the limit I_s, the saturation magnetization.

The upper part of the curve may be represented fairly well by O. Fröhlich's equation:

$$B-H=H/(a+bH)$$

in which $b=1/B_s$ and a is a constant which measures the magnetic hardness and is larger the stronger the field necessary to attain any given fraction of saturation. When H is small enough to be neglected in comparison with B, this equation may be expressed in the equivalent form used by A. E. Kennelly:

$$1/\mu=a+bH$$

and so a linear relation is found when $1/\mu$ is plotted against H. From a graph of this kind (fig. 25) one can easily determine the constants a and b, and interpolate to find the value of μ for intermediate values of H. The slope of the line, b, may be used to estimate the saturation induction ($b=1/B_s$), but this method cannot be depended on for accuracy for in some materials such as iron the slope changes markedly at inductions close to saturation. The ratio $1/\mu$ is termed the reluctivity.

In its middle portion the magnetization curve is the steepest, and the permeability has its greatest value. It is here that irreversible changes in magnetization are a maximum, as indicated by the fact that curves for increasing and decreasing field strength differ markedly. These irreversible changes and the consequent losses in energy will now be discussed.

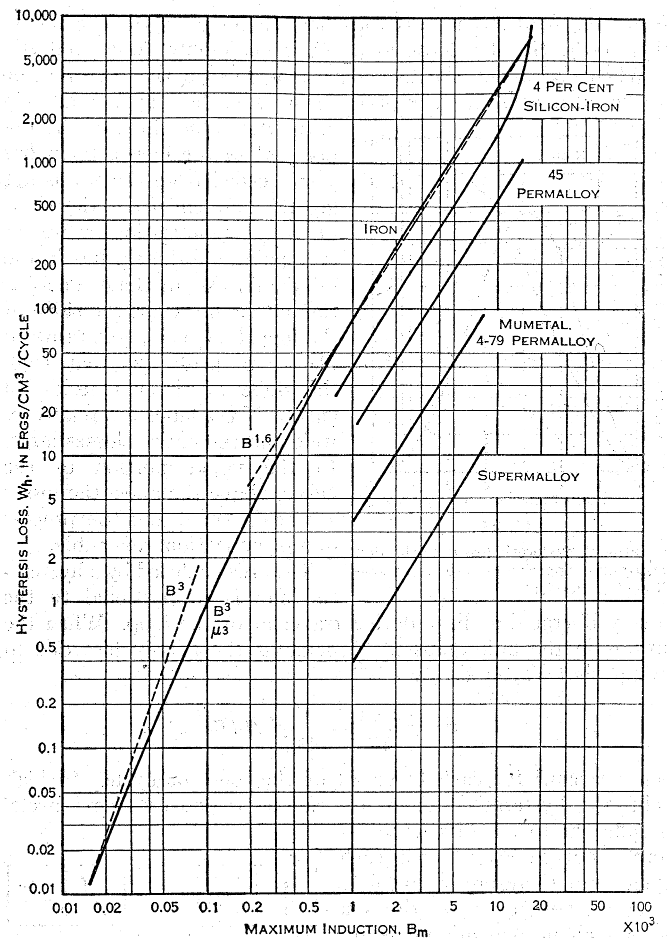

FIG. 27

Hysteresis loss as dependent on maximum induction for some important materials

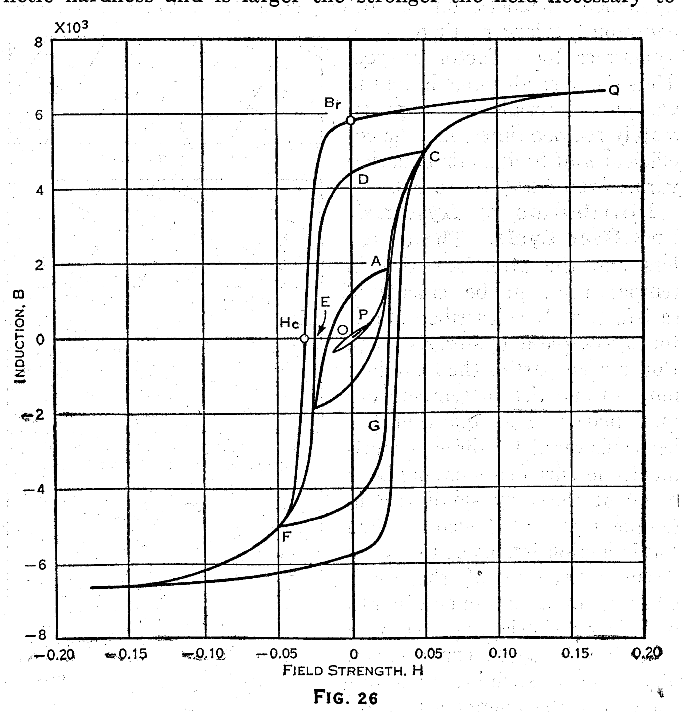

FIG. 26

Normal hysteresis loops for low, intermediate and high inductions. Residual induction, B_r, and coercive force, H_c, are values of B and H where curves cross axes

Hysteresis Loops.—A set of normal hysteresis loops is shown in fig. 26. In forming one of these the field strength is first increased from zero and the induction follows the magnetization curve OAC. H is then decreased, and the induction decreases slowly so that the hysteresis loop passes successively through the points D, E and F, and the field is reversed and the loop passes through G and back to C. At D the induction is called residual induction (B_r) and at E, when

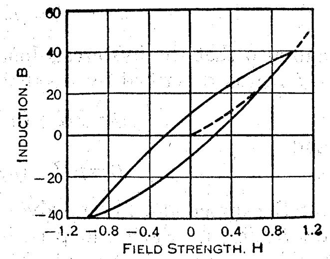

FIG. 28

Form of hysteresis loop for low inductions (Lord Rayleigh)

$B=0$, the field strength is the coercive force (H_c). The induction at the tip of a loop, as at C, is commonly designated B_m.

When the tip of the hysteresis loop lies on the first portion of the magnetization curve (OP in fig. 26), the loop is relatively narrow and the slope of the upper part of the loop after it has just receded from the tip, is not greatly different from the slope of the magnetization curve at that point. If the tip lies in the middle portion of the magnetization curve, however, the slope of the loop (*e.g.* at C, going toward D) is markedly different from the slope of the magnetization curve. These loops are relatively wide and the energy losses large. In the upper portion of the curve, above the knee, the losses are again small and the process of magnetization reversible.

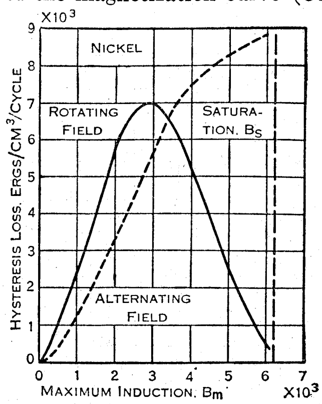

Fig. 29

Rotational hysteresis loss goes through maximum, approaches zero at saturation (A. Perrier)

The area enclosed by a hysteresis loop is proportional to the energy liberated as heat during traversal of the loop. When the area is in the units gausses × oersteds the energy loss due to hysteresis (Warburg's law) is

$$W_h=\frac{\text{area}}{4\pi}=\frac{1}{4\pi}\oint HdB$$

ergs per cm.³ for each traversal of the loop, or cycle. In high fields the hysteresis loss in iron, about 10,000 ergs/cm.³/cycle, is sufficient to raise its temperature about 0.0003° C. for each cycle, and therefore if the field is alternated 50 or 60 times a second about one minute is required for the iron to heat one degree.

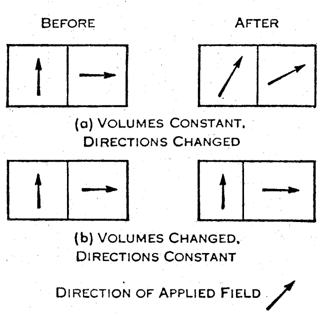

Fig. 30

Change in magnetization results from (a) change in direction (rotation) of magnetization in small regions of material, called domains, or (b) increase in size of some domains (boundary displacement) at expense of neighbours

The hysteresis loss rises rapidly as the maximum induction of the loop, B_m, increases. The curve of fig. 27 shows the relation between W_h and B_m for ordinary iron having a maximum permeability of 4,500. When B_m is very small W_h varies as B^3, and in the range $B_m=1{,}000$ to $15{,}000$, of special interest for work on power transformers, it varies approximately as the 1.6 power of B, in accordance with the empirical law of Steinmetz:

$$W_h=\eta B_m^{1.6}$$

in which the Steinmetz coefficient, η, is approximately constant for any one material.

The B^3 relation at low inductions was derived by Rayleigh. He showed, as noted above, that the magnetization curve near the toe followed the equation

$$B=\mu_0H+aH^2$$

and also that the hysteresis loop with tips at B_m, H_m and $-B_m$, $-H_m$ was described by parabolic equations

$$B=\mu H+(a/2)(H_m^2-H^2)$$

and

$$B=\mu H-(a/2)(H_m^2-H^2)$$

for the upper and lower halves of the loop, respectively. (Here $\mu=B_m/H_m$). Such a loop is shown with the corresponding magnetization curve in fig. 28. Measurements have been made for values of B_m as low as 2 gausses, and only slight deviations from the Rayleigh form observed. The area of a Rayleigh loop may

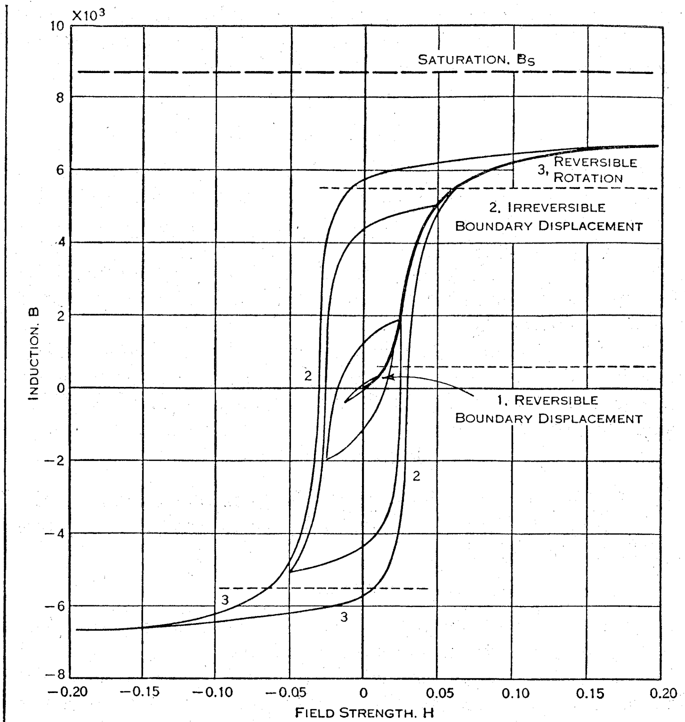

Fig. 31

Nature of change in magnetization in relation to position on magnetization curve and hysteresis loop

be calculated from the above equations, and the corresponding hysteresis loss, expressed in ergs/cm.³/cycle, is

$$W_h=\frac{aH_m^3}{3\pi}=\frac{aB_m^3}{3\pi\mu^3}.$$

This equation corresponds to the lower part of the long curve of fig. 27, and is valid in iron when B_m is below about 500 gausses.

The hysteresis losses of various materials vary over a wide range. Losses of some of the common permeable materials are indicated by curves in fig. 27, and one of these has about 1/200 the loss of iron at the same value of B_m. Materials used for permanent magnets, on the other hand, have hysteresis losses enormously larger than iron, sometimes by a factor of 500. Thus the over-all range in loss in various materials is approximately 100,000 times; *i.e.*, the coefficient η of Steinmetz' equation varies from 0.6×10^{-5} to 0.6.

Distribution of Hysteresis Loss Over Cycle.—The energy loss and the attendant rise in temperature can be calculated satisfactorily as described above for a complete hysteresis loop. But in what part of the loop does most of the rise in temperature take place? This question has been answered by direct experiment, measurements having been made of the very small rise in temperature that occurs when the induction is changed by only a small fraction of the total. Changes of about one-millionth of a degree centigrade have been measured in these experiments. The results of such investigations show that the energy losses are largest where the hysteresis loop is steepest. In addition to this

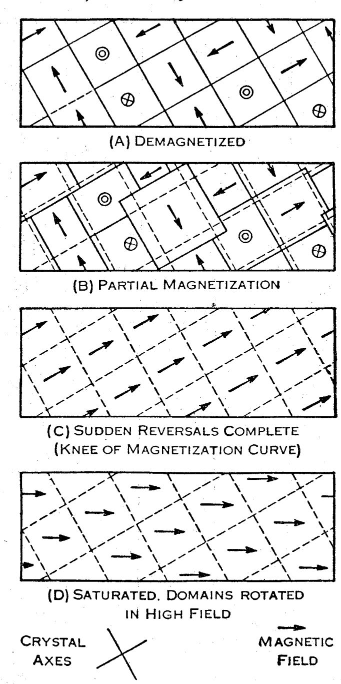

Fig. 32

Schematic of changes in domains at various stages of magnetization

irreversible loss, there is a heating of the specimen in strong fields as the field is increased, and an equal cooling as the field is decreased. This reversible heat does not, therefore, contribute to the hysteresis loss over a complete cycle.

Hysteresis in Rotating Fields.—The hysteresis loops mentioned so far have been measured with B and H either parallel or

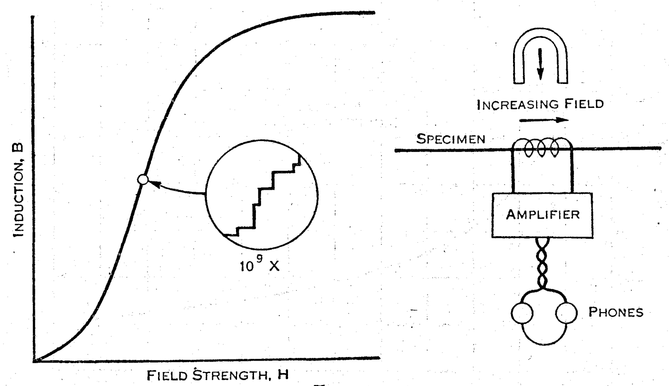

FIG. 33

Barkhausen effect shows that magnetization changes in discrete steps. Movement of magnet changes magnetization and causes noise to be heard in phones

antiparallel to each other. A different result is obtained if the field acting on a specimen is maintained constant in strength and varied continually in direction. This is usually called simply rotational hysteresis as compared with the usual alternating hysteresis. Measurement of rotational hysteresis is accomplished by placing a disk of the material to be examined between the poles of an electromagnet and rotating the disk so that H always lies in its plane. The force necessary to turn the disk is then a measure of the rotational hysteresis loss.

As the field strength increases from zero the rotational hysteresis first increases rapidly (fig. 29), more rapidly than the alternating hysteresis, but when the induction is half to three-quarters of saturation the alternating hysteresis goes through a maximum and decreases rapidly, approaching zero at saturation.

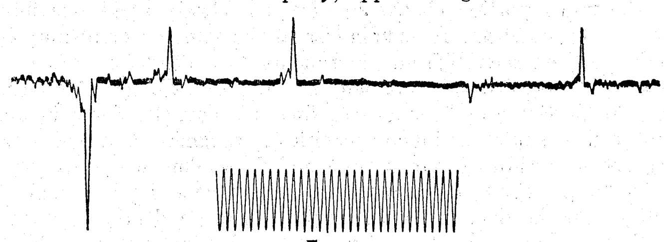

FIG. 34

Oscillographic records of impulses detected in experiments on Barkhausen effect. Each impulse corresponds to change of magnetization in a domain. Timing line has frequency of 60 cycles per second (R. M. Bozorth)

The disappearance of hysteresis in a high rotating field was predicted as a result of Ewing's theory, and its confirmation in 1896 indicated the fundamental soundness of the theory. Rotational hysteresis is of practical importance in the magnetic material forming the segments or teeth of rotating dynamo-electric machinery.

Domain Theory of Magnetization.—Many of the phenomena of the magnetization curve and hysteresis loop can be described to advantage in terms of the domain theory. The theory that a ferromagnetic material is composed of many small regions, each magnetized to saturation in some direction, was first stated by P. Weiss in 1907, and the description he gave at that time is accepted with but slight modification. The existence of such domains is evident from H. Barkhausen's experiments and even more definitely from the study of powder patterns (*see* below). In the unmagnetized state the directions in which the domains are saturated (the directions of easy magnetization) are distributed either at random or in some other way such that the resultant magnetization of the specimen as a whole is zero. Application of a field changes only the direction of magnetization in a given volume. The three main parts of the magnetization curve are distinguished from each other by the nature of this change in direction, which may take place in any of several ways.

The magnetic moment of any one domain is specified by the magnitude and direction of its magnetization and by its volume. Ordinarily at constant temperature the moment of a domain, and therefore the magnetization of the ferromagnetic body of which it is a part, is changed by

(a) a change in the direction of magnetization of the domain—"rotation"—, or
(b) a change in the volume of the domain—"moving boundary."

These processes are indicated graphically in fig. 30. It has been shown by R. Becker that the moving boundary is particularly important for changes occurring in low and medium fields. Processes may be classified also as reversible or irreversible accordingly as the energy dissipated in heat is a relatively small or large fraction of the potential energy.

In each of these portions of the magnetization curve, one type of process preponderates as indicated here:

(1) Initial portion—reversible boundary displacement.
(2) Middle portion—irreversible boundary displacement.
(3) Upper portion—reversible rotation.

Fig. 31 shows the three important processes in relation to the magnetization curve and hysteresis loops, and the corresponding energy losses due to hysteresis, for a specimen of a high permeability alloy. Fig. 32 (a) is a highly schematic representation of the domains in a part of an unmagnetized single crystal that may itself be a portion of an ordinary polycrystalline specimen of iron. The arrows, circles and crosses indicate the directions of local magnetization, and the sides of the squares the directions of the crystal axes. Figs. 32 (b) and 32 (c) represent the states of magnetization corresponding to the instep and knee of the curve, attained by reversible and irreversible boundary displacement, respectively, and 32 (d) represents saturation attained in high fields by the process of rotation. Although the domains have been represented here by squares, implying that the actual domains are cubes, actually no such conclusions should be drawn regarding the shape of domains. There is some evidence to be considered below to show that they are rodlike or platelike in form.

The factors which determine the direction of magnetization in a single domain of a specimen are the crystal structure, the state of strain, and, of course, the direction and strength of the magnetic field. The effect of crystal structure and of strain will be discussed in some detail in later sections of this article. It may be mentioned here in a preliminary way that the nature of the

FIG. 35

Pattern of fine powder on surface of iron crystal is due to domain structure beneath. In middle section magnetization of specimen is zero (L. W. McKeehan and W. C. Elmore). Magnification 1000 X

crystal structure affects mainly the upper part of the magnetization curve of a permeable material. In iron, for example, the crystal structure is such that the magnetic properties of a single crystal vary considerably with direction, and as a result of this variation exceptionally high fields are necessary to approach saturation in ordinary polycrystalline iron. The rotation of the domain by the field must be made against relatively powerful forces, and so the magnetization curve above the knee rises slowly over a considerable distance. This behaviour may be contrasted with that of permalloy containing 60% to 80% nickel and 40 to 20% iron—here the magnetic properties vary but little with the direction in the crystal, the domains therefore rotate

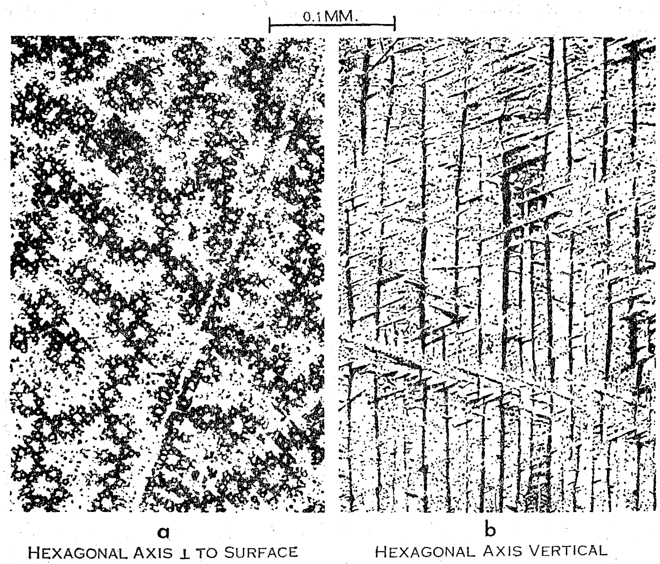

FIG. 36

Powder patterns of cobalt on surfaces perpendicular (a) and parallel (b) to hexagonal axis of crystal. (H. J. Williams)

easily, and the magnetization curve flattens out quickly above the knee, attaining saturation in relatively weak fields (fig. 9).

Just as strain affects magnetic properties, so magnetization changes the dimensions of a ferromagnetic body, or the body is said to exhibit magnetostriction. If the length of a material changes by a relatively large amount when magnetized to saturation, this material will be relatively sensitive to strain, *i.e.*, magnetostriction and strain-sensitivity are reciprocal properties. Strain affects mainly the lower and middle portions of the magnetization curve, and the strain and magnetostriction together determine the ease with which the interdomain boundary is moved by a change in the magnetic field. Thus the highest initial permeabilities are found in materials having very small magnetostriction, *e.g.*, permalloy containing about 80% nickel.

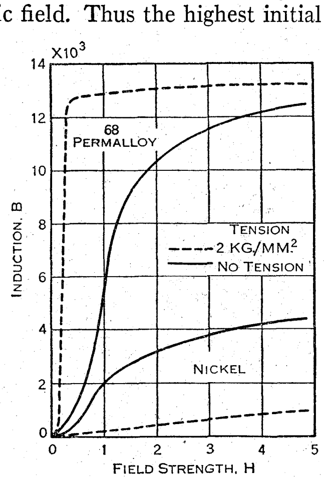

FIG. 37

Effect of tension on magnetization of 68 permalloy and nickel is opposite in direction. Tension is held constant while field is increased from zero

Barkhausen Effect.—In 1919 H. Barkhausen discovered the effect known by his name, and interpreted it as demonstrating that the magnetization of iron proceeds by steps and not in a continuous manner. This effect may be demonstrated simply as shown by the right side of fig. 33, which is self-explanatory. As the field is changed slowly the succession of clicks heard in the phones, or in a loud speaker, persists only when the magnetization is changing along the steep part of the magnetization curve or hysteresis loop. The clicks are identified with irreversible changes in magnetization (process (2) above) and are direct

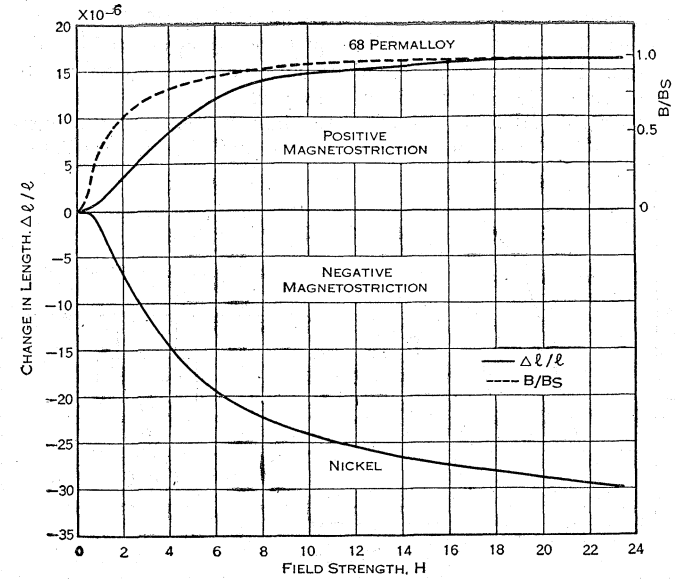

FIG. 38

Application of field causes increase in length of 68 permalloy (positive magnetostriction), and a decrease in nickel (negative magnetostriction). Compare with reciprocal effect of fig. 37

evidence of the existence of domains.

An oscillographic record of the Barkhausen effect is shown in fig. 34. Here each impulse is due to the sudden change of magnetization in some part of the specimen. The area under each impulse is a measure of the volume of the domain, the magnetization of which changed suddenly in direction at the time. The largest domains reverse on the steep portions of the magnetization curve and hysteresis loop, where the average volume of the domains is about 10^{-6} mm.^{3}, equal to the volume of a cube 0.01 mm. on an edge, and the farther one goes along the magnetization curve beyond the knee the smaller the impulses become. This agrees with the domain theory, according to which the domains in the upper portion change in direction slowly and reversibly and not by impulses. A domain size of the same order of magnitude has been derived from experiments on neutron scattering.

Powder patterns.—For many decades iron filings have been used to portray the directions of lines of magnetic force in air and to detect flaws or inhomogeneities in magnetic materials. In 1931 it occurred to L. von Hàmos and P. A. Thiessen to use fine magnetic powder to detect the local inhomogeneities in magnetization that the domain theory predicts. Independently F. Bitter applied a suspension of siderac (Fe_2O_3), having particles about 10^{-4} cm. in diameter, to a polished magnetized surface and observed under the microscope that the powder formed parallel lines regularly spaced about 0.1 mm. apart and aligned approximately perpendicularly to the direction of magnetization.

The technique and interpretation of such patterns were then the subjects of study by a number of workers. A notable advance was made by W. L. McKeehan and W. C. Elmore who first observed a well-defined pattern on a demagnetized single crystal. Fig. 35 shows such a pattern (middle) and also the patterns observed when the magnetization is directed into (left), or out of (right) the same portion of the surface. These striking pictures are probably the most direct evidence of the existence of magnetic domains. The suspension used for the experiments was a true colloid of Fe_2O_3 particles small enough to show Brownian movement, and a change in magnetization of the magnetic specimen was accompanied by a movement of the lines immediately visible to the eye.

Elmore simulated a magnetic crystal composed of domains by putting together small bars of permanent magnets, and found that the stray fields produced at the surface were similar to those observed on real crystals by the powder method.

Experiments on cobalt have been particularly instructive. Bitter observed two types of patterns on polycrystalline material and Elmore, working with single crystals, found the hexagonal lacelike patterns on surfaces perpendicular to the crystal axis and the straight line patterns on planes parallel to the axis (fig. 36). These patterns are in accord with the magnetic properties of cobalt, known to have a direction of easy magnetization parallel to the crystal axis. The domains are then expected to be long in the direction of the axis and packed together like a bundle of needles. The boundaries of such domains are outlined by the concentrations of powder shown in the patterns. Moving pictures of the patterns of cobalt taken with slowly changing field show sudden displacements much larger than those usually attributed to the Barkhausen effect.

6. STRESS AND MAGNETOSTRICTION

The magnetic properties of many ferromagnetic materials are sensitive to the application of stress, to such an extent that stress may be ranked with field strength and temperature as one of the primary factors affecting magnetic change. Stresses of two kinds should be distinguished: large stresses, that cause a permanent deformation of the material, almost invariably cause a decrease in permeability; stresses within the elastic limit may cause either an increase or a decrease in the permeability, depending on the nature of the material.

When a moderate tension is applied to a specimen of nickel, its permeability is decreased. The magnetization curve taken with tension applied always lies below that for the unstrained material (fig. 37), and the curve is always lower the greater the tension. The effect of stress on the magnetization curve is greatest in the middle portion of the curve, and approaches zero when the specimen is either unmagnetized or saturated.

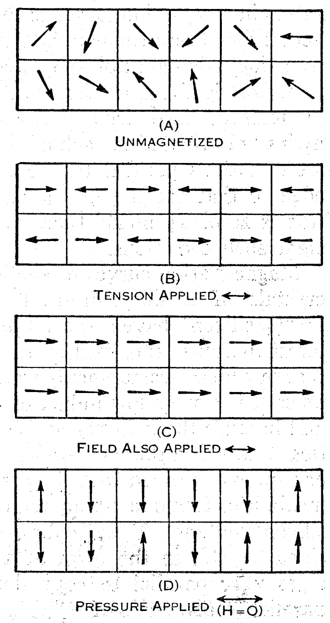

FIG. 39

Schematic domain interpretation of effect of stress and magnetic field applied to material with positive magnetostriction

With some materials, on the other hand, the effect of tension is to increase the permeability. For example, in permalloy containing 68% nickel and 32% iron the maximum permeability is higher by a factor of 8 when the tension is 2 kg./mm.^{2} and by a factor of about 30 when the tension is 11 kg./mm.^{2} (15,600 lb./in.^{2}), the elastic limit of this material. As the stress exceeds the elastic limit the permeability of permalloy, and indeed that of any material, decreases rapidly.

The effect of stress on magnetization is closely related to the change of dimensions that occurs when a magnetic body is magnetized (magnetostriction); that is, the effect of strain on magnetization and the effect of magnetization on strain are interdependent. When nickel is magnetized it contracts a small fraction of its original length, at most 40 parts per million. The fractional change of length, $\Delta l/l$, with field strength, H, (fig. 38) is first slow, then rapid, then again slow as it approaches a finite limit called "saturation magnetostriction," $(\Delta l/l)_s$. When 68 permalloy is magnetized it increases in length as shown.

Nickel and 68 permalloy are representative of materials with negative and positive magnetostriction, respectively. Tension increases the magnetization of a body having positive magnetostriction, decreases the magnetization if it has negative magnetostriction. The effect of compression is opposite to that of tension, consequently the magnetization of magnetostrictively positive materials is decreased by pressure. In referring to tension and compression it has been assumed that they are applied along a line parallel to the direction of the magnetic field; if pressure is applied in a direction at right angles to the field the effect on magnetization is opposite to the effect of compression applied parallel to the field, *i.e.*, compression applied to nickel at right angles to the field will increase the magnetization measured parallel to the field.

Iron and some other materials have magnetostriction that is sometimes positive and sometimes negative. The magnetostriction of iron is positive in weak fields, negative in strong fields; and the effect of tension is, as expected, to increase magnetization in low fields, decrease it in high fields.

Generally the magnetostriction begins to increase rapidly with field strength at about the knee of the magnetization curve. The magnetization reaches to one-half to two-thirds of its saturation value while the magnetostriction is still only one-fourth to one-third of its final value, $(\Delta l/l)_s$. For example when nickel is subjected to a field of $H=3.6$, $B/B_s=0.64$ while $(\Delta l/l)/(\Delta l/l)_s=0.33$ only (fig. 38).

Iron-nickel and Iron-cobalt Alloys.—Both the strain-sensitivity and magnetostriction of the iron-nickel alloys are of special interest. The saturation magnetostriction (the greatest change in length) goes through zero at about 81% nickel, a composition close to that of the permalloys having the highest permeability, and McKeehan has pointed out the close theoretical connection between the low magnetostriction and high permeability of these alloys. The strain-sensitivity of the permalloys is also zero at about 81% nickel, as would be expected. The greatest changes in length of any materials are observed in iron-cobalt alloys having 40% to 60% cobalt—here the expansion is as large as 60 to 80 x 10^{-6}, about twice the change in nickel.

Changes in Volume.—When iron is magnetized in not too strong a field its length increases, and its cross-sectional area decreases in about the same proportion, so that the volume remains approximately constant. However, there is a small change in volume, usually an expansion, that can be detected with sensitive apparatus. When the field is about 2,000 oersteds, the fractional change in volume in iron is about 10^{-6}, and in nickel about one-third of this amount. It is especially large in the iron-nickel alloys containing about 30% nickel, and here amounts to about 40 x 10^{-6} when $H=2{,}000$.

Closely connected with the change in volume with field strength is the change of magnetization with hydrostatic pressure. As indicated by the magnitude of the volume magnetostriction,

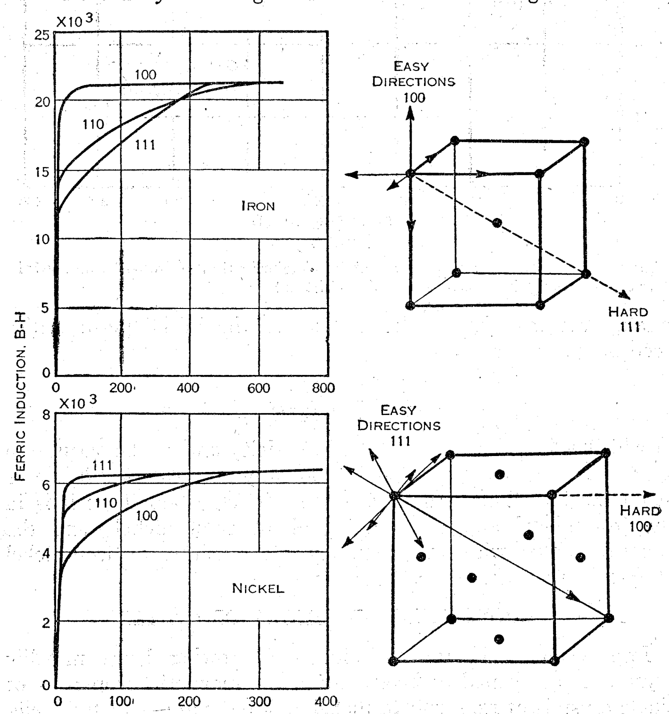

FIG. 40

Magnetic properties and crystal structures of single crystals of iron and nickel. The groups of arrows at the corners of the cubes—six for iron and eight for nickel—indicate the directions of easy magnetization (K. Honda and S. Kaya, W. L. Webster)

this change is small.

Domain Interpretation of Stress.—According to the domain theory, when tension is applied to a material with positive magnetostriction, the magnetization of a single domain will tend to be aligned parallel to the direction of the tension. In an unmagnetized material with domains oriented initially at random the domains are rotated by a sufficiently large tension as shown in fig. 39 (a) and (b), because the directions of easy magnetization in the various domains have been changed by the stress. If a field is then applied, half of the domains reverse in direction and the material is saturated. (No magnetostrictive change in length accompanies such domain reversals.) Compression causes the domains to orient transversely (fig. 39d). If a material has negative magnetostriction, tension will effect the same result, and a field subsequently applied will rotate the domains toward saturation.

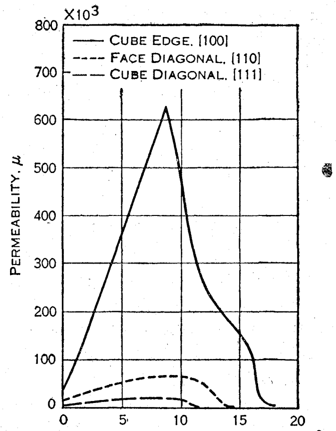

FIG. 41

Magnetic properties of single crystals of iron-silicon alloy (3.8% Si), measured in different directions in the crystal (H. J. Williams)

The domain theory has been successful in predicting the highest value of the initial permeability that can be attained when impurities have been reduced to a minimum and internal strains relieved as much as possible by annealing. The small strain then remaining is due to the magnetostriction of the separate domains and is proportional to the saturation magnetostrictions; and the smaller the magnetostriction the larger the initial permeability according to the relation

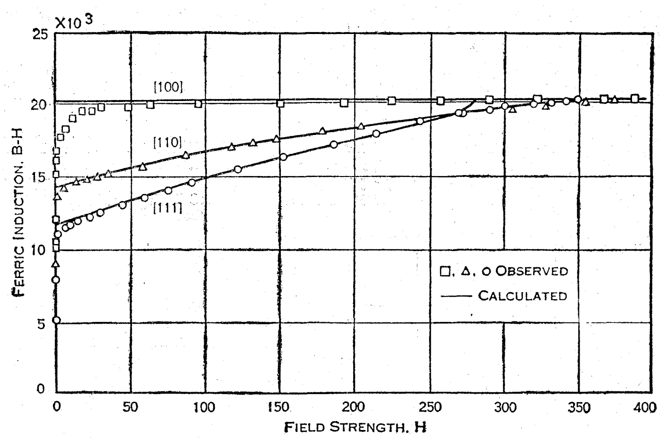

FIG. 42

Comparison of theory and experiment for magnetization of iron-silicon crystal in three principal directions (H. J. Williams)

$$\mu_0 = \frac{4I_s^2}{(\Delta l/l)_s^2 E}$$

in which E is Young's modulus of elasticity and I_s the saturation magnetization. This equation, although by no means exact, states again the fact that μ_o is large when $(\Delta l/l)_s$ is small, as it is in the iron nickel alloys containing about 80% nickel; and the equation holds with fair accuracy for a series of iron-nickel alloys. It was derived by M. Kersten.

7. PROPERTIES OF SINGLE CRYSTALS

Improvements in the technique of growing large metallic crystals have opened to investigation the magnetic properties of single crystals of iron, cobalt, nickel and many alloys of these elements. Crystals of some metals such as nickel and nickel-iron alloys, are grown by slow freezing of a melt of pure material. This method is not adapted to iron, because of its phase transformation at about 900° C.; single crystals of this element are grown by stretching a pure specimen a definite amount and then heating it for a long time just below the transformation temperature.

In the cubic crystals of iron and nickel the magnetic properties depend on the direction, with respect to the crystal axes, in which these properties are measured. Fig. 40 shows the magnetization curves for iron and for nickel, taken with B and H measured in the three principal directions, namely: (1) parallel to an edge of the cube—the [100] direction; (2) parallel to a diagonal of a cube face—the [110] direction; and (3) parallel to the space diagonal—the [111] direction. The direction for which the magnetization curve lies highest is the direction in which magnetization is most easily acquired, and is called the direction of easy magnetization. In iron this direction is parallel to a cube edge; in nickel it is parallel to a cube diagonal.

According to the domain theory the direction of easy magnetization in a crystal determines the actual direction of magnetization in a single domain not subjected to magnetic field or strain, and in unmagnetized iron the domains are oriented in each of the six directions parallel to a cube edge so that the net magnetization is zero. In nickel there are eight such directions.

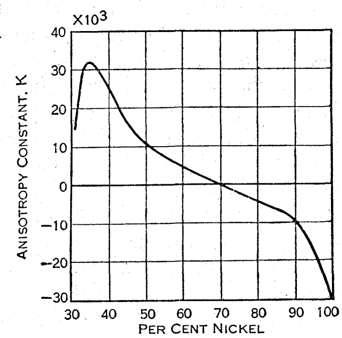

FIG. 43

Dependence of crystal anisotropy of iron-nickel alloys on composition. Note that anisotropy constant is zero near 70% nickel (H. J. Williams and R. M. Bozorth)

Magnetization curves of single crystals of a silicon-iron alloy (3.8% silicon) have a special interest because this is the first case in which measurements were extended to very low inductions, and because the high permeabilities obtained in these crystals are enormous compared with the permeabilities found in commercial silicon-iron sheet having the same silicon content. These data were made available by cutting a single crystal in the form of a hollow parallelogram so that all sides were parallel to equivalent directions in the crystal, *e.g.*, parallel to diagonals of cube faces, and so forming a closed magnetic circuit and measuring in the usual way. The highest permeability observed is about 100 times that of commercial transformer sheet (fig. 41).

Calculation of Magnetization Curves.—A theoretical study of the properties of crystals has made it possible to calculate the magnetization curve for any direction in a single cubic crystal like iron or nickel, provided a single constant of the crystal, the anisotropy constant, K, is known. This constant is a measure of the difference between the magnetization curves in different directions, and is numerically equal to four times the area between the I *vs.* H curves for the [100] and [110] directions. The constant is positive for iron and negative for nickel, and is approximately zero for iron-nickel alloys containing 60% to 70% nickel.

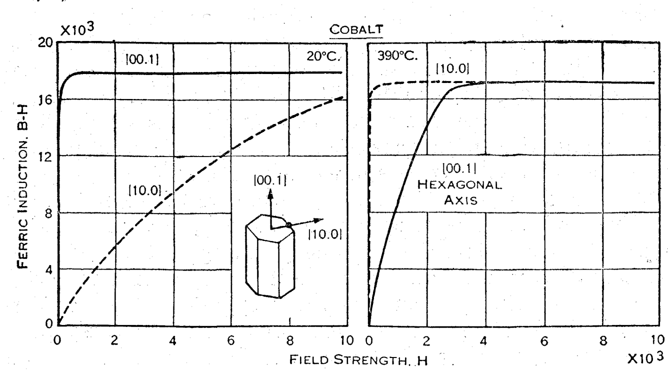

FIG. 44

Crystal anisotropy of cobalt reverses sign at about 270° C., direction of easy magnetization changing from hexagonal axis [00.1] by 90° to [10.0] (K. Honda and H. Masumoto)

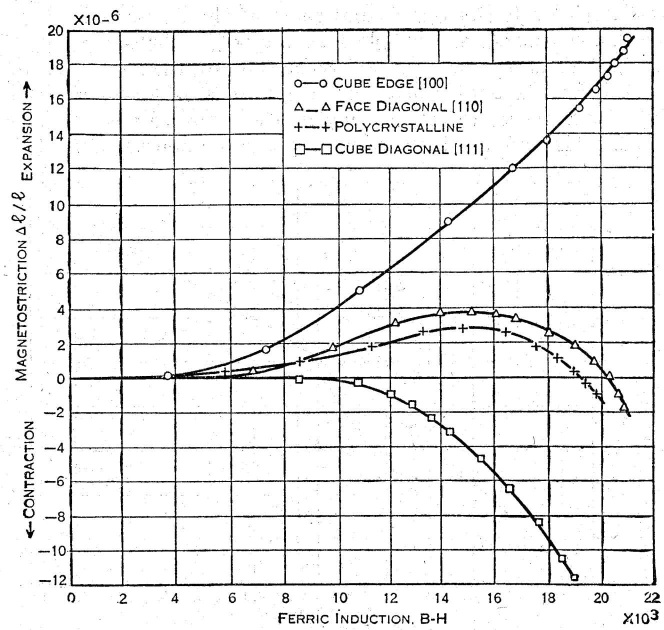

FIG. 45

Dependence of magnetostrictive change in length on crystal direction in iron (W. L. Webster)

Comparison of theory and experiment is made in fig. 42 using H. J. Williams' data for a single crystal containing 3.8% silicon, for which $K = 280{,}000$ ergs/cm³. The theory does not take account of the energy associated with the lower and middle portions of the magnetization curve; therefore, the calculated curves do not correspond to the true magnetization curve below its knee. In a polycrystalline material the magnetization curve is a combination of the separate curves for the many small single crystals of which it is composed. The calculation of such a composite curve has been made to show in what manner the magnetization curve approaches saturation, and fair agreement with observation has been found.

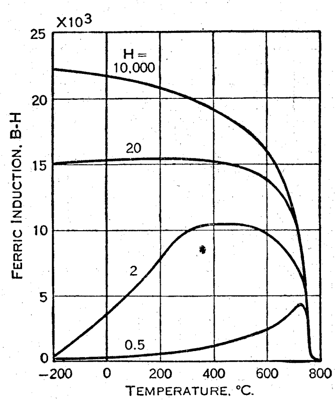

FIG. 46

Effect of temperature on magnetization of iron subjected to fields of various strength. Magnetization drops to low value at Curie temperature, 770° C. (E. M. Terry)

In iron and nickel the anisotropy constants decrease as the temperature increases, so that these metals are isotropic over a considerable range of temperature before they become nonmagnetic at the Curie point. At very low temperature, 20°K., the constant for nickel is 10 to 15 times what it is at room temperature, while for iron the corresponding ratio is only 1.5.

Anisotropy of Iron-nickel Alloys.—Unusual magnetic properties are found in alloys having small values of the anisotropy constant. Such alloys are the permalloys having nickel contents between 60% and 80% nickel, in which range of composition the constant goes from positive to negative (fig. 43). When the anisotropy is small, and the orientation of the domain therefore controlled only weakly by the crystal structure, the material responds easily to either magnetic field or to mechanical stress and therefore saturates in relatively low fields and is unusually strain sensitive.

The small anisotropy of the permalloys containing 60% to 80% nickel is also responsible for the fact that these alloys show unusual properties when heat treated in a magnetic field. A hysteresis loop of material so treated, and the high values of maximum permeability associated with the permalloys (fig. 12), have already been mentioned.

Anisotropy of Cobalt.—Cobalt differs from the other ferromagnetic elements, iron and nickel, by having a hexagonal crystal structure instead of a cubic one. At room temperature the direction of easy magnetization is parallel to the hexagonal axis of the crystal, and when unmagnetized the domains therefore lie in one of the two orientations parallel to this axis. This small number of easy directions, compared with the six or eight in a cubic crystal, means that the domains are needlelike and that the whole magnetic structure may be regarded as a bundle of needles magnetized initially in either direction at random. This picture is supported by powder patterns (*see* above) and by the measurements made by L. H. Germer of magnetic fields close to the surfaces of a single crystal of cobalt.

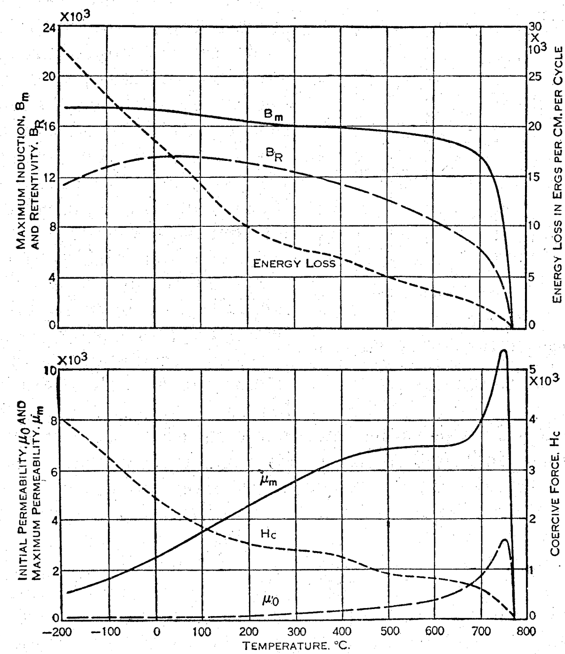

FIG. 47

Variation of some magnetic properties with temperature. Material is electrolytic iron annealed at 800° C. (E. M. Terry, 1910)

The crystal anisotropy of cobalt is large, consequently a strong field is necessary to saturate a crystal in the direction of most difficult magnetization. More than 10,000 oersteds are required for this purpose at room temperature (fig. 44), compared with 600 oersteds for iron and 300 for nickel.

At higher temperatures cobalt becomes isotropic, and above 300° C. the hexagonal axis is the direction of most difficult magnetization, all directions at right angles to the axis being equally easy. Magnetization curves for the principal directions at room temperature and at 390° C. are shown in fig. 44.

Magnetostriction in Single Crystals.—The magnetostrictive change in length of a single crystal is not the same in all crystallographic directions. Especially is this true in iron which expands when the field is applied parallel to a crystal axis, [100], contracts when it is applied parallel to a cube diagonal, [111] (fig. 45). In the direction of the face diagonal, [110], the crystal expands in low fields and contracts in high fields. Nickel con-

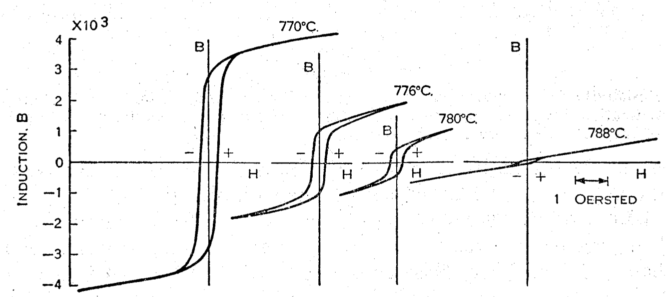

FIG. 48

Change in form of hysteresis loop of iron near the Curie point (H. Kühlewein) tracts in all field strengths in all directions.

8. TEMPERATURE AND THE CURIE POINT

It has been known for many years that when iron is heated to a high temperature it loses its ferromagnetism and is no longer strongly attracted by a magnet. The temperature at which any ferromagnetic material loses its magnetism is known as the Curie point; it is 770° C. for iron and 358° C. for nickel. The highest known Curie point is 1,120° C., for cobalt. For some materials the Curie point lies near the absolute zero of temperature.

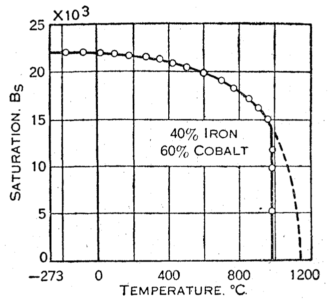

FIG. 49

Curie point determined by change in phase, at 980° C., of iron-cobalt alloy (60% cobalt). (A. Preuss)

When a magnetic material is subjected to a high constant field, an increase in temperature brings about a continuously accelerating decrease in induction. The induction comes down abruptly, almost to zero, at the Curie point (fig. 46), and the curve is retraced when the temperature is lowered again. On the other hand when the iron is subjected to a weak field the induction will first increase with increase in temperature and after passing through a maximum will drop to a low value at the Curie point as before.

The way in which other magnetic quantities change with temperature is indicated in fig. 47 for iron. In any material which may be called normal the curves are likely to have this same general character; *e.g.*, the initial and maximum permeabilities first increase and then decrease with increasing temperature, and the coercive force and hysteresis loss continually decrease. The characteristic maximum in the initial and maximum permeabilities, just below the Curie point, is associated with the low magnetic anisotropy at this temperature. The way in which the size

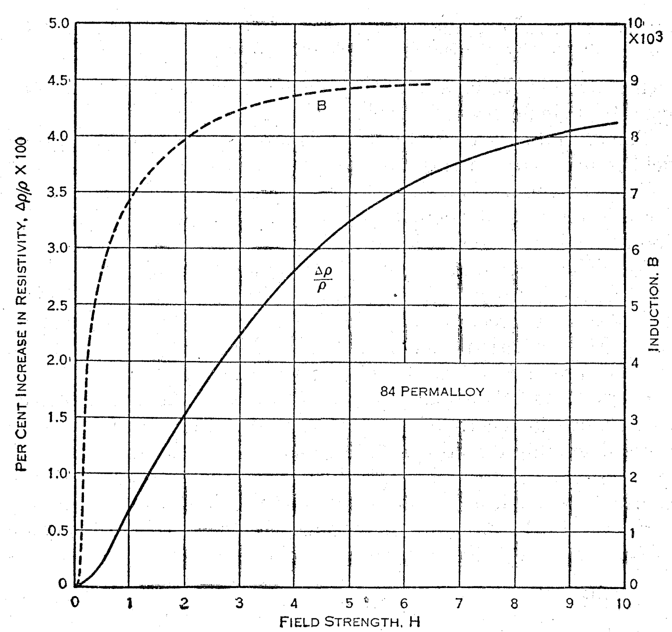

FIG. 50

Resistivity (ρ) of magnetic material (permalloy) increases slightly with magnetization. Most of increase occurs after magnetization is well beyond knee of magnetization curve. (L. W. McKeehan)

and shape of the hysteresis loop of iron change as the temperature approaches the Curie point is shown in fig. 48.

Effect of Phase Changes.—Iron and nickel are normal as to their magnetic behaviour with change of temperature. No changes in their crystal structures occur between room temperature and the Curie point. On the other hand such changes in structure do occur in many alloys, among which the so-called irreversible alloys of iron and nickel (5% to 30% nickel) investigated by J. Hopkinson, and some of the iron-cobalt alloys may be considered as examples. In the 60% cobalt-iron alloy a change in phase, due to a rearrangement of the atoms in the crystal, from a body-centred cubic (α) to a face-centred cubic (γ) form, occurs when the alloy is heated above 980° C. The α phase is ferromagnetic, the γ phase is nonmagnetic (*i.e.*, paramagnetic), consequently the material loses its ferromagnetism when heated through the temperature of change of phase, 980° C., and the magnetization (measured in a high field) drops toward zero precipitously (fig. 49) instead of in the normal fashion as it does for iron (fig. 46).

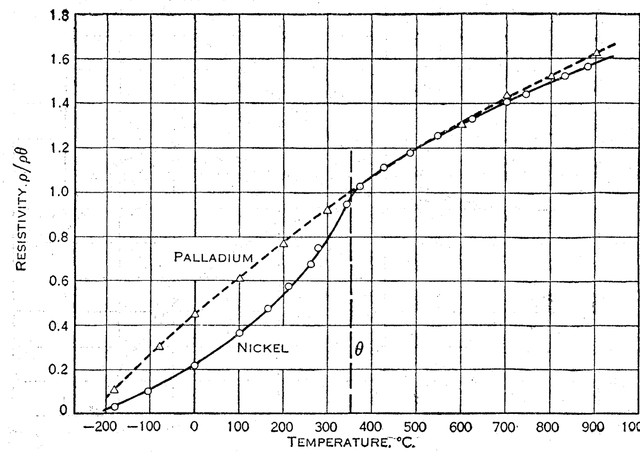

FIG. 51

Resistivity of magnetic material is abnormally low, as long as it is ferromagnetic (H. H. Potter and J. G. G. Conybeare)

9. EFFECT OF MAGNETIZATION ON OTHER PROPERTIES

Preceding paragraphs have described the magnetostriction that occurs during magnetization. Magnetization also effects changes in many other physical properties; and a ferromagnetic material, even though unmagnetized, possesses certain physical properties

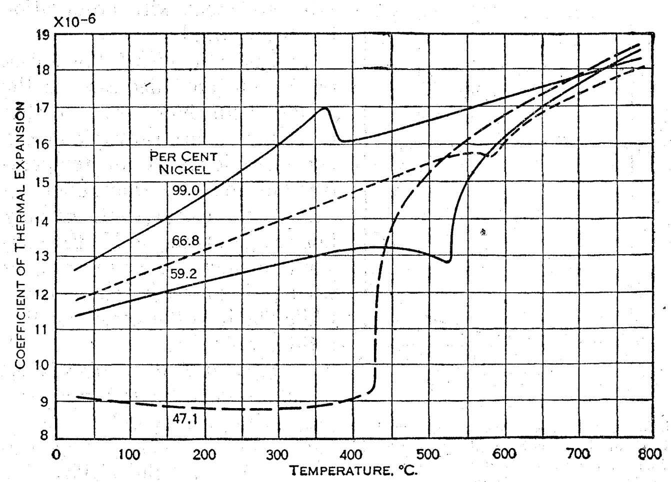

FIG. 52

Thermal expansion curves of magnetic materials show anomalies near and below Curie points. (P. Chévenard)

that are characteristic of its ferromagnetism. The more important of these properties are the following: (1) electrical resistance; (2) thermal expansion; (3) Young's modulus and other elastic constants; (4) magnetocaloric effect; (5) specific heat. The resistivity of magnetic materials is affected also by stress—tension may either increase or decrease the resistivity, depending on whether the material has positive or negative magnetostriction.

Magnetism and Resistivity.—When nickel is magnetized in a high field, its electrical resistivity is increased by about 2%, and a similar but smaller effect is found in iron. Such changes were first reported by W. Thomson (Lord Kelvin) in 1851. A larger change in resistivity, as high as 4% to 5%, is shown by the iron-nickel alloys having 70% to 85% nickel. The increase in resistivity with field strength for the 84% permalloy (fig. 50) illustrates the general rule that most of the change occurs when the magnetization is well beyond the knee of the magnetization curve, and suggests that the change in resistivity, like the magnetostrictive change in length, is associated with domain rotations and not with domain reversals. There is a close relation between changes in length and changes in resistivity, and these quantities usually have a constant ratio.

The resistivity of a ferromagnetic material is abnormally low by virtue of the fact that it is ferromagnetic. This may be illustrated by comparison of the resistivities of nickel and palladium, elements occupying similar positions in the periodic table. The resistivity-temperature curves (fig. 51) are drawn so that they coincide at a temperature just above the Curie point of nickel, when both metals are nonmagnetic, and the

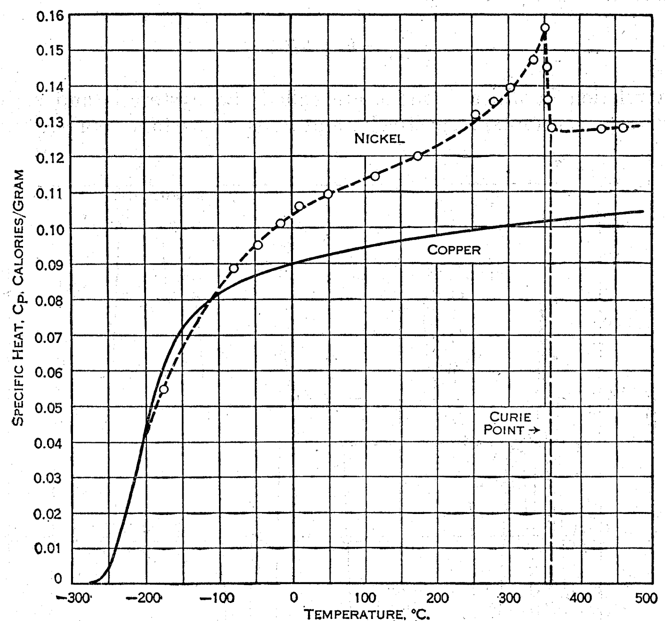

FIG. 53

Specific heat of a magnetic substance is unusually high. Curves for nickel (E. Lapp) and copper (H. Klinkhart) are compared

separation of the curves below this temperature indicates the lowering of the resistivity due to the ferromagnetism. The ferromagnetism becomes progressively weaker as the Curie point is approached, and the separation of the curves in the figure correspondingly less.

Magnetism and Thermal Expansion.—The thermal expansion of magnetic materials is abnormal to such an extent that occasionally such a material will contract instead of expand as the temperature is raised in the vicinity of the Curie point. In some alloys, such as invar, the expansion is very small over a range of temperatures that includes room temperature, and this property is of great technical importance.

The origin of the abnormal expansion lies in the change in the forces between atoms that occur when the material becomes ferromagnetic. The iron nickel alloys show these changes in a striking way (fig. 52). As nickel and the alloys containing more than 70% nickel cool through the Curie point, the expansion coefficients first increase and then decrease rapidly. In contrary fashion, the coefficients of alloys with 30% to 70% nickel first decrease sharply and then increase.

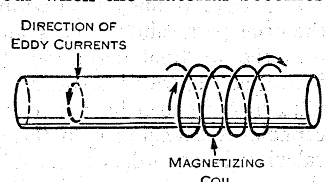

FIG. 54

Direction of eddy currents in solid bar is opposite to that of applied magnetizing current giving rise to them

These changes may be regarded as the result of the superposition of a "magnetic" expansion or contraction on the normal; in invar, containing about 36% nickel, the anomalous and normal expansion neutralize each other at room temperature. When the nickel content is about 70%, there is no anomalous magnetic expansion or contraction at any temperature; this is associated with the fact that at this composition the Curie point of these iron-nickel alloys

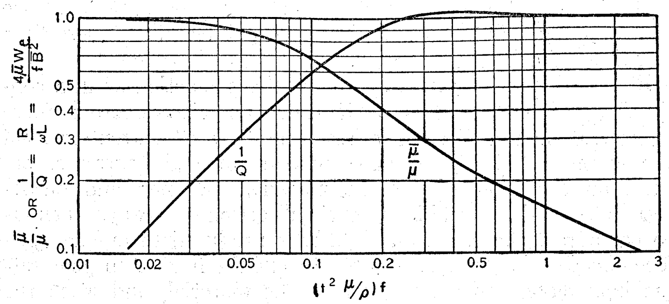

FIG. 55

Theoretical change of apparent permeability, $\bar{\mu}$, and energy loss, W_e, due to eddy currents, with frequency, f, for sheets of given thickness, t(cm), permeability μ, and resistivity ρ (ohm-cm. x 10^9)

is a maximum and independent of composition.

Abnormal Stress-Strain Relation.—In almost all substances a small mechanical stress, σ, (tension) will produce a strain, ϵ, (expansion) that is proportional to the stress, as required by Hooke's law

$$\epsilon=\sigma/E$$

in which Young's modulus, E, is constant. In an unmagnetized magnetic material, however, a tension will change the direction of local magnetization (fig. 39), and with such changes is bound a change in length equal to the magnetostriction of the material. Therefore when tension is applied to a magnetic material, the whole expansion will be the sum of the normal expansion and the magnetostrictive expansion, consequently Young's modulus will vary with stress and deviations from Hooke's law occur.

In a magnetic material Young's modulus will therefore vary both with the amount of strain and with the intensity of magnetization. The change of E with magnetization has been studied in a variety of materials and may be 10% or larger.

Specific Heat and Magnetocaloric Effect.—In comparing the specific heats of nickel and copper at various temperatures (fig. 53) it is apparent that there is an unusual effect in nickel in the neighbourhood of the Curie point. Such a rapid rise and still more rapid drop in the curve, occurring with rising temperature, is characteristic of a ferromagnetic material and is accounted for qualitatively and to a considerable extent quantitatively by theory. The heat necessary to raise the temperature of a magnetic material like nickel is equal to that necessary for a similar but nonmagnetic material (*e.g.*, copper), plus the heat necessary to overcome the mutual interatomic forces that hold the magnetic moments of neighbouring atoms parallel.

This characteristic specific heat of ferromagnetic bodies occurs whether or not the substance under examination is magnetized in the usual sense of the word. The existence of this phenomenon is strong evidence in favour of the existence of spontaneous magnetization in certain regions or domains in ferromagnetic materials.

Similar evidence for spontaneous magnetization is supplied by the magnetocaloric effect. According to theory, at temperatures near the Curie point high fields should increase the spontaneous magnetization, and with this increase there should be a rise in temperature of the material. Experimentally, P. Weiss and R. Forrer observed increases in temperature of more than 1° C. when a field of 18,000 oersteds was applied to nickel just below its Curie point. The change of spontaneous magnetization with temperature, derived from the data, is in good accord with the theory.

10. MAGNETIZATION IN ALTERNATING FIELDS

In many of their uses magnetic materials are subjected to an alternating field, produced by an alternating current in the wire associated with the material. The effects of the frequency of alternation on the magnetic properties of the material are primarily of three kinds: (1) the effective permeability of the material is reduced; (2) the energy loss in the material is increased; and (3) there is a time lag between the field strength and the corresponding induction. There also is some evidence that at ultra high frequencies the true permeability is less than it is at low frequencies.

Effect of Eddy Currents.—When the magnetic flux in a conducting medium changes with time, an electromotive force is generated, and there is a resulting flow of currents within the material. These Foucault currents, or eddy currents, depend on the geometry of the material specimen and on its resistivity and permeability; their direction is always such as to counteract the change in field that produced them (fig. 54). The effect of eddy currents is to prevent the field from penetrating immediately to the interior of the material, and when the applied field is varying continually, as it is in much of the apparatus in which magnetic material is used, the field strength in the interior of the material may never be more than a small fraction of the field strength at the surface. The magnetic induction, therefore, decreases from the surface toward the interior.

To avoid this reduction in field strength, and resultant decrease in alternating flux, the magnetic cores of transformers and other apparatus are laminated, each lamination being insulated electrically from its neighbour. The flux-carrying capacity of such a lamination depends on the thickness (t in cms.), permeability (μ) and resistivity (ρ in ohm-cm.. 10^9) of the material and on the frequency (f in cycles/sec.) of alternation of the magnetic field. It can be calculated accurately provided the permeability does not vary with field strength, and can be expressed in terms of the effective permeability, $\bar{\mu}$, defined as the ratio of the amplitude of the induction, $\bar{B}$, (averaged over the section of the lamination) to the amplitude of the applied field strength, H_a. When H_a varies sinusoidally with time, $\bar{\mu}/\mu$ varies with frequency is shown graphically in fig. 55.

In laminations as commonly used in power transformers, the reduction in permeability is only a fraction of 1%, and therefore negligible. When the frequency is high, $\bar{\mu}/\mu$ is inversely proportional to $\sqrt{f}$, or

$$\bar{\mu}=\frac{\sqrt{\mu\rho}}{2\pi t}\cdot\frac{1}{\sqrt{f}}.$$

In a transformer working at radio frequencies the constants of the materials used are such that 95% of the true permeability is lost. At these high frequencies the flux carrying power or value of a material of given resistivity and thickness is directly proportional to the square root of its permeability.

Energy Losses in Alternating Fields.—Eddy currents in a magnetic material consume power and raise the temperature of the material. The power loss, W_e, may be calculated with some precision provided μ does not vary with B. At low frequencies it is proportional to f^2. At high frequencies it is proportional to $f^{3/2}$, if the material is always magnetized to the same value of $\bar{B}$:

$$W_e=\frac{\pi t\bar{B}^2}{\sqrt{\mu\rho}}\cdot f^{3/2}.$$

If the amplitude of the magnetizing current is held constant, the loss is proportional to $f^{1/2}$. The hysteresis loss of a magnetic material at intermediate and high inductions is given approximately by Steinmetz' relation (*see* above).

$$W_h=\eta B^{1.6}f.$$

The total loss due to hysteresis and eddy currents at low frequencies may then be written

$$W=W_h+W_e=\eta B^{1.6}f+AB^2f^2$$

where A can be calculated theoretically under certain conditions, as shown above. This relation is sometimes used for the separation of the total loss (as measured with a wattmeter at a given value of B) into its hysteresis and eddy components.

When apparatus operates at low inductions, as it often does for transmission of the feeble signals used in communication, the energy losses incurred are usually measured with a Maxwell bridge, as described below under *Measurement of Magnetic Quantities*. The data obtained are the A.C. resistance, R, in ohms, and the inductance, L, in henries, of a coil surrounding the material under test. The ratio R/L is characteristic of the magnetic material and is related to the energy losses in ergs/cm.³ by the equation

$$\frac{R}{2\pi fL}=\frac{8\pi\bar{\mu}W}{B^2}.$$

The reciprocal of $R/(2\pi fL)$ is often called the quality factor, Q. When the frequency is low, the losses due to eddy currents and hysteresis may now be separated by plotting $R/(2\pi fL)$ against frequency. W_h varies as B^3f (see *Hysteresis Loops* above) and W_e as B^2f^2, and

$$\frac{R}{2\pi fL}=h_o+hB+ef$$

a relation in which h and e are called the hysteresis and eddy current constants, respectively, and h_o is a constant representing

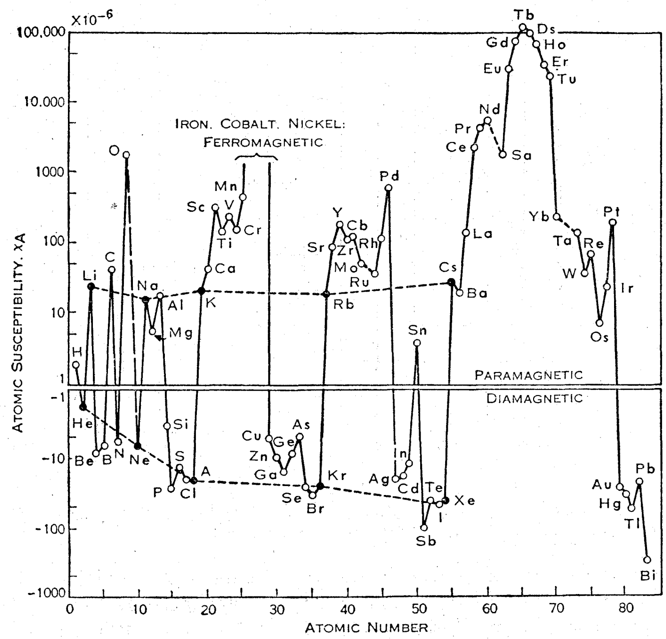

FIG. 56

Atomic susceptibilities of the elements at room temperature. Dotted lines connect alkali metals (paramagnetic) and rare gases (diamagnetic)

an energy loss of unknown origin, important only at very low inductions.

At high frequencies and low inductions the losses in a material of high permeability are usually due predominantly to eddy currents. These can be calculated as described above and for them $R/(2\pi fL)$, or Q, is shown by the curve of fig. 55.

Permeability at Very High Frequencies.—In considering the effect of frequency on permeability it has been assumed that the true permeability, μ, is independent of frequency and that only the apparent permeability, $\bar{\mu}$, diminishes as the frequency increases. There is some reason to believe, however, that at ultra high frequencies the magnetic moment of a domain is not capable of changing with the required rapidity. R. Becker has calculated the order of magnitude of the frequency at which the magnetization should fail to respond. By considering the magnetic energy required to move the surface separating one domain from its neighbour, assuming a reasonable value of the thickness of a domain, he estimates that the permeability will begin to decrease seriously when the frequency is about 2 x 10^9 cycles/sec., corresponding to a wave length in air of 15 cm. The existence of decrease in permeability at wave lengths under 50 cm. is indicated by the work of K. F. Lindmann.[1]

Time Lag in Magnetization.—As already mentioned, eddy currents cause a delay in magnetization so that after a sudden change in H from one value to another, a perceptible time elapses before B acquires its final corresponding value. There are other reasons, too, why B continues to change with time after H has become constant. One well-known cause of such change is metallurgical aging. This is usually observed in permanent magnets, the induction in which can be observed to change over a period of years, and this change is attributed to the slow precipitation of metallic phases from supersaturated solution at room temperature. Similar changes occur also in ordinary annealed iron to such an extent that the coercive force may eventually be doubled even though the material has not been heated above 100° C. Materials that have been severely cold worked sometimes become magnetically softer on account of the slow relief of the internal strains caused by the working.

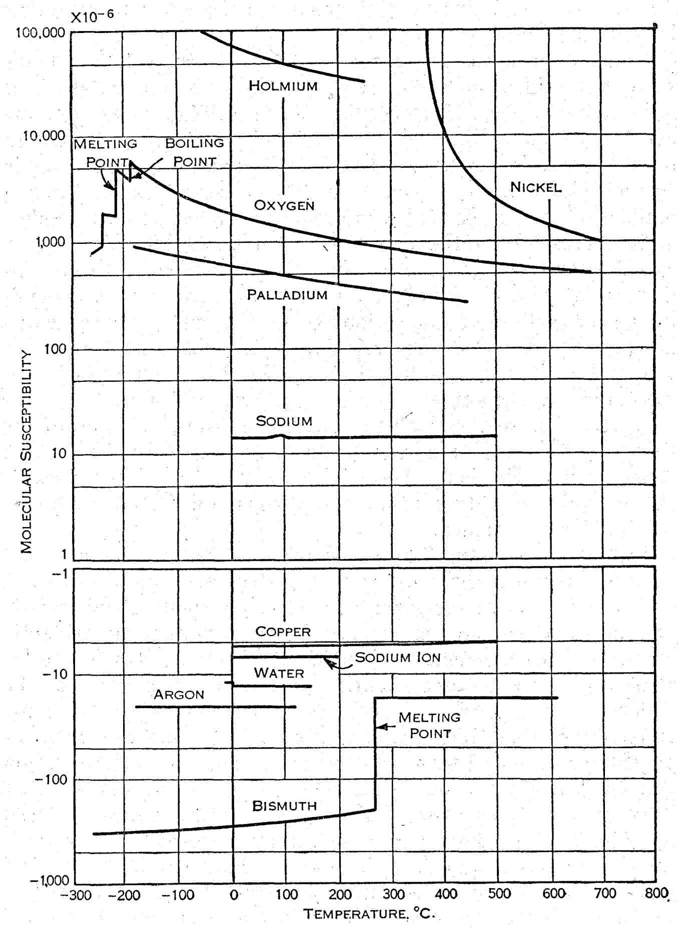

FIG. 57

Variation of atomic or molecular susceptibility with temperature, for some representative materials. Susceptibilities of diamagnetic and weakly paramagnetic substances are normally independent of temperature, those of strongly paramagnetic substances decrease with increasing temperature

A more rapid change of induction with time has been observed repeatedly since Ewing's experiments of 1885. One method of experimenting is to change H suddenly, then observe the change in B as dependent on time. Observable changes may last as long as 15 or 20 minutes, or as short a time as $\frac{1}{10}$ second, depending on the nature of the specimen and the temperature. In some materials the only lag observed can be accounted for by eddy currents. A second way of observing a change of magnetic state with time is to measure the permeability at very low inductions, at various times after demagnetizing and after the measuring current has been applied. It is particularly noticeable that in commercial silicon iron, subjected to a small alternating field of fixed amplitude, the permeability will continue to decrease measurably with time for more than a day. Such changes are associated in some way with the impurities present, for they disappear when these are removed by heat treatment at a high temperature in hydrogen. It has been suggested that the diffusion of small traces of nitrogen or oxygen in iron will impede the movement of domain boundaries in such a way as to account for the observed changes of permeability with time.

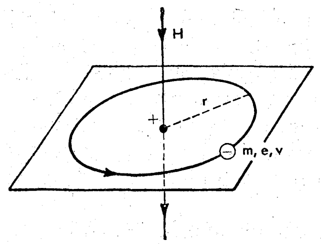

FIG. 58

Velocity of electron is changed by application of field H so that induced magnetic moment is in direction opposite to that of field

11. DIAMAGNETISM

Faraday showed in 1845 that all substances may be classified as diamagnetic and paramagnetic. He distinguished between the paramagnetism and diamagnetism of feebly magnetic substances by suspending them in a strong inhomogeneous field and noting whether they were drawn into or repelled from the strongest part of the field. The force with which a diamagnetic material is repelled by a field is proportional to the strength H and gradient dH/dx of the field and to the susceptibility κ and volume, v, of the material:

$$f = \kappa v H dH/dx.$$

The susceptibilities of solid diamagnetic substances are usually about -1×10^{-6} or -2×10^{-6}, and are normally independent of field strength. Bismuth has the exceptionally large value of -13×10^{-6}, but even in this substance the numerical value of the susceptibility is millions of times less than that of the ferromagnetic metals. Bismuth is also exceptional in that its susceptibility varies somewhat with the field at low temperatures (50° K.).

While diamagnetic and paramagnetic materials are not often of technical use, as such, a study of their behaviour is very important for our scientific knowledge of the nature of matter. Diamagnetism is an atomic property, and usually occurs when the atom has a symmetrical electronic structure and no permanent magnetic moment. In discussing diamagnetism it is appropriate to use the term atomic susceptibility defined as $\chi_A = \kappa A/d$, A being the atomic weight and d the density. Then $\chi_A H$ is the magnetic moment of one gram atomic weight, and when divided by Avogadro's number is the average magnetic moment per atom

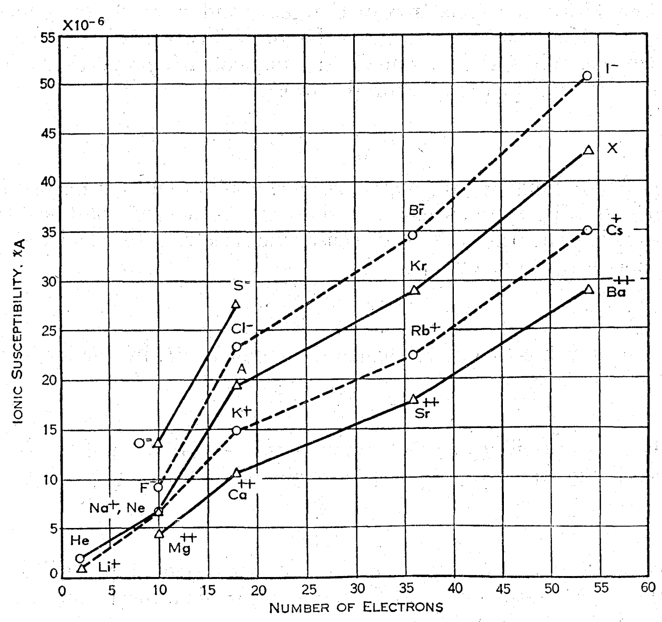

FIG. 59

Ionic susceptibilities of similar structures increase with number of electrons in ion resolved parallel to the magnetic field. Similarly $\chi_M = \kappa M/d$ is the molecular susceptibility, M being the molecular weight.

As P. Curie showed in his classical researches (1895), diamagnetism is usually independent of temperature, and so is not disturbed markedly by atomic collisions or the positions of nearby atoms. However, some change in the diamagnetic susceptibility is generally noted when a substance changes from the solid to the liquid state.

Following the work of Curie, K. Honda and M. Owen in 1910 and 1912 reported measurements of the susceptibilities of many elements. Fig. 56 shows the atomic susceptibilities as dependent on atomic number according to more recent data summarized by P. W. Selwood. Here it is apparent that the rare earth metals

are strongly paramagnetic, that the metals of the "transition groups" containing palladium and platinum are rather strongly paramagnetic, and that most good metallic conductors of electricity are weakly paramagnetic. This implies what is in fact the case, that in a metal the conducting electrons are paramagnetic. The other metals, and the nonmetals, are weakly paramagnetic or diamagnetic, except that antimony and bismuth have moderately strong diamagnetism.

Most ionic and molecular compounds are also diamagnetic because their electrons are paired and their permanent moments tend to cancel each other; however, gaseous oxygen, O_2, and nitric oxide, NO, are paramagnetic. Fig. 57 shows the atomic or molecular susceptibilities of some typical materials and the way in which they change with temperature.

Theory.—Our understanding of the origin of diamagnetism is due largely to P. Langevin who published his celebrated paper on magnetism and electron theory in 1905. He considered an atom with a single electron of charge, e, and mass, m, travelling with velocity, v, in a circular orbit of radius, r (fig. 58). This "current" gives rise to a magnetic moment, M, proportional to the current and the area of the orbit:

$$M = \frac{ve/c}{2\pi r} \cdot \pi r^2 = \frac{ver}{2c}.$$

As pointed out by Sir Joseph Larmor, application of a magnetic field H will create an e.m.f. in the orbit, as a result of the flux threading it, and this will cause the electron to change its velocity by an amount

$$\Delta v = -\frac{eHr}{2mc}$$

in such a direction as to change the moment, M, by the amount

$$\Delta M = \frac{er\Delta v}{2} = \frac{e^2 H r^2}{4mc^2}.$$

The susceptibility of this "atom" is then $-\Delta M/H$, and the susceptibility of one gram atomic weight is

$$\chi_A = -\frac{Ne^2 r^2}{4mc^2}.$$

If an atom contains many electron orbits, oriented in all directions with respect to the field, the expression for atomic susceptibility becomes

$$\chi_A = \frac{Ne^2 \Sigma \overline{r^2}}{6mc^2} = -2.83 \times 10^{10}\, \Sigma \overline{r^2}$$

in which the mean square orbital radius is summed over all the orbits in the atom.

The equation above, known as Langevin's equation of diamagnetism, is applicable to every substance, whether it be diamagnetic or paramagnetic. If an atom has a permanent moment and the material is consequently paramagnetic, it is still true that its susceptibility has the diamagnetic component given by this equation.

Knowing the number of electrons in the atom, one may calculate from the diamagnetic susceptibility the average (r.m.s.) radius of an atom and compare this with the radius determined by other means. Values so obtained are consistent with our other knowledge of atomic structure.

In quantum mechanics (*q.v.*) the Langevin formula still holds when the field of the nucleus is spherically symmetrical, as it is in atoms or ions. The meaning of the orbital radius, r, however, is somewhat different, since the electrons are assumed to be distributed in less localized orbits. Calculation of diamagnetic susceptibilities by wave mechanics has been attempted for a number of the simple atoms and molecules and has been moderately successful for the rare monotomic gases He, Ne, A, Kr, and Xe, and molecular hydrogen, H_2. For helium, theory indicates an atomic susceptibility (x 10^6) of 1.65 to 1.90, depending on the method of calculation; G. G. Havens' measured value is 1.91. For hydrogen the calculated and observed values are 2.10 and 2.01. For the other elements listed both theoretical and measured susceptibilities vary over a greater range.

Positive ions of the alkali and alkaline earth metals, and of the halogens, have the rare gas structure and can also be treated theoretically. The lack of precision in the calculation arises in the approximate nature of wave functions and the effective molecular charge assumed.

Simple Salts and Their Solutions.—Most salts are diamagnetic because the ions of which they are composed (*e.g.*, Na^+ and Cl^-) have the completed electron shells characteristic of the rare gases and consequently have no permanent magnetic moment. Measurements are made either on solid salts or on solutions, and the susceptibilities of the separate ions can be deduced from a series of such measurements. There is some ambiguity in separating the susceptibility of the salt into its component parts, and there is also some change with concentration and state of aggregation, but each ion has a value of χ_A that is approximately constant. Values of the separate ions, deduced by Miss V. C. G. Trew and others, are plotted in fig. 59 against the number of extra-nuclear electrons in the ion. The increase of χ_A with the number of electrons, n, is to be expected according to simple theory; the relative large increase between $n = 10$ and $n = 18$ is shown also by ionic radii deduced quite independently from investigations of crystal structure and of the refraction of light. In ions having the same number of electrons but a different nuclear charge, as in the series I^-, Xe, Cs^+ and Ba^{++}, the diamagnetic susceptibility decreases numerically with increasing charge because the larger charge draws the electrons

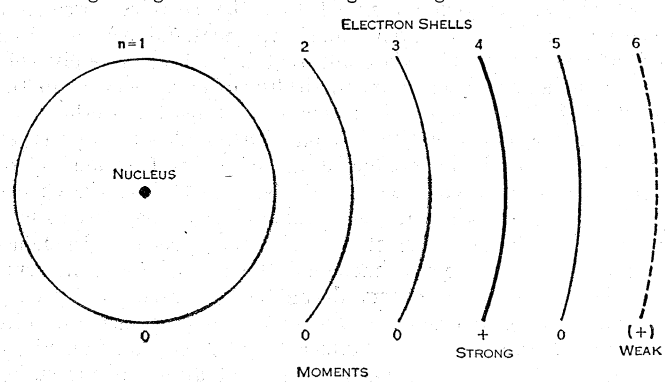

FIG. 60

Paramagnetism occurs when inner shell is incomplete (heavy line) and therefore has permanent moment (strong paramagnetism), or when electrons of outer shell (broken line) become conduction electrons in metal (weak paramagnetism) closer to the nucleus and so diminishes the value of $\Sigma\overline{r^2}$ of Langevin's equation.

The principle of additivity of the diamagnetism of ions may be extended to include also the more complex ions NO_3^-, SO_4^{--}, PO_4^{---}, NH_4^+ and others. Values for these are less certain than those for the simple ions already considered.

Organic Compounds.—In his early comprehensive experiments (1908–13) P. Pascal found that the molecular susceptibility of many organic compounds is the sum of the susceptibilities of the atoms composing them, plus additional terms characteristic of the various bonds occurring in the molecule. The atomic susceptibilities and constants of some elements and bonds are given in Table IV.

The method of using these numbers may be illustrated for ethyl bromide, C_2H_5Br. The calculated value of $-\chi_M \times 10^6$ is $(2 \times 6.00) + (5 \times 2.93) + 30.6 - 4.1 = 53.1$, and is close to the observed value of 53.3. Pascal's constants have been extended to many more complicated organic structures and groups of atoms. His work was also the basis of the additivity relations of inorganic ionic compounds discussed in previous paragraphs.

Diatomic Molecules.—While the Langevin theory is not very illuminating when applied to a simple diatomic molecule like H_2, quantum mechanics can be called upon provided the wave functions are known with sufficient accuracy. In the expression for χ_M there is a term, always positive, added to the negative term of the Langevin equation.

J. H. Van Vleck and N. H. Frank have used the wave functions of molecular hydrogen to calculate both terms of the expression, and found them to be -4.66×10^{-6} and $+0.51 \times 10^{-6}$. The net result of -4.15×10^{-6} may be compared favourably with the experimental values ranging from about -3.9 to -4.0×10^{-6}.

Calculation of heavier diatomic molecules cannot be carried out so rigorously, and the approximate wave functions generally used for these substances give too high a value of χ_M. Our knowledge of gases is also limited by the fact that measurements are difficult to make with accuracy.

Susceptibility of Water.—The magnetic properties of water are interesting for three reasons: (1) it is often used for calibration of apparatus; (2) its susceptibility must be subtracted from that of a solution to obtain the value for the solute; and (3) the variation of its susceptibility with temperature has been measured accurately and this gives us a conception of the amount and nature of the temperature variation of susceptibility of diamagnetic substances generally. The value of $\chi_M \times 10^6$ is 0.7218 at 20° C., and increases about 0.013% per ° C. The opinion of various investigators is that this change is due to depolymerization of the water with increase in temperature. Experience with water supports the general conclusion that diamagnetism is independent of temperature except for the slight change in the effect of surrounding molecules on the electron distribution of the atom or molecule under consideration. Such changes occur, of course, during melting and vapourization (fig. 57) and when molecules combine to form groups, as in polymerization.

12. PARAMAGNETISM

The paramagnetism of the materials examined by Curie was dependent on temperature, the susceptibility decreasing with increasing temperature. After that time it was found that there was a large class of paramagnetic substances for which the susceptibility was practically independent of temperature (fig. 57); this class includes many of the metallic elements when, and only when, they are in the solid conducting state, and the paramagnetism of these materials is due to the conduction electrons. This kind of paramagnetism is referred to as weak paramagnetism, whereas the former class has strong paramagnetism and is due to a permanent magnetic moment of the component atoms or molecules.

The origin of the two kinds of paramagnetism is shown schematically in fig. 60, where the curved lines represent electron shells in an atom. The outer line is broken to indicate that the electrons in this shell are loosely bound and become conduction electrons in a solid metal or valence electrons in a compound. In a metal the spins of a portion of these electrons can be changed by an applied field in a way that can be explained by quantum mechanics, and therefore give rise to weak paramagnetism as shown, for example, by metallic sodium. Most of the other shells have their full complement of electrons, and the magnetic moments due to their orbital and spin motions are self-neutralizing so that they contribute only diamagnetism to the atom. On the other hand some of the shells in some atoms are incomplete and therefore have a resultant moment that is large compared with the spin of the conduction electrons or the diamagnetic moment of the closed shells. Such incomplete shells occur notably in the iron group and rare earth group of elements, also in the palladium and platinum groups, and all of these show strong paramagnetism. In the extreme cases of the rare earth elements dysprosium and holmium, the fourth shell (fig. 60) contains electrons whose spin and orbital moments combine to give the largest magnetic moment of any atoms.

Before discussing the experimental results further it is desirable to outline the classical and quantum theories of strong paramagnetism, and the quantum theory of weak paramagnetism.

Langevin Theory.—Curie found that his measurements at various temperatures could be expressed by the law now known by his name:

$$\chi_M = C_M/T,$$

in which T is the absolute temperature and C_M the Curie constant characteristic of the substance. The classical theory of this kind of paramagnetism was developed by Langevin who investigated mathematically the behaviour of an ensemble of magnetic dipoles, each of moment μ_M, in a field of strength H. The effect of the field is to cause alignment, the thermal agitation to destroy this alignment. Assuming that the "molecules" are far enough apart so that their mutual forces can be neglected, the energy due to the field is

$$W = \mu_M H \cos\theta$$

for each dipole oriented so that μ_M makes the angle θ with H. If the ensemble is subject to thermal agitation, the principles of statistical mechanics show that at any temperature, T, the num-

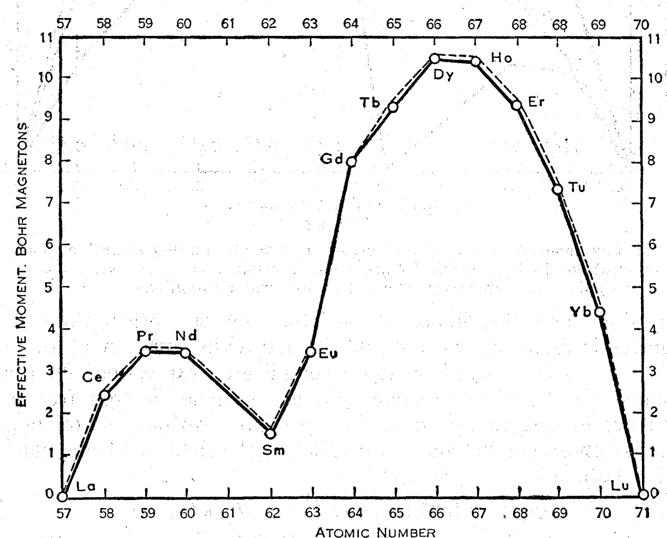

FIG. 61

Effective moment of the trivalent ions of the rare earth elements, at room temperature. Broken line shows values calculated by Van Vleck theory

ber of dipoles oriented in the solid angle $d\omega$ about the direction θ, is proportional to

$$e^{-W/kT}d\omega = e^{(\mu_M H \cos\theta)/kT}d\omega$$

(Boltzmann's equation). For all the molecules the average value of the moment in the direction of the field, $\bar{\mu}_M$, is calculated, and the ratio of this to the total moment, or the moment when all magnets lie parallel, is found to be

$$\frac{\bar{\mu}_M}{\mu_M}=\text{ctnh}\,\frac{\mu_M H}{kT}-\frac{kT}{\mu_M H}.$$

This is Langevin's equation of paramagnetism. At ordinary temperatures $\mu H << kT$, and this equation may be expanded in series form:

$$\frac{\bar{\mu}_M}{\mu_M}=\frac{\mu_M H}{3kT}-\frac{1}{45}\left(\frac{\mu_M H}{kT}\right)^3+\cdots.$$

Now the moment of a gram molecule is $N\bar{\mu}_M$ and the molecular susceptibility is then $\chi_M=N\bar{\mu}_M/H$, so that at ordinary temperatures, where the first term of this equation is sufficient, we have

$$\chi_M=\frac{N\mu_M}{H}=\frac{N\mu_M{}^2}{3kT}=\frac{C_M}{T}.$$

This is Curie's law, with the Curie constant given by

$$C_M=N\mu_M{}^2/3k.$$

Thus Langevin's work explained Curie's law and showed how the moment per molecule could be determined from the results of experiment.

Quantum Theory.—The advent of quantum theory has changed our notions of atomic structure in fundamental ways, and our interpretation of paramagnetic phenomena in several particular ways now to be discussed under four headings.

(1) Langevin assumed that any orientation of magnetic moment with respect to an applied field is possible; quantum theory requires that only discrete changes of angular momentum are possible, and this imposes restrictons on the orientations of magnetic moment. As a result the Langevin equation of paramagnetism is replaced by more complicated expression. In the simplest case, when an atom contains a single electron free to change its direction of spin, there are just two possible orientations—those parallel and antiparallel to the field—and the function becomes

$$\bar{\mu}_M/\mu_M=\tanh(\mu_M H/kT)=\mu_M H/kT+\cdots$$

the last part being applicable when H/T is not too large. When many orientations are possible the function approaches Langevin's as a limit.

(2) There is a natural unit for magnetic moment, the Bohr magneton, equal to the moment of one electron spinning about its own centre. Its value is

$$\beta=eh/4\pi mc=9.27\times10^{-21}\text{ erg/gauss}.$$

Here e is the charge and m the mass of the electron, h is Planck's constant, and c the velocity of light. It is convenient to convert susceptibility data to the apparent number of Bohr magnetons per atom, by dividing the moment per atom, determined from Langevin's expression for the Curie constant, by β. This number is called the effective Bohr magneton number: $\mu_{eff}=\mu_M/\beta$. In terms of the Langevin theory it may be expressed

$$\mu_{eff}=\frac{\mu_M}{\beta}=\sqrt{\frac{3k\,\chi_M T}{N\beta^2}}=2.83\sqrt{\chi_M T}=2.83\sqrt{C_M}$$

and can be calculated provided enough is known of the structure of the atom.

(3) The effective moment of an atom may change with temperature or field strength in a calculable way, and Curie's law will not then be obeyed. Under certain conditions χ_M will be of the form

$$\chi_M=\frac{N\mu_M{}^2}{3kT}+N\alpha.$$

Such an expression with the constant α included, accounts quantitatively for the behaviour of some of the rare earth ions, and is applicable in principle in other cases where, however, it cannot often be worked out in detail.

(4) The temperature-independent or weak paramagnetism of many metals (fig. 57) and of some conducting oxides and salts was quite inexplicable on classical theory. Quantum theory, however, provides an explanation by showing that conduction electrons, behaving as an electron gas, have just this observed character, as previously stated. Comparison of theory with experiment is discussed below.

The applications of these items to substances of various types will now be considered.

Rare Earths.—The ions of the rare earth elements cerium (58) to ytterbium (70) are good examples of strongly paramagnetic substances. The permanent magnetic moment is due to the 4f subshell of the 4th electron shell in the usually trivalent ions. This inner shell is protected by the outer shells from the influence of neighbouring atoms and so the assumptions underlying the theory are fairly well satisfied.

Ionic susceptibilities are deduced from measurements on solutions and on solid salts and oxides, by subtracting the contributions of water and other ions (fig. 61). The susceptibilities decrease with increasing temperature, as expected, except that χ_M for the samarium ion Sm^{+++} is almost constant above room temperature and that for europium shows also some unusual behaviour with temperature.

Calculation of the susceptibilities of the rare earth ions by quantum mechanics is one of the important successes of the Van Vleck theory (fig. 61), based on the earlier work of F. Hund. Both terms of the last equations above, those dependent on and independent of temperature, were derived quantitatively from theory, and the unusual change of χ_M with temperature for Sm and Eu satisfactorily explained.

Rare earths in metallic form have large susceptibilities, and gadolinium when cooled below 16° C is ferromagnetic. Values of χ_A x 10^6 are more than 100,000 for terbium and dysprosium at room temperature. Important deviations from Curie's law are observed, and a law of the form

$$\chi_A=C/(T-\theta)$$

is closely followed. This is the Curie-Weiss law applicable to many solid paramagnetics, particularly those in which the magnetic cores of the atoms are under the influence of magnetic or electric fields of nearby atoms, and the Langevin assumptions, therefore, not satisfied. For gadolinium, as for the other ferromagnetic elements, θ is approximately the Curie point (*see Theory of Ferromagnetism,* below), but the existence of θ in the Curie-Weiss equation does not mean necessarily that the material will be ferromagnetic below the temperature $T=\theta$; rather, the law breaks down before this point is reached.

Ions of the Iron Group.—Strong paramagnetism occurs also in the ions of the elements lying between (but not including) scandium and copper, and is most marked in the ions of manganese, iron and cobalt. The moments of the ions are generally less than those of rare earth ions, because the incomplete shell

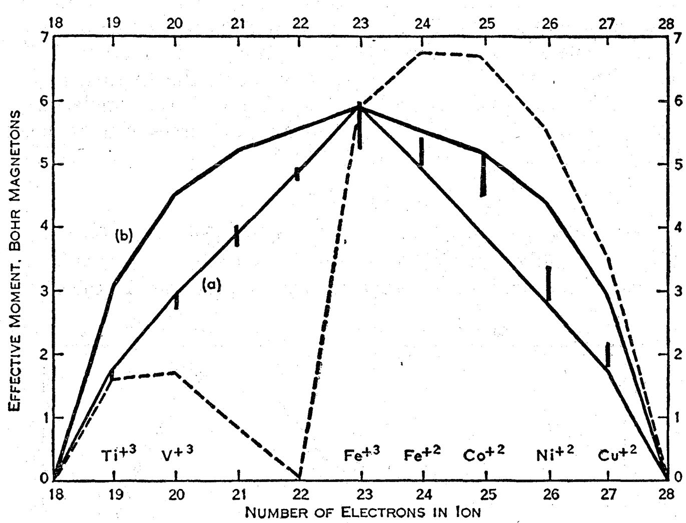

FIG. 62

Effective moment of ions of iron group of elements, plotted against number of electrons in ion. Vertical lines indicate range of observed values, connecting lines theoretical values based on different assumptions responsible for the paramagnetism has a capacity of 10 instead of 14 electrons.

In calculating the moments from quantum theory the method used for the rare earths is not at all successful, as shown by the broken line of fig. 62. Results of calculations made with other assumptions are shown by the solid lines (a) and (b), and it is seen that the observed values lie between these curves. E. C. Stoner has indicated the reason for this. The shell responsible for the moment is the outermost shell of the ion and so is subject to the influence of surrounding ions. These affect the orbital motions in a way difficult to calculate, but if the effect is severe only the spin moments will be influenced by the magnetic field and curve (a) results. On the other hand if the interaction between neighbouring ions is weak, the orbital motions will be affected and curve (b) is calculated; the further assumption is here made, that the energy of thermal agitation is capable of changing the distribution of electron spins in the unfilled shell, an assumption consistent with known facts concerning the structures of these ions. When the influence of surrounding ions on the unfilled shell is moderate, the actual ionic moments may be expected to lie between the two theoretical limits, as in fact they do.

Paramagnetism at Low Temperatures.—At ordinary temperatures the Langevin equation may be represented with sufficient accuracy by the first term of the series expansion, as noted above. However, at low temperatures and in strong fields $\mu_M H/kT$ may be so large that the complete equation, or its quantum equivalent, must be used. Under these conditions the susceptibility is no longer independent of the field strength, and the magnetic moment of the material approaches a limiting

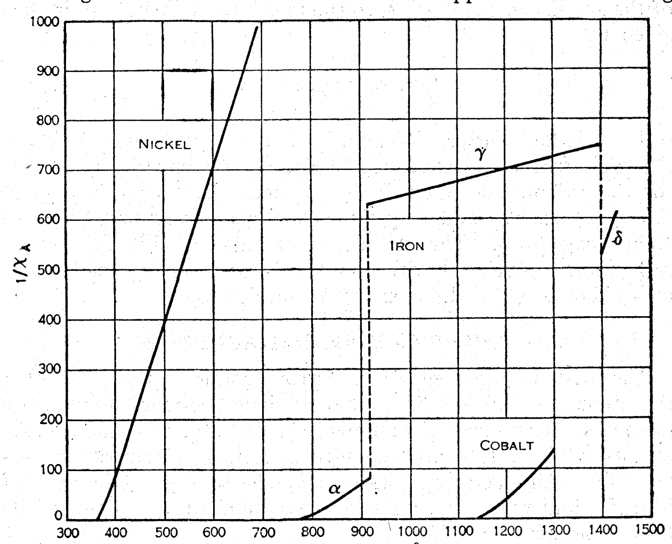

FIG. 63

Reciprocal of atomic susceptibility, χ_A, of iron, cobalt and nickel above their Curie points (P. Weiss and G. Foex)

value corresponding to alignment of the molecular magnets parallel to the field.

The first experimental test of this phenomenon was carried out at temperatures down to 1.3° K. and field strengths up to 22,000 oersteds, and the results confirmed the theory in a satisfactory manner. A slightly different relation was predicted by quantum theory, and this agrees with experiment entirely within the limits of accuracy of the experiments.

The magnetic behaviour of certain paramagnetic salts is important in the attainment of very low temperatures. A temperature just 0.004 degree above absolute zero was attained by W. S. de Haas and E. C. Wiersma in 1935.[1]

Paramagnetic Gases.—Most monotomic gases, such as those in the eighth column of the periodic table, are diamagnetic because they have complete electron shells and, therefore, no residual magnetic moments. Metal vapours, however, have

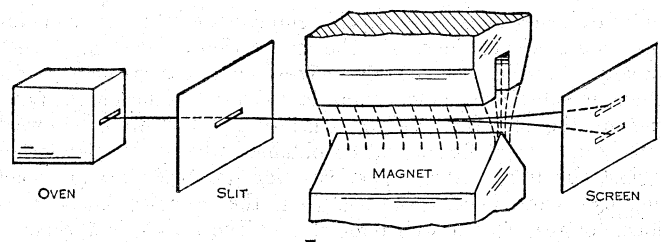

FIG. 64

Diagram of Stern-Gerlach experiment for determining magnetic moments of gaseous atoms (e.g., sodium). Beam of vapourized metal is split by strong inhomogeneous magnetic field

monatomic molecules in which the single electron in the outer shell should give rise to paramagnetism. Measurements on such vapours are difficult, but potassium and thallium are reported to be paramagnetic and the former obeys Curie's law over a limited range of temperatures and has a susceptibility, according to the rather inaccurate measurements, corresponding to a single uncompensated electron ($\chi_M = 1.06/T$).

Molecules containing more than one atom are generally diamagnetic because they contain an even number of electrons whose moments neutralize each other. There are two well-known exceptions to this rule, oxygen (O_2) and nitric oxide (NO). The former has an even number of electrons that remain uncompensated in a way not understood, the latter has an odd number of electrons. The paramagnetism of many other "odd" molecules has been studied to a lesser extent.

Oxygen follows Curie's law ($C_M = 1.00$) except at high pressures when the Curie-Weiss law is obeyed, with the constant θ small and negative. Liquid oxygen also follows the Curie-Weiss law, and the susceptibility increases with decreasing temperature through the solidification point.

The molecular susceptibility of nitric oxide has been measured from 20 to −160° C. (below its normal boiling point) and the effective Bohr magneton number, μ_{eff}, found to vary by about 15% over this range of temperature. Accurate calculation of μ_{eff} and its variation with temperature has been carried out by Van Vleck, who based his work on the electronic structure derived from spectroscopic data. The close agreement found between calculated and observed values is a tribute to the adequacy of the theory.

Paramagnetism of Free Electrons.—The weak temperature-independent paramagnetism of many of the metals (figs. 56 and 57) was inexplicable on the Langevin theory, according to which all paramagnetism should decrease with increase in temperature. According to modern theory the conduction electrons of a metal have spin moments that can be oriented slightly by a magnetic field. In the simplest case with one free electron per atom, quantum theory predicts an atomic susceptibility of $1.88 \times 10^{-6} (A/d)^{2/3}$, where A is the atomic weight and d the density in $g/cm.^3$. There is also a smaller diamagnetism predicted by quantum theory, equal to one-third the paramagnetic contribution when the electrons are free.

In actual metals the electrons are not wholly free but are partially bound to the atoms, and are influenced by the so-called correlation and exchange forces, quantum mechanical in nature. Also, the ionic core of the atom has an important diamagnetic contribution to the susceptibility. These various components have been calculated for sodium, and when summed they come within about 10% of the observed susceptibility. For other elements the calculations are less satisfactory.

The paramagnetic contributions of the electrons will vary with the nature of the metal, and the diamagnetism of the ionic cores will be different for different atoms, and it is easy to see qualitatively that these and other factors will cause some metals to be weakly paramagnetic, others weakly diamagnetic. The order of magnitude of the susceptibility is explained by theory; more exact calculations must await further quantitative development of atomic theory.

Ferromagnetic Materials Above the Curie Point.—All materials that exhibit ferromagnetism are paramagnetic when

[1] W. S. de Haas and E. C. Wiersma, *Physica* 2: 335 (1935).

they are heated above the Curie temperature. As the temperature continues to increase, the susceptibility decreases continually according to the Curie-Weiss law for strongly paramagnetic substances, unless there is a change in the phase structure of the material. If the Curie-Weiss law were followed exactly, a straight line would be obtained when $1/\chi_A$ is plotted against the temperature. The data for iron, cobalt and nickel (fig. 63) show some variations from the expected linear relations, for reasons not well understood. The breaks in the curve for iron are caused by changes in its crystal structure at these temperatures.

One should be able to calculate from the slope of each of these lines the magnetic moment per atom, and compare this with the moment calculated from the saturation magnetization determined at lower temperatures when the material is ferromagnetic. For nickel the ferromagnetic moment is 0.61 Bohr magnetons per atom, and the moment calculated from the Curie constant is 1.6 in the same units. Similar discrepancies occur for iron and cobalt. These results show that there is not an integral number of electron spins per atom, therefore the atoms will not all have the same moment at any instant. This means that the calculation of magnetic moment from the Curie constant cannot properly be made by the relation used. Modifications of the theory are necessary.

Molecular Beams.—According to the quantum theory, the magnetic moment of a molecule may have only a limited number of orientations with respect to the direction of a magnetic field in which it is placed. A direct test of this was made successfully by O. Stern and W. Gerlach in 1921. In this experiment silver atoms, issuing from an oven containing melted silver (fig. 64), are formed into a beam by using small slits, and then pass into the nonuniform field of an electromagnet. In the field the atoms are oriented so that the magnetic moment of each is either parallel or antiparallel to the direction of the field. Those oriented parallel to the field are deflected in the direction of the stronger field by a force proportional to the gradient (downward in the diagram), those oriented in the opposite direction are deflected toward the weaker field (upward). Thus the beam is split into two components, as detected by the image formed on the screen, and from the separation of the images the atomic moment can be estimated. It is necessary to know the velocity of the beam (calculated from the temperature of the oven) and the gradient of the field (about 200,000 oersteds/cm. in some experiments).

Later experiments, designed for more precise determination of the atomic moment, show that for the alkali metals and Cu, Ag and Au the moment has the theoretical value of one Bohr magneton, within the experimental error of about 1%. The elements Zn, Cd, Hg, Sn, Pb, etc., have zero atomic moment, as expected, because the two electrons in the outer shell are mutually compensating. Other elements, *e.g.,* thallium, are found to have the nonintegral number of Bohr magnetons derived by quantum theory from spectroscopic data.

Nuclear Moments.—The nucleus of an atom may itself have a magnetic moment. This is always much smaller than a Bohr magneton, and is detected most readily when the outer electronic structure is balanced magnetically so that its net moment is zero. Nuclear moments do not have any important influence on the magnetic properties of materials, but they are very important for our knowledge of nuclear structure, and techniques for their determination have been developed almost continually after 1931. Here the particular method known as "radio-frequency spectroscopy," used first by I. I. Rabi in 1939, will be outlined briefly.

As in other experiments a molecular beam is provided and defined by slits as shown in fig. 65. When the molecules enter the field, the vector representing the magnetic moment precesses around the direction of the field. Molecules are deflected downward by the field gradient produced by magnet *A,* and upward by the gradient of magnet *B,* and arrive at the point *D* where they are detected by a suitable device. Molecules of different velocities are focused at the same point after traversing other paths, provided no change occurs in the magnetic moment along the path.

A change in the vertical component of the moment is produced in the uniform field, *H,* of magnet *C* by superposing upon the field a rather weak alternating field, of frequency, *f,* produced

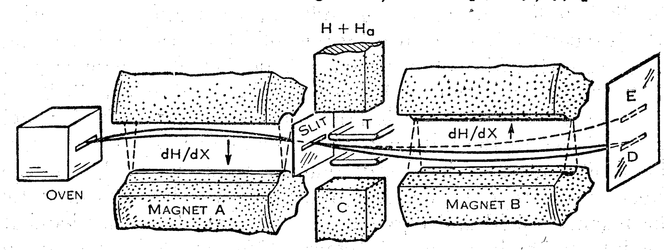

FIG. 65

Rabi method of determining nuclear moments by "radio frequency spectroscopy." Beam of atoms is bent by magnets as shown, is also acted upon by high frequency field generated in copper tubes T

by current in the copper tubes, **T**. The disturbing action of this field may best be explained by analogy with a spinning top precessing about a vertical axis under the influence of gravity. If a disturbing force is produced, as by oscillating the point of support, the top will become unstable provided the frequency of oscillation is equal to the frequency of precession. In the case of the molecules, instability is produced when their frequency of precession (proportional to the field strength *H*) and the frequency of oscillation of the weaker field are equal, and unstable molecules then deviate from their previous paths as indicated by the dotted line *E. H* is varied slowly until the number of molecules arriving at *D* is a minimum, and *H* and *f* noted. The ratio of the angular momentum, *J,* to the magnetic moment, μ, is then given by

$$\frac{\mu}{J} = 0.001312\, f/H.$$

The method derives its name from the fact that *f* lies in the radio-frequency range, *e.g.,* $f = 5{,}585$ megacycles per second for the Li^7 nucleus when $H = 3{,}420$ oersteds. For this nucleus $J = (3/2)\ (h/2\pi)$ and $\mu = 3.25$ nuclear magnetons or 3.25/1,840 Bohr magnetons. The nuclear moments of Li^7 atoms are rather large compared with those of other nuclei, but each is only about 0.2% of the moment of an electron.

13. THEORY OF FERROMAGNETISM

The first requirement of a ferromagnetic material is that the atoms, of which it is composed, have permanent magnetic moments. The magnetic moment of an atom is due to the electrons which it contains, since the nuclear contribution is negligible. An electron possesses a magnetic moment because of its spin, and may have an additional moment by virtue of its orbital motion.

A second requirement of ferromagnetism is the existence of some kind of interatomic force that maintains the magnetic moments of many atoms parallel to each other. Without such forces the atoms would be disordered by thermal agitation and the moments of neighbouring atoms would neutralize each other, and the large magnetic moment characteristic of ferromagnetic material would not exist.

Our knowledge of these interatomic forces and of the structure of the atom now permits a general description of the origin of ferromagnetism. The following steps in the theory may be enumerated: (1) the ultimate magnetic particle is the spinning electron, and a change in magnetization is fundamentally a change in the directions of spin of certain electrons, not to any appreciable extent to a change in their orbital motions; (2) in iron, cobalt and nickel the electrons responsible for ferromagnetism lie in the incomplete third shell of these atoms. In complete shells the electrons are arranged symmetrically so that the spins neutralize one another and the combined moment is zero; (3) in ferromagnetic materials the moments of neighbouring atoms are held parallel by strong quantum mechanical forces, whereas in the atoms of other substances the forces usually tend to make the moments of neighbouring atoms antiparallel and self-neutralizing. The circumstances under which these quantum forces effect parallel orientations and form ferromagnetic domains, or antiparallel orientations that lead to paramagnetism, will be discussed in the following paragraphs. Before considering these steps in modern theory in detail, however, it is appropriate to recall the earlier theories and their development.

Early Theories.—Sir James Ewing was one of the first to attempt to explain ferromagnetic phenomena in terms of the forces between atoms. He assumed with Weber that each atom was a permanent magnet free to turn in any direction about its centre. The interatomic forces holding neighbouring atoms parallel were assumed to be the usual magnetic forces known to act between large-scale bar magnets. The I, H curve and hysteresis loop were calculated for a linear group of such magnets and were determined experimentally using models having as many as 130 magnets arranged at the points of a plane square lattice. The calculations for a linear chain show that as the field is gradually increased in magnitude from zero there is at first a slow continuous rotation of all the magnets together, then sudden change in orientation and finally a further continuous rotation until the magnets lie parallel to the field. The I, H curves calculated for such a group of magnets resemble in general form the actual curves of iron: they show a permeability first increasing, then decreasing, and saturation and hysteresis.

G. S. Mahajani has calculated the magnetic potential energy of a group of magnets arranged in space in the same way that the iron atoms are arranged in a crystal. In agreement with Ewing's theory the magnets tend to be parallel, and some directions in the space-array are more stable or "preferred" than others. On the other hand our present knowledge of the structure of atoms and crystals makes it clear that such magnetic forces between atoms are not large enough to maintain the magnetic moments

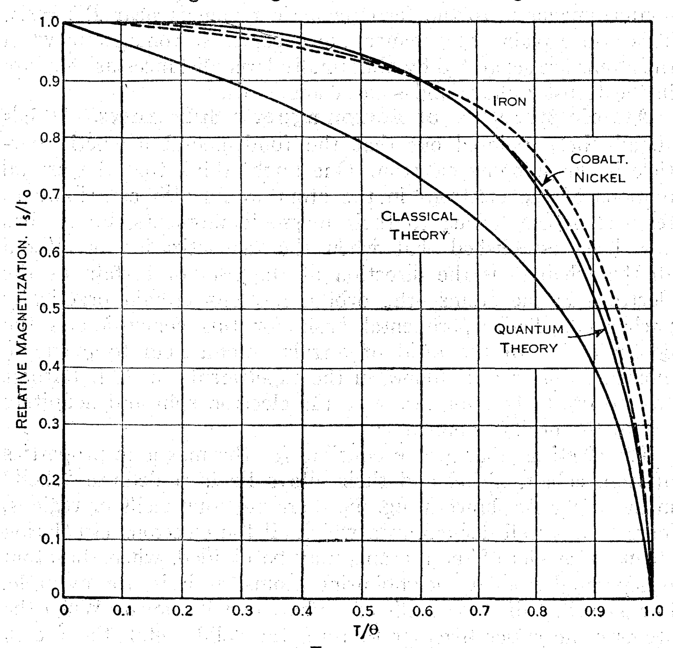

FIG. 66

Saturation magnetization as dependent on absolute temperature in relative units. Solid curves are theoretical, for classical (Weiss) and quantum theories

of neighbouring atoms parallel, as they must be if ferromagnetism is to exist. Such weak forces would be readily disturbed by the thermal motion of atoms at room temperature and even at temperatures a few degrees above absolute zero.

It is now well established that there are very powerful forces not contemplated when Ewing made his model and proposed his theory, which maintain the dipole moments of neighbouring atoms parallel. These are the electrostatic forces of "exchange" which will be discussed below in connection with the quantum theory.

Molecular Field Theory.—In order to understand how atomic forces give rise to ferromagnetism it is desirable to review briefly Weiss's theory of ferromagnetism, which introduces a

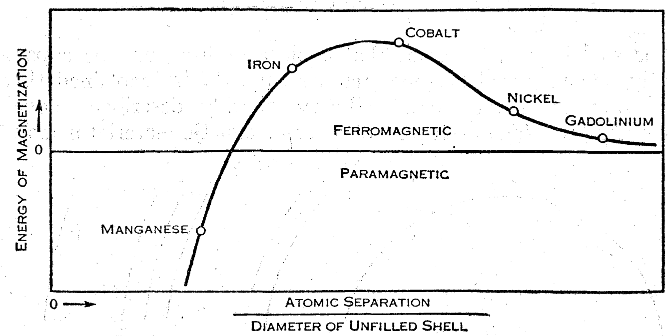

FIG. 67

Bethe's curve showing that ferromagnetic substances must have favourable ratio of distance between atoms to diameter of unfilled inner electron shell responsible for permanent moment

so-called "molecular field" that presently will be identified with the nature of these forces. Using an approach different from Ewing's, Weiss did not attempt to explain the nature of the interatomic forces but treated them empirically by assuming that they exerted a powerful effect that aided the applied field in lining up the atomic moments. This theory is an extension of Langevin's theory of a paramagnetic gas, which culminated in a formula relating the magnetization, I, to the field strength, H, and the temperature, T—the hyperbolic cotangent law,

$$\frac{I}{I_0} = \operatorname{ctnh} \frac{\mu_A H}{kT} - \frac{kT}{\mu_A H}$$

already referred to in the section on *Paramagnetism*. In deriving this, the assumptions are made that the elementary magnets, each of moment μ_A, are subject to thermal agitation and momentarily may have any orientation with respect to the direction of the field, and that they are too far apart to influence each other. Quantum theory alters the first of those assumptions by stating that in such an ensemble of elementary magnets (atoms) there will be only a limited number of possible orientations, in the simplest case only two, one parallel and the other antiparallel to the direction of the field. In this case the equation corresponding to Langevin's is

$$\frac{I}{I_0} = \tanh \frac{\mu_A H}{kT}.$$

Weiss assumed that there exists in a ferromagnetic material a "molecular field," proportional to the intensity of magnetization, that aids the magnetic field present. He therefore replaced the H of Langevin's equation by $H+NI$, calling N the molecular field constant. The resulting equation,

$$\frac{I}{I_0} = \tanh \frac{\mu_A(H+NI)}{kT},$$

is perhaps the most important in the theory of ferromagnetism. It indicates that even in zero field there is still a magnetization of considerable magnitude, provided the temperature is not too high. Putting $H=0$ and $\theta = \mu_A N I_0/k$, this equation reduces to

$$\frac{I}{I_0} = \tanh \frac{I/I_0}{T/\theta}.$$

This purports to specify the magnetization at zero applied field by a function that is the same for all materials, when the magnetization is expressed as a fraction of its value at absolute zero (I_0) and the temperature as a fraction of the Curie temperature on the absolute scale. This magnetization vs. temperature relation, plotted as the upper solid line of fig. 66, means that at all temperatures below θ the intensity of magnetization has a definite value even when no field is applied.

According to this conception the I of the last equation represents the magnetization of a domain, and is determined experimentally by measuring the magnetization of a specimen when all domains are parallel, *i.e.*, at saturation ($I=I_s$). This equation should then be written

$$\frac{I_s}{I_0}=\tanh\frac{I_s/I_0}{T/\theta}.$$

It is well known, however, that a piece of iron may be apparently unmagnetized at room temperature. Weiss explained this by formulating the domain theory, already described above, according to which each part of a ferromagnetic material is mag-

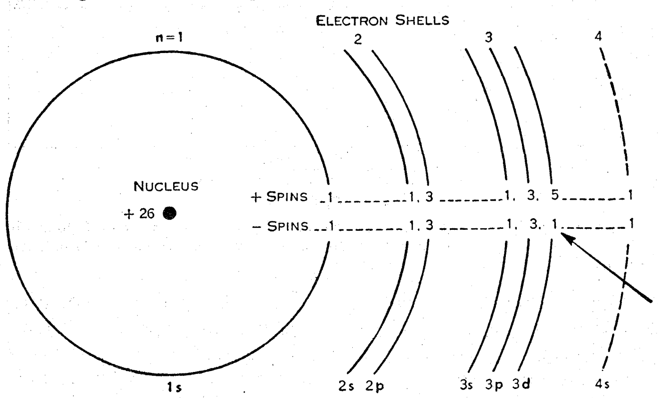

FIG. 68

Electron shells in an iron atom, showing location of inner unfilled shell (3d) responsible for magnetic moment. Electrons of outer shell (4s) of isolated atom become "free" electrons of metal

netized to saturation, the magnetic moments of the separate parts being oriented in different directions so that the over-all effect is zero.

These relations are also important for ferromagnetic materials above the Curie point, when they are paramagnetic. Then I is small compared to I_0 and we may write

$$\frac{I}{I_0}=\frac{\mu_A(H+NI)}{kT}.$$

If we put $\theta=\mu_A NI_0/k$ as before, and $C=I_0\mu_A/k$, this becomes

$$I=\frac{CH}{T-\theta},$$

the Curie-Weiss law. Thus θ is explained by the existence of the molecular field, NI, that aids the applied field, H, in orienting the elementary magnets. However, as pointed out above, the fact that a paramagnetic substance follows this law does not mean necessarily that it will become ferromagnetic at temperatures below $T=\theta$.

Quantum Theory.—The nature of the molecular field was unknown to Weiss when he developed his theory; he knew only that its power in orienting the elementary magnets was equal to that of a magnetic field of millions of oersteds (in iron, NI is as high as 7×10^6 oersteds). A rational explanation of this was first proposed in 1928 by W. Heisenberg who showed that it can be explained in terms of the quantum mechanical forces of exchange (*see* QUANTUM MECHANICS) acting between electrons in neighbouring atoms. Imagine two atoms some distance apart, each atom having a magnetic moment of one Bohr magneton due to the spin moment of one electron. A force of interaction, the exchange force already referred to, has been shown to exist between them in addition to the better-known electrostatic and (much weaker) magnetic forces. It is known that such quantum forces are negligible, as one would expect, when the atoms are

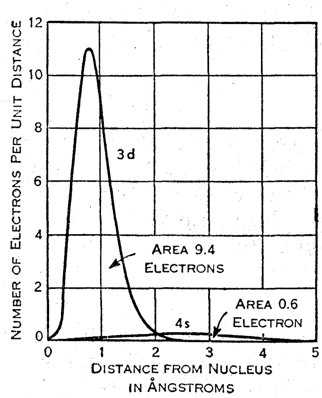

FIG. 69

Distribution of electrons in 3d and 4s shells of iron

two or three times as far apart as they are in crystals. It is supposed also, on the basis of discussions by H. Bethe, and by J. C. Slater, that as two atoms are brought near to each other from a distance, these forces at first cause the electron spins in the two atoms to become parallel (positive interaction). As the atoms are brought nearer the spin moments are held parallel more firmly until at a certain distance the force diminishes and then becomes zero, and with still closer approach the spins set themselves antiparallel with relatively strong forces (negative interaction). In the curve of fig. 67 the energies corresponding to these forces, as estimated by Bethe, are shown as a function of the distances between atoms.

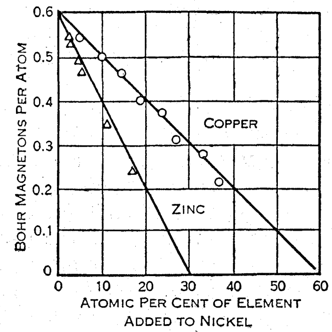

FIG. 70

Reduction in magnetic moment per atom of nickel, caused by adding copper (with one extra electron per atom) or zinc (two per atom). Extra electrons go into unfilled shell and therefore decrease its moment

Bethe's curve was drawn originally for atoms with definite shell radii and varying distances from atom to atom. It may equally well be used for a series of elements if we take account of the different radii of the shell in which the magnetic moment resides. The criterion of interaction for the metals of the iron group is the radius, R, of the atom (half the internuclear distance in the crystal) divided by the radius, r, of the 3d shell, in which the magnetic moment resides. In fig. 67 this ratio R/r has been used as abscissa and the elements iron, cobalt and nickel have been given appropriate positions on the curve. Slater has shown that the ratio R/r is larger in the ferromagnetic elements than in other elements having incomplete inner shells, and that the point at which the curve crosses from the nonferromagnetic to the ferromagnetic region is near $R/r=1.5$. This also explains why manganese becomes ferromagnetic when the atoms are separated by abnormally large distances as they are in the Heusler alloys and some compounds.

Atomic Structure of Ferromagnetic Substances.—It has already been pointed out that the fundamental magnetic particle is the spinning electron. One might think that the orbital motions of the electrons in the atom would also contribute to ferromagnetism, owing to their magnetic moments, but it has now been established that when the magnetization is altered all that changes is the direction of the spin of certain of the electrons in the atoms—the orbital motions remain practically unchanged. The experimental basis for this conclusion is the determination of the ratio of angular momentum to magnetic moment; this ratio is found, in the experiments of S. J. Barnett and others, to be appropriate to the electron spin and definitely not to the orbital moment.

The electrons that are responsible for the magnetic properties of iron, cobalt, nickel and their alloys lie in a definite "shell" in the atom. As shown in fig. 68, there are four shells or regions, more or less well defined, into which all the electrons circulating about the nuclei of these atoms may be divided, when the atom is separated from its neighbouring atoms, as it is, for example, in a gas. Two of these shells are subdivided as shown. When the atoms come closer together to form the solid metal, the fourth or outermost shell of each becomes disrupted, and the two electrons which comprised it wander easily from atom to atom and are the "free" electrons responsible for electrical conduction. The electrons in the outer part of the third shell are those responsible for the ferromagnetic moment. Some of these electrons spin in one direction and some in the opposite, as indicated, so that their magnetic moments neutralize each other partially but not wholly, and the excess of those spinning in one direction (+) over those spinning in the other (−) causes each atom as a whole to behave as a small permanent magnet.

The average moment of the atom in a ferromagnetic material may be determined from the saturation magnetization, I_0, at the absolute zero of temperature by dividing I_0 by the number of atoms in a cubic centimetre. Expressed in Bohr magnetons, β, the average or "effective" atomic moment is

$$\mu_{eff} = \frac{I_0 A}{N \beta d}$$

A being the atomic weight, N Avogadro's number and d density. Moments of iron, cobalt and nickel atoms, so calculated, are

Fe	2.22 Bohr magnetons
Co	1.70
Ni	0.61

The meaning of these nonintegral values may be discussed in either of two different ways used for many problems of the solid state. In the Heisenberg method of approach the atoms have their own electrons (some atoms necessarily more than others), and the disturbing effect of the interaction between neighbours is estimated as well as possible. The other approach, followed by F. Bloch, E. C. Stoner and others, is to consider the metal as composed initially of ions and free electrons, and to calculate the way in which the ionic fields modify the behaviour of the electrons, making them less free. According to the latter or "collective electron" description both the 3d and 4s shells of iron, cobalt and nickel atoms are incomplete and there is a distribution of electrons between them determined by the specific nature of the atomic fields. The calculations indicate that in iron the electrons in these shells are distributed (on the average) about the nuclei as indicated in fig. 69. The 3d shell is a rather dense ring of electrons, as contrasted with the 4s shell which extends farther from the nucleus, so far that in the solid the shells of neighbouring atoms overlap considerably.

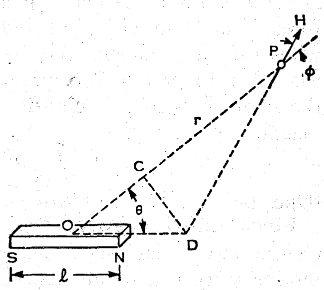

FIG. 71

Field produced at any point P by presence of bar magnet NS depends on distance r and angle θ

The above description of electron distributions in their relation to ferromagnetism is supported beautifully by experiments on the alloying of nickel with copper, zinc and other elements. The substitution of one copper for one nickel atom in the lattice is equivalent to adding one electron to the alloy. This electron seeks the place of lowest energy in the alloy and finds it in the 3d—shell of a nickel atom rather than in the copper atom to which it originally belonged. This lowers the magnetic saturation of the alloy by one Bohr unit, since the added electron in the 3d— shell just neutralizes the moment of one in the 3d+ shell. Addition of more copper to nickel decreases the average moment until the empty spaces in the 3d— shell are just full; this should occur when 60% of the atoms are copper, and then the magnetic saturation at 0° K. should be just zero. The theory is well confirmed by the data (fig. 70). When divalent zinc, having two available electrons per atom, is added to nickel the 3d shell is filled twice as fast as when monovalent copper is added, again in accordance with theory, and metals of higher valences behave accordingly.

14. MEASUREMENT OF MAGNETIC QUANTITIES

BASIC RELATIONS

As a prelude to a discussion of the production and measurement of magnetic fields, and the measurement of magnetization, it is desirable to consider quantitatively the fields and forces excited by currents and magnets. These may be discussed according to the following list:

(1) the fields produced by magnets; (2) the fields produced by currents; (3) the force on a magnet in a field; (4) the force on a current in a field; (5) the electromotive forces produced in coils by changes in induction within them. It is on these relations that most of the measurements of induction and field strength are based.

Field of a Magnet.—Consider a bar magnet NS (fig. 71) of pole strength m and interpolar distance l and therefore magnetic moment $M = lm$. Using the fundamental relation according to which the field strength varies inversely as the square of the distance, d, from a pole,[1]

$$H = m/d^2, \qquad (1)$$

and adding vectorially the fields produced by both poles it may be shown that the field strength at distant r from the centre of the magnet is given by

$$H = (M/r^3)\sqrt{1+3\cos^2\theta}$$

provided r is large compared with l. Here θ is the angle between the axis SN of the magnet and the line OP drawn from its centre to the point, P, at which the field is observed. The direction of the field at this point is defined by φ, the angle it makes with OP prolonged, and is determined by

$$2 \tan \varphi = \tan \theta.$$

A graphical construction based on this relation may be made easily by trisecting OP so that $OC = 2\ CP$, drawing CD at right angles to OP to cut SN produced at D. Then DP is the direction of the field at P. Here, as elsewhere in this article, H is expressed in oersteds, B in gausses, dimensions in centimetres, forces in dynes and currents in amperes.

Important special cases are the end-on position (first Gaussian position) for $\theta = 0$, and the broadside position (second Gaussian) for $\theta = 90°$. For these the fields are respectively

$$H_1 = (2M/r^3)(1 + l^2/2r^2),$$
$$H_2 = (M/r^3)(1 - 3l^2/4r^2).$$

When two magnets are placed very close together end-to-end, with opposite poles m_1 and m_2 separated by a distance, d, small compared with the extent of the surfaces, the two magnets are attracted with a force that may be very strong. For each portion of one of the nearby surfaces the corresponding part of the other has an attraction given by the fundamental relation

$$f = \frac{m_1 m_2}{d^2}.$$

Summing for the effect of all parts of one surface on all parts of the other one can obtain

$$f = AH^2/8\pi$$

proportional to the pole area, A, but independent of the distance between as long as this is small.

Fields Produced by Currents.—The simplest way of producing a magnetic field of known strength and direction is by the use of a long coil or solenoid of wire. The field is parallel to the axis of the coil, and when a current of i amperes flows in the windings (having n turns per cm.) the field strength within the coil is

$$H = 4\pi n i/10. \qquad (2)$$

When many layers of wire are used in a solenoid that is not very long in comparison with its diameter, the field strength varies with the position, and can be calculated with the help of the appropriate formula.[2]

When a field is produced by the current in a long straight wire of radius a, the direction of the field is everywhere at right angles to the wire axis, and at distance x from the axis the field strength is

$$H = \frac{2i}{10x}$$

outside the wire, while inside it the field strength is

$$H = \frac{2ix}{10a^2}$$

To create a relatively uniform field in a large volume Hermann Helmholtz proposed the arrangement of two thin circular

[1]This relation applies exactly when the magnet is surrounded by a vacuum; when the surrounding medium is air a very small modification may be necessary. In general, when surrounded by a medium of permeability μ the law is $H = m/\mu d^2$.

[2]G. C. Foster and A. W. Porter, *Electricity and Magnetism*, 3rd ed., p. 364 (London, 1913).

coaxial coils of diameter $2a$ and axial separation a. At the centre of symmetry, O, the field strength is

$$H = 0.899\, Ni/a.$$

N is the total number of turns of wire in each coil.

Other forms of coils may be used, and the strength and direction of the field calculated by summing the fields due to each current element. The magnitude of the field dH caused by a

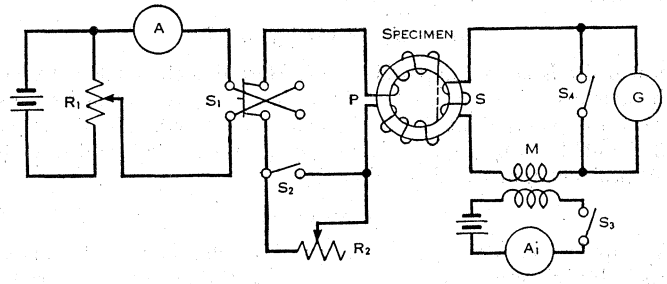

FIG. 72

Diagram of method of measurement of B and H in ring specimen. Current in primary winding P is controlled by resistances R_1 and R_2 and switches S_1 and S_2, and is read on Meter A. Secondary winding S is connected through mutual inductance M to ballistic galvanometer G. A_1 and S_3 are used for calibration

current i flowing in an element of wire dl cm. long, at a point r cm. from the current, is given by the equation

$$dH = (i/10r^2)\ dl\ \sin\theta$$

θ being the angle between the direction of the current and that of the line, r, connecting dl to the point. The direction of the field is at right angles to both the current and r.

Force on Magnet in Field.—The force on a single magnetic pole of strength m in a field of strength H is

$$f = Hm$$

dynes acting parallel to the field. In a uniform field a magnet of moment M' is acted on by a torque tending to turn the magnet upon an axis at right angles to its length and to the field so that it will lie parallel to the field. The magnitude of this torque is

$$L = M'H \sin\alpha$$

where α is the angle between the field and the length of the magnet. If the field is produced at P by a magnet of moment M placed at O (fig. 71), the torque acting on M' is

$$L = MM'\sqrt{1+3\cos^2\theta}(\sin\alpha)/r^3.$$

If a pivoted magnet is suspended in a field it will have a natural period of oscillation equal to

$$T = 2\pi\sqrt{K/MH}$$

seconds, if K is the moment of inertia about its point of suspension. If an additional known moment of inertia, k, is added to that already present, without changing the magnet moment, and this increases the period to T_1, the expression

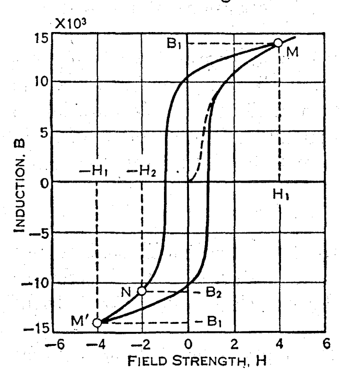

FIG. 73

Hysteresis loop illustrating ballistic method of measurement of B. When field strength is changed from H_1 to $-H_1$, B changes from B_1 to $-B_1$, and galvanometer deflection measures this change in B

$$MH = 4\pi^2k/(T_1^2 - T^2)$$

can be used to determine either H or M provided the other is known.

In a nonuniform field a magnet will experience a translational force as well as a torque, because the force pulling one pole parallel to the field will be opposed by a larger force caused by a larger field acting on the other pole. If the gradient of the field is dH/dx, the force on a magnet of moment M is

$$f = MdH/dx.$$

When the moment is induced by the field and is therefore

$$M = Iv = \kappa Hv,$$

the force acting on the volume, v, is

$$f = \kappa vHdH/dx. \qquad (3)$$

Force on Current in Field.—When a current i flows in an element of wire of length dl in a field of strength H, a force acts on the wire of magnitude

$$f = Hidl(\sin\theta)/10. \qquad (4)$$

Here θ is the angle between dl and H, and the direction of the force is at right angles to both. In two long parallel straight wires carrying currents the field of each acts on the current in the other to produce an attractive force if the currents are in the same direction, a repulsive force if they are antiparallel, of magnitude

$$f = 2ii'/(100a)$$

dynes per cm. length of wire.

Electromotive Force Due to Changing Flux.—When an electric circuit encloses a changing magnetic flux, φ an electromotive force is generated in the circuit, proportional to the time rate of change of flux, $d\varphi/dt$, and to the number of times, N, the circuit threads the flux. Thus if N turns of wire are wrapped around a piece of iron of cross-sectional area A, and a change in the induction, B, is produced in the iron, a voltage is produced at the ends of the wire equal to $10^{-8}\,NA$ times the rate of

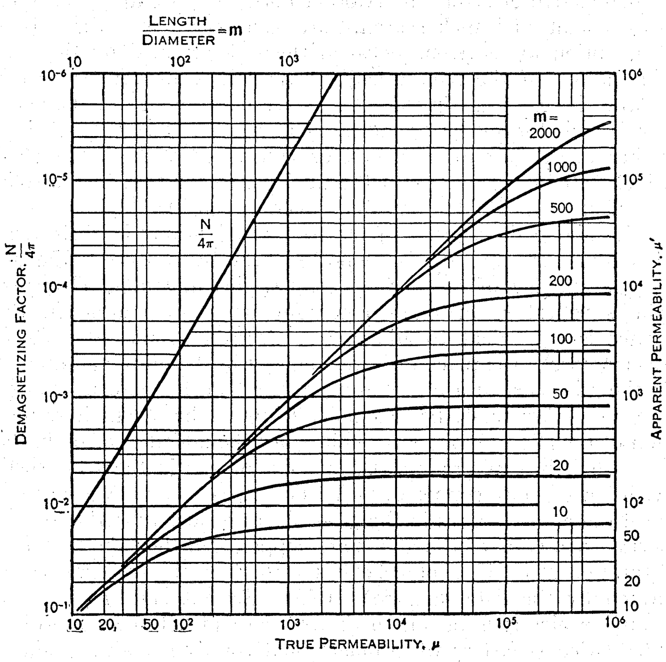

FIG. 74

Chart for converting apparent to true permeability, μ' to μ, of cylinders of given ratio m of length to diameter. Also demagnetizing factors, $N/4\pi$

change of induction in gausses per second:

$$E = 10^{-8}\,NA\,dB/dt.$$

The total change in B that has occurred in a specified time may be evaluated by integrating this equation with the result

$$B = 10^8 \textstyle\int E\,dt/NA. \qquad (5)$$

COMMON METHODS

Ballistic Method with Ring.—In determining magnetization curves and hysteresis loops the ballistic method, employing a ring specimen, is generally the most satisfactory. H. A. Rowland used this method in 1873, and was the first to express the results of measurement in an absolute system. A ring is cut with a radial thickness small compared with its diameter and two windings of wire are applied (fig. 72); a secondary winding (S), usually consisting of many turns of fine wire, is wound close to the specimen and connected to a ballistic galvanometer or fluxmeter (G), and a primary winding (P) of turns evenly spaced

TABLE V.—*Demagnetizing factors, $N/4\pi$, for rods and ellipsoids magnetized parallel to long axis*

Dimensional Ratio (length/diameter)	Rod	Prolate Ellipsoid	Oblate Ellipsoid

50	.00129	.00144	.01472
100	.00036	.000430	.00776
200	.000090	.000125	.00390
500	.000014	.0000236	.001567
1,000	.0000036	.0000066	.000784
2,000	.0000009	.0000019	.000392

is applied and connected to a current source. In the primary circuit means are provided for adjusting the current and for changing it rapidly from one value to another in the same or opposite direction. In the secondary circuit a mutual inductance (M) with an air core is provided for calibration and a switch for short circuiting the galvanometer. The field strength, H, is calculated according to Eq. (2) from the number of turns and the dimensions of the coil and the current indicated by the ammeter (A).

When H is changed suddenly from one value to another the resulting change in B induces a voltage in the coil S and causes a deflection of the galvanometer that is proportional to the change in B, according to Eq. (5) above (the ballistic galvanometer has a deflection proportional to $\int E dt$ provided the voltage impulse occurs in an interval of time short compared with the natural period of oscillation of the galvanometer coil and mirror). Since ballistic measurements always involve differences one must start with a known value of B. The most common procedure for accomplishing this is first to reduce the magnetization to zero, or demagnetize the core, by subjecting it to an alternating field of high strength and gradually reducing the amplitude to zero. To determine a point such as M in fig. 73, current corresponding to H_1 is applied and reversed several times with the galvanometer short-circuited, to establish a steady cyclic state, and then the galvanometer is connected in and the

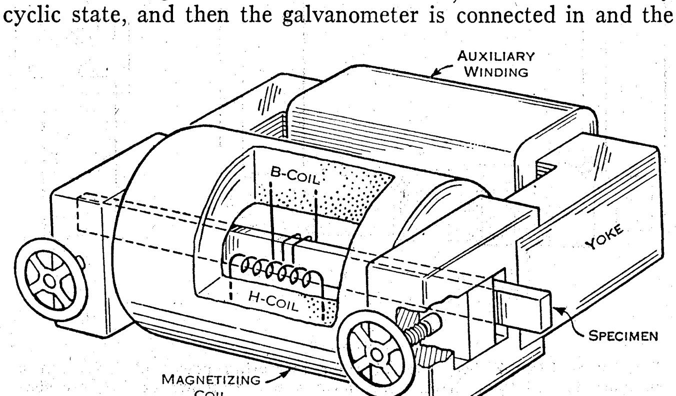

FIG. 75

Simple yoke method of compensating demagnetizing effect of ends of short specimen

deflection for reversal of H_1 noted. This deflection then corresponds to a change in B of $2B_1$, and B_1 can easily be calculated from the constant obtained by calibration. The point M on the normal magnetization curve is thus established and other points on the curve are determined similarly.

To determine a point, N, on a hysteresis loop the field is alternated several times between the points of the loop (*e.g.*, MM'), then H_1 is changed suddenly to $-H_2$ and the deflection noted and the corresponding change in B is subtracted from B_1, already determined, to give the value of $-B_2$ at N. By varying H_2, a sufficient number of points on the whole loop can be obtained.

The ring specimen is not adapted to rapid testing, for some time is consumed in machining the ring and in winding it with wire. However, several methods are available for the rapid application of turns. Stiff wires may be held in fixed positions and arranged so that the ring will slip over many of them at once, the wires being connected together by a plug-and-socket arrangement or with mercury contacts to make a single circuit. Also, toroidal winding machines are made that apply more than 25 turns a second to a closed ring.

Ordinarily the ballistic galvanometer and ring specimen are used for fields of intermediate strength. When the field strength is high, *e.g.*, 1,000 oersteds, the number of turns in the primary winding, or the current through it, must be large and the consequent heat generated interferes with the measurements. If the field strength is too low many turns must be wound on the secondary in order to obtain a sufficiently large galvanometer deflection, and this process is tedious and under some circumstances there may not be enough space available inside the ring. In very low fields A.C. methods should be considered.

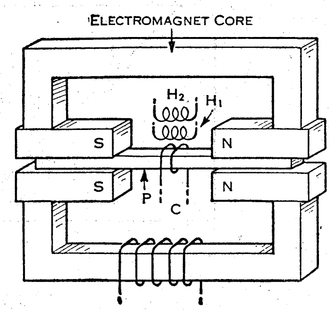

FIG. 76

Permeammeter for measuring B and H in strong fields. Yoke is core of powerful electromagnet having poles NS adjacent to specimen P. Field is measured with similar coils H_1 and H_2, and induction with search coil C

Rod Specimens; Demagnetizing Factors.—The ballistic method may be used with a straight specimen in the form of a rod, this being magnetized with the same procedure as that used for a ring. The specimen may easily be slipped into a long solenoid previously prepared, and the secondary winding or search coil should be placed around a small central portion of the specimen. Under these circumstances the more difficult quantity to determine is the field strength, because the field created by the solenoid will be disturbed by the magnetic poles of the specimen. The field created by the specimen itself is called the demagnetizing field, ΔH, and is proportional to the intensity of magnetization. It is usually specified by the demagnetizing factor, N, which depends on the ratio length/diameter of the rod:

$$\Delta H = NI.$$

The field acting on the middle of the rod is then the resultant of the field in the solenoid, H_0, and the demagnetizing field, ΔH, and (when I is replaced by $(B-H)/4\pi$) is

$$H = H_0 - \frac{N}{4\pi}(B-H).$$

Values of $N/4\pi$ have been determined by a number of experiments and selected values are given in Table V.

The term apparent permeability, μ', is often applied to the ratio B/H_0, and its relation to the (true) permeability, μ, can be derived from the above equation:

$$1/\mu = 1/\mu' - N/4\pi$$

by considering $N/4\pi$ to be negligibly small compared with one. The relation between μ and μ' for rods of various dimensional ratios m = length/diameter is shown graphically[1] in fig. 74. It is apparent that rods having dimensional ratios as large as 1,000 must be used to determine accurately the value of the permeability when it is more than 100,000.

In rods the induction varies from place to place in the bar, decreasing from the middle toward the ends. It is only when the specimen is in the form of an ellipsoid that the induction is uniform throughout. In specimens of such form the demagnetizing

[1] R. M. Bozorth and D. M. Chapin, *Jl. Appl. Physics*, 13:320–6 (1942).

factor may be calculated accurately from the lengths of the three axes of the ellipsoid, and the direction of the induction determined. Equations are given below for the two most useful cases: (1) the prolate ellipsoid having the major axis m times the two equal minor axes, and magnetized parallel to its major axis, and (2) the oblate ellipsoid or ellipsoidal disk having two

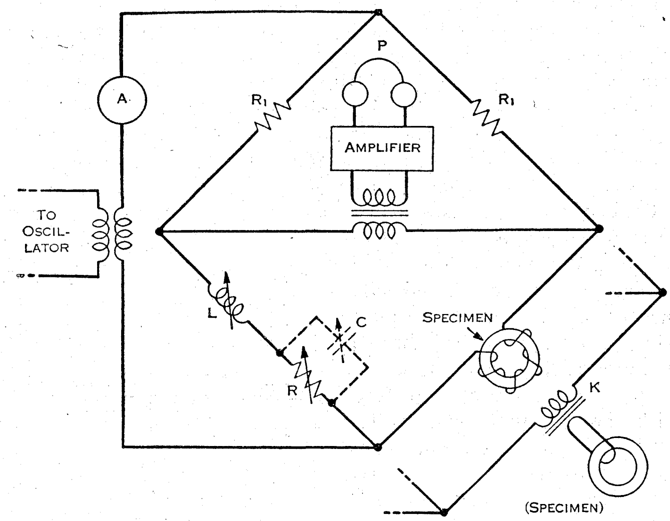

FIG. 77

Inductance bridge for measuring resistance and inductance of winding surrounding specimen. Alternatively, L may be omitted and a variable condenser, C, inserted in parallel with R. Specimen may be connected through transformer K having single turn secondary looped with specimen

long axes each m times the short axis, the specimen being magnetized parallel to a long axis.

$$\text{Prolate:}\quad \frac{N}{4\pi}=\frac{1}{m^2-1}\left[\frac{m}{\sqrt{m^2-1}}\log_e(m+\sqrt{m^2-1})-1\right],$$

$$\text{Oblate:}\quad \frac{N}{4\pi}=\frac{1}{2}\left[\frac{m^2}{(m^2-1)^{3/2}}\arcsin\frac{\sqrt{m^2-1}}{m}-\frac{1}{m^2-1}\right].$$

Values of $N/4\pi$ for various values of m are given in Table V.

Yokes and Permeameters.—When the specimen is in the form of a straight rod or tube or tape the demagnetizing field may be partially or completely annulled by connecting the two ends, outside the magnetizing solenoid, with magnetic material of high permeability and large cross-sectional area. Such a yoke may be used for specimens of high dimensional ratio, and measurements made with considerable accuracy.

More often, in the testing of permanent magnets or commercial materials in the form of bars or strips, it is desirable to use a yoke with a relatively short specimen and in this case the demagnetizing field must be taken into account or annulled in some way. One way[1] that has been satisfactorily used to accomplish both of these things is to measure the field with a ballistic galvanometer connected to a coil ("H-coil") of many turns placed in the magnetizing coil near the middle of the specimen but not surrounding it (fig. 75), and at the same time to magnetize the yoke with the current that passes through the magnetizing coil. The turns through which this current passes are adjusted to overcome the reluctance of the yoke and the air gaps that exist at each end of the specimen no matter how much care is taken to obtain good joints at these points. The search coil used in determining B is wound on the middle of the specimen as usual.

A further step toward increased accuracy was taken in the construction of the Burrows and the Niwa permeameters. These use auxiliary magnetizing and search coils to effect a uniform magnetization of the specimen by compensating for the air gaps that must be present. The induction is determined with a ballistic galvanometer.

Other methods of testing with a yoke have been proposed by F. P. Fahy and by A. Koepsel and these have been used extensively for routine testing of samples of standardized materials of moderate or low permeability. In the Fahy permeameter B and H are determined with the help of coils extending the full length of the specimen and connected to a galvanometer. An auxiliary magnetizing coil is used on the yoke. The Koepsel permeameter has the advantage of being a direct-reading instrument since it requires no galvanometer. To indicate the induction in the specimen a coil of wire is placed on a delicate bearing in an air gap in the yoke, and when a constant current is passed through this coil it deflects in accordance with Eq. (4) by an amount proportional to the field strength in the gap, which in turn depends on the flux in the specimen.

In determining the magnetic properties of materials in high fields, of the order of 300 to 10,000 or more, it is necessary to use some kind of an electromagnet (*q.v.*) to create the field. A modification[1] of the isthmus method used originally by J. A. Ewing and W. Low is shown in fig. 76. The heavy square yokes are wound with many turns of heavy wire, and when energized create a high field in the space between the pole faces, N and S. The specimen P is clamped between the pole pieces as indicated, and is surrounded by a search coil connected to a galvanometer for determining B. The field strength, H, is determined by measuring the change in the air flux in a coil placed near the specimen (H_1), and then in the same coil placed somewhat farther away (H_2). The field in this region varies approximately linearly with the distance from the surface of the specimen and its strength at the surface is obtained by extrapolation from the values H_1 and H_2. By making the core of the electromagnet of laminated material the magnetizing field can be changed quickly enough to make satisfactory ballistic measurements provided the period of the galvanometer is large. In investigations of properties in still higher fields, *e.g.*, 10,000 to 50,000, special methods have been used (*see* below).

Alternating Current Methods.—The principal uses of A.C. testing methods are for determining (1) permeability and energy

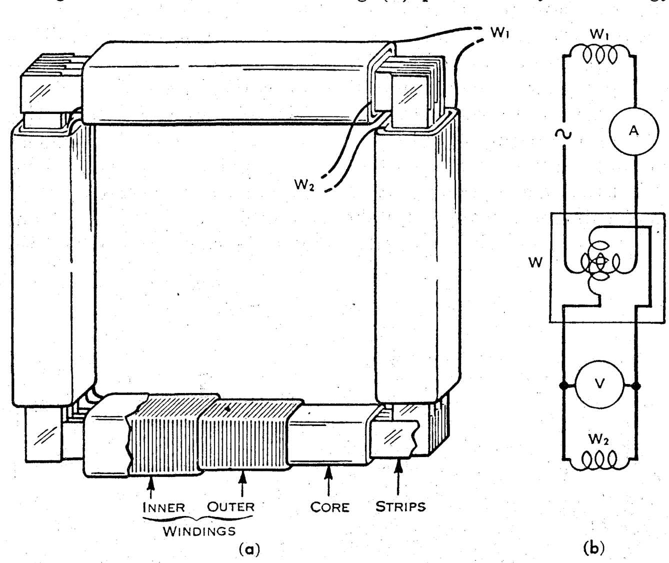

FIG. 78

Epstein, or Lloyd-Fisher, apparatus for measuring power dissipated in a specimen formed from strips. Coils, form wound as shown at (a), are connected as shown at (b) to voltmeter V and wattmeter W. Same coils are also used for ballistic measurements

losses of thin sheet at low inductions, usually not more than a few hundred gausses, using an inductance bridge, and (2) energy losses at high inductions, usually $B=15{,}000$, using the Epstein method.

A diagram of the inductance bridge is shown in fig. 77. Current of the desired frequency, f, is supplied by an oscillator and fed to opposite corners of the bridge through a transformer and a thermal ammeter, A. Two equal fixed resistances R_1 constitute

[1] B. J. Babbitt, *J. Opt. Soc. Am.*, 17:47–48 (1928); C. E. Webb and L. H. Fort, *Jl. Inst. El. Engrs.*, 67:1302–16 (1929).

[1] R. L. Sanford and E.G. Bennett, Bur. of Stand. *J. of Res.*, 10:567–73 (1933), 23:415–25 (1939); A. Neumann, *Zs. Techn. Phys.* 15:473–7 (1934).

two arms of the bridge, and in the others are the specimen, S, and variable inductance L and resistance R. When the bridge is balanced by adjusting L and R until no voltage is detected by the phones P or other instrument connected as shown through a transformer and amplifier, then L and R are equal to the inductance and A.C. resistance of the winding enclosing the specimen. The permeability can be calculated from L and the dimensions of the specimen, the field strength from the current through the core winding, and the energy loss in the specimen from the resistance R, correction being made for the losses in the copper wire. In another common modification of the Maxwell bridge the variable inductance L is removed and a variable condenser is connected in parallel with the variable resistor.

To save the application of many turns of wire to the specimen, necessary when low inductions are measured, G. E. Kelsall has used a device indicated schematically at K in fig. 77. Instead of connecting the windings of a specimen directly to one arm of the bridge, in the usual way, there is substituted a transformer having a many-turn primary and a single-turn secondary. This turn is wound on the specimen also, and the bridge is balanced as before. The core of the transformer is made of high quality laminated material and has low losses which, however, must be taken into account and subtracted from the bridge measurement to obtain the loss in the specimen. This instrument has been adapted for use at high temperatures as well as at ordinary temperatures.

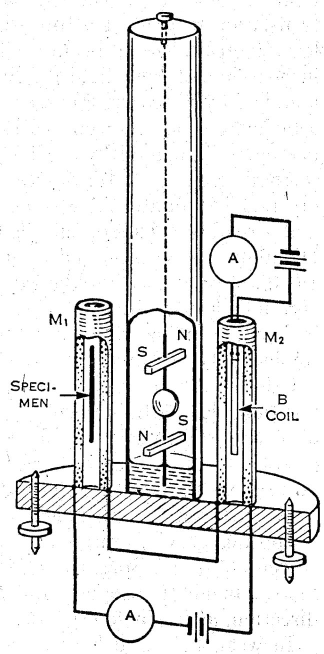

FIG. 79

Magnetometer for small specimen of wire or foil. M_1 and M_2 are similar magnetizing coils. Moment of specimen is balanced by adjusting current through small coil B placed inside of M_2, until suspended needles NS return to original position as indicated by light reflected from mirror (Tobusch-Bozorth)

In interpreting the permeability and energy losses measured by A.C. methods one must consider the apparent reduction of permeability due to skin-effect or shielding caused by eddy currents, and the separable losses attributable to eddy currents and hysteresis. This data obtained with the A.C. bridge are especially important in the study of materials used in communication engineering where small magnetic fields are important in the transmission of weak or undistorted signals.

The Epstein or Lloyd-Fisher apparatus is used primarily for measuring magnetic losses in material for power and other transformers operating at high inductions. The material in the form of strips is built into a hollow square. An alternating field is applied, in one winding, to magnetize it to a high induction measured by the voltage induced in a second winding, and the loss is indicated by a wattmeter connected to the circuits of both windings (fig. 78). Both windings are placed evenly on forms with square sections, and four such forms are placed to form a hollow square. The strips are slipped into the forms and carefully clamped at the corners after being abutted or overlapped there. Standard specifications control the manner of cutting and stacking the specimens, of correcting for the air flux in the coils, and of taking into account the wave form of the exciting current. Measurements are commonly made at $B=15{,}000$ and at a frequency of 60 cycles/sec. in the U.S. and 50 cycles/sec. in England.

In principle a simple method of testing a specimen by A.C. is by determining the current-voltage characteristics of a specimen having two windings, the current being a measure of H and the voltage a measure of B. Several ways have been used for accomplishing this, involving potentiometric measurements or rectification. From the results one can determine not only B and H, but also by taking account of the phase can determine the total energy loss in the material.

SPECIAL METHODS

Methods other than those described may be used advantageously for special investigations.

Measurements of very small quantities of materials, of single crystals in definite directions, of paramagnetic or diamagnetic solids, liquids or gases, all require specific arrangements for obtaining results of high accuracy with a minimum of effort.

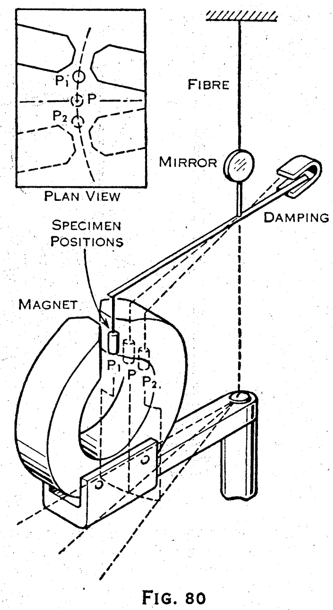

FIG. 80

Curie-Chéveneau balance for dia- and paramagnetic measurements. Specimen is placed on one arm of torsion balance and magnet is rotated in one direction about axis of torsion balance until maximum deflection of balance is recorded, using mirror. Magnet is then rotated in opposite direction and deflection in opposite direction recorded. Sum of two deflections is proportional to susceptibility

Magnetometers.—Years ago the intensity of magnetization of a specimen was usually measured by the torque it exerted on a small magnetic needle of known moment suspended nearby. The deflection of a light beam by a mirror attached to the delicate suspended system is still a very sensitive indicator of the state of magnetization of a specimen under investigation, but for most purposes the uncertainty in the positions of the magnetic poles of the specimen makes the magnetometer an instrument of low precision.

In principle the magnetometer measures field strength at a known distance from the poles of the specimen, in accordance with Eq. 1, $H=m/d^2$. It has been used recently for measuring with not too great accuracy, the magnetic properties of very small specimens in the form of fine wires or thin films deposited by evaporation or electrodeposition. In the arrangement proposed by H. Tobusch and modified by others (fig. 79), two oppositely directed needles of equal moment are placed one above the other on the same suspension, and the specimen made with a length about equal to the distance between the needles and placed parallel to the suspension. In this arrangement one pole of the specimen produces a twist on the nearest needle and the other pole a twist in the same sense on the other needle. The resultant twist is neutralized by a small solenoid (B-coil) place opposite the specimen and energized with a current that is proportional to the magnetization of the specimen. In this way films as thin as 10^{-5} cm., weighing considerably less than a milligram, have been investigated in fields of various strengths and at different temperatures.

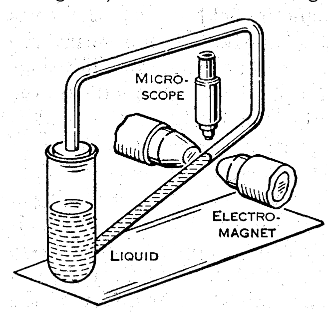

FIG. 81

Susceptibility of liquid is determined by noting (with microscope) the displacement of its meniscus in a capillary tube when the field of an electromagnet is applied in direction at right angles to tube (L. Gouy, G. Quincke)

Para- and Diamagnetic Materials.—Measurements of weakly magnetic substances usually depend on the translational force exerted on a magnetized body in a nonuniform magnetic field. Faraday suspended the material to be measured between the poles of an electromagnet, displaced from the central position so that the field gradient was large, and used a torsion balance to measure the force pulling the material toward the stronger part of the field or repelling it therefrom. This method was developed by P. Curie and used in his classical researches on the effect of temperature on paramagnetic and diamagnetic materials.

When the field-gradient is dH/dx, the force on material of magnetic moment M is MdH/dx dynes, and when expressed in terms of susceptibility and volume (Eq. 3) the force is

$$f = \kappa v H dH/dx.$$

The force is zero at the central position between the poles of the magnet because here dH/dx is zero, and the force is a maxi-

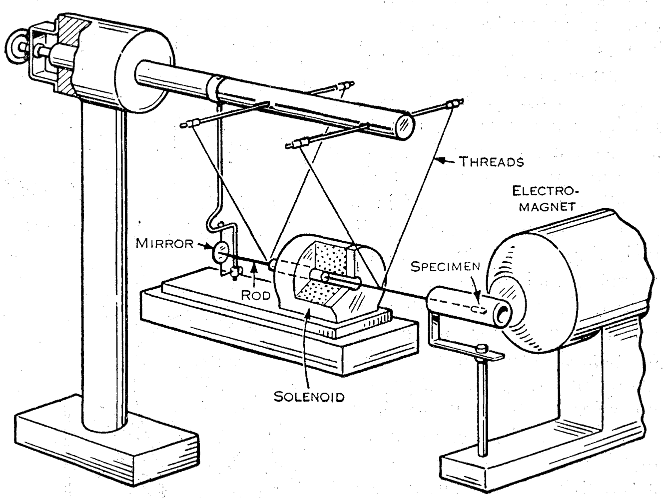

FIG. 82

Pendulum magnetometer has specimen on light frame hung from threads. Inhomogeneous field of electromagnet (half of which is shown) causes horizontal motion of frame, detected by tilting of mirror. Motion is compensated by magnetic plunger in solenoid, current through which is measure of magnetization of specimen (P. Weiss and G. Foëx)

mum at some point as shown by P_1 in fig. 80 and falls off again toward zero at points distant from the magnet.

To avoid the laborious mapping of the field to determine the product HdH/dx, and the careful setting of the sample at a given position, C. Chéveneau proposed that the magnet be moved until the sample deviates a maximum amount from its zero position P (fig. 80), against the restoring force of the torsion balance shown in the upper part of the figure. The deflection is then proportional to the susceptibility and to the maximum value of HdH/dx, and the proportionality factor is determined by calibration with a substance of known susceptibility.

Various refinements of these methods have been suggested. In one the torsion is measured electrically by the current in a solenoid that reacts with the field of a permanent magnet to produce a torque on the suspending fibre. P. Théodoridès has used a translational instead of a torsional balance, following the method of P. Weiss and G. Foëx described below. An ingenious quick-reading device has been described by W. Sucksmith.

Liquids and Gases.—The force exerted upon a magnetic material in an inhomogeneous magnetic field is also the basis of the methods of L. Gouy and G. Quincke for measuring the susceptibilities of liquids. There are numerous modifications of the original methods and adaptation has been made to the measurement of gases. The force on the liquid in the field is measured by its rise in a capillary tube, against the force of gravity. A simple modification is shown diagrammatically in fig. 81 which shows the poles of an electromagnet producing a high field at the surface of the liquid, the movement of which is measured by a microscope when the field is applied or removed. In using the method for gases a standard liquid of known susceptibility is employed and the gas fills the remainder of the tube. The force on the gas, caused by the field, adds vectorially to that on the liquid and the displacement of the meniscus is a measure of the resultant.

The force on a column of liquid (or gas) extending from a place where the field is H_1 to where it is H_0 may be obtained by integration of Eq. 3 to give

$$F = \kappa A (H_1^2 - H_0^2)/2$$

A being the cross-sectional area of the column. If a column of liquid (susceptibility κ_1) is opposed by a column of gas (susceptibility κ_2), the relation becomes

$$F = (\kappa_1 - \kappa_2) A (H_1^2 - H_0^2)/2.$$

Usually H_1 is the field strength directly between the poles of the magnet at the boundary between liquid and gas, and H_0 at the other end of the column is negligibly small. The susceptibility of gases has also been measured with the aid of a sensitive torsion balance.

Other Special Measurements.—The measurement of the saturation induction of ferromagnetic materials has been made with great accuracy by P. Weiss and his students in fields up to 20,000 oersteds, at temperatures ranging from about -250 to $+800°$ C. For this purpose they have used some modification of the scheme shown in fig. 82, in which the force is produced by a field gradient as in the Faraday method, but is measured as a translation instead of a torsion. Such a pendulum magnetometer has a light horizontal beam with the specimen mounted at one end in a region of high field gradient. The force due to the field is annulled by adjusting a current in a solenoid in which is a plunger attached to the other end of the beam, and the point of zero deflection is indicated by a tilting mirror. In a refinement of this method, used by L. W. McKeehan, the specimen (*e.g.*, of a single crystal) is mounted in a strong uniform field, easily measurable, and a readily calculable gradient is applied by means of two thin Helmholtz coils mounted near each other with fields opposing. In this way one avoids the mapping of the field, and also the uncertainty in the direction of the field and the rotational hysteresis in the specimen, difficulties likely to be encountered when a torsion balance is used.

Other methods of measurement in strong fields deserve brief mention. H. DuBois measured the intensity of magnetization by observing the rotation of the polarization of light reflecting from a magnetized surface (Kerr effect). The strength of a field can be measured by noting the change in the electrical resistance of a bismuth wire immersed in the field or by observing the force (opposing gravity) produced on a conductor carrying a known current (Eq. 4). Special methods have been devised for measuring the magnetic properties of materials in which these vary with direction, as in single crystals.

In weak fields, such as that of the earth, the methods of geomagnetism can be used (*see* TERRESTRIAL MAGNETISM). In 1936 an apparatus was constructed[1] for measuring and recording rapid changes in fields as small as one gamma (10^{-5} oersted), and during World War II this method was developed to even higher sensitivity. A piece of high permeability material is subjected to an alternating field of moderate amplitude, and if an additional steady field (that to be measured) is also present an alternating voltage of twice the exciting frequency will be produced and can be amplified and recorded. Its amplitude is proportional to the field strength to be determined.

A number of curve tracers have been made for taking magnetization curves and hysteresis loops so that a permanent accurate record may be obtained in a short time. Among the more accurate and convenient of these are the devices of F. E. Haworth, W. Thal and P. P. Cioffi. For the investigation of magnetic properties at high frequencies special techniques of some complexity must be used. (*See* also ELECTRICITY; ELECTROMAGNET; TERRESTRIAL MAGNETISM.)

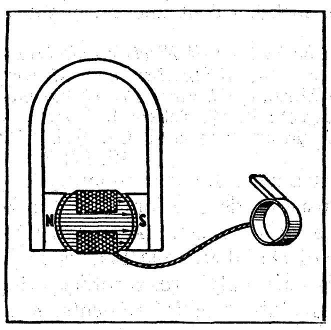
MAGNETITE or **MAGNETIC IRON-ORE,** a member of the spinel group of minerals with the formula, $Fe_2O_3.FeO$, corresponding to 72.4 per cent. of iron, hence its value as an iron-ore product. It is a black, opaque mineral with metallic lustre. Hardness about 6. Sp. g., 4.9 to 5.2. Streak, black. It is strongly magnetic and polar and has been known from very early times for this remarkable property which was described by Pliny. It crystallizes in the cubic system, in which it occurs usually in octahedra, and is frequently twinned. There is no distinct cleavage.

Magnetite is a mineral of wide distribution, especially as a constituent of igneous rocks, both intrusive and volcanic. It appears to have crystallized from the magma at an early period of consolidation, and marginal segregation has led in many cases to the formation of important ore-deposits (*see* NATURAL RESOURCES). Being a mineral not prone to decomposition, it is also found in detrital deposits, sometimes in a concentrated form, as *magnetite-sand*. The existence of pseudomorphs of magnetite after haematite (*q.v.*) and vice versa, however, prove that these minerals may be converted into one another by a change in the state of oxidation. Oxidation and hydration in the zone of weathering lead to limonite (*q.v.*). *Titaniferous magnetite* or *titano-magnetite* is a variety containing titanium. It consists of an intergrowth in various proportions of the minerals magnetite and ilmenite (*q.v.*).

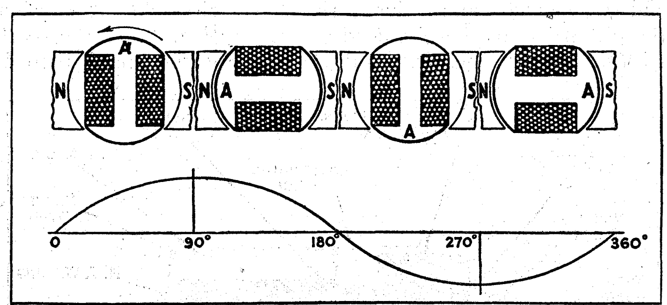
MAGNETO, HIGH-TENSION. The magneto is a special application of the electric generator employed where the output of energy required is very small. It is used to furnish energy for ignition of compressed gases in various types of internal combustion engines. The elements of construction comprise a permanent magnetic field, an armature, rotated within that field, a circuit breaker and a distributing mechanism which serves to convey the generated voltage to a desired point. The *low-tension* magneto consists merely of a permanent magnet, of inverted U form, and, rotating between its poles, a shuttle-wound armature containing a number of turns of comparatively coarse wire, as shown in fig. 1. The changes of flux in the armature core, due to its rotation in the permanent field, generate in the armature winding an electro-motive force, the magnitude of which is proportional to the field strength, the speed of rotation, and the number of turns of wire on the armature. As the armature core rotates into a position in a plane with the flux lines, the flux in the core increases to a maximum. As the rotation progresses, the flux in the core decreases until one-half cycle is completed. In the second half cycle, the coil direction is reversed with relation to the flux.



BY COURTESY OF J. H. CROWNE
FIG. 1.—SIMPLE MAGNETO SHOWING MAGNET PRIMARY WINDING

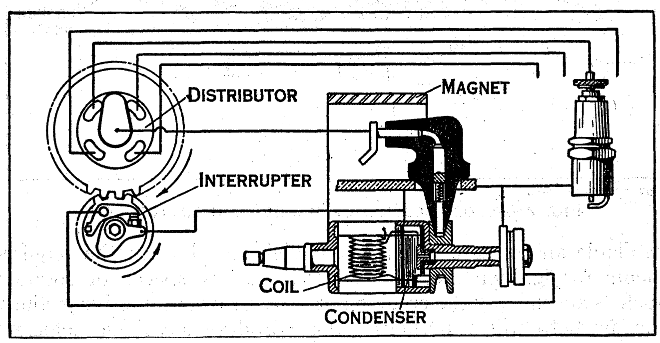
The generated electro-motive force, consequently, is alternating in direction and magnitude, and follows the variation of flux in the core. The change of electro-motive force with change of position of the armature is shown in fig. 2. The low-tension magneto has been used in conjunction with an induction coil as an ignition source, the coil serving to transform the voltage to a value sufficient to cause a spark across the terminals of a spark plug.

High-tension Magneto Construction.—The high-tension magneto has a secondary winding, comprising a great many turns of fine wire, superimposed upon the primary winding. The primary winding is short-circuited by means of an auxiliary device, during the building up of the field in the armature core. When the energy in the primary circuit has reached a maximum, this circuit is opened, and at the same instant, due to the rotation of the armature, the magnetic field is removed. The energy of the primary winding is discharged through the secondary, and due to the ratio of primary to secondary turns, a considerable increase in voltage is effected. This value may vary between 7,500 and 18,000 volts. The high-tension magneto when employed as a source of ignition for gas engines is operated synchronously with the engine by direct connection.



BY COURTESY OF J. H. CROWNE
FIG. 2.—SIMPLE ELECTRIC WAVE FORMED IN A MAGNETO, SHOWING POSITION OF THE ARMATURE AND THE CURRENT PHASE FOR EACH POSITION

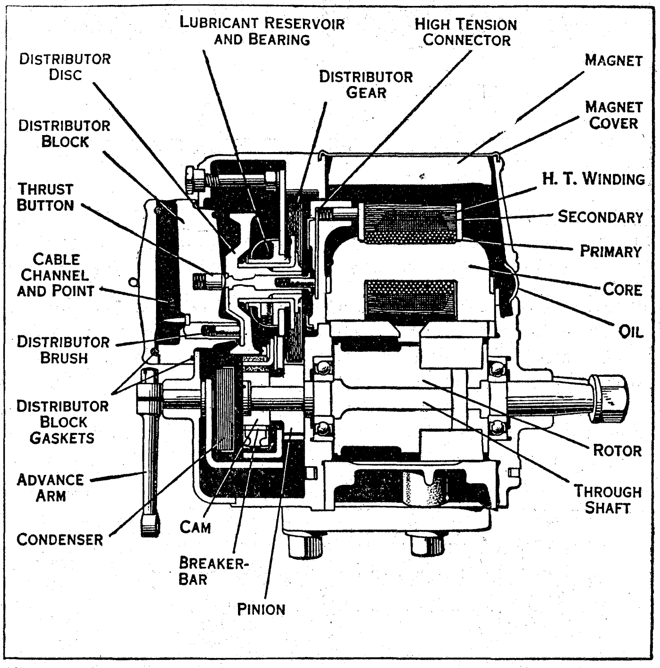
Fig. 3 shows the construction of a shuttle-armature type of high-tension magneto. The circuit breaker is operated by means of a cam, upon which the bumper or cam follower on the breaker bar, bears. Since the armature is directly connected to the engine, the frequency of the discharges through the secondary circuit is thus determined. (A shuttle-armature, having two poles, can generate two spark discharges per revolution.) The distributor serves to convey the voltage to each of the spark plug cables, in a desired sequence. Operating in synchronism with the armature, from which it is driven by means of a gear and pinion, the brush or firing pin of the distributor arm makes contact with a segment in the distributor block each time the secondary discharge occurs. By this means, the high-tension energy is carried to each spark plug in order. For a four cylinder engine, the distributor block carries four segments, and since the shuttle-armature generates two sparks per revolution, the gear ratio between armature and distributor is 2:1. The primary and secondary windings are common at one point and are there connected to the frame of the magneto. The return circuit of the secondary is thus completed through the body of the engine. The contact points of the circuit breaker, or interrupter, are made of an arc-resistant alloy.



BY COURTESY OF J. H. CROWNE
FIG. 3.—UNIT COIL FOR GASOLINE MOTOR IGNITION SYSTEM

A recent improvement in magneto design is offered in the inductor type instrument in which the coil is stationary and the flux changes are brought about by means of magnetic shunt segments which rotate between the magnet poles and bridge between them and the coil core. A cross-sectional drawing of this type is shown in fig. 4. By the use of four rotor segments, spaced 90° apart, four sparks per revolution may be generated. In addition, the flux direction through the coil core is reversed each quarter revolution. The direction of current through the contact points of the interrupter is thus alternated, and the excessive point pitting, due to a unidirectional arc is eliminated.

In order to vary the time of occurrence of the spark in the engine cylinder, the magneto cam, or the circuit breaker, is made rotatable through part of a revolution, and is connected, by means of a linkage, to a convenient advance-retard lever. This makes it possible to alter the relationship between the engine crank shaft and the magneto, and to ignite the charge either before or after the piston has reached its dead centre position. Since the spark intensity of a magneto varies directly with engine speed, there is



BY COURTESY OF J. H. CROWNE

FIG. 4.—CROSS SECTION OF MAGNETO, INDUCTOR TYPE

available an increase of energy at high speed when the requirements for ignition are most severe. At low speeds of rotation such as accompany the cranking or starting of automotive engines, the magneto will sometimes fail to produce a voltage sufficient to spark across the gap. There have been in use various impulse devices, such as "impulse couplings," which serve to couple the magneto to the engine and to accelerate its rotation in starting.

The magneto is employed on aircraft engines, where the highest engine efficiency must be maintained; on tractor engines, motorcycles, marine engines, and to a great extent on motorbuses and motor trucks. Stationary engines are also magneto-equipped. Minor commercial uses are found in the igniting of blasting charges (detonators), in igniters, for oil or gas burners; and, in conjunction with neon lamps, as stroboscopic indicating instruments. The total world production of magnetos for all uses, in the year 1927, was in excess of 525,000. (*See* also INDUCTION COIL and MOTOR CAR.) (I. H. C.)

MAGNETOCHEMISTRY. Iron is strongly attracted by a magnet; the iron is said to be ferromagnetic. There are few ferromagnetic materials, but all other substances experience either a weak attraction or a very weak repulsion by a magnet. Substances thus weakly attracted to a magnet are said to be paramagnetic, those repelled are diamagnetic. The measure of the attraction or repulsion is called the magnetic susceptibility. Magnetochemistry is the application of magnetic susceptibilities, and of closely related quantities, to the solution of chemical problems.

There are four major applications of magnetism to chemistry. These are (1) testing for traces of certain kinds of impurities in various substances; (2) the study of free radicals; (3) examination of inorganic solids with a view to finding their structures; and (4) the study of complex compounds. These four applications will be described more fully in the following paragraphs.

Magnetic susceptibility balances may be made very sensitive for the detection of paramagnetic impurities in diamagnetic substances, and especially so for ferromagnetic impurities. Three examples will be cited. The sand used for making glass must often be as free as possible from iron. Use of the magnetic balance will often detect a very small trace of such impurity and the measurements may be made in such a routine fashion as to be simpler and cheaper than any other method of detection. Similarly, traces of iron or of other ferromagnetic substances may be detected in metals such as magnesium. A third analytical application is in measuring the concentration of oxygen in mixtures of gases. The magnetic method is a convenient analytical tool for a variety of chemical and metallurgical operations.

The second use of magnetic measurements is in the study of free radicals. These substances, of which triphenylmethyl is an example, are of very considerable theoretical interest to chemists. Most chemical substances have an even number of electrons, and are diamagnetic, but free radicals have an odd number of electrons, and are paramagnetic. Magnetic susceptibility measurements may be used to establish the presence of free radicals, to estimate their amount, and to follow the chemical changes which they undergo, all in a very satisfactory manner.

A field of much interest and promise is the application of magnetic methods to the study of inorganic solids, particularly those solids of interest in catalysis. The possibility of relationships between catalytic activity on the one hand and magnetic properties on the other has interested many workers. It cannot be denied that those chemical elements, such as chromium and nickel, which show the most pronounced catalytic activity are the elements which show the most interesting magnetic effects. This is not to say that all catalytic activity is due to magnetism, but rather that catalysis and magnetism may, in some cases at least, have some common underlying basis. In a few cases it is possible to predict whether or not a substance will show catalytic activity, solely on the basis of magnetic measurements. Superactive catalysts, and catalysts showing undesirable side effects, may not infrequently be identified through use of the magnetic method.

The final application which will be mentioned is to complicated compounds, of which haemoglobin will serve as an example. Haemoglobin is the red matter in blood. It serves in the blood as the carrier of oxygen. Haemoglobin is composed in part of a complex compound containing iron. This substance is paramagnetic. When haemoglobin takes up oxygen, as it does in passing through the lung tissues, it becomes diamagnetic. From this change it is possible to draw conclusions concerning the spatial arrangement of the various atoms which make up the molecule of haemoglobin. Conclusions may also be drawn as to the mode of linkage between the haemoglobin and the oxygen. Similar studies have been made on a very wide range of complex compounds containing iron, nickel, cobalt and many other elements. *See* MAGNETISM; CATALYSIS.

Mathur, *Physical Principles and Applications of Magnetochemistry* (1935); P. W. Selwood, *Magnetochemistry* (1943); P. W. Selwood, "Magnetism and Catalysis" in *Chemical Reviews* (1946). (P. W. S.)

MAGNETOGRAPH, an instrument for continuously recording the magnetic elements, usually declination (D), horizontal force (H) and vertical force (V), but sometimes two rectangular force components in place of D and H. (*See* TERRESTRIAL MAGNETISM.) In each case variations only are recorded, the absolute values being determined by absolute instruments, *e.g.*, the unifilar magnetometer and the inclinometer.

Declination.—A suspended magnet carries a mirror, immediately below which is a second fixed mirror. Light passing through a vertical slit falls on the mirrors. After reflection the light passes through a plano-cylindrical lens with axis horizontal, and falls on a sheet of photographic paper, wrapped round a drum, which is rotated uniformly about a horizontal axis by clockwork. The two images due to the mirrors appear as dots of light on the paper. The light from the fixed mirror answers to a fixed direction, that from the magnet mirror to a direction which alters with the pointing of the magnet. The distance apart of the dots thus shows the changing inclination of the two mirrors, and so the changes of D. When the sheet is taken off and developed, we have a straight (base) line from the fixed mirror, and a curved line from the magnet mirror. The variations in the length of the ordinate measure the variations of declination.

Horizontal Force.—The suspension of the H magnet may be bifilar or unifilar, in the latter event a quartz fibre or fine metal wire. The suspension depends from a "torsion head" resting on the top of the suspension tube. By turning the torsion head the magnet is brought to be perpendicular to the magnetic meridian. A magnet of moment M inclined to the meridian at an angle θ experiences a magnetic couple $MH\sin\theta$ urging it towards the meridian; the change in the couple for a small change $d\theta$ in θ is $MH\cos\theta d\theta$. Thus when the magnet is perpendicular to the meridian the couple is MH and is insensitive to small changes in θ. Balancing this is the torsional couple $\tau\ (d-\theta)$. where τ and d are constants. If H increases, the magnet turns in the direction diminishing θ, and small changes in the angle are proportional to the changes in H. There is a magnet mirror and a fixed mirror, as for D, and similar optical arrangements. As before, the change in ordinate is proportional to the change in angle between the two mirrors and so to the change in H. Owing to the secular change of the magnetic meridian the instrument requires readjustment from time to time.

Vertical Force.—In what is often called the "Lloyd balance" the V magnet is mounted on a knife-edge in the Kew and Watson patterns, but on a frame standing on fine points in the Eschenhagen instrument. In either case it can turn freely about a horizontal axis, at right angles to its length. The magnet is balanced so as to be horizontal, the final adjustment being made with a horizontal screw. The magnetic moment being M, the couple VM is balanced by a gravitational couple, the centre of gravity being slightly on the opposite side of the knife edge from the dipping end of the magnet. Supposing V to alter, the magnet tilts one way or the other according as V increases or diminishes. The tilt shows itself by a change in the distance between two dots of light, one due to light reflected from a mirror carried by the magnet, the other to light reflected from a fixed mirror closely adjacent. In this case the axis of the drum carrying the photographic paper is naturally vertical. But in the Eschenhagen pattern the vertical motion of the dot of light is converted into horizontal motion by means of a reflecting prism. This enables a single drum with horizontal axis, carrying a single sheet of paper, to record the D, H and V traces, in addition to the trace of a thermograph. In another type of V instrument, first devised by W. Watson, the magnet is carried by a stretched wire or quartz fibre, the torsion in which opposes tilting caused by changes in V.

Temperature Effects.—All except D magnetographs suffer from temperature effects. A rise of temperature causes a fall in M, and so has the same effect on MH, for example, as a fall in H. There is a consequent decline in the H ordinate and similarly with V. Temperature again alters the torsion in a unifilar H suspension, and the position of the centre of gravity in the V magnet. There are various compensation devices, *e.g.*, in the case of V a horizontal zinc rod whose excess of expansion over steel helps to neutralize changes in M by changes in the centre of gravity. In the Eschenhagen pattern changes produced in an auxiliary field due to auxiliary magnets neutralize the direct effects of temperature on the principal magnet system. Compensation is usually imperfect, and corrections to the curve ordinate are calculated with the aid of a continuous thermograph record. The ideal thing is the use of a constant temperature room.

Scale Values.—The *time scale* is usually 15 mm. per hour, but is 20 mm. in the Eschenhagen pattern. There is usually provision for a time break every hour or second hour, enabling the time of a magnetic change to be fixed to perhaps the nearest half-minute. There is often provision for a "quick run," the drum being rotated at 12 times the usual speed.

Deflection Scale.—In the case of D, when torsion is negligible, as is usual in the Kew pattern, the scale value is invariable, depending only on the optical distance between the magnet mirror and the paper; the usual value is about 1′ per 1 mm. *i.e.*, 1 minute (1′) per 1 millimetre (1 mm.). When torsion is not negligible, its effect must be found by observing the change in the D ordinate produced by turning the torsion head through a given angle, and a corresponding correction must be applied to the scale value calculated from the optical measurements.

In the case of H, when the suspension is bifilar, the scale value can be altered by altering the distance apart of the two arms of the suspension. Similarly in the case of V the height of the centre of gravity, and so the sensitiveness, can be altered by means of a vertical screw. In these cases a pre-arranged scale value can be secured and maintained. Auxiliary magnets are sometimes used, the scale values altering with their position. Regular redeterminations of scale value are necessary in all force magnetographs. At some stations the magnet is at the centre of a large coil. A measured electric current produces a known change of magnetic field, and the scale value is calculated from the change of curve ordinate. In other cases an auxiliary magnet of known moment is used to deflect the H and V magnets. In Broun's method a knowledge of the moment of the deflecting magnet is unnecessary. The D magnet is deflected as well as the H and V magnets, the distance between the deflecting and deflected magnets and their relative positions being the same. The scale values are inversely as the changes of ordinate, the deflecting forces being the same, and the D scale value (in terms of force) can be calculated using an approximate value of H. Broun's method really assumes the D, H and V magnets closely alike, as in the Kew pattern, or else the deflection distances large.

The force equivalent of 1 in D is H x.000291, and so is .00005 C.G.S. (or 5 γ) when H equals 0.172, a value met with in northern England. In the absence of reasons to the contrary it is natural to aim at equal sensitiveness in D, H and V. Thus in England scale values per 1 mm., of 1′ in D and 5 γ in H and V are consistent especially as natural changes in H and in D (in terms of force) are very similar. But in India, where H may exceed 0.39 and D is a very quiet element, 0.5′ per 1 mm. would be more suitable. In high latitudes 2′ or even 5′ per 1 mm. may be desirable. In fact a D magnetograph is then so troublesome that it may be better to measure the changes of force in and perpendicular to the geographical meridian. For some purposes open scale magnetographs, say 1 γ or 2 γ per 1 mm., have advantages, but there is great risk of loss of trace at disturbed times. This risk can be reduced by the attachment to the magnet of two mirrors inclined at a small angle. This double mirror arrangement is usually carried by one at least of the Eschenhagen magnets. Eschenhagen also made use of a mirror inclined to the horizon, to give a supplementary trace of much lower sensitiveness. In really big magnetic storms a multi-mirror Eschenhagen magnetograph sheet may have a great mix up of traces. It is simpler, if funds permit, to run two magnetographs, one of high, the other of low sensitiveness.

Base Values.—Observations with the absolute instruments, e.g., the unifilar magnetometer, give the absolute values of the elements. The corresponding curve ordinates are measured, and their angular or force equivalents calculated from the known scale values. Subtracting the ordinate equivalent from the result of the absolute observation we have the base line value.

Use of Coils.—A wholly different way of measuring magnetic changes from that described above is the use of a coil in a circuit including a galvanometer, a continuous record being obtained of the current. The current gives the rate of change of the magnetic field normal to the coil. For complete registration three rectangular coils would be needed. A horizontal coil was installed at Parc St. Maur in 1892 by T. Moureaux and was in use for some time, and a large number of records have been obtained by A. Crichton Mitchell from a horizontal coil at Eskdalemuir. This method seems specially fitted for the study of short rapid changes of magnetic force.

(C. Chr.)

MAGNETOMETER, in its most general sense an instrument used to measure the intensity of any magnetic field, but often used in the restricted sense adopted in this article of an instrument for measuring the horizontal component, H, of the earth's magnetic field. The earth's magnetic elements which are usually measured directly (*see* Terrestrial Magnetism) are declination, horizontal force and inclination. For the last named, *see* Inclinometer; the two other elements, D and H, are usually measured with the same instrument, the unifilar magnetometer.

Measurement of Declination, D.—Two operations are involved, the determination of (a) the geographical meridian and (b) the magnetic meridian, the angle between the two being D. For the former operation at an observatory, use is made of a distant mark, the bearing of which has been accurately determined once for all; but in field work the geographical meridian is deduced from an observation of the pole star, or from a transit observation of the sun or ordinary star. In the case of the Kew pattern unifilar shown in fig. 1, when a distant horizontal mark is available the mirror N is removed, and the distant mark is sighted through the small glass windows of the magnet box A, which must be truly plane parallel. When a transit observation is necessary, the mirror N must be carefully adjusted. The axis about which it rotates should be parallel to the surface of the mirror, *i.e.*, horizontal, and perpendicular to the line of collimation of the telescope. When adjusting the mirror the magnet box A is replaced by a long hollow tube to prevent stray light falling on the object glass of the telescope B. The mirror having been adjusted, the time of transit of, say, the sun across the vertical wire of the

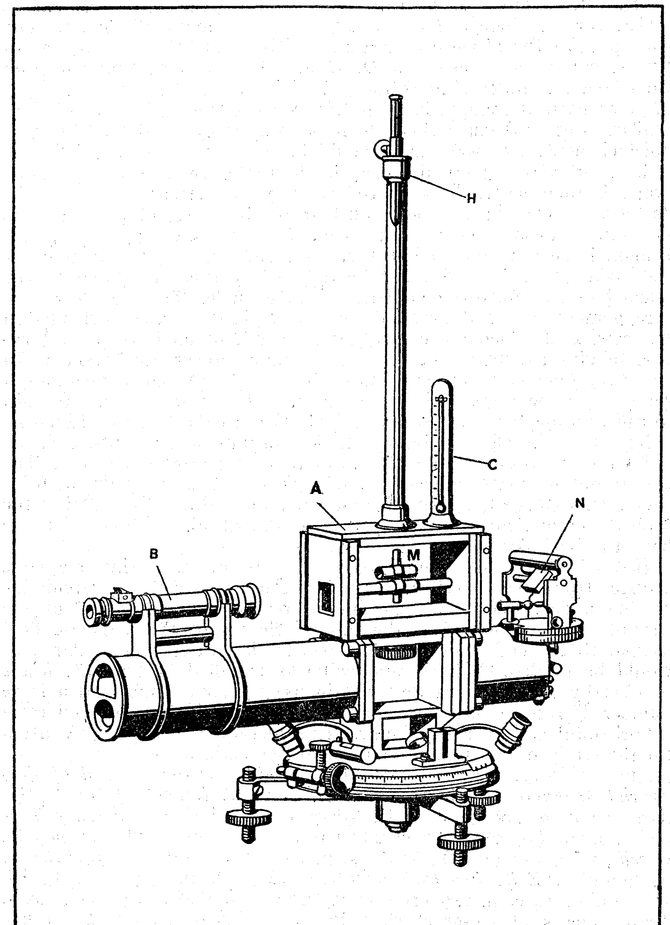

FIG. 1.—UNIFILAR MAGNETOMETER, ARRANGED TO INDICATE DECLINATION

telescope is determined with the aid of a chronometer. The sun's azimuth can be calculated if the latitude and longitude of the place are known. Thus the readings of the verniers on the azimuth circle made when the transit was observed enable us to deduce the reading which corresponds to the geographical meridian. Before determining the magnetic meridian, the torsion must be taken out of the suspension, usually a long thread of unspun silk, with the aid of a brass plummet. The collimator magnet, shown suspended in fig. 1 is a hollow steel cylinder, about 10 cms. long and 1 cm. in diameter, fitted with a lens in the end nearest the telescope and a scale in the other end. The scale is at the principal focus of the lens, and so can be sighted by B when focused on a distant object. The scale is illuminated by light reflected from the mirror N. During an observation the sides of the box A are closed by shutters, to protect the magnet from draughts. The upper end of the magnet's silk suspension is carried by a brass rod, which can be raised or lowered by a screw. The rod passes tightly through and can be clamped in the torsion head H, seen at the top of the suspension tube in fig 1. The magnet having been brought to a level suitable for invision, and the position of the mirror N adjusted for good illumination, the instrument is rotated about its vertical axis until the central vertical division on the scale appears to coincide with the vertical cross wire of the telescope. The two verniers on the azimuth circle having been read, the magnet is inverted, *i.e.,* turned 180° round its horizontal axis, and the setting is repeated. A second independent setting is generally made with the magnet inverted, and then another setting with the magnet in its original position. The mean of all the vernier readings is taken as corresponding to the magnetic meridian. The difference between this and the reading corresponding to the geographic meridian is the desired declination. The object of inverting the magnet is to eliminate error due to non-coincidence of the magnetic and optical axes. The magnet shown suspended in fig. 1 is intended only for H observations. To fit it for D observations it should have another shank. The most usual arrangement is to employ a single double-shanked magnet, of the type M in fig 1, which serves for both the D and the H observations. The short horizontal tube seen in fig. 1 above the magnet is the holder of the inertia bar, used in the special experiments for determining the moment of inertia of the magnet.

Measurement of Horizontal Force, H.—Two operations are involved. We first determine the time of vibration of the collimator magnet. This enables us to calculate $M\ H$, where M is the magnetic moment of the magnet. We then use the same collimator magnet to deflect an auxiliary magnet, and from the observed deflection angle we can calculate M/H. Combining the two results, we obtain H and M as well. For the vibration observation the magnet is suspended as in fig. 1, the shutters being attached. The time of vibration, deduced from several groups each of 100 vibrations, is obtained from transits of the collimator magnet, taken to 0.1 second by means of a chronometer, using the eye and ear method. The temperature is observed with the thermometer C before and after taking the vibrations. The magnetic couple is aided during the vibrations by a small torsion couple from the suspension, which necessitates the determination of a torsion coefficient by observing the effect of a torsion of 180° or 360° on the pointing of the magnet.

In the deflection experiment the magnetometer is arranged as shown in fig. 2. The collimator magnet K on a carriage L, which slides on the deflection bar D, deflects a smaller auxiliary suspended magnet. This carries a mirror, the normal to which is in the same vertical plane as the axis of the magnet. The auxiliary magnet is raised or lowered until its axis is level with that of K. Wooden panels which slide in vertical grooves are then inserted to protect it from draughts. When the unifilar has been turned until the deflection bar and the collimator K are approximately perpendicular to the magnetic axis of the auxiliary magnet, a reflection of the ivory scale B from the mirror becomes visible in the telescope A, suitably focussed. The position is further altered by a slow-motion screw until the centre of the scale coincides with the vertical wire in A, and the verniers are then read. The difference between this reading and that obtained when the magnet K is turned end for end is double the deflection angle θ produced by K at that particular distance r. The value of M/H is obtained from the equation $M/H=\frac{1}{2}\, r^3 \sin\theta\, (1+Pr^{-2}+Qr^{-4})^{-1}$ where P and Q are the two so-called "distribution constants." In reality

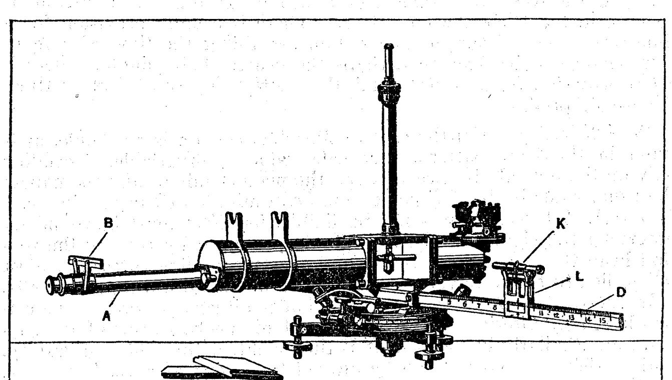

FIG. 2.—UNIFILAR MAGNETOMETER, ARRANGED TO SHOW DEFLECTION

deflections are taken with K at equal distances from the deflected magnet on the two arms of the bar. Also the arm opposite to that carrying the magnet carries a thermometer in a symmetrical position to K, which is read immediately before or after reading the verniers. With the thermometer is a counterpoise, the counterpoise and thermometer together equalling in weight the magnet and its carriage. The elimination of P and Q and the final calculation of M/H really involve the taking of deflections at three distances, *e.g.*, 25, 30 and 40 cms. In practice P and Q are derived from the mean of a large number of observations. Theoretically it is possible to make either P or Q zero by suitably choosing the relative dimensions of the deflecting and deflected magnets. For example, assuming the two magnets exactly similar in every way, Q should vanish when the length of the deflected magnet is 0.467 times that of the deflecting magnet. If Q is zero, or even very small, and the deflection distances are large, deflection at two distances suffices. In an old magnet carefully handled M changes very slowly. When pressed for time the best course may be to omit the vibration experiment, and assume a value obtained for M by interpolation from previous and later complete observations.

Corrections.—A number of corrections are necessary, *e.g.*, for temperature, temporary induction and even for the bending of the deflection bar. The practical use of the instrument postulates the determination of various constants and the calculation of several tables. The most important "constant"—which may be expected to change in the process of time—is the moment of inertia of the collimator magnet.

Variations of Pattern.—Silk suspension, though supplying a satisfactorily small torsion, is affected by mixture and somewhat uncertain, and use is sometimes made of a fine metal suspension. The method described above of taking solar transits assumes a very accurate knowledge of time. Less accuracy suffices if one can measure the altitude of the transiting sun or star. To accomplish this some patterns, *e.g.*, Cooke's India pattern designed by Capt. Denholm Fraser, replace B in fig. 1 by a transit telescope with vertical scale, while the department of terrestrial magnetism of the Carnegie institution, Washington, uses a combined magnetometer and theodolite. The magnet K when unprotected, as shown in fig. 2, and remote from the thermometer, has a somewhat uncertain temperature, especially in field work. In the India pattern it is enclosed along with a thermometer in a wooden box, which has a stud in its base which fits in one of several holes bored in the upper surface of the deflection bar; this calls for a large compensating weight. A single telescope, in this pattern, serves both for vibrations and deflections. The scale is in the telescope, the collimator magnet having the scale replaced by a cross. The auxiliary magnet used in the deflection experiment carries parallel to itself a hollow aluminum tube, fitted like the collimator magnet with a lens and a cross. When the auxiliary magnet is level with the deflecting collimator magnet the aluminum tube is at the height suitable for sighting by the telescope. The latest form of German magnetometer with an auxiliary arrangement for determining the "distribution constants" P and Q, has been described by R. Bock.

Other Instruments.—For less exact measurements of D use may be made of compasses of the ordinary or more complicated types. Explorers having to travel light sometimes calculate H from observations of total force F with a dip circle. (*See* INCLINOMETER.) We have $H=F\cos I$ where I is the angle of dip. A portable instrument in which measurements of the departure in the value of H from the value at a base station was measured through the varying torsion of a quartz suspension was devised in 1915 by G. W. Walker. A number of instruments suitable, like Walker's instrument, for the minute survey of small areas have been enumerated recently by L. Palazzo.

Coil Magnetometers.—H can be derived by comparisons with an artificial magnetic field produced by a measured current in a carefully constructed coil. W. Watson in 1902 constructed an experimental instrument of this kind with which he obtained results of high accuracy. Of late years coil magnetometers of various kinds have been designed in different countries, *e.g.*, by F. E. Smith in England, S. J. Barnett in the United States and N. Watanabe in Japan. Observations with these instruments occupy a very short time, and if sufficient pains be taken with the coil measurements and the auxiliary electrical outfit, a higher order of accuracy should be obtainable than with the unifilar. Until, however, international comparisons have been made some uncertainty must prevail on this point.

For taking observations at sea the instrument is naturally carried in gimbals. For measurements of D alone compasses of various kinds are available. An instrument consisting fundamentally of a compass but having an auxiliary magnet was designed by L. A. Bauer to measure H as well as D. The sea-deflector, as it is called, has the auxiliary magnet with its axis at right angles to the magnetic axis of the compass, the centres of the two magnet systems being a fixed distance apart in the same vertical. Using a Lloyd-Creak dip circle (*see* INCLINOMETER) H can be calculated, as on land, from an observation of total force.

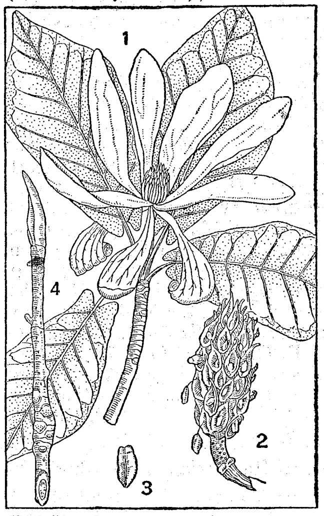
(C. CHR.)

MAGNIFICAT, the *Canticum beatae Mariae Virginis*, the song of praise of Mary in the house of Zacharias, with which she answered the greeting of Elizabeth—"Magnificat anima meum Dominum." It constitutes the most important canticle of the vesper service in the Roman Catholic church and of the evening office in the Anglican church. Besides having been set to plain song melodies in all the eight church modes, it has received countless settings by later composers.

MAGNITUDE of a star is the measure of its brightness adopted in astronomy. The higher the number expressing the magnitude the fainter the star. A step of 1 magnitude corresponds to a decrease in light intensity in the ratio 2.512, so that 5 magnitudes correspond to a decrease in the ratio 100 : 1. The absolute magnitude of a star is the apparent magnitude it would have if placed at a standard distance of 10 parsecs or about 33 light-years. The bolometric magnitude is an analogous measure of the heat-intensity of a star (*see* PHOTOMETRY: *Celestial;* STAR).

MAGNOLIA, a town in southwestern Arkansas, U.S.A., and the seat of Columbia county. It is situated about 150 mi. southwest of Little Rock and 50 mi. southeast of Texarkana at the junction of U.S. highways 79 and 82. It is served by the Louisiana and Northwest railroad. The altitude is 207 ft. The population was 2,158 in 1920; 3,008 in 1930; and 4,326 by the federal census of 1940. In 1940, 2,940 of the population were native white and 1,378 were Negro. The town was settled about 1840. The surrounding region produces valuable timber, farm produce, oil, cotton and cottonseed products and gas. Cotton ginning, marketing and a textile mill were the principal commercial activities until 1938 when the development of an oil field brought an additional source of income. The textile mill is one of the few plants in the region producing high quality broadcloth. The state-supported agricultural and mechanical college located in the town was established in 1910 as a vocational school and high school. Junior college courses were added in 1925. A general hospital was established in 1939, under city management. The town has a weekly and a daily newspaper with circulations of 2,154 and 1,979 respectively.

MAGNOLIA, the typical genus of the botanical family Magnoliaceae, named after Pierre Magnol (1638–1715). It contains about 35 species, distributed in Japan, China and the Himalayas and in North and Central America. Magnolias are trees or shrubs with deciduous or rarely evergreen foliage. They bear conspicuous, and often large fragrant white, rose or purple flowers. The sepals are three in number, the petals six to twelve, in two to four series of three in each, the stamens and carpels being numerous. The conelike fruit consists of a number of carpels which are borne on a more or less conical receptacle and dehisce along the outer edge to allow the scarlet or brown seeds to escape; the seeds, however, remain suspended by a long slender thread (the funicle). Of the old world species, the earliest in cultivation appears to have been *Magnolia denudata*, of China, of which the buds were preserved as well as used medicinally and to season rice; together with the closely related banana shrub (*Michelia fuscata*), it was transported to Europe in 1789 and thence to North America and is now cultivated in the middle states. There are many fine hybrid magnolias, among the best being *Magnolia soulangeana*, white tinted with purple, and the variety *M. soulangeana lennei.*



FROM HARRAR, "GUIDE TO SOUTHERN TREES" (MCGRAW-HILL BOOK COMPANY, INC.)
MOUNTAIN MAGNOLIA. 1. LEAVES AND FRUIT. 2. OPEN FRUIT. 3. SEED. 4.TWIG

Of the Japanese magnolias, *M. kobus* and the purple-flowered *M. obovata* were introduced into England in 1709 and 1804 respectively. *M. pumila,* the dwarf magnolia from the mountains of Amboyna, nearly evergreen and bearing deliciously scented flowers, was introduced in 1786. The Indian species are three in number, *M. globosa,* allied to *M. conspicua* of Japan, *M. sphenocarpa,* and the most magnificent of all magnolias, *M. campbellii,* which forms a conspicuous feature in the scenery and vegetation of Darjeeling. It is a large forest tree, abounding on the outer ranges of Sikkim, 80 to 150 ft. high and from 6 to 12 ft. in girth. The flowers are 6 to 10 in. across, appearing before the leaves, and vary from white to a deep rose colour.

The first of the American species brought to Europe (in 1688 by John Banister) was the sweet bay, *M. virginiana,* a beautiful deciduous or half-evergreen species about 15 ft. high with obtuse leathery leaves, blue-green above, silvery underneath, and globular, very fragrant flowers, creamy white or pale yellow in age. It is found in low situations near the sea from Massachusetts to Louisiana—more especially in New Jersey and the Carolinas. *M. acuminata,* the cucumber magnolia or cucumber tree, from the resemblance of the young fruits to small cucumbers, ranges from western New York and southern Ontario to Missouri and southward to North Carolina and Arkansas. The wood is yellow and is used for bowls; the flowers, 3 to 4 in. across, are glaucous green tinted with yellow. It was introduced into England from Virginia about 1736. A yellow-flowered variety of the cucumber tree (*M. acuminata cordata*), native to restricted areas in the southeastern states, was known only in cultivation for more than 100 years previous to its rediscovery in Georgia in 1913. It ranges in size from a large shrub to a fine tree 40 ft. or more high; it bears heart-shaped leaves, woolly beneath, and yellow flowers lined with purple. *M. tripetala* is known as the "umbrella tree," because the arrangement of the leaves at the ends of the branches resembles somewhat that of the ribs of an umbrella. The flowers, 5 to 8 in. across, are white and have a strong but not disagreeable scent. It was brought to England in 1752. *M. fraseri,* the mountain magnolia, discovered by John Bartram in 1773, is a native of the western parts of the Carolinas and Georgia, extending through northern Alabama to Louisiana to western Florida and southern Alabama. It grows 30 to 50 ft. high, has leaves a foot or more long, heart-shaped and bluntly auricled at the base, and fragrant pale yellowish-white flowers, 3 to 4 in. across.

The most beautiful species of North America is *M. grandiflora,* the bull bay, usually called evergreen or laurel magnolia in the U.S. It is native chiefly near the coast from North Carolina to Florida and westward to Arkansas and Texas. It was introduced into England in 1734. It grows a straight trunk, 2 ft. in diameter and upwards of 70 ft. high, bearing a profusion of large, powerfully lemon-scented creamy-white flowers. It is an evergreen tree, easily recognized by its glossy green oval oblong leaves with a rusty-brown under surface. The large-leaved magnolia, *M. macrophylla,* is a handsome deciduous tree, with smooth whitish bark and very large oblong leaves, 1 ft. to 3 ft. long and 8 in. to 10 in. broad. The sweet-scented, bell-shaped flowers, when open 8 in. to 10 in. across, are white with a purple blotch at the base of the petals. It occurs in the southern Allegheny mountains.

(*See* TULIPTREE.)

For a description of the principal species under cultivation *see* L. H. Bailey, *Standard Cyclopedia of Horticulture* (1943) and *Manual of Cultivated Plants* (1924). *See* also J. G. Millais, *Magnolias* (1926); A. Rehder, *Manual of Cultivated Trees and Shrubs* (2nd ed., 1939). (N. TR.)
