With the morning of Dec. 7, at 4:37 A.M. word came through that the Japanese ambassadors in Washington had asked for an interview with the secretary of state at 1 P.M. This was a clear indication that war was at hand. The message took some time to decode. It was not in the hands of the chief of naval operations till about 10:30. It was delivered at the war department between 9 a d 10 A.M. General Marshall. the chief of staff, was out horseback riding and did not see the dispatch till arriving at his office about 11:15 A.M. The chief of naval operations, Admiral Stark, even then, did not think that the communication called for any additional instructions to Kimmel. However, General Marshall did decide to send a new warning, and gave orders to the military command to communicate also with the navy. He did not telephone, fearing that his words might be intercepted. He sent his dispatch by telegram. There was a mix-up in communication, and the warning did not reach Hawaii till after the attack had begun. It is important to note that it had not been filed until noon, only an hour before the Japanese planes moved in on the great base.

At Pearl Harbor itself, there were incidents that, properly interpreted, might have given a brief warning. Four hours before the decisive moment a Japanese submarine was sighted by the destroyer U.S.S. "Ward". No report was made. About two and a half hours later, the commander of the U.S.S. "Ward" sent a message saying that he "had attacked, fired upon and dropped depth charges upon submarine operating in defensive sea area." While Admiral Kimmel waited for "confirmation!' of this report, the Japanese opened hostilities. In these same morning hours, an army private, practising on the radar set after its normal closing time: noticed a large flight of planes on the screen. When he telephoned his lieutenant, he was told to forget it, for a flight of B-17s from the United States was expected at that time. Once again, an opportunity was missed.

It was at 7:55 A.M. that the first dive bomber from the Japanese aircraft carrier arrived over Pearl Harbor. It was followed by a massive group of nearly 200 aircraft, including torpedo planes, bombers and fighters. Within a quarter of an hour the various airfields at the base were subjected to savage attack. At Wheeler field, in particular, where General Short had drawn up his planes, the destruction was fearful. Of the 126 planes on the ground, 42 were totally destroyed, 41 were damaged, and only 43 were left fit for service. Only six U.S. planes got into the air to repel the attackers on this first assault. At the same time a massive movement was directed against Admiral Kimmel's fleet, so conveniently moored at the base. The battleship U.S.S. "Arizona" blew up with a tremendous explosion. 'The U.S.S. "West Virginia" was riddled with bombs and torpedoes, and settled on an even keel on the bottom of the harbour. The old U.S.S. "Oklahoma," hit by four torpedoes within five minutes, rolled completely over, with her bottom and propeller rising ,above the waters of the harbour. The old target ship U.S.S. "Utah" was sunk. Hardly a vessel in the squadron escaped damage. The antiaircraft on the various vessels were fairly prompt in getting into action; the army fired away with what it had; but the force of the attack was in no serious way blunted.

At 8:50 A.M. the second wave of the attack began. Less successful than the first, it none the less succeeded in inflicting heavy damage. The battleship U.S.S. "Nevada" was hit by seven or eight bombs and was grounded at the head of the channel. The battleship U.S.S. "Pennsylvania" was hit and the two destroyers moored near her reduced to wrecks. The destroyer U.S.S. "Shaw" was split in two by a great expiosion. Shortly after 9 A.M. the Japanese withdrew.

No one could doubt that the Japanese had gained a great success. They had inflicted on the U.S. navy casualties to the number of 2,718, of which over 2,000 were fatalities. Army casualties exceeded 600 men, of whom more than 200 were killed. The attack had resulted in the total destruction of three battleships, in the capsizing of a fourth, in heavy damage to a fifth, and in lighter damage to three others. Two light cruisers were heavily damaged, and a third suffered less severe hurt. Three destroyers were put out of action, a repair ship badly punished, and a minelayer sunk. Heavy damage was inflicted on both army and navy planes on the ground. To accomplish these results the Japanese had sacrificed less than 100 men, 29 planes and five midget submarines. Their task force escaped without being attacked.

There was, however, one consoling feature to the tragedy. As a result of the dispositions made by Admiral Kimmel, two aircraft carriers were not in the harbour; they mere engaged in reinforcing other stations. notably Midway and Wake islands. In connection with this same operation, seven heavy cruisers and a division of destroyers were at sea. Of cardinal importance was the absence of the carriers. They were the only two vessels of this type in the area, and were to play a highly important role in future battles. The great disaster at Pearl Harbor led to numerous investigations. Almost immediately after the assault, the president appointed a commission headed by Justice Owen J. Roberts of the supreme court to examine the facts and to fix responsibility for the disaster. At a later date both army and navy boards reviewed the problem. In 1946 a full-scale congressional investigation took place. Probably no episode in U.S. military history has been so thoroughly examined, and on none has a wider divergence of opinion been expressed.

The most extreme view of the disaster is not to be found in any of the numerous investigations, but was disseminated long after the tragedy by Rear Adm. Robert A. Theobald of the U.S. navy in *The Final Secret* of *Pearl Harbor*. This view is that President Roosevelt "by unrelenting diplomatic pressure" "enticed" Japan "to initiate hostilities with a surprise attack by holding the Pacific fleet in Hawaiian waters as an invitation to that attack." Such a position is not taken by any responsible historian. It involves judgments as to motives which simply cannot he substantiated.

The president did indeed pursue a policy of support to Nationalist China which acted as a substantial irritant to the Tokyo government. and did much to provoke it to action. But at the same time there is substantial evidence that he sought to postpone a clash, rather than to incite one, and even in the closing days of the negotiations he made an appeal to the Japanese emperor, which if listened to, might have had that effect.

The success of the attack on Pearl Harbor was primarily due to a false estimate of the enemy's capabilities and intentions. The authorities in Washington knew that the Japanese forces were moving southward into the Gulf of Siam. They did not believe that coincident with this move they could or would mount an attack on the Hawaiian base. It seemed logical, too, that the Japanese would avoid such action because it would inevitably bring the United States into the war; operations in the far east directed against the British and the Dutch might not have this effect. True: the possibility of an air attack on Pearl Harbor had been frequently discussed in the course of the year. But, as matters came to a crisis, for the reasons mentioned above, it fell into the background.

It is a difficult matter (and one on which divergent opinions will long be held) to apportion responsibility between Washington and the commanders on the spot. The Roberts commission, the

body appointed by the president on Dec. 17, 1941, in a report presented only a few neeks later, placed the principal blame for the disaster upon Admiral Kimmel and General Short. The army and navy commissions which later examined the problem took a contrary view, throwing the blame on the war and navy departments. The majority report of a congressional committee, rendered in 1946, while not avoiding criticism of the chief of naval operations and the army chief of staff, laid stress on the lack of preparation in Hawaii. Two members of this committee strongly dissented, severely blaming the authorities in Washington, and a third took a kind of middle ground.

Those who defend the position of the Hawaiian commanders make the following points. General Short replied to Marshall's warning of Nov. 27, "Department alerted to prevent sabotage." When this reply passed over the chief of staff's desk, he neglected to notice that it mentioned only this one kind of preparation (as did Gen. Leonard T. Gerow, his subordinate). At no time in the next ten days was this neglect repaired. As for Admiral Kimmel, the point has been made that he was inadequately informed as to the seriousness of the crisis. In the months before Pearl Harbor the armed services, through the breaking of the Japanese code, were able to get much information as to Japanese purposes. Not a small part of this related to the position of the naval forces in Hawaii. Kimmel himself has claimed that had he been put in possession of this material he would have taken far stronger measures than he actually did. In defense of his failure to undertake more vigorous measures of reconnaissance, he urged the importance of his training program, and the limited nature of his resources.

The critics of Washington also asserted that by the evening of Dec. 6 the president had clear evidence that war was impending, and that he should have taken prompt measures to alert the war and navy departments. This view attached little importance to the warnings of Nov. 27.

Those who were critical of the commanders on the spot took the view that the warnings given were sufficient, and that a deplorable lack of imagination was shown in acting on them. Everyone who read the papers knew that war was imminent. Why was not the possibility of an air attack taken into account? Why were Short's airplanes drawn up in such fashion as to be most exposed to enemy attack? Why was the radar training program not more advanced? Why did Admiral Kimmel so handle his schedule that the Japanese could count on all the battleships being in port on Sunday? Why were normal week-end leaves and liberties granted? Why was not some attempt made to improve reconnaissance? Why was not the report on the Japanese submarine taken more seriously? Those uho emphasize the responsibility of Kimmel and Short also call attention to the fact that the war warnings of Nov. 27 brought much more vigorous action on the part of the commanders in the Canal Zone and the Philippines.

Whatever judgment may be rendered on this matter, more important than the question of responsibility is the question of the historical significance of Pearl Harbor. And here the verdict is easier to come at. Great as was the Japanese success in the short run, great as was the humiliation inflicted on the United States, the "sneak attack," in the longer perspective, was a monstrous error on the part of the government in Tokyo. Even from the tactical point of view it was a blunder. For in their purpose of destroying the fleet, the Japanese neglected the great oil supplies on Hawaii, the destruction of which would have immobilized the United States for months to come. But, more important, the Japanese attack brought the U.S. government into the war, unified the American people, and made the ultimate defeat of the Japanese militarists inevitable. There was much antiwar sentiment in the United States in the fall of 1941. Had the Japanese commanders directed their attention against the British and Dutch, it must have been at least doubtful whether President Roosevelt could have led the American people into the war in the Pacific. As in so many other instances in the history of the 20th century, in spite of the weaknesses of the democracies, the autocratic states made errors even more vital than the errors of the democracies. Pearl Harbor was atoned for in four and a half years of war; but the blunders of the Tokyo militarists resulted in utter and total defeat. This is the most memorable fact of all with regard to the "sneak attack" of Dec. 7, 1941.

BIBLIOGRAPHY.—The most voluminous source of material on the Pearl Harbor attack is the hearings of the Joint Committee on the Investigation of the Pearl Harbor Attack, 79th Cong., 1st. Sess. (39 vols.) followed by the report of the committee itself, 79th Cong. 2nd. Sess. Doc. 244. There are to be found the report of the Roberts Commission, the Army Pearl Harbor Board, the Naval Court of Inquiry, and the Hewett Inquiry,. ivith masses of testimony as to the attack itself. Of secondary materials the following may be mentioned. Walter Millis, *This is Pearl! the United States and Japan, 1941* (1947); Walter Lord, *Day of Infamy* (1957); Rear Admiral Robert .4. Theobald, *The Final Secret of Pearl Harbor* (1944); Admiral Husband E. Kimmel, *Admiral Kimmel's Story* (1955); George E. Morgenstern, *Pearl Harbor: The Story of the Secret War* (1947); Charles A. Beard, *President Roosevelt and the Coming of the War, 1941* (1948). An admirable brief analysis is to be found in Samuel Eliot Morison, *The Rising Sun in the Pacific* in vol. 3 of his History of United States Naval Operations in World War II (1948); and in Mark S. Watson, *Chief of Staff: Prewar Plans and Preparations,* pp. 494–520 (1950). The three volumes by Theobald. Kimmel and Morgenstern are distinctly polemical, and should be used with caution. Charles A. Beard's account is also slanted, but contains much material of great interest on the various hearings.

(D. Ps.)

PEARL RIVER, a river of the southeastern United States, rises in east-central blississippi, near Louisville, and flows southwest, south, and then slightly southeast to the head of its delta, south of Bogalusa, La. From there the East Pearl river continues southward for 34 mi, and passes into Mississippi sound near Grand Island. West Pearl river parallels East Pearl in the delta, several miles to the west, and enters the Rigolets, a tidal channel connecting Lake Pontchartrain with Lake Borgne. The two mouths of the Pearl are interconnected by a maze of channels.

The Pearl is approximately 490 mi. long and has a drainage basin of about 7,600 sq.mi. Chief tributaries are the Yokahockany and Strong rivers and the Bogue Chitto. Three locks on the West Pearl, completed in 1953, provide a 7-ft. channel from the mouth to Bogalusa. 58 mi. upstream. Navigation on the East Pearl and on the Pearl above Bogalusa is no longer important. Until the early 20th century. however, the river below Jackson, Miss., was a main route for transporting lumber. Columbia. Monticello and Jackson, Miss., and Bogalusa. La., are the chief river cities. Jackson obtains its domestic water supply from the Pearl. In 1958, the Mississippi legislature approved the issuing of revenue bonds for a 21-mi.-long reservoir north of Jackson, to provide water, flood and pollution control and recreational facilities for the Pearl river valley.

The lower course of the Pearl, and the East Pearl, form the boundary between Mississippi and Louisiana. Prior to 1812, when Louisiana was granted statehood, the Pearl was the eastern boundary of the province of A'est Florida. Honey Island swamp lies in the mid-delta area of the Pearl River valley, southwest of Picayune, Miss. This heavily forested swamp, criss-crossed by a maze of channels, is noted for its wildlife and fishing. (M. W. M.)

PEARSE, PATRICK HENRY (1879–1916), Irish leader and poet, was born in Dublin on Nov. 10, 1879. Educated at the Christian brothers schools and the Royal University of Ireland, he became editor of the *Claidheamh Soluis,* the weekly organ of the Gaelic league. He was secretary to the publication committee of the league and an energetic member of its executive. After touring Belgium to study bilingual methods, he published several *Fiana,* tales from Irish manuscripts. Pearse's chief interest was education and he approved Augustine Birrell's Irish Education bill, as it gave the Irish control over their own education. He founded St. Enda's school at Cullensmood, Dublin, moving it in 1910 to the Hermitage, Rathfarnham. After a tour in America, Pearse joined the Irish Volunteer movement and was commander in chief of the Irish forces in the rebellion of 1916. On April 30, 1916, he sent out an order to his troops to surrender. He himself was arrested and executed on May 3, 1916.

See his *Life* by Desmond Ryan (1919).

PEARSON, KARL (1857–1936), British mathematician, one of the founders of modern statistics, was born in London, March 27, 1357, and educated at University college school, London, and Kings college, Cambridge. He practised law from 1881–

84, when he received an appointment as professor of applied mathematics and mechanics at University college, London. There he taught until his retirement in 1933, becoming lecturer in geometry (1891), head of the department of applied mathematics (1907) and professor of eugenics (1911). Pearson was the founder and editor (1902–36) of the statistical journal *Biometrika,* editor of *The Annals of Eugenics* (1925–36) and director of the Biometric and Francis Galton Eugenics laboratories.

Pearson's early lectures, published as *The Grammar of Science* (1892), became one of the classics in the philosophy of science. Beginning in 1890 his interests began to shift to the application of statistics to biological problems of heredity and evolution; his greatest contribution was the methodology he developed for the handling of certain types of problems in the biological and social sciences. From 1893–1912 he wrote a series of 18 papers entitled *Mathematical Contributions to the Theory of Evolution,* which contained much of his most valuable work, including the chi-squared test of statistical significance. *See* PROBABILITY AND STATISTICAL THEORY: *Statistical Tests.* He died on April 27, 1936, in London.

Among his other works were *The Ethic of Free Thought* (1888); *The Chances of Death and Other Studies in Evolution* (1897); *The Life, Letters and Labours of Francis Galton* (1914, 1930); *Tables for Statisticians and Biometricians* (19'14, 1931); *Tables of the Incomplete Gamma Function* (1922); *Tables of the Incomplete Beta Function* (1934).

PEARSON, LESTER BOWLES (1897–), Canadian statesman, won the Nobel prize for peace in 1957. He was born at Toronto, Ont., on April 23, 1897. Educated in the public schools of Peterborough and Hamilton, he served in World War I in the Royal Flying corps. Invalided home, he entered the University of Toronto (B.A., 1919) and earned B.A. and M.A. degrees at Oxford university (1923, 1925). He was a lecturer (1924–26) and assistant professor (1926–28) of history at the University of Toronto before becoming a first secretary in Canada's newly formed department of external affairs. After a series of diplomatic posts and service on loan as secretary to two royal commissions. he became secretary (later counsellor) of the Canadian high commissioner's office in London. Canada's ambassador to the United States, 194.5–46, and undersecretary of state for external affairs, 1946–48, he was often spokesman for Canada at the United Nations. He served in 1947 as chairman of the political committee of the UK general assembly. In 1947 he was instrumental in securing UN passage of the Palestine partition resolution.

He entered politics in 1948, becoming secretary of state for external affairs in the Liberal government of Louis St. Laurent and member of parliament for Algoma East. Re-elected three times! he became a private member of the house of commons in opposition when his party was defeated in June 1957. He was awarded the Nobel prize for his efforts at resolving the 1956 Suez crisis. In 1958 Pearson succeeded St. Laurent as leader of the Liberal party. (W. D. A. O'H.)

PEARY, ROBERT EDWIN (1856–1920), **U.S.** arctic explorer who reached the north pole in 1909, was born at Cresson, Pa., on May 6, 1856. He graduated at Bowdoin college, Brunswick, Me., then joined the civil-engineering branch of the U.S. navy and took part in the survey of the Nicaragua canal route from 1885 to 1887. In 1886, with one companion, he journeyed inland from Disko bay over the Greenland ice sheet for about 100 mi., reaching 7,500 ft. above sea level. He returned in 1891 with seven companions, including his wife and F. A. Cook. After wintering in Hvalsund he sledged for 1,200 mi. to the northeast of Greenland, discovering Independence fjord and evidence of the insularity of Greenland. The "Arctic Highlanders," an isolated tribe of Eskimo, were befriended and studied; they were of the greatest assistance to Peary 'on later expeditions. He returned to Hvalsund in 1893 with a larger party, and sledging journeys were made to northeast Greenland again in 1894. Summer trips in 1896 and 1897 were mainly occupied in transporting three masses of meteoric iron irom Greenland to the United States. In 1898 he announced his intention of reaching the north pole, and from 1898 to 1902 reconnoitred routes from bases at Etah in Inglefield Land and Fort Conger on Ellesmere Island. Meanwhile the Peary Arctic Club of New York was formed to raise funds for the support of his further expeditions, thus relieving Peary of financial worries. A ship, the "Roosevelt," was built to his specifications and carried his next expedition, early in 1905, through Smith sound to Cape Sheridan, Ellesmere Island. The sledging season nas unsuccessful owing to adverse weather and ice conditions and the party only reached lat. 87° 6 N. Peary returned to Ellesmere Island in 1908 and early the following March left Cape Columbia on his successful journey to the north pole. He was accompanied on the last stage of the journey by Matthew Henson, his Negro aid, and four Eskimos, one of whom was drowned during the return. F. A. Cook's claims to have forestalled him by a year, though generally discredited, marred the enjoyment of Peary's triumph. He died on Feb. 20, 1920, in Washington, D.C. Peary's published works include *Northward over the "Great Ice"* (1898), *Nearest to the Pole* (1907), *The North Pole* (1910) and *Secrets of Polar Travel* (1917). (L. M. Fs.)

PEASANT, a countryman, either working for others, or owning or renting and cultivating by his own labour a small plot of ground (Fr. *paysan;* Lat. *pagensis,* belonging to the country).

PEASANT MOVEMENT. World War I and. paradoxically, the Russian Revolution gave a strong impetus to the political consciousness of a class which had seemed to be falling into insignificance. Through the centuries the peasants had occasionally played a forceful part in social convulsions, but since the Industrial Revolution western political life was dominated by leaders in commerce and industry; and that trend was only sharpened by the rise of the workers' movement. Eastern Europe had little industry: the bulk of its people were peasants, who had little share of material wealth and little influence in public life. And so it was natural that the stirrings of 1917 in that region should raise a peasant movement, with a social and political philosophy all its own.

Political Traditions of **the** Peasantry. — Between the French Revolution and 1848 the peasants of western and central Europe were gradually freed from all feudal servitudes. But the peasants derived only an indirect benefit from reforms achieved mainly by the urban middle classes, who needed freedom of action for the new capitalist enterprise.

The growing division between town and country was widened into a gulf by the rise of "scientific" socialism. The viewpoint of socialist economics was essentially the same as that of capitalist liberalism, except that the socialists wanted production to be planned. organized and controlled upon the largest scale. Marx gave credit to capitalism for having at least rescued considerable sections from the "idiocy of rural life"; he and his disciples placed the nationalization of the land and collectivised farming in the forefront of their program. This gave rise to the organization of many conservative agrarian groups in central and western Europe, which found in the peasants credulous recruits. The electoral effects gradually led to a watering down of socialist agrarian programs.

Populism.—The economic and political incentives which had interested the western bourgeoisie in rural emancipation had little meaning in the eastern half of the continent. Politically, that region was still in the autocratic stage. Its economic life rested on primitive agriculture and artisan manufacture. But the social incentive stirred up reformers in the east perhaps more deeply than in the west.

The younger intellectuals, imbued with 18th century humanitarian philosophy, centred all their ideals on freeing the peasants. But what for western liberals had been an end in itself, for the Russian reformers was merely a steppingstone to a free and full village life. Marxism was essentially a policy for transforming industrial society; in the east, socialism was for the peasants. Hence eastern socialists were forced to work out alternative ideas and programs suited to the problem of their own peasant populations. "Populism" became the expression of that trend. *(See* RUSSIA: *History.)*

The kernel of populism was the rejection of Marxist economic determinism. Marxism looked upon capitalist concentration of production as only a stage on the way to a socialist society. The Russian Populists put their faith in the existence of the village community (*mir*). They contended that a capitalist-proletarian phase was neither necessary nor possible in a backward agrarian country, as it would merely ruin the peasants, the only customers for industrial products. Above all, they believed that a rural democracy offered the masses the promise of a better life than industrial society. All they needed was more "land and liberty." and the backbone of the Populist program was a plea for the equal distribution of land among the peasants.

The later exponents of this program were the Social-Revolutionaries, the strongest party of the left up to the Bolshevik revolution. That the Populist doctrine had its roots in the natural conditions of the region is proved by the way it spread to the other agrarian countries of eastern Europe. It was perhaps natural that Serbia and Bulgaria should come under its influence, for both stood intellectually in close dependence on Russia. The decisive test is supplied by Rumania, a Latin country, strongly averse to Slav influence, yet there also the new doctrine engendered a strong rural current that joined with the others in denouncing Marxism.

The Peasant Renascence. — The Populist movement had remained largely theoretical because the peasants were restrained by a rigid political and social tutelage. Political activity and claims for the distribution of land were treated as revolutionary activity. The only outlet for their grievances were occasional uprisings, like those of 1905 in Russia and 1907 in Rumania, which were mercilessly repressed. But World War I and the Russian Revolution completed in the east the change begun by the French Revolution in the west. Sweeping reforms transferred the bulk of the land to the peasants, thus holding out to them the hope of economic independence. At the same time the peasants secured political rights, and were roused to a consciousness of their interests and their power as a class. Their movement was still loose and vague: its possibilities lay in the fact that more than half the population of the globe lived under a typically peasant "family economy," and that even in Europe there were more peasants than industrial workers.

In India the Congress party was led to take over the program of the Kisan Sabhas which had come into being after the 1930s; in China the strength of the Communist movement derived largely from its support of the peasants. There were stirrings in other far eastern countries, and also in South America and the middle east.

Doctrine and Program. — Unlike socialism, which had a fully developed doctrine before it had an organized following, the peasant movement sprang up separately in the various countries, though out of similar convulsive events. Hence its sociology was still in the making. and the programs of the several parties showed substantial variations. Its philosophy and policy were taken over and adapted to its own use elements from all the main political creeds. It can be summed up as a cross between liberalism and socialism: it stands firmly for democratic government and it holds tightly to the small family holding, which to the peasant is not merely a means of living but a way of life. For the rest, it generally accepts state control of public services and of primary and other big industries, though it wants small industries scattered about the country to combine work on the land and in the factory according to seasonal needs. It is generally anticapitalist, but would eliminate bankers and middlemen gradually by setting up co-operatives either for specific purposes or embracing the whole life of a village community. It believes in a rural society based on an educated, land-owning peasantry; and combining through a network of co-operative undertakings the virtues of small property with the means of large-scale enterprise.

The radicalism of the eastern peasant movement came from the peculiar conditions of the region. In the west, agrarian parties were a mixture of all rural classes, with big landowners to the fore, as in the German Landbund; the eastern parties were exclusively peasant. Secondly, oppression in the east had prevented the growth of a peasant middle class, so the movement was supported by a more uniform mass of small peasants. Thirdly, peasant antagonism toward town and capitalism had different effects in the two halves of Europe. In the west, finance and industry had entered a phase of international organization by means of cartels, trusts, etc.. and the outlook of the towns was cosmopolitan; as a reaction the countryside was conservative and nationalist. In the east, industry and finance were bound up with local nationalism. and the peasant who paid the bill of protectionism favoured a liberal and even a radical policy in all respects.

The Peasant Parties. — The peasant movement that sprang up after 1918 was peculiar to the eastern half of Europe. In the industrial countries of the west, even in Holland and Denmark, the peasants had been drann into conservative agrarian parties because of a general antagonism to industry and finance, partly through clerical influence. and largely by the fear of the socialist demand for land nationalization. But just as western socialism had stirred up industrial groups in the east and shaped their outlook, so the eastern peasant movement caused stirrings in the west. In France a peasant party was founded four weeks before the elections of 1928; in Germany, also before that year's elections, the left wing of the old *Landbund* formed a new Christian National Peasant party, and at the same time the Bavarian *Bauernbund* changed itself into a German Peasant party which dominated the parliamentary situation in Bavaria. Attempts to establish peasant parties were made in Holland and elsewhere.

Some of the eastern peasant parties were founded before World War I, but became important only after it. The Bulgarian Agrarian union, founded in 1899 as a professional body, became political in 1901: it polled 14.45% of the votes in 1911, 31% in 1919, 38.16% in 1920, 52.0% in 1923. In June 1923 a military coup led to the murder of Alexander Stambolisky and other party leaders. While in power, the party carried through broad co-operative measures and a law for compulsory civic service *(see* International Labour organization pamphlet, *Legislative Series*, 1920).

The Czechoslovak Republican Party of Farmers and Small Peasants, founded in 1896, at first conservative, veered leftward, led by Antonin Svahla, Rudolf Beran, and Milan Hodza. Czechoslovakia took the lead in adopting an 8-hour day for agriculture and working out practical ties between peasant producers' co-operatives and urban consumers' co-operatives. Alone of the eastern countries, it included members of the national minorities in the cabinet. All these steps were due to the party's initiative.

Poland had several peasant parties, reflecting its unsettled political outlook. The Polish Populist party, known as *Piast* (significantly the name of the first Polish royal dynasty, which was of peasant origin) was led by Wincenty Witos. Twice premier, he was rather conservative, admitted land reform only with compensation, and was open to clerical influence. The Liberation party, led by Stanislaw Thugutt, was radical, demanded land reform without indemnity, favoured regional autonomy for the minorities, and was anticlerical. A similar program was supported by the Peasant party led by Jan Dabski, representing chiefly the small peasants.

It is noteworthy that while the political movement was divided by regional, clerical and personal influences, the peasants worked together in their co-operative affairs, brought to high achievement by Stanislaw Mikolajczyk. The Rumanian National Peasant party, formed by the fusion of several groups, was the only substantial opposition; in Nov. 1928 it formed the first truly parliamentary government in Rumania, led by Iuliu Maniu, Nicholas Lupu, Ion Michalache, and the economist Virgil Madgearu.

In Yugoslavia the Croat Peasant party, founded in 1904, dominated Croatia after World War I and gained strength in Bosnia and Dalmatia. Stjepan Radid, Pavle Radid, Dr. Vladimir Maček and other leaders held office in various coalition governments. Remarkable for its organization and comprehensive activities, and especially for its spiritual cohesion, it was built upon a clear rural creed rather than upon agrarian interests.

There were also rising peasant parties in Finland, the Baltic

states and elsewhere.

International Organization.— A number of international agrarian bodies had existed before, but they had not been limited to peasant groups nor had they been set up for political action. Soon after World War I an attempt was made by Bavarian and Austrian farmers to unite the peasant groups of central Europe, the Bavarian Georg Heim being one of the initiators. The movement was conservative and anticommunist and, while some of the leaders kept neutral, others had a strong clerical bias. The attempt came to nothing. Though no peasant party existed in Russia, the Communists encouraged some of the refugees living in Moscow to set up there a Peasant International. Formed in *1923,* it held its first congress in *1925,* but made no visible impression on the peasant movement. On the initiative of the Bulgarian Stambolisky, an international bureau for research and information was set up in Prague in *1921,* the Czech, Bulgarian, Polish and Serbian parties being members. In May *1928,* the bureau was joined by the Croat, Rumanian and other parties, including the newly-formed French and Dutch parties. At the same time, eight parties of central and eastern Europe formed a regional group within the bureau itself with a joint executive, to work for the solution of political and social problems in the peasant interest; and to resist jointly any attempt at dictatorship, from the left or from the right.

The Interwar Period.— The potential strength of the eastern peasant movement was attested less by the actual power it enjoyed than by the strong efforts made to check it. As noted above, Stambolisky and other Bulgarian leaders were murdered in *1923* and the party broken up. The Croat leaders were repeatedly imprisoned, and ultimately Stjepan Radid died of wounds, and his nephew Pavle Radid and others were killed outright. The Rumanian leaders were persecuted and the party was denied the power to which its electoral strength entitled it.

In Poland, Witos was imprisoned for a short time and then had to flee the country. All these parties and leaders had stood firmly for democratic government and social reform. Their persecution everywhere ended in dictatorship, because the peasant groups also had to face the competitive antagonism of socialist parties. In Bulgaria, Rumania and Yugoslavia these were insignificant, but they were strong in Poland and Czechoslovakia. The division between the two sections of the working mass paved the way for reaction.

War and Aftermath.— World War II and the Nazi occupation found the peasants united with others in resistance; there was no defection among their groups and leaders. But after victory the movement again became the target of violent reaction, this time from the Communist left, backed by Russian military power. Against all Marxist teaching and Soviet policy, the new regimes in the eastern countries, including the Soviet zone of Germany, handed over the land to the mass of poorer peasants, in tiny uneconomic holdings, to undermine the solidarity of the peasant class. At the same time, all the peasant parties were suppressed, their leaders killed, imprisoned or driven into exile. The latter group revived in Washington, D.C., the activities of the International Peasant union in *1947.* Significantly, in Poland, Bulgaria, Rumania, Hungary and Czechoslovakia, the Communist regimes found it expedient to set up new peasant parties under their o n patronage.

Up to *1948* these regimes sought to keep the peasants quiet and at work by denying any intention to collectivise farming. But after *1948* collectivisation was pressed forward ruthlessly in all the "peoples' democracies." It was later pushed forward in China, where in *1948* the Communists had ridden to victory on the back of a discontented peasantry.

After Stalk.— This trend was sharply reversed after the death of Stalin. Nikita Khrushchev, who had formerly invented a scheme for the extreme concentration of farming in "agro-tonns," took the initiative in lowering taxes, reducing the compulsory deliveries. and giving higher prices for produce taken from the peasants by the state. Admitting that central planning had proved "wrong and inefficient," a decree in March 1955 also gave collective farms more power to run their own affairs. In China, also, in March *1957* peasants were given some ease, but later, new oppressive measures sought to end peasant resistance.

The Soviet reversal set off a more thorough retreat in the satellite countries. Apart from concessions to the peasants in the form of lower prices and reduced taxes Yugoslavia, Rumania, Hungary and Poland, the very policy of collectivisation was eased or virtually abandoned. In Poland, two thirds of collectivised farms were said to have been broken up and returned to individual holdings. In Indonesia and in Indochina the Communist leaders formally disclaimed any idea of nationalizing agriculture and promised to distribute land to the peasants.

The simple fact is that wherever the Communists gained power the Marxist agrarian idea had to be imposed by force and had to rely on force for its survival; western socialists who wanted to remain democratic in every instance had to abandon it. Whatever else the Soviet and other Communist regimes may have achieved, the agrarian problem has defeated them.

The peasants have not been allowed to revive their own parties, and no peasant has held office in the Soviet Politburo. But even in collectivised areas the peasants are still a class.

In the first general election of *1952* in India the Communists gained in depressed agricultural areas, not in cities. India began to experiment widely with a middle-of-the-way system of "community development." Side by side with essential heavy industries she encouraged cottage and village industries, and promoted agricultural improvement, with the village as a relatively self-contained economic and administrative (*panchayat*) unit. This policy followed closely the ideas of Gandhi, but it was also strikingly close to the outlook and program developed independently by the peasant movement in eastern Europe. It revealed how essentially peasant qualities are rooted in the peculiar conditions of rural work and life. 4s the peasant revival of the *1920s* showed, the peasants of eastern Europe, and other continents, were more closely linked by common peasant traits than they were divided by national differences.

See David Mitranp, *Marx Against the Peasant (1952).* (D. Mi.)

PEASE, EDWARD (1767–1858), the founder of a famous industrial Quaker family in the north of England, was born at Darlington on May *31, 1767.* With George Stephenson he took a prominent part in constructing the railway between Stockton and Darlington. He died July *31, 1858.*

PEAT, a product of decayed vegetation found in the form of bogs in many parts of the world. The principal areas of the peat deposits of the world are as follows: U.S.S.R., *65,000* sq.mi.; Canada, *37,000* sq.mi.; Finland, *30,000* sq.mi.; Sweden, *19,000* sq.mi.; and United States, *11,200* sq.mi.

The plants which give origin to these deposits are mainly aquatic, including reeds, rushes, sedges and mosses. *Sphagnum* is present in most peats, but in Irish peat *Rhacomitrium lanuginosum* predominates. It seems that the disintegration of the vegetable tissues is effected partly by moist atmospheric oxidation and partly by anaerobic bacteria, yeasts, molds and fungi, in depressions containing fairly still but not stagnant water, which is retained by an impervious bed or underlying strata. As decomposition proceeds the products become waterlogged and sink to the bottom of the pool; in the course of time the deposits attain a considerable thickness, and the lower layers, under the superincumbent pressure of the water and later deposits, are gradually compressed and carbonized. The most favourable conditions appear to be a moist atmosphere and a mean annual temperature of about 45° F. The peat bogs of Great Britain and Ireland vary in thickness from *5* to *30* ft.; and those of North America vary from *5* to *25* ft.

Peat varies from a pale yellow or brown fibrous substance, resembling turf or compressed hay and containing conspicuous plant remains, to a compact dark brown material, resembling black clay when met and some varieties of lignite when dry. Two typical forms may be noticed: hill peat (the mountain or brown bogs of Ireland), found in mountainous districts, and consisting mainly of *Sphagnum* and *Andromeda;* and bottom peat (the lowland or red bogs of Ireland), found in lakes, rivers and brooks, and containing *Hypnum.* The latter kind always contains much

water, up to 90%, which it is necessary to remove before the product can be efficiently employed as a fuel, and for most other purposes. A specimen dried at 100° C. had the following composition: carbon, 60.48%; hydrogen, 6.10%; oxygen, 32.55%; nitrogen, 0.88%; ash, 3.30%; the ash is very variable—from 2% to 15% and even more—and consists principally of clay and sand, with lesser amounts of ferric oxide, lime, magnesia, etc. On air-drying the peat loses from 8% to 20% of its moisture. In a good, dry season peat may be air-dried down to 17% or 18% moisture, while under moderate conditions it may be saved with 25% to 30% moisture. Average air-dried peat containing 25% moisture may be taken as having a calorific value of about 6,000 B.T.U. The specific gravity has been variously given, owing to the variable water content and air spaces; when dried and compressed, however, it is denser than nater. The yield per sq.km. (0 386 sq.mi.) for a depth of five metres (16.4 ft.) has been determined in Germany as approximately 800,000 tons of air-dried peat.

Peat-winning presents certain special features. The general practice is to cut a trench about 1 ft. deep with a peculiarly shaped spade, termed in Ireland a "slane," and remove sods from 3 to 4 ft. long. When one layer has been removed, the next is attacked, and so on. If the deposit be more solid step-working may be adopted, and should water be reached recourse may be had to long-handled slanes. The sods are allowed to drain, and then stacked for drying in the air, being occasionally turned so as to dry equally; this process may require about six weeks.

Machine Working.—Mechanical power has been applied, especially in Sweden and Germany, to the winning of peat, the operations involved being:—(I) The excavation and elevation of the raw peat from the bog. (2) The maceration and mixing of the raw peat by means of rotating and fixed knives and a single or double screw conveyor nhich forces the peat through a nozzle or nozzles in a stream which is cut into lengths for sods. (3) The transport of the formed sods and their deposition on the bog. (4) The collection and stacking of the air-dried peat. In the most recent German practice the operations indicated in (1) (2) and (3) are combined in one machine electrically driven.

Several processes have been invented for the carbonization of peat and recovery of the by-products. Among these is the Ziegler process which is, or was, in operation at Oldenburg in Germany, Rodkino in Russia and Beuerberg in Bavaria. The uncondensed gases from the coking plant at Beuerberg gave:—

Carbon dioxide	15.5 per cent
Oxygen	1 „
Carbon monoxide	20.4 „ „
Methane and other hydrocarbons	12.4 „ „
Hydrogen	28.6 „ „
Nitrogen	21.9 „ „
	99.9

The "coke" contained:

Carbon	73.89 per cent
Hydrogen	3.59 „ „
Oxygen	14.52 „ „
Nitrogen	1.49 „ „
Sulphur	0.20 „ „
Ash	2.50 „ „
Moisture	3.80 „ „
	99.99

and the calorific value of the semi-coke was 12,000 B.T.U. The volume of the gases amounted to 6.759 cu.ft. per ton.

The manufacture of producer gas from peat, in regard to which a number of methods exist, mostly based on the Mond process, has proved more or less successful. The briquetting of peat has also been carried out. The briquettes contain approximately 18% of moisture and are said to yield a high quality charcoal. One of the chief factors operating against the commercial success of peat as a fuel in competition with coal and other fuels has been the cost of drying the peat.

With the "Peco" process it is claimed, however, that the peat can he dried down to almost no water content, and that about 80% of the peat is recovered. But in practice the most suitable water content' for briquetting is 10%. Perhaps Ireland is the largest producer, with an output in the neighbourhood of 6,000,000 tons annually of air-dried peat.

See The *Winning, preparation and use of* peat, by the Fuel Research Board (1921); The *Utilization* of ***Peat*** Fuel, Department of Mines, Canada (1912). (R. R.)

PEBA, a name for the nine-banded armadillo. *See* ARMADILLO.

PEBAN, a group of tribes of South American Indians doubtfully to be regarded as constituting an independent linguistic stock. The Pebas (who have given their name to the group), the Yameos, and Yaguas, who form the stock, are on the northern side of the Amazon in the region of the Brazilian-Peruvian border.

PECAN. This is the most important nut producer of the genus *Carya*, and the tree native to temperate North America that has attained most extensive orchard culture. Pecan kernels rank with the finest of oily nuts. The tree is the largest of its genus, occasionally reaching maximum heights of about 180 ft. and trunk diameters of 8 ft. in deep, fertile soils. The nuts have brown. mottled shells, varying greatly in thickness; size varies from 45 to zoo per lb., and shape from long-cylindrical with pointed apex, to short and roundish, or intermediate. At maturity the fleshy hulls of the short-clustered fruits dry, split along suture lines and separate into four approximately equal sections, thus gradually freeing the nuts. Harvesting begins in late September, but may continue until late winter in southern orchards.

The original range of the pecan tree may not have extended into the northern Mexican highlands before men took nuts there from Texas. Native trees have been found from near the Rio Grande in southwest Texas, north and east to extreme southeast Nebraska, eastern Iowa, west-central and southern Indiana, and occasionally up the Tennessee river to near Muscle Shoals in Alabama. Limited cultivation of grafted varieties had begun in Louisiana by

J HORACE MCFARLAND CO

LEFT. BRANCH OF A PECAN TREE SHOWING NUTS ENCLOSED IN HUSKS. RIGHT: MATURE PECAN NUTS

1847; some important varieties were introduced before 1890, and thereafter the crop assumed increasing commercial importance from the Carolinas to New Mexico and Mexico. Georgia, Alabama and Mississippi soon became the most important producers of grafted pecan nuts. exceeding the total annual production of the states of Texas and Oklahoma nhich have the greatest numbers of native seedling trees. United States pecan production averages roughly from 100,000 000 to 200 000 000 lb. per year. Canada has been the principal importer of U.S pecans.

For good kernel development, even the earliest maturing pecans need high summer temperatures both day and night, so nuts are seldom matured on trees in northern California, northern Indiana, or north of tidewater Virginia and Maryland in the eastern U.S. Results in inland central and southern California have been a lit-

tle better, but walnuts outyield pecans there. The pecan has been introduced into many countries, but without becoming important in production outside the U.S. and northern Mexico. It is cultivated to a limited extent in Australia (New South Wales) and South Africa (Natal).

Pecan varieties are suited, for reasons of climatic requirement, to particular zones within the U.S. Important southeastern varieties are Brooks, Candy, Curtis, Desirable, Elliott, Farley, Mahan, Moore, Stuart and Success. In the central Texas group are Barton, Burkett, Clark, San Saba Improved, Squirrel, Texhan and Western. Clarksville, Giles, Greenriver, Hirschi, Major, Peruque, Posey, Starking and Witte ripen in midwestern orchards. Duvall and Sweeney were introduced from Maryland. For culture somewhat north of pecan limits, there are hicans (pecan-hickory hybrids) of which Burton, Des Moines, Henke and Jay Underwood are among the fruitful varieties, and McCallister, a useful pollinator.

See also HICKORY; NUT. (J. C. McD.)

PECCARY, the name given to the new world representatives of the swine (Suidae), from which it may be distinguished by the fact that the upper canine teeth (tusks) are directed downward, simple cheek teeth, sacculated stomach and three-toed hind feet. Peccaries range from New Mexico and Texas to Patagonia. The collared peccary (Tayassu *tajacu*) is a dark-gray animal with a white band across the chest from shoulder to shoulder. It is about 3 ft. long, living in small herds of eight to ten, and has an extensive range in Central and South America. The white-lipped peccary (T. *pecari*) is about 6 in. longer, blackish in colour, with white lips. Peccaries form the family Tayassuidae (see ARTIODACTYLA; SUINA). Extinct peccaries are known as far back as the Miocene in North America, but only in superficial deposits in the southern continent. This indicates that the group entered North America in the Upper Oligocene and subsequently reached their present habitat. (J. E. HL.)

PECHENEG or PATZINAK (Latin Bissenus), a nation which played a considerable part in the medieval history of eastern Europe. The Pechenegs were of Turkish origin, akin to the Cumans (*q.v.*), whose language, according to Anna Comnena, they spoke. They were probably a federation formed of the earlier Bukuk and Kangaris. In the 9th century A.D. they were living between the Volga and the Urals, having as their neighbours the Burtas on the west, the Khazars southwest, and the Ghuz southeast. About 860 the Khazars and Ghuz combined and drove them west, only a remnant remaining in their old territory, which was now occupied by the Ghuz. The remainder drove the Magyars, who were the western neighbours of the Khazars, over the Dnieper, themselves settling near the Don. In 889 they again drove the Magyars westward into Moldavia, arriving on the Dnieper in 895. In that or the following year they allied themselves with Khan Symeon of the Bulgars, inflicted a third and crushing defeat on the Magyars and drove them into their present homes in Hungary.

The Pechenegs made their own headquarters on the two banks of the Dnieper, where for a century they harassed Kiev and the trade route between that state and Constantinople, lurking near the rapids at mhich convoys disembarked, then charging on horseback and raining arrows on the crews. In addition, they ravaged Walachia, Bulgaria and the lands of the eastern Roman empire, perhaps the most formidable of their many incursions being that of 934, when, allied with the Magyars, they destroyed Varander. In 972 they had slain Svyatoslav of Kiev; but in 1036 Prince Yaroslav defeated them so heavily that they ceased to trouble Russian territory. Their incursions westward grew correspondingly more severe. Between 1020 and 1030 they invaded Bulgaria almost every year; from 1018 to 1053 they were at war with Byzantium without intermission. Then Constantine Monomachus granted them lands for settlement in northeastern Bulgaria, but their depredations continued.

The great westward raid of the Ghuz in 1064 passed through their territory, and many Pechenegs were probably then slain or absorbed by the Ghuz. Others fled into Hungary, where Ladislaus I defeated them in 1067. Colonies of the survivors were settled as guards on Hungary's western frontiers. In 1080 the emperor Alexius again defeated them, and their power was finally broken in 1091 by the crushing defeat which they suffered at Lebunien. Remnants of them, however, still lurked about the Balkans, and one band, imitating their old tactics on the Dnieper, attacked Peter the Hermit's party of crusaders north of Belgrade in 1096. The Sops in the plain of Sofia are believed to be their descendants.

The Pechenegs were ruled by a khan and organized in 8 hordes and 40 minor units, each under its khan of lower degree. They mere purely nomadic; on their raids they took their women and children with them, forming their camps out of rings of wagons. They wore long beards and mustaches and were dressed in long kaftans. The food of the wealthy was blood and mares' milk; of the poor, millet and mead.

They were originally "magicians," *i.e.,* fire worshipers; but a form of Islam early became current among them and the nation was temporarily converted to Christianity in 1007–08. They were the most dreaded and detested of all the nomads; Matthew of Edessa calls them "the carrion-eaters, the godless, unclean folk, the wicked, blood-drinking beasts." Other anecdotes are current of their shamelessness, and many of their cruelty; they invariably slew all male prisoners who fell into their hands. The modern Sops are short-legged and yellow-skinned, with slanting eyes and projecting cheekbones. The women's costumes show a profusion of gold lace.

See J. Marquart, *Osteuropäische und ostasiafische Streifzüge* (Leipzig, 1903), where the main original sources are given. (C. A. M)

BECHORA, a river of northern U.S.S.R., which rises in the Urals, almcst on lat. 62° N. and flows west and then north, aith a double north and south loop about 66° 20' N. It enters the Gulf of Pechora on the Barents sea by a delta after a course of 1,126 mi. Its main tributaries are the Izhma, Tsilma and Sula on the left, and the Ilych, Podcherem, Shugor and Usa on the right; the river and its tributaries provide 3,545 mi. of navigable waterways, of which 2.335 are fit for rafts and timber floats only and 580 are suitable for steamer navigation. The drainage basin of 126,255 sq.mi. is, however, mainly coniferous forest. and north of lat 67° N. bleak tundra. the Great Land Tundra on the east, and the Small Land Tundra on the west.

The scanty population consists mainly of Nomad Samoyede reindeer breeders and Zirian hunters.

During the brief summer there is steamer connection between Pustozersk and Kuya on the right of the delta, and Archangel. Short portages connect the Pechora waterway with the Kama and the Volga, and with the Vychegda and Northern Dwina, and longer portages, used mainly by Samoyedes, link it across the Urals with the Ob.

The chief freightage on the Pechora waterways consists of reindeer products, furs and fish going southward and grain and manufactured goods going north. Seals are caught in Pechora gulf, and fishermen migrate there from June to Aug., the Pechora salmon being specially valuable.

PECKHAM, JOHN (c. 1225–1292), archbishop of Canterbury, was probably a native of Sussex. About 1250 he joined the Franciscan order. He took his degree at the University of Paris, under St Bonaventure and for many years taught there, coming into contact with the greatest scholars of the day. About 1270 he went to teach at Oxford and in 1275 was elected provincial minister of the Franciscans in England, but soon afterward he was called to Rome as theological lecturer in the schools of the papal palace.

In 1279 Peckham returned to England as archbishop of Canterbury. He died at Mortlake on Dec. 8, 1292.

Peckham was always a strenuous advocate of the papal power, and the characteristic note of his primacy was an insistence on discipline which offended contemporaries.

In philosophy Peckham represents the Franciscan school which attacked the teaching of St. Thomas Aquinas on the "Unity of Form." He wrote much on scientific, scriptural and moral subjects, and defended the Franciscan rule and practice. His hymns are characterized by a lyrical tenderness.

PECKHAM, RUFUS WHEELER (1838–1909), associate

justice of the United States supreme court from 1896 to 1909. is chiefly remembered as the author of the majority opinion (*Lochner* v. *New York*, 198 U.S. 45 [1905]) which evoked one of the sharpest dissents by Justice Oliver Wendell Holmes (*q.v.*). Peckham held that the 14th amendment prevented the states from curtailing a man's liberty to engage in or contract concerning economic activity—in the Lochner case, the liberty of a baker to contract for working hours longer than ten per day. Holmes replied in dissent that the "Fourteenth Amendment did not enact Mr. Herbert Spencer's *Social Statics.*" Peckham is representative of the school of constitutional jurisprudence that felt it was the court's function to scrutinize carefully and form its own conclusion as to the reasonableness of a state regulation *(see* SUPREME COURT OF THE UNITED STATES, THE: *Role in American Life: Self-Lirnitution).* This judicial approach in cases involving economic regulation did not disappear until the 1930s, when the Holmes point of view became the almost unanimous opinion and such legislation as the minimum-wage law was held to be constitutional.

Peckham, a member of a distinguished New York judicial and legal family, was born in Albany, N.Y., on Nov. 8, 1838. and was educated in Albany and Philadelphia. In 1859 he was admitted to the bar and began practising law in Albany; in 1883 he was appointed a justice of the state supreme court and in 1886 became a member of the court of appeals of New York, the highest court in the state. Nominated to the U.S. supreme court by Pres. Grover Cleveland after the nomination of his brother, Wheeler Hazard Peckham, failed of senate confirmation, he took office on Jan. 6, 1896. Peckham died at Altamont, near Albany, on Oct. 24, 1909.

(A. DM.)

PECOCK (or PEACOCK), **REGINALD** (*c.* 1395–c. 1460), British prelate and writer, was probably born in Wales, and was educated at Oriel college, Oxford. Having been ordained priest in 1421, he secured a mastership in London in 1431, and soon became prominent by his attacks upon the religious position of the Lollards. In 1444 he became bishop of St. Asaph, and six years later bishop of Chichester. He was an adherent of the house of Lancaster and in 1454 became a member of the privy council. In attacking the Lollards he put forward religious views far in advance of his age.

Pecock asserted that the Scriptures were not the only standard of right and wrong; in general he exalted the authority of reason. Owing to these views the archbishop of Canterbury, Thomas Bourchier, ordered his writings to be examined. This was done and he was found guilty of heresy. He was removed from the privy council and he only saved himself from a painful death by privately, and then publicly (at St. Paul's Cross, Dec. 4, 1457), renouncing his opinions.

Pecock, who has been called "the only great English theologian of the 15th century," was then forced to resign his bishopric, and was removed to Thorney abbey in Cambridgeshire, where he doubtless remained until his death.

The bishop's chief work is the famous *Repressor of over-much weeting* [blaming] *of the Clergie,* which was issued about 1455. In addition to its great importance in the history of the Lollard movement the *Repressor* has an exceptional interest as a model of the English of the time, Pecock being one of the first writers to use the vernacular. In thought and style it is the work of a man of learning and ability.

A biography of the author is added to the edition of the *Repressor* published by C. Babington for the Rolls Series in 1860. Pecock's other writings include the *Book or* Rule *of Christian Religion;* the *Donet,* "an introduction to the chief truths of the Christian faith in the form of a dialogue between father and son"; and the *Folewer to the Donet.* The two last works are extant in manuscript. His *Book of Faith* has been edited from the manuscript in the library of Trinity college, Cambridge, by J. L. Morison (Glasgow, 1909). *See* also John Lewis, *Life of Pecock* (1744; new ed., 1820).

PECOS, a river in the southwestern United States, rises in Mora county in north-central New Mexico in the high peaks of the Sangre de Cristo Range. It is about 735 mi. long and drains about 30,000 sq.mi. of wild and rugged land which in places is devoid of population and communications. The Pecos flows south-southeast through eastern New Mexico and west Texas, emptying into the Rio Grande as it leaves Pecos canyon 40 mi. N.W. of Del Rio, Tex. After leaving the mountains, the Pecos flows over land of desert character and the stream channel is dry much of the year. A valley 1,000 ft. deep and from 5 to 30 mi. wide extends almost to Rosuell. N.M.

Near Roswell, the river widens into a basin which closes somewhat to a broad, shallow valley at the Texas-New Mexico border. Below this valley and in the last 125 mi. of its course, the Pecos has cut a narrow canyon over 1,000 ft. deep into the Edwards and Stockton plateaus. As the stream emerges from this canyon it empties into the Rio Grande river. Flow of the Pecos is regulated by two reservoirs. The Alamogordo at Fort Sumner, with storage capacity of 122,100 ac.ft. was completed in 1938. McMillan dam near Lakewood, N.M. stores 38.660 ac.ft. and was completed in 1906. About 150.000 ac. are irrigated from these units. Pecos tributaries are the Hondo, Gallinas, Felix, Seven rivers and Black rivers, all in New Mexico Santa Rosa, Fort Sumner, Roswell and Carlsbad, N.M. and Pecos, Tex. are important towns on or near the river. (M. J. L.)

PÉCS (German, *Fünfkirchen*), capital of Baranya county, Hungary, on the southeastern flank of the Mecsek hills. It is believed to date back to Roman times and has been the see of a bishop since 1009. It was occupied by the Turks from 1543 to 1686 and several of its churches were altered and used as mosques. The town is regularly laid out with an inner old town in the form of a square and four suburbs. A beautiful cathedral, reputed one of the oldest churches in Hungary as well as one of its finest medieval buildings, is the principal architectural asset The 14th century university, which lapsed after the battle of Mohács, has been revived. Pop. (1960) 114,713.

PECTIN, the commercially concentrated extract of a group of pectic substances found in the cell walls and intercellular layers of certain plant tissues. The chief use of commercial pectin is in the preparation of jellies, jams and marmalades but its property of forming thick solutions gives it numerous other uses in the food, confectionery, pharmaceutical and textile industries.

Pectic substances consist of an associated group of three polysaccharides: an arabinan, which on acid hydrolysis yields L-arabinose; a galactan, giving D-galactose on hydrolysis; and, most significantly for the physical properties of these substances, a pectic acid whose carboxyl groups are in part esterified with methanol and in part neutralized as salts of calcium and magnesium. Pectic acid is a polysaccharide in which units of D-galacturonic acid are joined in α-D-(1 $\rightarrow$ 4) linkages *(see* CARBOHYDRATES). The calcium salt of pectic acid is water insoluble and in the maturation of tissues, as in the ripening of fruits, complex enzymic changes occur in which the calcium salts are converted, in part, to methyl ester groups. The pectic substances are extractable with warm aqueous solutions of dilute acids. The extract may then be concentrated and sold as a liquid or converted to a powder. The product is known as pectin. The chief sources of commercial pectin are citrus waste and apple pomace. Sugar beet cossette (chip) pulp is employable and makes a usable product after suitable modification to remove an acetate ester group present. Pectin forms a viscous aqueous solution and in the presence of acids, as those of fruits, and added sugar, this solution will produce a jelly. Very small amounts (less than 1%) of pectin will suffice. It has been found that if the methyl ester (methoxyl) content is decreased, less sugar is required to give a gel which is formed by the addition of calcium ions.

PECTORAL, a word applied to various objects worn on the breast (Lat. *pectus*); thus it is the name of the ornamental plate of metal or embroidery formerly morn by bishops of the Roman Church during the celebration of mass, the breastplate of the Jewish high priest and the metal plate placed on the breast of the embalmed dead in Egyptian tombs. The "pectoral cross," a

small cross of precious metal, is worn by bishops and abbots of the Roman, and by bishops of the Anglican, communion.

See "Pectoral" in The Catholic Encyclopaedia.

PEDAGOGUE, a teacher or schoolmaster, in English since the late 16th century a term usually implying pedantry, dogmatism and narrow-mindedness. It is among the least scurrilous insults Thomas Nashe paid to his arch-enemy, Gabriel Harvey, in the epistle dedicatory to Have With You to Saffron *Walden* (1596); Sir Edward Hoby also applied it to his theological antagonist, John Floyd, in Counter-snarle (1616); the opprobrium of the term is implicit in Samuel Pepys' phrase in his diary (July 25, 1660): "A Welsh schoolmaster, a good scholar but a very pedagogue."

The Greek paidagogos (paid, "boy"; agogos, "leader") was not strictly an instructor, but rather a slave in the Athenian household who looked out after the safety and conduct of the sons of the master of the household and took them to and from school and the gymnasium. The Romans adopted the *paedogogus* or *pedagogus* toward the end of the republic (1st century B.C.). The Roman pedagogus probably took some part in the instruction of the boys (see SCHOOLS, ANCIENT). Under the empire the pedagogus was specifically the instructor of the boy slaves in the household of the emperor. rich nobles and other persons.

PEDAL CLARINET, a contrabass instrument invented by G. A. Besson (1820–75). It is pitched an octave below the bass clarinet, its compass descending to the D below the lowest note of the double basses. Besson also invented an apparatus for lowering the compass still further by the interval of one fourth. Music for the pedal clarinet is written a ninth higher than it sounds. It is used primarily in marching bands and has a rich, full tone, except for the lowest notes which tend to be rough in quality.

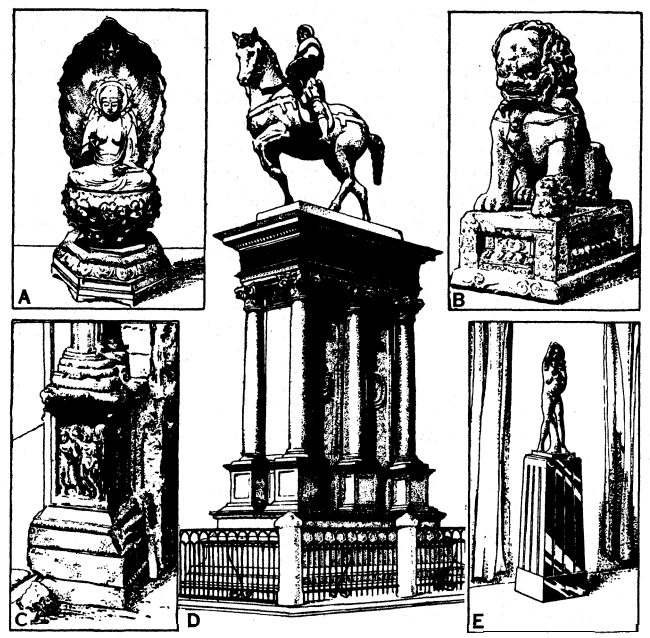
PEDERSEN, CHRISTIERN (c. 1480–1554), Danish humanist, one of the first to rediscover Denmark's national literary and historical heritage and to encourage the development of a vernacular style. Born near Helsingfors, he studied at Greifswald and took orders in 1505. In 1508 he went to Paris and there produced the first edition (now lost) of Saxo Grammaticus' Gesta Danorum, under the title *Historia* danica (1514). He also edited Peder Laale's proverbs and published a Latin-Danish lexicon. Returning to Denmark, he supported the Reformation and became secretary to Christian II, following him into exile in 1525. In Holland he translated, from the Vulgate, part of the New Testament (1529) and the Psalms (1531) and also adapted some of Luther's tracts. In 1532 he set up as a printer at Malmo, publishing Danish versions of French romances and the legends of Charlemagne. He had a share in the translation of the Bible published in 1550 as "Christian III's Bible," and based on Luther's translation, which marked an important stage in the development of Danish literature as well as in the progress of the Reformation. He died on Jan. 16, 1554, in Helsinge.

See Pedersen's Danske *Skrifter,* ed. by C. J. Brandt and B. T. Fenger, 5 vol. (1850–56).

PEDERSEN, HOLGER (1867–1953), Danish linguist of exceptional competence in a number of fields, especially Celtic, was born at Gjelballe, near Lunderskov, on April 7, 1867. After receiving his doctorate in 1897 with a masterly dissertation (*Aspirationen* i *Irsk*) he proceeded, while professor at Copenhagen, to enrich linguistic scholarship with an incredible number of articles and books, all highly original. Nurtured in the exacting methodology of the 19th-century neogrammarian (*q.v.*) movement, he went far beyond its limits and was either participant in, or critic of, most succeeding schools of linguistic thought; he even anticipated some new trends, but conscientiously avoided frills and fads.

The result of Pedersen's Celtic researches are contained in numerous articles and in his monumental Vergleichende Grammatik der keltischen Sprachen, (2 vol., 1909–13), also his Concise Comparative Celtic Grammar (with Henry Lewis, 1937). About 30 books in four languages (Danish, English, French, German) treat authoritatively Albanian, Armenian, Russian, Indo-European dialects, Lithuanian, Hittite, Tocharian, Czech, Turkish phonology, the relations between Indo-European and Semitic, between Indo-European and Finno-Ugric, the origin of runes, and the history of linguistic science. Holder of honorary degrees in nine countries and recipient of countless other scholarly honours, Pedersen closed a long and fruitful career in Copenhagen, where he died on Oct. 25, 1953. (R. A. Fs.)

PEDESTAL, a square, polygonal or circular block used as a support. Pedestals were originally employed only to carry statues or votive offerings, but the Romans, in the course of their many experiments in the decorative use of the orders, occasionally placed columns upon pedestals; this is notably the case in connection



BY COURTESY OF (B) THE MUSEUM OF THE UNIVERSITY OF PHILADELPHIA, (E) LORD & TAYLOR

TYPES OF PEDESTALS FROM ANCIENT TIMES TO THE PRESENT DAY
(A) Statue of Buddha, 700 years old, from Gaya; (B) Chinese lion, Ming dynasty: (C) type of Roman architecture under Septirnus Severus, A.D. 146–211; (D) statue of Bartolomeo Colleoni, Venice, begun by Verrocchi, 1481; (E) modern mahogany pedestal by Auguste Guenot

with such isolated columns as that of Trajan (A.D. 114) and in the case of the engaged columns of triumphal arches, where the proportions seemed to demand them. Similarly, in superposed orders, as in the Colosseum at Rome (A.D. 80), the parapet walls of each story were projected out under each column as pedestals. The Renaissance designers attempted to develop a separate pedestal for each order, with all its dimensions in proportion to those of the column (see ORDER). This has no basis in Roman usage.

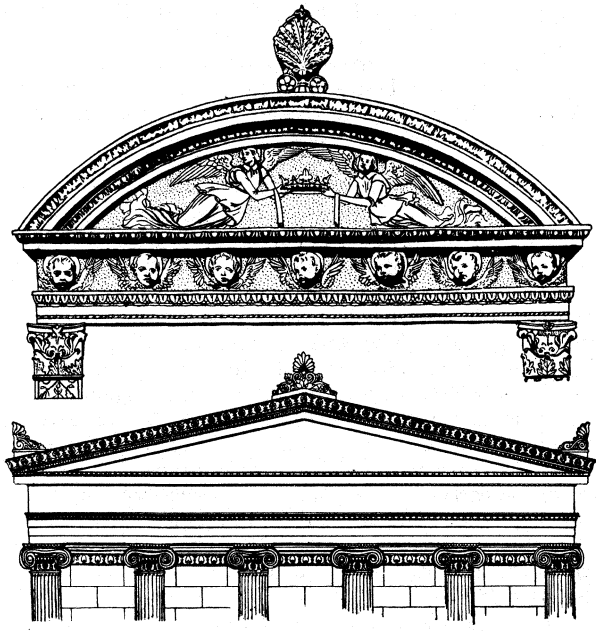
PEDICULOSIS or PHTHIRIASIS, the medical term for the presence of lice (pediculi), either on the head (Pediculus *capitis*), body (*P.* corporis, or vestimentorum), or pubes (P. pubis). This infestation of man and animals produces primary and secondary symptoms and disorders, the latter the result of scratching and subsequent invasion by bacteria. Vegetable as well as animal organisms are infested with lice. See LOUSE. (F. L. A.)

PEDIMENT, in architecture, is a triangular gable end, crowned with a raking cornice which follows the slope of its upper edges; or a similar form used decoratively. In common usage, the term is restricted to the classic styles; in others, the word gable is used.

The pediment was given a great importance by the Greeks as it was the crowning feature of every temple front. In Greek work, the entablature over the columns is carried completely through, horizontally under the pediment; and the tympanum (*q.v.*), or triangular wall surface, between this horizontal cornice and the raking cornice above was often decorated with sculpture. (See GREEK ARCHITECTURE.) The Romans not only used the pediment in this manner, as the end of a roof, but also adopted it as a purely decorative form to crown doors, windows and especially niches. Where many such decorative pediments occur in a row, the Romans frequently made them alternately triangular and seg-

mental in shape; in this they were copied by the High Renaissance in Italy.

Following certain late Roman precedents, in which the line of the raking cornice is broken back in the centre, the designers of the baroque period developed all sorts of fantastic broken, scrolled and reverse curved pediments; in some cases they even reversed the direction, so that the high part of the broken or sectional pediment was toward the outside of the composition rather than toward the centre, and in the Churrigueresque, or late Renaissance



FROM BUHLMANN, "CLASSIC AND RENAISSANCE ARCHITECTURE" (NEFF AND HELBURN)

PEDIMENTS: (UPPER) ITALIAN RENAISSANCE "FLORENTINE" PEDIMENT. BY THE DELLA ROBBIAS; (LOWER) GREEK. THE ERECHTHEUM, ATHENS

of Spain, little sections of pediment were used to indicate line patterning.

PEDIMENT, in geology, a low-angle slope'of $\frac{1}{2}°$–7°, and of slightly concave form, found at the base of hills in regions where the rainfall comes in heavy storms. There is frequently a sharp break of slope between the pediment and the steeper hillside above it. There may or may not be a soil cover. Water passes across the pediment by laminar sheet flow, but if this is disturbed the flow becomes turbulent and gullies develop. Many tropical towns sited on pediments (which offer easier building sites than the steep hillsides above or the river marshes below) show severe gullying where the water flow has been concentrated between walls and buildings. The pediment is the most important element in the tropical landscape, both for building and farming; under natural conditions it is the most permanent part of the landscape, but it is also the part most easily destroyed by human interference.

(J. C. PH.)

PEDIPALPI, a name having two different meanings: (1) the first postoral appendages of Arachnida, Gigantostraca and Xiphosura; (2) an order of Arachnida (*q.v.*) now subdivided into three orders, Schizomida, Thelyphonida or whip scorpions (*q.v.*), and Phrynichida. (A. PH.)

PEDLAR: see HAWKERS AND PEDLARS.

PEDODONTICS is the practice of dentistry for children; it is the dental counterpart to pediatrics in medicine. Seven qualifications for a pedodontist have been listed by the American Board of Pedodontics: The pedodontist should be able to manage the behaviour of a very young patient and control his relations with the child's parent; he should be a master of the operative and restorative procedures that are practised for the deciduous (first) teeth and the immature permanent teeth; he should possess a thorough knowledge of the physical and chemical properties of the materials employed in all types of dental treatment and utilize them with skill; he should be able to remove children's teeth skillfully and perform the minor oral surgery that may be required; he should be able to practise scientific root-canal treatment for infected teeth and confirm bacteriologically the removal of infecting microorganisms; he should be able to diagnose and treat any juvenile dental problem of growth, development or health; and he should be able to instruct the family in proper dental-health practice and to institute measures for the prevention of defects of the teeth or the mouth.

During the years when dentistry was developing from a mechanical trade, learned by apprenticeship, to a health profession, the teeth of young children were neglected consistently. The "baby" teeth, it was thought, would be replaced promptly by the adult or permanent teeth, hence the first set of teeth was unworthy of the expenditure of the dentist's time and the family's resources. From 1840, when the first dental school in the world was established in Baltimore, Md., until 1916, when teaching in dental schools in the United States was reorganized to include the human biologic sciences, children's teeth generally were treated by removal whenever they ached. The teaching of scientific techniques in dental schools for the comprehensive treatment of the teeth and mouths of children came even later.

Since the age commonly recommended by pedodontists for the first visit to the dentist is $2\frac{1}{2}$ to 3 years, children's dentists must be able to approach very young children, gain their trust and secure their co-operation. Otherwise, dental treatment would be impossible. Oversolicitous and frightened parents often must be guided also. Some aids from children's psychologists and psychiatrists have helped dentists to work out routines that assure a pleasant experience and the completion of a surprising amount of treatment, even during the preschool child's first appointment with the dentist.

On the child's first visit, many pedodontists include a planned introduction to the equipment and instruments of the dental office; secure a sample of saliva to be used in obtaining a count of acid-producing microorganisms; complete the cleansing and polishing of the teeth, much as in an adult's dental prophylaxis; and instruct the child in proper toothbrushing. In those areas in which the water supply is deficient in fluorine, a series of applications of a fluoride solution to the dried surfaces of the teeth sometimes is instituted. Such a series, begun at three years of age, has been shown to cause a 40% reduction in the number of new cavities otherwise expected to develop in the deciduous teeth.

A comprehensive examination also may be completed during the initial visit. The crowns of the teeth are checked for obvious cavities and for faults in the enamel. A number of dental X-ray films are exposed and developed, and these radiographs reveal the extent of development and the position of the permanent teeth in the bony arches; anomalies of development such as missing teeth, extra teeth or teeth calcifying in unusual positions; areas of diseased bone about abscessed teeth; and small cavities beginning on the tightly contacting surfaces of the adjacent crowns of the teeth, particularly the molars that provide so much mastication until 10 to 12 years of age.

The tongue, tonsils, glands of the neck and soft tissues about the teeth and lining the mouth ordinarily are inspected to determine their condition. Finally, the occlusion (or bite) of the teeth is examined. Such habits as sucking the fingers, thrusting the tongue, biting the lip or breathing through the mouth cause obvious deformities in the arrangement of the teeth. Frequently, the pedodontist obtains impressions of the upper and lower arches and prepares a plaster model of the mouth in order better to study the occlusion of the teeth, plan treatment or refer the child to the orthodontist. Later, for the benefit of the child whose salivary examination indicates the presence of a large number of lactobacilli, a dietary history may be obtained and the entire family placed on a diet low in sugar for a few weeks to change the bacterial flora of the mouth. The process of dental caries generally can be halted by such periodic dietary restrictions.

One of the responsibilities of the pedodontist is to participate as a member of the team of specialists that provides treatment for handicapped children, tuberculous and palsied children, children with muscular dystrophy, children who are mentally retarded

and children experiencing developmental peculiarities. Most often such treatment must be performed in a hospital in order to utilize general anesthesia. For the patient with a cleft palate, the pedodontist provides all the general dental treatment that accompanies the services of the oral surgeon and other dental specialists, along with those of the speech therapist, the pediatrician and the psychologist.

See also DENTISTRY; ORTHODONTICS. **(KH. A. E.)**

PEDRELL, FELIPE (1841–1922), Spanish composer and musicologist. was born at Tortosa on Feb. 19, 1841. His education was mainly self-acquired. As a choir boy in the cathedral at Tortosa, he became thoroughly familiar with old Spanish church music. Juan Antonio Nin y Serra, his first master, directed his attention to the folk music of Spain by suggesting that he use songs heard at home in his practice compositions. Pedrell's first musical work appeared in 1871 and some years later he began to teach musical history and aesthetics at the Madrid conservatory. He continued to teach until 1894 when he returned to Barcelona because of ill health.

Pedrell became interested in the writings of Antonio Eximeno (1729–1808) who held that nationalism was the true source of music—that the compositions of a country should flow from its national song. This idea led to a lifetime of prolific researches, two valuable results of which were the publication of the complete works of Tomas Luis de Victoria (*q.v.*), and a catalogue of the music in the municipal library at Barcelona. He also collected and published old Spanish church, theatre and folk music, some of the writings of Eximeno (1921), and wrote numerous critical and historical works on music. Among his compositions, generally too serious to gain popularity, were the operas *Los Pirineos* (1894); *La Celestina* (1903); and *El Comte Arnau* (1921), this last based on a classical Catalan ballad. In addition, Pedrell composed chamber music, songs and cantatas. Although generally unrecognized in Spain, he exercised a marked influence on the course of its musical development and especially of its modern composers. Of his students, the most outstanding was Manuel de Falla (q v). Pedrell died in Barcelona on Aug. 19, 1922.

PEDRO II (DOM PEDRO DE ALCANTARA) (1825–1891), second emperor of Brazil, was born in Rio de Janeiro on Dec. 2, 1825. On April 7, 1831. when he was not yet six years old, his father, Pedro I, abdicated in his favour, and for nine years the country was governed by a regency. He was declared of age on July 23, 1840, and was crowned July 18, 1841. He might have perpetuated his dynasty had he been more attentive to political exigencies. On his accession uprisings occurred in several provinces; these were promptly suppressed in São Paulo and Minas Geraes (1842) but held out in Rio Grande do Sul until 1845. The new government persisted in the policy of intervention in Uruguay which had caused the abdication of Pedro I. In 1852 Brazilian troops were chiefly responsible for the defeat of Rosas of Argentina; in 1864 a Brazilian army made Flores *de facto* dictator of Uruguay; and it was owing mainly to Brazilian arms and resources that Solano López, the dictator of Paraguay, was defeated in the Paraguayan War (1864–70). The government had to combat intermittent provincial rebellions (notably that in Pernambuco, 1849), and was faced with diplomatic crises with England, France and the United States. But it left a record unparalleled in South America for conscientious and enlightened rule. The slave trade was prohibited in 1850; in 1871 a law provided for the gradual emancipation of the slaves, and in 1888 an imperial disposition abolished slavery throughout Brazil. The emperor consistently sponsored public improvements, fostered public instruction, and earnestly patronized art and science. He travelled widely, visiting Europe in 1871, 1876 and 1886, and the U.S. in 1876, affiliating himself closely with foreign intellectual life In 1889 a crisis arose. The nobility were alienated by the antislavery measures and other legislation aimed at reducing their prerogatives; the military was demoralized by inactivity; the emperor showed little interest in matters of state On Nov 15, Manuel D. da Fonseca (q *v*) led a Republican revolt. supported by the army and navy. There nas no resistance, the empire ended, and the emperor embarked with his family for Europe Nov. 17. A Federal republic was proclaimed. (W. B. P.)

PEEBLES, a royal and small burgh and the county town of Peeblesshire, Scot., at the junction of Eddleston water with the Tweed, 23 mi. S. of Edinburgh by road. Pop. (1951) 6,013. Area 1.5 sq.mi. The burgh consists of the new town, on the south of the Eddleston, and the old on the north. Portions of the town walls still exist, and there are cellars constructed in the 16th and 17th centuries as hiding places against border freebooters. The old market cross stands in High street. The Chambers institution incorporates the mansion where the notorious "Degenerate Douglas," or "Old Q," 4th duke of Queensberry (1724–1810), was born. Of St. Andrew's church, founded in 1195, nothing remains but the tower, restored by William Chambers, the publisher, who was buried beside it in 1883. Cross kirk was erected by Alexander III, in 1261, to contain a supposed remnant of the true cross discovered there. The building remained till 1784, when it was nearly demolished to provide stones for a new parish church. Peebles was a favourite residence of the Scots kings when they went to hunt in Ettrick forest. It was created a royal burgh in 1367 and was the scene of the poem of *Peblis* to *the Play,* ascribed to James I of Scotland. Peebles lost its importance after the union of the crowns. There are several large woollen mills, and the town is an agricultural centre. The Buchan family (Lord Tweedsmuir) is associated with Peebles, and Mungo Park practised medicine there (1801–03). In June the "Beltane queen" is crowned, this being a survival of the ancient religion.

On the north bank of the Tweed stands Neidpath castle, of which the ancient peel tower dates probably from the 13th century. Its first owners were Tweeddale Frasers, from whom it passed to the earls of Tweeddale. It was besieged and taken by Cromwell in 1650. The 3rd earl of Tweeddale (1645–1713) sold it to the duke of Queensberry in 1686. The earl of Wemyss succeeded to the Neidpath property in 1810.

PEEBLESSHIRE or TWEEDDALE, county in the centre of the southern uplands, Scotland, bounded north and northeast by Midlothian, east and southeast by Selkirkshire, south by Dumfriesshire and west by Lanarkshire. Area 347.3 sq.mi. Pop. (1951) 15,232, of whom 57 persons could speak both English and Gaelic. It is mainly an agricultural county. but the wool and tweed industry is important at Peebles and Innerleithen. The hills are highest in the south, where they belong to the Silurian uplands of southern Scotland, succeeded by an Ordovician belt. The uplands are intersected by the valley of the Tweed, which rises at Tweed's Well in the extreme southwest corner of the county, and by those of its tributaries, chief among them being the Lyne and the Leithen water. Peeblesshire derives its alternate name of Tweeddale from the fact that for the first 36 mi. of its course of 97 mi. the Tweed river flows through the shire. South of the Tweed the highest points are Broad Law (2,754 ft.) and Cramalt Craig (2,723 ft.) on the confines of Selkirkshire; north of the river the heights exceed 2.000 ft. in few places. In the northwest a part of the Pentland hills is included, showing Upper Silurian and Lower Old Red Sandstone rocks. Much glacial boulder clay, in the gravel and sand, rests upon the higher ground, while morainic deposits are found in the valleys.

The character of the soil varies considerably, peat, gravel and clay being each represented. The low-lying lands consist generally of rich loam composed of sand and clay. The farming is pastoral rather than arable, sheep being important—blackface breed on the hills and Cheviots around the more sheltered farms. Wheat and barley are grown on lower grounds bordering the rivers and there is some dairy farming. Approximately a tenth of the county was arable land at mid-20th century.

Occupation in the Early Iron Age is indicated by the remains of numerous hill forts around Peebles, and there are standing stones near the confluence of the Lyne and the Tweed. The Romans left traces of their military rule in the camp at Lyne, locally known as Randal's walls. In mediaeval times a series of peel towers was erected; the best preserved is Neidpath castle.

Peeblesshire is closely associated with the legend of Merlin (q v.), and it provided background and other material for Sir Walter Scott. John Buchan and other writers. The rebuilt cottage of the Black Dwarf (David Ritchie) is southwest of Peebles,

and *St. Ronan's Well* is generally thought to have been inspired by the mineral springs at Innerleithen.

In 1955 Peebles combined with Roxburgh and Selkirk to form a joint constituency returning one member to parliament. It forms a sheriffdom with the Lothians; there is a sheriff substitute at Peebles. The chief towns are Peebles (1951 pop., 6,013), the only royal burgh, and Innerleithen (2.361). These are the only two burghs and they are both small.

PEEK, GEORGE NELSON (1873–1943), **U.S.** industrialist and government official. was born on Nov. 19, 1873, in Polo. Ill., and attended Northwestern university, Evanston, Ill. He entered private industry in 1893 and served as an executive with agricultural implement companies until 1923. In 1918 he was with the War Industries board as commissioner of finished products. The following year he acted as chairman of the industrial board in the U.S. department of commerce. As president of the American Council of Agriculture, 1925–28. Peek gained a knowledge of farm problems which proved valuable when he was appointed administrator of the newly formed Agricultural Adjustment administration in May 1933. In 1934 and 1935 he acted as special adviser on foreign trade to Pres. Franklin D. Roosevelt while serving as head of the Export-Import Bank of Washington. Peek wrote several articles and pamphlets dealing with national agricultural policy and foreign trade.

Peek died at Rancho Santa Fe, near San Diego, Calif., on Dec. 17. 1943.

PEEKSKILL, a city of Westchester county. N.Y., U.S., on the east bank of the Hudson river, 41 mi. above New York city. Peekskill is the shopping centre for northern Westchester and Putnam counties. Its name was derived from that of the adjacent creek, or "kill," on which Jan Peek. an early Dutch settler, conducted an Indian trading post from 1667 to 1677. The village was strategically important during the American Revolution, and large sections of it were burned by the British on March 23, 1777. It became a city in 1940.

For comparative population figures *see* table in NEW YORK: Population. (M. H. LE.)

PEEL, ARTHUR WELLESLEY PEEL, 1ST VISCOUNT (1829–1912). English statesman, who was an outstanding speaker **of** the house of commons. was the youngest son of Sir Robert Peel (*q.v.*). He was born in London on Aug. 3, 1829, and educated at Eton and at Balliol college. Oxford. He entered parliament in 1865, and after holding various offices became speaker in 1884. He was re-elected in 1886 and 1892, and on his retirement in 1895 received a viscountcy. He died at Sandy, Bedfordshire, on Oct. 24, 1912.

He was succeeded by his son WILLIAM ROBERT WELLESLEY PEEL (1867–1937), 2nd Viscount and 1st Earl (cr. 1929), who was prominent in London politics. Born in London on Jan. 7, 1867. and educated at Harrow and at Balliol college, Oxford, he entered parliament in 1900, and gained prominence as leader of the municipal reform party (1908–10) and as chairman of the London County council (1914–16). In 1919 he was appointed undersecretary of war, and after holding various other offices became secretary of state for India (1922–24 and 1928–29) and lord privy seal (1931). He died at Petersfield, Hampshire, on Sept. 28, 1937. **(A.** BRI.)

PEEL, SIR ROBERT, 2ND BART. (1788–1850), English statesman who was described by Lord Rosebery as the "model of all prime ministers." was born on Feb. 5, 1788, at Chamber hall, near Bury. Lancashire. His grandfather, Robert Peel. was a calico printer, who took to cotton spinning and became a wealthy businessman. His father. Robert Peel (1750–1830), carried on the family business and also interested himself in politics. He was M.P. for Tamworth, a supporter of Pitt and a warmhearted humanitarian. He became a baronet in 1800.

Young Robert Peel both benefited and suffered as a result of his Lancashire business background. It provided him with a considerable private fortune, which permitted him to devote most of his lifetime to politics; at the same time, it led to frequent taunts that he was a parvenu: Like his father, he was a Conservative in politics, but many traditionalist Conservatives, associated with the landed interest, thought of him disparagingly as "the Spinning Jenny."

If he was always Lancashire underneath, he had an impressive veneer of Harrow and Christ Church, Oxford. where he took a first class both in classics and mathematics. On leaving Oxford he was entered at Lincoln's Inn, and in 1809, at the age of 21, entered the house of commons. He sat at first for the close borough of Cashcl. Tipperary, then for Chippenham, Wiltshire.

He made his mark in the house by strict attention to all his parliamentary duties, by diligent industry, mastery of procedure and by a style of speaking which owed its force not to rhetoric but to detailed knowledge of parliamentary business, lucidity of exposition and tact in arranging his arguments. He soon was given office. He made his maiden speech, seconding the address in Jan. 1810; later in the year he became undersecretary for war and the colonies.

His first real opportunity in politics came in 1812 when he was transferred by Lord Liverpool to the more important but difficult post of secretary for Ireland. There he was engaged until 1818 in maintaining English ascendancy over a country heaving with discontent, teeming with conspiracy and on the verge of rebellion. "I believe an honest, despotic government would be by far the fittest government for Ireland," Peel remarked. Very systematically he set out to apply this policy, relying both upon coercion and patronage. He suppressed Irish opposition newspapers, resolutely opposed Catholic emancipation, instituted a regular Irish constabulary and on the more positive side tried to promote joint education as a means of reconciling religious differences. In applying this policy, which gave him his first real experience of administration, he had to face the opposition both of English advocates of Catholic emancipation, such as George Canning, and Irish politicians, such as Daniel O'Connell. In general, his despotic policy was not successful and did not prevent a combination of agrarian and political unrest. When in 1817 he was elected member of parliament for the University of Oxford, he expressed a desire to resign his Irish responsibilities, and just before he did so a year later, he wrote, "a fortnight hence, I shall be as free as air." Although he remained out of office until 1821, he had established himself. despite the failure of his policy, as one of the most promising young Tory politicians. His support of the union and the claims of the Irish Protestant Church weakened him in Ireland but strengthened him at Westminster. He won the Oxford seat against the opposition of Canning and with the support of die-hard Tories such as Lord Eldon. He remained on good terms with the official leaders of his party and, although he had opponents who considered him stiff and punctilious, his views always had to be taken seriously.

In 1819 he was made chairman of a secret committee of the Bank of England to consider the resumption of cash payments. This again was an important but difficult task, for currency problems at this time provoked sharp differences of opinion and conflicts of interest. Along with "corn and Catholics." they were the crucial political issues of the times. In 1797 Pitt had authorized the bank to refuse cash payment for sums over £1, and an era of finance by paper money had begun. After 1815 influential economists, led by David Ricardo. pressed for a return to gold. although many supporters of the landed interest and opponents of the fundholders were bitterly opposed to what they felt would be a deflationary or an inequitable measure. Peel threw his weight behind the orthodox economists, thereby clashing with his father, and on May 24, 1819, moved and carried in the house of commons four resolutions embodying the recommendations of his committee in favour of a return to cash payments. He admitted that he had changed his mind on the question. This was the first of several occasions during his life when he showed that he had an open mind and a readiness to listen to the opinion of "experts." The return to gold, which became effective in 1821, caused great hardship to debtors, of whom the landowners were the most important and influential group. They reproached Peel with having sacrificed the landed to the funded interest: the first time that this charge, which was frequently to be repeated, was made against him. Other critics of the bill were the Birmingham industrialists, who wished to

maintain a mild inflation, and William Cobbett, who hated paper money but felt that there should be no return to gold without considerable reduction of the national debt. As a result of the bill, the nation was insisting that debts which had been contracted in depreciated paper had to be paid in gold. Peel was thus attacked from many sides, although he was supported not only by economists but by the cotton interest, international trading houses and the City of London.

In 1822 Peel rejoined Liverpool's ministry as home secretary, and in this office he was less open to criticism. Although he had once more to concern himself with Irish discontent and to struggle hard against the supporters of Catholic emancipation, he was favoured by an improvement in the English domestic situation. The period of radical agitation after 1815. which was met by severe governmental repression, was giving way to a more liberal phase. Peel himself contributed to one aspect of the liberal movement by reforming and humanizing the criminal law, especially those parts of it which related to offenses against property and offenses punishable by death. Peel was a borrower rather than an initiator, and his reforms reflected the views of other reformers, such as Sir Samuel Romilly and Sir James Mackintosh. He gained much praise, however, especially from the Whigs, and he could rightly claim that all his legislation had sought "some mitigation of the severity of the criminal law, some prevention of abuse in the exercise of it, or some security for its impartial administration." The most important of his measures was the establishment of the metropolitan police force, a reform which for many years provoked sharp controversy. He knew how far to go in his reforms. Although, for instance, he believed that "the country has outgrown its police institutions." he realized that "the difficulty in this, as in ten thousand cases, is to devise any general rule which shall apply to a society so varying in its subdivisions as ours is." In governing England, Peel saw far more clearly than in governing Ireland that problems of administration were inextricably bound up with problems of economy and society, and that coercion was never enough.

It was Ireland and not England, however, which was to cause the next crisis in his career. In 1827 the Liverpool ministry, which had carried the country through war and peace, was broken up by the fatal illness of the prime minister, and under the new premier, Canning, with whom Peel had often disagreed, both Peel and the duke of Wellington refused to serve. The rivalry between Peel and Canning was both political and personal. Canning, the political diarist Mrs. Arbuthnot had written a few months earlier, "is excessively jealous of Mr. Peel and always objects to anything that is to strengthen Mr. Peel's party, which he considers as distinct from his own." The divisions within the Tory ranks continued after Canning's death (Aug. 1827) and even in Jan. 1828, when the duke of Wellington became prime minister and Peel home secretary again. They multiplied when Peel, faced with a political crisis in Ireland, found it necessary to change his views and for reasons of expediency to adopt the same Irish policy which Canning had supported earlier for reasons of principle. After a defeat in the house of commons, Peel had to acquiesce in the repeal of the Test and Corporation acts, which imposed civil disabilities on those persons who were not members of the Church of England. Immediately afterward the general question of Catholic emancipation was brought to a head by the election of O'Connell, Peel's old enemy. as "repeal" member of parliament for the county of Clare. O'Connell was supported by the militant and well-organized Catholic association, and Peel, with his fear of widespread disorder, saw at once that a change in Irish policy was necessary. The impression that the government meant to yield became prevalent in England, and stirred up Protestant opposition to Peel, who had been a Protestant hero until that moment. Peel was naturally anxious to commit the new policy to other hands. In Jan. 1829, however, because of the continued strength of Tory and royal opposition, Wellington told Peel that unless he stayed in office, there was no chance of carrying emancipation, which both of them now felt to be necessary. Subject to pressure, Peel consented to stay in office, although the cry of "traitor" was raised against him. The consent of the king, which could scarcely have been obtained except by Wellington and Peel, was extorted, withdrawn (the ministers being out for a few hours) and again extorted; and on March 5, 1829. Peel proposed Catholic emancipation in a speech of more than four hours. Protestant newspapers talked of a betrayal of the constitution and appeared with black borders, while Protestant Oxford rejected Peel and returned the ultra-Protestant Sir Robert Inglis in his place. Peel took refuge in the close borough of Westbury, from which he afterward moved to Tamworth. Staffordshire, in 1830. He continued to sit for Tamworth until his death.

Catholic emancipation broke up the party, which had already lost much of its cohesion by the time that Liverpool died. The Whig Reform bill, which was introduced by Lord Grey, Wellington's successor, in March 1831, helped to draw them together again. Some Tories opposed the bill intemperately, but Peel, as always, spoke with restraint and moderation. He maintained that the extension of the franchise and the redistribution of seats would destroy the existing balance of the constitution, create a division in the legislature between rural and industrial interests and prepare the way for a further chain of reforms and an eventual assault on property. "I was unwilling to open a door," he remarked, "which I saw no prospect of being able to close." He refused to join the duke of Wellington in trying to form a Tory government at the height of the parliamentary and popular storm in the spring of 1832, and when the Grey ministry had gone out after the king had refused to promise them to create new peers. Although by this time he was convinced that parliamentary reform was inevitable, he could not afford to risk his future by provoking a new charge of apostasy. After the Reform bill became law in June 1832 he accepted it as irrevocable, and when the general election of Dec. 1832 left him with barely 150 followers in the house of commons, he set out to weld them into a compact body, committed to cooperation inside the new political framework. His views were clearly stated in the so-called Tamworth manifesto to his constituents in 1834. The Reform bill, he explained, was "a final and irrevocable settlement of a great constitutional question." If willingness to adopt the spirit of the bill, he went on, merely implied a review of existing institutions and redress of abuses and grievances without infringing on established rights, he was prepared to subscribe to those principles. In this manifesto Peel showed that although he had served his political apprenticeship in the age of Lord Eldon and Lord Sidmouth, he had now learned to adapt his ideas and policies to the mood of the age. He showed too that the party which he led was not incapable of appealing to the new middle class electorate, brought into existence by the Whigs in 1832.

Peel drew up the manifesto after the Whigs had demonstrated that their own control of government remained precarious despite their triumphs between 1830 and 1832. In 1834 the Melbourne ministry, the successor to that of Grey, proved so weak that the king dismissed it, leaping at a half-proffered resignation. Peel took up power before he expected or desired it. He hurried from Rome, where he was on holiday, at the request of the duke of Wellington, and became prime minister for the first time, holding the two offices of first lord of the treasury and chancellor of the exchequer. When parliament was dissolved and he appealed to the electorate — the Tamworth manifesto was his own contribution — he gained considerably in strength but not enough to secure a majority. He was outvoted on the election of a speaker at the opening of the session, and after struggling on for six weeks longer, resigned on the question of appropriating part of the revenues of the church in Ireland to national education. His time had not yet come, but the capacity and resource he displayed in this short-lived minority government raised him immensely in the estimation of the house, his party and the country. The controversies of the past seemed dead and the cry of treachery to have been forgotten.

Between 1835 and 1839 he built up a parliamentary party with a tighter discipline than any party had possessed before. He used whips to control his supporters in parliament, and encouraged his supporters outside parliament to register for the franchise. He turned the Carlton club, which had been founded in 1831, into a party headquarters. From the general election of 1835 onaard, the Carlton club provided the initiative for scrutinizing local elec-

toral rolls, although contact between centre and constituencies was not so systematic as it became later in the century. The new discipline chafed some of his supporters, who complained that an attempt was being made "to convert a body of high-minded noblemen and gentlemen into a regiment of partisans," but for the time being it was effective. "Never had the leader of a party a more complete ascendancy over that party," wrote a commentator in 1836, "than has this Tory Coryphaeus over the Conservatives in the House of Commons." The trouble was that he did not win the hearts of his followers. He was sensitive and secretive, trying to educate his party into his own way of thinking, and while he carried most of them with him in supporting such reforms as the Municipal Corporations act of 1835, he often made them restless. The landed interest frequently advocated policies with which he was out of sympathy and a popular but prejudiced local Toryism in the north of England contrasted violently with his own sober version of Conservatism. There were some of his followers who felt also that his refusal to take part in what he called factious opposition was a surrender to liberal Whiggery.

In 1839 the weak Whig government resigned when a proposal to suspend the constitution of Jamaica, where the assembly had refused to perform its functions as a protest against interference from the home government, was carried by only five votes, and Peel was called upon to form a government. After he had submitted names for a cabinet, he resigned the commission because of the young Queen Victoria's persistent refusal to dispense with any of the Whig ladies of her bedchamber. Had it not been for this crisis in the relations between Peel and the queen, his policy of patient and thoughtful party building would have ensured a relatively early return to office, which he much preferred to opposition. As it was, he had to wait until the general election of 1841, when the Whigs were in a minority of 91. They resigned. and Peel became prime minister for the second time, with a sizable majority.

The situation demanded a master hand. The national finances were in disorder. For several years there had been a growing budget deficit, estimated for 1842 at more than £2,000,000, and attempts to remedy this by additions to assessed taxes and customs duties had failed. More serious still, there was a profound social problem, reflected in bitter class relations, unemployment and starvation among the poor and slack trade among the manufacturers. The Chartists were clamouring for the six points of their formula *(see* CHARTISM), and the Anti-Corn-La league (*q.v.*) was attacking the landlords as the enemies of society. Between 1841 and 1846 Peel did much not only to reorganize the national fiscal system but also to prevent revolution and restore confidence in government. His ministry laid the foundations of Victorian England. and Peel himself was conversant with all the great issues which confronted his ministers. Unfortunately he was less conversant with the doubts and grievances of his rank-and-file supporters, and administrative triumph was eventually accompanied by political disaster. Peel saved his country only by breaking up his party. Although in retrospect he could claim that he was "much more surprised that the union was so long maintained than that it was ultimately severed," he was shocked by the violence of the disintegration and the cries of "traitor" which were once more hurled at him by his former supporters.

Peel met the immediate fiscal crisis by introducing income tax on all incomes of more than £150 a year. To encourage trade he either removed or drastically reduced duties on a vast number of articles of import, especially raw materials and foodstuffs. Increased consumption, as he anticipated, countervailed the reduction in duty. The depression lifted, the deficits were turned into surpluses, and in 1844 he was able to convert £250,000,000 of debt from 33% to 3%. In 1845, while renewing the income tax for another three years, he repealed all duties on 450 imports and all the remaining duties on exports. He had sketched the outlines of a free-trade policy not on doctrinaire grounds but for reasons of sound administration. Among the other important measures he introduced was the Bank Charter act of 1844, which rigidly separated the banking and issue departments of the Bank of England and limited its rights of issue.

There was little conflict about such proposals, but as soon as Peel turned his attention to the Corn laws, social and political difficulties loomed large. The duties on the imports of foreign corn were considered as a necessary economic and social prop by the landed interest; by the Anti-Corn-La league they were felt to be a barrier to all economic progress. In 1842 Peel lowered the duties of the sliding scale, which had been introduced in 1828 as a modification of the 1815 Corn law. Many Tories already regarded this reform as a step toward free trade. and the ***Edinburgh Review*** commented that he had "prepared the way with great adroitness, but with much caution, for the final abandonment of protection." The leaguers. led by Richard Cobden (*q.v.*), felt that the change did not go far enough, and in 1843 Cobden declared that Peel was individually responsible for the distress in the country. Peel himself admitted to W. E. Gladstone in 1843 that he could no longer stand on agricultural protection as a principle, but such a private admission diverged sharply from the opinions of many of his followers. His decision to enact total repeal was taken only when the approach of the Irish potato famine lent urgency to the repealers' case. In Nov. 1845 he faced sharp opposition from inside his own cabinet, and in early Dec. he resigned. After Lord John Russell (*q.v.*) had failed to form a Whig government, Peel returned to office on Dec. 20. Supported by all his former colleagues, except Lord Stanley, he introduced his Corn law and Customs bill in the commons in Jan. 1846, in which he proposed total repeal, although the ports were not to be completely opened until 1849. In the long and fierce debates which followed, he was attacked with the most virulent invective. His party split, 231 Tories voting against him and only 112 for him in the crucial division on the second reading on Feb. 27. He was accused both of panic and betrayal, particularly by the rising young politician Benjamin Disraeli, and although he carried repeal with the help of his political opponents, he was defeated on June 25 by a coalition of protectionists and Whigs, who opposed his new Irish Coercion bill. He immediately resigned. Once again the impact of Ireland on English politics had directly influenced his prospects. In the course of the final debates. he paid a generous tribute to Cobden, but he refused to take Cobden's advice and appeal to the country on the issue of free trade. He was sensitive to middle-class needs, but unlike Cobden he refused to contemplate a new middle-class system of government. He certainly did not wish to undermine agriculture. Basically he was still a Conservative, who. in his own words, wished "to terminate a conflict which, according to our belief, would soon place in hostile collision great and powerful classes." He counted the interests of party for little in his long-term reckoning.

After the general election of 1847, in which the Whigs secured a majority, Peel gave them considerable outside support. He joined them, for example, in carrying the repeal of the navigation laws. In 1849 he returned to the problems of Ireland, which had concerned him for so long. In 1845 he had alienated many of his Tory supporters by granting an increased subsidy to the Roman Catholic priests' seminary at Maynooth. In 1849, in a speech on the Irish poor laws. he first suggested, and in the next year succeeded in establishing. a commission to facilitate the sale of estates in a hopeless state of encumbrance. The Encumbered Estates act was designed to transfer the land from ruined landlords to solvent owners capable of maintaining and improving their property. On June 28, 1850, he made his last great speech criticizing Lord Palmerston's foreign policy; it was in line with the cautious and peaceful approach he had always advocated in foreign affairs. The speech was thought to show that, if necessary or feasible, he would return to office. On the following day he mas thrown from his horse on Constitution hill, and died on July 2. He was still in the prime of life and his prestige was high. All the tributes which respect and gratitude could pay were made to him by the queen and Prince Albert, whose sympathy and friendship he had won between 1839 and his death, by parliament, by public men of all parties, by the press, and above all by the citizens of the great industrial areas, to whom he had given "bread unleavened with injustice."

Peel, who married Julia, daughter of Gen. Sir John Floyd, in 1820, had five sons and two daughters. His domestic life was as

happy as his public life was conscientious. No statesman was more impelled by an overriding sense of public duty, and there was no greater public contribution than his to the march of improvement in 19th-century England. *See* also CONSERVATIVE PARTY, BRITISH; CORN LAWS.

PEEL, a seaport and seaside town on the west coast of the Isle of Man, 10 mi. N.W. of Douglas by road and on the Isle of Man railway. Pop. (1951) 2,582; area .3 sq.mi. It lies on Peel bay at the mouth of the river Neb, which forms the harbour. The old town consists of narrow streets and lanes, but a modern residential quarter has grown up to the east. On the west side of the river mouth St. Patrick's Isle, connected with the mainland by a causeway, is occupied almost wholly by the ruins of Peel castle. St. Patrick is said to have founded there the first church in Man, and a small chapel, dedicated to him, appears to date from the 8th or 10th century. There is a round tower, also of early date.

The ruined cathedral of St. German has a transitional Norman choir, with an early crypt beneath, and a nave with an early English triplet at the west end. There are remains of the bishops' palace, of the palace of the lords of Man, of the keep and guard-room above the entrance to the castle, and of the Moare or great tower, while the whole is surrounded by battlements. In 1397 Richard II condemned the earl of Warwick to imprisonment in Peel castle, and in 1444 Eleanor, duchess of Gloucester, received a like sentence. Peel has a long-established fishing industry. It was called Holen ("island"; *i.e.,* St. Patrick's Isle) by the Northmen; the existing name is Celtic, meaning "fort."

BEELE, GEORGE (1556–1596), English dramatist, predecessor of Shakespeare, who experimented in many forms of theatrical art: pastoral, history, melodrama, tragedy, folk play and pageant. His *The Arraignmenf of Paris* is one of the earliest mythological pastorals, and his *Device of the Pageant Borne Before Woolstone Dixi* is the earliest surviving complete lord mayor's show, the annual pageant produced for the inaugural ceremonies of the lord mayor of London.

Peele was born in London, the eldest son of a middle-class urban family. His father. James, was an accountant and teacher who himself wrote pageants, as well as two treatises explaining double-entry bookkeeping. Shortly after George's birth James was appointed head bookkeeper of Christ's hospital, at that time a home and school for London orphans. There the dramatist lived and studied until he went to Oxford in 1572.

What is known of Peele's career at Broadgates hall (later Pembroke college) and Christ Church, Oxford, indicates that he began his varied literary career by translating into English one of the plays of Euripides. William Gager, the celebrated Latin dramatist, wrote two commendatory poems to the young student, praising him for his literary skill; and Anthony à Wood records that Peele was "esteemed a most noted Poet in the University."

In 1579 Peele made two trips to London. His second visit was cut short at the request of the hospital governors, who seem to have felt that the added burden of a student able to shift for himself was too distracting for the now-ailing father. Peele returned to Christ Church, where he married Anne Cooke and settled down in the university community. During this period he probably wrote the first of his surviving works, a 485-line verse epitome of the *Iliad,* titled *The Tale of Troy* (published 1589).

In 1581 he moved to London but during the next two years returned to Oxford many times to cope with litigation over property his wife had inherited. Pleasanter business necessitated his return in 1583, when Christ Church presented two spectacular plays by Gager, and Peele was hired as one of the technical directors.

About this time Peele had joined a group of Oxonians living just outside the London city wall and had begun to experiment with poetry in various metres. From this association with the so-called "university wits" comes a blank verse commendatory poem to the poet Thomas Watson and two mythological pastorals: *The Arraignment of Paris* (1584) and *The Hunting of Cupid.* This sort of gentleman's writing probably brought Peele less money than praise, for shortly afterward he produced *The Device of the Pageant Borne Before Woolstone Dixi* (1585). It was followed by other pageants for the city, of which anly *Descensus Astraeae* (1591) survives.

The Arraignment of Paris was produced for the courtiers, but the rest of Peele's life was devoted to writing for the popular stage. Of the many playhouse dramas he must have had a hand in, only four can be certainly ascribed to him: *The Battle of Alcazar* (1594), *The Old Wives Tale* (1595; ed. by R. L. Blair, 1936), *Edward I* (1593) and *The Love of King David and Fair Bethsabe* (1599). To supplement a meagre income, Peele turned out poems commemorative of noteworthy events: *A Farewell* (1589), to John Norris and Francis Drake on their departure with a counterarmada to fight the Spanish; *An Eglogue Gratulatorie* (1589), to the earl of Essex on his return home from this expedition; *Polyhymnia* (1590), celebrating an important tilting match; *The Honour of the Garter* (1593), commemorating the earl of Northumberland's installation as knight of the Garter; and *Anglorum Feriae* (1595), another memorial of a noteworthy tilt. The only other work which can with any certainty be ascribed to Peele is a poem, "The Praise of Chastity," which appeared in *The Phoenix Nest* (1593), an anthology of Oxford poets.

It used to be customary to describe Peele as dissipated, depraved and desperate, but the evidence on which such an estimate of his character was largely based—an anonymous jestbook that made free use of his name—is valueless in this respect. He lived and died a varied life fraught with the perils of poverty; shortly before his death he sent his eldest daughter to Lord Burghley with a request for money, describing himself as enfeebled by long sickness. His contemporaries praised him highly. Modern critics accord him a place, along with Robert Greene, Thomas Kyd and Thomas Nashe, as an important early playwright with considerable technical skill.

PEERAGE. Although in England the terms peerage (Fr. *pairage;* Med. Lat. *paragium;* M E. *pere;* O.Fr. *per, peer,* later *pair;* Lat, *paris,* "equal"), nobility, House of Lords are commonly regarded as synonymous, in reality each expresses a different meaning. A man may be a peer and yet not be a member of the House of Lords, a member of the House of Lords and yet not strictly a peer, though all peers are members of the House of Lords. either *in esse* or *in posse.*

In the United Kingdom the rights, duties and privileges of peerage are centred in an individual, while to the old monarchical notions of the Continent, nobility conveyed the idea of family, as opposed to personal, privilege.

The Origin of Peerage.—Etymologically, peers are equals *(pares),* and in Anglo-Norman days the word was invariably so understood. The feudal tenants-in-chief of the Crown were all the peers of one another; so, too, a bishop had his ecclesiastical peer in a brother bishop, and the tenants of a manor their peers in their fellow-tenants. That even so late as the reign of John the word was still used in this general sense is clear from Magna Carta, for the term *judicium parium* therein must be understood to mean that every man had a right to be tried by his equals. This right was asserted by the barons as a body in 1233 on behalf of Richard, earl marshal, who had been declared a traitor by the king's command. The English barons undoubtedly were using the word in the sense it held in Magna Carta. The change in England was gradual and probably gathered force as the gulf between the greater barons and the lesser widened, until in course of time, for judicial purposes, there came to be only two classes, the greater barons and the rest of the people. Ecclesiastics had special privileges for most purposes, being triable only by the Church. The first use of the word peers, as denoting

those members of the baronage who were accustomed to receive regularly a personal writ of summons to parliament, is found in the record of the proceedings against the Despensers in 1321. (Stubbs, *Const. Hist.* ii. 347.)

Anglo-Norman Baronage.—Properly to understand the growth and attributzs of the peerage it is necessary to trace the changes which occurred in the position of the Anglo-Norman baronage, first through the gradual strengthening of royal supremacy, with the consequent decay of baronial power locally, and subsequently by the consolidation of parliamentary institutions during the reigns of the first three Edwards In place of the individual absolute ownership of Saxon days, the Conqueror became practically the sole owner of the soil. The change, though not immediately complete, followed rapidly as the country settled down and the power of the Crown extended to its outlying frontiers. The new owners became direct tenants of the king. All tenants-in-chief were termed generally barons (*see* BARON).

The King's Court.—The king's tenants owed as a duty the service of attending the King's Court (*curia regis*), and out of this custom grew the parliaments of later days. In theory all the king's tenants-in-chief, great and small, had a right to be present as incident to their tenure. The King's Court was held regularly at the three great festivals of the Church and at such other times as deemed advisable The assembly for several generations neither possessed nor pretended to any legislative powers. Legislative power was a product of later years, and grew out of the custom of the Estates granting supplies only on condition that their grievances were first redressed. The great bulk of the tenants were present for the purpose of assenting to special taxation above and beyond their ordinary feudal dues. When necessary a general summons to attend was sent through the sheriff of every county, who controlled a system of local government which enabled him to reach every tenant. In course of time to a certain number of barons and high ecclesiastics it became customary to issue a personal writ of summons, thus distinguishing them from the general mass summoned through the sheriff.

Magna Carta and Personal Summons to the **Majores** Barones.—The sequel is found in Magna Carta, wherein it is provided that the archbishops, bishops, abbots, earls and greater barons are to be called up to the council by writ directed to each severally; and all who hold of the king in chief, below the rank of greater barons, are to be summoned by a general writ addressed to the sheriff of their shire: Magna Carta thus indicates two definite sections of the king's tenants, a division which had evidently persisted for some time. The "greater barons" are the parents of the peers of later days. As for the rest of the tenants-in-chief, poorer in estate and therefore of less consequence, it is sufficient here to note that they fell back into the general mass of manorial owners; and that their representatives, the knights of the shire, after some hesitation, at length joined forces with the city and burgher representatives to form the House of Commons. From 1254 to 1295 in varying numbers there were summoned to the King's Councils representatives of the counties, boroughs and cities. The assembly of 1295, called the Model Parliament, is regarded legally as the first of our freely-elected properly representative assemblies, but recent research now ascribes this character to a Parliament summoned as early as 1275.

To every spiritual and temporal baron accustomed to receive an individual writ, one was issued. Every county elected its knights, and every city or borough of any importance was instructed by the sheriff to elect and to return its allotted number of representatives. It may be taken for granted, however, that any assembly held since 1295, which did not conform substantially to the model of that year, cannot be regarded constitutionally as a full parliament. The point is even of modern importance, as in order to establish the existence of a barony by writ it must be proved that the claimant's ancestor was summoned by individual writ to a full parliament, and that either he himself or one of the heirs of his body was present in a full parliament.

Grades of Peerage.—An examination of the early writs issued to individuals shows that the baronage consisted of archbishops, bishops, abbots, priors, earls and barons. While the archbishops and bishops received their writs with regularity, the summonses to heads of ecclesiastical houses and greater barons were intermittent. The prelate held an office which lived on regardless of the fate of its temporary holder, and if by reason of death, deprivation or translation the office became vacant, a writ still issued to the "Guardian of the Spiritualities." The prior or the abbot, on the other hand, often outside the jurisdiction of the English Church, and sometimes even owing allegiance to a foreign order, was but the personal representative of a land-holding community. The conclusion, then, may be drawn that in theory the issue of a writ was at the pleasure of the Crown, and that in practice the moving factor in the case of the prelates was office and personal importance, and in the case of priors, abbots, earls and barons, probably, in the main, extent of possession.

Hereditary Principle.—The next point for consideration is when did the peerage, as the baronage subsequently came to be called, develop into a body definitely hereditary? Here again growth was gradual and somewhat obscure. Throughout the reigns of the first three Edwards summonses were not al ays issued to the same individual for successive parliaments; and it, is quite certain the king never considered that the issue of one writ to an individual bound the Crown to its repetition for the rest of his life, much less to his heirs in perpetuity. Again we must look to tenure for an explanation The custom of primogeniture tended to secure estates in strict family succession, and if extent of possession had originally extracted the acknowledgment of a personal summons from the Crown it is more than probable that as successive heirs came into their inheritance they, too, would similarly be acknowledged. In early days the summons mas a burden to be suffered of necessity, an unpleasant incident of tenure, in itself undesirable, and probably so regarded by the majority of recipients during at least the two centuries following the Conquest. Gradually the free and indiscriminate choice of the Crown became fettered by the principle that, once a summons had been issued to an individual to sit in parliament and he had obeyed that summons, he thereby acquired a right of summons for the rest of his lifetime; and in later years, when the doctrine of nobility of blood became established, his heirs were held to have acquired the same privilege by hereditary right.

The earl's position in the baronage needs some explanation. Modern historical opinion inclines to the view that while originally an earldom may have been something of an office, it rapidly became little more than an added name of dignity conferred on one already a leading member of the baronage. Earls received individual summonses to parliament by the name of Earl (*q.v.*); but there is reason to believe that in early clays at any rate they sat by tenure as members of the baronage.

If we review the political situation at the beginning of the 14th century a great change is evident. The line between those members of the baronage in parliament and the rest of the people is firmly and clearly drawn. Tenure as the sole qualification for presence in the national assembly has disappeared, and in its place there appears for the baronage a system of royal selection and for the rest of the people one of representation.

Peerage a Personal Dignity.—Primogeniture, a custom somewhat uncertain in early Anglo-Norman days, had rapidly developed into a definite rule of law. As feudal dignities were, in their origin, inseparable from the tenure of land, it is not surprising that they, too, followed a similar course of descent, although as the idea of a dignity being exclusively personal gradually emerged, some necessary deviations from the rules of law relating to the descent of land inevitably resulted. In the 11th year of his reign Richard II. created by letters patent John Beauchamp "Lord de Beauchamp and baron of Kyddermynster, to hold to him and the heirs of his body." These letters patent were not founded on any right by tenure of land possessed by Beauchamp, for the king makes him "for his good services and in respect of the place which he has holden at the coronation (*i.e.*, steward of the household) and might in future hold in the king's councils and parliaments, and for his noble descent, and his abilities and discretion, one of the peers and barons of the kingdom of England; willing that the said John and the heirs-male of

his body issuing, should have the state of baron and should be called by the name of "Lord de Beauchamp and baron of Kyddermynster." The grant rested wholly on the grace and favour of the Crown, and was a personal reward for services rendered. Here, then, is an hereditary barony entirely a personal dignity and quite unconnected with land. From Richard's reign to the present day, baronies (and, indeed, all other peerage honours) have ccntinued to be conferred by patent. The custom of summons by writ was not in any way interfered with, the patent operating merely to declare the dignity and to define its devolution. Summons alone still continued side by side for many generations with summons founded on patent; but after the reign of Henry VIII. the former method fell into disuse, and during the last 250 years there have been no new creations by writ of summons alone. So, from the reign of Richard II., barons were of two classes, the older, and more ancient in lineage summoned by writ alone, the honours descending to heirs-general, and the newer created by letters patent, the terms of which governed the issue of the summons and prescribed the devolution of the peerage in a line usually of the direct male descendants of the person first ennobled.

Peerages by Tenure. — It was long believed that, originally, there existed peerages by tenure alone and that such could devolve by right of tenure independent of descent. The Berkeley case of 1858–61 (better reported 8 H.C.L. 21) is essential for the student who wishes to examine the question carefully; and may be regarded as finally putting an end to any idea of bare tenure as an existing means of establishing a peerage right. (*See* also Cruise on Dignities, 2nd ed., pp. 60 et seq.)

The main attribute of a peerage is that hereditary and inalienable quality which ennobles the blood of the holder and his heirs, or, as a great judge put it in 1625, in the earldom of Oxford case, "he cannot alien or give away this inheritance because it is a personal dignity annexed to the posterity and fixed in the blood" (Dodridge, J., at p 123, Sir W. Jones's Reports).

Dukes. — Until the reign of Edward III. the peerage consisted only of high ecclesiastics, earls and barons. The earls were barons with their special name of dignity added, and their names always appear on the rolls before those of the barons. In 1337 King Edward III. created his son, the Black Prince, duke of Cornwall, giving him precedence over the rest of the peerage. Subsequently several members of the royal family were created dukes, but no subject received such an honour until 50 years later, when Richard II. created his favourite, Robert de Vere, earl of Oxford, duke of Ireland (for life). The original intention may have been to confine the dignity to the blood royal, since, with the exception of de Vere, it was some years before a dukedom was again conferred on a subject.

Marquesses. — In 1385 Richard II. had created Robert de Vere marquess of Dublin, thus importing an entirely new and unknown title into the peerage. The grant was, however, only for life, and was, in fact, resumed by the Crown in 1387, when its recipient was created duke of Ireland.

Viscounts. — Under the name of viscount (*q.v.*) Henry VI. added yet another order, and the last in point of time, to the peerage, creating in 1440, John, Baron Beaumont, Viscount Beaumont and giving him precedence next above the barons. The name of this dignity was borrowed from the Continent, having been in use for some time as a title of honour in the king's French possessions. None of the new titles above mentioned ever carried with them any official position; they were conferred as additional honours on men who were already members of the peerage.

Spiritual Peers. — The application of the hereditary principle to temporal peerages early differentiated their holders from the spiritual peers. Both spiritual and temporal peers were equally lords of parliament, but hereditary pretensions on the one side and ecclesiastical exclusiveness on the other soon drew a sharp line of division between the two orders. Gradually the temporal peers, strong in their doctrine of "ennobled" blood, came to consider that theirs was an order above and beyond all other lords of parliament, and before long, arrogated to themselves the exclusive right to be called peers, and as such the only persons entitled to the privileges of peerage.

The pretensions of the lay peers were not admitted without a struggle on the part of the prelates, who made the mistake of aiming at the establishment of a privileged position for their own order while endeavouring to retain every right possessed by their lay brethren. They fell between two stools, lost their position as peers and were beaten back in their fight for ecclesiastical privilege. For themselves Churchmen never claimed the privilege of trial by peers, and when arraigned, alleged to be altogether beyond secular authority. The Standing Orders of the House of Lords for 1625 contain the statement that "Bishops are only Lords of Parliament and not Peers" (*Lords Journals*, iii. 349). In 1640 the "Lords Spiritual" were altogether excluded from the House of Lords by act of parliament, and were not brought back until the second year of the Restoration.

Henry VIII. and the Peerage. — The reign of Henry VIII. brought about far-reaching changes in the position of the peerage. When that king ascended the throne the hereditary element was in a decided minority, but the balance was rapidly redressed until a bare hereditary majority was secured and the dissolution of the monasteries made possible. The peers, many now grown fat on abbey lands, at once began to consolidate their position; precedents were eagerly sought for, and the doctrine of ennobled blood began to find definite and vigorous expression So long, the peers declared, as there is any ennobled blood, a peerage must exist; and it can be extinguished only by act of parliament, failure of heirs or upon corruption of blood by attainder.

Surrender of Peerages. — From the doctrine of nobility of blood is derived the rule of law that no peerage (a Scots peerage is under Scots Law, which admits surrender) can be surrendered, extinguished or in any way got rid of unless the blood be corrupted. The rule is well illustrated by the earldom of Norfolk case (*Law Reports* [1907], A C. 10), in which its development was traced, and the principle authoritatively confirmed. Historically, there is little to support such a decision, and, indeed, this rigid application of the law is of comparatively recent date. Without doubt king, nobles and lawyers alike were all agreed, right down to Tudor days, that such surrenders were entirely valid. Many certainly were made, but, according to the decision of 1906, any living heirs of line of those nobles who thus got rid of their peerage honours can, if their pedigrees be provable and no attainders bar the way, come to the House of Lords with a fair chance of reviving the ancient honours.

Attainder and Corruption sf Blood. — The application of the doctrine of corruption of blood to peerages arises out of their close connection with the tenure of land, peerage dignities never having been regarded as personal until well on into the 14th century. Conviction for any kind of felony — and treason originally was a form of felony — was always followed by attainder. This resulted in the immediate corruption of the blood of the offender, and its capacity for inheritance was lost for ever. Such corruption, with all its consequences, could be set aside only by act of parliament This stringent rule of forfeiture was to some extent mitigated by the passing, in 1285, of the statute De Donis Conditionalibus (see ENTAIL), making possible the creation of estates tail, and when a tenant-in-tail was attainted forfeiture extended only to his life interest. The statute De Donis was soon applied by the judges to such dignities as were entailed (*e.g.*, dignities conferred by patent with limitations in tail), but it never affected baronies by writ, which were not estates in tail but in the nature of estates in fee simple descendible to heirs-general. In the reign of Henry VIII. an act was passed (1534) which brought estates tail within the law of forfeiture, but for high treason only The position then became that peerages of any kind were forfeitable by attainder following on high treason, while baronies by writ remained, as before, forfeitable for attainder following on felony In 1708, just after the union with Scotland, an act was passed by which, on the death of the Pretender and three years after Queen Anne's death, the effects of corruption of blood consequent on attainder for high treason were to be abolished, and the actual offender only punishable (stat. 7 Anne, c. 21, sec. 10). Owing to the 1745 rising, the operation of this act was postponed until the decease

of the Pretender and all his sons (stat. 17 Geo II. c. 39, sec. 3). In 1814, forfeiture for every crime other than high and petty treason and murder, mas restricted to the lifetime of the person attainted (stat. 54 Geo. III. c 145) Finally, in 1870, forfeiture, except upon outlawry, mas altogether abolished, and it was provided that "no judgment of or for any treason or felony should cause any attainder or corruption of blood, or any forfeiture or escheat."

In many cases there have been passed special parliamentary acts of attainder and forfeiture, and these. of course, operate apart from the general law. In any event, attainder and forfeiture of a dignity, whether resulting from the rules of the common law or from special or general acts of parliament can only be reversed by act of parliament

Growth of the Lords.—The numbers of the House of Lords grew steadily throughout the Tudor period, and during the reign of the first two Stuarts underwent a still greater increase. In the Great Rebellion the majority of the peers were the king's stoutest supporters, and thus inevitably involved themselves in the ruin of the royal cause Under Cromwell they disappeared as a legislative body and did not return to their ancient place until the restoration of Charles II.

From the reign of William of Orange the peerage has been freshened by a steady stream of men who, as a rule, have served their country as statesmen, judges, sailors and soldiers By the Act of Union with Scotland (1707) the Scottish parliament was abolished; but the Scottish peerage was given the privilege of electing, for each parliament of Great Britain, 16 of their number to represent them in the House of Lords. Further creations in the Scottish peerage were no longer to be made. The effect of this act was to leave the great majority of the Scottish peers outside the House of Lords, since only 16 of their number were to become lords of parliament. Close upon 100 years later Ireland was united with Great Britain, the Irish parliament being merged in the parliament of the United Kingdom of Great Britain and Ireland Twenty-eight Irish peers were to be elected for life by their order to represent it in the House of Lords. One archbishop and three bishops were also chosen in turn to represent the Irish Church in the House of Lords, but when that Church was disestablished in 1867 the spiritual lords lost their seats The merger of the three kingdoms had an important effect on their peerages Every peer, in his own country, had been a lord of parliament by hereditary right. The English peer (and, as the Acts of Union were passed, the peer of Great Britain and the peer of the United Kingdom) continued by hereditary right a lord of parliament. Although the Scottish and Irish peers lost this right by the two Acts of Union, they retained every other privilege of peerage. Henceforth they were to be lords of parliament only when their fellow peers elected them

The erection of southern Ireland into a self-governing dominion of the Crown has indirectly but definitely affected the status of the Irish peerage. This peerage belonged to the old united Ireland; and cannot to-day arbitrarily be divided between its two halves The Irish Free State Constitution Act, 1922, together with the machinery acts dependent thereon, has destroyed the procedure whereby Irish representative peers are elected; whether intentionally or by accident is not known Existing representative peers, having been elected for life, remain in the House of Lords, but no vacancies can henceforth be filled The Irish peerage will thus slowly diminish in numbers as existing peerages die out.

The modern meaning of the term peerage can now be rnore clearly defined. It will be noted that there have always been separate peerages of England, Ireland and Scotland. After the union of England with Scotland new creations became of the peerage of Great Britain, and after the union of Great Britain with Ireland: of the United Kingdom of Great Britain and Ireland; and now, since the advent of the Irish Free State, probably we must speak of the "United Kingdom of Great Britain and Northern Ireland" Many members of the House of Lords hold peerages in several of these groups

Several attempts have been made to limit the absolute rights of peers to a writ of summons, but this is a question which belongs rather to the history of the House of Lords as a legislative chamber. It will suffice here to note that in 1856 an attempt was made to create one of the judges a life peer, but the House, after long debate, rejected the writ, and a patent of customary form had to be followed. In 1876 legislation was passed creating two lords of appeal (with power to appoint two more) with a right to sit and vote during the holding of office. In 1887 further legislation conferred on all lords of appeal and ex-lords of appeal life peerages.

The Scottish Peerage.—The Scottish peerage, like that of England, owes its origin to feudalism. When the Scottish earls and barons came to parliament, they did not withdraw themselves from the rest of the people, it being the custom for the estates of Scotland to deliberate together, and this custom persisted until the abolition of their parliament by the Act of Union in 1707. The territorial spirit of the nobles inevitably led them to regard the honour as belonging to, and inseparable from, their land, and until comparatively late in Scottish history there is nowhere any record of the conferment of a personal dignity unattached to land such as that conferred in England on Beauchamp by Richard II. This explains the frequent surrenders and altered grants which are so common in Scottish peerage history, and which, in sharp distinction to the English rule of law, are there regarded as perfectly legal. To-day there exists no Scottish dukedom (except the royal dukedom of Rothesay), marquessate or viscounty created before the reign of James VI. of Scotland (and I. of England). Of the existing Scottish peerages 63 were created in the period between James's accession to the English throne and the Act of Union. There are now only 87 in all.

The Irish Peerage.—The Anglo-Norman conquerors of Ireland carried with them the laws and the system of tenure to which they were accustomed in England, and consequently the growth of the baronage and the establishment of parliamentary government in Ireland proceeded on parallel lines with the changes which occurred in England. Until the reign of Henry VIII the Irish were without representation in parliament, but gradually the Irish were admitted, and by the creation of new parliamentary counties and boroughs were enabled to elect representatives. In 1613 the whole country shared in representation (Ball's *Legislative Systems* of *Ireland).* Just as James I. had added many members to the Scottish peerage, so he increased the number of Irish peers.

On the death of a representative peer of Scotland a vacancy occurs and a new election takes place, but in accordance with modern practice promotion to a United Kingdom peerage does not vacate the holder's representative position (May's *Parliamentary Practice,* p 11 n.). Scottish and Irish peers, if representative, possess all the privileges of peerage and parliament enjoyed by peers of the United Kingdom; if non-representative all privileges of peerage, except the right to a writ of summons to attend parliament and to be present at and vote in the trial of peers.

Though many peers possess more than one peerage, and frequently of more than one country, only that title is publicly used which is first in point of precedence. Every peerage descends according to the limitations prescribed in its patent of creation or its charter, and where these are non-existent (as in the case of baronies by writ) to heirs-general.

In dealing with English dignities it is essential to realize the difference between a mere title of honour and a peerage. The Crown, as the fountain of honour, is capable of conferring upon a subject not only any existing title of honour, but may even invent one for the purpose So James I. instituted an order of hereditary knights which he styled baronets, and Edward VII. created the duchess of Fife "Princess Royal"—a life dignity. The dignities of prince of Wales, earl marshal and lord great chamberlain have been for centuries hereditary, and though of high court and social precedence, of themselves confer no right to a seat in the House of Lords—they are not peerages.

There is no limitation on the power of the Crown as to the number of United Kingdom peerages which may be created. As

to Scotland, the Act of Union with that country operates to prevent any increase in the number of Scottish peerages. and consequently there have been no creations since 1707, with the result that the Scottish peerage, as a separate order, is gradually approaching extinction. The Irish peerage is supposed always to consist of 100 exclusively Irish peers, and the Crown (before the erection of the Irish Free State) had power to grant Irish peerages up to the limit. When the limit was reached no more peerages might be granted until existing ones had become extinct or their holders succeeded to United Kingdom peerages. Only seven lords of appeal in ordinary may hold office at any one time. The number of archbishops and bishops capable of sitting in the House of Lords is fixed by various statutes at 26.

Since party government became the rule, the new peerages have usually been created on the recommendation of the prime minister of the day, though the Crown, especially in considering the claims of royal blood, is believed in some instances to take its own course; and, constitutionally. such action is entirely legal. By far the greater number of peerage honours granted during the last two centuries have been rewards for political services. The roll of the lords spiritual and temporal for the session of parliament assembling Feb. 1928 numbered 740.

Privileges of Peerage.—As centuries have gone by and customs changed, many privileges once keenly asserted have either dropped out of use or been forgotten. The most important now in being are a seat in the House of Lords and the right to trial by peers on any charge of treason or felony. Whatever the origin of this latter right, and some date it back to Saxon times (Trial of Lord Morley, 1678, *State Trials,* vii, 145), Magna Carta has always been ,regarded as its confirmatory authority.

The peers have always strongly insisted on this privilege of trial by their own order, and several times the heirs of those wrongly condemned recovered their rights and heritage on the ground that there had been no proper trial by peers (R.D.P., v. 24). In 1442 the privilege received parliamentary confirmation (stat. 20 Henry VI. c. 9). If parliament is sitting the trial takes place before the House of Lords in full session; *i.e.,* the court of our lord the king in parliament; if not, then before the court of the lord high steward. The office of lord high steward was formerly hereditary, but has not been so for centuries and is now only granted *pro hac vice.* When necessity arises, the Crown issues a special commission naming some peer (usually the lord chancellor) lord high steward *pro hac vice* (Blackstone's *Comm.,* iv, 258). When a trial takes place in full parliament a lord high steward is also appointed. but his powers there are confined to the presidency of the court, all the peers sitting as judges of law as well as of fact. Should the lord high steward be sitting as a court out of parliament, he summons a number of peers to attend as a jury, but rules alone on all points of law and practice, the peers present being judges of fact only. Whichever kind of trial is in progress, it is the invariable practice to summon all the judges to attend and advise on points of law. The distinction between the two tribunals was fully discussed and recognized in 1760 (Trial of Earl Ferrers, Foster's *Criminal Cases,* 139). The most recent trial was that of Earl Russell for bigamy (reported 1901, A.C. 446).

Peeresses and nonrepresentative peers of Ireland and Scotland have, with the exception of the right to sit in the House of Lords and its attendant privileges, every peerage privilege. In 1922 Sibyl Viscountess Rhondda presented a petition claiming the right to a writ of summons. The claim was heard and reheard before the Committee for Privileges and eventually rejected. This decision has disposed of the claims of peeresses in their own right, under the existing law, to sit in the House of Lords. A widowed peeress retains her privilege of peerage while unmarried, but loses it if she marries a commoner (Co. Litt. 166; *Cowley* v. *Cowley* [1901] A.C. 450).

The children of peers are commoners. The eldest son of a peer of the rank of earl (and above) is usually known socially by the name of his father's next peerage, but the courtesy nature of such title is clearly indicated in every public or legal document, the phraseology employed being "John Smith, Esq., commonly known as Viscount Blackacre." Several cases are on record in which peers' eldest sons have actually borne courtesy titles not possessed as peerage honours by their fathers. but inasmuch as such are only accorded by courtesy. no question of peerage privilege arises. The younger sons of dukes and marquesses by custom use the prefix "lord" before one of their Christian names, and all the daughters of earls as well as of dukes and marquesses are entitled similarly to style themselves "lady." on the principle that all the daughters are equal in rank and in precedence. The younger sons of earls and all of the children of viscounts and barons, including lords of appeal, use the prefix "honourable" before one of their Christian names, but this style is one of written address and reference only. Usually, when the direct heir of a peer dies, his children are given, by the Crown, on the death of the peer, the courtesy titles and precedence they would have enjoyed had their father actually succeeded to the peerage.

An alien may be created a peer, hut while remaining an alien cannot sit in the House of Lords, nor. if a Scottish or Irish peer, can he vote at elections for representative peers.

Claims to peerages are of two kinds: (1) of right; (2) of grace. In theory the Crown, as the fountain of honour, might settle any claim without reference to the House of Lords, and issue a writ of summons to its petitioner. This would not in any way prevent the House of Lords from examining the patent and writ of summons when the favoured petitioner or any heir claiming through him came to take his seat. If of opinion that the patent was illegal the House might refuse admittance. as it did in the Wensleydale case. In the case of a petitioner who has persuaded the Crown to terminate in his favour as a coheir the abeyance of an ancient barony and who has received his writ of summons, the matter is more difficult. The House cannot refuse to admit any person properly summoned by the Crown, as the prerogative is unlimited in point of numbers; but it can take into account the precedence of the newcomer. The Crown, therefore, unless there can be no question as to origin and pedigree, seldom terminates an abeyance without referring the matter to the House of Lords, and invariably so refers all claims which are disputed or which involve any question of law.

The Committee for Privileges, which for peerage claims is usually constituted of the lam lords and one or two other lords interested in peerage history! sits as an ordinary court of justice and follows all the rules of law and evidence. The attorney general attends as adviser to the committee and to watch the interests of the Crown. According to the nature of the case the committee reports to the House, and the House to the Crown, that the petitioner (if successful): (1) has made out his claim and is entitled to a writ of summons; or (a) has proved his coheirship to an existing peerage, and has also proved the descent of all coheirs that can reasonably he traced. In the first case the writ of summons is issued forthwith. but the second. being one of abeyance, is a matter for the pleasure of the Crown, which need not be exercised at all, but, if exercised, may terminate the abeyance in favour of any one of the coheirs.

During the parliamentary session of 1926 the House of Lords appointed a select committee to examine the history of abeysnt peerages and to report on the advisability of limiting future claims. After debate on the report. the House resolved that these claims ought not to be considered where long abeyance has existed and where the claimants possess only a small fraction of the original heirship. The resolution of the House was duly reported to the Crown. The recommendation of the House does not, and, in law, cannot affect the prerogative of the Crown to terminate any abeyance, but there can be little doubt that the representations made will have due weight with the advisers of the Crown in the consideration of all future claims. The report of and evidence taken by the committee is printed as a House of Lords paper (1927). (G. EL.)

See Sir W. R. Anson, *Law and Custom of the Constitution,* vol. i, "Parliament" (1911); F. B. Palmer, *Peerage Law in England* (1907); L. W. Vernon Harcourt, *His Grace the Steward and Trial of Peers* (1907); L. O. **Pike,** *Constitutional History of the House of Lovds.*

PEERLKAMP, PETRUS HOFMAN (1786–1836), Dutch classical scholar and critic, expounded the subjective method of textual criticism. which consisted in rejecting in a classical author whatever failed to come up to the standard of what that author, in the critic's opinion, ought to have written.

Descended from a family of French refugees named Perlechamp, Peerlkamp was born at Groningen, Neth.. on Feb. 2, 1786. He was professor of ancient literature and universal history at Leyden from 1822 to 1849, when he resigned from that post and retired to Hilversum near Utrecht. He died there on March 27, 1865.

His method of textual criticism was chiefly exercised on the *Odes* of Horace, the greater part of which he declared spurious, and the *Aeneid* of Virgil.

Peerlkamp also edited the *Ars poetica* and *Satires* of Horace, the *Agrzcola* of Tacitus and the romance of Xenophon of Ephesus, and he was the author of a history of the Latin poets of the Netherlands *(De vita, doctrina, et facultate Nederlandorum quz carmina latzna composuerunt,* 1838).

See L. Muller, *Geschichte der klassischen Philologie in den Niederlanden (1869);* J. E. Sandys, *History of Classical Scholarship,* vol. iii, p. 276 (1908).

PEERS, EDGAR ALLISON (1891–1952), English Hispanic scholar, was born at Leighton Buzzard. Beds., on May 7. 1891. He was educated at Dartford grammar school and at Christ's college, Cambridge. After working as modern languages master at Mill Hill and Felsted schools and Wellington college, he was appointed to the Gilmour chair of Spanish at the University of Liverpool in 1920. Attracted to the romantic aspects of English and French literature, he soon came under the spell of Spanish mysticism. He published his first Spanish study in 1923 (*Rivas and Romanticism in Spain)* and a stream of scholarly works quickly followed, establishing his reputation as an authority on Spanish thought.

Peers' studies of Spanish Romanticism culminated in the *History of the Romantic Movement in Spain,* 2 vol. (1940). His work on Hispanic mysticism, including *Spanish Mysticism* (1925) and *Studies of the Spanish Mystzcs,* 2 vol. (1927–30; vol. 1, rev. ed., 1951), as well as penetrating studies of such great Spanish mystics as *Ramon Lull* (1929), *St. John of the Cross* (1932) and *St. Teresa of Jesus* (1945) opened a rich field of poetry and devotion to English readers. He also translated St. John's *Complete Works* (3 vol., 1934–3j), St. Teresa's *Complete Works* (3 vol., 1946), Ramón Lull's *Art of Contemplation* (192j), *Blanquerna* (1926), *Tree of Love* (1926) and *Book of the Lover and the Beloved* (1923; rev. ed. 1946), and part of Bernardino de Laredo's *Ascent of Mount Sion* (1952).

He published numerous books on Spanish politics *(The Spanish Tragedy, 1930–1936,* 1936; *The Spanish Dilemma,* 1940), some travel books on Spain and was a contributor to the *Encyclopædia Britannica.* Under the pseudonym of Bruce Truscot. Peers wrote several books pleading for a recognition of the potentialities of the modern ("red-brick") universities.

Peers died at Liverpool on Dec. 21, 1952.

PEEWEE, the name (from their cry) of two North American birds of the genus *Myiochanes* (fam. Tyrannidae). The wood peewee (M. *virens*) is a little bird about six inches long, dark olive above, with a whitish throat and yellowish belly. The name closely represents its musical call. It breeds in North America and migrates in winter through eastern Mexico to South America. West of longitude 100° it is replaced by M. *richardsonii,* the western wood peewee, which has no olive tinge above and has the wings and tail slightly longer. It also winters in South America

PEEWIT, an alternative name for the lapwing (*Vanellus vanellus*), from its cry. *See* LAPWING

PEFFER, WILLIAM ALFRED (1831–1912), U.S. senator and journalist, was born in Cumberland county. Pa.. on Sept 10, 1831. He became a teacher at the age of 15 and during the summers helped his father, a farmer.

He was married to Sarah Jane Barber, who was also a teacher, in 1852, and in the following year they went to Indiana, where he engaged in farming. He later moved to Missouri and in 1862 settled in Illinois.

Peffer studied law while he was serving with the Union army from 1862 to 1865, and after his discharge as a lieutenant was admitted to the Tennessee bar. After practising law at Clarksville, Tenn., he went to Kansas, where he was editor of the *Fredonia Journal* and later editor of the *Coffeyville Journal.* In 1881 he became editor of the *Kansas Farmer,* a leading farm journal.

He was elected to the state senate of Kansas in 1874 and became a member of the U.S. senate as a representative of the People's party in 1891. He was not renominated in 1896.

Peffer's published works include *Peffer's Tariff Manual* (1888); *Americanism and the Philippines* (1900); and *Rise and Fall of Populism in the United States* (1900).

PEGASUS, a winged horse said to have sprung from the trunk of the Gorgon Medusa when her head was cut off by Perseus. After his service to Bellerophon (*q.v.*) and the latter's fall. Pegasus served Zeus (Hesiod. *Theog.,* 281).

Later authors identify him with the constellation Pegasus or Equus. The spring Hippocrene or Hippucrene (Horsewell) on Mt. Helicon is said to have sprung up from a blow of his hoof; for the connection between horses, or horse-shaped *daimones,* and water. *see* POSEIDON. Hence the erroneous derivation of *Pegasos* from *Pege* (the name is derived from the Greek *Pegos,* compact, strong, not from *Pege,* a spring). Hence also the fancy of modern poets (first in Boiardo, *Orlando inamorato)* that he is the horse of the Muses and hence a symbol of poetry.

PEGMATITE, a name originally given by French mineralogist René Haüy (1743–1822) to masses of graphic granite, comprising coarse crystals of alkali feldspars with regular intergrowths of quartz. Later usage of the term has been much broadened to include almost any wholly crystalline igneous or metamorphic rock that is at least in part very coarse grained, whose major constituents include minerals typically found in ordinary igneous rocks. and in which extreme textural variations, especially in grain size, are characteristic. Giant crystals, with dimensions measured in feet or yards, occur in some pegmatites. but the average grain size of all such rocks is only three or four inches.

Pegmatites are little different from the common igneous rocks in major elements of bulk composition, and they range from acid to basic. Granitic and syenitic types are most abundant. Quartz and alkali feldspars are the essential constituents; the most common varietal and accessory minerals are muscovite. biotite, apatite, garnet and tourmaline. Many granitic pegmatites contain various minerals that bespeak unusual concentrations of the less abundant elements, *e.g.,* beryllium in beryl, chrysoberyl, phenacite; boron in tourmaline, axinite; fluorine in apatite, micas, topaz, tourmaline; lithium in lepidolite, spodumene, several phosphate minerals; rare alkalies in pollucite, beryl, feldspars, micas; tin in cassiterite; tungsten in wolframite; zirconium in zircon; and tantalum, niobium, uranium, thorium and rare earths in many oxide and phosphate minerals *(see* GEOCHEMISTRY: *Residual Melts and Solutions).*

Most bodies of pegmatite are tabular, podlike or irregular in form, and range in size from single crystals of feldspar to dikes hundreds of feet thick and nearly a mile long Many are intimately associated with masses of fine-grained aplite (*q.v.*). They are found in terranes of igneous and metamorphic rocks in all parts of the world. and are most abundant in rocks of relatively great geologic age. Some are segregations within much larger bodies of intrusive igneous rocks. others are distributed satellitically in the rocks that surround such bodies, and still others are not recognizably associated with igneous rocks.

Granitic and syenitic pegmatite deposits are the chief source of commercial feldspar, sheet mica and beryllium, tantalum-niobium, and lithium minerals. They also yield significant quantities of cassiterite, gem minerals, scrap mica, molybdenite, tungsten minerals, rare-earth minerals, zircon and certain types of kaolin. either directly or as the sources of placer deposits. Economic lode concentrations generally occur in zoned pegmatite bodies, *i.e* , those within which two or more different rock types are systematically disposed

Three contrasting mechanisms together account for the origin of most pegmatites: (1) replacement of pre-existing non-pegma-

titic rocks through the action of various fluids; (2) crystallization of silicate melts derived by partial fusion of pre-existing rocks; and (3) crystallization of residual fluids developed during late stages in the consolidation of intrusive magmas. The first process is essentially metamorphic, the others mainly igneous. The presence of water and other volatile substances seems necessary, and probably is common to all three processes; such constituents depress the temperature range of crystallization, participate directly in the formation of many minerals and lower the viscosity of igneous melts, thereby promoting formation of large crystals. Experimental evidence indicates that the presence of a separate vapour phase is necessary for development of the giant crystals found in pegmatites.

Features indicating replacement of one mineral by another are widespread within many bodies of pegmatite. Most are attributable to attack of earlier-formed minerals either by residual liquid, by vapour separated from the liquid or by liquid condensed from such vapour. The end stages of some pegmatite crystallization are marked by development of well-faced transparent crystals, commonly as linings and partial fillings of cavities. Such occurrences have yielded handsome mineral specimens, as well as apatite. beryl, chrysoberyl, corundum, feldspars, garnets, phenacite, quartz, scapolite, spinels, spodumene, topaz, tourmaline and zircon of gem quality.

Ore minerals, chiefly sulfides and oxides, are widespread in pegmatites, but rarely are abundant. The origin and behaviour of ore-forming fluids derived from magmas (*see* ORE DEPOSITS) probably are intimately related to the processes responsible for development of pegmatites. For discussion of replacement and other mechanisms referred to above see METASOMATISM; MINERALOGY; PETROLOGY. (R. H. J.)

PEGOLOTTI, FRANCESCO BALDUCCI (*fl.* 1315–40), Florentine merchant and writer, was a factor in the service of the mercantile house of the Bardi, and in this capacity he was at Antwerp from 1315 (or earlier) to 1317; in London in 1317 and apparently for some time after; in Cyprus from 1324 to 1327, and also in 1335, when he obtained from the king of Little Armenia (*i.e.,* mediaeval Cilicia, etc.) a grant of privileges for Florentine trade. Between 1335 and 1343, he compiled his *Libro di divisamenti di paesi e di misuri di mercatanzie e d'altre cose bisognevoli di sapere d' mercatanti,* commonly known as the *Pratica della mercatura* (the name given it by Pagnini). Beginning with a sort of glossary of foreign terms then in use for all kinds of taxes or payments on merchandise as well as for "every kind of place where goods might be bought or sold in cities," the *Pratica* next describes some of the chief trade routes of the 14th century, and many of the principal markets then known to Italian merchants; the imports and exports of important commercial regions; the business customs prevalent in those regions; and the comparative value of the leading moneys, weights and measures.

There is only one ms. of the *Pratica,* viz., No. 2,441 in the Riccardian Library at Florence (241 fols. occupying the whole volume), written in 1471; and one edition of the text, in vol. iii. of Gian Francesco Pagnini's *Della Decima e delle altre gravezze imposte dal commune di Firenze* (Lisbon and Lucca—really Florence—1766); Sir Henry Yule. *Cathay,* ii. 279–308, translated into English the most interesting sections of Pegolotti, with valuable commentary (London, Hakluyt society, 1866) *See* also W. Heyd, *Commerce du Levant,* ii. (Leipzig, 1886); H Kiepert, in *Sitzungsberichte der philos.-hist. Cl. der berliner Akad.* (Berlin, 1881); C. R. Beazley, *Dawn* of *Modern Geography,* iii. (Oxford, 1906).

PEGU, a town and former capital of Lower Burma, giving its name to a district and a division. The town is situated on a river of the same name, 47 m. N.E. of Rangoon by rail; pop. (1953) 47,378: It is still surrounded by traces of the old walls, about 40 ft. wide, on which have been built the residences of the British officials. The most conspicuous object is the Shwe-maw-daw pagoda, 324 ft high, considerably larger and even more holy than the Shwe-dagon pagoda at Rangoon. Pegu is said to have been founded in 573, as the first capital ot the Talaings; but it was as the capital of the Toungoo dynasty that it became known to Europeans in the 16th century. About the middle of the 18th century it was destroyed by Alompra; but it rose again, and was important enough to be the scene of fighting in both the first and second Burmese Wars. It gave its name to the province (including Rangoon) which was annexed by the British in 1852.

The district, which was formed in 1883, consists of a portion of the forested Pegu Yomas and an alluvial tract between the Pegu Yoma range and the Sittang river: area, 4,124 sq.mi.; pop. (1941) 582,959, showing an increase of 92,990 in the decade. Christians numbered 11,038 in 1931, mostly Karens. Almost the only crop grown is rice, which is exported in large quantities to Rangoon. The district is traversed by the railway, and also crossed by the Pegu-Sittang canal, navigable for 85 mi., with locks.

The division of Pegu comprises the districts of Rangoon town, Hanthawaddy, Insein, Tharrawaddy, Pegu and Prome, lying east of the Irrawaddy: area 13,799 sq.mi.; pop. (1941) 2,961,249.

PEGUY, CHARLES (1873–1914), French author and poet. born at Orleans in 1873, came of a family which had been vine-growers for generations, and was proud of his peasant origin. He was educated at the *École Normale* and at the Sorbonne. The object of his life is perfectly indicated in the dedication of his first book, *Jeanne d'Arc* (1897), "à toutes celles et à tous ceux qui auront vécu . . . pour l'établissement de la République socialiste universelle." His works from that time until his death in Sept. 1914 are devoted to the glory of France. He was a determined republican; at the same time he was a devout Catholic. A mystical lover of France, and yet a strong socialist, he puzzled anti-clerical socialists and Catholic nationalists equally. His *Notre Patrie,* in which his views of what was necessary for the regeneration of the republic were set out, was written in 1905, but his most important prose works and the majority of his poems were written between 1910 and 1914. *Les Cahiers de la Quinzaine,* founded by him in 1900, were devoted to the expression of truth without regard to party, and in them Péguy's development, and the development of the "new France" he did so much to inspire, may be traced for over a decade. They were primarily imbued with his spirit, though in their pages many now well-known writers first came into public notice. For him truth was not to be found in compromise, and his extreme views were pronounced even at the risk of a subsequent *volte-face.* At the *École Normale* he came under the influence of Bergson, to whom he has done homage in his *Note sur* M. *Bergson* (1914). He kept his own little shop in the shadow of the Sorbonne, where he was continually amending his works. There he sold the *Cahiers.* He lived in the country, walked into Paris every morning, and brought with him something of the *province.* When war came in 1914 he refused a captaincy, because he wished to go on foot with his men. He fell leading a company on the first day of the battle of the Marne. The first volumes of his collected works were published in 1916.

See R. Johannet, *Pe'guy et ses Cahiers* (1914); J. E. Roberty, *Charles Pe'guy* (1916); A. Suarès, *Pe'guy* (1916); *D.* Halévy, *Charles Ptguy et les Cahiers* (1918); *M.* Péguy, *La Vocation de C. Ptguy* (1926).

PEINE, a town in the Land of Lower Saxony, Germany, 16 mi. W.N.W. of Brunswick, on the railway to Hanover and Hamburg. Pop. (1950) 27,404. Peine was at one time a strongly fortified place, and until 1803 belonged to the bishopric of Hildesheim. Its industries include iron and steel works, breweries and brickyards, and the manufacture of soap, sugar, malt, machinery and boots. There are also large cattle markets held here.

PEINE FORTE ET DURE, the term for a barbarous torture inflicted on those who, arraigned of felony, refused to plead and stood silent, or challenged more than 20 jurors, which was deemed a contumacy equivalent to a refusal to plead. Before he could be tried, a prisoner must plead "guilty" or "not guilty." By the Statute of Westminster, 1275, the penalty was "strong and hard imprisonment," but in 1406 pressing to death by heavy weights was substituted. This was abolished in 1772; "standing mute" being then made equivalent to conviction. By an act of 1827 a plea of "not guilty" was to be entered against any prisoner refusing to plead, and that is the rule to-day. An alternative to the *peine* was the tying of the thumbs tightly together with whipcord until pain forced the prisoner to speak. This was said to be a common practice at the Old Bailey up to the 19th century.

The last recorded instance of the infliction of the *peine* was

in 1741 at Cambridge assizes, when a prisoner was so put to death; the penalty of thumb-tying having first been tried. The only known American instance was in 1692 at Salem, Massachusetts, when Giles Corey, accused of witchcraft, was pressed to death.

PEIPING: *see* PEKING.

PEIPUS, a lake lying between north-west Russia and Estonia, also known as PEIPSI or CHUDSKOYE OZERO. The boundary between the two countries passes northwards for 60 m. through the centre of the lake, leaving the east bank in Russia and the west in Estonia, but turns east towards the north, thus including the whole northern shore and the outlet of the Narova river, in Estonia. Including its southern extension, sometimes known as Lake Pskov or Pihkwa, it has an area of 1,390 sq.m. Its shores are flat and sandy, and in part wooded; its waters are deep, and they afford valuable fishing. The lake is fed by the Velikaya, which enters it at its southern extremity, and by the Embach or Ema, along which timber is brought to Tartu, and which flows in half way up the western shore of the lake. It drains into the Gulf of Finland by the Narova, which issues at its north-east corner.

PEIRAEEUS or **PIRAEUS** (Gr. Πειραιεύς), the port of Athens, with which its story is inseparably connected. About 5 m. S.W. of Athens, the sandy bay of Phaleron is closed westward by a rocky promontory which falls abruptly also landwards into the plain. Its highest point, called Munychia, is at the north-east end; the lower plateau, Acté, stretches seaward to south-west, beyond the saddle which connects two small coves, Munychia and Zea, on the south-east coast, with the completely landlocked basin of Peiraeeus, with its inner port, Cantharus, running northward between Munychia hill and the detached ridge, Eëtioneia, which dominates the north side of the entrance. In early days Athenians used only the sandy Phaleron for sea traffic. It was Themistocles who persuaded the Athenians to fortify and utilize Peiraeeus, about 493 B.C., for their new fleet. The "long walls" from the base of Munychia hill to Athens were built soon after 460 B.C., and the town of Peiraeeus itself was laid out on a rectangular plan by the architect, Hippodamus of Miletus, probably at the suggestion of Pericles. The fortress of Eëtioneia was added during the Peloponnesian war. Traces remain of the ship-houses surrounding Zea and Munychia; the town-plan is followed by the modern streets; and the tomb of Themistocles, on the Act, and the great gate of Fort Eëtioneia are conspicuous. Peiraeeus was subjected during World War II to the bombing which Athens was spared. Axis troops occupied the port in April 1941.

PEIRCE, BENJAMIN (1809–1880), American astronomer and mathematician, son of a Harvard university librarian and historian, was born at Salem, Mass., on April 4, 1809. He graduated from Harvard in 1825 and, returning there as a tutor in mathematics in 1831, continued to teach in the university till his death nearly 50 years later. Tributes concur in the estimate that he was a wonderfully inspiring teacher. In the United States he was the leading mathematician of his time. In Europe he was elected an associate of the Royal Astronomical Society, a foreign member of the Royal Society of London, a correspondent of the British Association for the Advancement of Science, an honorary fellow of the Royal Society of Edinburgh, and a correspondent of the Gesellschaft der Wissenschaften in Göttingen. About one-quarter of Peirce's publications deal with topics in pure mathematics and three-quarters with topics mainly in the fields of astronomy, geodesy and mechanics. Of his 11 works, in 12 volumes, six were elementary texts some of which went through several editions. Among his other works were the notable *Analytic Mechanics* (1855), and the remarkably original *Linear Associative Algebra* (lithographed edition of 100 copies, 1870; new ed. by his son C. S. Peirce in *American Journal of Mathematics*, vol. IV., 1881, reprinted 1882), anticipating important work of Study and Scheffers. There are many references in scientific literature to Peirce's criterion for the rejection of doubtful observations, and it was only shown in later years (*Popular Astronomy*, 1920) that this was fallacious. The computation of the general perturbations of Uranus and Neptune, and the resulting controversy with Leverrier, was the first work to extend Peirce's reputation. He died on Oct. 6, 1880.

See R. C. Archibald, *Benjamin Peirce 1809–1880, Biographical Sketch and Bibliography* (1925). (R. C. A.)

PEIRCE, CHARLES (SANTIAGO) SANDERS (1839–1914), U.S. philosopher and logician, was born at Cambridge, Mass., on Sept. 10, 1839. He was the son of Benjamin Peirce, the Harvard mathematician. He graduated at Harvard in 1859, and at the Lawrence scientific school in 1863. Soon thereafter he joined the staff of the U.S. coast survey, where his work on the problems of geodesy and his researches on the pendulum received wide recognition.

In 1877 Peirce was the first American representative to the International Geodesic congress. In 1880–81 he gave a series of lectures on philosophical logic at Johns Hopkins university; in the spring of 1903 a series on pragmatism at Harvard and another in 1903–04 on logic at the Lowell institute, Boston. He introduced the principle of pragmatism into philosophy, defining his theory in the *Popular Science Monthly* for January 1878. Though he did not there call it *pragmatism*, he is known to have originated the word as well as the idea. It is said to have first appeared in print in his article in Baldwin's *Dictionary of Philosophy*, 1901. To avoid confusion with the theories of his contemporaries, he later changed the name to pragmaticism. He died at Milford, Pa., on April 14, 1914.

In addition to his contributions in mathematical logic, meteorology, psychophysics, philology, and other subjects, his published works include: five papers on logic in *Proc. of Amer. Acad. Arts and Sciences*, vol. 7 (1867); *Photometric Researches* (1878); *Studies in Logic* (1883); "The Architecture of Theories," *Monist*, vol. i. (1890); "What Pragmatism is," *Monist*, vol. xv. (1905); *Collected Papers of Charles Sanders Peirce*, ed. by C. Hartshorne and P. Weiss, 6 vol. (1931–35).

PEIRESC, NICHOLAS CLAUDE FABRI DE (1580–1637), French archaeologist, naturalist, scholar and promoter of learning, was born on Dec. 1, 1580, at Beaugensier, Provence. Intended by his father for the law he early showed a preference for the study of antiquities, and from 1599 to 1602 traveled in Italy visiting the museums and galleries, meeting and debating with the learned men of the universities—among them Galileo—and studying for his legal degree, which he took at Aix in 1604.

In the following year he succeeded his uncle as senator for Provence, and shortly after visited England, having interviews with King James I, Camden, Selden, William Harvey and John Barclay (*qq.v.*).

Apart from his very voluminous private correspondence no writings of Peiresc's are known; but, owing both to his great erudition and his liberality in lending scholars books and in allowing them access to his collections of coins, medals and other antiquities, his influence on the humanism and learning of the early 17th century was very great.

It was largely due to Peiresc that Barclay's *Argenis* (*see* BARCLAY, JOHN) was published in Paris (1621) shortly after its author's death: he assisted in editing Duchesne's *Historiae Normannorum scriptores antiqui* (1619), and was mainly responsible for the publication of Nicholas Bergier's *L'Histoire des grands chemins de l'Empire Romain* (1622).

The astronomers pierre Gassendi, Grotius, Thomas Campanella, Maria Mersenne and William Camden, were all indebted in various ways to him.

Peiresc was made abbé of the monastery of Guistres in 1618, and as senator was a judge of the parlement of Aix, the highest court for Provence. He was one of the earliest scholars to realize the importance of numismatics to historical research, and as evidence of his wide interests it may be mentioned that he seems to have introduced the Angora cat to Europe, and eider-down quilts and many exotic plants—including tulips—into France, and was the first to verify by experiment Harvey's discovery of the circulation of the blood.

He died at Aix on June 24, 1637.

BIBLIOGRAPHY.—Pierre Gassendi's *N. C. Fabricii de Peiresc vita* (1641) was translated into English by W. Rand and published as *The Mirrour of true nobility and gentility, etc.* (1657); Peiresc's correspondence with Rubens has been edited by M. Rooses, 6 vol. (1887–

1909) and his general correspondence by Ph. Tamizey de Larroque (7 vol.: *Collection* de *Documents inédits sur l'histoire de France,* 2e série, 1888–98).

PEISANDER, of Camirus in Rhodes, Greek epic poet, supposed to have flourished about 640 B.C. He was the author of a *Heracleia,* in which he introduced a new conception of the hero, the lion's skin and club taking the place of the older Homeric equipment. He is also said to have fixed the number of the "labours of Hercules" at twelve. The Alexandrians admitted it to the epic canon—(but see Clement of Alexandria, *Stromata,* vi. 2).

See fragments in *G.* Kinkel, *Epicorum graecorum fragmenta* (1878); also F. G. Welcker, *Kleine Schriften,* vol. i. (1844).

PEISISTRATUS (605?–527 B.C.), Athenian statesman, was the son of Hippocrates and second cousin to Solon, whose friendship he retained in spite of their political opposition. About 570 he became well known and popular as commander in the war with Megara which resulted in the recovery of Salamis. He next appears in politics as leader of the third party, the men of the hill-country (Diacrii), who were still discontented in spite of Solon's reforms, which had given them freedom, but not land. Peisistratus' family estates at Marathon were in this district. His eloquence and personal charm soon made him a popular favourite; Solon (frag. 8, Diehl) warned Athens of the danger, but was unheeded. The other two parties were the Shore (Parali), led by the Alcmaeonidae, at the moment represented by Megacles, and the Plain (Pedieis) under Miltiades.

The chronology of Peisistratus' rise to power is disputed, though the sequence of events is known. By feigning an attack on his life, Peisistratus got a guard assigned to him, armed with staves, with whose assistance he seized the Acropolis and established a tyranny in 561–560. Almost at once a coalition between the Plain and the Shore drove him out, but in 560–559 Megacles had fallen out with his allies and recalled Peisistratus. Peisistratus married Coesyra, daughter of Megacles, and apparently refused to have children by her, the Alcmaeonidae being under a curse. The coalition was renewed, and in 556 Peisistratus was again driven out. He settled at Rhaecelus, where he founded a city and established friendly relations with Macedon, and then obtained command of the silver-mines of Mt. Pangaeus. This enabled him to raise a mercenary army, and he strengthened his position by intriguing with Thebes and Argos. Then he moved to Eretria as a base for operations against Athens, and in 541 landed near Marathon, among his own party, defeated the Government forces and established himself as tyrant for good. The Alcmaeonidae fled; Lygdamis, Peisistratus' assistant in the business, he made tyrant of Naxos. He ruled Athens peaceably till his death in 527.

There is no doubt that the rule of Peisistratus was generally beneficial to Athens. His foreign policy was remarkably adroit. His own interest demanded that the neighbouring States should not be alienated, or they would have harboured the plots of his exiled opponents. So he contrived to keep peace with Sparta, Argos, Thessaly, Aegina and Thebes all at the same time. Further afield he was more ambitious. The silver of Pangaeus and Laureium he already controlled. Its effect is seen in the increasing value of the Athenian tetradrachm, which reacted favourably on Athenian commerce, Of his other exploits the most important are in the northern Aegean. By recapturing Sigeium and encouraging Miltiades' venture in the Thracian Chersonese he controlled the vital corn route to the Pontus. Of his domestic policy it is admitted that it was just and beneficent, and preserved the fcrm of the Solonian constitution, while keeping the magistracies in the hands of himself and his family. It may be added that he completed Solon's work by giving land (confiscated from his enemies) to those to whom Solon had only given freedom. He put a tax of one-tenth (or one-twentieth) on the produce of the land, and used it partly to advance money to the new proprietors, to the advantage of agriculture, partly on the fortification of the city. Thus Athens was free of wars and internecine struggle, and for the first time for years knew settled financial prosperity.

The money which he accumulated he put to good use in the construction of roads and public buildings. Like Cleisthenes of Sicyon and Periander of Corinth, he realized that one great source of strength to the nobles had been their presidency over the local cults. This he diminished by increasing the splendour of the Panathenaic festival every fourth year and the Dionysiac rites, and so created a national rather than a local religion. With the same idea he built the temple of the Pythian Apollo and began, though he did not finish, the temple of Zeus. To him are ascribed also the original Parthenon on the Acropolis, afterwards burned by the Persians, and replaced by the Parthenon of Pericles. It is said that he gave a great impetus to the dramatic representations which belonged to the Dionysiac cult, and that it was under his encouragement that Thespis of Icaria, by impersonating character, laid the foundation of the great Greek drama of the 5th and 4th centuries. Lastly, Peisistratus carried out the purification of Delos, the sacred island of Apollo of the Ionians; all the tombs were removed from the neighbourhood of the shrine, the abode of the god of light and joy.

He gave equal encouragement to poetry; Onomacritus, the chief of the Orphic succession, and collector of the oracles of Musaeus, was a member of his household. As to the library of Peisistratus, we have no good evidence; it may perhaps be a fiction of an Alexandrian writer. There is a strong tradition that he first collected the Homeric poems, and had them sung at the Panathenaea.

It appears that Peisistratus was benevolent to the last, and, like Julius Caesar, showed no resentment against enemies and calumniators. What Solon said of him in his youth was true throughout, "there is no better disposed man in Athens, save for his ambition." He was succeeded by his sons Hippias and Hipparchus, by whom the tyranny was in various ways brought into disrepute. (*See* also GREECE: *History;* ATHENS.)

PEKALONGAN, a residency of the province of central Java, Indonesia, area 2,176 sq.mi. It is in the north central part of the island, bounded on the west by Cheribon, on the east by Semarang, on the south by Banyumas, and on the north by the Java sea. Mountain groups flank all of its southern border—the Dieng, Slamat and Kumbang groups, the spurs of Slamat projecting into its centre, and from which flow its two rivers, the Chomal and Pomali. Along the valleys of these two rivers and the coast, for a considerable distance inland, the land is flat and fertile, and the Chomal and Pomali have built for themselves alluvial promontories at their mouths. The chief product of Pekalongan is sugar, and the manufacture of this is its chief industry, although it is noted also for its batik industry, and it is a coffee-, cocoa- and kapok-growing district. Rice is the chief food crop. The population of Pekalongan is 3.210,751, mostly Javanese, but including about 5.000 Europeans and more than 30,000 Chinese and other foreign Asiatics.

The capital, Pekalongan, on the coast, in the eastern part of the residency, population (1957 est.) 94.904. the seat of the resident, exports sugar and is on the stream tramway line from Cheribon to Semarang. Tegal, population (1956 est.) 85,602, is another port and is also on the tramway line. likewise Brebes, pop. (1957 est.) 23,263, and Pemalang, (1957 est.) 42.484. The railway from Cheribon to Surabaya passes through Pekalongan. There is a coast road and one by the Pomali to Purnakerta in Banyumas.

Pekalongan was granted to the Dutch by the Susuhanan in 1746 and occupied by the Japanese from 1942 to the end of World War II. In 1946 it became part of the Republic of Indonesia.

PEKIN, the seat of Tazewell county, Illinois, U.S., is an important port on the Illinois river, 10 mi. below Peoria in the central part of the state. A shipping centre for grain, cattle and coal, Pekin is served by several railroads and is on the Lakes-

to-Gulf Waterway. Its manufactures include corn products, alcohol, liquor, malt, steel tanks, barrels, burial vaults, and copper, brass, iron and aluminum castings. Ice cutting was once an important business.

The first settler was Jacob Tharp in 1824; the town was laid out in 1829 and in 1830 was named Pekin, the "new Celestial City," by Mrs. Nathan Cromwell, wife of a founder. The dragon and other Chinese symbols are still used. An outpost for Indian warfare, its first schoolhouse (Snell school) was fortified during the Black Hawk War as Fort Doolittle. Incorporated as a city in 1849, Pekin for many years'remained a rough river port, characterized by much violence. Abraham Lincoln argued cases in its old courthouse. Early settlers were Anglo-Americans from Virginia, Kentucky and Tennessee and also from the northeast. German immigration began in the 1840s and grew after the Civil War; until World War I the German language was used in schools, churches and in business. Italians and Irish also settled there.

Good hunting and fishing in the vicinity make Pekin a favourite spot for sportsmen. Its large Mineral Springs park has excellent swimming and other recreation facilities. Pekin's older streets are named Ann Eliza, Cynthiana, Henrietta, Matilda, etc., for friends of Mrs. Cromwell. For comparative population figures see table in ILLINOIS: *Population.* (M. Ws.)

PEKING (PEIPING), the capital of China, situated in Hopeh province. The name Peiping, which means "northern peace," was used in the Nationalist period, 1928–1949, while the nation's capital was at Nanking ("southern capital"). The name Peking (Pei-ching) meaning "northern capital," was used while the city was the capital of China, from 1421 to 1928, and again under the Communist regime after 1949. Peking is situated in lat. 39° 54′ N. and long. 116° 28′ E. at the northern apex of the alluvial north China plain. Its area is the point of convergence of routes from Manchuria via Shan-hai-kuan (the "gate between mountains and the sea"), and the easiest routes from the Mongolian plateau via the valley of the Yung-ting Ho and Nankow pass.

Only 35 mi. northwest of the city at its nearest point, the Great Wall of China, following the crests of the scarpland belt at an elevation of 4.000 ft., marks the historic frontier defence of the agricultural plain against the pastoral nomads of the interior plateaus. The narrow apex of the plain is thus the crucial region in the relations of China, Mongolia and hlanchuria, and is historically the border zone between two strongly contrasted types of social organization.

History.— The earliest city of which there is authentic record was that of Ch'i the capital of Ten, the most northerly of the feudal states which acknowledged the authority of the Chou dynasty in the twelfth century B.C. Thus early was the site of Peking within the Chinese culture area, but Yen was clearly a buffer state, intended to keep back the Tatar hordes, and is significantly mentioned in records of the 6th century B.C. as possessing great numbers of horses. Ch'ien Lung, the famous scholar-emperor of the Manchu dynasty, made extensive researches into the exact site of Ch'i and located it slightly to the north of the present city.

The city was destroyed by Shih Huang Ti, the "First Emperor" and founder of the Ch'in dynasty (221 B.C.), who unified China and completed the frontier defenses of the Great Wall. Yen was one of the districts which made up his empire. Cnder the Han dynasty a new city arose close to the site of Ch'i and was known first as Yen and later as Yu-chow. It remained a definitely Chinese city until the end of the Han dynasty, but in the ensuing period of anarchy and disintegration was for two centuries under Tatar control. The T'ang dynasty (7th to 10th centuries), like the Han, maintained the frontier defenses of the empire intact, and Yu-chow was the headquarters of a military governor. But early in the 10th century it came into the hands of the K'itans, one of the most famous of the Tatar groups prior to the rise of the Mongols, who successfully resisted the attempts of the Sung emperors to recover it for China. The K'itans under the Liao dynasty (sometimes called the Iron dynasty) rechristened the city Nan-ching, signifying southern capital and later (986) rebuilt it on imperial lines with walls said to have been 13 miles in length and 30 feet high.

From early in the 11th century it was known as Yenching but the K'itans of the Iron dynasty continued to hold it until 1122 when it was captured by the chief of the Tatars of the Golden Horde from the northern steppes of Manchuria, who greatly enlarged and beautified it and made it one of the three capitals of his large empire, that of the Kin or Chin (Gold) dynasty. The other two capitals were Pien-ching (now Kai-feng) in Honan and Shen-yang (Mukden) in the north, so the future Peking mas known at this period as Chung-tu or the "middle capital." This phase lasted until early in the 13th century when the greatest of all the steppeland powers arose, the Mongol empire.

The City *Under Kublai Khan.*—Kublai Khan took the decisive step of making it the metropolitan city of the immense Mongol empire. which now stretched from the Pacific to beyond the Black sea. But although this was the technical status of the city after Kublai had moved his headquarters there from Rarakorum in 1267, it was as the new capital of China that the choice was of the greatest ultimate significance. Kublai was indeed the "Great Khan who ruled in China" but his descendants were primarily emperors of China.

Under Kublai the city was once again rebuilt and on a more magnificent scale than ever before. It was named Khanbaliq, "city of the Khan," but the Chinese knew it as Ta-tu. "great capital." Through the reports of Marco Polo, who visited China at that time. Khanbaliq became known in medieval Europe as Cambaluc. This was often, as by Longfellow, inaccurately spelled Cambalu. Marco Polo described the magnificence of the capital in glowing terms. Cambaluc was laid out on a rectangular plan and had a circuit of 24 mi. Its walls, 50 ft. high and on top 15 ft. thick, were each pierced by three gates, the roadways connecting them running straight across the city.

Marco Polo was followed by the Pope's envoy, Giovanni di Monte Corvino, who was well received by Kublai and made archbishop of Khanbaliq in 1307.

The Ming and *Manchu Dynasties.*—Later under the Ming and early Manchu dynasties the Jesuits were in favour at the capital, and were encouraged to practise western mathematics and astronomy. The communications of Khanbaliq with the rest of China were actively developed by the construction of radial roads on which well-organized courier services were maintained, and by extending the Grand Canal from the Yellow river to Tientsin and connecting it by the Pai Ho and a small canal, the capital was brought into direct water-communication with the lower Yangtze valley.

Khanbaliq continued to be the capital of China throughout the Yuan dynasty but the city temporarily lost its imperial status when in 1368 Chu Yuan-chang (Hung Wu) headed the successful revolt against the Mongols and established the native ?*ling dynasty. After being under the control of foreign steppeland powers for about 450 years the region was once again under direct Chinese rule and Khanbaliq, now known as Peiping, served, as in the days of the Han and T'ang dynasties, the function of a border garrison town, subordinate to the capital city of Nanking. This phase lasted until 1421, when the third Ming emperor, Yung Lo, transferred his court to the north and Peiping was given the name of Peking.

The reason for this decisive step was undoubtedly strategic, for the Mongols were still troublesome and the hlanchurian tribes were becoming increasingly strong and restless. Peking was the only frontier capital which could guard both the vulnerable flanks. The menace from the north. increased by internal revolts, culminated in the Manchu conquest of 1644 and China once again came under Tatar domination. The new Manchu (or Ch'ing) dynasty transferred their court from Mukden to Peking and administered their newly won empire from a capital which, while it lay within the Chinese culture area, was in close contact with their own recruiting ground.

The Modern Period.—Two and a half centuries later the rule of the decadent Manchus was ended by the revolution of 1911 and the imperial office was abolished. Peking continued to function as the capital of the new republic. But the disintegrating effects of the civil war and the rise of the nationalist movement, focused in the south, meant that the rule of the Peking government was

increasingly ineffective and nominal. The final northward advance of the nationalist armies in the spring of 1928 was quickly followed by the proclamation of Nanking as the capital of the new China and by autumn 1928 the northern city had lost its metropolitan status and was known once more as Peiping, the name which it bore under the early Ming emperors. So, too, the province, in the centre of which it lies, reverted to the ancient name of Hopeh ("north of the river," *i.e.,* the Yellow river) in place of Chihli ("direct rule").

After the Tangku truce of 1933 which ended the Manchurian invasion, the Japanese endeavoured to separate Peiping and north China from the rest of China. The Chinese government was forced to approve the establishment in Peiping of a Hopeh-Chahar political council under the chairmanship of Gen. Sung Chih-yuan, commander of the 29th army. By the Ho-Umetsu agreement of 1935 all Chinese troops and Kuomintang organizations were excluded from north China. In spite of strong Japanese pressure, Sung remained loyal to the Chinese government. On July 7, 1937, the Japanese during maneuvers attacked the Marco Polo bridge (Lukou-ch'iao) across the Yung-ting Ho southwest of Peiping to sever the last railroad link with the rest of China. The Chinese garrison resisted and thus began the war with Japan which merged in 1941 with World War II. The city was taken by the Japanese in July 1937 and remained occupied until the end of World War II in 1945, when it reverted to Nationalist control. In 1949, Peiping fell to the Chinese Communists, who made it once more the capital of China under its historic name of Peking. (See also CHINA: History.)

Description. — Peking consists essentially of two walled cities, the northern Inner city and the southern Outer city. The Inner city, also known as the Tatar city, lies approximately on the site of Khanbaliq of the Mongol dynasty. It is in the form of a square with walls nearly 15 mi. in length.

The Outer city, also known as the Chinese city, was added during the reign of the emperor Chia Ching (1522–66) of the Ming dynasty. It is in the form of an oblong adjoining the Inner city, with walls 14 mi. in length, including 4 mi. of the southern wall of the Inner city.

BLACK STAR

WU MEN, PAINTED WOODEN IMPERIAL PAILOU OR GATEWAY ENTRANCE TO THE FORBIDDEN CITY IN PEKING. THE CHINESE CHARACTERS ON IT READ: "MAY BLESSINGS BE GENEROUSLY SHOWERED UPON THE PEOPLE OF THE CELESTIAL EMPIRE"

Within the Inner city was the Imperial city, also in the form of a square and with red-plastered walls six and one-half miles in length, of which only the southern wall and a part of the western wall remain. And within the Imperial city was the moated Forbidden city, with walls two and one-quarter miles long, plastered with a violet-coloured mortar, whence comes the popular name of the Purple city. The Forbidden city contained the Imperial palaces, which have been converted into a museum. The palaces, symmetrically arranged, consist of outer throne halls, an inner court, and the palace buildings.

The entrance to the Forbidden city is through the Wu Men (Meridian gate). Ancient works of art are found in T'ai-ho-tien (Hall of Supreme Harmony) and Pao-ho-tien (Hall of Preserving Harmony), two of the outer throne halls. Works of art of different dynasties ranging from the Shang (1600–1100 B.C.) to the Ming, are found in halls on the east side of the inner court. In halls on the west side of the inner court are works of art of the Manchu dynasty.

In side halls on both sides of the courtyard in front of the Wu Men is the historical museum, exhibiting historical objects from primitive times, through the Hsia (2100–1600 B.C., Shang and Chou dynasties to the Sui (A.D. 581–618) and T'ang dynasties. In the main hall above the Wu Men are objects of China's modern history after the Opium war of 1840.

South of the Palace museum, the former imperial roadway separates two parks that have been converted into public recreation areas under the Communist regime. On the west side is Sun Yat-sen park, surrounding the former Altar of Land and Grain, and on the east side is the Working People's Palace of Culture, which was the Imperial Ancestral temple, in which tablets of emperors were displayed and worshiped.

Adjoining the parks on the south is part of the remaining southern wall of the former Imperial city. The wall is pierced by T'ien-an Men (Gate of Heavenly Peace), on which China's Communist leaders gather on ceremonial occasions to review military and civilian parades in the square adjoining the gate.

Adjoining the Forbidden city on the east, in the southeast quadrant of the Inner city, is the old legation quarter, where foreign representatives had their residences. The legation quarter contains many hotels, department stores, theatres and cinemas.

In the northeast quadrant of the Inner city stand some of the most historic buildings of China, including the Lama temple and the simple but beautiful Temple of Confucius. Nearby is the Bell tower, where the curfew was sounded nightly in imperial times.

Extending in an irregular chain from the north wall of the Inner city are six artificial lakes supplied from a moat outside the nalls of the city. The shores of Pei Hai (North lake), just northwest of the Palace museum, have been converted into a park. The National library stands on the southwest shore. Grouped around Chung Hai (Middle lake) and Nan Hai (South lake), just west of the Palace museum, are the government buildings of the Chinese Communist regime.

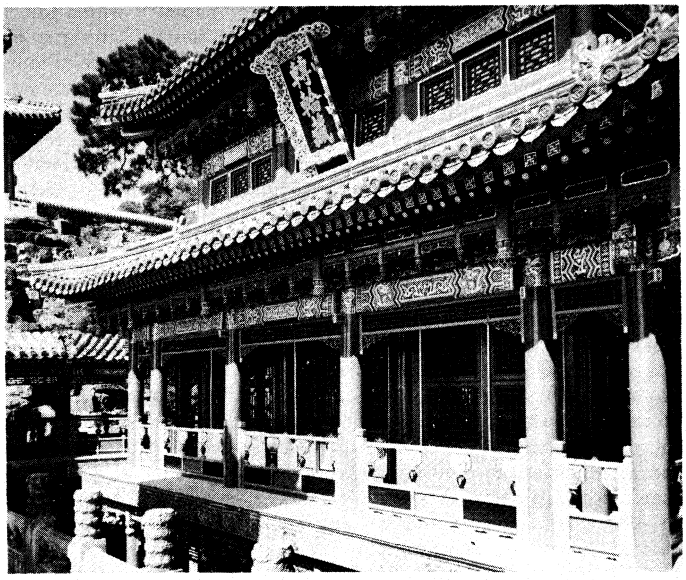
The northern part of the Outer city is a busy commercial and shopping area adjoining the city's main railroad terminal at the Ch'ien Men, the main gate connecting the Inner city and the Outer city. In the southern portion are the grounds of the Temple of Heaven and of the Temple of Agriculture.

In modern times, and especially after 1949, Peking has expanded far beyond the two walled cities that constitute its core. Residential suburbs and educational centres have risen to the west and northwest. Extending along a road going northwest to the former Summer palace and its lakes and parks are many of China's important universities: Peking (former Yenching university, Tsinghua university, People's university and many specialized institutions of higher learning, such as the Central Institute of Nationalities, and schools in the fields of iron and steel, geology, aeronautics and other engineering disciplines. Outside the northwestern gate, Hsi-chih Men, are the city's zoo and permanent exhibition grounds.

Industry.—While the city's educational and cultural institutions are being expanded largely in the western and northwestern suburbs, Peking's growing industries are concentrated east of the city. In connection with the city's growth as China's political and cultural centre under the Communist regime, attention was also given to the expansion of industry.

Manufacturing was traditionally restricted to light industry (flour mills, textiles, garments). After 1949, several heavy industrial enterprises were added, including a machine-tool plant, a printing machinery factory and a synthetic fibres mill. An auto

parts factory was expanded into a small automobile plant, and a farm-machine factory was converted into a tractor plant. Other industrial suburbs, southwest of the city, include Feng-t'ai. aith railroad marshalling yards, bridge-construction, concrete railroad ties and asbestos-pipe factories, and Ch'ang-hsin-tien, with loco-



EASTFOTO

CHUAN-LUN-TSANG. ONE OF THE BUILDINGS IN THE MANCHU EMPERORS' SUMMER PALACE PEKING

motive and rolling-stock shops.

The iron and steel plant of Shih-ching-shan is situated on the Yung-ting Ho. 14 mi. west of the city centre. This plant, first opened in 1920, was completed in 1937 and produced 80,000 tons of pig iron at its peak under Japanese rule. The plant was greatly expanded by the Communists, and annual production increased to more than five times its previous capacity. Beyond Shih-ching-shan, at the end of a rail spur, 20 mi. west of the city centre, are the coal mines of Men-t'ou-kou.

Peking is a transportation hub with rail connections to Hankow, Canton, Kalgan, Pao-t'ou, Tientsin, Mukden, Tungchow and Ch'eng Te. It is also linked to the Soviet Union via Manchuria and via Outer Mongolia.

Administration.— Under the Nationalist regime, Peking's municipal area covered more than 300 sq.mi. Under the Communists, the city limits were greatly expanded. As a result of annexations in 1953, the municipal district was extended to the Great Wall, 35 mi. from the city centre.

Within this expanded area of 1,750 sq.mi., the 1953 census reported a population of 2,768,149, of whom about 830,000 lived in the walled Inner city, 220,000 in the Outer city, and 1,700,000 in suburbs outside the walls. By the late 1950s, the population of Peking was estimated to be more than 4,000,000 as a result of the in-migration of people attracted by the city's growing importance as the nation's political, educational and economic centre. In March 1958, a second expansion of the municipal area took place, nearly doubling its territory from' 1,750 sq.mi. to 3,386 sq.mi. This time Peking absorbed the towns of T'ung-chou (Tungchon) and Shun-yi on the east, Ta-hsing on the southeast, and Fang-shan and Liang-hsiang on the southwest. The new municipal area had an estimated population of 5,420,000, of whom about 2,000,000 were rural farmers.

Peking is administered directly by the central government, and is outside the jurisdiction of Hopeh province. The municipal district itself is divided into five suburban districts (*hsien*) and eight boroughs (*ch'u*). The latter are Hsi-ch'eng and Tung-ch'eng in the Inner city; Ch'ung-men and Hsuan-wu in the Outer city; and the suburban *ch'u* of Hai-tien, with the city's educational institutions; Men-t'ou-kou, with the coal mines; Feng-t'ai and Ch'ao-yang.

The ***hsien*** consist of Ch'ang-p'ing with the Ming tombs north of the city, Fang-shan where the remains of Peking Man were found southwest of the city; Ta-hsing, T'ung and Shun-yi.

(T. SD.)

PELAGIA, SAINT (? c. 311), a 15-year-old Christian girl of Antioch who. nrobablv during Diocletian's nersecution. threw herself from a housetop to avoid outrage, and died on the spot. Her feast day is June 9.

The memory of this historical Pelagia helped to give rise to two legends of fictitious Pelagias: namely, Pelagia the Penitent (also called Margarito), a prostitute of Antioch who experienced sudden conversion and lived the rest of her days in a cave at Jerusalem. disguised as a man; and Pelagia of Tarsus. nho refused to marry the emperor Diocletian and was punished by being roasted to death. Both are named in some calendars.

The origin of the first of these two legends was the repentance of a notorious Xntiochene woman, of whom John Chrysostom speaks without mentioning her name.

Both legends are connected with that of St. Margaret (*q.v.*).

See H. Delehaye, ***The*** Legends of ***the*** Saints ***(1907).*** (D. XR.)

PELAGIUS, the name of two popes.

PELAGIUS I, (d. 561), pope from 556 to 561, was a noble born at Rome, date unknonn. Under Popes Agapetus I, Silverius and Vigilius his ecclesiastical roles were highly important. He was elected to succeed Vigilius in 555 and consecrated on April 16, 556. At first opposed to Vigilius' condemnation of the "Three Chapters" (554; ***see*** PAPACY) Pelagius upheld it as pope, winning thereby hostility in the west, especially in northern Italy, where long schism developed.

He died on March 4, 561.

PELAGIUS II (d. 590), pope from 5i9 to 590, was born at Rome date unknonn, of Gothic descent. During his pontificate, which began on Sov. 26, 579, Lombard barbarians pressed more deeply into Italy. Schism arising out of the "Three Chapters" controversy resisted his conciliatory efforts in northern Italy. Pelagius protested when the bishop of Constantinople assumed the title "ecumenical patriarch." He died on Feb. 7, 590.

(JN. F. B.)

PELAGIUS (*c.* 360–c. 420), early British theologian. Of the origin of Pelagius almost nothing is known. He seems to have been one of the earliest, if not the very earliest, of that remarkable series of men nho issued from the monasteries of Scotland and Ireland, and carried back to the Continent in a purified form the religion they had received from it. Coming to Rome in the beginning of the 5th century (his earliest known writing is of date 405), he found a scandalously low tone of morality prevalent. But his remonstrances were met by the plea of human weakness. To remove this plea by exhibiting the actual powers of human nature became his first object.

It seemed to Pelagius that the Augustinian doctrine of total depravity and of the consequent bondage of the will both cut the sinew of all human effort and threw upon God the blame which really belonged to man. His favourite maxim was, "If I ought. I can."

Judging from the general style of his writings. his religious development had been equable and peaceful. not marked by the prolonged mental conflict. or the abrupt transitions. which characterized the experience of his great opponent. With no great penetration he saw very clearly the thing before him. and many of his practical counsels are marked by sagacity, and are expressed with the succinctness of a proverb ("corpus non frangendum, sed regendurn est").

The peculiar tenets of Pelagius, though indicated in the commentaries nhich he published at Rome previous to 409, might not so speedily have attracted attention had they not been adopted by Coelestius, a much younger and bolder man than his teacher. Coelestius. probably an Italian, had been trained as a lawyer, but abandoned his profession for an ascetic life. When Rome was sacked by the Goths (410) the two friends crossed to Africa. There Pelagius once or twice met with Augustine, but very shortly sailed for Palestine, where he justly expected that his opinions would be more cordially received. Coelestius remained in Car-

thage with the view of receiving ordination. But Aurelius, bishop of Carthage, being warned against him, summoned a synod, at which Paulinus, a deacon of Milan, charged Coelestius with holding the following six errors: (1) that Adam would have died even if he had not sinned; (a) that the sin of Adam injured himself alone, not the human race; (3) that new-born children are in the same condition in which Adam was before the fall; (4) that the whole human race does not die because of Adam's death or sin, nor will the race rise again because of the resurrection of Christ; (j) that the law gives entrance to heaven as well as the gospel; (6) that even before the coming of Christ there were men who were entirely without sin. To these propositions a seventh is sometimes added, "that infants, though unbaptized, have eternal life," a corollary from the third. Coelestius did not deny that he held these opinions, but he maintained that they were open questions, on which the Church had never pronounced. The synod condemned and excommunicated him. Coelestius, after a futile appeal to Rome, went to Ephesus, and there received ordination.

In Palestine Pelagius lived unmolested and revered, until in 415 Orosius, a Spanish priest, came from Augustine to warn Jerome against him. The result was that in June of that year Pelagius was cited by Jerome before John, bishop of Jerusalem, and charged with holding that man may be without sin, if only he desires it. This prosecution broke down, and in December of the same year Pelagius was summoned before a synod of fourteen bishops at Diospolis (Lydda). The proceedings, being conducted in various languages and by means of interpreters, lacked certainty, and justified Jerome's application to the synod of the epithet "miserable." But there is no doubt that Pelagius repudiated the assertion of Coelestius, that the divine grace and help consists only in free will, and in the giving of the law and instruction; at the same time he affirmed that a man is able, if he likes, to live without sin and keep the commandments of God, inasmuch as God gives him this ability. The synod was satisfied with these statements, and pronounced Pelagius to be in agreement with Catholic teaching. Pelagius naturally plumed himself on his acquittal, and provoked Augustine to give a detailed account of the synod, in which he shows that the language used by Pelagius was ambiguous, but that, being interpreted by his previous written statements, it involved a denial of what the Church understood by grace and by man's dependence on it. The North African Church as a whole resented the decisions of Diospolis, and in 418 Zosimus, bishop of Rome, was prompted to draw up a circular inviting the bishops of Christendom to subscribe to a condemnation of Pelagian opinions. Nineteen Italian bishops refused, among them Julian of Eclanum in Apulia, a man of good birth, approved sanctity and great capacity, who now became the recognized leader of the movement. But not even his acuteness and zeal could redeem a cause which was rendered hopeless when the Eastern Church (Ephesus, 431) confirmed the decision of the West. Pelagius himself disappears after 420; Coelestius was at Constantinople seeking the aid of Nestorius in 428.

The first principle of Pelagianism is a theory which affirms the freedom of the will, in the sense that in each volition and at each moment of life, no matter what the previous career of the individual has been, the will is in equipoise, able to choose good or evil. We are born characterless (non pleni), and with no bias towards good or evil (ut sine virtute, ita et sine vitio). It follows that we are uninjured by the sin of Adam, save in so far as the evil example of our predecessors misleads and influences us (non propagine sed exemplo). There is, in fact, no such thing as original sin, sin being a thing of will and not of nature; for if it could be of nature our sin would be chargeable on God the creator. This will, capable of good as of evil, being the natural endowment of man, is found in the heathen as well as in the Christian, and the heathen may therefore perfectly keep such law as they know. But, if all men have this natural ability to do and to be all that is required for perfect righteousness, what becomes of grace, of the aid of the Holy Spirit, and, in a word, of Christianity? Pelagius appears to have confused the denial of original sin (in the sense of inherited *guilt*) with the denial of inherited nature or disposition of any kind. Hence he vacillates considerably in his use of the word "grace." In his most careful statements he appears to allow to grace everything but the initial determining movement towards salvation. He ascribed to the unassisted human will power to accept and use the proffered salvation of Christ. It was at this point his departure from the Catholic creed could be made apparent. Pelagius maintains, expressly and by implication, that it is the human will which takes the initiative, and is the ,determining factor in the salvation of the individual; while the Church maintains that it is the divine will that takes the initiative by renewing and enabling the human will to accept and use the aid or grace offered. This was tha position most strongly contested by Augustine (*q.v.*). The result was the rise of Semipelagianism, which was an attempt to hold a middle course between the harshness of Augustinianism and the obvious errors of Pelagianism. It appeared simultaneously in North Africa and in southern Gaul. In the former Church, which naturally desired to adhere to the views of its own great theologian, the monks of Adrumetum found themselves either sunk to the verge of despair or provoked to licentiousness by his predestinarian teaching. When this was reported to Augustine he wrote two elaborate treatises to show that when God ordains the end He also ordains the means, and if any man is ordained to life eternal he is thereby ordained to holiness and zealous effort. But meanwhile some of the monks themselves had struck out a via media which ascribed to God sovereign grace and yet left intact man's responsibility. A similar scheme was adopted by Cassian of Marseilles (hence Semipelagians are often spoken of as *Massilians*), and was afterwards ably advocated by Vincent of Lerins and Faustus of Rhegium. The differentia of Semipelagianism is the tenet that in regeneration and all that results from it, the divine and the human will are co-operating (synergistic) coefficient factors. Pelagius was familiar with the Greek language and theology, and frequented Rufinus, upholder of Greek theology.

PELARGONIUM, a genus of plants belonging to the geranium family (Geraniaceae, *q.v.*) and including most of the cultivated ornamentals known as "geraniums." There are hundreds of species, chiefly South African. (See GERANIUM.)

PELASGIANS. Various traditions were current among the Greeks with regard to the pre-Greek inhabitants of their country. They were inclined to call all these by the general name of Pelasgians, although they recognized Carians and Leleges as distinct. The Dorians claimed that the Ionians were Pelasgian or at least mainly so, and that they themselves were true Greeks. The inhabitants of Attica, who were regarded as Ionian, boasted that they were autochthonous, the original inhabitants of the land.

In the' Homeric poems Pelasgians appear as allies of Troy. They appear to be settled in south-eastern Thrace close to the Hellespont in a district called Larissa (*Il.,* ii. 840–843, x. 429). Some suppose that the Larissa here mentioned is the town of that name in Thessaly, but the catalogue of ships, in which the passage occurs, appears to follow a definite geographical order. Larissa stands between the Hellespont and Thrace. The Iliad also refers to the district of Argos near Mt. Othrys in Thessaly as Pelasgic, and also uses the same epithet in a famous passage of the Zeus of Dodona (*Il.,* ii. 681–684, xvi. 233-235). In the Odyssey Pelasgians appear in Crete (Od. xvii. 175–177). Hesiod refers to Dodona as "seat of Pelasgians," while Hecataeus refers to Pelasgus as king of Thessaly. To Aeschylus and Sophocles Argos in the Peloponnese is the Pelasgian land. Herodotus knows of actual Pelasgians at Placie and Scylace on the Asiatic coast of the Hellespont as well as near Creston on the Strymon. The islands of Lemnos and Imbros had also, he informs us, a Pelasgian population, conquered by Athens at the close of the 6th century. Apart from these actual instances of Pelasgians, both Herodotus

and Thucydides appear to regard any survival from pre-Greek times as Pelasgic. A well-known example of this is the prehistoric wall of the Athenian acropolis, anciently regarded and still commonly referred to as Pelasgian, and the epithet spread to all similar prehistoric masonry, especially that built of large blocks, in any part of Greece.

It has been held that the common Greek tradition arose from a misunderstanding, particularly perhaps by Hesiod and Hecataeus, of the two passages in the Iliad in which the Zeus of Dodona and the Thessalian Argos are referred to as Pelasgic. Where Homer used a general epithet meaning "remotely ancient," later writers have wrongly concluded that he referred specifically to actual Pelasgians as inhabitants of these places. If this is so, the problem is merely thrown farther back, for an explanation is needed of how the epithet Pelasgic had attained the general meaning of "ancient" by the time of the composition of the Homeric poems To certain people at a certain period "Pelasgic" must have been a specific epithet. The Pelasgians must have been regarded either as very ancient people or as former inhabitants of the land. Much turns upon the meaning of the epithet Pelasgic as applied in the Iliad to the Zeus of Dodona. Zeus is the last one would expect to be referred to as Pelasgic, for of all the gods' names his is most certainly Greek. The simplest explanation is perhaps that there existed at Dodona a very ancient pre-Greek or pre-Achaean shrine occupied by Greeks who attached to the deity the name of their own god Zeus.

All instances of actual Pelasgians from Homer to Herodotus point to their being a northern people. Thrace, Epirus and Thessaly are their homes. It is certain that there were pre-Achaean inhabitants of Greece. The simplest view now held is that Greek-speaking peoples broke down into Greece from the north in three successive waves, Ionian, Achaean and Dorian, subduing a previous "Helladic" population and setting up, after the second invasion (*i.e.*, of Achaeans), the Mycenean civilization in the Peloponnese. If this is the simplest view, it does not solve all problems and it does not as yet rest upon a certain foundation of fact An early stratum of population in Greece was in close touch with Xnatolia. A large number of Greek place-names point to the conclusion that Greece was colonized from Anatolia. By whom we do not know, and we are also ignorant of what language these early people spoke. It is also possible that the Achaeans themselves were in Asia Minor before they were in Greece and that they brought thither the Anatolian place-names. It is no more than tradition that connects such early people with the Pelasgians.

The name Pelasgi which almost certainly stands for Pelak-skoi or Pelag-Skoi has been connected with πέλαγος, "the sea," and the people consequently regarded as sea-faring. The connection is not very convincing. It has also been related to the name of the semi-Illyrian Pelagones of Macedonia, and it is possible, though unproven, that the names do represent the same stem. Possibly the Pelasgians were no more than Vlachs, or Wallachian shepherds, who in classical as in modern times have been in the habit of wandering in large numbers down into Greece. The name is perhaps no more than Velak-ski. If this were so, it would account for their being dotted over various regions in Thrace and the north and also, if their habits were the same at the dawn of history as afterwards, of their being an ancient and integral part of Greek tradition and life. G. Sergi describes as "Pelasgian" one branch of the Mediterranean or Eur-African race.

PELECYPODA, a name, now replaced by Lamellibranchia, for the bivalve Mollusca (*q.v.*).

PELEUS, in Greek legend. king of the Myrmidones of Phthia in Thessaly, son of Aeacus, king of Aegina, and usually brother of Telamon. The two, having killed Telamon's third son Phocus, were banished. Peleus took refuge in Phthia with his uncle Eurytion. who purified him from the guilt of murder and gave him his daughter Antigone to wife and a third of the kingdom as her dowry. Having accidentally killed his father-in-law at the Calydonian boar-hunt. Peleus was again obliged to flee, this time to Iolcus, where he was purified by Acastus (*q.v.*). The most famous event in the life of Peleus was his marriage with the sea-goddess Thetis (*q.v.*).

Peleus survived both his son Achilles and his grandson Neoptolemus, and was carried away by Thetis to dwell forever among the Nereids.

PELHAM, the name of an English family, derived from Pelham in Hertfordshire, which was owned by a certain Walter de Pelham under Edward I., and is alleged to have been in the possession of the same family before the Norman conquest The family dignities included the barony of Pelham of Laughton (1706–1768), the earldom of Clare (1714–1768), the dukedom of Newcastle (1715–1768), the barony of Pelham of Stanmer from 1762, the earldom of Chichester from 1801 and the earldom of Yarborough from 1837.

In the reign of Queen Elizabeth SIR WILLIAM PELHAM (c. 1530–1587), third son of Sir William Pelham (d. 1538) of Laughton, Sussex, became lord justice of Ireland. After much service abroad he was sent to Ireland in 1579, when he was knighted by Sir William Drury, the lord justice. Drury died in October, and Pelham was provisionally made his successor, an appointment subsequently confirmed by Elizabeth. Elizabeth protested strongly against Pelham's action in proclaiming Gerald Fitzgerald, 15th earl of Desmond, a traitor, though his action was soon justified by the sack of Toughal by Desmond. Thomas Butler, 10th earl of Ormonde, was entrusted with the campaign in Munster, but Pelham joined him in February 1580. The English generals laid waste northern Kerry, and proceeded to besiege Carrigafoyle Castle, which they stormed, giving no quarter to man, woman or child. Other strongholds submitted on learning the fate of Carrigafoyle. Pelhamvainly sought for help from the gentry of the county, who sympathized with Desmond, and were only brought to submission by a series of "drives." After the arrival of the new deputy, Lord Grey of Wilton, Pelham returned to England. Leicester desired his services in the Netherlands, but it was only after much persuasion that Elizabeth set him free to join the army by accepting a mortgage on his estates as security for his liabilities. Pelham was wounded at Doesburg in 1586, and accompanied Leicester to England in 1587. He died at Flushing on Nov. 24, 1587.

From Sir William are descended the Pelhams of Brocklesby, Lincolnshire, earls of Yarborough (cr. 1837). From Sir Nicholas Pelham, elder brother of William, were descended the DUKES OF NEWCASTLE (*q.v.*). Among the other distinguished members of this family were THOMAS PELHAM, earl of Chichester (1728–1805), who held many offices under George III.; HENRY PELHAM (*q.v.*), GEORGE PELHAM (1766–1827), bishop successively of Bristol, Exeter and Lincoln; Thomas Pelham, 2nd earl of Chichester (1756–1826), who held office under Pitt and Addington.

See Lower, *Pelham Family* (1873).

PELHAM, HENRY (1696–1754), prime minister of England, younger brother of Thomas Holles Pelham, duke of Newcastle, was born in 1696. He was a younger son of Thomas, 1st Baron Pelham of Laughton (1650–1712; cr. 1706) and of Lady Grace Holles, daughter of the 3rd earl of Clare. He was educated by a private tutor and at Christ Church, Oxford, which he entered in July 1710. In 1717 he entered parliament for Seaford, Sussex. Through strong family influence and the recommendation of Walpole he was chosen in 1721 a lord of the treasury. The following year he was returned for Sussex county. In 1724 he became secretary for war, exchanging this office in 1730 for the more lucrative one of paymaster of the forces. He supported Walpole on the question of the excise, and in 1743 a union of parties resulted in the formation of an administration in which Pelham was prime minister, with the office of chan-

cellor of the exchequer; his brother, the duke of Newcastle, was very powerful in the cabinet, and there were occasional disputes between them. Being strongly in favour of peace, Pelham carried on the war with indifferent success. The king, thwarted in his favourite schemes, made overtures in 1746 to Lord Bath, but his purpose was upset by the resignation of the two Pelhams (Henry and Newcastle), who, however, at the king's request, resumed office. Pelham remained prime minister till his death on March 6, 1754, when his brother succeeded him. His very defects were among the chief elements of Pelham's success, for one with a strong personality, moderate self-respect, or high conceptions of statesmanship could not have restrained the discordant elements of the cabinet for any length of time.

See W. Coxe, *Memoirs of the Life of Henry Pelham (2* vols., *1829).*

PELHAM, HENRY FRANCIS (1846–1907), English scholar and historian, was born at Bergh Apton, Norfolk, on Sept. 19, 1846, son of John Thomas Pelham (1811–1894), bishop of Norwich, third son of the 2nd earl of Chichester. He was educated at Harrow, under Butler and Westcott, and at Trinity college, Oxford, where he took a first class in *litterae humaniores* in 1869. He was a tutor of Exeter college from 1869 to 1890, taking over the teaching of ancient history from C. W. Boase. In 1887 he became university reader in ancient history and, two years later, Camden professor. He became curator of the Bodleian library in 1892, and in 1897 president of Trinity college. He was also an honorary fellow of Exeter, a fellow of the British Academy and of other learned societies, and a governor of Harrow school. His chief contribution to ancient history was his article on Roman history in the 9th edition of the *Encyclopedia Britannica* (1886), which was republished with additions as the *Outlines of Roman History* (1890). His university lectures were full of original research and learning. He married, in 1873, Laura Priscilla, daughter of Sir Edward North Buxton. He died on Feb. 13, 1907.

Apart from the *Outlines* he published only *The Imperial Domains and the Colonate* (1890), *The Roman Frontier System (1895)* and articles in periodicals of which the most important was an article in the *Quarterly Review* on the early Caesars (April 1905). Many of these articles were published in collected form after his death by Professor F. Haverfield *(Essays on Roman History,* 1911).

PELICAN, a large fish-eating water-fowl, remarkable for the big extensible skin-pouch between the flexible rami of the lower jaw of its long, weak bill. The common pelican *(Pelecanus onocrotalus)* inhabits south-east Europe, south-west Asia and north-east Africa. It haunts the margins of large lakes and rivers, where fish are plentiful; and companies may be seen in a shallow bay, stretched out in a long line, fishing. The nest is on the ground among the reeds; the two white eggs, with chalky shells, hatch into greyish-brown plumaged young. The adult, except for the black primaries, is white, tinged with pink and, on the head, yellow. A larger eastern species, P. *crispus,* has a crest of curled feathers. Two humeri of pelicans have been found in the English fens and probably belong to this species. There are two American forms, whose methods of feeding and plumage are quite different, P. *occidentalis,* the brown pelican, individually seeking its prey from the air, is marine; P. *erythrorhynchos,* the white pelican, often combining in companies to drive fish into the shallows. In summer it haunts fresh-water. Remarkable ceremonies of courtship and relieving guard at the nest occur. *(See* F. Chapman, *Camps and Cruises of an Ornithologist.)* Allied species occur in south Asia and in Africa. It may be mentioned that the legend of the pelican feeding (and revivifying) its young with the blood from its own breast is entirely unfounded.

AUSTRALIAN BLACK-BACKED PELICAN (PELECANUS CONSTRICILLATUS), FOUND IN AUSTRALIA, TASMANIA AND NEW GUINEA

PELION, a mountain in Thessaly in the district of Magnesia, between Volo and the east coast (mod. Plessidi, 5,075 ft.). In Greek mythology, the giants piled it on Ossa to scale Olympus, the abode of the gods. It was the home of the centaurs, especially of Chiron, who in a cave near its summit educated many youthful heroes. On its summit at an altar of Zeus Actaeus, a festival was held in the dog-days, by worshippers clad in skins.

PELISSIER, AIMABLE JEAN JACQUES (1794–1864), duke of Malakoff, marshal of France, was born on Nov. 6, 1794, at Maromme (Seine Inférieure). His early service was mainly in Algeria. The severity of his conduct in suffocating a whole Arab tribe in the Dahra or Dahna caves, near Mustaganem, where they had taken refuge (June 18, 1845), awakened such indignation in Europe that Marshal Soult, the minister of war, publicly expressed his regret; but Marshal Bugeaud, the governor-general of Algeria, gave it his approval, and secured for Pélissier the rank of general of brigade, which he held till 1850, when he was promoted general of division. On May 16, 1855, he succeeded Canrobert as commander-in-chief of the French forces before Sevastopol. *(See* CRIMEAN WAR.) His perseverance was crowned with success in the storming of the Malakoff on Sept. 8. On the 12th he was promoted marshal. On his return to Paris he was named senator, created duke of Malakoff (July 22, 1856), and rewarded with a grant of 100,000 francs per annum. From March 1858 to May 1859 he was French ambassador in London, being recalled to take command of the army of observation on the Rhine. In the same year he became grand chancellor of the Legion of Honour. In 1860 he was appointed governor-general of Algeria, and he died there on May 22, 1864.

See Marbaud, *Le Mare'chal Pélissier (1863);* Castille, *Portraits historiques,* 2nd series (1859).

PELL, JOHN (1610–1685), English mathematician, was born on March 1, 1610, at Southwick in Sussex, where his father was minister. He was educated at Steyning, and entered Trinity College, Cambridge, at the age of thirteen. Pell was professor of mathematics at Amsterdam (1643–46) and at Breda (1646–52). He was Cromwell's agent in Switzerland for some years. After the Restoration he took orders and held a living in Essex. He studied mainly algebra and Diophantine analysis. He introduced the sign ÷ into England; and the indeterminate equation $ax^2+1=y^2$ bears his name although his connection with it consists simply of the publication of solutions of it in his edition of *Brounker's Translation of Rhonius's Algebra* (1668). He died on Dec. 12, 1685, in London in great poverty.

PELLA, the capital of ancient Macedonia, about 32 m. N.W. of Salonika, at the village Neochori (Turkish Yeni-keui). The seat of government was transferred hither from Edessa by Philip II., and his son Alexander was born here. Under Hadrian it was still of some importance. Scanty remains are visible and neighbouring springs are known as the "baths of Pel."

PELLAGRA AND RELATED DISORDERS. Pellagra is a dietary deficiency disease, noncontagious and occurring in persons of any age, of either sex, of any race and in any stratum of society. Until rather recently it was considered by many to be merely a disease of the skin, the Italian term *pelle agra* meaning "rough skin." For more than 200 years it was associated especially with corn-eating areas of the world.

Some of the early symptoms are weakness, apathy, loss of appetite, indigestion and neurasthenia. In the late stages of the disease appear the classical four D's: dermatitis, diarrhoea, dementia and death. The symptoms vary greatly in each case. If dermatitis is present it begins as an erythema resembling sunburn that becomes reddish brown, roughened and scaly. Lesions may appear on any portion of the body, but the commonest sites are the hands, wrists, elbows, under the breasts, knees, feet and perineal regions. A sharp line of demarcation separates the lesion from the healthy skin. Glossitis and stomatitis are common symtoms. The tongue becomes red and thickened and the mucous membrane is reddened. Severe watery diarrhoea often is present in the acute stage. Nervousness, insomnia, headache and dizziness may be present, and pellagrins are subject to periods of depression and apprehension. Unless early and adequate treatment is adminis-

tered, confusion, hallucinations and complete disorientation as to time. place and person develop. Death inevitably occurs unless the afflicted person receives prompt and intensive treatment.

The pellagrin is relieved of his disease when niacin (a member of the B group of vitamins) and substances that act similarly are given in adequate amounts. The diet of the pellagrin is deficient not only in niacin but also in thiamine (vitamin B_1), riboflavin (vitamin B_2) and folic acid (folacinj, as well as many other essential nutrients. *(See* VITAMINS.) Physicians treat all those deficiency diseases at the same time and call the tablets or capsules they use "mixed vitamin therapy." Persons who develop symptoms of pellagra, beriberi, riboflavin deficiency or folic acid deficiency not only should receive mixed vitamin therapy but they should have a diet rich in lean meat. eggs, milk. fruit and vegetables. Dried brewers' yeast powder and crude liver extracts contain these vitamins and many other useful nutrients. It is preferable to prevent deficiency diseases by means of a proper diet of the type indicated above. rather than to let the diseases develop until medical treatment is required. (T. D. Ss.)

PELLICANUS, CONRAD (1478–1556), German humanist, whose original name was Kürsner, was born at Ruffach, Alsace, on Jan. 8, 1478. He studied at Heidelberg and at Tubingen, where he became a favourite pupil of the guardian of the Minorite convent there, Paulus Scriptoris, and began the study of Hebrew. He had no teacher and no grammar; but Paulus Scriptoris brought him a huge codex of the prophets borne on his own shoulders all the way from Mainz. He learned the letters from the transcription of a few verses in the *Star of the Messiah* of Petrus Niger, and, with a subsequent hint or two from Reuchlin, who also lent him the grammar of Moses Kimḥī, made his way through the Bible for himself with the help of Jerome's Latin. In 1501 he composed the first Hebrew grammar in the European tongue. It was printed in 1503, and afterwards included in Reysch's *Margarita philosophica.* The chief fruit of his Hebrew studies is the vast commentary on the Bible (Zurich, 7 vols., 1532–39).

Pellicanus was ordained priest in 1501, and continued to serve his order at Ruffach, Pforzheim and Basel till 1526. At Basel he did much laborious work for Froben's editions. He abandoned his habit on receiving through Zwingli a call to Zurich as professor of Greek and Hebrew. He died on April 6, 1jj6.

Pellicanus's Latin autobiography *(Chronicon* C.F.R. ed. Riggenbach, 1877) is one of the most interesting documents of the period. *See* also Emil Silberstein, *Conrad Pellicanus; ein Beitrag zur Geschickte des Studiums der hebr. Sprache* (1900).

PELLICO, SILVIO (1788–1854), Italian dramatist, was born at Saluzzo, Piedmont, on June 24, 1788. At the age of ten he composed a tragedy under the inspiration of Caesarotti's translation of Ossian. His tragedy *Francesca da Rimini,* was brought out with success by Carlotta Marchionni at hlilan in 1818 (Eng. trs. 1915). The representation of his next tragedy *Eufemio da Messina,* was forbidden. Pellico attempted to weaken the hold of the Austrian despotism by indirect educational means. He acted as secretary to the powerful literary executive which gathered about Counts Porro and Confalonieri, the management of the *Conciliatore,* which appeared in 1818–19 as the organ of the association, resting largely upon him. In 1820 Pellico was arrested on the charge of carbonarism and after his removal to the Piombi at Venice in 1821, he composed several *Cantiche* and the tragedies *Ester d'Engaddi* (Eng. trs. 1836) and *Iginia d'Asti.* The sentence of death pronounced on him in Feb. 1822 was commuted to fifteen years *carcere duro,* and in the following April he was placed in the Spielberg at Briinn. Here he composed the tragedy *Leoniero* da *Dertona,* for the preservation of which he was compelled to rely on his memory. After his release in 1830 *Ester* was played at Turin in 1831, but immediately suppressed. In 1832 appeared his *Tre nuovi tragedie,* and the famous *Le Mie prigioni* (Eng. trs. 1915), an account of his sufferings in prison. In 1834 the hlarchesa di Barolo, the reformer of the Turin prisons, bestowed on him a yearly pension of 1200 francs and in 1838 gave him a home in her palace. His tragedy *Tommaso Moro* appeared in 1833 and his *Opere* in 1837. He died on Jan. 31, 1854. The simple and naïve egotism of *Le Mie prigioni* established his fame.

See Piero Maroncelli, *Addizioni alle mie prigioni (1834);* G. Briano *Della Vita* e *delle Operc di S. Pellico (1854);* P. Giuria: *S. Pellico e il suo tempo* (1854) and A. Gustarelli: *La Vita,* "Le *Mie Prigioni" e di Pellico. Saggio Biografico-critico* (Florence 1917).

PELLISSON, PAUL (1624–1693), French author, was born at Béziers on Oct. 30, 1624. In 1653 he published a *Relation contenant l'histoire de l'académie française.* He was rewarded by a promise of the next vacant place and by permission to attend their meetings. In 1657 Pellisson became secretary to the minister of finance, Nicolas Fouquet, and when in 1661 the minister was arrested, his secretary was imprisoned in the Bastille. Pellisson stood by Fouquet, in whose defence he issued in 1661, *Discours au roi, par zm de ses fidèles sujets sur le procès de M. de Fouquet,* and *Seconde défense de M. Fouquet.* I'ellisson was released in 1666. He became historiographer to the king, and wrote a fragmentary *Histoire de Louis XIV.,* covering the years 1660 to 1670. In 1670 he was converted to Catholicism and obtained rich ecclesiastical preferment. He died on Feb. 7, 1693. He was very intimate with hlle. de Scudéry, in whose novels he figures as Herminius and Acante.

See Sainte-Beuve, *Causeries du lundi,* vol. xiv.; and F. L. Marcon, *Étude sur* la *vie et les œuvres de Pellisson* (1859).

PELLITORY, a small hairy perennial herb which grows on old walls, hedgebanks and similar localities in the British Isles and is known botanically as *Parietaria officinalis.* It has a short woody rootstock from which spring erect or spreading stems 1 to 2 ft. long, bearing slender leafy branches, and axillary clusters of small green flowers. It belongs to the nettle family *(Urticaceae),* and is nearly allied to the nettle, *Urtica,* but its hairs do not sting. A similar species, P. *pennsylvanica,* is widely distributed in North America.

PELLOUX, LUIGI (1839–1924), Italian general and politician, was born on March 1, 1839, at Laroche (Haute-Savoie) of Italian parents. Entering the army as lieutenant of artillery in 1857, he fought at Custozza (1866) and at the siege of Rome (1870). He was minister of war in the Rudini and Giolitti cabinets of 1891–1893, and in the Rudini cabinet of 1896, and was appointed senator. In May 1897 he secured the adoption of the Army Reform Bill, fixing Italian military expenditure at a maximum of £9,560,000 a year, but in December of that year he was defeated in the Chamber on the question of the promotion of officers. Resigning office, he was in May 1898 sent as royal commissioner to Bari, where, without recourse to martial law, he restored public order. General Pelloux succeeded Rudini as prime minister in 1896, resigned in 1899, but again took office to repress the revolutionary elements in southern Italy. His new cabinet was military and conservative, and Pelloux was forced to resign office after the general election in June. In 1901 he was appointed to the command of the Turin army. He died on Oct. 26, 1924.

PELOPIDAS (d. 364 B.C.), Theban statesman and general. In 38j B.C. he served in a Theban contingent sent to the support of the Spartans at Mantineia, where he was saved, when dangerously wounded. by Epaminondas (*q.v.*). Upon the seizure of the Theban citadel by the Spartans (383 or 382) he fled to Athens, and took the lead in a conspiracy to liberate Thebes. In 379 his party surprised and killed their chief political opponents. and roused the people against the Spartan garrison, which surrendered to an army gathered by Pelopidas. In this and subsequent years he was elected *boeotarch,* and about 375 he routed a much larger Spartan force at Tegyra (near Orchomenus). This victory he owed mainly to the valour of the Sacred Band, a picked body of 300 infantry. At the battle of Leuctra (371) he contributed greatly to the success of Epaminondas's new tactics by the rapidity with which he made the Sacred Band close with the Spartans. In 370 he accompanied his friend Epaminondas as *boeotarch* into Peloponnesus. On their return both generals were unsuccessfully accused of having retained their command beyond the legal term. In 369, in response to a petition of the Thessalians, Pelopidas was sent with an army against Alexander, tyrant of Pherae After driving Alexander out, he passed into Macedonia and arbitrated between two claimants to the throne. In order to secure the influence of Thebes, he brought home hostages, includ-

ing the king's brother, afterwards Philip II., the conqueror of Greece. Next year Pelopidas was again called upon to interfere in Macedonia, but, being deserted by his mercenaries, was compelled to make an agreement with Ptolemaeus of Alorus. On his return through Thessaly he was seized by Alexander of Pherae, and two expeditions from Thebes were needed to secure his release. In 367 Pelopidas went on an embassy to the Persian king and induced him to prescribe a settlement of Greece according to the wishes of the Thebans. In 364 he received another appeal from the Thessalian towns against Alexander of Pherae. Though an eclipse of the sun prevented his bringing with him more than a handful of troops, he overthrew the tyrant's far superior force on the ridge of Cynoscephalae; but wishing to slay Alexander with his own hand, he was cut down by the tyrant's guards.

Plutarch and Nepos, *Pelopidas;* Diodorus xv. 62–81; Xenophon, *Hellenica,* vii. 1. *See* also THEBES.

PELOPONNESIAN WAR, THE, was the great war waged towards the end of the 5th century B.C. by Sparta and the other members of the Peloponnesian Confederacy upon Athens and the Athenian empire. The cities of the Boeotian Confederacy under Theban leadership were Sparta's allies from the first. Syracuse and other Sicilian cities gave active help in the last part of the war. Argos, her hands tied by a treaty with Sparta, remained neutral during the first ten years, but, as a democracy, was benevolently inclined towards Athens. Persia at first held aloof, waiting her opportunity to reassert her dominion over the Greek cities of the Asiatic seaboard which Athens had liberated and added to her own empire. Athens, indubitably unpopular with many members of her empire, found small sympathy beyond its limits. Her maritime supremacy however held the malcontents firmly in check. As the war progressed, the whole Greek world became divided practically into two hostile groups, and both sides resented neutrality bitterly, as the cruel fate of Melos in 416 B.C. showed. The war began on April 4, 431 B.C., by a Theban attempt to surprise Plataea, Athens' ally and outpost on the northern base of Cithaeron. It ended on April 25, 404 B.C., when Athens capitulated. Thus it lasted 27 years, and Thucydides, writing its history after its close, definitely regards it as a single war, though a peace concluded between Athens and Sparta on April 11, 421 B.C., lasted technically some seven years. During these years there was heavy fighting in the Peloponnese in which Spartan and Athenian troops were engaged on opposite sides, and Thucydides' view is so far justified The war divides into three main sections: (1) The "First" or "Archidamian" War, 431–421 B.C.; (2) The "Sicilian" War, 421–413 B.C.; (3) The "Later" or "Ionian" or "Decelean" War, 412–404 B.C.

CAUSE OF THE WAR

The true cause of the war was Sparta's fear of the growth of the power of Athens. This is Thucydides' own final judgment. The whole history of the rise and power of the Athenian empire in the 50 preceding years justifies this view, though the immediate occasions of the war concerned Corinth, Sparta's chief naval ally, rather than Sparta. Since the peace of 445 B.C. Pericles had consolidated Athenian resources, made Athens' navy incomparable, concluded, in 433 B.C., a defensive alliance with the strong naval power Corcyra (Corinth's most bitter enemy), and renewed alliances with Rhegium and Leontini in the West. The very food supply of the Peloponnese from Sicily was endangered. In the Aegean, Athens could always enforce a monopoly of seaborne trade. To this extent the Peloponnesian War was a "Trade War," and on this ground chiefly Corinth appealed to Sparta to take up arms. The appeal was backed by Megara, well-nigh ruined by Pericles' economic boycott (he hoping thereby to compel her once more to join Athens), and by Aegina, reluctant member of the Athenian empire, heavily taxed, and claiming as a right established by treaty that Home Rule which Athens refused her. But had not Sparta herself been eager for war, peace would have lasted. She was but waiting the opportunity, which came when Athens was temporarily embarrassed by the revolt of her subject-ally Potidaea in Chalcidice in the spring of 432 B.C. The rebel city held out until the winter of 430 B.C. and its blockade meant a constant drain upon Athenian military and naval resources. Sparta seized the chance. Confident of speedy victory, she refused the offer of arbitration upon all disputed questions made her by Pericles, though the peace of 445 B.C. bound her to accept it. The ultimatum despatched to Athens was tantamount to the destruction of the prestige if not of the actual existence of the Athenian empire. At Pericles' urging the Athenian people stood firm and Sparta declared war. She had a bad conscience but a good war-cry, liberation of the Hellenes from Athenian despotism.

THE FIRST YEARS, 431–427 B.C.

In a war between the chief military and the chief naval power in Greece a decisive issue was unlikely to come speedily. Sparta relied on the old traditional strategy of Greek warfare. She hoped by invading Attica and devastating the crops to induce such war-weariness in the Athenians as to make them sue for peace, unless they could be provoked first to fight the one pitched battle which must end the war. In the numbers, as in the discipline and efficiency of the troops, Athens was markedly inferior to the Peloponnesian-Boeotian levy. The flaw in this strategy was that Athens, unlike other Greek cities, could not be starved intc submission. For her food supply she was independent of the produce of Attic soil. The old king of Sparta, Archidamus, realized this, and warned his folk that the war would be bequeathed to their children. But the Spartans were confident of speedy victory.

Upon this confidence Pericles based his own strategy. He was fighting for the *status quo ante bellum,* for the survival, not for the aggrandisement, of the empire. To the enemy's "Strategy of Annihilation" he opposed his own "Strategy of Exhaustion" which should give the foe no opportunity of any success in battle. Upon invasion by the enemy the country-folk took refuge within the walls of the "linked-fortress" Athens-Peiraeus. So Athens became "an island," impregnable to attack. The great fleet should secure the empire against disaffection within and attack without, and, offensively, was to raid the Peloponnesian coast. Meanwhile every spring and autumn the Athenian land army should waste the Megarid when the Peloponnesians were busy with their own crops at home, and compel Megara to renew her former alliance with Athens. All access from the Peloponnese by land into Attica would then be denied the enemy, and the dangerous Boeotian army on the north, invaluable allies to a Spartan force in Attica, would not dare cross the Cithaeron-Parnes range unsupported. So the baffled enemy should offer acceptable terms of peace.

This Periclean strategy also had elements of grave weakness, quickly revealed, mainly psychological. The Athenian temper proved unequal to the strain. The Spartans, though disappointed of their hopes, stuck doggedly to the war. Then chance struck Athens a heavy blow. In June 430 B.C. plague, imported by merchant vessels from Egypt or Libya, seized on the city, and the crowding of the refugees within the walls in the glaring summer heat spread the infection horribly. No adequate provision of housing or sanitation had been made. Reinforcements sent to the army blockading Potidaea carried the pestilence on the troop-ships, and here too the mortality was great. No other Greek city of any importance suffered. The devastation of the fields and the ravages of the plague overcame Athens' will to endure, despite all Pericles' noble oratory. There were as yet no compensatory successes. Megara, though starving, refused to submit. The naval raids round Peloponnese, one conducted on a great scale by Pericles himself, were futile pinpricks. Sparta cared nothing for them. It was Athens which first became "exhausted," thanks to the Periclean strategy. Even her great financial superiority at the beginning of the war began rapidly to vanish. Pericles, in fact, in framing his strategy, had been too fearful of the "casualty-list," always a matter of grave peril to any statesman in a Greek democracy. And, himself an admiral of repute, he had been curiously blind to the opportunities afforded an army, even admittedly inferior, by co-operation with a powerful fleet to harass and distract the enemy. A strong expeditionary force based on Cythera, which should have been seized at once (actually the island was taken first—and uselessly—in June 424 B.C.) would at least have kept Peloponnesian armies out of Attica, and have

encouraged Athenian hopes. Pericles flung away the strategical chance offered him in the proper use of naval predominance.

As early as August 430 B.C. Athens sent a peace embassy to Sparta. It was fruitless, and the war continued. In the following winter Potidaea capitulated, and next year two remarkable naval victories at Chalcis and Naupactus at the mouth of the Corinthian Gulf, won by Phormio, the Nelson of Athens, further cheered the Athenians. In September 429 B.C. Pericles died, and when in the June following, Mitylene, chief city of Lesbos, revolted, the very truth of the dead statesman's main contention, that Athens' maritime empire was unassailable, seemed questionable. It was however soon triumphantly vindicated. The Spartan admiral Alcidas, sent a year later to redeem a promise of help to the rebels, was a coward and fled back home after a hurried raid on Ionia at a mere glimpse of two Athenian warships. Mitylene surrendered at discretion in July 427 B.C. The city was cruelly punished, though more mercy was shown than pleased an Athenian politician then coming into prominence, Cleon "the tanner," *bête noire* of the playwright Aristophanes. In August 427 B.C. Plataea at last surrendered, when its tiny garrison was on the brink of perishing of hunger. At the insistence of their Theban enemies the Plataeans were slaughtered in cold blood and their city was utterly destroyed. Corcyra was finally secured for Athens by its democratic faction amid scenes of unspeakable barbarity, consummated in 426 B.C. by a ferocious massacre. But the whole war languished and drew near to stalemate.

ATHENS' "SECOND STRATEGY," 426–421 B.C.

At last, in 426 B.C., Athens bestirred herself, under direction of Cleon and of Demosthenes, the latter her best tactician in the war. The new leaders, though always hampered by the wealthy and influential Nicias, trusted chief and representative of the *bourgeoisie,* initiated a strategy of offence far more vigorous than the Periclean. Sicily, Boeotia, the Peloponnese itself, were all to be spheres of Athenian activity. To meet the cost, Cleon in 425 B.C. largely increased the tribute imposed on all members of the empire, in many cases up to or even beyond 50%. In June 426 B.C. Demosthenes with a handful of Athenian troops proceeded to Acarnania, ostensibly to consolidate Athenian influence in the district at the expense of Ambracia, Sparta's chief ally there. His real hopes were centred upon an invasion of Boeotia by way of Phocis in co-operation with the main Athenian army which, under Nicias, was to invade by way of Tanagra on the south-east and threaten Thebes directly. The plan was a dismal failure. Demosthenes with his large army of local levies without any real stiffening by Athenian hoplites was trapped in the heart of the forests of Aetolia at Aegitium at the very outset of his enterprise, and his whole force was cut to pieces by the natives. He himself barely escaped with his life to the Athenian base at Naupactus, whence he did not dare to return to Athens to become the scapegoat of the people's indignation. Nicias won an insignificant victory at Tanagra and then withdrew. Sparta entered on vigorous reprisals. A large army under Eurylochus marched from Delphi, threatened Naupactus (which Demosthenes secured just in time), and laid siege eventually to Amphilochian Argos, Athens' ally on the Ambraciot gulf. Then Demosthenes redeemed his reputation. Two brilliant victories, those of Olpae and Idomene, won by tactical devices novel in the humdrum warfare of the time, finally destroyed all Peloponnesian and Ambraciot influence in the entire district and shattered Spartan honour. Though Acarnanians and Ambraciots henceforward observed the war from a distance, the way was henceforth clear for Athenian ships to Sicily, and Demosthenes returned in triumph to Athens.

Next year, 425 B.C., Athens, thanks to Demosthenes and Cleon, achieved the "crowning mercy" of Sphacteria. A fleet *en route* for Sicily put in to Navarino bay and Demosthenes built and himself garrisoned a rude fort here on Pylos promontory. The angry Spartans came down upon him by land and sea.. He beat off the assault on the fort, and the Athenian fleet returning on his summons from its slow voyage to the north penned up the Spartan navy in the bay and cut off a Spartan force landed on the island of Sphacteria from all hope of rescue. **A** temporary armistice secured to Athens the peaceful surrender of the hostile fleet, which she refused to return when negotiations were broken off. So Sparta for a dozen years ceased to have a fleet in being. The blockade of the island was protracted, and the approach of winter seemed likely to secure the escape of the garrison. Cleon, appointed general upon Nicias' pusillanimous, even malignant, resignation, brought Demosthenes needful reinforcements, and the latter, landing at last in overwhelming numbers on Sphacteria, overcame the Spartans' heroic resistance and brought the remnant of survivors, 292 in all, alive as prisoners to Athens. The moral effect of their surrender was prodigious throughout the Greek world. Not until the victory of Mantinea seven years later did Sparta wipe out the disgrace. Strategically the effect was to safeguard Attica from all invasion, so long as Spartan prisoners were in Athens' dungeons. Sparta now in her turn sued for peace, which Cleon refused.

Then came the black year, 424 B.C. All the Athenians' main offensive schemes miscarried. In the spring a congress held at Gela, persuaded by the Syracusan statesman Hermocrates, decided to adopt the "Monroe doctrine" of Sicily for the Sicilians, and the Athenian admirals had no choice but to return home, where they were heavily punished for a quite unavoidable failure. In the summer the renewed plan of a converging attack on Boeotia, this time from three sides, resulted in November in a crushing defeat of the main Athenian army at Delium, inflicted by the resolution and tactical ability of the Theban Pagondas. His device of a deepened wing and his skilful use of cavalry for shock tactics anticipated the coming renown of the Theban army under Epaminondas. Meanwhile an attempt to capture Megara by treachery had been frustrated when on the very pint of success by the sudden dash to the city's rescue by Sparta's greatest soldier Brasidas, and only Megara's port Nisaea remained in Athenian hands. Then Brasidas completed the discomfiture of the Athenian "Second Offensive." hlarching at top speed through Boeotia and Thessaly he appeared in the early winter in Chalcidice, the Achilles-heel of the Athenian empire, offering liberty and protection to cities revolting against the tyrant Athens. Amphipolis quickly surrendered herself, and the historian Thucydides, then in naval command in the north Aegean, arrived in hot haste from Thasos only in time to save Eion at the Strymon's mouth. Cleon's vengeance punished him unjustly with 20 years' exile. Athens sought to check Brasidas' triumphant progress by concluding a truce, the "Truce of Laches," in April 423 B.C., with Sparta, whose only anxiety was to recover the prisoners of Sphacteria. Brasidas paid no heed, taking Scione and Mende defiantly. The indignant Athenians hurried reinforcements to what was now the only scene of active war. Nicias recovered Mende this year, and in 422 B.C. Cleon hoped to end the matter. To carelessness in a reconnaissance outside Amphipolis he added cowardice. Brasidas sallie'd from the city, routed the enemy, and Cleon himself was slain. But the Spartan, like Wolfe, fell in the moment of victory. So the two great advocates of bitter war unexpectedly perished, and Nicias was able, on April 11, 421 B.C., to conclude with Sparta that peace, called after his own name, which he hoped would end the Peloponnesian War for all time.

PEACE AND WAR, 421–417 B.C.

There followed a period of uneasy peace between the Greek cities; of alliances projected, spoilt, effected; of recriminations and of diplomatic *finesse,* much of it wasted, all of it suspicious. Corinth and Boeotia refused stoutly to be parties to the Peace of Nicias. Neither Sparta nor Athens fulfilled its conditions, though the latter did surrender her Spartan prisoners in good faith. But she retained Pylos and Nisaea when Sparta professed her inability to render up Amphipolis. And when, in July 420 B.C., a new Quadruple Alliance of Athens, Argos, Mantinea and Elis confronted a Spartan-Roeotian Alliance, the already moribund peace was doomed. This new democratic League was the work of one man at Athens, Nicias' political rival Alcibiades. Like Disraeli entering on a public career about the age of 30, like him a man of brilliant talents and unbounded ambition he too in-

curred the undying distrust, even hatred, of the "respectable" majority of his fellow-citizens. Though henceforward to the end of the war Alcibiades' personality dominates Athenian life and politics, his unquestioned oratorical and military abilities could not surmount finally this handicap, and the party-animosity which he provoked was the final cause of Athens' downfall. This is Thucydides' own certain judgment.

Athens' "Third Offensive Strategy" was in idea her best. Thanks to her new Peloponnesian allies she now threatened Sparta at home and made her rival stake her very existence upon the fortunes of a single fight. Then, to her salvation, Sparta discovered in her King Agis the second of her great soldiers, one remarkable alike for strategical and for tactical ability. Taking the initiative, Agis assembled a powerful army at Phlius by a masterly piece of night-marching and descended from the north upon Argos. His Boeotian contingent failed him at the critical moment, and, forced to extricate the remainder from peril as best he could, he concluded a much misunderstood treaty with the enemy. A few months later Argos, at Alcibiades' insistence, denounced the treaty, and the allies, though including only a miserably inadequate Athenian contingent and weakened further by the selfish absence of the Eleans, threatened Tegea. Agis hastened to the rescue, and the resulting battle of Mantinea in August 418 B.C. was so striking a Spartan victory that by this, the greatest land battle of the war, Sparta redeemed her lost reputation. Argos henceforward ceased to count. That the Third Athenian Strategy was so disastrous a failure was largely due to the blind folly of Alcibiades' political enemies, through whom he himself was not elected general in this the decisive year of its trial

THE EXPEDITION AGAINST SYRACUSE, 416–413 B.C.

One hope only of bold offence now remained for Athens. In 416 B.C., on an appeal for help made by Egesta, Alcibiades advocated vigorous intervention again in Sicily. To conquer Syracuse, subdue the whole island, crush Carthage, and then return with triumphant prestige and added forces to finish the war at home was a strategy which might seem to promise a great, even if a temporary success, and did in fact come within an ace of succeeding at Syracuse itself. The expedition to Sicily was no error of judgment, and the glamour of the west which cast its spell over the vigorous youth of Athens was no false gleam. In vain Nicias urged the dreary alternative of continued operations in Chalcidice. Expedition after expedition had been sent there in 419–417 B.C. and all had been dolefully futile. Only in the west could Athens win the war. The expedition was voted with enthusiasm. On May 22, 415 B.C., the Hermae busts in Athens' streets were mysteriously mutilated. Despite the omen the great armada sailed in June, under three generals of equal authority, Alcibiades the author, Kicias the resolute opponent of the plan, and Lamachus, a straightforward soldier. Hardly had it reached western waters when Alcibiades was recalled to stand his trial at Athens for sacrilege. He had in vain demanded a trial before he sailed. In his absence his enemies played upon the religious credulity of the pious and upon the general dread of oligarchic plots. Alcibiades' own adherents were with him on shipboard. At Athens a death sentence awaited him. He eluded his escort and fled, furious, to Sparta.

Some progress at first was made in Sicily. A preliminary landing at Dascon in Syracuse Great Harbour in November 415 B.C. resulted in a useless Athenian victory. But in April 414 B.C. the whole fleet and army moved from Catana on Syracuse, and the Athenians began to encompass the city with a wall on the landward side while the fleet blocked the harbour approaches. But presently everything went wrong. Lamachus was killed, the fleet was heavily defeated, supplies ran short, a Spartan commander-in-chief, Gylippus, sent at Alcibiades' prompting, arrived to stiffen the Syracusan defence, and the circumvallation was stopped by a cross-wall. In response to Nicias' pitiful despatches Athens sent out Demosthenes with a second armada of 73 vessels. On his arrival, in July 413 B.C., he led an attack by night on the cross-wall. It was ruinously defeated. Nicias still dallied and refused Demosthenes' urgent entreaty to leave Syracuse. At last he had consented, after criminal delay, when, on August 27, an eclipse of the moon worked on the men's superstitious fears and Nicias bowed to the soothsayers' mandate to remain. The Syracusans under Hermocrates and Gylippus seized the unexpected chance. The Athenian fleet was penned up in the Great Harbour by a boom across its mouth, and, in a final desperate engagement, was heavily worsted. The Athenians, abandoning the ships, struck inland for the hills, then, their road here blocked by the enemy, turned south again in two divisions. The rear, under Demosthenes, was surrounded on Sept. 14 in the olive-yard of Polyzelus and surrendered. The van, under Nicias, struggled on for two more days until, cut off on the banks of the river Assinarus, the survivors of a bloody massacre surrendered also. The two captured generals were put to death, against Hermocrates' pleading, in cold blood. Many prisoners perished in the horrors of the quarries at Syracuse. Scarcely a man returned to Athens. The great armada was annihilated. Thucydides' story of this disaster remains the masterpiece of Greek historical writing. In its stark simplicity, sombre majesty, and tragic intensity, his narrative has never been surpassed.

ATHENS' RECOVERY, 412–408 B.C.

The whole Greek world now expected Athens' immediate downfall. Sparta, who had resumed war officially in August 414 B.C., had the disposal of a fleet of equal or superior strength, with naval reinforcements added from the west. Athens' own best mariners were dead. Her treasury was practically empty. In March 413 B.C. King Agis at Alcibiades' suggestion had occupied Decelea and kept her in a state of semi-blockade. and 20.000 of her slaves deserted to the king. The cities of her empire fell away from her in a series of revolts in 412–411 B.C. Persia now for the first time intervened actively in the war, and Sparta seemed able to count on the support of Tissaphernes, satrap of Sardis. Finally there was a successful conspiracy in Athens herself against the utterly discredited democracy, and the oligarchic extremists, Antiphon, Peisander and Phrynichus, seizing the power in June 411 B.C., opened secret and treasonable negotiations with the enemy. Two men saved Athens in this extremity. At home the "Moderate" leader Theramenes frustrated and crushed the extremists and established the "Constitution of the Five Thousand," which guarded the city and maintained the struggle. Alcibiades meanwhile had fled from Sparta to Sardis and by his charm so prevailed upon Tissaphernes that the satrap's aid to Sparta in gold was niggardly and in ships was nil. The Athenian navy, strongly democratic in sympathy, recalled Alcibiades to command at Samos, its base, and at Theramenes' urging the people in the city confirmed the election. Athens once more had a powerful fleet in being, but it was her last, and could not with safety be divided, however strenuously reinforced. The last stages of the war are purely naval.

Presently operations shifted to the Hellespont, where a victory won by the Athenian commanders Thrasybulus and Thrasylus over the Spartan Mindarus at Cynossema in Sept. 411 B.C., if far from decisive, at least restored Athenian confidence, though all hopes of Persian support had by this time been proved fallacious. At this point Thucydides' narrative breaks off short, and Xenophon, an inferior and dull, though an honest and trustworthy writer, takes up the tale. But in March 410 B.C. Alcibiades and his colleagues won so crushing a victory over the hostile navy and its supporting Persian army on land at Cyzicus in the Sea of Marmora that the Athenians were once again indisputable masters of the sea and Sparta actually suggested peace. The newly restored democracy under the demagogue Cleophon's guidance let slip the opportunity. Next year Alcibiades recaptured rebel Byzantium, cleared the Bosporus, secured Athens' corn supply, and so on June 16, 408 B.C., was able to make a triumphal entry into Athens after seven years' absence. He received a rapturous welcome, though there were many who cherished bitter ill-will against him secretly; was appointed general with autocratic powers; and so left to rejoin the fleet, now once again at Samos. He never saw his city again.

ATHENS' DOWNFALL, 407404 B.C.

Sparta at last discovered a great admiral in Lysander. Coming to his naval base at Ephesus in the autumn of 408 B.C. he built up a large well-equipped fleet, assisted by the new satrap, Prince Cyrus, second son of the Persian king, who co-operated enthusiastically with the Spartan, placing Persia's illimitable resources and bis own private purse at the latter's command. Persian vacillation thus ended, the only flaw in Sparta's naval organization was the rule forbidding the same man to hold the admiral's office in two consecutive years. In 407 B.C. Lysander resisted steadily all Alcibiades' efforts to entice him out to battle. Then that weakness, shortage of supplies, which hampered all Athenian operations in the "Ionian War," compelled Alcibiades to divide his fleet. He himself sailed north to plunder enemy coast towns, leaving in observation at Notium a squadron under one Antiochus, a good seaman and an old friend from boyhood, with strict orders not to offer battle. During his superior's absence at hostile Cyme Antiochus challenged Lysander insultingly to combat. The latter sallied out of harbour and routed him. Alcibiades returned and renewed the blockade of the foe, but the mischief was done. His personal enemies at Athens persuaded the people to dismiss him from his command. He withdrew quietly to a castle on the Hellespont, and a new board of generals next year replaced him.

Lysander, too, was superseded by Callicratidas, a brave and energetic officer. The latter, overcoming all hindrances placed in his way by Lysander and Cyrus, blockaded the Athenian Conon in Mitylene harbour. A large Athenian fleet, raised with desperate energy, sailed from Peiraeus to this general's succour. At the resulting battle of Arginusae in August 406 B.C. the fleets engaged were the largest hitherto seen on both sides in the war, but the tactics were nearly as clumsy as in the days before Phormio. Callicratidas was defeated heavily and he himself was drowned. Again Sparta offered peace. Again Cleophon, in drunken madness, secured its rejection. The very victory was marred by a failure, due in part only to heavy weather, to rescue many hundred drowning Athenian sailors from sinking or waterlogged ships. The generals were recalled to Athens. Six who obeyed were put on trial and, illegally condemned en bloc, were executed, Theramenes, whom they had tried to make their scapegoat, being largely responsible for their doom. By their removal he may have hoped to achieve Alcibiades' recall even at the eleventh hour. In this he failed. The new generals of 405 B.C. were, with one exception, Alcibiades' political opponents.

These proceeding to Ionia, moved the entire fleet up to the open roadstead of Aegospotami in the Hellespont. Lysander lay opposite in security at Abydos. In vain Alcibiades rode down to warn his compatriots of their perilous position. Insults rewarded this, the last of his many efforts to save his city. By a clever ruse de guerre Lysander in Sept. 405 B.C. captured the whole of the opposing fleet without a blow and "in one single hour brought the longest of wars to an end." Only Conon and some 20 Athenian ships escaped. So Athens lost her fleet and, with it, the war, thanks to incompetence and political partisanship combined. With slow deliberation Lysander sailed upon the city and blockaded Peiraeus. King Pausanias lay with his army outside the walls. After six terrible months of slow starvation Theramenes secured terms from Sparta tolerable compared with the utter destruction of the city demanded by Corinth and Thebes. On April 25, 404 B.C., Athens capitulated, and the Spartans marched in. Her long walls were pulled down to the merry sound of flutes. Her empire was dissolved. Samos, alone defiant, was taken. The oligarchy of the "Thirty Tyrants" was established at Athens, and Critias, its chief, presently secured the judicial murder of Theramenes in the city and the assassination of Alcibiades at Phrygian Melissa. "Liberty returned to Hellas." The Peloponnesian War was ended.

With the war the greatest, if not the happiest days of Athens' history are ended. Her political pre-eminence passes away. Interest centres rather on Thebes and Macedon in the 4th, on Achaea and Sparta in the 3rd century. Hence it is that the Peloponnesian War enjoys such importance in world-history. Apart from this, it is the genius of Thucydides which has raised to the rank of a world-epic, almost of a world-tragedy, a struggle which has seemed to some little better than a petty quarrel of ancient days.

PELOPONNESUS ("Island of Pelops"), the ancient (and modern Greek official) name for the part of Greece south of the Isthmus of Corinth. In mediaeval times it was called the Morea, from its resemblance to a mulberry-leaf in shape.

PELOPS, in Greek legend, the grandson of Zeus, son of Tantalus and Dione, and brother of Niobe. His father's home was on Mt. Sipylus in Asia Minor. Tantalus one day served up to the gods his own son Pelops, boiled and cut in pieces. The gods detected the crime, and none of them would touch the food except Demeter, who, distracted by the loss of her daughter Persephone, ate of the shoulder. The gods restored Pelops to life, and the shoulder consumed by Demeter was replaced by one of ivory. Poseidon carried Pelops off to Olympus, where he dwelt with the gods, till, from his father's sins, he was cast out from heaven. Then. taking much wealth with him, he went to Pisa in Elis and won Hippodamia by the treachery of Myrtilus (*cf* OENOMAUS). When Myrtilus claimed his promised reward. Pelops flung him into the sea near Geraestus in Euboea, and from his dying curse sprang the woes of the house of Pelops.

Among the sons of Pelops by Hippodamia uere Atreus and Thyestes. Pelops is closely connected with Olympia. A mound there was supposed (falsely) to be his tomb; his sacrifice was an important part of the festival; he is said to have celebrated the Games "more notably than any man before him" (Paus. v., 8. 2). It is likely that his family is of the eastern branch of the Achaeans known from Hittite records to have existed in Asia Minor in early times.

PELOTA, a Spanish word meaning ball. In the Basque provinces of Spain and France the word is used to denote the popular game known as "jai-alai" or "pelota vasca," a sport played regularly or occasionally in many places, *e.g.,* Madrid, Barcelona, Buenos Aires, Havana, Miami. Fla , etc In Cuba, pelota sometimes means baseball; as in the U.S., it is the favourite sport.

PELOTAS, a city of the state of Rio Grande do Sul. Brazil, on the left bank of the São Gonçalo river near its entrance into the Lagoa dos Platos, 30 mi. N.W. of the city of Rio Grande. Pop. (1950) 78,014.

Railways connect the city with Rio Grande, and with São Paulo to the north, and with Argentina and Uruguay. The São Gonçalo river is the outlet of Lagoa Mirim, and Pelotas is therefore connected with the inland water routes. The city is built on an open, grassy plain (*campo*), a little above the level of the lake (28 ft. above sea level). Pelotas is the centre of the xarque (jerked beef) industry of Rio Grande do Sul. In its outskirts and the surrounding country are a number of xnrqueadas (slaughter-houses).

There are many factories or packing houses where the by-products are prepared for market. Shoe and furniture factories also exist.

Pelotas became a *vila* in 1830 and a city in 1835. (R. D'E.)

PELTASTS, properly, ancient Greek soldiers, carrying a light shield (πέλτη) instead of the heavier shield (ὅπλον), carried by the Hoplites. They were light infantry and were

recruited originally from Thracian mercenaries. After Iphicrates made them an efficient fighting force the term "peltasts" was applied to all light infantry (cf. Xen.. *Hell.*, iv, 4. 16 and 5, 12).

PELTIER, JEAN CHARLES ATHANASE (1785–1845), French physicist. whose discovery (1834) that an electric current produces, according to direction, either heat or cold at the junction of two dissimilar metals in a circuit completed the discovery of T. J. Seebeck. He was born at Ham (Somme), Fr., on Feb. 22. 1785, and became a clockmaker. He died in Paris on Oct. 27, 1845. (D. McK.)

PELUSIUM, an ancient city and port of Egypt, now represented by two large mounds close to the coast and the edge of the desert. 20 mi. E. of Port Said.

It lay in the marshes at the mouth of the most easterly (Pelusiac) branch of the Nile, which has long since been silted up, and was the key of the land toward Syria and a strong fortress, which, from the Persian invasion at least. played a great part in all wars between Egypt and the east.

PEMBA, an island in the Indian ocean off the east coast of Africa, forming part of the sultanate of Zanzibar. Pemba lies 25 mi. N.E. of Zanzibar in 5° S. latitude. It is 42 mi. long by about 14 mi. broad (maximum measurements). and has an area of 380 sq.mi. It is of coral origin. The average rainfall is 76.47 in. a year: the mean maximum temperature is 86.4' F. and the mean minimum 76.2° F. The population in 1948 was 114,587. Three-quarters of the inhabitants are Africans of Bantu stock (including the aboriginal Wapemba) and most of the remainder are Arabs; there are also about 2.000 Indians. mainly shopkeepers. The greater part of the plantations on Pemba were devoted to coconut cultivation until 1872, when a hurricane destroyed most of the clove trees on the island of Zanzibar. Thereupon, to benefit from the great rise in price of cloves. the Pemba planters cut down their palms and planted cloves, the cultivation of which became the major industry. The principal imports are rice and cotton piece goods. A telephone system connects the principal centres on Pemba, and a radio station keeps the island in communication with Zanzibar. There are about 70 mi. of roads suitable for motor traffic. An air service to and from Zanzibar and the mainland was inaugurated in 1954. Chake Chake, the capital (pop., 1948, 3,010), is centrally situated at the head of a shallow tidal creek partly blocked by dense growths of mangroves. Mkoani is on the southwest coast. Wete on the northwest coast; at the last-named port there is a deep and well-sheltered harbour. (*See* also ZANZIBAR.)

PEMBRQKE, EARLS OF. The title of earl of Pemhroke has been held successively by several English families, the jurisdiction and dignity of a palatine earldom being originally attached to it. The first creation dates from 1138, when the earldom of Pemhroke was conferred by King Stephen on GILBERT DE CLARE (d. 1148), son of Gilbert Fitz-Richard, who possessed the lordship of Strigul (Estrighoiel, in *Domesday* Book), the modern Chepstow, and who, after the battle of Lincoln (1141), in which he took part, joined the party of the empress Matilda and married Henry I's mistress, Isabel, daughter of Robert de Beaumont, earl of Leicester.

For his son RICHARD, and earl. and for WILLIAM MARSHAL, who succeeded to the title through his marriage with Isabel, Richard's daughter and heiress. *see* separate articles.

Marshal's eldest son, WILLIAM MARSHAL (d. 1231), 2nd earl of Pembroke of this line, passed several years in warfare in Wales and in Ireland. where he was justiciar from 1224 to 1226; he also served Henry III in France. His second wife was the king's sister, Eleanor. .afterward the wife of Simon de Blontfort. but he left no children. His brother RICHARD MARSHAL (d. 1234), 3rd earl, came to the front as the leader of the baronial party and the chief antagonist of the foreign friends of Henry III. Fearing treachery he refused to visit the king at Gloucester in Aug. 1233, and Henry declared him a traitor. He crossed to Ireland. where Peter des Roches had instigated his enemies to attack him, and in April 1234 he was overpowered and wounded; he died a prisoner. His brother GILBERT (d. 1241), who became the 4th earl, was a friend and ally of Richard, earl of Cornwall. He was succeeded in turn by two brothers. On the death of ANSELM, the 6th earl (Dec. 1245), the male descendants of the great earl marshal became extinct. The extensive family possessions were now divided among Anselm's five sisters and their descendants, the earldom of Pembroke reverting to the crown.

The next holder of the lands of the earldom of Pembroke was WILLIAM DE VALENCE (d. 1296), a younger son of Hugh de Lusignan. count of La Marche. by his marriage with Isabel of Angoulême (d. 1246), widow of the English king John; he was born at Valence, near Lusignan. In 1247 William and his brothers, Guy and Aymer, crossed over to England at the invitation of their half-brother, Henry III. who arranged a marriage between William and Joan de Munchensi (d. 1307), a granddaughter of William Marshal. 1st earl of Pembroke. He was hated as one of the most prominent of the rapacious foreigners. He quarrelled with Simon de Montfort, refused to comply with the provisions of Oxford, and took refuge in Wolvesey castle at Winchester, where he was besieged and compelled to surrender and leave the country. In 1259 he and Simon de Montfort were formally reconciled in Paris, and in 1261 he was again in England. He fought for Henry at the battle of Lewes, and then, after a stay in France, he landed in Pembrokeshire and took part in 1265 in the siege of Gloucester and the battle of Evesham. After the royalist victory he was restored to his estates and accompanied Prince Edward. afterward Edward I, to Palestine. He died in England before May 18, 1296, and was buried in Westminster abbey.

William mas never created earl of Pembroke but toward the end of his life he began to be so styled; and the title was tacitly conceded to his eldest surviving son, AYMER (*c.* 1270–1324). He was one of the lords ordainers, but later joined the king and fought at Bannockburn. In 1317, when returning to England from Rome, he was taken prisoner and was kept in France until a large ransom was paid by the king. In 1318 he again took a conspicuous part in making peace between Edward and his nobles. and in 1322 assisted at the formal condemnation of Thomas, earl of Lancaster, and received some of his lands. His second wife, Mary de Chatillon, was the founder of Pembroke college, Cambridge.

In 1339 LAURENCE. LORD HASTINGS (1320–48), a great-grandson of William de Valence, having inherited through the female line a portion of the estates of the Valence earls of Pembroke, was created, or recognized as, earl of Pembroke. His son JOHN (1347–7j) married Margaret Plantagenet, daughter of King Edward III, and on the death without issue of his son in 1389 the earldom of Pembroke reverted again to the crown.

In 1414 HUMPHREY PLANTAGENET, fourth son of King Henry IV, was created duke of Gloucester and earl of Pembroke for life, these titles being subsequently made hereditary, with a reversion as regards the earldom of Pembroke, in default of heirs to Humphrey, to WILLIAM DE LA POLE. earl of Suffolk. Accordingly. on the death of Humphrey. without issue, in 1447 this nobleman became earl of Pernbroke. He was beheaded in 1450 and his titles were forfeited. About Nov. 1452 the title was given to SIR JASPER TUDOR, second son of Owen Tudor and half-brother of King Henry VI. Sir Jasper being a Lancastrian, his title was forfeited during the predominance of the house of York, but was restored on the accession of Henry VII. On his death without heirs in 1495, his title became extinct.

During his attainder Sir Jasper was taken prisoner by SIR WILLIAM HERBERT (d. 1469), a Yorkist, who had been raised to the peerage as Baron Herbert by Edward IV, and for this service Lord Herbert was created earl of Pembroke in 1468. His son William (d. 1491) received the earldom of Huntingdon in lieu of that of Pembroke, which he surrendered to Edward IV, who thereupon conferred it (1479) on his son EDWARD, PRINCE OF WALES; and when this prince succeeded to the throne as Edward V, the earldom of Pembroke merged in the crown.

ANNE BOLEYN was created marchioness of Pembroke in 1532, a few months previous to her marriage witn Henry VIII.

The title of earl of Pembroke was next revived in favour of SIR WILLIAM HERBERT (*c.* 1506–70), whose father, Richard, was an illegitimate son of the 1st earl of Pembroke of the house of Herbert. He had married Anne Parr, whose sister later became

Henry VIII's sixth wife, and was created earl in 1551. The title has since been held by his descendants.

His elder son HENRY (d. 1601), who succeeded as 2nd earl, was president of Wales from 1 j86 until his death. He married in 1 j53 Katherine, sister of Lady Jane Grey; the marriage was dissolved after the Grey family fell. His third wife, married in 1577, was Mary Sidney, the famous countess of Pembroke (1561–1621), third daughter of Sir Henry Sidney and his wife Mary Dudley. Sir Philip Sidney, her eldest brother, wrote *The Countesse of Pembroke's Arcadia* for her pleasure. The two also worked at a metrical edition of the Psalms. On his death she made herself his literary executor, correcting the unauthorized editions of the *Arcedin* and of his poems, which appeared in 1590 and 1591. Edmund Spenser dedicated his *Ruines of Time* to her, and refers to her as Urania in *Colin Clout's Come Home Againe;* in Spenser's *Astrophel* she is Clorinda. In 1599 Queen Elizabeth was her guest at Wilton, and the countess composed for the occasion a pastoral dialogue in praise of Astraea. The countess's other works include: *A Discourse of Life and Death,* translated from the French of Duplessis-Mornay, and *Antonius,* a version of a tragedy of Robert Garnier (published together, 1592).

WILLIAM HERBERT, 3rd earl of Pembroke (1580–1630), son of the 2nd earl; was a conspicuous figure in the society of his time and at the court of James I. He was lord chamberlain of the royal household (1615–26) and lord steward (1626–30). Like his brother Philip, the 4th earl, he took a lively interest in colonial enterprises in America and the West Indies. He was chancellor of the Cniversity of Oxford in 1624 when Thomas Tesdale and Richard Wightwick refounded Broadgates hall and named it Pembroke college in his honour. By some Shakespearean commentators Pembroke has been identified with the "Mr. W. H." referred to as "the onlie begetter" of Shakespeare's sonnets in the dedication by Thomas Thorpe, the owner of the published manuscript, while his mistress, Mary Fitton (*q.v.*), has been identified with the "dark lady" of the sonnets. (*See* SHAKESPEARE, WILLIAM.) He and his brother Philip are the "incomparable pair of brethren" to whom the first folio of Shakespeare is inscribed. The earl left no sons when he died in London on April 10. 1630.

His brother, PHILIP HERBERT, the 4th earl (1584–1650), was for several years the chief favourite of James I. In 160j the king created him earl of Montgomery and Baron Herbert of Shurland, and since 1630, when he succeeded to the earldom of Pembroke! the head of the Herbert family has carried the double title of earl of Pembroke and hlontgomery. Charles I made him lord chamberlain in 1626 and frequently visited him at Wilton. He worked to bring about peace between the king and the Scots in 1639 and 1640, but when in the latter year the quarrel between Charles and the English parliament was renewed he deserted the king, who in July 1641 deprived him of his office of chamberlain. Trusted by the popular party, Pembroke was made governor of the Isle of Wight, and he was one of the representatives of the parliament on several occasions, notably during the negotiations at Cxbridge in 1645 and at Newport in 1648, and when the Scots surrendered Charles in 1647. In Feb. 1649 he became a member of the Commonwealth council of state and in April, although a peer, he was elected and took his seat in the house of commons as member for Berkshire.

THOMAS, the 8th earl (*c.* 1656–1733), was a person of note during the reigns of William 111 and Anne.

His son HEKRY, the 9th earl (*c.* 1689–1750), was a soldier but was better known as the "architect earl." He was largely responsible for the erection of Westminster bridge. Later holders of the title included HENRY, 10th earl (1734–94), a soldier, who wrote the *Method of Breaking Horses* (1761); and GEORGE AUGUSTUS, 11th earl (1759–1827), a soldier and ambassador extraordinary to Vienna in 1807.

See G. T. Clark, *The Earls, Earldom and Castle of Pembroke* (Tenby, 1880); G. E. C(okayne), *Complete Peerage,* rev. ed., vol. x (London, 1945).

PEMBROKE, RICHARD DE CLARE, 2ND EARL OF (d. 1176), commonly known as "Strongbow," son of Gilbert de Clare, the first earl, succeeded to his father's estates in 1148, but had forfeited or lost them by 1168. In that year Derrnot, king of Leinster, driven out of his kingdom by Roderick, king of Connaught, came to solicit help from Henry II. He secured the services of Earl Richard, promising him the hand of his daughter Eva and the succession to Leinster. The earl crossed over in person (1170), took both Waterford and Dublin, and was married to Eva. But Henry II., jealous of this success, ordered all the troops to return by Easter 1171. In May Dermot died; this was the signal of a general rising, and Richard barely managed to keep Roderick of Connaught out of Dublin. Immediately afterwards he hurried to England to solicit help from Henry II., and surrendered to him all his lands and castles. Henry crossed over in Oct. 1172; he stayed in Ireland six months, and put his own men into nearly all the important places, Richard keeping only Kildare. In 1173 Richard went in person to France to help Henry II., and was present at Verneuil, being reinstated in Leinster as a reward. In 1174 he advanced into Connaught and was severely defeated, but fortunately Raymond le Gros reestablished his supremacy in Leinster. Early in 1176 Richard died, just as Raymond had taken Limerick for him. As he had no male issue his daughter, Isabel, became countess of Pembroke in her own right, and the title was borne by her husband, Sir William Marshal. (*See* below.) Strongbow was the statesman, as the Fitzgeralds were the soldiers, of the conquest. He was buried in the cathedral church of Dublin, where his effigy and that of his wife are still reserved.

See Giraldus Cambrensis, *Expugnatio hibernica;* and the *Song* of *Dermot,* ed *G. H.* Orpen (1892).

PEMBROKE, WILLIAM MARSHAL, 1ST EARL OF (? – 1219), English statesman, second son of John le Maréchal, by Sibylle, the sister of Patrick, earl of Salisbury, succeeded to the title through his marriage with Isabel, daughter of Richard, 2nd earl of Pembroke (*q.v.*). In 1170 he was admitted to the household of Prince Henry, the heir-apparent, and remained there until the death of his young patron (1183). He undertook a pilgrimage to the Holy Land, where he served as a crusader with distinction for two years Although he had abetted the prince in rebellion he was pardoned by Henry II. and admitted to the royal service about 1188. In 1189 he covered the flight of Henry II. from Le Mans to Chinon, and, in a skirmish, unhorsed the undutiful Richard Coeur de Lion. None the less Richard, on his accession, promoted Marshal and confirmed the old king's licence for his marriage with the heiress of Strigul and Pembroke. This match gave Marshal the rank of an earl, with great estates in Wales and Ireland, and he was included in the council of regency which the king appointed on his departure for the third crusade (1190). He took the side of Prince John when the latter expelled the justiciar, William Longchamp, from the kingdom, but in 1193 he joined with the loyalists in making war upon the prince. Richard allowed him to succeed his brother, John Marshal, in the hereditary marshalship, and on his death-bed designated him as custodian of Rouen and of the royal treasure during the interregnum.

Though he quarrelled more than once with John, Marshal was one of the few English laymen who clung to the royal side through the Barons' War He was one of John's executors, and was subsequently elected regent of the king and kingdom by the royalist barons in 1216. He prosecuted the war against Prince Louis and the rebels with remarkable energy. In the battle of Lincoln (May 1217) he charged and fought at the head of the young king's army, and he was preparing to besiege Louis in London when the war was terminated by the naval victory of Hubert de Burgh in the straits of Dover. He was criticized for the generosity of the terms he accorded to Louis and the rebels (Sept. 1217); but his desire for an expeditious settlement was dictated by sound statesmanship. Self-restraint and compromise were the key-notes of Marshal's policy. Both before and after the peace of 1217 he reissued Magna Carta. He fell ill early in the year 1219, and died on May 14, at his manor of Caversham near Reading. He was succeeded in the regency by Hubert de Burgh, in his earldom by his five sons in succession.

PEMBROKE, a town of Ontario. Canada, capital of Renfrem county, 74 mi. W.N.W. of Ottawa by rail on the south shore of Allumette lake, an expansion of the Ottawa river, and on the Canadian Pacific and Canadian National railways. Pop. (1951) 15,241.

Pembroke is the seat of a Roman Catholic bishopric, a lumber trade centre and is near Petawawa military camp.

PEMBROKE, municipal borough of Pembrokeshire, Wales. Pop. (1951) 12,296. Area 7.3 sq.mi. It is an agricultural market town on the tidal waters of the Pembroke river which flows into Milford Haven. A fortress seems to have been built there by the Norman Arnulf de Montgomery, about 1090. In the 12th and 13th centuries it was enlarged by the earls palatine of Pembroke, who made it their chief seat, and the town was surrounded with an embattled wall. The circular vaulted keep, built by William Marshall (c. 1200) is 75 ft. high and the walls are 19 ft. thick at the base. The great hall is built over the Wogan, a lofty natural cavern about 70 ft. long and 60 ft. wide having direct access to the river. As capital of the palatinate and the nearest port for Ireland, Pembroke was one of the most important fortified sites in the west. Henry VII was born in the castle in 1457. Facing the castle are remains of Monkton priory, founded by Arnulf de Montgomery in 1098.

The town was first incorporated by Henry I in 1109, and again by Richard de Clare in 1134. its privileges being later confirmed and extended. With the Act of Union (1536) the county palatine of Pembroke was abolished and in 1835 the corporation of Pembroke town was remodelled.

In 1814 a naval dockyard was built on the banks of Milford Haven, within the borough boundaries, and the tonn of Pembroke Dock grew up around this yard. The dockyard was closed in 1926 but reopened as a naval air base in 1931. The borough was made a development area under the Distribution of Industries act (1945) and has shipbuilding and repairing, light engineering and textile manufacture as its main industries. Pembroke Dock is also a garrison town.

PEMBROKESHIRE, the most westerly county of south Wales, bounded N.E. by Cardigan. E. by Carmarthen. S. by the Bristol channel, and W. and N.W. by St. Bride's bay and Cardigan bay of St. George's channel. The coast line is much indented and more than 140 mi. in length. Area 614.1 sq.mi. Pop. (1951) 90,906. In 1952 the coast became a national park.

From Haverfordwest, the county town and the main marketing centre, no fewer than ten roads radiate to ail parts of the county. Fishguard and Milford Haven have the two most westerly railway terminuses in Wales.

Pembroke, with Pembroke Dock, on the south of Milford Haven, is the only industrial area. Fishguard on the north coast is the Welsh port for steamboat service with Rosslare in Ireland. St. David's, nominally a city by possession of a cathedral, is in fact no more than a small village.

Physiography. — Much of the county consists of undulating or hilly pasture land, the highest ground being in the north. where the Prescelly hills (Mynydd Preseli) reach 1,760 ft. There are numerous streams, but the only rivers of importance are the East and West Cleddau whose estuaries merge about 4 mi. southeast of Haverfordwest and extend south to Milford Haven, thus severing direct communication between the Pembroke peninsula and the west of the county. There are magnificent cliffs along the south coast, gray Mountain Limestone alternating with Old Red Sandstone. The long, narrow inlets represent drowned valleys and there are many sandy bays. There are submerged forests in the vicinity of Amroth.

The north and south arms of St. Bride's bay are prolonged by groups of small islands of which Skokholm, Skomer and Grassholm are well-known breeding places of sea birds. The islands are protected, and the Council for the Promotion of Field Studies established a centre at Dale head, inside the northern entrance to Milford Haven.

Geology. — The region falls naturally into an upland northern section of older rocks and a lowland southern section of somewhat newer rocks. In the north the rocks range from pre-Cambrian near St. David's to the Ordovician and Silurian, forming the mass of the Prescelly hills. The general strike of the beds is southwest to northeast. From the Carmarthenshire border westward the rocks of the northern section of the county become older and oider — Silurian. Ordovician, Cambrian and finally pre-Cambrian granitic and volcanic rocks near St. David's. As the rocks get older to the west so the elevation of the hills becomes reduced and the Prescelly finger out to sea forming numerous headlands, islands and bays.

The rocks of the north and west are interspersed with igneous material such as the gabbros and diabases of Strumble head, Fishguard. Llanwnda and Prescelly; diorites northwest of St. David's, bostonites and porphyrites about Abercastle and the basaltic laccolite of Pen Caer. beside various contemporaneous acid lavas and tuffs. The Ordovician and Silurian rocks extend southward to the neighbourhood of Narberth and Haverfordwest. Silver-bearing lead has been mined at Llanfrynach. The southern plain is open to the sea and may be looked upon geologically as a continuation westward of the south Wales coalfield, with associated Lower Carboniferous. Old Red Sandstone and narrow belts of Silurian rocks, the whole having been considerably folded and faulted, producing a general northwest to southeast strike. The coal measures, highly inclined and anthracitic, stretch across from Carmarthen bay to the shore of St. Bride's bay; they are bordered on the north and southeast by the Millstone Grits, Carboniferous Limestone series and Old Red Sandstone. Because of folding, the limestone appears again farther south of Pembroke, Caldy island and St. Gowan's head, most of the remaining ground about Milford Haven being occupied by Old Red Sandstone with infolded strips of Silurian.

History. — The outstanding feature of the early history of Pembrokeshire is its importance in Megalithic times. The northwest section of the county (including the southern slopes of the Prescelly hills) is especially rich in Megalithic remains---dolmens, alignments, standing stones and stone circles. There are similar remains in the southern half of the county but they are not nearly so marked, as a group, as in the northwestern district. This wealth of Megalithic remains suggests that northwest Pembrokeshire had cultural relations with many of the northwest coastal promontories of Europe in the days when metal was beginning to be known in the west.

The interest of the stone circle culture in Pembrokeshire was increased when it was shown that the stones forming the inner circle at Stonehenge were derived from rocks in Pembrokeshire. There are the well-preserved dolmens of the Longhouse near Mathry and the Pentre Evan near Newport. The stone circle known as Parc-y-Marw near Fishguard is also well preserved.

The county does not show a wealth of Bronze Age objects though isolated discoveries fringe, as it were, the Megalithic area. The number of hilltop camps, presumably of Romano-British type and date, is important. especially guarding ways in from the coast, though actuai Roman influence in the county is slight. It is probable that the hilltop camps continued to be occupied through the post-Roman centuries as the county suffered from raiders from over the sea. In Pembrokeshire, as in Ireland, the native cultures lived on uninterrupted by Roman influences, and Pembrokeshire was apparently invaded by the Irish Deisi about A.D. 270. In the early centuries of our era the county maintained its contacts with Ireland and Brittany and became a great centre of Celtic Christianity. Memorials of this period remain in the numerous church dedications and in the beautiful Celtic crosses such as those of Carew. Penally and Nevern. Stones with Ogham inscriptions were found at Caldy Island, Bridell, St. Dogmell's (Dogmael's), Cilgerran and other places.

The route that had linked Ireland, Pembrokeshire. Cornwall, Brittany and northwest Spain in Megalithic times became the route of the Celtic saints and, in the middle ages, an important pilgrim's way to the shrine of Santiago de Compostela (northwest Spain) (see A. Hartwell Jones, Y *Cymmrodor,* 1912). In a shel-

tered valley, at a focus of roads from a number of little landing places on the northwest coast of Pembrokeshire, there grew up the great cathedral of St. David's (q v.), soon to become a centre of pilgrimage, and at the landing places were built chapels for the pilgrims. St. Non's and St. Patrick's were probably built very early.

Pembrokeshire was known to the Welsh in these early times as Dyfed. On the death of Rhodri Mawr in 877. Dyfed fell nominally under the sway of the princes of Deheubarth, or south Wales; their hold was never very secure, nor were they able to protect the coast towns from the Scandinavian pirates. This is shown by the large number of Scandinavian place names found in the coastal districts, especially near the southern coast. In 1092 Arnulf de Montgomery, son of Roger, earl of Shrewsbury, did homage to the king for the Welsh lands of Dyfed. With the building of Pembroke castle, the Normans began to spread over southern Dyfed, while about the turn of the 12th century William Fitz Martin built Nenport castle, which became the *caput* of his extensive lordship of Kemes (Cemaes) between the Teifi river and the Prescelly hills.

Flemish settlers were planted in the hundred of Rhôs, or Rhoose, in or about the years 1106, 1108 and 1111 with the approval of Henry I, and again in 1156 under Henry II. The castles of Haverfordwest and Tenby were erected to protect these aliens, and despite the fierce attacks of the Welsh princes their domain grew and their district became known as "Little England beyond Wales." In 1138 Gilbert de Clare was created earl of Pembroke with the full pouers of an earl palatine in Dyfed.

Examination of the mediaeval record shows a marked contrast between the *Englishery* of the south, with its compact villages and cultivation, and the *Welshery* of the north, with its scattered farms and tribal groups. The south was better populated than the north and maintained a closer contact with the affairs of the English plain. It was also the Norman stronghold and the south of the county has long been famous for its mediaeval castles. The finest examples are to be observed at Pembroke; Manorbier, built in the 12th century and interesting as the birthplace and home of Giraldus Cambrensis; Carew, exhibiting many interesting features of both Norman and Tudor architecture; and Picton. Other castles are the keep of Haverfordwest and the ruined fortresses at Narberth, Tenby, Newport, Wiston, Benton, Upton and Cilgerran. There are remains of monastic houses at Tenby and Pembroke, but the most important religious communities were the priory of the Augustinian friars at Haverfordwest and the abbey of the Benedictines at St. Dogmell's (Dogmael's). The latter, founded by Robert Fitz Martin in the 12th century. owned the priories of Pill and Caldy. Extensive ruins of the abbey exist near the left bank of the Teifi about one mile below Cardigan.

Of the ancient preceptory of the Knights of St. John at Slebech scarcely a trace remains, but of the college of St. Mary at St. David's founded by Bishop Houghton in 1377, the shell of the chapel survives.

Interesting examples of mediaeval domestic architecture are the ruins of the former episcopal mansions at Llawhaden, St. David's and Lamphey, the two latter of which were erected by Bishop Gower between the years 1328–47. The cathedral at St. David's is the greatest ecclesiastical monument in the county as well as in the principality. The nave dates largely from 1180–98 and the building was continued into the 13th century, added to in the 14th and 16th centuries, and restored in the 19th century.

By the Act of Union (27 Henry VIII), the king abolished all special jurisdiction in Pembrokeshire. Some parts of the county were for the king in the 17th century, though the influence of the parliament grew as the castles of Tenby and Haverfordwest fell to their arms.

Administration.— Municipal boroughs are Haverfordwest, Pembroke and Tenby. The hamlet of Bridgend and a part of St. Dogmell's (Dogmael's) parish are within the municipal limits of Cardigan. Newport (Trêfdraeth), once the chief town of the barony of Kemes, or Cemaes. was incorporated by Sir Nicholas Fitz Martin (c. 1210–1282) and mas given a nominal municipal body, the mayor being appointed by the lord of the manor. Milford Haven, Narberth, Neyland, and Fishguard and Goodwick are urban districts. Pembrokeshire lies in the south Wales circuit.

From 1918 the county returned one member to parliament. It lies in the diocese of St. David's. The national trust owned 1,487 and protected 2,397 ac. in the county in April 1953.

Occupations.— The south of the county has a warmer climate with more sunshine and less rain than any other region of Wales, although it is open to southwesterly winds, and so it is especially suited to agriculture. Milk production is particularly important. In the early 1950s there were more than 3.000 registered milk-producers, and there was a creamery at Merlins Bridge, Haverfordwest. The north of the county, particularly the area around the Prescelly hills, is devoted largely to sheeprearing.

Approximately 90,000 ac. were under tillage during the early 1950s, with about 2.000 ac. of wheat. 1,000 of potatoes and 1,000 of sugar beets. Fishing, formerly an important occupation, dwindled. Industries are relatively small and mostly connected with agriculture except at Pembroke, where some shipbuilding and repairing is carried on at Pembroke Dock.

PEMMICAN. A North American Indian (Cree) word for a meat prepared in such a way as to contain the greatest amount of nourishment in the most compact form. As made by the Indians it was composed of the lean parts of the meat, dried in the sun, and pounded or shredded and mixed into a paste with melted fat. It is flavoured with acid berries If kept dry it will keep for an indefinite time, and is thus particularly serviceable in arctic or other explorations.

PEMPHIGUS, a skin disease of unknown aetiology characterized by large blebs or bullae which rupture and form scabs. Four forms are usually distinguished; acute pemphigus. *pemphigus vulgaris, pemphigus foliaceus* and *pemphigus vegetans.* Acute pemphigus (also known as butcher's pemphigus) runs a rapid fulminating course. Its frequent occurrence after injuries has led to the suggestion that it does not belong to the pemphigus group but is a nonspecific staphylococcal infection.

The name is also applied to certain conditions in the newborn and also to certain skin lesions associated with syphilis.

(See SKIN DISEASES.) (F. L. A.)

PEN, an instrument for writing or for forming lines with an ink or other coloured fluid (Lat. *penna,* a feather, pen). The earliest writing implement was probably the stilus (Gr. γραφίς), a pointed bodkin of metal. bone or ivory, used for producing incised or engraved letters on boxwood tablets covered with wax. The calamus (Gr. κάλαμος) or arundo, the hollow tubular stalk of grasses growing in marshy lands, was the true ancient representative of the modern pen; hollow joints of bamboo were similarly employed. An early specific allusion to the quill pen occurs in the 7th century writings of St. Isidore of Seville, but there is no reason to assume that it was not in use at a still more remote date. The quills still occasionally employed among Western communities as writing instruments are obtained principally from the wings of the goose *(see* FEATHER).

In 1809 Joseph Bramah devised and patented a machine for cutting up the quill into separate nibs by dividing the barrel into three or even four parts, and cutting these transversely into "two. three, four and some into five lengths." Bramah's invention first familiarized the public with the appearance and use of the nib slipped into a holder. But a more distinct advance was effected in 1822, when J. I. Hawkins and S. Mordan patented the application of horn and tortoise shell to the formation of pen nibs. the points of which were rendered durable by small pieces of diamond, ruby or other very hard substance, or by lapping a small piece of thin sheet gold over the end of the tortoise shell.

Metal Pens.—Metallic pens. though not unknown in classical times—a bronze pen found at Pompeii is in the Naples museum—were little used until the 19th century and did not become common till near the middle of that century. It is recorded that a Birmingham split-ring manufacturer, Samuel Harrison, made a steel pen for Dr. Joseph Priestley in 1780. Steel pens made and sold in London by a certain Wise in 1803 were in the form of a tube or barrel, the edges of which met to form the slit, while the sides were cut away as in the case of an ordinary quill. Their

price was about five shillings each, and as they were hard, stiff and unsatisfactory instruments they were not in great demand. To John Mitchell probably belongs the credit of introducing machine-made pens, about 1822, and James Perry is believed to have been the first maker of steel slip pens. In 1828 Josiah Mason, who had been associated with Samuel Harrison in the manufacture of split rings, saw Perry's pens on sale in Birmingham, and after examining them saw his way both to improve and to cheapen the process of making them. He therefore put himself in communication with Perry, and the result was that he began to make barrel pens for him in 1828 and slip pens in 1829. Perry, who did much to popularize the steel pen and bring it into general use, in his patent of 1830 sought to obtain greater flexibility by forming a central hole between the points and the shoulders and by cutting one or more lateral slits on each side of the central slit; and in 1831 an improvement, which consisted in forming elongated points on the nibs of the pens, was described by Joseph Gillott.

The metal used consists of rolled sheets of cast steel of the finest quality made from Swedish charcoal iron. These sheets, after being cut into strips of suitable width, annealed in a muffle furnace and pickled in a bath of dilute sulphuric acid to free the surface from oxidized scale, are rolled between steel rollers till they are reduced to ribbons of an even thickness, about $\frac{1}{160}$ in. From these ribbons the pen blanks are next punched out, and then, after being embossed with the name of the maker or other marks, are pierced with the central perforation and the side or shoulder slits by which flexibility is obtained. After another annealing, the blanks, which up to this point are flat, are raised or rounded between dies into the familiar semicylindrical shape. The next process is to harden and temper them by heating them in iron boxes in a muffle furnace, plunging them in oil, and then heating them over a fire in a rotating cylindrical vessel till their surfaces attain the dull-blue tint characteristic of spring-steel elasticity. Subsequently they are scoured in a bath of dilute acid, and polished in a revolving cylinder. The grinding of the points with emery follows, and then the central slit is cut by the aid of two very fine-edged cutters. Finally, the pens are again polished, are coloured by being heated over a fire in a revolving cylinder, and in some cases are coated with a varnish of shellac dissolved in alcohol. An increasing quantity of pens are plated with metal alloys which give them a silverlike finish and increased resistance to acids and atmospheric conditions. Birmingham was the first home of the steel-pen industry and continued its principal centre. Manufacture on a large scale was begun in the U.S. about 1860 at Camden, N.J. Metals other than steel have been frequently suggested by inventors — gold, silver, zinc, German silver, aluminum and aluminum bronze. In 1926 pens made from stainless steel were introduced. These pens are highly resistant to the acids used in writing inks and are nontarnishing under extreme climatic conditions. *(See* also FOUNTAIN PEN.)

PENALTY: *see* DAMAGES.

PENANCE, that repentance or sorrow for sins which in the Christian revelation is a requisite for salvation: "Unless you repent, you will all perish" (Luke xiii, 5). The English word derives from the Latin *poenitentia.* In its root meaning, penance signifies regret or sorrow for a past act, though it connotes also the intention to avoid similar error in the future.

In Roman Catholic usage penance has a threefold meaning: first, interior repentance, a disposition of mind and will which includes both sorrow for past sins and a purpose of amendment for the future; secondly, the Sacrament of Penance, a religious rite in which the Christian who has sinned, after confession of sins and an act of interior penance, receives divine forgiveness through the absolution of the priest; finally, the word designates penitential works, either those imposed on the penitent by the priest in the sacramental rite, or those performed voluntarily by a repentant sinner, as a form of satisfaction to God for past sins and a manifestation of interior repentance.

PENANG, an island and state of the Federation of Malaya, situated at 5° 24' N. and 100° 21' E., about $2\frac{1}{2}$ mi, distant at its nearest point from the northwestern coast of the Malayan peninsula. It is about $15\frac{1}{2}$ mi. long by $10\frac{1}{2}$ mi. wide at its broadest point, with an area of 110 sq.mi. The mountainous centre of the island contains some jungle, coconuts grow by the shores and rice is cultivated at Balik Pulau and several other places. The population was 274,325 in 1957 and was predominantly Chinese and Tamil, although Malays were well represented.

The town, properly the "City of George Town" but generally also termed Penang, is built on the promontory nearest to the mainland and behind it Penang hill rises to a height of 2,428 ft. There is a fine hill railway, completed in 1923. George Town is the federation's chief port and is essentially a lighter harbour. The town itself, with a population of 234,855 in 1957, is distinguished by fine public buildings, tree-lined roads and the pulsating life of its Chinatown. By Penang hill is the tiered Ayer Itam (Buddhist) temple and at Sungei Kluang, 7 mi. away, is the Snake temple. In the town are St. George's church and Islamic mosques; there is also a museum. In the old cemetery is the tomb of Francis Light, the founder of the settlement. The Waterfall Botanic gardens, completely surrounded by evergreen jungle-clad hills 1,200 ft. high and containing an unusual wealth of flowers, shrubs and trees, are among the finest public gardens in the east.

Ships of many lines call at Penang and there are regular coastal sailings to ports of the Malayan peninsula, to Thailand and to Burma. The airport at Bayan Lepas, about 10 mi. S., is used by Malayan and Thai airways for local services and for connection with international airlines. Malayan railways connect by ferry to Prai in Province Wellesley (which for administrative purposes is integrated with Penang) and also run a direct service to Kuala Lumpur and to Singapore and northward via the frontier station of Padang Besar for connection with the Thai railways.

Since its foundation in 1786 Penang has been a free port and it is the chief port of northern Malaya for trans-shipment and distribution. The main exports are rubber and tin, coconut oil, copra, tapioca, betel nuts, hides, reptile skins and spices. The main imports are building materials, textiles, wheat flour and a large variety of general goods. The biggest tin-smelting company in Malaya operates in Penang; there are also four Chinese-owned coconut-oil mills and various other industries such as milling and soap factories. A large proportion of George Town's population is engaged in commerce, while the rural people live mainly from farming and fishing.

Penang was founded on July 17, 1786, the area having been ceded to the East India company by the Malay sultan of Kedah in 1785 by an agreement with Capt. Francis Light. It was then almost uninhabited and was made a penal settlement. In 1805 it was made a separate presidency and when in 1826 Singapore and Malacca were incorporated with it, Penang continued to be the seat of government. In 1837 Singapore was made the capital of the Straits Settlements and in 1867 the Straits Settlements were created a crown colony, in which Penang and Malacca were included. After 1867 Penang was under the administrative control of a resident councilor responsible to the governor of the Straits and aided by officers of the Malayan civil service. Unofficial members of the legislative council of the colony, which held its sittings in Singapore, were appointed, with the sanction of the secretary of state for the colonies, to represent Penang. Their term of office was three years. The official name of the island was Prince of Wales Island.

In Dec. 1941 Penang was bombed and occupied by the Japanese. Some of the European population was evacuated and large food and rubber stocks and shipping fell into Japanese hands. After the British return to Penang in 1945 its prewar status was restored. As a result of the Federation of Malaya agreement, 1948, steps were taken toward self-government in Malaya and there was a progressive democratization of the island's administration, culminating on Jan. 1, 1957, with the declaration of George Town as the first city of the Federation of Malaya; controlled by an elected city council. On Aug. 31, 1957, when the Federation of Malaya became an independent nation, the former settlement became a state of the federation and the post of resident commissioner lapsed. Under the new federal constitution Penang has a governor, appointed by Malaya's paramount ruler, and a chief minister nominated by the governor. (C. J. S.)

PENARTH, an urban district in the Cardiff South East parliamentary division of Glamorgan, south Wales. is situated on the south side of the estuary of the river Ely, about 5 mi. S. of Cardiff by road. Pop. (1951) 18,544; area 3.3 sq.mi. Parallel nith the river is an extensive dock built in 1860 in connection with the export of coal. South of this area and separated from it by rising ground is a modern residential area forming a dormitory for Cardiff business people and a seaside resort with pebble beaches. Penarth is well laid out with open spaces and tree-lined streets, and there are steamer trips from Penarth pier to Bristol channel ports. Turner house, presented to the town by J. P. Thompson and administered by the National museum of Wales, contains pictures by J. M. W. Turner, David Cox and J. S. Cotman.

PENATES, the household gods of the Romans and other Latin peoples, more properly di *penates.* Strictly speaking they were gods of the *penus,* "storeroom," or the penetralia, the innermost part of the house, but by extension their protection reached the entire household. They are associated with other deities of the house: Vesta (*q.v.*), the goddess of the hearth, and particularly the lares (*q.v.*), with whom they are often named interchangeably. They cannot be identical, however, for the penates, unlike the lares, are never referred to in the singular. The penates are thus all or some specific group of deities with household connections. Their number and precise identity were a puzzle even to the ancients. Thus Jupiter, Juno, Minerva, Neptune, Apollo and others (besides Vesta and the lares) are reckoned at times among their number.

The penates were worshiped privately as protectors of the individual household and also publicly as protectors of the Roman state. Each house had a shrine, however simple, with images of them that were worshiped at the family meal and on such personal occasions as birthdays and other anniversaries of special events. Offerings were of portions of the regular meal or of special cakes, wine, honey, incense and more rarely a blood sacrifice. The state as a whole worshiped them as the penates *publici,* about whom there were various opinions of nature and origin. There was a tradition connecting them with the "great gods" of the Samothracians (see CABEIRI) as well as the tradition, followed by Virgil in the Aeneid, that Aeneas brought them from Troy. A conflation of these two has the Samothracian deities introduced first at Troy and subsequently brought by Aeneas to Latium. The connection with the Cabeiri explains their further association with Castor and Pollux (*q.v.*), with whom they were popularly assumed to be identical. Indeed, their cult statue in the temple on the Velia in Rome represented them as the twins, and they are similarly represented on coins.

The worship of the penates in a state cult occupied a significant role as a focal point of Roman patriotism and nationalism. Through the republic the chief magistrates of the Roman people and commanders taking the field offered special sacrifices at their shrine at Lavinium, traditionally the original shrine in Latium founded by Aeneas. In the Augustan era much stress was placed upon the revival of the state cult as a factor in creating national unity, loyalty and support of the new regime. The personal gods of the house of Augustus (*i.e.,* the Julian gens, which had already traced its origins back to Aeneas himself) became thus associated with the gods of the Roman state.

PENCIL, a name originally applied to a small, fine pointed brush used in painting, and still employed to denote the finer camel's hair and sable brushes used by artists (Lat. *penicillus,* brush; literally, little tail), but now commonly signifying a solid rod of marking material used for writing and drawing, either encased in wood or enclosed in some form of holder.

It has been asserted that a manuscript of Theophilus shows signs of having been ruled with a black lead pencil; but the first distinct allusion to a pencil occurs in the treatise on fossils by Conrad Gesner of Zurich (1565) who describes an article for writing formed of wood and a piece of lead, or as he believed, an artificial composition called by some *stimmi anglicanum* (English antimony). The famous Borrowdale mine in Cumberland having been discovered about that time, it is probable that we have here the first allusion to that great find of graphite. While the supply of the Cumberland mine lasted, the material for English pencils consisted simply of the native graphite as taken from the mine.

Strenuous efforts were made, however, to render manufacturers independent of the Cumberland mine, whose supplies showed signs of exhaustion. In Niirnberg, where the great business of the family Faber (*q.v.*) was established in 1760, pencils were made from pulverized graphite cemented into solid blocks by means of gums, resins, glue. sulfur and similar adhesives, but none of these preparations yielded useful pencils. In 1795 N. J. Conté first produced pencils made of graphite which had been ground with certain clays, pressed into sticks and fired in a kiln. This method forms the basis of manufacture of all modern pencils.

Manufacture of Pencils.—Graphite (*q.v.*) and selected clays are mixed together in proportions determined by experiment and research. The materials are mixed in water and ground in heavy mills. Here is determined quality and degree; the quality by the selection of material and the intensity of grinding; the degree by the proportions of clay and graphite. After grinding, the mass is transferred to a specially prepared filter press and subjected to intense pressure, usually hydraulic, to squeeze out surplus moisture and obtain close texture. The mass so made, of a very firm consistency and just plastic, is inserted into heavy power-driven presses to be forced through an aperture of the desired diameter and shape, whence there exudes a thin, still plastic, stringlike strip which is laid on boards to dry. After drying, the leads are sealed in crucible boxes and fired in kilns to a suitable heat to vitrify the clay; the temperature varies from 600° to 1,200° C.

Cedar **for** Pencils.—Cedar wood is found in many countries, but the fine aromatic, soft, straight-grained wood most suitable for the manufacture of pencils (Juniperus *virginiana*) comes from the United States. Wood of similar class is grown in large quantities in the parallel belt of Africa, particularly in Kenya, but the Kenya wood is harder, heavier, and inferior to the American variety. Because of the steady exhaustion of cedar wood from Virginia, Californian incense cedar was introduced to the industry about 1900 and is largely used for the cheaper grades of pencils.

The slats of cedar require careful maturing to prevent warp. They are cut into various widths according to the size and growth of the log, but where possible they are produced wide enough to enable seven pencils to be manufactured simultaneously. The slats are planed and grooved in such a manner that when the two planed surfaces are brought together the grooves form either a round or other aperture which correctly embraces the lead. The surfaces are glued and the boards are clamped in piles, to be subsequently transferred to automatic shaping machines where they are reduced to single pencils, by appropriate machine tools.

The manufacture of "leads" for coloured pencils varies from the method used for the graphite pencils, the basis being kaolin blended with suitable waxes and gums, which are ground together with the necessary colour to obtain the tint required. The firing process is eliminated. "Copying" pencils used to be constructed on the same lines, with a substitution of aniline dye as the colouring matter. About 1898 improvements were made in copying pencils by blending graphite and aniline dye. (F. P. Do.)

PENCIL DRAWING. The common instrument used in pencil drawing is composed of graphite enclosed in a casing of wood (see PENCIL). The cylindrical graphite pencil, because of its usefulness in easily producing linear gray-black strokes, became the successor of the older metallic drawing stylus with which late medieval and Renaissance artists and tradesmen sketched or wrote on paper, parchment or wood.

The silverpoint (silver stylus) was the favourite instrument for metal-point drawing or writing although styluses of lead or lead alloys were frequently used. Metal points containing lead could be used on the natural surface of paper or parchment, but the metal points of silver, gold. brass and bronze required that the drawing surface be covered with an applied ground. This ground, usually made with lead white and a binding solution of glue or gum arabic, was brushed over the surface and when dry provided the

means by which the metallic tools produced strokes. The ground, either white or slightly tinted with the addition of a coloured pigment, in combination with the silverpoint provided a medium of very delicate and precise drawing. These characteristics, along with its fine linear effects, appealed to many of the great draftsmen of the late middle ages and Renaissance. Van Eyck, Durer, Raphael and Leonardo were some of the outstanding masters who used the metal point antecedents of the graphite pencil.

The metal points of lead or lead alloys, because of the metallic reflections and slightly rougher texture of their dark gray strokes, were the most apparent forerunners of the pencil. This superficial similarity in the appearance of lead-point and graphite strokes led, in England, to an erroneous and widespread identification of the graphite pencil as a "lead pencil," a mistaken identification that is still common.

Although graphite was being mined as early as the 16th century, the utilization by artists of pieces of natural graphite, inserted in a *porte-crayon* (holder), has not been established in extant drawings produced before the 17th century. At that time minor graphite details were included in sketches, notably in landscape renderings by Dutch artists such as David Teniers the Younger and Albert Cuyp. During the 17th and most of the 18th century graphite served as a means of making preliminary sketch lines for drawings to be completed in other media. Exceptions were drawings completely finished with graphite, as in the case of a few 18th-century works by Thomas Gainsborough and George Romney.

Although pencil drawings were much less commonly produced by artists of those centuries than sketches in the preferred mediums of chalks, charcoal and pen and ink, the use of graphite gradually increased among painters, miniaturists, architects and designers. By the late 18th century an ancestor of the modern pencil was constructed in the form of a rod of natural graphite fitted into a hollow cylinder of wood. However, it was not until 1795, when Nicolas Jacques Conté devised his method of producing pencil rods from mixtures of graphite and clays. that a true prototype of the modern graphite pencil was developed. Conté's technical improvement made possible the production of fine pencils whose strokes could be controlled. varying from type to type in softness and hardness, darkness and lightness. The excellent quality of these graphite pencils encouraged wider use by artists of the 19th century, and pencil drawing was to become a common method for creating studies and preliminary sketches. The fact that the graphite pencil could be used on almost any type of drawing surface helped to make it an indispensable instrument of the artist's studio.

Although graphite pencils provided a substantial range of light-dark effects and the opportunity for tonal modeling, the greatest masters of pencil drawing always retained in their creations the elements of a simple linearism or limited shading that were appropriate to drawing in this medium. This concept of pencil drawing contrasted with that sometimes employed in the 18th and 19th centuries in which extensive tonal modeling of three-dimensional forms and elaborate effects of light and shade were produced by artists and miniaturists by rubbing the soft graphite particles with a stump, a tightly rolled piece of soft paper or chamois.

The preciseness and clarity associated with the use of a moderately hard graphite pencil were developed in the highly selective draftsmanship of the French neoclassicist Jean Auguste Dominique Ingres. His figure sketches and portrait studies were the epitome of a type of pencil drawing in which lucid contours and limited shading combined to create a spirit of elegance and restraint. This manner of drawing was accepted by many artists throughout Europe, including German draftsmen such as Ludwig Richter, who exhibited a preference for the hardest of pencils and sharpest of points in order to produce wirelike delineations of figures and landscapes. Softer and darker graphite pencils offered the possibility of appropriate effects to artists whose tastes required more freedom and spontaneity of drawing. The sketches of the romanticist Eugene Delacroix, created swiftly and filled with flamboyant and undetailed strokes, possessed a visual suggestiveness of dramatic figures and compositions. Van Gogh chose a broad carpenter's pencil for powerful, blunt strokes.

One of the most sensitive of those who used the graphite pencil in the 19th century was Edgar Degas. A master pastelist and draftsman with coloured chalks and charcoal. Degas created pencil drawings possessing warmth and charm that were quite unlike the cool, classic works of Ingres or the highly animated and sometimes violent sketches of Delacroix. Degas. with high selectivity, combined graciously fluid outlines with soft, limpid tonal shadings. In creating these effects he often employed more than a single pencil in order to extend the range of softness or darkness in various parts of his figure studies.

Pencil drawing seems to have been a desirable medium for sculptors, and the sketches of Auguste Rodin, Aristide Maillol and others suggest the efficacy of the pencil for studies of contours and masses so important in sculptured figures and in the compositional grouping of sculptural forms.

Artists of the 20th century continue to use the graphite pencil as a device for sketching and for making preliminary rehearsals of conceptions later carried out in painting or sculpture. Because of the nature of much contemporary painting, there is less cause for artists to draw or preplan their paintings with the assistance of pencil studies; nevertheless, the function of drawing persists, and among many artists it is still considered an essential skill. Distinguished artists such as Henri Matisse. Amedeo Modigliani, Pablo Picasso and others, whose taste for basically linear conceptions was revealed in their graphic works, selected the graphite pencil as a device for creating lucid and simple images. *See* also DRAWING (TECHNIQUES OF); PEN DRAWING; PENCIL.

PENCK, ALBRECHT (1858–1945), German geographer and geologist. Although extremely versatile, his chief interest was in geornorphology, especially its glacial aspects. Born at Reuditz, near Leipzig, on Sept. 25. 1858, he studied at the University of Leipzig and secured a Ph.D. degree at the University of Munich in 1883. He was appointed professor at the University of Vienna in 1885 and in 1906 became professor at the University of Berlin and also director of the marine museum there. Through the years he traveled to all continents of the world except the polar regions. In the course of his journeys he was Silliman lecturer at Yale university in 1908, and in 1909 Kaiser Wilhelm exchange professor at Columbia university. On virtually any topic in the field of geography and geology he had stimulating ideas to offer. Among other things he promoted the production of the 1:1,000,000-scale map of the world. For years before his death he was considered the grand old man of German geography and geology. Together with a long series of papers, two books are considered his chief works. The two-volume *Morphologie der Erdoberflache* (1894) is an account of the production and sculpture of land forms followed by a systematic, empirical classification and description of their types. However, since this approach lacked a unifying principle, it lost significance when the genetic, explanatory U.S. studies appeared. His work with E. Brückner on the Ice Age in the Alps, *Die Alpen im Eiszeitalter,* in three volumes (1901–09) is, on the other hand, an enduring, basic, comprehensive study. He had a wide range of interests and continued his activity late in life. Penck died at Prague on March 9, 1945. (O. D. v. E.)

PENDA, king of Mercia (d. 654 or 655), son of Pybba, probably came to the throne in 626. but it is doubtful whether he actually became king of Mercia until 633, the year of the defeat and death of Edwin of Korthumbria. According to the Anglo-Saxon Chronicle he was 80 years old at his death, but the energy of his administration and the evidence with regard to the ages of his children and relatives render it almost impossible. In 628 the chronicle records a battle between him and the West Saxons at Cirencester in that year. In 633 Penda and Ceadwalla overthrew Edwin at Hatfield Chase; but after the defeat of the Welsh king by Oswald at "Hefenfelth" in 634, Mercia seems to have been for a time subject to Northumbria. In 642 Penda slew

Oswald at a place called Maerfeld. Me was continually raiding Northumbria and once almost succeeded in reducing Bamborough. He drove Cenwalh of Wessex, who had divorced his sister: from his throne. In 654 he attacked the East Angles and slew their king Anna. (*See* EAST ANGLIA.) In 654 or 655 he invaded Northumbria in spite of the attempts of Oswio to buy him off, and was defeated and slain on the banks of the "Winwaed." In the reign of Penda the districts corresponding to Cheshire, Shropshire and Herefordshire were probably acquired. Although a pagan, it was in his reign that Christianity was introduced into Middle Anglia by his son Peada.

PENDENTIVE, in architecture, a triangular segment of a spherical surface, filling in the upper corners of a square, rectangular or polygonal room, in order to form, at the top, a circular support for a dome. Its intersections with the walls against which it abuts are semicircles, and are usually carried by arches. The problem of supporting a dome over a square or polygonal hall was of continually growing importance to the late imperial Roman builders. This they attempted to solve, either by corbelling out the corners, projecting each course of masonry slightly over the one below, or by throwing across the corner diagonal arches or niches, which are known as squinches (*q.v.*). An early approximation of the pendentive form occurs in a domed room in one of the side buildings of the baths of Caracalla (A.D. 217). This form, however, was obtained by corbelling, whereas the true pendentive is built like a portion of a dome with radiating joints. It remained for the Byzantine architects to recognize the possibilities of the form and give it definitive development. One of the earliest examples is also one of the largest—that of the great church of Hagia Sophia at Istanbul (begun 532). Pendentives occur commonly in the domed Romanesque churches of Aquitania in France, as in S. Front at Perigueux (begun 1120). They occur spasmodically in Romanesque work in Italy. During the Renaissance the development of domed churches gave great importance to the pendentive. As a result of Byzantine influence, pendentives are frequent in Islamic architecture, often decorated with stalactite ornament or sometimes, as in Iran, with delicate ribbing. A vaulting form in which the curve of the pendentive and dome is continuous. without a break, is known as a pendentive dome.

See BYZANTINE ARCHITECTURE; DOME; ROMANESQUE ARCHITECTURE.

PENDLETON, EDMUND (1721–1803), U.S. lawyer and statesman, was born in Caroline county, Va., on Sept. 9, 1721. In 1774 he became president of the Virginia provincial convention and in 1776, as president, he drew up the instructions to the Virginia members of congress directing them to advocate the independence of the American colonies. In the same year he was chosen the first speaker of the house of delegates. With Jefferson and Chancellor George Wythe he drew up a new law code for Virginia. He was president of the court of chancery from 1777 to 1788, and was president of the Virginia court of appeals from 1779 until his death at Richmond, Va., on Oct. 23. 1803.

PENDLETON, GEORGE HUNT (1825–1889), U.S. lawyer and legislator. was born in Cincinnati. O., July 19, 1825. His early education was in his home city but in 1844 he went abroad for two years and studied at the University of Heidelberg. He was admitted to the bar in 1847 and practised law at Cincinnati. He became a Democratic member of the Ohio senate, 1854–55, was defeated for the U.S. congress in 1854, but was elected in 1856 and served from 1857 to 1865. He was a member of the ways and means and judiciary committees. He opposed coercion of the South in 1861 and became a critic of the Lincoln administration. In 1864 he was the Democratic candidate for vice-president. He was defeated for congress in 1866 but won western support for the presidential nomination as the leading advocate of the "Ohio idea," that the government should, pay the principal of the 5–20 year 6% bonds in greenbacks instead of in gold or silver. At the 1868 national Democratic convention he led on the early ballots for the presidential nomination but eastern opposition prevented his nomination.. The next year he was defeated for governor of Ohio by Rutherford B. Hayes. His interests centred on the presidency of the Kentucky Central railroad and his law practice until his election to the U.S. senate for the term 1879–85. He was acclaimed as the author of the civil service reform act of 1883, but it was a factor in his defeat for another term. Re served as minister to Germany, 1885–89, and died in Brussels, Nov. 24, 1889. His culture and aristocratic bearing gave him the nickname "Gentleman George." (E. H. Ro.)

PEND OREILLE, a large, question mark-shaped lake in northern Idaho, U.S., fed chiefly by the Clark Fork and drained by the Pend Oreille river. Noted for its rugged shore line and size (43.2 mi. long and 6.25 mi. wide), it covers 123 sq.mi. and a depth of 1,150 ft. has been recorded. Sport fishing for trout, including Kamloops, or Kootenay trout, which like steelheads are exceptionally large rainbows (up to 30 lb. or more), whitefish and landlocked salmon is popular. The name, meaning "earbob," is believed to refer either to the shape of the lake surface (a pendant hanging from an ear) or to earrings worn by the local Indians. The first trading post in Idaho, Kullyspell House, was established by David Thompson at the mouth of the Clark fork in 1809. Albeni falls dam, about 20 mi. below the lake on the Pend Oreille river, controls the water level of the lake. (M. E. Ms.)

PEN DRAWING. Pens have had the longest history and greatest popularity of all the drawing media of the artist. In part, this is the result of the variety of linear effects that can be provided by the three basic types of pens and of their adaptability to the changing styles of draftsmanship that have occurred over many centuries. These three basic types are: quill pens: cut from the wing feathers of fowls and birds; reed pens, formed and trimmed into proper shapes from stems of bamboolike grasses; and metal pens! fabricated from various metals, especially fine steel.

Pen drawing is fundamentally a linear method of image-making with the visual descriptions of the drawing being produced by a simple outline or a complex of ink strokes. In pure pen drawing where the artist wishes to supplement his outlines with tonal suggestions of three-dimensional form, this modeling must necessarily be effected by the close juxtaposition of a series of strokes forming areas of hatching or crosshatching. On the other hand, many pen studies are produced with the substitution of tonal washes laid onto the drawing with a brush, in which case the outlines or other important definitions of the figures or landscape are established by the pen lines.

Paper and Ink.—Pen drawing is usually done on papers expressly produced for this purpose. In the middle ages and the Renaissance parchment also was occasionally used. Although the pen was the instrument with which the artist distributed the delineating strokes in their desired arrangement on the paper, ink was the actual medium that made pen drawing possible. Inks used in pen studies were of various types and contributed an additional diversity to the final effects in sketches. The prime requisites of inks for drawing were great fluidity as well as strong tinting power.

Three types of ink possessed these qualities and were most frequently chosen by the great masters of drawing. One was black carbon ink. made from extremely fine particles of the soot of burnt oils or resins incorporated into a solution of either glue or gum arabic. This ink retained its original blackness over long periods of time, and old drawings produced with it reveal lines as strong as when they were initially made. The finest type of black carbon ink was known as Chinese ink and was the prototype of the modern black India ink used by artists: architects, engineers and other draftsmen. A brown ink popular with the old masters was known as bistre. It was prepared by boiling wood soot in order to obtain the liquid and transparent brown extract. Many artists chose bistre for its warm, luminous colour qualities, and it was especially effective for the illusionistic drawings of 17th- and 18th-century masters, including Rembrandt and Giovanni Battista Tiepolo. The third important ink was an iron gall or chemical ink. Its principal ingredients were iron sulfate, the extract of gall nuts and a gum arabic solution. It was, in fact, the common writing ink for centuries and was employed for most early drawings. Its colour when first applied to the paper was bluish-black, but it rapidly turned blackish and, over the course of years, became a dull brown; the effect is commonly seen in old handscript letters and documents as well as old drawings. Other inks, usually coloured inks made

from natural or synthetic dyestuffs, mere used on rare occasions. Throughout the history of drawing, however, coloured inks were less favoured, and studies in which chromatic effects were introduced are exceptional.

Pens.—The oldest of the artist's pens was the reed, although its use in antiquity and in the middle ages was for writing; it was not employed for drawings until the Renaissance, when its fibrous structure and blunt point were found attractive to some draftsmen for creating simple, heavily linear drawings, as those by Luca Cambiaso, or for large drawings, as those by Odoardo Fialetti and Marco Boschini. The outstanding master of the reed pen was Rembrandt, who used it many times in combination with the quill pen and washes to produce the richly suggestive atmospheric illusionism of his works. His usual method was to introduce very bold strokes of a broadly cut reed in order to articulate forms within shadows, while the more illuminated parts of the drawing were indicated with delicate quill lines.

The reed pen never had the widespread popularity of quill or metal pens, but for special effects it served artists admirably. Vincent van Gogh in his last years used it to produce the blunt, po erful strokes that in his drawings were counterparts of the heavy brush strokes typical of many of his Expressionist canvases. Among modern artists the reed pen occasionally has been chosen because of the simple or vigorous strokes that it easily creates; Henri Matisse and George Grosz, both distinguished practitioners of drawing, selected the reed pen for strong linear elements falling halfway between those usually associated with a fine steel pen and a wide brush.

In the history of drawing as it developed in the western world, the quill pen made from the large, hollow wing feathers of the goose, swan or raven has served with the greatest distinction of all pens, and until the time of the acceptance of the modern steel pen there were few master draftsmen who did not engage in quill-pen drawing. Before the end of the middle ages, when paper-making was introduced into Europe, providing a relatively cheap material for sketches and other types of studies, the quill pen was used in making the fine delineations of images in manuscripts. Just as it was the best pen for the precise handscript lettering of the manuscripts, so also its nibs, which could be sharpened to extreme fineness, permitted the craftsman to create small linear figures or ornamental decorations on the pages or along the borders of the parchment leaves. Whereas the fibrous reed pen gave the sensation of being dragged over the paper, the delicately cut point of the quill pen glided over the surface and needed only to be guided by the hand of the artist to create a graceful and calligraphic type of drawing. This characteristic, combined with the flexibility of the quill point, which responded to pressure for varying the widths of lines or forming accents. made it adaptable to the diverse hands and personal styles of draftsmen. Moreover, its adaptability to artistic demands enabled the quill to meet the requirements of changes in style that took place from the 15th to the end of the 19th century. Whether the requirements were for highly controlled but restless vigour as in Albrecht Dürer's linearism, graceful contour drawing similar to that of Raphael, or spontaneous and suggestive strokes as in Rembrandt's studies, the quill served artists equally well.

In most respects the metal pen became the successor of the quill. Although pens of silver, bronze, brass and gold alloy had been tried in the past, it was the development of excellent steel pens by James Perry in the 1830s, and mass production by stamping pens from steel blanks, that led to the supplanting of the quill by the metal pen. Nevertheless, artists were reluctant to adopt the steel pen, even after its ready acceptance for writing, and most drawings in pen and ink done prior to the 20th century were still produced with quills.

Although contemporary artists on occasion select reed or quill pens for the handsome and diversified effects they provide in drawing, the steel pen now is used for drawing almost exclusively. This type of metal pen has its virtues both in its easy availability and in the great variety of shapes and sizes, stiffness or flexibility. Because of the crisp, incising type of line it can produce with modern black inks, it is especially appreciated by artists and draftsmen who execute drawings to be reproduced in books and periodicals. It has become standard studio equipment of the illustrator, cartoonist and designer. Pen drawings by outstanding painters and sculptors such as Pablo Picasso, Matisse and Henry Moore suggest the assistance the steel pen provides in producing the sharpness of linear definitions generally preferred by modern masters. *See* also DRAWING (TECHNIQUES OF); ENGRAVING, LINE; INK; PEN; PENCIL DRAWING.

PENELOPE, in the Odyssey, the wife of Odysseus and daughter of Icarius of Sparta and the nymph Periboea. During the course of the long absence of her husband after the fall of Troy many chieftains of Ithaca and the islands round about became her suitors. To rid herself of their importunities she bade them wait until she had woven a winding sheet for old Laertes, the father of Odysseus. But every night she undid the piece that she had woven by day. This she did for three years, until her maids revealed the secret. She was relieved by the arrival of Odysseus. In the *Telegonia,* she married Telegonus, the son of Odysseus and Circe, after he had killed his father, and dwelt with him in the Island of Aeaea or in the Islands of the Blest. Probably quite distinct from her is an Arcadian Penelope, mother of Pan. *See* HOMERIC POEMS; ODYSSEUS.

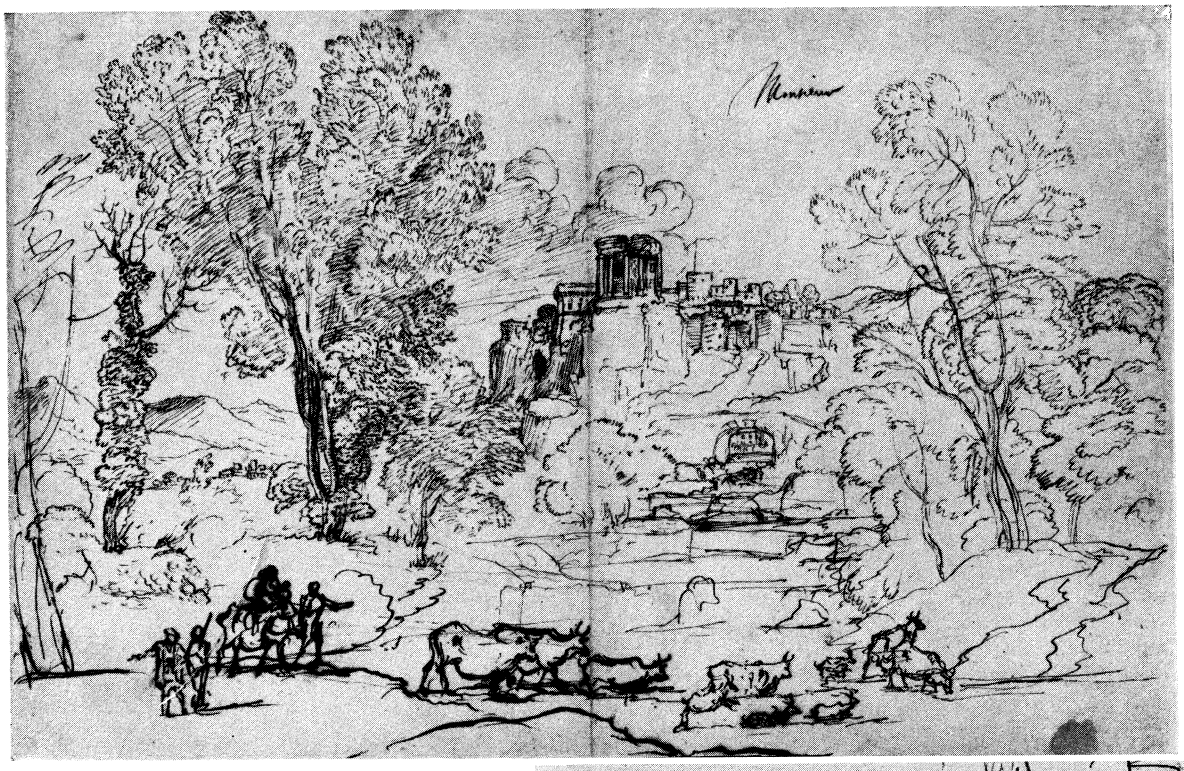
PENGE, an urban district in the Beckenham parliamentary division of Kent, Eng., about 9 mi. S.S.E. of Charing Cross, London, and part of Greater London. Pop. (1951) 25,012. Area 1.2 sq.mi. The Crystal palace, transferred from Hyde Park, London, to a site in the northwest of Penge in 1854, was burned down in 1936. Its grounds were taken over by the London County council in 1951 and within them are motor car, motorcycle and cycle racing tracks, sports grounds and a BBC television mast which can be seen for many miles round. In Penge are the Watermen's and Lightermen's almshouses (1841) and the naval asylum (1847) which houses 12 widows of naval officers. The district's chief industries are the making of plastic goods, ventilators, universal machine tools, electrical switch control gear, cycles, small electric motors and bleach preparations; printing; and pickling.

PENGUIN, the name originally given to the garefowl (*q.v.*), but now applied to the flightless sea birds forming the family Spheniscidae. The wings lack quills and are incapable of flexure, though they move freely at the shoulder joint. In the water the birds use them as paddles, and on land they are employed for fighting and, in some species, in walking. The plumage consists of small scalelike feathers and the three metatarsals are imperfectly united. Penguins feed on fish and crustacea; they have few enemies, the leopard seal or sea leopard (*q.v.*) and McCormick's skua (Megalestris *maccormickii*) being perhaps the worst, though man is even more serious as a foe when he has easy access to a rookery. The penguins belong to the southern hemisphere, none extending farther north than the Galápagos Islands, while the majority do not reach the tropics. They breed in immense rookeries, often in the most desolate parts of Antarctica. Two white eggs (one in the case of the emperor penguin) are laid in a rough nest on the ground and the young penguin is at first clad in down. The young are helpless, needing care for an unusually long time.

The largest forms are the emperor (Aptenodytes forsteri) and king (*A.* longirostris) penguins. The former breeds in the height of the antarctic winter in order that the young may be fully fledged before the next winter. The brooding instinct is so strong that birds may brood lumps of ice. The young birds are in many species cared for communally and not by their parents only. Many penguins progress on ice either by walking upright or flat on their bellies, kicking with their legs. The little Adélie penguin (Pygosceles *adeliae*) may breed several miles from the sea; it may continue to brood though completely covered with snow. It is very playful, and takes "joy rides" on pieces of floating ice. The birds have interesting mutual courtship and greeting ceremonies. The genus Eudyptes comprises the rock hoppers. About 14 species altogether are known.

PENICILLIN is a powerful antibacterial substance elaborated by certain molds of the genus *Penicillium.* It belongs to the class of antibiotics; *i.e.,* substances produced by living organisms that have a specific antagonistic effect on microorganisms. At first it was thought that there was only one penicillin, but it was later discovered that the mold could produce at least four penicillins differing slightly in their chemical structure. These have been named, in the United States, F, G, X and K, and in Great Britain 1, 2, 3 and K.

History.—Penicillin was described and named by Sir Alexander



"Classical Landscape" by Claude Lorrain (Gellée) (1600–82), French. Quill pen and iron-gall ink. In the Art Institute of Chicago

Fleming (*q.v.*) in 1929. The work was initiated in 1928 by the unexpected contamination of a culture plate of staphylococcus by spores of *Penicillium notatum*. In the neighbourhood of the growth of the contaminating mold the colonies of staphylococcus, which had been well developed. appeared to be undergoing dissolution. The mold was isolated in pure culture and it was found to produce a substance that had a powerful destructive effect on many of the common bacteria that infect man, while it had no effect on many others. This antibacterial substance, which was christened "penicillin." was liberated into the fluid in which the mold was grown. This is the basis of all commercial penicillin production.

While penicillin had a strong antibacterial action, it was apparently without toxicity to human cells. This combination of destructive action on bacteria and absence of toxicity to human cells was unique. All the antiseptics then in common use were more toxic to human cells than they were to bacteria. Penicillin in the crude culture fluid was too weak and too impure to demonstrate its remarkable curative properties, but from 1929 onward it was used in bacteriological laboratories to facilitate the isolation of bacteria, especially members of the *Haemophilus* group.

In 1939 a team of Oxford workers. headed by Sir Howard Florey (*q.v.*), decided to investigate antibiotics. They selected penicillin as a promising one to commence with and succeeded in concentrating and purifying it. They demonstrated its curative properties first on experimental infections in mice and then on human patients suffering from staphylococcal and other infections. The next question was production on a large scale. The Oxford workers developed methods of production and extraction, and in 1941 Florey took these to the U.S. and induced the authorities there to commence production. The pharmaceutical manufacturers in England also interested themselves and there was free interchange of information. The progress was phenomenally rapid and many advances in methods of production were made: (1) the culture medium was improved by the addition of "corn steep liquor" and other substances; (2) the fermentation was carried out in large tanks instead of in thousands of bottles; (3) other strains of mold of the *Penicillium notatum-chrysogenum* group were discovered that in the fermentation tanks gave larger yields of penicillin than did the original strain isolated in 1928; (4) better methods of extraction were evolved. The penicillin molecule has been synthesized, but the synthetic method of production was found to be much less economical than production by mold fermentation. The materials used in the fermentation are cheap, so that when the initial outlay in manufacturing plant has been overcome the cost of production of penicillin is relatively small; synthesis may have no more than an academic value.

Action on Bacteria.— Penicillin is very selective in its action, having a powerful effect on some bacteria and little or none on others. (See table.)

Sensitive	Insensitive
Staph. aureus	*Enterococcus*
Staph epidermis	Nonpathogenic Gram-negative cocci found in the mouth
Streptococcus (hemolytic)	*Ps. aeruginosa*
Sir. viridans	*P. vulgaris*
Pneumococcus	*K. pneumoniae*
Gonococcus	*Baci. coli*
Meningococcus	*B. typhosus*
N. catarrhalis	*Salmonella*
B. anthracis	*Shigella*
Air-borne micrococci	*V. cholerae*
Sarcina	*Pasteurella*
Actinomyces	*Br. abortus and melitensis*
Cl. welchii	*M. tuberculosis*
Cl. oedematiens	*Haemophilus* group
Cl tetani	
Spirochetes	

The original crude culture fluid described in 1929 was bacteriostatic (capable of arresting growth) when diluted 800 times. Pure penicillin is bactericstatic even in a 1 in 80,000,000 dilution. The drog is not only bacteriostatic but it is also bactericidal (lethal to bacteria) and in some species it induces lysis (dissolution of the bacterial bodies). It acts only on bacteria when they are actively growing and dividing, and in concentrations too small to arrest growth it appears to hinder cell division, so that misshapen forms appear—giant forms or long threads instead of the normal short bacilli. The exact mode of action is unknown, but it seems likely that penicillin interferes with the enzymic action involved in the metabolism of the growing microbe.

Therapeutics.— Penicillin is used for the treatment of all infections by "sensitive" bacteria. It is very diffusible and if injected subcutaneously or intramuscularly, it rapidly appears in the blood. It is quickly excreted by the kidneys. To maintain a sufficient concentration in the blood the injections have to be repeated every two or three hours with small doses (15,000 to 50,000 units) or less often with larger doses (200,000 to 1,000,000 units). After injection penicillin circulates in the blood and reaches the infecting microbes anywhere in the body, with the notable exception of the cerebrospinal fluid. To avoid frequent injection, a suspension of procaine penicillin can be used. This is only slowly dissolved in the body, and one injection daily suffices. Solutions of penicillin also are injected into an infected area such as an abscess, the pleural cavity or the spinal canal to attack the infecting microbes locally.

The drug is also used in an ointment, cream or dusting powder for local application, or in lozenges, chewing gum or fine spray for local treatment of mouth and throat infections. Injections of penicillin are used for prophylactic purposes in operations and in war or accidental wounds where subsequent sepsis is feared. It is almost without toxicity and doses up to 2.5 g. a day have been given without harm resulting. One of the great social benefits of penicillin has been its curative action on venereal disease. After a single large dose or two or three smaller ones a gonorrheal infection disappears; in syphilis eight to ten days' active treatment suffices for the eradication of the infection in most cases.

Unit of Penicillin.—When the Oxford workers in 1940 concentrated penicillin they established a unit of potency. This corresponded with the amount that, when dissolved in 50 ml. of nutrient broth, would just inhibit the growth of their test organism, a staphylococcus. After penicillin was obtained in a pure and crystalline form an international unit was agreed on corresponding to the original Oxford unit. This international unit is equal to 0.0006 mg. of penicillin G (*2*); 1,000,000 units represents 0.6 g.

Development of Other Antibiotic Agents.— The term "antibiosis" was first used by P. Vuillemin in 1889. Louis Pasteur and Jules François Joubert in 1877 were the first to show that one microbe could prevent the growth of another, and since that time innumerable instances of bacterial antagonism have been described. Various antibiotic substances were used before penicillin for the treatment of infections, notably pyocyanase, which is produced by Bacillus pyocyaneus (*Pseudomonas* aeruginosa). This had a vogue in the early years of the 20th century, but the results were not striking and it disappeared. Long before the advent of penicillin, molds and fungi had been used in the treatment of infections, Moldy bread is an old-fashioned remedy for local septic conditions, but there are thousands of different molds that will grow on bread and only a few of them, so far as is known, will produce anything likely to be of benefit. It may be that a penicillin-producing mold sometimes was used, but it can have been only seldom. In 1939, ten years after penicillin had been described but before its remarkable curative properties had been demonstrated, René Jules Dubos described gramicidin—an antibacterial substance produced by the Bacillus *brevis*. This has a specific action on the Gram-positive bacteria, and it has been extensively used locally in superficial septic conditions. It is too toxic to be used systemically by injection into the blood stream.

The great success of penicillin stimulated an extensive search all over the world into the products of bacteria, mold, fungi and even the higher plants for other antibiotic substances. Large numbers have been found, but most of them are useless for therapeutic purposes. Many are too poisonous, some will not function in blood or body fluids. Some, however, are of great use and have greatly extended the range of antibiotic treatment. Streptomycin, for example, is effective on many Gram-negative bacilli that are insensitive to penicillin and is especially used for the treatment of tuberculosis. Chloromycetin (Chloramphenicol), aureomycin and terramycin have a very wide antibacterial spec-

trum and have had dramatic results on rickettsia1 infections such as typhus fever, in primary atypical pneumonia and in many other conditions. These antibiotics are produced by different varieties of streptomycetes, and chloromycetin was the first of the antibiotics to be synthesized commercially.

PENINGTON, ISAAC (1616–1679), eldest son of Sir Isaac Penington, was one of the most notable of the 17th-century Quakers. In 1661 Penington was imprisoned for refusing to take the oath of allegiance, and on several subsequent occasions he passed long periods in Reading and Aylesbury jails. He died on Oct. 8, 1679. Edward Penington (1667–1711), son of Isaac Penington, emigrated to Pennsylvania, where he founded a family. Isaac Penington's stepdaughter, Gulielma Springett, married William Penn.

PENINSULAR WAR (1808–1814). This term is applied to the operations conducted by the British, Spanish and Portuguese armies against the French in the Iberian peninsula during the years above noted. The British make the most of it: first, because they were, with one or two trifling exceptions, their only successful military operations in the whole period 1794–1814; second, because they justly raised British military reputation to the highest point; and third, because they contributed very materially to the exhaustion of France and the downfall of Napoleon.

The immediate cause of the war was Napoleon's endeavour, since he was powerless at sea, to reduce England to submission by starving its trade. With this object he had on Nov. 21, 1806, issued his Berlin decrees, ordering all continental ports to be closed to British subjects. The next thing was to enforce those decrees. The situation seemed so formidable in England that the British ministers thought seriously of abandoning all effort to trade with the old world, and of seeking new markets in Spanish America. England had but two friends in Europe: Sweden and Portugal. Napoleon left it to Russia to deal with Sweden, and resolved to take Portugal in hand himself. In Aug. 1807 he called upon it to comply with his decrees, and being answered by a protest, overawed the weak king of Spain, Charles IV, and his corrupt minister, Manuel de Godoy, into granting free passage for French troops through Spain to Portugal. Moreover, by a secret treaty, signed at Fontainebleau on Oct. 27, 1807, it was agreed that Spanish troops should assist the French, that Portugal should be divided between France and Spain and that a principality should be carved out of it for Godoy. Already on Oct. 19, 30,000 French troops under Gen. A. Junot had crossed the Spanish frontier; under orders from Napoleon, these hastened their march upon Lisbon. After long and painful vacillation between the demands of England and France the Portuguese regent fled to Brazil with the Portuguese fleet, and Junot, with an army reduced by haste and hardship to a mob of undisciplined, half-starved and half-armed stragglers, occupied Lisbon.

Next, Napoleon turned his designs against Spain itself. First he persuaded the king to send 15,000 of his best soldiers to help the French in the Baltic. Next he massed French troops upon the Spanish frontier, the treaty of Fontainebleau allowing him to send 40,000 men through Spain to the support of Junot. In Jan. 1808 he ordered from 70,000 to 80,000 men to cross the marches; in February and March the fortresses of San Sebastian, Pamplona, Figueras and Barcelona were treacherously occupied; by the middle of March there were more than 90,000 French troops in Spain, and on March 26 Murat occupied Madrid as Napoleon's vicegerent and commander in chief. The Spaniards, after a first outbreak of rage against Godoy and the king, accepted the situation in mute stupefaction. King Charles IV abdicated in favour of his son Ferdinand, who threw himself abjectly upon Napoleon's mercy; but Napoleon, setting Ferdinand aside, resolved to substitute for him his own brother Joseph. Murat intimidated his Spanish council at Madrid into requesting, on May 13, that Joseph might reign over them; but meanwhile the Spaniards had realized that they were subjected to France and on May 2 had risen in revolt.

The insurrection at Madrid was ruthlessly quelled by Murat, but the movement spread like wildfire. In province after province a junta, or committee of administration, was appointed. Troops were levied; armies were formed; about 100,000 men were collected in different parts of Spain, all alike brave and enthusiastic, but without arms, discipline, organization or commanders. Portugal likewise rose in revolt, and Junot, cut off by the Spanish insurgents from the French armies in Spain, withdrew the whole of his force into Lisbon. The Spanish province of Asturias sent emissaries to England to ask for help, and meanwhile the governor of Gibraltar, Sir Hew Dalrymple, offered such aid as could be given by British ships and by a force of 5,000 men under Gen. Brent Spencer, awaiting orders in Gibraltar harbour.

Napoleon took action against the Spaniards at once. Their most formidable force lay in Andalusia, on his front, and in Galicia on his right flank; and he judged it further most important to secure the ports on the east coast and to seize the fortress of Zaragoza, as a link of union between his forces in Catalonia and in central Spain. He accordingly detached Gen. P. Dupont with 20,000 men toward Andalusia, Moncey with 9,000 more to advance along the east coast and C. Lefebvre-Desnouettes with 4,000 more to deal with Zaragoza, while Gen. Merle with a smaller column was ordered to restore order on the northern coast. All except Merle failed. On the east coast not only Valencia but Gerona repulsed French attacks; Zaragoza defended itself with desperate tenacity; and Dupont, thanks in part to useful demonstrations made by Spencer's force on the coast, so mismanaged his operations that on July 23 he was forced at Baylen to capitulate with 18,000 men. Had not the Spanish army of Galicia, under Gen. Blake, imprudently accepted battle and been totally defeated at Medina de Rio Seco by J. B. Bessières (July 14), practically all of Napoleon's operations would have been fruitless.

The Campaign in Portugal, 1808.—Meanwhile the British government had in June decided to comply with the Spanish appeal for help. Not many troops were available, for 12,000 had been sent under Sir John Moore upon a hopeless enterprise to Sweden. However, between 10,000 and 11,000 men were embarked under Sir Arthur Wellesley. He was empowered to add Spencer's force to these, and his first objective was to be the Tagus. His information was that Junot had but 20,000 men in all, of which at least 6,000 were at a distance from Lisbon, so he landed without hesitation on Aug. 1 at the mouth of the Mondego. Thence moving south he drove back an advanced French division under Gen. Delaborde at Roliça (Aug. 17) and took up a position at Vimeiro to cover the landing of reinforcements, which were waiting off the coast to join him. Further reinforcements were on their way, including Moore's 12,000 men; but, since Moore, who was senior to Wellesley, had offended the government by returning from Sweden, two officers, Sir Harry Burrard and Sir Hew Dalrymple, had been specially appointed to keep Moore out of the chief command. Burrard appeared off the coast on Aug. 20; and on Aug. 21 Junot with 13,000 men attacked Wellesley, who had 17,000 at Vimeiro, and was hopelessly worsted. Left to himself Wellesley would have captured Junot and his whole army, but Burrard interposed, and before Burrard had held command 24 hours, Dalrymple appeared to supersede him. Though an excellent administrator, Dalrymple was inexperienced and nervous in the field. He would not follow up the beaten French, and ultimately Junot and his army were sent back to France by sea under the convention of Cintra (Aug. 31). The ministry made Dalrymple the scapegoat for the mistakes, mainly its own, which had led to the convention; but at least Lisbon had been secured as a base for future operations.

The British government decided to prosecute the advantage gained. The Spaniards had driven the French behind the line of the Ebro, and four Spanish armies, so-called, under four different commanders, each of them jealous and unskilled. with no commander in chief, were ranged along the river from Tudela to Reinosa, talking big of expelling the enemy from Spain. A space in this line was left for the English, and in September the British government resolved that it should be filled with 40.000 British

troops. Although Sir Harry Burrard had been expressly appointed to exclude Sir John Moore from the chief command, it was now determined to supersede Burrard by Moore. a decision which Burrard received not only with obedience, but in an ideal spirit of loyalty and patriotism. But meanwhile, upon the news of the disaster of Baylen, Napoleon had ordered 80.000 men to march into Spain; early in September he organized the army of Spain into six corps and a reserve, with a total strength of 200,000 men. By the end of October he had not far short of 120,000 effective men on the Ebro; on Nov. 6 he took personal command. The Spaniards likewise had been reinforced by the transport of 9,000 out of Romana's 15,000 men from the Baltic to Santander by the British fleet; but nothing. could give strength to ill-organized and half-disciplined levies. On Oct. 29 one Spanish army was dispersed at Zornosa. On Nov. 10 another was utterly routed at Gamonal, on Nov. 11 and 13 another underwent the same fate at Espinosa and Reinosa; and on Nov. 23 yet another army was signally defeated at Tudela. Briefly, the Spanish army of the left had ceased to exist, and those of the centre and right had been broken and routed. The way to Madrid was open and on Dec. 4 the capital was occupied by the French.

Sir John Moore's Campaign of 1808–09.—Meanwhile Moore, much hampered by want of transport and money, had set his troops in motion at the end of October. He had actually with him about 22,000 men, but a further body of about 18,000 more under Sir David Baird was under orders to sail from England to Corunna; Moore decided that, with the Spanish armies lying between him and the enemy, he might safely effect his junction with Baird by land. While, therefore, he himself moved northeast upon Ciudad Rodrigo and Salamanca, Baird was to strike southeastward from Corunna, and meet him at Valladolid, or even farther to the east. Owing to the lack of roads, however, Moore was obliged to send the cavalry and artillery under Sir John Hope by the valley of the Guadiana, to move eastward through Talavera to Madrid, and thence northwestward through the Escorial pass of the Guadarrama—a very considerable detour. On his march northward Moore received only disquieting news of the Spanish dispositions, and upon reaching Salamanca on Nov. 14 he heard definitely that the Spaniards had been routed at Zornosa, and that the French were advancing on Valladolid. Plainly, it was madness to think of advancing farther to effect his junction with Baird, and he therefore halted and wrote to inform the government that the plan of campaign which they had prescribed for him was visionary, that the Spaniards themselves had no definite plans, and that it was impossible for him to get any authority in Spain to take any notice of his presence.

Baird, meanwhile, had reached Corunna with his infantry on Oct. 13, but had found his arrival anything but welcome to the junta of Galicia. However, by Nov. 13 the whole of his cavalry had also joined him. and by Nov. 22 he had reached Astorga. There he received news of the rout of the Spaniards at Zornosa and Espinosa, not from any Spanish source—for the Spaniards ignored his existence—but from his own intelligence officers; and he made up his mind to retreat. On Nov. 28 Moore at Salamanca heard of the defeat of the Spanish right at Tudela, and at once decided to retire upon Portugal. He therefore sent orders to Gen. John Hope, who was already across the Guadarrama, to hasten to him with all speed, and to Baird to fall back to Corunna and join him at Lisbon by sea. Baird began his retirement at once, and Hope, by a forced march by way of Avila, Fontiveros, Peñeranda and Alba de Tormes. regained touch with Moore on Dec. 4. Urgent messages now reached Moore from J. H. Frere. the British minister at Madrid, to make an effort to save the capital, which was preparing for a desperate resistance; Moore, though distrustful, countermanded his orders to Baird, and bade him return to Astorga. On Dec. 9 he learned of the fall of Madrid, and he then resolved to make a dash upon the French communications at Burgos. On Dec. 13 he moved his headquarters from Salamanca northeastward to Alaejos, where, by great good fortune, an intercepted dispatch from L. A. Berthier, Napoleon's chief of staff, to N. J. de Dieu Soult, gave him the key to the French dispositions and showed that Soult's corps, little over 20,000 strong, lay isolated on the Carrion about 90 mi. northeast of him. Incidentally, he learned that the French in Spain now numbered 250,000, but, though fully alive to the risk, he resolved to advance and strike at Soult. Moving northward he joined hands with Baird at Mayorga on Dec. 17, his advanced parties more than once brushing against the French on the way, and marched upon Sahagun, where, on Dec. 21, his cavalry fought a brilliant little action against the French horse. On Dec. 23 he had made all his preparations for falling upon Soult on the morrow, when intelligence reached him that the French under the emperor in person were moving against him in great force. Thereupon he gave orders for immediate retreat. He had been expecting that he would have to "run for it" and now the time had come.

Napoleon had been fully convinced that the British had withdrawn into Portugal and could hardly give credence to Moore's audacity. He realized it, however. on Dec. 19, and taking 42,000 men in hand himself, and entrusting as many more to Junot and Soult, he flew to the pursuit, hoping to make an end of Moore by a great enveloping movement. Moore retired upon Corunna, but the emperor could never overtake him, and on Jan. 1, 1809, he made over the chase to Soult. The discipline of the British began to fail very early in some regiments, but Moore hustled them on, fighting many petty rearguard actions on the way, and after much hardship in crossing the mountains of Galicia, on Jan. 11, brought his army, sadly thinned indeed but safe, to Corunna. The transports having been delayed in their arrival by foul winds, he was obliged to take up a position to cover his embarkation. The ships arrived on Jan. 14, and on Jan. 16 Soult, with 20,000 men and 40 guns, attacked Moore with 15,000 men and 9 light cannon. Soult was repulsed, but Moore was mortally hurt; Baird was disabled by a severe wound, and it fell to General Hope to re-embark the troops and bring them safely to England. The result of the campaign seemed to be a failure, but Moore had dislocated the whole of Napoleon's plans and, moreover, had caused him to scatter his troops far too widely over the surface of the peninsula, with fatal consequences.

Campaign in Portugal and Spain, 1809.—Austria was preparing again to take up arms against Napoleon, and the question was whether England should act in its support. Moore had quite correctly declared the Portuguese frontier to be indefensible. Wellesley, who was now consulted, opined that, if the Portuguese army and militia were reorganized and 20,000 British were added to them, the French would need 100,000 men to conquer Portugal, and that if the Spaniards continued to resist, the French could not spare so many. The cabinet resolved to make its main effort on the Scheldt, and only with great difficulty Castlereagh persuaded them to send Wellesley out to the peninsula and to give him 26.000 men. Wellesley reached the Tagus at the end of April. He found that Soult, after his march to Corunna, had invaded Portugal and taken Oporto; that M. Ney, who had also joined in the chase of Moore, was subjugating Galicia and that C. Victor-Perrin was lying at Merida within 40 mi. of the eastern Portuguese frontier, threatening invasion by the line of the Tagus. The Spaniards had not done well during the winter. Gen. St. Cyr had beaten them badly in Catalonia, and the army of the centre had sustained defeats at Ucles (Jan. 12), Ciudad Real (Feb. 18) and Medellin (March 28). There was nothing to stop Soult except some disheartened Portuguese levies, nor to check Victor except the demoralized army of Gen. Cuesta, which had just been beaten at Medellin. However, both Soult and Victor were stationary; their headquarters were 200 mi. apart; and, although they were supposed to be acting in concert, they were not in communication with each other. Viscount Beresford and other British officers had by this time brought 15,000 Portuguese troops into a fairly efficient condition; with these and 25,000 British, Wellesley, on May 7, advanced northward against Soult. The marshal, suspecting nothing, had scattered his troops in considerable depth to south and north of Oporto, and Wellesley tried to cut off the southern detachments, but failed. He crossed the Douro just above Oporto, however, under Soult's very nose, and catching the French army by surprise drove it away as a mere disorderly mob, which would have been destroyed but for the timidity of Gen. Murray, one of Wellesley's

divisional commanders. Following Soult, Wellesley drove him north through a miserable country; and only by desperate marches and after desperate perils did the marshal finally make his way to Lugo, having lost 6,000 men and the whole of his artillery. He owed his safety mainly to the fact that Wellesley had, on the 18th, been obliged to abandon the pursuit, having received news that Victor was in motion on the Tagus.

Victor's movement proved to be nothing but a reconnaissance in force, designed to obtain intelligence of Soult; and King Joseph at Madrid, having learned, not from Soult but from Paris, of the mishaps which had befallen that marshal, recalled Victor up the Tagus to Talavera. Soult, having called upon Ney at Lugo to re-equip his army, the two commanders and their respective armies had quarrelled violently, with the result that joint operations planned between them against the Galician insurgents came quite to nought, and the French were driven out of Galicia for ever. Rather by accident than design Ney and Soult drifted southward; and by the beginning of July their corps, as also that of Mortier, some 50,000 men in all, were assembled at Astorga, Benavente and Valladolid within 50m. of the valley of the Tagus. Joseph had in and near Madrid 27,000 men, and Victor's corps numbered about 23,000; so that he was in a position at short notice to concentrate at this time 100,000 men in that valley. Such was the situation when Wellesley, having returned to Abrantes from northern Portugal, proposed that he, with 23,000 British, and Cuesta with as many Spaniards, should march on Madrid by way of the Tagus. The supreme Government of Spain eagerly accepted the suggestion, undertaking to provide everything; and, quite unconscious of the storm that was gathering before him, Wellesley marched (June 27) to join Cuesta at Plasencia. On July 17 the two armies advanced. The march was one long story of wrangling and distress. Cuesta was old, infirm, incompetent and obstinate. His army was without order or discipline; and no measures had been taken for transport and supply. Victor fell back before the allies till reinforced by Joseph to a strength of 46,000 men; then the allies fell back in turn, the Spaniatds turning their retreat into a flight. With much difficulty Wellesley stopped the panic and took up a position at Talavera (July 27). Victor attacked the key of the position on the same night and was repulsed; and renewing the onslaught in force on the next day was again repelled with a loss of 7,000 men and 17 guns. Wellesley himself had lost 5,000 men, but being reinforced by the Light Brigade on the 29th, was eager to advance. Cuesta fortunately refused, and on Aug. 1 Soult came down the pass of Baños, which Cuesta, in spite of Wellesley's urgent entreaties, had declined to defend, into the valley of the Tagus. Wellesley, awaking to his danger, abandoned his wounded, crossed the river by the bridge of Arzobispo, and led his starving army back to Portugal by way of Badajoz. Though the preoccupation of Napoleon with the Austrian war justified Wellesley in making an extraordinary effort, he had taken an unwarrantable risk. He had been warned that the Spanish troops were worthless and their supply system chaotic; and he had disregarded the warning. Having now learned his lesson, he resolved to have nothing to do with the Spaniards in the future. However, for his victories he was created Viscount Wellington.

Campaign of 1810–11.—During the winter Wellington thought matters out. The Spaniards, untaught by experience, embarked on a new winter campaign which resulted in the total defeat of Cuesta's successor, Areizaga, at Ocaña, (Nov. 19). But out of this evil came good. Soult and Joseph, from sheer cupidity, invaded Andalusia, failed from carelessness to master Cadiz and found themselves set down to the siege of a place which, without a naval force, was impregnable. Wellington gladly spared a few troops, which were made up from England to 8,000, to aid in the defence of Cadiz. The more troops squandered by the French in useless enterprises, the better for him. But the situation was serious. Napoleon had reduced Austria to submission at Wagram and would doubtless use every available soldier to master the Peninsula in 1810. Yet Wellington, so long as he had Lisbon, saw his way to thwart him. The French had three things against them. First, the sea was not open to them. Secondly, the Spanish population was to a man against them, and though the Spanish armies were valueless, the people were always cutting off stragglers and small parties, insomuch that a letter could not be sent by the French with a smaller escort than 25 men. Thirdly, the French armies always lived on the country. Wellington reasoned somewhat in this fashion: "I have to encounter 300,000 men with 40,000. I must train the Portuguese army with the help of English officers so as to make my 40,000 into 50,000." This task he committed to Beresford. "The French," he argued next, "live on the country and therefore cannot stay long in one place. I have the sea to furnish me with all that I want; and if I organize my service for feeding my army perfectly, I can go when I please and stay where I wish as long as I wish." So he set himself to organize an efficient service for transport and supply. "But," he went on, "everything depends on my base on the sea, Lisbon, and I must make Lisbon impregnable." He did so by throwing up the fortified lines of Torres Vedras, 25m. north of the city. "Now," he argued, "if I have 50,000 men the French must bring 60,000 to beat me. The removal of 60,000 men must weaken them in some part of Spain, and there the Spaniards will make trouble. If they advance against me, I shall retire before them, accepting battle if they give me a favourable opportunity, for the missile action of my lines is superior to the shock-action of their columns; but, if not, retreating steadily till I reach my fortified lines. They cannot wait long before them, because they live on the country and will exhaust it. They *must* retreat in time, through territory which they have already eaten up, and I, carrying my food with me, can pursue them and cause them heavy loss. I can go on playing this game as long as they like. I *must* win in the end. The only trouble is that, though the natural access for the French to Portugal is from the north-east, by way of Salamanca and Almeida, they can enter it also from the east by the line of the Tagus, so that I must divide my force to secure both routes. If they advance by both routes in strength, it may be awkward; but that is unlikely. The way by the Guadiana, south of the Tagus, is luckily sealed up for the present by the Spanish fortress of Badajoz. But even if driven from Portugal, I can land my army at Cadiz and play the same game there. I *must* win in the end, and the more certainly because the French generals are always quarrelling among themselves, and pay no obedience to King Joseph, their nominal commander."

And so it came about. Napoleon gave Masséna the command of 65,000 men as the army of Portugal, and Soult the command of as many as the army of Andalusia. Wellington with 18,000 British and 14,000 Portuguese awaited Masséna near Almeida, leaving Gen. Hill with about 20.000 men, mostly Portuguese, to guard the route by the Tagus. Masséna first besieged and captured Ciudad Rodrigo, which barred his way (July 10), and then pushed his advanced troops across the frontier. Gen. Craufurd with the Light Division engaged these most unnecessarily on the Coa (July 23), happily without serious mishap, though the odds against him were four to one. Then Masséna advanced, and Wellington retreated steadily before him. At Bussaco, having summoned Hill to him, Wellesley offered battle with 50,000 men in a very strong position. Masséna accepted it (Sept. 27) and was repulsed with 4,600 casualties, whereas Wellington's did not exceed 1,250. Then the retreat began again, and Wellington entered the lines of Torres Vedras (Oct. 10). Masséna lingered before them for a month, till compelled by want of subsistence to retire 30m. to Santarem. Here he waited with persistence, for it was expected that the British Ministry would fall and be supplanted by the Whigs, who would certainly withdraw the British army from the Peninsula. It was an anxious time for Wellington, for in Jan. 1811, Soult appeared with another army before Badajoz, and the Spanish army on the spot offered battle, which Wellington had begged that it would on no account do, and was, of course, beaten. Wellington detached Beresford with ten British battalions and some Portuguese to watch Soult; and at last, on March 5, Masséna began to retreat. Wellington followed him up with 44,000 men. but was obliged immediately to send 8,000 of them to Beresford, since Badajoz had (March 10) been treacherously surrendered to Soult. With the remainder he con-

tinued his pursuit; and by April 8 Masséna had recrossed the Portuguese frontier on his way to Salamanca, with his army in rags, starved and demoralized. The campaign had cost him 25,000 men killed, captured, or dead from sickness.

Campaign of 1811.—Meanwhile Sir Thomas Graham and the Spaniards had fallen upon the besiegers of Cadiz, and the British had fought a brilliant action against them at Barrosa (March 5). Thereupon Soult hurried back from Badajoz to Andalusia; and Wellington, reinforcing Beresford, set him down to beleaguer Badajoz (April 22), with the option of fighting Soult or refusing battle as soon as the marshal should march back, as he certainly would, to relieve the fortress. He then returned to his own army, which had stopped its pursuit of Masséna on the Portuguese frontier, and was now covering the blockade of Almeida. Masséna advanced from Salamanca to relieve it, and Wellington offered him battle (May 3) at Fuentes de Oñoro, just across the Spanish frontier. Masséna assailed the village on the 3rd and was repulsed with 6jo casualties, Wellington's not exceeding 250. On the 5th Masséna made a geceral attack; and then, as Wellington said, "if Boney had been there, we should have been beat." But, though Wellington's position was defective, the steadiness of his troops enabled him to hold his own. His casualties were 1,530, Masséna's 2,200; and on the 7th Masséna retreated to Salamanca, leaving Almeida to its fate. The fortress was presently abandoned and blown up by the French, the garrison, to Wellington's great vexation, escaping. Masséna was shortly afterwards recalled and replaced by Marmont; but Wellington always considered Masséna the ablest of all the French generals with whom he had to do in the Peninsula.

Meanwhile, for want of proper artillery, Beresford's siege of Badajoz had not prospered. Soult with 24,000 men and 50 guns returned from Andalusia to its relief in May, and on the 16th Beresford, with 8,000 British and 21,000 Spaniards, engaged him at Albuera. Beresford mismanaged the action and would have lost it but for one of his staff, Capt. Henry Hardinge. He was saved by the steadiness of his British troops, who suffered 4,000 casualties. The Spaniards lost 3,000 and Soult 8,000. The marshal retired, and all was safe for the present; but Wellington, with his little force, had actually fought two general actions on the two main lines of entry into Portugal—a very severe strain upon his strength.

He now (May 29) re-opened the siege of Badajoz with bad Portuguese cannon, for, living in almost daily dread of orders to evacuate the Peninsula, he had all this time kept his own siege-train on its ships in Lisbon harbour. On June 10 the prospective junction of Marmont with Soult obliged him to raise the siege and withdraw his troops, 37,000 British and 17,000 Portuguese, to the Caia, a little to west of Badajoz. Soult and Marmont having joined forces at Merida (June 17) advanced against him with nearly 60,000 men, but decided to leave him alone. The two marshals then quarrelled; and Soult returned (June 28) to Andalusia, leaving troops which raised Marmont's strength to 43,000 men. On July 13 Marmont withdrew to the valley of the Tagus. Wellington then landed his siege-train, and moved north to the blockade of Ciudad Rodrigo, leaving the bulk of his force under Graham and Hill to protect the eastern frontier. Marmont, collecting 58,000 men, marched to its relief, and Wellington, calling up troops which gave him a strength of 30,000 British and 16,000 Portuguese, raised the blockade and awaited him. On Sept. 25 hfarmont made a reconnaissance in force which brought on a lively little combat at El Bodon, but he was afraid to go farther, and on Oct. 1 retired to his cantonments on the Tagus. The campaign ended by a spring of Gen. Hill upon an isolated French detachment at Arroyo Molinos, to the north-east of blerida, when 2.000 French were killed or captured at a cost of 100 British casualties (Oct. 28).

Campaign of 1812.—Throughout the perilous year 1811, when Wellington had borne the brunt of the attack of the armies both of Portugal and Andalusia, the Spaniards had accomplished very little. But their armies had now been in large measure replaced by guerrilla-bands of irregulars, frequently under very able leaders, which made the task of holding Spain in subjection more difficult to the French than ever. To paralyse one of these chiefs, Ballesteros, in the south, Soult (Dec. 1811) directed an attack upon one of his principal bases, Tarifa, which was repelled with trifling loss to the little garrison, half Spanish, half English, but cost the French 500 casualties. And now Napoleon, intent on the invasion of Russia, decided that he would draw upon Marmont's army to subdue the eastern provinces and Andalusia thoroughly, and then turn all his strength upon Portugal. Wellington for his part had planned the capture of Ciudad Rodrigo, so as to close the north-eastern gate of Portugal; and on Jan. 8 he invested the place, battered a breach and on the 19th stormed it out of hand, with no more than 500 casualties, before Marmont could even assemble troops to save it. Marmont was left gasping with dismay. Ciudad Rodrigo, with a garrison of 5,000 raw Spaniards, had defied Marshal Ney for 25 days, and Wellington had snatched it from a French garrison in 12 days. Wellington then dispersed his trcops innocently into cantonments, as did Marmont. being unable to keep them concentrated for want of supplies. On Feh. 16 Wellington advanced to the siege of Badajoz, stationing Hill at Merida to cover the operation from the east. Ground was broken on March 17, a breach was battered, and on April j the place was taken by escalade, the storming parties having failed in their assault. The capture of Badajoz cost Wellington 5,000 casualties, and for 48 hours the troops were out of all control; but the gain was great, for he had captured the French siege-train at Ciudad Rodrigo and their pontoon-train at Badajoz. He then detached Hill to destroy the French bridge of boats over the Tagus at Almaraz (May 17), thereby reducing Soult and Marmont to the bridge of Toledo for communication between their armies; and then leaving Hill at Merida with 22,000 men to parry any movement of Soult, he advanced (June 13) with 28,000 British and 15,000 Portuguese against Marmont at Salamanca. The marshal fell back to the Douro till, being reinforced, he took the offensive (July 16) and manoeuvred against Wellington's communications. On more than one day the two armies raced each other in two parallel columns, only a few hundred yards apart, ready to wheel into line and engage at any moment. At last on July 22 Marmont made a false movement, leaving his left wing in isolation, and Wellington sprang upon him instantly and inflicted a crushing defeat. He had 50,000 men, including Spaniards, and 60 guns; Marmont had 47,000 and 78 guns The French losses were 14,000 men, 20 guns and two eagles; Wellington's casualties were 5,000. The French retreated north-east upon Burgos, and Wellington, having entered Madrid in triumph (Aug. 12) invested Burgos. The siege was most unskilfully conducted; and Wellington was obliged to raise it (Sept. 22) upon the advance of the French against him in force from all parts of Spain. With difficulty he gained time for Hill to join him as he retreated, and on Nov. 11, with 68,000 British, Portuguese and Spaniards, he offered battle to 90,000 French on the field of Salamanca. The French declined the challenge; and Wellington pursued his retirement, with some sufferingto his troops but little molestation from the enemy, to Ciudad Rodrigo, where the campaign came to an end (Nov. 19). His losses in the retreat were 9 ooo, but foreign critics count it his greatest achievement. The advance on Madrid was no doubt a mistake; but the campaign had been brilliant. It had cost him 20,000 men; but it had cost the French 40,000 and some hundreds of guns, and lastly it had cleared the French out of all Spain south of the Tagus.

Campaign of 1813.—The new year found Wellington an earl and a marquis, and Napoleon the poorer by some 400,000 men lost in the snows of Russia. The emperor was fain to draw many troops from the Peninsula, and of those that remained the unfortunate King Joseph had less control than ever. The *cortes* of Spain, on the other hand, had nominated Wellington commander-in-chief of their armies, of which a contingent. 20.000 strong, was under his immediate orders for the coming campaign. Furthermore, in 1812 the British Government had landed some 9,000 troops from the Mediterranean on the east coast of Spain —a sphere beyond the reach of Wellington—and these. with the addition of 20,000 Spanish troops in English pay, seemed likely to give trouble to the French in that quarter. Their commander,

however, Sir John Murray, the general who had failed Wellington on the Douro in 1809, was a feeble creature of whom little could be expected. He succeeded in repelling an attack by Gen. Suchet at Castalla (April 12) and with a little enterprise might have turned his success to great account. His army, though composed of five different nations, was 17,000 strong, whereas Suchet had at most 15,000; and Suchet's casualties in the action numbered 1,000 against Murray's 500. But Murray allowed the opportunity to slip; and a subsequent operation which he undertook against Tarragona was so disgracefully mismanaged that it brought Murray to a court-martial.

This, however, was only a minor incident in the Peninsular operations. In the main field Wellington marched from Portugal with a full strength of about 100,000 men, 47,000 of them British and the remainder Spanish and Portuguese. The Spanish guerrilla-leaders were so active and so formidable in Biscay and Navarre that they found full employment for no fewer than four French divisions under Gen. Clausel. Thus weakened, the French army could make no stand on the Douro, but fell back north-eastward, abandoning Burgos, to the line of the Ebro. Wellington forced it to retire by turning its northern flank; and Joseph, with Marshal Jourdan for his adviser, decided to fight a delaying action in the basin south of Vitoria, to cover his further retreat. He had only 50,000 men, for Clausel, in spite of repeated orders, had not joined him; whereas Wellington had 72,000; and had Wellington's orders been followed few of the French would have escaped. As things fell out Joseph got away with the loss of all his artillery, 150 pieces, and every scrap of baggage, but of no more than 7,000 men, Wellington's casualties being 5,000. The French retreated over the Pyrenees into France, and Wellington, having pursued them as far as Pamplona, decided to abandon the chase. It was essential to master the fortresses of Pamplona and San Sebastian before he could advance farther, and until these should fall he occupied the main western passes of the Pyrenees on a front of about 50m. south-eastward from San Sebastian. Pamplona was blockaded by the Spaniards, and the siege of San Sebastian, a tiny fortress, was entrusted to Sir Thomas Graham with one British division and one Portuguese brigade.

Meanwhile Napoleon had displaced Joseph, sending Soult to take command of all the troops that had retreated from Spain. The marshal arrived on July 13, and having received fresh artillery and restored, more or less, the organization and discipline of his 70,000 men, he on July 20 launched a great counter-attack along the three main valleys of the Pyrenees which lead to Pamplona. He met with some initial success, for Wellington's divisional generals were always rather helpless unless their commander-in-chief was at hand; but Soult's plans were not fulfilled as he had intended, and it was rather by accident than design that on July 26 he found himself at Sorauren, facing 16,000 of Wellington's troops with 30,000 of his own men. He attacked, but was repulsed with heavy loss, and Wellington then taking the offensive in his turn drove the French back after six days' fighting, as a mere demoralized mob, to their former position on the northern slopes of the Pyrenees. Soult admitted a loss of 13,000 men, whereas Wellington's did not exceed 7,000.

In the course of these operations the first assault on San Sebastian was delivered on July 25, and repulsed with a loss of 400 men. Want of ammunition then compelled the turning of the leaguer into a blockade till Aug. 22, when the siege was renewed; and on the 31st the place was successfully stormed though at great cost of life. First and last the casualties at San Sebastian were over 3,700. On the day of the storm Soult made a final effort to save the fortress, but was beaten back with a loss of 3,800, the casualties of the allies being 2,600. The brunt of the two days' fighting fell upon the Spaniards, whose losses exceeded 1,600. Soult now resolved to stand on the defensive and fortified lines of excessive extent to the south of the Bidassoa. These Wellington attacked on Oct. 7, and carried with little difficulty after three days' combat, wherein both sides lost about 1,600 men. Soult then began to fortify another position a little to the northward on the Nivelle, and Wellington, bringing his troops forward to the high ground to north of the Bidassoa, halted till the fall of Pamplona should allow him to advance farther.

He was not quite happy notwithstanding all his successes. His relations with the Spanish Government were such that he had resigned his command of the Spanish armies (Oct. g), and with the Portuguese Government they were little better. It was clear to him that, in case of a reverse, retreat into Spain would be out of the question. Moreover, though Napoleon's star was already on the wane, Wellington as yet knew only that he was standing up to his enemies in Germany; and it was always possible that he might win a great victory, come to terms with them, as his custom was, and return to launch all his forces against his foes in the Pyrenees. Moreover, on the east coast of Spain the latest British commander, Lord William Bentinck, had contrived to sustain at Ordal a reverse at the hands of Suchet (Sept. 13). However, on Oct. 25, Pamplona fell, and on Nov. 10 Wellington attacked Soult's position on the Nivelle and carried it, capturing 69 guns; the casualties, 4,300, being about the same on both sides. He was now fairly established on the plains of France, and recognized that it was vital to him to have the population on his side. He could by this time count upon the good behaviour of his own troops towards the inhabitants; but the Spaniards had suffered too much at the hands of the French and could not be kept from maltreating them. "With 40,000 Spaniards I don't know where I should stop," he wrote at this time, "but if they plunder they will ruin all." Reluctantly and regretfully he sent most of them back to Spain.

On Dec. 8 came the great news that Napoleon had been utterly overthrown at Leipzig, with orders that Wellington was to press the invasion of France. Thrown back from the Nivelle, Soult had entrenched himself on the river Nive, south of Bayonne, and here Wellington attacked him on Dec. 9. The operations lasted five days, Soult counter-attacking without success on the 10th and 11th, and were greatly complicated by the sudden rise and fall of the rivers, fed by the glaciers of the Pyrenees. Owing to the destruction of a bridge by a flood Soult was able to attack with 30,000 men and 30 guns a force of 14,000 men and 14 guns under Gen. Hill, which stood in isolation about St. Pierre (Dec. 13), but after a very severe action he was repulsed, his losses being 3,000 and the British 1,700. The casualties on the French side for the five days were 5,600 and of the allies 5,000.

Soult then withdrew to a position on the Adour; and meanwhile the European situation again gave Wellington anxiety. The allies after their victory at Leipzig had all fallen at variance with each other, and their military plans seemed to Wellington to be insane. Napoleon, moreover, was negotiating for the detachment of Spain from the side of the allies, in order to withdraw Suchet's troops thence. On this latter point Wellington's mind was soon set at ease (Jan. 9, 1814) through the rejection of Napoleon's overtures by the Spanish Government; but his misgivings as to the military projects of the allies were justified. However, after much delay through bad weather, by a series of skilful movements (Feb. 17–24, 1814) he manoeuvred Soult out of his position on the Adour, crossed the river—500 yards wide—on a bridge of most ingenious construction, and thus forced Soult into the open. Leaving Sir John Hope to invest Bayonne and the strong garrison installed there by Soult, Wellington followed the marshal in his retreat eastward, overtook him at Orthez (Feb. 27), and with 34,000 men against 37,000, drove him off with a loss of 4,000 killed, wounded and prisoners, his own casualties being just under 2,000. Soult continued his retirement eastward with Wellington in close pursuit, till days of heavy rain brought the British to a standstill, and contact was lost between the two armies (March 3). Wellington took the opportunity to occupy Bordeaux as his new base on the sea, but Soult hurried his troops as a disorderly mob towards Toulon, not halting till he reached Tarbes (March 8). Then at last he realized that his enemies were stationary some 35m. to the north-west of him, and on March 13 he moved up to Wellington's outposts as if to attack, but thought better of it and on the 16th moved away slowly to southward. He had orders from Napoleon to keep his field of action as near as possible to the Pyrenees, and endeavoured thus to fulfil them. For all that he knew the emperor would yet hold his own.

These had in fact been most critical days farther north. The Prussians had given Napoleon an opportunity, and he had struck at them a succession of telling blows. Austrians, Prussians and Russians alike were terrified, for all that they outnumbered him by three to one, and staggered back in dismay. Matters remained in doubt till March 25, when Napoleon resolved to manoeuvre against the rear and communications of the allies, and they in turn plucked up courage to ignore him and continue their march to Paris.

On March 18 Wellington, with a force raised to nearly 50,000 men by the arrival of a contingent of Spaniards, resumed his pursuit of Soult and on the 19th was constantly engaged with his rearguard. On the 20th Soult fought a useless little combat at Tarbes, which only delayed his retreat to no purpose, and compelled him to take the longer of two roads to his next point, Toulouse. Wellington followed the shorter road, and Soult, in order to anticipate him, was compelled to hurry his wretched troops on with a speed which reduced them to a rabble. Nevertheless Wellington moved on slowly and cautiously. For one thing the rain was incessant, but even more disturbing was a report which had reached him that Napoleon had fallen back to Orléans. This might mean that he intended to join Soult and raise all southern France against the British and their allies, which would be a serious matter indeed. Not till the 26th did he come up before Toulouse, unaware, of course. that on the previous day Napoleon's doom had been sealed.

The position taken up by Soult was very strong, and could not soon be approached without preparatory operations of extreme delicacy. But, having a beaten army before him, Wellington took every imaginable liberty. and finally attacked on April 10 in a most primitive and hazardous fashion. His casualties, 4,000 men, were twice as great as Soult's, and the French later were inclined to claim the fight as a victory. But Soult knew better and, evacuating Toulouse on the 12th, continued his retreat. On that day news reached Wellington of the fall of Napoleon. He at once informed Soult, but, through no fault of the marshal, the garrison of Bayonne made a sortie on the night of the 14th, which cost them 900 and the allies 800 casualties. This was the last blood shed. On the 18th an agreement for the suspension of arms was signed and the Peninsular War was over.

The heroes of the war were, whatever the British may think, the Spaniards. It is true that their provisional Government was inefficient, their improvised armies of little military value, and their most prominent commanders, such as Cuesta, Castaiios and La Romana, incompetent. Their heads were turned by their initial success at Baylen, when they had to do with a frightened man, and they were always trying to repeat Baylen with raw levies under unskilled leaders. There were, moreover, endless jealousies between rival authorities, provinces and commanders. But the spirit of the nation as a whole was beyond praise, and was quickened by a savage hatred of the French. Every French straggler's throat was cut and small bodies of men were destroyed without mercy. The French tried to quell this spirit by reprisals —burning villages and shooting villagers—but the Spaniards retorted in kind, and before the close of 1808 both sides had exhausted their powers of terror, the French by burning Spaniards alive in their houses, the Spaniards by sawing a captured French general asunder. But the losses thus inflicted upon the French were very formidable. Marbot reckoned the average number of deaths of French soldiers, from all causes, from the beginning to the end of the war as 100 daily. From the year 1812 the guerrilla-leaders took matters very much out of the hands of the regular military commanders, and proved to be much more efficient than the regular generals. These leaders were drawn from all classes—one of the best was a priest—and, as their followings swelled to three, four and even five thousand men of all three arms, they became most dangerous opponents. Their knowledge of the country in the wild mountainous districts which they preferred gave them enormous advantages over their enemies, while if closely pressed they could disperse for the time and reassemble when the peril was over. Their quality varied very greatly. Some were composed of every description of desperate adventurer, not excluding British and French deserters, and were rather wild. Others were under far stricter restraint. At least one was subjected to discipline as stern as that of Cromwell's Ironsides, and began every day with mass. Taken altogether they wrought great things for the liberation of their country, and were perhaps the best expression of the national will to victory. But the sufferings of Spain from French oppression and extortion and from the ravages of war were terrible. They were the source of many of her troubles during the 19th century, and she has not yet, perhaps, recovered from the effects of those awful years. But she has good right to be proud of her *Guerra de Independencia.*

In Portugal likewise the national spirit was admirable. There is no more frugal, patient, docile, industrious man than the Portuguese peasant, and with British officers in the higher regimental ranks to superintend his training, he made an excellent soldier. When he failed, as at one moment he did, it was owing to his Government's neglect of him; but when, in response to British protests, that fault was amended, the Portuguese soldier speedily recovered himself. The Portuguese are still proud of a phrase written by Wellington from the Pyrenees in 1813, in which he described their countrymen as "the fighting-cocks of the army." It must be added, that when once the French had been driven across the Pyrenees, the Portuguese began to manifest considerable jealousy of the British officers in their army, and that Wellington's efforts to obtain some of his old Portuguese regiments for the campaign of Waterloo failed completely. Still this was, perhaps, no more than natural. The Portuguese, like the Spaniards, suffered terribly from the war and still suffer from it. They have, however, retained two things British—their rule of the road and their bugle-calls.

The fact, nevertheless, remains that, without the little British army under the command of Wellington, Spaniards and Portuguese could hardly have worked out their deliverance. At first, as has been seen, Wellington did not realize all the difficulties of the problem set him; but after the experience of 1809 he was under no illusions, and there and then thought out the solution. His first task, however, was to train his own troops, for the army had no regular administrative services in those days and indeed was subject to three different departments—the cavalry and infantry under the commander-in-chief and War Office, the artillery and engineers under the Board of Ordnance, and supply and transport under the Treasury. The last named was that which gave him most trouble, for the Treasury's commissaries, even after 14 years of war, had little experience of the needs of an army in the field; and on landing on the Mondego in 1808 he was obliged to draw up for them a complete table for the hiring and organization of transport. Roads in Portugal hardly permitted the use of wheeled vehicles; and he was obliged later to form his transport entirely of pack-mules, which he gradually brought up to a perfect system.

As has been seen, this formed an essential part of his plan for getting the better of the French, but it was also the principal means to the great end of discipline. Soldiers regularly fed had no excuse for helping themselves, and no commander was more keenly alive than Wellington to the demoralizing effects of marauding, nor more resolute to check it. Unfortunately the House of Commons, in defiance of all military opinion, had insisted in 1805 in altering the procedure of regimental courts martial, with the result that for a long time these courts were ineffective for enforcing discipline. It was the uncertainty of punishment which allowed the men to get out of hand in the retreats from Talavera and from Burgos, and after the assaults on Ciudad Rodrigo, Badajoz and San Sebastian; and indeed it was not until Wellington in 1812 imported a lawyer to help him through the intricacies of the new procedure that discipline began to improve. The establishment of a corps of military police—the first of its kind in the British army—materially contributed towards the same object, with the result that the behaviour of the British troops in France was exemplary. Thus it came about that the French peasants sold their produce and their cattle to the English commissaries, while Soult and their own countrymen went away empty. Thus also it was that at the conclusion of the war a British division marched

almost the whole length of France without a single complaint of any French inhabitant against a British soldier.

In addition to the transport and supply service, Wellington gradually trained a staff of extreme efficiency with an intelligence department of great excellence. In other respects his staff required much training from him, but improved steadily. When the army latterly swelled to some 100,000 men of all nations it was divided, practically, into three corps of which one was under Wellington's immediate command; and the staff proved itself perfectly competent to handle it.

With the help of Sir James McGrigor, the father of British military hygiene, Wellington brought the organization and working of the medical service to a pitch of perfection till then unapproached in any European army.

In the matter of tactics, when occupying a defensive position he always hid away his troops on the reverse side of a hill. one reason for the cautiousness of the French generals, in the later stages of the war, in offensive movements against him. His habit of meeting French columns with English lines is too well known to need more than mere mention. In respect of artillery, the 12-pounders, called by Napoleon his "pretty girls" — were of greater range and calibre than any of the English field-pieces. But the English had the spherical case-shot invented by Maj. Shrapnel, which enabled the English gunners to rain grape-shot upon an enemy at long ranges.

To come last to the French, their misfortunes were due mainly to the injustice of their cause, to the fact that sea-transport was denied to them, to their dependence upon the invaded country not only for subsistence but for money, to the jealousy and cupidity of their generals, and to Napoleon's great blunder in endeavouring to control the operations from a distance instead of appointing a commander-in-chief upon the spot and insisting that he should be obeyed. No attempt was made to conciliate the Spaniards and much was done to exasperate them, with the result that the invaders were loathed beyond human bounds. The closing of the sea compelled the transport of all stores of war to be made by land, which was a great strain. Subsistence upon the country again frequently meant that the stronger men took such food as was to be obtained, while the weaker died of starvation.

Again for want of a commander-in-chief the French operations were ill-concerted and executed with ill-will. Every French general wished to be independent and many of them thought only of filling their pockets. High commanders, again, set the example of taking women into the field. From all these causes discipline suffered; the morale of the French troops deteriorated; and by 1812 every French commander was afraid to meet the British. As Napoleon drew soldiers from the Peninsula to make good his losses in Russia, the quality of Soult's force sank lower. By the end of 1813 the French army in southern France had become almost contemptible.

PENITENTIAL, a manual used by priests of the Catholic Church for guidance in assigning the penance due to sins. Such manuals played a large rôle in the early middle ages; they were mainly composed of canons drawn from various councils and of *dicta* from writings of some of the fathers. Disciplinary regulations in Christian communities are referred to from the very borders of the apostolic age, and a system of careful oversight of those admitted to the mysteries developed steadily as the membership grew and dangers of contamination with the outside world increased. The treatment of the lapsed produced what has frequently been called the first penitential, the *libellus* in which, according to Cyprian (*Ep.* 51), the decrees of the African synods of 251 and 255 were embodied for the guidance of the clergy in dealing with their repentant and returning flocks. This manual, which has been lost, was evidently not similar to the code-like compilations of the 8th century, and it is somewhat misleading to speak of it as a penitential. Certain patristic letters had acquired almost the force of decretals; the most important were the three letters of St. Basil of Caesarea (d. 379) to Bishop Amphilochius of Iconium containing over eighty headings.

Three things tended to develop these rules into something like a system of penitential law. These were the development of auricular confession and private penance; the extension of the penitential jurisdiction among the clergy owing to the growth of a parochial priesthood; and the necessity of adapting the penance to the primitive ideas of law prevailing among the newly converted barbarians, especially the idea of compensation by the *wergild.* In Ireland in the middle of the 5th century appeared the "canons of St. Patrick." In the first half of the next century these were followed by others, notably those of St. Finian (d. 552). At the same time the Celtic British Church produced the penitentials of St. David of Menevia (d. 544) and of Gildas (d. 583) in addition to synodal legislation. These furnished the material to Columban (d. 615) for his *Liber de poenitentia* and his monastic rule, which had a great influence upon the continent of Europe. The Anglo-Saxon Church was later than the Irish, but under Theodore of Tarsus (d. 690), archbishop of Canterbury, the practice then in force was made the basis of the most important of all penitentials. The *Poenitentiale Theodori* became the authority in the Church's treatment of sinners for the next four centuries. (*See* Haddan and Stubbs's *Councils and Ecclesiastical Documents relating to Great Britain and Ireland,* iii. 173 *seq.*) A *Poenitentiale Commeani* (St. Cumian), dating apparently from the early 8th century, was the third main source of Frankish penitentials. Bishop Halitgar was commissioned (in 829) by Ebo of Reims to prepare a definitive edition; he used among his other materials, a so-called *poenitentiale romanum,* which was really of Frankish origin. The canons printed by David Wilkins in his *Concilia* (1737) as being by Ecgbert of York (d. 766) are largely a translation into Anglo-Saxon of three books of Halitgar's penitentials. In 841 Hrabanus Maurus undertook a new *Liber poenitentium* and wrote a long letter on the subject to Heribald of Auxerre about 853. Then followed the treatise of Regino of Prum in 906, and finally the collection made by Burchard, bishop of Worms, between 1012 and 1023.

BIBLIOGRAPHY.—In addition to the works mentioned above the one important work on the penitentials was L. W. H. Wasserschleben's epoch-malting study and collection of texts, *Die Bussordnungen der abendländischen Kirche nebst einer rechtsgeschichtlichen Einleitung* (Halle, 1851). *See* articles in Wetzer and Welte's *Kirchenlexikon,* Hauck's *Realencyklopädie,* and Haddan and Stubb's *Councils. Oakley, *English Penitential Discipline and Anglo-Saxon Law* (New York, 1923); H. J. Schmitz, *Buss und Bussdisziplin,* 2 vols. (1883–1898).

PENN, WILLIAM (1621–1670), British admiral, son of Giles Penn, merchant and seaman of Bristol, served his apprenticeship at sea with his father. In the first Civil War he fought on the side of the parliament, and was in command of a ship in the squadron maintained against the king in the Irish seas. In 1648 he was arrested, probably on suspicion of being in correspondence with the king, and sent to London, but was soon released, and sent back as rear admiral in the "Assurance" (32). After 1650 he was employed in the Ocean, and in the Mediterranean in pursuit of the Royalists under Prince Rupert.

When the first Dutch War broke out Penn was appointed vice-admiral to Blake, and was present at the battle of Sept. 28, off the Kentish Knock. In the three days' battle off Portland, February 1653, he commanded the Blue squadron, and he also served with distinction in the final battles of the war in June and July.

He sat on the commission of admirals and generals at sea, who exercised the military command of the fleet, as well as on the board of management. In 1654 he offered to carry the fleet over to the king, but in October he commanded the expedition to the West Indies sent out by Cromwell, which conquered Jamaica. He was not responsible for the shameful repulse at San Domingo, which was due to a panic among the troops. On their return he and his military colleague Venables were sent to the Tower. When released he retired to the estate he had received in Ireland.

He continued in communication with the Royalists, and in 1660 had a rather obscure share in the Restoration. He was reappointed commissioner of the navy by the king, and in the second Dutch War served as "great captain commander" or captain of the fleet, with the duke of York (afterwards King James II.) at the battle of Lowestoft (June 3, 1665). Penn died on Sept. 16, 1670, and he was buried in the church of St. Mary Redcliffe, Bristol. His portrait by Lely is in the Painted Hall at Greenwich. By his wife Margaret Jasper, he was the father of William Penn, the founder of Pennsylvania. Penn was one of the authors of the first code of tactics provided for the navy; it was the base of the "Duke of York's Sailing and Fighting Instructions," which continued for long to supply the orthodox tactical creed of the navy.

PENN, WILLIAM (1644–1718), English Quaker, advocate of religious toleration, and founder of Pennsylvania, was born at Tower Hill, London, on Oct. 14, 1644, the son of Admiral Sir William Penn. He acquired the foundations of a classical education at Chigwell school, where he came under Puritan influences, and went on in 1660 to Oxford, from which he was "sent down" at the beginning of his second year for nonconformity. (He was later to denounce the English universities as "Signal Places for Idleness, Looseness, Prophaneness, Prodigality, and gross Ignorance.") After a period of travel on the continent of Europe, during which he spent nearly two years at the Protestant university of Saumur, France, he returned to England to give himself briefly to the study of law at Lincoln's Inn. This was the extent of his formal education; but, such as it was, it was to stand him in good stead in his writings and his encounters with British justice.

In 1666 his father sent him to Ireland to manage the family estates. It was there that he decided to throw in his lot with the despised sect of Quakers *(see* FRIENDS, SOCIETY OF). The instrument of his "convincement" was Thomas Loe, an itinerant Quaker preacher of Oxford. For his presence at a Quaker meeting at Cork in 1667 Penn was thrown into prison — the common fate of the Quakers under the Clarendon code. He was quickly released, but not before he had expressed in a letter to the earl of Orrery, lord president of the province of Munster, Ireland, his commitment to the principle of religious freedom. His father, outraged by his devotion to his new found faith, threatened to disinherit him, but young Penn refused to be turned aside and soon emerged as an able and outspoken defender of the religion of the Inner Light.

Truth Exalted (1668), a pamphlet attacking in turn the doctrines of the Roman Catholics, the Anglicans and the dissenting bodies, marked his entry into the theological lists. Before his literary career was over, Penn was to publish more than 100 works, ranging in length from broadsheets to lengthy books. *Truth Exalted* was followed by *The Sandy Foundation Shaken* (1668), in which he questioned the doctrine of the Trinity as commonly received. Though later, in *Innocency With Her Open Face* (1669), he qualified his heterodoxy, he was committed to the Tower of London. In the tower he wrote his most famous book, *No Cross, No Crown* (1669), in which he expounded with learning, eloquence and occasionally humour, the Quaker-Puritan morality. Perhaps the book's most characteristic dictum is: "True Godliness don't (*sic*) turn Men out of the World, but enables them to live better in it, and excites their Endeavours to mend it" — a sentence which reflects both the Puritan conception of "intramundane asceticism" and the Quaker ideal of social reform. *No Cross, No Crown* stands alongside some of the letters of St. Paul, Boethius' *Consolations of Philosophy* and Bunyan's *Pilgrim's Progress* among the world's finest examples of prison literature.

Though many of Penn's doctrinal and devotional works have lasting value, it is as a protagonist by word and act of religious toleration that he earned his prominent place in English history. In 1670 he wrote *The Great Case of Liberty of Conscience,* the most systematic and thorough exposition of the theory of toleration produced in Restoration England. Though he founded his arguments on theological and Scriptural grounds, he did not overlook rational and pragmatic considerations: he pointed out, for instance, that the contemporary prosperity of Holland was based on "her Indulgence in matters of Faith and Worship."

In that same year he had an unsought opportunity to strike another blow for freedom of conscience and for the traditional rights of Englishmen. On Aug. 14, 1670, the Quaker meeting-house in Gracechurch street. London, having been padlocked by the authorities, he preached in the street to several hundred persons. After the meetings, he and William Mead were arrested and imprisoned for riot. A full account of their trial in the Old Bailey, a vivid courtroom drama. was soon published under the title *The People's Ancient and Just Liberties Asserted* (1670). With calm courage born of his Quaker faith and with skill in pleading derived from his legal training, Penn exposed the illegality of the proceedings; the jury, under the leadership of one Edward Bushell, manfully resisted the browbeating of the mayor and recorder. For their refusal to bring in a, verdict of "Guilty," as directed by the bench, the jurymen mere fined and imprisoned; but they were vindicated, when Sir John Vaughan, lord chief justice, enunciated the principle that a judge "may try to open the eyes of the jurors, but not to lead them by the nose." "Bushell's case" stands as a landmark in English jurisprudence, establishing beyond question the independence of the jury.

Sir William Penn died in 1670, having finally become reconciled to his son's Quakerism. Young Penn inherited his father's estates in England and Ireland, and became, like his father, a frequenter of the court, where he enjoyed the friendship of Charles II and his brother James, an unusual experience for a Quaker. In 1672 he married Gulielma Springett, daughter of Mary Penington by her first husband Sir William Springett, and stepdaughter of Isaac Penington, a Quaker, like Penn, of high birth and literary attainments. Of this marriage eight children mere born, four of whom died in infancy.

During the 1670s Penn was ceaselessly busy as a polemicist and minister, producing no less than 40 controversial tracts, in which he engaged theologians of various persuasions on matters of religious doctrine and practice. These productions are probably the least interesting of his writings to the modern reader, though they were of the utmost importance to the Society of Friends, still struggling to vindicate its place among Christian bodies and fortunate to have so able and fluent a defender. Penn also undertook two preaching missions to the continent. In 1671 he traveled through Holland and into northern Germany visiting small groups of Friends and religious seekers, including the followers of the mystic Jean de Labadie (who rebuffed him) and the princess palatine Elizabeth (who welcomed him gladly). Six years later, in company with George Fox, Robert Barclay and George Keith, three of the foremost Quakers of the time, he made another missionary journey through the same region. renewing his friendship with Princess Elizabeth and established contacts which would later help him in peopling Pennsylvania with emigrants from the Low Countries.

The latter years of the decade were occupied with political activities. In the midst of the excitement generated by the "popish plot," he twice supported the candidacy of the radical republican Whig Algernon Sidney for parliament. At Guildford and later at Bramber in 1679 he campaigned vigorously but unsuccessfully for his friend, drawing down upon himself the criticism of those Quakers who considered such activity unsuitable for one of their religious profession. During these years he also wrote a number of pamphlets on behalf of the radical Whigs. *England's Great Interest in the Choice of This New Parliament,* (1679) is especially noteworthy as one of the first clear statements of party doctrine

ever laid before the English electorate.

Even before this excursion into English politics, he had become involved in American colonization as a trustee for Edward Byllynge, one of the two Quaker proprietors of West New Jersey. Though recent scholarship tends to give Byllynge the major credit for writing the "Concessions and Agreements" of West New Jersey, there is no doubt that Penn had a hand in making it the remarkable democratic and libertarian document it is. In 1681 he and 11 other Quakers bought the proprietary rights to East New Jersey from the widow of Sir John Carteret. In the same year, discouraged by the untoward turn of political events in England, where Charles II was ruling without parliament and prospects for religious freedom seemed dark, he sought and received a vast province on the west bank of the Delaware river, which was named Pennsylvania for his father (to whom Charles II had owed a large debt cancelled by this grant). A few months later the duke of York granted him the three "lower counties" (later Delaware). In Pennsylvania Penn hoped to provide a refuge for Quakers and other persecuted people and to erect an ideal Christian commonwealth. "There may be room there, though not here," he wrote to a friend in America, "for such a holy experiment."

The fundamental law of this "holy experiment" was to be the Sermon on the Mount, whose principles the Quakers construed not as counsels of perfection but as practical guides to life. As proprietor, Penn was free to create a government which should embody his Quaker-Whig ideas. In drawing up the Frame of Government he intended, he said, to leave himself and his successors "no power of doing mischief, that the will of one man may not hinder the good of a whole country." Freedom of worship was, of course, to be absolute, and all the traditional rights of Englishmen were carefully safeguarded. The actual machinery of government outlined in the Frame proved in some respects clumsy and unworkable, but he wisely included an amending clause—the first in any written constitution—so that it could be altered as necessity required.

Penn himself sailed for his province late in 1682 in the "Welcome," leaving his family behind. He found his experiment well under way. The city of Philadelphia was already laid out as a "green country town" on a gridiron pattern according to his instructions and settlers were pouring in to take up the fertile lands lying around it. Presiding over the first assembly, he saw the government of the "lower counties" united with that of Pennsylvania and the laws "agreed upon in England" incorporated in the "Great Law" of the province. In a series of treaties based on mutual trust he established good relations with the Leni-Lenape Indians. (Benjamin West's famous painting of the "Great Treaty" at Shackamaxon, however, must be regarded as an exercise of the historical imagination.) He also held an unsuccessful conference with Lord Baltimore, proprietor of the neighboring province of Maryland, to negotiate a boundary line. This boundary was to remain a bone of contention for more than half a century; in 1684, after only two years in his colony, he was obliged to go back to England to defend his interests against Baltimore.

Before his return, he published *A Letter to the Free Society of Traders* (1683), containing his fullest description of Pennsylvania and including a valuable account of the Leni-Lenape, based on firsthand observation. With the accession of his friend the duke of York as King James II, he found himself in a position of great influence at court, whereby he was able to have hundreds of Quakers, as well as political prisoners such as John Locke, released from prison. When James issued his Declaration of Indulgence in 1687, Penn welcomed it, though this attitude laid him open to criticism, since the declaration provided only for the toleration of dissent at the royal pleasure, not as a matter of fundamental right. But the Act of Toleration (1689), passed after James's abdication, finally established the principle for which Penn had laboured so long and faithfully.

His close relations with James brought him under a cloud when William and Mary came to the throne. His colony was temporarily (1693–94) taken from him, and for a time he was forced to live virtually in hiding to avoid arrest. He used this period of enforced retirement to write some of his most charming and thoughtful books. Among other works he produced *An Essay Towards the Present and Future Peace of Europe* (1693), in which he proposed an international organization to prevent wars by arbitrating disputes; *Some Fruits of Solitude* (1693), a collection of religious and practical maxims which Robert Louis Stevenson was to praise, two centuries later, as a "sweet, dignified, and wholesome book"; and *The Rise and Progress of the People Called Quakers* (1694), the earliest effort to set down the history of the Quaker movement. He also drafted (1696) the first plan for a union of the American colonies.

In 1696, his first wife having died, he married Hannah Callowhill of Bristol, by whom he had seven children, five of whom lived to adulthood. Meanwhile, affairs had been going badly in Pennsylvania. The assembly quarreled constantly with the council and with Penn's deputy governors. The "lower counties" were unhappy at being unequally yoked with the larger province. Relations with the home government were strained by the Quakers' conscientious refusal to provide military defense. And the quitrents, by which the proprietor hoped to gain an income from his province, proved almost impossible to collect. In 1699 the proprietor with his wife returned to his province and took up residence at Pennsbury, his handsome country seat on the Delaware, north of Philadelphia (now reconstructed by the commonwealth of Pennsylvania). He contrived to settle many of the outstanding difficulties and in 1701 promulgated a revised constitution, known as the charter of privileges, under which legislative power was vested in a single-chamber assembly. This democratic instrument of government was to remain in force until 1776. After less than two years his affairs at home once more demanded his presence and he left the province, never to see it again. His Pennsylvania interests he left in the capable hands of his secretary, James Logan, who upheld them loyally for the next half century.

Penn's final years were unhappy. His eldest son, William Jr., turned out a scapegrace. His own poor judgment in choosing his subordinates (save for the faithful Logan) recoiled upon him: his deputy governors proved incompetent or untrustworthy, and his steward, Philip Ford, cheated him on such a staggering scale that he was forced to spend nine months in debtors' prison. In 1712, discouraged at the outcome of his "holy experiment," he commenced negotiations to surrender Pennsylvania to the crown, saving only the precious principle of religious freedom. A paralytic stroke, which seriously impaired his memory and dulled his once-keen intellect, prevented the consummation of these negotiations. He lingered on, virtually helpless, until 1718, his wife undertaking the management of his proprietary concerns. He died July 30, 1718, and was buried at Jordans in Buckinghamshire.

Penn's collected works were published in 1726 (reprinted 1771, 1782, 1825). *The Witness of William Penn,* edited by Frederick B. Tolles and E. Gordon Alderfer in 1957, is an anthology of his writings.

BIBLIOGRAPHY.—Samuel M. Janney's *Life of William Penn* (1850) is still valuable, especially for its many excerpts from Penn's letters. Three useful modern biographies are William I. Hull's *William Penn: a Topical Biography* (1937); William Wistar Comfort's *William Penn 1644–1718: a Tercentenary Estimate* (1944); and Catherine Owens Peare's narrative *William Penn* (1957). *(F. B. T.)*

PENNANT, THOMAS (1726–1798), Welsh naturalist and traveler whose *British Zoology* (1766 *et seq.)* gave a strong impetus to zoological and particularly ornithological work in Great Britain. He was born on June 14, 1726, at Downing, Flintshire. His *Synopsis of Quadrupeds* (1771) was later enlarged into a *History of Quadrupeds* (1781). The *Arctic Zoology* was published in 1784–87. His travel books, all containing valuable information on local customs, natural history and antiquities, include the *Tour in Scotland in 1769* (1771), followed by an account of another Scottish tour (1774); *A Tour in Wales* (1778), in the second edition of which (1784) was incorporated the *Journey to Snowdon;* and *The Journey From Chester to London* (1782). His *Tour on the Continent,* describing a journey in 1765 when he met various eminent naturalists, remained in manuscript until published by the Ray society in 1948. Other works include his popular *London* (1790) and *Outlines of the Globe* (unfinished).

Pennant took no degree while at Oxford; but academic honours conferred later included membership of the Royal Society of Uppsala (1757), fellowship of the Royal society (1767) and D.C.L. of Oxford (1771). Among his many correspondents in Great Britain and abroad was Gilbert White, whose *Natural History of Selborne* is largely in the form of letters to Pennant.

(C. MN.)

PENNELL, JOSEPH (1857–1926), U.S. etcher. lithographer and writer, was born in Philadelphia, Pa., on July 4, 1857, and first studied there and in Germantown. Like his compatriot and friend, J. M. Whistler, he afterward went to Europe and made his home in London. He produced numerous books (many of them in collaboration with his wife, Elizabeth Robins Pennell), but his chief distinction is as an original etcher and lithographer, and notably as an illustrator. He contributed! indeed, more than any other artist of his period to the art of illustration. During his lifetime Pennell produced more than 900 etchings and mezzotints and more than 600 lithographs, on subjects ranging from the Panama canal and Yosemite park to the factories of England and the temples of Greece. His publications include *Pen Drawing and Pen Draughtsmen* (1889), *Lithography and Lithographers* (1898), a biography of Whistler. with Mrs. Pennell (1908), *Etchers and Etching* (1919) and *The Adventures of an Illustrator* (1925). Pennell moved back to the United States during World War I and died in Brooklyn. N.Y., on April 23, 1926.

See E. R. Pennell, *Life and Letters* of *Joseph Pennell* (1929).

PENNEY, SIR WILLIAM GEORGE (1909–), English physicist, known for his work in the field of atomic weapons, was born on June 24, 1909, and educated in the technical school. Sheerness, and the Royal college of science, London university. After holding research fellowships and exhibitions at Wisconsin university (1931–33) and at Trinity and Pembroke colleges, Cambridge, he was assistant professor of mathematics at the Imperial college of science and technology, London university (1936–45). He was elected fellow of the Royal society in 1946. During World War II, he was engaged in scientific work for the ministry of home security and the admiralty; and in 1944–45, he was principal scientific officer of the department of scientific and industrial research at the Los Alamos laboratory, N.M. In 1946–52, he was chief superintendent of armament research, ministry of supply. He was created a knight of the British empire in 1952, and was made director of atomic weapons research and development at Aldermaston, Berkshire, in 1953. Sir William Penney has published many papers in scientific journals on the theory of molecular structure. (D. McK.)

PENNINES, an extensive system of hills in the north of England formed by an upfold of Carboniferous rocks running southward from the Scottish border into Derbyshire. The name is probably derived from the Celtic *pen,* high. On the north a well-marked depression. falling below 500 ft. in height. between the low-r valleys of the Irthing and the South Tyne, from which it is known as the Tyne gap, separates the Pennines from the Cheviots. On the northwest the Eden valley falls between the Pennines and the hills of the Lake district, and the division is continued by the upper valley of the Lune. For the rest the physical boundaries consist of extensive lowlands — on the east the vale of York, on the west the coastal belt of Lancashire and the plain of Cheshire and on the south and southeast the valley of the Trent river. The Pennines thus cover parts of Cumberland, Westmorland and Northumberland, Lancashire, Yorkshire and Durham, Cheshire and Derbyshire, while the southern foothills extend into Staffordshire and Nottinghamshire.

The Pennine system is often wrongly called a chain, but it is hardly even a range. The hills are broken up into numerous short ranges by valleys cut back into them in every direction, for the Pennines iorm a north and south watershed which determines the course of all the larger rivers in the north of England. They are divided into two sections by a gap formed by the Aire river flowing east and the Ribble flowing west. To the north of this gap rise the Craven uplands and to the west Bowland forest.

The northern section of the Pennine system is broader and generally higher than the southern. Its western slope is generally short and steep, the eastern long and gradual, this distinction applying to the system at large. In the northwest a sharp escarpment overlooking the Eden valley is known as the Cross Fell Edge irom its highest point, Cross Fell (2,930 it.), to the southeast of which a height of 2.780 ft. is reached in Milburn forest and of 2,591 ft. in Mickle Fell. This range is marked off eastward by the upper valleys of the South Tyne and the Tees. In the northern section the highest points are Cross Fell, Whernside (2,419 ft.), Ingleborough (2,373 ft.) and Pen-y-Ghent (2,273 ft.), and in the southern Kinder Scout (2,088 ft.) which includes the Peak. It is seen that the higher elevations, like the steeper slopes, lie toward the west. The hills between the Lune valley on the west and the headstream of the Eden and the Ribble on the east are broken into masses by the dales of tributaries to the first-named river. The Ribble and Eden valleys afford a route for the railway between Settle and Appleby. Well-marked eastward ranges occur there between Swaledale and the Ure river, which traverses Wensleydale, and between the Ure and Wharfe. In the first the highest points are High Seat (2,328 ft.) and Great Shunner Fell (2,340 ft.); and in the second Buckden Pike (2,302 ft.) and Great Whernside (2,310 ft.). There is then a general southerly slope to the Aire gap.

In the southern section heights above 2,000 ft. are rare; the centre of the section is the well-known Peak (*q.v.*) of Derbyshire. Throughout the system the structure is of Carboniferous limestone and millstone grit with some local shales between. The drier parts of the hills are covered with heather moor while the wet peaty areas are covered mostly with cotton grass. Where the limestone has been exposed, such as in the limestone pavement of Ingleborough, the surface is bare except in the fissures where there is a luxuriant vegetation. The summits of the hills are rounded or nearly flat so that the profile of the Pennines is not striking as a rule, but much fine scenery is found in the narrow dales throughout — Wensleydale, Wharfedale and other Yorkshire dales. The population in the uplands is scanty, though some sheep are kept. There are many farms in the fertile dales and valleys. In the parts about Settle below Ingleborough, in Derbyshire and elsewhere remarkable caverns and subterranean watercourses in the limestone have been explored to great depths. In Ingleborough itself are the Ingleborough cave, near Clapham; the chasm of Gaping Gill, more than 350 ft. deep; Helln or Hellan Pot, a vast swallow hole 359 it. deep, only exceeded by Rowten Pot (365 ft.) near Whernside; and many others. Malham tarn, near the head of the Aire, is drained by a stream which quickly disappears below ground, and the Aire itself is fed by a brook gushing forth in full stream at the foot of the cliffs of Malham cove. A notable example in Derbyshire is the disappearance of the Wye into Plunge hole, after which it traverses Poole's cave, close to Buxton. There may also be noted the remarkable series of caverns near Castleton. Lakes are few and small in the Pennines but there are reservoirs for the supply of the populous manufacturing districts of Lancashire and the West Riding of Yorkshire. The Pennines have long been playgrounds for people living on either side, a fact recognized by the establishment of the Pennine way — a 250 mi. footpath route along the hills from end to end.

Prehistoric remains are numerous, the great circle at Arbor Low being one of the best known. The Romans left many traces, chief among them being Hadrian's wall which was built across the northern Pennines from Carlisle to the mouth of the Tyne and part of which stands on the Whin sill. (*See* ENGLAND; CUMBERLAND; YORKSHIRE; etc.)

PENNS GROVE, a borough of New Jersey in Salem county on the Delaware river opposite Wilmington, Del. Originally a part of Upper Penns Neck township, the settlement developed around a river boat landing. By 1830 it consisted of eight dwellings, a tavern and a store and was a daily point of call for the Wilmington-Philadelphia steamboat. In 1876 the railroad entered the town from Woodbury, and in 1894 Penns Grove became a separate borough. Its subsequent growth was stimulated by the expansion of the Du Pont industries, whose gunpowder plant was started in 1891 immediately south of Penns Grove and whose dye works were established in 1917, the year a trolley line was built from Salem. Afterward, lead-ethyl plant expansion was a further source of employment. For comparative population figures *see* table in NEW JERSEY: *Population.* (H. F. WI.)

PENNSYLVANIA, popularly known as the "Keystone state" because of its central position among the 13 original states, is one of the four states of the U.S. which are officially styled commonwealths. It is bounded north by Lake Erie and New York; east by New York and New Jersey; south by Delaware, Maryland and West Virginia; and west by the Panhandle of West Virginia and by Ohio. Thirty-third among the 50 states in size, Pennsylvania has a total area of 45,333 sq.mi., of which 288 sq.mi. are water surface. The state capital is at Harrisburg (*q.v.*). Pennsylvania's state flower is the mountain laurel, the state tree is the hemlock and the state bird is the ruffed grouse. The name. meaning "Penn's woods," was given by Charles II of England in honour of Adm. William Penn, father of William Penn, the founder of the colony.

PHYSICAL GEOGRAPHY

Physical Features. — Pennsylvania is in the form of a rec-

tangle lying between latitude 39° 43' (the Mason and Dixon line) and 42° N. and longitude 74° 43' and 80° 31' W. of Greenwich, with three exceptions: a triangular projection to latitude 42° 16' N. gives it almost 40 mi. of Lake Erie shore line; t o large bends of the Delaware river cut deeply into New York and New Jersey; and an unusual semicircular boundary separates it from Delaware.

The state has five principal physiographic divisions: the coastal plain, the older Appalachians, the newer Appalachians, the Allegheny plateau and a small part of the Lake Erie plain. The Appalachian mountain system, which curves across the state from southwest to northeast, is the most prominent feature of its topography. The state varies in height from sea level on the Delaware river to 3,213 ft. (Mt. Davis) in Somerset county. At the extreme southeast the coastal plain touches Pennsylvania in a narrow belt along the Delaware near Philadelphia (*q.v.*).

The southeast province of the older Appalachians includes the piedmont with its limestone lowlands in Chester, Lancaster and York counties and Triassic lowlands extending from Bucks county to Adams county. The northern edge of this province is a discontinuous line of uplands and hills which rise to become South mountain a few miles west of the Susquehanna river, reach an elevation of 2,100 ft. at the Maryland border and continue southward as the Blue Ridge.

A region of ridges and valleys lying beyond South mountain and its related uplands, bordered on the northwest by the high eastern edge or front of the Allegheny plateau, is known as the newer Appalachians or the central province. This province has two main subdivisions. the Great valley and the ridge and valley section, separated by the long ridge of Kittatinny or Blue mountain. The Great valley, locally called the Lehigh. Lebanon or Cumberland valley. is 12 to 20 mi. wide and 150 mi. long. The ridge and valley section, which parallels it with a width of 45 to 70 mi., is notable for ridges of considerable length and uniformity of crest lines, broken only by an occasional V-shaped wind gap, a narrow water gap or a rounded knob, and for long parallel valleys usually only a few miles wide.

In the northeast the newer Appalachians meet the Pocono plateau, a part of the Allegheny plateau which continues on to form the Catskill plateau in New York. The Allegheny plateau extends from the Allegheny front to and beyond the south, west and north borders of the state, and includes the state's highest elevations.

Nearly all of the southeast and central provinces and the northeast portion of the Allegheny plateau are drained by the Susquehanna and Delaware river systems into Chesapeake and Delaware bays. The greater part of the Allegheny plateau is drained by the Allegheny and Monongahela rivers into the Ohio. Tributaries of the Potomac drain a small part of the southeast and central provinces; the Lake Erie plain is drained by short streams into the lake; and a small section of the Allegheny plateau in northern Potter county is drained by the Genesee river into Lake Ontario.

The Susquehanna, which drains almost half of the state, is a wide, shallow stream with numerous islands. At Northumberland it forks into two major tributaries, the North branch and the West branch. both with zigzag courses. The Susquehanna and the Delaware and their principal tributaries flow for the most part transverse to the geological structure. The gorges and water gaps through which they pass in the mountain region provide some of Pennsylvania's most picturesque scenery. The gorges are also of great economic importance as passages for railways and highways. As a result of the sinking of the coastal plain the sea has entered the lower portion of the Delaware river, making a tidal estuary at the head of which the port of Philadelphia developed.

The Allegheny and Monongahela, after following southwesterly and northwesterly courses, join to form the Ohio river at Pittsburgh (q *v.*). They are of economic importance for transportation in the western Pennsylvania industrial region, and the Ohio river makes Pittsburgh the state's second port.

Climate. — Since the prevailing winds are from the west. Pennsylvania has what is called a humid continental type of climate with extremely variable weather, but with rainfall usually adequate for most crops grown in its latitude. Climatically speaking, there are two regions: one with long summers and mild winters in the southeast and in the Ohio-Monongahela valley, and one with short summers and severe winters in the Allegheny plateau and the north. The mean annual temperature is about 52° F. in the southeast, 50° in the centre, 47° in the northwest and 49° on the shore of Lake Erie. Temperatures over 100° and below zero have been recorded in the long-summer region, while the short-summer region sometimes has daytime summer temperatures over 90°, although the nights are cool. The summer maxima on the mountains are usually 8° to 10° less than in the valleys directly below them. The average annual rainfall is 42 in.

Soil. — In keeping with its topography, Pennsylvania has many types of soil. The limestone soils of the Lancaster plain, the southeastern part of the Great valley and the valleys of the ridge and valley section are the best for agriculture, although there are some good limestone soils in the southwest. The alluvial soils along the river valleys are also good. In other parts of the state where sandstone and shale predominate the soils are less fertile, varying from good to poor.

Vegetation. — Originally Pennsylvania was covered with forests, but the settlers cleared their farms, the charcoal iron furnaces used vast quantities of timber and finally great lumbering operations in the latter part of the 19th century cut down virtually the last of the original stands. In 1897 the state began the purchase of forestry reserves, and from this grew the department of forests and waters with its scientific forest conservation program. Trees were planted, seedlings provided to private land owners and forest fires fought.

By the late 1950s the total forest area of Pennsylvania amounted to more than 15,000,000 ac. or over half the area of the state. More than 1,870,000 ac. were in state forest, 470.000 ac. in national forest, 900,000 ac. in state game land and about 11,000,000 ac. in privately owned woodland which included farm woodland. On the higher elevations the trees are mostly white pine, yellow pine and hemlock, but in the valleys oaks, hickories, maples, locusts and birches predominate. Beautiful smaller trees and shrubs include the dogwood and the mountain laurel. Among the wild flowers are hepatica, wild honeysuckle, trillium, dog's-tooth violet and anemone.

Animal Life. — The primeval forest of Pennsylvania was rich in animal and bird life. Elk, moose, deer, black bear, panthers, wildcats, wolves and passenger pigeons were abundant, but most of these subsequently became extinct. The protection and restoration of wildlife mas a part of the conservation movement in the state. The state game commission opened its first game refuge in 1905 and by the purchase of game lands, the licensing and regulation of hunting and the propagation of game birds and animals it has greatly increased the wildlife resources of the state. The black bear was saved from extinction and is now fairly common in mountain regions, the white-tailed deer was restocked and smaller animals such as raccoons, squirrels, rabbits, skunks and woodchucks are common. Wild ducks and geese, ruffed grouse. quail, pheasants and turkeys are among the game birds. The fish commission protects and propagates fish, stocking streams and regulating and licensing fishermen. Consequently, hunting and fishing have remained major sports in Pennsylvania.

State Parks and Recreation. — In keeping with the increased interest in outdoor recreation, the state has developed an elaborate system of parks and recreation areas. There are 53 parks, 52 forest picnic areas, 13 forest monuments and 12 historical parks. More than 3,000 mi. of roads and 4.000 mi. of marked trails have been constructed by the state in developing such sites as Hickory Run northeast of Hazleton, a 12,721-ac, forested tract, and Pymatuning north of Jamestomn where a 17,000-ac, lake originally designed to supply water to industry is open to boaters and fishermen. The historical parks include famous sites such as Valley Forge. where Washington's army spent the winter of 1777–78, and Bushy Run battlefield, scene of an Indian defeat during Pontiac's rising in 1763. In addition. the Pennsylvania historical and museum commission has restored and developed 21 historical properties. The Civil War battlefield at Gettysburg is a national monument.

HISTORY

The country along the lower Delaware river was disputed by the English. Dutch and Swedes in the early days of exploration, trade and settlement. Henry Hudson, an Englishman in the service of the Dutch, entered Delaware bay in 1609. Subsequently both the Dutch and the English traded along the river and established temporary posts in what is now Pennsylvania. but the Swedes were the first to make a permanent settlement, an expansion of settlements which they had begun in Delaware in 1638. In 1643 Johan Printz, a governor of New Sweden, built a fort on Tinicum Island (at Essington) which he called New Gothenborg. Another settlement was soon established at Upland (renamed Chester by William Penn), and other small farming settlements grew up along the river. Since Finland was then under the Swedish crown, Finns made up a large proportion of the settlers. The Dutch seized the Swedish colony in 1655, but were in turn dispossessed by the English who took over their colonies in 1664 as a grant to the duke of York. The Duke's Laws were put into operation along the Delaware and a court was established at Upland. The Swedish and Finnish settlers remained as a nucleus for Penn's colony.

The Quaker Colony.—William Penn (*q.v.*) and other Quakers early became interested in a colony in America for Quakers suffering persecution in England under the so-called Clarendon code. Despite his Quaker beliefs Penn was in good standing with Charles II and his brother the duke of York; later James II, because of the services of his father, Adm. William Penn (*q.v.*). Furthermore, the younger William had inherited a substantial claim against the crown. In 1680 he petitioned for a grant of land for a colony, the duke supported his petition and on March 4, 1681. Charles II granted the charter. Penn was made proprietary of the lands, but the laws of England were to be applicable in the colony until replaced by new laws adopted with the consent of the freemen and subject to review by the crown. Penn granted several successive "frames of government" or constitutions, gradually increasing the powers of the elected assembly until the Charter of Privileges in 1701 gave it more privileges and powers than any other legislative body in the English colonies. In keeping with the purpose of his colony. provisions guaranteeing religious freedom were embodied in its first law code, the Great Law, adopted Dec. 7, 1682. All Christians holding certain amounts of property were eligible as voters and officeholders.

Penn sent commissioners to lay out, in a regular pattern, a "great town" which he named Philadelphia ("city of brotherly love"). In an advantageous location between the Delaware and Schuylkill rivers, the city grew rapidly in population and prosperity. The first assembly mas held at Chester in 1682, soon after Penn's arrival in the colony, but Philadelphia was thereafter the seat of the government. Penn maintained a friendly and peaceful policy toward the Indians, taking care to purchase their claims before surveying and settling lands. Of the many treaties which he held with them the most famous was the "Great treaty" of Shackamaxon. according to Voltaire "the only treaty not sworn to and never broken." This policy of fair dealing preserved Pennsylvania from Indian hostilities during Penn's lifetime and indeed until 1755.

In 1692, following the fall of James II and the accession of William and Mary, Penn was removed from the governorship and the colony was placed under the rule of Gov. Benjamin Fletcher of New York. Penn was reinstated, however, in 1694. Except during his two visits, in 1682–84 and 1699–1701, he and his heirs governed through deputy or lieutenant governors bound by detailed instructions and advised by a provincial council. After Penn suffered a stroke in 1712 his wife Hannah acted as proprietary, first for him until his death in 1718 and then for their children. John, Thomas and Richard. until her own death in 1727. John, who had a half interest, died in 1746, and Thomas Penn then became the chief proprietary until his death in 1775. Thomas Penn was a shrewd and somewhat narrow man who lacked his father's idealism and took an interest in the colony chiefly for the financial return it brought him. Two sons of Richard Penn mere the last lieutenant governors of the colony, John Penn in 1763–71 and 1773–76 and Richard Penn in 1771–73. John Penn continued to live in Pennsylvania until his death in 1795.

Colonial Immigration. — The liberal and tolerant principles of Pennsylvania's government attracted a constantly increasing flow of immigrants, not only from the British Isles but also from the Rhine country of Germany. Some came for refuge from intolerance, oppression and war; others came to seek a better living in a new country, lured by the enthusiastic pamphlets which Penn had circulated widely. English Quakers were the dominant element to the time of the Revolution, but Welsh Quakers came in large numbers before 1700, a large colony settling in the "Welsh barony" in Montgomery and Delaware counties. The southeastern counties became predominantly English.

German immigration began with the Mennonite Francis Daniel Pastorius (*q.v.*), who came to Pennsylvania with some Dutch Quakers in 1683 and founded Germantown (*q.v.*), the pioneer German settlement. The earlier German settlers were for the most part members of the smaller sects who came and settled as groups; they included the Mennonites. Amish, Dunkers or German Baptists, Schwenkfelders and Moravians. After 1727 the volume of German immigration greatly increased but then it consisted mainly of "church people," members of the Lutheran and Reformed churches who were thus distinguished from the smaller "sects." The Pennsylvania Dutch, as they came to be called, predominated in Northampton. Berks and Lancaster counties and adjacent areas. Their farming skills made this region a rich agricultural area and helped to increase the prosperity of the colony. By the time of the Revolution they numbered about 100,000, more than a third of the population.

The third important element in the colony's population was the Scotch-Irish who began to immigrate in numbers about 1728. A hardy, restless, pioneering people, they naturally gravitated to the frontier. pushing forward the area of settlement into the Cumberland valley and southwestern Pennsylvania. Because they differed from the Quakers and the Germans in temperament and in the problems which they faced on the frontier, they formed an opposition to the ruling Quaker element throughout the 18th century. They numbered about 70,000 by the end of the colonial period.

There was also a considerable amount of remigration from other colonies, with Marylanders settling in York county, Virginians moving into southwestern Pennsylvania and Connecticut "Yankees" settling in the beautiful Wyoming and Muncy valleys on the North branch of the Susquehanna after 1770.

This remigration reflected to some extent the serious boundary disputes with Maryland, Virginia and Connecticut. After a long period of litigation, the boundary between Maryland and Pennsylvania was surveyed in 1763–67 by Charles Mason and Jeremiah Dixon, and this Mason and Dixon line (*q.v.*) later became significant as separating the free and the slave states. Farther west, Virginia laid claim to southwestern Pennsylvania and the two colonies established rival county governments in the area in the 1770s. In 1779 a joint commission was set up. and it was decided that the Mason and Dixon line should be extended to a point five degrees west from the Delaware river: with the western boundary extending thence due north to Lake Erie. Connecticut's claim to the northern third of Pennsylvania arose out of the vague language of its sea-to-sea charter, but it was promoted by a private association called the Susquehanna company, organized in 1753. Vigorous efforts to settle the Wyoming valley gave rise to the so-called Yankee-Pennamite wars of 1769–75. During the Revolution a special court of arbitration set up by the Continental Congress decided in favour of Pennsylvania's claim in the Trenton decree, 1782. The boundary with New York. surveyed in 1786–87. caused no serious dispute. In 1792 Pennsylvania bought the Erie triangle, the small triangular strip north of the 42nd parallel. from the federal government in order to have a port on Lake Erie.

Colonial Politics. — The natural conflict between the proprietary and popular elements of the colony's government led to sharp political controversy, in which Benjamin Franklin after 1740 became the leader of the Quaker or popular party. This party. which usually controlled the assembly, contended for the right to tax proprietary iands, to issue paper money and to control expenditures; and one after another the governors went down to defeat.

These party battles, which taught Pennsylvanians the art of politics, did not interfere with the colony's rapid economic and cultural growth, however.

Pennsylvania led the colonies in the production of cereals, hay and livestock, and had a surplus for export. The lumber, textile, shipbuilding and iron industries made early beginnings. Printing and publishing began in 1686, and the first paper mill was erected by William Rittenhouse before 1693. By 1775 the colony had nine newspapers Strategically located to draw upon the resources of Pennsylvania, western New Jersey and Delaware, the merchants of Philadelphia developed an extensive foreign trade, and the city rapidly became a commercial metropolis. The cultural and intellectual life of the colony kept pace with its material prosperity. Science and invention, medicine and the arts made notable progress. Architecture flowered in such public buildings as the statehouse (later called Independence hall) and in the fine colonial mansions of the Philadelphia area. The American Philosophical society, one of the aorld's oldest learned societies, was founded in Philadelphia in 1743. and the University of Pennsylvania dates back to the same period.

The French and Indian War.—The peaceful development of the colony was interrupted by the conflict between France and Great Britain for possession of the Ohio valley, where Pennsylvania and Virginia traders had begun to trade with the Indians as early as the 1720s. The French, who considered the Ohio river an essential link between their colonies of Canada and Louisiana, became alarmed by the British penetration and especially by the formation of the Ohio Company of Virginia to exploit the lands in southwestern Pennsylvania, then claimed by Virginia. As a result, the French in 1753 began building a line of forts to secure possession of the valley, of which the first were Ft. Presque Isle (at present Erie) and Ft. Le Boeuf (at Waterford, Erie county). After sending George Washington to Ft. Le Boeuf in Dec. 1753 to warn the French against encroaching on British territory, Virginia prepared to build a fort at the forks of the Ohio where the city of Pittsburgh now stands. In April 1754 a French expedition drove away the Virginia workmen and built Ft. Duquesne on the site. An expedition led by Washington defeated a French scouting party, but was later besieged by a stronger French force at the hastily erected Ft. Necessity and compelled to surrender. The British then sent an army under Gen. Edward Braddock against Ft. Duquesne. but on July 9, 1755, at the battle of the Monongahela, Braddock's army was cut to pieces by a smaller force of French and Indians. In the same year the French built Ft. Machault at Venango (present Franklin) to strengthen their communications.

Cut off from their usual trade with the British, impressed by French successes and perhaps recalling some old grievances about sales of land, the Indians took the French side and began raiding Pennsylvania's outlying settlements. To protect the settlers the Pennsylvania government built a line of forts, and even staged a successful raid against the Indian village of Kittanning on the Allegheny (1756). In 1758 an expedition under Gen. John Forbes was successful in taking Ft. Duquesne, and in 1759 the capture of Ft. Niagara by Sir William Johnson compelled the French to evacuate their other forts on Pennsylvania soil. When Forbes took possession of the ruins of Ft. Duquesne he named the place Pittsburgh in honour of the British prime minister, and a new fort was built there and called Ft. Pitt. (See also FRENCH AND INDIAN WAR)

In 1760 the forts in northwestern Pennsylvania were rebuilt, but they were taken and destroyed by the Indians in 1763 at the outbreak of Pontiac's War, and Ft. Pitt was besieged. Col Henry Bouquet defeated the Indians in a two-day battle at Bushy Run and relieved Ft. Pitt. The next pear he led a bloodless but impressive expedition into Ohio as far as the Muskingum river and compelled the Indians to sue for peace. As a result, southwestern Pennsylvania was opened to settlement. which proceeded rapidly and made the area the first important trans-Allegheny extension of the American colonies.

Pennsylvania and the Revolution.—Pennsylvania's opposition to the Stamp act and other tax measures by which Britain sought to raise revenue from the colonies was strong but quiet in its expression. Philadelphia merchants adopted nonimportation agreements, and John Dickinson (*q.v.*) wrote the famous Letters From a Farmer in *Pennsylvania* in defense of American rights. In 1770 Philadelphia citizens refused to permit a tea ship to unload its cargo, but there was no demonstration like the Boston "tea party" and the vessel returned to England. After the so-called Coercive acts were passed to punish Boston, protest meetings were held in Pennsylvania, and an extralegal government by committees of correspondence and committees of safety gradually took shape after 1774.

Pennsylvania's attitude in the dispute with the mother country was of great importance because of its resources and central location. The opposition of many Quakers, Dunkers and Mennonites to war and revolution, the loyalty of the Church of England minority to Britain and the disinterest of the German population made Pennsylvania's position doubtful. The Scotch-Irish on the frontiers strongly favoured independence, however, and the fact that the first and second Continental Congresses met in Philadelphia (1774 and 1775–83) also helped Pennsylvania's revolutionary leaders. After the adoption of the Declaration of Independence, which Pennsylvania's delegation supported by only a narrow majority, a provincial convention met in Philadelphia, took over the government and wrote a state constitution which went into effect in Sept. 1776 without being submitted to a vote of the people. This constitution provided for an assembly of one house and for a multiple executive, the supreme executive council, which consisted of 12 members, one elected from each county and one from the city of Philadelphia. By a joint vote the two bodies annually elected a president of the council, who was titular head of the government. Existing inequalities in representation were corrected in favour of the western counties, and the suffrage was extended to all freemen who paid taxes. The Revolution in Pennsylvania was more than a break with Britain; it marked the end of Quaker dominance in the government.

Under the leadership of Joseph Reed and George Bryan the new radical government ruled with a strong hand, disfranchising the opposition by a test act and even confiscating the estates of suspected loyalists. It contributed greatly to the success of the Revolutionary War by furnishing troops and supplies. By the divesting act of 1779 the Penn heirs were deprived of the proprietary lands, although they were allowed to keep the estates or manors which had been surveyed and were further compensated by a grant of £130.000. which was paid after the end of the war. The most lasting achievement of the radicals was the passage of the gradual emancipation act of March 1, 1780. which provided that no child born in Pennsylvania after that date should be a slave. Thus slavery was ended in a generation. While the radicals ruled the state, conservatives aided the Revolutionary cause in congress and the army. Robert Morris organized congressional finances, raising money when others failed. Dickinson wrote many important documents, among them the Articles of Confederation. Anthony Wayne was the most brilliant of the generals from Pennsylvania.

Some important campaigns of the war were fought on Pennsylvania soil (see AMERICAN REVOLUTION, THE). Toward the end of the Revolution, a political reaction began which eventually brought the conservatives to power, and they confirmed their gains by repealing the test act. In spite of strong radical opposition, they secured Pennsylvania's ratification of the federal constitution on Dec. 12, 1787, and went on in 1790 to draft a second state constitution. The supreme executive council was abolished, the office of governor was restored with extensive powers and a two-house legislature was established. From 1790 to 1800 Philadelphia, then the largest and wealthiest city in the United States, was the seat of the federal government.

Pennsylvania to the Civil War.—Under Gov. Thomas Mifflin (1790–99) Pennsylvania at first supported the Federalist party, and the state aided in suppressing the Whisky rebellion in western Pennsylvania (1794) and the "Hot Water War" in eastern Pennsylvania (1799), both directed against unpopular federal taxation. The rising opposition elected Thomas McKean governor in 1799, and from then until 1860 the Democrats were the majority party, even though intraparty quarrels sometimes gave victory to

their opponents. The westward movement of population and agrarian distrust of the metropolis moved the capital from Philadelphia to Lancaster in 1799, and from Lancaster to Harrisburg in 1812.

After the Revolution settlement increased beyond the mountains in western Pennsylvania. Purchases from the Indians at Ft. Stanwix (1784). Ft. McIntosh (1785) and Ft. Harmar 11789) opened northwestern Pennsylvania to settlers, a large part of these lands being granted to veterans. The upper Susquehanna valley also had many settlers in this period. In 1800 the state's population reached 602.000. The extension of settlement led to a demand for better communications, and there was a widespread campaign for internal improvements. Roads were extended to all parts of the state. and many bridges mere built. The first important turnpike in America was the Philadelphia-Lancaster turnpike, completed in 1794. and by 1832 about 3.000 mi. of road had been built by 220 turnpike companies. The building of canals began in 1797, but the first long canal was the Union canal, completed in 1827 between Middletown on the Susquehanna river and Reading on the Schuylkill. In 1826 the state undertook to build a line of "state works" from Philadelphia to Pittsburgh, with the Allegheny portage railroad and the Columbia and Philadelphia railroad serving as links in the canal system. This was opened for traffic in 1834. Numerous branch canals were also built. The canals greatly benefited the economic development of the state, but they were ruinously expensive and created such a burden of debt that they were sold between 1843 and 1858. and later abandoned when railroads took their place. The early railroads were mainly short lines to carry coal from the mines to canals or rivers, but they eventually developed into a great transportation network.

Throughout the period there was a trend toward more popular government. A new constitution in 1838 lessened the powers of the governor. increased the number of elective officers and shortened the tenure of office. In the political controversy which led up to the Civil War, Pennsylvania generally held to a moderate course, helping to elect James Buchanan of Pennsylvania to the presidency in 1856. However. the antislavery movement found much support from the Quakers and other humanitarian groups. This and the growth of the protectionist movement drew Pennsylvania toward the newly formed Republican party. In 1860 Pennsylvania elected the Republican Andrew G. Curtin as governor and gave Lincoln a majority for the presidency.

The Civil War.—As the crisis of Southern secession developed early in 1861. the state legislature pledged support to the Union, and Governor Curtin organized the state's resources in men and money. Pennsylvania supplied 323,629 soldiers to the army. as well as 14.307 sailors and marines. Industrial development was spurred by the need for munitions and supplies. During the war Pennsylvania suffered several Confederate invasions, and the turning point of the war came on Pennsylvania soil when Gen. Robert E. Lee's march into the Cumberland valley was halted at the battle of Gettysburg (July 1–3, 1863). Nearly one-third of the Union troops in that battle were Pennsylvanians. (See also AMERICAN CIVIL WAR.)

After the Civil War.—Politically the state was dominated after the Civil War by a remarkable dynasty of "bosses." founded by Simon Cameron and continued by his son James Donald Cameron and by Matthew Stanley Quay and Boies Penrose until the latter's death in 1921. Under their astute management the Republican party generally ruled Pennsylvania, although reform movements occasionally interrupted their control, as when the Democrat Robert E. Pattison was elected governor in 1882 and 1890. During and after the Civil War there mas tremendous expansion in the iron and steel industry, in coal mining and other industries, which transformed Pennsylvania from a predominantly agricultural state to an industrial giant. The demand for labour in the growing industrial economy brought a new wave of immigration from 1865 to 1914, and Poles, Italians: Czechs, Hungarians, Russians and others supplemented the earlier population groups. As the state grew industrially a labour movement developed and gave rise to the American Federation of Labor and the Congress of Industrial Organizations, both of which began in Pennsylvania.

Progress was made in extending the services of government. Insurance and banking departments were created in 1873 and 1891 as regulatory agencies. During the administration of Gov. Samuel W. Pennypacker (1903–07) a number of new departments were created, including forestry, health and highways, and a state police force was organized. In 1915 a department of labour and industry was established. Under Gov. William C. Sproul (1919–23) the public-school system was reorganized, an extensive program of highway building was undertaken and a department of welfare was created.

After the death of Penrose, the progressives in the Republican party gained more influence; Gifford Pinchot was elected governor in 1922 and 1930. During his first term (1923–27) the administrative code was enacted to consolidate departments and centralize control. thus increasing the governor's power. This was amended and made still more complete under the intervening conservative Gov. John S. Fisher (1927–31). The division in the Republican party and the coming of the New Deal brought victory to the Democrats in 1934 for the third time since the Civil War. and they elected George H. Earle as governor and one United States senator. The Republicans regained the governorship in 1938 by electing Arthur H. James, and then elected three governors in succession, Edward Martin. James H Duff and John S. Fine. The Democratic party, box-ever. did not revert to its former weak position; it elected George M. Leader governor in 1954 and David L. Lawrence in 1958

During the depression the state undertook a program of building construction at health, penal, military and educational institutions through the General State authority, approved in 1937. The first section of the Pennsylvania turnpike from Carlisle to Pittsburgh was begun in 1938. At the close of World War II the state also undertook extensive highways and public works construction. and notable progress was made in a conservation program which involved clearing rivers of silt and pollution, reforestation and soil conservation.

GOVERNMENT

Pennsylvania is governed under its fourth state constitution, adopted in 1873 and amended frequently after 1901. Amendments must be approved by a majority of each house in two successive legislatures and then ratified by a majority of a popular vote.

Executive.— The governor, lieutenant governor, auditor general and state treasurer are elected for four years and are ineligible for a second consecutive term. The secretary of internal affairs is also elected for four years but without any limitation on succession. The governor has extensive powers, appointing, subject to the advice and consent of two-thirds of the state senate. the heads of all departments except those who are elected, the members of all independent administrative boards and commissions and—with few exceptions—the members of all departmental boards and commissions. He fills vacancies in various offices which occur when the senate is not in session. His power of veto extends to items in appropriation bills: it may be overridden by a two-thirds vote in each house. His power of pardon is exercised only on the recommendation of three members of a board of pardons consisting of the lieutenant governor, secretary of the commonwealth, attorney general and secretary of internal affairs. In the event of the governor's death, resignation, conviction on impeachment or other disability, the lieutenant governor succeeds him.

A law known as the administrative code, adopted in 1923 and amended in 1927 and later. consolidated the administrative agencies of the state into 19 departments: state, justice, auditor general. treasury, public instruction, internal affairs, military affairs, agriculture, forests and waters. labour and industry, health. highnays, public welfare. banking, insurance, mines, property and supplies, revenue and commerce. Important independent administrative commissions include game, fish, public utility, milk control and historical and museum; and similar boards include liquor control, parole and tax equalization. The governor and six department heads whom he designates constitute the executive board which standardizes employment in the various departments and approves the establishment or discontinuance of bureaus or other

divisions in the departments. Through the budget bureau, authorized in 1929, and the office of administration, established in 1955, the governor exercises control of expenditures, personnel and policies in all but the three elective departments.

Legislative. — The legislative branch of the government is officially called the general assembly. It consists of a senate of 50 members elected for four years and a house of representatives with 210 members elected for two years. The lieutenant governor presides over the senate but has no vote on the final passage of legislation. The senate has the right of confirming or rejecting appointments made by the governor and sits as a court of impeachment. The house originates appropriation bills and impeachment proceedings. The general assembly may not pass any local or special bills on a wide range of subjects but especially with regard to the affairs of counties. cities, townships, boroughs and school districts. It meets annually on the first Tuesday of January, but the sessions in even-numbered years are limited to fiscal matters. The governor may call it into special session, in which case legislation is limited to the subjects specified in his proclamation.

Judicial. — The supreme court dates from 1705, with the number of justices varying from three to five until the constitution of 1873 fixed it at seven. They are elected for terms of 21 years by the voters of the state at large; minority representation is secured by the provision that each elector shall vote for one less than the number of justices to be chosen at each election. The work of the supreme court had increased to such an extent by 1895 that the general assembly passed an act creating the superior court, consisting of seven judges elected for ten years and eligible for re-election. The supreme court handles all appealed cases involving more than $2,500 or involving felonious homicide, and is the court of last resort. The superior court handles all other appealed cases. Below the appellate courts there are courts of common pleas. courts of quarter sessions and oyer and terminer and orphans' courts which function in 59 judicial districts. usually corresponding to counties. Philadelphia has a municipal court, and Allegheny county a county court. Justices of the peace, magistrates and aldermen, elected in townships, city wards and boroughs, have jurisdiction over lesser crimes and disputes.

Local Government. — Counties, townships, cities, boroughs and other civil subdivisions in Pennsylvania derive their powers of self-government from the state, and the general assembly has enacted codes for each type of subdivision. Counties have been divided into eight classes on the basis of population, and cities into four classes. Under a constitutional amendment of 1922, the general assembly has granted cities the right to frame and adopt their own charters, as was done by Philadelphia in 1951–52.

Pennsylvania has 67 counties including Philadelphia where the functions of county government are performed by the city. The constitution provides for the election of various county officers, including a board of three county commissioners which acts as the chief administrative agency. The 51 cities are each governed by a mayor and city council, but in the third-class cities the mayor is a member of council and he and the other members direct various departments. The 938 boroughs are governed by a burgess and borough council, and there is also one town, Bloomsburg, where the president of the council performs most of the functions of the burgess. Townships are divided into two classes. The 63 first-class townships are populous suburban areas and are governed by township commissioners. The second-class townships, mainly in rural areas, are governed by township supervisors whose authority is relatively limited.

Finance. — The chief sources of state revenue are a selective sales and use tax and taxes on motor vehicles, corporations, motor fuels, alcoholic beverages, tobacco and inheritance. In 1933 the state assumed control of the sale of alcoholic beverages, setting up a system of state stores for the sale of wine and liquor. From this source it derived an income of more than $80,000,000 annually in the early 1960s. More than half the state's income was spent on education and highways. The state net debt more than trebled during the post World War II period. It was greatly increased in 1949 and 1957 as the result of state-wide elections authorizing the payment of bonuses to veterans of World War II and the Korean conflict.

POPULATION

The population of Pennsylvania in 1790 was 434,373; in 1830 it was 1,348,233; in 1870, 3,521,951; in 1910, 7,665,111; in 1950, 10,498,012; and in 1960, 11,319,366. This last figure represented an increase of 17% over 1950. The population per square mile in 1960 was 249.7, as compared with 233.1 in 1950 and with 49.7 for the U.S. in 1960.

The urban area, defined as including all incorporated places of 2,500 or more, all townships having a total population of 10,000 and a density of 1,000 or more persons per square mile, the thickly settled suburban area or "urban fringe" adjacent to cities of 50.000 or more and unincorporated places of 2,500 or more outside this fringe, had a population in 1960 of 8,102,051 or 71.6% of the state total. In 1950 the comparable figures were 7,403,036 and 70.5%. The state has 11 standard metropolitan statistical areas. These areas had a total population of 8,382,326 or 74.1% of the total population of the state in 1960.

The number of occupied dwelling units in 1950 was 2,918,672. The average population per household was 3.5 in 1950.

The population of the state was distributed by colour and nativity in 1950 as follows: 86.5% native white; 7.4% foreign-born white; and 6.1% nonwhite, practically all Negro. Of the foreign-born white population in 1950. 21% were born in Italy, 11.3% in Poland and 7.7% in Germany. There were 97.0 males per 100 females in the 1950 population, as compared with 100.0 in 1940; 8.6% of the population was 65 years old or over; and 52.1% of the population 14 years old and over was in the labour force.

Of the total number of employed males, 5.4% were engaged in agriculture. 6.9% in mining, 7.4% in construction, 36.1% in manufacturing. 6% in transportation, 16% in wholesale and retail trade and 16% in service activities of all kinds.

In spite of the great volume of immigration from southern and eastern Europe which came mainly to the industrial centres in the latter part of the 19th century, the original population pattern of the state is still noticeable in customs, architecture and speech. This is especially true in Lancaster, Berks, Lebanon, Lehigh and neighbouring counties where the Pennsylvania Germans predominate. Of these the most distinctive are the "plain people," members of the Mennonite, Amish, Dunkard and other small sects, who make up less than 10% of the Pennsylvania Germans. The "plain people" tend to retain more of the old speech, customs and dress than the other Pennsylvania Germans. The industrious diligence of the Pennsylvania Germans has kept their region as a prosperous farming country for two centuries, and they are noted for their well-kept fields and large barns, often decorated with geometric designs called "hex" signs. Authorities differ on whether these are talismans for protective purposes or merely for decoration. The Pennsylvania German love of colour and decoration is expressed in their folk art.

EDUCATION

Public-School System. — Pennsylvania's system of free public education began with the Free Public School act of 1834 which created local school districts, permitted the levy of taxes for the support of free elementary schools and provided state aid to districts accepting the act. Earlier laws had provided schooling for children 5 to 12 years old whose parents were unable to pay for it, but these were called pauper education acts and parents were reluctant to educate their children on such terms. Despite some early opposition, the public-school system gradually expanded and the state constitution of 1873 definitely provided for the education of all children above the age of six years and for a state superintendent of public instruction. High schools were established in Philadelphia and Pittsburgh in 1836 and 1849 and were authorized in every district of the state in 1895.

In 1834 the minimum school term was three months; by 1899 it had been lengthened to seven months; and it was finally extended to a minimum of 180 days of school. In 1895 the first compulsory school attendance law required all children 8 to 13 years of age to attend school 16 weeks a year, with certain exemptions pro-

Note: Dash indicates place did not exist during reported census, or data not available.

vided by law. This was subsequently extended to make attendance compulsory for all children between the ages of 8 and 16 throughout the school year. About 1,750,000 children enrolled annually in the public schools and about 460,000 in private and parochial schools. Even in 1834 the state made substantial contributions to the support of the schools. In 1921 the state appropriations were made contingent on the maintenance of cerfain minimum standards as to courses and teachers' salaries and qualifications. By the second half of the 20th century the annual state appropriations amounted to almost $200,000,000.

Higher Education. — After 1854 the need for trained teachers led to the establishment of normal schools under private auspices. These schools received a gradually increasing amount of state aid, and in 1911 the state was authorized to purchase them. In'1926 they were re-organized as state teachers' colleges at Bloomsburg (originally founded in 1839), California (1852). Cheyney (1837), Clarion (1866), East Stroudsburg (1893), Edinboro (18573, Indiana (1871), Kutztown (1866), Lock Haven (1877), Mansfield (1858), Millersville (1854), Shippensburg (1871), Slippery Rock (1889). and West Chester (1869). They offer four-year courses leading to the degree of bachelor of science in education and became state colleges in 1959.

Pennsylvania State. — Pennsylvania State university at University Park, a land-grant institution. receives almost its entire financial support from public revenue. Originally chartered in 1855 as Farmers' High school, it first gave instruction on the college level in 1859. The name was changed to the Agricultural College of Pennsylvania in 1862, to Pennsylvania State college in 1874 and to Pennsylvania State university in 1953.

The university includes colleges of liberal arts, agriculture, business administration, chemistry and physics. education, engineering and architecture, home economics, physical education and athletics. and mineral industries and schools of journalism and forestry. Fourteen two-year branch campuses are located throughout the state. A department of nuclear engineering was set up in 1958. and-the Research Reactor building on the University Park campus contains an atomic reactor used in various research projects. Also in 1958 the Groth institute of crystallography and a centre for continuing liberal education were established. The university owns a student-operated FM station.

The University of Pennsylvania. — The University of Pennsylvania, Philadelphia, was founded in 1740 as a charity school. Largely through the efforts of Benjamin Franklin and other leading citizens of Philadelphia, it was transformed in 1753 into an academy, with Franklin as president of the first board of trustees. Two years later it was chartered as the College and Academy of Philadelphia. With the foundation in 1765 of the first medical school in North America the institution became in fact a university, but it was not so called until 1779 when it was, for a time. state supported. Following the passage of an act of the state legislature in 1791 it became a privately endowed and controlled institution. although it receives some state aid.

The divisions of the university include the colleges of arts and sciences! liberal arts for women and general studies. schools of education. engineering, law, dentistry, medicine, veterinary medicine. social work, allied medical professions. nursing and fine arts and the Wharton school of finance and commerce. The Wistar Institute of Anatomy, the first anatomical institute in America devoted entirely to research. was founded in 1892. Also part of the university are the Henry Phipps Institute for the Study, Treatment and Prevention of Tuberculosis, affiliated with the university in 1910; the William T. Carter foundation of Child Helping: the Institute of Local and State Government: the Albert M. Greenfield Center for Human Relations; and the Psychological Laboratory and Clinic. founded in 1887, the oldest such institution in the United States. Among its activities the university offers through the Institute for Humanistic Studies a special program for corporation executives. Teaching and research programs in radio, television and allied fields are given by the Annenberg school of communications. The university participates with Princeton in the operation of a high-energy nuclear research centre sponsored by the U.S. Atomic Energy commission.

Other Universities and Colleges. — Pennsylvania is especially rich in institutions of higher learning, many of them dating back to the 18th century. Dickinson college at Carlisle (Methodist) was founded in 1773: Franklin and Marshall college, Lancaster (United Church of Christ), the University of Pittsburgh (nonsectarian) and Washington and Jefferson college. Washington (nonsectarian), were all founded in 1787. Philadelphia. which first became a cultural centre in colonial times; is the seat of Temple university (1884; nonsectarian), Drexel Institute of Technology (1891; nonsectarian), LaSalle college (1863: Roman Catholic) and St. Joseph's college (1851; Roman Catholic). among others. Bryn Mawr college for women (1880; nonsectarian), Haverford college (1833; Society of Friends), Swarthmore college (1864; nonsectarian) and Villanova university (1842; Roman Catholic) are located nearby in municipalities of the same names. Other Pennsylvania universities' and colleges include Allegheny college, Meadville (1815; Methodist), Bucknell university, Lewisburg (1846; nonsectarian). Duquesne university (1881; Roman Catholic) and the Carnegie Institute of Technology (1900; nonsec-

tarian), both at Pittsburgh, College Misericordia, Dallas (1924; Roman Catholic), Gannon college, Erie (1944; Roman Catholic), Geneva college. Beaver Falls (1848; Reformed Presbyterian), Gettysburg college, Gettysburg (1832; Lutheran), Grove City college, Grove city (1876; Presbyterian). Lafayette college. Easton (1826; Presbyterian), Lehigh university, Bethlehem (1865; nonsectarian), the University of Scranton (1888; Roman Catholic) and Marywood college (1915; Roman Catholic). both at Scranton, Westminster college, New Wilminpton (1852; Presbyterian) and Wilkes college. Wilkes-Barre (1933; nonsectarian). (See also PHILADELPHIA.)

HEALTH AND WELFARE

Care of the needy was recognized as a public responsibility even under the duke of York and again in the Great Law of 1682. For a long period poor relief was administered by poor boards or overseers of the poor in a complex system which had no uniform pattern, and there were county homes or almshouses for institutional relief in most of the counties. In 1937 a uniform system was established. The county homes and similar institutions were placed under county institution districts and a state department of assistance was created to function through county boards of assistance in administering old-age assistance, general assistance to the unemployed, aid for dependent children and the disabled, blind pensions, unemployment counseling, school medical assistance, burial assistance and foster homes. In the late 1950s almost half the money expended for these programs came from the federal government. The department of assistance was merged with the department of welfare in 1958 to create the department of public welfare.

The department of welfare operated 18 hospitals for mental disorders, four schools for mental defectives and ten state-owned general hospitals. The management of penal and correctional institutions was transferred to the state justice department in 1953. They include four penitentiaries, an institution for defective delinquents, an industrial home for women, an industrial school and two diagnostic and classification centres. A board of parole was created in 1941 for the uniform administration of parole in the state.

THE ECONOMY

Agriculture. — Although Pennsylvania is an industrial rather than an agricultural state, it remains important for its farm production, ranking among the first 15 states in cash receipts from farm products in the second half of the 20th century. About 50% of its area was in farms and more than half of its farm acreage nas improved. The number of farms increased from 127,577 in 1850 to 224,248 in 1900 but gradually decreased thereafter as submarginal farms were abandoned and also as small farms were consolidated into larger farms. The value of all farm property in 1930 was $1,535,484,000. This decreased by about one-third during the depression and World War II years, but the earlier position had been substantially regained by the 1950s.

Farming in Pennsylvania began as general farming with emphasis on grain growing. About 1790 livestock farming began to assume greater importance. but there was also diversification into fruit growing and truck farming. About 1900 dairy farming to produce milk became the most important farm enterprise, and milk, dairy products, poultry, eggs and other livestock products came to far exceed all other agricultural products in value. Dairy farming predominates in the northern counties. where a shorter growing season favours pastures and the growing of hay, but the greatest number of cattle are in the south and west. More than 6,000,000,000 lb. of milk are produced annually. The number of sheep declined precipitously after 1900, but swine increased in both numbers and value. Chicken raising is an important source of farm income.

Usually all the rough and most of the concentrated food for stock is raised on the farms. Corn is the leading crop in value. Others include tame hay, wheat, oats, potatoes, barley, rye, buckwheat and commercial truck crops. Pennsylvania ranks high among the states in buckwheat production. Most of the buckwheat. barley and oats is grown in the northern and western counties. while corn, wheat and rye are raised more extensively in the northeast. Tobacco is raised chiefly in Lancaster county; Pennsylvania leaf is especially valued as a cigar filler and wrapper. Adams, Franklin and York counties in the south central part of the state and Erie county in the northwest are the principal fruit-growing sections. Adams county leads in the production of apples. Peaches are grown in most of the southern counties and grapes are raised mainly in the lakeshore section of Erie county.

Important farm groups have formed state associations for the study of improved methods and the advancement of their interests, beginning with the dairy farmers in 1874. A state board of agriculture was created in 1876 and this became a department in 1895. Agricultural education has been developed extensively in the schools, and the extension services of the college of agriculture of Pennsylvania State university have helped to introduce scientific methods. Soil conservation districts have been set up by many counties in co-operation with the state department of agriculture to control and prevent erosion and otherwise maintain soil resources.

Industry. — Pennsylvania consistently ranks second to New York in the value of its manufactures, which increased from about $2,800,000,000 in 1914 to more than $7,000,000,000 in 1923, declined to around $3,000,000,000 during the depression of the 1930s but rose to well over $25,000,000,000 by the'mid-1950s. During the same period and reflecting the same economic trends, the number of plants fell from around 27,500 in 1914 to about 12,000 in 1933 and then rose to more than 17.000 in the 1950s, when there were about a third more employees than in 1914. These figures reflect a trend toward larger plants.

The development of manufacturing resulted largely from abundance of fuel, the facilities for shipment through the port of Philadelphia, the availability of the ores of the Lake Superior region and the development of transportation, first by canal and later by railroad. By far the most important industry is the production of iron and steel, in which the state has always held the lead. The first ironworks in Pennsylvania was a bloomery forge, erected by Thomas Rutter in Berks county in 1716. Charcoal iron furnaces were numerous in eastern Pennsylvania after that time, and the industry continued to prosper and expand there when anthracite took the place of charcoal With the increase in the use of bituminous coal and of coke made from it, and with the development of the steel industry. western Pennsylvania became the iron and steel manufacturing centre and the Pittsburgh district in particular received a new impetus from the introduction of iron ore from the Lake Superior region. In the manufacture of pig iron Pennsylvania is easily first among the states.

Pennsylvania's industries are remarkable for their diversity and balance. Although metals are by far the most important, it is virtually impossible to mention a single manufactured product which is not made somewhere in the state. Such diversification has tended to diminish the effects of the decline in coal mining and similar but more temporary slumps in various industries. In the mid-1950s the leading manufactures were primary metal products, fabricated metal products, electrical and other machinery, petroleum and coal products, food and kindred products, textiles, apparel and related products, paper, pulp and products, printing and publishing, chemicals, stone, clay and glass products and transportation equipment.

Philadelphia is the great manufacturing centre of the state and one of the most important in the nation. It is surrounded by an area of highly diversified industry. In 1957, for example, there were within the city 4,411 factories which employed 299,552 persons and had a product valued at $5,527,693.100, or about one-quarter of the total produced in the state. Despite the development of steel mills in other parts of the state and nation, Pittsburgh remained the centre of the iron and steel industry. After Philadelphia and Pittsburgh, the more important manufacturing cities are Erie. Scranton. Reading. Allentown, Bethlehem, Chester. Wilkes-Barre, New Castle, Lancaster, Harrisburg, York, Altoona and M'illiamsport (*qq.v.*).

Mining. — Coal. — If petroleum and natural gas are included,

Pennsylvania stands second to Texas as a mineral-producing state. A large part of this output is represented by coal. With the exception of small areas in Colorado and New Mexico, Pennsylvania contains the only anthracite deposits in the United States. They are found within an area of less than 500 sq.mi. in the northeastern part of the state, chiefly in Lackawanna, Luzerne, Carbon, Schuylkill and Northumberland counties. In addition, Pennsylvania has extensive bituminous coal measures, and most of the coal obtained from these is of high quality. They form the northern extremity of the great Appalachian coal field and underlie an area of 15,000 sq.mi. or more in the west of the state. The Pittsburgh district, comprising the counties of Allegheny, Washington, Fayette and Westmoreland. is exceptionally productive. The coal in Allegheny and Washington counties is noted for its gas-producing qualities, while the famous Connellsville coking coal is obtained in Fayette and Westmoreland counties. The output of coal in Pennsylvania rose steadily from 1880, when 28,650,000 tons of anthracite and 18,425,000 tons of bituminous were mined, to World War I, when the peak figures were 99.612.000 tons of anthracite in 1917 and 178.551.000 tons of bituminous in 1918. Thirty years later, in 1948, the respective tonnages had fallen to 57,140.000 and 132,550,000, and the downward movement showed no signs of stopping. This decline reflected technological changes in industry and transportation and a shift from coal to natural gas and oil for home heating. It caused much unemployment in the coal regions, which have sought to develop new industries. The state makes loans to aid local authorities in attracting new plants to these depressed areas, and research to find new ways of utilizing coal is being conducted. Vast coal reserves remain underground. In the early 1960s it was estimated that about 13,000,000 tons of bituminous coal and 8,000.000 tons of anthracite were recoverable at the current price level and by current methods.

Petroleum.—Extending from the southwest corner of the state is the Pennsylvania section of the Appalachian oil field which, with a small section in New York, furnished nearly all of the country's supply of petroleum for several years after the discovery of its value for illuminating purposes. The first petroleum well was drilled by Edwin L. Drake near Titusville in 1859. and oil wells mere developed rapidly in the Oil creek valley and up the Allegheny river from Franklin to Tidioute. The state's output of petroleum reached its peak in 1891 with a production of 31,424,206 bbl. Thereafter the yield declined as the older wells were exhausted and few new wells were developed; in the late 1950s production was only about 6,000.000 to 8,000,000 bbl. a year. While the quantity produced has become relatively small, however, the physical and chemical characteristics of Pennsylvania oil give it special value as a base for lubricants.

Natural Gus.—Much natural gas was found and wasted in the early years of oil production. but later it was utilized as a fuel and an illuminant. The peak recorded natural gas production, 138.000.000.000 cu.ft., came in 1906 but it fell to 61,000,000,000 cu.ft. in 1932. This figure was subsequently raised by the discovery of the Leidy gas field in Clinton county.

Iron.— Deposits of various kinds of iron ore were found in the southeastern, eastern. central and some of the western counties, and from the middle of the 18th century until near the close of the 19th Pennsylvania ranked high among the states in production of iron ore. As late as 1880 it was first with 1,951,496 long tons. After the first successful experiments in making pig iron with bituminous coal, the state's iron foundries rapidly moved westward into the bituminous coal area and away from the early producing centres. The shipment of iron ore from the Lake Superior region, beginning about 1853, caused a further decline of iron mining within the state, since Lake Superior ore could be shipped to the Pittsburgh region at less cost than ore could be shipped from mines within the state. In 1932 the ore mined amounted to only 103,000 long tons, but it increased somewhat thereafter. Most of this ore comes from one mine, the famous Cornwall ore banks, worked continuously since 1740.

Miscellaneous Minerals.—Pennsylvania has extensive areas of limestone rock suitahle for making cement, and enormous quantities of it are used in this industry in Northampton and Lehigh counties. In Lehigh county the first successful portland cement plant in the United States was erected in 1870, and thereafter Pennsylvania continued to lead all states in annual cement output. Limestone and dolomites suitable for building purposes are obtained chiefly in Montgomery, Chester and Lancaster counties. Until increased facilities of transport brought more desirable stones into competition they were used extensively in Philadelphia. There are limestone quarries in nearly two-thirds of the counties and great quantities of this stone are used for flux in iron furnaces, for making quicklime, for railway ballast and in road building. Northampton, Lehigh and York counties contain the most productive slate quarries in the U.S. Northampton and Lehigh slate is the only kind in the United States used for school blackboards. There is an extensive area in the southeastern part of the state containing shale clay of a superior quality for making common brick. Kaolin abounds in Chester and Delaware counties, and fire clay in several of the western counties. The state leads all others in the value of its clay and clay products. Glass sand is abundant in both the eastern and western regions, and for many years Pennsylvania has ranked among the leading states in the manufacture of glass. In Chester county, also, is one of the most productive deposits of feldspar, second only to those of Maine.

Trade and Finance.—From colonial days when Philadelphia merchants developed a prosperous commerce with other colonies and with Europe. trade has been an important element in the state's economy. The internal improvements of the 19th century opened channels of trade with the west, and Pittsburgh grew to economic importance as the commercial gateway to the Ohio valley. In the late 1950s more than 17,000 carloads of commodities originated in the state, more than 13.000 terminated in it and more than 12,000 moved within it. There were more than 15,000 wholesale trade establishments and 120.000 retail establishments.

Pennsylvania has one port of entry on the Atlantic coast, one on the Ohio river and one on the Great Lakes. Philadelphia, the Atlantic port, exports chiefly coal, grain and flour and imports chiefly petroleum, iron ore, sugar, drugs and chemicals, manufactured iron, hemp, jute and flax. It has long ranked second among the ports of the United States in the tonnage of its foreign commerce, surpassed only by New York city. Pittsburgh has ranked high among U.S. interior ports. Erie has been an important port in the Great Lakes trade and received its first ocean-going vessel through the St. Lawrence seaway in May 1959.

The thriving commerce of colonial Philadelphia built up surplus wealth for investment and gave it an early lead as a financial centre. The first fire insurance company to be chartered in America was the Philadelphia Contributionship, founded in 1752, and the first life insurance company was formed in 1759. In 1780, 90 Philadelphians formed a bank to finance the Revolutionary army, and this bank was succeeded by the Bank of North America, chartered by congress in 1781 and by Pennsylvania in 1782, the first bank to be chartered in America. The first and second Banks of the United States were also located in Philadelphia, and many other banking institutions developed there and elsewhere in Pennsylvania. Although New York city became the leading financial centre after the Civil War, Pennsylvania remained important in this field with many insurance companies and with banks and savings and loan associations in all important centres of population. A decline in the number of banks reflected the growth of branch banking.

Transportation and Communication.— Transportation was an essential factor in Pennsylvania's development. Since the mountain ranges made east-west travel difficult, it was necessary to overcome these difficulties by roads, canals and railways. After the early roads, turnpikes and canals (see History, above), a network of railways began to develop between 1830 and 1860. The Philadelphia & Reading railway, begun in 1835, and the Lehigh Valley railroad, chartered in 1846, gradually extended' their lines to link the coal regions with New York state. The Pennsylvania railroad, chartered in 1846, opened its line from Harrisburg to Pittsburgh in 1852, using the tracks of the state's Allegheny portage railroad until its own mountain division was finished. Later, it purchased the main line of the state works and thus had a com-

plete rail line from Philadelphia to Pittsburgh, with the state's Columbia railroad. It then extended its lines rapidly to become one of the nation's most important railroads. With these and other railways the state had a virtually complete network of rail transportation by the time of the Civil War. Although some additions were made later, the basic pattern was already established. The railway mileage, *8.453* in *1890,* increased to *11,693* in *1915.* This had decreased somewhat by the early 1960s, but Pennsylvania still had the third longest track mileage in the United States.

In *1911* the state began an extensive program of highway construction which was accelerated by the introduction of the automobile. After *1918* funds were provided by bond issues) drivers' licence fees and a gasoline tax. By the late *1950s* the state highway system included more than *41.000* mi. of improved roads, while county, township. city, and borough highways totaled over *61.000* mi.. about *38,000* mi. of which were improved. In *1938* the Pennsylvania turnpike was begun as a toll road penetrating the Allegheny mountains through seven tunnels to connect eastern and western Pennsylvania. This four-lane limited-access highway was opened from Carlisle, near Harrisburg. to Pittsburgh in *1940,* and later extended from the Ohio border to the Delaware river, where it was connected with the New Jersey turnpike in *1956.* In *1957* a northeastern extension to Clark's Summit was completed, and the entire system totaled *470* mi.

The communication of ideas was also important to Pennsylvania's progress. The first newspaper was established in Philadelphia in *1719,* the fourth in the American colonies. By *1775, 9* newspapers were published in Pennsylvania and by *1810* there were *i3.* These grew to more than *400* with a total circulation of over 8,000,000. Other means of communication also developed early.

The first commercial telegraph line in the United States was opened from Philadelphia to Lancaster in *1846* and the telephone was introduced in the 1880s. The first commercial radio broadcasting station in the world was KDRA, Pittsburgh, which began a regular daily schedule on Nov. *2, 1920.* Pennsylvania has almost *100* telephone companies and more than 4,000,000 telephones are in use. There are more than *200* radio stations and more than *20* television stations.

PENNSYLVANIA, UNIVERSITY OF, a U.S. institution of higher learning, founded in 1740 at Philadelphia, Pa. *(see* PENNSYLVANIA: *Education).*

PENNY, a British coin (German *pfennig),* equal in value to one-twelfth of a shilling *(q.v.),* denoted after a numeral by *d.* (from Lat. *denarius).* The term is also used colloquially in the United States to denote a cent, the hundredth part of a dollar.

Whatever earlier currency the name and denomination may have had it was not until the reign of Offa *(757–796)* that English coinage was formally based on a silver penny showing the king's name on the obverse. Offa's penny weighed $22\frac{1}{2}$ gr. and *240* pennies weighed one Saxon pound (or Tower pound, as it was afterward called), hence the term pennyweight (dwt.). In *1257* Henry III struck experimentally a gold penny of the value of *20* silver pence. During the reign of his successor, Edward I, halfpence and farthings (four to a penny) became a regular part of the coinage, the penny having been cut for trade purposes into halves, quarters and perhaps even thirds. The silver penny remained the general coinage of England until the introduction of the gold florin by Edward III in *1344.* The weight and value of the silver penny declined from *1300* onward. Whereas in *1066* it weighed $22\frac{1}{2}$ gr., in *1300* it weighed *22* gr. and by *1601* it weighed only $7\frac{3}{4}$ gr.

Silver pence were struck for general circulation until the reign of George II; since then they have been coined only as part of the royal alms on Maundy Thursday. Copper halfpence were first issued by Charles II, but it was not until *1797* that copper pence were struck, weighing *1* oz. avoirdupois, together with copper twopences weighing *2* oz.: both series were found cumbersome and nere soon discontinued. In *1860* bronze was substituted for copper, the alloy containing *95* parts of copper, four of tin and one of zinc. The weight was also reduced, *1* lb. of bronze making *48* pennies, as against *24* of the earlier copper pennies. The figure of Britannia first appeared on the copper coins of Charles II.

See also NUMISMATICS: *British Coins.* (JO. M. L.)

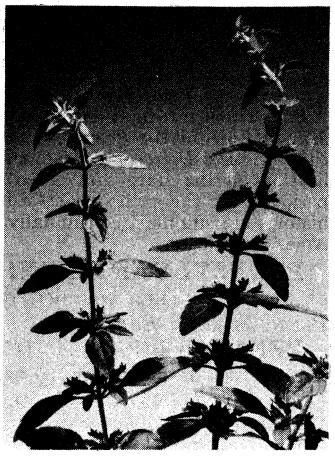
PENN YAN, a village of northwest central New York, U.S., located at the northern end of Lake Keuka. *50* mi. S.E. of Rochester; the seat of Yates county. Lake Keuka, shaped like a "Y," is one of the most beautiful of the "finger lakes" of central New York. The Keuka college for women (Baptist, founded *1892)* is at Keuka Park, *4* mi. S. of Penn Yan on the western shore of the lake. The region is a resort area but it is also known for its grapes, dairies, poultry, sheep and grain. Manufactures include buckwheat products. wines, vinegar, fruit baskets, flour, roofing paper base, baby baskets, boats, store fixtures, clothing, canned fruits, vegetables and chemical products.

The first settlers of Penn Yan were chiefly followers of Jemima Wilkinson (1753–1819), a religious enthusiast from Rhode Island, who in *1788* settled near Lake Seneca. Her followers began to desert her before *1800,* and gradually the community broke up. In 1799 the first dwelling was built on the site of Penn Yan, named as a compromise between the Pennsylvania and Yankee (New England) settlers.

It became the county seat when Yates county was created in *1823.* Penn Yan was incorporated in *1833.* For comparative population figures *see* table in NEW YORK: *Population.*

PENNYROYAL, an aromatic herb formerly much used in medicine, the name being a corruption of the old herbalist's name "Pulioll-royall," *Pulegium regium.* It is a member of the mint genus, and has been known to botanists since the time of Linnaeus as *Mentha pulegium.* It is a perennial herb with a slender branched stem. square in section, up to a foot in length and rooting at the lower nodes, small opposite stalked oval leaves about

half an inch long and dense clusters of small reddish-purple flowers in the leaf axils, forming almost globular whorls. It grows in damp gravelly places, especially near pools, on heaths and commons. It has a strong smell somewhat like that of spearmint, due to a volatile oil which is readily obtained by distillation with water, and is known in England as *Oleum pulegii.* The specific name recalls its supposed property of driving away fleas (*pulices*). Like the other mints it has carminative and stimulant properties.



ROCHE

AMERICAN PENNYROYAL (HEDEOMA PULEGIOIDES)

The similar American pennyroyal (Hedeoma *pulegioides*), also belonging to the mint family (Labiatae), occurs in dry fields from Cape Breton Island to Ontario and North Dakota, southward to Florida and Arkansas.

PENOLOGY, penal science, that part or division of criminology which concerns itself with the philosophy and practice of prison administration and the treatment of prisoners. See CRIME; CRIMINOLOGY; JUVENILE DELINQUENCY; PRISON.

PENRITH, a market town and urban district in the Penrith and the Border parliamentary division of Cumberland, Eng., 11 mi. S.S.E. of Carlisle by road. Pop. (1961) 10,931. Area 11.9 sq.mi. At Penrith are remains of a Roman military settlement known as Voreda. The parish church of St. Andrew is of Norman foundation with a 14th-century tower. and its list of vicars is complete from 1223. In the churchyard are the "Giant's grave" (ancient hogback stones and cross shafts) and the "Giant's thumb" (the remnant of a 10th-century rose cross). Fairs are held three times a year and there is a weekly market on Tuesday, all under a charter granted by Henry III in 1223.

In 1242 the manor of Penrith was handed over to Alexander II of Scotland, who held it until 1295, when Edward I seized it. In 1397 Richard II granted it to the 1st earl of Westmorland; it then passed to Warwick the Kingmaker and on his death to the crown. It later passed from the earl of Portland to the dukes of Devonshire. and the market rights were purchased by the urban council in 1878. A 14th-century grammar school was refounded by Elizabeth I in 1564, and there are two mansions dating from the same reign which have been converted into inns. The town suffered much from the incursions of the Scots, in defense against whom Ralph, earl of Westmorland, who died 1426, built Penrith castle. During the Civil War the castle was dismantled by royalist command, and the ruins are now preserved as an ancient monument. In 1597–98, 2,260 people perished by plague in the Penrith rural deanery. Hutton hall, near the parish church, was built about 1480 and incorporates an old peel tower. Though there are some small foundries. a brewery, motor repair works and sawmills, Penrith depends mainly on agriculture, particularly the breeding and sale of livestock. Small industries, such as checks, linen cloth and ginghams, and clock and watch making, carried on in houses in the 18th century, have disappeared.

Lake Ullswater is j mi. S.W. of Penrith. The village of Edenhall, east of the town, recalls the celebrated enameled goblet, known as the "Luck of Edenhall," which belonged to the Musgrave family and is now in the Bank of England. Penrith beacon (937 ft.) is a fine viewpoint for the Lake district mountains.

PENROSE, RICHARD ALEXANDER FULLERTON, JR. (1863–1931), U.S. geologist, who left a large fortune to scientific societies, was born in Philadelphia on Dec. 17, 1863. He mas graduated from Harvard university (A.B., 1884; Ph.D., 1886), where he acquired a broad view of science and a practical one of geology. After writing his thesis on phosphates, he managed mines for the Anglo-Canadian Phosphate company (1886–88) and later surveyed mineral deposits for the states of Texas (1888–89) and Arkansas (1889–92).

In 1892 he became professor of economic geography at The University of Chicago. and was full professor, 1895–1911. In 1895 Penrose was a founder of the Commonwealth Mining and Milling company at Pearce, Ariz., which produced gold; and in 1903 he founded, with his father and brother Spencer, the Utah Copper company at Bingham, Utah. The property proved to be in the largest deposit of porphyry copper in the world and became the largest single producing area in the United States.

A founder of the Society of Economic Geologists in 1920, he was its first president. He established the Penrose gold medal for economic geology and a similar medal for outstanding work in any aspect of geology, to be awarded by the Geological Society of America. He was president of that society in 1930–31 He never married and at his death on July 31. 1931, the bulk of his estate of about $10,000,000 was left to the Geological Society of America and the American Philosophical society.

PENRY, JOHN (1559–1593), Welsh Puritan, was born in Brecknockshire in 1559; tradition points to Cefn Brith, a farm near Llangammarch. as his birthplace. He was educated at Peterhouse, Cambridge, and St. Alban's hall. Oxford. He did not seek episcopal ordination, but was licensed as university preacher. The tradition of his preaching tours in Wales is slenderly supported; they could only have been made during a few months of 1586 or the autumn of 1587.

At this time ignorance and immorality abounded in Wales. In 1562 an act of parliament had made provision for translating the Bible into Welsh, and the New Testament was issued in 1567; but the number printed would barely supply a copy for each parish church. Indignant at this negligence! Penry published, early in 1587, *The Aequity of an Humble Supplication—in the behalf of the country of Wales, that some order nzay* be *taken for the preaching of tlze Gospel among those people.* Archbishop Whitgift thereupon caused him to be brought before the high commission and imprisoned for about a month.

On his release Penry married at Northampton, where he lived for several years, and set up a printing press. It was successively located at East Molesey (Surrey), Fawsley (Northampton), Coventry and other places in Warwickshire, and finally at Manchester, where it was seized in Aug. 1589. On it were printed Penry's *Exhortation to the governours and people of Wales,* and *View of . . . such publike wants and disorders us are in the service of God . . . in Wales;* as well as the celebrated *Martin Marprelate* tracts.

In Jan. 1590 his house at Northampton was searched and his papers seized, but he succeeded in escaping to Scotland. There he published several tracts, as well as a translation of a learned theological work known as *Theses Genevenses.* Returning to England in Sept. 1592, he joined the Separatist Church in London, in which he declined to take office, though after the arrest of the ministers, Francis Johnson and John Greenwood, he seems to have been the regular preacher. He was arrested in March 1593, and efforts were made to find some pretext for a capital charge. Failing this a charge of sedition was based on the rough draft of a petition to the queen that had been found among his private papers, the language of which was indeed harsh and offensive, but which had been neither presented nor published. He was convicted by the queen's bench on May 21, 1593, and hanged on the 29th.

See the ***Life,*** by John Waddington (1854).

PENRYN, a market town, port and municipal borough in the Falmouth and Camborne parliamentary division of Cornwall, Eng., 2 mi. N.W. of Falmouth and 34 mi. E.N.E. of Land's End by road. Pop. (1961) 4,448. Area 1.3 sq.mi. The town lies at the head of the estuary of the Penryn river, which opens on the west coast of Carrick Roads, into which flows the Fal. It owed its development to the bishops of Exeter, within whose demesne lands it stood. These lands appear in Domesday Book under the name of Trelivel. Glasney college was founded by Bishop Bronescombe in 1265 and became a considerable centre of learning, but appears to have been suppressed in 1547. Bishop Walter de Stapeldon secured a market on Thursdays. a fair at the feast of St. Thomas and, in 1311, a three days' fair at the feast of St. Vitalis. Mary I gave the parliamentary franchise to the burgesses in 1553. James I granted

and renewed the charter of incorporation, providing markets on Wednesdays and Saturdays and fairs on May 1. July 7 and Dec. 21. The charter having been surrendered, James II by a new charter among other things confined the parliamentary franchise to members of the corporation. This proviso. however. was soon disregarded, the franchise being freely exercised by all the inhabitants paying scot and lot. From 1553 to 1832 the borough returned two members to parliament. An attempt to deprive it of its members, because of corrupt practices?was defeated by the house of lords in 1827. The act of 1832 extended the franchise to Falmouth, in spite of the rivalry existing between the two boroughs. In 1885 the united borough was deprived of one of its members.

There is no parish church within the borough boundaries, but the church of St. Gluvias. to the north. fulfills this function. Although largely restored in 1883 it retains a 15th-century tower. Penryn's foreign trade, dating from the 14th century, is large. Granite, which is extensively quarried in the neighbourhood, is dressed and polished at Penryn, and there are also engineering works and boat repairing and lumberyards. The harbour dries at low tide, but at high tide has 13 ft. of water.

PENSACOLA, a city of Florida, U.S., located in the northwestern part of the state on the northern shore of Pensacola bay about 6 mi. (11 mi, by channel) N. of the Gulf of Mexico and 50 mi. S.E. of Mobile, Ala.; the seat of Escambia county. The city is separated from the Gulf of Mexico by Santa Rosa Island. At the western end of the island is Ft. Pickens and across the channel to the west is Ft. Barrancas. Pensacola retains much of the atmosphere of an old Spanish city, with its Plaza Ferdinand VII, Seville square. Spanish street names and religious festivals. From the ochre-yellow banks of the bay the city rises gently to heights commanding views of beautiful bayous and the Escambia river. which flows into the bay on the east. Public parks and beaches give pleasure to thousands. There are two public junior colleges: Pensacola, organized in 1948, and Washington, opened in 1949. The city has a council-manager form of government in effect since 1931.

The city's trade area includes parts of Alabama. Louisiana and Georgia. Nylon yarn, paper, wallboard. industrial chemicals, lumber, naval stores; tile, concrete, cottonseed oil and small boats predominate as manufactured products. The deep-water port of Pensacola suffers because of its proximity to Mobile.

Pensacola bay was discovered in 1516 by a ship's pilot, Diego Miruelo. In 1528 Pánfilo de Narváez with 242 followers made a water stop at Pensacola. In Jan. 1530 Diego Maldonado, commander of Hernando de Soto's fleet, entered the harbour and named it Puerto d'Achusi.

Tristán de Luna in 1559 colonized the bay, which he renamed Santa Maria de Gálvez, but the settlement was abandoned two years later.

An expedition under Juan Enriquez Barroto and Antonio Romero rediscovered Pensacola bay on Feb. 6, 1686, while searching for a colony planted by René Robert Cavelier, sieur de la Salle. Reports describing the friendly Panzacola Indians and the magnificent bay inspired an expedition, led by Adm. Andrés de Pez and Dr. Carlos de Sigiienza y Góngora, a noted Mexican mathematician, to explore Pensacola bay in 1693. It was, however, renewed French interest in the area which galvanized the Spanish into action. In 1698 expeditions under Andrés de Arriola and Capt. Juan Jordan de Reina established Ft. San Carlos at the entrance of the bay.

In the brief French-Spanish war of 1719–20 Pensacola mas seized by Jean Baptiste le Moyne, sieur de Bienville, almost immediately recaptured by Spain, seized again and burned by France and restored to Spain in the treaty of Feb. 17, 1720. A small, indolent garrison was maintained by Spain after 1720 and, except for a hurricane which destroyed the town in 1754, the post was undisturbed. At the end of the Seven Years' War the Floridas, including Pensacola, mere transferred to England. Although the Spanish inhabitants left for Mexico and Cuba, the British swiftly re-established the settlement and Pensacola was made the capital of West Florida.

During the American Revolution Pensacola was a haven for Tories. On May 9, 1781, it was captured by Bernardo de Gálvez, the Spanish governor at New Orleans. and Spanish possession was confirmed in the definitive treaty of peace of 1783.

During the War of 1812 the British made Pensacola a centre of operations despite Spanish protests, and in 1814 entered the harbour to take formal possession, but were repulsed by Gen. Andrew Jackson. In 1818 General Jackson captured the city from the Spanish, maintaining that they were encouraging the Seminole Indians in raids against the U.S., and in 1821 Florida as a whole was finally transferred to the U.S. In 1824 Pensacola was chartered as a city and mas selected as the site of a federal navy yard. During the American Civil War, on Jan. 12, 1861, the navy yard mas seized by the state qovernment but Ft. Pickens remained under federal control and on May 8, 1862, the Confederates evacuated the city.

Railroad development after the Civil War led to extensive lumbering, which in a few years devastated the pine forests of the area. In 1872 commercial shipments of fish began and by the 1880s Pensacola seafood, especially red snapper, was shipped to an ever-nidening market In 1913 the inactive navy yard was reopened as a naval air station and is now a large aviation training school.

Pop. (1960) 56,752; for comparative population figures see table in FLORIDA: *Population.* In that year, for the first time in a federal census, the population exceeded 50,000 and the Pensacola standard metropolitan statistical area (Escambia and Santa Rosa counties. pop. 203,376) was established by the census bureau.

(E. C. Jo.)

PENSHURST, a village in the Sevenoaks rural district of Kent, Eng.. at the confluence of the Eden and Medway, 5 mi. S.W. of Tonbridge. Pop. (1951) 1,554. The village has some old houses, including a timbered house of the 15th century.

Penshurst place is celebrated as the home of the Sidney family, and there Sir Philip Sidney was born in 1554. The mansion is quadrangular and has a court, chapel and hall (c. 1341) with open timber roof and a minstrels' gallery. The state rooms are open to the public during the spring and summer.

PENSIONARY, a name given to the leading functionary and legal adviser of the principal town corporations of the Netherlands, because they received a salary, or pension. At first this official was known by the name of "clerk" or "advocate." The office originated in Flanders. The earliest "pensionaries" in the Netherlands were those of Dort (1468) and of Haarlem (1478). The pensionary conducted the legal business of the town, and was the secretary of the town council and its representative and spokesman at the meetings of the provincial states. The post of pensionary was permanent and his influence was great.

In the states of the province of Holland the pensionary of the order of nobles (Ridderschap) was the foremost official of that assembly and he was named (until the death of Oldenbarneveldt in 1619) the land's advocate, or more shortly, the advocate. The importance of the advocate was much increased after the outbreak of the revolt in 1572. and still more so during the long period 1586–1619 when John van Oldenbarneveldt held the office. The advocate drew up and introduced all resolutions, concluded debates and counted the votes in the provincial assembly. When it was not in session he was a permanent member of the college of deputed councillors who carried on the administration. He was minister of justice and of finance. All correspondence passed through his hands, and he was the head and the spokesman of the deputation, who represented the province in the states-general. The conduct of foreign affairs in particular was entrusted almost entirely to him.

After the downfall of Oldenbarneveldt the office of advocate was abolished. and a new post, tenable for five years only, was erected in its place with the title of Raad-Pensionaris, or pensionary of the council, usually called by English writers grand pensionary. In the stadtholderless regime 1650–72 the grand pensionary became even more influential than Oldenbarneveldt himself, since there was no prince of Orange filling the offices of stadtholder, and of admiral and captain general of the union. From 1653 to 1672 John de Witt, re-elected twice. made the name of grand pensionary of Holland forever famous during the time of

the wars with England. The office was abolished after the conquest of Holland by the French in 1795. (G. E.)

PENSIONS. Pensions are periodic payments, usually for the natural life of a person who retires because of age or disability. Sometimes the term refers to periodic payments to wives, widows or children of a primary or deceased person or pensioner; occasionally, a pension will be conveyed solely as an honour for conspicuous service or valour. Pensions are provided by government in three guises: (1) as compensation or recompense to mar veterans and families for old age or for disability or death, usually from service causes; (2) as disability or old-age retirement benefits for civilian employees of government; (3) as social security payments for the aged, disabled or deceased citizenry based on past employment history or subject to current evidence of need. Pensions are also provided by many nongovernmental employers as a means of protecting workers retiring for age or disability and for relieving the payroll of superannuated personnel. They are sometimes provided by union-management welfare funds, associations or trusteeships. Only rarely do employees in groups, associations or unions undertake their own pension program without employer or governmental assistance.

Pensions are variously viewed in the concepts of charity, paternalism, deferred pay, depreciation or replacement charges, part of current payroll, honorarium for service rendered. the general welfare clause, aiding the velocity of money and others. Fundamental provisions of any pension plan include eligibility, conditions for the receipt of pension, pension benefit formula, death and withdrawal features, source of contributions, method of and medium for funding, equities if plan terminates (only in nongovernmental plans).

Costs are a principal concern in the pension field. This includes magnitude of costs, incidence thereof and proper accounting therefor; also the nature of the reserve—full actuarial, modified basis or pay-as-you-go (no reserve). True cost outlay can only be known in retrospect; it equals benefits paid plus expenses incurred minus interest earned on reserve funds.

UNITED STATES

U.S. pension plans for employees may be classified according to the characteristics of the employer. Examination may be made under the following headings: (1) industrial pensions; (2) public employee pensions; (3) teachers' pensions (other than [2]); (4) pensions for employees of religious bodies; and (j) pensions for other nonprofit employees. Other "pension" headings found below are (6) mothers' and widows' pensions; (7) state old-age and blind pensions; and (8) Townsend plan pensions. The main reference for (6) and (7) is under SOCIAL SECURITY. Also, military pensions are not treated below, the main reference for which is under WAR PENSIONS.

Industrial Pensions.—By the mid-1950s nearly 20,000 pension plans were in effect for about 14,000,000 employees of private industry in the United States. These were formal documental plans approved by the internal revenue service, thus clearing the employer's contributions as tax deductible and imposing no taxes on employees until distribution from the plan. In addition, many informal plans existed, either with no advance funding or with a fund represented on the books of the employer and not beyond his control..

The formally funded industrial plans had aggregate assets of the order of $21,000,000,000. They were mainly carried through either an insurance company medium or a segregated trust fund; assets were very roughly of equal magnitude for the two methods. Various insurance company contracts are used as the pension vehicle, comprising the group-annuity contract (the direct purchase of units of pension for each year of service as rendered), the deposit-administration contract (insurance company administers unallocated fund with direct purchase of individual annuities at retirement), the group-permanent contract (life insurance to retirement age with maturity then as pensions). and individual policies (various types maturing as pensions at retirement, with or without prior life insurance) held by a trustee. The trust-fund medium may be established with little or much administrative detail for the trustee (corporate or natural person or persons) and with all or none of the investment direction placed in the employer. There were various combinations of insured and trust-fund pension devices at mid-century.

Industrial plans on a formal basis were rare before the 20th century; the U.S. Steel corporation fund started in 1911, the American Telephone and Telegraph plan in 1913 (but no separate fund until 1927). Insurance companies first offered contract mediums for pensions in the early 1920s. Trust companies did not actively bid for the business until the early 1940s. The enactment of the Social Security act in 1935, instead of retarding the growth of industrial pension plans. acted as a stimulant for plans supplementing the act. The excess profits taxes of World War II and the wartime restrictions on wages and salaries also increased the incentives for the formulation of plans.

In the latter 1940s some union uelfare funds contained pension features, mainly supported by employers' contributions of so much per hour, of a set percentage of pay or of "x" cents per unit produced; e.g, per ton of coal In 1949 pensions mere ruled by the courts to be proper subjects for collective bargaining. The president's steel industry board's report and the steel union strikes of the fall of 1949 forced the implementation of the courts' dictum and pensions were won by many unions on a quasi-noncontributory basis.

Seldom is there one industrial pension plan identical to another in all respects; even in the 1949 attempts of the C.I.O. unions to set up uniform patterns in the steel and automotive industries, many variations developed in the settlements effected by collective bargaining.

By reason of union negotiations, the general desire for pension security and the incentive of tax deductions for employer contributions to pension plans, great activity in establishing these plans, or in adopting liberalizing amendments, was still under way in the 1950s. The wide coverage of these plans and the billions of dollars involved in the funds, spurred on by cases of fraud or irregularity discovered in a few union welfare plans, caused both the federal congress and the New York state legislature to commence an examination of benefit plans (including pensions) with a view to possible legislation for supervising these plans. A N.Y. state law for this purpose was passed in 1956.

Public Employee Pensions.—Under this heading fall not only employees of federal, state, county and municipal governments, and their subdivisions by department or occupational classification, but also those of certain quasi-governmental establishments, such as publicly owned corporations, municipal transit companies, the Tennessee Valley authority, the federal reserve system and others. Moreover, the employees of the international bodies such as the United Nations, the International Bank for Reconstruction and Development, the International Monetary fund, the International Labour office and others could reasonably be included as public employees for whom the U.S. furnished support, including pensions.

Public-employee plans in the United States were inaugurated before the beginning of the 20th century. The "retired-pay" measures of the armed services had already been in effect, but not as pension systems in the usual sense; they continued a certain proportion of pay, the recipients were subject to recall to duty and there was no advance funding or thought of employee contributions (see WAR PENSIONS). Agitation for a general plan for federal employees began around the turn of the century, but it was not until 1920 that enabling legislation finally brought their realization.

The federal Civil Service Retirement and Disability fund, established in 1920, as amended up to 1956, contained the following main provisions:

Voluntary retirement from age 62 to age 70 (mandatory) with 15 years of service. Certain earlier retirement privileges after 25 or 30 years of service. The pension based on length of service and on the employee's best five-year average annual salary; employee to receive 1½% of such annual salary for each year of service, or, if greater, 1% of such salary plus $2 j tor each year of service, maximum benefit 80% of such salary. Total disability pension after five years of service, determined by the better of the two formulas above. Employee to

contribute 6% of his salary and in case of death or termination of service prior to retirement, to receive a refund of his contributions with interest. If, however, at the death of an employee with five or more years of service, a qualified dependent survives (widow and/or child), one-half of the regular pension to be payable to the widow at age 50 or more, and if a child (under 18) is present, whether the mother is 50 or not, an additional one-fourth of the regular pension (with certain limits) to be payable to each child under 18; if the child alone survives, one-half pension payable. In case of termination after five years of service, employee might leave his refund and be credited with a vested deferred pension (age 62) computed on the better of the two formulas above, thus also getting credit for the government share of accrued liability; this method to be automatic if he leaves after 20 years' service. Various optional death benefit forms of pension available at retirement. Optional additional employee contributions might be made to augment the regular pension, but without direct additional government contributions. The government to meet the pensions and death benefits not provided by employee contributions from annual appropriations by congress.

Actuarial reports in the mid-1950s estimated the annual cost at about 15½% of covered payroll (including the 6% from employees) without including any amortization of "past service"; even so, it was higher than congress was appropriating. On June 30, 1955, the fund contained cash and government investments of about $6,200,000,000 which amounts to considerably less than the actuarial value of pensions already granted plus the amount of active employee contributions accumulated; hence no "employer reserve" for active employees existed in 1955.

Several special plans for certain other segments of federal employees were enacted after 1900, including one covering members of congress (retirement age, 62 or later). Aside from the civil service plan proper, and excluding military "retired-pay" systems, there were about 20 pension plans set up by, or under the aegis of, the federal government by the mid-1950s. These plans were found in the categories of District of Columbia teachers, policemen and firemen; the U.S. judiciary; certain commissioned services. such as the public health service; and quasi-federal organizations, such as the federal reserve system, permanent TVA employees and others.

The earliest state plans for public employees were those to care for superannuated teachers, starting in 1896 in New Jersey, when a noncontributory plan was adopted. The first contributory state teachers' retirement plan was provided for in 1913 in Massachusetts. (See also below, under Teachers' Pensions.) General state-employee plans began with that of Massachusetts in 1911; their growth was slow at first, then rapid; for example, there were 38 such plans in 1955 against 12 in 1940. There were at least ten plans for policemen and firemen by 1900, but plans established as large municipal-employee systems came later: in 1916 for Philadelphia, in 1920 for New York city and in 1922 for Chicago. Smaller cities followed but many of them and most towns, counties and other subdivisions among the approximately 37,000 political subdivisions of the country had no pension plans worthy of the name by 1955. (Counting all types and sizes of school districts, sanitary districts, etc.. there were perhaps 115,000 such subdivisions.) In several states progress was made on the problem by opening up the state-employee plan to participation by the local government unit and its employees. After 1950 state and local employees might elect as a group, or subgroup, to join the coverage of the federal Social Security act.

There was considerable variation in the specifications and administration of public-employee systems. While some were of the noncontributory type, most of them required employee contributions; joining the plan was mandatory in most cases; retirement age was usually quite flexible, optional, say, from age 60 to 65 and mandatory at 70; benefit formulas in relation to pay varied substantially; some vesting of benefits at termination of service was a common feature; widows' benefits existed in some plans but frequently were an elective retirement option, reducing the benefit while both husband and wife were alive; administration and funding varied, from the use of life-insurance policies to various kinds of funds, and from pay-as-you-go benefit payments to full actuarial funding. As to "international" plans, there were tendencies in the direction of larger contributions and higher degrees of vesting. The plan in effect for the old League of Nations employees probably set the pattern for the later retirement plans or "provident funds" of the International Labour office and the United Nations. Comprehensiveness and liberality of benefits and provisions were found, with costs possibly running over 20% of payroll.

Teachers' Pensions. — (See above for early state plans for public-school teachers' pensions.) Among nongovernmental educational institutions — universities, colleges and schools of various types — there were in the mid-1950s possibly 300,000 employees comprised of academic employees, nonacademic employees and employees of business enterprises owned or controlled by the institutions. Prior to 1950 these employees, except the last two, had been excluded from the Social Security act. In 1950 they became eligible to be included under the act on an elective basis by groups.

Educational groups have at their disposal all of the benefit devices and funding mediums available to industrial employers. Trust-fund plans, insured plans — individual policy, group annuity, group permanent-employer-reserve systems, and pay-as-you-go methods, formal or informal, were all possibilities for meeting the retirement problem. An additional facility established especially for this category (including many publicly administered or tax-supported educational institutions) has been freely utilized — the Teachers Insurance and Annuity Association of America (T.I.A.A.) which was incorporated in 1918 in New York state as a nonprofit legal-reserve life-insurance company. This company was founded to avoid perpetuating the adverse experience of the Carnegie Foundation for the Advancement of Teaching. To obtain a self-supporting actuarial basis, the foundation financed the formation of T.I.A.A. and met its expenses for many years. A further gift of more than $6,000,000 in 1938 permitted complete separability. A new feature was introduced by T.I.A.A. in 1952 by the formation of an affiliate, the College Retirement Equities fund (C.R.E.F.), to implement a new pension idea whereby the C.R.E.F. annuities would vary according to the variation in market value of its fund invested mainly in common stocks. Teachers could elect the respective portions of contributions going toward (1) the variable annuities of C.R.E.F. and (2) the fixed annuities of T.I.A.A., subject to at least 50% of such contributions going to the fixed annuity form. Since the establishment of C.R.E.F., the variable principle has been adopted by a few industrial pension plans and in the mid-1950s the insurance companies began looking into the principle as a possibility for issuing special annuity policies.

Pensions for Employees of Religious Bodies. — The care of their aged and disabled workers was early recognized as an obligation of the churches, even though provision for such care was not always on a satisfactory or adequate basis. The Roman Catholic Church takes care of the dependent years of its full hierarchy, which is implicit in the arrangements made and expected on all sides. The problem confronting the Protestant churches is a greater one because the wife in the rectory is so integral a part of the life and work of the pastor that widow and orphan pensions have been quite universally an important part of the ministerial pension programs of the Protestant churches. Naturally in the early days of the life of these churches in America these benefits took the form of relief grants payable on the basis of need.

The general assembly of the Presbyterian Church in the United States of America created a commission in 1904 to study the whole matter and report its findings and recommendations. As a result, a contributory annuity plan was started in 1907, partly funded on an actuarial basis and partly supported by current contributions from the churches. In the ensuing years similar plans were established in a number of the other denominational bodies.

For instance. in 1908 the Methodist Episcopal Church set up provisions for age and disability pensions for the superannuated members of the conference and also for widows' pensions and orphans' benefits. This plan was not at first set up as a contributory reserve plan, but later the Methodist Church adopted as its pension policy a church-wide contributory reserve pension plan.

In 1917 the Episcopal Church established provisions for ministerial pensions based upon service and salary. The pensions, due at retirement after 68 or prior disability, approximated half the

average salary of a minister after 40 years of membership; there was also provision for widows' pensions and orphans' allowances. The entire cost of the plan is paid for by the churches through required contributions expressed as percentages of the salaries paid to the covered members. Several other large denominations followed the lead of the Episcopal Church and set up pension programs established along similar lines but on a contributory basis.

As a result of the developments described above, the leading denominational bodies by the mid-1950s had in operation as protection to the ordained men and their families actuarial reserve systems, chiefly contributory, which in many cases were supplemented by relief grants where the regular pension or annuity payments were found inadequate. Some of these systems include widows' pensions or other death benefits. Furthermore, after the early 1950s ministers were eligible for voluntary participation in the federal Social Security coverage under the self-employment provisions thereof.

More than 20 of the leading Protestant denominations through their pension boards comprised the Church Pensions conference in the mid-1950s. Together, these denominations represented about 137,000 ministers and more than 35,000,000 church members. While in the early days all beneficiaries were relief beneficiaries, these numbered only about 5,800 while the pension beneficiaries numbered more than 38,000 (including widows and orphans). Yearly relief benefits amounted to approximately $2,000,000 whereas the pension benefits approximated $27,000,000. The reserve funds accumulated by these pension boards to meet future pension payments exceeded $345,000,000; there was also on hand more than $140,000,000 of endowment and other funds.

Denominations outside of this conference group no doubt had a smaller proportion of reserve plans and more of the relief type or none at all. Along with the development of the pension and annuity programs for the clergy, provision for the pensioning of the lay workers of the churches had also developed to a lesser extent.

Pensions for Other Nonprofit Employees.—Although many nonprofit organizations were not at the start subject to the Social Security act, many others were, and the line of demarcation was not distinct. Legislation in 1950 made it possible for all nonprofit groups to be covered by the act subject to election by the individual employer and by at least two-thirds of his employees at that time. Following this amendment to the act, a rather general election in favour of the coverage took place, with the result that by the mid-1950s most of the nonprofit employee categories were covered thereunder and had amended their own pension plans to co-ordinate with the basic federal benefit.

Many nonprofit groups adopted pension plans, often of long duration and tested provisions. In fact, this was one reason for early opposition to inclusion in the social security plan—that the latter would supersede the organization's own plan. Nonprofit groups, especially the religious, were also chary of inclusion under the Social Security act because it levied an excise tax on employers and it was feared that this would be the entering wedge for further taxation or regulation. Many of these fears were later abandoned, however, and the nonprofit group as a whole came to believe in basic advantages for their more than 1,000,000 employees (and, to a degree, for themselves as employers) of social-security inclusion.

A special nonprofit category was the charitable and welfare agencies. Large numbers of employees in federal, state and local government employ were engaged in what is rather vaguely designated as "social work." Whatever governmental employees this term might encompass, they were primarily classified as "public employees" (*see* above). But in addition to the governmental workers, there were numerous groups in this category of a nongovernmental nature, or of a quasi-governmental nature, and the pension problem had to be faced by them as it became more and more serious with the aging of their employees.

While rather homogeneous in the nature of their enterprises, these nonprofit, social-agency types of employers vary significantly in size, in geographical distribution, in the source of their funds, in their degree of likely permanence and in their employee composition by sex, age, length of service and salary levels. Taken together they comprise a relatively large group, having possibly more than 400,000 employees at mid-century. They include such organizations as hospitals, community chests, philanthropic funds and foundations, the multiplicity of charitable offices found in any city, Y.M.C.A.'s, home economics groups, local housing authorities (even though subsidized federally) and others too numerous and specialized to mention.

While many of the larger nonprofit employers had established their own plans, the smaller category continued to face difficulties. In order to make a start in solving this problem of the small nonprofit employer, the National Health and Welfare Retirement Association, Inc., acted as a vehicle for centralizing pension planning and funding. The association was formed in Jan. 1945 and incorporated under the insurance laws of New York state, with supervision of the plan by the superintendent of insurance. Benefit payments and guarantees were further protected through the association's having effected reinsurance in the form of a group-annuity contract with a well established group-writing life-insurance company.

Mothers' and Widows' Pensions.—Benefits for mothers, widows with children and elderly widows had frequently become adjuncts to U.S. employee pension plans. The former assistance which was granted needy cases under state statute later gave way to the Social Security act (*see* SOCIAL SECURITY) in which title I provided federal-state channels for assistance for needy cases in this category, and title II included benefits for widows and children of deceased covered employees as part of the old-age and survivors insurance system. While group life insurance had largely minimized the demand for widows' and orphans' benefits in industrial pension plans, and some plans with that feature had found it too costly to continue, certain labour-union demands of 1949–50 included a proposal for continuing to a dependent the pension of a deceased retired worker for a period, such as 18 months, following his death. Many pension plans had included a provision whereby an employee at or ahead of his retirement date might elect a smaller pension during his lifetime in order that it might be continued, in part at least, to a named dependent following his death. Since this option must usually be the actuarial equivalent of the full pension to the employee alone, no great or uncontemplated cost strain was imposed upon the system.

State Old-Age, Disability and Blind Pensions.—These types of assistance were mainly the problems of the individual states prior to 1935 when the Social Security act established federal-state channels for assistance to the needy aged and the blind. Later, the needy disabled were included. (*See* SOCIAL SECURITY.) The federal government also accorded special income-tax relief through added "exemptions" to the aged and the blind.

Townsend Plan Pensions and Others.—With the growth in the number and proportion of the aged in the U.S., and with the depression of the 1930s followed by the inflation of the war and postwar periods in the 1940s, a good milieu existed for the proponents of old-age benefit panaceas—greater distribution and "velocity" of money. While many proposals were forthcoming—such as "ham and eggs," "$30 every Thursday," general welfare payments, etc.—the best known was the Townsend plan, invented and nurtured with the help of many local "clubs" and emotional and political appeals, by Francis W. Townsend. This plan went through several modifications, but essentially the scheme was based on a "right" of every person over age 60 or 65 ("senior citizen") to receive a monthly income of $100 to $200, subject to the conditions that he retire and that this sum be spent by the recipient within a short time (*e.g.*, a month). The venture would be run by the federal government and the funds to pay benefits would be secured by imposing a federal "sales," "transactions" or "gross income" tax; hence, the velocity of turnover of money would in turn breed new taxes to in turn support the succeeding benefits.

GREAT BRITAIN

Civil Service Pensions. — The pension system for British civil servants is governed by the Superannuation acts, *1834* to 1957. It is noncontributory, except for pensions for widows and children and other dependents. Only established (*i.e.*, permanent) staff are pensionable. Pension is payable after not less than ten years' service at any time on retirement for ill-health, or on retirement after the minimum retiring age (normally 60). A civil servant may resign voluntarily after 50, when payment is deferred until the retiring age, unless immediate payment is allowed on compassionate grounds.

Pension is at the rate of one-eightieth of retiring salary for each year of reckonable service. A lump sum is also paid at the rate of three-eightieths of retiring salary for each year of service. Not more than 40 years' service up to age *60* may be reckoned, but those who continue to serve after that age may count further service subject to an overriding maximum of 45 years. Pension for ill-health retirement is calculated on the years of service, except that for those retiring with between 10 and *20* years' service it is based on 20 years, or on the service the officer would have completed had he served for five years after the retiring age, if that is less. Salary and pensionable emoluments are averaged over the last three years' service in all these calculations. Temporary service after age *18* preceding establishment counts as established service if rendered after July 1949; if rendered before that date it counts as one-half. Officers who serve overseas in unhealthful places receive additional pension rights. The system provides for transfers of staff between the civil service and many other forms of public employment.

Provision for *Widows*, Children, *etc.*—The pension for a widow is one-third of the civil servant's own pension, or, if he dies while still serving, of the pension which he would have been paid if he had retired because of ill-health on the date of his death. The widow may also be paid a children's pension varying according to the number of children from one-twelfth (for one child) to one-third (for four or more children) of the officer's pension. If there are children but no widow, the children's pension is at a higher rate, varying from one-sixth to one-third of the officer's pension. About half the estimated cost of these benefits is paid by the contributions of civil servants, made either by periodical deductions of one-eightieth of salary during service, or by a deduction from the lump sum or death gratuity payable at the end of service. All married men must participate in this plan. A retiring civil servant may also, subject to his passing a medical test, surrender up to one-third of his pension to provide an actuarially equivalent pension for his wife or some other dependent. There is also a voluntary contributory plan for pensions to dependents other than widows and children.

Other Provisions. — A civil servant who is retired because of the abolition of his post, or in the interests of efficiency, may be granted immediately the pension and lump sum for which his service qualifies him. On the death of a civil servant who has served for not less than five years, a gratuity of a year's pay or the lump sum he would have received had he retired on the day he died, whichever is more, is paid to his legal personal representatives. Civil servants with less than ten years' service who retire on account of age, ill-health or abolition of post are paid a gratuity calculated on their reckonable service. A gratuity is also paid to women civil servants with not less than six years' service who resign on marriage.

Armed Forces Pensions. — Retired pay and pensions for officers and men in the navy, army and air force are governed by royal warrant or other appropriate prerogative instrument. There are difierent systems for officers and other ranks.

The basis of the officers' plan is a series of standard rates of pay related to rank; these rates are payable to officers who are retired compulsorily, either on reaching the compulsory retiring age for the rank or earlier because they have not been promoted or because no further employment is available for them. Normally, *20* years' service is necessary to qualify for retired pay; the service needed to qualify for the full standard rate ranges from *20* years in the lowest rank to *30* years in the highest. The rates take account of the relatively early retirement of many officers and are designed to provide some compensation for shortness of career. Officers permitted to retire at their own request receive reduced rates of retired pay. After 1950 officers also became eligible on retirement for a lump sum terminal grant in addition to retired pay or pension, at the rate of three times the retired pay. The rates of retired pay, pension and terminal grant are given in the command paper on Services Pay and *Pensions* (H.M.S.O., London, 1956). A major receives £625 retired pay and terminal grant of £*1,875*, a brigadier £1,150 and £4,350; and there are higher rates for senior officers. For other ranks there is a basic scale of pension for men completing *22* years' service, with additions for longer periods of service. The scale is based partly on length of service and partly on rank. The service element in pensions after Feb. 1956 was 1*s*. 6*d*. a week for each year up to 22 years with higher rates for service beyond *22* years; the rank element ranged from 8*d*. a week for each year of service as a corporal to 2*s*. 5d. for each year as a warrant officer class I; basic rates of terminal grant range from £*125* to £*330* according to the length of service. Retired pay and pensions for members of the women's services are related broadly, in the proportion of two-thirds, to those for men.

Provision is also made for pensions for widows of regular members of the forces. The plan in force in the mid-1950s dated from Dec. 1952 and was noncontributory. It covers widows of officers and other senior ranking men who had completed enough service at the time of death to qualify for service pension; also other ranks below staff sergeant, for whom there is a longer qualifying period. The rates vary with the husband's rank; a major's widow receives £140, and the rates for other ranks range from 10*s*. a week (for the corporal or private with long service) to £60 a year.

Judicial Pensions. — The lord chancellor of Great Britain receives a pension of £3,750, for which there is no qualifying period; he usually continues to sit judicially in the house of lords without salary. Judges receive pensions — in England, ranging from £2,625 to £3,000, and in Scotland, nine-sixteenths of salary — after 15 years' service or on retirement through permanent ill-health. County court judges, stipendiary magistrates and the two full-time sheriffs and the sheriffs substitute in Scotland receive pensions based on their salaries and length of service. A lump sum is also payable to all judicial pensioners on retirement or death and from it is deducted a contribution to the widows' and children's pension plan.

Local Government Pensions. — The Local Government Superannuation acts, 1937–53, provide for the superannuation of local government employees in England and Wales; the London County council, City of London, Manchester and some metropolitan boroughs operate their own programs There are about 480 local government superannuation funds, including joint funds run by local authorities in combination with one another. Bodies closely connected with local government may be admitted to local authority funds.

All full-time officers are compulsorily superannuable. Authorities may make manual workers and part-time officerssuperannuable. Benefits consist of pensions based on one-eightieth of average salary over the last three years of service for each year of contributing service (noncontributing service reckoning at half-rate), and a retirement grant of three-eightieths for each year of service. The widow's benefit is one-third of the officer's pension and is financed by a reduction in the retirement grant to one-eightieth for each year of service. There are also arrangements for death grants, injury allowance and short service grant. (These benefits are laid down under the 1953 act. People employed before they came into force on Oct. 1, 1954, could elect to retain their rights under the 1937 act; *i.e.*, an annual pension based on sixtieths without any retirement grant or widow's pension.) Pension is payable at 65 or on earlier retirement due to permanent ill-health after not less than ten years' local authority service; or at 60 after 40 years' service. Extra pension can be earned up to 70 subject to a maximum of 45 years' reckonable service. Officers contribute 6% of salary and manual workers 5%. The employing authority pays an

equivalent contribution and makes good any deficiency disclosed at each quinquennial valuation of the fund. Contributions are funded.

On termination oi employment before becoming eligible for pension the employee's contributions are returnable—in some cases with, and in others w-ithout, interest. Arrangements exist for the preservation of superannuation rights on transfer to the civil service, teaching, the national health service, public boards, colonial and commonwealth services and certain other public services. Similar provisions apply in Scotland.

National Health Service Pensions.— The ministry of health administers a program for employees of the regional hospital boards and other bodies set up under the National Health Service act, 1946, and for medical and dental practitioners giving general medical and dental services under the act. The principal benefits, pension and lump sum, are normally calculated on eightieths of the last three years' average remuneration, multiplied by the years of reckonable service, but there are exceptions where these are calculated on a percentage of total superannuable remuneration. A widow's pension is provided, the retiring lump sum benefit payable to married employees being reduced on that account. The rates of contribution are 6% for the employee and 8% ior the employer (5% and 6% for manual workers). The program is not funded. Special provisions allowed officers transferred into the new service when it began on July 5, 1948, to retain rights corresponding to those previously enjoyed. Provision was made for interchange with other superannuation plans and those leaving the national health service for other similar employment may stay in the plan in approved cases. A similar program is operated in Scotland.

`Teachers' Pensions.— England and Wales.—The teachers' superannuation plan was established in 1918 and amplified in 1925 and 1956. It applies mainly to teachers in schools aided by state grants. The main benefits are pensions and lump sums, payable at 60, or on retirement if later, based on length of service and on average salary for the last three years' service. The plan also provides for breakdown allowances (after ten years' service) and for gratuities payable on death (after five years' service). A pensioned teacher under 70 reemployed for periods totaling at least 12 months may be awarded additional benefits. Teachers contribute 6% of salary toward the cost of benefits. Employers pay equivalent contributions and are liable for payments to meet deficiencies. The program is not funded: benefits are paid from, and contributions into, the exchequer.

Scotland.— The same system applies in Scotland, but contributions are paid to, and benefits paid from, the Education (Scotland) fund, to which the exchequer contributes eleven-eightieths of net expenditure (benefits paid less contributions received) on teachers' superannuation in England and Wales.

Police and Firemen's Pensions.— Pensions for the members of all police forces in Great Britain and for their dependents are provided under the Police Pensions act, 1948. Pensions are normally calculated on average pay during the three years preceding retirement, and an ordinary service pension rises from one-half of average pay after 25 years' service to a' maximum of two-thirds of average pay after 30 years' service. A pension proportionate to length of service is awarded where a policeman retires on grounds of health after ten or more years' service. If an officer cannot continue serving as a result of injuries received on duty, an ill-health pension is payable even if he has less than ten years service; this may be supplemented if his earning capacity is affected. A widow's pension is normally payable on the death of serving policemen or police pensioners either on a scale related to the husband's average pay at the time of his death or retirement, or as a flat rate award varying according to the husband's rank; children's allowances are payable with the flat rate award. Policemen pay contributions not exceeding 6¼% of their pay toward the cost of pensions and the balance is borne in equal shares by the exchequer and the local rate funds.

Broadly similar provisions are applied to full-time operational members of local fire brigades under the Fire Services act, 1947. One-quarter of the balance of the cost of these pension benefits, not met by the men's contributions of 5% of their pay, is borne by the exchequer. If death is the result of injury on duty, the widow's pension and children's allowances are increased.

Civil List Pensions.— These are pensions granted by the sovereign upon the recommendation of the first lord of the treasury and paid (since 1837) from the Consolidated fund. By 1 and 2 Vict.C.2 they are to be granted to "such persons only as have just claims on the Royal beneficence, or who by their personal service to the Crown, by the performance of duties to the public, or by their useful discoveries in science and attainments in literature and the arts have merited the gracious consideration of their Sovereign and the gratitude of their country." A sum of £1,200 a year was allotted up to 1937, when it was increased to £2,500. In 1952 the annual allotment was increased to £5,000, in addition to the pensions already in force. A list of the pensions granted each year is presented to parliament.

Perpetual or Hereditary Pensions.— Perpetual or hereditary pensions in Great Britain were freely granted either to court favourites or as a reward for political services in the late 17th and 18th centuries. Victorious commanders such as the duke of Marlborough (£4,000), Lord Rodney (£2,000) and Lord Nelson (£5,000) were similarly rewarded. In 1887, iollowing protests by the radical politician Charles Bradlaugh, a select committee of the house inquired into the subject. As a result oi the committee's recommendations, the majority of such pensions were gradually extinguished by commutation. The Marlborough pension, for example, was redeemed in 1884 for £107,000; under the Traialgar Estates act, 1947, the Nelson pension ceased in 1951 on the death of the earl at that time. No further perpetual pensions were granted but capital sums were voted to Lord Kitchener in 1902 and to Lord Haig and other distinguished commanders after World War I. After World War II, however, neither capital sums nor perpetual pensions were granted.

Political Pensions.— The only political pensions payable are made under the Ministers of the Crown act, 1937, as amended by the Ministerial Salaries acts, 1946 and 1957. These acts entitle former prime ministers to a pension of £2,000 a year provided they are not receiving a salary of more than £750 as members of parliament, or a salary as leader of the opposition, or any other salary drawn from public funds. The House of Commons Members Fund acts, 1939, 1948 and 1957, enable periodic payments, not strictly pensions, to be paid to former members of the house of commons of at least ten years' standing or to their widows, widowers or orphans, if they are in reduced circumstances. The payments are made from funds provided solely by compulsory reductions from members' parliamentary salaries and not from the public purse.

Ecclesiastical Pensions.— Archbishops, diocesan bishops and suffragan bishops of the Church of England whose sees are in England are-entitled to receive pensions on retirement at or after the age of 70 under a contributory program governed by the Episcopal Pensions measures, 1926 and 1945, and administered by the church commissioners. All other Church of England clergy rendering ecclesiastical service or holding educational, charitable or public appointments in England are entitled to receive pensions on retirement at or after the age of 70 under a noncontributory program governed by the Clergy Pensions measures, 1948 and 1954. This program was contributory until 1954. It is administered by the Church of England Pensions board, but financial responsibility rests with the church commissioners. Under this plan there are reciprocal arrangements in respect of overseas service in many other countries. The Church of England Pensions board also administers contributory programs for pensions for widows and dependents, and for deaconesses and lay workers.

(E. E. Bs.)

PENSTEMON, a genus of perennial herbs (family Scrophulariaceae), comprising about 250 species, chiefly natives of North America, with showy open-tubular flowers. Noteworthy species are *P. laevigatus* (smooth beardtongue), P. digitalis (foxglove beardtongue) and P. *hirsutus* (hairy beardtongue) of the eastern and southern states; *P. alpinus* (alpine beardtongue), *P.* cyananthus (blue beardtongue) and *P. barbatus* (bearded penstemon) of the Rocky mountain region; and *P.* antirrhinoides (snapdragon beardtongue), *P. diffusus* (spreading beardtongue) and P. centranthifolius (scarlet bugler) of the Pacific states; these and various others are more or less cultivated. The penstemon of the florist has, however, sprung from P. hartwegi of Mexico and *P.* cobaea of southwestern United States and possibly some others.

RUTHERFORD PLATT

PENSTEMON, KNOWN ALSO **AS** BEARDTONGUE

The plants endure mild winters unharmed in favoured situations. They winter safely in cold frames, protected by mats or litter during frost, but tend to die out in a year or two, especially if grown in open sunlight. They produce seed freely, new kinds being obtained by that means.

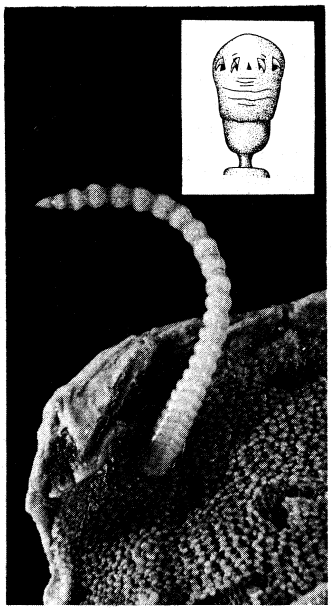
PENTAGON, a large five-sided building in Arlington county, Virginia, near Washington, D.C. It was built in 1941–42 to bring under one roof the U.S. war department offices then housed in widely scattered buildings. After World War II it became the headquarters of the department of defense, including all three services— army, navy and air force. The largest office building in the world, the pentagon covers 34 ac. (including a 5-ac. central

court), offers 3,700,000 sq.ft. of usable air-conditioned floor space and provides work space for about 30,000 persons, military and civilian. Built of structural steel and reinforced concrete, with some limestone facing, the entire structure cost $83,000,000.

The Pentagon consists of five concentric pentagons or "rings" with ten spokelike main corridors connecting the whole. (See WASHINGTON, D.C., for photograph.) With only five floors, plus a mezzanine and basement, the height of the building is short compared with its horizontal dimensions. A huge concourse larger than two American football fields provides a shopping centre for Pentagon workers. Beneath the concourse are bus and taxi terminals. Parking areas adjacent to the building can accommodate over 8,000 cars. A heliport for the Pentagon was added in 1956. (H. C. T.)

PENTASTOMIDA (LINGUATULIDA) are a small group (usually considered a class) of wormlike, bloodsucking arthropods which live as internal parasites of vertebrates. The body of an adult is externally ringed—and in many species looks like a thick string of beads—though there is no true internal segmentation. The alternate name Linguatulida or "tongue worms" is descriptive of the linguiform or tongue-shaped body of other species. Although some authorities consider the pentastomes a separate phylum, certain characteristics point to their very close arthropod relationship: (1) jointed legs in the embryo; (2) ecdysis or molting in the larval stage; and (3) the presence of breathing pores scattered over the body.

The name Pentastomida refers to the five openings arranged in a crosswise line on the head; the centrally located one is the oval, chitinous mouth, and the other two flanking pairs are the openings of pockets or sacs containing protractile hooks. The body is elongate and cylindrical in most species, a few being short and somewhat flattened. Adjoining a short head region is the long abdomen (from about ½ to 6 in. in length) marked with a variable number of superficial rings that do not represent true internal body segments and devoid of appendages. Although renroductive. nervous and digestive systems are present, there are no organs of circulation or respiration. Mouth parts are wanting and the digestive canal opens posteriorly. Sexes are separate. and the females are several times larger than the males.



PHOTOGRAPH BY COURTESY OF HOWARD R. HILL

VENTRAL VIEW DRAWING OF HEAD OF POROCEPHALUS AND PHOTOGRAPH SHOWING HEAD OF ARMILLIFER MONILIFORMIS EMBEDDED IN LUNG TISSUE OF PYTHON HOST

These bloodsuckers usually attain their adult stage within cold-blooded vertebrates, the nymphal forms occurring in warm-blooded vertebrates upon which the adult hosts feed. Adults live in the air passages of their host whereas nymphs are most frequently found encysted in the liver of their host. Development is usually combined with a change of host.

The number of known species is over 50, and they are not always restricted to a single host species. Raillietiella *furcocerca orientalis* is a common parasite of snakes in the eastern hemisphere. *Reighardia sternae* is a cosmopolitan parasite of gulls and terns. In America, *Kiricephalus coarctatus* is often found in the air passages of snakes.

Linguatula serrata, usually found in dogs, wolves and several other mammals, and Armillifer *armillatus* have been occasionally found in man. The eggs of L. serrate are scattered in sneezing, and the larvae develop in the viscera of the intermediate host—usually a rabbit, rat or sheep. After several molts the nymphal stage is attained, which may last for two or three years. Man can serve both as an intermediary and as a final host.

The adult of Armillifer armillatus is a common parasite in the lungs of large snakes in the eastern hemisphere. Pythons often become infected by devouring an infected mammal. In man, infection takes place by swallowing eggs scattered over vegetables or in water. The encysted larvae settle in various organs, and a heavy infection may lead to grave disturbances and may even result in death.

Pentastomida are divided into two orders: (1) the Cephalobaenida, with two families and four genera (Cephalobaena, *Raillietiella*, Reighardia, etc.); and (2) the Porocephalida, with two families and 14 genera (Porocephalus, Linguatula, etc.). These two orders are distinguished by the structure of their reproductive and nervous systems, the Cephalobaenida being the more primitive.

One of the best treatises is by R. Heymons, "Pentastomida," in Bronn's *Klassen und Ordnungen* (1935). *For* an extensive list of literature *see* Howard R. Hill, ['Annotated Bibliography of the Linguatulida," *Bull.* S. *Calif. Acad. Sci.,* vol. *47,* pt. *2* (1948). (H. R. HI.)

PENTATEUCH. The name Pentateuch (from the Greek pentateuchos *biblos,* "book of five volumes") designates the first five books of the Old Testament—Genesis, Exodus, Leviticus, Numbers and Deuteronomy—which embody the Law of Moses and hence are called also TORAH. The Pentateuch consists of narratives into which collections of laws are interpolated; the narratives begin with the creation of the world and conclude with the death of Moses, just before the entrance of the Israelites into the land of Canaan. They relate the primitive history of man, the stories of the patriarchs, the exodus of the Israelites from Egypt and their journey to Canaan, and the institution of the Israelite Covenant and laws at Sinai.

Development of Criticism of the Pentateuch. — Jewish and Christian tradition until the 19th century, with a few rare and uninfluential exceptions, attributed the Pentateuch to Moses. The French physician Jean Astruc suggested in 1753 that Moses compiled Genesis from two documentary sources, one of which employed the divine name Yahweh and the other the divine name Elohim. Astruc did not intend to question the authorship of Moses; but his introduction of the divine names as a criterion of documentary sources gave the impulse to the literary criticism of the Pentateuch which engaged almost every major biblical scholar of the 19th century.

The text of the Pentateuch exhibits numerous traits which indicate a complex literary origin. There are two creation accounts (Gen. i, 1–ii, 4a; ii, 4b–24). The account of the deluge (Gen. vi, 5–ix. 17) shows evidences of two accounts which have been compiled into one (the number of animals taken into the ark, the duration of the deluge, the two entrances of Noah into the ark, the blessings and Covenant pronouncements after the deluge). Ex. iv, 19 is the logical sequence of Ex. ii, 23. The expulsion of Hagar by Abraham (Gen. xvi; xxi), the call of Moses (Ex. iii; vi) and the miracles of the quail and the manna (Ex. xvi; Num. xi) are narrated twice. The wife of a patriarch is taken into the harem of a foreign ruler, or threatened with this, three times (Gen. xii; xx; xxvi). When the text is studied closely, other similar phenomena are observed. If these passages are analyzed and grouped, three strands of narrative emerge, each with distinctive characteristics of vocabulary and style, of which variation in the use of the divine names is only one.

Proceeding on these data, J. G. Eichhorn (1781) distinguished various sources in Genesis. K. D. Ilgen (1798) observed the source called Elohist could not be considered as a single source but must be divided into two. Geddes (1792), Vater (1802–05) and De Wette (1805) proposed the "theory of fragments," which assumed that there was no single document in the Pentateuch; they found in it a compilation of fragments of numerous different documents. The most important contribution of De Wette was his isolation of Deuteronomy as a distinct source. The unity of the sources, however, was too evident to be denied; and Ewald (1823) and De Wette (1840) adopted the "complementary theory," which assumed that one basic document was enlarged by the addition of fragments from other sources. This basic docu-

ment was called the Elohist. Subsequently H. Hupfeld (1853) restored Ilgen's theory of two Elohist documents. One of these (the Priestly source of later scholars) he called the First Elohist as the oldest; the Jahwist document followed, and the Second Elohist was the most recent. With the addition of Deuteronomy the lines of the four-document hypothesis were drawn.

The decisive contribution was made in 1865 by Graf, who proposed that the First Elohist was actually the most recent of the sources and was postexilic, the work of the Jerusalem priesthood. He introduced the sign "P" to designate this source. Kuenen (1869) announced that he had reached the same conclusions independently. Julius Wellhausen, in a series of works published between 1876 and 1901 and remarkable for brilliant and persuasive clarity, presented this hypothesis both to scholars and to the general public, and after 1900 it was almost universally accepted. Wellhausen's own contribution was a theory of the historical and cultural evolution of Israel and its religion, which explained the growth of Israelite belief as a rectilinear progress from the primitive polytheism of early Israel through the ethical monotheism of the prophets, the great creative thinkers of Israel, to the formal legalism and sacerdotalism of postexilic Israel. This theory of the evolution of Israel cannot now be sustained; Wellhausen worked at the beginning of the period of the great discoveries relating to the history and culture of the ancient near east, and these discoveries have rendered the theory as a whole impossible. But since in the early years of the 20th century the theory of the religious evolution of Israel was not always distinguished from the theory of the literary origins of the Pentateuch, many conservative theologians of all churches regarded Wellhausen's theory as an attack on revealed religion.

Documentary Theory.— In its classical form the documentary theory finds the Pentateuch to be a compilation of four documents: the Jahwist (German spelling; J), composed in the 9th century B.C.; the Elohist (E), composed in the 8th century B.C.; the Deuteronomist (D), composed in the 7th century B.C.; and the Priestly document (P), composed in the 5th century B.C. The Jahwist is Judahite, the Elohist Ephraimite in origin. These two versions of early Israelite tradition were fused into one document after the fall of Israel in 721 B.C. Deuteronomy was added after the exile. These were amalgamated with the Priestly source into the present Pentateuch about 400 B.C.

This hypothesis did not explain all questions of detail. Subsequent work was devoted to further analysis of the documents, to the isolation of other sources and to a more precise dating of the documents. The analysis of the documents was pushed by some scholars to the point where it issued in a new "fragment theory," and analysis based on minutiae has been proved exaggerated; the unity of the sources in some form must be explained. It is generally accepted that the documents represent strata of material rather than single unified compositions, and that the processes of redaction and expansion are too complex to permit a definitive analysis of the entire text. For the same reasons a precise date for each of the sources is scarcely possible.

Later critics, especially those of the Scandinavian school, have affirmed that the entire documentary hypothesis is false, since it does not reflect ancient methods of composition and transmission. This school asserts the primacy of oral tradition; the "documents," they say, are modern historical conceptions. While the oral traditions may be designated by the symbols J, E, etc., these actually are cycles of oral traditions not written until a relatively late date, postexilic in any case. Most contemporary critics believe that the Scandinavian school exaggerates the place of oral tradition; ancient near eastern culture offers numerous examples of the collection of traditions in writing. It is altogether probable. however, that most of the traditions of the Pentateuch were orally composed and orally transmitted in their early stages of development.

Later criticism also emphasizes the importance of literary form and of the "situation in life" in which the traditions arose. Noth, von Rad and others see in these traditions not mere popular or tribal memories, but traditions which have arisen from cultic recitals. On such great feasts as Passover the ritual included a recital of the saving deeds of Yahweh on behalf of Israel. These took variant forms in different cultic centres; the traditions of northern Israel, for instance, make Jacob prominent, while the traditions of Judah give greater prominence to Abraham. But the traditions all have in common that they are "history of salvation," a profession of the faith of Israel. Scholars agree that the study of any particular tradition must take account of its preliterary history as far as this can be traced: its local origin, its clan or tribal emphasis, its cultic significance. The compilers of the written sources were not creators; they found well-formed oral traditions which they arranged into a new literary unity.

Jahwist.—The literary composition of the Jahwist tradition probably may be placed in the reign of David or of Solomon as an expression of the new unity and prosperity of Israel under the monarchy. It began with the creation of man in Eden and contained the stories of the fall, primitive man, the deluge and the tower of Babel. The patriarchal stories of the Jahwist give the chief place to Abraham, who dwelt in the south, the later territory of Judah; it incorporates selected materials from the northern cycles of Jacob and Joseph, in particular the story of the marriages of Jacob and the births of the eponymous ancestors of the tribes. In the story of Joseph the Jahwist makes Judah the protagonist of the brothers. Analysis of the sources in Exodus and Numbers is more difficult; the Jahwist appears to have made Kadesh-barnea the focal point of his account of the wandering.

The Jahwist has been called the national epic of Israel. His are some of the best-known pieces of biblical narrative; they are concrete, vivid and moving. His conception of the deity is the most anthropomorphic of all the sources, and his human characters are portrayed with earthy realism. In spite of the childlike and primitive traits of his narrative, some of the most profound theological ideas of the Bible are expressed in such stories as those of the fall, the deluge, primitive man, the destruction of Sodom. Israel escapes from the curse, which he traces to human origins, by accepting the blessing granted to Abraham and to his seed; and the promises are obviously fulfilled in the peace and prosperity of the monarchy of David.

Elohist.—Compared to the Jahwist, the Elohist appears to be a torso; no doubt the document was edited by the Judahite compilers when it was fused with the Jahwist. The Elohist begins with Abraham and emphasizes Covenant rather than blessing. It contains at length the stories of Jacob and Joseph, the heroes of the northern tribes. The story of the exodus is centred about the Covenant of Sinai. The Elohist lacks the vividness of the Jahwist; his conception of the deity avoids grosser anthropomorphisms, and his human characters are more idealized. The literary composition of the Elohist is to be placed after the establishment of the divided kingdom; like the Jahwist, it is an expression of the traditions of the kingdom, with more emphasis upon the northern element in those traditions.

Priestly.— The Priestly source is often called a précis of history. It begins with an elaborate account of creation (Gen. i); but elsewhere it appears as brief notices, genealogies and lists, and the narrative is prolonged only when religious institutions are concerned, many of which it retrojects to earliest times. It has created an artificial chronological scheme. Its style is dry and pedestrian and easily detected. The historical sketch of the Priestly source is intended as framework for the priestly collection of law.

Law and History.— In addition to the priestly collection of laws there are other collections of laws of various date and provenance. A historical prologue usually stood at the beginning of ancient near eastern legal collections. This is in a sense the conception which governs the compilation of the Pentateuch. Israelite law arises out of the history of Israel, but not its secular history; law is incorporated into the history of the saving deeds and the revelation of Yahweh, who elects Israel as his people and lays down as terms of his Covenant the laws by which Israel should live.

In the history of Judaism the Torah, the law of Moses, as the Pentateuch was designated, was the dominant influence. The Torah was the exclusive object of study and interpretation in the

rabbinical schools, whose interpretations were collected in the Talmud. The Pentateuch is designated as law in the prologue of Sirach (written about 130 B.C.) and frequently in the New Testament. From the Pentateuch arises the characteristic Jewish conception of Israel as a people chosen by God, delivered and preserved by his saving deeds, established in a commonwealth by him and living under his revealed law. This conception of Israel as the people of God was incorporated into the teaching of primitive Christianity and applied to the church.

See BIBLE and articles on the separate books; for the special problems of DEUTERONOMY *see* that article; on the extension of the sources of the Pentateuch in subsequent books of the Old Testament *see* HEXATEUCH. *See* also references under "Pentateuch" in the Index volume.

PENTATHLON is an athletic contest involving five distinct types of competition (from the Greek *penta,* "five," and *athlon,* "contest"). In the ancient Greek Olympics, the pentathlon included a race the length of the stadium (200 m.), the broad jump. discus throw, javelin throw and a wrestling match between the two athletes scoring highest in the previous four events.

This Greek pentathlon was adopted for modern track and field competition by setting the sprint distance at 200 m, and by substituting a 1,500-m. run for the wrestling match. The event was introduced to the Olympic games in 1912 but discontinued after 1924.

The modern or military pentathlon, which has been included in the Olympic games since 1912, demands far greater diversity of skills than its track and field counterpart. It requires each contestant to perform the tasks that might confront a mounted courier under historical battle conditions.

Entrants are required to: (1) ride a strange horse, selected by lot, over a 5.000-m. obstacle course; (2) engage each of his rivals in an épée fencing match; (3) shoot with pistol at a silhouette target; (4) swim 300 m.; (5) run 4,000 m. on an unfamiliar cross-country course. The competition takes three days.

Each nation enters three contestants and they are scored according to a point table established by the International Pentathlon union. Team prizes are awarded by adding up the three individual scores. World championships, under International Amateur Athletic federation auspices. are held in non-Olympic years. Military men have dominated the event, with Swedish officers nearly monopolizing the Olympic titles. *See* OLYMPIC GAMES. (E. J. G.)

PENTECOST (from Greek *pentekostos,* "50th"), the Jewish Feast of Weeks, or Shabuoth, celebrated on the 50th day after Passover. The name also is given to the Christian feast popularly called Whitsunday, celebrated on the 50th day after Easter to commemorate the descent of the Holy Spirit on the apostles. *See* JEWISH HOLIDAYS; WHITSUNDAY.

PENTELICUS (mod hiendeli), a mountain northeast of the Athenian plain, height 3.638 ft. Its white marble was not regularly worked until after the Persian wars; later all the chief buildings and sculptures of Athens were constructed of it.

PENTLANDITE. A sulfide of nickel and iron is the chief source of nickel. It is abundant in the nickel mines of Canada, as in the Sudbury district of Ontario where the mineral has an average nickel content of 35%. It also occurs in Norway, Sweden and South Africa; in the United States it is found in Nevada and Yakobi Island, Alaska. It was named after J. B. Pentland, who first noted the mineral. The formula is (Fe, Ni)S. It crystallizes in the cubic system but is never found in distinct crystals. It has a metallic lustre and light bronze-yellow colour. It is nearly always associated with pyrrhotite. For production and uses *see* NICKEL. (W. F. FG.; X.)

PENUMBRA (Lat. *paene,* "almost"; *umbra,* a "shadow"), in astronomy, the partial shadow of a heavenly body as cast by the sun. It is defined by the region in which the light of the sun is partially but not wholly cut off through the interception of a dark body. *See* also ECLIPSE.

PENUTIAN, a stock of North American Indian languages defined by the linguist E. Sapir as extending originally from British Columbia to Mexico. The families and languages are, from north to south: Tsimshian; Chinook (including Wishram); Sahaptian (Sahaptin, including Nez Perce, Yakima; Molala-Cayuse; Klamath); Oregon Penutian (Coastal: Alsea, Siuslaw, Coos; Kalapuya; Takelma): Californian (Wintun, Maidu, Miwok-Costanoan, Yokuts); Mexican Penutian (Zoque, Huave). It has been suggested that Penutian is part of a larger grouping (phylum), Macro-Penutian, which includes Azteco-Tanoan (Uto-Aztecan; Kiowa-Tanoan), and possibly Mayan and Totonac in Mexico. The relationships have not been worked out in detail, but may be considered reasonably valid. About 5,000 speakers of Penutian are left, and some of the languages are extinct.

Penutian languages (and Macro-Penutian as a whole) have structures that remind one of Indo-European — inflectional suffixes, internal stem-change, noun cases — with much variation. *See* also CENTRAL AND NORTH AMERICAN LANGUAGES; AMERICAN ABORIGINAL LANGUAGES; INDIAN, NORTH AMERICAN. (G. L. T.)

PENZA, an *oblast* of the Russian Soviet Federated Socialist Republic, U.S.S.R., surrounded by those of Saratov, Tambov, Ryazan, Gorki and Ulyanovsk. Area 16,680 sq.mi. Pop. (1959) 1,510,000. The *oblnst* forms part of the central Russian plateau, there reaching a height of 900 ft. It is deeply dissected by rivers, the chief being the Moksha, flowing north to the Oka, the Sura to the Volga, and the Khoper flowing south to the Don. The Moksha and Sura are navigable, and other streams are available for floating timber. Patches of forest occur in the west and also to the east of the Sura river but are insufficient for local timber needs, most of which are supplied by timber floated down the rivers from the north. Most of the land favourable for cultivation is used. and agriculture is the main occupation. Marshes exist in the Krasnoslobodsk district, and sandy stretches along the rivers, but there is much fertile black earth. Winter rye and oats are the chief crops, lentils are produced, and peas, sunflower seed, potatoes, beetroot, fruit and vegetables are grown.

Sheep, dairy and working cattle, pigs and horses are bred, the sheep providing wool for the felt and woolen industry and fat for tallow. Industries include sawmilling, paper and match manufactures, and woolen cloth, felt, glass, leather and tobacco works.

PENZA, capital of Penza *oblast,* Russian Soviet Federated Socialist Republic, U.S.S.R., at the confluence of the Penza with the navigable Sura. Pop. (1959) 254,000. The town has sawmills and paper and match factories, and is an important trading centre for corn, timber and the products of sheep and cattle raising. It dates from the 17th century and was captured by E. Pugachev in 1774. Several times fire destroyed it.

PENZANCE, a municipal borough, seaport and holiday resort, in the St. Ives parliamentary division of Cornwall, 280 mi. W.S.W. of London by road and the most westerly town in England. Pop. (1961) 19,433. Area 4.9 sq.mi. After 1934 the borough included Newlyn, Mousehole, Gulval and Heamoor. It is the only quarter sessions borough in Cornwall.

The town stands on rising ground overlooking Mounts bay, and has a remarkably equable climate, enabling many subtropical plants to flourish in the open air. Great quantities of early vegetables, flowers and fruits are raised locally and in the Isles of Scilly (*q.v.*), and are sent to London and elsewhere. Penzance is connected with the Scilly Isles by steamer and air services. Some fishing is done from Penzance harbour, but most of the fishing boats work from Newlyn harbour. From the mean sea level in Newlyn harbour — ordnance datum — is calculated the elevation of all places shown on ordnance survey maps. Newlyn is a well-known centre for artists.

Edward III granted Penzance a charter market in 1332. In 1512 Henry VIII granted a charter as to profits from all ships visiting the harbour, although the town's importance as a fishing port dates from the 14th century. The charter of incorporation was granted in 1614 and in 1663 Penzance was constituted a coinage town for tin, and so remained until 1838. The old name (Pen-

sans) is thought to have referred to a chapel of St. Anthony (patron saint of fishermen) formerly on the headland south of the harbour. The seal and coat of arms granted by the College of Heralds in 1934 to replace the old corporate seal, however, makes a very free translation of the name and depicts the head of St. John the Baptist on a charger.

PEONAGE, a form of involuntary servitude which developed in Mexico. It prevailed extensively in Yucatan and especially in the Valle Nacional, where cheap labour was required in the cultivation of tobacco. The beginning of peonage, however, has been traced as far back as the conquest of Mexico by the Spaniards. Early in the history of Mexico the conquerors worked out a scheme by which the poor, especially the Indians, could be forced to do the work of the planters and mine operators. The word *peon* became synonymous with the English word labourer, but it later was restricted in its meaning to those labourers who were compelled to serve their creditors to pay debts which by contract they had pledged themselves to pay in labour. Although the 13th amendment and legislation of the U.S. government prohibited any such involuntary servitude in that country, the former slave-holding states devised certain legislation, following emancipation, which might make labour compulsory. Under these state laws employers deceived ignorant men by inducing them to sign contracts for labour in payment of debts, and those who might pay fines imposed by the courts to sign other similar contracts. In rural districts far removed from the populous centres the chain gang system of forced labour under the pretense of farming out the services of misdemeanants or penal offenders developed into great injustices. The practice of leasing short-term prisoners, both blacks and whites, to managers of labour camps was continued in a few of the southern states. (C. G. W.)

PEONY, common name for *Paeonia,* a genus of plants remarkable for their large and showy flowers; it belongs to the buttercup family (Ranunculaceae). The peonies are native mostly to Europe and Asia; one species, *P. browni* (the western peony), is found naturally along the Pacific coastal mountains in North America.

Known from ancient times, and called *paeonia* by the Greeks, after Paeon, the god of healing, the peony was regarded with the greatest respect. As late as the 17th century its roots, flowers and seeds were used in medicine in England. In China and Japan it has been grown for ages and esteemed for its beauty and fragrance. The Mongols in Siberia were reported, in the 18th century, to have eaten the roots and seeds of the peony.

There are two distinct general groups of peonies—the herbaceous and the tree or moutan peonies. The herbaceous are strong-growing perennials from two to three feet in height; the large, glossy, much-divided leaves, decorative from spring to fall, are supported on annual stems, which arise from the fleshy root-stock. The ample flowers, which blossom in late spring and early summer, when few flowers equal them in effect, vary in form from the open single to the globular sorts of the double varieties. The Chinese *Paeonia albiflora* and the European P. *officinalis* (the common peony—an old garden favourite), along with their many horticultural varieties, are the herbaceous garden peonies which produce the large single and double flowers of white, pink, rose and deep crimson. Modern garden hybrids are quite beautiful, the flowers being in many instances delicately tinted uith more than one colour, such as buff with bronzy centre, carmine with yellowish centre, rose with orange centre, white tinted with rose, etc. Hundreds of names are given to the colour variations of both the herbaceous and tree peonies.

The moutan or tree peonies, which have sprung from the Chinese P. *suffruticosa,* are stiff-growing plants with half-woody permanent stems. They are remarkable for their subshrubby habit, forming vigorous plants sometimes attaining, a height of four to six feet, and producing in late spring magnificent flowers which vary in colour from white to lilac, magenta, violet and rose. These are produced on the young shoots and are in consequence liable, unless protected, to be cut off by spring frosts. They require to be thoroughly ripened in summer, and therefore a hot season and a dryish situation are desirable for their well-being;

ROCHE

JAPANESE DOUBLE TREE PEONY (HORTICULTURAL VARIANT OF PAEONIA SUFFRUTICOSA)

and they require rest during winter. They are increased by grafting in late summer or autumn on the roots of the herbaceous peonies.

A race of hybrids has been developed by crossing the tree peony with P. *lutea,* mostly double flowered in shades of yellow and yellow with tinges of red.

All peonies thrive in rich moist garden loam in a sunny location, planted—preferably in the spring—so that the buds or "eyes" of the fleshy roots are not more than three inches deep. They are not commonly grown from seed. After about a year they become well established and will produce blooms for years without the necessity of dividing.

An annual top-dressing of bonemeal or rotted manure is beneficial, since peonies are heavy feeders.

PEORIA, a city of north-central Illinois, U.S., on the Illinois river where it widens to form Lake Peoria, ,roughly midway between Chicago and St. Louis, Mo., is a leading commercial centre of downstate Illinois and the seat of Peoria county.

Named for one of the five Indian tribes in the Illinois confederacy. Peoria represents one of the oldest settled locations in the state. The French under René Robert Cavelier, Sieur de La Salle (*q.v.*) first built Fort Crèvecoeur on the bluffs opposite the present city in 1680. but it was plundered and deserted later that same year. Subsequent settlements around Peoria lake by the French, Indians and Americans give an almost unbroken history to the region. After 1813 the location was known as Fort Clark and when Peoria county was established in 1825, the community reverted to the French-Indian name of Peoria and was established as the county seat. Peoria was incorporated as a town in 1835 and chartered as a city in 1845. It was there, on Oct. 16, 1854, that Abraham Lincoln publicly denounced slavery in a rebuttal to a speech by Stephen Douglas.

Peoria is situated in the heart of the corn belt, with deposits of bituminous coal, sand, gravel and gypsum nearby. It has excellent rail, road and air transport facilities including the Illinois waterway.

The city's industry is both vast and varied. Producing more than 900 different products in more than 200 manufacturing plants, Peoria is as well known for its tractors, agricultural implements and earth-moving equipment as it is for products of its numerous distilleries and breweries. The output of chemicals, food products, household goods. brick, tile and stone, radio equipment and electric power is also extensive.

The northern regional research laboratory of the G.S. department of agriculture which searches for new and improved uses for farm commodities is located there.

The city, extending for more than 10 mi. along the Illinois river, is noted for its setting amid the scenic beauty of the surrounding area. Six public parks totaling more than 2,000 ac. offer opportunities for relaxation and recreation.

Bradley university, located near the west edge of the city, was established by Lydia Bradley in 1897 and endowed by her with a gift of $2,000,000.

The population of the city was 103,162 in 1960, and of the Peoria standard metropolitan statistical area, comprising Peoria and Tazewell counties. was 288.833. (R. M. Su.)

PEPE, GUGLIELMO (1783–1855), Neapolitan general, born at Squillace in Calabria, took part in 1799 in the republican movement at Naples inspired by the French Revolution; he fought against the Bourbon troops under Cardinal Ruffo, was captured

and exiled to France. He entered Napoleon's army and served first under Joseph Bonaparte and later under Joachim Murat. After commanding a Neapolitan brigade in the Peninsular campaign, Pepe returned to Italy in 1813, with the rank of general, to help to reorganize the Neapolitan army. fhen the news of the fall of Napoleon (1814) reached Italy Pepe and other generals demanded from Murat a constitution. On Napoleon's escape from Elba (1815) Pepe served on Murat's staff in the campaign of 1815. The Neapolitan officers retained their rank under Ferdinand IV (*q.v.*) who now regained the throne of Naples. While engaged in suppressing brigandage in the Capitanata, Pepe organized the *Carbonari* (*q.v.*) into a national militia. In 1820 a military revolt broke out. Pepe was sent against the rebels, but Ferdinand promised a constitution (July 1820). The king. who had no intention of respecting the constitution, obtained the loan of an Austrian army with which to restore absolute power. Pepe now took command of the army and marched against the Austrians. He attacked them at Rieti (March 7, 1821), but his ram levies were repulsed. In 1848 Pepe returned to Naples, where a constitution had again been proclaimed. He was given command of the Neapolitan army which was to co-operate with Piedmont against the Austrians, but when he reached Bologna the king recalled him and his troops. Pepe resigned his commission in the Neapolitan service! and crossed the Po with 2,000 volunteers to take part in the campaign. On the fall of Venice, Pepe and Manin were among those excluded from the amnesty; he again went into exile and died in Turin in 1855.

PEPERINO, an Italian name applied to a brown or gray volcanic tuff (*q.v.*), formed from volcanic ash or dust and containing fragments of basalt and limestone, with disseminated crystals of augite, mica, magnetite, leucite, etc. The typical peperino occurs in the Alban hills, near Rome, and was used by the ancients, under the name *lapis albanus,* as a building stone and for the basins of fountains. Other tuffs and conglomerates in Auvergne and elsewhere are also called peperino. The name originally referred to the dark coloured inclusions, suggestive of peppercorns. See also ROME: The Ancient *City: Materials.*

PEPO, the typical fruit of the plants of the gourd family (Cucurhitaceae) consisting of a large, fleshy. berrylike structure with a tough rind and a spongy seedy interior, as in the pumpkin, squash. melon and cucumber.

PEPPER is a name applied to several unrelated plants from which pungent spices are obtained: black, white and long pepper (Piper); red, chili and cayenne peppers (*Capsicum*) and Melegueta pepper (*Aframomum melegueta*). Pepperroot (*Dentaria*) whose underground Parts and peppergrass (*Lepidium*) whose fruits have a pungent taste are members of the crucifer family. A number of plants named pepper, including the California pepper tree (*Schinus molle*), pepper vine (*Ampelopsis arborea*) and sweet pepper bush (Clethra *alnifolia*), are grown as ornamentals and are not used for spices.

The true pepper or black pepper (*Piper nigrum,* family Piperaceae) is native to northwest India, and in early historic times was widely cultivated in the tropics of southeastern Asia, where it became highly regarded as a condiment. Marco Polo in the 13th century observed great quantities of peppers being used in China and noted that their cultivation expanded as far as Java. Pepper early became an important item of overland trade between India and Europe. It became a medium of exchange, and tributes were levied in pepper in Greece and Rome. The Venetians and Genoese were two of the chief distributors, and their virtual monopoly of the trade helped instigate the search for a sea route to the far east.

The pepper plant is a woody climber that by means of aerial roots reaches heights of 30 ft. or more. The shiny green leaves are broad, ovate and alternately arranged. The inconspicuous flowers, which lack a perianth, are arranged in dense slender spikes of about 50 flowers each. The fruit, called a peppercorn, a small globose berrylike structure, $\frac{1}{5}$–$\frac{1}{4}$ in. in diameter, becomes yellowish red at maturity and bears a single seed. A number of cultivated varieties are known.

The plant requires a long rainy season, fairly high temperatures and partial shade to produce its best growth. Propagation is generally by stem cuttings, which are set out near a tree or a pole that will serve as a support. The plants are sometimes interplanted in tea or coffee plantations. Peppers start bearing in two to five years and under good conditions may produce for 40 years or more. Harvesting is done by hand just before the fruits ripen. The peppercorns are spread out to dry in the sun or occasionally over fires. In a few days the green fruits turn black and are ready for shipment. When ground, the whole peppercorn yields black pepper. For the preparation of white pepper, which has a milder flavour, the outer hull and pulp are first removed from the seed by fermentation in water. White pepper also is prepared from the whole dried peppercorns by grinding off the outer coating.

W. H. HODGE

FRUITING BRANCH OF A BLACK PEPPER TREE (PIPER NIGRUM)

Pepper owes its pungency to a resin and its flavour to a volatile oil. Piperine, an alkaloid with the same empirical formula as morphine, $C_{17}H_{19}NO_3$, also is present. It is probably the world's most widely used spice and also has a limited usage in medicine.

The pepper is rather widely cultivated in India. Thailand, the East Indies, and islands of the South seas. with Indonesia producing the bulk of the world's supply. The plant has been successfully introduced into tropical areas of Africa and of the western hemisphere. World exports have amounted to 170,000,000 lb. a year, with U.S. imports reaching 50,000,000 lb. a year.

Long pepper, whose culture and preparation is similar to that of black pepper, is prepared from Piper *retrofractum,* native to Java, and Piper *longum,* native to India. Although it was popular in Europe during the middle ages, it is little used today outside the areas where it is grown. Of the some 600 to 700 species of Piper, a few others are of economic importance. Cubebs from Piper *cubeba,* native to the East Indies and cultivated in the far east, formerly were used as a spice or condiment and now have a limited use in medicine for the treatment of catarrh. The roots of Piper *methysticum* are used throughout Oceania to produce the beverage kavakava. The leaves of the betel pepper (*Piper betle*) are chewed with the nuts of the betel palm in much of the tropics of the old world as a masticatory.

For the sweet garden peppers, cayenne, etc., see CAPSICUM; CAYENNE PEPPER.

See Howard Scott Gentry, "Introducing Black Pepper into America," Econ. *Bot.,* vol. ix, pp. 256–268 (1955); Albert F. Hill, *Economic* Botany (1952). (C. B. H.)

PEPPERGRASS, a name given, especially in the United States, to certain species of *Lepidium* (family Cruciferae), which are widely spread as needs. They are erect, mostly annual herbs with freely branching stems, about one-half to one and one-half feet high, small, toothed or deeply cut leaves, minute white or yellow flowers, followed by elongated, cylindrical clusters of small, short-stalked, flattened, nearly round, two-seeded, slightly notched pods. Examples are the wild peppergrass (L. *virginicum*), with mostly undivided leaves, found in fields from Quebec to Minnesota and southward to Mexico and the West Indies, and also naturalized in southern Europe, and the roadside peppergrass (L. ruderaie), with narrowly divided leaves, native to Europe but now naturalized from Nova Scotia to Texas, and occurring also in Australia.

PEPPERMINT, a perennial herb of the family Labiatae, and genus *Mentha* (see MINT), the species *M. piperita,* is distinguished from other species of the genus by its stalked leaves and oblong-obtuse spikelike heads of flowers. It is native to Europe and has become naturalized in North America, found near streams

and other wet sites. In several parts of the world, including Europe, Asia and North America, it is cultivated for its essential oil. Many varieties of peppermint have resulted from natural hybridization among wild species, but only two varieties, the black and white, are recognized by growers. The former has purplish and the latter green stems; the leaves are more deeply toothed in the white. Black peppermint (also known as English peppermint and mitcham mint) is the form extensively grown in the United States, probably because it is found to yield more oil. The white variety is less hardy and less productive but its oil is considered more delicate in odour and obtains a higher price.

U.S. DEPARTMENT OF AGRICULTURE

PEPPERMINT (MENTHA PIPERITA)

After about 1900 the United States became an important producer of peppermint oil. Production on a large commercial scale was first attained in southern Michigan and was later extended to northern Indiana. Shortly after World War II, the states of Washington and Oregon became important centres of peppermint culture because of climatic factors, including long summer days with abundant sunshine. which favour the production of high yields of oil. In the beginning of the second half of the 20th century, the United States was the leading peppermint-producing country, with production of over 2,000,000 lb. accounting for nearly three-fourths of the world's supply of peppermint oil. Bulgaria, Italy. the U.S.S.R., France and other countries in Europe and Asia also produce the oil. Peppermint can be grown on a wide range of soil types but does best in deep, rich soils well supplied with moisture from rainfall or irrigation. In the United States it is produced on muck soils in Michigan and Indiana and sandy-loam soils in Oregon and Washington. Peppermint is propagated commercially by planting stolons (underground shoots) taken from existing fields. It is often grown in rows the first year and then allowed to spread over the field in solid stands spoken of as meadow mint. Fields may produce satisfactory crops for two to five years or longer if weeds and diseases are controlled. Best yields of oil are obtained when peppermint is harvested by cutting at the full-bloom stage.

Oil of peppermint is a volatile oil distilled with steam from the partially dried herb. It is widely used for flavouring dental creams, mouth washes, tooth pastes, cough drops, chewing gum and confectionery, and to a lesser extent for masking the flavour and odour of numerous medicinal products. When pure, peppermint oil is nearly colourless and has an agreeable odour and a powerful aromatic taste, followed by a sensation of cold when air is drawn into the mouth. When oil of peppermint is cooled to 4° C. it sometimes deposits colourless hexagonal prisms of menthol, which are soluble in alcohol and ether, almost insoluble in water, and fusible at 92" F.; the oil consists chiefly of menthol and a ketone called menthone. Oil of peppermint is sometimes adulterated with phellandrene or other terpene compounds, water soluble glycols or synthetic menthol. Adulteration with terpenes or glycols can be detected readily by using appropriate chemical or physical tests, but no satisfactory method has been found for proving adulteration with synthetic menthol. Oil of Japanese mint (*M. arvensis* var. *piperascens*) is a rich source of menthol, very different from peppermint oil. The name Japanese peppermint is sometimes used for this plant, but it should not be confused with true peppermint.

See E. Guenther. *The Essential Oils,* vol. 3, pp. 586–640 (1949).

(L. M. Pz.)

PEPPERRELL, SIR WILLIAM (1696–1759), American soldier, was born in Kittery, Me., then a part of Massachusetts, on June 27, 1696. He studied surveying and navigation. and joined his father in his shipbuilding, fishing and general trading business, becoming one of the wealthiest and most influential men in the province and a colonel of militia. Pepperrell served in the Massachusetts general court (1726–27), and in the governor's council (1727–59), of which for 18 years he was president. Although not a lawyer, he was chief justice of the court of common pleas from 1730 until his death. In 1745 he was commander in chief of the New England force which besieged and captured the French fortress of Louisburg. Pepperrell, in Nov. 1746, was created a baronet—the only New Englander so honoured. Active in raising troops during the French and Indian War, he was made lieutenant general in Feb. 1759. He died in Kittery on July 6, 1759.

See Usher Parsons, *Life of Sir William Pepperrell, Bart.* (1855); L. Dame, "Life and Character of Sir William Pepperrell," *Essex Inst. Hist. Coll.,* vol. xxi, pp. 161–176 (1884); "The Pepperrell Papers," *Mass. Hist. Soc. Coll.,* ser. 6, vol. x (1899); Charles Henry Lincoln (ed.), *The Journal of Sir William Pepperrell Kept During the Expedition Against Louisbourg* (1910); and John Francis Sprague, sketch in *Three Men from Maine* (1924).

PEPPER TREE, a tree which has no proper connection with the true pepper (Piper). and is really a member of the family Anacardiaceae, being known botanically as *Schinus molle,* from the Peruvian name *Molle.* It is a native of tropical South America and is grown in the open air in the south of Europe. Introduced into California, it became widely popular as an ornamental tree! but later it was found to be a host plant for scale insects very destructive to orange orchards. with the result that in citrus districts the trees were cut down and further plantings discouraged. It is a small tree with unequally pinnate leaves, filled with volatile oil stored in large cells or cysts which are visible to the naked eye and appear like holes when the leaf is held up to the light. When the leaves are thrown upon the surface of water the resinous or oily fluid escapes with such force as to agitate them violently. The flowers are small, whitish, arranged in terminal clusters and polygamous or unisexual, with five sepals, as many petals, ten stamens (as large as the petals in the case of the male flower, very small in the female flower, but in both springing from a cushionlike disk surrounding the base of the three-celled ovary).

The fruit is a small, globose. pealike drupe with a bony kernel enclosing a single seed; its fleshy portion has a hot aromatic flavour from the abundance of the resin it contains. The resin is used for medicinal purposes by the Peruvians, and has properties similar to mastic. The very similar Christmasberry tree (S. terebinthifolia), native to Brazil, with stiffer, less pendulous branches, more densely clustered flowers and smaller, bright red fruit, is sparingly planted for ornament. The Japan pepper tree is Zanthoxylum *piperitum* the fruits of which have also a hot taste.

Along the Riviera the tree known as Melia *azedarach* or the "pride of India." is also incorrectly called the pepper tree.

PEPSIN is the powerful enzyme. or ferment, in gastric juice that digests proteinous foods such as meat, eggs or seeds that are introduced into the stomach. Enzymes (*q.v.*), in general, are catalysts that in small quantities speed up biochemical reactions. They are formed by living tissues, and all cells are dependent upon them to speed up the many reactions that otherwise would proceed far too slowly. No enzyme has been synthesized in the laboratory.

Pepsin was first recognized in 1836 by the German physiologist Theodor Schwann. Nearly a century later, in 1930, it was crystallized and its protein nature established by John H. Northrop of the Rockefeller Institute for Medical Research.

The tissues lining the stomach make and store pepsin in an inactive form called pepsinogen, or propepsin. When pepsinogen is secreted into the stomach and mixed with the acidic gastric juices, it is rapidly converted into pepsin. Pepsin speeds up this conversion, and since it is also a product of the conversion, the reaction once started goes faster and faster; *i.e.,* it is self-accelerating or autocatalytic. The digestive power of pepsin

changes with acidity, and, as might be expected, it is fastest at the acidity of normal gastric juice (pH 1.5–2.5).

Proteins, in general, are made up of some 20 different kinds of amino acids linked together. Only the links between certain pairs of amino acids are opened by pepsin In the digestive tract this leads to only partial degradation of proteins to smaller units called peptides. which are then either absorbed from the intestine into the blood stream or are broken down further by pancreatic enzymes. The magnitude of the digestive power of pepsin may be indicated by pointing out that one ounce of pure pepsin can coagulate (an early step in the digestion) 200,000 gal. of milk in an hour at body temperature or can digest thousands of times its weight of other proteins in a similar period. Although pepsin is a protein, it is resistant to its own digestive powers.

Like other enzymes and proteins, pepsin is a large, complex molecule. On a weight scale in which an atom of hydrogen is 1 and ordinary table salt (sodium chloride) is 58, pepsin is 35,000.

Pepsin is prepared commercially from swine stomachs, which contain on the average about one gram (one-thirtieth of an ounce) of enzyme per stomach. Crude pepsin is used in the leather industry to remove hair and residual tissue from animal hides prior to their being tanned. It is also used in the recovery of silver from discarded movie films, which it does by digesting the gelatin layer that holds the silver compound. Still another commercial use is in the preparation of peptone (partially digested protein), which is an important ingredient of growth media for bacteria and related microorganisms.

See also DIGESTION; PROTEINS.

BIBLIOGRAPHY.—The original papers describing most of the work of Northrop and his colleagues on pepsin appeared in the J. *Gen. Physiol.*, vol. 13–32 (1930–48). *See* also J. *H.* Northrop, M. Kunitz and R. M. Herriott, *Crystalline Enzymes,* 2nd ed. (1948); J. B. Sumner and G. F. Somers, *Chemistry and Methods of Enzymes,* 3rd ed. (1953).

(R. M. **Hr.**)

PEPUSCH, JOHN CHRISTOPHER (1667–1752), English musician! of German parentage, was born in Berlin. He was for many years musical director at Lincoln's Inn Fields theatre, and arranged the tunes and composed the overture for John Gay's *Beggar's Opera,* doing the like later for its sequel, *Polly.* In 1737 he became organist of the Charterhouse. His later years were spent in study, in the composition of chamber music and some admirable motets and in teaching some favoured pupils, among these being William Boyce. Pepusch died on July 20, 1752. His *Treatise on Harmony* (anonymous 1st ed., 1730) is believed to have been an embodiment of his rules drafted by his pupil, Viscount Paisley, aftenvard earl of Abercorn.

PEPYS, SAMUEL (1633–1703), English diarist, was born on Feb. 23, 1633, in a house in Salisbury court, close to St. Bride's churchyard, where his father, John Pepys, carried on the business of a tailor. The family can be traced in Cambridgeshire as far back as the reign of Edward I. They rose by slow degrees from the class of small copyholders and yeoman farmers to the position of gentry. In 1563 they had a recognized right to use a coat of arms. The name was pronounced in the 17th century, and has always been pronounced by the family, "Peeps." John Pepys was a younger son, who, like other gentlemen in his position in that age, went into trade. He married Margaret Kight, "washmaid to my Lady Veere," whose brother William was a butcher in Whitechapel. This was regarded as a *mésalliance,* for Samuel refers to his mother's relations with a certain disrespect. In 1661 John Pepys inherited a small estate at Brampton near Huntingdon where he died in 1680, his wife having predeceased him in 1667.

Samuel was fifth child and second son of a large family, all of whom he survived. His first school was in Huntingdon, but he was afterward sent to St. Paul's in London, where he remained till 1650. On June 21 in that year he was entered at Trinity hall, Cambridge, but migrated to bfagdalene as a sizar on Oct. 1. On March 5, 1651, he went into residence, obtaining a Spendluffe scholarship a month after entering, and one on John Smith's foundation on Oct. 4, 1653. In March 1654 he proceeded to the B.A. degree, and in 1660 to that of M.A. Nothing is known of his university career except that on Oct. 21, 1653, he was publicly admonished with another undergraduate for having been "scandalously overseene in drink." At Cambridge he wrote a romance, *Love is* a *Cheat,* which he afterward destroyed.

On Dec. 1, 1655, he was married at St. Margaret's church, Westminster. to Elizabeth, daughter of Alexander Marchant, sieur de St. Michel, a French Huguenot exile from Anjou who had married an English lady named Kingsmill. Pepys had at this time no independent means and probably relied on his relatives, the Mountagus. to provide for him. On March 26, 1658, he was cut for the stone. an event which he always kept in memory by a solemn anniversary. In 1659 he went as secretary with his kinsman, Edward Mountagu, afterward earl of Sandwich, on a voyage to the sound. On his return he was engaged as a clerk under (afterward Sir) George Downing, one of the four tellers of the exchequer. In 1660 he accompanied Mountagu when he commanded the fleet which brought King Charles II back from exile. In that year, by the interest of his kinsman, he was appointed clerk of the acts in the navy office, but was compelled to buy off a competitor, one Barlow, with an annuity of £100. Though he was so ignorant of business that he did not even know the multiplication table when he first took office, he soon mastered the needful mechanical details by working early and late. He had other posts and honours, which came to him either as consequential on his clerkship or because he was a useful official.

The Official.—On July 23, 1660, he was appointed a clerk of the privy seal, but he resigned the office on Aug. 17, 1662. On Sept. 24, 1660, he was made a justice of the peace. In 1662 he was appointed a younger brother and in 1672 an elder brother of the Trinity House. In 1662 also he was named a commissioner for managing the affairs of Tangier, then occupied by an English garrison. In 1664 he became a member of the corporation of the royal fishery, and in 1665 was appointed treasurer for Tangier. In that year also he was elected a fellow of the Royal society.

During the naval war with Holland (1665–67) he proved himself an indefatigable worker. As surveyor of victualling, the whole burden of a most important department was thrown on him in addition to his regular duties. While the plague was raging in London in 1666 he remained at his post when many of his colleagues ran away, and he manfully avowed his readiness to take the risk of disease, as others of the king's servants faced the dangers of war. He had now gained the full confidence of the lord high admiral, the duke of York, afterward King James II. When, on the termination of the war, the navy office was violently attacked in parliament, he was entrusted with its defense. The speech which he delivered at the bar of the house of commons on March 5, 1668, passed for a complete vindication. The charges of mismanagement were well founded, but the fault was not in the officials of the navy office only, and Pepys, who was master of the details, had no difficulty in making out a defense.

Nobody indeed was better acquainted with the defects of the office. for in 1668 he drew up for the duke of York two papers of inquiry and rebuke, "The Duke's Reflections on the several Members of the Navy Board's Duty" and "The Duke's answer to their several excuses." (*See* Pepysian manuscript at Magdalene, no. 2242, and Harleian manuscript 8003.) In 1668 he went for a fortnight's tour in the west of England, and in 1669 he and his wife travelled in Holland and France. His success in addressing parliament gave him the ambition to become a member of the house of commons. He stood for Aldeburgh, but the death of his wife, on Nov. 10, 1669, prevented him from conducting his canvass in person, and he was not elected. In 1673 he was, however, returned for Castle Rising. The validity of his election was questioned by his opponent, Offley, and the committee of privileges decided against him, but the prorogation of the house prevented further action.

The no-popery agitation was now growing in strength. The duke of York was driven from office by the Test act, and Pepys was accused of "popery," partly on the ground that he was said to keep a crucifix and altar in his house, partly because he was accused of having converted his wife to Roman Catholicism, but the charges broke down on examination. In 1673 Pepys **was**

transferred by the king from the navy office to the secretaryship of the admiralty. In 1679 he was member for Harwich, and in the height of the "popish plot" mania he was accused, manifestly because he was a trusted servant to the duke of York, of betraying naval secrets to the French. He resigned office on May 21, 1679, and on the following day he was committed to the Tower, but he was released on bail on July 9, and in the following February the charges against him were finally dropped.

In Oct. 1680 he was with the king at Newmarket, and took down the narrative of his escape after the battle of Worcester. In 1676 Pepys had been appointed a governor of Christ's hospital and was elected master of the Trinity House, and in 1677 he became master of the Clothworkers company. A proposal to make him provost of King's college, Cambridge, in 1681 came to nothing. In 1682 he accompanied the duke of York to Scotland, and in 1683–84 he was engaged in arranging for the evacuation of Tangier. He visited the place and kept a diary of his voyage and of a subsequent tour in Spain. In 1684 he was elected president of the Royal society.

When the admiralty commission of 1679 was dissolved in 1684 Pepys was restored to the secretaryship of the admiralty, and he retained the office when James II ascended the throne. His chief work during this period was the establishment of the special commission of 1686 "for the recovery of the navy." by which its impaired efficiency was entirely restored. In 1685 he again sat in parliament as member for Harwich, and in the same year he was for a second time master of the Trinity House. The revolution of 1688 ended his official career. He was dismissed on March 9, 1689, and spent the rest of his life in retirement and, except for two brief imprisonments in 1689 and in 1690 "on suspicion of being affected to King James," in peace. He died at his friend William Hewer's house in Clapham on May 26, 1703, in the 71st year of his age.

His last years were passed in correspondence with his friends, who included Evelyn and Dryden, or in arranging his valuable library. This was left on his death to his nephew, John Jackson, son of his sister Paulina, and in 1724, by the terms of his will, was transferred to Magdalene college, Cambridge, where it is still preserved.

The Diary. — Such was the outward and visible life of Samuel Pepys, public servant, whose diligence was rewarded by success. The other Pepys, whom Sir Walter Scott called "that curious fellow," was revealed in 1825 when his secret diary was partly published. The first entry was made on Jan. 1, 1660, the last on May 31, 1669, when the increasing weakness of his eyes. which had given him trouble since 1663, compelled him to cease writing in the conditions he imposed upon himself. If there is in all the literature of the world a book which can be called "unique" with strict propriety, it is this. Confessions, diaries. journals, autobiographies abound, but such a revelation of a man's self has not been discovered. The diary is a thing apart by virtue of three qualities which are rarely found in perfection when separate and nowhere else in combination. It was secret: it was full; and it was honest. That Pepys meant it for his own eye alone is clear. He wrote it in Shelton's system of tachygraphy, published in 1641, which he complicated by using foreign languages or by varieties of his own invention whenever he had to record the passages least fit to be seen by his servants or by "all the world." Relying on this cypher, he put down whatever he saw, heard, felt or imagined, every motion of his mind, every action of his body, and he noted all this, not as he desired it to appear to others, but as it was to his seeing.

The result is "a human document" of amazing vitality. The style is as peculiar as the matter — colloquial, garrulous, racy from simplicity of language and full of the unconscious humour which is never absent from a truthful account of the workings of nature in the average man. To his credit must be put the facts that he knew the animalism and the vice of the Restoration period to be what they were; that he had a real love of music and gave help to musicians, Cesare Morelli, for instance; that though he made money out of his places he never allowed bad work to be done for the navy if he could help it; that he was a hard worker; and that he had a capacity for acts of kindness and generosity.

The diary, written in shorthand in six volumes, was included among his books at Magdalene. On the publication of Evelyn's diary in 1818, the then master of Magdalene, the Hon. and Rev. George Neville, decided to publish Pepys's. The library contained both the short and the longhand copy of Pepys's account of King Charles's adventures, but its contents were so little known by the curators that this key was overlooked. The manuscript was deciphered between 1819 and 1822 by John Smith, afterward rector of Baldock in Hertfordshire. The first and partial edition, edited by Richard Griffin Neville, 3rd Lord Braybrooke, appeared in 1825. It attracted great attention, and was reviewed by Sir Walter Scott in the *Quarterly* for Jan. 1826. A second edition followed in 1828. A third and enlarged edition appeared in 1848–49 and a fourth in 1854. A still fuller edition was published in 1875–79 by Mynors Bright. Finally, in 1893–99, H. B. Wheatley printed the whole of the diary with the exception of a few unprintable passages. Pepys's only known publication in his life was the *Memoires of the Royal Navy* (1690).

PERACIDS. The term used in the older literature to characterize acids which contain a peroxide group **(–O–O–j** and which are more properly called peroxy acids; *e.g.*, peroxymonosulfuric acid (H_2SO_5) and peroxydisulfuric acid ($H_2S_2O_8$). *See* PEROXYACIDS. (J. B. Ps.)

PERAVIA: see TRUJILLO VALDEZ.

PERCEPTION is a living organism's awareness of external objects or situations, an awareness gained by means of its senses. In 1765 the Scottish philosopher, Thomas Reid, distinguished between sensation (*q.v.*) and perception; applying the term sensation to the immediate data that come directly from stimulation and the term perception to the larger awareness that includes the reference of these sensations to the external stimulating object. This distinction held until the third decade of the 20th century when, under the influence of Gestalt psychology *(see* PSYCHOLOGY, HISTORY OF: *Gestalt Psychology*) the concept of sensation tended to drop out of use and psychologists began to direct their attention to the larger systems of sensory stimulation, which. since objective reference is implicit in them, are properly called perceptions.

THEORIES OF PERCEPTION

A theory of perception undertakes to explain how the individual organism is aware of the external world in which it lives. Since an organism, if it is to survive and succeed, must have adequate information about its environment, one crucial question is this: how is correct perception possible?

Discrimination. — In the first place, it must be noted that discrimination provides the evidence of perception. The animal or person must react discriminatively to objects or situations if others are to know that perception is taking place. It is much easier to be assured of the occurrence of adequate perception than to know whether the perception is consciously or unconsciously mediated.

A rat can learn always to choose the brighter of two disks of equal size if the brighter of the pair consistently marks the door to a food box. The rat thus perceives a difference in brightness.

In a sense he may be said to have a conscious perception of the disks, but actually that question does not have to be raised. A man engrossed in conversation with his dinner companion finds that the little pile of nuts by his plate has disappeared and that he even has a nut in his mouth. Another man across the table saw him actually eat the nuts. So he must have perceived the nuts, for he discriminated them from other inedible objects which he did not try to ingest. Most psychologists would say that such well-habituated perception is unconscious, although an exact answer to that question depends on the definition of consciousness (see below)

This general rule holds: perception of an object by an organism is always the organism's discrimination among objects as evidenced by its specific reaction to the object.

Representation in Kind.—The Greeks believed that objects emit faint copies of themselves, copies which are transmitted by the senses to the sensorium which perceives the object by perceiving its copy. While this view was too naive to survive in the age of science, the basic principle that perception resembles its object recurs again and again in psychological theory. For instance, John Locke in 1690 distinguished between the primary and secondary qualities of perceived objects. The primary qualities are those characteristics in which the perception resembles its object, like spatial extension. The secondary qualities are the characteristics in nhich the perception does not resemble its object. like colour. This is an important distinction. In modern terms the secondary qualities are those in which there is a functional dependence between experience and stimulus without representation in kind: seen redness depends upon light of long wave lengths, but there is nothing long or undulatory about the hue red itself

About *1920* the Gestalt psychologists proposed psychophysiological isomorphism as a theory of perception. This theory lays down the principle that, in respect of spatial relations, there is a point-to-point correspondence between the experienced perception and the brain pattern nhich underlies the perception, a correspondence such that all the spatial orders of one system are preserved in the other, although shapes and magnitudes may not be preserved. In other words, the correspondence between the brain pattern and the experienced pattern is topological, but not necessarily topographical. The chief evidence for this view comes from the physiological discovery that the excitation of the visual area of the brain corresponds topologically, point for point, to the excitatory pattern on the retinas.

Thus there are four patterns, all topologically isomorphic with one another: *(1)* the projected stimulus pattern of light; *(2)* the pattern of excitation on the retinas; (3) the neurally projected pattern on the visual areas of the brain; and (4) the experienced pattern in the perception. In this way, for the visual perception of bidimensional spatial patterns, the simple theory of perceptual representation of the object in kind, a modern theory of primary qualities, is preserved.

The Gestalt psychologists carried isomorphism further. They believe that the principle holds for tridimensional visual space perception, that the visual perception of depth and solidity corresponds to a tridimensional field of excitation in the brain. They also hold that the perception of intensity, time and movement are ismorphic. In certain cases this theory requires that the characteristics of the stimulus object, which are represented functionally but not in kind in the initial phases of excitation, must be reconstituted in the brain fields that underlie the experienced perception. For instance, in the stereoscopic perception of depth, the depth is represented on the retinas, not in kind, but by disparity between the two retinal images. Isomorphism requires that this disparity operate in the action of the nervous system to reconstitute a solid excitatory field in the visual areas of the brain. The evidence was not yet conclusive in the 1950s as to how or even whether this reconstitution of the stimulus field actually occurs in the brain *(see* below).

Functional Representation.— It is quite clear that not all perceptual qualities are primary; some are secondary. Not all perceptual representation is in kind; some of it is a correspondence between dissimilars, a correspondence that is adequate because it is functionally specific. The longest visible wave lengths of light always look red if they fall, uncombined with other wave lengths, upon the retina of a man who is not colour-blind. That is *a* functional correspondence of dissimilars, the case where isomorphism in perception is certainly not the correct principle.

This view is fully as old as Johannes Müller's theory of specific nerve energies, which he first formulated in *1826* as a protest against the ancient doctrine that perceptual representation. is always in kind. Muller argued for the existence of five specific nerve "energies" or qualities. one for the nerve of each of the five senses. The sensorium perceives, he said. not the properties of the objects themselves, but the properties of the nerves which the objects affect. Thus sight and light are quite different kinds of events. The reason that a person knows there is light when he has sight is that there is, according to Muller, a "specific irritability" of the retina which makes it most easily excited by light. C. S. Sherrington later *(1906)* used the term "adequate stimulus" to designate this specificity of relation between a sense organ and its normal stimulus. Illusion occurs when an unusual stimulus is effective, in spite of its inefficiency, as when pressure on the eyeball arouses the perception of coloured patterns.

It would seem that all perception must imply functional representation of the perceived characteristics of the stimulus, both in the brain and in the experienced perception. Sometimes. but not always, this representation is "in kind" or isomorphic. Presumably there is a topological representation of the stimulus characteristics in the perception of temporal duration, stimulus intensity, visual and tactual spatial patterns in two dimensions, and visual, tactual and auditory movement.

Perceptual Context.— Thus far only the sensory core of a perception, a core which in familiar perceptions is adequate by itself for the identification of the stimulus object, has been considered. Often! however, the core alone is insufficient to constitute the complete perception that the organism wishes or needs. A context must be added to the core if identification of the perceived object is to be satisfactory. I smell a rose. What have I perceived? An odour. But if, by association, there is added to the odour a visual image of a rose, then this visual context, accruing to the olfactory core, provides greater specificity of meaning and further completes the perception. I see a face. It is strange. Then a name comes to mind, and, because of that added context, I have recognized the face.

This context theory of perception is basically an associative theory of perceptual meaning. It was first elaborated by Bishop George Berkeley in 1709, then developed by the associationists (Thomas Brown in 1820, James Mill in 1829, Wilhelm Wundt in 1874), and finally made the basis for Wundt's "mental chemistry" in which meaning is always explained by compounding, by the association of two or more conscious items. The associations that form these identifying contexts are often learned, but they may be inherited reflexes. For instance, a human infant instinctively gives the startle reflex when stimulated suddenly by a loud sound. That reflex is not learned, yet it constitutes the context which makes the sound perceived as "something to be startled by." Similarly a protozoon that turns away from the light may be said to perceive the light as something to be avoided. The light is the core; the turning, the context.

The context theory of perception'was named by E. B. Titchener in 1909. His chief contribution was to note that contexts may be conscious or unconscious, that novel perceptions generally require conscious contexts for their specification, but that the conscious context tends to drop off as the perception becomes familiar, leaving the meaning to be carried unconsciously and evidenced by the adequate discriminatory behaviour of the organism. When a person first sees the word "argali" the perception is inadequate. He does not know what the word means. When he has been told that an argali is a kind of wild sheep or has been shown a picture of one, then for a while the verbal core will arouse an identifying context, the word "sheep" or the visual image of an argali. When the word has become familiar, this context drops off. He can now comprehend the meaning of argali without the context, as is evi-

denced by the fact that later on he can demonstrate his correct comprehension of a text which contains the word. New words need contexts, but in most reading there is no time for the perceptual contexts to accrue. Thus the context theory recalls the basic fact that the evidence of perception is discrimination (see above).

The foregoing theories of perception are supplementary and not mutually exclusive. When perception occurs, the perceived characteristics must have functional representation in the brain. Sometimes this representation is in kind, is isomorphic, and there is further evidence that in some cases physiological means exist for re-establishing a topological correspondence between the stimulus field and the brain field, even when such correspondence has been lost in the initial phases of excitation.

TYPES OF PERCEPTION

The foregoing discussion of theories of perception indicates that perception may be conscious or unconscious, that the functional adequacy of a perception normally enables the organism to obtain correct information about its environment and that a perception, especially a novel one, normally receives further specification by the addition to its sensory core of a context, either a learned association or an innate reflex. It is now proper to discuss further the reconstitution of objects in perception, the perception of relations and unconscious perception.

Perceptual Reconstitution. — Stereoscopic vision furnishes one of the best examples of how the characteristics of the stimulating object are reconstituted in perception. A solid object, viewed with the two eyes, produces somewhat disparate images on the two retinas. Since the two eyes perceive only a single perceptual field, one might expect to see this disparity as a doubling of some of the lines. Instead one perceives a solid object in three dimensions, with no doubling, in spite of the fact that it would not be possible to make the two retinal images coincide in superposition.

The fact that one sees objects single in binocular vision is also an instance of this principle of reconstitution. In this case a little is known about the physiological basis for the perception: corresponding points on the two retinas are projected to the same region of the brain.

The Gestalt psychologists made a great deal of what has been called the constancy phenomenon, that is to say, the tendency to see objects as constant in size, shape, brightness and hue, even when the immediate stimulation from them varies greatly. For instance, a receding object does not lose size nearly so rapidly as the retinal image of it diminishes. Experiments have shown that in free binocular vision the perception of an illuminated disk in the dark may not diminish in size at all as the disk recedes from a distance of 20 ft. to a distance of 200 ft., although the retinal image under those conditions shrinks to $\frac{1}{10}$ of its initial linear size. Such perceived constancy depends, however, on the availability to the organism of clues to the distance, so that the perceiving mechanism can, as it were, correct the perception for the distance. When the clues to distance are reduced by eliminating the use of one eye and eliminating all sight of the intervening space, then the constancy is also reduced and the perceived size is found to diminish with the size of the retinal image.

It is obvious that perceptual constancy can be of great advantage to the organism in its struggle for survival and success. Experiments show that chickens, trained to choose the larger grains of corn and to let the smaller lie, will choose remote large grains which, because remote, have small retinal images, in preference to near small grains which, because near, have the larger retinal images. They choose always the larger object, whether its image on the retina be the larger or the smaller.

The shape of objects also tends to be reconstituted in perception when an oblique viewing of the stimulus distorts the shape of the retinal image. A circle in oblique regard continues to look like a circle, even though its retinal images may be narrow ellipses.

The apparent brightness of an object likewise tends to remain constant in spite of varying illumination. Coal, recognized as coal, looks black even in bright sunlight. Snow, recognized as snow, looks white even in shadow. Actually the snow in shadow may he darker than the coal in sunlight. If both objects are viewed through tubes, which obscure the clues to their nature as objects and reveal only small circular patches of the two surfaces, then the illuminated coal will appear a much brighter gray than the shaded snow.

A discrete displacement of the retinal image will, with the right speeds and spacings, give rise to the visual perception of continuous movement. The cinema makes use of this principle. Actually the translation of the discrete displacement into continuous movement is often a reconstitution of an original stimulus. A moving object is seen clearly only when the eyes move with the object, allowing the image momentarily to remain stationary on the retina. Thus discrete retinal displacement is the rule in the perception of continuous movement, and the perception of continuity of movement is really a reconstitution of the original continuity.

Auditory localization also illustrates the way in which the stimulus situation is reconstituted in the perception. A sound that originates in the median plane between the two ears affects both ears equally and is heard not as a double sound, one on the right and another on the left, but as a single sound localized correctly in the median plane. A sound from the right, however, coming earlier and louder to the right ear is localized at the right. Thus, in general, any sound which comes to both ears but is either earlier or louder at one ear will he localized as coming from the side of that ear.

The general rule is that perception, insofar as it is adequate, tends to reconstitute the characteristics of the stimulus object. Many of these principles were worked out by Gestalt psychology although some of the basic facts. like singleness of vision with two eyes, have been recognized since antiquity.

Perception of Relations. — For the most part perception is relativistic and not absolute. An object has no perceived size, except as is it compared with another object. Precise judgments of tonal pitch, of visual brightness and even of hue are possible only by reference to some standard. Accurate perception is always the perception of a relation.

It is well known that the perception of pitch is relative and that a melody or harmony depends on the relations between the musical notes and not on their absolute pitches. In the same way the visual perception of brightness is relative. If a man or animal learns to choose the brighter of two grays, he will take a given gray when it is combined with a darker one and reject it when it is combined with a lighter one. Men, children, apes, dogs, rats and bees all react in this relativistic manner.

Unconscious Perception. — Whether a perception is to be regarded as conscious or unconscious depends almost entirely upon the definition of consciousness (*q.v.*). It is usual, however, to regard perception as being unconscious when an accurate discrimination leaves no memory trace of its occurrence, when the perceiver cannot say minutes or even seconds afterward whether he perceived or what he perceived. Familiar, well-habituated perceptions fall in this class (see above), as do all rapid discriminations. A man can perceive a familiar designated object quickly when it lies on a table with 99 other strange objects, and he can pick out the designated object again and again from different sets of strange objects, quickly and accurately. He must indeed "see" the other objects in order to reject them and continue his rapid search for the specified object, but he cannot afterward tell much about these other objects. This hurried negative perception of wrong objects, perceived in order to reject them, is practically unconscious — for they do not stick in memory.

There have been experiments in which a discrimination has been determined or aided by clues of which the discriminator declares he was fully unaware. In the same way judgments can be passed without the judge being aware of the motives and prejudices that influence his thought.

There is also the case of contradictory perception which occurs with hypnotism (q.v.). For example, the hypnotist may suggest to the hypnotic subject that they two are alone in the room, although actually there is a third person present. The subject then becomes "blind" to the third person and acts consistently as if he were not there. Nevertheless, the subject never collides with the third person, never tries to sit where the third person is sitting. If the hypnotist suggests that the subject take the chair occupied by the "invisible" person, the subject will find excuses and reasons for not doing what is, in fact, impossible for him to do. In this case it appears that the subject "sees" the man to whom he is blind in order that he may know not to "perceive" him. From these instances it appears that unconscious perception is essentially equivalent to immediately unremembered discrimination.

Social Perception. — This term, which came into vogue in the late 1940s, is used to designate either: (1) the perceptions of social phenomena, like the perception of anger or danger; or (2) those perceptions which are understood by reference to their social determining causes.

The first class of social perceptions presents no new problems or principles. It consists of perceptions of social meanings in which the determinants and even the sensory cores may be unreportable by the perceiver and in that sense are unconscious. Thus a man may perceive anger in another man without knowing what bits of behaviour or facial expressions form the basis for his perception. Nor is this case different from the perception of the constant apparent size of a receding object when the observer does not know that he is unconsciously tdking perceived distance into account.

Of the other class of social perceptions it has been said that the perceived pattern of the external world always mirrors the pattern of the needs of the perceiver. There are many well-known subje-tive determinants of perception, and by no means do they all operate to create illusion, lor true knowledge of the real world is one of the fundamental needs of the organism. Perceptual mechanisms tend to reconstitute the perception in such a manner as to increase the accuracy with which perception represents external objects and other events. Stereoscopic perception of depth, the object constancies and the perception of continuous movement with cinematic dis-

continuity *(see* above) are all cases in point.

Organisms have, however, many other needs besides knowledge of the truth. Illusion may be created by the projection of wishes into perception. "If she be not fair to me, what care I how fair she be." The thematic apperception test samples the needs of a subject or patient by having him describe what he sees in a given picture, one that is capable of many interpretations. Sometimes children see desired objects as larger than undesired ones when all objects are of the same size, and this tendency to subjective distortion has been measured in experiments which provide a set of neutral comparison objects.

Social determinants operate like any of the other determinants of perception. They may work, for instance, in a defensive manner: as when a person, given sufficient time to perceive a rapidly exposed word, nevertheless fails to perceive it because it is an unwelcome word, one that embarrasses or shames him. This case belongs with the contradictory perceptions of the hypnotic state *(see* above), for presumably the respondent must first have perceived the word in order to be able to exclude it from his immediate memory.

(E. G. BOR.)

PERCEVAL, the hero of a comparatively small but highly important group of romances, now forming part of the Arthurian cycle. Originally the story of Perceval was of the character of a folk tale, and that one of considerable importance and world-wide diffusion. He is represented as the son of a widow, *"la dame veuve,"* his father having been slain, in battle or tourney, either immediately before or shortly after his birth. The mother, fearful lest her son should share his father's fate, flies to the woods, either with one attendant or with a small group of faithful retainers, and there brings up her son in ignorance of his name and parentage and all knightly accomplishments. The youth grows up strong, swift-footed and of great personal beauty but, naturally, of very limited education. He spends his days chasing the beasts of the forest.

As the result of a chance meeting with a party of knights he determines to set forth into the world in search of knighthood. He comes to Arthur's court, where he creates a sensation by his personal beauty and uncouth behaviour. He succeeds, by a cast of his javelin, in slaying the Red Knight, a foe of Arthur's who has vainly challenged the knights of the Round Table, and clothing himself in his armour sets out on a series of adventures which differ in the various versions, but the outcome of which is that he becomes a skilful knight and regains the heritage of his father.

This, the Perceval story proper; has been recognized by scholars as the variant of a widespread folk-tale theme, designated by J. G. von Hahn as the Aryan expulsion and return formula, which counts among its representatives such heroes as Perseus, Cyrus and Romulus and Remus. This particular variant appears to be of British-Celtic origin, and the most faithful representative of the original tale is now very generally held to be the English *Sy Percyvelle of Galles,* a poem preserved in the Thornton manuscript of Lincoln cathedral library. Here the hero is nephew to Arthur on the mother's side, and his father, of the same name, is a valiant knight of the court. A noticeable feature of the story is the uncertainty as to the hero's parentage; the mother is always a lady of rank, a queen in her own right or a sister of kings, but the father's rank varies. He is never a king, more often simply a valiant knight, and never of equal rank with his wife.

The connection of the story with Arthur and his court brought about an important development, the precise steps of which are not yet clear. Perceval became the hero of the Grail quest, ousting Gawain to whom the adventure originally belonged, and the Perceval became merged in the Grail tradition. Of the Perceval-Grail romances the oldest, from the point of view of manuscript preservation, is the *Perceval* or *Conte del Graal* of Chrétien de Troyes, but as Chrétien had already in a previous poem (*Cligés*) referred to Perceval as *"un vassal* de *grant renon,"* and states at the commencement of the *Conte del Graal* that he is about to "rimoier" the best tale told in a royal court, it is quite clear that, contrary to the theory of Foerster and Golther, Perceval is no invention of Chrétien's but was already a popular hero. Unfortunately the *Perceval* mas left unfinished, so there is no guide (which the conclusion might have afforded) to the precise character of Chrétien's source and the three writers, Wauchier de Denain, Gerbert and Manessier, who eventually carried the story to a conclusion, differ widely from each other and were clearly familiar with divergent traditions. An interesting problem is that of the relation between Chrétien's poem and the *Parzival* of Wolfram von Eschenbach, which was long held to be a translation from the French poem in spite of the fact that Wolfram himself asserts that his source was the work of a certain Riot and that Chrétien has told the story wrong. A fragment attached to two of the Chrétien manuscripts relates the birth and parentage of the hero, the death of his father and flight of the mother (details only alluded to by Chrétien) in a manner which corresponds curiously with the German poem and which, taken in connection with the knowledge on the part of other writers of features peculiar to the *Parzival,* would indicate that Wolfram was right and that the two works are independent derivations from a common source.

There are also two prose versions of the *Perceval* story, the older, contained in two manuscripts only, is attributed to Robert de Borron and forms the final section of his trilogy, concluding with a version of the death of Arthur manifestly derived from a rhyming chronicle akin to but not identical with that of Wace. The second romance, the *Perlesvaus,* obviously knew and used this text, but it is a much longer and more complicated romance, relating the adventures of Gawain, Lancelot and Perceval (Perlesvaus) in quest of the Grail. It probably formed at one time the *Quest* section of the prose *Lancelot,* and was later displaced in favour of the Galahad version. In fact two Paris manuscripts retain its opening adventure as introductory to the Galahad *Queste,* and in the early printed editions the two are found together. It was in all probability composed toward the close of the 12th century by a Welsh monk of Glastonbury, and was designed to exploit the discovery of the tombs of Arthur and Guenevere in that abbey.

The exact position of the Welsh *Mabinogi, Peredur, Son* of *Evrawc,* is still a matter of debate. It contains incidents which are found in Chrétien, but there is much which is obviously of Welsh and folk-lore origin. The theory that it is a mere translation of the French poem must be rejected, but its exact relation, with that of other *Mabinogion,* to the parallel French versions is uncertain. (*See* also GRAIL, THE HOLY; WAGNER, WILHELM RICHARD.)

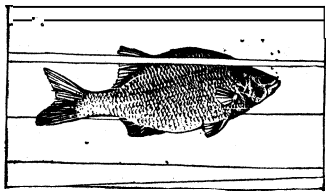
(J. L. W.)

PERCEVAL, SPENCER (1762–1812), prime minister of England from 1809 to 1812, second son of John, 2nd earl of Egmont, was born in Audley square, London, on Nov. 1. 1762. He was educated at Harrow and at Trinity college, Cambridge, and was called to the bar at Lincoln's Inn in 1786, becoming K.C. in 1796. Entering parliament for Northampton in 1796, he supported the administration of Pitt. In 1801, on the formation of the Addington administration, he was appointed solicitor general, and in 1802 he became attorney general. An ardent opponent of Catholic emancipation, he delivered in 1807 a speech on the subject which helped to destroy the Grenville administration; he then became chancellor of the exchequer under the duke of Portland, whom in 1809 he succeeded in the premiership. Perceval retained office till he was shot by a madman named Bellingham, a bankrupt with a grievance who had vainly applied to him for redress, in the lobby of the house of commons on May 11, 1812. Bellingham was certainly insane. nevertheless he was hanged.

See Spencer Walpole, *Life of Spencer Perceval* (1874); P. Treherne,

Spencer Perceval (1909).

PERCH, a fresh-water fish (Percn *fluviatilis*), generally distributed over Europe, northern Asia and North America, and a type of the Percidae, a family of spiny-rayed fishes. It inhabits rivers and lakes but thrives best in waters with a depth of more than 3 ft.; in large lakes it frequently descends to 50 fathoms and more. It occurs in Scandinavia as far north as the 69th parallel. The species exhibits many variations in shape, some specimens being high-backed, others low and long-bodied. A rich greenish brown with golden reflections covers the back and sides, which are ornamented with five or seven dark crossbands. A large black spot occupies the membrane between the last spines of the dorsal tin; and the ventral, anal and lower part of the caudal are bright vermilion. The perch is carnivorous and most voracious. Perch are good, wholesome food and. highly esteemed in inland countries. The perch is exceedingly prolific; it begins to spawn when three years old. in April or in the first half of May, depositing the ova, which are united by a viscid matter in lengthened or net-shaped bands. on water plants. The American yellow perch is almost identical with the perch of Europe. but the American white perch is more nearly related to the European bass. Other members of the Percidae are the pope and the pike-perch (*q.v.*).



BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY

THE WHITE PERCH (MORONE AMERICANA), ONE OF 125 SPECIES

PERCHE, a region of France extending over the departments of Orne, Eure. Eure-et-Loir and Sarthe. Its boundaries are Normandy on the north arid west; Maine, southwest; Vendômois and Dunois, south; Beauce, east; and Thimerais. northeast. The greater part of the district is occupied by a semicircle of heights (from 650 to 1,000 ft.) stretching from Moulins-la-Marche to Montmirail; within the basin formed thereby lie the chief towns —Mortagne, Nogent-le-Kotrou and Bellême. Stock raising and dairy farming flourish in the Perche, which is famous for the production of a breed of large horses. Cider apples and pears are grown. In the middle ages the Perche constituted a countship of which Corbon, Mortagne and Nogent-le-Rotrou were successively the capitals. Under the *ancien régime* it formed. together with Maine, a *gouvernement* of which Mortagne was the capital.

PERCIVAL, JAMES GATES (1795–1856), U.S. poet, philologist, and geologist, was a man of many parts. Born in Kensington, Conn., on Sept. 15, 1795, after receiving B.A. and M.D. degrees from Yale, he attempted many professions, becoming a physician, a tutor, and then a lecturer in chemistry at West Point. His reputation in literature, gained by his Poems (1821), proved ephemeral. In 1827 he worked with Noah Webster on the latter's dictionary until the two men quarreled. Percival knew ten languages, was a prolific poet in his own and in foreign tongues, and studied German, Scandinavian, and Slavic cultures. He was the state geologist for Connecticut (1835–42) and for Wisconsin from 1854 until his death at Hazel Green, May 2, 1856.

His Poetical Works, with a biographical sketch by L. W. Fitch, were published in 1859.

See J. *H.* Ward, *Life and Letters of James Gates Percival* (1866).

PERCUSSION INSTRUMENTS, the name given to those musical instruments from which sound is produced principally by striking. They are divided into two main classes which sometimes overlap: idiophones, in which sound is produced by striking or clashing together hard substances — wood, metal, etc.—and memhranophones, in which sound is produced by vibrating a stretched skin. There are separate articles on all the main percussion instruments or classes of instruments in use in the modern orchestra or dance band; this article traces the development of early instruments, and also describes some unusual and interesting examples of instruments of this type used in folk music or in ancient civilizations. See also CHINESE MUSIC; JAPANESE MUSIC; INDIAN MUSIC; AFRICAN MUSIC.

The first stage in the making of music and the development of musical instruments began when primitive man stamped on the ground or slapped his own body to produce rhythmic sound The sounds produced varied in tone according to whether the heels or toes were used in stamping or whether bony or fleshy parts of the body were struck in slapping With this preinstrumental music is associated the stamped pit, a hole dug in the ground and covered at the top or midway down with a lid of bark. The earliest knonn prehistoric instrument, found always associated with the stamped pit in Paleolithic excavations, is the slung rattle, which was shaken or hung from the ankle. arm or neck of the dancer. It consisted of several shaking pieces nutshells, seeds, hooves, teeth or similar hard objects The gourd rattle (a gourd containing such hard objects) became an important instrument in ritual and to mark time for dancing. Like other primitive instruments it was believed to possess magical power. As a nursery toy, its modern equivalent soothes and amuses children. Under the name maraca (see below) it is an important instrument in the modern Latin-American dance orchestra.

Primitive Drums. — Next in chronological order are the slit drum and the membrane drum found in Neolithic excavations. In its earliest form the slit drum was a hollowed tree trunk, the fashioning of the cavity giving the drum two distinct tones, one on each side of the opening. The original instrument was stamped upon. rammed with long sticks or struck with cudgels, the tone produced being of considerable resonance and carrying power. Existing specimens measure up to 20 ft. in length and 7 ft. in width. The size of the instrument diminished as it developed. In the modern orchestra, the slit drum is found in the form of the Chinese wood block. a small percussion instrument with a clear, penetrating tone.

The drum became indispensable in primitive life. Credited with powers of magic and having numerous other functions, it was held to be the most sacred of instruments, and was therefore developed in several forms. The early membrane drum, which was struck with the bare hands, consisted of a section of hollowed tree trunk covered at one end with reptile or fish skin. Later. the end was covered with the skin of hunted game or of cattle, and sticks were used for striking the drum. which was played in an upright or slanting position, according to its length. The double-headed drum came later, and, with the advent of pottery, the clay drum, an earthenware vessel taking many shapes — goblets, cups, etc. Various methods were used for fastening the skins, some of which are still in use. The skin might be secured to the single-headed drum with pegs, nails, glue, buttoning or neck lacing with cord, while the skins of the double-headed drum were directly cord-braced (*i.e.* laced through the holes of the skin).

Each of the early civilizations furnishes evidence of the development of the drum. A vase from Bismaya (*c.* 3000 B.C.) and other objects found in Mesopotamia at this period illustrate the shallow or frame drum and small cylindrical drums being played in horizontal and vertical positions. A drum (nailed head) as tall as the two players is depicted on a Sumerian vase of the same period. Early Egyptian artifacts show a drum with the skins stretched by a network of thongs, and provide evidence of the use of clappers and concussion sticks. Struck together, the latter were used to scare birds, as a musical instrument to accompany ritual dances and to provide rhythm for work in the fields and at the stamped wine press. An ancient tomb of the Egyptian kings in the catacombs of Eleithya, near Thebes, depicts a group of performing women, one of whom holds a curved concussion stick in each hand.

The origin of the hourglass drum is obscure. A waisted drum, narrower in the middle than at the ends and little longer than it is wide. is seen on one of the Bharatat reliefs, the oldest Indian temple reliefs (2nd century B.C.). The instrument is suspended from an ape's shoulders, and is heing played with two sticks by the animal. The Indian clapper drum (*damaru*), a small drum which is similar in shape to the hourglass, has one or two cords fixed in such a manner that they strike the skins when the instrument is moved to and fro. An hourglass drum with movable pitch (*kalengo*), is still used in Nigeria. Leather thongs stretch from end to end, connecting the two membranes. The drum is held in the hand or under the arm, the player squeezing the cords or releasing the pressure to alter the pitch. The kalengo is played

with the hands or a curved flat-ended stick. It is used by the Yoruba for their Sakara dances and signaling. Skilled players are able to make the drum follow their own tonal language and to interpret it. The manufacture of an important drum involves considerable ceremony. and its use is observed with time-honoured customs. In east Africa, the drum is considered holy and the drumyard a place of refuge. The coronation drums are struck with sticks made of human tibias, and offerings such as cattle made to the royal instruments. Complex rhythms characterize the playing of African drums.

The barrel and shallow nail drum are associated with India and the far east. The wooden frame of the shallow Chinese drum is lacquered red, as a symbol of happiness. and the skins emblematically adorned with the dragon and phoenix. The drum is normally suspended on a stand, the player striking the centre with leather-knobbed sticks. named male and female. A spring is fixed inside certain types of shallow drums of Chinese origin. The spring strikes the inner side of the skins when the outer surfaces are struck. Giant drums were used in Asia in war. The drums and players (who were madmen recruited from prisons) nere secured to wagons drawn by oxen, and placed at the head of battle formation. The frenzied performers pounded their instruments unceasingly with heavy clubs and whips. The strength of the noise from the opposing sides often proved a decisive factor in the conflict. The giant drum of the Chinese called *Hiuen-Kou* is said to have been invented for use in the imperial palace in 1122 B C. This instrument was a barrel drum with nailed heads, upward of four inches in diameter and depth. It oscillated on a specially prepared stand and had a smaller drum on each side.

The wooden fish (China and Japan) is a form of slit drum expertly carved to resemble a mythical fish. The instrument is hollowed out through a ventral slit representing the creature's open mouth, lacquered red and gold and is struck with a heavy painted stick similarly coloured. It is beaten to attract the attention of the divinity, and is tolled in slow tempo by mourners at a funeral service. In modern times the wooden fish is found in many sizes in western orchestras under the name of temple block. It often replaces the coconut shells used to imitate the sound of horses' hooves, and it adds humour to numerous situations on film and radio such as the sound of a popping champagne cork.

The *tablā* player. who is a prominent musician in Indian chamber music, performs on two drums, the *bāmyā* and *tablā*. The *bāmyā* is a small kettledrum (metal shell) with skin stretched by means of leather thongs. The *tablā* has the shape of a truncated cone, is made of wood and is painted in multicoloured stripes. The skin is stretched by leather thongs which are tightened by movable wooden dowels. Circular patches of a substance resembling hard rubber are affixed to the vellum of each drum. The skins are struck with the hand, finger tips, or side of the thumb and vibrated by friction, the ingenious rhythms being enhanced by the different tones obtained from various parts of the vellums. A skilled *tablā* player ranks as a virtuoso. Nakers is the name given in medieval times to small hand-drums with bowl-shaped bodies made of metal, the precursor of the orchestral timpani. *Naqqára* is the Arabic name for similar instruments, which came to Europe as the result of the Crusades. Nakers are often mentioned in medieval literature. and depicted in the Louterell Psalter of the early 14th century, where a pair is seen suspended in front of the player by a strap round the waist, a stick being held in each hand. In Holbein's wood engraving "Dance of Death" Death is seen beating a drum with a thighbone. The instrument is similar in appearance to and positioned like the medieval naker.

Bongoes are'small Cuban drums, bucket-shaped wooden vessels with strong vellum heads which are struck with the fingers and thumb. They form part of the Latin-American orchestra and modern dance bands and consist of a pair of drums of different size and pitch, normally tuned a fifth apart. The instruments are fixed together, and held between the knees or affixed to a stand. Timbales, the French name for kettledrums, is a term loosely applied to instruments in the form of large bongoes in the Latin-American orchestra. They are a pair of drums mounted on a stand and played with sticks. Often the player also performs on a cowbell or paila (mounted on the same stand); the latter was originally an upturned bucket but was later made in the form of a metal plate. (See DRUM).

Percussion **Groups.**—Marrow bones and cleavers is the name given to the traditional music of the butchers of England and Scotland, for which the meat vendors of the old Clare market. London. were long famous. The players produced a musical effect from their implements by a skillful manipulation of their knives (cleavers), and an assortment of marrow bones. A complete octave, rendering the effect of a peal of bells, was produced from the cleavers, and rhythmic features were provided by striking the bones and also drums. Important weddings brought these players considerable remuneration both for their attendance and their abstention. On being informed that the "orchestra" intended to serenade the couple, the father of the bride would seldom refuse the gratuity in advance to escape the infliction. The marrow bones and cleavers can be observed in use in plate VI of Holbein's series "The Wedding of the Industrious Apprentice to His Master's Daughter" (1538). An early use of percussion instruments in domestic music making is seen in Bottom's remark in *A Midsummer Night's* Dream ". . . I have a reasonable good ear in music. Let's have the tongs and the bones." A domestic instrument associated with the marrow bones and cleavers was the saltbox. It mas beaten with a rolling pin in such a manner as to produce varying sounds, and was used to provide a rhythmic accompaniment to an instrumental ensemble. The verse in Bonnell Thornton's burlesque "Ode to St. Cecilia's Day" (1763). which so amused Dr. Johnson, describes the method of performance.

> In strains more exalted the salt-box shall Join,
> And clattering and battering and clapping combine;
> With a rap and a tap while the hollow side sounds,
> Up and down leaps the flap, and with rattling rebounds.

Steel Band.—This form of music originated in Trinidad; the instruments consisted at first of dustbin lids. and Iater, of oil drums. It is believed that these domestic appliances replaced various bamboo instruments, and that the authorities prohibited their use on feast days in view of their possible use as weapons during periods of unrest. Dents are skillfully fashioned in metal receptacles of varying size. and the base of the depression struck with a mallet. The pitch of the note is determined by the diameter and depth of the indentation. The steel band in commercial entertainment has a considerable musical attraction, the range of the instruments covering four chromatic octaves.

Bell Instruments.— The Turkish crescent (chapeau *chinois* or jingling johnny) is an instrument introduced into the military bands of Great Britain and elsewhere about 1800, at the time of the popularity in western Europe of Janissary music. The crescent is an upright pole surmounted by a tent-shaped construction and metal headpiece. composed of a crescent and other symbols. from which points and elsewhere on the pole, hang small bells and jingles. Plumes made from horsetails further ornament the instrument, the bells and jingles of which are shaken in rhythm.

The sistrum is an instrument of percussion of definite pitch (occasionally found in Italian scores) consisting of a series of small mushroom-shaped bells, mounted in pyramid-fashion on a handle. The compass of the instrument ranges from one to three octaves, with the bells mounted diatonically in a single row, or chromatically in two rows. (See SISTRUM; GLOCKENSPIEL; BELL.)

The tubaphone was a popular solo instrument in the military band repertoire during the early part of the 20th century. It consisted of a series of short metal tubes arranged in a frame in tuo rows. Similar in design and sound to the orchestral glockenspiel, it was played in the same manner.

The jingles are a spray of bells, or metal pieces, smaller than the normal sleigh or harness bells.

Percussion Instruments in the **Orchestra.**—"Slap-Stick" is a device used in the orchestra to produce the sound of the crack of a whip and consists of two pieces of wood, joined in a V-shape by hinging at the base, or partway up to form a handle.

The maraca or maracas is a Latin-American percussion instrument used in pairs in the rumba band. A gourd, or substitute, fixed to a handle is filled with dried seeds which rustle when the

instrument is shaken. or alternatively produce a clicking sound when the gourd is tapped with the forefinger. (*See* above), Claves are round sticks of hardwood six to eight inches in length, descendants of the primitive concussion sticks (*see* above). In the Latin-American dance orchestra rhythm is marked by the claves which the player strikes in a recurring pattern. One piece of wood, held over the upturned fingernails of one hand, is struck with the other, held lightly in the manner of a drum stick. Bones are a percussion instrument used in the 19th-century British or American Negro minstrel band. Two pieces of a rib bone of an animal, are held between the fingers and clicked together. The cabaça is a Latin-'American instrument consisting of a calabash shell surrounded with a network of beads. The handle of the cabaça is held in the right hand with the bowl of the instrument resting in the palm of the left hand. Rotation of the handle causes the resonant bowl to turn within its network of beads, producing a gentle rasping sound.

The guiro (known also as scraper or reso-reso) is a calabash gourd, or short length of bamboo stem into which is plowed a series of deep grooves in regular formation. Sound is produced by drawing over the grooves a thin strip of bamboo, or similar rigid object. Stravinsky wrote a part for the "guero" in the original score of *Le Sacre du printemps* but later deleted it. The guiro forms an integral part of the modern rumba band.

PERCY (FAMILY). This family, whose deeds are so prominent in English history, was founded by WILLIAM DE PERCY (*c.* 1030–96), a follower of the Conqueror, who bestowed on him a great fief in Yorkshire and Lincolnshire. The register of Whitby abbey, which he founded anew, and in later days the heralds. were responsible for the fabulous origin and pedigree of the family. By Emma, daughter of Hugh de Port, a great Hampshire baron. William was father of several sons. of whom ALAN the eldest succeeded him. His grandson WILLIAM (d. 1175) was the last of the house in the direct line. and left two daughters and coheiresses, Maud countess of Warwick, who died childless, and Agnes. Agnes de Percy had married Jocelin, brother of Queen Adelaide, second wife of Henry I, and from this marriage descended the second house of Percy (which name it assumed). till its own extinction in the male line five centuries later (1670). By it was brought into the family the great Petworth estate in Sussex, which Jocelin had obtained from his sister. His son RICHARD (*c.* 1170–1244) was one of the 25 barons appointed to enforce the observance of Magna Carta and in 1216 was an active supporter of Louis of France against King John.

HENRY DE PERCY (1273–1314) was one of Edward I's most active agents in the subjugation of Scotland until the success of Robert Bruce drove him out of Turnberry castle, and made him withdraw into England. Summoned to parliament as a baron in the time of Edward I, he later, as one of the lords ordainer, supported the baronial opposition to the personal rule of Edward II. Hitherto the family had been mainly connected with Yorkshire, but Henry gave its fortunes a new direction by his purchase of lands in Northumberland from Antony Bek, bishop of Durham, among them the great lordship of Alnwick, which became the principal seat of the family. Henceforth the Percys, now the greatest landowners in Northumberland, became the principal guardians of the northeastern border against the Scots, and successive members of the family served regularly as wardens of the marches.

Henry's son, another HENRY (c. 1299–1352), did splendid service to his sovereign by defeating and taking prisoner David II, king of Scotland. at the battle of Neville's Cross (1346).

To him succeeded his son, another HENRY PERCY (1322–1368), a feudal baron like his predecessors. who fought at Crécy during his father's lifetime and whose brother THOMAS PERCY (1333–1369) was bishop of Norwich from 1356 to 1369. Henry's son, HENRY PERCY. 1st earl of Northumberland, father of the famous Hotspur, SIR HENRY PERCY (*q.v.*), was killed at Bramham Moor in 1408, his title and estates being forfeited after his rebellion in 1405. Henry V formally restored them in 1416 to this earl's grandson, HENRY (1394–1455), then' a prisoner with the Scots, whose liberation he procured. For the later history of the family *see* NORTHUMBERLAND, EARLS AND DUKES OF. (C. D. R.)

BIBLIOGRAPHY.—E. B. De Fonblanque, *Annals of the House of Percy* (1887), and G. Brenan, *History of the House of Perry, W. A.* Lindsay, ed (1902), both somewhat adulatory; Surtees Society, vol. 117, *The Percy Chartulary* (1911); Northumberland County History Committee, *History of Northumberland* (1893–1940); *W.* Dugdale, *The Baronage of England* (1675); G. E. C(okayne), *Complete Peerage,* revised ed., vol. ix and x (1936, 1945).

PERCY, SIR HENRY, called HOTSPUR (1364–1403), eldest son of Henry. 1st earl of Northumberland, was born on May 20, 1364 He saw active service when he was 14 at the siege of Berwick. His zeal in border warfare won the name of Hotspur for him from his opponents. In 1386 he was sent to Calais and raided French territory, but was shortly afterward recalled to defend England against a naval attack by France. In popular story and ballad he is known as one of the heroes of Otterburn or Chevy Chase. In the summer of 1388 the Scots invaded England by way of Carlisle, sending a small body under the earls of Douglas, Mar and Moray to invade Northumberland. The earl of Northumberland remained at Alnwick, but sent his sons Sir Henry (knighted in 1377) and Sir Ralph against the enemy. In hand-to-hand fighting before the walls of Newcastle, Douglas is said to have won Hotspur's pennon, which he swore to fix upon the walls of Dalkeith. The Scots then retreated to Otterburn where Hotspur, who was bent on recovering his pennon, attacked them on a fine August evening in 1388. Douglas was slain in the battle, though not (as is stated by Walsingham) by Hotspur's hand. Hotspur was captured by Sir John Montgomery, and his brother Ralph by Sir John Maxwell. Hotspur was released on the payment of a heavy ransom, to which Richard II contributed £3,000, and in the autumn his term as warden of Carlisle and the West March was extended to five years.

In 1399, together with his father, he joined Henry of Lancaster (afterward Henry IV), who gave the charge of the West March to Northumberland, while Hotspur received the castles of Bamburgh, Roxburgh and Berwick and the wardenship of the East March, with a salary of £3,000 in peacetime and £12.000 in war. During the first year of Henry's reign Hotspur was appointed justiciar of North Wales and constable of the castles of Chester. Flint, Conway, Denbigh and Carnarvon. Henry also gave him a grant of the island of Anglesey, with the castle of Beaumaris. William and Rees ap Tudor captured Conway castle on April 1, 1401, and Percy in company with the prince of Wales set out to recover the place, Percy providing the funds.

In May he reported to the king the pacification of Merioneth and Carnarvon, and before the end of the month Conway was surrendered to him. His demands for arrears of pay were, however, refused, and he had the same difficulty in obtaining money for his northern charge as he had experienced in Wales. Anglesey was taken from him, and he was deprived of Roxburgh castle in favour of his rival. the earl of Westmorland. The Scots again invaded England in the autumn of 1402, headed by the earl of Douglas and Murdoch Stewart, son of the duke of Albany, but were heavily defeated by Northumberland and Hotspur at Humbledon, or Homildon hill. on Sept. 14. Disputes with the king arose over the disposal of the Scottish prisoners, Percy insisting on his right to hold Douglas as his personal prisoner, and he was summoned to court to explain.

It is related that when he arrived Henry asked for Douglas, and Hotspur demanded in return that his brother-in-law, Edmund Mortimer, should be allowed to ransom himself from Owen Glendower, with whom he was a prisoner. High words followed, in the course of which Henry called Percy a traitor, struck him on the face, and drew his sword on him. Percy is said to have answered this defiance with the words, "Not here, but on the field."

In the summer of 1403 Hotspur raised the standard of rebellion in Cheshire, where Richard II had won for himself a special loyalty. Henry was accused of having broken his promises, of murdering Richard II, and of excluding from the throne Richard's legitimate heir, the young earl of Rlarch, to whom Hotspur was related

through his wife, Elizabeth Mortimer. The king's speedy action prevented Hotspur's occupying Shrewsbury and joining his Welsh ally, Glendower, and on July 21, 1403, Hotspur, accompanied by his uncle. Thomas Percy, earl of Worcester, and the earl of Douglas, with a force of Cheshire men, was forced to give battle outside Shrewsbury. Hotspur was killed, the earls of Douglas and Worcester, Sir Richard Venables of Kinderton and Sir Richard Vernon were captured, and the rebel army dispersed. Worcester, Venables and Vernon were executed the next day. Percy's body was buried at Whitchurch, but was disinterred two days later to he exhibited in Shrewsbury. The head was cut off and fixed on one of the gates of York. *See* also NORTHUMBERLAND, EARLS AND DUKES OF: PERCY (FAMILY).

PERCY, THOMAS (1729–1811), English man of letters and bishop of Drornore, whose ballad collection *Reliques of Ancient English Poetry* (1765) stimulated research into ballad poetry and inspired the romantic movement. He was born at Bridgnorth, Shropshire, April 13, 1729. He went to Christ Church, Oxford, and held livings at Easton Maudit (1753) and Wilby (1756), both in Northamptonshire, for many years. In 1763 he edited the poems of the earl of Surrey and published *Five Pieces of Runic Poetry From the Islandic Language*. The *Reliques* were based on an old manuscript he rescued from a friend's house, where parts of it had been used to light the fire. He edited them at William Shenstone's suggestion and, although some doubted their authenticity and many scoffed at their primitive style, they became increasingly popular and profoundly influenced Scott, Wordsworth and Coleridge. The standard edition is by H. B. Wheatley (1876). In 1770 Percy published *Northern Antiquities*, a set of translations including one (from a Latin version) of the Icelandic *Edda*, which thus became available to English readers for the first time. In his preface he makes a scholarly distinction, unusual for his period, between the various branches of the Celtic and Teutonic peoples. His *Ancient Songs*, chiefly on Moorish subjects, translated from Spanish, were edited by D. Nicol Smith (1932).

Percy became domestic chaplain to the duke of Northumberland (1770) and, through his influence! dean of Carlisle in 1778 and bishop of Dromore in Ireland in 1782. He died there on Sept. 30, 1811.

PERDICCAS, the name of three kings of Macedonia, who reigned respectively *c.* 700 B.C., *c.* 454–413 B.C., and 364–359 B.C., and of one of Alexander the Great's generals, son of Orontes, a descendant of the independent princes of the province of Orestis. At Alexander's death Perdiccas was probably acting chiliarch (vizier), and supported the claim of the unborn child of Roxana to the throne. Meleager's revolt forced a compromise under which Philip Arrhidaeus and the unborn child (if a son) were to be joint kings. with Craterus as regent for Arrhidaeus and, perhaps, Perdiccas for the infant, who was duly born a son (Alexander IV.). The Lamian war called Craterus to Europe and left Perdiccas in control; it was he who divided up the satrapies. In the ensuing confusion Perdiccas may be classed among those who wished to keep the Empire a unity, though personal friendship and circumstances first grouped him with Ptolemy, a convinced separatist, against Antipater and Antigonus. Perdiccas had to abandon Alexander's Arabian schemes, but set himself to complete the conquest of Asia Minor. When Antigonus refused to help, he invaded Cappadocia in 322, established his most reliable subordinate, Eumenes. there and made progress in Pisidia and Armenia. Then he called Antigonus to account; Antigonus fled to Antipater and Craterus and convinced them that Perdiccas was aiming at the throne; Ptolemy joined them. Perdiccas marched to meet the allies, failed to force the Nile at Pelusium, and his soldiers mutinied and murdered him. *(See* MACEDONIAN EMPIRE.) (E. R. B.)

PERDIGUIER, AGRICOL (1805–1875). French worker-writer, and a leading spokesman of the French working-class movement of the 1830s and 1840s. Born on Dec. 3, 1805, at Morières near Avignon, he was largely self-educated and learned the trade of cabinetmaker working his way across the country in the *Tour de France* customary for members of a *compagnonnage; i.e.,* one of the centuries-old secret societies of journeymen-artisans that were the most effective labour organizations of the period. Going to Paris in 1829, he worked actively and wrote extensively to reform the *compagnonnages*, but his lifelong labours to unify the warring societies were in vain. The *compagnonnages* themselves were doomed by their own exclusiveness and by their failure to adjust themselves to the industrial transformations of the age.

A republican, Perdiguier was elected to the constituent assembly in 1848 and to the legislative assembly in 1849. On Louis Napoleon's *coup d'ttat* in 1851, he was exiled, although he had been neither a socialist nor a conspirator. In Belgium and Switzerland he wrote his most important book, *Mémoires d'un compagnon* (1854–55, 2nd ed., with introduction by D. Halévy, 1914), which describes his *tour* and gives a vivid picture of life, work and labour organization in Restoration France. Back from exile in 1855, Perdiguier remained a man of moderation and opposed the Paris Commune of 1871. He died in Paris on March 26, 1875.

See Jean Briquet, *Agricol Perdiguier: compagnon du Tour de France et représentant du peuple, 1805–75* (1955). (V. R. L.)

PEREDA, JOSÉ MARÍA DE (1833–1906), Spanish novelist, was born at Polanco near Santander, and began his literary career by contributing articles to a local journal, *La Abeja montañesa,* in 1858. In 1864–71 appeared his powerful realistic sketches of local life and manners under the title of *Escenas montañesas,* and a second series was published under the title of *Tipos y paisajes* (1871). These were followed by *Bocetos al temple* (1876), *Tipos trashumantes* (1877), and *El Buey suelto* (1877), which was intended as a reply to the thesis of Balzac's work, *Les Petites misères de la vie conjugale*. More and more pessimistic as to the political future of his country, Pereda took occasion in *Don Gonzalo González de la Gonzalera* (1879), to ridicule the revolution as he had seen it at work, and to pour scorn upon the *nouveaux riches* who exploited liberalism for their personal ends. Two novels by his friend Pérez Galdós, *Doña Perfecta* and *Gloria,* drew from Pereda a reply, *De Tal palo tal astilla* (1880), in which he endeavours to show that tolerance in religious matters is disastrous alike to nations and to individuals. The *Esbozos y rasguños* (1881) is of lighter material, and is less attractive than *El Sabor de la Tierruca* (1882), a striking piece of landscape which won immediate appreciation. In *Pedro Sdnchez* (1883) Pereda leaves his native province to portray the disillusion of a sincere enthusiast who has plunged into the political life of the capital. Pereda's masterpiece is *Sotileza* (1884), a vigorous rendering of marine life by an artist who perceives and admires the daily heroisms of his fisher-folk. It has often been alleged against the author that he confines himself to provincial life, to lowly personages and to unrefined subjects, and no doubt an anxiety to clear himself from this absurd reproach led him to attempt a description of society at the capital in *La Montálvez* (1888), which is certainly the least interesting of his performances. In *La Puchera* (1889) he returned to the marine subjects which he knew and loved best. Again in *Peñas arriba* (1895), his love of country life is manifested in the masterly contrast between the healthy labour of the fields and the squalid life of cities.

Pereda belongs to the native realistic school of Spain, which, founded by the unknown author of *Lazarillo de Tormes,* was continued by Mateo Alemán, Cervantes, Quevedo, Castillo Solórzano and many others. With the single exception of Cervantes, however, the picaresque writers are almost entirely wanting in the spirit of generous sympathy and tenderness which constitutes a great part of Pereda's charm. His realism is purely Spanish, as remote from Zola's moroseness as from the graceful sentimentality of Pierre Loti. Few 19th-century writers possessed the virile temperament of Pereda, and, with the single exception of Tolstoy, none kept a moral end more steadily in

view. This didactic tendency unquestionably injures his effects. Moreover, his grim satire occasionally degenerates into somewhat truculent caricature, and the excessive use of dialect and technical terms which caused him to supply Sotileza with a brief vocabulary is a grave artistic blemish. But he saw, knew, understood character; he created not only types, but living personages, such as Andrés, Cleto and Muergo in Sotileza, Pedro Juan and Pilara in La *Puchera;* and he personified the tumult and calm of the sea with more power than Victor Hugo displayed in *Les Travailleurs de la mer*. His descriptive powers were of the highest order, and his style, pure of all affectations and embellishments, is of singular force and suppleness. With all his limitations, he was as original a genius as Spain produced during the 19th century. (J. F.-K.)

PÈRE DAVID'S DEER, an aberrant mule-like deer (*q.v.*), the first evidence of whose existence was made known in Europe by the Abbé (then Père) David, who in 1865 obtained the skin of a specimen from the herd in the imperial park at Pekin. The front prong of the main fork of each of the large antlers, which lack brow-tines, curves forward and divides at least once; while the hind prong is of great length, undivided, and directed backwards in a manner found in no other deer. The tail reaches the hocks, and is donkey-like in form. The head is long and narrow, with a prominent ridge for the support of the antlers, moderate-sized ears, and a narrow and pointed muzzle. A gland and tuft are present on the skin of the outer side of the upper part of the hind cannon-bone; but there is no gland on the inner side of the hock. Although new-born fawns are spotted, the adults are uniformly coloured; the general tint of the coat at all seasons being reddish tawny with a tendency to grey. The antlers are shed and replaced twice a year, a unique feature. The true home of this deer has never been ascertained, all now living being kept in confinement.

PERE DAVID'S DEER, THE MI-LOU OF CHINA; TRUE HOME UNKNOWN

PEREGRINE FALCON: *see* FALCON.

PEREGRINUS PROTEUS (2nd cent. A.D.), Cynic philosopher, of Parium, Mysia. At an early age he was suspected of parricide, and was obliged to leave his native place. During his wanderings he reached Palestine, where he became the virtual head of the Christian community. His fanatical zeal and craving for notoriety led to his imprisonment, but the governor of Syria freed him. He resumed his wandering life, at first assisted by the Christians, but having been detected profaning the rites of the Church, he was excommunicated. During a visit to Egypt he made the acquaintance of the famous Cynic Agathobulus and joined the sect. Meeting with little encouragement, he journeyed to Rome, whence he was expelled for insulting the emperor Antoninus Pius. Crossing to Greece, he finally took up his abode at Athens. Here he obtained many pupils, including Aulus Gellius. But, having given offence by his attacks on Herodes Atticus and finding his popularity diminishing, he announced his intention of immolating himself on a funeral pyre at the celebration of the Olympian games in 165, and actually carried it out. Lucian, who was present, has given a full description of the event.

See C. M. Wieland's *Geheime Geschichte des Philosophen Peregrinus Proteus* (Eng. trans., 1796); this is an attempt to rehabilitate his character. *See* also Lucian, *De morte Peregrini;* Aulus Gellius xii. II.; Ammianus Marcellinus xxix.; Philostratus, *Vit. Soph.* ii. *1.,* 33; J. Bernays, *Lucian und die Kyniker* (1875); E. Zeller, "Alexander und Peregrinus," in his *Vorträge und Abhandlungen,* ii. (1877); and Uberweg, *Grundriss der Gesch. der Philosophie,* Bd. *1.* (1926).

PEREIRE (Pereira), GIACOBBO RODRIGUEZ (1715–1780), one of the inventors of deaf-mute language, was born at Estremadura, Spain, on April 11, 1715. He fell in love with a young girl who had been dumb from birth, and devoted himself to discovering a method of imparting speech to deaf-mutes. He devised a sign alphabet for the use of one hand. Pereire was made a member of the Royal Society of London in 1759. He died at Paris on Sept. 15, 1780.

PEREKOP, a village of the Crimean A.S.S.R., on the isthmus which connects the Crimea with the Continent. It was formerly a salt trading town, but declined rapidly after the opening of the Rharkov to Sevastopol railway. It was re-graded as a village in 1925. In ancient times the isthmus was crossed by a ditch which gave the name of Taphros to a Greek settlement. This line of defence having fallen into decay, a fort was erected and a new ditch and dike constructed in the 15th century by the Tatar khan of the Crimea, Mengli Ghirai, and by his son and successor Sahib Ghirai. The fort, known as Kapu or Or-Kapu, became the nucleus of the town. In the middle ages Perekop was known as Tuzla. In 1736 it was captured by the Russians and again in 1738 under Lassy (Lacy), who blew up the fort and destroyed a great part of the dike. In 1754 the fort was rebuilt by Krim Ghirai; but the Greek and Armenian inhabitants of Perekop formed a new settlement at Armyanskiy Bazar (Armenian Market), 3 mi. south. Captured in 1771, the town passed into Russian possession with the rest of the Crimea in 1783.

PERENNIALS, the name given to those plants whose natural term of life or life cycle continues for more than two growing periods or years in contradistinction to annuals. which exist for a single growing period, and biennials whose life term embraces only two growing periods. Perennials may be woody (*e.g.,* trees and shrubs) or herbaceous (*e.g.,* iris).

PEREYASLAVL, a town of the Ukrainian S.S.R.. in 50° 4' N., 31° 30' E, at the confluence of the Trubezh and the Alta, which reach the Dnieper 5 mi. lower down at the town's port, the village of Andrushi Pop. (1956 est.) 22,200. Though founded in 993 by Vladimir the Great of Moscow in memory of his success over the Turkish Pechenegs, Pereyaslavl has now few remains of antiquity. From 1054 Pereyaslavl was the chief town of a separate principality. As a southern outpost it often figures in the 11th, 12th and 13th centuries, and was plundered by the Mongol. in 1239. In later times it was a centre of the Cossack movement; and in 1628 the neighbourhood was the scene of the extermination of the Polish fdrces known as "Taras Night." By the Treaty of Pereyaslavl in 1654 the Cossack chieftain Bogdan Chmielnicki acknowledged the supremacy of Tsar Alexis of Russia. The town is the centre of an agricultural district and has a flour-milling industry.

PEREZ, ANTONIO (*c.* 1540–1611), for some years the favourite minister of Philip II. of Spain and afterwards the object of his unrelenting hostility, was the natural son of Gonzalo Perez, secretary both to Charles V. and to Philip II. Legitimated by an imperial diploma issued (1542) at Valladolid, Pérez became secretary of State in 1567, protonotary of Sicily, and at the death of Ruy Gomez de Silva, prince of Eboli, in 1573, head of the "despacho universal," or private bureau, from which Philip governed by correspondence the affairs of his dominions. Juan de Escovedo, another of the king's secretaries, attached after 1574 to Don John of Austria to check the latter's ambitious schemes, was sent by John to Rome to obtain the pope's consent to his plan for making himself master of England by marrying Mary Queen of Scots. Pérez was shown the pope's letter by his nuncio in Spain; he informed Philip who authorized him to arrange for the murder of Escovedo. After several unsuccessful attempts to poison Escovedo, Pérez had him assassinated in a street of Madrid on March 31, 1578. A prosecution was set on foot by the representatives of the murdered man. Philip appeared at first willing to protect his accomplice; ultimately he was the secret instigator of those who sought his ruin. Pérez was arrested on July 28, 1579. The process dragged on until 1589 when, on the eve of being condemned, Perez escaped to Aragon. An Aragonese by birth, by the ancient "fueros" of that kingdom, he could claim a public trial and so bring into requisition documentary evidence of the king's complicity-in the deed.

To avoid this, Philip ordered Pérez to be transferred from the civil prison in Saragossa to that of the Inquisition, on a charge

of heresy arising from certain blasphemous expressions used by Perez. A popular tumult broke out. Perez escaped across the Pyrenees, and Aragon was punished by losing its ancient "fueros" altogether (1591) after a crushing defeat from Philip's armies. Perez was well received at Pau by Catherine de Bourbon, passed on to the court of Henry IV of France, and both there and in England, his talents and diplomatic experience, as well as his well-grounded enmity to Philip, secured him at first much popularity. In England he became intimate with Francis Bacon, and was also much in the society of the earl of Essex. After the Peace of Vervins (1598) he lost all political importance; his efforts to obtain pardon from Philip III proved vain and he died in poverty and obscurity in Paris on Nov. 3, 1611.

See J. A. Froude, *An Unsolved Historical Mystery* in *The History of the Spanish Armada* (London, *1892*); M. Hume, *Españoles e ingleses* (1903); J. Fitzmaurice-Kelly, *Antonio Pérez* (Oxford, 1922).

PÉREZ DE AYALA, RAMÓN (1881–), Spanish novelist and poet, was born at Oviedo. Beginning with a volume of verse. *La Paz del sendero* (1904), he first attracted notice as a novelist by *A. M. D. G. (ad majorem Dei gloriam)* (1910). *La Putn de la raposa* (1912), *Belarmino y Apolonio* (1921), *Luna de miel* and its sequel *Urbano y Simona* (1922) and the short stories *El Ombligo del mundo* (1925) consolidated his literary reputation. His last full-length novels were *Tigre Juan* and *El Curandero de su honra* (1926). After serving as ambassador to Great Britain (1931–36) he went to live in Argentina.

PÉREZ DE HITA, GINES (1544?–1619), Spanish novelist and poet, served in the campaign of 1569–71 against the Moriscos. He relates his experiences in the second part of the *Guerras civiles de Granada* (1595–1604?), which purports to be a chronicle based on an Arab original. It is in reality a historical novel. The events which led to the downfall of Granada are related with uncommon brilliancy, and the sympathetic transcription of life at the Emir's court undoubtedly influenced the Hispano-Mauresque novels of Mlle. de Scudéry and others.

PÉREZ GALDOS, BENITO (1843–1920), Spanish novelist, was at first engaged in political journalism, but the reception given to his early novels, *La Fontana de oro* (1870) and *El Audaz* (1871), encouraged him to adopt novel writing as a profession. He had already determined upon the scheme of his *Episodios nacionales*, a series which might compare with the *Comédie humaine*. Old charters, old letters, old newspapers were collected by him with the minuteness of a German archivist; no novelist was ever more thoroughly equipped as regards the details of his period. *Trafalgar*, the first volume of the *Episodios nacionales*, appeared in 1873, and long before the first series ended in 1879 Perez Galdós took rank among the foremost novelists of his time. A monument of industry and exact knowledge, of realism and romantic conception, the *Episodios nacionales* were carried on into a fifth series, raising the total of volumes to 46. Parallel with his immense achievement in historical fiction, Perez Galdós published a collection of romances dealing with contemporary life, its social problems and religious difficulties. Of these the best known, and perhaps the best, are *Doña Perfecta* (1876); *Gloria* (187;) ; *La Familia de Ledn Roch* (1878); *Marianela* (1878); *Fortunata y Jacinta* (188;); and *Angel Guerra* (1891). Nor does this exhaust his prodigious activity. Besides adapting several of his novels for stage purposes, he wrote original dramas such as *La Loca de la Casa* (1893), *San Quintin* (1894), *Electra* (1900) and *Mariucha* (1903); but his diffuse, exuberant genius was scarcely accommodated to the convention of theatrical form.

PERFUMES, substances, generally of complex composition, which by reason of their fragrance gratify the sense of smell. The history of perfumes is closely associated with that of cosmetics (*q.v.*), and many of the earliest forms were made by digesting odorous vegetable substances with sesame, almond or olive oil. The principle underlying this process is still made use of although in an improved form and will be referred to later under *Maceration.*

Natural Perfumes.—These are the product of plant metabolism and their highest form is found in the scent of fresh flowers. This fragrance is due to the occurrence in the petals of minute traces of essential oil which in rose and lavender is in the free state, whereas in jasmin and tuberose it is in the form of a glucoside. Under favourable conditions this complex substance is progressively decomposed in the presence of an enzyme or ferment with the formation of a volatile oil. The occurrence of natural perfume is, however, by no means confined to the inflorescence but frequently exists in other parts of the vegetable organism. Briefly it is found in the

flowers of cassia, carnation, clove, hyacinth, heliotrope, mimosa, jasmin, jonquille, orange blossom, rose, reseda, violet and ylang ylang;
flowers and leaves of lavender, rosemary, peppermint and violet;
leaves and stems of geranium, cinnamon and patchouli;
barks of cinnamon and cassia;
woods of cedar, linaloe and santal;
roots of angelica, sassafras and vetivert;
rhizomes of calamus, ginger and orris;
fruits of bergamot, lemon, lime and orange;
seeds of bitter almonds, anise and nutmeg;
gums or *oleo-resinous exudations* from myrrh, peru balsam, storax and tolu

As mentioned above, the odoriferous constituents of the plant generally occur as a volatile oil which, after separation as described below, is a highly aromatic, mobile liquid. This usually contains several individual bodies, differing chemically, and to one or more of these the typical odour of the oil is due. Chemistry has been able in many cases to establish definitely these principal constituents, as, for instance, the odour of almond oil is attributed principally to *benzaldehyde*, of clove oil to *eugenol* and of lemon oil to *citral*. Where the oil is of complex composition, the typical odour is believed to be due to several perfectly blended constituents. For instance, in rose otto the *higher aliphatic aldehydes* in minute traces, together with the esters of the alcohols *geraniol* and *citronellol*, undoubtedly determine the distinctive rose fragrance. The separation of these natural odoriferous materials from the plant is no easy matter since a process that is suitable for one is of no use for another because the delicate perfume substance may be destroyed or decomposed or, furthermore, may be incompletely extracted. It will be best to describe briefly each process of the plant material under treatment.

Distillation. — This is effected by either boiling the vegetable organism with water in a closed apparatus when the source of heat may be an open fire or a steam-heated coil or jacket in the bottom; or by blowing live steam through the material. In each case the still is connected at the top with a condenser, through which the steam passes, carrying with it in suspension the fine particles of essential oil, the condensed steam and oil emerging from the lower orifice. On standing aside the oil floats to the top and is separated. Distillation with an open fire is the oldest process and in places far distant from modern factories this is resorted to by the peasants. It is, however, not free from danger, for if the water in the apparatus gets low the material is burned, then the odour of the resulting oil is impaired. In some parts of Bulgaria this method is used for preparing rose otto and in some parts of India for distilling palmerosa oil. When steam is used for distillation a separate boiler is erected near by and the question of damaging the oil by burning is therefore eliminated. Generally the raw material does not touch the bottom of the apparatus but is supported upon a false bottom or perforated sheet of metal and sometimes placed in an open wire basket suspended inside. In some cases the water used for distillation dissolves part of the oil or its constituents. It is sold separately, as, for instance, rose water or orange-flower water. Modern apparatus as used in Europe and America is often required to take one ton of material, such as lavender or peppermint, the capacity of the still being about 1,200 gallons. This process is applicable to the majority of the vegetable organisms mentioned above, the principal exceptions being some of the *flowers* and most of the *fruits.*

Expression.—The general name of the processes used to extract the essential oil occurring in the peels of bergamot, lemon, lime and orange fruits. The *sponge process* is used mainly for lemons and oranges cultivated in Sicily and the Calabrian belt. Girls cut the fruits either transversely or longitudinally and remove the pulp. The peel is then steeped in water to make the

cells more turgid. Men then press this drained peel on sponges which absorb the oil. The sponges are squeezed and the oil runs out into a shallow earthenware bowl placed in front of each operator. As each bowl is filled it is emptied into jars and allowed to stand until any juice has separated at the bottom. Subsequently it is filtered and packed in copper cans for export. The *Ecuelle* method consists of rolling the whole fruits about in hollow vessels covered with spikes inside. The oil cells are broken and the liquid flows into a receptacle in the handle. It is then clarified as above. Machines are now largely used to extract the oil from bergamots and lemons. In some cases the peel is broken and the oil collected, while in others the whole fruit is subjected to pressure, when the oil and juice run out together. The oil is separated in a machine something like a milk separator and comes out at the top (cream orifice). Limes are sometimes pressed by the sponge process, but the greater part of the oil is a by-product in the preparation of lime-juice.

Extraction. — The general name given to the processes used for extracting the essence from those flowers to which distillation would not be suitable because (1) the high temperature of steam would damage some of the unstable aromatic constituents and (2) the yield would be inadequate. Enfleurage has been employed in the south of France for many years and until comparatively recently was the process used for extracting all flowers. To-day it is used mainly for jasmin and tuberose and depends upon the absorption of perfume by fats. Wooden frames, called "chassis," each support a glass plate, on both sides of which is painted a specially prepared and purified mixture of beef and pork fats. The petals are spread lightly on the layers of grease and the chassis piled one upon the other. These are left for some hours until the grease has absorbed all the perfume. Fresh flowers replace the exhausted ones and the process is repeated until the fats are fully charged with perfume. These fats are known as pomades. Maceration differs from enfleurage in that the flowers are immersed in hot fats or oils at about 65°C. The heat ruptures the cells and the perfume is absorbed by the fat. Roses and all other flowers excepting jasmin and tuberose are treated this way. Volatile solvents are now largely used for extracting the essence from all flowers and many leaves and mosses. The vegetable organism is placed in a series of hermetically sealed cylinders and petroleum ether of great purity is allowed to run through them slowly. The last container is connected with a vacuum still and the solvent is distilled off and returned to the tank for use again. The perfume remains behind in the retort and is called a concrete. It contains the highly odorous essence together with natural and insoluble plant waxes. The concretes are shaken with strong and pure alcohol for 24 hours in machines called "batteuse." The perfume and some wax is dissolved and the insoluble waxes filtered out. The alcoholic extract is then placed in a freezing mixture, when the soluble waxes are separated. The solution of the pure flower essence is distilled in *vacuo*, which removes the alcohol and leaves behind the so-called absolute flower oil. This is the most expensive type of perfumery raw material and in the case of jasmin is worth from £3 to £6 an ounce according to the flower crop. The quantity of this flower used per annum for oil or other of these processes has for many years exceeded 1,300 tons while in the case of orange blossom it is even 2,000 tons.

Animal Perfumes. — These are of great importance in preparing finished perfumes and impart to them "life" and diffusiveness. The principal animal perfume is musk. This is a dried secretion from the preputial follicles of the male musk deer, which inhabits the mountainous districts of the Atlas and Himalayan ranges. The most important commercial variety is known as *Tonquin* musk, coming from Tibet and the plains of Kokonor, where the animal is found at altitudes of about 8,000 feet. The Chmese hunters capture the deer by various means and after killing it remove the gland completely. This is dried to develop the odour when it is known as a musk pod. After treatment and frequent adulteration with blood, earth, shot and hide the pods find their way to Tatsienlu in the province of Szechven. This is the principal centre for the trade and pods are then sent to dealers in Shanghai, whence they are exported. A quantity of musk is retained by the Chinese for medicinal purposes. Ambergris is a calculus formed in the intestines of the sperm whale. It is sometimes found there when the animal is killed but at others is picked up in the sea after being expelled. The calculus is the product of an intestinal disease caused probably by the insufficient digestion of cuttlefish, a food much appreciated by the sperm whale, To find a large piece of ambergris is a rare stroke of luck for sailors and one of the largest pieces ever found was stated to weigh 248 lb. and was valued at £13,200. Civet is a soft fatty substance of foetid odour imported principally from Abyssinia and packed in horns. It is a glandular secretion of both male and female civet cats. Castor is another perfume of animal origin, being the dried preputial follicles and their secretion from the Canadian and Russian beaver.

Balsams, Gums and Oleo-resins. — These are very important raw materials for perfumes because they generally have a soft and tenacious odour. Commercial samples consist of the natural exudation from the plant together with extraneous matter which is present owing to the crude methods of collection in different parts of the world. The valuable portion of the material contains a small percentage of highly odorous essential oil and a large proportion of soluble resin. The extraneous matter is eliminated by treating the crude substance with alcohol or other solvent, filtering out the insoluble matter and concentrating the filtrate by suitable methods. Some of the more important substances coming under this head are as follows: — Benzoin is obtained from trees native to Siam, Sumatra and Java. Incisions are made in the trunk and when the bark is removed the resin flo s out as a milky sap and dries in the sun. Labdanum is a secretion from the leaves of several species of a genus of the rock rose family. The modern method is to collect the leaves and extract them, as described above, by means of volatile solvents. *Storax* is a balsam obtained from trees occurring in vast forests in the south-west of Asia Minor. It is collected by the Yaruks who beat the outer bark of the tree in midsummer and this causes the balsam to exude into the inner bark. The outer bark is then removed and the inner bark stripped off with knives. It is boiled with water, whcn the balsam separates and floats to the top.

Synthetics and Isolates are substances of standard quality prepared by chemical means. An isolate exists in a natural product and is separated from it in a nearly pure state. Examples of this are geraniol, an alcohol from palmerosa oil; carvone, a ketone from caraway oil; eugenol, a phenol from clove oil; safrol, a phenolic ether from camphor oil. A synthetic is "built up" from other substances, but this does not mean that it cannot exist in nature. There are many instances where a perfumery material occurs as one of the constituents of an essential oil, but it would never pay to separate it because it can be synthesised chemically much cheaper. Examples are phenyl ethyl alcohol, occurring in rose otto but synthesised from phenyl acetic esters; benzyl acetate, occurring in jasmin oil but synthesised from benzyl alcohol; linalyl acetate, occurring in lavender and bergamot oils but synthesised from acetic anhydride and linalol. Many synthetics, however, do not, so far as is known, exist in nature but are the result of chemical research. Examples are ionone, having the odour of violets and synthesised from citral and acetone; hydroxy-citronellal, having the odour of lilies and lilac and synthesised by hydrating citronellal; phenyl acetic aldehyde, having the odour of hyacinths and synthesised from cinnamic acid; musk ketone, having an odour recalling that of animal musk and synthesised by nitrating butyl-meta-xylene; d-cresyl phenylacetate, having an odour resembling that of narcissus and synthesised from coal tar liquors. Other important synthetic aromatic chemicals are amyl salicylate — (odour of clover); anisic aldehyde — (odour of may-blossom); benzylidene acetone — (odour of sweet pea); beta naphthol ethers — (odour of orange blossom); coumarin — (odour of tonka-beans); iso-eugenol — (odour of carnation); heliotropin — (odour of heliotrope); ethyl protocatechuic aldehyde — (odour of vanilla); gamma undecalactone — (odour of peaches); methyl phenyl acetate — (odour of gardenia); terpineol — (odour of lilac).

Artificial Flower Oils. — These are very widely used in the

perfumery industry, not only as a basis for finished perfumes, but more particularly for scenting cosmetics. The misconception which exists concerning the crudeness of odour of these oils is altogether unfounded, especially when they have been prepared by an expert. It is quite true to say that no perfume offered to the public is entirely made from natural flower extracts. It is the *absolutes* skilfully blended with the synthetics, balsams and animal extracts that impart the delicious softness of odour so much appreciated. The question of price generally decides how much of the natural substance shall enter the artificial compound. For instance, a good jasmin oil made without any absolute would cost about two shillings an ounce. If about 2% of real Jasmin were added (and this proportion is necessary for the best oils) then the price would be doubled. In many cases the perfume of flowers has been analysed, not completely because so far the reactions are not known for detecting many of the mere traces of aromatics present in a flower. When a flower perfume has been analysed by present methods, however, it is a relatively simple matter to prepare an imitation from the known constituents, but there is always something lacking in the artificial odour. In order to compensate for this missing link a small quantity of the natural extract is used. In those cases where the composition of the flower perfume is not known the chemist must employ the nearest natural substance having an odour akin to that being imitated. For instance, the composition of the perfume of violets is not known, so a small percentage of cassia absolute is used to give a natural finish to the ionone employed as its base.

Finished Perfumes.—These are prepared from the artificial flower oils by solution in alcohol of about 80% strength. They are toned or blended with balsams, gums and oleo-resins, which retard the rate of evaporation, and small quantities of extracts of animal origin are added to give greater persistence and diffusiveness of odour.

In many cases further quantities of flower extracts are added to improve the delicacy of the perfume and the whole is allowed to stand for several weeks or months in glass-lined tanks to allow it to mature.

The tenacity of a scent is of the utmost importance, and the longer a perfume will remain fragrant after application to the handkerchief or garment the more popular it becomes. This is known as *fixation* and must be controlled during the whole of the process of manufacture.

Examples of fixators are (1) oils—patchouli, clary sage, sandalwood, vetivert; (2) balsams, gums and oleo-resins—benzoin, labdanum, myrrh, oakmoss, storax; (3) synthetics—benzyl cinnamate, ethyl phthalate, coumarin, musk ambrette, heliotropin, vanillin. Many perfumes are so-called bouquets of flowery odour, yet representing no particular flower. In these cases the typical odour is generally a combination of synthetics, one of which is used in sufficient quantity to create a new perfume note. (W. A. Po.)

PERGA (mod. *Murtana*), an ancient city of Pamphylia, situated about 8 m. inland, at the junction of a small stream (Sari Su) with the Cestrus. It was a centre of native influences as contrasted with the Greek, which were predominant in Attalia, and it was a great seat of the worship of "Queen" Artemis, here represented as a human-headed cone and a purely Anatolian nature goddess.

In Perga, Paul and Barnabas began their first mission in Asia Minor (Acts ix. 13). A much frequented route into Phrygia and the Maeander valley began at Perga, and Alexander made it the starting-point of his invasion of inner Asia Minor. Long the metropolis of Pamphylia Secunda, it was superseded in Byzantine times by its port, Attalia, which became a metropolis in 1084. The extensive ruins all lie in the plain south of the Acropolis. The walls are well preserved, but of late Roman or Byzantine reconstruction. The most notable monument is the theatre outside the walls on the S.W. Modern Murtana is only a large village.

PERGAMUM or PERGAMUS (mod. *Bergama*), an ancient city of Teuthrania, a district in Mysia. It is usually named Πέργαμον by Greek writers, but Ptolemy has the form Πέργαμος.

Little but mythology is known of the city till the time of Xenophon, but it had been striking coins since 420 B.C. at latest. Its importance began under Lysimachus. In 283 B.C. Philetaerus, governor of the fortress, rebelled, and Pergamum became the capital of a little principality. Philetaerus contrived to keep on good terms with his neighbours on all sides (283–263 B.C.). His nephew Eumenes (263–241) succeeded him, increased his power, and even defeated Antiochus II. of Syria near Sardis. His successor Attalus I. (241–197) won a battle over the Gauls, and assumed the title of king. Other Greek kings in Asia Minor reduced Pergamenian power to a very low ebb about 222. On the other hand, the influence of the Romans was beginning to make itself felt in the East. Attalus prudently connected himself with them and shared in their continuous success. Pergamum thus became the political and cultural capital of a considerable territory. The splendour of Pergamum was at its height under Eumenes II. (197–159). He continued true to the Romans during their wars with Antiochus and Perseus, and his kingdom spread over the greater part of western Asia Minor, including Mysia, Lydia, and a great part of Phrygia, Ionia and Caria. He left an infant son, Attalus (III.), and a brother, Attalus II. (Philadelphus), who ruled 159–138, and was succeeded by his nephew, Attalus III. (Philometor). The latter died in 133, and bequeathed his kingdom to the Romans, who erected part of it (excluding Great Phrygia, which they gave to Mithradates of Pontus) into a province under the name of Asia. Pergamum continued to rank for two centuries as the capital, and subsequently, with Ephesus and Smyrna, as one of the three great cities of the province; and the devotion of its former kings to the Roman cause was continued by its citizens, who erected on the Acropolis a temple to Augustus. It was the seat of a *conventus*, including the cities of the Caïcus valley and some of those in the northern part of the Hermus valley. Under the Roman Empire Pergamum was one of the chief seats of the worship of Asclepius "the Saviour." Pergamum was the chief centre of the imperial cult under the early empire, and in Rev. ii. 13 is referred to as the place of "Satan's throne." It was also an early seat of Christianity, and one of the Seven Churches. The place, re-fortified by the Byzantines, and still retaining its name as Bergama, passed into Muslim hands early in the 14th century. The lower town was rebuilt, and in the 17th and 18th centuries became a chief seat of the great Dere Bey family of Kara Osman Oglu, which did not resign it to direct Ottoman control until about 1825. It is still an administrative and commercial centre of importance. Excavations in the late 19th century at the south end of the Acropolis led to the discovery of the Altar of Zeus erected by Eumenes II. in 180 B.C. to celebrate his victory over the Gauls. In very high relief and representing furious action, these altar sculptures are the finest which survive from the Pergamene school, which replaced the repose and breadth of earlier schools by excess of emphasis and detail. The summit of the Acropolis is crowded with public buildings, between the market place, which lies at the southern point, and the Royal Gardens on the north. In the interval are the Zeus altar; the great hexastyle Doric temple of Athena flanked by the palace on the east, by the theatre and its long terrace on the west, and by a library on the north; and a large Corinthian temple of Trajan. The residential part of the Greek, and practically all the Roman city lay below the Acropolis on ground now mostly occupied by modern Bergama; but west of the river Selinus, on rising ground facing the Acropolis, are the remains of a Roman theatre, an amphitheatre and a circus.

PERGOLESI (or PERGOLESE), **GIOVANNI BATTISTA** (1710–1736), Italian musical composer, was born at Jesi near Ancona on Jan. 3, 1710. He was sent by a noble patron to complete his education at Naples, where he became a pupil of Greco, Durante and Feo for composition and of Domenico de Matteis for the violin.

His earliest known composition was a sacred drama, *La Conversione di S. Guglielmo d'Aquitania,* between the acts of which was given the comic intermezzo *Il Maestro di musica.* These works were performed in 1731, probably by fellow pupils, at the monastery of St. Agnello Maggiore. Pergolesi was then commissioned to write an opera for the court theatre, and in the winter of 1731 successfully produced *La Sallustia,* followed in 1732 by *Ricimero,* which was a failure. Both operas had comic intermezzi, but in neither case were they successful. After this he abandoned the theatre for a time and wrote 30 sonatas for two violins and bass for the prince of Stigliano.

In Sept. 1732 he returned to the stage with a comic opera in Neapolitan dialect, *Lo Fratè inammorato,* which was well received; and in 1733 he produced a serious opera, *Il Prigionier,* to which the celebrated *Serva padrona* furnished the intermezzi. About this time (1733–34) Pergolesi accompanied the duke of Maddaloni to Rome. The failure of *L'Olimpiade* at Rome in Jan. 1735 was followed by a conspicuous success with his comic opera *Il Flaminio* at Naples in September of the same year. In 1736 he was sent by the duke of Maddaloni to the Capuchin monastery at Pozzuoli. the air of the place being considered beneficial to cases of consumption. There he is supposed to have written the celebrated *Stabat Muter;* Paisiello, however, stated that this work was written soon after he left the *Conservatorio dei poveri di Gesù Cristo* in 1729. Of quite a different nature was the humorous, not to say improper, *Scherzo fatto ai Cappuccini di Pozzuoli.* Pergolesi died prematurely on March 17, 1736, and was buried in the cathedral of Pozzuoli.

BIBLIOGRAPHY.—The most complete life of Pergolesi is that by E. Faustini Fasini (Ricordi, 1900); G. Annibaldi, *Il Pergolesi in Pozzuoli, vita intima* (Jesi, 1890), gives some interesting additional details derived from documents at Jesi, but is cast in the form of a romantic novel. H. M. Schletterer's lecture in the *Sammlung musikalischer Vorträge,* ed. by Count P. von Waldersec, is generally inaccurate and uncritical, but gives a good account of later performances of Pergolesi's works in Italy and elsewhere. Complete lists oi his compositions are given in Eitner's *Quellen-Lexicon* and in *Grove's Dictionary* (New York, 1955).

PERI, JACOPO (1561–1633), Italian musical composer, was born at Florence on Aug. 20, 1561, of a noble family. After studying under Cristoforo Malvezzi of Lucca, he became *maestro di cappella,* first to Ferdinand, duke of Tuscany, and later to Cosmo II.

He was a member of the literary and artistic circle which frequented the house of Giovanni Bardi, conte de Vernio, where the revival of Greek tragedy with its appropriate musical declamation was a favourite subject of discussion. The poet Ottavio Rinuccini supplied a drama with the title of *Dafne,* to which Peri composed music, and this first attempt at opera was performed privately in 1597 in the Palazzo Corsi at Florence. In 1600 Rinuccini and Peri were commissioned to produce an opera on the occasion of the marriage of Henry IV of France with Maria de' Medici. This work (*L'Euridice*) attracted a great deal of attention, and the type once publicly established, the musical drama was set on the road to success by the efforts of other composers and the patronage of other courts.

Peri afterward wrote recitatives to Rinuccini's *Arianna* (1608), an opera *ddone* for Mantua (1620) and *La Precedenza delle dame* for the court of Florence (1625). He died in Florence on Aug. 12, 1633.

Peri's *Dafne* (which has entirely disappeared) and *L'Euridice* (printed at Florence. 1600; reprinted Venice, 1608, and Florence. 1863) are of the greatest, importance not only as being the earliest attempts at opera, but as representing the new monodic and declamatory style which is the basis of modern music as opposed to the contrapuntal methods of Palestrina and his contemporaries. Of his work only *L'Euridice* and the *Varie musiche a una, due a tre voci* (Florence, 1609) survive.

See R. Rolland, *Histoire de l'opéra en Europe avant Lulli et Scarlatti* (1895).

PERIANDER (625–585 B.C.), the second tyrant of Corinth. In contrast with his father Cypselus, the founder of the dynasty, he is generally represented as a cruel despot. The Greek tradition, however, is probably derived from a prejudiced source. There is no doubt that he was ruthless with the remains of the nobility. A careful sifting of the available evidence would rather tend to represent Periander as a ruler of probity and insight, and the firmness and activity of his government is beyond dispute. His home administration was so successful that he was able to dispense with direct taxation, and, combined with the farseeing colonizing activities, laid the foundations of Corinth's commercial and industrial prosperity.

Periander further appears as a patron of literature, for it was by his invitation that the poet Arion came to Corinth to organize the dithyramb. To promote and protect Corinthian commerce he established colonies at Potidaea and Apollonia in Macedonia. at Anactorium and Leucas in northwestern Greece, and he is said to have projected a canal through the isthmus. In Greece proper he conquered Epidaurus and annexed Corcyra. He cultivated friendly relations with the tyrants of Miletus and Mytilene, and maintained a connection with the kings of Lydia, of Egypt and, possibly, of Phrygia.

Periander was reckoned one of the seven sages of Greece, and was the reputed author of a collection of maxims in 2,000 verses. The letters ascribed to him are spurious.

See Herodotus iii. 48–53, v, 92; Aristotle, *Politics,* v, 6, 10–12; Heracleides Ponticus in C. Müller's *Frag. hist. graec.,* ii, 212; Nicolaus Damascenus, *ibid.*, iii, 393; Dioyenes Laertius, *De vitis clarorum philosophorum,* i, ch. 7; *Cambridge Ancient History,* vol. iii (1925).

PERIANTH, the term used in botany to denote the outer covering of the flower, composed of more or less modified but nonreproductive leaves and divided usually into an outer, often greenish whorl, the calyx of sepals; and an inner, often brightly-coloured whorl, the corolla of petals.

(See FLOWER.)

PERIBOLOS or PERIBOLUS, in architecture, a sacred enclosed space, usually containing a temple, altar or shrine, especially used of such enclosures in ancient Greece, but occasionally of the enclosed, consecrated ground around an early mediaeval church, which was the limit to which its rights of sanctuary extended.

PERICARDIUM, DISEASES OF. The serous sac (pericardium) containing the heart may become the seat of inflammation (pericarditis) just as the cardiac valves and heart muscle may during the course of such acute diseases as rheumatic fever. (For anatomy, *see* COELOM AND SEROUS MEMBRANES.) The normal shiny appearance is lost; the membrane becomes congested; and inflammatory serum exudes into the cavity. In this stage the visceral and parietal layers grate upon one another with each heart beat and give rise to a "friction rub" over the front of the chest which can be heard with the stethoscope and may be perceptible to the hand. As more inflammatory exudate collects, the surfaces are separated and friction disappears. Thereafter the course of the disease varies as the inflammation advances or recedes. The accumulation may become so extensive that it seriously impedes cardiac action; and if the pericarditis accompanies or follows pneumonia the fluid may become purulent. In either event exit must be given to the fluid surgically.

If the disease recedes the roughened pericardial surfaces again come into contact through absorption of the exuded fluid and friction reappears. Fibrous adhesions form between the pericardial layers over a greater or smaller area; sometimes they become universally adherent and the cavity is obliterated. Occasionally when the covering of the heart and the lining of its sac become firmly adherent one to another, the mechanical function of the heart is disturbed and congestive heart failure results. Calcium may be deposited in the pericardium under these circumstances,

making the diagnosis much easier by its appearance in X-rays of the chest. For this condition there are highly successful surgical procedures. Exudation of fluid into the pericardial cavity, apart from inflammation, occurs in certain diseases of the kidney; in these cases often unaccompanied by symptoms though. it is a serious omen. In rupture of the heart or in certain varieties of aneurysm the pericardial sac is suddenly filled with blood. Distress is extreme, and death from mechanical interference with the action of the heart occurs after a few seconds.

Another condition that occasionally results in accumulation of fluid in the pericardial sac is myxedema (hypothyroidism). This condition can be completely alleviated by the administration of thyroid extract. Tumours of the pericardium are very rare and are nearly always benign. They may cause mechanical difficulty in the heart's activity. *See* also HEART, DISEASES OF THE; HEART AND LUNG, SURGERY OF. (W. S. L.-B.; E. B. BY.)

PERICLES (*c.* 490–429 B.C.), Athenian statesman, was born about 490 B.C., the son of Xanthippus and Agariste. His father took a prominent part in Athenian politics, and in 479 held high command in the Greek squadron which annihilated the remnants of Xerxes' fleet at Mycale; through his mother, the niece of Cleisthenes, he was connected with the former tyrants of Sicyon and the family of the Alcmaeonidae. His early training was committed to the ablest and most advanced teachers of the day; Damon instructed him in music, Zeno the Eleatic revealed to him the powers of dialectic; the philosopher Anaxagoras, who lived in close friendship with Pericles, had great influence on his cast of thought and was commonly held responsible for that calm and undaunted attitude of mind which he preserved in the midst of the severest trials.

The first important recorded act of Pericles falls in 463, when he helped to prosecute Cimon on a charge of bribery, after the latter's Thasian campaign; but as the accusation could hardly have been meant seriously Pericles was perhaps put forward only as a lay figure.

Undue prominence has commonly been assigned to him in the attack upon the Areopagus in 462 or 461 (see AREOPAGUS; CIMON), which was mainly the work of his senior colleague Ephialtes. To Ephialtes likewise we must ascribe the renunciation of the Spartan alliance and the new league with Argos and Thessaly (461).

Not long after, however, when Ephialtes fell by the dagger, Pericles undoubtedly assumed the leading position in the state. On several later occasions, and throughout the period 443–429 B.C., he held the office of strategus (general in command), and to the end of his life he remained the most influential speaker in the ecclesia (popular assembly).

The beginning of his ascendancy is marked by an unprecedented outward expansion of Athenian power. In continuance of Cimon's policy, 200 ships were sent to support the Egyptian insurgents against Persia (*c.* 459 B.C.), while detachments operated against Cyprus and Phoenicia.

At the same time Athens embarked on several wars in Greece proper. An alliance with the Megarians, who were being hard pressed by their neighbours of Corinth, led to enmity with this latter power, and before long Epidaurus and Aegina were drawn into the struggle. On sea the Athenians, after two minor engagements, gained a decisive victory which enabled them to blockade Aegina. On land their general Myronides beat off two Corinthian attacks on Megara, which had been further secured by long walls drawn between the capital and its port Nisaea, located nearly a mile distant. In 457 the Athenians and their allies ventured to intercept a Spartan force which was returning home from central Greece. At Tanagra in Boeotia a pitched battle was fought, in which both Pericles and the partisans of Cimon distinguished themselves.

The Spartans were successful but did not pursue their advantage. and soon afterward the Athenians, seizing their opportunity, sallied forth again and obtained the submission of all Boeotia, save Thebes, and of Phocis and Locris. In 455 Tolmides secured Naupactus on the Corinthian gulf; in 454 Pericles himself made a descent upon Oeniadae at the mouth of the gulf. These years mark the zenith of Athenian greatness. Yet the drain on the country's strength was severe, and when news arrived in 453 that the Egyptian armament had been destroyed by the Persians a reaction set in, and Cimon was empowered to make peace with Sparta on the basis of the status quo. For a while the old anti-Persian policy again found favour in Athens, and Cimon led a great expedition against Cyprus; but on his death hostilities were suspended, and a lasting arrangement with Persia was brought about. It was probably in order to mark the definite conclusion of the Persian War and to obtain recognition for Athens' work in punishing the Mede that Pericles now proposed a pan-Hellenic congress at Athens to consult about the rebuilding of the ruined temples and the policing of the seas; but owing to the refusal of Sparta the project fell through.

Pericles may now have hoped to resume his aggressive policy in Greece proper, but the events of the following years completely disillusioned him. In 447 an Athenian army, which had marched into Boeotia to quell an insurrection, had to surrender in a body at Coroneia, and the price of their ransom was the evacuation of Boeotia. Upon news of this disaster Phocis, Locris, and Euboea revolted, and the Megarians massacred their Athenian garrison, while a Spartan army penetrated into Attica as far as Eleusis. In this crisis Pericles induced the Spartan leaders to retreat, apparently by means of a bribe, and hastened to reconquer Euboea; but the other land possessions could not be recovered, and in a thirty years' truce which was arranged in 445 Athens definitely renounced her predominance in Greece proper. Pericles' foreign policy henceforward underwent a Profound change—to consolidate the naval supremacy, or to extend it by a cautious advance, remained his only ambition. While scouting projects for interference in distant countries, he occasionally made a display of Athenian power abroad, as in his expedition to the Black sea (after 445 B.C.) and in the coionization of Thurii (445–443 B.C.), which marks the resumption of a western policy. The peaceful development of Athenian power was interrupted by the revolt of Samos in 440. Pericles himself led out a fleet against the seceders; he won a first engagement, but unwisely divided his armament and allowed one squadron to be routed. In a subsequent battle he reduced the town itself.

Turning to Pericles' policy towards the members of the Delian League, we find that he frankly endeavoured to turn the allies into subjects (*see* DELIAN LEAGUE). A special feature of his rule was the sending out of numerous cleruchies (*q.v.*), which served the double purpose of securing strategic points to Athens and converting the needy proletariat of the capital into owners of real property. The land was acquired either by confiscation from disaffected states or in exchange for a lowering of tribute. The chief cleruchies of Pericles are: Thracian Chersonese (*c.* 450 B.C.), Lemnos and Imbros, Andros, Naxos and Eretria (before 447); Brea in Thrace (446); Oreus (445); Amisus and Astacus in the Black sea (after 445); Aegina (431).

In his home policy Pericles carried out more fully Ephialtes' project of making the Athenian people truly self-governing. His chief innovation was the introduction of payment from the public treasury for State service. He provided a remuneration of one to two obols a day for the jurymen, and he created a "theorikon" fund which enabled poor citizens to attend the dramatic representations of the Dionysia. In connection with this system of salaries should be mentioned a somewhat reactionary law carried by Pericles in 451, by which an Athenian parentage on both sides was made an express condition of retaining the franchise and with it the right of sitting on paid juries. The measure by which the archonship was opened to the poorer citizens (457 B.C.) may also be due to Pericles (see ARCHON).

The last years of his life were troubled by a new period of storm and stress. A conflict between Corcyra and Corinth, the second and third naval powers of Greece, led to the simultaneous appearance in Athens of an embassy from either combatant (433). Pericles had, as it seems, resumed of late a plan of western expansion by renewing alliances with Rhegium and Leontini, and the favourable position of Corcyra, on the trade-route to Sicily and Italy, as well as its powerful fleet, no doubt helped to

induce him to secure an alliance with that island, and so to commit an unfriendly act towards a leading representative of the Peloponnesian League. Pericles now seemed to have made up his mind that war with Sparta, the head of that League, had become inevitable. In the following spring he fastened a quarrel upon Potidaea, a town in Chalcidice, which was attached by ancient bonds to Corinth, and in the campaign which followed Athenian and Corinthian troops came to blows. A further *casus belli* was provided by a decree forbidding the importation of Megarian goods into the Athenian empire, presumably in order to punish Megara for her alliance with Corinth (spring 432). The combined complaints of the injured parties led Sparta to summon a Peloponnesian congress which decided on war against Athens, failing a concession to Megara and Corinth (autumn 432). In this crisis Pericles persuaded the wavering assembly that compromise was useless, because Sparta was resolved to precipitate a war in any case. An embassy calling upon the Athenians to expel the accursed family of the Alcmaeonidae, clearly aimed at Pericles himself as its chief representative, was left unheeded, and early in 431 hostilities began between Athens and Sparta and their respective allies (*see* PELOPONNESIAN WAR).

At the same time Pericles was being sorely hampered by his adversaries at home. The orthodox Conservatives and some democrats who were jealous of his influence, while afraid to beard the great statesman himself, combined to assail his nearest friends. The sculptor Phidias (*q.v.*) was prosecuted on two vexatious charges (probably in 433), and before he could disprove the second he died under arrest. Anaxagoras was threatened with a law against atheists, and felt compelled to leave Athens. A scandalous charge against his mistress Aspasia, which he defeated by his personal intercession before the court, was taken very much to heart by Pericles. His position at home scarcely improved during the war. His policy of abandoning the countryside was unpopular with the land-owning section of the people, who from the walls of Athens could see their own property destroyed by the invaders. At the end of the first year of war (early in 430) Pericles made a great appeal to the pride of his countrymen in his well-known funeral speech. But in the ensuing summer, after a terrible outbreak of plague had ravaged the crowded city, the people became thoroughly demoralized. Pericles led a large squadron to harry the coasts of the Peloponnese, but met with little success. On his return the Athenians sued for peace, though without success, and a speech by Pericles had little effect on their spirits. Late in 430 they deposed him from his magistracy. In addition to this they prosecuted him on a charge of embezzlement and imposed a fine of 50 talents. A revulsion of feeling soon led to his reinstatement, apparently with extraordinary powers. But the plague, which had carried off two of his sons and a sister, had left its mark also on Pericles himself. In the autumn of 429 he died and was buried near the Academia, where Pausanias (150 A.D.) saw his tomb. A slightly idealized portrait of Pericles as *strategus* is preserved to us in the British Museum bust, No. 549, which is a good copy of the well-known bronze original by Cresilas.

If we now endeavour to give a general estimate of Pericles' character and achievements, it will be well to consider the many departments of his activity one by one. In his foreign policy his standpoint was at all times purely Athenian. We may clearly distinguish two periods in his administration of foreign affairs. At first, joining to Cimon's anti-Persian ambitions and Themistocles' schemes of western expansion a new policy of aggression on the mainland, he endeavoured to push forward Athenian power in every direction, and engaged himself alike in Greece proper, in the Levant and in Sicily. After Cimon's death he renounced the war against Persia, and the collapse of 447–445 had the effect of completing his change of attitude. Henceforward he repressed all schemes of adventure and confined himself to the gradual expansion and consolidation of the empire. It is not quite easy to see why he abandoned this successful policy in order to hasten on a war with Sparta, and neither the Corcyrean alliance nor the Megarian decree seems justified by the facts as known to us, though commercial motives may have played a part which we cannot now gauge. In his adoption of a purely defensive policy at the beginning of the Peloponnesian War he severely tried the temper of the Athenians, but in the main his policy was sound, and the disasters of the war cannot fairly be laid to his charge. In his attitude towards the members of the Delian League Pericles likewise maintained a purely Athenian point of view, and his appropriation of federal funds for Athenian purposes is difficult to justify. But he could hardly be said seriously to have oppressed the subject cities. Under Pericles Athens also attained her greatest measure of commercial prosperity, and the activity of her traders all over the Levant, the Black sea and the West, is attested not only by literary authority, but also by many Attic coins and vases.

Pericles' home policy has been much debated since ancient times. His chief enactments relate to the payment of citizens for State service. These measures have been interpreted as an appeal to the baser instincts of the mob, but this assumption is entirely out of keeping with all we know of Pericles' general attitude towards the people, over whom Thucydides says he practically ruled as a king. We must, then, admit that Pericles sincerely contemplated the good of his fellow-countrymen, and we may believe that he endeavoured to realize that ideal Athens which Thucydides sketches in the funeral speech—an Athens where free and intelligent obedience is rendered to an equitable code of laws, where merit finds its way to the front, where military efficiency is found along with a free development in other directions and strangles neither commerce nor art. In accordance with this scheme Pericles sought to educate the whole community to political wisdom by giving to all an active share in the government, and to train their aesthetic tastes by making accessible the best drama and music. It was most unfortunate that the Peloponnesian War ruined this project by diverting the large supplies of money which were essential to it.

Pericles also incurred unpopularity because of his rationalism in religious matters; yet Athens in his time was becoming ripe for the new culture, and would have done better to receive it from men of his circle—Anaxagoras, Zeno, Protagoras and Meton—than from the more irresponsible sophists. The influence of Aspasia on Athenian life, though denounced unsparingly by most critics, may indeed have been beneficial, inasmuch as it tended towards the emancipation of the Attic woman from the over-strict tutelage in which she was kept. As a patron of art and literature Pericles was a still greater force. He counted Sophocles and probably also Herodotus among his personal friends, and he left a profound impression on the mind of Thucydides. He is largely responsible for the splendour of Attic art in his time, for had he not so fully appreciated and given such free scope to the genius of Pheidias, Callicrates and Ictinus, Athens would hardly have witnessed the raising of the Parthenon and other famous structures.

Of Pericles' personal characteristics we have a peculiarly full and interesting record. He was commonly compared to Olympian Zeus, partly because of his serene and dignified bearing, partly by reason of the eloquence with which he held friend and foe spellbound. The same dignity appeared in the grave beauty of his features, though the abnormal height of his cranium afforded an opportunity for ridicule of which the comedians made full use.

ANCIENT AUTHORITIES.—Our chief source must always remain Thucydides (i. and ii. 1–65), whose insight into the character and ideals of Pericles places him far above all other authorities. The speeches which he puts into his mouth are of special value in disclosing to us Pericles' inmost thoughts and aspirations (i. 140–144; ii. 35–46; ii. 60–64). Thucydides alone shows sympathy with Pericles, but he was by no means a blind admirer. Of other 5th-century sources, Aristophanes is obviously a caricaturist, pseudo-Xenophon (*de republica Atheniensium*) a mere party pamphleteer. Plato, while admiring Pericles' intellect, accuses him of pandering to the mob; Aristotle in his *Politics* and especially in the Constitution of Athens, which is valuable in that it gives the dates of Pericles' enactments as derived from an official document, accepts the same view. Plutarch (*Pericles*) gives many interesting details as to Pericles' personal bearing, home life, and patronage of art, literature and philosophy; but he reproduces scandalous anecdotes in a quite uncritical spirit.

For Pericles' politics, *see* E. Abbott, *Pericles and the Golden Age of Athens* (1898); Ad. Schmidt, Das Perikleische *Zeitalter;* and the relevant parts of the general histories of Greece. For Pericles' buildings,

see E. A. Gardner, *Ancient Athens* (1902) and M. L. d'Ooge, *The Acropolis of Athens* (1908). *See* ATHENS: *History;* GREECE: *History;* and GREEK ART. (M. C.)

PERIDOTITE is a dark, heavy, igneous rock containing at least 10% olivine; other iron- and magnesia-rich minerals, generally pyroxenes; and not more than 10% feldspar. Most peridotites are coarse-grained and granitoid, although some are coarsely porphyritic. Peridotite occurs in four main geologic environments: (1) interlayered with iron-, lime- and magnesia-rich rocks in the lower parts of tabular-layered igneous complexes or masses; (2) as irregular masses, rich in olivine $(Mg,Fe)_2SiO_4$, with or without related gabbro, in alpine-type mountain belts; (3) in volcanic pipes (the variety known as kimberlite); and (4) as dikes and irregular masses with rocks exceptionally rich in potash and soda. The layered complexes are believed to have been formed in place by selective crystallization and crystal settling from a previously intruded fluid or magma; the remaining types seem to have ranged from fluid magmas to semisolid crystal mushes at the time of emplacement. Nearly all peridotite is more or less altered to serpentine (*q.v.*) and cut by many irregular shear surfaces.

Peridotite is the ultimate source of all chromium ore and naturally occurring diamonds, and of nearly all chrysotile asbestos. It is one of the main host rocks of talc deposits and platinum metals and formerly was a major source of magnesite. Some varieties of serpentine (verd antique) are used as building and ornamental stone, and fresh dunite (pure olivine rock) is used in parts of glass furnaces. In warm humid climates peridotite and serpentine have weathered to soils and related deposits (*see* LATERITE) which, though now worked on a relatively small scale, are enormous potential sources of iron, nickel, cobalt and chromium. (T. P. T.)

PÉRIER, CASIMIR PIERRE (1777–1832), French statesman. was born at Grenoble on Oct. 11, 1777, the son of a rich banker and manufacturer, Claude PCrier (1742–1801), who was one of the first directors of the Bank of France; of his eight sons, Augustin (1773–1833), Xntoine Scipion (1776–1821), Casimir Pierre and Camille (1781–1844), all distinguished themselves in industry and in politics. Casimir joined the army of Italy in 1798. On his father's death he left the army and with his brother Scipion founded a bank in Paris. He opposed the ruinous methods by which the duc de Richelieu sought to raise the war indemnity demanded by the allies, in a pamphlet *Réflexions sur le projet d'emprunt* (1817), followed in the same year by *Dernières réflexions* . . . in answer to an inspired article in the *Moniteur*. In the same year he entered the chamber of deputies for Paris, taking his seat in the left centre and making his first speech in defense of the freedom of the press. Re-elected for Paris in 1822 and 1824. and in 1827 for Paris and for Troyes, he sat for Troyes until his death. Under Louis Philippe, PCrier became president of the chamber of deputies, and sat for a few months in the cabinet without a portfolio.

On the fall of the ministry of Laffitte, Casimir PCrier, who had drifted more and more to the right, was summoned to power (March 13, 1831); and in a year he restored civic order in France and re-established her credit in Europe. Paris was only held in check by the premier's determination; revolts at Lyons and Grenoble were also put down. The minister refused to be dragged into armed intervention in favour of the revolutionary government of Warsaw, but he constituted France the protector of Belgium by the prompt expedition of the army of the north against the Dutch in Aug. 1831; French influence in Italy was asserted by the audacious occupation of Ancona (Feb. 23, 1832); and the refusal of compensation for injuries to French residents by the Portuguese government was followed by a naval demonstration at Lisbon. In the spring of 1832 during the cholera outbreak in Paris, PCrier visited the hospitals with the duke of Orleans. He fell ill the next day and died on May 16, 1832.

His *Opinions et discours* were edited by A. Lesieur, 2 vol. (1838); C. Nicoullaud published in *1894* the first part (*Casimir-Périer, député de l'opposition, 1817–1830*) of a study of his life and policy; and his ministry is exhaustively treated by Thureau-Dangin in vol. i and ii (1884) of his *Histoire de la monarchie de juillet.*

For the family in general *see* E. Choulet, *La Famille Casimir-Périer* (1894).

PERIGEE, in astronomy, that point of the moon's orbit or of the sun's apparent orbit at which the rnoon or sun approaches nearest to the earth (Gr. *peri,* "near." *ge,* "the earth"). The sun's perigee and the earth's perihelion (*q.v.*) are so related that they differ 180° in longitude; the first being on the line from the earth toward the sun, and the second from the sun toward the earth. The longitude of the solar perigee is now ror°, that of the earth's perihelion 281°.

PÉRIGORD, as a French province, formed part of the military government of Guienne and Gascony, and was bounded on the north by Angoumois, on the east by Limousin and Quercy, on the south by Agenais and Bazadais. and on the west by Bordelais and Saintonge. It is now represented by the *ddpartement* of Dordogne and part of Lot-et-Garonne. PCrigord was in two divisions: PCrigord Blanc (cap. PCrigueux) and PCrigord Noir (cap. Sarlat). Under the Roman empire it was included in *Aquitania secunda,* and it afterwards formed the diocese of PCrigueux. From the 8th century it had its own counts, who were feudatories at first of the dukes of Aquitaine and afterwards of the kings of England. In the 15th century the county passed to the dukes of Orléans, and in the 16th came to the family of d'Albret, becoming crown land again on the accession of Henry IV.

See the *Dictionnaire topographique du ddpartement de la Dordogne* by the Vicomte de Gourgues *(1873)*; the Bulletin of the *Société historique et archkologique du Pkrigord (1874 et seq.)*; *L'Inventaire sommaire de la "Collection de Pdrigord"* in the Bibliothèque nationale *(1874)*; J. L. Dessalles, *Histoire du Ptrigord,* 3 vol. (1883–86).

PÉRIGUEUX, a town of southwestern France, formerly capital of the old province of PCrigord Blanc, now chief town of the *département* of Dordogne, 79 mi. E.N.E. of Bordeaux, on the railway between that city and Limoges. Pop. (1954) 37.168. Vesunna was the capital of the Petrocorii, allies of Vercingetorix when Caesar invaded Gaul. The country was afterwards occupied by the Romans, who built a second city of Vesunna on the right bank of the Isle river, opposite the site of the Gallic town. The barbarian invasion brought this prosperity to a close. St. Front preached Christianity here in the 4th century and over his tomb there was raised a monastery, which became the centre of the new town called Le Puy St. Front. The *cité* was pillaged by the Saracens about 731, and in 844 the Normans devastated both quarters. The new town soon began to rival the old city in importance, and it was not until 1240 that the attempts of the counts of PCrigord and the bishops to infringe on their municipal privileges brought about a treaty of union. During the Hundred Years' War, PCrigueux was twice attacked by the English, who took the *cite'* in 1356; and the whole town was ceded to them by the treaty of Brétigny, but returned to the French crown in the reign of Charles V. The county passed by marriage into the hands of Anthony of Bourbon. father of Henry IV, and was converted by the latter into royal domain. During the Huguenot wars PCrigueux was frequently a stronghold of the Calvinists, who in 1575 did great destruction there; and it also suffered during the troubles of the Fronde.

The town, standing on a height on the right bank of the Isle, is divided into three parts. On the slope of the hill is the medieval town; to the west is the modern town; to the south of the modern town is the old Roman town or *cite'.* Three bridges connect PCrigueux with the left bank of the Isle, where stood Vesunna, the capital of the Petrocorii. Hardly a trace of this old Gallic town remains, but not far off, on the Plateau de la Boissibre, the rampart of the old Roman camp can still be traced. On the right bank of the Isle, in the Roman city, there have been discovered some baths of the 1st or 2nd century, supplied by an aqueduct 4 mi. long, which spanned the Isle. A circular building, called the "Tower of Vesunna," stands at what was formerly the centre of the city. It is believed to have been originally the cella or main part of a temple, probably dedicated to the tutelary deities of Vesunna. The amphitheatre, now in ruins, had a diameter of 1,312 ft., that of the arena being 870 ft.; it dates from the 3rd

or even the 2nd century. The counts of Périgueux used it for their château, and lived in it from the 12th to the end of the 14th century. In 1644 it was given over by the town to the Order of the Visitation, and the sisters built their nunnery with stones from it. Of the ruins of the *cite'*, the Château Barrière is an example of the fortified houses formerly common there. Two of its towers (3rd or 4th century) formed part of the fortified *enceinte;* the highest tower is of the 10th century; and the part now inhabited is of the 11th or 12th century, and was formerly used as a burial chapel. The bulk of the château is of the 12th, and some of the windows of the 16th century.

The chief medieval building in the *citd* is the (11th and 12th centuries) church of St. Etienne, once the cathedral; it has a fine carved wooden reredos of the 17th century and a tomb of a bishop of the 12th century. In the medieval town, known as Le Puy St. Front, is the cathedral of St. Front which, till its restoration in the 19th century, was of unique architectural value. Nearby are the remains of an old basilica of the 6th century, above which rises the unique Byzantine 11th-century belfry. It is composed of two massive cubes, placed the one above the other in retreat, with a circular colonnade surmounted by a dome. To the southwest of St. Front, the buildings of an old abbey (11th to 16th century) surround a 13th-century cloister. Of the fortifications of Le Puy St. Front, the chief relic is the Tour Mataguerre (14th century).

Périgueux is the seat of a bishop, prefect and court of assizes, and has tribunals of first instance and of commerce, and a board of trade arbitrators. The trade of the town is in pigs, truffles, vegetables, brandy, poultry, pies known as *pâtés de Pkrigord,* and all kinds of preserved foods. There are quarries in the adjacent vicinity.

PERIHELION, in astronomy, the point of nearest approach of a body to the sun (Gr. *peri,* "near," *helios,* "sun"). The earth is at perihelion about Jan. 3.

PERIM, an island in the Strait of Bab-el-Mandeb, 96 mi. W. of Aden, and within the British colony of Aden. Pop. about 1,700. Formed of volcanic rocks, it stands on the shallow threshold of the Red sea, 2 mi. from the Arabian shore, and is about $3\frac{1}{2}$ mi. long with an area of 5 sq.mi. Its highest point is 214 ft. It is horseshoe-shaped, and a good harbour occupies the concavity on the south side. At one time Perim was of importance as a coaling station. With cessation of commercial operations there in 1936 the cable station was closed. Perim, the Diodorus of the *Periplus,* was garrisoned briefly by the British in 1799. Reoccupied in 1857, in view of the cutting of the Suez canal, it is administered in conjunction with Aden.

PERINTHUS (Turk. ***Eski*** *Eregli,* "Old Heraclea"), an ancient town of Thrace, on the Propontis, 22 mi. W. of Selymbria, strongly situated on a small peninsula. It was a Samian colony, founded about 599 B.C. for trade with Thrace and beyond. Its original name was Mygdonia; later it was called Heraclea Thraciae or Heraclea Perinthus. In 340 B.C. it successfully resisted Philip II of Macedon and rivalled Byzantium in importance.

PERIODICAL. This term, which was once applied to all publications appearing at regular intervals, is now used by librarians and others to designate all such serials except newspapers (*q.v.*).

Early Periodicals. — The forebears of the literary periodical in the 17th century were the book notices inserted by publishers in the early newsbooks. By 1646 such notices, accompanied by short critical comments, were appearing with some regularity; about 1650 they began to be grouped together and to form a regular feature of the newsbook or paper. Of far greater importance than the book notice was the digest or abstract journal, of which the pioneer was the *Journal des sçavans* (later *Journal des savants),* first issued in Paris on Jan. 5, 1665, by Denys de Sallo and continued in a series unbroken except for a short period of suppression from 1797 to 1816. Though original material began to appear in it after the issue of the first few numbers, its primary aim was to give summaries of all important books published in Europe, together with obituaries and bibliographies of prominent writers and reports on important philosophical, literary and scientific matters. The *Journal des sçavans* was closely followed by the *Philosophical Transactions (Acta philosophica)* of the Royal society of London (March 1665), the first abstract journal in English, designed to record "the present undertakings, studies and labours of the Ingenious in many considerable parts of the world." Italy followed with the short-lived *Giornale de' letterati* (Rome, 1668–81) — another journal with the same title was published at Parma from 1668 to 1690 (with a break between 1679 and 1686) — and the *Galleria di Minerva* (Venice, 1696–1717); in Germany the *Acta eruditorum,* published in Latin, appeared in Leipzig from 1682 to 1731. Christian Thomasius' *Monatsgesprache* (1688) was the first periodical in the German language.

Meanwhile the book advertisements in the newsbooks had developed into regular catalogues — of which the *Mercurius librarius* (1668–70) or *Term Catalogues* was the most noteworthy — though these were but "dry things, scarce able to raise in men that gust and appetite for learning" that the *Weekly Memorials for the Ingenious* (1681–83) hoped to foster by means of the critical notes that it attached to each title. This periodical was the precursor of the critical review; it was shortly followed by the *Universal historical bibliothkque* (1686) which announced its intention of printing reviews of important books, and for the first time invited contributions from scholarly critics.

In 1690, Samuel Wesley, father of John and Charles, joined John Dunton in launching the *Athenian Gazette* (later the *Athenian Mercury,* ended 1697), the forerunner of *Notes and Queries* and *Answers,* which attempted a kind of information service on all literary and scientific matters about which its readers might ask. Daniel Defoe was one of the contributors. In 1692 Dunton began to issue supplements dealing with natural history and natural phenomena. Dunton's later journal, *The Compleat Library* (1692–94), virtually the successor of the *Athenian Mercury,* was the first periodical of importance to allot, in the manner now customary in learned journals, definite proportions of its space to original contributions and to book reviews.

Side by side with these attempts to popularize learning were the periodicals of amusement, of which *Mercurius Jocosus* (1654) was one of the earliest, and Donneau de Vizé's *Mercure galant* (Paris, 1672–1820) the most successful. Modeled on the latter, but more serious in content, was P. A. Motteux's *Gentleman's Journal* (1692–94), which contained essays, verses, letters and stories. Edward Ward's *London Spy* (1698–1700), with lively sketches of London manners and customs, was one of a number of short-lived journals whose contents were mainly humourous, vulgar or obscene.

GREAT BRITAIN

If the 17th century saw the establishment of the abstract journal or digest, the learned journal, the critical review and the periodical of amusement, the 18th century produced in the essay periodical its own characteristic contribution to English journalism. This form, itself one of the most important manifestations of 18th-century English literature, constituted the first attempt to create an organized popular opinion in matters of literary taste and manners in general. Richard Steele issued the *Tatler* in 1709–10; and a dozen similar publications appeared in the same year, at least half of them imitating the title as well as the form. Joseph Addison contributed to the *Tatler* and, with Steele, ran its successor the *Spectator* (1711–14) and also the *Guardian* (1713). Swift and Bolingbroke wrote political articles for the *Examiner* (1710–14); the *Spectator* and the *Guardian* replied on behalf of the Whigs, the latter finding itself in no way cramped in this respect by its early profession of freedom from political controversy.

The Stamp act of 1712 struck a hard blow at the essay periodicals — the *Spectator's* sales dropped from about 4,000 copies to 1,600 — but the very severity of the act is striking evidence of their success in forming public opinion not only in the literary but also in the political sphere.

Meanwhile a series of literary reviews — the *History of the Works of the Learned* (1699–1712), the *Memoirs of Literature* (1710–17) and others — carried on the tradition of the *Weekly Memorials for the Ingenious* and the publications of John Dunton. The first Irish review, *A Literary Journal* (Dublin, 1744–46), falls

within this period. Of importance was the *Monthly Review* (1749–1844). The first magazine or miscellany of modern type was Edward Cave's *Gentleman's Magazine* (1731–1907), modeled on Motteux's *Gentleman's Journal* of 1692; Samuel Johnson joined the staff in 1738. *The London Magazine or Gentleman's Monthly Intelligencer* (1732–85) was the most formidable of a large number of rivals to the *Gentleman's Magazine;* others were the *Scots Magazine* (1739–1826); the *North Briton,* edited by John Wilkes (1762–63); the *European Magazine and London Review* (1782–1826); and the *Monthly Magazine* (1796–1843). The most noteworthy development of the last few years of the century was the specialized periodical — Archaeologia (1770), *Curtis's Botanical Magazine* (1787), the *Philosophical Magazine* (1798) and the *Farmer's Magazine* (1800–25) being among the more important examples, and the first three the longest-lived.

The 19th Century. — To Edinburgh is due the first high-class critical journal, the *Edinburgh Review* (1802–1929), established by Sydney Smith, Henry Brougham and Francis Jeffrey and issued in the buff and blue colours of the Whig party that it supported. Among its more eminent contributors were Carlyle, William Hazlitt and Macaulay. Its brilliant Tory competitor, the *Quarterly Review* (1809), was begun by the London publisher John Murray at the instance of Sir Walter Scott, who, though at first contributing to the *Edinburgh,* soon found himself dissatisfied with it. George Canning, Robert Southey, Lord Salisbury and Gladstone were all contributors to the *Quarterly,* and Scott himself reviewed in it. The third of the famous 19th-century periodicals was *Blackwood's Magazine* (1817), with contributions from Scott, John Lockhart, John Galt and many others. The *Edinburgh* ceased publication with the end of its 250th volume; the *Quarterly* and *Blackwood's* were still current at mid-20th century.

Of other quarterlies may be noted the *Westminster Review* (1824–1914), *Mind* (1876) and a large number of denominational reviews. Among the monthlies and weeklies were the *Christian Observer* (1802–77), the *Monthly Repository* (1806–38), the *Athenaeum* (1828, later combined with *New Statesman and Nation*), the *Spectator* (1828), the *Fortnightly Review* (1865–1950, monthly from 1866), the *Contemporary Review* (1866) and the *Nineteenth Century* (1877, called *Twentieth Century* after 1950). W. T. Stead's *Review of Reviews* (1890–1936) introduced a new development in printing criticisms of work published in other reviews. The *Times* (London) began to issue its *Literary Supplement* in 1902.

The 19th century also produced a flood of popular magazines. John Limburd published the *Mirror* (1822–49) as a twopenny illustrated magazine. A decade later came *Chambers's Journal* (1832), long conducted by the John Chamberses, father and son; the *Penny Magazine* (1832–46), published by Charles Knight; and the *Saturday Magazine* (1832–44), issued by the Society for Promoting of Christian Knowledge. Charles Dickens' *Household Words* (1850–59) was followed by his *All the Year Round* (1859–95); the latter was continued by the novelist's son. Leading sixpenny monthlies were the *Cornhill Magazine* (1860–1939), initially edited by Thackeray and the first to publish serial fiction regularly; *Fraser's Magazine* (1830–82), which published much early Thackeray and some of the best of Thomas Carlyle; and *Temple Bar* (1860–1906), first edited by G. A. Sala. *Notes and Queries* (1849) has long interested the curious antiquary. Nor were the interests of women forgotten: the *Queen* (1861) and the *Lady* (1885) were destined for long lives.

The 20th Century. — The late 19th century saw the birth of the illustrated magazine proper, and the 20th saw its great development. Many magazines had already inserted full-page illustrations and woodcuts in the 1860s, but none of these approached what is now accepted as an illustrated magazine. The continually changing attitude of the public is clearly shown by Sala's statement in *Temple Bar* that, with due regard to the interests of his readers, he preferred to give them 16 extra pages of print rather than an illustration or two. The *English Illustrated Magazine* (1883–1913) may perhaps be considered the parent of illustrated monthlies.

Innumerable publishers forthwith adopted the view of Sir George Newnes that a magazine should give "wholesome and harmless entertainment to crowds of hard-working people craving for a little fun and Bmusement," by providing light literature and illustrations. The *Strand Magazine* (1891–1950) was designed to "contain stories and articles by the best British writers and special translations of the chief foreign authors." No limit was to be put to illustration. It was a bold move, and even the publishers felt that they were embarking "upon the wildest extravagance in furnishing no fewer than a hundred and ten illustrations in a single number." This was before the general adoption of process engraving, and woodcuts were still in use. The success which followed was phenomenal. In a different category must be placed the illustrated weeklies in which the illustrations counted for more than the letterpress; of these the *Illustrated London News* (1842) was the pioneer. The *Sphere* began in 1900, the *Tatler* in 1901; *Picture Post* (1938–57) was the most striking example at mid-20th century.

Besides illustrations, 20th-century magazines are notable for variety of specialization in the professions. industries, trades, religion, arts and letters, sports, etc. *Radio Times* (1923), which reached a spectacular 9,000,000 circulation by mid-century and continued to rise, was an outstanding example. There were many prosperous motion-picture periodicals, and many devoted to women's interests; the weekly *Woman* (1937) had over 3,000,000 circulation before the end of its second decade.

The outbreak of World War II wrote finis to the files of many periodicals; in 1939 death came to the literary *Criterion* (1922), Sir John Squire's *London Mercury* (1919), and the monthly *Windsor* (1895).

Shortage of paper supply continued to cripple magazine publication for some years after the end of the war.

Children's Magazines. — Another outstanding feature of the late 19th century was the development of literature for the young. Since the spread of education had inspired the production of encyclopaedias and dictionaries expressly intended for the comprehension of children, it is not surprising that periodicals for boys and girls should also have assumed an important role. The best magazines contained a mixture of fiction. science and practical suggestions to young people in a variety of crafts and hobbies. Most prominent of the 19th-century juveniles were *Chatterbox* (1866–1934), *Little Folks* (1871–81), the *Boy's Own Paper* (1879–1904) and the *Girl's Own Paper* (1880). *My Magazine* (1914–33) is a later example.

The so-called "comics" descended upon Britain in mid-20th century like the locusts upon Egypt of old.

Historical and Scientific Magazines. — Though specialized journals began to make their appearance in the late 18th century, it was not until the end of the 19th that any very great expansion of their numbers took place. Mention must be made, however, of a few outstanding earlier examples, such as the *Lancet* (medical; 1823); the *Provincial Medical and Surgical Journal* (1840–52), followed by *British Medical Journal* in 1857; the *Economist* (1843); and *Nature* (general science; 1869). After 1880 every science, art, profession and trade began to issue its own periodical or periodicals until no field of activity, however highly specialized, was unrepresented. It must be sufficient here to list only a few: the *Law Quarterly Review* (1885), the *English Historical Review* (1886), the *Library* (1889), the *Studio* (art; 1893), *Man* (anthropology; 1901), the *Hibbert Journal* (theology and philosophy; 1902).

Canada. — The first monthly in eastern Canada was the *Novia Scotia Magazine* (1789–92), and in Canada proper the *Canadian Magazine* (Montreal, 1823–25). In addition to these were the bilingual *Quebec Magazine* (1791–93), a quarterly; and several others entirely in French: *L'Abeille canadienne* (1818–19), *La Bibliothèque canadienne* (1825–30; continued as *L'Observateur* [1830–31]) and the *Magasin du Bas-Canada* (1832). The *Literary Garland* had a longer life (1838–51) than most of those that preceded it, and was for some time the only English magazine published in Canada. A series of interesting French-Canadian reviews followed; the foremost, *La Revue canadienne* (1864–1922), contained the best writings of contemporary French-Canadian men

of letters.

Maclean's Magazine (1896) has long been the best known general magazine in Canada. It is published from Toronto, the country's magazine capital, whence are issued also the *Canadian Home Journal* (1904); and *Chatelaine* (1928), the leading Canadian women's journal. Some U.S. periodicals have large circulations in Canada.

Australia and New Zealand.—The *Australian Magazine* was published in Sydney in 1821–22, and was followed by the *South Asian Register* (1827), the *Australian Quarterly Journal* (1828) and a second *Australian Magazine* (1838). The *Sydney University Magazine* (1855 and 1878–79), continued as the *Sydney University Review,* was of some importance and of literary value. Australian periodicals are strongest in the weekly field. Greatest of general popular weeklies is the *Bulletin* (1880), founded in Sydney by J. F. Archibald, which became important in the development of the country's literature and art. Largest circulation in the commonwealth was claimed in the late 1950s by the *Australian Women's Weekly* (1933), which had publication offices in all the leading cities and was said to enter one-third of Australian homes.

FRANCE

The *Journal des sçavans,* the first number of which appeared on Jan. 5, 1665, is acknowledged to be the parent of modern periodical literature. About 1663, François Eudes de Mézeray obtained a privilege for a regular literary periodical, but the idea came to nothing; and the credit for having produced the first periodical must go to Denys de Sallo, who at the time was regarded as a genius and inventor for having framed the scheme. Its intention and scope is given in the *Encyclopédie méthodique:* "Il a été inventé pour le soulagement de ceux qui sont ou trop occupés ou trop paresseux pour lire les livres entiers" ("It has been invented for the relief of those who are either too busy or too lazy to read whole books").

The severe literary and political censorship enforced in France was directly responsible for the introduction of the literary periodical into the Netherlands, where no fewer than 31 first-rate journals were issued within the century 1680–1780 by French Protestant refugees.

In this manner appeared Pierre Bayle's *Nouvelles de la république des lettres* (1684–1718), one of the principal successors of the *Journal des sçavans;* and Jean Le Clerc's *Bibliothèque universelle et historique* (1686–93)—to mention only two. A few years later, the *Mémoires pour l'histoire des sciences et des beaux-arts,* commonly known by the name of *Journal de Trévoux* (1701–67), was brought out at Paris under the auspices of the Jesuits. Their primary object was to defend religion from attack, and it was probably for this reason that the journal incurred the displeasure of Voltaire. For 30 years the printers of the little town of Trévoux were kept busy, until it became more convenient to transfer the headquarters of the journal to Paris.

Meanwhile the *Spectator* and *Tatler* were appearing in England; but the French were cautious in adopting the essay periodical, though an incomplete translation of the *Spectator* appeared in Amsterdam in 1714. It was not until 1722 that Marivaux made his unsuccessful attempt to rival the Englishmen by issuing his *Spectateur français* (1722). The *Spectateur suisse* (1723), *Le nouveau Spectateur* (1758) and others came after but were of little value. *Le Pour et contre* (1733–40), edited by the Abbé Prévost and full of anecdote and miscellaneous information, was similar in form to the English reviews.

Another periodical of high rank of the 18th century was the *Journal encyclopédique* (1756–93), founded by Pierre Rousseau, who carried on his work for many years under the protection of the count of Horion, minister of the prince bishop of Liège. When the latter died, Rousseau was compelled to transfer the journal from Liège to Bouillon on account of the philosophical articles it contained, but permission was given him to establish his presses there. Voltaire, Diderot and others contributed to the Paris *Gazette littéraire* from 1764 to 1766. During the revolutionary period, and until the abolition of the censorship in 1828, most periodicals were suspended or suppressed.

Specialized journals began in the latter half of the 17th century and continued in quantity. *Revue des deux mondes* (1829–1944) reached its greatest importance as a fortnightly in mid-19th century, when leading literary figures were contributors. It was succeeded by *Revue: littérature, histoire, arts et sciences des deux mondes* (1948). Other 20th-century reviews are *Nouvelle revue* (1879), *Mercure de France* (1890), *Revue de Paris* (1894) and *Les Oeuvres libres* (1921). *L'Illustration* (1843–1944) was long a world-famous picture magazine. *Paris-match* (1949) quickly gained circulation leadership among French weeklies by brilliant illustration and timely, informative text. Periodicals devoted to women's interests and fashions have also been very successful, as the monthly *Marie-Claire* (1954). Children's periodicals have been popular, as *Le Magasin d'éducation et récréation* (1864–1905), which published Jules Verne and was illustrated by Gustave Doré and J. L. E. Meissonier. "Comics" grew in favour, reaching a distribution of over 20,000,000 monthly at mid-20th century.

GERMANY

The *Acta eruditorum* (Leipzig, 1682–1731), the earliest of German periodicals, was not only limited in its choice of subjects to mathematics, physics and botany, but was also handicapped by the use of the Latin language. Nevertheless, such German men of science as Leibniz and the botanist Michael Ettmüller, combined to make the *Acta* a central meeting ground where the results of their researches might be read. The *Acta* had many imitators. Soon after the English periodicals of Addison and Steele had reached Hamburg, the Germans taking these, especially the *Spectator* and the *Guardian,* as models, brought out *Der Vernünftler* (1713), *Die lustige Fama* (1718) and *Discoursen der Maler* (1721). J. C. Gottsched's *Die vernünftigen Tadlerinnen* (1725–26) was the first women's journal. In 1759 F. Nicolai introduced his *Briefe, die neueste Literatur betreffend* to the world, and enlisted as collaborators Lessing and Moses Mendelssohn; it lasted six years. The *Frankfurter gelehrte Anzeigen* (1772–90), a successor of the *Franckfurtische gelehrte Zeitungen* (1736–71), followed a few years later and is chiefly interesting because Goethe wrote for it as a young man; the *Jenaische allgemeine Litteratur-Zeitung,* of which Goethe may be said to have acted as editor in chief, was issued in 1804–41. C. M. Wieland's *Der Teutsche Merkur* (1773–89) stands out as a literary periodical of the first importance, as does also the *Allgemeine Literatur-Zeitung* (1785–1849).

The periodicals issued in the various German states during the next 60 years displayed an ever-increasing political consciousness, and some indeed, such as the *Hallische Jahrbücher* (1838–43), received government support. The *Jahrbücher für wissenschaftliche Kritik* (1827–46), first published by J. F. Cotta, was a noteworthy publication of this period. By the end of the period politics had almost ousted literature from German reviews.

The revolution of 1848 was disastrous to the periodical press, and very few journals survived it. Developments in the later part of the 19th century followed much the same course as in England. Among the best-known journals of this time are the *Deutsche Rundschau* (1874), *Historische Zeitschrift* (1859), *Neue Rundschau* (1889), *Die Literatur* (1898–1942), *Deutsche Vierteljahrsschrift* (1923), *Erkenntnis* (1930–39).

The National Socialist revolution produced a further wave of suppressions, and the division of Germany into zones of occupation in 1945 resulted in many changes and gradual resumption of publication. By the 1950s some 4,000 periodicals were in course of publication. Among reviews were *Deutschland Review* (1949, Hamburg), *Die Besinnung* (1946, Nürnberg) and *Revue* (1948, Munich). *Spiegel* (1947, Hamburg) was a popular weekly; and among picture magazines were *Heute* (1945–51, Munich) and *Zeit und Bild* (1947, Frankfurt).

OTHER COUNTRIES

The Netherlands.—Apart from the journals of French origin already described, the earliest periodicals in the Netherlands were the *Examinator* (1719–20) and *Den Amsterdamschen Hermes* (1722–23). In 1837 *De Gids* was founded as the organ of liberal-

ism and at the same time of a new movement in literature and it remained an important review. *Haagsch Maandblad* (1924) is a literary monthly, and *Erasmus* (1933) an important scientific journal. There are many technical and class periodicals. The official *Radiogids* has a wide circulation.

Italy. — Conditions in Italy were long unfavourable to the growth of periodicals. Politics was not a safe subject for free comment, and the church interfered much in matters of science and literature as well as religion. Nevertheless, the *Journal des sçavans* had its imitator in Rome when Cardinal Ricci began to print *Giornale de' letterati* (1668–81); and Venice, always in the forefront in literary activities, issued the *Galleria di Minerva* (1696–1717). The rivalry, however, of both the academies and the princes acted as a continual curb, and the outlook of editors and writers remained circumscribed for a long period. G. Baretti, in *La Frusta letteraria* (1763–65), so mercilessly attacked the writers of Italy and even the ruling princes that after two years of precarious existence the *Frusta* was suppressed. *Il Caffé* (1764–66) was much influenced by French ideas. Important modern reviews have been *Nuova Antologia* (1866). Benedetto Croce's *La Critica* (1903–44), *Scientia* (1907), *La Rassegna italiana* (1918), *Rinascita* (1944) and *Italia contemporanea* (1953). *Scena Illustrata* (1865) is one of the oldest of illustrated monthlies. *Epoca* (1944) is a popular illustrated weekly.

Portugal.—*Jornal Enciclopedico* (1779–92) and *Jornal de Coinzbra* (1812–20) were the chief early Portuguese reviews. *Panorama* was largely historical and literary; Alexandre Herculano's historical tales were published in it. Most 19th-century journals were short-lived; but *Instituto* (1852) had a long life as a literary and scientific review, and *Naturalia* (1936) enjoyed wide acceptance.

U.S.S.R.—In Russia the Academy of Sciences led the way by the issue of *Yezhemyesyatchniiya Sochineniya* ("Monthly Works") (175j–64); and four years later the first private undertaking, the *Trudolyubivaya Pchela* ("Industrious Bee") (1759) with critical essays and translations from the *Spectator*, appeared. Few periodicals appeared in Russia until the 19th century, when the most representative magazines were the *Vestnik Evropy* (1802–30), edited by the historian N. M. Karamzin; the *Biblioteka dlya Chteniya* (1834–65), the first to obtain any commercial success; the *Sovremennik* (1836–66), founded by Pushkin; the *Russky Vestnik* (1856–1906), edited by the well-known publicist M. N. Katkov; the *Vestnik Evropy* (1866–1919), a continuation of the earlier *Vestnik*, to which the novelist Turgenev contributed; *Russkaya Misl* (1880–1927); *Letopis* (1915–17), edited by Maxim Gorky. The Bolshevik revolution produced a great upheaval and was responsible for an enormous output of periodicals of all kinds, but without any real freedom of the press. *Novyi Mir* ("New World") (1925) was one of the more important reviews of the Soviet regime. The Soviet publication system calls for the production of a journal in every major field of industry, technology, art. *Literaturnaia Gazetta* (1929) was the leading literary journal. Two periodicals were published from Moscow in English, German and French as well as in Russian — Soviet *Literature* (1932) and *Soviet Woman* (1945).

Scandinavian Countries. — The northern countries of Europe — Sweden, Norway and Denmark — have never lagged behind in the production of literature. The earliest periodical in Sweden was *Smanska Argus* (1732–34), a journal similar to the *Spectator*. Of modern magazines the following are worth mentioning: *Ord och Bild* (1892); *Nordisk Tidskrift* (1878), which prints historical and philosophical articles; *Nya Sverige* (1907–28), a conservative review; and the weekly *Idun* (1888). The first Norwegian periodical was *Ugentlige Korte Afhandlinger* (1760). *Samtiden,* begun by Gerhard Gran in Bergen in 1890 and moved to Oslo a decade later, was long the leading Norwegian journal. *Nye Tidender om lærde Sager* (1720–1837) was the earliest critical journal in Denmark. Leading 20th-century monthlies were *Tilskueren* (1884–1939), *Gads Danske Magasin* (1906), *Danske Magasin* (1952).

Spain. — In Spain the periodical came much later than in France, and it was in the beginning dependent on its French prototype. Political and religious censorship was as severe as it was in Italy. The earliest periodicals date from the middle of the 18th century, the best known being *Efemérides barometricomedicas matritenses* (1743–47) edited by Fernández Navarrete; the *Diario de los literatos de España* (1737–38); and *Memorial literario* (1784–1808).

Three early 19th-century periodicals are worth noting — *Miscelánea de Comercio* (1819), *Artes y literatura* (1819–21) and *El Censor* (1820–22). The influence both of the censorship and of the foreign periodical declined greatly during the regency of Maria Cristina (1833–41). Of a large number of reviews which began in the mid-19th century, mention may be made of the *Revista Ibérica* (1861–63), the *Revista de Cataluña* (Barcelona, 1862–63) and the *Revista de España* (1868–95). *España moderna* (1889–1914), *La Lectura* (1901–20), *Revista de Occidente* (1923–36; first edited by Ortega y Gasset) and *Gaceta literaria* (1927–32) were among the more important periodicals of the first quarter of the 20th century. The outstanding weekly was *Blanco y negro* (1891–1936). The *Revista hispano-americana de ciencias, letras y artes* (1921–36) was one of the better-known reviews of Latin-American interest published in Spain. Many Spanish periodicals fell victims to the strict censorship imposed by the Franco regime. *Mundo Hispánico* (1948) was a later monthly.

Switzerland. — The *Nova litteraria helvetica* (1703–15) of Zurich is the earliest literary periodical which Switzerland can show; followed by the *Bibliothèque italique* (1728–34) and the *Bibliothkque britannique* (1796–1815), both published at Geneva. The *Bibliothkque universelle* (1816) and *Revue suisse* (1838) amalgamated in 1858 as the *Bibliothèque universelle et revue suisse.* Among later periodicals may be mentioned *Revue mensuelle* (1897–1926); *Zwingliana* (1897); *Archives de psychologie de suisse romande* (1901) edited by Flournoy and Claparède; *Untersuchungen zur neueren Sprach- und Literaturgeschichte* (1903–12); *Revue de Genkve* (1920–24); and *Schweizerische Monatshefte* (1921). In the second half of the 20th century, leading monthlies were *Atlantis* (1929), *Schweitzer Journal* (1935) and *Gegenwart* (1939); and leading weeklies were *Schweitzer familien-Wochenblatt* (1881), *Patrie suisse* (1884), *Schweitzer illustrierte Zeitung* (1912) and *Weltwoche* (1933).

India. — The first Indian magazine was the *Oriental Magazine, or Calcutta Amusement* (1785–86). Several periodicals were conducted, usually for brief periods, by western missionaries. The *Hindustan Review* (1900, Patna) was founded and long edited by Sachschudananda Sinha, at Allahabad. The *Indian Review* (1900, Madras) was established by G. A. Natesan. In the course of India's economic development of the mid-20th century, a large number of professional, technical and industrial periodicals sprang up.

South Africa. — The *South African Journal* (1824, Cape Town) was the pioneer journal of this region. The periodicals of South Africa are chiefly centred in Cape Town and Johannesburg, and are largely trade and industrial journals of 20th-century growth.

Japan. — The Meiji restoration of 1868 brought a renaissance of culture and popular education in Japan and marked the beginning of magazines as distinct from newspapers. In the early 20th century the leading figure in the publication of Japanese magazines was Noma Seiji, whose nine periodicals nearly all had reached circulation in six figures. Many of the country's leading magazines survived World War II; and by the end of the occupation in 1952 there were more than 2,000 periodicals in course of publication, including popular miscellanies, women's journals, an interesting class of light literary reviews, magazines for youth and periodicals devoted to the stage, screen, radio. television and sports. There was a large group of small magazines devoted to verse. Weekly news magazines issued by leading newspapers had large circulations. Outstanding class periodicals were *Shufu No Tomo* ("Woman's Friend," 1917), *Yoiko No Tomo* ("Child's Friend," 1924) and *Shin Eiga* ("New Movies," 1938).

China. — The Christian missionaries William Milne, Robert Morrison and Liang A-fa established the first successful Chinese general magazine, under the title *Tsachihshu Maiyueh Tungchichuan* ("Chinese Monthly Magazine"). Printed in Malacca, it was circulated in Chinese territory (1815–22). The first to be published in China itself came from Canton in 1833, was moved to

Singapore four years later and published there for a decade; it was called *Tunghsiyankao Maiyueh Tungchichuan* ("Eastern-Western Monthly Magazine") and was founded by Charles Gutlaff, a missionary, but in 1837 it was taken over by the Society for the Diffusion of Useful Knowledge, a British institution. Various and numerous periodicals offering religious, philosophical, literary and scientific matter were published in the chief Chinese cities in the 19th century; but it was not until the period of Liang Chi-chao and his fellow reformers and publicists, beginning in the second decade of the 20th century, that modern periodicals came into wide circulation. Liang himself was editor, usually for brief periods, of, eight different periodicals. Among long-lived magazines were *Tung-fang Tsa-chih* ("Eastern Miscellany," 1904) and *Chiao-yü Tsa-chih* ("Educational Miscellany," 1908). The Communist revolution of 1949 resulted, after a few years, in wider distribution of periodicals than formerly; but these were controlled by the government and highly propagandist.

Central and South America.— Early gazettes and journals in Central and South American countries often partook of the nature of magazines, being miscellaneous in character; but not until the 20th century did periodicals as such flourish. By that time colour printing had been well developed, and illustrated weeklies and monthlies were widely popular. The largest Cuban magazine was the attractively illustrated *Bohemia* (1911), a weekly. In Mexico the leader was *La Familia* (1931), a fortnightly. In Brazil were two outstanding magazines in the Portuguese language—Eu *Sei Tudo* (1920), a general monthly; and *Vida Domestica* (1920), a women's journal. Argentina had many more magazines than any other South American country, as well as wider readership. *Maribel* (1932), rotogravure weekly miscellany, boasted at mid-20th century a larger circulation than any other South American magazine, though *Para Ti* (1922), also of Buenos Aires, a women's weekly, was a close second. (C. T. H. W.; F. L. K.; F. L. MT.).

UNITED STATES

The first American magazines were two Philadelphia, Pa., publications that dated their first numbers Jan. 1741. Actually first to appear was Andrew Bradford's *American Magazine*, followed in three days by Benjamin Franklin's *General Magazine*. The former lasted three months and the latter six. About 100 magazines were founded in the Colonies, most of them very short-lived. Outstanding were three Philadelphia periodicals—the *Pennsylvania Magazine* (1775–1776), edited by Thomas Paine; the *Columbian Magazine* (1786–92), called the *Universal Asylum* in its last two or three years; and Mathew Carey's *American Museum* (1787–92). Also important were Isaiah Thomas' *Royal American Magazine* (1774–75) and *Massachusetts Magazine* (1789–96); and Thomas and James Swords' *New-York Magazine* (1790–97).

More than 500 periodicals were published for shorter or longer periods in the first quarter of the 19th century; nearly 100 were being issued in 1825. There was marked development in weekly miscellanies supported by literary coteries in many cities and towns; in periodicals for women and children; in religious journals and those devoted to such reforms as antislavery and temperance; in medical, legal and agricultural journals; and in theatrical and comic papers. This class journalism increased tremendously in the next 25 years, so that by mid-19th century there were about 600 periodicals in course of publication.

Outstanding monthlies were *Godey's Lady's Book* (1830–98, Philadelphia), famous for its stenciled coloured fashion plates; *Graham's Magazine* (1826–58, Philadelphia), which began as the *Casket;* the *Southern Literary Messenger* (1834–64, Richmond, Va.); and the *Knickerbocker Magazine* (1833–65, New York city). Chief quarterlies were the *North American Review* (1815–1940), which developed from the *Monthly Anthology* (1803–11, Boston, Mass.) and had a famous line of editors, including Jared Sparks, Edward Everett, James Russell Lowell, Henry Adams, and George B. M. Harvey; *The Dial* (1840–44), famous transcendental magazine edited by Margaret Fuller, Thoreau and Emerson; and *De Bow's Review* (1846–80, New Orleans, La.). Notable weeklies were the *Youth's Companion* (1827–1929), a family periodical with a long line of famous contributors; and the *Saturday Evening Post,* founded in 1821, but brought to its later pre-eminence as a popular weekly after its purchase by Cyrus H. K. Curtis in 1897.

A **New Era, 1850.—A** new era began with the founding of *Harper's New Monthly Magazine* in New York city in 1850, with copious woodcut illustration, 144 pages and English fiction serials. A worthy competitor came in 1870, *Scribner's Monthly,* later the *Century* (1881–1930). *Scribner's Magazine* (1887–1939) was another quality illustrated monthly. By 1890 these richly illustrated general magazines surpassed anything of the kind ever before known in any country. The *Atlantic Monthly,* Boston, without illustrations, began its distinguished literary career in 1857, under Lowell's editorship. William Dean Howells, Thomas Bailey Aldrich, Walter Hines Page and Ellery Sedgwick were among its editors. Other famous monthlies of the latter 19th century were the *Galaxy* (1866–78), New York; *Overland Monthly* (1868–1935), San Francisco, whose first editor was Bret Harte; *Forum* (1886–1940), New York; *Lippincott's Magazine* (1868–1916), Philadelphia; and *Frank Leslie's Popular Monthly,* New York, which began in 1876 and from 1906 to 1956 was published as the *American Magazine.* Three prominent New York weeklies were *Harper's Weekly* (1857–1916); *The Nation,* founded by Edwin Lawrence Godkin in 1865; and *Outlook* (1870–1935), which began as *Christian Union* under Henry Ward Beecher's editorship. By 1870 there were about 1,200 periodicals in the United States, close to 2,400 in 1880, and nearly 3,000 by 1890. The great majority of these were class journals, serving business, industry and the professions.

In the 1890s came the high-class illustrated monthlies selling for 10 or 15 cents in place of the 35 cents asked by the "quality" magazines. The only one of this spectacular group to survive was the *Cosmopolitan,* founded in 1886 by John Brisben Walker; others were *McClure's Magazine* (1893–1933), *Munsey's Magazine* (1889–1929) and *Everybody's Magazine* (1899–1929). These, with the *Arena* (1889–1909), of Boston, and the weekly *Collier's* (1888–1957), were leaders in the muckraking which exposed corruption in municipal government, finance, etc., throughout the decade 1902–12. Leading muckrakers for *McClure's* were Lincoln Steffens. Ida M. Tarbell and Ray Stannard Baker, who later took over the ailing *Frank Leslie's Popular Monthly* and renamed it the *American Magazine.*

Later Magazines.— In 1922 *Reader's Digest* began as a pocket-size, adless magazine containing condensations of articles from other periodicals. By mid-century it had attained the largest circulation of any single serial publication ever known, said to be about 21,000,000 monthly, including editions distributed in most foreign countries and printed in 13 languages. It began to accept advertising ($26,500 a black and white page) in 1955. Other "digests" and pocket-size periodicals had more modest successes.

Time was founded in 1923 by Briton Hadden, who died in 1929, and Henry R. Luce. A weekly news magazine, its success had a considerable effect on the art of reporting. *Newsweek,* founded in 1933, was the most successful of its followers. In 1936 Time, Inc., launched a weekly picture magazine whose title, *Life,* was purchased from the satirical weekly (founded 1883) which had just suspended. The new *Life* made a great success and had many imitators, chief of which was the fortnightly *Look* (founded 1937).

Prominent among U.S. periodicals in the 20th century were the great illustrated magazines for women, such as *Ladies' Home Journal,* founded by Cyrus H. K. Curtis in 1883, and becoming famous in the 1890s under the editorship of Edward Bok; *Harper's Bazaar,* founded in 1867 by Fletcher Harper; *McCall's Magazine,* founded as a fashion journal in 1870; *Woman's Home Companion,* founded in Cleveland, O., as *Home Companion* in 1873 and discontinued with the number for Jan. 1957; *Good Housekeeping,* founded in Holyoke, Mass., in 1885; and Condé Nast's *Vogue,* founded in 1892, which absorbed *Vanity Fair* (1889) in 1936. A 20th-century success was *Better Homes and Gardens,* Des Moines, Ia., founded in 1922.

There were about 7,000 periodicals in the course of publication in the United States by the late 1950s.

(F. L. MT.)

PERIODIC LAW. Dmitri I. Mendeléyev discovered in the mid-19th century that the chemical elements show a periodic recurrence of properties when they are arranged in a certain order, which is approximately the order of increasing atomic weight. The statement of this fact, which has been of inestimable value in the development of the science of chemistry, is called the periodic law; and a tabular arrangement of the elements which brings those with similar properties into juxtaposition is called the periodic table or periodic system of the elements.

It was recognized during the second decade of the 20th century that the order of elements in the periodic system is that of their atomic numbers, the integers which are equal to the positive electrical charges of the atomic nuclei expressed in electronic units; and in recent years great progress has been made in explaining the periodic law in terms of the electronic structure of atoms and molecules. This clarification has increased the value of the law, which is used as much today as it was at the beginning of the 20th century, when it expressed the only known relationship among the elements.

History of the Periodic Law.—The classification of the chemical elements is a comparatively recent problem, for it was not until about the beginning of the 19th century that the two kinds of chemical substances, elements and compounds, were clearly differentiated. The early years of the century witnessed a rapid development in analytical chemistry—the art of distinguishing different chemical substances—and the consequent building up of a vast body of knowledge of the chemical and physical properties of both elements and compounds. This rapid expansion of chemical knowledge soon necessitated classification, for on the classification of chemical knowledge are based not only the systematized literature of chemistry but also the laboratory arts by which chemistry is passed on as a living science from one generation of chemists to another. The elementary substances are few in number, about 100, with distinctive properties, whereas compound substances are extremely numerous, with properties correspondingly diversified and often overlapping. It thus occurred that the classification of elements lagged many years behind that of compounds, and, in fact, no general agreement had been reached among chemists as to the classification of elements for nearly half a century after the systems of classification of compounds had become established in general use.

J. W. Döbereiner in 1817 showed that the combining weight of strontium lies midway between those of calcium and barium, and some years later he showed that other such "triads" exist (chlorine, bromine and iodine; and lithium, sodium and potassium). J. B. A. Dumas, L. Gmelin, E. Lenssen, Max von Pettenkofer and J. P. Cooke expanded Döbereiner's suggestions between 1828 and 1854 by showing that similar relationships extended further than the triads of elements, fluorine being added to the halogens, and magnesium to the alkaline-earth metals; while oxygen, sulfur, selenium and tellurium were classed as one family; and nitrogen. phosphorus, arsenic, antimony and bismuth as another family of elements.

Attempts were subsequently made to show that the atomic weights of the elements could be expressed by an arithmetical function, and in 1862 A. E. B. de Chancourtois proposed a classification of the elements based on the new values of atomic weights given by Stanislao Cannizzaro's system of 1858. De Chancourtois plotted the atomic weights on a helical curve such that corresponding points differed by 16, the atomic weight of oxygen. This curve brought closely related elements on to corresponding points, and he suggested in consequence that "the properties of the elements are the properties of numbers," a remarkable prediction in the light of modern knowledge.

In the following year, 1863, J. A. R. Newlands proposed a system of classification of the elements in the order of atomic weights, the elements being assigned ordinal numbers from unity upward and divided into seven groups having properties closely related to the first seven known elements, hydrogen, lithium, beryllium, boron, carbon. nitrogen and oxygen. This relationship was termed the law of octaves, by analogy with the seven intervals of the musical scale. Then in 1869 Mendeléyev, as a result of an extensive correlation of the properties and the atomic weights of the elements, with special attention to valency, proposed the periodic law, by which "the elements arranged according to the magnitude of atomic weights show a periodic change of properties." Lothar Meyer had independently reached a similar conclusion, which he published after the appearance of Mendeléyev's Russian paper and of an account of it in German. (See VALENCE.)

Mendeléyev's periodic table of 1869 contained 17 columns, with two nearly complete periods (sequences) of elements, from potassium to bromine and rubidium to iodine (see Table III), preceded by two partial periods of seven elements each (lithium to fluorine and sodium to chlorine), and followed by three incomplete periods. In his 1871 paper Mendeléyev presented a revision of the 17-

TABLE I.—The Short-Period Form of the Periodic System of the Elements

Group O	I a	I b	II a	II b	III a	III b	IV a	IV b	V a	V b	VI a	VI b	VII a	VII b	VIII
	H 1

*Lanthanum and the lanthanous.

group table, the principal improvement being the correct repositioning of 17 elements. He, as well as Lothar Meyer, also proposed a table with eight columns, obtained by splitting each of the long periods into a period of seven. an eighth group containing the three central elements (such as iron, cobalt, nickel; MendelCyev also included copper, instead of placing it in group I), and a second period of seven. The first and second periods of seven were later distinguished by use of the letters "a" and "b" attached to the group symbois, which were the Roman numerals.

With the discovery of the inert gases helium, neon, argon, etc., by Lord Rayleigh and Sir William Ramsay in 1894 and the following years, MendelCyev and others proposed that a new "zero" group to accommodate them be added to the periodic table. The "short-period" form of the periodic law, with groups 0, I. II, . . . VIII, became popular, and remained in general use until recent years. A new table, devised in 1895 by J. Thomsen, was interpreted in terms of the electronic structure of atoms by Niels Bohr in 1922. In this table, Table II, there are periods of increasing length, each extending from one noble gas to the next noble gas; the table thus contains a period of 2 elements, two periods of 8 elements, two periods of 18 elements, a period of 32 elements and an incomplete period. The elements in each period are connected by tie-lines with corresponding elements in the following period. The principal disadvantage of this periodic table is the large space required by the period of 32 elements and the difficulty of tracing a sequence of closely similar elements along the slanting tie-lines. A very satisfactory compromise, shown in Table III, is to compress the period of 32 elements into 18 spaces by omitting the 14 rare earths, or lanthanons, which are indicated below. This form of the periodic table is the work of T. Bayley (1882).

The great value of the periodic law was made evident by Mendeléyev's success in 1871 in finding that, by changing 17 elements from the positions indicated by the atomic weights which had been accepted for them into new positions, their properties could be correlated with those of other elements. This change indicated that there were small errors in the previously accepted atomic weights of several of the elements, and large errors for several others, for which wrong multiples of the combining weights had been used as atomic weights. MendelCyev was also able to predict the existence and many of the properties of the undiscovered elements eka-boron, eka-aluminum, eka-silicon, eka-manganese, dvi-manganese and eka-tantalum, now identified with the elements scandium, gallium, germanium, technetium, rhenium and protactinium, respectively. Similarly, after the discovery of helium and argon, the periodic law permitted the prediction of the existence of neon, krypton, xenon and radon. Moreover, Bohr pointed out that element 72 would be expected, from its position in the periodic system, to be similar to zirconium in its properties rather than to the rare earths; this observation led G. von Hevesy and D. Coster in 1922 to examine zirconium ores and to discover the missing element, which they named hafnium.

Many of the elements in the MendelCyev and Lothar Meyer periodic tables of 1871 were required by their properties to be put in positions somewhat out of the order of atomic weights. Most of these displacements have been rectified by redeterminations of the atomic weights; three, however, remain, and are real. In the three pairs of elements argon and potassium, cobalt and nickel, and tellurium and iodine, the first element of each pair has the greater atomic weight, but the earlier position in the periodic system. The solution of this difficulty had been indicated by Newlands, who had assigned the successive ordinal numbers to the elements arranged approximately according to atomic weight.

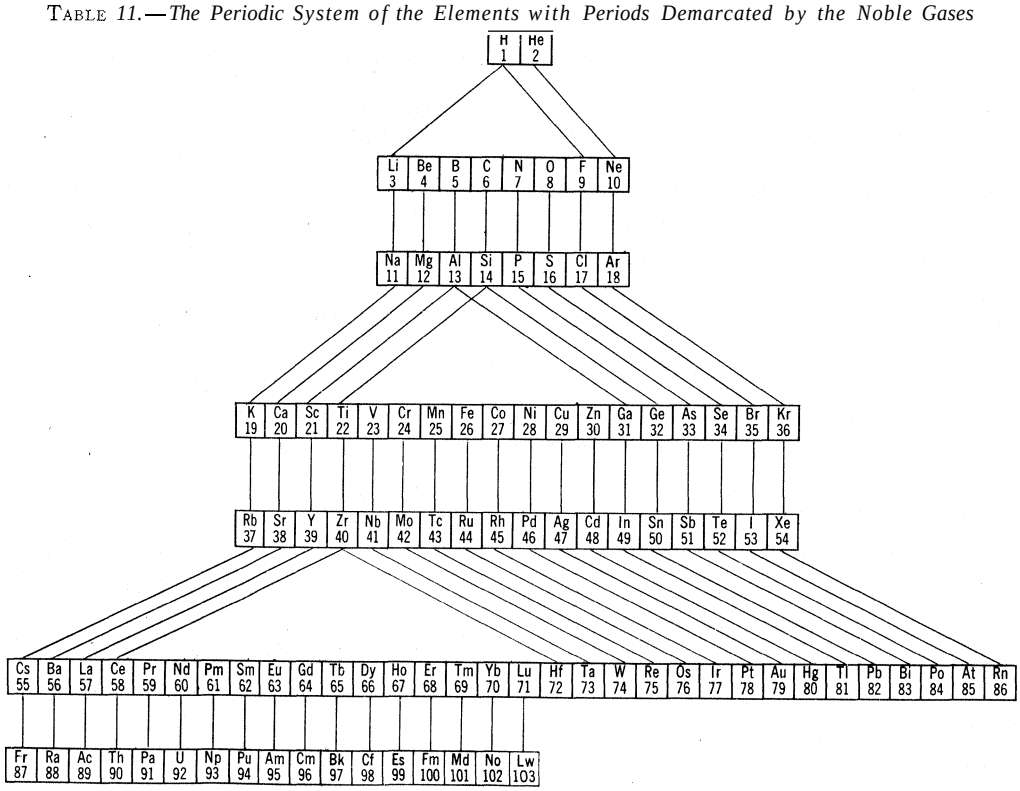
Ernest Rutherford's experiments on the scattering of alpha particles by the nuclei of heavy atoms led to the determination of the nuclear electrical charge. The ratio of the nuclear charge of the electron was noted to be roughly one-half the atomic weight. In 1911 A. van den Broek suggested that this quantity, the atomic number, might be identified with the ordinal number of the element in the periodic system. This suggestion was brilliantly confirmed in 1913 by H. G. J. Moseley's measurements of the wave lengths of the characteristic X-ray spectral lines of many elements. There is no longer any uncertainty about the position of any element in the ordered series of the periodic system. All of the elements from 1 to 103 are now known, and it is to be expected that new elements beyond 103 will be made by nuclear reactions.

The small significance of the exact atomic weight of an element to its position in the periodic system is shown by the existence of isotopes (*q.v.*) of every element, atoms which have the same atomic number but different atomic weights. The chemical properties of the different isotopes of an element are essentially the same, and all of the isotopes of an element occupy the same place in the periodic system.

The detailed understanding of the periodic system has developed along with the quantum theory of spectra and the electronic structure of atoms, beginning with the work of Bohr in 1913. Important forward steps were the formulation of the general rules of the old quantum theory by W. Wilson and A. Sommerfeld in 1917, the discovery of the exclusion principle by W. Pauli, Jr., in 1925, the discovery of the spin of the electron by G. E. Uhlenbeck and S. Goudsmit in 1925, and the development of quantum mechanics by W. Heisenberg and E. Schrodinger during the same year. The development of the electronic theory of valence and molecular structure, beginning with the discovery of the shared electron pair by G. N. Lewis in 1916, also played a very important part in explaining the periodic law.

MendelCyev stated that a natural law acquires scientific impor-

TABLE 11.—*The Periodic System of the Elements with Periods Demarcated by the Noble Gases*



tance only when it yields practical results in elucidating unexplained phenomena, in disclosing unrecognized occurrences and in evoking verifiable predictions. The periodic law has been found to be very useful indeed in the simplification of the science of chemistry through the classification of the elements; in the determination of the correct multiples of equivalent weights to be taken as the atomic weights of elements; in indicating errors in atomic weights; in the prediction of the existence and properties of new elements; and especially as a basis for chemical reasoning and prediction in the planning of experimental work. Its value has increased with increasing understanding of the law and its basis in the electronic structure of atoms, and it has now become one of the firm foundation stones of the great edifice of science.

Survey of the Elements in Relation to the Periodic System.—The long-period form of the periodic system, Table III, is used as the basis of the discussion which follows. This table has the great advantage over the short-period form, Table I, that it does not confuse the user by placing in the same group such dissimilar elements as the halogens and manganese and its congeners. It is also more useful and in some respects more satisfactory than Table II, the periodic system with groups demarcated by the noble gases. In particular, the condensation of the very long period, cesium, 55, to radon, 86, by the omission of the rare-earth metals permits the closely related elements such as copper, silver and gold to be placed close together in a compact column.

The long-period form of the periodic system of the elements, Table III, contains all of the chemical elements which have as yet been discovered or made, arranged, in the order of their atomic numbers, in seven horizontal periods, with the rare-earth metals (cerium, 58, to lutecium, 71) and the actinons (thorium, go, to lawrencium. 103) indicated separately below. The periods are of varying lengths. First, there is the hydrogen period, consisting of the two elements hydrogen, 1, and helium, 2. Then there are two periods of eight elements each: the first short period, from lithium, 3, to neon, 10; and the second short period, from sodium, 11, to argon, 18. There follow two periods of 18 elements each: the first long period, from potassium, 19, to krypton, 36; and the second long period, from rubidium, 37, to xenon, 54. The very long period of 32 elements, from cesium, 55, to radon, 86, is condensed into 18 columns by the omission of the 14 lanthanons (which are indicated separately below), permitting the remaining 18 elements, which are closely similar in their properties to corresponding elements of the first and second long periods, to be placed directly below these elements. The last period, extending from francium, 87, to lawrencium, 103, is incomplete. The properties of these elements indicate that this period is a second very long period of 32 elements. The elements from thorium to uranium are indicated in the table in two places: first, below the elements hafnium to tungsten respectively, to which they show considerable similarity in properties; and second, below the corresponding lanthanons.

The six noble gases, helium, neon, argon, krypton, xenon and radon, occur at the ends of the six completed periods, and constitute the 0 group of the periodic system. For convenience, this group is repeated at the left side of Table III. The seven elements lithium to fluorine and the seven corresponding elements sodium to chlorine are placed in the seven groups, I, II, III, IV, V, VI and VII, respectively. Each of these seven groups is joined by tie-lines with two elements of the first long series. The 17 elements from potassium, 19, to bromine, 35, are distinct in their properties, and might well be considered to constitute 17 subgroups of the periodic system. Largely for historical reasons (the use of the short-period form of the periodic system, Table I), however, it is customary to describe them as constituting 15 subgroups, the three consecutive elements iron, cobalt and nickel and their congeners in the succeeding periods being placed in a single group, VIII. The elements potassium, 19, to manganese, 25, are assigned to subgroups Ia, IIa. IIIa, IVa, Va, VIa and VIIa respectively; and the elements copper, 29, to bromine, 35, are assigned to subgroups Ib to VIIb, respectively.

It is customary to consider the first group, that of the alkali metals, as including, in addition to lithium and sodium, the metals of subgroup Ia (potassium, etc.), but not the much less similar metals of subgroup Ib (copper, etc.). Also the second group, the alkaline-earth metals, is considered to include beryllium, magnesium, calcium, strontium, barium and radium, but not the elements of subgroup IIb. The properties of the elements do not indicate unambiguously whether the boron group might be better considered to include the subgroup IIIa or the subgroup IIIb. The other four groups include the corresponding "b" subgroups: the carbon group, IV, consists of carbon, silicon, germanium, tin and lead; the nitrogen group, V, includes nitrogen, phosphorus, arsenic, antimony and bismuth; the oxygen group, VI, includes oxygen, sulfur, selenium, tellurium and polonium; and the halogen group, VII, includes fluorine, chlorine, bromine, iodine and astatine. The proposed inclusion of potassium and its congeners with lithium and sodium as group I is indicated in the table by representing the subgroup by the symbol I(a), and similarly for II(a), IV(b), V(b), VI(b) and VII(b). The ambiguity for group III, which is considered by about equal numbers of authorities to include scandium and its congeners, on the one hand, and gallium and its congeners, on the other, is not resolved in this table. Possibly Table III would be improved by deleting the tie-lines from I to Ib, II to IIb, IV to IVa, V to Va, etc.

Hydrogen is indicated by tie-lines to be related to both the alkali-metal group and the halogen group. In its chemical properties it is not closely similar to either the alkali metals or the halogens. However, it is assigned the oxidation number +1 in its compounds such as HF, and −1 in its compounds such as LiH; and it may hence be considered as being similar to a group I element and to a group VII element, respectively, in compounds of these two types, taking the place first of Li and then of F in LiF. Hydrogen is, in fact, the most individualistic of the elements: no other element resembles it in the way that sodium resembles lithium, chlorine resembles fluorine, and neon resembles helium. It is a unique element, the only element that cannot conveniently be considered a member of a group.

Ten of the elements of each long period are called the transition metals. These are usually taken to be scandium, 21, to zinc, 30 (the iron-group transition metals); yttrium, 39, to cadmium, 48 (the palladium-group transition metals); and hafnium, 72, to thallium, 81 (the platinum-group transition metals).

The periodicity in properties of the elements arranged in order of atomic number is strikingly shown by the consideration of the physical state of the elementary substances and such related properties as the melting point, density and hardness. The elements of group 0 are difficultly condensable gases. The alkali metals, in group I, are soft, metallic solids with low melting points. The alkaline-earth metals, in group II, are harder and have higher melting points than the adjacent alkali metals. The hardness and melting point continue to increase through groups III and IV, and then decrease through groups V, VI and VII. The elements of the long periods show a gradual increase in hardness and melting point from the beginning alkali metals to the centre of the period (cobalt, rhodium, iridium), and then a fairly regular decrease to the halogens and noble gases.

The valence of the elements is closely correlated with position in the periodic table, the elements in the principal groups having maximum positive valence (oxidation number) equal to the group number; and maximum negative valence equal to the difference between eight and the group number.

The general chemical properties described as metallic or base-forming, metalloid or amphoteric, and nonmetallic or acid-forming are correlated with the periodic table in a simple way: the most metallic elements are to the left and to the bottom of the periodic table; and the most nonmetallic elements are to the right and to the top (ignoring the unreactive noble gases). The metalloids are adjacent to a diagonal line from boron to polonium. A closely related property is electronegativity, the tendency of atoms to retain their electrons and to attract additional electrons, as shown by ionization potential, electron affinity, oxidation-reduction potential, the energy of formation of chemical bonds with other elements and other properties. The electronegativity depends upon position in the periodic table in the same way as nonmetallic character, fluorine

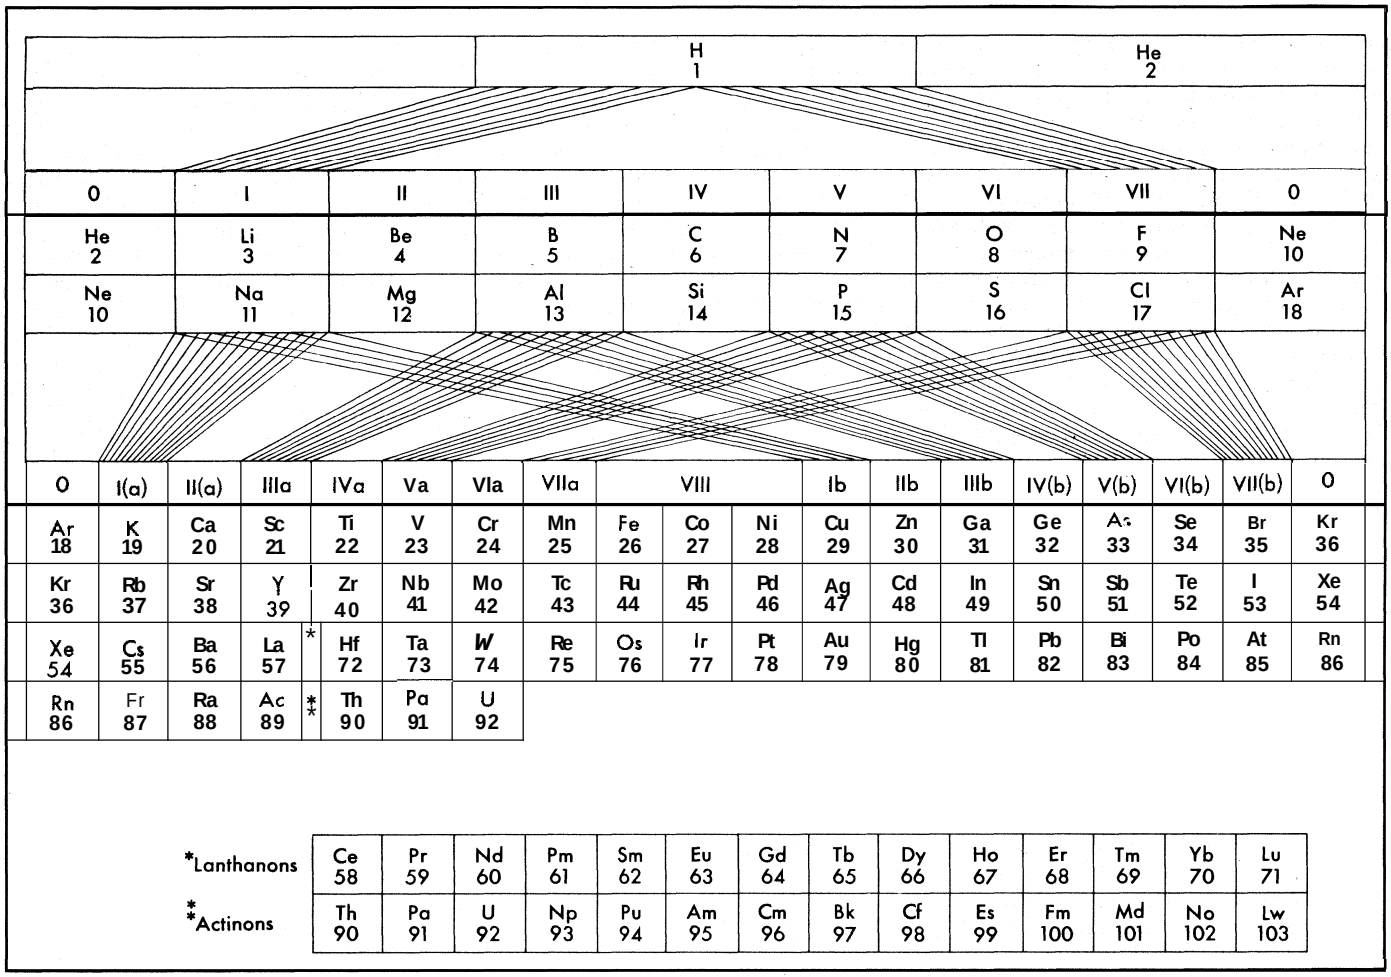


TABLE 111.—The Periodic System of the Elements

being the most electronegative element and cesium (or francium) the least electronegative (most electropositive) element.

The sizes of atoms vary regularly through the periodic system. Thus the effective bonding radius in the elementary substances in crystalline or molecular form decreases through the first short period from 1.52 Å (Angstrom unit $= 10^{-8}$ cm.) for lithium to 0.73 Å for fluorine, then rises abruptly to 1.86 Å for sodium, and gradually decreases through the second short period to 0.99 Å for chlorine. The behaviour through the long periods is more complex: the bonding radius decreases gradually from 2.31 Å for potassium to a minimum of 1.25 Å for cobalt and nickel, and then rises slightly, and falls to 1.14 A for bromine. The sizes of atoms are of importance in the determination of co-ordination number, and hence of the composition of compounds. The increase in atomic size from the upper right corner of the periodic table to the lower left corner is reflected in the formulas of the oxygen acids of the elements in their highest states of oxidation, as shown in Table IV.

TABLE IV.—*Formulas of Oxygen Acids of Elements in their Highest Oxidation State*

$H_2Be(OH)_4$	H_3BO_3	H_2CO_3	HNO_3		
	$HAl(OH)_4$	H_4SiO_4	H_3PO_4	H_2SO_4	$HClO_4$
		H_4GeO_4	H_3AsO_4	H_2SeO_4	
		$H_2Sn(OH)_6$	$HSb(OH)_6$	H_6TeO_6	HIO_4
				and	and
				H_2TeO_4	H_5IO_6

The smallest atoms group only three oxygen atoms about themselves; the next larger atoms, which co-ordinate a tetrahedron of four oxygen atoms, are in a diagonal belt; and the still larger atoms, which form octahedral oxygen complexes (stannic acid, antimonic acid, telluric acid, paraperiodic acid), lie below and to the left of this belt.

It is only the chemical and physical properties of the elements that are determined by the extranuclear electronic structure which show the periodicity described in the periodic law. The properties of the atomic nuclei themselves, such as the magnitude of the packing fraction and the power of entering into nuclear reactions, are, although dependent upon the atomic number, not dependent in the same periodic way.

The Electronic Structure of Atoms as the Basis of the Periodic System.—The noble gases, helium, neon, argon, krypton, xenon and radon, have a striking chemical property—that of forming no chemical compounds. It would be surmised that this property depends upon their possession of especially stable electronic structures. During the development of modern atomic physics and the theory of quantum mechanics, a precise and detailed understanding has been obtained of the electronic structure of the noble gases and other atoms which explains the periodic law in a thoroughly satisfactory manner.

The Pauli exclusion principle states that no more than two electrons can occupy the same orbit (or, in wave-mechanical language, orbital) in an atom, and that these two electrons in the same orbital must be paired; that is, must have their spins opposed. The orbitals in an atom may be described by a total quantum number, n, which may assume the values 1, 2, 3, . . . ; and an azimuthal quantum number, l, which may assume the values 0, 1, 2, . . . , $n - 1$. There are $2l + 1$ distinct orbitals for each set of values of n and l. The most stable orbitals, which bring the electron closest to the nucleus, are those with the smallest values of n and l. The electrons which occupy the orbital with $n = 1$ (and $l = 0$) are said to be in the K shell of electrons; the L, M, N, . . . shells correspond respectively to $n = 2, 3, 4, \ldots$. Each shell except the K shell is divided into subshells corresponding to the values 0, 1, 2, 3, . . . of the azimuthal quantum number l; these subshells are called the s, p, d, f. . . . subshells, and they can accommodate a maximum of 2, 6, 10, 14, . . . electrons.

The approximate order of stability of the successive subshells in

an atom is indicated by the above figure. The most stable shell, the K shell, is completed at helium, with two electrons. The L shell is then completely filled at neon, with atomic number 10. The atoms of the heavier noble gases do not, however, have a completed outer shell, but instead, completed s and p subshells; *i.e.*, an outer shell of eight electrons, called an octet of electrons. The d subshells and f subshells are also filled with electrons after the less stable orbitals are occupied.

The electron occupancy of the shells in the noble gas atoms is:

Electrons in	K	L	M	N	O	P	Q	shell
He 2:	2							
Ne 10:	2	8						
Ar 18:	2	8	8					
Kr 36:	2	8	18	8				
Xe 54:	2	8	18	18	8			
Rn 86:	2	8	18	32	18	8		
118:	2	8	18	32	32	18	8	

The numbers 2, 8, 18 and 32 correspond to filling the s; s and p; s, p and d; and s, p, d and f subshells, respectively.

The first period of the periodic table is complete at helium, when the K shell is filled with two electrons. The first and second short periods represent the filling of the 2s and 2p subshells (completing the L shell at neon), and the 3s and 3p subshells (at argon), leaving the M shell incomplete. The first long period begins by the introduction of electrons in the 4s orbital. Then at scandium the five 3d orbitals of the inner M shell begin to be occupied. It is the successive occupancy of these five 3d orbitals by their complement of ten electrons that characterizes the ten elements of the iron-group transition series.

At krypton the M shell is complete and there is an octet in the N shell. The second long period, of 18 elements, similarly represents the completion of an outer octet and the next inner subshell of 10d electrons.

The very long period of 32 elements results from the completion of the 4f subshell of 14 electrons, the 5d subshell of 10 electrons, and the 6s, 6p octet. The filling of the 4f orbitals corresponds to the sequence of 14 lanthanons, and that of the 5d orbitals to the 10 platinum-group transition metals.

The next period, which is incomplete, involves the 5f subshell of 14 electrons, the 6d subshell of 10 electrons, and the 7s, 7p octet. The filling of the 5f orbitals corresponds to the actinons, the elements beginning with thorium, 90.

The successive periods of the system hence correspond to the introduction of electrons into the following orbitals:

The very short period, H, He.	2	elements. 1s.
The first short period, Li to Ne.	8	elements. 2s, 2p.
The second short period, Na to Ar.	8	elements. 3s, 3p.
The first long period, K to Kr.	18	elements. 3d, 4s, 4p.
The second long period, Rb to Xe.	18	elements. 4d, 5s, 5p.
The very long period, Cs to Rn.	32	elements. 4f, 5d, 6s, 6p.
The incomplete period, Fr to 118.	32	elements. 5f, 6d, 7s, 7p.

There are advantages to replacing the K. L, M, . . . shells by a different grouping of the subshells, in which those with nearly the same energy are grouped together, in close correlation with the periodic system. The new set of shells is the following:

The helium shell.	2	electrons. 1s.
The neon shell.	8	electrons. 2s, 2p.
The argon shell.	8	electrons. 3s, 3p.
The krypton shell.	18	electrons. 4s, 4p, 3d.
The xenon shell.	18	electrons. 5s, 5p, 4d.
The radon shell.	32	electrons. 6s, 6p, 5d, 4f.
The eka-radon shell.	32	electrons. 7s, 7p, 6d, 5f.

(See ATOM.)

The Properties of the Elements of the Main Groups.— The periodicity of properties of the elements is caused by the periodicity in electronic structure. The noble gases are all chemically unreactive because their electronic structures are stable— their atoms hold their quota of electrons strongly, have no affinity for more electrons, and have no tendency to share electrons with other atoms. An element close to a noble gas in the periodic system, on the other hand, is reactive chemically because of the possibility of assuming the stable electronic configuration of the noble gas, by losing one or more electrons to another atom, by gaining one or more electrons from another atom, or by sharing electrons. *(See* VALENCE.) The alkali metals, in group I, can assume the noble-gas configurations by losing one electron, which is loosely held in the outermost (valence) shell, to another element with greater electron affinity, thus producing the stable singly charged positive ions. Similarly the alkaline-earth metals can form doubly charged positive ions with the noble-gas electronic configurations by losing the two loosely held electrons of the valence shell; the positive ionic valences of the elements of the first groups are hence equal to the group numbers. The elements just preceding the noble gases can form negative ions with the noble gas configurations by gaining electrons; the negative ionic valences of these elements are equal to the difference between eight and their group numbers.

The covalence of an atom is also determined by its electron number and the stable orbitals available to it. An atom, such as fluorine. with seven electrons in its outer shell can combine with a similar atom by sharing a pair of electrons with it, thus achieving the noble-gas configuration, with three unshared pairs and one shared electron pair in the valence shell,

The properties of elements in the same group of the periodic system are, although similar, not identical. The trend in properties from the lighter to the heavier elements may be attributed to changes in the strength of binding of the outer electrons and especially to the increasing size of the atoms.

The Transition Elements.— The nature of the three transition groups can be discussed with the iron group as an example, the other two groups being similar.

In potassium and calcium the valence electrons, outside of the argon shell, occupy the 4s orbital. Additional valence electrons, in scandium, titanium, etc., enter not the 4s subshell, but the 3d subshell, which is then completely filled, along with 4s, in zinc. The elements potassium, calcium, scandium, titanium, vanadium, chromium and manganese have maximum oxidation numbers from one to seven, respectively, corresponding to their successive positions following argon. The atoms titanium to manganese are, however, not similar to the corresponding atoms carbon to fluorine or silicon to chlorine in the short periods because they are not directly followed by a noble gas, whose stable structure they might achieve by gaining or sharing electrons. Instead, these atoms have a strong tendency to form bipositive or terpositive ions by losing two or three electrons, the remaining valence electrons occupying the 3d orbitals, which for these positive ions are more stable than the 4s orbital.

The elements copper, by losing one electron, and zinc, by losing two, can form the ions Cu^+ and Zn^{++} with a completed M shell of elections. If the 4s and 4p orbitals were much less stable than the 3d orbitals, instead of about equally stable, this electronic configuration would be similar to the neon configuration; and nickel would be a noble gas, copper an alkali metal and zinc an alkaline-earth metal. The actual, different properties of nickel, copper and zinc result from their power of using the 4s and 4p orbitals in forming chemical bonds. Nevertheless, the effect of the 18-shell configurations (of Cu^+, Ag^+, Au^+) is evident in the normal valences of the elements of subgroups Ib. IIb, IIIb, IVb, which are equal to the group numbers.

These elements may also assume other valences, one or two greater (by losing additional electrons, leaving the 3d subshell incomplete) or two less (by having the 4s orbital occupied by an unshared electron pair).

It is convenient to consider ten of the elements in each long period or very long period to be transition elements, corresponding to the introduction of ten electrons in a d subshell. There is some arbitrariness in the selection of these elements, because the sharp differentiation of s. p and d subshells for the outer electrons of an atom in a molecule or crystal is not possible; these subshells are precisely defined only for a system with spherical symmetry; *i.e.*, for a system containing only one nucleus.

Although the selection is arbitrary, it is convenient to consider the elements titanium to gallium inclusive as the first transition elements; zirconium to indium as the second; and hafnium to thallium as the third.

The **Lanthanons.**—The existence of a long series of very

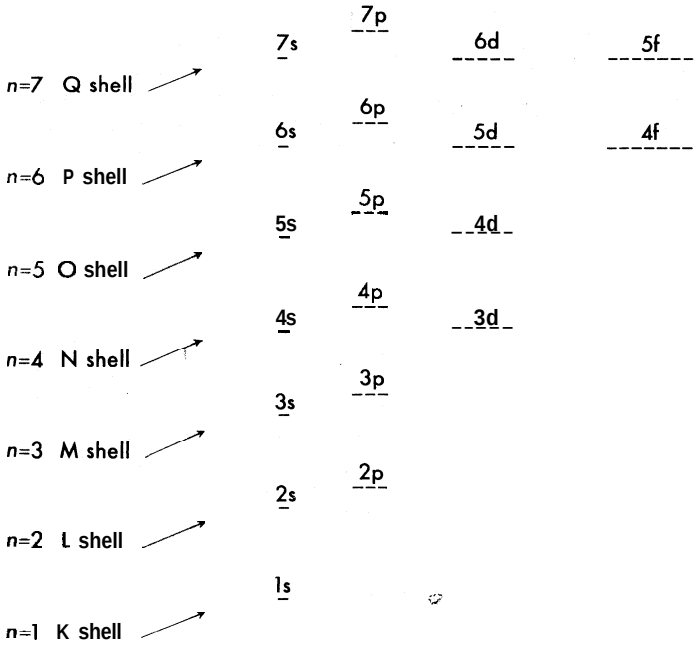

DIAGRAM REPRESENTING QUALITATIVELY THE RELATIVE STABILITY OF SUCCESSIVE ELECTRON ORBITALS IN ATOMS; THE RELATIVE ENERGY VALUES CHANGE SOMEWHAT WITH CHANGE IN ATOMIC NUMBER

closely related elements, the lanthanons or rare-earth elements, has been clarified by the development of the understanding of the electronic structure of atoms. With increase in the atomic number of the elements the seven 4f orbitals become increasingly stable, until, at lanthanum, 57, or cerium, 58, these orbitals begin to be occupied. In the terpositive gadolinium ion, 64, the 4f subshell is half-filled, with one electron in each of the seven orbitals; and in the luteciurn ion, 71, it is completely filled with its complement of 14 electrons.

The lanthanons thus comprise the 14 metals from cerium to lutecium. with the same electronic structure except for the variation from 1 to 14 in the number of 4f electrons. Often lanthanum, with the same electronic structure hut with no 4f electrons in the terpositive ion, is also included among the lanthanons, increasing their number to 15.

The 4f orbitals are deep within the atoms — there is a stable noble-gas shell of eight 5s and 5p electrons outside, as well as, in the neutral atoms, two valence electrons in the 6s orbital and perhaps one in a 5d orbital. Because the 4f orbitals are in an inner shell, the properties of the atom or ion are changed only slightly by change in the number of electrons which occupy them; hence the lanthanons are closely similar to one another in physical and chemical behaviour. This similarity was made strikingly evident by the great difficulty of separating them from the complex mineral mixtures in which they occur in nature, which caused their discovery to be spread over a period of more than a century (see RARE EARTHS).

The lanthanons all have $+3$ as principal oxidation state, corresponding to the loss of the three valence electrons to more electronegative atoms. Cerium, praseodymium and terbium also occur in oxidation state $+4$, and samarium, europium and ytterbium in oxidation state $+2$.

The Actinons.—The only important general question about the periodic system to which the answer remains doubtful is that as to the nature of the last period. Because thorium is more closely similar to hafnium than to cerium in many of its properties, and uranium is more closely similar to tungsten than to neodymium, it has been thought that the uranium elements constitute the beginning of a transition period similar to the two long periods, and involving the occupancy of the 6d subshell. However, G. T. Seaborg has pointed out that the properties of the transuranium elements suggest that these elements are members of a second series of the lanthanon type, with occupancy of the 5f orbitals beginning at thorium. It is true that uranium is unlike the lanthanons in that the $+6$ oxidation state is the most stable of its oxidation states ($+6, +5, +4, +3, +2$); but neptunium, instead of being similar to rhenium, is reported not to have a stable $+7$ state; instead, neptunium and plutonium are said to have the same oxidation states as uranium, but with a general shift in stability toward the lower oxidation states.

An answer to this question can be given by the consideration of the stability and nature of the electronic orbitals involved. Although d orbitals contribute to the formation of strong covalent bonds, inner f orbitals are not useful in this way, as is shown by the small tendency of the lanthanons to form covalent compounds. The fact that uranium does form covalent compounds shows that the 6d orbitals are stable enough to be used for this purpose; and the stability of the $+6$ oxidation state shows that the 5f orbitals of uranium are not sufficiently stable to attract any of the six valence electrons very strongly. Hence the uranium period differs from the immediately preceding period in that the 5f orbitals are less stable relative to the 6d orbitals than are the 4f relative to the 5d orbitals. However, with increase in atomic number the 5f orbitals will increase in stability more rapidly than the 6d orbitals, and ultimately the 5f orbitals will be filled. It is likely that this process has begun at neptunium; and presumably it would be completed at element 103, which would be similar to lutecium in structure and properties, with probably a greater tendency to the formation of covalent compounds. The 6d, 7s and 7p subshells would then be successively occupied, with element 118, eka-radon, as the next noble gas, though probably able to form some chemical compounds. The 14 elements from thorium to lawrencium are called the actinons.

Thus this great generalization, the periodic law, which first showed its value through Mendeléyev's prediction of the existence and properties of undiscovered elements, is again being put to the same use; the undiscovered elements of present interest being those that have greater atomic number than the known elements, and that will be sought not in nature's minerals, but in preparations made by man.

PERIODONTAL DISEASES are diseases of the soft tissues around the teeth. Periodontal tissue includes both the tissue that surrounds the neck of a tooth, which is called the gum or gingiva; and the soft tissue that surrounds the root of a tooth, lying between the root and the bony socket of the root and known as the dental ligament or attachment membrane.

The free edge of the gingiva is like a collar that surrounds the neck of a tooth and slopes away on the outside to become continuous with the oral tissue covering the bony process of each jaw. This outer surface of the gum or gingiva is firm, pink in colour and slightly stippled (rough). As the gingiva completely surrounds the neck of a tooth, in its normal healthy condition, a shallow sulcus or crevice lies between the border of the gingiva and the line of attachment to the tooth surface. The remaining inner surface of the gingiva is normally attached to the roots of the teeth and is continuous with the deeper periodontal tissue.

The health of the gingiva is largely dependent upon the practice of regular daily hygienic care by proper tooth brushing and the use of dentifrices and mouth rinses. A surface covering of epithelium protects the soft tissue from injury and infection. Beneath the epithelium is another tissue, the connective tissue, which is well supplied with blood vessels. Protecting blood cells gather rapidly in the presence of injury or infection to heal injuries to the soft tissue and resist. the infecting agent, but where there is continuous irritation in the gingiva, inflammation results from the struggle to remove or destroy the injurious agent. This brings about the beginning of periodontal disease in its simplest form, known as gingivitis. This is a progressive disturbance if uncorrected and the gingiva restored to a healthy condition.

Gingivitis.—Gingivitis begins as a mild inflammation causing bleeding gums. It is common and seldom painful and therefore easily overlooked or neglected. It is usually a chronic condition

brought about by a low-grade infection in the gums associated with constant irritation by dental calculus, by food packing between two adjacent teeth, by the retention of food and soft deposits around the gum line, or by mechanical irritation. The commonest cause of all is the lack of thorough daily home care with a good toothbrush. Inflammation in the gingiva gradually extends into the deeper periodontal tissues, loosening them from their normal attachment to the roots of the teeth. This eventually causes a pocket to form along the root surface beneath the collar of **gum** tissue, the beginning of a periodontal pus pocket, formerly called a pyorrhea pocket. Vincent's infection, a gingivitis commonly called "trench mouth," is an acute and painful form of gingivitis caused by specific microorganisms. Some authorities consider it to be a contagious disease, and probably during the most active period of the infection it may be contagious.

Hyperplastic gingivitis, or inflammatory enlargement of the gingival tissue, often is associated with certain systemic disturbances, such as diabetes, blood diseases, metal poisoning and nutritional deficiences. A more fibrous type of gingival enlargement, known as fibrous gingival hyperplasia, is frequently associated with hormone disturbance during adolescence or pregnancy. Another form of hyperplasia appears as a side effect in the use of sodium dilantin in the treatment of epilepsy; this is a very firm, painless but disfiguring type of fibrous hyperplasia.

All these types of gingivitis are amenable to treatment and can be cured by the removal or correction of the cause. This includes thorough removal of calculus deposits, correction of mechanical irritation, control of infection and daily home care:

Periodontitis.— Periodontitis, like gingivitis, is a progressive inflammation. It involves the deeper tissue surrounding and attached to the roots of the teeth. As the pocket deepens, the support of the tooth is weakened by loss of surrounding bone. Food residue and bacteria accumulate and stagnate in the pocket. Pus is formed and discharged from the pocket opening into the mouth. Eventually the tooth loosens because of the loss of its bony support. Sometimes an acute infection occurs in a deep periodontal pocket, causing much pain followed by swelling of the surrounding tissue. This is a periodontal abscess. It is not associated with the commoner abscesses that are found at the root tip when there is infection in the root canal.

Periodontitis is curable if treated early. The pockets should be curetted and irrigated, and the roots made smooth. Very often surgical removal of the overlying unattached soft tissue wall of the pocket is necessary to eliminate the pocket. Home care is as important as care by the dentist.

Gingivosis and **Periodontosis.**—These are degenerative diseases that are difficult to understand and to control.

Gingivosis is a rather uncommon and painful condition sometimes found on the labial surface of the gingiva. The surface of the epithelium seems to peel or slough away because of degeneration of the underlying connective tissue, leaving a raw surface. The cause is unknown.

The cause of periodontosis, affecting the deeper periodontal tissue, also is not entirely clear. It seems to have several etiological factors, probably being associated with some systemic disturbance that interferes with the nutrition in this local tissue, causing it to break down. Periodontosis is characterized by drifting or separating teeth and by sudden pocket formation of considerable depth. There are seldom any calculus deposits on the affected teeth or any bleeding until a late stage of development. Injury from the occluding forces as the teeth are brought together has an important relation to destruction of the supporting bone and loosening of the teeth.

Tissues that are continuously subjected to severe stress may be affected by certain systemic factors that reduce their ability to maintain their function and to repair the damage of daily wear and tear. The gums may appear healthy while the deeper tissue along the root surfaces is degenerating. It is thought that some internal disturbance interferes with the nutrition and function of the cells in the supporting tissue of the teeth. Some diseases interfere with metabolism and thus lower the ability of the blood to nourish the tissues properly. Inherited tendencies may affect the quality of constantly developing new bone and muscle tissue. Teeth with weakened support cannot sustain the normal functional demands of occlusion. Degeneration in the deep periodontal tissues cannot be seen clinically, but when the teeth begin to separate and drift away from their normal position it becomes evident that the supporting tissue is affected and the early symptoms of periodontosis are appearing. The onset of periodontosis cannot be predicted. No one can predict which teeth will become involved in a person susceptible. The condition most commonly occurs in the third or fourth decade of life, but systemic diseases may influence an earlier or later appearance. If inflammation develops in the gingiva and the deeper tissue, the progress of the two types of disease—inflammatory and degenerative—acting simultaneously is greatly increased. Deep pockets form along the surfaces of the roots and discharge pus into the mouth. The X-ray picture reveals great loss of bony support of the affected teeth.

The anterior teeth often separate and protrude, while the posterior teeth move from their normal positions and are brought into abnormal relation with posterior teeth of the opposite jaw. This often subjects those teeth to abnormal biting stress and hastens their loss because of injury to the surrounding periodontal tissues. In the later stages of periodontosis, both the degenerative and the inflammatory symptoms become combined in a condition known as periodontitis complex.

In the early stages periodontosis can be alleviated and often cured. It is necessary to correct an unbalanced diet and to institute very thorough home care of the teeth and gums. When the teeth begin to drift, retaining appliances are necessary. Surgical removal of pockets is essential to remove diseased tissue and restore healthy underlying bone upon which new soft tissue can grow. At regular intervals dental care is required to assist in maintaining the health of the gingival and periodontal tissues.

Traumatism.—The teeth are normally held firmly within a bony socket surrounded by very dense and strong tissue fibres of the periodontal attachment or ligament. Although the teeth may seem immovable, there is a slight movement when pressure is applied horizontally. This movement is physiological up to a certain distance. The periodontal attachment tissue varies in thickness from 0.1 to 0.3 mm., which is considered normal; but the root of a tooth will crush the periodontal tissue against the bony socket if it moves more than one-half of that distance under pressure.

When the teeth are brought into occlusion the cusps of the teeth of one jaw should fit into the grooves of the teeth in the opposite jaw in cusp-to-groove contact. Many influences interfere with this ideal arrangement, causing malocclusion, which results in abnormal horizontal stress upon some tooth or teeth. Constant horizontal stress may force a tooth to move and eventually loosen it in its socket. The effect of this causes traumatic injury in the supporting tissue. This has been known as traumatic occlusion, but is more correctly called traumatism.

Periodontal Atrophy.— Atrophy is a wasting away or shrinkage of tissue. Periodontal atrophy is classed as a degenerative condition, although it is not classed as a disease. Receding gums with a healthy colour and a normal attachment to the crown or root of a tooth are an evidence of shrinkage and not of disease. When teeth have no occluding contact or function, the attachment tissue on the root surface undergoes a degenerative change, just as does almost any other unused muscle or organ. This is called disuse atrophy. Another form of atrophy, occurring late in life, is called senile atrophy. Atrophic changes in the gingival tissue may occur at any time after middle life. Brushing the teeth crosswise may cause toothbrush trauma to the gingiva and early recession of the gingival border of the gums, but does not result in periodontal disease.

PERIOECI, in Greek PERIOIKOI, in ancient Laconia the class intermediate between the Spartan citizens and the helots (*q.v.*). Ephorus says (Strabo viii, 364 et *seq.*) that they were the original

Achaean inhabitants of the country (Gr. περίοικοι, dwellers around).

The term: however, came to denote not a nationality but a political status, and afterward included Arcadians on the northern frontier of Laconia; Dorians, especially in Cythera and in Messenia; and Ionians in Cynuria. They inhabited a large number of settlements, varying in size from important towns like Gythium to insignificant hamlets. The perioeci possessed personal freedom and some measure of communal independence, but were under the immediate supervision of Spartan harmosts (governors) and subject to the general control of the ephors. They were excluded from all Spartan offices of state and from the assembly, and, because of the absence of any legal right of marriage (ἐπιγαμία), the gulf between the two classes was impassable.

(*See* SPARTA.)

PERIPATETICS, the name given in antiquity to members of the school of Aristotle and their successors. The name was derived from the Peripatos, a covered walk in the Lyceum in Athens, where Aristotle began to teach in the year 33j B.C., on his return from Macedonia. Previously, he had attended the school of Plato in the Academy (up to Plato's death in 348–347 B.C.); it was in the Peripatos that he completed his transformation of the Platonic teaching, abandoning the doctrine of transcendent ideas and adopting in its place an empirical attitude to reality as manifested in nature and in history. This led to the most comprehensive encyclopaedic system of thought that was ever known in antiquity. (*See* ARISTOTLE.)

Aristotle's immediate successor as leader of the school was Theophrastus (*q.v.*). Neither he nor Eudemos of Rhodes (*q.v.*) made any radical change in the teaching; they concentrated rather on the development of individual aspects. Theophrastus, however, tried to strengthen the systematic unity of the whole, giving further development to nearly every part of Aristotle's doctrines. But the increasing decline of the metaphysical elements, together with the expansion of empirical methods. was preparing the way for the coming independence of the specialized subjects. Soon the Peripatos could hardly any longer be called a school of philosophy. since it had lost even its unity of ethical teaching and was disintegrating into a number of separate disciplines. Dicaearchus and Aristoxenus (*qq.v.*), abandoning the cardinal principle of Aristotelian metaphysics, renounced belief in the immortality of the soul. Furthermore. Dicaearchuj ceased to subscribe to the contemplative ideal of life preached by Theophrastus; and Aristoxenus confronted the ethics of Plato and Aristotle with a so-called Pythagorean theory reconstructed from traditional sources.

Further proof of how soon the school lost its philosophical unity is supplied by Clearchus of Soli who, like Aristoxenus and Dicaearchus. may still have been a personal disciple of Aristotle. In opposition to the other two, he clung to the idea of the soul's immortality. However, he attempted to prove this not through the dialectic methods of Plato and Aristotle but by means of popular tales about states of ecstasy, which he tried to link to primitive shamanistic traditions. In his treatment of ethical questions Clearchus seems to adhere to a general ideal of "moderation" which was not bound to any particular philosophical premisses. Thus in his treatise, *Peri Bion* in which he explains his attitude toward hedonism, the Aristotelian idea of the coexistence of several equally justified ways of life seems to have been forgotten.

A characteristic of this disintegration is the increasing number of specialized treatises on the natural sciences. Some such treatises written by Theophrastus are extant, and we know at least the titles of certain monographs on zoology, on physiology and on medicine by Strato of Lampsacus and by Clearchus. Strato moreover. in his physics, separated himself entirely from the teleological principles of Aristotle. approaching more nearly to the atomic theories of Democritus. According to the scientific qualifications of each investigator, this specialization in the sciences proved to be sometimes an advantage and sometimes a drawback: thus some Peripatetics contributed to the development of empirical disciplines of considerable stature, while others produced a number of works on the miraculous intended only for entertainment.

The achievements of the Peripatos are equally uneven in the field of the humanities. The foundation had been laid by Aristotle, who gathered material for his teaching on statecraft from political history, studied the philosophy of his predecessors as a basis for his own theories and discovered in ancient poetry important and vital examples for his own ethics. Here again the various branches became increasingly independent as time went on. Thus Demetrius Phalereus, who ruled as Macedonian governor in Athens from 317 to 307 B.C., wrote on Athenian constitutional history as well as on his own political activities. In their commentaries on the poets, the Peripatetics were able to refer back to old traditions that had begun with the explanations of Homer by the Rhapsodists; and their biographies of the poets were based on popular books on the life of Homer or Hesiod, from which they often borrowed the fictional embellishments. Aristotle, Dicaearchus, Demetrius Phalereus and Chamaeleon (a representative of the first generation of disciples) are all attested to have written works on Homer; and lyric and dramatic authors were equally favourite subjects for dissertations. The Peripatos notably stimulated the Alexandrian grammarians from Zenodotus to Aristarchus, whose editions and interpretations of the classical texts preserved that literature for posterity.

A new period in the history of the Peripatetics began in the 1st century B.C., when Andronicus of Rhodes (*q.v.*) published the long-neglected works of Aristotle and thus aroused interest in the philosophical tradition proper to the school. With Andronicus there came into being a way of interpreting the main writings of Aristotle which was to last as long as the Roman empire, reaching its climax with Alexander of Aphrodisias (*q.v.*). Admittedly Alexander interpreted Aristotle in a nominalist sense, maintaining that the universal was a mere abstraction from the particular (whereas Aristotle had in fact given it ontological priority, though conceding that our knowledge may spring from the particular). Alexander's interpretation, as Strato's long before him, involved opposition to Platonism at a time when other exponents were attempting on the contrary to smooth out as far as possible the differences between the teachings of Plato and the teachings of Aristotle.

As a synthesis of the two philosophies was actually brought about soon after Alexander's time by Plotinus, Aristotelian thought came to exert an influence in Neoplatonism (*q.v.*). This survived long after the school of the Peripatetics had perished. (F. WI.)

PERIPATUS, a genus of remarkable wormlike Arthropoda (*q.v.*) belonging to the class Onychophora (*q.v.*). The name is often loosely used to denote all members of this class, which is in many respects intermediate between the segmented worms (Annelida; *q.v.*) and the Arthropoda (insects, spiders, crabs, etc.), though most nearly related to the latter.

There are about 110 species of Onychophora, found chiefly in tropical America. tropical Africa and the East Indies. The true *Peripatus* is American.

PERISCOPE, an optical instrument used in land and sea warfare and submarine navigation to enable an observer to see his surroundings while remaining under cover, behind armour or submerged. Technicians engaged in nuclear research employ extremely long periscopes to observe the functioning of nuclear reactors from a safe distance.

A periscope always includes, among its optical elements, two mirrors or reflecting prisms to change the direction of the light coming from the scene being observed: the first reflects it down through a vertical tube and the second diverts it horizontally so that it can be viewed conveniently. There is usually a telescopic optical system, which may be very complex, which gives magnification. provides as nide an arc of vision as possible and includes a crossline or a reticle pattern which establishes the line of sight to the target. There may also be devices or accessories for estimating the range and course of the target, and for photographing through the periscope.

The simplest type of periscope is illustrated in fig. 1. It consists of a tube at whose ends are two mirrors which are parallel

to each other but at 45° to the axis of the tube. This device produces no magnification and does not give a crossline image for gun-sighting use. The arc of vision is limited by the simple geometry of the tube—the longer or narrower the tube, the smaller the field of view. Periscopes of this type found very wide use in World War II in tanks and other armoured vehicles, as observation devices for the driver, gunner and commander. When fitted with a small auxiliary gunsight telescope at the side of the tube, the tank periscope can also be used in pointing and firing the guns. By employing tubes of rectangular cross section, approximately 7 in. by 2 in., wide horizontal fields of view can be obtained—large vertical fields are not necessary in surface combat. The vertical displacement of the line of sight is of the order of one foot. Sometimes solid prisms of glass or plastic are used in place of the end assemblies pictured in fig. 1, each of which consists of a mirror and two sealing windows. The periscopes and their swivel mounts are designed and constructed so as to be as water- and dust-tight as possible. The top mirror assembly or prism may be detachable, and readily replaceable with a spare unit in case it is shattered by enemy gunfire or is otherwise damaged.

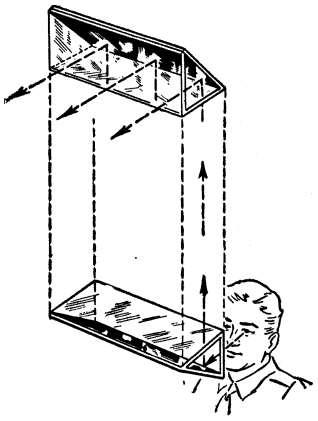

FIG. 1.— THE SIMPLE TANK PERISCOPE

Turret Periscopes.—Periscopes are installed in the gun turrets and armoured conning towers of battleships and cruisers in order that the gunnery officer can sight on the target and, if desired, can bring the guns to bear on it, when the turret is in "local control." The shape and construction of the turret may necessitate a periscope length of as much as 10 ft., for unobstructed vision. A simple instrument of the two-mirror type would have much too narrow an angular field of view; so a telescopic optical system is always employed. This may be thought of as having the effect of placing the observer's eye much closer to the top end of the periscope, thereby greatly increasing his arc of vision. It also makes possible magnification, which is necessary because the guns fire at long ranges. A crossline reticle can easily be included for gun-sighting use.

A typical optical system for such a periscope is shown schematically in fig. 2, in which the outline of the instrument is indicated also, for reference. The function of each optical part, described in order: is as follows: the upper sealing window *A*, through which light enters from the target scene; the head mirror or prism B, which reflects the incoming light down the periscope tube; the objective lens C, a cemented achromatic doublet lens which brings the light to a focus; a plano-convex collective lens D, located at this focus. and upon which the crossline or other reticle pattern may be etched; a pair of similar achromatic doublet lenses E and *F* which erect the image; the lower deflecting prism G, which turns the light into a horizontal path; the sealing plate H, at the lower end of the main periscope tube; one or more colour filters **I,** for haze and glare reduction, usually interchangeable red, yellow: polarizing and clear plates; the eyepiece. which consists of two doublet lenses, a so-called field lens *K* and an eye lens L. If it is desired to be able to illuminate the reticle for night use. the crossline may be etched on the lower sealing plate H rather than on the collective lens D. The sealing plate must then be located at the second focal point, J. The reticle markings may include several short vertical lines equally spaced on each side of the vertical crossline; these are used in estimating the deflection error of the projectiles. Moving parts outside the sealed main portion of the periscope are the interchangeable colour filters and. the eyepiece which can be adjusted in focus to suit the individual observer.

This optical system can be thought of as consisting of two astronomical telescopes. The upper one is made up of lenses C, D and E. It provides little magnification but transfers the target image and field of view down the periscope tube to lens *F*, which is the objective lens of the second telescope; K and L constitute its eyepiece. This second astronomical telescope magnifies the image in the ratio of the focal lengths of the objective and eyepiece. It also erects the image, which has been inverted in both the up-and-down and left-to-right senses by the first telescope.

The mirror or reflecting prism at the upper end of the periscope tube is so arranged that it can be tilted by means of a mechanism that is actuated by a handwheel located near the eyepiece; the line of sight may thus be carried through as much as 30° above and below the horizontal. The entire periscope can be rotated in its mount about its vertical axis through 360°, so as to scan the horizon. In order to prevent fogging of optical surfaces and the consequent loss of vision, the interior of the periscope must be thoroughly dried, filled with dry air or nitrogen and sealed tightly against the atmosphere. Gas inlet and outlet valves are ordinarily provided for this purpose.

A typical turret periscope will have an optical magnification of approximately 10 and an angular field of view of 4° to 6°. The brilliance of the image seen by the observer depends on the over-all light transmission of the instrument and on the size of the exit pupil; *i.e.*, the beam of light that emerges from the eye lens. Conditions imposed on the optical design usually permit a fairly large exit pupil, say 5 mm. in diameter, which is sufficient for day use. For night use. however, the emergent beam of light should entirely fill the pupil of the observer's eye for maximum brightness of image. This necessitates an exit pupil of 7- to 8-mm. diameter, which usually entails larger diameter optical elements throughout. with a concomitant increase in over-all size, weight and cost of the instrument. The percentage of light transmitted by an optical instrument can be greatly increased by coating all air-to-glass surfaces of the various lenses and prisms with so-called reflection-reducing films. The use of such films in the optical system of fig. 2 will increase its light transmission from around 30% to more than 50%, a gain of almost 100%. Also, the image rendition is improved in that crisper, clearer images are obtained and ghost images and flare spots are eliminated.

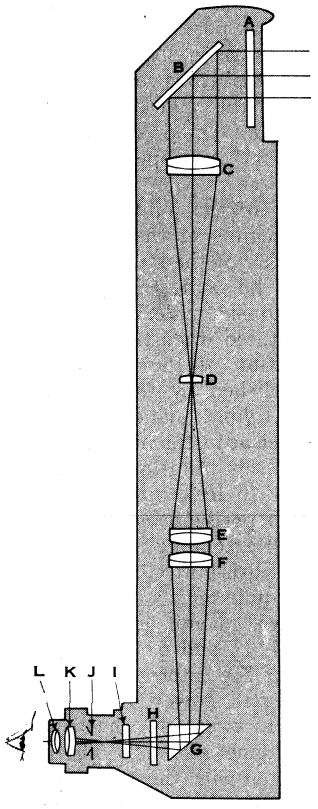

FIG. 2.—OPTICAL SYSTEM OF TURRET PERISCOPE USED IN WARSHIPS (see text)

This technique of coating optical surfaces came into wide use in military optical instruments during World War II.

Submarine Periscopes.—Periscopes used in submarines are similar in principle to the turret periscopes of warships but differ from them in certain important respects because of the following special conditions which are imposed: the submarine periscope must be much longer, and the top few feet of its length must be greatly reduced in diameter. The periscope must be capable of being raised and lowered into the hull of the submarine; it should have available both low and high optical magnifications,

The over-all length of a periscope may exceed 40 ft., and a iarge fraction of this length will be exposed, outside the hull of the submarine, at maximum extension of the periscope. Great forces are exerted on the tube in dragging it through the water when the submarine is underway submerged. Thus, the tube must be large enough to give sufficient rigidity without offering too

much resistance to motion through the water; a diameter of from 6 to 8 in. is usually selected, depending on the length. This tube must be made of a corrosion-resistant material and must be very carefully machined for perfect roundness, straightness and uniformity in diameter. since it must permit both rotation about its vertical axis and raising and lowering of the periscope in the long watertight gland through which it enters the hull of the submarine. Near the upper end of the periscope tube is a tapered portion above which is a narrow tube 2 or 3 ft. in length, surmounted by a slightly larger head which contains the entrance window and the elevating prism.

The diameter of this tube is made as small as possible, often less than 2 in., to reduce the probability of its detection by enemy observation and to cut down the size of the wake or "feather" caused when the submerged submarine is in motion with its periscope elevated into observing position.

All of the joints in the periscope tube, the sealing of the upper window and the packing of the stuffing box at the hull line must be made tight enough to withstand the considerable hydrostatic pressures encountered when the submarine submerges. Rotation of the periscope is usually accomplished by the observer, who grasps two folding handles at the lower end; proper adjustment of the stuffing box permits this rotation without allowing sea water to leak into the submarine.

The periscope is raised. or is lowered into a well extending into the hull of the boat, by a push-button-actuated electrical hoisting equipment controlled by the observer.

Two magnifications are usually provided. $1\frac{1}{2}$ and 6. The first gives the observer the impression of normal viewing, the extra power over unity being necessary to overcome the psychological effect of "tunnel vision." The field of view associated with the $1\frac{1}{2}$ pon-er is in the range 32°–40°, depending on other design considerations. Use of the higher power enables the observer to see greater target detail, but restricts the field of view to 8°–10°, one-fourth of the low-power values of angular field, but one-sixteenth the areas.

The magnification change is effected by rotating one of the folding handles at the lower end of the periscope. Rotation of the other handle moves the line of sight through angles between 10° depression below horizontal and 45° elevation. by tilting the head prism. The wide use in World War II of aircraft to hunt down enemy submarines, however. made it necessary to provide "high-angle" or sky-searching periscopes capable of viewing at such elevations as to be able to scan the entire sky, from horizon to zenith.

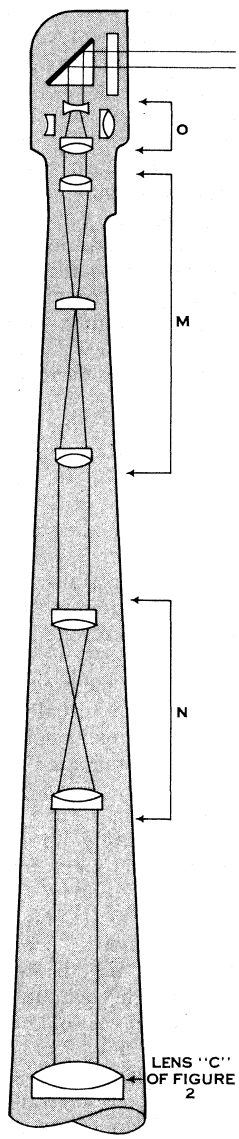

FIG. 3.—UPPER PORTION OF LONG. NARROW-TUBE SUBMARINE PERISCOPE (not to scale)

The exit pupil diameter of standard submarine periscopes is 4–5 mm. This is sufficient for day use, but not for the best performance at night, when a value of 7 mm. is needed. In order to obtain this larger light-gathering power, the size of the lenses near the head prism must be increased. Therefore, it is impossible to retain the very small diameter of the upper portion of the periscope tube.

Certain schools of thought maintain. however, that too much emphasis has been placed on. and too high a price paid for. keeping this dimension so small. The light transmission of the most complicated periscopes may be around 15%, which is undesirably low. Treatment of the air-to-glass surfaces of all the lenses and prisms with reflection-reducing films raises the transmission by as much as 200%, according to the number of surfaces involved. The resulting gain in image brightness is very noticeable and is particularly valuable during nighttime. dawn and dusk. the most favourable periods for submarine torpedo attacks.

The reticle lens has engraved upon it special telemeter scales which make possible a rough calculation of the distance of a target vessel. based on an estimate of its length or height. More accurate ranges can be determined by the special stadimeters usually built into or attached to submarine periscopes.

The optical system of a submarine periscope may be essentially that of fig. 2, except that the focal lengths and spacing of the lenses are adjusted to give a magnification of 6. However, for very long periscopes in which the narrowest possible top portion is desired, which severely restricts the diameter of the upper lenses, this optical system will not provide the observer with sufficient field of view. A solution to these difficulties is illustrated in fig. 3. In a location corresponding to above lens *C* of fig. 2 there are added two complete astronomical telescopes) *M* and *N*, each consisting of two or three lenses. The telemeter scales are then engraved on a plano-convex lens in the uppermost astronomical telescope. rather than on lens *D* of fig. 2.

In order to provide the lower magnification of $1\frac{1}{2}$ and still retain a wide field of view and sizable exit pupil. additional lenses must be added at the top end of the complete telescopic system. This is usually done as illustrated in fig. 3, by bringing into the line of sight a small four-power reversed Galilean telescope *O* which consists of two achromatic lenses, the upper of which is diverging and the lower converging. The higher magnification of 6 is obtained when these lenses are swung to the side, in the positions shown in dotted lines. The provision of movable lenses and the necessary controls in this already crowded portion of the tube calls for very careful mechanical design. The periscope just described employs the most complicated optical system used in any common military instrument. See also SUBMARINE.

(S. S. B.)

PERISSODACTYLA, an order of hoofed, herbivorous mammals, including the tapirs. horses, rhinoceroses and their extinct relatives, in all of which the number of digits (toes) on each hindfoot is either three or one. The name Perissodactyla ("odd toes") was given by Sir Richard Owen, to distinguish the group from the Artiodactyla. or even-toed, ungulate (hoofed) mammals, in which the number of functional digits on each foot is usually either four or two.

The earliest known perissodactyls (Lower Eocene) had four toes on each forefoot and three on each hindfoot. These numbers are still retained in the feet of the existing tapirs, but in the ancestral rhinoceroses the outer digit of the forefoot (corresponding to the fifth of the human hand) gradually became reduced and finally disappeared, leaving three toes on each forefoot and three on each hindfoot. as in existing rhinoceroses.

In the horse family the earliest known members started with four functional digits in each hand and three in each foot. the only traces of the first and fifth toes of the ancestral mammals being the inner and outer wrist bones (carpals) that formerly supported these digits. In the course of time the whole foot of the early horses grew very long. the side toes were lifted off the ground. became much reduced in size and were finally eliminated. the chief traces of the second and fourth toes of the original five-toed foot being the "splint" bones, or vestigial metacarpals, on the side of the greatly enlarged middle toe. This symmetrical middle toe of the horse therefore represents the logical extreme of the initial perissodactyl tendency for the axis of symmetry to pass through the middle or third digit rather than between the third and fourth digits as in the artiodactyls.

Both the perissodactyls and the artiodactyls were originally small, swift-footed, herbivorous mammals, in which the wrist and

heel were raised far above the ground and the animals ran on the enlarged nails, or hooves, of their principal digits. The numerous resemblances between perissodactyls and artiodactyls are chiefly independently acquired adaptations to similar habits. Even in Lower Eocene times (perhaps 60,000,000 years ago) representatives of the two orders differed so greatly in skeleton and dentition that they must have been derived from widely different families of primitive placenta1 mammals of the Cretaceous epoch. The old concept of the Perissodactyla and the Artiodactyla as being suborders of a single group, the Ungulata Vera or Diplarthra, is erroneous and the two "suborders" are in fact wholly distinct.

As noted above, the oldest known perissodactyls are found in the Lower Eocene of North America and Europe. It was formerly believed that these were in turn derived from Phenacodus (*q.v.*), but more recent palaeontological research shows that *Phenacodus* was a specialized side-branch of its own order, the Condylarthra, and is definitely excluded from the ancestry of the Perissodactyla by numerous details of specialization. The direct ancestors of the Eocene Perissodactyla remain unknown. However, the comparative morphology of the dentition and of the skeleton indicates that the Perissodactyla, like other orders of placental mammals, were derived eventually from small insectivorous placental mammals of the Cretaceous period. The origin and evolution of the numerous families of perissodactyls from the Lower Eocene through many ascending horizons of the Tertiary has been intensively studied in Europe and North America, and their palaeontological history is more fully known than that of any other mammalian order.

The early Eocene perissodactyls were small animals with four toes on each forefoot and three on each hindfoot. The upper molar teeth bore four principal cusps with two oblique cross-crests running from the two inner cusps forward and outward, toward the outer side. The two main outer cusps were conical, the second set further in toward the middle than the first, so that the outer half of the crown was oblique. Each lower molar crown was more or less W-shaped in top view. The premolars were not yet molariform, although the last upper premolar (p^4) was already well on the road toward the molar pattern. The front teeth (incisors) were all present, small and not peculiarly specialized.

Horses.—From such a form the line leading to the horses began to lengthen the middle digits and lift the side toes off the ground; in the upper molar teeth the oblique cross-crests became markedly twisted, while the main outer cusps became broadly crescentic; the upper premolars gradually became more molariform until three of them equalled or even surpassed the molars in size and complexity. The subsequent evolution of the horse family is treated elsewhere (see EQUIDAE; HORSE).

Tapirs.—In the line leading to the tapirs the number of toes did not change but the animals grew larger, heavier and their feet broadened. In the cheek teeth the cross-crests became less oblique, more transverse, finally becoming two high, straight, sharp-edged ridges, shearing with similar ridges on the lower molars. The most distinctive feature is the trunk or proboscis, in which the nose and upper lip are combined into a mobile, more or less protrusile organ. The proboscis of the tapir, however, has no fingerlike projection of the tip and lacks the mobility and adaptability of that of the elephant. The corresponding alterations in the skull of the tapir are far less than in the case of the elephant, involving only a moderate retreat or retraction of the nasal bones. The middle septum or cartilage of the nose also is far more conspicuous and extended further forward (see TAPIR). Thus the skeleton as a whole retains much that was characteristic of the earliest Eocene members of the order. The feet, for instance, have the same number of digits and arrangement of all the elements as in the very earliest Perissodactyla, and the rest of the skeleton is also primitive except for the modifications of the nasal region for the support of the proboscis. Even the cross-crested molars are much like those of the Eocene lophiodonts (family Lophiodontidae), which were, however, intermediate between the tapirs and the rhinoceroses.

Palaeotheres.—The family of the palaeotheres (Palaeotheriidae) was characteristic of the Eocene of Europe and was closely related to the horse family. The typical genus, Palaeotherium, resembled a tapir in general proportions but had three instead of four toes on each forefoot; it had at most only the beginning of a proboscis; the upper molar crowns comprised a W-shaped outer wall and two oblique cross-crests united with the two conical inner cusps. The palaeotheres are connected with the horses through such small light-limbed forms as Plagiolophus.

Titanotheres.—The titanothere family (Brontotheriidae) ranged from the Lower Eocene of Wyoming to the summit of the Lower Oligocene in South Dakota, Nebraska and Saskatchewan. Representatives have also been found in the Eocene of Europe and in the Upper Eocene and Lower Oligocene of Mongolia. The oldest known titanotheres (Eotitanops) were about as large as a sheep but shaped more like a tapir except that they had no proboscis, while the nose and lips were possibly somewhat horse-like. The most distinctive character is found in the upper molar teeth, the crowns of which had a W-shaped outer wall, two conical internal cusps and vestigial cross-crests. The lower molar crowns were W-shaped. This general type of molar was retained throughout the history of the family, the chief modification being that in the later forms the W-shaped outer wall of the upper molar crowns became higher and more curved toward the mid-line of the palate, while the internal cusps remained conical and low.

During the Eocene and Lower Oligocene the titanotheres became differentiated into numerous genera and over 100 species. The fossil remains of the Oligocene were formerly abundant in the "Big Badlands" on the White river in South Dakota and Nebraska. The primitive perissodactyl numbers of four toes on the forefeet and three on the hindfeet were retained throughout the family. In the main lines leading to the Lower Oligocene end-forms the size of the body increased until a bulk surpassing that of the largest recent rhinoceros was finally attained. Of the middle-sized genera of the Middle and Upper Eocene the most notable was the genus *Palaeosyops,* comprising animals larger than tapirs, with widespreading feet, broad, rounded skull and low-crowned, circular-cusped molars. At the opposite extreme was the genus *Dolichorhinus,* with an extremely elongated skull and snout, laterally compressed but not long feet, and upper molars with deepened outer wall and flattened outer cusps. The genus Manteoceras ("prophet-horn") was more or Iess intermediate between these extremes, but possessed a small bony swelling above and in front of the eye on each side of the skull. In later forms this swelling became more and more pronounced, until in the Oligocene titanotheres it grew into huge transversely-paired bony outgrowths from the naso-frontal junction, above and in front of the eyes. The shape of these bony protuberances differed in the numerous genera and species. In the more primitive Oligocene forms the "horns" were more or less three-sided, with a pointed tip, but in the more advanced genera they were broad transversely and compressed anteroposteriorly (Brontotheriztm), or erect with cylindrical section (*Megacerops*), or club-shaped (Brontops *robustus*), or three-faced with a rounded, recurved tip (Menodus). The skulls of these genera were relatively long (*Brontotherium,* Menodus), or wide (Brontops *robustus, Megacerops*), or of intermediate proportions (*Allops*). The skeleton of the largest titanotheres abounded in adaptations for the support of the huge bodies. Whereas the earliest forms had rather narrow hands and feet, the later giants of the race had very broad four-toed forefeet, parallel to those of the hippopotamus, and broad, short, three-toed hindfeet, parallel to those of the rhinoceros. The angles of the elbows and knees, which were well bent in the earlier running forms, opened out in the larger forms as in other "graviportal" mammals, while the ilium spread widely across the back to support the weight of the viscera. The great monograph on the titanotheres by H. F. Osborn affords one of the clearest and most interesting demonstrations of the facts of evolution yet recorded.

Chalicotheres.—The family of the chalicotheres (Chalicotheriidae) has been described under ANCYLOPODA. Here it will suffice to note that the primitive hoofs grew into long curved claws which seem to have been used for scratching the ground, perhaps in search of water and succulent tubers. The earliest known chalicothere, *Eomoropus* of the Eocene of Wyoming, re-

tained the primitive perissodactyl numbers of four toes in the forefeet and three in the hindfeet, while the upper molars approximated to the Eocene perissodactyl type.

Rhinoceroses. — The family of the rhinoceroses (*see* RHINOCEROS) is connected with that of the lophiodonts by such forms as *Hyrachyus* of the Eocene of North America. *Hyrachyus* has been called "the cursorial rhinoceros" because by comparison with its massive modern relatives it was distinctly light-limbed. Somewhat smaller than a South American tapir, it resembled that animal in the general configuration of its body and limbs. It did not, however, have a proboscis and, unlike a rhinoceros, it had no horn above the nose. All its front teeth of both jaws were unspecialized, not yet like those of later rhinoceroses. Its upper molar teeth, however, had already begun to foreshadow the rhinoceros type in the obliquity and marked flattening of the outer surface of the hinder outer cusp, although the two outer main cusps were not yet submerged in the general outer wall. None of the known species of *Hyrachyus* were directly ancestral to the lines leading to the later rhinoceroses, some of the forerunners of which (named *Prohyracodon* and *Eotrigonias*) were already established during Eocene times. In *Trigonias* of the Lower Oligocene the true rhinoceros characters of the molars and premolars were well defined and the second lower incisors had begun to be enlarged as tusks. On the other hand, *Trigonias* was hornless and retained four toes on each forefoot and the upper canines, though small, were still retained. Most of the later Oligocene rhinoceroses had eliminated the fifth or outer digit of the forefoot and had also lost the upper and lower canines. In *Diceratherium,* a small rhinoceros abundant in the Lower hliocene of Nebraska, a small transversely-placed pair of oval horn-swellings developed near the tip of the nasal bones. This group became extinct during the Miocene. Meanwhile the "aceratheres," or hornless rhinoceroses of Europe, were numerous during the Oligocene and Miocene and some of them probably gave rise to the lines leading to the modern Sumatran and Indian rhinoceroses.

In addition to these central forms there were many peculiar side lines. In the Miocene and Lower Pliocene of North America and Europe were swarms of extremely short-footed hippopotamus-like rhinoceroses (*Teleoceras,* etc.), with massive heads and very high-crowned molars and a single horn on the tip of the nose. The two existing species of African rhinoceroses and the related woolly rhinoceros of the Pleistocene of Europe are very highly specialized; their exact derivation is unknown. The strangest of all was the fossil *Baluchitherium* from the Upper Oligocene of Turkestan, Baluchistan and Mongolia, a titanic animal with a skull over 4 ft. long and an estimated height at the shoulder of 13 ft.

Besides all these true rhinoceroses, there were two extinct groups to which some authors give the rank of distinct families, namely the hyracodonts and the amynodonts. The hyracodonts were small cursorial forms with rhinoceros-like molar teeth and unspecialized front teeth. Of these, the very small *Triplopus* of the Middle and Upper Eocene had exceedingly long, slender, three-toed feet. The Oligocene *Hyracodon* was much larger, — about the size of a calf.--with stockier feet. Both genera were exclusively North American. The amynodonts were larger forms, the oldest of which appears in the Upper Eocene of Utah. It was followed in the Lower Oligocene of the Big Badlands region of South Dakota by *Metamynodon,* a somewhat hippopotamus-like form with enlarged tusklike upper and lower canine teeth and very elongated oblique outer walls of the upper molars; the stout forefeet retained four digits, the spreading hindfeet had the usual three toes of the rhinoceroses. Members of the same family have been found in the Lower Oligocene or Uppermost Eocene of Burma. Europe and Rlongolia.

Origin of the Order.—The Perissodactyla as an order probably originated in the northern hemisphere, perhaps in basal Eocene times, from some as yet undiscovered relatives of the Eocene condylarths or protoungulates. By Lower Eocene times the group was well represented in western North America and western Europe and was already beginning to diverge into numerous families which have been classified by Osborn in five superfamilies, namely the Equoidea (containing the lines leading to the palaeotheres and horses). the Chalicotheroidea (or chalicotheres), the Brontotherioidea (or titanotheres), the Tapiroidea (or tapirs and lophiodonts) and the Rhinocerotoidea (or rhinoceroses, hyracodonts and amynodonts). By Upper Eocene times the order was well represented in Burma and Mongolia. It was not until late Miocene or Pliocene times that the horses and tapirs penetrated into South America, and the group never reached even the outposts of the Australian region. In Africa, which is now its greatest stronghold, it is conspicuously absent from the Upper Eocene and Lower Oligocene of Egypt and is not known until the Miocene or Pliocene. On the whole the existing Perissodactyla represent a beaten order which has been gradually crowded out by the ruminant artiodactyls. Of its surviving families, the rhinoceroses and tapirs seem doomed to extinction unless preserved by stringent regulation. The zebras, however, seem to have a better chance of survival in certain districts.

PERITONITIS, inflammation of the peritoneum. (*See* COELOM AND SEROUS MEMBRANES.) It may be acute or chronic and either localized or diffused.

Acute peritonitis arises commonly as a result of extension of infection from neglected appendicitis which has been permitted to become gangrenous and perforate, discharging infected fecal material into the abdominal cavity. It may also follow the perforation of a gastric or duodenal ulcer; the bursting of abscesses or cysts into the abdominal cavity; or the extension of gonorrheal infection of the uterus in the female. It may arise as a complication of abdominal surgery, usually when a leak occurs when the intestines are sutured together following the removal of a segment for cancer or some other disease. The escape of bile from the gall bladder or a bile duct into the peritoneal cavity may produce a rapidly fatal, acute peritonitis. The peritoneum loses its shiny appearance, becoming rough and granular and markedly congested. An exudate into the peritoneal cavity occurs; it is at first thin and turbid, later becoming thick and purulent with increasing amounts of fibrin. The intestines become glued together and adherent to the omentum, abdominal wall and other abdominal organs. The inflammation of the peritoneum is usually due to the aerobic and anaerobic bacteria commonly present in the intestinal tract, which overcome the resistance of the peritoneum when constantly replenished, as from a leak in the bowel, or from infected foreign material such as food or a bit of necrotic appendix.

Acute peritonitis usually begins with a chill, vomiting and pain in the abdomen with extreme tenderness so that pressure, even of the bedclothes, cannot be borne. The patient lies on the back with the knees drawn up to relax the abdominal muscles; the breathing becomes rapid and shallow and is performed by movements of the chest only. the abdominal muscles remaining quiescent, which is not the case in healthy respiration. The abdomen becomes swollen as a result of gaseous distention of the intestines, and there is usually constipation. The pulse is rapid and feeble, and the temperature rises to 104° or 105° F. There is a complete absence of intestinal peristalsis. A cold, clammy sweat appears on the forehead, and the eyes are withdrawn into the orbits. The expression is one of great anxiety, but the mind remains clear even when death approaches.

Death results from the cessation of movements in the intestinal tract so that gastric and duodenal secretions accumulate in the stomach and are lost to the body as a result of vomiting. The continued escape of the digestive secretions produces a progressive demineralization, dehydration and alteration in the chemical composition of the blood. The secretion of urine decreases and finally stops. When this factor is combated by decompression of the stomach and intestines by suction tubes and intravenous ad-

ministration of salt solution, many patients make a remarkable recovery. It is probable that paralysis of the intestines, secondary to the infection of the peritoneal cavity, is more important as the cause of death in generalized peritonitis than is invasion of the blood stream by bacteria or the absorption of poisonous materials from the peritoneal cavity.

The treatment of generalized peritonitis consists in the administration, systemically, of drugs such as penicillin, streptomycin, aureomycin or sulfadiazine; and a surgical operation designed to remove from the peritoneal cavity foreign material which serves as a nidus, or focus of infection, to close perforations of the intestinal tract and to provide drainage. Decompression of the intestinal tract by means of tubes introduced through the nose into the stomach, with constant suction, is of great value. Blood transfusions and intravenous administration of physiological solutions of sodium chloride and other salts are very helpful.

(L. R. DT.)

PERIWINKLE, any small marine snail belonging to the family Lzttorinidae. They are widely distributed shore (littoral) snails, chiefly herbivorous, usually found on rocks, stones or pilings between high and low tide marks; a few are found on mudflats and some tropical forms are found on the prop roots of mangrove trees. Of the approximately 80 species in the world, ten are known from the western Atlantic. The common periwinkle, Littorina littorea, may be found in great abundance on the rocky shores of northern Europe and northeastern North America. It is the largest, most common and widespread of the northern species It may reach a length of 1½ in. (38 mm.), is usually dark gray in colour and has a solid spiral (turbinate) shell which readily withstands the buffeting of waves.

Formerly, periwinkles were an important source of food, particularly for the poorer classes in the British Isles, France and the Netherlands In 1858 the London market consumed 76,000 bu. Since that time periwinkles have been considered a delicacy by many people and are still consumed in large quantities. In Europe they are frequently sold by street vendors particularly in seaside towns. In France. where they are known as *vignot* or vignette, the snails are usually boiled in a small amount of heavily salted water (the salt tends to loosen the animal from the shell). The meat is then either made into periwinkle soup or served with butter or a variety of sauces.

The breeding habits of periwinkles are quite variable. Littorina saxatilis, which lives high up on rocks and is often out of water for long periods of time, holds its eggs in a brood sac until the young are fully developed, at which time they emerge as tiny crawling replicas of the adult.

The common periwinkle was introduced into North America at Halifax, Nova Scotia about 1857 and has spread as far south as New Jersey. It is very common on the rocky shores of New England, and also occurs on shallow muddy bottoms, along the banks of tidal estuaries and among the roots and blades of marsh grass where the water is only moderately salty.

All species in the Littorinidae are important as a favorite food of many shore birds, particularly ducks.

In manv sections of the southern United States the term periwinkle or penny-winkle is applied to any small fresh-water snail.

See also GASTROPODA; SNAIL; SHELLS AND SHELL COLLECTING.

See J. C. Bequaert, "The Genus *Littorina* in the Western Atlantic," *Johnsonia* 1, no. 7, pp. 1–27, pl. 1–7 (1933); C. M. Yonge, The Sea *Shore* (1939). (R. *D.* T.)

PERIWINKLE, the name given to various species of the botanical genus Vinca, of the dogbane family (Apocynaceae). The name periwinkle is possibly taken from *pervinka,* the Russian name of the flower, which in turn is derived from *pervi,* "first," as it is one of the first flowers of spring. The lesser periwinkle (V. minor) with lilac-blue flowers, ¾ in. across, an evergreen, trailing perennial, has run wild throughout eastern North America. It is native to Europe and is found in the British Isles. The similar greater periwinkle (V. major), with purplish-blue flowers, 1 to 2 in. across, native to continental Europe, has become naturalized in England. The Madagascar periwinkle (V. rosea) is of worldwide distribution in the tropics.

ROCHE

PERIWINKLE (VINCA MINOR)

PERJURY, in a general sense and by etymologic origin, means lying under oath. The common definition of perjury as a criminal offense is an intentional misstatement of material fact made under oath or affirmation in a legal proceeding before a tribunal authorized to conduct the proceeding. Related offenses under modern penal codes deal with "false swearing" under other circumstances, and with non-sworn falsification in official matters.

As a transgression of spiritual significance, it was formerly in England subject only to religious sanctions administered by ecclesiastical authorities. In the 17th century in England the Court of Star Chamber began to punish the giving of false sworn testimony as a secular offense akin to obstruction of justice. Anglo-American legislation thereafter defined and expanded the offense of falsification in official matters. It was broadened to include false sworn testimony not only before judges but also in legislative and administrative hearings. Either by further enlargement of perjury, or by special enactments on "false swearing." falsification of affidavits was made punishable. Penal sanctions were extended to falsification on "affirmation" as well as oath, so that the statutes would apply to those un illing to be sworn. In the 20th century, criminal law in this area, departing entirely from the oath concept, expanded in a variety of statutes penalizing any written or even oral, misrepresentation in official inquiries or proceedings.

A classic requirement of the law of perjury is that the falsification be "material." With few exceptions, the legislatures and the courts have refused to treat trivial or irrelevant lies as felonies. Usually it is said that anything "capable of influencing the tribunal on the issue before it" is material. But the scope of perjury was sometimes restricted by stringent and arbitrary interpretations. Thus a leading New York case held that it was not perjury falsely to testify in a divorce suit that the husband had committed adultery with X on one occasion, when the divorce complaint charged only the commission of an adulterous act with X on another occasion, since only the latter was material in the suit (People v. Teal, 196 N.Y. 372, 89 N.E. 1086 [1909]). In reaction against such decisions, some codes have eliminated materiality as an element of the offense. See, for example, Indian Penal Code, par. 193; Canadian Criminal Code, par. 99(a) and 112; and the *Model Perjury Act* recommended by the commissioners on uniform state laws in 1952. More commonly, the materiality requirement has been retained for felonious perjury but eliminated in the statutory misdemeanour denominated false swearing. The American Law institute approved this solution in 1957.

To establish perjury the prosecution must prove that the statement was false and known to be so. Furthermore, it is commonly provided that the testimony of a single uncorroborated witness shall not suffice to prove falsity. On the other hand, it has been held that a person may be convicted of perjury regardless of the objective truth of the statement made, if, true or false, he did not believe it. In such case, it is said, he falsely represented his own belief.

A special problem of some importance in the law of perjury is whether a person commits the offense by lying under oath in a criminal or other proceeding directed against him. Under some legal systems, of or derived from continental Europe, defendants and other litigants are not sworn or the perjury statute has a restricted application to them. It is thought to be unfair or unrealistic to impose penal sanctions on a witness who is so obviously under pressure to give an account favourable to himself. On the same principle, in a minority of English-speaking jurisdictions, including England and the state of Georgia, the defendant in a criminal case may make an unsworn statement. Generally, however, U.S. law makes no such distinctions in favour of defendants, who, if they choose to testify, may be prosecuted for

perjury. In consequence, there have been cases where a person has been tried for crime, acquitted and subsequently convicted of perjury based upon his sworn denials of guilt in the earlier trial. See. for example, *State* v. *Leonard, 236* N.C. *126, 72* S.E. 2d *1 (1952).* Cf. *United States* v. *Williams, 341* U.S. *58* (1951), conviction of perjury for false self-exculpating testimony in prior trial where Williams was nevertheless convicted of the crime charged.

The opportunity to question a putative culprit under oath as to alleged misconduct in the remote past has also been used to secure from him sworn denials which can then be prosecuted as perjury, notwithstanding that prosecution for the original offense would be barred by the statute of limitations. It has been argued that this violates the spirit of limitations provisions, which are intended to prevent prosecution where lapse of time, death of witnesses and dimming of recollection make it difficult to determine the truth. See comment on the prosecution of Alger Hiss, *40 J. Crim. Law 344 (1949)*; Note, *102* U. *Pa. Law* **Rev.** *630, 649 (1954).*

The outer limits of the area in which the criminal law may be usefully or safely employed to repress lying are reached when legislatures undertake to penalize unsworn oral misrepresentation to any sort of official, *e.g.,* a policeman or an individual legislator making informal inquiries. In *King* v. *Manley* (1933), *1 K.B. 529,* the English court of criminal appeal affirmed conviction of a woman who falsely reported that she had been robbed, thus effecting a "public mischief" by wasting police time and public money in investigating false leads. A few statutes go so far as to punish any false statement relating to an alleged offense. The American Law institute in *1957* tentatively approved provisions on this subject in its *Model Penal Code* which would cover the offense of Manley, but would reach other oral misrepresentation to law enforcement officials only if it falsely implicates another person in crime. The danger sought to be avoided is that people might be subjected to criminal prosecution for denying their own guilt, *e.g.,* when stopped by a policeman for a traffic offense or for denying knowledge of a crime under investigation, out of fear, friendship or mere reluctance to become involved.

(L. B. S.)

PERKIN, SIR WILLIAM HENRY (1838–1907), English chemist, the discoverer of aniline dyes, was born in London on March *12, 1838.* He attended the City of London school and devoted all his spare time to chemistry. In *1853* he entered the Royal College of Chemistry and studied under August W. von Hofmann, to whom he later became an assistant.

He devoted his evenings to private investigations in a rough home laboratory, and was inspired by some remarks of Hofmann's to undertake there the artificial production of quinine. In the course of his experiments *(1856)* he oxidized impure aniline with potassium bichromate, and obtained a black product from which he was able to extract a bluish substance with excellent dyeing properties. This was the first artificial or aniline dye to be prepared, and it subsequently became known as aniline purple or mauve. A patent for the process of manufacturing the dye was taken out in *1856,* and, with the aid of his father and brother, Perkin set up in *1857* works at Greenford Green, near Harrow, for the commercial production of mauve. In this way the aniline dye industry was founded.

In *1858* he and *B.* F. Duppa synthesized glycocoll, and in *1861* tartaric acid. Perkin also had an important share in the development of artificial alizarin (*q.v.*), which entirely replaced the red dye of the madder root. C. Graebe and C. T. Liebermann in *1868* prepared the substance synthetically from anthracene, but their process was not practicable on a large scale. In *1869* Perkin patented a commercial process which secured for his Greenford Green works a monopoly of alizarin manufacture for several years. He also carried out investigations on other dyes and on flavouring materials, in the course of which *(1868)* he synthesized the first artificial perfume, coumarin (*q.v.*), the odoriferous principle of woodruff and the tonka bean. He also investigated the constitution of saligenin.

About *1874* he abandoned manufacture and devoted himself exclusively to research. In *1878* he discovered the Perkin reaction for the preparation of unsaturated acids; *e.g.,* cinnamic acid which depends on the condensation of aromatic aldehydes with the salt of a fatty acid. Later he made a comprehensive study of the relation between chemical constitution and the rotation of the plane of polarization of light in a magnetic field and calculated the magnetic rotatory power of various elements and radicals.

Perkin was elected a fellow of the Royal society in *1866* and was awarded the Royal medal of the society in *1879* and the Davy medal in *1889.* He was knighted in *1906,* on the 50th anniversary of his discovery of mauve.

He died at Harrow on July *14, 1907.*

PERKIN, WILLIAM HENRY (1860–1929), English chemist: one of the foremost synthetic organic chemists of his time, son of Sir William Perkin, was born at Sudbury on June *17, 1860.* He was educated at the Royal College of Science *(1877–79)* and then *(1880–85)* in Germany under Johannes Wislicenus and J. F. W. A. von Baeyer, whose assistant he became. In *1886* he was appointed professor at Edinburgh, in *1892* at the University of Manchester and in *1912* at Oxford. He worked particularly on camphor, terpenes, centroasymmetry, alkaloids, and their degradation products.

Perkin died at Oxford on Sept. *17, 1929.* A special issue of the *Journal* of the Chemical Society of London *(1932)* was devoted to an extended discussion of his life and works.

(R. E. O.)

PERKINS, GEORGE WALBRIDGE (1862–1920), U.S. financier who participated in many of the great financial transactions of the Morgan firm, was born in Chicago, Ill., Jan. *31, 1862.* He mas educated in the public schools and at the age of 15 entered the employ of the New York Life Insurance company as a clerk in the firm's Chicago office. He rose through the positions of assistant bookkeeper, cashier, solicitor, agency director and inspector of agencies to third vice-president by *1892.* In *1900* he became chairman of the finance committee and in *1903* vice-president.

His achievements as a business executive and financier were well recognized, and in *1900* he became a J. P. Morgan partner. In this capacity his abilities were further evidenced. He became a director of a number of firms, including the United States Steel corporation, the International Harvester company and the International Mercantile Marine company.

He was also actively involved in politics, and in *1910* he retired from the Morgan firm in order to devote more time to public and political work. He was an active member of the Progressive party and became chairman of its national executive committee. In *1912* he worked in support of Theodore Roosevelt in the presidential campaign and also contributed substantial financial support.

Perkins died at Stamford, Conn., June *18, 1920.*

(H. J. Sc.)

PERLITE (PEARLSTONE), a natural glass generally of composition equivalent to granite with concentric cracks, such that the rock breaks into small pearllike bodies or "pebbles," and formed by rapid cooling of viscous lava or magma. A rhyolite (*q.v.*), it is commonly gray or greenish but is known to occur in shades of brown, blue and red. The lustre is pearly to waxy. Prior to about *1950* perlite was virtually unknown in commerce; but in the second half of the 20th century great deposits were worked in New Mexico, Nevada, California and other western states. Production outside the United States increased very slowly. When crushed perlite is rapidly heated to its softening temperature (c. *1,500"–2,000'* F.), the contained water is converted to steam to form multitudes of tiny bubbles within the softened particles. The perlite is thus "popped" or suddenly expanded up to *20* times its original volume. This frothy glass may be considered an

artificial pumice. Because of its very low density. heat-treated perlite is a substitute for sand in lightweight wall plaster and concrete aggregate. Due to its porous nature the material is ideal for heat and sound insulation and the manufacture of insulating wallboard and acoustic plaster. Other uses include lightweight ceramic products, filters and fillers.

The spherical or perlitic cracks which characterize this rock are generally considered to be due to contraction of the cooling glass. Some studies indicate the cracks form in response to hydration. The concentric arrangement of cracks causes small pellets of glass to separate from the rest of the rock. These "pebbles" may range up to an inch across but are usually the size of lead shot. They may appear as spherules widely distributed through a sort of matrix, or they may be so closely packed as to mutually interfere and form polygon-shaped pellets somewhat resembling dried peas. The pearly lustre is attributed to reflections from the thin air films formed along the concentric fractures.

Some perlites are of intrusive origin (dikes), but others constitute major portions of lava flows. These glassy rocks may grade into nearly completely crystalline volcanic types. Like obsidian (*q.v.*) they may carry large crystals (phenocrysts) of quartz, alkali feldspar, and plagioclase and in some cases biotite or hornblende. Where phenocrystc are abundant the rock passes into vitrophyre. Crystalline bodies (see SPHERCLITE: CRYSTALLITE) may also abound, and curved or wavy trains of these are common evidence of flowage of the viscous molten material.

Microscopically some of the small glass pellets show slight double refraction indicating a strained condition in the material, and doubly refracting glass at the contact with phenocrysts suggests strain due to differential contraction.

The chemical composition, index of refraction. and specific gravity of perlite are similar to those of obsidian. The water content. however, is considerably higher (generally 3%–4%), much having been added subsequent to consolidation. (See PITCHSTONE.)

Devitrification or conversion of the glass to a microscopically fine crystalline aggregate is usually initiated spontaneously along cracks or at the surfaces of phenocrysts and spherulites. Some minutely crystalline rocks show well-developed perlitic structure and undoubtedly represent completely devitrified perlite. The localization of spherulites along curved and concentric bands in certain glass-free rocks suggests a devitrified perlite with spherulitic growth along the perlitic cracks.

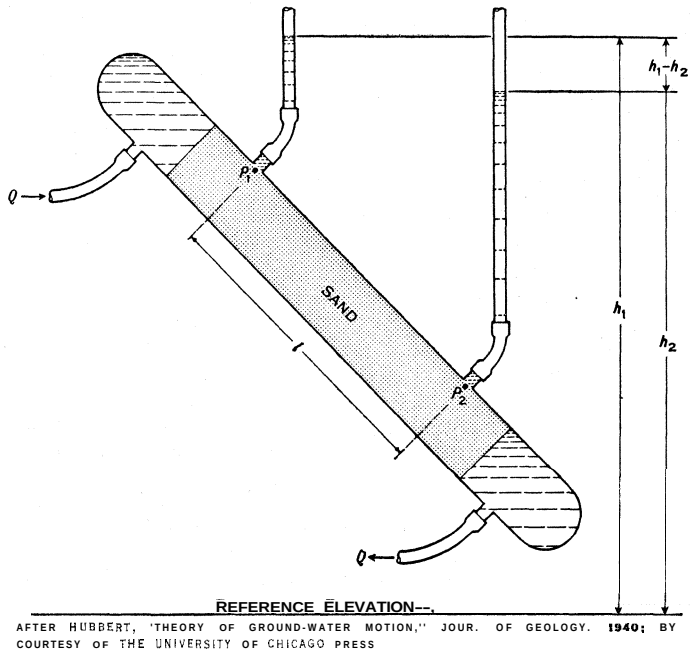
For chemical analyses of perlite and related glassy rocks, see PITCHSTONE. (C. A. CN.)

PERM, a town of the Russian Soviet Federated Socialist Republic. U.S.S.R., administrative centre of Perm *oblast*, on the left bank of the Kama river in 58° N., 56° 15' E. Pop. (1959 census) **628,000.** It has an important position on the railway since the products of the Crals converge on the town, partly by rail and partly by river. It mas planned to continue the line north of Perm, which terminated at Kotlas, to Sorok on the west of Lake Onega and thus link Perm and the Crals with Murmansk. The town manufactures agricultural machinery, especially separators for the Siberian dairy industry, and has sawmills and timber works, cardboard, match and leather factories. The Perm district was formerly occupied by a Finnish tribe, the Permyaks, speaking a language closely related to that of the Komi (Zirians); and they are still to be found on the upper Kama. In 1568 the Russian merchant princes, the Stroganovs, established a settlement there named Brukhanovo, which received the name Perm in the 17th century. In 1723 copper works were founded near the town, which under the official name of Perm became an administrative centre in **1781.** After the revolution of 1917–18 the named was changed to Molotov. It became Perm again on Oct. 3, 1958.

PERMANENT COURT OF INTERNATIONAL JUSTICE: see INTERNATIONAL COURT OF JCSTICE.

PERMEABILITY (FLUID). The permeability of a solid with respect to fluids is a measure of the facility with which fluids can penetrate or flow through the solid. Thus, of two solids, that one is the more permcable through which, under identical conditions, the greater quantity of a given fluid will pass in a fixed time. Solids owe their permeability to the existence of an internal porosity comprising a three-dimensional network of intricately branching and interconnecting channels. (See also GROUND WATER; HYDROLOGY.)

Darcy's Law. — The fluid permeability of a solid is defined and measured in terms of a flow experiment analogous to that illustrated in fig. 1. Here a liquid is made to flow through a porous solid into which two manometers along the same flowline have



AFTER HUBBERT, "THEORY OF GROUND-WATER MOTION," JOUR. OF GEOLOGY. 1940; BY COURTESY OF THE UNIVERSITY OF CHICAGO PRESS

APPARATUS FOR MEASURING THE PERMEABILITY OF SAND

been tapped. It is found experimentally (and can also be deduced theoretically) that the volume of liquid. q, crossing the unit gross area normal to the flowlines in unit time is given by

$$q=(Nd^2)(\rho/\mu)(-g\partial h/\partial l)$$

in which N is a dimensionless shape factor and d a length parameter characterizing the geometry of the solid, p and μ are the density and viscosity of the fluid. g the acceleration of gravity, and $\partial h/\partial l$ the rate of increase with distance in the flow direction of the manometer height h with respect to a reference elevation. This equation, which is knoan as Darcy's law, is valid for flow in any direction, and for all velocities small enough so that forces of inertia are negligible.

Of the three groups of factors on the right-hand side of the above equation. the first Nd^2, depends only on the pore geometry of the solid; the second, ρ/μ, is a property of the liquid; and the third. $-g(\partial h\partial l)$, is the impelling force acting upon each unit of mass of the liquid. In the past, various combinations of these factors have been taken as a measure of permeability, but opinion and usage have gradually converged toward agreement that the term "permeability" shall pertain to a property of the solid only.

Of these factors, only the first, Nd^2 (often expressed by the symbol k). satisfies this condition, and it is accordingly taken as a proper measure of the permeability of the solid. Transposing the equation, the permeability of the solid is given by

$$k=Nd^2=-\frac{q\mu}{\rho g(\partial h/\partial l)}$$

and its dimensions are $[L^2]$.

Units of Permeability. — Hence, in any consistent system of measurement in which one of the fundamental units is that of length, the unit of permeability is the square of the unit of length—for example, the square centimeter or the square foot.

For granular solids, if the mean grain diameter is taken as the characteristic length d, the factor N has an order of magnitude of 10^{-1}. Hence the permeabilities of clastic sediments, ranging

from fine silts. with mean grain diameters of 10^{-4} cm., to coarse sands. with mean grain diameters of 10^{-1} cm., vary from about 10^{-12} to 10^{-6} sq.cm. Since the useful range of permeabilities of most sedimentary rocks is from about 10^{-12} to 10^{-8} sq.cm., there would be some advantage in having a practical unit defined by 1 practical unit $= 10^{-12}$ sq.cm.

Inconsistent units in wide current use are the Meinzer unit (5.42×10^{-10} sq.cm.) and the darcy (0.987×10^{-8} sq.cm.).

PERMEABILITY, MAGNETIC. The force between two magnetic poles varies as the product of the strengths of the poles, and inversely as the square of the distance between them. It depends also on the nature of the intervening medium. In the (centimetre-gram-second) electromagnetic system of units, unit pole is defined as one which repels an equal pole at a distance of one centimetre in empty space with a force of one dyne. Let F be the force between two poles of strengths m_1, m_2 at a distance r apart. Then, in a vacuum, $F = \frac{m_1 m_2}{r^2}$. More generally, $F = \frac{m_1 m_2}{\mu r^2}$. The constant μ depends on the' medium, and is known as the permeability. The permeability may also be defined as the ratio of the magnetic induction, B, to the magnetizing force, H; the induction being a measure of the magnetic force which would be exerted on unit pole placed in a narrow crevasse in the medium, perpendicular to the direction of the magnetic force.

Thus $\mu = B/H$. The conception of permeability is due to Michael Faraday, who spoke of it as "conducting power for magnetism," and the term was introduced by William Thomson (later Lord Kelvin) in 1872.

Substances are divided into two main magnetic classes: diamagnetics. with the permeability μ less than 1; and paramagnetic~with μ greater than 1. In diamagnetics the directions of the magnetization and the magnetizing force are opposite, in paramagnetics the same. For most substances the permeability differs very little from 1, and does not vary with the magnetizing field. A few paramagnetic substances, below certain critical temperatures, arc ferromagnetic, having magnetic properties resembling those of iron. The permeability of ferromagnetics (which include iron, nickel and cobalt and some of their alloys) is a function of the magnetic force, and generally depends on the previous history of the specimen. The permeability may be very large; the maximum for some dynamo steels and for iron-nickel alloys being greater than 100,000. A knowledge of the permeability characteristics of iron and iron alloys. in particular, is of great technological importance. Material having a high permeability for definite ranges of magnetic force is generally required in the construction of electrical machinery.

See MAGNETISM: *Magnetization* und *Permeability Curves.*

PERMEAMETER, an instrument for measuring the permeability of a sample of iron or steel, and more generally for examining the magnetic characteristics. *See* MAGNETISM: *Measurement of Magnetic Quantities: Yokes and Permeameters.*

PERMIAN PEOPLES. The term Permian is used by ethnologists and linguists outside of the Soviet Cnion to designate collectively two groups who speak closely related languages belonging to the Finno-Ugric family: Udmurt or Votyak and Komi or Zirian (Ziryen). Some Russian scholars also distinguish a third Permian branch, the Komi-Permyak, who constitute 70% of the 200.000 inhabitants of a special national area in the Sverdlovsk *oblast* of the Ural region; but this tripartite division seems to be based on politicai considerations alone, for Permyak is simply the southernmost dialect of Komi.

The common ancestors of the Udmurts and Komis separated from the westbound Volga-Finns (Cheremis and Mordvins) during the 1st millennium B.C., and continued as a uniform speech community for about 1,500 years thereafter. This period is known to specialists as the Permian (it has no connection. of course, with the geological period of the same name). The Permian community split into two branches during the 9th century A.D.

Udmurt Peoples.—Udmurt is spoken by more than 600.000 persons in the Udmurtsk-Autonomous Soviet Socialist republic (capital, Izhevsk, a U.S.S.R. industrial centre), roughly in the area between the Vyatka and Kama rivers. The Udmurts, organized in strong clan relations, are almost entirely peasants; each village was governed by a council of clan elders (kenesh), which even farm collectivization did not succeed in wiping out. The Udmurts came under Russian administration in 1587, and were successfully converted to Christianity after 1740 under the influence of Archbishop Veniamin, a man of exceptional character who set up a church in the region of Glazov.

Komi Peoples.—Komi is spoken in an immense area, from the neighbourhood of the Udmurts northward almost to the Arctic sea, and on the Kola peninsula. The Komi Autonomous Soviet Socialist Republic (capital, Syktyvkar) is the largest of all the autonomous republics in European Russia. Komi society has been shaped to a great extent by geographic location and climatic conditions, by the type of economy suitable for the area, and by Russian influence in cultural and political life. The location is responsible for the Komis' isolation and tardy progress; the uninviting climate protected them from extensive colonization until after World War II. The agricultural form of economy which prevailed for centuries remained dominant, though by no means uniform. After 1932, the Ukhta-Pechora region was gradually transformed into a mining and industrial area, and into a fuel producer for Leningrad industries; the modern development of the area is synonymous with that of three big undertakings, the oil trust. the coal trust, and the Northern Pechora Railway line. The principal focus of the new arctic mining activities is Vorkuta. In its vicinity the Komis changed after World War II from owners of large reindeer farms into workers on state farms, along with many Russian settlers. *See* also MORDVINIANS; SYRYENIANS.

PERMIAN SYSTEM, a geological term designating the uppermost system of rocks and the final period of the Paleozoic era (the era of ancient life)—a time believed to have begun about 235,000,000 years ago, and lasting about 25,000,000 to 35,000,000 years, as indicated in the accompanying geologic time chart.

Geologic Time Chart

System and Period	Series and Epoch	Distinctive Records of Life	1,000 Years
CENOZOIC ERA			
Quaternary	Recent	Modern man	11
	Pleistocene	Early man	1,000
Tertiary	Pliocene	Large carnivores	
	Miocene	Whales, apes, grazing forms	
	Oligocene	Large browsing mammals	
	Eocene	Rise of flowering plants	
	Paleocene	First placental mammals	70,000
MESOZOIC ERA			
Cretaceous		Extinction of dinosaurs	130,000
Jurassic		Dinosaurs' zenith, primitive birds, first small mammals	160,000
Triassic		Appearance of dinosaurs	200,000
PALEOZOIC ERA			
Permian		Reptiles developed, conifers abundant	235,000
Carboniferous			
Upper (Pennsylvanian)		First reptiles, coal forests	260,000
Lower (Mississippian)		Sharks abundant	285,000
Devonian		Amphibians appeared, fishes abundant	320,000
Silurian		Earliest land plants and animals	350,000
Ordovician		First primitive fishes	400,000
Cambrian		Marine invertebrates	500,000
PRE-CAMBRIAN TIME			
		Few fossils	3,500,000–4,000,000

General Conditions of Permian Time.—The Permian was a time of crisis in world history. During much of preceding and succeeding Paleozoic and Mesozoic time: the continental areas were low and widely flooded by shallow seas, and the climate was equable over much of the earth. During the Permian, wide areas of the continents were emergent, there were extensive mountain chains and harsh climatic contrasts, with widespread deserts and continental glaciers; conditions were thus not unlike those of our modern era. Plant and animal life underwent many changes toward the end of Permian time, all species and many genera disappearing, some families and orders declining, others increasing in prominence, bringing about a change from the characteristic Paleozoic life to the characteristic Mesozoic life. (See also PALAEOBOTANY; PALAEONTOLOGY.)

Nevertheless, one should not think of these critical times as a cataclysm; their distinctive features began and ended gradually. Many of the mountain chains, such as the Appalachians of North America, had been growing since middle Paleozoic time. Permian marine invertebrates were not impoverished by the harsher conditions, but exceeded in variety and number those of some earlier periods. Many genera persisted into the Triassic, and the evolutionary forebears of Triassic life can be found in Permian strata.

Some Permian geographic and climatic features are inexplicable in terms of the modern world, and suggest a radical rearrangement of its surface between then and now. Permian rocks and fossils are much alike in all continents of the southern hemisphere and in India, and include deposits of continental glaciers. It is widely believed that these southern lands were once joined into a single continent, Gondwanaland (*q.v.*), and have since been separated either by foundering of the connections into the ocean basins, or by drifting apart of the continents. But there are as many objections to continental foundering or continental drifting as there are arguments for them, and the anomalies of Permian geography remain one of the riddles of geology.

Definition of Permian System.—The Permian system was named by Sir Roderick Impey Murchison in 1841, after a visit to European Russia. for the province of Perm not far west of the Ural mountains; rocks of the same age had long been known in western Europe, where they had been termed the Dyas in Germany, and had been considered the basal part of the New Red Sandstone in Great Britain. Murchison originally used the term for what are now called the Kungurian. Kazanian and Tartarian series. a sequence of red beds, evaporite deposits and fossiliferous limestone. The underlying Artinskian limestones of the type area were thought to be equivalent to limestones of the Carboniferous system in western Europe.

Later work has shown that the Artinskian, and even part of the Uralian beneath it (termed the Sakmarian series) is younger than the typical Carboniferous farther west. Beds between typical Permian and Carboniferous were, for a time, designated as "Permo-Carboniferous," but this usage has passed out of favour, and general practice now is to extend the base of the Permian considerably below the base originally designated.

North American stratigraphers usually put the base of the Permian at the bottom of the Wolfcamp series and the zone bearing fossils of Pseudoschwagerina, a genus of the fusulinid family of Foraminifera (*q.v.*), which is about equivalent to the bottom of the Sakmarian in Russia. It is thought that a boundary so placed can be recognized more readily than one at a higher level, and that it marks a significant stage in invertebrate evolution. European stratigraphers differ as to the classification of the Sakmarian, but some place it in the Carboniferous. On the other hand, the lower part of the German Dyas seems to be a continental equivalent of the Sakmarian and Wolfcamp.

The boundary of the Permian with the overlying Triassic can be drawn successfully in most marine sequences on the basis of characteristic invertebrate fossils, but its position is uncertain where the beds near the boundary are nonmarine and poorly fossiliferous—as they are in many places. In some areas the classification, as between Permian and Triassic, of formations and whole series has been much debated.

The classification of rocks in geologic systems is dealt with in GEOLOGY: *Historical* Geology. Additional information on the use of fossils in classifying and correlating deposits will be found in FOSSIL. See also SEDIMENTARY ROCKS; STRATIFICATION.

PERMIAN DEPOSITS

Deposits of Permian time are characterized by several distinctive assemblages, which reappear from one continent to another around the world. These types include:

(1) Red beds and other clastic rocks composed of fragments of pre-existing rocks, evaporites (gypsum, anhydrite, rock salt, potash minerals), dolomites and limestones. Red beds contain vertebrates (amphibians and reptiles) and plants, the limestones and dolomites an invertebrate fauna: mainly brachiopods. pelecypods and gastropods, relatively impoverished and without great diversity of genera and species. They were formed on extensive, flat, continental areas, partly on the surface of the land; partly in dessication basins, partly in shallow ephemeral seas, probably in a dry climate. Deposits of this type occur widely in the northern hemisphere. as in Russia, Germany, Great Britain and the mid-continent region of North America.

(2) Marine deposits, in some areas of considerable thickness—shales, sandstones, and limestones, in places with thick reefs formed by lime-secreting organisms. Rocks of this type contain a large and diversified suite of marine invertebrates—fusulinids (a group of Foraminifera), bryozoans, brachiopods, pelecypods, gastropods, ammonoids, and the last of the trilobites. Such deposits are extensive in the southern part of the northern hemisphere and into the tropics—in Eurasia from the Mediterranean eastward to Indonesia in the ancient seaway called Tethys; in North America in western Texas, and Mexico.

(3) Volcanic rocks, mainly marine—lavas. pyroclastics and tuffs. with some nonvolcanic shales and limestones. Some beds contain marine invertebrates. such as fusulinids and brachiopods, and at some localities the fish *Helicoprion.* These deposits are characteristic of the most mobile parts of the geosyncline surrounding the Pacific ocean, from California through British Columbia into Alaska. in Japan and New Zealand. An outlying volcanic sequence occurs at Las Delicias, Coahuila, Mex.

(4) Glacial and continental beds, generally with tillites near the base and a thick sequence of shales and sandstones above. with beds of coal. These deposits contain the distinctive seed fern, *Glossopteris,* and some reptiles. They are characteristic of wide areas in the continents of the southern hemisphere—southern Africa. eastern South America, Australia, Antarctica and peninsular India. Continental beds interfinger marginally in places with cold-water marine deposits containing the pelecypod *Eurydesma* and a few other invertebrates.

Permian of Europe.—Below are described some of the principal sequences of Permian rocks in the various continents, belonging to one type or another of the assemblages just listed.

The type Permian, in European Russia, lies in a broad basin that extends westward from the Ural mountains to Moscow. Thickness and nature of the rocks vary greatly across the basin, from thick clastic deposits on the east to thinner limestones on the west, but the general assemblage is of type 1, above. The following succession occurs (descending order):

EUROPEAN RUSSIA

Tartarian series.—Continental red beds, about 500 ft. thick, with many vertebrate fossils; upper part is Triassic.

Kazanian series.—In the west, marine limestone with invertebrate fossils, about 300 ft. thick, passing eastward into thicker nonmarine red beds.

Kungurian series.—Largely evaporites, with interbedded clays and marls; more than 2,500 ft. thick in the east, but thinning westward.

Artinskian series.—In the east, shales and sandstones, partly marine, partly continental, about 5,000 ft. thick, represented westward by upper part of limestones of Ufa plateau. Contains several zones of the fusulinid Schwagerina, as well as many ammonoids and brachiopods.

Sakmarian series.—In Ufa plateau, limestones 500 to 750 ft. thick, with large reef bodies, containing the fusulinid *Pseudoschwagerina,* the gastropod *Omphalotrochus,* the ammonoid *Artinskia* and other invertebrates. Passes eastward into much thicker sandstones and conglomerates. Formerly included in the Artinskian of the Urals and

in the Uralian elsewhere. Lies on earlier Uralian limestones that contain the fusulinid Triticites.

In Germany, where the Permian has been termed the Dyas, the section is somewhat thinner, but of the same general type as in Russia. The sequence is as follows (descending order):

GERMANY

Zechstein (Thuringian).—At base, a copper bearing black shale a few feet thick, the Kupferschiefer, overlain by 100 ft. of dolomitic limestone containing an impoverished marine invertebrate fauna. Above it, several thousand feet of evaporites, which give rise to the salt domes of northern Germany, and which are mined for rock salt and potash at Stassfurt.

Upper Rothliegende (Saxonian).—Red sandstones and shales with much interbedded lava.

Lower Rothliegende (Autunian).—Shales, red beds and some coal, containing *Walchia, Callipteris* and other plants. A much more local deposit than the two higher divisions, but locally attaining a thickness of several thousand feet.

The Permian of Great Britain resembles that of Germany. Its magnesian limestone appears to be the same as the dolomitic limestone of the lower Zechstein, and is likewise overlain by evaporites.

Permian of North America.—In North America the standard Permian section is that in west Texas, where most of the sequence is marine and highly fossiliferous (type 2, above), and attains a thickness of 10,000 ft. Best exposures are in the Guadalupe and Glass mountains lying, respectively, on the northwest and south sides of the Delaware basin, a depositional area of Permian time. There the sequence is as follows (descending order):

NORTH AMERICA

Ochoa *series.*—Evaporites, mainly anhydrite below and rock salt above, the latter containing workable potash-bearing layers. At top, a widespread thin dolomite (Rustler) with the only fossils in the series (brachiopods, gastropods, pelecypods). Overlain with hiatus by Upper Triassic, so relation to lowest Triassic is unknown.

Guadalupe series.—Marine sandstone, shale and thin limestone in Delaware basin, passing marginally in upper part into thick barrier reefs (Capitan limestone). Contains the fusulinids *Parafusulina* and *Polydiexodina,* the ammonoids *Waagenoceras, Timorites* and *Xenaspis,* and a rich and varied brachiopod fauna.

Leonard series.—Mainly black shale and thin-bedded limestone in Delaware basin (Bone Spring formation), passing marginally into limestone banks and small reefs. Contains the fusulinids Schwagerina and Parafusulina, the ammonoids *Perrinites* and Medlicottia, and numerous brachiopods, including Dictyoclostus *ivesi.*

Wolfcamp series.—In Glass mountains, shale with thin beds of limestone and conglomerate, but farther northwest a more solid body of limestone (Hueco). Contains the fusulinids *Pseudoschwagerina* and *Schwagerina,* the ammonoid Artinskia, the gastropod *Omphalotrochus,* and numerous brachiopods. Lies on Virgil series of Pennsylvanian (Upper Carboniferous), with Triticites and Uddenites, in places with angular unconformity.

North and northeast of the Delaware basin in the midcontinent area of central Texas, Oklahoma and Kansas, marine beds largely give place to red beds and evaporites; the Permian is of type 1.

Toward the northwest, also, the marine beds pinch out. At the Grand canyon in northern Arizona the Permian is about 2,000 ft. thick and consists. below the Triassic, of the Kaibab and Toroweap limestones. Coconino sandstone, Hermit red shale and Supai red beds. Only the Kaibab and Toroweap (with *Dictyoclostus ivesi* and *D.* bassi) are marine; the Coconino is an ancient dune deposit and the strata below are flood-plain deposits, with plant remains and reptile and amphibian tracks. Much of the sequence is of Leonard age, but the lower nonmarine beds include Wolfcamp equivalents.

Farther north, the Park City and Phosphoria formations form an interfingered set of deposits zoo to more than 1,000 ft. thick, which cover wide areas in contiguous parts of Utah, Wyoming, Idaho and Montana. They lie on Pennsylvanian, are overlain by early Triassic and cover a wide span of Permian time: parts are as old as the Leonard or Wolfcamp, but the main body, with the *Spirijerinu pulchra* brachiopod fauna! is of Guadalupe age. The Park City and Phosphoria beds interfinger eastward with the red beds of the midcontinent area and are bordered on the west by volcanic rocks of the circum-Pacific belt.

Permian of Southern Hemisphere.— Permian rocks of the southern hemisphere belong mainly to type 4, above. The section in South Africa is representative and forms the lower part of the Karroo system. The Permian part of the Karroo varies from a few thousand feet thick in most of the region to nearly 15,000 ft. in the Cape mountains on the south. It consists of the following (descending order):

SOUTH AFRICA

Beaufort series.—Interbedded sandstones and shales, probably flood-plain deposits, containing reptiles at many levels and a few *Glossopteris* in the lower part. Reptiles indicate that only lower part of series is Permian, the higher being Triassic.

Ecca series.—Mainly shale and mudstone, but with interbedded sandstone in places and coal measures in the middle in Transvaal and Natal. Contains abundant *Glossopteris-Gangamopteris* flora.

Dwyka series.—In the south, thick tillites, with shales below and above, lying conformably on upper beds of the Cape system. Farther north, the series is missing entirely in places; in others, only the tillite is present>lying on a striated pavement of pre-Cape rocks. Upper shales contain sparse marine fossils in southwest Africa, including the pelecypod *Eurydesma* and the reptile *Mesosaurus.*

The tillites of the Dwyka are boulder-bearing clays which are moraines of a continental ice sheet; striae indicate that its centre was in Transvaal or farther north, from whence the ice moved south and southwest, the thick tillites on the south probably being a terminal moraine deposited at the edge of the continent. (See also AFRICA: *Geology.*) The Dwyka tillites record a climax of glacial conditions, but relations elsewhere indicate that the period of refrigeration was prolonged; in eastern Australia boulder beds of glacial origin are interspersed through more than 10,000 ft. of section.

Correlation of the Permian rocks of the southern hemisphere with those of the northern is difficult because the *Glossopteris* flora and cold-water marine fauna of the former extend but rarely into rocks of the latter region. Age of the tillites is especially disputed, geologists placing them variously entirely in the Carboniferous, entirely in the Permian or partly in both. In northern India (Salt Range and Kashmir) and in western Australia, tillites, cold-water marine beds and beds with *Glossopteris* flora are followed by beds with marine fossils which can be correlated with the Artinskian (Leonard) of the northern hemisphere, thus suggesting that the climax of glaciation was during Sakmarian (Wolfcamp) time. In other areas, where tillites extend through a greater thickness of strata, glaciation may have begun earlier and ended later than the Sakmarian.

BIBLIOGRAPHY.—General information about the Permian system is carried in most textbooks on geology and paleontology (*see* GEOLOGY: *Bibliography;* PALAEONTOLOGY: *Bibliography*). Authoritative articles on specific phases of the subject include: C. O. Dunbar, "The Type Permian (Russia): Its Classification and Correlation," Amer. Ass. Petrol. *Geol. Bull.,* vol. 24, pp. 1–46 (1940); "Permian Faunas: a Study in Facies," *Geol. Soc. Amer. Bull.,* vol. 52, pp. 313–332 (1941); A. L. Du Toit, The Geology of South Africa, 3rd ed., pp. 264–370 (1954); C. S. Fox, "The Gondwana System and Related Formations," Geol. *Surv. of India,* memoir 58, pp. 1–241 (1931); P. B. PERNAMBUCO, a northeastern Atlantic state of Brazil. Area, 37,868 sq.mi.; pop. (1950) 3,395,185. It comprises a comparatively narrow coastal zone, a high inland plateau and an intermediate zone formed by the terraces and slopes between the two. Its surface is much broken by the remains of the ancient plateau which has been worn down by erosion, leaving escarpments and ranges of flat-topped mountains, called chapadas, capped in places by horizontal layers of sandstone. The coastal zone is low, well-wooded and fertile. It has a hot, humid climate, relieved to some extent by the southeast trade winds. This region is locally known as the *matas* (forests). The middle zone, called the caatinga or agreste region, has a drier climate and lighter vegetation. The inland region, called the *sertão,* is high, stony and dry and frequently devastated by prolonged droughts (*sêcas*). The climate is characterized by hot days and cool nights and is generally considered healthful. There are two clearly defined seasons: a rainy season from March to June and a dry season for the remaining

months.

The rivers of the state include a number of small plateau streams flowing southward to the São Francisco river, and several large streams in the eastern part flowing eastward to the Atlantic. The largest of the coastal rivers are the Goiana, the Capibaribe, the Ipojuca, the Sirinhaém and the Una.

The state of Pernambuco is, for the most part, agricultural, the lowlands being devoted to sugar and fruit, with coffee in some of the more elevated localities; the agreste region to cotton, tobacco, Indian corn, beans and stock; and the *sertão* to grazing and in some localities to cotton. Sugar, molasses, rum (*aguardente* or *cachaça*), tobacco and fruit are largely exported. Coconuts, cacao, bananas, mangoes and other tropical fruits are produced in profusion, but the production of foodstuffs (beans, Indian corn, mandioca, etc.) is not sufficient for local consumption. Mangabeira rubber is collected to a limited extent, and piassava fibre is an article of export. Orchids are also collected for export in the districts of Garanhuns and Timbauba. Cotton weaving and cigar making are leading manufacturing industries, after the large *engenhos* devoted to the manufacture of sugar and rum. The railways of the state concentrate at the port of Recife.

The capital of the state is Recife; pop. (1950) 512,370. There are a number of large towns in Pernambuco; the most important are: Bom Conselho, a town of the higher agreste region, Caruaru, Garanhuns, Goiana, Limoeiro, Olinda, the old colonial capital and episcopal see, Timbauba and Vitória. These towns range in population from about 10,000 to 50,000.

Pernambuco, at its inception in 1526, was settled by Christovão Jacques, who founded a settlement on the Rio Iguarassú that was afterward abandoned. The first permanent settlement was made by Duarte Coelho Pereira at Olinda in 1530, and four years later he was granted a capitania of 50 leagues extending from the mouth of the São Francisco northward to that of the Iguarassu. Adjacent to this grant on the north was the capitania of Itamaracá, granted to Pero Lopes de Souza, which covered the remainder of the present state. The *capitania* of Pernambuco was ably governed and took an active part in the expulsion of the French from the trading posts established along the coast northward to Maranhão, and in establishing Portuguese colonies in their places. In 1630 Pernambuco was occupied by the Dutch and continued under their rule until 1654. Although an active guerilla warfare was waged against the Dutch during a large part of that period, they did much to promote the agricultural and commercial interests of the colony, especially under the wise administration of Maurice of Nassau. As a result of their victory over the Dutch the people of Pernambuco developed a strong regional feeling and resentment of all foreign domination, including the Portuguese.

In 1817 Pernambuco was the scene of a revolutionary outbreak, which resulted in the temporary separation of the present states of Alagôas and Rio Grande do Norte, Ceará and Paraiba. There was another insurrection in 1822 when the Portuguese were expelled; and in 1824 dissatisfaction with the arbitrary proceedings of Dom Pedro I at Rio de Janeiro led to a separatist revolution for the formation of a new state, to be called the Federação do Equador. There was another outbreak in 1831 and frequent disorders to 1838, which culminated in another unsuccessful revolution. The population of the Pernambuco *sertão* became noted for its turbulent, lawless character, due partly to the distance from the coast where the bulk of the population is concentrated, partly to difficult means of communication and partly to the fact that this remote region became the refuge of criminals from the coast towns. (R. D' E.; R. E. P.)

PERNICIOUS ANEMIA: see ANEMIA; BLOOD.

PERNIK: see DIMITROVO.

PERON, JUAN DOMINGO (1895–), Argentine president and army officer, was born on Oct. 8. 1895, near Lobos, a small town 60 mi. S. of Buenos Aires. He was educated in military schools, becoming a full lieutenant in the army at the age of 20. He became one of the leaders of the *Grupos* de *Oficiales Unidos*, a nationalist clique of young army officers with totalitarian leanings. and played an important role in the coup d'état that overthrew the regime of Ramón S. Castillo on June 4, 1943. Although Perón held only minor official posts in succeeding governments, he was the power behind the throne. In 1944, when Gen. Edelmiro Fárrell became president, Perón was made war minister and later added the office of vice-president. He succeeded Fárrell in 1946 and was re-elected president in 1951. Before her death in 1952, Maria Eva Duarte de Perón, whom he married in Oct. 1945. participated in political activities, and was especially important in the management of labour factions and social services. The Perón government, controlled by the official Peronista party, which drew its support principally from the army and the General Confederation of Labour (C.G.T.), was essentially a military dictatorship. During his second administration, relations with the Roman Catholic Church steadily deferiorated. and he was excommunicated on June 16. 1955, after two church prelates had been expelled from Buenos Aires. On the same day the navy led an abortive attempt to depose him by force. Perón at first made conciliatory overtures but on Sept. 1 declared a state of siege. The armed revolt was resumed actively on Sept. 16 and three days later Perón resigned. On Sept. 23 Maj. Gen. Eduardo Lonardi was sworn in as provisional president. Perón, who had fled to a Paraguayan gunboat near Buenos Aires, flew to Paraguay to begin his exile.

PÉRONNE, a town of northern France, capital of an arrondissement in the *département* of Somme, on the right bank of the Somme at its confluence with the Cologne, 35 mi. E. by N. of Amiens by rail. Pop. (1954) 4,105. The Frankish kings had a villa at Pkronne, and a monastery was founded there in the 7th century by, or for, Scottish monks; a collegiate church was built and dedicated to St. Fursy, the first abbot. By about 1200 it had escheated to the French crown, and Philip Augustus gave it a charter (1209). By the treaty of Arras (1435) it was given to the Burgundians; bought back by Louis XI. it passed to Charles the Bold in 1465. On the death of Charles, in 1477, Louis X I resumed possession. In 1536 the emperor Charles V besieged Pkronne without success. It was the first town after Paris at which the league was proclaimed in 1577. Wellington took Péronne in 1815, the Germans captured it in 1871, 1911 and 1910.

PEROVSKITE, essentially calcium titanate. originally found in a chlorite schist at Achmatovsk in the Ural mountains and named after Count L. A. Perovski. Crystals are lustrous. yellow to brownish black, highly twinned cubes or octahedra (actually orthorhombic very nearly cubic symmetry). Common occurrences are as accessory constituents of basic or alkalic-basic igneous rocks or at metamorphic contacts of these rocks with limestones. The composition is $CaTiO_3$. Rare-earth elements. sodium potassium and iron substitute for Ca, and niobium and tantalum substitute to a considerable extent for Ti in the natural mineral.

The name perovskite is also applied to an important crystal structure family. including calcium titanate ($CaTiO_3$) and related natural and synthetic compounds, all possessing similar pseudocubic or cubic structures. Element substitutions in natural perovskite suggested many of the chemical variations later shown to he possible by synthesis.

The importance of this family to the electrical industry was recognized with the discovery of ferroelectricity in barium titadate, $BaTiO_3$. Members of this family, including the titanates, zirconates and niobates, have become very important to the entire electronics industry, where they are used for their high dielectric constants and as transducers (transformers of electrical energy into mechanical energy) capable of withstanding high temperatures (see ULTRASONICS). (RU. R.)

PEROXYACIDS are oxyacids which contain one or more peroxide groups, **–O–O–,** or they may be regarded as oxyacids in which an OH– group has been replaced by an –OOH group. They are formed by boron, carbon, titanium, zirconium, germanium, tin, nitrogen, phosphorus, vanadium, columbium, tantalum. sulfur, chromium, selenium. molybdenum and tungsten. Some are described under the corresponding elements: *e.g.,* peroxysulfuric acid and peroxydisulfuric acid under SULFUR. (J. B. Ps.)

PEROZ, Sassanid king of Persia. A.D. 457–484, son of Yazdegerd II. He rebelled against his brother Homizd III. and in 159 defeated and killed him with the help of the Ephthalites, or White Huns: who had invaded Bactria. He also killed most of his other

relatives, and persecuted the Christians. But he favoured the introduction of Nestorianism, in opposition to the orthodox creed of Byzantium. With the Romans he maintained peace, but he tried to keep down the Ephthalites, who began to conquer eastern Iran. The Romans supported him with subsidies, but all his wars were disastrous. Once he was himself taken prisoner and had to give his son Kavadh as hostage till after two years he was able to pay a heavy ransom. Then he broke the treaty again and advanced with a large army. But he lost his way in the eastern desert and perished with his whole army (484). (ED. M.)

PERPENDICULAR PERIOD, in architecture, the latest style of English Gothic, roughly embracing the period from 1375 to the introduction of the Renaissance, during the 16th and 17th centuries. It gains its name from the dominance of vertical lines in window tracery (*q.v.*) and wall paneling; in windows the vertical mullions sometimes carry unbroken from the sill to the under side of the arch and the upper part of the window is further subdivided by additional, smaller, vertical mullions carried by the apex of arches connecting the larger mullions. Continuous horizontal lines of arches and cornices are sometimes carried across high windows to divide the whole into many small arched lights, in each one of which could be placed the effigy of a saint in stained glass. In structure the tendency is toward the reduction of wall surface, the increase of window area, the continuity of vertical lines and supports and the lavish development of decorative vaulting by means of liernes and, later. the elimination of structural vaulting ribs altogether, and the substitution of cut-stone. traceried fan vaults. (See ARCH AND VAULT.)

Timber-trussed ceilings and roofs were developed to a point of great perfection and richness, as in that of Westminster hall, London (1395–99), and in countless simpler parish churches, *e.g.,* Chipping Norton, Holy Trinity, Hull. The period also saw the construction of many beautifully outlined and lavishly detailed church towers, usually square and without spires. Those of Gloucester cathedral (1450–57), Magdalen college, Oxford (1492–1505), the central tower at Canterbury (1495) and the west towers of York (1432–70) are typical. In decorative detail the period is marked by the introduction of the four-centred or Tudor arch. the covering of wall surfaces with ranges of traceried panels, chiefly rectangular, the general flatness of molding profiles, diminished importance of the capital, the enclosing of door and window arches within a rectangular hood mold and the replacement of the earlier naturalism in carved ornament by a rather dry. incisive and, at times, mechanical. conventionalism.

The Perpendicular period appears first in work in Gloucester cathedral about 1360, but the spread of the style was so rapid that by 1380 Perpendicular work was being built throughout the country. It was a style so vital that it yielded but slowly to the influx of Renaissance ideas; and, particularly in Oxford. its effect was felt in building well into the 17th century. (T. F. H.)

PERPETUAL MOTION or PERPETUUM MOBILE, in its usual significance, not simply a machine which will go on moving for ever, but a machine which, once set in motion, will go on doing useful work without drawing on any external source of energy, or a machine which in every complete cycle of its operation will give forth more energy than it has absorbed. Briefly, a perpetual motion usually means a machine which will create energy in the form of motion.

The earlier seekers after the "perpetuum mobile" did not always appreciate the exact nature of their quest; for we find among their ideals a clock that would periodically rewind itself, and thus go without human interference as long as its machinery would last. The energy created by such a machine would simply be the work done in overcoming the friction of its parts, so that its projectors might be held merely to have been ignorant of the laws of friction and of the dynamic theory of heat. Most of the perpetual motionists, however, had more practical views, and explicitly declared the object of their inventions to be the doing of useful work, such as raising water, grinding corn, and so on. Like the exact quadrature of the circle, the transmutation of metals and other famous problems of antiquity, the perpetual motion has now become a venerable paradox. Still, like these others, it retains a great historical interest for as a result of the vain quest, there grew up the greatest of all the generalizations of physical science, the principle of the conservation of energy.

There was a time when the problem of the perpetual motion was one worthy of the attention of a philosopher. Before that analysis of the action of ordinary machines which led to the laws of dynamics, and the discussion of the dynamical interdependence of natural phenomena which accompanied the establishment of the dynamical theory of heat, there was nothing plainly unreasonable in the idea that work might be done by the mere concatenation of machinery. It had not then been proved that energy is uncreatable and indestructible in the ordinary course of nature; even now that proof has only been given by induction from long observation of facts. There was a time when wise men believed that a spirit, whose maintenance would cost nothing, could by magic art be summoned from the deep to do his master's work; and it was just as reasonable to suppose that a structure of wood, brass and iron could be found to work under like conditions.

The principle of the conservation of energy, which in one sense is simply denial of the possibility of a perpetual motion, rests on facts drawn from every branch of physical science; and, although its full establishment only dates from the middle of the 19th century, yet so numerous are the cases in which it has been tested, so various the deductions from it that have been proved to accord with experience, that it is now regarded as one of the best-established laws of nature. Consequently, on any one who calls it in question is thrown the burden of proving his case. If any machine were produced whose source of energy could not at once be traced, a man of science (complete freedom of investigation being supposed) would in the first place try to trace its power to some hidden source of a kind already known; or in the last resort he would seek for a source of energy of a new kind and give it a new name.

If a man likes to indulge the notion that, after all, an exception to the law of the conservation of energy may be found, then provided he submits his idea to the test of experiment at his own charges without annoying his neighbours, all that can be said is that he is engaged in an unpromising enterprise. The case is otherwise with the projector who comes forward with some machine which claims by the mere ingenuity of its contrivance to multiply the energy supplied to it from some of the ordinary sources of nature and sets to work to pester scientific men to examine his supposed discovery, or attempts therewith to induce the credulous to waste their money. This is by far the largest class of perpetual-motion-mongers nowadays.

It was no doubt the barefaced fallacy of most of the plans for perpetual motion that led the majority of scientific men to conclude at a very early date that the "perpetuum mobile" was an impossibility. We find the Paris Academy of Sciences refusing, as early as 1775, to receive schemes for the perpetual motion, which they class with solutions of the duplication of the cube, the trisection of an angle and the quadrature of the circle. Stevinus and Leibnitz seem to have regarded its impossibility as axiomatic; and Newton at the beginning of his *Principia* states a principle which virtually amounts to the same thing.

The famous proof of P. de la Hire simply refers to some of the more common gravitational perpetual motions. The truth is that, if proof is to be given, or considered necessary, it must proceed by induction from all physical phenomena.

By far the most numerous class of perpetual motions is that which seeks to utilize the action of gravity upon rigid solids. We have not read of any actual proposal of the kind, but the most obvious thing to imagine in this way would be to procure some substance which intercepts gravitational attraction. If this could be had, then, by introducing a plate of it underneath a body while it was raised, we could elevate the body without doing work; then, removing the plate, we could allow the body to fall and do work; eccentrics or other imposing device being added to move the gravitation intercepter, behold a perpetual motion complete! The great difficulty is that no one has found the proper material for an intercepter.

Fig. 1 represents one of the most ancient and oftenest-repeated

of gravitational perpetual motions. The idea is that the balls rolling in the compartments between the felloe and the rim of the wheel will, on the whole, so comport themselves that the moment about the centre of those on the descending side exceeds the moment of those on the ascending side. Endless devices, such as curved spokes, levers with elbow-joints, eccentrics, etc., have been proposed for effecting this impossibility. The student of dynamics at once convinces himself that no machinery can effect any such result; because if we give the wheel a complete turn, so that each ball returns to its original position, the whole work done by the ball will, at the most, equal that done on it. We know that if the laws of motion be true, in each step the kinetic energy given to the whole system of wheel and balls is equal to that taken from the potential energy of the balls less what is dissipated in the form of heat by frictional forces, or vice versa, if the wheel and balls be losing kinetic energy—save that the friction in both cases leads to dissipation. So that, whatever the system may lose, it can, after it is left to itself, never gain energy during its motion.

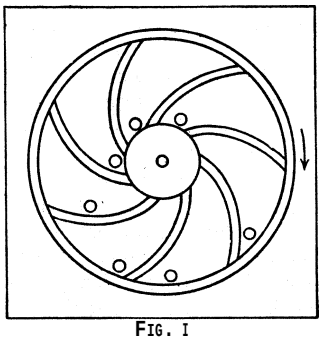

FIG. 1

The two most famous perpetual motions of history, viz., the wheels of the marquis of Worcester (d. 1667) and of Councillor Orffyreus, were probably of this type. The marquis of Worcester alludes to the marvellous performance of his machine in his *Century* of Inventions (1663): the wheel was 14 feet in diameter and bore 40 weights of 50 pounds apiece!

Orffyreus (whose real name was Johann Ernst Elias Bessler) (1680–1745) appears to have constructed more than one wheel: his last one was 12 ft. in diameter and 1 ft. 2 in. broad; it consisted of a light framework of wood, covered in with oilcloth so that the interior was concealed, and was mounted on an axle which had no visible connection with any external mover. It was examined and approved of by the landgrave of Hesse-Cassel, in whose castle at Weissenstein it is said to have gone for eight weeks in a sealed room. The most remarkable thing about this machine is that it evidently imposed upon the mathematician W. J. 'sGravesande, who wrote a letter to Newton giving an account of his examination of Orffyreus's wheel undertaken at the request of the landgrave, wherein he professes himself dissatisfied with the proofs theretofore given of the impossibility of perpetual motion, and indicates his opinion that the invention of Orffyreus is worthy of investigation. He himself, however, was not allowed to examine the interior of the wheel. The inventor seems to have destroyed it himself. One story is that he did so on account of difficulties with the landgrave's government as to a licence for it; another that he was annoyed at the examination by 'sGravesande, and wrote on the wall of the room containing the fragments of his model that he had destroyed it because of the impertinent curiosity of 'sGravesande.

The overbalancing wheel perpetual motion seems to be as old as the 13th century. Dircks quotes an account of an invention by Villard de Honnecourt, an architect whose sketchbook is still preserved in the Écoles des Chartes at Paris. De Honnecourt says, "Many a time have skilful workmen tried to contrive a wheel that shall turn of itself; here is a way to do it by means of an uneven number of mallets, or by quicksilver."! He thereupon gives a rude sketch of a wheel with mallets jointed to its circumference. It appears that Leonardo da Vinci worked with similar notions.

Another scheme of the perpetual motionist is a water-wheel which shall feed its own mill-stream. This notion is probably as old as the first miller who experienced the difficulty of a dry season. One form is figured in the *Mathematical Magic* (1648) of Bishop Wilkins (1614–1672); the essential part of it is the water-screw of Archimedes, which appears in many of the earlier machines of this class. Some of the later ones dispense with even the subtlety of the water-screw, and boldly represent a water-wheel pumping the water upon its own buckets.

Perpetual motions founded on the hydrostatical paradox are not uncommon; Denis Papin exposes one of these in the *Philosophical Transactions* for 1685. The most naïve of these devices is that illustrated in fig. 2, the idea of which is that the larger quantity of water in the wider part of the vessel weighing more will overbalance the smaller quantity in the narrower part, so that the water will run over at C, and so on continually.

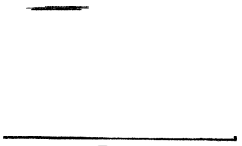

FIG. 2

Capillary attraction has also been a favorite field for the vain quest; for, if by capillary action fluids can be made to disobey the law of never rising above their own level, what so easy as thus to produce a continual ascent and overflow, and thus perpetual motion? Various schemes of this kind, involving an endless band which should raise more water by its capillary action on one side than on the other. have been proposed. The most celebrated is that of Sir William Congreve (1772–1828). EFG (fig. 3) is an inclined plane over pulleys; at the top and bottom travels an endless band of sponge, *abcd,* and over this again an endless band of heavy weights jointed together. The whole stands over the surface of still water. The capillary action raises the water in *ab,* whereas the same thing cannot happen in the part *ad,* since the weights squeeze the water out. Hence, inch for inch, *ab* is heavier than *ad;* but we know that if *ab* were only just as heavy inch for inch as *ad* there would be equilibrium, if the heavy chain be also uniform; therefore the extra weight of *ab* will cause the chain to move round continually in the direction of the arrow.

The more recondite vehicles of energy, such as electricity and magnetism, are more seldom drawn upon by perpetual-motion inventors than might perhaps be expected. William Gilbert, in his treatise *De Magnete,* alludes to some of them, and Bishop Wilkins mentions among others a machine "wherein a loadstone is so disposed that it shall draw unto it on a reclined plane a bullet of steel, which, still, as it ascends near to the loadstone, may be contrived to fall through some hole in the plane and so to return unto the place whence at first it began to move, and being there, the loadstone will again attract it upwards, till, coming to this hole, it will fall down again. and so the motion shall be perpetual." The fact that screens do exist whereby electrical and magnetic action can be cut off would seem to open a door for the perpetual-motion seeker. Unfortunately the bringing up and removing of these screens involves in all cases just that gain or loss of work which is demanded by the law of the conservation of energy. A shoemaker of Linlithgow called Spence pretended that he had found a black substance which intercepted magnetic attraction and repulsion, and he produced two machines which were moved, as he asserted, by the agency of permanent magnets. thanks to the black substance. The fraud was speedily exposed, but it is worthy of remark that Sir David Brewster thought the thing worth mentioning in a letter to the *Annales de chimie* (1818), wherein he states "that Mr. Playfair and Captain Kater have inspected both of these machines and are satisfied that they resolve the problem of perpetual motion."

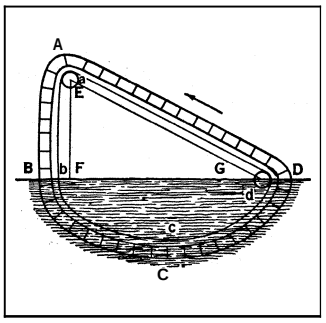

FIG. 3

One more page from this chapter of the book of human folly; the author is the famous Jean Bernoulli the elder. We translate his Latin, as far as possible. into modern phraseology. In the first place we must premise the following. (See fig. 4.) (1) If there be two fluids of different densities whose densities are in the ratio of G to L, the height of equiponderating cylinders on equal bases will be in the inverse ratio of L to G. (2) Accordingly, if the height AC of one fluid, contained in the vase AD, be in this ratio to the height EF of the other liquid. which is in a tube open at

both ends, the liquids so placed will remain at rest. (3) \Therefore, if AC be to EF in a greater ratio than L to G, the liquid in the tube will ascend; or if the tube be not sufficiently long the liquid will overflow at the orifice E (this follows from hydrostatic principles). (4) It is possible to have two liquids of different density that will mix. (5) It is possible to have a filter, colander, or other separator, by means of which the lighter liquid mixed with the heavier may be separated again therefrom.

Construction.—These things being presupposed (says Bernoulli), I thus construct a perpetual motion. Let there be taken in any (if you please, in equal) quantities two liquids of different densities mixed together (which may be had by hyp. 4), and let the ratio of their densities be first determined, and be the heavier to the lighter as G to L, then with the mixture let the vase AD be filled up to A. This done let the tube EF, open at both ends, be taken of such a length that AC:EF > 2L:G+L; let the lower orifice F of this tube be stopped, or rather covered with the filter or other material separating the lighter liquid from the heavier (which may also be had by hyp. 5); now let the tube thus prepared be immersed to the bottom of the vessel CD; I say that the liquid will continually ascend through the orifice F of the tube and overflow by the orifice E upon the liquid below.

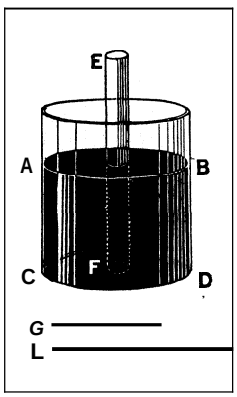

FIG. 4

Demonstration.—Because the orifice F of the tube is covered by the filter (by constr.) which separates the lighter liquid from the heavier, it follows that, if the tube be immersed to the bottom of the vessel, the lighter liquid alone which is mixed with the heavier ought to rise through the filter into the tube. and that, too, higher than the surface of the surrounding liquid (by hyp. 2), so that AC:EF = 2L:G+L; but since by constr. AC:EF > 2L:G+L it necessarily follows (by hyp. 3) that the lighter liquid will flow over by the orifice E into the vessel below, and there will meet the heavier and be again mixed with it; and it will then penetrate the filter, again ascend the tube, and be a second time driven through the upper orifice. Thus, therefore, will the flow be continued for ever.—Q.E.D.

Bernoulli then proceeds to apply this theory to explain the perpetual rise of water to the mountains, and its flow in rivers to the sea, which others had falsely attributed to capillary action—his idea being that it was an effect of the different densities of salt and fresh water.

One really is at a loss with Bernoulli's wonderful theory, whether to admire most the conscientious statement of the hypothesis, the prim logic of the demonstration, so carefully cut according to the pattern of the ancients, or the weighty superstructure built on so frail a foundation. Most of our perpetual motions were clearly the result of too little learning; surely this one was the product of too much. (G. CL.)

The foregoing article by the distinguished mathematician George Chrystal, who died in 1911, is devoted to a delusion which is still distressingly prevalent. A certain number of weak heads genuinely succeed in deceiving themselves with the old fallacies, and often spend money which they can ill afford in taking out patents for patent absurdities. No man of science who has any susceptibilities can receive their communications without a certain compassion. On the other hand we have the conscious charlatans, who prey upon a class of people, by no means extinct, which possesses great cupidity, some money, a dangerous smattering of science and no sense. The form under which the perpetual motion is presented for the benefit of the credulous and affluent has been modified of recent years, to keep pace with the march of science. Whereas formerly the perpetual motion engine was usually a mechanical arrangement of weights, wheels and water-buckets, or such like, which did work without a supply of energy, to-day the form under which the invention is presented is usually an electrical one. Frequently the vendor or inventor makes no claim to create energy out of nothing, a point to which he directs special attention, admitting that this is known to be impossible by such shrewd and learned men as the prospective purchaser of shares, but states that his machine takes in a certain amount of electrical energy and turns out a greater amount of energy—a steady supply of 20 kilowatts is turned into an output of 37.5 kilowatts, say. The popular confusion between work and power, and between volts and amperes and electrical energy renders it easy to delude the self-satisfied victim, and the plausible denial of any creation of something out of nothing makes the creation of much out of little seem comparatively reasonable.

The latest scientific invention is often made the basis of a perpetual motion claim, in more or less good faith. For instance, shortly after the liquid air machine became a commercial success, claims are put forward—not by the inventor of the machine, of course—that part of the air liquefied by such a machine could be made to furnish a source of motive power which would run the machine itself, so that a continuous and increasing supply of liquid air could be produced without input of energy, once the machine was started.

The kind of perpetual motion which has been considered in Professor Chrystal's article is against all the ordered experience which is embodied in the first law of thermodynamics. This law states the equivalence of heat and work as alternative forms of energy, and denies that energy can be created. There is, however, nothing in the first law of thermodynamics against the following line of argument: Heat is equivalent to work. It is possible to build machines which turn heat into work. Therefore it must be possible to build a machine whish will take heat from some ordinary body at atmospheric temperature, say a pond, and turn it into work. The pond will, of course, grow colder, but this need not disturb us, as for a very slight cooling we should obtain a large amount of work. For instance, a pond 200 yards across and of an average depth of 6 feet, cooling 1° centigrade, would yield 75,000 horse-power-hours if the heat lost could all be turned into work. It is usual to speak of a machine which could convert the heat of surrounding bodies into work as effecting a *perpetual* motion of *the* second kind, perpetual motion of the first kind being thet which creates energy out of nothing. A perpetual motion of the second kind involves no creation of energy, but a conversion of energy under certain conditions.

The second law of thermodynamics (see THERMODYNAMICS), which, like the first law, is an embodiment of the physical experience of generations of experimenters and observers of the first rank, denies that it is possible to derive mechanical energy from bodies by cooling them below the temperature of the surrounding object, that is, it denies precisely that a perpetual motion of the second kind is possible. For us to be able to convert heat into work we must have a source of heat above the temperature of the surrounding bodies, or, in the language of the engineer, we must have both a boiler and a condenser (although, of course, we need not actually build the condenser, but can use the surrounding air as condenser if for any reasons, such as exist in the case of the locomotive, a condenser is impracticable). The bigger the difference of temperature between the hot source of heat and the cold condenser, the bigger the fraction of the heat of the source which we can turn into work: when the temperature difference is zero we can turn none of the heat into work.

The impossibility of a perpetual motion, either of the first or of the second kind, is implicit, then, in the two great laws of Thermodynamics, which express our knowledge of the behaviour of matter in such quantities as are handled in ordinary mechanical and chemical processes. They are statistical laws, and do not apply to individual molecules, or to small collections of molecules, but to matter as we deal with it in engineering, where the smallest particle considered consists of millions of millions of millions of molecules! When we come down to micrbscopic and ultra-microscopic particles perpetual motion is possible, as exemplified by the ceaseless movement of tiny particles held in suspension in a fluid at a uniform temperature. *(See* BROWNIAN MOVEMENT.) Such movement of microscopic particles, however, does not enable us to derive useful work from the heat agitation of the liquid, that is, from the perpetual motion of the molecules themselves.

It does not contradict, but supplements our knowledge of the behaviour of matter in bulk, which tells us that perpetual motion is a mechanical impossibility. (E. N. DA C. A.)

PERPETUITY, in lam the tying-up of an estate for a lengthened period for the purpose of preventing or restricting alienation. As being opposed to the interest of the State and individual effort, the creation of interests indefinite in time has been considerably curtailed, and the rule against perpetuities in Great Britain now forbids the making of an executory interest unless beginning within the period of any fixed number of existing lives and an additional period of 21 years (with a few months added, if necessary, for the period of gestation). The rule applies to dispositions of personal property (see TRUST) as well as of real property. Section 163 of the Law of Property Act, 1925, enacts in effect that a remainder to children at an age in excess of 21 years is to be read as at 21 years, thereby making the remainder legal instead of void (see also ss. 164–166 of the Law of Property Act, 1925). There are certain exceptions to the rule, as in the case of limitations in mortmain and to charitable uses, and of a perpetuity created by act of parliament. In the United States the English common-law rule against perpetuities obtains in many of the States; in others it has been replaced or reinforced by statutory rules. (*See* Gray on *Alienation.*) The general tendency of American legislation is to favour tying up estates to a greater extent than was formerly approved.

PERPIGNAN, a town of France, capital of the *département* of Pyrénées-Orientales, on the Têt, 7 mi. from the Mediterranean and 42 mi. S. by W. of Narbonne by rail. Pop. (1954) 63,863. I'erpignan dates at least from the 10th century. In the 11th and 12th centuries it was a capital of the counts of Roussillon, from whom it passed in 1112 to the kings of Aragon. In the 13th century it belonged to the kingdom of Majorca, and its sovereigns resided there until, in 1344, that small state reverted to the kings of Aragon, who in 1349 founded a university at Perpignan. When Louis XI occupied Roussillon as security for money advanced by him to the king of Aragon. Perpignan resisted the French arms and yielded only in 1475. Roussillon was restored to Aragon by Charles VIII and Perpignan was again unsuccessfully besieged in 1512 under Francis I. Later on, however, the inhabitants, angered by the Spanish governor, surrendered the town to Louis XIII. The citadel held out until 1642. and the place was formally ceded to France by the treaty of the Pyrenees (1659). In 1602 the bishopric of Elne was transierred to I'erpignan.

On the south the town is overlooked by a citadel enclosing a castle (13th century) ,of the kings of Majorca. The chapel is a mixture of the Romanesque, Pointed and Moorish styles. The ramparts surrounding the citadel are the work of Louis XI, Charles V and Vauban. The cathedral of St. Jean (14th to 16th centuries) has a remarkable 17th-century reredos.

PERRAULT, CHARLES (1628–1703), French writer of fairy tales and influential literary controversialist, was born in Paris. Jan. 13, 1628. Three of his four brothers are also noteworthy: PIERRE (1611–*c.* 1680), an official in the revenue department who upheld the Moderns against the Ancients in the preface to his translation of Alessandro Tassoni's La *Secchia rapita* (Le *Seau enlevé,* 1678) and in *Critique* des *deux tragédies d'Iphigénie d'Euripide et* de *M. Racine* (unpublished); CLAUDE (1613–1688), a doctor of medicine whose activities as an architect were derided by Boileau in *L'Art poétique,* book iv (1673,; NICOLAS (1624–1662), a doctor of theology who inclined to Jansenism.

After studying law, Charles Perrault began work under his brother Pierre but won some reputation about 1660 as a writer of burlesque verse and amourous poems. From 1663, when J. B. Colbert assumed the protection of literature and the arts, Perrault did important work under him. envisaging the establishment of a general academy such as Napoleon was later to set up in the Institut. Elected to the Xcademie Française in 1671, he died in Paris on the night of May 15–16! 1703.

Perrault is chiefly remembered for his charming fairy tales, *Histoires ou contes du temps* passe' (with the alternative title *Contes de* ma *mère l'Oye*), published in 1697 but written, according to the abbe J. B. du Bos, sometime earlier, to amuse Perrault's children. The tales are notably free from the affectation and spurious naïveté that disfigure other fairy tales of the period. In his own time, however, Perrault was most important as the champion, in the Acadkmie Française, of the Moderns against the Ancients (from 1672 on). His poem "Le *Siècle de* Louis *le* Grand," read to the Académie on Jan. 27, 1687, was an outspoken polemic that provoked Boileau to protest forcefully on the spot. Perrault, however, maintained his attitude in his *Parallèle* des *Anciens* et des *Modernes* (1688–92).

The most systematic and the most radical of the Moderns, he believed that the human mind made continuous progress and that a nation's literature corresponded to its state of civilization, so that ancient literature was inevitably coarser and more barbarous than modern. Shocking to his contemporaries and to later critics, Perrault's extremism makes his thought a historic landmark in the revolt against the humanist tradition.

See P. Bonnefon, "Charles Perrault . . . ," three articles, ***Revue d'histoire littéraire de la France*** (1904–05), *a* most important study; also A. Adam, *Histoire de la littérature française au XVIIe siècle,* vol. iii and v (1952–56). **(AE. A.)**

PERRERS (or DE WINDSOR), **ALICE** (d. 1400), mistress of the English king Edward III, belonged probably to the Hertfordshire family of Perrers, although it is also stated that she was of humbler birth. She entered the service of Edward's queen, Philippa, before 1366, and was married to Sir William de Windsor, deputy of Ireland (d. 1384). Her intimacy with the king began about 1366. Alice was accused of interfering in the courts of law to secure sentences in favour of her friends, and the parliament of 1376 forbade all women from practising in the law courts. Alice was banished. but John of Gaunt allowed her to return to court in June 1376, and the parliament of 1377 reversed the sentence against her. She was again banished in June 1377; but this sentence was annulled two years later, and Alice regained some influence at court.

PERRIN, JEAN BAPTISTE (1870–1942), French physicist. who was awarded the Nobel prize for physics in 1926 for his extensive studies on the motion (called Brownian movement) and distribution of small particles suspended in a liquid, was born at Lille, on Sept. 30, 1870. He was educated at the École Normale Supérieure in Paris and from 1898 to 1910 was professor of physical chemistry in the University of Paris. He was elected a member of the French Académie des Sciences in 1923 and was president in 1938. His researches were mainly concerned with colloids. Brownian movement and the determination of absolute molecular weights. He was the first to establish experimentally (1895) that cathode rays consist of negatively charged particles. His researches on Brownian movement gave experimental confirmation of Albert Einstein's theoretical studies in which it had been shown that such suspended particles should follow the gas laws even to the extent of giving a means of determining Avogadro's number (N), an important physicochemical constant, namely, the number of molecules in a gram molecule of any gas. the number obtained by Perrin being 6.8×10^{23}. His book, Les *Atomes* (1913; 3d ed., 19-10), describing this work, became a classic. He died in New York city on April 17, 1912. (D. MCK.)

PERROT, SIR JOHN (*c.* 1527–1592), lord deputy of Ireland, the son of Mary Berkley (afterward wife of Thomas Perrot), was generally reputed to be a son of Henry VIII, and was attached to the household of William Paulet; 1st marquess of Winchester. Perrot was knighted at the coronation of Edward VI and though imprisoned during Mary's reign on the charge of harbouring heretics. he received the castle and lordship of Carew in Pembrokeshire, and at the beginning of Elizabeth I's reign was entrusted with the naval defense of South Wales. In 1570 Perrot became lord president of Munster, in which capacity he hunted down James Fitzmaurice Fitzgerald, whose submission he received in 1572. Perrot resented the reinstatement of Gerald Fitzgerald, 15th earl of Desmond, and after vainly seeking his own recall left Ireland without leave in July 1573 and, presenting himself at court, was allowed to resign his office, in which he was succeeded by Sir William Drury. He returned to his Welsh home, where he was occupied with his duties as vice-admiral of the Welsh seas.

In 1584 Perrot succeeded Arthur Grey. Lord Grey de Wilton, as lord deputy of Ireland, and was instructed to divide the confiscated estates of the earl of Desmond among English landlords who were to supply English labour. But his plans were disturbed by the raids of the Macleans and the MacDonnells, invited to Ulster by Sorley Boy, whom he reduced to submission in 1586. In 1585 Perrot, succeeded in completing the "composition of Connaught," a scheme for a contract between Elizabeth and the landholders of the province by which the queen should receive a small quitrent. During his career as lord deputy he had established peace, and had deserved well of Elizabeth, but his indiscretions had made him numerous enemies. A plan for the conversion of the revenues of St. Patrick's cathedral. Dublin, to provide funds for the erection of two colleges led to a quarrel with Adam Loftus, archbishop of Armagh, and in Jan. 1588 he returned to London in disgrace. After his return a forged letter purporting to be from him to Philip II of Spain gave colour to a charge of treason. He was found guilty, but died in the Tower in Sept. 1592.

PERRY, BLISS (1860–1954), U.S. writer, chiefly known as an essayist and critic. was born at Williamstown, Mass., Nov. 25, 1860. He graduated from Williams college in 1881 (A.M., 1883), continuing his studies at the universities of Berlin and Strasbourg. He was professor of English at Williams college, 1886–93; professor of oratory and aesthetic criticism at Princeton university, 1893–1900; professor of English literature at Harvard university, 1907–30; and Harvard lecturer at the University of Paris, 1909–10. He was editor of the *Atlantic Monthly,* 1899–1909. His autobiographical *And Gladly Teach* appeared in *1935.* Perry died at Exeter, N.H., Feb. 13. 1954.

PERRY, MATTHEW CALBRAITH (1794–1858), **U.S.** naval officer, who concluded the first treaty between Japan and the United States, was born at South Kingston. R.I., April 10, 1794. He was commanding officer (1838–40) of the "Fulton II," first U.S. steam warship. In 1843 (with the honorary rank of commodore) he commanded a squadron that was sent to Africa, under the terms of the Webster-Ashburton treaty, to aid in suppressing the slave trade. During the Mexican War; Perry commanded a naval force that captured Frontera and Tabasco, thereby cutting, off Mexico from Yucatan; and in March 1847, his unit carried out a bombardment that permitted the landing of troops at Veracruz.

In March 1852, Perry was appointed commander of a naval expedition to be sent to Japan to induce the government to establish diplomatic relations with the U.S. After studying the situation, Perry concluded that Japan's traditional isolation policy would be altered only if superior naval forces were displayed and if the Japanese officials were approached with a "resolute attitude.'! He decided "to demand as a right, and not to solicit as a favour, those acts of courtesy which are due from one civilized country to another. . . ." With two frigates and two sailing vessels he entered the fortified harbour of Araga on July 8, 1853. He refused to obey Japanese orders to leave and sent word that if the Japanese government did not delegate a suitable person to receive the documents in his possession, he would "go on shore with a suitable force and deliver them personally, be the consequences what they might." A high Japanese official was finally dispatched and, amid much ceremony, the U.S. documents were delivered. Perry then reported that he would return the following year, with a much larger naval force, to receive a reply to Pres. Millard Fillmore's request ior a treaty.

In Feb. 1854 Perry reappeared in Edo (modern Tokyo) bay with more ships than before and on March 31 concluded the first treaty between the Cnited States and Japan. The presents given by Perry to celebrate the occasion filled several boats and included a model railway, telegraph instruments, modern guns. telescopes and other items that served to impress the Japanese with the technological and scientific achievement of the west.

The treaty merely assured better treatment of shipwrecked seamen and permitted U.S. ships to obtain fuel and supplies at two Japanese ports. But it demonstrated the military government's inability to enforce its traditional isolation policy and thus contributed to the collapse of the feudal regime and to the modernization of Japan.

The success of the expedition made Perry a recognized authority on the far east. Through his nritings and speeches he stressed the danger of British and Russian expansion and urged that the United States play a more active role in the orient. He died in New Tork city, March 4. 1358.

PERRY, OLIVER HAZARD (1785–1819), U.S. naval officer, who commanded the United States fleet at the battle of Lake Erie during the War of 1812, was born at South Kingston, R.I.. on Aug. 23. 1785. He entered the navy as midshipman (1799) with his father, Christopher Raymond Perry (1761–1818). a captain in the navy, and saw service against the Barbary pirates. At the beginning of the War of 1812 he was in command of a flotilla at Newport, but was transferred (Feb. 1813) to the Great Lakes. He served with Commodore Isaac Chauncey, and then was sent from Lake Ontario to Lake Erie, where he took up the chief command at the end of March 1813. With the help of a strong detachment of officers and men from the Atlantic coast he equipped a squadron consisting of one brig, six schooners and one sloop, with which superior force he completely defeated the British squadron under Capt. Robert Barclay off Amherstburg. Perry commanded the "Java" in the Mediterranean expedition of 1815–16.

He died of yellow fever at Port of Spain in Trinidad on Aug. 23, 1819.

See O. H. Lyman, *Commodore O. H. Perry and the War on the Lakes* (1905); James Cooke Mills, *Oliver Hazard Perry and the Battle of Lake Erie* (1913); and Charles Oscar Paullin (ed.), *The Battle of Lake Erie* (1918).

PERRY is an alcoholic beverage made by fermenting pear (*q.v.*) juice. Mostly it is produced in those northern countries, of temperate climate, where it is easier to grow pears and apples than grapes. Dessert pears cannot be used for perry; the fruit must have "vintage" qualities, and where the soil is suitable for cider (q v.) orchards it will also bear perry orchards successfully. In England, in Herefordshire, Worcestershire, Gloucestershire and in parts of Monmouthshire, Somerset and Kent, perry orchards flourish; they like best a sandy loam. In France only a little perry is produced in Brittany, but in Germany it is preferred to cider. Formerly there was a large production of perry in the eastern states of the United States.

Many English varieties of perry pears, such as Barland, Holmer, Huffcap and Taynton Squash, can be traced to the end of the 17th century. The origin of some varieties, for instance Cheat Boy, Longland and Blakeney, cannot be traced, but others can be dated to the 18th century (such as Buff) or to the early 19th century (Aylton Red). It was then that perry lost popularity; the orchards became derelict and were widely uprooted.

After World War II popular taste in Britain adopted sparkling perry and pear juice is imported from Switzerland, as it possesses "vintage" quality when blended with English pear juice.

See R. Hogg, *The Apple and Pear as Vintage Fruits* (1886).
(C. C. H. F.)

PERSE, SAINT JOHN (pseudonym of MARIE RENÉ AUGUSTE ALEXIS LEGER) (1887–), French poet and diplomatist, who was awarded the Nobel prize for literature in 1960. He was born at St. Léger des Feuilles, Guadeloupe, March 31, 1887, studied at the universities of Bordeaux and Paris and in 1914 entered the diplomatic service. He went to China and was successively consul at Shanghai and secretary at Peking. In 1921 he attended the Washington Disarmament conference as an expert on far eastern affairs. He was later secretary to Aristide Briand. In 1933 he was appointed secretary general of the foreign ministry, with the rank of ambassador. Dismissed from office in 1940, and deprived of French citizenship by the Vichy government, he went to the United States, where he worked in the Library of Congress. He continued to live there after the liberation of France, although his French citizenship was restored and he retained an estate on the Riviera.

His early poetry, published before his diplomatic career gained

momentum, includes *Éloges* (1904–08) and Images *à Crusoe* (1909), and shows the influence of Symbolism, though he later developed a more personal style. The language of his poetry, admired, especially by poets, for its precision and purity, is difficult, and he has made little appeal to the general public. His best known early work is the long poem *Anabase* (1925; Eng. trans. by T. S. Eliot, 1930). In the poems written in exile—Exil (1942). Vents (1946), Amers (1957) and Chronique (1960)—he achieved a more deeply personal note and, by some American readers. was regarded as an embodiment of the French national spirit: intellectual yet passionate, deeply conscious of the tragedy of life, a man of affairs with an artist's feeling for perfection and symmetry.

PERSEPHONE was the daughter of Zeus and Demeter. In cult and in mythology Demeter and Persephone were closely associated, being known together as the two goddesses, the venerable or august goddesses, 'sometimes as the great goddesses. The latter is often called *Korē* ("the Maiden"); whether this results from the identification of two different goddesses, or not, is uncertain. She is the consort of Hades (pee PLUTO), who carried her off as she was gathering flowers.

Demeter sought her in vain; in her sorrow, she caused a famine, and men would have died of hunger if Zeus had not persuaded Hades to let Persephone go. But she had eaten, in the underworld, the seed of a pomegranate, and thus she could not stay away from him for ever. So it was arranged that she should spend two-thirds (according to later authors, one-half) of every year with her mother and the heavenly gods, and should pass the rest of the year with Hades beneath the earth. There can be little doubt that this is a mythological expression for the growth of vegetation in spring and its disappearance in autumn. As wife of Hades Persephone sent spectres, ruled the ghosts, and carried into effect the curses of men. From the head of a dying person she, or *Thanatos* (Death), was supposed to cut a lock of hair which had been kept sacred and unshorn through life (Virgil, *Aen.*, iv. 698 et seq., Eurip. *Alc.*, 74–76).

On the other hand, in her character of goddess of spring Persephone was honoured with flower-festivals in Sicily and at Hipponium in Italy. Sicily was a favourite haunt of the two goddesses, and ancient tradition affirmed that the whole island was sacred to them. The Sicilians claimed to be the first on whom Demeter had bestowed the gift of grain, and hence they honoured the two goddesses with many festivals. They celebrated the festival of Demeter when the grain began to shoot, and the descent of Persephone when it was ripe. Demeter and Persephone were worshipped together by the Athenians at the greater and less Eleusinian festivals, held in autumn and spring respectively (see MYSTERY). At Rome Persephone's name was corrupted into Proserpina; she was sometimes identified with the native Latin goddess Libera. The pomegranate was Persephone's symbol. and the pigeon and cock were sacred to her In works of art she appears with a cornucopia or nith ears of wheat and a cock. As the wife of Hades she was represented with the insignia of royalty and a torch. The regular form of her name was Persephone, but various other forms occur: Phersephone, Persephassa, Phersephassa, Pherrephatta, etc.

For bibliography see under DEMETER.

PERSEPOLIS, an ancient city of Persia, situated some 40 m. N E of Shiraz, not far from where the small river Pulwar flows into the Kur (Cyrus). The site is marked by a large terrace with its east side leaning on *Kuh-i-Rahmet* ("the Mount of Grace '). The other three sides are formed by a retaining wall, varying in height with the slope of the ground from 14 to 41 ft.; on the west side a magnificent double stair, of very easy steps, leads to the top. On this terrace are the ruins of a number of colossal buildings, all constructed of dark-grey marble from the adjacent mountain. The stones were laid without mortar, and many of them are still in situ. Especially striking are the huge pillars, of which a number still stand erect. These ruins, for which the name "Sad-Sutun" ("the 100 columns"), can be traced back to the 4th century, are now known as *Takht-i-Jamshid* ("the throne of Jamshid"). That they represent the Persepolis captured and partly destroyed by Alexander the Great has been beyond dispute at least since the time of Pietro della Valle.

Behind Takht-i-Jamshid are three sepulchres hewn out of the rock in the hillside, the façades, one of which is incomplete, being richly ornamented with reliefs. About 8 m. N.N.E., on the opposite side of the Pulwar, rises a perpendicular wall of rock, in which four similar tombs are cut, at a considerable height from the bottom of the valley. The modern Persians call this place Naksh-i-Rustum ("the picture of Rustam") from the Sassanian reliefs beneath the opening, which they take to be a representation of the mythical hero Rustam. That the occupants of these seven tombs were kings might be inferred from the sculptures, and one of those at Naksh-i-Rustam is expressly declared in its inscription to be the tomb of Darius Hystaspis, concerning whom Ctesias relates that his grave was in the face of a rock, and could only be reached by means of an apparatus of ropes. Ctesias mentions further, with regard to a number of Persian kings, either that their remains were brought "to the Persians," or that they died there. Now we know that Cyrus was buried at Pasargadae (*q.v.*) and if there is any truth in the statement that the body of Cambyses was brought home "to the Persians" his burying-place must be sought somewhere beside that of his father. In order to identify the graves of Persepolis we must bear in mind that Ctesias assumes that it was the custom for a king to prepare his own tomb during his lifetime. Hence the kings buried at Naksh-i-Rustum are probably, besides Darius, Xerxes I., Artaxerxes I. and Darius II. Xerxes II.. who reigned for a very short time, could scarcely have obtained so splendid a monument, and still less could the usurper Sogdianus (Secydianus). The two completed graves behind Takht-i-Jamshid would then belong to Artaxerxes II. and Artaxerxes III. The unfinished one is perhaps that of Arses, who reigned at the longest two years, or, if not his, then that of Darius III. (Codomannus), who is one of those whose bodies are said to have been brought "to the Persians" (see Arian iii. 22, 1). Another small group of ruins in the same style is found at Takht-i-Tā'us, on the Pulwar.

Since Cyrus was buried in Pasargadae, which moreover is mentioned in Ctesias as his own city, and since, to judge from the inscriptions, the buildings of Persepolis commenced with Darius I., it was probably under this king, with whom the sceptre passed to a new branch of the royal house, that Persepolis became the capital (see PERSIA: Ancient History) of Persia proper. As a residence, however, for the rulers of the empire, a remote place in a difficult alpine region was far from convenient, and the real capitals were Susa, Babylon and Ecbatana. This accounts for the fact that the Greeks were not acquainted with the city until it was taken and plundered by Alexander the Great.

In 316 B.C. Persepolis was still the capital of Persis as a province of the great Macedonian empire. The city gradually declined; but the ruins of the Achaemenidae remained as a witness to its ancient glory. It is probable that the principal town of the country, or at least of the district, was always in this neighbourhood. About A.D. 200 we find there the city Istakhr (properly Stnkhr) as the seat of the local governors. There the foundations of the second great Persian empire were laid. and Istakhr acquired special importance as the centre of priestly wisdom and orthodoxy. The Sassanian kings have covered the face of the rocks in this neighbourhood. and in part even the Achaemenian ruins, with their sculptures and inscriptions, and must themselves have built largely here. although never on the same scale of magnificence as their ancient predecessors. The Romans knew as little about Istakhr as the Greeks had done about Persepolis, in spite of the fact that for four hundred years the Sassanians maintained relations, friendly or hostile, with the empire.

At the time of the Arabian conquest Istakhr offered a desperate resistance, but the city was still a place of considerable importance in the 1st century of Islam, although its greatness was speedily eclipsed by the new metropolis Shiraz.

In the 10th century Istakhr had become an utterly insignificant place, as may be seen from the descriptions of Istakhr, a native (c. 950), and of Mukaddasi (c. 985). During the following centuries Istakhr gradually declines, until, as a city, it ceased to

exist. This fruitful region, however, mas covered with villages until the frightful devastations of the 18th century; and even now it is, comparatively speaking, well cultivated. The "castle of Istakhr" played a conspicuous part several times during the Mohammedan period as a strong fortress. It was the middlemost and the highest of the three steep crags which rise from the valley of the Kur, at some distance west or northwest of Naksh-i-Rustum.

PERSEUS, in Greek legend, son of Danae and Zeus. When Perseus was grown to manhood Polydectes, king of Seriphus, cast his eye on Danae, and, in order to rid himself of the son, exacted of him a promise that he would bring him the head of the Gorgon Medusa. The Gorgons (*q.v.*) dwelt with their sisters, the Graeae, in the west. Guided by Hermes and Athena, Perseus came to the Graeae. They were three hags, with but one eye and one tooth between them. Perseus stole the eye and the tooth, and would not restore them till the Graeae had guided him to the Nymphs, from whom he received the winged sandals, a wallet (κίβισις, resembling a gamekeeper's bag) and the helmet of Hades, which rendered him invisible. Thus equipped and armed by Hermes with a curved sword (*harpe*), he came upon the Gorgons as they slept, and cut off Medusa's head, while with averted eyes he looked at her reflection which Athena showed him in the mirror of her shield. Perseus put the Gorgon's head in his wallet, and fled, pursued by Medusa's sisters, to Ethiopia, where he delivered Andromeda (*q.v.*) from a sea-monster and afterward married her. With her he returned to Seriphus in time to rescue his mother from Polydectes, whom with all his court he turned to stone by showing them the Gorgon's head. Perseus then gave the head of Medusa to Athena, and, with Danaë and Andromeda, hastened to Argos to see his grandfather, Acrisius, once more. But before his arrival Acrisius, fearing the oracle, had fled to Larissa in Thessaly. Thither Perseus followed him, and unwittingly slew his grandfather by the throw of a discus. Ashamed to return to Argos, Perseus gave his kingdom to Megapenthes (Acrisius' nephew) and received from him Tiryns in exchange. There he reigned and founded Mideia and Mycenae and became the ancestor of the Persides, among whom were Eurystheus and Heracles. *See* E. S. Hartland, The *Legend of Perseus* (1894–96).

PERSEUS AND ANDROMEDA, FROM A COPY OF THE ORIGINAL IN THE CAPITOLINE MUSEUM, ROME

PERSEUS, in astronomy, a constellation of the northern hemisphere, called after the Greek legendary hero. It contains a double cluster forming an interesting object for low-power telescopes. The second brightest star in the constellation is the famous eclipsing variable Algol (*q.v.*). A number of naked-eye stars—of which α Persei is the brightest—make up a loose cluster, which is located at a distance of about 400 light years from the sun. The double cluster itself is much more remote; its distance is of the order of 7,000 light years.

PERSEUS OF MACEDONIA (b. *c.* 212 B.C.), the last king of Macedonia, eldest son of Philip V. He had his brother Demetrius killed, and thus cleared his way to the throne in 179. War broke out with Rome in 171 B.C. when P. Licinius Crassus attacked him. Perseus defeated Crassus at Callinicus in Thessaly, but in 168 he was routed at Pydna by L. Aemilius Paulus. He died in captivity at Xlba Fucens. (*See* MACEDONIAN EMPIRE.)

PERSHING, JOHN JOSEPH (1860–1948), U.S. soldier, was born near Laclede, Mo., on Sept. 13, 1860—destined to as astonishing a rise from humble circumstances as Joseph Joffre, the first French commander in chief in World War I.

He taught school to gain the means to study at the Kirksville, Mo., normal school and then competed for entry into the U.S. Military academy. In 1886, he was commissioned in the 6th cavalry and saw service against the Apaches in Arizona. In 1890, during an uprising of the Sioux, he served in Dakota, in charge of the Indian scouts. In 1891 he was appointed military instructor at the University of Nebraska, where he graduated in the law school. After being instructor in tactics at the U.S. Military academy, he served in Cuba through the Santiago campaign (1898), where he earned from his commander the tribute, "Pershing is the coolest man under fire I ever saw." Soon afterward he showed that he was more than merely brave and energetic, for, sent to the Philippines, he pacified by 1903 the fanatical Moros of Mindanao. In 1905 he went to Japan as military attach& and witnessed part of the campaign in Manchuria. As a reward for his Philippines service, Pres. Theodore Roosevelt in 1906 promoted him from captain to brigadier general, passing him over 862 senior officers. He returned to the Philippines as commander of the department of Mindanao and governor of the Moro province. Returning in 1913, he was sent from San Francisco in 1916 to command the expedition into Mexico against Francisco Villa, and after the death of Maj. Gen. Frederick Funston in 1917 he succeeded as commander on the Mexican border.

On the U.S. entrance into World War I Pershing was chosen to command the American expeditionary force in Europe, an honour gained perhaps not only by his record of achievement but also by his proofs in Mexico of extreme loyalty to government authority under hampering circumstances. With his staff he reached England on June 9, 1917, and four days later landed in France. To pass from guerrilla expeditions in jungle, mountain and desert to the vast siege then in progress—or stagnation—on the western front was an extreme test, but in compensation for a military experience limited to small expeditions he brought a trained administrative sense, with the will and knack of carrying through plans under difficulties. From the start Gen. Pershing insisted that the integrity of the U.S. army be preserved, making a firm stand against French tutelage and against the French desire to infuse the new blood of U.S. manpower into its own military system. And while the Washington war department was contemplat'ng a limited liability war, Pershing in France was methodically laying the foundation for an army of 3,000,000 men—stamped with the Pershing seal. If this plan, inevitably slow in fruition, imposed a severe strain on the exhausted Allies, it was justified not only by the proverbial warning against "putting new wine into old bottles"; for the alternative would have demanded an unprecedented sacrifice of national prestige. If the realization of an independent U.S. army would be, as Pershing felt, a serious blow to German morale, it was also likely to uplift the military spirit and self-confidence of the United States not only for the moment but for all time.

The disasters of early 1918 seemed to show that a great risk had been taken in pursuit of this ideal, and they led Pershing to place all his resources freely at Marshal Ferdinand Foch's disposal. But as soon as the crisis began to pass he reverted to his policy, and at St. Mihiel in September it was consummated by the victory of the first U.S. army in the first entirely U.S. operation. This was followed by the Meuse-Argonne battle (*q.v.; see* also WORLD WAR I) under Pershing's direction. If the attainment of its aims was slower and more costly than had been expected, Pershing had accepted the actual battleground in deference to his allies and against his own preference for a blow toward Metz. Even so, it is probable that he underrated the difficulties of breaking through a strongly organized trench system, as well as the causes that had sapped the offensive spirit of the French. He had a Grant-like ruthlessness, similarly lacking the personal magnetism which leads men to lay down their lives gladly, but he had the character which compels men not only to die but to work, grumbling perhaps but respecting him.

It was a just recognition of his achievement in creating almost

from nothing the vast structure of the national army that, in Sept. 1919, congress created the rank of general of the armies. As such he was the highest ranking military officer in U.S. history, outranking even generals of the army. In 1921 he was appointed chief of staff and during his tenure of office designed the new permanent framework of the U.S. army. He also served as chairman of the American Battle Monuments commission and in 1931 published My *Experiences* in *the World War*. After 1941 he lived in retirement in quarters built for him at Walter Reed hospital in Washington, D.C. He died there July 1j, 1948, and was buried in Arlington National cemetery. (B. H. L. H.; X.)

PERSHORE, a town and rural district on the Avon river in the South Worcestershire parliamentary division of Worcestershire. Eng., 9 mi. S.E. of Worcester by road. Pop. (rural district, 1961) 17,599. Market gardening and fruit growing (especially plums) are the staple industries. The churches of Holy Cross, a former mitred Benedictine abbey, the nave of which has entirely disappeared, and St. Andrew, mainly early 15th century, face one another.

PERSIA (IRAN), a kingdom of western Asia. In 193j the name "Iran" was officially adopted for the state previously known to other countries as Persia. On Oct. 2j, 1949, however, it was announced that the Tehran government reverted to the name "Persia" in foreign languages.

Persia is bounded on the north by the U.S.S.R. and the Caspian sea; on the east by Afghanistan and Pakistan; on the south hy the Persian gulf and the Gulf of Oman; and on the west by Iraq and Turkey, The total area of Persia is about 636,293 sq.mi. and the length of the frontiers is about 2.750 mi.

Frontiers. — The frontier with the U.S.S.R. is that laid down in the treaty of Turkmanchai (Turkman) (1828), further defined in a convention of July 8, 1893, and modified in minor details in 1951. It has two sections divided by the Caspian sea. Its eastern section joins the Afghan frontier at the Zulfikar defile. The Afghan frontier was defined in 1881 and in the convention of July 8, 1893 From the Siah Kuh (where it joins the Pakistan frontier) to the Kuh-i-Malik Siah it follows a line fixed by Sir Frederick Goldsmid in 1872 and by Sir Henry MacMahon in 1903–05. The southern boundary is the coast line from Gwatar to the mouth of the Shatt-al-Arab. The islands nearest to the Persian coast are Persian territory. They are, from east to west, Hormuz, Larek, Qishm (Kishm), Hangam, Farur, Qais, Hinderabi, Shnikh Shuaib, Kharag and Khargu. On the west, the frontier with Turkey starts from Mt. Ararat and meets the Persian, Turkish and Iraqi boundaries at Rudbar-i-Haji Bey. From this point the frontier line with Iraq extends about 550 mi. to the Shatt-al-Arab; it then follows the low-water line to the mouth but includes the anchorages of Khorramshahr (formerly Mohammerah) and Abadan in Persia. This is the line relerred to in the treaty of Erzerum (1847), demarcated in 1914 by Perso-Turkish commissioners assisted by British and Russian commissioners with arbitral powers. and reaffirmed by an agreement between Iraq and Persia in 1937.

Geology. — Little is known with certainty of the geology of wide areas of Persia, notably in the north and east. The search for oil has made the southwest the best-known region. Only late investigations provided information concerning the structures and deposits of the central plateau.

A Pre-Cambrian land surface subsided locally in Cambrian times, and limestones and shales with rock salt and gypsum beds were laid down in the Zagros and in central Persia. Quiescent conditions during the Palaeozoic era were interrupted by the subsidence which led to Devonian deposits in the northwest. In Permian times the country was covered by the great Tethys sea with shore lines to north and south near the present frontiers of Persia. except for a great gulf covering the present site of the Caspian sea. Within the Tethys basin were laid down the thick Jurassic limestones of the Zagros.

In middle Cretaceous times intensive folding affected the Persian area and narrowed the Tethys geosyncline, but heavy sedimentation still went on toward Mesopotamia, Upper Cretaceous deposits, mainly limestones, being laid down in the southern Zagros region to a thickness of 3,000 ft. During the Tertiary period deposition continued but in a steadily shrinking sea. Renewed pressure from inner Asia in Pliocene times led to the intense folding which moulded the Zagros ranges into their present form, a great series of parallel folds running northwest to southeast. The east-uest folds of the Makran and those with a southwest to northeast trend reaching toward the Suleiinan mountains originated at the same period. In the northwest movement was mainly along the fault lines already established and was accompanied by intense volcanic activity.

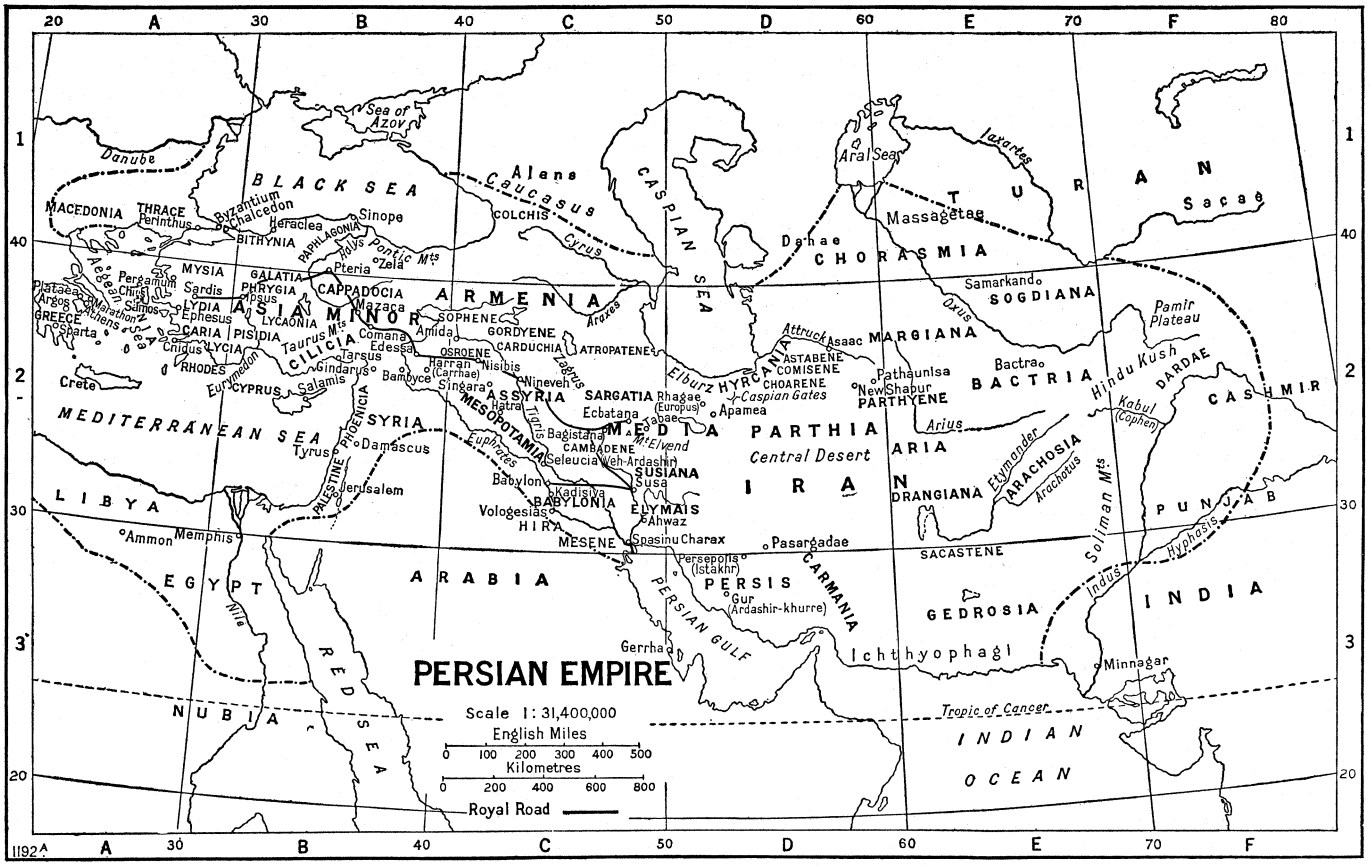
Though there is still room for much disagreement over details, the broad picture of the structure of Persia seems tolerably clear. The central plateau, if not an actual fragment of either Angaraland or Gondwanaland. appears to have acted as though it were, transmitting to its margins the outward pressures originating from the former; *i.e*, irom the northeast. Though the Zagros ranges have a long geological history they are mainly the result of these pressures as exerted in Tertiary times. The northern ranges, including the Elburz. have a similar origin, though too little is known of them to fix the age or detailed succession of the earth movements which formed them. Only in the lake district of Azerbaijan has fracturing rather than folding been the main factor in determining the topography.

Physical Geography. — Persia includes the major part of the Iranian plateau, a moderately high region enclosed within a great loop of the Alpine-Himalayan fold mountain system. The mountain border is sharply marked in the west by the Zagros ranges, on the north by the Elburz range and on the east by the Suleiman range, overlooking the Indus plains. The eastern third of the plateau falls within the borders of Afghanistan and Baluchistan. The border ranges converge in the Armenian massif to the northwest and the Hindu Kush to the northeast. Persia thus consists of a central plateau with wide depressions separated by low folds and a high mountainous fringe which sharply marks it off from surrounding lowlands.

The obvious division of the country is into plateau and mountains, but the mountains are so varied in character that it is more convenient to treat them in three sections — the Zagros and their extension to the Makran, the Elburz and Khurasan ranges of the north and the eastern highlands — and to treat the central plateau in a fourth section.

1. *The Zagros folds* include the ranges of the west and southwest and fall into three subregions. The northernmost, beyond the 35th parallel, is mainly an area of faulted blocks and basins which have been subjected to heavy erosion. The saline waters of the shallow Lake of Urmia (Daryacheh-i-Rizaiyeh) occupy the lowest parts of the greatest of these basins. Altitudes on the plateau surface decrease to the southeast so that geographically the subregion forms a transition between Armenia and the Persian interior. A group of great volcanic cones (*e.g.*, Savalan, 14.200 ft.) forms a distinctive feature and is associated with the fault system. The annual range of temperature is probably unequalled anywhere, the winters being bitterly cold and snowy, the summers very hot and arid. The plateaus afford only poor grazing but the basins where irrigated are very productive and support, for Persia, a dense population. Tabriz, 3; mi. from the unhealthful shores of the Lake of Urmia, is a great market at a centre of route convergence and the second city of Persia. It guards the main entry to the country from Turkey and European Russia.

The ranges of the central Zagros subregion are of the Appalachian tqpe; *ie.*, numerous parallel ranges and valleys corresponding closely to the underlying fold structure. They form a belt about 12j mi. wide between the inner foothills and the Mesopotamian plain as far south as the 27th parallel. Overthrusting on the inner margins exposes rocks as old as the Cambrian, the high central area is of Jurassic limestones, and the western edge is largely made up of massive Tertiary limestones. Between these overdrained ridges are long, secluded valleys, often rich in agricultural produce (*e.g.*, the Rhurramabad basin) but extremely difficult of access. As in the northern subregion, the melting of the heavy winter snows and springs irom the limestones maintain perennial streams. These issue through tangs, deep narrow defiles,



to the western lowlands. Thus the Poul-i-Tang, only 10 ft. wide, carries a stream 25 ft. deep at low-water level. The country is mainly pastoral with seasonal migration between valley and upland (transhumance). The chief population centres are on the few cross routes; *e.g.*, Kermanshah on the way from Tehran to Baghdad and Shiraz on the Bushire-Isfahan road. Oil occurs in the shallow anticlines of the foothills on the Mesopotamian margin, especially in the basin of the Karun river. The reservoir rock is the fissured Asmari limestone which is capped by the shales of the Fars series, both of Miocene age. Geological and topographic conditions make the exploitation of the deposits cheap and easy. Few wells are needed to work the field, and gas and water pressures make pumping from the bores unnecessary. With careful siting of the pipe lines the oil flows under gravity alone to the refining centre at Abadan. A lesser field is exploited west of Kermanshah for local needs.

The third region, the Makran, fronts the Arabian sea. Here the general fold direction is east-west from Bandar Abbas to the borders of Baluchistan. Sandstones not limestones are the dominant rock type. A narrow coastal lowland rises quickly to a plateau at about 2,000 ft. which is capped by scarped hills rising to 7,000 ft. Short streams in deep valleys run directly to the sea. In this extremely arid region fish is the main product. Dried, it is exported or used as local food for both man and beast, being fed to sheep and camels. Some of the inner valleys grow dates.

2. *The northern highlands* fall into two distinct sections—the Elburz mountains and associated hills and the border ranges of Khurasan—which together form the shorter link in the Alpine-Himalayan system between the Armenian knot and the Hindu Kush. The Elburz range stretches in a great arc around the southern shores of the Caspian sea and is built of steep, narrow folds, fractured at a few places and including a number of volcanic cones. The greatest of these is the snow-capped Demavend (18,600 ft.). The slope to the Caspian is very steep, summits of 10,000 ft. occurring within ten miles of the water's edge. In a region of very heavy rain this gives rise to many torrential streams which flow in deep gorges directly to the Caspian. The southern and drier side is less eroded but has steep scarps overlooking immense gravel spreads. Some of the streams issuing from the hills reach immense alluvial fans. Where deposits are fine enough to be irrigated they prove very fertile.

The Caspian plain, never more than 70 mi. wide and often much less, rises gently at first from a marshy lagoon coast left behind by the shrinking sea. The steeper ground behind it up to 8,000 ft. carries dense deciduous forest except where it has been cleared and cultivated. A great range of crops—including such subtropical plants as rice, cotton and tea—is raised, and the region was long famous for its silk production. It is much the most densely peopled area in Persia (2,000,000 to 3,000,000 out of a total of 13,000,000).

The Elburz range declines in height to the east and finally vanishes on the edge of the Atrek trough. East of this gap the ranges trend from northwest to southeast. The northern series, the Kopet-dagh (10,000 ft.), is separated from a southern series, the Kuh-i-Aleh and Kuh-i-Binalud, by a wide valley drained to the west by the Atrek and to the east by the Kashuf. This formed the invasion route and trade highway from the Merv steppes toward Tehran and the Caspian. The uplands are poor grazing grounds, but the valley has much cultivated ground, especially near Meshed, where the production of wheat and barley justifies the description of that city as the granary of eastern Persia. It is also a great city of pilgrimage. Kuchan, near the centre of the valley, is notorious for the frequency and severity of its earthquakes.

3. *The* eastern *uplands* do not form a real mountain border on that side of Persia, the true edge of the plateau being far away to the east. Indeed the eastern frontier of Persia cuts right across the grain of the country. In the north it follows the gorges of the lower Hari Rud where that river cuts through the folds; in the centre it crosses the great Seistan depression; and in the south it traverses the east-west ridges of the Makran. The border country is a barren, almost uninhabited region, cursed with an extremely low rainfall, extreme seasonal changes of temperature and most violent winds. These cause severe blizzards in the winter. From the beginning of June the "wind of 120 days" blows with-

out ceasing and with great force from the northwest, building sand dunes and creating dust storms. The lowest part of the Seistan basin is occupied by a fresh-water lake, the Hamun, which is fed by the Helmund river coming from the Afghan highlands. The delta has almost completely filled the lake. suggesting the early history of other depressions now dry. A few people live in the reedy marshes while others raise grain crops and pasture a few cattle on the delta fringe, where irrigation'is possible though difficult.

4. *The central plateau* is far from being the flat, featureless country so often pictured. It is crossed by two mountain lines which faintly mirror the great marginal folds. The more western runs southeastward from near Mianeh to Kerman with heights of 14,000 ft. near the latter city. Between it and the Zagros lie the Isfahan and other basins. Another mountain series follows a more southerly trend from the region of Nishapur to the Baluchistan border. thus separating the Seistan basin from the central desert region. Both mountain series are fold ranges with centres of volcanic activity and exposures of ancient crystalline rocks with which are associated ore deposits (*e.g.,* lead at Anarak, iron near Kerman).

The floors of the valleys between the ridges often show sand dunes and shallow salt lakes. Where fresh water draining from the hills can be tapped by tunnelling beneath the gravel-covered slopes cultivation is carried on. Caravan traders have for centuries followed the routes which link these oases. These form a sort of inner circle to the important highways joining the larger centres of early Persian culture situated in the wider and more generally fertile basins along the inner face of the border ranges. Thus the inner route Kerman-Yezd-Qum (Kum) runs parallel to that linking Shiraz-Isfahan-Hamadan-Tehran.

The areas between the two mountain series form desert basins. These are floored with thick deposits of detritus from the mountains. often over lake deposits of Tertiary and Quaternary age. These basins sink to levels 6,000 to 7,000 ft. below the bordering ranges; this explains their rainless character and very high summer temperatures. Several types of desert surface are recognized and given special names. Firm surfaces of gravel or hard sand are termed *dasht*. areas without either water or vegetation of any kind are known as *lut*, while the black muddy marshes covered with crusts of salt are called *kavir*. The *kavir* are particularly feared by travellers as the salt crusts are of uncertain thickness and may cover water channels or areas of liquid mud of considerable depth.

Climate. — The climate of Persia is markedly continental in character. The summer monsoon of India reaches the eastern districts only after crossing the Indus plains and the mountains of Afghanistan and Baluchistan. Except over the coast lands, therefore. where it is humid and oppressive, the summer is extremely dry and hot. Seistan, for example, has a July mean temperature of 90° F., and the noonday heat is fierce everywhere below 5,000 ft., though there are refreshingly cool nights in the interior. The transition from summer to winter and from winter to summer is abrupt, except on the Caspian sea where there is a short autumn season. In winter the border highlands toward Turkistan are too low to prevent the inflow of intensely cold and dry air from Siberia; *e.g.,* Meshed has a January mean temperature of 34° F. and 0.8 in. of rain. On the other hand, the mountain barriers of the south and west are high enough to prevent the spread of maritime influences from the Persian gulf, the Caspian and the Mediterranean. These ranges have thus a humid outer face and a dry inner one. The height of the plateau itself contributes to the cold of winter. The northwest (Tabriz) district is probably the coldest; mean temperatures toward the south rapidly become higher. Frost, often severe, is experienced everywhere except near the Makran coast. In northwest Persia and the Zagros mountains snow falls heavily and frequently between November and March. In sheltered hollows on Demavend and other high summits it may remain all year. Elsewhere the thaw begins in March or April, freeing the pastures for the annual migration of the pastoral tribes and flooding the streams which give water for irrigation. The snow cover in the colder regions protects the crops from severe frost, and the harvest greatly depends on it.

Rain mainly results from depressions originating in the Mediterranean area and hence is heaviest in the high northwest and also on the Caspian sea, with 20–50 in. The recorded fall to the south and east of the mountains shows great irregularity. varying at Tehran, for example, from 4 in. to more than 20. in. and at Bushire from less than 2 in. to more than 26 in. In general, however, rainfall decreases toward the east and south, and an arid zone with less than four inches fall in an average year stretches from the northern salt deserts to the Makran coast and from Seistan to Isfahan. Most rain falls between September and April.

Vegetation. — It has been estimated that there are considerably more than 5,000 species of seed-bearing plants in Persia, of which a great number are endemics. Knowledge on the subject is, however, very incomplete.

On the Caspian coast lands, where rainfall is abundant. a lush vegetation and almost tropical forests of creeper-covered trees are found. Large areas have been cleared for cultivation. Behind this belt the northern slopes of the Elburz range are clothed in forests containing a wide variety of trees in nhich oak, hornbeam, maple, ash, elm and, on the lomer slopes. nitch hazel predominate. Conifers are very rare. The southern slopes of the Elburz are entirely different; though they look barren, there are scattered patches of shrubs and herbs. Various species of *Astragalus,* many of which are endemic, are common there and in other desert parts In northern Khurasan the rainfall is lower, the forests disappear and most of the country has a semidesert appearance. *Artemisia* dominates the hills below grass steppes, while in the lower-lying parts halophytes (mainly belonging to the goosefoot family or Chenopodiaceae) grow in the salty districts, tamarisk on the fringe of the desert and camel thorn in the arid parts. The northwestern provinces are steppe and semidesert. Dwarf iris crocus (particularly near the Lake of Urmia) and many other flowers appear in the spring, folloned in June by members of the Caryophyllaceae, the yellow *Phlomis armeniaca*, borage. thyme and other herbs. On the Zagros ranges there is a wide variety of shrubs and herbs, including liquorice, tamarisk, chenopodiaceous plants and many geophytes Except for the highlands, where poplars and willows grow on the river banks, conditions are so unfavourable to plant gronth in eastern and southern Persia that xerophqtes and halophytes are the only types found. Along the shores of the Persian gulf plant growth is generally poor except in the north where date and other fruit gardens are found and the tamarisk and tamarind flourish.

Fauna. — Detailed knowledge of the fauna of Persia is incomplete; W. T. Blandford. who wrote in 1876, remained an important authority, although his work became out-of-date in matters of detail.

The lion (the national emblem of Persia) was formerly common in parts of the southwest but is now almost extinct. The tiger is still found in the forests of Mazanderan and the leopard in Asterabad and Kerman. Cheetahs, jackals, wolves and wildcats are widely distributed. The brown bear wild goat, Persian squirrel, hyena. jerboa, mongoose, fox and Indian crested porcupine occur in suitable localities. Two types of nild sheep have been identified, and the Persian gazelle and fallow deer are common; the red deer lives in the Elburz; the roe deer is found there also and in Kurdistan. The wild boar is common in well-watered districts; the wild ass moves in the desert regions of the east.

In addition to a large number of resident birds, including many western European species, others visit Persia to breed or to winter or pass through the country on migration. More than 400 species are known. There are marked variations in the types within any given species found in different parts of the country. There are four species of partridge of which the chukar is the commonest. Other game birds include sand grouse and snipe. Many varieties of duck visit all parts of Persia in winter and swans and geese are found on the Caspian coast and in Seistan. Notable summer visitors are the nightingale and cuckoo. Various types of owl are found and also falcons, buzzards and kestrels. Eagles are rare except for the booted eagle and the sea eagle, which is found on the Caspian. Large numbers of pelicans breed

on the northern shores of the Persian gulf and flamingos are found there also and in Seistan.

Most of the rivers of Persia are too short and too variable in flow to contain a wide variety of fish. The chub, barbel and trout are found in the rivers draining the Elburz mountains, and the northern rivers contain catfish, chub and other species. Various kinds of carp live in the rivers of the south. The Caspian sea (*q.v.*) and the lower reaches of the rivers flowing into it are rich in fish, of which the sturgeon and Caspian salmon are of special importance.

Among the few amphibia, frogs and toads are found where it is wet enough. The Greek tortoise is common except at high altitudes. The agamids are the commonest lizards and racers (*Coluber)* the commonest snakes; there are many poisonous vipers.

ARCHAEOLOGY

Pre-Achaemenid **Period.**—Palaeolithic cultures in Iran are known from surface-found artifacts and from caves excavated by the University museum of the University of Pennsylvania, Philadelphia, in 1949 near Kermanshah and the Caspian sea. The transition to village life with pottery and agriculture is found at Bakun B and in a cave east of Susa corresponding typologically to the cultures of Jarmo and Hassunah in northern Iraq. At the time of the Samarra, Halaf and Ubaid periods of Iraq, Persia was settled with villages made possible by the development of agriculture and the domesticating of animals. During this time two distinct cultural areas existed, one in the northeast (Siyalk, Rayy, Hissar, Anau) and the other in the west and southwest (Giyan, Susa, Bakun). The northeast is characterized by red-surfaced pottery, the west and southwest by buff-coloured ceramics, both of which are artistically painted with geometric and representational designs. In their most developed form both cultures had the technical equipment necessary for civilized life—the potter's wheel and kiln, open-moulded and hammered copper tools, houses built of mould-made, sun-dried mud bricks, woven cloth; they evidently also had a burial ritual, and human and animal pottery figurines have been found.

In the early part of the 4th millennium B.C. new cultures replaced the old. Two successive cultures with gray, unpainted pottery evolved in the northeast, disappearing c. 2000 B.C. Elsewhere remains have been found only in Khuzistan (Susa, Ghazir), which is culturally linked to Iraq. New types of painted pottery typify the west thereafter (Giyan, Susa, Tall-i-Chagal near Persepolis). Ritual rock relief scenes at Kurangun in the southwest are attributed (by E. Herzfeld) to this time. Thenceforth until Achaemenian rule, Elam (Susa) was the civilized, literate province of Iran, culturally similar to Sumer and Babylonia.

In the 2nd millennium two cultures occupied the west between Susa and Kermanshah, the earlier with rock-lined, cist tombs and painted pottery with tripod feet, the later with amphorae painted with bird designs. A much-defaced relief at Naksh-i-Rustam may indicate Elamite rule in the province of Fars. To the end of this millennium is assigned a cemetery at Siyalk whose gray, unpainted pottery has Caucasian connections.

With the exception of an Iron Age cemetery at Siyalk, with elaborately painted vessels showing relations with the Caucasus and Phrygia, known archaeological remains of the early 1st millennium are confined to the west. The last settlement at Giyan continued after 1000 B.C. At this time a remarkable art in bronze developed in the provinces of Luristan and southern Azerbaijan, with striking representations of animals, horse trappings being numerous and striking. The chief finds (discovered mainly in graves) comprise cast bronzes finished with engraving. but at Kuh-i-Dasht (a settlement with a temple) the material was chiefly *repoussé*, principally pins with large disk heads, presenting an elaborate religious repertoire with west Asiatic affiliations. No settlements of these Assyrian provinces are archaeologically known. though such are shown on Assyrian reliefs.

Achaemenid Empire.—Little survives from the short-lived Median empire, which grew up under Assyrian influence in north Persia, though treasures found in Azerbaijan in 1947 either are of Median date or include Median works of art. In contrast, the monuments of its Achaemenid successors are numerous. Oldest is the royal city of Pasargadae built by Cyrus (549–529 B.C.). This consists of a palace complex in a walled garden, a tower, a walled temple precinct and the king's tomb. Near or at the southeast corner of the palace area wall was a gate building, a rectangular, columned hall with doors flanked by bull colossi and small side rooms, one with a winged genius on its doorjamb. To the northwest was a similar hall but with columned porticoes on each of three sides, a square room in each of two corners, and on the fourth side another portico the over-all length. Still a third version of the type, north of this, had porticoes on both the long sides of the central hall with small rooms at its ends. The main halls range in length from 78 to 111 ft. and vary in proportions from almost square to approximately 3:1; all apparently had clerestory lighting. The type was evidently developed from an earlier form of wooden trabeated structure. The walls themselves were of mud brick, although stone was used for the foundations, for the pillars, for the doorways and for tall blocks at the outer corners of the porticoes which were notched at the top to contain roof beams.

No evidence exists for the presence of an upper story in any Achaemenian building; indeed, the exceptional slimness of the columns would render it impracticable. The roofs must have been flat and covered with mud plaster. Black and white stones were strikingly combined in some of the interior finish. The impost blocks consisted of addorsed forequarters of horned lions or bulls. Minor buildings, both in the official precincts and in the town, must have been built of sun-dried bricks and *pisé*, traces of which remain some distance away.

The tomb of Cyrus stands in a small court. On a stone platform rises a little gabled building, obviously the stone reproduction of a simple wooden house; very probably it was copied from an ancient type of dwelling that must have been widely disseminated. Elevating it on the six-level base, however, gave it special status. On a natural hill overlooking the site is a stone-built platform which was part of a citadel enclosing a pocket in the hills. The tomb is paralleled by a similar but unfinished structure, possibly the tomb of Cambyses, lying between Persepolis and Naksh-i-Rustam.

The rectangular, walled temple court contained two altars and, on one side, an oblong rectangular temple platform of mud brick, almost 230 ft. long. more than 115 ft. wide and nearly 20 ft. high, stepped up in at least four levels.

The tower at Pasargadae and the structure at Naksh-i-Rustam (near Persepolis) which is its pendant have sometimes been considered fire temples (*e.g.*, F. Wachtsmuth, in A. U. Pope and P. Ackerman (eds.), *A Survey of Persian Art From Prehistoric Times to the Present,* vol. i, p. 311 [1938]), but are more convincingly identified as tombs and have similarly been persuasively interpreted as copies of an anterior dwelling type (E. Herzfeld, *Archaeological History of Iran.* p. 35 [1935]). They are both tall rectangular buildings of yellow limestone, with a doorway and two tiers of blind windows in black limestone; the interior contains a small chamber but is solid for half its height; neither light nor air could be admitted except through the door, which was carefully constructed so that when closed it hermetically sealed the chamber. The exterior scheme reproduces the effect of wooden or stone corner posts with clay walls between them, and the stereotomy does not accord with the structural design. The simulated doors and windows imply three stories, though these are not consistently related on the three sides; and projecting under the roof are imitation beam ends. Tower dwellings are known to have been used in Armenia, and bronzes from that region illustrate two versions of the type, with significant relations to the actual buildings in Persia.

Darius commemorated his stormy accession by a great inscription and relief carved, perhaps in 516 B.C., upon the cliff at Behistun (Bisitun), near the scene of one of his victories. He is shown, attended by two nobles at his back, planting his foot

upon the prostrate body of the Magian, behind whom comes a line of nine other rebels, standing in chains; the last, a Scythian wearing a tall, pointed hat, was carved later than the others, obliterating part of the inscription. The symbol of the god Ahura Mazda, which floats in the air above the prisoners. is carved after the manner of the Assyrian Assur, and many of the other details, as well as the plan of the relief, show Assyrian influence. But the figures project farther from the background, so that the forms have more rounding than was necessary in Mesopotamia, while the region of the eyes and the folds of the drapery are carved in a more naturalistic style than had ever been seen in Assyrian work.

Between 520 and 515 B.C. Darius began the building of a new capital at Persepolis, 25 mi. S.W. of Pasargadae. A great terrace was constructed on a spur of rock at the valley's edge and encircled by a wall including a ridge of the mountains to its east. This was a fort in contrast with the walled park at Pasargadae. Access to the fort was gained by a gate building whose front and rear entrances were guarded by pairs of huge bulls. The terrace was levelled at three different heights. On these varying levels stood the royal buildings, the most imposing being audience halls, the *apadana* begun by Darius and the hundred-column hall begun by Xerxes. Palaces were built'by Darius (the *tachara*) and by Xerxes (the *hadish),* while one of Darius III's was unfinished and of inferior quality. Other buildings were a treasury or administrative centre and a storehouse begun by Darius and developed by his successors, a harem belonging to Darius and Xerxes, an entrance building to the palace area and the site of a temple or another palace. These structures generally faced on courtyards which were connecting links rather than focuses as in Babylonia.

The usual building plan consisted of a columned portico leading to a pillared hall surrounded by minor rooms. The *apadana,* however. had two porticoes reached by double stairs on which were magnificent reliefs representing new year ceremonies. On one side are shown courtiers, and guards watching tribute bearers from all the empire mount the other side of the stairs. The treasury was without entrance portico and consisted of a complex of large rectangular and square, columned halls, subsidiary rooms between and two courts, one with a pair of orthostat reliefs.

These structures were built, like the palaces of Cyrus, of unbaked brick reinforced with stone, but differ from them in many particulars. Thus the two-colour scheme is abandoned; the pillared rooms are usually square; walls are broken by stone windows and niches of the same size and shape; these and the doors bear the petal cavetto cornice characteristic of Egyptian work; the columns have fluted shafts instead of smooth, their bases (after Darius) and caps have elaborate floral ornaments, and they end in large impost blocks composed of addorsed *protomes* of two identical couchant animals — bulls; winged, human-headed bulls; lions; and fantastic lions — all stylized and powerfully rendered. The ceilings were carried on thick beams resting on the animal impost blocks. The façades of the kings' tombs show the ends of the beams penetrating to the exterior of the building. On the cornice above is an ornamental frieze, with a floral design on glazed brick at the *apadana.*

The stone stairs, doors and sometimes windows were decorated with splendid reliefs. In addition to the scene of the *apadana* stairs, others show courtiers in attendance or servants bearing food to the palaces. Sculpture within the buildings was confined largely to doorjambs on which the king is seen enthroned in audience (as in the treasury orthostats) or leaving the palace with attendants, or a hero is shown fighting with rampant bull or mythical monsters. While Achaemenid sculpture was deeply indebted to the long Mesopotamian tradition and perhaps to Median art. it shows particular qualities, and some marked superiorities of its own, especially in the sensibility and inner life of its human forms. This is probably connected with the mysterious. rapid development of Greek sculpture in the 6th century B.C. from rigid formality to vital flexibility.

The palace at Susa. built by Darius and rebuilt by Artaxerxes II (404–358) after a fire, was entirely different in conception from the buildings of Pasargadae and Persepolis. Instead of consisting of self-contained units, the Susa palace was laid out on the Assyrian plan, with successive rooms opening onto central courts. Of these there were three in a row. The entrance, on the east, led into a large court surrounded by service buildings, and beyond that was the much smaller central court. On the south side of this were little rooms; on the north were two identical parallel halls, long and narrow, one beyond the other; and at right angles to them, on the west, a long narrow passage leading north to an independent structure, a columnar audience hall similar to that of Xerxes at Persepolis.

The smallest western court again had the pair of long narrow halls, but on the south side and on the north were two large square halls, side by side, with anterooms, while on the other sides were the royal apartments. Still farther west was a very large hall, mith a direct entrance, also, in the middle of the west wall.

The decoration consisted partly of stone reliefs similar to those at Persepolis and partly of glazed brick panels, already in use locally centuries earlier, executed here with blue. white, yellow and green glazes. At the east portal were found glazed-brick winged bulls and spearmen of the guard. In the central court were the winged disk of Ahura Mazda and a pair of confronted sejant regardant crowned sphinxes. In the west court were griffins and more winged bulls and spearmen.

Further examples of Achaemenian stone relief sculpture are preserved on the rock-cut tombs of the kings. Of those at Naksh-i-Rustam near Persepolis, one bears the inscription of Darius, while the remaining three are usually connected mith the names of his immediate successors. The three similar tombs in the cliff behind the platform of Persepolis doubtless belong to later members of the dynasty, and their sculptures exhibit inferior qualities. In every case the central part of the sculpture, 60 ft. wide, represents the façade of a palace, and above (as though upon the roof) is set a dais, supported by figures of subject races, upon which the king worships the gods, whose presence is indicated by the symbol of Ahura Mazda and the moon. The interiors of the tombs are simple chambers with niches cut in the rock for the reception of bodies; but a skeleton was found at Susa buried in a bronze tub and, from the Greek accounts of his tomb, the same practice seems to have been followed in the burial of Cyrus.

Apart from the royal remains nothing is known of the buildings of the age; houses must all have been of mud brick and no further temples or other public buildings are known. The only private sculptures of the age are a couple of reliefs found near the capital of the satrap of northern Asia Minor. The Xchaemenid art, as it is known, was essentially dynastic, confined to the king and his courtiers. The same condition extends to the minor arts; the gold and silver ornaments and vessels (such as comprise the British Museum's "Treasure of the Oxus"), the stone vases, the engraved gems. are all luxuries suited only to the houses of rich nobles. A lobed silver mine bowl bearing an inscription of Artaxerxes I recalls Esther i, 7 (P. Ackerman, *Guide* to *the Exhibition* of *Persian Art,* 2nd ed., p. 322 [1940]; and for illustrations *see* A. U. Pope and P. Ackerman [eds.], *A Survey of Persian Art,* iv, Plates 77–127 [1938]).

Hellenism. — In some statuettes from the Oxus treasure the Greek influence is overwhelming, but these may be later than the destruction of the Achaemenid empire by Alexander, which brought with it the eclipse of Asiatic art. In Syria and north India, however, the Achaemenian palace was imitated during the Hellenistic age, while in Mesopotamia and Persia it was ignored in the fashion for Hellenism. Apparently under both Macedonian and Parthian rule a Hellenistic style was adopted in Persian buildings, and in the Parthian rock carvings of Behistun Hellenistic methods are applied to oriental subjects of royal glorification. Characteristically Hellenistic are bronze sculptures found at Shami in temple ruins (Sir Aurel Stein, Old *Routes* of *Western Iran,* pp. 150–152 [London, 1940]). Another temple of the Hellenistic period was excavated in the plain below Persepolis. Parthian archaeology is otherwise known only from excavations at Rayy and Susn.

Sassanian Empire. — The Sassanids (*c.* A.D. 224–651) restored Persia to its former predominance, with the result that art flour-

ished once more within the borders of their ancestral principality. The traditions of the Parthian empire, however, were retained under the new rulers, and it is possible that among the great mass of Sassanian material are included a few objects which in reality should be described as Parthian; the intaglio seals, which were numerous, are especially difficult to date accurately. Since the Sassanid monarchy was modelled on the Achaemenid, the main features of the Persepolitan palace were preserved—the great hall for public levees and the hall for private audiences with small adjacent offices—but these features were united into one and the same building.

Moreover, the method of construction was radically different from that of the preclassical period; instead of mud-brick walls carrying flat mud roofs on wooden ceilings, walls of small-cut stones or burned bricks bound with niortar carried barrel vaults over the offices or corridors and domes over the halls. The barrel vault had already been employed on a grand scale in the palace at Hatra, which dates from the 1st or 2nd century A.D. The development of the dome is still obscure but it seems to have proceeded in the east rather than in the west: the Pantheon in Rome has a hemispherical roof, constructed on the lines of a barrel vault, over a building itself following the same curve, while the use of the dome over a square chamber with squinches was an invention of Parthian Persia.

The principal Sassanian ruins in Fars are at Firuzabad, Girra, Shapur and Sarvistan. Several buildings have been excavated at Shapur, where mosaic floors were found, and a town at Kasr Abu Nasr near Shiraz. In Khuzistan is the Ivan-i-Karkha and also bridges at Dizful and Shustar, in Iraq Ctesiphon, Dastajird and excavated palaces at Kish and Hira. On the Iraq-Iran road are Kasr-i-Shirin, Hawsh-Kuri, Taq-i-Girra and Taq-i-Bustan; and in the north the excavated palaces near Rayy and at Damghan. Small ruins include several fire temples. Firuzabad was built by the first Sassanid king, and Sarvistan shows a further development of the same plan.

In Firuzabad, a large vaulted entrance flanked by side chambers forms a block which is connected with a triple row of domed rooms, and these in turn lead to the small rooms that surround the great court. The blank external walls are relieved by arcades and pilasters of no structural import, as at Hatra and in Roman Syria, while arched doorways and niches break the line of inner walls, and a cornice with the Egyptian cavetto rises incongruously over the arch to emphasize the resemblance to Persepolis. At Ctesiphon, in the palace built during the next reign, the entrance again serves as audience hall, but at Sarvistan a shallow porch communicates with the great domed hall, and this again leads into a court behind, while the smaller rooms to right and left form separate entities which communicate with the outside as well as with the central block. The result has more the character of a residence than has Firuzabad, which might serve in case of need as a fortress.

The walls were usually decorated with stucco reliefs or other applied work; legend says that the walls of Ctesiphon were encrusted with precious stones, suggesting that some kind of coloured ornamentation, perhaps mosaics, was present. Persian influence may be traced in pictures in the caves of Chinese Turkistan, and presumably that influence was directly pictorial. Statues must have been as rare as under the Achaemenids, and in the normal course of events Moslem prejudice would prevent their survival; indeed a fallen and broken statue near Shapur, the colossus of a standing king, is the sole example.

There remain a few statuettes attributable to the Sassanian period, but the characteristic sculpture of the epoch was the rock-cut relief, in which, as in other forms of art, the relationship to Achaemenian work is noticeable; indeed the carvings of the Sassanids were sometimes placed next to monuments of the earlier dynasty with the deliberate intention of provoking comparison. For instance, a relief of the first king, Ardashir. is cut in the cliff of Naksh-i-Rustam, which holds the tombs of Darius and his successors. Here the god Ahura Mazda (on the right) hands the king the symbol of sovereignty, a large ring tied round with ribbons; a servant holds a fly whisk over the king's head. Beneath the feet of each horse is a human figure, that on the right representing Ahriman, the evil spirit, the other the last of the Parthian kings. This relief, though less adept than later works, yet exemplifies most of the virtues and defects of Sassanian sculpture; in monumental power the style has had few rivals, but it suffers from laboured symmetry, heaviness and a lack of grace in the minute details.

The Sassanian silverwork is outstanding, even allowing for the fact that a number of pieces previously accepted as Sassanian proved on reinvestigation to be instead contemporary Syrian productions. By far the greatest collection is in the Hermitage museum, Leningrad, with smaller groups and single pieces in Paris, London and New York city. The most typical vessels are shallow wine bowls, about 8 to 11 in. across, and the most distinctive technique is inset *repoussé* sections of the figures in high *repoussé* (including even small portions in full round) made of a separate sheet of silver, attached by inserting the edges into slits cut in the beaten foundation plate. Other parts of the design and details are engraved, and usually some areas are parcel gilt. Hollow vessels are decorated with the usual *repoussé*. Many wine bowls are worked in champlevé, with the background cut away leaving the design in low flat relief. Some, especially post-Sassanian continuations of the style, are only engraved. The most important theme is the king, as a rule mounted, hunting, but other court scenes are shown as well as animals, real and fantastic, and birds, with stylized plants. Splendid bronze vessels also were made, especially large ewers distinguished in form (for illustrations *see* Takon Ivanovich Smirnoff, *L'Argenterie orientale* [Leningrad, 1909]; Orbeli and Trever, *Orfèvrerie sasanide* [1935], A. U. Pope and P. Ackerman [eds.], *op.cit.*, vol. iv, Plates 203–246).

The Sassanian coins provide a series of royal "portraits," showing the distinctive identifying crown of each monarch.

Sassanian Persia was also famous for its patterned silks, best known from representations in the Taq-i-Bustan reliefs. These are characterized by formally rendered animal and bird patterns, each commonly framed in a roundel, often pearled. The designs were widely copied in the near east for centuries, and are reproduced in wall paintings and stone carvings in mediaeval Europe. The fabulous "Spring Carpet" of Chosroes II, symbolizing a garden (*see* RUGS AND CARPETS), which was seized and cut up by the Arab conquerors and sold for great sums, was evidently an embroidery (or tapestry), heavily encrusted with metal threads and jewels. Toward the end of the 3rd century sculpture and also coins reached their peak of perfection. Reliefs of the middle of the dynasty tend to be traditional and have less vitality. Vividly pictorial in treatment is the latest group of reliefs, cut by order of Chosroes II (590–628), in which an Indian influence seems to account for some details.

After the Moslem conquest, the manufacture of plate and silks continued without appreciable alteration, and Sassanian motives, long surviving the dynasty, were taken into the arts of nearly every region of the east. Thus the characteristic recumbent animals, framed in varied scrolling foliate branches, were used in the caliphs' palace at Samarra, the Sassanian animal type was adopted both in Iraq and in Chinese Turkistan. Byzantine patterns have their exact Sassanian prototypes, and in many respects the decorative work of Persia remained for long unchanged. Sassanian influence reached Europe when naturalism had ceased to satisfy, and the development of the Byzantine school must have been stimulated by contact with its formal ideals.

HISTORY

The name "Persia" in its strict significance denotes the area inhabited by the people designated as Persians; *i.e.*, the district known in antiquity as Persis (*q.v.*), the modern Fars. In the west,

following classical usage, custom extended the designation to the whole Iranian plateau and then to the political state occupying most of that plateau.

Ancient Ethnography. — In historical times the major portion of Iran was occupied by peoples of Indo-European origin, calling themselves Aryans (Arya; Zend. Airya) and their language Aryan —so in the inscriptions of Darius; it was the same name as was used by the consanguineous tribes of India aho were their nearest relations. The whole country is designated Ariana (Zend, Airyana)—'the land of the Aryans"—the original of the Middle Persian "Eran" and the modern "Iran"; the Greek geographers Eratosthenes and Strabo were in error when they limited the name to the eastern districts of Iran. Thus the name "Iranian" is understood to comprehend all these people of Aryan derivation.

Besides the Iranians, numerous tribes of alien origin were found in Iran. In Baluchistan the eponymous Iranian inhabitants, who penetrated there only a few centuries ago, are even today found side by side with the ethnologically and philologically distinct group of the Brahui, who are probably connected with the Dravidians of India. In them we may trace the original population of these districts; and to the same original population may be assigned the tribes which settled there in antiquity: the Paricanii and Gedrosii (Gadrosii), and the Myci (Herodotus iii, 93, vii. 68; the Maka of Darius, the modern Makran), to whom the name "Xethiopians" is also occasionally applied (Herod. iii, 94, vii, 70). In Media the Greek geographers mention a people of Anariacae (Strabo xi, 508, 514; Pliny, *Natural* History, vi, 48; Ptolemy vi, 25; in Polybius v, 44 9, Ἀναριάκαι); *i.e.*, "non-Aryans." To these the Tapuri, Amardi, Caspii and especially the Cadusii or Gelae—situated in Gilan on the Caspian—probably belonged.

In the chain of the Zagros there are similar non-Aryan groups: the Guti, Lullubi, Cossaei, Barahshi. Ellipi and, in Elam (Elymais or Susiana), the Elamites (Elymaeans). These peoples are generally designated. for want of a better term, "Caucasian," and belong to the ethnic substratum later conquered by the Indo-Europeans.

That the Iranians probably came from the east to their later home is indicated by their close relationship to the Indians. with whom they previously formed a single people, bearing the name "Arya." Their residence must have lain chiefly in the great steppe which stretches north of the Black sea and the Caspian, through south Russia, to Turan (Turkistan) and the Oxus and Iaxartes. For there traces of Iranian peoples are continually discovered. The names and words of the Scythians (Scoloti) in south Russia. which Herodotus has preserved, are for the most part perfectly transparent Iranian formations, identified by K. Zeuss and K. V. Mullenhoff; among them are many proper names in Aria- (Αριο) and *aspa* (-horse, -αδπος; Zend, *aspa*). The predatory tribes of Turan (*e.g.*, the Massagetae) seem to have belonged to the same stock. These tribes are distinguished by the Iranian peasants as Dahae (Gr. Δάαι), "enemies," "robbers"; by the Persians as Sacae (Saka; *q.v.*); and by the Greeks as Scythians.

From the region of the steppes the Aryans must have penetrated into the cultivable land of eastern Iran; thence one part spread over the district of the Indus and then on to the Ganges; another moved westward to Zagros and the borders of the Semitic world.

The date of this migration cannot yet be determined with certainty. We know only that the Aryans of India already occupied the Punjab in the Vedic era, c. 1200 B.C. On the other hand, Aryan names appear in contemporary documents from the 16th century in Mesopotamia and Syria. In the kingdom of Mitanni (in northern Mesopotamia) the Aryan origin of the dynasty is prqved by the names of the kings (Artatama, Shutarna, Artasumara, Dushratta); in a treaty the Indian gods Mitra and Varuna, Indra and the Nasatyas are invoked by the side of the Mitannian gods, and in the archives of Boghaz Keui a book on horse races written by a Mitannian named Kikkuli was found, in which Indian numerals and other Indian words are used. Among the dynasts of Syria and Palestine whose letters to their sovereign, the Pharaoh of Egypt, are preserved in the archives of Tel el Amarna (about 1400 B.C.), many bear Iranian names (*e.g.*, Artamanya. Arzawiya, Shuwardata), and their portraits are represented in Egyptian reliefs (*e.g.*, in the tomb of Haremhab, now in Leyden). Here their features are of a European character, totally different from those of the Semites and of the Hittites. Later still. in the Assyrian inscriptions we occasionally meet with Iranian names borne by north Syrian princes—*e.g.*, Kundaspi and Kustaspi (=Hystaspis).

But it appears that toward the middle of the and millennium before Christ, in the time of the Hyksos empire, the early Iranian tribes made a great forward movement to the west, at first probably in the role of mercenaries. In the Egyptian and Hittite texts they form a ruling military class under the Aryan name "Marianni"; *i.e.*, warriors. Some of their leaders founded principalities of their own in Mesopotamia, Syria and Palestine, much as did the Germans under the Roman empire. With this we may probably connect the well-known fact that it was about this very period (1700 B.C. approximately) that the horse made its appearance in Babylonia, Egypt and Greece, where for centuries afterward its use was confined to war and the war chariot. Before this it was as foreign to the Babylonians as to the Egyptians under the 12th dynasty. On the other hand, it had been familiar to the Aryans from time immeinorial; indeed they have always been peculiarly a people of riders. Thus it is quite conceivable that they brought the horse with them into western Asia; and the quarter from which it came is sufficiently indicated by the fact that the Babylonians wrote the word "horse" with a group of signs denoting "ass of the east."

These Aryan warriors and dynasts in the west were extirpated in the many wars with the Egyptians, Hittites and Assyrians. or absorbed by the native population. At the same time the great highland of Iran was occupied by the Iranians. who were divided into nuinerous tribes, these, again, being subdivided into minor tribes and clans. The principal, according to the inscriptions of Darius—which closely agree with Herodotus—are the following, several of them being also enumerated in the *Avesta*:

1. The Medes (Mada) in the northwest (see MEDIA).

2. The Persians (Parsaj in the south (see PERSIS). To these belong the Carmanians and the Utians (Yutiya), mentioned by Darius as inhabiting a district in Persis (Behistun III, 40).

3. The Hyrcanians (Varkana in Darius; Zend, Vehrkana) on the eastern comer of the Caspian, in the fertile district of Asterabad.

4. The Parthians (Parthyaei; Persian, Parthava) in Khurasan (see PARTHIA).

5. The Arians (Ἀρεῖοι, Persian, Haraiva), in the vicinity of the Arius river (Hari Rud), which derived its name from them. This name, which survives in the modern Herat, has no connection with that of the Aryans.

6. The Drangians (Zaranka in Darius; Sarangians in Herod. ii, 93, 117, vii, 67), situated south of the Arians, in the northnest of Afghanistan (Arachosia) by the western affluents of Lake Hamun, and extending to the present Seistan.

7. The Arachotians (Persian, Harauvati), in the district of the Helmund and its tributaries round Kandahar. They are mentioned in the lists of Darius and by the Greeks after Alexander. In Herodotus their place is taken by the Pactyans, whose name survives to the present day in the word "Pushtu," with which the Afghans denote their language (Herod. iii, 102; iv. 44; vii. 67, 85). Probably it was the old tribal name. Xrachosia being the local designation. The Thamanaeans, who appear in Herodotus (iii, 93, 117), must be classed with them.

8. The Bactrians (Persian, Bakhtri), on the northern declivity of the Hindu Kush, as far as the Oxus. Their capital was Bactra, the modern Balkh (see BACTRIA).

9. The Sogdians (Persian, Sugudu), in the mountainous district between the Oxus and Iaxartes.

10. The Chorasmians (Khwarizmians; Persian, Uvarazmiya) in the great oasis of Rhiva. which still bears the name "Khwarizm." They stretched far into the midst of the nomadic tribes.

11. The Margians (Persian, Margu), on the river Margus (Murghab), chiefly inhabiting the oasis of Merv. which has preserved their name. Darius mentions the district of Margu but like Herodotus omits them from his list of peoples, so that ethnographically they are perhaps to be assigned to the Arians.

12. The Sagartians (Persian, Asagarta); according to Herodotus

(vii, 85), a nomadic tribe of horsemen, speaking, as he expressly declares, the Persian language. Herodotus describes them (i, 125) as a subordinate nomad clan of the Persians. They, with the Drangians, Utians and Myci, formed a single satrapy (Herod. iii, 93). Ptolemy (vi, 2, 6) speaks of Sagartians in the eastern Zagros in Media.

13. Mention has already been made of the nomadic peoples (Dahae, Dahans) of Iranian derivation who occupied the steppes of Turkistan as far as the Sarmatians and Scythians of south Russia about 700 B.C. That these were conscious of their Aryan origin is proved by the names "Ariantas" and "Ariapeithes" borne by Scythian (Scolot) kings (Herod. iv, 76, 87). Still they were never counted as a portion of Iran or the Iranians. To the settled peasantry, these nomads of the steppe were always "the enemy" (Dana, Daha, Δάαι, Dahae). Side by side with this name we find "Turan" and "Turanian," a designation applied both by the later Persians and by modern writers to this region. The origin of the word is obscure, but it is perhaps derived from an obsolete tribal name. It has no connection whatever with the much later "Turks," who penetrated there in the 6th century after Christ. Though found neither in the inscriptions of Darius nor in the Greek authors, the name "Turan" must nevertheless be of great antiquity; for not merely is it repeatedly found in the Avesta, under the form "Tura," but it occurs in a hymn which, without doubt, originates from Zoroaster himself and in which "the Turanian Fryana" and his descendants are commemorated as faithful adherents of the prophet (Yasna, 46, 62).

The dividing line between Iranian and Indian is drawn by the Hindu Kush and the Suleiman mountains of the Indus district. The valley of the Kabul (Cophen) has been occupied by Indian tribes, especially the Gandarians; and the Satagydae (Persian, Thatagu) who lived there were presumably also of Indian stock. The non-Aryan population of Iran itself has been discussed above. Of its other neighbours, we must here mention the Saka or Sacae, a warlike equestrian people in the mountains of the Pamir plateau and northward, who were probably also of Aryan origin. Herodotus relates that the Persians distinguished "all the Scythians"—*i.e.*, all the northern nomads—as Saka; and this statement is confirmed by the inscriptions of Darius. The Babylonians employ the name "Gimiri" (Gimirrai; *i.e.*, Cimmerians) in the same sense.

Beginnings **of** History.—The southwestern Zagros region early became a part of Elam, whose royal capital in Sumerian times was Awan but was subsequently shifted to Susa. Throughout the 2nd millennium Elam was involved in the history of Babylonia and under Shilhak-Inshushinak (1165–51 B.C.) became the greatest empire of the area. This empire, built too rapidly, collapsed at his death, and for four centuries the records are silent regarding the area of Susa and Anshan. For the central Zagros, long since overrun by the Aryan push to the west, a connected chain of historical evidence begins in 836 B.C. when, under Shalmaneser (Salmanassar) II, the Assyrians for the first time penetrated farther into the mountains of the east. There they subdued a few Median tribes as well as some non-Iranian peoples. These wars were continued under successive kings, till the Assyrian power in these regions attained its zenith under Sargon (*q.v.*). In 715 B.C. Sargon led into exile the Median chief Deioces (*q.v.*), a vassal of the Mini (Mannaeans), with all his family, and subjugated the princes of Media as far as the mountain of Bikni (Elburz) and the border of the great desert. At that time 28 Median "town lords" paid tribute to Nineveh; two years later (713 B.C.), no fewer than 46 paid tribute.

Early in the 7th century B.C. Achaemenes (Hakhamanish) had carved out for himself a dominion in Parsumash, to the northeast of Susa. His son Teispes (Chishpish) took Anshan from the waning power of Elam. Although apparently at first subdued by the Mede Pharortes, he was able subsequently to take advantage of the Scythian invasion of Media (653–625) to press on down through the Zagros valleys to the district of Parsa, known to the Greeks as Persis and made famous by his descendants. It was natural for Teispes to divide his realm between his sons Ariaramnes (640–615) and Cyrus I (640–600). Yet it was not long before Cyaxares brought the Iranian plateau again under Median control (625) and made both these Persians his vassals, even denying to Ariaramnes and his heirs, Arsames and Hystaspes (Hystaspes was the father of Darius I) the title of king. For the history of the empire Cyaxares founded see MEDIA.

In 612 B.C. Nineveh, the capital of the Assyrian empire, was conquered and destroyed by Cyaxares and Nabopolassar of Babylon, and the provinces were divided by the victors. Not only was Median power extended over Iran, but in the west Armenia and Cappadocia were subdued by Cyaxares. In a war with the Lydian empire the decisive battle was broken off by the celebrated eclipse of the sun on May 28, 585 B.C., foretold by Thales (Herod. i, 74). After this a peace was arranged by Nebuchadrezzar of Babylon and Syennesis of Cilicia, recognizing the Halys river as the borderline. The great powers of the near east remained in this state of equilibrium during the first half of the 6th century B.C.

THE ACHAEMENID EMPIRE, 6TH–4TH CENTURIES B.C.

Cyrus the Great *(559–529)* **and** Darius *I* **(522–486).**—The balance, however, was disturbed when the Persian Cyrus, king of Anshan, Parsumash and Parsa, revolted against his suzerain Astyages, the son of Cyaxares, and three years later defeated him at Pasargadae (*q.v.*). Shortly afterward Astyages was taken prisoner, Ecbatana reduced and the Median empire replaced by the Persian. The Persian tribes were welded by Cyrus into a single nation, and now became the foremost people in the world (see CYRUS; PERSIS). At first Nabonidus of Babylon hailed the fall of the Medes with delight and took the opportunity of occupying Harran (Carrhae). But before long he recognized the danger that threatened from that quarter. Cyrus and his Persians paid little heed to the treaties which the Median king had concluded with the other powers, and the result was a great coalition against him, embracing Nabonidus of Babylon, Amasis of Egypt, Croesus of Lydia and the Spartans, whose highly efficient army seemed to the oriental states of great value. In the spring of 546 B.C. Croesus opened the attack. Cyrus flung himself upon him, bent him at Pteria in Cappadocia and pursued him to Lydia.

A second victory followed on the banks of the Pactolus; by the autumn of 546 Sardis had already fallen, and the Persian power advanced at a bound to the Mediterranean. During the next few years the Greek littoral towns were reduced, as were the Carians and Lycians. The king of Cilicia voluntarily acknowledged the Persian suzerainty. In 539 Nabonidus was defeated and Babylon occupied, while, with the Chaldaean empire, Syria and Palestine also became Persian. The east of Iran was further subdued, and after Cyrus met his end (529 B.C.) in a war against the eastern nomads (Dahae, Massagetae), his son Cambyses conquered Egypt (525 B.C.). Cyprus and the Greek islands on the coast of Asia Minor also submitted, Samos being taken by Darius. On the other hand, an expedition by Cambyses against the Ethiopian kingdom of Napata and Meroe came to grief in Nubia. The usurpation of the kingdom by Smerdis (522 B.C.) and his death at the hands of Darius was the signal for many insurrections in Babylon, Susiana, Persis, Media, Armenia and many of the eastern provinces. But within two years they were all crushed by Darius and his generals.

The causes of this astonishing success, which in the brief space of a single generation raised a previously obscure and secluded tribe to the mastery of the whole orient, can be discerned only partially from the evidence at our disposal. The decisive factor was of course their military superiority. The chief weapon of the Persians, as of all Iranians, was the bow, which accordingly the king himself holds in his portraits; *e.g.*, on the Behistun rock and the coins (darics). In addition to the bow the Persians carried short lances and short daggers. But it was not by these weapons, nor by hand-to-hand fighting, that the Persian victories were won. They overwhelmed their enemy under a hail of arrows and never allowed him to come to close quarters. While the infantry knelt to shoot, the cavalry swarmed round the hostile squadrons, threw their lines into confusion and completed their discomfiture by a vigorous pursuit. In a charge the iniantry also might employ lance and dagger; but the essential point was that the archers should be mobile and their use of the bow unhampered. Conse-

quently only a few distinguished warriors more shirts of mail. The rank and file merely carried a light, hide-covered shield. Thus the Persian army was lost if heavy-armed hoplites succeeded in gaining their lines. In spite of all their bravery they succumbed to the Greek phalanx when once the generalship of a Miltiades or a Pausanins had brought about a handsto-hand conflict; and it was with justice that the Greeks—Aeschylus, for instance—viewed their battles against the Persian as a contest between spear and bow. None the less, till Marathon the Persians were successful in discomfiting every enemy' before he could close, whether that enemy consisted oi similarly accoutred bowmen (as the Medes), of cavalry armed with the lance (as the Lydians) or of heavily armoured warriors (as the Babylonians, Egyptians and Greeks).

To all this should be added the superiority of their leaders; Cyrus especially must have been an exceedingly able general. Obviously, also, he must have understood the art of organizing his people and arousing the feeling of nationality and the courage of self-sacrifice. In his time the Persians were a strong, manly peasantry, living in a healthful climate and accustomed to all hardships—a point repeatedly emphasized in the tales preserved by Herodotus as the cause of their successes (*e.g.*, Herod. ix, 122). Herodotus. however, also records (i, 135) that the Persians were "of all mankind the readiest to adopt foreign customs, good or bad." a sentence which is equally applicable to the Romans and which goes far to explain not merely the successes of both nations but also the character of their empires.

Administration of the **Empire:** the Peoples.—The fundamental features of the imperial organization must have been attributable to Cyrus himself. Darius (*q.v.*) followed in his steps and completed the vast structure. His role, indeed, was peculiarly that of supplementing and perfecting the work of his great predecessor. The organization of the empire was planned throughout on broad, free lines; there was nothing mean or timorous in it. The great god Ahura Mazda, whom king and people alike acknowledged, had given them dominion "over this earth afar, over many peoples and tongues"; and the consciousness was strong in them that they were masters of the world. Thus their sovereign styled himself the "king of kings" and the "king of the lands"—that is to say, of the whole civilized world, for the provinces remaining unsubdued on the extreme frontiers to the west, the north and the east were in their view almost negligible quantities. And far removed as the Persians were from disavowing their proud sense of nationality ("a Persian, the son of a Persian, an Aryan of Aryan stock," says Darius of himself in the inscription on his tomb), yet equally vivid was the feeling that they ruled the whole civilized world, that their task was to reduce it to unity. And by the will of Ahura Mazda they were pledged to govern it aright.

This is most clearly seen in the treatment of the subject races. In contrast with the Assyrians and the Romans, the Persians invariably conducted their wars with great humanity. The vanquished kings were honourably dealt with, the enemy's towns were spared except when grave offenses and insurrections. as at Miletus and Athens, made punishment imperative, and their inhabitants were treated with mildness.

Like Cyrus. all his successors welcomed members of the conquered nationalities to their service, employed them as administrators or generals and made them grants of land; and this not only in the case of Medes, but also of Armenians, Lydians. Jews and Creeks. The whole population of the empire was alike bound to military service. The subject contingents stood side by side with the native Persian troops; and the garrisons—in Egypt, for instance—were composed of the most varied nationalities.

Among the subject races the Medes particularly stood high in favour. Darius in his inscriptions always names them immediately after the Persians. They had held sway before the Persians and were the more civilized people. Their institutions, court ceremonial and dress were all adopted by the Achaemenids. Thus the tribal distinctions began to recede, and the ground was prepared for that amalgamation of the Iranians into a single, uniform nation which under the Sassanians was completely perfected—at least for the west of Iran.

The lion's share, indeed, fell to the dominant group itself. The inhabitants of Persis proper—from which the eastern tribes of Carmanians, Utians, etc., were excluded and formed into a separate satrapy—paid no taxes. Instead they brought the best of their possessions (*e.g.*, a particularly fine fruit) as a gift to their king on festival days; peasants meeting him on his excursions did the same (Plutarch, Artaxerxes, 4, 5; Dinon *ap.* Aelian, Varia Historia, i, 31; Xenophon, Cyropaedia, viii, 5, 21, 7, 1). In recompense for this, he distributed on his return rich presents to every Persian man and woman—the women of Pasargadae, who were members of Cyrus' tribe, each receiving a piece of gold (Nicolaus of Damascus, fragment 66; Plutarch, *Alexander*, 69). He was always the people's king as far as his Persians were concerned. At his accession he was consecrated in the temple of a warrior goddess (Anaitis?) at Pasargadae and partook of the simple meal of the old peasant days—a mess of figs, terebinths and sour milk (Plut., *Artax.*, 3). The Persians swore allegiance to him and prayed to Ahura Mazda for his life and the welfare of the people, while he vowed to protect them against every attack and to judge and govern them as did his fathers before him (Herod. i, 132; Xen., Cyr., xviii. 5, 25, 27). For helpers he had at his side the "lawbearers" (databara Dan. iii, 2, and in Babylonian documents; *cf.* Herod. iii, 31, v, 25, vii, 194; Esther i, 13, etc.). These —the Persian judges—were nominated by the king for life and generally bequeathed their office to their sons. The royal decision was based on consultation with the great ones of his people, and such was the case with his officials and governors everywhere (cf. the Book of Ezra).

Every Persian able to bear arms was bound to serve the king—the great landowners on horseback, the commonalty on foot. The noble and well-to-do, who did not need to till their fields in person, were pledged to appear at court as frequently as possible. Their children were brought up in company with the princes "at the gates of the king," instructed in the handling of arms, in riding and hunting, and were introduced to the service of the state and the knowledge of the law as well as the commandments of religion. Then such as proved their worth were called to high office and rewarded, generally with grants of land.

The highest rank was held by the descendants of the six great families. The Greeks class them and the king together under the name of "the seven Persians." These enjoyed the right of entering the royal presence unannounced, and possessed princely estates in the provinces. Besides these, however, numbers of other Persians were dispatched to the provinces, settled there and endowed with lands. There existed, in fact, under the Achaemenids a strong colonizing movement, diffused through the whole empire; traces of this policy occur more especially in Armenia, Cappadocia and Lycia. but also in the rest of Asia Minor and not rarely in Syria and Egypt. These colonists formed the nucleus of the provincial military levy and were a tower of strength to the Persian dominion. They composed, moreover, the Persian council and viceregal household of the satraps, exactly as the Persians of the home country composed that of the king.

Though the idea of the world empire of Persia was thus deeply impressed, care was nevertheless exercised that the general duties and interests of the subject races should receive due consideration. We find their representatives, side by side with the Persians, occupying every sort of position in the regal and viceregal courts. They took their part in the councils of the satraps, as they did in military service (*cf.* the evidence of Ezra); and they, too, were rewarded by bounties and estates. To wield a peaceful authority over all the subjects of the empire, to reward merit and to punish transgression—such was the highest task of king and officials.

On his native soil Cyrus had built a town, with a palace and a tomb, in the district of Pasargadae (now the ruins of Murghab). This Darius replaced by a new capital, deeper in the centre of the country, which bore the name "Persian" (Parsa), the Persepolis (*q.v.*) of the later Greeks. But the district of Persis was too remote to be the administrative centre of a world empire. The natural centre lay, rather, in the ancient fertile tract on the lower Tigris and Euphrates. The actual capital of the empire was therefore Susa, where Darius I and Artaxerxes II erected their magnificent palaces. The winter months the kings spent chiefly

in Babylon, the hot summer in the cooler situation of Ecbatana, where Darius and Xerxes built a residence on Mt. Alvand, south of the city. From a palace of Artaxerxes II in Ecbatana itself, the fragments of a few inscribed columns (published by B. T. A. Evetts in Zeitschrift fur *Assyriologie,* v [Leipzig, 1890]) have been preserved. The kings visited Persis and Persepolis at their coronations but only occasionally afterward.

Method of Government. — Within the empire, the two great civilized states incorporated by Cyrus and Cambyses, Babylon and Egypt, occupied a position of their own. After his defeat of Nabonidus, Cyrus proclaimed himself "king of Babel," and the same title was borne by Cambyses, Smerdis and Darius. In Egypt Cambyses adopted in full the titles of the Pharaohs. In this we may trace a desire to conciliate the native population, with the object of maintaining the fiction that the old state still continued. Darius went still further. He encouraged the efforts of the Egyptian priesthood in every way, built temples and enacted new laws in continuance of the old order. In Babylon his procedure was presumably similar, though there is no local evidence. But he lived to see that his policy had missed its goal. In 486 B.C. Egypt revolted and was only reduced by Xerxes in 484. It was this, probably, that induced Xerxes in 484 to renounce his title of king of Babel and to remove from its temple the golden statue of Bel-Marduk (Merodach), whose hands the king was bound to clasp on the first day of each year. This proceeding led to two insurrections in Babylon (probably in 484 and 479 B.C.), which were speedily repressed. After that the kingship of Babel was definitely abolished. In Egypt the Persian kings still retained the style of the Pharaohs, but we hear no more of concessions to the priesthood or to the old institutions and, apart from the great oasis of Rharga, no more temples were erected.

At the head of the court and the imperial administration stood the commandant of the bodyguard — the 10,000 "immortals," often depicted in the sculptures of Persepolis with lances surmounted by golden apples. This grandee, whom the Greeks termed "chiliarch," corresponds to the modern vizier. In addition there were seven councillors (Ezra vii, 14; cf. Esther i, 14). Among the other officials, the "eye of the king" is frequently mentioned. To him was entrusted the control of the whole empire and the superintendence of all officials.

Administration: Language. — The orders of the court were issued in a very simple form of the cuneiform script, probably invented by the Medes. This consisted of 36 signs, almost all of which denote single sounds. In the royal inscriptions, a translation into Elamite and Babylonian was always appended to the Persian text. In Egypt one in hieroglyphics was added, as in the inscriptions of the Suez canal; in the Grecian provinces, another in Greek (*e.g.,* the inscription of Darius on the Bosporus; Herod. iv, 37, cf. iv, 91). The cuneiform script could be written only on stone or clay. Thus there has been discovered in Babylon a copy of the Bisitun (*q.v.*) inscription preserved on a block of dolerite (F. H. Weissbach, Babylonische *Miscellen,* p. 24 [Berlin, 1900 *et seq.*]). For administrative purposes, however, it would seem that this inconvenient material was not employed, its place being taken by skins (*διφθέραι*, parchment), the use of which was adopted from the western peoples of the empire. On these were further written the journals and records kept at the court (*cf.* Diodorus 11, 22, 32; Ezra iv, 15, v, 17, vi, 2; Esther vi, 1, ii, 23). With such materials the cuneiform script could not be used; instead, the Persian language was written in Aramaic characters, a method which later led to the so-called Pahlavi; *i.e.*, Parthian script. This mode of writing was employed in the state services from Darius I, and so may explain the fact that, under the Achaemenids, the Persian language rapidly declined and in the inscriptions of Artaxerxes III appears only in a neglected guise.

Side by side with Persian, Aramaic, which had long been widely diffused as the speech of commerce, enjoyed currency in all the western half of the empire as a second dominant language. Thus all deeds, enactments and records designed for these provinces were furnished with an official Aramaic version (Ezra iv, 7). To the three cuneiform inscriptions of his tomb at Naksh-i-Rustam Darius added an Aramaic version; and of the account of his deeds in the inscription in Behistun he distributed copies in Aramaic over his empire; large fragments of one of these, written in beautiful characters, have been preserved in the papyri of the Jewish garrison at Elephantine, together with numerous documents in the same tongue.[1] The coins minted by the satraps and generals usually bear Aramaic inscriptions. The Demotic in Egypt was employed in private documents. In the Hellenic provinces of the empire Greek replaced Aramaic (cf. the letter to Pausanias in Thucydides i, 129; an edict to Gadatas in Magnesia: G. Cousin and G. Deschamps, Bulletin de *correspondance héllénique,* xii, 204 [Athens, 1888]; C. F. W. Dittenberger, Sylloge *Inscriptionum* Graecarum, ii, 3rd ed. [Leipzig, 1915–24]; so, also on coins) — a clear proof that the Persians had already begun to recognize the independent and important position of Greek civilization.[2]

Provincial **Organization.**—Darius I divided the Persian empire into 20 great provinces, satrapies, with a "guardian of the country" (*khshathrapavan;* see SATRAP) at the head of each. A list is preserved in Herodotus (iii, 89 et seq.); but the boundaries were frequently changed. Each satrapy was again subdivided into several minor governorships. The satrap was the head of the whole administration of his province. He levied the taxes, controlled the legal procedure, was responsible for the security of roads and property and superintended the subordinate districts. The heads of the great military centres of the empire and the commandants of the royal fortresses were outside his jurisdiction; yet the satraps mere entitled to a body of troops of their own, a privilege which they used to the full, especially in later periods. The satrap was held in his position as a subject by the controlling machinery of the empire, especially the "eye of the king"; by the council of Persians in his province, with whom he was bound to debate all matters of importance; and by the army. In the hands of the messengers (Pers. *ἀστάνδαι* or *ἄγγαροι*, a Babylonian word;) the government dispatches traveled "swifter than the crane" along the great imperial highways, which were all provided with regular postal stations (cf. the description of the route from Susa to Sardis in Herod. v, 52).

Within the satrapies the subject races and communities occupied a tolerably independent position; for instance the Jews, under their elders and priests, convened a popular assembly in Jerusalem (cf. the books of Ezra and Nehemiah). They also enjoyed, as a rule, the privilege of deciding lawsuits among themselves. The pressure of despotism was manifest, not so much in that the king and his officials consistently interfered in individual cases, but that they did so on isolated and arbitrary occasions, and then swept aside the privileges of the subject, who was impotent to resist.

The subject population can be divided into distinct groups. In the desert (as among the Arabian and Turanian nomads), in wild and sequestered mountains (as in Zagros in north Media, and Mysia, Pisidia, Paphlagonia and Bithynia in Asia Minor) and also in many Iranian tribes, the old tribal constitution, with the chieftain as its head, was left intact under the imperial suzerainty. The great majority of the civilized provinces were subdivided into local administrative districts governed by officials of the king and his satraps. These the Greeks named *ἔθνη*, "peoples." Within these, again, there might lie large town settlements, such as Babylon, Jerusalem, the Egyptian cities, Tarsus and Sardis, whose internal affairs were controlled by the elders or the officials of the community. On the same footing were the dominions of the high priests, with their great temple property — Bambyce in Syria, the two Comanas in Cappadocia and so forth. Vast districts were either converted into royal domains (*παράδεισοι*) with great parks and huntinggroundsunder royal supervision,or else bestowed by the king on Persians or deserving members of the subject peoples (the "benefactors"). Many of these estates formed respectable principalities; *e.g.,* those of the house of Otanes in Cappadocia, of Hydarnes in Armenia, Pharnabazus in Phrygia, Demaratus in Teuthrania, Themistocles in Magnesia and Lamp-

sacus. They were absolute private property, handed down from father to son for centuries, and in the Hellenistic period not rarely became independent kingdoms. These potentates were styled by the Greeks δυνάσται or μόναρχοι.

The last class, quite distinct from all these organizations, was formed by the city-states (πόλεις) with an independent constitution — whether a monarchy (as in Phoenicia), an aristocracy (as in Lycia) or a republic with council and popular assembly (as in the Greek towns). The essential point was that they enjoyed autonomy. This was only to be seen in the extreme western provinces of the empire, among the Phoenicians, Greeks and Lycians, whose cities were essentially distinct from those of the east. Indeed to Greek eyes the eastern cities were only great villages (κωμοπόλεις). It is readily intelligible that the character of the city-states should have proved practically incomprehensible to the Persians, with whom they came into perpetual collision. The Persians sought, as a rule, to cope with the difficulty by transferring the government to individual persons who enjoyed their confidence, the "tyrants" of the Greek towns. Only Mardonius, after his suppression of the Ionic revolt — which had originated with these very tyrants — made an attempt to govern them by the assistance of the democracy (492 B.C.).

Economic Problems. — The provinces of the empire differed as materially in economy as in organization. In the extreme west a money currency in its most highly developed form — that of coinage minted by the state or an autonomous community — had developed since the 7th century among the Lydians and Greeks. In the main portion, however, of the oriental world — Egypt, Syria, Phoenicia and Babylonia — the old mode of commerce was still in vogue, conducted by means of gold and silver bars, weighed at each transaction; a money currency did not begin to make headway in these districts until the 4th century B.C. In the eastern provinces the primitive method of exchange by barter still held the field. Only in the auriferous and civilized frontier districts of India (the Punjab) did a system of coinage find early acceptance. There Persian and Attic money was widely distributed, and imitations of it were struck, in the 5th and 4th centuries B.C.

Thus the empire was compelled to grapple with all these varied conditions and to reconcile them as best it might. At the court, "natural economy" was still the rule. The officials and oriental troops received payment in kind. They were fed "by the table of the king," from which 15,000 men daily drew their sustenance (cf. Heraclides of Cyme in Athenaeus iv, 145 B, etc.) and were rewarded by gifts and assignments of land. The Greek mercenaries, on the contrary, had to be paid in currency; nor could the satraps of the west dispense with it. The king, again, needed the precious metals not merely for bounties and rewards but for important enterprises in which money payment was imperative. Consequently the royal revenues and taxes were paid partly in the precious metals, partly in natural produce — horses and cattle, grain, clothing and its materials, furniture and all articles of industry (cf. Theopompus, fragment 124, 125, etc.). The satraps, in addition to money payments, also levied contributions "for their table," at which the officials ate (Nehemiah v, 14).

The precious metals brought in by the tribute were collected in the great treasure houses at Susa, Persepolis, Pasargadae and Ecbatana, where gigantic masses of silver and, more especially, of gold were stored in the bullion or partially wrought into vessels (Herod. iii, 96; Strabo xv, 731, 735; Arrian iii, 16, etc.) exactly as was the case more than 2,000 years later in the shah's treasure chamber. When the king required money he minted as much as was necessary. A reform in the coinage was effected by Darius, who struck the daric (Persian, *zariq; i.e.*, "piece of gold"; the word has nothing to do with the name of Darius), a gold piece of 130 gr., this being equivalent to 20 silver pieces ("Median shekels," σίγλοι) of 86.5 gr. The coinage of gold was the exclusive prerogative of the king; silver could be coined by the satraps, generals, independent communities and dynasts.

Attempt at Consolidation. — The extent of the Persian empire was, in essentials, defined by the great conquests of Cyrus and Cambyses. Darius was no more a conquistador than Augustus. The task he set himself was to round off the empire and secure its borders. For this purpose he subdued the mountain tribes in Asia Minor and Armenia and advanced the frontier as far as the Caucasus, Colchis alone remaining an independent kingdom under the imperial suzerainty. So, too, he annexed the Indus valley and the auriferous hill country of Kafiristan and Kashmir (Κάσπιοι or Κάσπειροι; Herod. iii, 93, vii, 67, 96; Stephen of Byzantium), as well as the Dardae in Dardistan on the Indus (Ctesias, India fr. 12, 70, etc.). From this point he directed several campaigns against the Amyrgian Sacae (Saka), on the Pamir plateau and northward, whom he enumerates in his list of subject races and whose mounted archers formed a main division of the armies dispatched against the Greeks. It was obviously an attempt to take the nomads of the Turanian steppe in the rear and to reduce them to quiescence which led to his unfortunate expedition against the Scythians of the Russian steppes (c. 512 B.C.; see DARIUS).

Side by side with these wars, we can read, even in the scanty tradition at our disposal, a consistent effort to further the great civilizing mission of the empire. In the district of Herat, Darius established a great water basin designed to facilitate the cultivation of the steppe (Herod. iii, 117). He had the course of the river Indus explored by the Carian captain Scylax of Caryanda, who then navigated the Indian ocean back to Suez (Herod. iv, 44) and wrote an account of his voyage in Greek. The desire to create a direct communication between the seclusion of Persis and the commerce of the world is evident in his foundation of several harbours, described by Nearchus, on the Persian coast. But this design is still more patent in his completion of a great canal, already begun by Necho, from the Nile to Suez, along which several monuments of Darius have been preserved. Thus it was possible, as says the remnant of a hieroglyphic inscription there discovered, "for ships to sail direct from the Nile to Persia, over Saba." In the time of Herodotus the canal was in constant use (ii. 158; iv, 39); afterward, when Egypt regained its independence, it decayed, till restored by the second Ptolemy. Even the circumnavigation of Africa was attempted under Xerxes (Herod. iv, 43).

Religion. — It has already been mentioned that in his efforts to conciliate the Egyptians Darius placed his chief reliance on the priesthood, and the same tendency runs throughout the imperial policy toward the conquered races. Thus Cyrus himself gave the exiled Jews in Babylon permission to return and rebuild Jerusalem. Darius allowed the restoration of the Temple; and Artaxerxes I, by the protection accorded to Ezra and Nehemiah, made the foundation of Judaism possible (see JEWS: Earliest Times to *the* Mediaeval). Analogously, in an edict of which a later copy is preserved in an inscription, Darius commands Gadatas, the governor of a domain (παράδεισος) in Magnesia on the Maeander, to observe scrupulously the privileges of the Apollo sanctuary. With all the Greek oracles — even those in the mother country — the Persians were on the best of terms. And since these might reasonably expect an enormous extension of their influence from the establishment of a Persian dominion, we find them all zealously mediatizing during the expedition of Xerxes.

For the development of the Asiatic religions, the Persian empire was of prime importance. The erection of a single, vast, world empire cost them their original connection with the state and compelled them to address themselves not to the community at large but to individuals; to promise not political success nor the independence of the people but the welfare of the man. Thus they became at once universal and capable of extension by propaganda. With this they entered into keen competition one with the other. These developments are most clearly marked in Judaism, but after the Achaemenid period they are common to all oriental creeds, though our information about most is scanty.

The exact nature of the religion of the Achaemenid kings is a subject of controversy. That Darius, Xerxes and Artaxerxes I were loyal servants of the great Ahura Mazda all are agreed, but there are different estimates of their understanding of the religion of Zoroaster (*q.v.*), either in its purity or its Magian adaptation and adulteration. Some scholars make Zoroaster a contemporary of Cyrus and Darius (or, at least, of the latter's father, Vishtaspa), but fe would claim that even Darius was a member of the prophet's community. Darius' inscriptions may indicate a mono-

theistic spirit in the prophet's tradition, but his rule of a vast empire certainly showed no fanaticism in enforcing the worship of Ahura Mazda. At his court were Magian priests and rites, and there during Xerxes' reign were enacted the cultic rites of the Haoma (Vedic Soma), so abominated by Zoroaster (cj. G. G. Cameron, Persepolis *Treasury* Tablets [1948]). Whatever the exact form of the Persian religion, there is evidence that it was vigorously spread by the Iranians throughout the empire, especially in Armenia and Cappadocia, where the religion took deep root among the people, as also in Lydia and Lycia. Unlike Judaism, Zoroastrianism was not exclusive and intolerant, and it found little difficulty in recognizing other gods as subordinate to Ahura Mazda. Consequently the foreign cults and creeds often reacted upon the Persian and strange syncretisms developed.

The gorgeous cult of the gods of civilization (especially of Babylon), with their host of temples, images and festivals, exercised a corresponding influence on the mother country. The unadulterated doctrine of Zoroaster could not become a permanent popular religion, for the masses could make little of its abstractions and its omnipotent, omnipresent deity; they needed concrete divine powers, standing nearer to themselves and their lot. Thus the old figures of the Aryan folk religion returned to the foreground, there to be amalgamated with the Babylonian divinities. The goddess of springs and streams (of the Oxus in particular) and of all fertility — Ardvisura Anahita, Anaitis—was endowed with the form of the Babylonian Ishtar and Belit. She was now depicted as a beautiful and strong woman, with prominent breasts, a golden crown of stars and golden raiment. She was worshipped as the goddess of generation and all sexual life (cf. Herod. i, 131, where the names of Mithras and Anaitis are interchanged), and religious prostitution was transferred to her service (Strabo xi, 532; xii, 559).

At her side stood the sun-god Mithras, represented as a young and victorious hero. Both deities occupied the very first rank in the popular creed, while to the theologian they were the most potent of the good powers — hlithras being the herald and propagator of the service of light and the mediator between man and Ahura Mazda, who faded more into the background. Thus, in the subsequent period, the Persian religion appears purely as the religion of Mithras. The festival of Mithras was the chief festival of the empire, at which the king drank and, mas drunken, and danced the national dance (Ctesias, fr. 55; Duris, *fr.* 13). This development culminated under Artaxerxes II, who, according to Berossus (*fr.* 16 *ap.* Clement of Alexandria. Protrepticus, i, 5, 65), first erected statues to Anaitis in Persepolis. Ecbatana, Bactria, Susa, Babylon, Damascus and Sardis. The truth of this account is proved by the fact that Artaxerxes II and Artaxeraes III are the only Achaemenids who in their inscriptions invoke Anaitis and Mithra side by side with Ahura Mazda. Other gods who came into prominence were the dragon slayer Verethragna (Artagnes) and the Good Thought (Vohumano, Omanos); and even the Sacaean festival was adopted from Babylon (Berossus, fr. 3; Ctesias, *fr.* 16; Strabo xi, 512, etc.). The chief centres of the Persian cults in the west were the district of Acilisene in Armenia (Strabo xi, 532, etc.), the town of Zela in Cappadocia (Strabo xii, j59) and several cities in Lydia.

Achaemenid Art. — The position of the Persian monarchy as a world empire is characteristically emphasized in the buildings of Darius and Xerxes in I'ersepolis and Susa. The peculiarly national basis, still recognizable in Cyrus' architecture at Pasargadae. recedes into insignificance. Influences are evident not only from the old Median architecture but also from Egypt, Babylon, to some extent Greece and, in the rock-cut tombs, probably from Asia Minor. Yet the result is Persian, for all these elements are combined into an organic unity, a great style which made possible the greatest architectural complex that the ancient east created. Nor were the complementary arts, sculpture and metalwork, any less distinguished. Silver and a few gold vessels of great dignity remain, jewellery of impressive richness and finely carved cylinder seals. Gut finally, with the collapse of the empire, the imperial art vanished also; when 500 years later a new native dynasty arose under the Sassanids, a characteristically Persian art grew up again, using traditions of its Achaemenid predecessors, though with many differences, above all in structural methods.

Sources for the Period. — The history of the Persian empire was often written by the Greeks. The most ancient work preserved is that of Herodotus, who is a very valuable source for the period up to 479 B.C. His material was drawn partly from sound tradition, partly from original knowledge — as in the account of the satrapies and their distribution, the royal highway, the nations in Xerxes army and their equipment. There is also much that is admittedly fabulous: for instance, the stories of Cyrus and Croesus, the conquest of Babylon, etc. Forty years later (s. 390 B.C.), the physician Ctesias of Cnidus, who for 17 years (414–398) remained in the service of Artaxerxes II, composed a great work on the Persian history, known to us from an extract in Photius and numerous fragments. Ctesias possesses a more precise acquaintance with Persian views and institutions than Herodotus, and where he deals with matters that came under his own cognizance he gives much useful information. For the early period, on the other hand, he proves only how rapidly the tradition had degenerated since Herodotus; here his narrative can be used only in isolated cases: and that with the greatest caution. Of more value was the great work of Dinon of Colophon (c. 340), which we know from numerous excellent fragments; and on the same level may be placed a few statements from Heraclides of Cyme, which afford especially important evidence on Persian institutions. To these must be added the testimony of the other Greek historians (Thucydides, Ephorus, Theopompus, etc., with the histories of Alexander), and, before all, that of Xenophon in the *Anabasis* and *Hellenica.* The *Cyropaedia* is a didactic romance, written with a view to Greek institutions and rarely preserving genuine information on the I'ersian empire. Of oriental sources, only the contemporary books of Ezra and Nehemiah are of much importance; important also are a few statements in the much later Esther romance. Berossus' history of Babylon contained much valuable and trust\\-orthy information, but next to nothing has survived. The *Babylonian Chronicle* gives important detail on the rise of Cyrus to power (cf. Sidney Smith. *Babylonian Historical* Texts, pp. 110 ff., col. ii, 11, 1–4 [London, 1924]). In Persia itself, memories of the empire and its significance evidently lingered in oral tradition. For a more detailed account of the empire in these sources see EZRA AND NEHEMIAH, BOOKS OF; HERODOTUS. The scanty number of original documents from the time of the Achaemenids (among them a large quantity of business contracts from Babylonia, dated after the years of the kings) has been greatly increased by the Aramaic documents from Elephantine (see above), from the time of Darius II, which throw light on the administration and the judicial procedures in Egypt (cf. Eduard Meyer, "Zu den aramaische Papyri am Elephantine," *Sitzungsberichte der preussischen* Akademie der *Wissenschaften* [Berlin, 1911), and by the 85 treasury drafts in Elamite found in the Persepolis treasury and dated in the reigns of Darius and Xerxes (*cf.* G. G. 'Cameron, *op. cit.*), along with the much less significant thousands found in the fortification walls of Persepolis. On the struggle of the Egyptians for independence in the 4th century we obtain some information from the so-called Demotic *Chronicle,* published in 1914; cf. Eduard Meyer, "Aegyptische Documente aus der Perserzeit," *Sitzungsberichte* der *Berlinen Akademie* (Berlin, 1915), reprinted in *Kleine Schriften,* vol. ii, and ed. (Halle, 1924). There are also the long-known Achaernenid inscriptions to which there have been additions from Persepolis (for definitive discussion, cf. R. G. Kent, "Old Persian Texts." *Journal* of *Near* Eastern Studies, vol. i, pp. 415–423; vol. ii, 105–116, 302–313; vol. iii, 232–233; vol. iv, 39–52, 228–233 [1942 et *seq.*]).

The external history of the empire is treated under the individual kings (see also history sections of articles EGYPT; GREECE; etc.). The order is as follows:

Cyrus (559–529); conquered the Medes in 550; king of Babylon from 539
Cambyses (529–522)
Smerdis (Gaumata) (522)
Darius I (522–486)
Xerxes I (486–465)

Artaxerxes I (465–424)
Xerxes II and Secydianus or Sogdianus (424–423)
Darius II Nothus (423–404)
Artaxerxes II (404–358)
Artaxerxes III Ochus (358–338)
Arses (338–336)
Darius III (336–330)

The chronology is exactly verified by the Ptolemaic canon, by numerous Babylonian and a few Egyptian documents and by the evidence of the Greeks. The present article gives only a brief conspectus of the main events in the history of the empire.

The Wars Against Greece.—Though Darius, unlike Cyrus and Cambyses, made no new expeditions of conquest, a great empire which is not bounded by another equally great but touches on many small tribes and independent communities is inevitably driven to expansion. It has already been shown that the attempt of Darius to control the predatory nomads in the north led to his expedition against the Scythians; this, again, led to the incorporation of Thrace and Macedonia, whose king, Perdiccas, submitted. And since a great portion of the Mediterranean coast line belonged to the empire, further complications resulted automatically. In contrast with the Greeks, Carthage took the part of Persia. Darius, indeed. numbers the city—under the name of Karka—among his dominions; as also the Maxyans (Maciya) on the Syrtes (F. C. Andreas, *Verhandlungen* d. *xiii oriental. Congresses,* p. *97* [Hamburg, 1902]). But above all, the Greek cities, with their endless feuds and violent internal factions, were incessant in their appeals for intervention. Nevertheless, Darius left European Greece to itself until the support accorded to the Ionian and Carian insurgents by Athens and Eretria (499 B.C.) made war inevitable. But the expeditions of Mardonius (492) and Datis (490) and even the carefully prepared campaigns of Xerxes, in conjunction with Carthage, completely failed (480–479). On the fields of Marathon and Plataea the Persian archers succumbed to the Greek phalanx of hoplites; but the actual result was decided by Themistocles, who had meanwhile created the Athenian fleet which at Salamis proved its superiority over the Perso-Phoenician armada, thus precluding the success of the land forces.

The wreck of Xerxes' expedition was the turning point in the history of the Persian empire.' The superiority of the Greeks was so pronounced that the Persians never found courage to repeat their attack. On the contrary, in 466 B.C. their army and fleet were again defeated by Cimon on the Eurymedon, the sequel being that the Greek provinces on the Asiatic coast, with all the Thracian possessions! were lost to Persia. In itself, indeed, this loss was of no great significance to such a vast empire, and the attempts of Athens to annex Cyprus and conquer the Nile valley, in alliance with the rebellious Egyptians, ended in failure. Athens, in fact, had not sufficient strength to undertake a serious invasion of the empire or an extensive scheme of conquest. Its struggles with the other Hellenic states constrained it, by the peace of Callias (448), definitely to renounce the Persian war; to abandon Cyprus and Egypt to the king; and to content itself with his promise, not that he would surrender the littoral towns, but that he would abstain from an armed attack upon them. The really decisive point was, rather, that the disasters of Salamis and Plataea definitely shattered the offensive power of the empire; that the centre of gravity in the world's history was shifting from Susa and Babylon to the Aegean sea. The Achaemenid power was beginning to suffer that inner disintegration which is the ever-recurrent doom of dynasties, if not of states. The oriental empire belonged to the past; the immediate future belonged to the Hellenes.

Decay of the Empire.—Thus the great empire was reduced to immobility and stagnation—a process which was assisted by the deteriorating influences of civilization and world dominion upon the character of the ruling race. The Persians continued to produce brave and honourable men; but the influences of the harem, the eunuchs and similar court officials made appalling progress, and men of energy began to find the temptations of power stronger than their patriotism and devotion to the king. Thus the satraps aspired to independence, not merely because of unjust treatment, but also through avarice or because conditions were favourable. As early as 465 B.C. Xerxes was assassinated by his powerful vizier (chiliarch) Artabanus, who attempted to seize the reins of empire in fact if not in name. Bagoas (*q.v.*), the murderer in 338 of Artaxerxes III, was another who seized power thus. To these factors must be added the degeneration of the royal line. Kings like Xerxes and, more especially, Artaxerxes I and Artaxerxes II, so far from being gloomy despots, were good-natured potentates, but weak, capricious and readily accessible to personal influences. The only really brutal tyrants were Darius II, who was completely dominated by his bloodthirsty wife, Parysatis, and Artaxerxes III, who, though he shed rivers of blood and all but exterminated his whole family, was successful in uniting once more the empire, which under the feeble sway of his father had been threatened with dissolution.

The upshot of these conditions was that the empire never again undertook an important enterprise, but neglected more and more its great civilizing mission. In considering, however, the subsequent disorders and wars, it must be borne in mind that they affected only individual portions of the empire, and only on isolated occasions involved more extensive areas in long and serious strife. For most of the provinces the Achaemenid dominion was synonymous with two centuries of peace and order. Naturally, however, the wild tribes of the mountains and deserts, who could be curbed only by strict imperial control, asserted their independence and harassed the neighbouring provinces. Among these tribes were the Carduchians in Zagros, the Cossaeans and Uxians in the interior of Elam, the Cadusians and other non-Aryan tribes in northern Media, the Pisidians, Isaurians and Lycaonians in the Taurus and the Mysians in Olympus. All efforts to restore order in these districts were fruitless, and when the kings moved their court to Ecbatana they were actually obliged to purchase a free passage from the mountain tribes (Strabo xi, 524; Arrian iii, 17, 1).

The kings (*e.g.*, Artaxerxes II) repeatedly took the field in great force against the Cadusians, but unsuccessfully. When in 400 Xenophon marched with the mercenaries of Cyrus from the Tigris to the Black sea the authority of the king was nonexistent north of Armenia, and the tribes of the Pontic mountains, with the Greek cities on the coast, were completely independent. In Paphlagonia the native dynasts founded a powerful though short-lived kingdom, and the chieftains of the Bithynians were absolutely their own masters. The frontier provinces of India were also lost. Egypt, which had already revolted under Libyan princes in the years 486–484 and again with Athenian help in 460–454, finally asserted its independence in 404. Thereafter the native dynasties repelled every attack, till they succumbed once more before Artaxerxes III and Mentor of Rhodes.

In the other civilized countries the old passion for freedom had been completely obliterated, and after the days of Darius I—apart from the Greek. Lycian and Phoenician towns—not a single people in all these provinces dreamed of shaking off the foreign dominion. All the more clearly, then, was the inner weakness of the empire revealed by the revolts of the satraps. These were facilitated by the custom—one quite contrary to the original imperial organization—which entrusted the provincial military commands to the satraps. who began to receive great masses of Greek mercenaries into their service. Under Artaxerxes I and Darius II these insurrections were still rare. But when the revolt of the younger Cyrus against his brother (401) had demonstrated the surprising ease and rapidity with which a courageous army could penetrate into the heart of the empire—when the whole force of that empire had proved powerless to prevent 12,000 Greek troops, completely surrounded and deprived through treachery of their leaders, from escaping to the coast; when they escaped without even a serious attack—then, indeed, the imperial impotence became manifest. After that revolts of the satraps in Asia Minor and Syria were of everyday occurrence, and the task of suppressing them was complicated by the foreign wars which the empire had to sustain against Greece and Egypt.

At this very period, however, the foreign policy of the empire gained a brilliant success. The collapse of the Athenian power before Syracuse (413 B.C.) induced Darius II to order his satraps Tissaphernes and Pharnabazus, in Asia Minor, to collect the trib-

ute overdue from the Greek cities. In alliance with Sparta (see PELOPONNESIAN WAR), Persia intervened in the conflict against Athens, and it was Persian gold that made it possible for Lysander to complete its overthrow (404). True, war with Sparta followed immediately, over the division of the spoils, and the campaigns of the Spartan generals in Asia Minor (399–395) were all the more dangerous as they gave occasion to numerous rebellions. But Persia joined the Greek league against Sparta, and in 394 Pharnabazus and Conon annihilated the Lacedaemonian fleet at Cnidus. Thus the Spartan power was crippled; the upshot of the long-protracted war was that Sparta ruefully returned to the Persian alliance, and by the peace of Antalcidas (*q.v.*), concluded in 387, not only renounced all claims to the Asiatic possessions but officially proclaimed the Persian suzerainty over Greece. Ninety years aftet Salamis and Plataea the goal for which Xerxes had striven was actually attained and the king's will was law in Greece. In the following decades no Hellenic state ventured to violate the king's peace, and all the feuds that followed centred on the efforts of the combatants — Sparta, Thebes, Athens and Argos — to draw the royal powers to their side (see GREECE: History).

But for these successes the empire had to thank the internecine strife of its Greek opponents rather than its own strength. Its feebleness when thrown on its own resources is evident from the fact that during the next years it failed both to reconquer Egypt and to suppress completely King Evagoras of Salamis in Cyprus. The satrap revolts, moreover, assumed more and more formidable proportions, and the Greek states began once more to tamper with them. Thus the reign of Artaxerxes II ended, in 358 B.C., with a complete dissolution of the imperial authority in the west. His successor, Artaxerxes III Ochus, succeeded yet again in restoring the empire in its full extent. In 355 he spoke the fatal word which a second — or rather a third — time demolished the essentially unsound power of Athens. In 342 he reduced Egypt, and his generals Mentor and Memnon, with his vizier Bagoas (*q.v.*), crushed once and for all the resistance in Asia Minor. At his death in 338, immediately before the final catastrophe, the empire to all appearances was more powerful and more firmly established than it had been since the days of Xerxes.

THE HELLENISTIC DOMINION, 4TH-2ND CENTURIES B.C.

The Rise of Hellenism. — These successes were won only by means of Greek armies and Greek generals. Simultaneously the Greek civilization — diffused by mercenaries, traders, artists, prostitutes and slaves — advanced in ever-greater force. In Asia Minor and Phoenicia we can clearly trace the progress of Hellenism (*q.v.*), especially by the coinage. But the vital point is that the absolute superiority of the Hellene was recognized as incontestable on both sides. The Persian sought to protect himself against danger by employing Greeks in the national service and turning Greek policy to the interests of the empire. In the Greek world itself the disgrace that a people called to universal dominion and capable of wielding it should be dependent on the mandate of an impotent Asiatic monarchy was keenly felt by all who were not yet absorbed in the rivalry of city with city. The spokesman of this national sentiment was Isocrates. but numerous other writers gave expression to it, notably the historian Callisthenes of Olynthus. Union between Greeks, voluntary or compulsory, and an offensive war against Persia was their aim.

Nor was the time for its fulfilment far distant. The new power which now rose to the first rank, created by Philip of Macedon, had no ingrained tendency inimical to the Persian empire. Its immediate purpose was rather Macedonian expansion, at the expense of Thrace and Illyria, and the subjection of the Balkan peninsula. But in its efforts to extend its power over the Greek states it was bound to make use of the tendencies which aimed at the unification of Greece for the struggle against Persia, and this ideal demand it dared not reject.

Thus the conflict became inevitable. In 340 Artaxerxes III and his satraps supported the Greek towns in Thrace — Perinthus and Byzantium — against Macedonian aggression; in 338 he concluded an alliance with Demosthenes. When Philip, after the victory of Chaeroneia, had founded the League of Corinth (337) embracing the whole of Greece, he accepted the national ideal and in 336 dispatched his army to Asia Minor. That he never entertained the thought of conquering the whole Persian empire is certain. His ambitions would have been satisfied with the liberation of the Greek cities and, perhaps, the subjection of Asia Minor as far as the Taurus. With this his dominion would have attained much the same compass as the later dominion under Lysimachus; this was as much as Isocrates hoped.

Alexander. — Philip's assassination in 336 fundamentally altered the situation. In the person of his son, the throne was occupied by a soldier and statesman of genius, saturated with Greek culture and Greek thought and intolerant of every goal but the highest. To conquer the whole world for Hellenic civilization by the aid of Macedonian spears, and to reduce the whole earth to unity, was the task that this heir of Heracles and Achilles saw before him. This idea of universal conquest was with him a conception much more strongly developed than that which had inspired the Achaemenid rulers, and he entered on the project with full consciousness. In fact, if we are to understand Alexander, it is important to remember that he died at the beginning of his career, at the age of 33. How Alexander conquered Persia, and how he framed his world empire, cannot be related in detail here. (See ALEXANDER III THE GREAT; MACEDONIAN EMPIRE; HELLENISM [for later results]). The essential fact, however, is that after the victory of Gaugamela (Oct. 1, 331 B.C.) and, still more completely, after the assassination of Darius — avenged, according to the Persian laws, on the perpetrators — Alexander regarded himself as the legitimate head of the Persian empire and therefore adopted the dress and ceremonial of the Persian kings. With the capture of the capitals the Persian war was at an end and the atonement for the expedition of Xerxes was complete — a truth symbolically expressed in the burning of the palace at Persepolis.

Now began the world conquest — not in the sense of the "world kingdom" concept that subsequent to Alexander grew to comprehend specifically a plan to conquer the Mediterranean shores to the Pillars and in the Alexander Romance had the great Macedonian actually accomplishing this feat, but in the more general and accepted sense of the vast Persian empire, whose ruler had become the nearest approach of the orient to its ancient ideal of universal king and whose domain Alexander probably expected to secure and extend. The basis of this new world order was to be the union of Macedonia and Persia, which Alexander began even while campaigning in the east and carried forward upon his return from India. The adoption of the Persian court ceremonial of prostration and deification of Alexander were aimed to support this program. This was readily accepted in Persia. but reluctantly in Greece, although at the Olympian festival of 324 B.C. the command was issued to all the cities of Greece to recognize him as god and to receive the exiles home. Simultaneously, in Persia the union of the two countries was consummated by a great marriage feast at Susa, at which all Alexander's supreme officers, with about 10,000 Macedonians, were wedded to Persian wives. The hlacedonian veterans were released and the army reorganized, with Persians serving on an equal footing. At this critical juncture Alexander died in Babylon, on June 13, 323 B.C.

The Diadochi.—Alexander left no heir. Consequently, his death not only ended the scheme of universal conquest but led to an immediate Macedonian reaction. The army, which was considered as the representative of the people, took over the government under the direction of its generals. The Persian'wives were practically all discarded and the Persian satraps removed — at least from all important provinces. But the attempt to maintain the empire in its unity proved impracticable, and almost immediately there began the embittered war, waged for several decades by the generals (Diadochi) for the inheritance of the great king (See PTOLEMIES; SELEUCID DYNASTY.) It was soon obvious that the eastern rulers, at all events, could not dispense with the native element. Peucestas, the governor of Persis, there played the role of Alexander and won the Persians completely to his side, for which he was dismissed by Anitgonus in 315 (Diodorus Siculus xix, 48). A similar position was attained by Seleucus — the only one of the Diadochi who had not divorced his Persian wife, Apama

—in Babylonia, which he governed from 319 to 316 and regained in the autumn of 312. While Antigonus, who since 315 had striven to win the kingdom of Alexander for himself, was detained by the war with his rivals in the west, Seleucus, with Babylon as his headquarters, conquered the whole of Iran as far as the Indus. In northern Media alone, which lay outside the main scene of operations and had been only partially subject to the later Achaemenids, the Persian satrap Atropates, appointed by Alexander, maintained his independence and bequeathed his province to his successors. His name is borne by north Media to the present day—Atropatene, modern Azerbaijan or Adherbaijan. So, too, in Armenia the Persian dynasty of the Hydarnids held its ground. To these must be added, in the east of Asia Minor, the kingdoms of Pontus and Cappadocia, founded *c.* 301 by the Persians Mithradates I and Ariarathes I. These states were fragments of the Achaemenid empire which had safely transferred themselves to the Hellenistic state system.

The **Seleucids.**—The annexation of Iran by Seleucus Nicator led to a war for the countries on the Indian frontier, Seleucus' opponent being Sandracottus or Chandragupta Maurya (*q.v.*), the founder of the great Indian empire of Maurya (Palimbothra). The result was that Seleucus abandoned to the Indian king not merely the Indian provinces but even the frontier districts west of the Indus (Strabo xv, 689–724), receiving as compensation 500 elephants. with other presents (Appian, Syriaca, 55; Justin xv. 4; Plut., Alex., 62; Athen. i, 18 D). His next expedition was to the west to assist Lysimachus, Ptolemy and Cassander in the overthrow of Antigonus.

The battle of Ipsus, in 301, gave him Syria and the east of Asia Minor, and from that time he resided at the Syrian town of Antiochia on the Orontes. Shortly afterward he handed over the provinces east of the Euphrates to his son Antiochus, who in the following years, till 282, exercised in the east a very energetic and beneficial activity, which continued the work of his father and gave the new empire and the oriental Hellenistic civilization their form. In his campaigns Alexander had founded several cities in Bactria, Sogdiana and India in which he settled his veterans, and before his death he had begun or planned the foundation of Greek cities in Media and other parts of Iran. These plans were now executed by the Seleucids on the largest scale. Most of the new cities were based on older settlements; but the essential point is that they were peopled by Greek and Macedonian colonists and enjoyed civic independence with laws, officials, councils and assemblies of their own—in other words, an autonomous constitution under the suzerainty of the empire. A portion, moreover, of the surrounding land was assigned to them. Thus a great number of the country districts—the ἔθνη above mentioned—were transformed into municipal corporations and were thereby withdrawn from the immediate government of the king and his officials (satraps or strategoi), though they were still subject to their control except in the cases where they received unconditional freedom and so ranked as "confederates." The native populations of these villages and rural districts at first had no civic rights but were governed by the foreign settlers. Soon, however, the two elements began to coalesce; in the Seleucid empire, the process seems generally to have been both rapid and complete. Thus the cities became the main factors in the diffusion of Hellenism, the Greek language and the Greek civilization over all Asia as far as the Indus. At the same time they were centres of commerce and industrial life; this, in conjunction with the royal favour and the privileges accorded them, continually drew new settlers (especially Jews), and many of them developed into great and flourishing towns (cf. Eduard Meyer, *Blüte* und Niedergang des *Hellenismus in* Asien [Berlin. 1925]; see further under HELLENISM).

Shortly after his conquest of Babylonia Seleucus had founded a new capital. Seleucia (*q.v.*), on the Tigris, his intention being at once to displace the ancient Babylon from its former central position and to replace it by a Greek city. This was followed by a series of other foundations in Mesopotamia, Babylonia and Susiana (Elam). "Media," says Polybius (x, 27), "was encircled by a sequence of Greek towns, designed as a barrier against the barbarians." Among those mentioned are Rhagae (Rayy), which Seleucus metamorphosed into a Hellenic city, Europus, Laodicea, Apamea and Heraclea (Strabo xi, 525; Pliny vi, 43). To these must be added Achaea in Parthia and, farther to the east, Alexandria Arion in Aria, the modern Herat; also Antiochia Margiana (Strabo xi, 514, 516; Pliny vi, 46, 93), now Merv, and many others; further, Alexandria in Arachosia, near Kandahar, and the towns founded by Alexander on the Hindu Kush and in Sogdiana.

Thus an active Hellenic life soon arose in the east; Greek settlers must have come in numbers and founded new cities which afterward formed the basis of the Graeco-Bactrian kingdom (cf. W. W. Tarn, The Greeks in Bactria and *India*, 2nd ed. [Cambridge, 1951]). Antiochus' general Demodamas crossed the Iaxartes and set up an altar to the Didymaean Apollo (Pliny vi, 49). Another general, Patrocles, took up the investigation of the Caspian, already begun by Alexander. In contrast with the better knowledge of an older period, he came to the conclusion that the Caspian was connected with the ocean and that it was possible to reach India on shipboard by that route (Strabo ii, 74, xi, 518; Pliny vi. 38). Seleucus' project to connect the Caspian with the Sea of Azov by a canal is mentioned by Pliny (vi, 31). To Patrocles is attributable the information that an active commerce in Indian wares was carried on with the shores of the Black sea, through the Caspian (Strabo xi, 509).

While Hellenism was thus gaining some footing throughout the east, the native population remained absolutely passive. Apart from the rude mountain tribes, no national resistance was dreamed of for a long time. The Iranians quietly accepted the foreign yoke, and the higher classes adopted the external forms of the alien civilization even though they actually retained their own characteristics. Eratosthenes, for instance, speaks (*ap.* Strabo i, 66) in high terms of the Iranians (Ariani), ranking them (as well as the Indians, Romans and Carthaginians) on a level with the Greeks in their capacity for adopting city civilization. The later Parsee tradition contends that Alexander burned the sacred books of Zoroaster, the Avesta, and that only a few fragments were saved and afterward reconstructed by the Arsacids and Sassanids. This is absolutely unhistorical. The Persian religion was never attacked by the Macedonians and Greeks. Under their dominion, on the contrary, it expanded with great vigour, not only in the west (Armenia, north Syria and Asia Minor, where it was the official religion of the kings of Pontus and Cappadocia), but also in the east, in the countries of the Indian frontier. That the popular gods—hfithras, Anaitis, etc.—had come to the forefront has already been mentioned. This movement, however. was void of all national character and ran on precisely the same lines as the movement in the Syrian, Jewish and Egyptian cults. Only in Persis itself did the national character of the religion survive side by side with the memory of their old imperial position; there a local Persian dynasty continued to rule in the centre of the province at Istakhr (see PERSIS).

Decline of the **Seleucids.**—In 282 B.C. Seleucus took the field against Lysimachus, and the next year annexed his dominions in Asia Minor and Thrace. In 280 he was assassinated in crossing to Europe, and his son Antiochus I mas left supreme over the whole empire. From that time onward the Seleucid empire was never at rest. Its gigantic extent, from the Aegean to the Indus, everywhere offered points of attack to the enemy. The Lagidae especially, with their much more compact and effective empire, employed every means to weaken their Asiatic rivals; and auxiliaries were found in the minor states on the frontier—Atropatene, Armenia, Cappadocia, Pontus and Bithynia, Galatia, Pergamum, Rhodes and other Greek states. Moreover, the spread of Greek civilization and city life had created numerous local centres, with separate interests and centrifugal tendencies, struggling to attain complete independence and perpetually forcing new concessions from the empire. Thus the Seleucid kings, courageous as many of them were, were always battling for existence

These disturbances severely affected the borders of Iran. In Parthia two brothers, Arsaces and Tiridates, revolted against their Seleucid satrap and founded an independent kingdom and the Parthian era, beginning 247 B.C. This nas the year of the death of Antiochus II. who had been so harried by Ptolemy II Philadel-

phus and so absorbed in the defense of his western provinces that he was unable to hold the eastern area in line. Although Diodotus, satrap of Bactria, was married to a sister of Seleucus II (247–226), by the time of his death (c. 230 B.C.) he may have become independent (cf. W. W. Tarn, *op. cit.*, p. 74). Certainly his son Diodotus II so acted. allying himself with the Parthian king and Seleucid enemy, Tiridates I. The latter was forced in 228 to retreat before Seleucus II. Seleucus, however, could not consolidate his eastern victories since he had to hurry home to settle a dynastic revolt. Meanwhile Diodotus II was slain by Euthydemus, son-in-law of the now widowed sister of Seleucus II, and under him and his son Demetrius the independence of the Graeco-Bactrian state was firmly established (Polybius x, 28 et seq., 480 et seq., xi, 34; Justin xli. 5).

Greater success attended Antiochus III the Great (223–187). At the beginning of his reign (220) he subdued, with the help of his minister Hermias, an insurrection of the satrap Molon of Media, who had assumed the royal title and was supported by his brother Alexander, satrap of Persis (Polyb. v, 40 ff.). He further seized the opportunity of extorting an advantageous peace from Ring Artabazanes of Atropatene, who had considerably extended his power (Polyb. v, 55). He waged an unsuccessful war with Ptolemy IV for the conquest of Coele-Syria, but suppressed the revolt of Achaeus in Asia Minor and recovered the former provinces of the empire in that quarter.

Antiochus then led a great expedition into the east designed to restore the imperial authority in its full extent. He first removed (211) the Armenian king Xerxes by treachery (Polyb. viii, 25; John of Antioch, fr. j3) and appointed two governors, Artaxias and Zariadris, in his place (Strabo xi, 531). During the next year he reduced the affairs of Media to order (Polyb. x, 27); he then conducted a successful campaign against Arsaces of Parthia (209) and against Euthydemus of Bactria (208–206). In spite of his successes he concluded peace with both kingdoms, rightly considering that it mould be impossible to retain these remote frontier provinces permanently. He next renewed his old friendship with the Indian king Sophagasenus (Subhagasena) and received from him 150 elephants (206). Through Arachosia and Drangiane, in the valley of the Etymander (Helmund), he marched to Carmania and Persis (Polyb. xi, 34). Both there and in Babylonia he reestablished the imperial authority and in 205 undertook a voyage from the mouth of the Tigris through the Arabian gulf to the town of Gerrha in Arabia (now Bahrein) (Polyb. xiii, 9).

Shortly afterward, however, his successful campaign against Ptolemy V Epiphanes led to a war with Rome in which the power of the Seleucid empire was shattered (190 B.C.), Asia Minor lost and the king compelled to pay a heavy contribution to Rome for many years. In order to raise money he plundered a wealthy temple of Bel in Elam, but was killed by the inhabitants in 187 (Diod. xxviii, 3, xxix, 15; Strabo xvi, 744; Justin xxxii, 2; St. Jerome [Hieronymus] on *Daniel* xi, 19; Eusebius, *Chronica,* i, 253). The consequence of this enfeeblement of the empire was that the governors of Armenia asserted their independence. Artaxias founded the kingdom of Great Armenia and Zariadris the kingdom of Sophene on the Euphrates and the sources of the Tigris (Strabo xi, 531). In other districts! also. rebellions occurred; and in the east, Euthydemus and his successors (Demetrius, Eucratides, etc.) began the conquest of the Indus region and the Iranian borderland (Arachosia, Aria). (*See* DEMETRIUS; EUCRATIDES; MENANDER.)

The energetic Seleucids fought desperately against their fate. Antiochus IV Epiphanes (175–163) restored once more the eastern dominion, defeated Artaxias of Armenia (Appian, *Syrians,* 45; Diod. xxxi, 17 A; St. Jerome on *Dan.* xi, 40), restored several towns in Babylonia and subdued the Elymaeans. His attempt, however, to plunder the sanctuary of Nanaia failed (Polyb. xxxi, 11; *cf.* Maccabees, i, 6, ii, 1, 13; App., *Syr.,* 66). Persis, also, and Media were still subject to him. He tried to strengthen Hellenism throughout his empire by settling Greek colonists and mercenaries in the native towns—then, also, in Babylon and Jerusalem—and granting them the right of Greek cities. But after his death at Gabae (Isfahan) in Persis (163 B.C.; *cf.* Polyb. xxxi, 11; Macc. i, 6, ii, 9; Josephus, *Antiquitates Judaicae,* xii, 9, 1), the Romans took advantage of the dynastic broils to destroy the Seleucid empire. They reduced its army and fleet and favoured every rebellion, among others that of the Jews. In spite of all. Demetrius I Soter (162–150) succeeded' in suppressing (159) a revolt of Timarchus of Miletus. governor of Babylon, who had occupied Media, assumed the title of "great king" and been recognized by the Romans (App., Syr., 45–47; Trogus, *Prologi,* 34; Diod. xxxi, 27 A; cf. the coins of Timarchus). See also ANTIOCHUS; HELLENISM; SELEUCID DYNASTY.

THE PARTHIAN EMPIRE, 2ND CENTURY B.C.–3RD CENTURY A.D.

The Arsacids.—Meanwhile, in the east, the Arsacids had begun their expansion. Phraates I (*c.* 176–171) subdued the Mardians in Elburz. His brother Mithradates I (c. 171–138) had to sustain a difficult war with Eucratides of Bactria, but eventually succeeded in wresting from him some districts on the Turanian frontier. Indeed, he penetrated beyond the Indus (Diod. xxxiii, 18; Orosius v. 4, 16). In the west he conquered Media and then subdued Babylonia. He further reduced the Elymaeans, sacked their temple in the mountains and captured the Greek city of Seleucia on the Hedyphon (Strabo xvi. 744; Justin xli, 6). The Seleucids, meanwhile, were harassed by aggravated disorders and insurrections. Nevertheless, in 140 Demetrius II Nicator took the field in order to save the east! but was defeated and captured. Shortly afterward Mithradates I died. His son Phraates II (c. 138–128) was attacked in 130 by Antiochus Sidetes, the brother of Demetrius II, on which the Parthian king released the latter. Antiochus pressed successfully on. and once more recovered Babylonia, but in 129 was defeated in Media and fell in a desperate struggle. With this battle the Seleucid dominion over the countries east of the Euphrates was definitely lost. The Babylonian towns, especially Seleucia, were handed over by Phraates to the Hyrcanian Himerus, who punished them severely for their resistance.

During these wars great changes had taken place in eastern Iran. In 159 Mongolian tribes, whom the Chinese call Tue-chi and the Greeks Scythians. forced their way into Sogdiana and. in 139, conquered Bactria (Strabo xi. 571; Justin xlii, 1; Trog., Prol., 41). From Bactria they tried to advance farther into Iran and India. Entering into an alliance with Antiochus Sidetes, they assailed the Parthian empire. Phraates II marched to encounter them, but was himself defeated and slain and his country ravaged far and wide. His successor, Xrtabanus II (also numbered I; c. 128–123), the uncle of Phraates, also fell in battle against the Tokharians, the principal Scythian tribe (Justin xlii, 1, 2; Johannes Xntiochen. *fr.* 66); but his son Mithradates II, called the Great (*c.* 123–91), defeated the Scythians and restored for a while the power of the Arsacids. He also defeated Artavasdes, the king of Great Armenia; his son Tigranes (*q.v.*), a hostage in the hands of the Parthians, was redeemed only by the cession of 70 valleys (Strabo xi, 532). When Tigranes attempted to seize Cappadocia, and the Roman praetor P. Cornelius Sulla advanced against him. Mithradates in 92 B.C. concluded the first treaty between Parthia and Rome (Plut., *Sulla,* v; Livy, *epit.* 70).

The dynastic troubles of the Seleucids in Syria gave Mithradates an opportunity for successful intervention (Jos., *Ant. Jud.,* xiii, 13, 4; 14, 3). Shortly afterward he died and with his death the Arsacid power collapsed for the second time. The possession of the western provinces and the dominant position in western Asia passed to Tigranes, who wrested from the Parthians Mesopotamia and the suzerainty of Atropatene, Gordyene. Adiabene and Osroene. Simultaneously began a new and severe conflict with the Scythians. Parthian coins probably dating from this period (W. W. Wroth, *Catalogue of the Coins of Parthia,* p. xxx and p. 40 [London, 1903]) mention victorious campaigns of Parthian kings and a conquest of the provinces of Aria, Margiane and (?) Traxiane (*cf.* Strabo xi, 505). But the confusion of the situation is shown by the fact that in 77 B.C. the octogenarian king Sinatruces was seated on the Parthian throne by the Scythian tribe of the Sacaraucians (cf. Strabo xi, 511; Trog., Prol., 42). The names of his predecessors are not known. Obviously this period was marked by continual dynastic feuds (cf. Trog., Prol., 42).

Not until Sinatruces' successor, Phraates III (70–*c.* 57), was the kingdom again in a settled state.

A fact of decisive significance was that the Romans now began to advance against Tigranes. In vain Mithradates of Pontus and Tigranes turned to the Parthian king, Tigranes even proffering restitution of the conquered frontier provinces. Phraates, though rightly distrusting Rome, nevertheless concluded a treaty with Lucullus (69 B.C.) and with Pompey, and even supported the latter in his campaign against Tigranes in 66. But after the victory it was manifest that the Roman general did not consider himself bound by the Parthian treaty. When Tigranes had submitted, Pompey received him into favour and extended the Roman supremacy over the vassal states of Gordyene and Osroene, though he had allured the Parthian king with the prospect of the recovery of his old possessions as far as the Euphrates. Phraates complained, and simultaneously attacked Tigranes, now a Roman vassal (64). But when Pompey refused reparation Phraates recognized that he was too weak to begin the struggle with Rome and contented himself with forming an alliance with Tigranes, in the hope that the future would bring an opportunity for revenge (Dio Cassius xxxvi, 3, 5, xxxvii, 5 ff.; Plut., Luc., 30; Plut., Pomp., 33, 38; cf. Sallust's letter of Mithradates to Arsaces).

Although Phraates III had not succeeded in regaining the full power of his predecessors, he felt justified in again assuming the title "king of kings"—which Pompey declined to acknowledge—and even in proclaiming himself as god (Phlegon, fr. 12 *ap.* Photius cod. 97; and on part of his coins), but about 57 B.C. he was assassinated by his sons Orodes and Mithradates.

Organization.— The Parthian empire as founded by the conquests of Mithradates I and restored first by Mithradates II and again by Phraates III was, to all exterior appearance, a continuation of the Achaemenid dominion. Thus the Arsacids now began to assume the old title "king of kings" (the shahanshah of modern Persia), though previously their coins, as a rule, had borne only the legend "great king." The official version, preserved by Arrian in his Parthica (*ap.* Phot. cod. 58; see PARTHIA), derives the line of these chieftains of the Parnian nomads from Artaxerxes II.

In reality, however, the Parthian empire was totally different from its predecessor, both externally and internally. It was anything but a world empire. The countries west of the Euphrates never owned its dominion, and even of Iran itself not half was subject to the Arsacids. There were indeed vassal states on every hand, but the actual possessions of the kings—the provinces governed by their satraps—consisted of a rather narrow strip of land, stretching from the Euphrates and north Babylonia through southern Media and Parthia as far as Arachosia (northwest Afghanistan), and following the course of the great trade route which from time immemorial had carried the traffic between the west of Asia and India. We still possess a description of this route by Isidore of Charax, probably dating from the Augustan period (in K. Müller, Geographi graeci *minores*, vol. i [Paris, 1855]; see also Isidore of Charax, tr. by W. H. Schoff, Parthian Stations [1914], in which is contained a list of the 18 imperial provinces known also to Pliny [vi, 112; cf. 41]. Isidore, indeed, enumerates 19, but Sacastene, which he includes, formed no part of the Parthian empire, as has been shown by A. von Gutschmid).

The Provinces.— The lower provinces (*i.e.*, the districts west of Parthia) are: (1) Rfesopotamia, with northern Babylonia, from the Euphrates bridge at Zeugma to Seleucia on the Tigris; (2) Apolloniatis, the plain east of the Tigris, with Artemita; (3) Chalonitis, the hill country of Zagros; (4) Western Media; (5) Cambadene, with Bagistana (Behistun), the mountainous portions of Media; (6) Upper Media, with Ecbatana; (7) Rhagiane or Eastern Media. Then with the Caspian Gates—the pass between Elburz and the central desert, through which lay the route from west Iran to east Iran—the upper provinces begin: (8) Choarene and (9) Comisene, the districts on the verge of the desert; (10) Hyrcania; (11) Astabene, with the royal town Asaac on the Attruck; (12) Parthyene with Parthaunisa, where the sepulchres of the kings were laid; (13) Apavarcticene (now Abiward, with the capital Kelat); (14) Margiane (Merv); (15) Aria (Herat); (16) Anauon, the southern portion of Aria; (17) Zarangiane, the country of the Drangians, on the lake of Hamun; (18) Arachosia, on the Etymander (Helmund), called by the Parthians "White India," extending as far as Alexandropolis (Kandahar), the frontier city of the Parthian empire.

On the lower Etymander, the Sacae (Saka) had established themselves—obviously on the inroad of the Scythian tribes—and after them the country was named Sacastene (now Sejistan, Seistan). Through it lay the route to Kandahar, and for this reason the district is described by Isidore, though it formed no part of the Parthian empire.

The Vassal States.— Around these provinces lay a ring of numerous minor states, which as a rule were dependent on the Arsacids. They might, however, partially transfer their allegiance on the rise of a new power (*e.g.*, Tigranes in Armenia) or a Roman invasion. Thus it is not without justice that the Arsacid period is described in the later Persian and Arabian tradition as the period of "the kings of the part-kingdoms"—among which the Ashkanians (*i.e.*, the Arsacids, from Ashak, the later pronunciation of the name; Arshak = Arsaces) had won the first place. This tradition, however, is nebulous in the extreme; the whole list of kings which it gives is totally unhistorical, only the names of one Balash (= Vologaeses) and of the last Ardewan (= Artabanus) having been preserved. The period from the death of Alexander to the Sassanid Ardashir I is put by the Persian tradition at 266 years; this was afterward corrected, after Syro-Grecian evidence, to 523 years. The actual number is 547 years (*i.e.*, 323 B.C. to A.D. 224). The statements of the Armenian historians about this period are also absolutely worthless.

The ten most important of the vassal states were:

1. The kingdom of Osroene (*q.v.*) in the northeast of Mesopotamia with Edessa as capital, founded c. 130 B.C. by the chieftain of an Arabian tribe, the Orrhoei, which established itself there.

2. To this must be added the numerous Arabian tribes of the Mesopotamian desert, under their chiefs, among whom one Alchaudonius came into prominence in the period of Tigranes and Crassus. Their settlement in Mesopotamia was encouraged by Tigranes, according to Plutarch (*Luc.*, 21) and Pliny (vi, 142). In later times the Arabic town Atra in an oasis to the west of the Tigris, governed by its own kings, gained special importance.

3 and 4. To the east of the Tigris lay two kingdoms: Gordyene (or Cordyene), the country of the Carduchians (now Bohtan), a wild mountainous district south of Armenia; and Adiabene (Hadyab), the ancient Assyria, on either side of the Zab (Lycus).

5. On the farther side of Zagros, adjoining Adiabene on the east, was the kingdom of Atropatene in north Media, now often simply called Media (*q.v.*).

While the power of Armenia was at its height under Tigranes (86–69 B.C.) all these states owned his rule. After the victories of Pompey, however, the Romans claimed the suzerainty, so that during the next decades and the expeditions of Crassus and Antony they oscillated between Rome and Parthia, though their inclination was generally to the latter. For they were all orientals and, consciously or unconsciously, representatives of a reaction against that Hellenism which had become the heritage of Rome. Also, the loose organization of the Parthian empire afforded them a greater measure of independence than they could hope to enjoy under Roman suzerainty.

6. In the south of Babylonia, in the district of Mesene (the modern Maisan), after the fall of Antiochus Sidetes in 129 B.C., an Arabian prince, Hyspaosines or Spasines (in a cuneiform inscription of 127, on a clay tablet dated after this year, he is called Aspasine), founded a kingdom which existed until the rise of the Sassanian empire. Its capital was a city (modern Khorramshahr, or Mohammerah) first founded by Alexander on an artificial hill by the junction of the Eulaeus (Karun) with the Tigris and peopled by his veterans. The town, originally named Alexandria and then rebuilt by Antiochus IV as Antiochia, was refortified with dikes by Spasines, and named Spasinu Charax ("the wall of Spasines"), or Charax (Pliny vi, 138 ff.). In the following centuries it was the main mercantile centre on the Tigris estuary.

The kingdom of Mesene, also called Characene, is known from occasional references in various authors, especially Lucian (*Ma-*

crobii, 16), as well as from numerous coins, dated by the Seleucian era, which allow us to frame a fairly complete list of the kings.' The Arabian dynasty speedily assimilated itself to the native population, and most of the kings bear Babylonian-in a few cases Parthian—names. The official language mas Greek, until, on the destruction of Seleucia (A.D. 164), it was replaced on the coinage by Aramaic. Another Babylonian dynast must have been Hadadnadinaches (*c.* 100 B.C.), who built in Tello the fortified palace which was excavated by G. C. E. Chocquin de Sarzec.

7. East of the Tigris lay the kingdom of Elymais (Elam), to which belonged Susa and its modern representative Ahwaz, farther down on the Eulaeus. The Elymaeans (Elamites), who had already offered a repeated resistance to the Seleucids, were subdued by Mithradates I, as mentioned above; but they remained a separate state which often rebelled against the Arsacids (Strabo xvi, 744; cf. Plut., Pomp., 36; Tacitus, Annals, vi, 50). Of the kings who apparently belonged to a Parthian dynasty, several bearing the name Camnascires are known to us from coins dated 81 and 71 B.C. One of these is designated by Lucian (Macrobii, 16) "king of the Parthians"; while the coinage of another, Orodes, displays Aramaic script (Allotte de la Fuÿe, Revue numismatique, 4th series. vol. vi, p. 92 ff. [1902]). The kingdom, which is seldom mentioned, survived till Ardashir I. In its neighbourhood Strabo mentioned "the minor dynasties of the Sagapenians and Silacenians" (xvi, 745). The Uxians, moreover, with the Cossaeans and other mountain tribes, maintained their independence exactly as under the later Achaemenids (Strabo xvi, 744; Pliny vi, 133).

8. In the district of Persis, the local dynasts became independent after the time of Antiochus IV. They perpetuated the Achaemenian traditions. and on their coins—which bear the Persian language in Aramaic characters; i.e., the so-called Pahlavi—appear as zealous adherents of Zoroastrianism and the fire cult (see PERSIS). They were forced, however, to acknowledge the suzerainty of Parthia, to which they stood in the same position as the Persians of the time of Cyrus and his forefathers stood to the Median empire (cf. Strabo xv, 728, 733, 736; Lucian, Macrobii, 1 j). In later times, before the foundation of the Sassanid dominion, Persis disintegrated into numerous small local states. Even in Carmania there were independent kings, one of whom gave his name to a town, Vologesocerta (Balashkert).

9. The east of Iran—Eactria with Sogdiana, eastern Arachosia and Gedrosia—was never subject to the Arsacids. There the Graeco-Bactrian and Graeco-Indian kingdoms held their own until, in 139 B.C., they succumbed before the invading Mongolian and Scythian tribes (see BACTRIA and works quoted there). But in the Indus district the Greek kings held their ground for an appreciably longer period and. for a while. widely extended their power (see MENANDER of India). Among the kings then following. known only from their coins. there appears a dynasty with Iranian and sometimes peculiarly Parthian names which seems to have reigned in the Punjab and Arachosia. Its best-known representative, Gondophares or Hyndopherres, to whom legend makes the apostle Thomas write. reigned over Arachosia and the Indus district from about A.D. 19 to 45 (W. W. Tarn, op. cit., p. 353 et seq.). Further, about A.D. 70, the Periplus of the Erythraean Sea mentions that the great commercial town of Minnagar in the Indus delta was under Parthian kings, "who spent their time in expelling one another." Here, then, it would seem there existed a Parthian dynasty which probably went back to the conquests of Mithradates I (cf. Vincent A. Smith, "The Indo-Parthian Dynasties From About 120 B.C. to A.D. 100," Zeitschrift der deutschen morgenländischen Gesellschaft, lx [Leipzig, 1906]; E. Herzfeld, "Sakastan," Archaeologische Mitteilungen aus Iran, iv [Berlin, 1931–32]). Naturally such a dynasty would not long have recognized the suzerainty of the Arsacids. It succumbed to the Indo-Scythian empire of the Kushana, who had obtained the sovereignty of Bactria as early as about A.D. 50 and then pressed onward into India. In the period of the Periplus (*c.* A.D. 50) the Scythians were already settled in the Indus valley (pp. 38, 41, 48); their dominion reached its zenith under Kanishka, whose date is controversial, either A.D. 78–103 (cf. W. W. Tarn, op. cit., p. 352) or after A.D. 128 (Sir John Marshall in Journal of the Royal Asiatic Society, pp. 3–32 [London, 1947]).

This empire of the Kushana merits special mention here, because of its peculiar religious attitude, which we may gather from the coins of its kings, on which an alphabet taken from the Greek is employed (cf. Sir Aurel Stein: "Zoroastrian Deities on Indo-Scythian Coins," Babylonian and Oriental Record, vol. i [London, 1887]). Kanishka, as is well known, had embraced Buddhism, and some of his coins bear the image and name of Buddha. Iranian divinities, however, predominate on his currency: Mithras (Mihro or Helios); the moon, Mah (also Selene); Athro, the fire; Orthragno (Verethragna); Pharro = Farna (Hvarena), "the majesty of kingship"; Teiro = Tir (Tistrya, "the archer"); Nana (Nanaia); and others. Here, then, was a perfect example of syncretism, as in the Mithras cult in Armenia, Asia Minor and, still further, in the Roman empire. Buddhism and Zoroastrianism were wedded in the state religion and, in characteristic Indian fashion, were on the best of terms with one another.

10. Originally a part of the Turanian steppe belonged to the Arsacids; it was the starting point of their power. Soon, however, the nomads (Dahae) gained their independence and, as we have seen, repeatedly attacked and devastated the Parthian empire in conjunction with the Tokharians and other tribes of Sacae and Scythians.

The Character of the *Empire.*—It may appear surprising that the Arsacids made no attempt to incorporate the minor states in the empire and create a great and united dominion, such as existed under the Achaemenids and was afterward restored by the Sassanids. This fact is the clearest symptom of the inner weakness of their empire and of the small power wielded by the "king of kings." In contrast alike with its predecessors and its successors, the Arsacid dominion was peculiarly a chance formation—a state which had come into existence through fortuitous external circumstances and which had no firm foundation within itself or any intrinsic raison d'dtre.

Three elements of widely differentkinds contributed to its origin and defined its character. It was sprung from a predatory nomad tribe (the Parnian Dahae, Scythians) which had established itself in Khurasan (Parthia), on the borders of civilization, and thence gradually annexed further districts as the political situation or the weakness of its neighbours allowed. Consequently these nomads were the main pillar of the empire, and from them were obviously derived the great magnates, with their huge estates and hosts of serfs, who composed the imperial council, led the armies, governed the provinces and made and unmade the kings (Strabo xi, 515; Justin xli, 2; the former terming them συγγενεῖς, "kinsmen," of the king, the latter probuli). Of these great families that of Surenas held the privilege of setting the diadem on the head of the new king (Plut., Crassus, 21; Tac., Ann., vi, 42).

The military organization, moreover! was wholly nomadic in character. The nucleus of the army was formed of armoured horsemen, excellently practised for long-distance fighting with bow and javelin, but totally unable to venture on a hand-to-hand conflict, their tactics being rather to swarm round the enemy's squadrons and overwhelm them under a hail of missiles. When attacked they broke up, as it seemed, in hasty and complete flight, and, having thus led the hostile army to break its formation, they rapidly reformed and renewed the assault. How difficult it was for infantry to hold their own against these mounted squadrons was demonstrated by the Roman campaigns, especially in broad plains like those of Mesopotamia. In winter, however, the Parthians were powerless to wage war, as the moisture of the atmosphere relaxed their bows. The infantry, in contrast with its earlier status under the Persians, was wholly neglected, but every magnate put into the field as many mounted warriors as possible, chiefly servants and bought slaves who, like the Janissaries and Mamelukes, were trained exclusively for war. Thus Surenas, in 53 B.C., is said to have put at the king's disposal 1,000 mailed horsemen and 10,000 men, including the train, which also comprised his attendants and harem (Plut., Crass., 21; description of the military

PARTHIA. THE THICKER BROKEN LINE MARKS THE BOUNDARIES OF PROVINCES UNDER CONTINUOUS PARTHIAN RULE. THE BOUNDARIES OF THE EMPIRE CONTINUALLY VARIED, AND THE OUTLINES OF CERTAIN VASSAL PROVINCES ARE SHOWN

organization in Dio Cass. 40, 15; Justin xli, 2). In the army of 50,000 mounted men which took the field against Mark Antony there were, says Justin, only 400 freemen.

How vital was the nomadic element in the Parthian empire is obvious from the fact that in civil wars the deposed kings consistently took refuge among the Dahae or Scythians and were restored by them. But in Parthia these nomads were amalgamated with the native peasantry and had adopted their dress and manners as well as their religion. Even the kings, after the first two or three, wore their hair and beards long in the Iranian fashion, whereas their predecessors were beardless.

Although the Arsacids were strangers to any deep religious interest (in contrast with the Achaemenids and Sassanids), they acknowledged the Persian gods and the leading tenets of Zoroastrianism. They erected fire altars and even obeyed the command to abandon all corpses to the dogs and fowls (Justin xli, 3). The union, moreover, recommended by that creed between brother and sister—and even son and mother—occurred among them. And besides the council of the nobility, there was a second council of "Magians and wise men" (Strabo xi, 515).

Again, they perpetuated the traditions of the Achaemenid empire. The Arsacids assumed the title "king of kings" and derived their line from Artaxerxes II. Further, the royal apotheosis, a very ancient Asiatic conception so common among them and recurring under the Sassanids, was a direct development of Iranian views. At the side of the great god Xhura Mazda there stood a host of subordinate divine beings who executed his will—among these the deified heroes of legend, to whose circle the king was now admitted, since on him Xhura Mazda had bestowed victory and might.

This gradual absorption by the Iranians of the Parthian empire is shown by the way later Iranian traditions, and Firdousi in particular, apply the name of the "Parthian" magnates (*Pahlavan*) to the glorious heroes of the legendary epoch. Consequently, also, the language and writing of the Parthian period, which were retained under the Sassanids, received the name "Pahlavi"; *i.e.*, "Parthian." The script was derived from the Aramaic.

But to these oriental elements must be added that of Hellenism, the dominant world culture, which had penetrated Parthia and Media. It was indispensable to every state which hoped to play some part in the world and was not so utterly secluded as Persis and Atropatene; and the Arsacids entertained less thought of opposition as they were destitute of an independent national basis. All their external institutions were borrowed from the Seleucid empire: their coinage with its Greek inscriptions and nomenclature; their Attic standard of currency; and, doubtless, a great part of their administration also. In the towns Greek merchants were everywhere settled. Mithradates I even followed the precedent of the Seleucids in building a new city, Arsacia, which replaced the ancient Rhagae (Rayy, Europus) in Media. The further the Arsacids expanded, the deeper they penetrated the province of Hellenism: the first Mithradates himself assumed, after his great conquests, the title of *Philhellene*, "the protecter of Hellenism," which mas retained by almost all his successors. Then follow the surnames *Epiphanes*, "the revealed god"; *Dikaios*, "the just"; *Euergetes*, "the benefactor." All were essentially Greek in their reference and also were regularly borne by all the kings. After the conquest of the Euphrates and Tigris provinces it was imperative that the royal residence should be fixed there. But as no one ventured to transfer the royal household and the army, with its hordes of wild horsemen, to the Greek town of Seleucia, and thus disorganize its commerce, the Arsacids set up their abode in the great village of Ctesiphon on the left bank of the Tigris, opposite Seleucia, which accordingly retained its free Hellenic constitution (see CTESIPHON; SELEUCIA). Orodes I spoke good Greek, and Greek tragedies were staged at his court (Plut., *Crass.*, 33).

In spite of this, however, the rise of the Arsacid empire marks the beginning of a reaction against Hellenism—not a conscious or official reaction, but a reaction which was all the more effective

because it depended on the impetus of circumstances working with all the power of a natural force. The east was turning away from the Mediterranean and the Hellenic world, feeling that it could derive no fresh powers from that quarter and that, consequently, the influence of the oriental elements must steadily increase. This process can be most clearly traced on the coins—almost the sole memorials that the Parthian empire has left. From reign to reign the portraits grow poorer and more stereotyped and the inscriptions more neglected, till it becomes obvious that the engraver himself no longer understood Greek but copied mechanically the signs before his eyes, as is the case with the contemporary Indo-Scythian coinage and also in Mesene. Indeed, after Vologaeses I (51–79), the Aramaic script is occasionally employed. The political opposition to the western empires, the Seleucids first, then the Romans, precipitated this development. Naturally enough the Greek cities beheld a liberator in every army that marched from the west and were ever ready to cast in their lot with them—a disposition for which the subsequent penalty was not lacking. The Parthian magnates, on the other hand, with the army, would have little to do with Greek culture and Greek modes of life, which they contemptuously regarded as effeminate and unmanly. They required of their rulers that they should live in the fashion of their country, practise arms and the chase and appear as oriental sultans, not as Grecian kings.

These tendencies taken together explain the radical weakness of the Parthian empire. It was easy enough to collect a great army and achieve a great victory; it was absolutely impossible to hold the army together for any longer period or to conduct a regular campaign. The Parthians proved incapable of creating a firm, united organization, such as the Achaemenids before them and the Sassanids after them gave to their empire. The kings themselves were toys in the hands of the magnates and the army, who, tenaciously as they clung to the anointed dynasty of the Arsacids, were utterly indifferent to the person of the individual Arsacid. Every moment they were ready to overthrow the reigning monarch and to set another on his throne. The kings, for their part, sought protection in craft, treachery and cruelty, and succeeded only in aggravating the situation. More especially they saw an enemy in every prince and the worst of enemies in their own sons. Assassination was thus common in the royal household, and frequently it was merely a matter of chance whether the father acted before the son or the son before the father. The conditions were the same as obtained later under the Mohammedan caliphate and the empire of the Ottomans. The internal history of the Parthian dominion is an unbroken sequence of civil war and dynastic strife.

For the literature dealing with the Parthian empire see PARTHIA.

The Wars With Rome.—These conditions elucidate the fact that the Parthian empire, though founded on annexation and perpetually menaced by hostile arms in both the east and the west, never took a strong offensive after the days of Mithradates II. It was bound to protect itself against Scythian aggression in the east and Roman aggression in the west. To maintain, or regain, the suzerainty over Mesopotamia and the vassal states of that region, and also over Atropatene and Armenia, was its most imperative task. Yet it always remained on the defensive and even so was lacking in energy. Whenever it made an effort to enforce its claims, it retreated as soon as it was confronted by a resolute foe.

Thus the wars between Parthia and Rome did not proceed from the Parthians—deeply injured though they were by the encroachments of Pompey—but from Rome itself. Rome had been obliged, reluctantly enough, to enter upon the inheritance of Alexander the Great and since the time of Pompey had subjected the Hellenistic countries as far as the Euphrates. Thus the task now faced the Romans of annexing the remainder of the Macedonian empire, the whole east from the Euphrates to the Indus, and of thereby saving Greek civilization (cf. Plut., *Comparatio Niceas et Crassus,* 4). The aristocratic republic quailed before such an enterprise, though Lucullus at the height of his successes entertained the thought (Plut., *Luc.,* 30). But the ambitious men whose goal was to erect their own sovereignty on the ruins of the republic took up the project. With this objective M. Licinius Crassus, the triumvir, in 54 B.C. took the aggressive against Parthia, the occasion being favourable because of the dynastic troubles between Orodes I, the son of Phraates III, and his brother Mithradates III. Crassus met his death through treachery after his army was routed at Carrhae (June 9, 53 B.C.). With this Mesopotamia was regained by the Parthians and King Artavasdes of Armenia now entered their alliance. But, apart from the ravaging of Syria (51 B.C.) by Pacorus, the son of Orodes, the threatened attack on the Roman empire neither materialized then nor during the civil war of Caesar and Pompey.

At the time of his assassination Caesar was intent on resuming the expedition of Crassus. The Parthians formed a league with Brutus and Cassius, as previously with Pompey, but gave them no support until in 40 B.C. a Parthian army led by Pacorus and the republican general Labienus harried Syria and Asia Minor. But it was easily repulsed by Ventidius Bassus, Mark Antony's lieutenant. Pacorus himself fell on June 9, 38 B.C., at Gindarus in northern Syria. Antony then attacked the Parthians in 36 B.C. and penetrated through Armenia into Atropatene, but was defeated by Phraates IV—who in 37 B.C. had murdered his father, Orodes 11—and was compelled to retreat with heavy losses. The continuation of the war was frustrated by the conflict with Octavian. Armenia alone was again subdued in 34 B.C. by Antony, who treacherously captured and executed King Artavasdes.

The **Pax** Romans.-The Romans expected Augustus to take up the work of his predecessors, annihilate the Parthian dominion and subdue the east as far as the Indians, Scythians and Seres (cf. Horace and the other Augustan poets). But Augustus disappointed these expectations. His whole policy and the needs of the newly organized Roman empire demanded peace. His efforts were devoted to reaching a *modus vivendi,* by which the authority of Rome and its most vital claims might be peacefully vindicated. This the weakness of Parthia enabled him to do without much difficulty. His endeavours were seconded by the revolt of Tiridates II, before whom Phraates IV was compelled to flee (32 B.C.) until he was restored by the Scythians. Augustus lent no support to Tiridates in his second march on Ctesiphon (26 B.C.), but Phraates was all the more inclined on that account to stand on good terms with him. Consequently in 20 B.C. he restored the standards captured in the victories over Crassus and Antony and recognized the Roman suzerainty over Osroene and Armenia. In return the Parthian dominion in Babylonia and the other vassal states was left undisputed.

Thus it was due not to the success and strength of the Parthians but largely to the principles of Roman policy as defined by Augustus that the Parthian empire appears as a second great independent power, side by side with Rome. The precedence of the Caesars, indeed, was always admitted by the Arsacids; and Phraates IV soon entered into a state of dependency on Rome by sending (9 B.C.) four of his sons as hostages to Augustus—a convenient method of getting rid of them without killing them. In 2 B.C., however, Phraates was assassinated by his favourite wife, Musa, and her son Phraates V. In the subsequent broils a Parthian faction obtained the release of one of the princes interned in Rome as Vonones I (A.D. 8). He failed, however, to maintain his position for long. He was a stranger to the Parthian customs, and the feeling of shame at dependency on the foreigner was too strong. So the rival faction brought out another Arsacid, resident among the Scythian nomads, Artabanus III, who easily expelled Vonones —only to create a host of enemies by his brutal cruelty and to call forth fresh disorders.

Similar proceedings were frequently repeated in the period that followed. In the intervals the Parthians made several attempts to reassert their dominion over Armenia and there install an Arsacid prince; but on each occasion they retreated without giving battle as soon as the Romans prepared for war. The dynasty of Atropatene was finally deposed, however, and the country placed under an Arsacid rules. Actual conflict with Rome broke out under Vologaeses (Volagases) I (51–79), who made his brother Tiridates king of Armenia. After a long war in which the Roman army was commanded by G. Domitius Corbulo, a peace was concluded in 63, confirming the Roman suzerainty over

Armenia but recognizing Tiridates as king (see CORBULO, GNAEUS DOMITIUS). Tiridates himself visited Rome and was there invested nith the diadem by Nero (66). After that Armenia continued under the rule of an Arsacid dynasty.

These successes of Vologaeses were counterbalanced by serious losses in the east. He was hampered in an energetic campaign against Rome by attacks of the Dahae and Sacae. Hyrcania also revolted and asserted its independence under a separate line of kings. A little later the Alans (Alani), a great Iranian tribe in the south of Russia—the ancestors of the Ossets—broke for the first time through the Caucasian passes and ravaged Media and Armenia—an incursion which they often repeated in the following centuries.

Progress of Anti-Hellenism.—On the other side, the reign of Vologaeses I mas characterized by a great advance in the oriental reaction against Hellenism. The line of Arsacids which came to the throne in the person of Artabanus II (AD. 10) stood in open opposition to the old kings with their leanings to Rome and their at least external tinge of Hellenism. The new regime obviously laid much more stress on the oriental character of its state, though Philostratus in his life of Apollonius of Tyana (in reality a fantastic romance which contains scarcely any historical information) states that Vardanes I (A.D. 39–47), the rival king to the brutal Gotarzes (A.D. 38–51), was a cultivated man (Vit. Ap., i, 22, 28, 31 et seq.); and Vologaeses I was distinguished by his excellent relations with his brothers Pacorus and Tiridates, the kings of Media and Armenia. But the coins of Vologaeses I are quite barbarous, and for the first time on some of them appear the initials of the name of the king in Aramaic letters by the side of the Greek legend. The Hellenism of Seleucia was now attacked with greater determination. For seven years (37–43) the city maintained itself in open rebellion (Tac., Ann., xi, 8), until at last it surrendered to Vardanes, who in consequence enlarged Ctesiphon, which was afterward fortified by Pacorus II (A.D. 78–96: V. Ammianus Marcellinus, 23, 6, 23); although one of his coins, dated 115/116, was found at Seleucia, fdr which cf. R. H. McDowell, Coins From *Seleucia* on the Tigris, p. 193 (1935). In the neighbourhood of the same town Vologaeses I founded a city, Volagesocerta (Balashkert), to which he attempted to transplant the population of Seleucia (Pliny vi, 122; cf. T. Noldeke, *Zeitschrift* der *deutschen morgenländischen* Gesellschaft, xxviii, 100 [1874]). Another of his foundations was Volagesias (the Arabian Ullais), socth of Babylon on the Euphrates, which did appreciable damage to the commerce of Seleucia and is often mentioned in inscriptions as the destination of the Palmyrene caravans.

After Vologaeses I came a period of great disturbances. The literary tradition is lacking, but the coins and isolated literary references prove that during the years 77 to 147 two kings, and sometimes three or more, were often reigning concurrently: Artabanus IV, 80–81; Osroes, 109/110–128/129; Vologaeses II, 105/106–147; Vologaeses III, 148–192; Vologaeses IV, 191–207/208; Vologaeses V, 207/208–222/223; Artabanus V, c. 213–227; Artavasdes, *c.* 227–228/229?; *cf.* N. C. Debevoise, *A* Political History of *Parthia,* p. 270 (1938).

The coinage of this period, increasingly poor, indicates a marked cultural deterioration within the empire. Obviously the empire can have seen little peace during these years, a fact which materially assisted the aggressive campaigns of Trajan (113–117). Trajan resuscitated the old project of Crassus and Caesar, by which the empire of Alexander as far as India was to be won for western civilization. In pursuance of this plan he reduced Armenia, Mesopotamia and Babylonia to the position of imperial provinces. On his death, however, Hadrian immediately reverted to the Augustan policy and restored the conquests. Meanwhile the rise in the east of the powerful Indo-Scythian empire of the Kushana doubtless limited still further the Parthian possessions in eastern Iran.

An era of quiet seems to have returned with Vologaeses III, and no more is heard of rival kings. With the Roman empire a profound peace had reigned since Hadrian (117), which was first disturbed by the attack of Marcus Aurelius and Aelius Verus in 162, This war, which broke out on the question of Armenia and Osroene, proved of decisive significance for the future development of the east, for in its course Seleucia was destroyed by the Romans under Avidius Cassius (164). The downfall of the great Greek city sealed the fate of Hellenism in the countries east of the Euphrates. Greek culture practically vanished and gave place to Aramaic; it is significant that from that time the kings of Mesene stamped their coinage with Aramaic legends. This Aramaic victory was powerfully aided by the ever-increasing progress of Christianity, which soon created an Aramaic literature of which the language was the dialect of Edessa, a city in which the last king of Osroene, Abgar IX (179–214), had been converted to the faith. After that Greek culture and Greek literature were accessible to the orientals only in an Aramaic dress. Vologaeses III is probably also the king Valgash who, according to a native tradition preserved in the *Dinkart,* began a collection of the sacred writings of Zoroaster—the origin of the Avesta which has come down to us. This would show how the national Iranian element in the Parthian empire was continually gathering strength.

The Roman war was closed in 165 by a peace which ceded northwest Mesopotamia to Rome. Similar conflicts took place in 195–202 between Vologaeses IV (191–208) and Septimius Severus, and again in 216–217 between Artabanus V (213–227) and Caracalla. They failed, however, to affect materially the position of the two empires.

THE SASSANIAN EMPIRE, *c.* A.D. 224–651

Ardashir I (226–241).—That the Arsacid empire should have endured 400 years after its foundation was the result not of internal strength but of chance working in its external development. It might have existed equally well for centuries more. But under Artabanus V the catastrophe came. In his days there arose in Persis—precisely as Cyrus had arisen under Astyages the Mede—a great personality. Ardashir (Artaxerxes) I, son of Papak (Babek), the descendant of Sasan, was the sovereign of one of the small states into which Persis had gradually been divided. His father, Papak, had taken possession of the district of Istakhr, which had replaced the old Persepolis, long a mass of ruins. Thence Ardashir I, who reigned from about A.D. 208, subdued the neighbouring potentates—disposipg of his own brothers among the rest. Ardashir's seizure of Carmania, Isfahan, Susiana and Mesene quickly led to war with his suzerain, Artabanus V. The conflict lasted several years and the Parthians were worsted in three battles. The last of these (224) witnessed the fall of Artabanus, though a Parthian king, Artavasdes—one of the sons of Artabanus and known only from his own coins—appears to have retained a portion of the empire for some time longer. The members of the Arsacid line who fell into the hands of the victor were put to death; a number of the princes found refuge in Armenia, where the Arsacid dynasty maintained itself until 429.

Ardashir subdued Seistan (Sakastan), Gurgan (Hyrcania), Abharshahr (modern Khurasan), Merv (Margiana), Balkh (Bactria), Khwarizm (Chorasmia). Afterward the king of Kushana and the kings of Turan (Quzdar, south of Quetta) and of Makran recognized him as sovereign. The victorious Ardashir also took possession of the palace of Ctesiphon and assumed the title "king of the kings of the Iranians" (*βασιλευς βασιλεων 'Αριανων*).

The new empire founded by Ardashir I—the Sassanian or neo-Persian empire—was essentially different from that of his Arsacid predecessors. It was, rather, a continuation of the Achaemenid traditions which were still alive on their native soil. Consequently the national impetus, already clearly revealed in the title of the new sovereign, again became strikingly manifest. The Sassanian empire was once more a national Persian or Iranian empire (see ARDASHIR). The religious element was, of course, inseparable from the national, and Ardashir, like all the dynasts of Persis, was an ardent devotee of the Zoroastrian doctrine and closely connected with the priesthood. In his royal style he assumed the designation "Mazdayasnian" (*Μασδάσνος*), and the fire cult was everywhere vigorously disseminated. Simultaneously the old claims to world dominion made their reappearance. After the defeat of Artabanus, Ardashir, as heir of the Achaemenids, formulated his pretensions to the dominion of western Asia (Dio. Cass.

80, 3; Herodian vi, 2, 4; Zonar xii, 15; similarly under Shapur II: Ammian. Marc. xvii, 5, 5). He attacked Armenia, though without permanent success (cj. A. von Gutschmid, Zeitschrijt der *deutschen morgenländischen* Gesellschaft, vol. xxxi, p. 47 [1877], on the fabulous Armenian account of these wars), and dispatched his armies against Roman Mesopotamia. They strayed as far as Syria and Cappadocia. The inner decay of the Roman empire and the widespread tendency of its troops to mutiny and usurpation favoured his enterprise. Nevertheless the armies of Alexander Severus, supported by the king of Armenia, succeeded in repelling the Persians, though the Romans sustained severe losses (231–233).

Toward the end of his reign Ardashir resumed the attack while his son Shapur I (241–272) reduced Nisibis and Carrhae and penetrated into Syria, but was defeated by Gordian III at Resaena (243). Soon afterward, however, the Roman empire seemed to collapse utterly. The Goths defeated Deciu's (251) and harried the Balkan peninsula and Asia Minor, while insurrections broke out everywhere and the legions created one Caesar after the other. Then Shapur resumed the war, subdued Armenia and plundered Antioch. The emperor Valerian, who marched to encounter him, was overthrown at Edessa and taken prisoner (260). The Persian armies advanced into Cappadocia; but there Ballista or Balista (d. c. 264) beat them back and Odaenathus (Odainath), prince of Palmyra (*q.v.*), rose in their rear, defeated Shapur, captured his harem and twice forced his way to Ctesiphon (263–265). Shapur was in no position to repair the defeat or even to hold Armenia, so that the Sassanid power failed to pass the bounds of the Arsacid empire. Nevertheless Shapur I, in contrast with his father, assumed the title "king of the kings of the Iranians and non-Iranians" (*βασιλευς βασιλεων, Αριανων και Αναριανων*; *shahan* shah Eran ut Aneran), thus emphasizing his claim to world dominion. His successors kept the title, little as it corresponded to the facts, for the single non-Iranian land governed by the Sassanids was, as under the Parthians, the district of the Tigris and Euphrates as far as the Mesopotamian desert; western and northern Mesopotamia remained Roman.

Organization.— The Sassanid ruler was the representative of the "kingly majesty," derived from Ormuzd (Ahura Mazda), which appears in the Avesta as the angel Kavaem Hvareno, "the royal glory," and according to legend, once beamed in the Iranian kings, unattainable to all but those of royal blood. A sculpture that frequently recurs in the rock reliefs of Ardashir I and Shapur I represents the king and the god Ormuzd both on horseback, the god in the act of handing to his companion the ring of sovereignty. Thus it is explicable that all the Sassanids, as many of the Arsacids before them, included the designation of "god" in their formal style. From this developed (as already under the Arsacids) a strict principle of legitimacy. It applied, however, to the whole royal house, precisely as it did later in the Ottoman empire. The person of the individual ruler was a matter of indifference. He could readily be removed and replaced by another; but no usurper who was not of the legitimate blood could hope to become the genuine king. Therefore the native tradition carried the Sassanid line back to the Achaemenids and, still further, to the kings of the legendary period.

Officially the king was all powerful, and his will, guided by the god and bound up in his law, was unfettered. Externally, he was surrounded by all the splendour of sovereignty: on his head he wore a great and resplendent crown, varying with each different ruler; he was clothed in gold and jewels; around him was a brilliant court, composed of his submissive servants. He sat in dazzling state on his throne in Ctesiphon. All who would approach flung themselves to the ground; life and death depended on his nod. Among his people he was accounted the fairest, strongest and wisest man of the empire; from him was required the practice of all piety and virtue, as well as skill in the chase and in arms—especially the bow. Ardashir I and his successors, moreover, endeavoured to establish the validity of the royal will by absorbing the vassal states and instituting a firmer organization. Nevertheless they failed to attain the complete independence and power of the Achaemenids. Not strong enough to break up the nobility, with its great estates, they were forced to use it and still further to promote its interests; while their dependence on its good will and assistance led inevitably to incessant gifts of money, lands and men. This state of affairs had also prevailed under the later Achaemenids and had materially contributed to the disintegration of the empire and the numerous insurrections of the satraps.

But the older Achaemenids held an entirely different position, and hardly a single Sassanid enjoyed even that degree of power which was still possessed by the later Achaemenids. It was of fundamental importance that the Sassanian empire could not make good its claim to world dominion; and, in spite of the title of its kings, it always remained essentially the kingdom of Iran—or rather west Iran, together with the districts on the Tigris and Euphrates. This fact, again, is most closely connected with its military and administrative organization. The external and internal conditions of the empire were in mutual reaction. The empire, which in extent did not exceed that of the Arsacids with its vassal states, was protected on the east and west by the great deserts of central Iran and Mesopotamia. For the defense of these provinces the mounted archers, who formed the basis of the army, possessed adequate strength; and though the Scythian nomads from the east or the Romans from the west might occasionally penetrate deep into the country, they never succeeded in maintaining their position. But the power of the neo-Persian empire was not great enough for further conquests. Though its army was capable and animated by a far stronger national feeling than that of the Parthians, it still consisted of levies from the retinue of the magnates led by their territorial lords; and although these troops would stream in at the beginning of a war they could not be kept permanently together. For, on the one hand, they were actuated by the most varied personal interests and antipathies, not all of which the king could satisfy; on the other hand, because of the natural character and organization of his dominions, he could not maintain and pay a large army for any length of time. Thus the great hosts soon melted away and a war begun successfully ended ingloriously and often disastrously. Under such circumstances an elaborate tactical organization employing different kinds of arms, or the execution of a comprehensive plan of campaign, was out of the question. The successes of the Sassanids in the east were gained in the later period of their dominion; and the Roman armies, in spite of decay in discipline and military spirit, still remained their tactical and strategical superiors. A great victory might be won; even an emperor might be captured, like Valerian; but immediately afterward successes such as those gained against Shapur I (who was certainly an able general) by Ballista and Odaenathus of Palmyra, or the later victories of Carus, Julian and others, demonstrated how far the Persians were from being on an equality with the Romans. That Babylonia permanently remained a Sassanian province was a result chiefly of the geographical conditions and of the political situation of the Roman empire, not of the strength of the Persians.

Among the magnates six great houses—seven if we include the royal house—were still regarded as the foremost, precisely as under the Achaemenids, and from these were drawn the generals, crown officials and governors (*cf.* Procopius, Persica, i, 6, 13 et seq.). In the last of these positions were princes of the blood, who then bore the royal title (shah). Some of these houses—whose origin the legends derive from King Gushtasp (*i.e.*, Vishtaspa), the protector of Zoroaster (J. Marquart, *Zeitschrift* der *deutschen* morgenlandischen Gesellschajt, vol. xlix, p. 628 et seq. [1895])—already existed under the Arsacids; *e.g.*, the Suren (Surenas) and Karen (Carenes; Tac., Ann., xii, 12 et seq.), who had embraced the cause of the victorious dynasty at the correct moment and so retained their position. The name Pahlavan, moreover, which denoted the Parthian magnates, passed over into the new empire. Below these there was an inferior nobility, the dihkans ("village lords") and the "knights" (*aswar*), who, as among the Parthians, took the field in heavy scale armour. To an even greater extent than under the Arsacids the empire was subdivided into a host of small provinces, at the head of each being a marzban ("boundary lord," "lord of the marches"). These were again grouped in four great districts. With each of these local potentates the king could

deal with as scant consideration as he pleased, always provided that he had the power to make himself feared. But to break through the system or replace it by another was impossible. In fact he was compelled to proceed with great caution whenever he wished to elevate a favourite of humbler origin to an office which custom reserved for the nobility. Thus it is all the more worthy of recognition that the Sassanian empire was a fairly orderly empire, with an excellent legal administration, and that the later sovereigns did their utmost to repress the encroachments of the nobility, to protect the commonalty and to carry out a just system of taxation.

Religious Development. — Side by side with the nobles ranked the spiritual chiefs, now a far more powerful body than under the Arsacids. Every larger district had its upper Magian (*Magupat*, mobed; *i.e.*, "lord of the Magian"). At their head was the supreme mobed, resident in Rhagae (Rayy), who was regarded as the successor of Zoroaster. In the new empire, of which the king and people were alike zealous professors of the true faith, their influence was extraordinarily strong (*cf.* Agathias ii, 26)—comparable with the influence of the priesthood in later Egypt and, even more, in Byzantium and mediaeval Christendom. 4s has already been indicated, the essential difference between the Sassanid empire and the older Iranian states lay in their religious attitudes. But in detail the fluctuations were so manifold that it is necessary at this point to enter more fully into the history of Persian religion (*cf.* especialiy H. Gelzer, "Eznik und die Entwickelung des persischen Religions-systems," *Zeitschrift fur armenische Philologie*, vol. i, p. 149 *et seq.* [Marburg, 1903]).

The Persian religion spread more and more widely after the Achaemenian period. In the Indo-Scythian empire the Persian gods were zealously worshipped; in Armenia the old national religion was almost entirely banished by the Persian cults (H. Gelzer, "Zur armenischen Gotterlehre," in *Berichte über die Verhandlungen der Königlich sachsischen der Wissenschaften xu Leipzig, pkililogisch-historische Classe* [1896]); in Cappadocia, north Syria and the west of Asia Minor, the Persian gods were e erywhere adored side by side with the native deities. It was in the 3rd century that the cult of Mithras, with its mysteries and a theology evolved from Zoroastrianism, attained the widest diffusion in all Latin-speaking provinces of the Roman dominion. It even seemed for a while as though the *Sol invictus Mithras*, highly favoured by the Caesars, would become the official deity in chief of the empire. But in all these cults the Persian gods were perfectly tolerant of other native or foreign divinities; vigorous as was their missionary zeal, it was yet far removed from an attack on other creeds. Thus this Parseeism always bears a syncretic character, and the supreme god of Zoroastrian theory, Ahura Mazda (*i.e.*, Zeus or Jupiter), in practice yields place to his attendant deities, who work in the world and are able to lead the believer, who has been initiated and keeps the commandments of purity, to salvation.

But meanwhile in its Iranian home and especially in Persis the religion of Zoroaster was undisturbed by the proceedings of the outside world. There the poems of the prophet and fragments of ancient religious literature survived, understood by the Magians and rendered accessible to the faithful laity by versions in the modern dialect (Pahlavi). There the opposition between the good spirit of light and the demons of evil—between Ormuzd (Ahura Mazda) and Ahriman—still remained the principal dogma of the creed; and all other gods and angels, however estimable their aid. were but subordinate servants of Ormuzd. whose highest manifestation on earth was not the sun god Mithras but the holy fire guarded by his priests. There all the prescriptions of purity—partly connected with national customs and impossible of execution abroad—were diligently observed; even the injunction not to pollute the earth with corpses, but to cast out the dead to vulture and dog, was obeyed in its full force. At the same time Ahura Mazda preserved his character as a national god, who bestowed on his worshippers victory and world dominion. In the sculptures of the Sassanids, as also in Armenian traditions, he appears on horseback as a war god. Here again the theology was further developed and an attempt made to annul the old dualism by envisaging both Ormuzd and' Ahriman as emanations of an original principle of infinite time (Zervan), a doctrine which long enjoyed official validity under the Sassanids until, in the reign of Chosroes I, "the sect of Zervanites" was pronounced heretical.' But, above all, the ritual and the doctrine of purity were elaborated and expanded, and there was evolved a complete and detailed system of casuistry dealing with all things allowed and forbidden, the forms of pollution and the expiation for each, etc., which in its arid and spiritless monotony vividly recalls the similar prescriptions in the Pentateuch. The consequences of this development mere that orthodoxy and literal obedience to all priestly injunctions assumed an importance far greater than previously; from that time the great comniandment of Zoroastrianism, as of Judaism, was to combat the heresies of the heathen, a movement which had already had an energetic representative in the prophet himself. Heathenish cults and forbidden manners and customs were considered a pollution to the land and a deep insult to the true God. Therefore the duty of the believer was to combat and destroy the unbeliever and the heretic. In short, the tolerance of the Achaemenids and the indifference of the Arsacids were replaced by intolerance and religious persecution.

Religion of the **Sassanids.**—Such were the views in which Ardashir I grew up, and in their energetic prosecution he found a potent instrument for the building up of his empire. It has previously been mentioned that Vologaeses III had already begun a collection of the holy writings; the task was resumed under Ardashir. At his order the orthodox doctrines and texts were compiled by the high priest Tansar; all divergent theories were prohibited and their adherents proscribed. Thus arose the *Avesta*, the sacred book of the Parsees. Above all, the sacred book of laws, the *Vendidad*, breathes throughout the spirit of the Sassanian period in its intolerance, its casuistry degenerating into absurdity, and its soulless monotony. Subscription to the restored orthodox doctrine was to the Iranian a matter of course. Ardashir imprisoned the schismatics for a year; if at the end of this period they still refused to listen to reason they were executed. It is even related that in his zeal for uniformity of creed Ardashir wished to extinguish the holy fires in the great cities of the empire and the Parthian vassal states, leaving only that which burned in the residence of the dynasty. This plan he was unable to execute. In Armenia, also, Ardashir and Shapur, during the period of their occupation, sought to introduce the orthodox religion, destroyed the heathen images—even those of the Iranian gods which were there considered heathen—and turned the shrines into fire altars (H. Gelzer *loc. cit.*, p. 135). Shapur I, who appears to have had a broader outlook, added to the religious writings a collection of scientific treatises on medicine, astronomy, mathematics, philosophy, zoology, etc., partly from Indian and Greek sources.

A short time afterward, the Roman empire followed the example of the Sassanids and attempted to enforce unity of creed on all subjects. With Decius (250) began the systematic persecution of the Christians. For, meanwhile, the Christian religion had travelled far in east and west, spread with equal zeal and equal exclusiveness and intolerance. In the countries of the Tigris and Euphrates. now altogether Aramaic, Christianity had gained a firm footing.[2] But its missionary enterprise stretched over the whole of Iran and even farther. The time had come when. in the western and eastern worlds alike! the religious question was for large masses of people the most important question in life, and the diffusion of their own creed and the suppression of all others the highest and holiest of tasks. The man who thinks thus knows no compromise, and so Zoroastrianism and .Christianity confronted each other as mortal enemies. Still, the old idea that every religion contained a portion of the truth, and that it was possible to borrow something from one and amalgamate it with another, had not yet lost all its power. From such a con-

ception arose the teaching of Mani or Manes. Knowledge of Manichaeism (*q.v.*) was greatly increased by the discovery of many fragments of its literature in eastern Turkistan (Turfan); but these fragments are surpassed in importance by a large Chinese manuscript in the British Museum containing translations of Manichaean hymns and ritual (cf. E. Waldschmidt and W. Lenz, Journal of the Royal Asiatic Society, 116f [1926]; "Die Stellung Jesu im Manichaeismus," *Abhandlungen* der *preussichen* Akademie [1926]; also Sitzungsberichte der Akademie der *Wissenschaften,* philosophisch-historiche Klasse, pp. 480 et seq. [1933]). It is clearly seen that Manichaeism originated from a Gnostic sect. Mani, a Persian from Babylonia, proclaimed himself as the last and greatest apostle of Jesus and as the paraclete announced in the Gospel of John. But with the Gnostic interpretation of the Gospel he tried to combine the doctrines of Zoroaster and of Jesus to create a new universal religion. He is said to have made his first appearance as a teacher on the coronation day of Shapur I. He found numerous adherents, both at court and among the great of the empire. Even the king was impressed, until In a great decisive debate the Magians gained the predominance. None the less Mani found means to diffuse his creed far and wide over the whole empire. Even the heir to the throne, Hormizd I (272–273), was favourably disposed to him; but Shapur's younger son, Bahram I (273–276), yielded to sacerdotal pressure and Mani was executed. After that Manichaeism was persecuted and extirpated in Iran. Yet it maintained itself not merely in the west, penetrating far into the Roman empire from its centre at Babylon, but also in the east, in Khurasan and beyond the bounds of the Sassanian dominion. There the seat of its pontiff was at Samarkand; from there Manichaeism penetrated into central Asia, where, buried in the desert sands which entomb the cities of eastern Turkistan, numerous fragments of the works of Mani and his disciples, in the Persian language (Pahlavi) and Syrian script, and in an east Iranian dialect called Sogdian which was used by the Manichaeans of central Asia, have been discovered.

Art and Literature.— Like the Arsacids, the Sassanian kings resided in Ctesiphon, where at least part of the great vaulted hall of the vast palace built by Chosroes I is still standing. On the ruins of Seleucia, on the opposite bank of the Tigris, Ardashir I built the city of Veh-Ardashir ("good is Ardashir"), and later kings made various additions to it. In Susiana, where the ancient capital of the Persian empire had been, Shapur I built the great city of Gunde-Shapur. Meanwhile, Iran itself was regaining its old prestige, especially the new capital, Istakhr, immediately adjacent to the Achaemenid ruins of Persepolis (now known as Hajiabad). Farther to the southeast Ardashir I also built Gur (modern Firuzabad), so called from the Sassanian name Ardashir-Khurre ("the glory of Ardashir"). On these sites, and others in Fars, Khuzistan, Iraq-i-arab and scattered places, are Sassanian ruins in which were combined Parthian elements, Achaemenid details and typical Sassanian features; these buildings served in turn as models for the structures of the caliphs.

After its long quiescence under the Arsacids, native art underwent a general renaissance which, though not aspiring to the Achaemenian creations, was still of no small importance. Of the Sassanian rock sculptures, some have already been mentioned; besides these, numerous intaglio stamp seals have been preserved. The metalwork, carpets and fabrics of this period enjoyed a high reputation; they were widely distributed and greatly influenced western art.

In the intellectual life and literature of the Sassanian era, the main characteristic was the complete disappearance of Hellenism and the Greek language. Ardashir I and Shapur I still appended Greek translations to some of their inscriptions, but all of later date are written in Pahlavi alone. The coins invariably bear a Pahlavi legend—on the obverse the king's head with his name and title, on the reverse a fire altar (generally with the inscription "fire of Ardashir, Shapur, etc."; *i.e.,* the fire of the royal temple) and the name of the place of coinage, usually abbreviated. Elements of western culture were still brought in by the Aramaeans (Syrians), who were connected with the west by their Christianity and whose translations spread Greek literature through the orient. But there also developed a rather extensive Pahlavi literature. It began with the translations of the sacred books (the Avesta), but it was not limited to religious subjects; it included belles-lettres, modernizations of the old Iranian epics and native traditions—*e.g.,* the surviving fabulous history of Ardashir I—ethical tales, etc., with translations of foreign literature, principally Indian—one instance being the book of tales Kalilah and Dimnah, dating from Chosroes I (see SYRIAC LITERATURE).

Foreign Policy.—In foreign policy the problems under the Sassanian kings[1] remained, as af old, the defense and, when possible, the expansion of the eastern and western frontiers. In the first two centuries of the Sassanian empire practically nothing is known of its relations with the east. Only occasional notices show that the inroads of the oriental nomads had not ceased and that the extent of the empire had by no means exceeded the bounds of the Parthian dominion—Sacastene (Seistan) and western Afghanistan.

Far to the east, the Kushans had become limited to Bactria, with Kabul and Gandhara, and were subject to the Sassanids until after the rise of the Gupta empire in India in the 4th century. In the west the old conflict for Osroene and northern Mesopotamia (now Roman provinces), with the fortresses of Edessa, Carrhae and Nisibis, still smouldered. The Sassanids were all the more eager to regain Armenia, since there the Arsacid dynasty still survived and turned for protection to Rome, with whom, in consequence, new wars perpetually broke out. In the reign of Bahram II (276–293), the emperor Carus, burning to avenge the disaster of Valerian, invaded Mesopotamia without meeting opposition and reduced Coche (near Seleucia) and Ctesiphon; but his sudden death in Dec. 283 prevented further success, and the Roman army returned home. Bahram, however, was unable to take advantage of this as his brother Hormizd (Hormuzd) was in arms, supported by the Sacae and other tribes (Mamertinus, Panegyricus Maximiniano, 7, 10; Genethliacus *Maximiniano,* 5, 17). He chose, consequently, to buy peace with Diocletian by means of presents. After his death (293), his uncle Narses was forced by his nobles to rebel against Bahram III and gained the crown. In memory of his victory he erected a great tower at Paikuli, in the mountains west of the upper Diyala, which was discovered in 1843 by Sir Henry Rawlinson and explored in three expeditions by E. Herzfeld (published by Herzfeld, *Paikuli* [Berlin, 1924]; additional report published in Zeitschrift der *deutschen* morgenlandischen Gesellschaft, N.F. v, pp. 269–275 [1926]). The monument is covered with busts of him and with a long inscription in the two forms of Pahlavi writing, the Parthian and the Persian, of which many blocks have been preserved. It contains an account of the way in which he defeated his opponent, and gives at the end a long list of the kings and dynasts who sent embassies of congratulation at his accession, headed by the Kushanshah of India and the Caesar of Rome After his victory Narses occupied Armenia and defeated the emperor Galerius at Callinicum (296). But in the following year he sustained a severe reverse in Armenia, in which he lost his war chest and harem. He then concluded a peace, by the terms of which Armenia remained under Roman suzerainty, and the steppes of northern Mesopotamia, with Singara and the hill country on the left bank of the Tigris as far as Gordyene, were ceded to the victor (Ammian. Marc. xxv, 7, 9; Petrus Patricius, *fr.* 13, 14; Rufus, *brev.* 23). In return Narses regained his household. This peace, ratified in 297,

(Boran and others, 629–632)
Yazdegerd III, 632–651
On most of these kings there are

completely expelled the Sassanids from the disputed districts and lasted for 40 years.

After the death of Hormizd II (302–309), the son of Narses, the nobles imprisoned or put to death his adult sons. one of whom, Hormisdas, later escaped to the Romans, who used him as a pretender in their wars. Shapur II (310–379), a posthumous child of the former king. was raised to the throne. proof that the great nobles held the sovereignty in their own hands and attempted to order matters at their own pleasure. Shapur, however, when he came to manhood proved himself an independent and energetic ruler.

Renewed Conflict With **Rome.**—Meanwhile the Roman empire had become Christian, the sequel of which was that the Syro-Christian population of Mesopotamia and Babylonia—even more than the Hellenic cities in former times—gravitated to the west and looked to Rome for deliverance from the infidel yoke. On similar grounds Christianity, as opposed to Mazdaism enforced officially by the Sassanids, became predominant in Armenia. Between these two great creeds the old Armenian religion was unable to hold its own; as early as 294 King Tiridates was converted by St. Gregory the Illuminator and adopted the Christian iaith. For this reason the Sassanid empire was the more constrained to champion Zoroastrianism. It was under Shapur II that the compilation of the *Avesta* was completed and the state orthodoxy perfected by the chief mobed, Aturpad. All heresy was proscribed by the state, defection from the true faith pronounced a capital crime, and the persecution of the heterodox—particularly the Christians—began (*cf.* C. E. Sachau, "Die rechtlichen Verhaltnisse der Christen in Sassanidenreich," in *Mitteilungen des Seminars für orientalische Sprachen für Berlin*, x, Abt. 2 [Berlin and Stuttgart, 1907]). Thus the duel between the two great empires became simultaneously a duel between the two religions.

In such a position of affairs a fresh war with Rome was inevitable.[1] It was begun by Shapur in 337, the year that saw the death of Constantine the Great. The conflict focused upon the Mesopotamian fortresses: Shapur thrice besieged Nisibis without success. but reduced several others, including Amida *(359)* and Singara (360), and transplanted great masses of inhabitants into Susiana. The emperor Constantius conducted the war feebly and mas consistently beaten in the field. But in spite of all. Shapur found it impossible to penetrate deeper into the Roman territory. He was hampered by the attack of nomadic tribes in the east, among whom the Chionites now begin to be mentioned. Year after year he took the field against them *(353–358)*, until finally he compelled them to support him with auxiliaries (Ammian. Marc. *14, 3*, 16, *9;* 17, 5; 18, *4, 6)*. With this war is evidently connected the foundation of the great town New-Shapur (Nishapur) in Khurasan.

By the resolution of Julian *(363)* to begin an energetic attack on the Persian empire, the conflict, after the lapse of a quarter of a century, assumed a new phase. Julian pressed forward to Ctesiphon but succumbed to a wound; his successor, Jovian. soon found himself in such straits that he could extricate himself and his army only by a disgraceful peace at the close of *363*, which ceded the possessions on the Tigris and the great fortress of Nisibis and pledged Rome to abandon Armenia and its Xrsacid protégé, Arsaces III, to the Persian.

Shapur endeavoured to occupy Armenia and introduce the Zoroastrian orthodoxy. He captured Arsaces III by treachery and compelled him to commit suicide; but the Armenian magnates proved refractory, placed Arsaces' son Pap on the throne and found secret support among the Romans. This all but led to a new war, but in *374* Valens sacrificed Pap and had him killed in Tarsus. The subsequent invasions of the Goths, in battle with whom Valens fell at Adrianople (378), definitely precluded Roman intervention; and the Armenian troubles ended when (*c.* 390) Bahram IV (388–399) and 'l'heodosius the Great concluded a treaty by which the extreme west of Armenia was abandoned to the Romans and the remainder was confirmed in the Persian possession. Thus peace and friendship could at last exist with Rome, and in 408 Yazdegerd I contracted an alliance with Theodosius II. In Armenia the Persians immediately removed the last kings of the hduse of Arsaces (430), and thenceforward the main portion of the country remained a Persian province under the control of a *marzban,* though the Armenian nobles still made repeated attempts at insurrection. The introduction of Zoroastrianism was abandoned; Christianity was already far too deeply rooted. But the sequel to the Roman sacrifice of Armenian interests was that the Armenian Christians now seceded from the orthodoxy of Rome and Constantinople and organized themselves into an independent national church *(see* ARMENIAN CHURCH). This church mas due, before all, to the efforts of the catholicos Sahak (390–439), whose colleague Mesrob by his translation of the Bible laid the foundations of an Armenian literature.

From Yazdegerd I **to** the Turks.—In the interior of the Sassanian empire the old troubles broke out anew on the death of Shapur II *(379)*. At first the nobles raised his aged brother Ardashir II to the throne, then in *383* deposed him and enthroned Shapur's son as Shapur III. In *388*, however, he was assassinated, as was also his brother Bahram IV in *399*. But the son of the latter, Yazdegerd I (399–421), was an energetic and intelligent sovereign, who held the nobles within bounds and severely chastised their attempts at encroachment. He even sought to emancipate himself from the Nagian church, put an end to the persecutions and allowed the Persian Christians an individual organization. In the Persian tradition he is consequently known as "the Sinner." In the end he was probably assassinated. So great was the bitterness against him that the nobles would admif none of his sons to the throne. One of them, however, Bahram V, found an ally in the Arab chief Mondhir, who had founded a principality in Hira, west of the lower Euphrates; and, as he pledged himself to govern otherwise than his father, he received general recognition. This pledge he redeemed and he is in consequence the darling of Persian tradition, which bestows on him the title of Gor ("the Wild Ass") and is eloquent on his adventures in the chase and in love. This reversal of policy led to a Christian persecution and a new war with Rome. Bahram, however, was worsted, and in the peace of 422 Persia agreed to allow the Christians free exercise of their religion in the empire, while the same privilege was accorded to Zoroastrianism by Rome. Under Bahram's son Yazdegerd II (438–457), who revived the persecutions of the Christians and the Jews, a short conflict with Rome again followed (441), while at the same time war prevailed in the east against the tribe of Kidarites, also named Huns.

There a new foe soon arose in the shape of the Ephthalites (Haital), also known as the "White Huns," a barbaric tribe which shortly after 450 raided Bactria and ended the Kushana dominion (Procop., *Pers.*, i, *3)*; soon they extended their invasions to India, where they destroyed the Gupta empire about 500. These Ephthalite attacks harassed and weakened the Sassanids, exactly as the Tokharians had harassed and weakened the Arsacids after Phraates II. Peroz (459–484) fell in battle against them; his treasures and family were captured and the country devastated. His brother Balash (484–488), being unable to repel them, mas deposed and blinded, and the crown was bestotved on Kavadh I (488–531), the son of Peroz. As the external and internal distress still continued. he was dethroned and imprisoned, but took refuge among the Ephthalites and was restored in *499* by their assistance—like so many Arsacids by the arms of the Dahae and Sacae. To these struggles obviously must be mainly attributed the fact that in the whole of this period no Roman war broke out. But, at the same time, the religious duel had lost in intensity, since among the Persian Christians the Nestorian doctrine was now dominant. Peroz had already favoured Nestorianism and in *483* it was officially adopted by a synod, after which it remained the Christian church of the Persian empire, its head being the patriarch of Seleucia-Ctesiphon.

Kavadh proved himself a vigorous ruler. On his restoration he brought about order in the interior. In *502* he attacked the Romans and captured and destroyed Amida (the modern Diarbekr), but was compelled to ratify a peace because of an inroad of the Huns. Toward the close of his reign (527) he resumed the

[1] For the succeeding events *see* also under ROME: *Ancient History;* and articles on the Roman emperors and Persian kings.

war, defeating Belisarius at Callinicum (531) with the zealous support of the wild Arab Mondhir II of Hira. On his death his son Chosroes I concluded a peace with Justinian (532), pledging the Romans to an annual subsidy for the maintenance of the Caucasus fortresses. In his home policy Kavadh was reminiscent of Yazdegerd I. Like him he had little inclination to the orthodox church and favoured Mazdak, the founder of a communistic sect which had made headway among the people. Kavadh thought that this sect might be used as a weapon against the nobles, for Mazdak demanded that the rich should live less luxuriously and should distribute their superfluous wealth. Another feature of his doctrine was the community of wives. The crown prince Chosroes was on the other hand wholly orthodox, and toward the close of his father's reign, in conjunction with the chief Magian, he carried through the condemnation of the Mazdakites, who were butchered in a great massacre (528). Chosroes I (531–579), surnamed Anushirvan ("the Blessed"), then restored the orthodox doctrine in full, publishing his decision in a religious edict. At the same time he produced the official exposition of the *Avesta*, an exegetical translation in the popular tongue (Pahlavi), and declared its contents binding. Defection from Zoroastrianism, and therefore Christian preaching, was punished with death, though the Syrian martyrologies prove that the kings frequently ignored these proceedings as long as it was at all possible to do so.

Chosroes I was one of the most illustrious sovereigns of the Sassanian empire. From him dates a new and equitable adjustment of the imperial taxation, which was later adopted by the Arabs. His reputation as an enlightened ruler stood so high that when Justinian, in 529, closed the school of Athens, the last Neoplatonists bent their steps to him in hopes of finding in him the true philosopher-king. Their disillusionment, indeed, was speedy and complete, and their gratitude was great when, by the conditions of the armistice of 549, he allowed their return. From j40 onward he conducted a great war against Justinian which, though interrupted by several armistices, lasted till the 50 years' peace of 562. The net result, indeed, was merely to restore the *status* quo; but during the campaign Chosroes sacked Antioch and transplanted the population to a new quarter of Ctesiphon (540). He also extended his power to the Black sea and the Caucasus; on the other hand, a siege of Edessa failed (544).

A second war broke out in 572, chiefly on the question of Armenia and the Caucasus territory. During this, in 575, Chosroes ravaged Cappadocia; but the campaign in Mesopotamia was unsuccessful. In the interval between these two struggles (570) he dispatched assistance to the Arabs of Yemen, who had been assailed and subdued by the Abyssinian Christians; after that period Yemen remained nominally under Persian suzerainty until its fate was sealed by the conquests of Islam.

The Turks.—Meanwhile, about 560, a new nation had sprung up in the east, the Turks. Chosroes concluded an alliance with them against the Ephthalites and so conquered Bactria south of the Oxus, with its capital, Balkh. That the alliance with the Turks should soon change to hostility and mutual attack was inevitable from the nature of the case; in the second Roman war the Turkish khan was leagued with Rome.

Chosroes bequeathed this war to his son Hormizd IV (579–590), who, in spite of repeated negotiations, failed to re-establish peace. Hormizd had not the ability to keep his father's authority, and he further affronted the Magian priesthood by declining to proceed against the Christians and by requiring that, in his empire, both religions should dwell together in peace. Eventually, he succumbed to a conspiracy of his nobles headed by the general Bahram Chobin, who had defeated the Turks but was afterward beaten by the Romans. Hormizd's son, Chosroes II, was set up against his father and forced to acquiesce in his execution. But immediately new risings broke out, in which Bahram Chobin—though not of the royal line—attempted to secure the crown, while simultaneously a Prince Bistam entered the lists. Chosroes fled to the Romans and the emperor Maurice undertook his restoration at the head of a great army. The people flocked to his standard; Bahram Chobin was routed (591) and fled to the Turks, who slew him, and Chosroes once more ascended the throne of Ctesiphon; Bistam held out in Media until 596. Maurice made no attempt to turn the opportunity to Roman advantage, and in the peace then concluded he even abandoned Nisibis to the Persians.

Chosroes II (590–628) is distinguished by the surname of Parviz ("the Conqueror"), though in point of fact he was immeasurably inferior to a powerful sovereign like his grandfather, or even to a competent general. He lived, however, to witness unparalleled vicissitudes of fortune. The assassination of Maurice in 602 impelled him to a war of revenge against Rome, in the course of which his armies—in 608 and again in 615 and 626—penetrated as far as Chalcedon opposite Constantinople, ravaged Syria, reduced Antioch (611), Damascus (613) and Jerusalem (614), and carried off the holy cross to Ctesiphon; in 619 Egypt was occupied. Meanwhile the Roman empire was at the lowest ebb.

The great emperor Heraclius, who assumed the crown in 610, took years to create the nucleus of a new military power. This done, however, he took the field in 623 and repaid the Persians with interest. Their armies were everywhere defeated. In 624 he penetrated into Atropatene (Azerbaijan) and there destroyed the great fire temple; in 627 he advanced into the Tigris provinces. Chosroes attempted no resistance, but fled from his residence at Dastagerd to Ctesiphon. These proceedings, in conjunction with the avarice and licence of the king, led to revolution. Chosroes was deposed and slain by his son Kavadh II (628); but Kavadh died in a few months and absolute chaos resulted. A list of kings and pretenders—among them the general Shahrbaraz and Boran, a daughter of Chosroes—followed rapidly on one another, until finally the nobles united and in 632 elevated a child to the throne, Yazdegerd III, grandson of Chosroes. In the interval—presumably in the reign of Queen Boran (629–630)—peace was concluded with Heraclius, the old frontier being apparently restored. The cross had already been given back to the emperor.

The Arabs.—Thus the 100 years' struggle between Rome and Persia, which had begun in 527 with the attack of the first Kavadh on Justinian, had run its fruitless course, utterly enfeebling both empires and consuming their powers. Room was given to a new enemy which now arose against both states and both religions—the Arabs. In the same year that saw the coronation of Yazdegerd 111—the beginning of 633—the first Arab squadrons made their entry into Persian territory. After several encounters the fate of the Sassanian empire was decided at the battle of Kadisiya, fought in 637 on one of the Euphrates canals. A little previously, in Aug. 636, Syria had fallen in a battle on the Yarmuk (Hieromax), and in 639 the Arabs penetrated into Egypt. The field of Kadisiya laid Ctesiphon, with all its treasures, at the mercy of the victor. The king fled to Media, where his generals attempted to organize the resistance; but the battle of Nehavend (641) decided matters there. Yazdegerd sought refuge in one province after the other, until, at last, in 651 he was assassinated in Merv (see CALIPHATE).

Thus ended the empire of the Sassanids, no less precipitately and ingloriously than that of the Achaemenids. By 650 the Arabs had occupied every province to Balkh and the Oxus. Only in the secluded districts of northern Media (Tabaristan), the "generals" of the house of Karen (Spahpat, Ispehbed) maintained themselves for a century as vassals of the caliphs—exactly as Atropates and his dynasty had done before them.

The fall of the empire sealed the fate of its religion. The Moslems officially tolerated the Zoroastrian creed, though occasional persecutions were not lacking. But little by little it vanished from Iran, with the exception of a few remnants (chiefly in the oasis of Yezd), the faithful finding a refuge in India at Bombay. These Parsees have preserved but a small part of the sacred writings; but they still number their years by the era which dates from Yazdegerd III, the last king of their faith and the last lawful sovereign of Iran, on whom rested the god-given royal glory of Ormuzd.

FROM THE FALL OF THE SASSANIDS TO THE RISE OF THE SAFAWIDS, 651-1502

The Arab Caliphates.— After the Arab conquest the greater part of Persia was divided into four provinces: Khuzistan and Fars, attached to Basra; Media or Persian Iraq, attached to Kufa; Khurasan; and Seistan. Arab tribal forces were established in a number of garrison towns (such as Qum and Shiraz), the largest bodies of them being settled in Khurasan (Nishapur, Merv, Herat, and later on Balkh, Bukhara and Samarkand), to serve as the effectives for further conquests in central Asia. The Arabs interfered little with the Persian population or their religions. For the most part the feudal nobility (dihkans) and the small principalities in the east were left in possession of their lands and privileges, subject to good behaviour and the payment of a stipulated rate of taxation or tribute, for which the local dihkans acted as collectors. Relations between the Arab administration and the feudal classes seem to have been generally good, and a contingent of Iranian troops assisted the Arabs in the conquests in Transoxiana (notably under Kutaiba ibn Muslim, 705–715) and in repelling the later counterattacks of the central Asian Turks. There is abundant evidence that the Arabs intermarried extensively with the Iranian population and that at an early date the mingling of the two speeches had begun to lay the foundations of the modern Persian language by a process of fusion not unlike that by which modern English emerged from the mixture of Anglo-Saxon with Norman French.

On the other hand, increasing fiscal pressure under the later Omayyads caused discontent among the cultivators and townsmen, as well as among a number of *dihkans.* The social strains resulting from the old feudal system also were intensified as large numbers of Persians were converted to Islam, with its equalitarian ideals. These discontents mere exploited by the missionaries of Arab revolutionary groups opposed to the Omayyad caliphate, and particularly, from 745, by an emissary of the Abbasid family named Abu Muslim (see CALIPHATE). By clever tactics he took advantage of the tribal feuds by which the Arabs in Khurasan were divided; and, adding his weight to a general rising of the Yemenite (or southern Arab) faction, he drove the Omayyad governor, Nasr ibn Sayyar, out of Khurasan and, on the occupation of Iraq by the Khurasanian forces, succeeded in supplanting the Omayyads by the Abbasid caliphate (750).

The Abbasid caliphs based their military power upon a standing army of Khurasanians, both Arabs and Persians, stationed at Baghdad, and their administration, under the influence of Khurasanian nobles, notably the Barmecides (*q.v.*), was closely assimilated to the former Sassanian regime. When, however, the second Abbasid caliph, al-Mansur, suspicious of Abu Muslim's power and designs in Persia, murdered him in 754, a series of insurrections by his followers disturbed the peace in Khurasan for about 50 years. After the overthrow of the Barmacides a serious general rising broke out and Harun al-Rashid died at Tus on the way to suppress it (809).

The government of Khurasan passed to his son al-Ma'mun, who restored order but quarrelled with his brother, the caliph al-Amin. A new Khurasanian army was raised, commanded by the Persian general Tahir ibn Husain, who besieged and captured Baghdad and killed al-Amin (813). After much fighting the Khurasanians re-established the caliph's control over the Arab provinces, but when a fresh insurrection threatened to break out in Persia under Mazdakite leadership al-Ma'mun found it necessary to appoint Tahir viceroy of Khurasan and the east (820). Tahir was succeeded by his sons, and until 872 the Tahirids constituted a practically independent dynasty, and at the same time held the command of the caliphs' Khurasanian guard at Baghdad. During the half century of Tahirid government Persia as a whole reached probably one of the highest levels of general prosperity that it ever enjoyed. Favoured by a regular administration and internal peace and security, industry and agriculture flourished and commerce expanded by land and sea to all parts of Asia.

Minor Dynasties.—While the Tahirid dynasty represented a continuation in new terms of the alliance between the Abbasid caliphate and the Sunni feudal aristocracy of Persia, the growing weakness of the caliphate encouraged the rise of other autonomist or opposition movements. From about 825 to 898 the Arab family of Abu Dulaf ruled the region of Hamadan, nominally as governors for the caliphs, and Mazanderan (which had been subdued only in 769) was again largely in the hands of local chiefs. In Azerbaijan the Mazdakite or khorrami sectaries held out against the imperial armies for many years. From 865 the authority of the Abbasid caliphate and the feudal regime of the Tahirids began to be faced with more serious challenges. From the beginning of the Omayyad caliphate a section of the Arab tribesmen at Kufa had maintained the doctrine that the only legitimate rulers were the descendants of Mohammed through Ali, the fourth caliph, and their supporters were known as the Shi'ah or "party" of Ali (see ISLAM). Among the Persian and Persianized population of Iraq, Shi'ism had become a symbol of opposition to the Omayyad caliphate, but it had gained little foothold in Persia itself, except in the Kufan colony of Qum and among some of the followers of Abu Muslim. During the reign of Harun al-Rashid an Alid refugee won a temporary following in the mountainous region of Dailam, in the Elburz range, northwest of Tehran. In 865 the Alids re-established themselves in Dailam as leaders of a popular revolution, and for many centuries Dailam was to remain the principal and permanent base of Shi'ism in Persia. About the same time another revolt broke out in Seistan, led by Yakub ibn Laith. The forces behind this revolt appear to have been discontented *ghazis* or frontier warriors. Within a few years Yakub had occupied all eastern and southern Persia from Balkh to Shiraz and driven the Tahirids from Khurasan. Although defeated in an attempt to march on Baghdad, he and his brother Amr maintained themselves until 900, when they were defeated and their eastern territories annexed by the Samanid Ismail ibn Ahmad.

The Samanids, who had been governors of Transoxiana under the Tahirids, built up a strong and prosperous feudal kingdom in Khurasan and central Asia, distinguished by extensive commerce, learning and all the arts of civilization. It was under their rule that modern Persian revived as a language of culture and a distinctively Persian-Moslem (though by no means Shi'ite) civilization began to emerge and that Islam spread among the Turks of central Asia. In western Persia, however, they were checked by the Shi'ite mountaineers of Dailam, who were now, under the leadership of Merdawij ibn Ziyar, flooding into the lowlands. From about 932 the Dailamites were organized by a group of three brothers, sons of Buya (Buwaih), a former officer under the Samanids. The eldest, Ali, established himself in Fars. Hasan in Media and Ahmad in Kerman and Khuzistan; and the Ziyarids were pushed back into Tabaristan and Gurjan. In 946 Ahmad (Mu'izz

ad-Dawla) occupied Baghdad and deposed the reigning caliph. Though for political reasons the Buyids maintained the Abbasid caliphate, the genera! administration was taken over by their own viziers, several of whom were distinguished patrons of letters and the arts. The outstanding figure among the Buyids was Hasan's son, Fana-Khusru, entitled Adud ad-Dawla (949–982), who endeavoured to stem the economic disorders and disturbances arising from the ravages of the Dailamite troops, their conflicts with the Turkish troops and the growing breakdown of administration.

Gnder the Buyids was first established the new type of political organization which under many later dynasties replaced the old system of centralization under a single sovereign. The Buyid territories were held as a kind of family estate; the members governed various portions as independent rulers, but accorded a certain general authority to the eldest or most powerful. Almost inevitably, however, the later generations became involved in rivalries and warfare which made them an easy prey to their enemies and led to much devastation and misery. During the period of their expansion, the Buyids had been linked in a loose association with the Kurds (though these mere Sunnis), who also set up a number of minor dynasties in the north and west (Hasanwaihids in Kurdistan, Rawwadids in Azerbaijan, Marwanids in Diarbekr, Shaddadids in Arran). Early in the 11th century the Buyid province of Media was annexed by the Kurd Ibn Kakwaih, and the remainder fell ultimately to the new Turkoman invaders.

Ghaznevids and **Seljuks.**—After the middle of the 9th century, the practice grew up in all Moslem kingdoms of purchasing Turkish prisoners and slaves from central Asia (Mamelukes) and forming them into regiments of guards. As each dynasty weakened, its Turkish officers acquired an increasing measure of control and occupied the chief political offices at the capital and in the provinces. This led in due course to armed rivalries and revolts, by which the power and authority of the dynasty were undermined. The Samanids, after their conquest of Afghanistan, had established a Turkish officer as governor in Ghazni; this officer's son, Alptegin, ousted by a rival from his command in Khurasan, withdrew to Ghazni in 962 and defied the Samanid prince. He was succeeded by his son and several of his Mamelukes, the third of whom, Sabuktegin (976–997), made his peace with the Samanids and obtained the government of Khurasan in addition to Ghazni. Sabuktegin was succeeded after a year's interval by his son Mahmud of Ghazni (*q.v.;* 998–1030), the first of the great military sultans, under whom the Moslem invasion of India began. When the Turkish Ilkhans (see below) destroyed the Samanid kingdom, Mahmud kept them out of Khurasan and finally forced them to acknowledge his suzerainty. His government was a centralized military despotism in which the old feudal structure was gradually broken down; his administrative officers, however, were drawn from the landowning classes in Khurasan, where the old traditions of the Tahirids were still preserved; and their strong Sunni sympathies contributed to Mahmud's championship of the Abbasid caliphs against the Buyids and other Shi'ite sectaries.

At the end of the 10th century the converted Turkish tribes of central Asia had, under the leadership of the Ilkhans, occupied Transoxiana. Among the nomadic Turkoman groups that had migrated into the country, one, the Ghuzz, was transported by Mahmud to Khurasan. During a struggle between Mahmud's sons, the Ghuzz, led by Tughril and Chakir of the Seljuk family, allied themselves with the nobles of Khurasan, defeated the Ghaznevid army at Dendenkan (1040) and set out on the conquest of western Persia (see SELJUKS). Tughril entered Baghdad in 1055, and he and his successors Alp Arslan (1063–72) and Malik-shah (1072–92), aided by the great Khurasanian vizier Nizam ul-Mulk, united the whole of Persia, with Iran and Syria, under their rule. Each province was assigned to a Seljuk prince (*malik*), whose army was maintained by military fiefs (ikta). After Malik-shah's death the rivalries of these princes led to renewed disintegration, except in Khurasan where his son Sanjar maintained order until 1153. Most of the other principalities were taken over piecemeal by former officers of the Seljuk army, called atabegs. who founded new dynasties, the most important of which in Persia were the atabegs of Azerbaijan and the Salghur Turkomans of Fars. Favoured by this disintegration, the Shi'ite sect of the Assassins (*q.v.*) firmly established themselves in the highlands of Dailam, and by their terrorism contributed to the demoralization of the governing classes.

The massive immigration of Turkoman tribes accompanying the Seljuks also made heavy inroads on the economy of Persia. Much cultivated land was turned into pasture, and only the walled cities and fortresses provided a measure of security for their environs, from which the revenues of the military fiefs were drawn. The devastation was increased when fresh bands of Ghuzz swarmed into Khurasan, defeated and captured Sanjar and looted its cities, before moving on to occupy Kerman and to extinguish the Seljuk principality there. Sanjar's territories were disputed between his former vassals, the shahs of Khwarizm (Khiva), and the chiefs of Ghor in Afghanistan; eventually the Khwarizm-shah Takash (1172–99) conquered Khurasan and Isfahan, and his son Ala ud-Din Mohammed (1199–1220) drove out the Ghorids, conquered the rest of Persia and occupied Transoxiana. Their armies, recruited mainly from the half-pagan Kipchaks of the steppes, added to the general rapine and disorder, and the Khwarizm-shah Mohammed himself devastated the border lands of Transoxiana in his conflicts mith the Turkish khans in central Asia.

Mongols.—It is thus historically false to represent the Mongol invasions as suddenly and ruthlessly tearing down a flourishing civilization and prosperous economy and reducing Persia to a desert. Their effect was rather to intensify the process of nomadization, by destroying most of the cities—especially those of Khurasan during the first invasion under Jenghiz Khan (*q.v.*) in 1220—and disrupting the organizations in which the old traditions of Persian-Islamic culture were still cultivated. It was as if, in mediaeval Europe, the cities and schools of Italy and France had been laid in ruins and their populations killed or dispersed. Except for a few individuals in the service of the Mongols, learning and culture survived only in the peripheral regions! of which Fars was the most important. There is therefore some symbolic truth in the popular view of the Mongols, in so far as they finally destroyed the social and economic foundations upon which the culture of Persia had rested, even if more and more precariously, for a thousand years.

Under the successors of Jenghiz Khan the Mongols extended their power over the whole of Persia and consolidated it by a fresh invasion led by his grandson Hulagu, who destroyed the Assassin fortresses in 12 j6 and captured Baghdad in 1258, putting the last of the Abbasid caliphs to death. Hulagu thus became the first of the new "provincial dynasty" (Ilkhans) of Persia, which, though nominally subordinate to the Mongol Great Khan in China, governed their territories as autonomous princes until 1335.

The **Ilkhans.**—Except for occasional conflicts with their Mongol kinsmen of the Golden Horde to the north and the Jaghatai khanate to the east, the external policy of the Ilkhans was directed for about 50 years toward the conquest of Syria. This brought them into conflict with the Mamelukes of Egypt (see EGYPT: *History*) and some ineffectual negotiations mith the crusaders and the Christian powers, but their ephemeral seizures of Aleppo and Damascus in 1260 and 1303 were terminated by crushing defeats.

In internal affairs the most constructive policy of the Ilkhans was their interest in trade, which was directed through Azerbaijan to the Black sea and made Tabriz into a centre of international commerce. They introduced a new system of administration and taxation which continued into the Safawid period but was constantly impeded by tribal risings and military disturbances. Religious questions also created many difficulties. The early Mongols were Buddhists, but were generally tolerant toward Moslems and all other religious communities. The third Ilkhan, Ahmed Takudar, adopted Islam in 1282 but was dethroned by the Mongol nobles and replaced by his nephew Arghun, under whom there was a reaction against the Moslems. His employment of a Jewish doctor, Sa'd ad-Dawla, as finance minister in 1288, and the latter's severe measures against the Moslems, led to such general disorder and discontent that Sa'd ad-Dawla's downfall and execution was followed by violent pogroms in all the provinces. A still more disastrous attempt was made in 1294 to issue paper

currency, in imitation of the Chinese *chau,* but without monetary backing. In the following year Arghun's son Ghazan was raised to the throne. although he was already converted to Islam, and set on foot an impressive series of measures of reform. Most of them aimed at reconstituting the pre-Mongol land system, including military fiefs, and restoring order and security, but Ghazan's early death (1304) prevented him from carrying them through.

Although the economic results of Ghazan's reign were quickly dissipated, the political and religious results were important. Islam again became the official religion of the state, and its religious and social institutions benefited from state support. Most of the Mongol nobles and tribesmen in Persia had by now been converted to Islam? and the faith was making rapid progress also in the neighbouring khanate in central Asia. The reign of Ghazan's brother Uljaitu (1304–16) was a period of relative tranquillity and moderate prosperity. Under his nephew Abu Sa'id (1316–35) the internal and external forces of disruption became too strong to hold down. Powerful officers contended for control of the Ilkhanate, and after his death set up rival successions of puppet princes. The contest was won finally by the Mongol Jelairs, whose chief Hasan Buzurg (1336–56) established them in power in Iraq and Azerbaijan.

Out of the confusion which attended the decay of the Ilkhans, Fars and Herat (in both of which local dynasties had continued under Mongol rule for several decades) regained independence, Herat under its former Ghorid princes, known as the Kurts, Fars under the dynasty of Muzaffar. Besides the Jelairs, other nomadic chiefs governed parts of Persia, notably in Luristan. A more remarkable phenomenon was the success of an association of local bands in Khurasan, who called themselves Serbadars and controlled most of the province, an instance of the new kind of associations which were growing up (mostly in relation to some Sufi leader or group; see below) among the general population, in reaction to the political anarchy of the preceding centuries. The most notable political event of the period was the failure of an attempt by the Golden Horde to seize Azerbaijan (1357), while the economic decay of Persia was accentuated both by the disruption of trade routes and by disastrous plagues.

Whatever elements of urban culture survived these disasters were almost entirely destroyed by Timur (*q.v.*). The Mongol Ilkhans had only with much difficulty protected the eastern frontier against the Jaghatai-khans of Transoxiana. This task, on passing to the Kurt kings of Herat, was eased for a time by internal dissensions in the Jaghatai khanate. But when, between 1370 and 1380, Timur recreated a centralized power at Samarkand, they were powerless to resist, and after the fall of Herat in 1381 he swept over Persia without meeting effective opposition. Later risings were put down with ruthless cruelty; city after city was destroyed and their populations were massacred, except for the craftsmen who were transported to Samarkand to embellish the conqueror's capital. (H. A. R. G.)

Timurids and Turkomans.—Timur died as he was setting out on an expedition to China (1405), and his conquests were divided between numerous descendants, of whom his sons Miranshah (d. 1407) and Shahrukh held western and eastern Persia respectively, and a grandson, Pir Mohammed, held Fars. The devastation and depopulation of Persia had left only three centres of power outside Transoxiana; these were Herat, Fars and Tabriz, and the conflicts of the next century developed into a struggle between Herat and Tabriz. Rivalries and warfare among the Timurids weakened them against the Turkomans of Azerbaijan and Armenia, themselves grouped in two rival confederacies, the Kara-Koyunlu (Black Sheep) and Ak-Koyunlu (White Sheep). The Black Sheep were at first the more powerful, and their chiefs Kara Yusuf (1388–1420) and Iskandar (1420–38) repeatedly occupied Azerbaijan and Mesopotamia. Nevertheless Shahrukh (1405–47) succeeded in time in reuniting most of Timur's empire under his rule. Unlike his father, he devoted himself to restoring some measure of prosperity and made of his capital Herat the centre of a renewed and artistically brilliant Persian culture. He was succeeded by his son Ulugh Beg (1447–49), formerly governor of Samarkand; Ulugh Beg's name was made famous by the astronomical tables (*zij*) drawn up under his patronage, but in his time the Uzbeg Turkomans began to challenge the Timurid government in Transoxiana. His murder was followed by further struggles among the Timurids, during which the Black Sheep under Jahanshah (1435–67) extended their rule over Iraq, Fars and Isfahan (1453). Scarcely had Miranshah's grandson Abu Sa'id established his power in the east than Jahanshah invaded Khurasan and seized Herat (1458), but the growing power of the White Sheep under Uzun Hasan brought about an agreement between Abu Sa'id and Jahanshah to divide Persia between them. Defeated by the Ottoman Turks in 1461, Uzun Hasan turned against the Black Sheep and defeated and killed Jahanshah (1467), whose son appealed to Abu Sa'id for assistance. Rejecting Uzun Hasan's overtures for peace, Abu Sa'id marched into Azerbaijan and was defeated and killed (1469). The White Sheep were now supreme in the west, but were preoccupied with the growing Ottoman power, and the Timurids remained in possession of Herat, where the sultan Husain Baykara (1469–1504) maintained a brilliant and luxurious court. After the deaths of Uzun Hasan (1478) and his son Ya'kub (1490), the White Sheep confederacy began to break up, and western Persia and Iraq gradually became fragmented between petty governments, which opened the way to the conquests of the Safawids.

THE SAFAWIDS, 1502–1736

The **Sufi** Movement. — Mention has already been made of the new types of political association under religious sponsorship which had come into existence in Persia. These organizations arose from the development of religious guilds or fraternities linked by common veneration of a particular religious teacher (*sheikh* or *pir*), within the general movement of Islamic mysticism or Sufiism (*q.v.*). After the destruction of the older Persian-Islamic culture under the Mongols, it was the Sufi movement which supplied and maintained a common basis of religious culture among the mass of the Persian people and the Turkoman immigrants, and stimulated a succession of great poets (Sa'di, Rumi, Hafiz, Nizami, Jami), in whom the poetic genius of Persia reached its climax.

In most cases the Sufi fraternities were entirely pacific, but where all public law and order had disappeared they furnished a means of organizing self-defense and tolerable conditions in their local areas. More particularly, among the Turkomans they served to create a bond of solidarity among local groups in support of local chiefs. The great majority of these Sufi associations were Sunni or orthodox in doctrine, but in most of them the memory of the caliph Ali was held in special veneration, as the reputed founder or ancestor of the fraternity. During the Mongol period a Sufi congregation was founded by Safi ud-Din (1252–1334), who claimed to be a descendant of the Imams, at Ardabil, in a region traditionally devoted to Shi'ism, and his successors, called after him Safawis, gradually adopted the Shi'ah faith. His grandson Khoja Ali (d. 1429) gained the respect of Timur, who released at Khoja Ali's intercession his Anatolian Turkoman prisoners. These, known as the Rumlu, were settled at Ardabil and formed the first group of armed adherents of the Safawids. Khoja Ali's grandson Sheikh Junaid came into conflict with the Black Sheep, and after an unsuccessful attack on Trebizond allied himself by marriage with Uzun Hasan, but was killed in battle in Shirvan in 1460. His young son Haidar married a daughter of Uzun Hasan and the Greek princess Katerina; he greatly expanded the Safawid military organization by enrolling further groups of Turkomans from Syria, Karaman and elsewhere, and devised for them their peculiar red cap with 12 gores from which they got the nickname of *kizilbash* (redheads). In 1488 Haidar renewed the campaign against Shirvan, but was defeated and killed by the alliance of its prince with the White Sheep. His sons, after several years of imprisonment, again became involved in hostilities with the White Sheep. The youngest of them, Ismail (b. 1487), escaped to Lahijan, where he remained in concealment until 1499, when he returned to Ardabil, took command of his Turkoman adherents and renewed the war in Shirvan with success, capturing Baku (1500). He then turned to deal with the White Sheep and after defeating

them at Shurur occupied Tabriz (1502).

Ismail I (1502–24).—On the conquest of Tabriz Ismail took the title of shah, although it was several years before he could subdue all the provinces held by local potentates. The White Sheep were finally defeated and Fars was occupied in 1503, and by 1508 all western Persia and Iraq had been conquered. From the first Ismail set himself zealously to establish the Shi'ah doctrine in his dominions; the Sunnis, who were in the majority in the cities, were coerced into conformity and the Sunni theologians extirpated. Simultaneously the Uzbeg Turkomans, who were as rigidly Sunni as Ismail was Shi'ah, had put an end to ,the Timurid line in Transoxiana (1500) and after the death of Husain Baykara had invaded Khurasan and captured Herat (1507), under the command of Shaibani Khan, a descendant of Jenghiz Khan. The rivals inevitably came into conflict and in Dec. 1510 Ismail heavily defeated the Uzbegs near Merv. Shaibani Khan perished in the battle and his skull was mounted in gold to serve as a drinking cup for the shah. By his victory Ismail united all Persia under his rule, but the Uzbegs remained masters of Transoxiana.

The attachment of the national and religious sentiment of the Persians to the Safawid house was, however, evoked still more strongly by the conflict which now opened with the other great Sunni power to the west, the Ottoman Turkish empire. It began after the accession of the sultan Selim I in 1512 (see TURKEY: History), and continued intermittently for more than two centuries. The rise of a Shi'ah family to the throne of Persia would naturally excite deep religious animosity, and the sultan determined to extirpate it before it struck roots. As a preliminary measure he sought out and put to death 40,000 of his subjects who were believed to belong to the heretical sect. He then marched to the Persian frontier.

Selim commanded the most formidable army of the period, consisting of thousands of long-service musketeers—the celebrated Janissaries—a strong artillery and a division of cavalry. Ismail, on the other hand, depended entirely on his tribesmen, who were commanded by their chiefs. The Persian attempt to attack on both flanks was defeated by the deadly fire of .the musketry and artillery. Ismail displayed the greatest gallantry, killing the aga of the Janissaries, but he was wounded and nearly taken prisoner; after suffering terrible losses, the survivors fled from the field. Selim massacred his prisoners and then marched on Tabriz, which submitted. Because of the lack of supplies, which caused a mutiny, the victor was obliged to evacuate Tabriz, but he annexed Georgia, Diarbekr and Kurdistan. Of far greater importance was the deadly blow given to Persian morale, since it was realized that a force led by the shah, although able to defeat the Uzbegs. was no match for a Turkish army. It is stated that, after this defeat, Ismail never smiled again. He died in 1524, deeply regretted by his subjects. He is described by the Venetian Angiolello in the following words: "He is fair, handsome and pleasing; not very tall, but of a light and well framed figure. His hair is reddish, he only wears moustachios. He is as brave as a gamecock and stronger than any of his lords."

Shah Tahmasp (1524–76).—The eldest son of Ismail succeeded to the throne when a boy. The Ottoman Turks renewed the war under Suleiman the Magnificent, who repeatedly invaded Persia, taking Tabriz and advancing as far into the interior as Sultaniya on one of his campaigns. He also captured Van, which was considered to be impregnable. Tahmasp followed an entirely defensive policy and is the theme of Milton's lines:

> As when the Tartar from his Russian foe,
> By Astracan, over the snowy plains,
> Retires, or Bactrian Sophi, from the horns
> Of Turkish crescent, leaves all waste beyond
> The realm of Aladule, in his retreat
> To Tauris and Casbeen.

(Paradise *Lost,* x, lines 431–436. The Sophi is the Safawid monarch, Aladule is Ala ad-Dawla Dhu'l-Quadar [the Alidoli of contemporary Italian travellers] and Tauris and Casbeen are, respectively, Tabriz and Kazvin.)

These lines reveal a remarkable knowledge of the political situation in Persia and there is every reason to believe that Milton gained his information from the account given by Anthony Jenkinson, who had conceived the bold plan of trading with Persia across Russia. Descending the Volga, he crossed the Caspian sea and came to Shemakha, where he was well received by the Persian governor. At Kazvin, he presented the letters of Queen Elizabeth, but the fanatical shah replied: "Oh thou unbeliever, we have no need to have friendship with the unbelievers." The shah, who was treating with Suleiman at the time, indeed thought of sending Jenkinson's head as a suitable gift to the sultan, but the intrepid Englishman finally returned to England with good profits to show for the risks he had run.

As the years passed, fanaticism lessened and both powers grew weary of the constant warfare. Negotiations were opened and the sultan stated that "so long as the frontiers were respected, there would be no hostilities." Turkey considered that it was dealing with a defeated power. At the same time, the sultan wished to reduce his commitments in Asia. It is of especial interest to note that Ogier de Busbecq, the ambassador of the emperor at Constantinople, stated that: "It is only the Persian who stands between us and ruin."

In 1576 Tahmasp ended his long reign, leaving Persia much weaker than he had found it. After his death there was a period of anarchy, furious animosities being unchained among various rivals for power. Throughout this period the position of Persia was one of confusion, but it was destined to be followed by a reign during which the dynasty reached its zenith.

The Accession of Shah Abbas I.—The 16th century was a wonderful period, both in Europe and in Asia. It was a time of great rulers, Charles V, Elizabeth I, Suleiman and Akbar constituting a remarkable group in which Shah Abbas (1587–1628) can fittingly take his place. And yet, how unpromising were the prospects of the child who was destined to make Persia a great power. Left by his father Khudabanda in Khurasan as its nominal ruler, throughout his boyhood he was a mere puppet in the hands of rival chiefs. His guardian, the Shamlu chief, fought the chief of the Ustajlu, and Abbas took part in the fight, having his horse shot under him. The Ustajlu chief, having won the day, stopped the pursuit to throw himself at the feet of young Abbas and secured his person. At this period Khudabanda, who was almost blind and entirely unfitted to reign, was attempting to enforce his authority in Fars, but Abbas was proclaimed shah by his new guardian, who advanced on Kazvin and occupied it. The unfortunate Khudabanda was thereupon deserted by his followers and shortly afterward died; Abbas, who matured quickly, put his guardian to death and seized the reins of power.

War With the Turks.—In view of Turkish predominance, the position of Abbas was far from enviable. In 1587 a Turkish force surprised and defeated a Persian army. This victory culminated in the occupation of the western provinces of Persia, from Georgia in the north to Khuzistan in the south. Abbas realized that he could not face the Turks and wisely decided to make peace with the sultan as a temporary expedient, although it meant bringing Turkey on to the Caspian sea in the north and into the valley of the Karun in the south.

To add to Abbas' troubles, the Uzbegs attained the zenith of their power at this time under Abdullah II, who ruled an empire stretching from Khotan to Balkh. He invaded eastern Khurasan and menaced Meshed. Abbas endeavoured to relieve the city, but illness delayed his movements and it was taken and sacked. After Abdullah's death the shah, profiting by dissensions among the Uzbegs, regained most of Khurasan in 1597–98, but the Uzbegs' power swiftly revived under their new chiefs of the house of Astrakhan, and Shah Abbas, after being severely deieated near Balkh, was compelled to leave that city in the possession of the victors.

Early in 1599 an English adventurer, Sir Anthony Sherley. his brother Robert and a number of other Europeans arrived at the Persian court on an unofficial mission from the earl of Essex, its object being to induce the shah to combine with the princes of Christendom against the Turks, and also to improve commercial relations between England and Persia. The shah was at that time much concerned at the inferiority of his army to that of the Turks. His forces consisted only of tribal levies which, besides being

largely untrained and lacking in discipline, owed allegiance not to him but to their chiefs. With the aid of the Sherley brothers and a cannon founder whom they had brought with them, the shah set about the reorganization of his army. Dispensing with most of the levies, he formed three main corps of regular troops, namely, the *qullar* ("slaves"), the *tufangchis* ("musketeers") and the artillery; all these men were paid by the crown and were under its direct control. The *qullar,* who formed the cavalry, were not in fact slaves, but were so called because they were recruited for the most part from Caucasia from where the Persians were in the habit of taking slaves; like the Turkish Janissaries, the *qullar* were mostly of Christian descent. Shah Abbas took a further step to free himself from dependence on the tribal chiefs and at the same time to curb their power and influence when he formed a new tribe called the Shah Seven or "friends of the shah." Thousands of tribesmen abandoned their chiefs to join this tribe and serve directly under the shah. By these means and thanks very largely to Robert Sherley, Shah Abbas was able to form in a comparatively short time a formidable, well-trained force consisting of cavalry, infantry and artillery. Shah Abbas was naturally anxious to put his new weapon to the test. Accordingly, in 1603 he reopened hostilities with Turkey. His new army swiftly showed its mettle by the recapture of Tabriz, a success for which the Persian artillery was mainly responsible. His troops subsequently drove the Turks from Erivan and Kars, and in 1606 they inflicted a signal defeat on them at Sis, a place between the Lake of Urmia and the Turkish frontier. In a later campaign Shah Abbas wrested Baghdad from the Turks. As a result of these wars he succeeded in regaining all the territory which the Turks had seized. In consequence Persian prestige was greatly enhanced; the nation could feel that it could now meet the hereditary enemy on more than equal terms. Although no formal treaty of alliance was ever concluded between Persia and the Christian powers, the fact that the Ottoman Turks now had to contend with a brave and well-organized foe in their rear did much to curb Turkish activities in Europe.

The Genius of Shah Abbas.—The fame of Shah Abbas does not rest solely on his military exploits; it is also founded on his genius for administration, his tolerance in religious matters and his active encouragement of commerce and the arts. By these means he made his country once more a great power and welded the different peoples—Persians, Turks and Arabs—into a nation. Realizing the vital importance of communications, he improved the routes, building bridges and caravanserais and, above all, making them safe for travellers by his merciless suppression of brigandage. He did much to encourage trade not only in Persia but also with foreign countries, whose representatives he welcomed at his court. In religion Shah Abbas was an ardent Shi'ah, but he allowed Christian missionaries to enter his kingdom and establish missions and churches. As most of the holy cities of Islam were in the hands of the hated Sunnis, he urged his subjects to confine their pilgrimages to the shrines of the Imam Riza at Meshed and of his sister Fatima at Qum; he set them an example by performing the pilgrimage from Isfahan to Meshed on foot. Shah Abbas' most striking administrative act was his creation of a new capital at Isfahan. He transformed it from a provincial town into a city of magnificent buildings which before long rivalled even London in size. Among the important buildings erected by Shah Abbas were the majestic Masjid i-Shah, the smaller but exquisite mosque of Sheikh Lutfullah, the Ali Kapu and the Chihil Sutun.

Intercourse With Europe.—One of the most important events in Persian history was the rounding of the Cape of Good Hope by Bartholomeu Diaz de Novaes in 1487 and the subsequent establishment of direct intercourse by sea between Europe and the east. Greatest among the Portuguese captains was Alphonso d'Albuquerque who, with a squadron of six ships, captured the island emporium of Hormuz. Because of mutiny D'Albuquerque was unable to keep his conquest on this occasion, but eight years later he returned as viceroy in command of a powerful fleet and built the famous fort, which is almost as perfect today as at the date of its construction. Throughout the 16th century, the Portuguese, because of their sea power, dominated the Persian gulf, in spite of strong Turkish naval opposition, and monopolized its commerce, to the intense anger of the Persians.

The English appeared in eastern waters just a century later than the Portuguese. Their chief commodity was broadcloth, for which there was little demand in India, and it was consequently decided to open up relations with Persia, which was reported to have a cold climate. In view of the position of the Portuguese in the Persian gulf, it was decided to begin operations at Jask, and in 1616 a ship loaded with a trial cargo was dispatched to that port. The English were well received by Abbas. Apart from the hope that they might help him to expel the Portuguese, he was most anxious to export silk, which was a royal monopoly, by the Persian gulf instead of overland, thereby depriving the Turks of a large source of customs revenue.

The Portuguese viewed the arrival of the English with intense hostility. They attempted to capture the pioneer ship, but were just too late. However, when a second expedition appeared on the scene they were waiting off Jask and attacked the English. In spite of their superior force they were unable to capture the English ships and were completely defeated. The result of this action was most important. In 1622 the shah realized that his hoped-for chance of expelling the Portuguese had come, and the English were induced to co-operate. As the soil on the island of Hormuz was impregnated with salt, it produced neither food supplies nor fresh water, all of which had to be brought by boat from the neighbouring island of Qishm or the mainland. As a preliminary operation the English and Persians captured a Portuguese fort on Qishm Island and cut off supplies from there. The English ships then blockaded Hormuz and large numbers of Persian troops were landed on it. Although the Portuguese defended themselves bravely, their fleet made little or no attempt to help them, and they were forced to surrender after holding out for two months. This was the first, but by no means the last, manifestation of English sea power in the Persian gulf.

Decline of the Safawid Dynasty.—After the death of Shah Abbas in 1629 his descendants occupied the throne for nearly a century; but it was a period of decline, and as time went on only the veneration in which the dynasty was held prevented its fall. Because of the jealousy which Abbas had shown toward his sons, the princes of the blood, instead of being trained to arms, were immured in the harem under the tutelage of eunuchs. Shah Safi (1629–42) was a cruel tyrant who put to death his own relations of both sexes and executed most of the generals and councillors who had made the reign of his great predecessor so illustrious. The contemporary Turkish ruler was Murad IV, the last of the warrior sultans, who invaded Persia repeatedly, massacred the inhabitants of Hamadan, Tabriz and Baghdad and annexed the last-mentioned city. Under Shah Abbas II (1642–66), Persia recovered some of its glory, and the pomp and pageantry of the court dazzled European envoys and travellers. On Abbas' death, decline set in once more and became accentuated after the accession of Shah Sultan Husain in 1694. This monarch was humane, pious and meek, but he cared nothing for affairs of state and allowed the control to pass to the courtiers and eunuchs. During the Safawid period the province of Kandahar was a bone of contention between Persia and the Mogul rulers of India, with the result that it changed hands several times. When Shah Sultan Husain came to the throne it was in Persia's possession, but the Ghilzai Afghans, whose chief city it was, were intriguing with Delhi. On hearing this news, the shah sent a Georgian prince named Gurgin Khan as governor to Kandahar, together with a strong Persian garrison. Gurgin Khan at once arrested Mir Vais, the astute Ghilzai chief, and sent him under a strong guard to Isfahan. There he uon over the credulous shah with a story that Gurgin Khan was plotting to hand over Georgia to Peter the Great. The shah thereupon reinstated Mir Vais and allowed him to return to Kandahar, where he was soon able to arrange for the murder of Gurgin Khan and the massacre of his troops. Mir Vais was then virtually independent until his death in 1715.

Mir Vais's son Mahmud raided Persia in 1720, penetrating as far as Kerman, but he was defeated and driven back by a capable Persian general who mas later dismissed and disgraced. Two years

later Mahmud again invaded Persia; although he took Kerman, he failed to capture Yezd. Nevertheless, he marched boldly on Isfahan, halting at Gulnabad, a large village situated on level ground 12 mi. E. of the capital. There he found himself confronted with a Persian force of 50,000 men, well equipped and furnished with some heavy artillery. The Ghilzais, on the other hand, numbered only 8,000, with an equivalent number of Baluch and other tribesmen; their only cannon were *zanburaks* or light swivel guns mounted on camels. What the Afghans lacked in numbers, however, they more than made up for by their courage and impetuosity, while the Persians, long unused to war and commanded by incompetent and irresolute officers, were impressive only in appearance. The Persians gained an initial advantage in the battle that ensued, but their lack of training and the failure of their commanders to act in co-ordination with one another proved disastrous, and the whole force fled in headlong disorder from the field. The Afghans swiftly followed this victory by advancing on and closely investing the capital. During the siege that followed, Tahmasp, the heir apparent, escaped from the city with the object of raising a force to march to its relief, but the young man took no active steps to do this. Meanwhile the siege went on and, all supplies having been cut off, famine followed by pestilence soon claimed many victims. With its population decimated and with no hope of succour, the city surrendered in Oct. 1722 and Shah Sultan Husain abdicated in favour of Mahmud. Although the Safawid dynasty did not actually come to an end until Nadir Shah usurped the throne in 1736, it ceased actually to rule when the meek Husain surrendered.

The chaos caused by the Afghan invasion enabled both Russia and Turkey to seize large portions of Persian territory. Peter the Great, ever anxious to extend his power to the south and southeast, was first in the field, capturing Derbent in 1722; his forces later occupied Baku and the province of Gilan. Alarmed at these moves by Russia, the Turks crossed the frontier and annexed Georgia and Shirvan. They particularly coveted Baku, but found themselves forestalled by Peter. War between Russia and Turkey seemed imminent, but in 1724 a peaceful settlement was reached, whereby Russia kept the districts which it had already occupied and the three Caspian provinces, while Turkey recovered the western provinces that it had lost during the reign of Shah Abbas.

Mahmud was put to death in 1725 and was succeeded by his cousin Ashraf, who proved himself to be a capable ruler. Though he enjoyed great prestige among his fellow tribesmen, his position was one of great difficulty. He held Isfahan, Shiraz and southeast Persia, but could hardly be said to administer the country. Indeed the Afghans were totally lacking in the art of administration and, being Sunnis, were detested by the Persians. Prince Tahmasp was collecting a force in the north, while Russia and Turkey were determined to maintain their hold over the territories which they had seized. Ashraf dispatched an embassy to Constantinople to remonstrate with Turkey for combining with a Christian power against the Sunni Afghans. In spite of the feeling that this mission aroused in Constantinople, the Turks declared war on Ashraf and advanced on Isfahan. Ashraf defeated them, and by his studied moderation after his victory and by his appeal for unity among Sunnis, he succeeded in making peace on not unfavourable terms, being recognized by the sultan as shah of Persia. The Turks, however, refused to give up the provinces that they had occupied.

***Nadr* Kuli** Beg.—Ashraf was no sooner freed from the Turkish menace than he was confronted with another serious danger. Prince Tahmasp was at this juncture joined by the leader of a robber band named Nadr Kuli Beg, a soldier of genius who was destined not only to usurp the throne of Persia but also to achieve fame as the conqueror of India. Nadr Kuli Beg brought with him 5.000 of his Afshar tribesmen. Tahmasp had already collected about 3,000 Kajars under their chief Fath Ali Khan, and other recruits began to pour in. Nadr Kuli Beg. who could brook no rivals, speedily made away with the Kajar chief and persuaded Tahmasp to secure Khurasan before attacking the Ghilzai Afghans. This campaign was entirely successful, both Meshed and Herat being recaptured from the chiefs who had occupied them.

Meanwhile Ashraf, who was seriously alarmed at the national revival, determined to attack before the Persian army became too strong. The two armies met at Mihmandust near Damghan in 1729. The Afghans, whose morale was very high after their victory over the Turks, charged, but were met with heavy musketry and artillery fire by Nadr, who then advanced and drove the Afghans from the field. They stood again at Isfahan and at Shiraz, but were finally crushed, and the survivors were hunted across Persia to the desert, where the Baluchis intercepted and killed Ashraf.

The Afshar tribesman Nadr Kuli Beg, who was destined to restore the power and prestige of Persia, was born in a tent close to Muhammadabad in the district of Darragaz, in the province of Khurasan. In the summer his father inhabited the village of Kubkan, situated on the route between Kuchan and Muhammadabad. He died young, leaving his wife very poor. Four years later, Nadr Kuli Beg entered the service of the governor of Darragaz. The times were troubled and Nadr soon won a reputation for bravery; he so distinguished himself that his master gave him his daughter in marriage. Upon the governor's death Nadr succeeded to his post. Summoned to Meshed by Malik Mahmud, the ruler of Khurasan, he defeated a raiding force of Uzbegs, but, because he claimed what was considered to be an excessive reward, he was beaten and dismissed. He soon reappeared on the scene at the head of a body of robbers. But he aimed at higher things, captured Nishapur and occupied it in the name of Shah Tahmasp, whose service he entered.

Nadr fought three campaigns against the Turks at this period of his career. He lost one battle, but finally defeated the national enemy and recovered the western provinces of Persia. The Russian government, after the death of Peter the Great, decided to withdraw from Persia, and restored its Caspian provinces in 1732. Three years later, when war broke out between Russia and Turkey, Nadr secured Baku and Derbent from Russia by threatening to join the Turks unless these important towns were handed over. In 1732 Nadr deposed the feeble Tahmasp after he had, in Nadr's absence in Khurasan, waged a disastrous campaign against the Turks. He then placed the former shah's infant son Abbas on the throne and had himself appointed regent. By his wonderful leadership, the former robber had revived the military prowess of the Persians and had expelled the Afghans, Turks and Russians from their country.

In 1736 he had his reward, when the young Abbas was deposed and he himself was unanimously elected shah. Dropping the title of Tahmasp Kuli Khan, by which he had for some time been known, he changed his first name, Nadr, to Nadir and ruled as Nadir Shah. (P. M. S.; A. U. P.; H. A. R. G.; L. Lo.)

FROM NADIR SHAH TO THE REVOLUTION, 1736–1907

Nadir had settled accounts with Turkey and Russia, but the nation thirsted for vengeance on the Ghilzai Afghans, the recovery of whose country would restore to Persia all the territories ruled by Shah Abbas. Accordingly, in the year after his coronation, Nadir led a powerful army, 80,000 strong, toward Kandahar. The city was ruled by Husain, brother of Mahmud, the captor of Isfahan.

Being unable to meet Nadir in the field, Husain decided to defend the city, trusting to its great strength. Nadir, who had no heavy artillery, was thus reduced to a blockade. For nine months the siege continued without any appreciable progress being made, but in Jan. 1738 Nadir's troops stormed a commanding ridge, up which they hauled their cannon with great difficulty. Much damage was then done to the defenses, but the city nevertheless held out for another two months. Bearing in mind the Ghilzais' excellent fighting qualities and the prospect of further campaigns, Nadir treated them with such clemency that many of them enlisted in his army and served him loyally until his death.

***Invasion* of *India*, 1739.**—During the tedious months spent outside Kandahar, Nadir prepared his plans for a campaign in India, which was the natural sequel to the recovery of the cnstcrn provinces of Persia. The great Mogul dynasty had declined rapidly since the death of Aurangzeb, in 1707, and Mohammed Shah,

his degenerate descendant, "was never without a mistress in his arms and a glass in his hand." This despicable monarch and his effeminate troops were no match for virile Nadir and his warlike veterans. Treachery was also at work, and more than one Indian noble had opened up relations with the shah. With incredible folly, the Mogul court relied on the Ghilzais to repulse Nadir, and not only made no preparations for defense but treated with contempt his requests that no fugitives should be granted asylum across the frontier.

After the capture of Kandahar Nadir, whose prestige was much enhanced, marched northeast, following in the footsteps of Alexander the Great. After taking Kabul he marched on toward India. Traversing the mountains by the Tsatsobi pass, he attacked the Indian forces guarding the Khyber pass from the rear and routed them. By this time Mohammed Shah was thoroughly alarmed, but before either he or his councillors could really grasp the situation, Nadir had captured Peshawar and crossed the Indus at Attock.

One of the historical battlefields of India is at Karnal, 70 mi. N. of Delhi. Mohammed Shah formed a strongly entrenched camp there, and supinely awaited the invaders. Nadir, realizing the strength of this camp, decided to give battle if the Indians emerged and to march directly on Delhi if they remained inactive. While matters were in this state, Sa'adat Khan, the subahdar of Oudh, joined Mohammed Shah with 30,000 men. Hearing a report that the Persians were plundering his baggage train, Sa'adat Khan impetuously attacked them, but was lured into a trap, defeated and captured. The emperor's forces, advancing to Sa'adat Khan's assistance, then became involved with Nadir's army. In the ensuing battle Nadir was completely victorious and forced the Indians back to their camp with heavy loss; he then surrounded the camp and cut off all supplies.

Mohammed Shah, realizing that his troops would not fight again and that supplies would soon be exhausted, decided to surrender. Nadir treated him outwardly with respect but in reality made him and his nobles prisoners. In company with the luckless emperor, Nadir thereupon marched in triumph to Delhi, which he entered in March 1739. He then proceeded to strip the emperor and his people of their treasures, obtaining, it is said, booty to the value of 700,000,000 rupees. As the Indian historian Anand Ram remarked, "the accumulated wealth of 348 years changed owners in a moment."

Nadir remained for two months in Delhi. He put down with such severity a rising of the citizens against his troops that a "Nadir Shahi" is still synonymous there with a massacre. After this tragic event, Nadir demanded and obtained the hand of a granddaughter of Aurangzeb for his son Nasrullah. When, in accordance with Mogul etiquette, inquiries were made about Nasrullah's descent to the seventh generation, Nadir replied: "Tell them he is the son of Nadir Shah, the son of the sword, the grandson of the sword, and so on till they have a descent of 70 instead of 7 generations."

Knowing that he could not hold Delhi, Nadir restored it and the bulk of the empire to Mohammed Shah, but he annexed the provinces on the right bank of the Indus, which during the reign of Darius had formed part of the Persian empire. Thus, after a stay of less than a year in India, he returned to Persia with greater power, wealth and fame than any other Asiatic conqueror since Timur. It remains to add that he was the last great Asiatic conqueror.

***Campaign Against Bukhara and Khiva*, 1740.**—During the siege of Kandahar Nadir had dispatched his eldest son and heir against Balkh, whose ruler had promised help to the Ghilzai chief. Riza Kuli had proved himself worthy of the command, for his assault was so fierce and so continuous that the city was surrendered. The young prince had then crossed the Oxus and defeated a strong army of Uzbegs. Nadir, unwilling to attack Bukhara at this juncture, recalled his son and wrote to the amir of Bukhara that he had ordered Riza Kuli "not to disturb countries ruled by descendants of the Turkoman." After the Indian campaign the situation was entirely changed. Nadir had not forgotten the raids made on Khurasan by the Turkomans of Khiva, and he realized that a campaign against the two Uzbeg states would form a natural corollary to the conquest of northern India and would protect Khurasan against raids for many years to come. Finally, he expected rich spoils and little resistance. Large quantities of grain had been collected at Balkh and loaded into boats, and the expedition commenced its march down the Oxus to Charjui, where a bridge of boats was constructed. The amir of Bukhara, realizing that he could not resist Nadir's veterans, promptly submitted and proceeded to the Persian camp. There, at first, he was treated with disdain, but he was finally restored to the throne on condition that the Oxus should again constitute the boundary of Persia and that he should supply a contingent of troops for the Persian army The treaty, which was accompanied by the payment of huge sums of money, was cemented by a double alliance of marriage.

After Bukhara it was the turn of Khiva. Hearing of Nadir's approach, Ilbars, the khan of Khiva, set out to destroy the bridge of boats at Charjui, but Nadir forestalled him and routed his forces. Taking his supplies by boat down the Oxus, Nadir marched along the river bank in pursuit of the enemy, whom he decisively defeated near Khiva. Soon afterward Ilbars surrendered. As the khan had put to death the envoys whom Nadir had sent to him before the campaign, the conqueror executed him, together with 30 of his councillors. At Khiva Nadir found two Englishmen, members of the staff of Jonas Hanway, the intrepid merchant who attempted to trade with Persia and central Asia across Russia and left a most valuable account of the state of Persia at this period. Nadir treated the Englishmen with kindness, giving them passports and a promise of redress for their losses. One result of this campaign was the release of thousands of Persian and Russian slaves. Many of the former were settled in Nadir's homeland of Darragaz, some in a village which the shah founded near the site of his birthplace.

The conquests of Nadir were now finished. He had restored the boundaries of Persia and made them wider than those of the Safawid dynasty. He had made Persia once more famous as a great fighting power and he not only had released the inhabitants of Khurasan who were slaves but had ensured their safety in the future. Had he possessed any administrative capacity he could have restored prosperity to Persia, but success and wealth had spoiled his character and made him a miser, and the remaining years of his life are a record of ever-increasing avarice and cruelty, which made him detested by his subjects.

***Lesghian Campaign*, 1741–43.**—There is a Persian proverb that runs, "If any shah is a fool, let him march against the Lesghians." During the siege of Kandahar, Ibrahim Khan, Nadir's only brother, heard of his nephew's successes in Turkistan and wished to emulate them. He was rash enough to attack the Lesghians, but lost his life in so doing. Nadir, on his return from Turkistan, felt bound to avenge his brother and accordingly invaded Daghestan in 1741. At first all went well and the tribes inhabiting the foothill country submitted. The main bodies of the Lesghians, however, retreated to the densely wooded higher country, where conditions were ideal for defense and for surprise attacks. Consequently they defeated the Persians repeatedly. These reverses infuriated Nadir, but, despite his utmost efforts, the stubborn Daghestanis more than held their own and eventually forced him to retreat, baffled and sullen. At the end of the campaign, Nadir found himself with an exhausted and dispirited army and with his prestige much impaired.

Like Shah Abbas the Great, Nadir suffered from jealousy of his eldest son. While he was on his way to Daghestan, he was shot at from an ambush, and believed that the would-be assassin was in the pay of Riza Kuli Mirza. Though the prince was innocent, Nadir ordered him to be blinded, but bitterly repented when it was too late. Persians remember the remonstrance of the unfortunate prince: "It is not my eyes but those of Persia which you have put out."

The success of the Lesghians caused rebellions to break out in various parts of the empire, but they were suppressed with merciless severity. Nadir had unwisely attempted to reunite Islam by abolishing the Shi'ah sect and by substituting the Ja'fari, which he intended to be the fifth Sunni sect. At the time there was no open objection to the change by his subjects, who feared to oppose

him, but the following decision was given by the religious leaders of Turkey: "The new sect is contrary to the true belief, and it is permitted to kill the people of Persia." This decision was followed by the invasion of an enormous Turkish army, which was determined to avenge former defeats; but Nadir was as great a general as ever, and he inflicted a crushing defeat, capturing the whole of the artillery and military stores of the enemy. Negotiations for peace followed in which Nadir agreed to abandon his claims to found a new sect and released his prisoners. This was his last victory.

The Death of Nadir, 1747.—As the years passed Nadir put to death so many of his trusted officers, that finally he was attacked at night by members of his own bodyguard and killed, fighting to the end. Thus fell Nadir Shah, who, endowed with superb physique, a voice of thunder, dauntless courage and a genius for war, had hewn his way to the throne. Like Napoleon, with whom he may well be compared, success caused moral deterioration, and when he died the nation which he had saved from the Afghans, the Turks and the Russians received the news with intense relief, Had he died after the conquest of Khiva he mould have been the national hero for all time.

The assassination of Nadir Shah gave the signal for the breakup of his composite army. The Afghans under Ahmad Khan alone remained loyal, but, being unable to avenge his fallen leader, Ahmad marched off to Kandahar and, aided by the capture of a treasure convoy, founded the kingdom of Afghanistan, which included most of the Indian provinces situated on the right bank of the Indus. Throughout, he remained loyal to the family of Nadir and when, after desperate contests for power, Shahrukh, the son of ill-fated Riza Kuli. was set on the throne of Khurasan and then blinded, Ahmad Shah, as he had proclaimed himself, avenged Shahrukh and constituted Khurasan a separate kingdom for him under Afghan protection and suzerainty.

Fath Ali Khan of the Kajar tribe, who was killed by Nadir when he joined Tahmasp, had a son. Mohammed Husain Khan. After the death of Nadir Shah, he raised a force with which he successfully opposed Ahmad Shah and occupied the Caspian provinces. A second claimant was Karim Khan, a member of the Zand tribe of Fars. A man of humble extraction, he raised himself to power by sheer force of character and had a large following in south Persia. Finally there was Azad. an Afghan general, who was supreme in Azerbaijan. A curious triangular contest ensued in which each claimant at one period seemed to have won, but finally Mohammed Husain was defeated and killed and Azad surrendered, leaving Karim Khan supreme.

Karim Khan to Fath Ali Shah.—Karim Khan never aspired to the title of shah, but termed himself *vakil* or regent. He made Shiraz his capital and adorned it with many fine buildings. Under his kindly rule Persia gained a sorely needed rest and began to recover something of its ancient prosperity. Upon his death, however, there was the usual fight for power among the members of his family. Meanwhile Agha Mohammed Khan, the eunuch chief of the Kajar tribe, collected a force and, winning over to his side Hajji Ibrahim, the redoubtable vizier of the Zand monarch, finally defeated Lutf Ali, the heroic representative of the Zand dynasty, who was barbarously done to death by the cruel Kajar.

Agha Mohammed was a good soldier and, after the final defeat of his rival, decided to attack Heraclius of Georgia, who, upon the death of Nadir Shah, had declared the independence of his country and had annexed provinces up to the river Aras. He had also made a treaty with Russia, by the terms of which he was entitled to receive protection. Heraclius realized that he could not receive immediate help from Russia, yet he foolishly met the overwhelming Persian army in the field and was defeated. Tiflis was taken, the priests and infirm were massacred and the able-bodied of both sexes were enslaved. After Georgia, the shah turned his attention to Khurasan. The wretched Shahrukh was unable to offer any resistance, but Agha Mohammed required more than submission. He coveted with passion priceless jewels from Delhi which he knew were in the possession of the blind monarch, and set his torturers to work. Day by day some valuable gem was produced. Last of all the famous ruby of Aurangzeb was extracted and Shahrukh, worn out by the tortures, died cursing the Kajar eunuch. Shortly afterward, the tale of his cruelties was brought to an end by the hands of two of his body servants whom he had doomed to death but yet permitted to attend him. Thus, in 1797, after only three years' rule over the whole of Persia, died the founder of the Kajar dynasty, who was rightly detested by all classes.

Under his nephew, Fath Ali, Persia came within the orbit of European politics. The first step was taken by the British rulers in India. In 1798 Lord Wellesley received a letter from the amir of Kabul in which he stated his intention of making an expedition into India. This would have upset British policy and Wellesley sent a Persian, who was acting resident at Bushire, to induce the Persian court to put pressure on the amir. The task of the envoy was made easy by an Afghan demand for the cession of Khurasan, to which the young shah replied that he intended to restore the eastern boundaries of Persia as they were in Safawid days. He followed up this threat by dispatching a force to help two Afghan pretenders, with the result that the amir retired from Lahore to meet the threat in the west. The mission of the British agent was thus entirely successful and paved the way for an accredited British envoy, who was about to land on Persian soil.

Franco-British Rivalry in Persia.—The genius of Napoleon dominated his adversaries to such an extent that even his fantastic schemes caused them great alarm. Among these must be reckoned his plan of using the shah as an instrument for the invasion of India in co-operation with French and Russian troops. Accurate modern maps showing the barren nature of these countries have revealed the impracticability of the scheme, but in 1800 it was seriously considered by Napoleon and Paul of Russia. Indeed, Paul actually ordered the Don Cossacks to march on India. The movement was begun, without supply columns or maps, but it was stopped at the Volga upon the death of the tsar, which was fortunate for all concerned. The British, determined to forestall the French, instructed their agent, Capt. John Malcolm, to induce the shah to bring pressure on the amir of Kabul to counteract the designs of the French and to negotiate a political and commercial treaty. Malcolm's success was complete, and he speedily gained all his objects. Moreover, he established a high regard for British honour in Persia.

The British foolishly withdrew Malcolm and left no permanent representative at Tehran. Napoleon took advantage of the favourable position and in 1802 made definite overtures to Persia. These were followed in 1806 by the appearance at Tehran of a French envoy, who, in view of the fact that the emperor had declared war on Russia, offered to restore Georgia to Persia and to subsidize the shah, who in return was to join France in an invasion of India. Fath Ali was most unwilling to become the ally of a nation which had put its monarch to death. However, he could obtain no reply to his appeals from the British, who could not make up their minds what to do. Finally, therefore, he agreed to the French proposals. Fortune, however, favoured the British, since, by the time the Franco-Persian treaty had been signed, Napoleon had made peace with the tsar, and Persia lost all hope of recovering Georgia through his aid.

Outwardly a French mission held the field, and Malcolm, when he again reached Persia in 1810, was affronted. In spite of this, the situation was changing; the French mission was dismissed and Sir Harford Jones, representing the crown, as distinct from the governor general of Bengal, was given a magnificent reception. A new treaty was negotiated and in 1814 a definite treaty was signed, by the terms of which treaties or military co-operation with nations hostile to Great Britain was barred; Persia further pledged itself to use its influence aith the states of central Asia to adopt a similar policy. In return, Persia was granted a subsidy of £150,000 a year, which was to be stopped if it engaged in an aggressive war. This treaty dealt with the French peril after it had passed. On the other hand. it mas not realized by British statesmen that so far as Persia was concerned the annexation of Georgia and Karabagh by Russia had created an entirely new situation, that the treaty had not recognized the fact and was therefore likely to lead to trouble.

Struggle for Georgia.—Persia was bound to fight for Georgia,

and the campaigns that followed may be considered to fall into two distinct periods. The first ended with the defeat of Persia in 1812, peace being made in the following year by the treaty of Gulistan. Thirteen years later Persia again attempted to reconquer Georgia and its final defeat is recorded in the treaty of Turkmanchai (Turkman), which was signed in 1828. The Persian army was commanded by the heir apparent, who invariably lost his head on the battlefield and rendered the efforts of a handful of British instructors futile. The first campaign opened with the siege of Erivan by a Russian force, which was so harassed by the cutting of its lines of communication that the operation was abandoned. The campaign was ended in 1812 by a decisive action fought at Aslanduz. A small Russian column surprised the Persian army in broad daylight. The British officers had drawn up their men when Abbas Mirza in a panic ordered a hasty retreat, with the result that the force was annihilated.

After this disaster, the shah, who was also panic-stricken, agreed to abandon all claims to Georgia; he also ceded Derbent, Shirvan and Karabagh. Russia, at this very time, was at the crisis of its fate because of the invasion of Napoleon, and it is astonishing that Persia abandoned its possessions and made no further effort against such a sorely embarrassed enemy. As was to be expected, Persian opinion regarded the treaty of Gulistan as a national disgrace. It had been vaguely worded, so much so that the possession of three districts remained in dispute. Kegotiations were being carried on but before they were completed Russia occupied the areas. Persian opinion was deeply stirred, recruits poured in and the shah was forced by public opinion to break the treaty. At first the Persians carried all before them and occupied Shirvan and Talish in less than a month. But the Persians would not face Russian troops. In an action fought near Ganja, although the Persians were numerically superior, their cavalry fled, demoralized by artillery fire. The Russian infantry then advanced and swept the Persians off the field. Fath Ali was a miser; he refused to pay the troops in the winter and they perforce were disbanded. Realizing the position, a small Russian force marched on Tabriz and captured not only the city but also the entire artillery park of the Persian army. Thus ignominiously hostilities were ended. By the treaty of Turkmanchai, the Aras became the boundary of Persia. An indemnity was demanded and extraterritorial rights were included as well as a commercial treaty, by the terms of which there was a 5% tax on imports and exports. This treaty inaugurated a new era and became the basis on which other European nations conducted their intercourse with Persia. Great Britain recognized the changed position and, in view of the fact that Persia was the aggressor, declined to pay the subsidy. Persia was, however, in dire straits from its inability to pay the Russians, and it mas arranged that a single payment of £150,000 should be held to cancel all further claims on the subsidy.

Persia and Afghanistan. — Persia realized that its defeat by Russia was final. To salve its wounded pride, it decided to make strenuous efforts to recover Herat and the other provinces that now formed the state of Afghanistan. This trend of policy was viewed with apprehension by the British government, since Persia was under Russian influence and if Herat, Kabul and Kandahar were reconquered, Russian agents would be established close to the Punjab. Actually Persia's objective during this period was Herat, and Great Britain made strenuous and successful efforts to keep that province outside the influence of both Persia and Russia.

Abbas Mirza was more successful in eastern Persia than against Russia. He gradually reconquered Khurasan until Sarakhs alone held out, encouraged by the presence of the khan of Khiva. However the khan, alarmed by the surrender of Kuchan, retired, and Sarakhs was stormed, a feat which restored Persian prestige in central Asia. Shortly afterward, Abbas Mirza and then Fath Ali Shah died (1834).

Mohammed Shah was the son of Abbas Mirza and, when he had defeated various pretenders and established himself on the throne, it was clear that he was determined to capture Herat. He had already, during his father's lifetime, commanded a force which was besieging that city, but had hastened to Tehran to secure his nomination as heir apparent upon hearing the news of his father's death. At this period a second British military mission reached Tehran, but it was received with marked coldness by the young shah and was unable to serve any useful purpose. It is impossible to give any account of British policy in Afghanistan and we must confine ourselves to the question of Herat. In 1837 the shah opened his campaign, and the first prisoner that was captured was bayoneted in his presence. Yar Mohammed, the able vizier of the prince of Herat, had made every preparation for a siege. The fortifications had been repaired and strengthened; supplies in large quantities had been stored, and all villages within 12 mi. of the city had been burned. An English artillery officer, Eldred Pottinger, arrived on the scene and gave valuable help. In the spring of 1838 Sir John McNeill, the British envoy, reached the Persian camp and nearly persuaded the shah to break off the siege. Ho ever, at this juncture, the Russian envoy offered the services of a Russian officer. McNeill was consequently flouted and quitted the Persian camp. Shortly after his departure, the shah made his final effort. For six days the defenses were battered, but the general assault failed. The shah was utterly dejected, and when he received a communication from the British minister that his government would view the occupation of Herat as a hostile act, and that the island of Kharag had been seized by British troops, he agreed to British demands and broke off the siege. He died in 1848, leaving Persia on the verge of revolution and bankruptcy.

Nasr ed-Din (1848–96).—His son, Nasr ed-Din, began his reign well. He brought with him from Tabriz his adviser, Mirza Tski Khan, and appointed him his vizier. He was the most remarkable Persian of his generation, being not only capable and hard-working but also incorruptible. He set to work to abolish the sale of appointments and of justice; and the embezzlement of the soldiers' pay, the grant of pensions to favourites and many other abuses were all taken in hand. His reforms raised up a host of enemies, among them the mother of the shah, who persuaded her son that the vizier was too powerful, with the result that he was executed—a terrible blow to Persia. After this the shah, generally speaking, ruled in the bad old way, although he was a more enlightened ruler than his predecessor, partly as a result of his visits to Europe.

During the early part of Nasr ed-Din's reign, an inhabitant of Shiraz preached a new religion. He proclaimed himself the Bab or "gate" through which men might attain to knowledge of the 12th Imam (see BABIISM). The Bab was the son of a grocer, and when he attempted to convert his fellow townsmen he was considered to be a madman and was imprisoned. His followers, however, increased to such an extent that the shah finally ordered him to be executed at Tabriz. After his death the doctrine spread far and wide, causing risings and an attempt on the shah's life, which was met with pitiless persecutions. The Baha'i sect, an offshoot of the one founded by the Bab, still exists and counts many followers, not only in Persia but in the Levant and in America.

During the generation that followed its victories over Persia, Russia not only strengthened itself in that country by the creation of a naval base on the Persian island of Ashurada in Asterahad bay, but made great efforts to gain a footing in central Asia and in Afghanistan. It was probably at Russia's instigation that Nasr ed-Din determined to win renown by the capture of Herat. Yar Mohammed, the capable vizier, had died. leaving the province to his son, who was mentally deficient and whose first act was to open up negotiations with Persia. The British government thereupon imposed a treaty on Persia by the terms of which Persia promised not to send troops into the Herat province unless it was attacked from outside. The treaty caused intense irritation to Persia and was the main cause of relations being broken off between the two countries. Persia then gained possession of Herat through. an Afghan nominee in 1836, and there was intense delight throughout the country. But Great Britain had to be reckoned with. In addition to paying a subsidy to the amir, it declared war on Persia and landed an expeditionary force at Bushire. Under Sir James Outram, a march was made inland and a Persian force was defeated. The troops were then transferred to the mouth of the Karun river, where a second success was gained. Persia had already sued for peace, and by the terms of a treaty signed in Paris

in 1857 the shah agreed to evacuate Herat and to recognize the independence of Afghanistan. No indemnity or concessions were demanded.

Nasr ed-Din was fated to see the advance of Russia across central Asia until his northern frontiers were entirely enveloped. The khanates, as they were termed, were annexed one by one, until only the Turkoman was left. In 1881, after more than one failure, Mikhail Skobelev stormed the stronghold of the Tekke Turkomans at Geok-Tepe, the other tribes gradually submitted and Russia forced Persia to accept an unfavourable boundary that gave its new neighbour a stranglehold on Khurasan.

We must now turn to the advance of the Indian empire. Baluchistan had relapsed into anarchy at the end of the 18th century, and no immediate attempt would have been made to interfere with this state of affairs but for the fact that it was decided to construct a telegraph line from England across Persia to India. Negotiations were opened with Persia, with the result that a boundary was finally drawn between Persian and British Baluchistan. This latter province may be said to have been the creation of Sir Robert Sandeman, through whose exertions law and order were gradually introduced into a no man's land. From the Persian point of view these boundaries, mhich included the delimitation of its frontier with Turkey, completed its envelopment.

Constitutional Movement. — The desire for a constitution in Persia came relatively late. Persia was affected by the construction of telegraph lines and so forth, but national pride in its own perfection was also strong. The shah as a young man was in favour of progress, but the failure of the attempt at constitutional government in Turkey in 1876 frightened him, and his later policy tended toward keeping Persia free from dangerous new ideas. "I want ministers who do not know whether Brussels is a city or a cabbage," was his frank avowal, and although his point of view was selfish the event did prove that Persia was not ripe for the new order. Nasr ed-Din was assassinated in 1896. His successor, Muzaffar ed-Din, led Persia toward bankruptcy by borrowing large sums of money from Russia, which he wasted on his journeys to Europe and on his favourites. During his reign all fear of the shah passed away, and the tribes robbed with impunity on the caravan routes, inflicting serious losses on all classes.

The movement in favour of a new order was led by Jamal ed-Din, an agitator who gained considerable influence in Turkey and Persia during the last years of Nasr ed-Din. He was rather a Pan-Islamist than a constitutionalist (see PANISLAMISM), and vehemently denounced the corruption of the Persian vizier. Another moving spirit was Prince Malkom, a clever Armenian with a French education. He was the Persian minister in London and while holding this post quarrelled with the vizier over a lottery which the shah had sold to him but which the vizier wished to cancel. Prince Malkom published a paper in which he advocated a parliament for Persia, while he never ceased to denounce his enemy the vizier.

The weakening of the power of the shah encouraged the reformers, and in 1905 a definite movement began in favour of a constitution. It began with a protest against the vizier, who was held responsible for the costly journeys of the shah, for the corrupt government and for the disorder in the country. A number of merchants followed a time-honoured custom and took bast or sanctuary at a mosque in the capital, where they were joined by some mullahs. Driven from the mosque by orders of the vizier, they proceeded to the shrine of Shah Abdul Azim outside Tehran, where their numbers rapidly increased. In vain the shah intervened by sending his favourite to induce them to disperse. Finally the shah was obliged to dismiss the obnoxious vizier and to promise to convene an adalatkhana or "house of justice" — it is to be noted that there was no demand for a constitution at this juncture. Upon receiving the royal promise, the *bastis* returned to their homes and the shah took no steps to convene a house of justice. In 1906 the shah had a paralytic stroke and the vizier decided to take strong measures against the reformers. This led to the second Dart, which ended in the departure of the mujtahids or "doctors of the Divine Law" to Qum and the threat that they would lay the land under an interdict. Simultaneously thousands of citizens took *bast* at the British legation and declined to leave it until a national assembly had been granted by the dying shah. This was, at length, conceded by Muzaffar ed-Din, who opened the assembly in Oct. 1906 and died shortly afterward.

The Revolution. — Mohammed Ali, who succeeded his father, was an oriental despot of the worst type. He attempted to blind the reformers by twice pledging himself to adhere to the new constitution. However, he had no intention of keeping his solemn promises, for he resented any infringement of his absolute power to dispose of the revenues of Persia for his own purposes. The able vizier of Nasr ed-Din was recalled to office with secret instructions to overthrow the constitution. He set to work to gain the consent of the majority of the majlis, or national assembly, for the raising of a loan, for the shah had found the treasury empty and could not buy partisans without money. It seemed as if the vizier was achieving his purpose when he was assassinated. This act was glorified and the 40th day after the suicide of the assassin was observed as a national holiday. Public opinion forced the shah to appoint Nasir al-Mulk, who had been educated at Oxford, to be his vizier. This honest statesman realized that it was essential to restore the finances of Persia, but before he could carry through any of his reforms the shah, who had collected gangs of ruffians, called out his forces with the intention of closing the obnoxious *majlis* and of arresting its leaders. But he suddenly hesitated and stayed his hand. The majlis thereupon collected armed volunteers and sent telegrams to the provinces asking for support, which evoked a wave of enthusiasm.

The shah yielded to the popular feeling and sent a Koran to the assembly sealed with an oath that he would observe the constitution. This is the most solemn form of oath in Persia. Six months later, the shah bombarded the building in which the majlis sat, arresting some of the leaders and regaining control of the government for the time being. The answer to this outrage was a rising at Tabriz. In vain the shah dispatched troops to crush the rebellion. They merely blockaded the city, and in the spring of 1909 the Russians broke up the blockade in the interest of Russian subjects. The defense of Tabriz gave time for national forces to be organized at Resht and Isfahan. These forces combined and entered Tehran, whereupon the shah, who was in camp a few miles from the capital, fled and took refuge in the Russian legation. He was deposed by the victors and left Persia.

Thus, with little loss of life, the Persian revolution was successfully accomplished.

Anglo-Russian Agreement, 1907. — For a century there had been keen rivalry in Asia between Great Britain and Russia. The military party in Russia, which desired to approach ever nearer to India, was averse to any settlement with Great Britain, but the disasters of the war with Japan had a chastening effect. Moreover, both Russia and Great Britain were becoming alarmed at the growing might of Germany. Consequently the two powers concluded an agreement which was designed to settle all differences between them in regard to Tibet, Afghanistan and Persia. Here reference mill be made to the agreement only so far as it affected Persia. It began with a solemn declaration to respect the "strict independence and integrity of Persia," and then stipulated that each state bind itself to seek no concession of any kind in regions conterminous to the frontier of the other. To avoid misunderstandings, the commercial spheres were then defined. That of Russia included northern and central Persia, while Great Britain merely reserved the deserts of southeast Persia. It was a mistake not to have included the whole of south Persia, as there alone would commercial concessions be sought, and leaving it neutral was certain to lead to trouble. This was pointed out at the time, and the subsequent enormous development in oil proved that this view was correct. Persia naturally disliked the agreement. It had based its policy on the rivalry of its two neighbours and viewed with dismay the new order, by which, in its opinion, the two powers had agreed to dismember Persia. But the country was not in a position to protest against this threat of encroachment. It was soon clear that Russian officials considered that northern Persia had been made over to them and, when World War I broke out, they were gradually annexing it. The agreement was annulled both

by Great Britain and by Russia after the conclusion of World War I. (P.M. S.; A. U. P.; L. Lo.)

HISTORY OF THE PERIOD 1909–52

Constitutional Government. — The 35 years following 1909 were epoch-making in the history and evolution of Persia, and may be said to have begun with the accession of the boy king Sultan Ahmad Shah and the re-establishment of constitutional government.

The first cabinet of the new government included two patrician heroes of the revolution, the Sipahdar (to be known later as Sipah Salar) as prime minister and the veteran Bakhtiari chief Sardar Asad as minister of the interior; but they soon found themselves mere figureheads in the hands of the more extreme elements among the late revolutionaries, whose aim seemed to be to control the government without sharing its responsibilities. In these circumstances it was not long before the two ministers resigned their portfolios and took their seats in the *majlis* as ordinary deputies, a new cabinet being formed under the presidency of a well-known figure in Persian politics, Mustaufi al-Mamalik, with a sprinkling of the most able of the Young Persian element. Nevertheless, the first year of the revived constitution was marked by a continuation of cabinet crises and by the division of the *majlis* into a number of conflicting factions.

After the nationalist occupation of Tehran, Ephraim Khan, the military leader of the revolutionaries, promptly organized a vigorous police administration which gave the city immunity from those disorders which are so often experienced in such cases, and the lives and properties of foreigners were in no way molested. Nevertheless, on the plea that special measures were needed for the protection of their nationals, Russian troops were dispatched to Kazvin, and having succeeded in effecting a temporary occupation, they refused to withdraw, despite the earnest remonstrances of Great Britain, which advocated a policy of nonintervention in accordance with the spirit of the 1907 convention. The lack of administrative experience on the part of the personnel of the new regime soon made it apparent that the departments of the government could not be effectively reorganized without the assistance of foreign advisers, and when the subject came up for specific discussion Great Britain and Russia required that nationals of one or more of the minor powers should be engaged, failing which they must press for the appointment of their own nationals.

The deliberations in this connection extended into the new year (1911), and eventually it was decided that the United States should be engaged for the supervision of finances and Sweden for police and gendarmery. Action was taken accordingly, and in due course, in the following May, a U.S. citizen, Morgan Shuster, was engaged to serve as treasurer general for a period of three years, with a staff of four assistants, for the supervision, collection and disbursement of the revenues of Persia.

Hardly had they begun to work when, on June 17, the recently deposed Mohammed Ali Shah unexpectedly landed at Gumesh Tepe on the Caspian, bent on an attempt to recover the throne; while at the same time his brother, Salar ed-Dowleh, making a sudden appearance in Kurdistan, there too raised the standard of revolt, ostensibly on his brother's behalf. At first the menace to the capital from these two directions was undeniably serious, but the former shah's effort was conducted with that incapacity and indecision which had distinguished all his activities, and ended in a complete fiasco. The credit for this result was mainly attributable to the redoubtable Ephraim Khan and to Shuster's financial reforms which supplied his resources.

Meanwhile Shuster's financial plans had brought him into conflict with Russian interests. Finally the confiscation of the estates of the former shah's brother Shua as-Saltaneh (who, it was claimed, was in debt to the Russian bank) for the part he had played in his brother's abortive exploit was held to afford sufficient grounds for the presentation of an ultimatum to the Persian government, in which were included demands for an indemnity and for the dismissal of Shuster, failing which, it was announced, there would be an advance of Russian troops on Tehran. Great Britain made diplomatic protests at Tehran but they were of no avail and Russia persisted in its demands.

Relations With Russia and Great Britain. — National feeling was outraged by the abominations committed by the Russians at Tabriz, which were in the worst of the tsarist traditions. The independence, the very life of the nation, seemed at stake. Russian goods were boycotted (British goods also, in the south), and in a dramatic meeting the *majlis* refused to sanction compliance with the ultimatum. In view of the aggression of the Russians it was for many members an act of heroism and patriotism. Approximately 4,000 Russian troops at Kazvin and 2,000 more at Mazanderan threatened the capital, where Russian bribery and intrigue were already at work. An unprecedented demonstration by patriotic women of Tehran held the *majlis* firm to its decision. In the face of imminent disaster, the regent, Nasir al-Mulk, with the co-operation of the cabinet (which should have resigned on a vote of no confidence), effected a coup d'état on Dec. 24, dissolved the *majlis* and notified the Russians of compliance. The contracts with Shuster and his colleagues were terminated and Shuster left the country on Jan. 11, 1912. Affairs at the capital and throughout the country were in great confusion. Financial administration was carried on as well as could be in the circumstances by the Belgian customs administration, but no constructive improvement was possible.

British official consent to Russian policies, the ousting of Shuster and the defeat of Persia's hope for reorganization and a new era aroused resentment not only in the U.S. but in liberal circles in Britain and elsewhere. Though not denying the honesty, energy and ability of Shuster or the promising results he was accomplishing, the British government reported him as tactless and diplomatically inexperienced, but after World War I offered a more substantial justification for British policy in seeming to connive at the destruction of Persia's independence. Sir Edward Grey, the foreign minister, and the cabinet as well, were deeply anxious over the impending threat of Germany to world peace, and were convinced that there was little hope of successful resistance without a *rapprochement* with Russia and that such a vast stake excused compromise and injustice.

On the conclusion of the war, Persia was admitted as an original member of the League of Nations.

The British government negotiated a treaty with the cabinet of Vosuq ed-Dauleh on Aug. 19, 1919, using strong and unconventional pressure. The sum of $750,000 was somewhat irregularly advanced to three members of the cabinet to cover certain undesignated expenses. This treaty categorically reaffirmed the integrity and independence of Persia. But the subsequent provisions of the treaty were not consistent with this declaration and mould have reduced Persia to the status of a protectorate. They provided for British advisers, military and civil, to the Persian government, a substantial loan from Great Britain, co-operation with the British government for the improvement of communications (a provision that had in view the construction of a Persian railroad by British firms), and the revision of customs tariffs. Public opinion, educated by the Russian-British pressure for the defeat of the Shuster mission, rallied swiftly and brought irresistible pressure on the *majlis* to refuse ratification.

The Soviet Union, which already had been recognized by Persia, saw its opportunity of gaining Persian friendship and demonstrating the sincerity of its rejection of imperialistic policies by negotiating a treaty (initialled Jan. 16, 1921). This treaty renounced the old tsarist policy of force and aggression and guaranteed nonintervention in the affairs of Persia. All treaties that had been concluded between the tsarist regime and other powers in regard to Persia were denounced, a provision aimed especially at the Anglo-Russian convention of 1907. All concessions that had been granted to the Russian government or Russian subjects were cancelled. All loans and debts were likewise cancelled, and a cash balance in excess of $2,000,000 in the Imperial Bank of Russia was given to Persia. Railways, roads, ports and docks formerly Russian concessions reverted to Persia, the extraterritorial rights of Soviet citizens were abolished and Persians were allowed to have ships in the Caspian sea. It was expressly stipulated that none of the property returned to Persia could be alienated to any

other power. Meanwhile, the weakness and corruption of the cabinet and the irresponsibility and incompetence of the young shah stirred patriotic nationalists to hope and work for a drastic change. Saiyid Zia ad-Din, editor of an influential newspaper, the *Rad*, established contact with Riza Khan, then in command of the Cossack brigade. With 4,000 troops Riza Khan then marched on the capital from Kazvin, cutting communications as he went, and arrived in Tehran in the early morning of Feb. 22, 1921. The state offices were occupied and the government was taken over with hardly a shot. A new government was set up with Zia ad-Din as premier, but the real power resided in Riza Khan and Zia ad-Din a few months later retired to voluntary exile in Switzerland, where he remained until 1943 when he returned to Persia.

Four days after the coup d'état, the treaty with Russia was signed, and on the same day the Anglo-Persian treaty of 1919 was denounced and Persia started on a new regime — the regime of Riza Shah Pahlavi (*q.v.*).

Accession and Reforms of Riza Shah. — On the retirement of Zia ad-Din on April 3, 1921, Riza Khan, although officially only minister of war, actually controlled the government. He appointed Qavam as-Saltaneh prime minister. Almost his first task was to build up a dependable and efficient army. As this was impossible without regular pay, he insisted that certain branches of the ministry of finance be placed under his control as minister of war. He gradually converted the miscellaneous contingents into a disciplined force of 40,000 men, and then concentrated his efforts on the subjugation of the distant and semidependent tribes. His phenomenal success in this was soon reflected in the increased measure of security prevailing in the provinces and in the growth of the national revenues. In 1922, as the result of negotiations with the U.S. government, a strong financial mission arrived from the U.S. under the leadership of A. C. Millspaugh with the aim of reforming Persian finances.

In Oct. 1923 the shah left for Paris. Riza Khan appointed himself prime minister and summoned the *majlis*.

Late in 1924 Riza Khan reduced to submission Sheikh Khaz'al Khan, the semi-independent chief of Mohammerah (Khorramshahr), who had for years been greatly favoured by the British. On April 19, 1925, the sheikh was arrested by Persian troops and forthwith removed to Tehran, where he was detained as a political prisoner. He died in 1934.

In Feb. 1925 Riza Khan demanded from the *majlis* the grant of definite and comprehensive military powers withdrawable only by a vote of that body. His request having been granted, he became completely independent of the shah's authority, and six months later he formally asked for the crown of Persia. The change of ruler and dynasty was quietly effected, the deposition of the absent Sultan Ahmad Shah being executed by a simple declaration of the *majlis* on Oct. 31, 1925. A constituent assembly was then convened, which proceeded to elect Riza Khan Pahlavi shah of Persia, with right of succession to his heirs. On Dec. 15 the new shah took the oath to defend the constitution, and the following day he was publicly proclaimed amid much popular enthusiasm. A few weeks later his eldest son, Shahpur Mohammed Riza, was appointed crown prince. On April 25, 1926, the coronation took place.

The contracts of the members of Millspaugh's financial mission expired in Aug. 1927 and were not renewed. After a short interregnum, during which the financial administration was carried on by the Belgian customs staff, a German financial expert, Kurt Lindenblatt, was appointed (April 1928) to succeed Millspaugh, but with much reduced powers.

Following the example of Turkey and Afghanistan, in 1927 the shah gave notice to the powers concerned of his intended denunciation of all treaties in which extraterritorial rights (capitulations) were conferred. The abolition was formally put into effect on May 28, 1928. After difficult negotiations extending over several months, an agreement was reached in Nov. 1928 for the establishment of bases in Persian territory for the Imperial Airways service to India. At the League of Nations in Sept. 1928 Persia was elected to the council of the League. In 1929 Persia recognized the new state of Iraq.

During the period 1929–35, Persia's relations with foreign powers improved. Better relations with the U.S.S.R. were celebrated by a magnificent exhibition of Persian art in Leningrad and an International Congress for Iranian Art and Archaeology at the same time. The Anglo-Persian Oil company's D'Arcy concession of 1901, cancelled in 1932, was replaced by a new agreement in 1933 after reference to the League of Nations. The presence of British coaling stations at Basidu and Hanjam led to some friction, until these were removed in 1935 to the Bahrein Islands.

In Persia itself, Riza Shah, using his well-trained army with courage and ability, effectively subjugated and disarmed the tribesmen, a feat that was entirely beyond the power of the previous dynasty. More than this, the Kashgais and Bakhtiaris were put under the rule of military officers and their chiefs were either put in prison or accepted subordinate positions. The same policy was pursued with the smaller tribes. As the tribesmen were prevented from robbery, security of the roads was established. Nomadism was suppressed; transition to fixed habitations was sometimes cruelly enforced, but was later mitigated by generous allotments of land, houses and other facilities. The mullahs, like the nomad chiefs, lost their power for evil. Persia was really under military government.

The shah realized the importance of communications, and steady progress was made in road building under U.S. engineers. Even the poor began to travel, with the result that a wider outlook grew up. The postal services were radically improved, and the Junkers company inaugurated a regular service between Tehran and Baku, Baghdad, Shiraz and Meshed. Radio stations were also established and were available for public use. The construction of a railway line from the Caspian to the Persian gulf was eagerly desired by the progressive shah, whose enthusiasm infected the entire nation. U.S. engineers examined the various routes: and in the autumn of 1927 the shah inaugurated this great undertaking, which was carried out under tender by European and Persian contractors, with Italian and native labour, under the supervision of the Consortium Kampsax, a Swedo-Danish syndicate which took over the work in 1933. Of equal importance for the country was industrialization: textile, cement, sugar beet and other factories were established in various parts of the country. Many of them soon showed a profit and contributed to economic stability and a rising standard of living. Education was substantially reformed and improved and the proportion of literacy steadily rose. To the staff of the University of Tehran were united European experts of good standing. Medicine and hygiene showed a marked advance. The judiciary was remodelled along French lines. Civil offices were opened for marriages. Here, as in other reforms, the policy of Turkey was influential. Women were unveiled by a sudden and effective decree in 1935.

(P. Z. C.; A. T. W.; A. U. P.; L. Lo.)

Foreign Relations, 1938–41. — Persia viewed the onset of World War II with deep anxiety. Having suffered from the invasion of three armies — Turkish, Russian and British — in World War I, the country unanimously resolved to keep clear of all entanglements.

As late as 1939 the sympathies of the people were almost entirely with the Allies. The shah himself and some army officers, however, tended to favour Germany and Italy, partly because of the almost constitutional distrust of the U.S.S.R. and Great Britain and also because they were contemptuous of the timidity and confusion in Allied councils which culminated in the Munich agreement. The shah, resolute and forthright in all things, believing in swift, implacable decisions, was impressed by these same qualities in Mussolini and Hitler. German propaganda, moreover, was well organized, well financed, skilful and unscrupulous.

The U.S.S.R.'s accommodation with Germany, the indecision and ambiguity of Allied plans and the disastrous defeat of France convinced the shah, his officers and gradually the people that the democracies were doomed. The Germans meanwhile laid their plans well for their new *Drang nach Osten*, aiming at the Persian gulf and India.

Since 1935 Germany had held third place in Persian foreign trade, and by 1938 it had begun to make strenuous efforts not only to enlarge this trade but also to secure a dominant role in Persia's

internal economic development. Despite the memory of unethical procedures in the German part of the railway construction, and even more of the corruption and mismanagement by German officials of the National bank, the Germans were able by propaganda and infiltration to secure a commanding position in Persia. Within one year they tripled their exports of iron, urgently needed in Persia, and supplied textile machinery, radio equipment, military supplies (artillery and transport), agricultural machinery and other heavy industrial products; they built chemical, glass and hardware factories and provided first-class specialists at uneconomic rates to maintain technical services. Propaganda films were made available without payment, and generous contributions were given to charities. After the Allies occupied Syria and Iraq, Tehran became a centre for German intrigue for the whole near east, and the German legation was, according to Nazi custom, heavily overstaffed.

Much of this economic penetration was legitimate and in Persia's own interest, no different from what the U.S.S.R.. more naturally situated, had already accomplished; but much of it was part of the Nazi plans for world domination.

Made apprehensive by treachery to the Allied cause in both Syria and Iraq, and alarmed by the German advance against the U.S.S.R. with its threat to the Caucasus and ultimately Persia, the British and Soviets decided in 1941 that they could take no chances. Negotiations ineptly conducted through the Persian foreign office instead of by direct conversations with the shah, and the exaggeration in formal Allied communications of the number of German propagandists in Persia, created an overbold resistance on the part of the shah, and it was felt that his attempts to deny or dally with the problem could no longer be tolerated in view of the oncoming peril. That this threatened disaster quite as much to Persia as to the Allies, the Persians insufficiently understood.

The U.S.S.R. had reasonable justification for action under the terms of its treaty with Persia of 1921, which provided, on the one hand, that the U.S.S.R. should defend Persia from any invasion from the north, such as the Germans obviously contemplated, and on the other authorized the Russians to press for the expulsion from Persia of any foreign officials who were engaged in any action hostile to the U.S.S.R.; it even permitted the use of Persian territory to repel any invasion that might come from the south. The Soviets, acting under these provisions, and the British, under the necessity of self-preservation, simultaneously descended on Persia in Aug. 1941.

Foreign Occupation.——In a few hours British naval vessels had overcome the resistance of a few Persian coastal craft, an expeditionary force was landed in the gulf and another came up from Iraq through Kermanshah, rushing north to meet the oncoming Soviets south of Kazvin. The occupational zones were carefully delimited, the U.S.S.R. being responsible for the northern provinces, Azerbaijan, Gilan and Mazanderan and Great Britain for the rest.

The immediate consequence of this joint action by Great Britain and the U.S.S.R. was the abdication of Riza Shah in favour of his eldest son, Mohammed Riza, a young man of 22 who had been educated in Europe. The former shah was sent first to Mauritius and later to South Africa, where he died in July 1944.

The new shah immediately announced his intention of ruling as a constitutional monarch, which he described as "the best way," although it is now agreed that the first 12 years of his father's reign had provided the energy, discipline and control which had been essential for the renaissance of Persia. The transition to a fully democratic regime, which had been insufficiently prepared for, mas inevitably difficult, and there was much political rivalry and manoeuvring in Tehran.

On Jan. 29, 1942, Great Britain, the U.S.S.R. and Persia concluded a treaty of alliance, whereby the first two powers undertook to respect Persia's territorial integrity and sovereignty and to evacuate their forces within six months of the conclusion of hostilities with Germany and its allies. In Sept. 1943 Persia declared war on the Axis powers.

The trans-Persian railway proved to be of inestimable benefit to the Allies, who greatly increased its usefulness and capacity by constructing docks and supply centres in the south, building a branch line from Ahwaz to the port of Khorramshahr (Mohammerah) and importing many locomotives and additional rolling stock. The road system was also much improved. The result was that vast quantities of urgently needed war material were soon pouring across Persia to the U.S.S.R. The operations of the Anglo-Iranian Oil company in southern Persia were also of immense importance to the Allied cause, as they made available large supplies of aviation and motor gasoline, fuel oil and other products.

Although it was technically not an occupation, the presence of British and Soviet troops on Persian soil was most distressing to the inhabitants, who saw in it a physical renewal of the ancient threat of Great Britain and Russia to partition the country between them. A bad harvest and the diversion of transport facilities for Allied military purposes led to a serious food shortage in many parts of Persia in the minter of 1942–43. The situation was aggravated by the refusal of the U.S.S.R. to allow grain and rice to be sent from Azerbaijan to the other provinces in order to relieve conditions there. The spending by the Allied powers in Persia produced greatly increased income, especially in the middle and working classes; the cessation of importation resulted in the scarcity of certain consumer goods. The combination of these three factors led to destructive inflation, threatened the stability of the currency and multiplied the sufferings of the country. The price of food and other essential commodities soared in some instances to more than ten times their prewar levels.

At this juncture the young shah and Hussein Ala, the minister of court, as well as veteran liberals such as Furughi and Taqizadeh who had done much to create the modem Persia, turned to the United States. The Persian people, fearing both the Soviet Union and Great Britain, felt that the U.S. had no political axes to grind and had on occasion in the past rendered friendly and disinterested services. On the recommendation of the U.S. state department, A. C. Millspaugh was appointed treasurer general with wide powers, and Col. Norman Schwartzkopf was appointed to reorganize and direct the gendarmery. About 90 other U.S. experts in finance, agriculture, transport and other services were also employed.

Recovery was slow and necessarily took the disagreeable route of high taxation. Friction developed and was not helped by the sensational growth of a free press, for, released from the restraints of the former press law and government censorship, 40 to 50 new journals sprang up. Many were single sheets. improperly financed and run without experience, of small circulation and brief duration, but they added their quota to the confused situation.

In the meantime the U.S.S.R. had been strengthening its influence in the north. Rumours that it intended to secure a preponderant position there as well as direct access to the Persian gulf led the Soviet government to give repeatedly categorical assurances that it had no designs on Persian territory, a pledge that was reaffirmed and, moreover, jointly underwritten by both Great Britain and the U.S. at the Tehran conference, where, on Dec. 1, 1943, Winston Churchill, Franklin D. Roosevelt and Joseph Stalin jointly signed the declaration recognizing the territorial integrity, independence and sovereignty of Persia.

Notwithstanding this declaration, the U.S.S.R. continued to extend its influence in the north, supporting the left-wing Tudeh party and fostering the separatist tendencies of certain minority elements. In Sept. 1944 the Soviet government suddenly demanded an exclusive oil concession covering the northern provinces and applied such pressure that the prime minister, Mohammed Sa'id Maraghei, was forced to resign. This brusque behaviour produced a remarkable reaction in Persia, and the *majlis* passed a bill tabled by Mohammed Mossadegh (who was then a comparatively unknown deputy) forbidding the granting of oil concessions to any foreign interests during the war.

Postwar Developments.—When the war was over, Great Britain and the U.S. duly withdrew their forces from Persia though the U.S. had not been a party to the 1942 treaty. The U.S.S.R., on the other hand, disregarded its obligations and at first refused to evacuate the northern provinces. When the Soviet army finally withdrew it left behind agents who, late in 1945, started a move-

ment to make Azerbaijan secede from Persia and join the U.S.S.R. A puppet "democrat" regime was set up and carefully manipulated elections were held. In Dec. 1946, despite Soviet protests and threats, Ghavam-es-Saltaneh, the Persian prime minister, sent a force into Azerbaijan which overthrew this regime and restored Persian authority. Earlier that year, during a visit to Moscow, Ghavam had been forced to sign an agreement with the Soviet government to establish a joint Perso-Soviet company to exploit oil in northern Persia. This agreement proved so unpopular in Persia that in Oct. 1947 the *majlis* declared it null and void.

Late in 1948 the Anglo-Iranian Oil company (A.I.O.C.) and the Persian government opened negotiations for revising, in the latter's favour, the terms of the company's 1933 agreement, and a supplemental agreement was signed in July 1949 which increased the basic royalty rate and included other substantial financial advantages for Persia. The supplemental agreement was to come into force on ratification by the *majlis*. Later in 1949 the *majlis* passed an act implementing the seven-year plan, an ambitious project for raising the standard of living of the Persian people, to be financed largely by means of the A.I.O.C.'s royalties. Unfortunately the plan soon became moribund through the diversion into other channels of much of the money allocated to it, mismanagement and, finally, the cessation of royalty payments in 1951 because of the Anglo-Persian oil dispute.

Because of opposition by Mohammad Mossadegh, the bill to ratify the supplemental agreement was withdrawn from the *majlis* in Dec. 1950. When in Feb. 1951 the A.I.O.C. offered to conclude a 50-50 profit-sharing agreement, the campaign for the nationalization of the Persian oil industry was in full swing; this campaign coincided with a wave of intense nationalism in Persia. Gen. Ali Razmara, the prime minister. on being asked whether nationalization of the oil industry was practicable, consulted his experts who reported against it. On March 7, 1951, four days after he had submitted their reports to the *majlis,* he was assassinated.

Mossadegh became prime minister on April 30; three days later the act for the nationalization of the oil industry was passed by parliament and received the shah's assent. Protests by the A.I.O.C. and the British government proved unavailing, and no compromise could be reached. The A.I.O.C., after closing the oil fields and the Abadan refinery, was forced to withdraw its British staff from Persia in Oct. 1951. A subsequent offer by Pres. Harry S. Truman and Winston Churchill to resolve the deadlock was rejected (Aug. 1952), and on Oct. 22 the Persian government formally broke off diplomatic relations with Great Britain.

From April 1953 onward there was an open and often violent struggle for power rallying increasingly round General Fazlollah Zahedi, former minister of the interior in the Razmara and Mossadegh cabinets. His supporters accused the government of collusion with the Communist-led Tudeh party and the Soviet government. With considerable hesitation the shah signed a decree appointing Zahedi prime minister in place of Mossadegh. An attempt to arrest Mossadegh failed on Aug. 15 and for three days he appeared irresistible, while the Tudeh party openly demonstrated against the shah and in favour of a republic. The shah fled to Rome and Zahedi went into hiding. On Aug. 19 came another reversal, precipitated by mob action supported by the army. Mossadegh was overthrown and arrested, Zahedi took office and on Aug. 22 the shah returned to a frenzied welcome in Tehran. The coup was plainly welcomed by the western powers and sharply criticized by the U.S.S.R. The United States speedily answered Zahedi's appeal for funds with a first instalment of $45,000,000.

Zahedi's two most difficult decisions were to put Mossadegh on trial and to renew diplomatic relations with Great Britain. Charges of high treason were announced against the former premier who on Dec. 21 mas sentenced to three years' solitary confinement. By an ironical coincidence, the first members of the new British embassy reached Tehran on the same day.

In April 1954 a group of eight oil companies opened negotiations with Persia on the oil dispute and on Sept. 19 an agreement was signed at Tehran between Persia and an international oil consortium which included A.I.O.C. with a 40% interest. Despite Communist attempts to prevent it, the agreement was ratified by the parliament and received the shah's assent. The principal terms were that Persia should obtain 50% profit on all Persian oil exported: should pay the A.I.O.C. £25,000,000 in compensation over 10 years from 1957, free of interest; and that the agreement should stand for 25 years. At the option of the consortium it could be renewed under certain conditions for three periods of five years each.

This initiated a policy of increasing economic and political cooperation with the countries outside the Soviet bloc. Thus, Persia signed a commercial treaty with India in Dec. 1954, made contracts with British, French, West German, U.S., Danish and Belgian firms, signed a treaty of friendship with the Gnited States (Aug. 1955) and in Nov. 1955 defied Soviet protests by joining the Baghdad pact. Relations with the Soviet Union continued cordial. however: long-standing negotiations between the two countries reached a satisfactory conclusion in Dec. 1954 when the U.S.S.R. agreed to pay its war debt to Persia and to allow the mapping of the Persian-Soviet frontier (finally completed in April 1957).

Internally, affairs continued unsettled. In April 1955, Zahedi was replaced by Hussein Ala. A new aid agreement was signed with the United Nations in Feb. 1956. In April 1957 Hussein Ala was succeeded by Manouchehr Eghbal, a personal friend of the shah. Eghbal issued a decree ending martial law, which had been in force for 16 years, and declared his intention of encouraging a free press and free speech, of establishing a democratic two-party system and of allowing the formation of new political parties, except by Communists. In May the formation of a new People's party was announced: its leader was Assadollah Alam, former minister of labour.

POPULATION

Racial Divisions.—In 1935 the name "Iran" was officially adopted for the country known as Persia for many hundreds of years, the intention of the shah being to stress the Indo-European origin of the inhabitants whose forebears had entered it from the central Asian steppes in the 2nd millennium B.C. Rut the people who are generally known as Persians are themselves of mixed and various race, and the country has important Turkish, Baluchi and Arab elements in addition to Kurds and Lurs, and minority communities of Armenians. Assyrians (Nestorian Christians), Georgians, Dravidian Brahuis and Afghan Hazaras of Mongolian origin.

Kurdish nationalism (embracing the Kurds of Turkey, Iraq, Syria and Persia) received some encouragement from the British after World War I and, persisting as an intellectual movement, later flared up in local revolt in Persia as elsewhere; the separatist tendencies of the Turkic people of the Azerbaijan province received Russian encouragement to rebel in 1945–46; and signs of hostility toward the Persian government have been shown by the Arabs of Khuzistan. But, generally speaking, there is little racial animosity and these outbreaks have usually been somewhat artificial if considered as expressions of racial consciousness. The great preponderance of Shi'ah Islam and the way of life prescribed by it form unifying factors transcending racial differences and the differences between tribesman, peasant and townsman and between the six estates—ulema (the learned), nobles, landowners, merchants, citizens and peasants—into which Persian society was traditionally divided. The religious minorities—Christian, Jewish and Zoroastrian—are too small to create a problem, but discrimination against them is by no means unknown.

The Kurdish tribes living on the northwestern borders from Urmia in the north to the plains of Kermanshah are nomadic, and until such movement was forbidden by Riza Shah some crossed into Iraq on their annual migration after the melting of the snows in search of fresh grazing for their flocks. The organization which such moves demand has kept alive the tribal system under the chiefs (agas), but mountain conditions have led to the breakup of the larger tribal units and there is little cohesion now among them. Among the settled Kurds the tribal system remains in

existence but the authority of the agas is usually less than among the nomads. The Lurs of the Pish-i-Kuh and Pusht-i-Kuh ranges on the western frontier south of Kermanshah were almost independent of the government under their own valis until Riza Shah brought them under control: he deported some sections to Khurasan. Their life resembles that of their northern Kurdish neighbours. The Rakhtiari, a large tribe of the southern Zagros, are akin to the Lurs. Their main divisions are the Haft Lang, mainly nomadic. and the Chahar Lang, mainly sedentary. The name "Bakhtiari" is properly confined to the ruling families and their retainers. The chiefs are among the most advanced among the tribes of Persia: in 1906 they took a leading part in the revolution which led to the grant of the constitution. They have latterly shown a keen business sense and for many years have been educated in Europe, and their daughters have received at least an elementary education. The women among the Kurds. Lurs and Bakhtiaris have considerably more freedom than do the women in the smaller towns and villages. They do not wear the veil and are not secluded from male company. In Rurdistan there is even a tradition of matriarchy. and tribes have been very successfully ruled by women. The Kashgai. a large tribe of Turkic origin. are neighhours of the Bakhtiari. with summer quarters extending over the highlands between Shiraz and Isfahan. In winter their flocks are found in the lowlands northwest and east of Shiraz. Riza Shah attempted the subjugation of the Kashgai but they soon reasserted themselves after his abdication.

A revolt of the tribe in 1946. when the leaders demanded autonomy on the pattern of that which the Azerbaijanis were expecting, was quelled. but the tribe remains an important political force.

The southern region of Rhuzistan (or Arabistan) is more akin to the delta lands of southern Iraq both in physical geography and in population. Some Lurs visit the northern fringes for winter pasture but the majority of the population is Arab and tribal, sedentary. seminomadic and nomadic. The principal tribes are the Al Kathir and the Bani Lam. who have a large branch in eastern Iraq, on the Tigris north of Amara. The sedentary and seminomadic tribesmen rear horned cattle and cultivate cereals or rice. Some also keep sheep or camels and own or work in date gardens.

In Khurasan bordering on the C.S.S.R. are the Turkmen tribes, and also some Kurdish and Baluchi tribes. There are few nomads since conditions are favourable for agriculture, and the tribal structure. though persisting, is gradually being replaced by that of the village community. Throughout the country there are many smaller tribal groups of varying racial origin. owing their present location to voluntary migration or to expulsion from an earlier home. They thus present a picture as confused as that of the detribalized elements of various racial origin among whom homogeneous blocks are even more rarely to be found. An exception is the Turkic community of Azerbaijan which has been settled for many centuries in more or less compact groups in the towns and villages of this province.

Whatever may have been the original population of Persia before the coming of the Aryan invaders. it was absorbed by them and by subsequent waves of conquering tribes whose blood has been mixed with that of the people of the plateau to a much greater extent than with that of the mountain tribes. Thus. among the Persian-speaking people there persists a widespread physical type on the border of the medium- and long-headed classifications for which the term "Iranian" has been reserved by some writers. Distinct from them are the short-headed Kurds, and the Lurs and Bakhtiaris, the Turki and Baluchis and the people found in southern Fars and Makran who speak a language of the Dravidian family.

Persian Society. — The basic industry of Persia is agriculture, and the life of the shepherd. peasant and landowner, whether tribal or settled, dictates conduct and customs and influences the moral outlook of the country dwellers and. through its impact upon them, that of the townsmen also. A notable feature of Persian society is its fluidity and individuality; though there are recognized classes. transition from one to another is easy; there is no caste system.

The townsmen and villagers as a rule lead a fairly easy life unless the local landowners and officials are especially tyrannous, for it is with them that the power lies upon which their living conditions depend.

The mullahs (priests) have little influence except in religious matters and in their guidance of public opinion. Absentee landlords are many. The towns are commercial rather than industrial and have a large class of shopkeepers and craftsmen — shopkeepers who are found grouped by trades in the bazaar. This pattern is found in all towns and villages, varying only in the wealth of the classes and the size of the community. The peasants and tribesmen live in houses or tents according to the climate of their district and to their way of life, settled or nomadic. The position of women is, on the whole, better in the tribes than in the settled communities. Their situation, too, has suffered from polygamy. easy divorce and *muta*, or temporary marriage. which is tolerated under the Shi'ah interpretation of Koranic law. Much was done under Riza Shah to destroy these old traditions, by permitting women to sue for divorce on certain grounds, by allowing them to hold property and by encouraging female education.

Numbers and Distribution. — In March 1953 the population of Persia was estimated at 20,477,672. Of this total 80% is rural. The largest proportion is found in the province (*ostan*) of Tehran (16.2%). The areas next in order of numbers of population are Gilan and the Elburz foothills to the west of Tehran, Azerbaijan and Khurasan, which however has a large area and thus lower density of population. The most densely populated districts (more than 100 per square mile) are a narrow belt along the Caspian coast; a district in the far northwest to the north of the Lake of Urmia, small areas round Meshed and on the Karun river near the southern oil fields. The principal cities and towns with their populations in round figures are: Tehran (the capital). 600.000 plus 400.000 in the suburbs and vicinity; Tabriz, 270,000; Meshed. 200.000; Isfahan. 200.000; Hamadan, 120,000; Shiraz. 110,000; Resht, 110,000; Kermanshah, 100,000; Qum (with Mahallat), 85,000; Kazvin, 80,000; Ardebil, 80,000; Arak (Sultanabad), 60,000; Kashan, 55,000; Urmia (Rizaiyeh), 50,000; Kerman, 50,000; Ahwaz, 50,000; Yezd. 50,000; Dizful, 48,000; Burujird, 48,000; Zenjan, 40.000; Babul (Barfurush), 40,000; Naragha, 35,000; Bushire, 25,000. The oil port of Abadan with Khorramshahr and the immediate vicinity has a population of 200,000.

Language. — The languages of Persia are: Persian, Kurdish, Luri. Turki. Baluchi and Arabic (see also IRANIAN LANGUAGES).

Persian (Farsi) is an Indo-European language based upon the Old and Middle Persian tongues which were introduced by invaders from the central Asian steppes east of the Caspian. After the conversion of Persia to Islam many Arabic words were introduced and a modified form of the Arabic script was adopted and is still used. In the written language some Arabic constructions also were adopted. There has been a tendency (as in Turkey) to expel Arabic words and forms, but devotion to the early literature. which contains them, hampers such efforts at Persianization. Dialects are spoken in certain parts of the country,

Kurdish is a language distinct from Persian although belonging to the Indo-European group. The principal dialects spoken in Persia are Gorani and that spoken by the Mukri Kurds of the northeastern district.

Luri, the language of Luristan, of the Bakhtiari and of some other tribes, has affinities with Old Persian, to which it is more nearly related than is Kurdish.

Turki.—The Azeri dialect of Turkish spoken in Azerbaijan is grammatically close to Xnatolian Turkish but the pronunciation is broader. It has more Persian and fewer Arabic words than the Turkish of Anatolia. Turkic spoken by the Turkmens of Khurasan is closer to eastern Turkish than to the Azeri dialect.

Baluchi is an Aryan language mixed with modern Persian.

Arabic is spoken by the Arab tribes of Khuzistan and along the coast of the gulf and of Makran, and by some sections of the Khamseh tribes of Fars.

Religion. — The state religion is Shi'ah Islam (see ISLAM) of the Ithna Xsharaya sect which recognizes 12 hereditary Imams.

There is also a Sunni minority. The Zoroastrians (known as gabrs) are relics of the followers of Zoroaster, whose doctrine was founded upon the ancient Mithraic faith; the majority of those who refused to accept Islam in the 7th century A.D. fled to India, where they formed the Parsee community. Jews have been in Persia since the time of the Babylonian captivity., The Christian churches are represented by Nestorians (Assyrians), Armenians (Gregorians and Catholics) and Protestants and Catholics who are Europeans or else converted Assyrians or Armenians.

Moslems.—The Shi'ahs were, in the past, strongly influenced by the mujtahids (doctors of the law), whose edicts affected political and other nonreligious affairs until the revolution of 1906 marked the beginning of a decline in their power. Riza Shah did much during his reign to break their authority, which was, in any case, founded on the superstitious awe of the ignorant rather than on profound religious belief, as the tendency to heterodoxy and agnosticism shows. "A host of heterodox sects born on Persian soil—Shi'ites, Sufis, Isma'ilis, philosophers—arose to vindicate the claim of Aryan thought to be free" (E. G. Browne, *A* Year Amongst the Persians).

Sunnis are found in scattered groups in various parts of Persia. The compact communities are the Kurds, the Baluchis and the Turkomans.

There are also some dissident sects: Sufis, the mystics whose teaching dates back to Abbasid times; the Ismailis, the direct forebears of the modern Ismailis whose head is the Aga Khan, who originated in a schism after the death of the sixth Iman (about A.D. 797) and afterward created the society of the Assassins (*q.v.*); the Ali Ilahis, an extreme sect found among the Kurdish tribes; and the Baha'is, who, in spite of the repression of 1850, still exist in Persia and have played an influential part in the reform movements. The numbers of these sects are small and no reliable statistics are available.

Zoroastrians are a small community (10,000–15,000) living principally in and around Yezd and Kerman. They are both urban and country people, successful as traders and famed as gardeners.

Jews.—In spite of legal equality, the Jews are regarded as foreigners and administrative posts are barred to them, though some have deserted the traditional business of moneylending and trade and have become doctors. Small Jewish communities are to be found in most towns. Some have left Persia for Israel and the total number in Persia in 1953 was about 40,000.

Christians.—The Armenians number about 120,000 and are both rural and urban. Peasants are most numerous in Azerbaijan and the largest town communities are found in Tabnz, Tehran and Isfahan, where the suburb of Julfa is almost exclusively Armenian.

The Assyrians are Nestorians or Uniate Catholics, known as Chaldaeans. Most of them live in the Urmia (Rizaiyeh) region of the northeast and are peasants or small traders, mechanics and motor drivers.

Catholic missionary work was begun early in the 17th century by the Carmelites, was suspended about 1780 but renewed in 1850 when the Lazarists opened a mission in Tabriz. Protestant activity dates from 1811. In 1829 an American mission was established at Urmia and was taken over later by the Presbyterians, who founded missions also in Tehran, Tabriz, Hamadan and Resht. The Church Missionary society began work at Isfahan in 1869. Until the time of Riza Shah the mission schools were tolerated, but the teaching of religion in all schools was forbidden in 1928 and the mission schools were absorbed into the state system. The hospital system was introduced to Persia by missionaries in the 1830s and hospitals, welfare centres and dispensaries continue to do most valuable work. Purely missionary activities meet with almost insuperable difficulties in Persia as in all Moslem countries.

Education.— Until the first reforms were introduced by Nasr ed-Din Shah (*q.v.*) in the middle of the 19th century, education, in the narrower sense, had been centred in the religious schools, the maktabs in the villages and towns and the *madressehs* or religious colleges which gave higher education in theological subjects, law and medicine. But Persia enjoyed the advantage of widespread and popular interest in its literary heritage so that, unlike other Moslem countries of the period, education, in spite of the illiteracy of the majority of the population, was founded not only upon the Koran but also upon the Persian classics, which are still widely known by recitation. In 1852 Nasr ed-Din Shah founded the Dar ul-Funun (College of Science) in Tehran and three years later established a ministry of science and arts, aiming rather to create a teaching body in the first instance than to modernize and extend primary education. A translation bureau was formed in 1862 to translate European works into Persian, and a royal library was founded in 1873, the year of the shah's first visit to Europe. He then decided to send a few young Persians of good family to France for military training at St. Cyr, for engineering at the École Polytechnique and to study law and medicine and modern art. But the development of the modern educational system more properly dates from 1897 when a "society for the establishment of national schools" (afterward known as the Anjuman-i-Ma'aruf, or Education council) was founded. Its efforts resulted in the opening of numerous elementary and secondary schools which with some foreign schools—notably the American Mission college which had been founded in Tehran in 1872, the Anglican Stuart Memorial college founded in Isfahan in 1904 and French Catholic schools—formed the basis upon which subsequent progress was made. The constitution of 1906 emphasized the importance of modern education and the freedom of all to study sciences, arts and crafts and to publish books, provided that religious laws were not transgressed. The establishment of schools at government expense and the regulation of compulsory education were recognized as a national responsibility. In 1911 a law was passed laying down the organization of a ministry of education which. with the Anjuman-i-Ma'aruf, had 128 primary schools, 2 secondary schools and 3 colleges under its supervision. The work of the ministry was considerably extended between 1911 and 1921 but the greatest impetus was given after the accession of Riza Shah in 1925, as Table I shows. After 1950 U.S. aid had a considerable influence in the development of education, particularly in the rural districts. In co-operation with the ministry of education an increase of about 1,600 teachers and 6,400 pupils had been effected by 1954.

TABLE I.—*Growth of* Educational Institutions

Year	Number of institutions			Number of students

The control of the educational system is centralized in the ministry of education, which has four directorates general dealing with (1) education proper; (2) administration, staff and finance; (3) fine arts (including painting, archaeology, the national library, museums, etc.) and (4) pious foundations (wakfs). There are in addition secretariats dealing with higher education and the theological sciences, a high education council and other bodies. There are also educational establishments under other ministries: certain technical schools under the ministry of national economy, a trade school under the ministry of labour, and institutes of hygiene under the ministry of health. There are also some private schools under general supervision but free to administer themselves, of which one of the most important was the Technical institute formerly run by the Anglo-Iranian Oil company at Abadan. This was taken over in 1951 by the National Iranian Oil company. Most of the higher technical colleges have been absorbed in the University of Tehran. In 1949 a program was introduced establishing a four-year minimum course for the primary schools; the secondary schools provide a five- or six-year course, the sixth year being specialized and intended to prepare a pupil for entry to a college or to the university. The University of Tehran, with 5,000 students, mas founded in 1934 and has faculties of arts (literature), law (including economics and political science), philoso-

phy and theology, medicine, engineering and science, together with certain colleges of faculty status: the Higher Teachers' Training college (literature and science) and the School of Fine Arts. The University of Tabriz has faculties of medicine and literature.

GOVERNMENT AND ADMINISTRATION

Constitution.—Up to 1906 the shah of Persia was an absolute monarch in the ancient tradition. He delegated wide powers to a grand vizier but was himself absolute in legislative, executive and judicial functions. The clergy (mullahs) exercised considerable temporal as well as spiritual power and played an important part in the events leading to the setting up of a national consultative assembly (majlis) by Muzaffar ed-Din Shah in 1906 and the grant of a formal constitution. Muzaffar died in 1907 and although his successor, Mohammed Ali, signed the constitution in its final form on Oct. 8, 1907, he soon attempted to suppress the majlzs and overthrow the constitution. An attempt on his life in 1908 was followed by a civil war in the provinces, and in 1909 Mohammed Ali Shah abdicated. His son Sultan Ahmad (a child of 12) was crowned shah with the head of the Kajar tribe as regent. A new majlis was elected and the constitution, differing little from that still in force in the early 1950s, was established. Sixteen years later Ahmad Shah was deposed after a precarious and unhappy reign during which the prestige of the government had reached a very low ebb. Riza Khan (see RIZA SHAH PAHLAVI), an officer of the Cossack brigade, led a coup d'état against the government in 1921 and became prime minister himself two years later. Meanwhile his vigorous action as minister of war had restored the authority of the central government and in 1925 he received dictatorial powers from the majlis and secured the deposition of Ahmad Shah. In Dec. 192 j he was elected shah and the sovereignty was vested in the Pahlavi dynasty. He abdicated in Sept. 1941 and was succeeded by his son, Shah Mohammed Riza Pahlavi.

The fundamental laws of the Persian constitution which were promulgated on Dec. 30, 1906, dealt seriatim with the constitution of the *majlis,* or national consultative assembly. the duties of the *majlis,* the proposal of measures on the part of the *majlis* and the conditions regulating the formation of the senate. A supplementary fundamental law was promulgated on Oct. 7, 1907, in which Islam, according to the Shi'ite Ja'fari doctrine, was prescribed as the official religion of Persia, which the shah must profess and foster. The doctors of the theological law (mujtahids) are its guardians and a committee of no fewer than five "mujtahids or other devout theologians." properly elected, may veto any law which infringes Islamic ordinance. This power seems to have remained a dead letter. The right of equality before the law, the guarantee of life. liberty, home and honour; the right to be tried in an appropriate tribunal; the liability only to penalties laid down by the laws; the right of property; the right to freedom of teaching; a free press; freedom of assembly and the secrecy of the post—all were set out at length. The powers of the state derived from the nation are defined as legislative, executive and judicial in such a way as to form a representative constitutional monarchy. The shah derives his power in trust from the people. These powers and those of the ntajlis are defined. The ministers are responsible to the majlis and the senate for all acts carried out in the name of the shah, and the shah's person is exempted from all responsibility. The appointment and dismissal of ministers is effected by royal decree, and it has become the practice, when a new prime minister is required, for the *majlis* to meet and agree on a name for submission to the shah; the shah appoints the person named and the latter selects his ministers for the shah's approval. If the *majlis* or the senate, by an absolute majority, declares itself dissatisfied with the cabinet or with one particular minister, that cabinet or minister shall resign. The number of deputies in the *majlis* was at first 162 but, after changes in 1909 and 1911, it was raised to 200 in 1957. In April 1949 a constituent assembly was formed to examine the draft of two new articles of the constitution, one of which gave the shah the right to dissolve either or both chambers while the other laid down the procedure for future amendments of the constitution of 1906. Under that constitution there was to have been a senate with 60 members, 30 elected and 30 nominated by the shah. No steps were taken, however, to create the senate until 1949, when the majlis passed a bill laying down the procedure for its election. This bill conformed generally to the articles of the fundamental law constituting the senate but stipulated that the internal regulations of the senate were to be approved by the senate itself (not by the majlis) and prescribed a system of two-stage election for the members. The first senate assembled in 1950. Laws may be initiated by the shah, by the cabinet, by the senate or by the majlis. Bills initiated by the cabinet are debated in the *majlis;* those proposed by the majlis are sent to the senate. The shah's signature is necessary before any bills can become law. Only the *majlis* has the right to enact and approve laws connected with revenue and expenditure. The supplementary law of 1907 provided for the establishment of provincial and departmental councils (*anjunmans*) but no steps had been taken to establish them by the mid-1950s. The cabinet comprises a prime minister with, usually, 11 or 12 ministers responsible for the following departments: foreign affairs; finance; interior; health; justice; war; agriculture; posts, telegraphs and telephones; labour; roads; national economy; education.

By 1957 the constitutional parliamentary system had had 50 years of trial in Persia but no truly independent parliament and cabinet had been established and no party system based on political principles had been developed.

From 1925 to 1941 Riza Shah ruled with absolute powers, ignoring the constitutional checks upon them, and all control of affairs passed out of the hands of the majlis. His successor respected the constitution but the amendments of 1957 strengthened his prerogatives.

Administration.— Until 1938 Persia was divided into 26 provinces. In that year a reorganization took place and ten large provinces (ostans) were created. These were divided into districts (*shahristans*). Further adjustments took place in 1946, when the *ostans* of Azerbaijan and Sub-Azerbaijan were merged, and in 1947, when Tehran, the capital of Persia, became an ostan. Baluchistan, with Sistan, continued to form a separate governorate. In 19j5 the administrative divisions were as follows:

Ostan	*Capital*	*Shahristans*
Tehran	Tehran	Tehran, Qum, Mahallat, Kazvin, Saveh, Demavend
Gilan	Resht	Zenjan, Arak, Resht, Fumen, Lahijan, Talesh, Bandar Pahlavi
Mazanderan	Sari	Shahsawar, Kashan, Semnan, Damgar Shahrud, Sari, Amul, Babul, Gurgan (Asterabad), Shahi, Dasht-i-Gurgan, Nanshahr
Azerbaijan	Tabriz	Tabriz, Ahar, Marand, Mianeh, Khalkhal, Ardebil, Maragha, Khoi, Urmia (Rizaiyeh), Mahabad, Maku
Kermanshah	Kermanshah	Eilam, Shahabad, Qasr-i-Shirin, Kermanshah, Sanandaj, Hamadan, Nahavand, Saqqiz, Malayer, Bijar
Khuzistan	Ahwaz	Khurammabad, Burujird, Dizful, Ahwaz, Gulpaigan, Dasht-i-Mishan, Shustar, Khorramshahr, Abadan, Behbehah
Fars	Shiraz	Shiraz, Kazerun, Firuzabad, Bushire, Fasa, Abadeh, Jahrum, Lar
Kerman and Mokran	Kerman	Kerman, Sirjan, Rafsinjan, Bam, Jiruft, Bandar Abbas
Khurasan	Meshed	Sabzavar, Birjand, Turbet-i-Haidari, Kashmir, Meshed, Nishapur, Guchan, Bujnurd, Gonabad, Firdans
Isfahan	Isfahan	Isfahan, Shahrikurd, Shahriza, Yezd, Daran, Nain
Baluchistan	Zahidan	Chahbar, Iranshahr, Sarawan, Zabul, Zahidan

Each ostan is administered by an *ostandar* (governor general), appointed by and directly responsible to the minister of the interior. He is assisted by a staff from other departments — health,

education, etc., appointed by their ministers. The shahristan is governed by a *farmandar;* further subdivisions are the bakhsh, consisting of a number of dehs (villages) and towns. Cities in the larger administrative divisions have their own municipality or town council administration under a mayor appointed by the minister of the interior. The Tehran council has 12 members; the town councils in first-class shahristans have 9 and the others 6. Members, who receive no salary, are elected for two years. Under the mayor they determine the kind and amount of the municipal taxes, study and approve the municipal budget (which must have the final approval of the minister of the interior) and supervise the financial affairs of the town. The administrative system, which is based on the prefectural system of France, is seen to be highly centralized. During the reign of Riza Shah this defect was accentuated and the withdrawal of his strong hand and the confusion inevitable during the period of Allied occupation resulted in a partial paralysis of the administration.

Justice. — Before the constitution of 1906 there existed in Persia two systems of law: the Sharia or Islamic religious law based on the Koran and administered by the clergy, and the common or customary law knoun as *urf,* which governed transactions not specifically covered by the Sharia. although, theoretically. the Islamic law applies to every act of man. (See ISLAMIC LAW.) In addition to these mere royal edicts. The Islamic law gradually became restricted to questions of personal status (marriage, inheritance, etc.), faith and morals. The *urf* represented local custom in matters such as water and grazing rights, landlord-tenant relations, etc The shah's edicts covered public administration, public security and taxation. The fundamental law of 1907 laid down the general principles of criminal and civil procedure. In 1912 a lan was passed setting up a judicial administration modelled upon European standards and in 1914 a system of commercial courts was established. Attempts to enforce these measures and to introduce reformed legal codes were successfully blocked by the action of the mullahs and it was not until Riza Shah came to power that modern systems were enforced The civil code, based upon the Sharia with adaptations from the French code. was adopted in 1928 and absorbed most of the functions of the Islamic law. The penal code, abolishing the principle of the *lex* talionis, was introduced in 1926 and is also based upon French law. The commercial code and the civil and criminal codes of procedure are also based on the French system. The most important change uas the authorization by the *majlis* in 1928 of the articles of the civil code which provided a uniform basis for the application of the modified Sharia law and thus eliminated the individual interpretations of the mujtahids. In 1931 the privileges of the teachers of Islam were further curtailed by a law requiring that all marriage contracts and acts of divorce be registered with a civic official. The law is administered by minor courts nhich sit in villages and small towns with a single magistrate and have jurisdiction in civil cases involving small sums and petty offenses. Appeal is to the district courts which correspond to the French courts of first instance and deal also with major misdemeanours and with the more important civil cases. The provincial high courts, to which lie appeals from the district courts, deal nith offenses classed as crimes and disputes between examining magistrates and public prosecutors of the district courts. The supreme court of cassation or appeal is in eight sections and hears appeals from the provincial courts or from special tribunals.

Police. — The police, some of whom carry firearms, are subject to the minister of the interior and are nominally under the local civil governors, though there is a chief of police in the larger towns.

Jurisdiction Over Foreigners. — A system similar to the regime of capitulations in Turkey was voluntarily conceded by a firman of Shah Abbas to Sir Anthony Sherley in 1600 to induce British merchants to enter Persia to trade. But although these privileges were extended to the nationals of other countries they nere not formally recognized until 1828. when, under the terms of the treaty of Turkmanchai. Russia obtained important commercial and diplomatic privileges. Russian consuls, with extra-territorial rights, could be appointed at will. Similar rights and privileges were later granted to other powers by virtue of most-favoured-nation clauses in other treaties. These privileges were renounced by the Russians in their treaty of 1921. In 1927 after the reformation of the judicial system (which was necessary to make it acceptable to foreigners) Riza Shah announced the formal abrogation of the capitulatory regime. to take effect within 12 months. The French government accepted at once. The British government objected on the ground that the rights which their nationals enjoyed were based on firmans issued by shahs of Persia before the signature of the treaty of Turkmanchai and on general international law. Eventually abolition was accepted as part of a settlement of various matters under dispute, and with the introduction of certain safeguards which applied to British subjects and to most other foreigners. These provisions may be briefly summarized as follows: (1) The rules of international law will be followed by the Persian government in all its relations with foreigners. (2) In all civil and commercial cases in which one of the parties is a foreigner, only written evidence will be admitted. (3) Foreigners are not to be tried by religious tribunals. (4) Foreigners will be sentenced to imprisonment only by a police court which designates imprisonment in lieu of a fine. Such imprisonment shall not exceed a week in duration. No sentence of corporal punishment shall be inflicted on foreigners. (5) No foreigner may be arrested or imprisoned without a warrant, save *flagrante delicto,* nor may he be kept imprisoned for more than 24 hours without being brought before a magistrate. No entry or search of foreigners' houses may be undertaken without a warrant. (6) A foreigner arrested shall have the right to communicate with and be visited by his consul. (7) Facilities for release on bail shall be granted save in cases of serious crime. (8) A foreigner sentenced to more than one month's imprisonment has the right to demand that he be kept in one of the prisons recognized to fulfil certain necessary hygienic conditions. (9) Trials are to be held in public save in very exceptional cases. (10) In matters of succession, divorce and personal status, non-Moslem British subjects shall have recourse to their own courts if they so wish. (11) Foreigners are not liable to civil arrest, except where there is a serious risk that distraint would not be effective and could not be otherwise assured.

Public Health. — In 1904, in accordance with a provision of the International Sanitary convention held in Paris during the previous year, a sanitary council was created. In 1925 the president of the council became the director of public health services, and in 1945 the ministry of health was established. Until 1911, when it became obligatory by law for all students of medicine to take a diploma of the Government Medical school, certificates to practice had been given to apprentices of Persian doctors and to assistants trained in foreign hospitals. This reform made possible a gradual expansion of the medical services. But in 1949 the 102 state hospitals and 37 private hospitals together still provided only one bed to rather more than 3,000 people. In addition there mere some foreign and mission hospitals and medical services, including those established by the Anglo-Iranian Oil company. Under the seven-year plan of 1947 it was proposed to divide the country into health districts, each representing a population of 50,000, and to subdivide so that one health centre would exist for every 12,500 inhabitants of the country. Private and voluntary agencies are the Imperial Social Services organization, which provides dispensaries in remote villages, and the Red Lion and Sun society.

DEFENSE

During the reign of Nadir Shah (1736–47) British, French, Italian and Austrian military missions in turn took a hand in the organization of the Persian army, but the Cossack brigade, founded in 1882, armed and trained on the Russian model and commanded by Russian officers, was the only efficient unit. In 1921 the Cossack brigade had a strength of about 14,000; the household troops about 20,000; the South Persia rifles, British-trained and equipped during World War I, about 6,000; and the Swedish-trained gendarmery (amnieh) about 12,000. When Riza Khan became minister of war in that year he immediately began to organize the army purely on Persian national lines, and his ability to secure

the downfall of the Kajar dynasty and to seize and retain power was a result of the new spirit with which he infused it. By 1939 the strength of the army had increased to 105,000 and it had considerable successes against the tribes. But it had to yield before the British and Russian forces when they entered Persia in 1941. A conscription law was introduced in 1925 prescribing two years' military service for all men over 21. Some details of this law were modified in 1938. The army, air force and navy are all controlled by the minister of war. The strength of the army in 1950 was about 100,000 and consisted of ten infantry divisions of varying strength, four independent infantry brigades and a mechanized brigade. The air force had in 1950 about 200 aircraft, training and operational. The navy, with 500 officers and men, had three gunboats, one frigate and a mine sweeper in the Persian gulf. Riza Shah established two officers' training schools in Tehran and military students nere sent, before World War II, to France and Germany for further military instruction. Small armament factories and arsenals were also established. The general staff is organized on the French pattern, and the chief of the general staff is directly responsible to the shah, who is the titular commander in chief. He has a military council to advise him.

The amnieh, or gendarmery, is responsible for security outside the towns and particularly on the roads. It was formerly under the ministry of war but responsibility was transferred to the ministry of the interior in 1941. It remains, however, a semimilitary organization, and from 1942 to 1948 was under the active control of a U.S. mission; after 1948 the functions of the mission became advisory.

The corruption, inefficiency and highhandedness of the force had made it extremely unpopular in the countryside and the efforts of the U.S. advisers did not appear to have been wholly successful in eradicating the traditional abuses. The strength of the gendarmery is somewhat more than 20,000.

ECONOMIC CONDITIONS

The Seven-Year Plan Organization. — In 1946 the government initiated a seven-year plan for the development of the country's economy and created a board which presented an outline plan which was approved by the *majlis* in Feb. 1949. A detailed project prepared by a U.S. firm in 1947 had not been adopted, and further recommendations submitted by another U.S. firm were presented to the government in Aug. 1949. Of an estimated total expenditure of $656,000,000, agriculture was to receive 25%, transport 23.8%, industries and mines 14.3%, petroleum development 4.8%, communications 3.6% and social welfare 28.6%. The whole of the revenue from the petroleum industry was earmarked for the plan, which went into effect in 1949. Progress was hampered by the cessation of oil revenues after the first two years and by the inability of the Bank Melli Iran to grant adequate loans in face of the other needs of the government.

With the resumption of oil output in 1954 the prospects were greatly improved and a new seven-year plan estimated to cost $930,000,000 was approved in March 1956. Under the main headings of expenditure, communications were allotted 32%, agriculture 26% and industry and mines 15%.

AGRICULTURE

Although Persia is primarily an agricultural country, the percentage of the whole area under cultivation at any one time is extremely small. In addition to the vast deserts and the land which lies fallow every year, very large cultivable but unused areas await development. Water is wasted, methods are out of date, landholdings are often uneconomical in size, and the system of land tenure gives little incentive to the cultivator.

The bulk of the land is held under three main types of ownership: (1) *khalisa* lands, which are public domains, sometimes leased in large blocks to wealthy persons who then often sublet; (2) *milkiat,* land held in full private ownership in accordance with Islamic law; (3) ***wakf,*** land held in trust either for groups of persons or for religious or educational purposes.

Tradition and these types of ownership favour absentee landlordism. It was estimated that the class holding 250 ac. (100 ha.) or more constituted 0.2% of the total rural families and landowners but held 33.8% of the total annually cultivated land. Crop sharing varies in different parts of the country but, in general, is based on the principle that there are five factors in production — land, water, seed, oxen and labour, the last including implements. Whoever provides one of these elements receives one-fifth of the crop. This system applies both to the crop-sharing peasants and to small landowners or communal owners working their own land, but not, of course, to leasehold or hired labour. It is modified by local custom and differs between summer and winter and between irrigated and rain-fed crops. In 1946 and 1952 decrees were issued by the government designed to modify this system so as to improve the peasants' lot, but the difficulty of applying them hampered their effectiveness. In 1951 the shah issued an edict for the sale of crown lands on long-term instalments to farmers occupying them. The area affected exceeded 800,000 ac. of cultivated or potentially cultivable land. In 1954 the government presented a bill to the *majlis* for the distribution of more than 10,000,000 ac. of state lands.

Water Supply. — It is estimated that, of the total cultivated area, about three-fifths is dry-farmed, two-fifths irrigated. Methods of irrigation are:

1. Kanats, water channels about 4,000 m. long which tap the water table underground at a level higher than that to be irrigated. The slope of the kanat is less than that of the surrounding land and the water is delivered by gravity. The kanat is the traditional Persian system of irrigation, though it is used also to a limited extent in Iraq and northern Syria.

2. River irrigation; brushwood dams are much used. They are renewed annually. Under the seven-year plan numerous projects were put in hand for irrigation from surface sources.

3. Wells with water wheels, used chiefly in the south; these usually consist of skin buckets worked by oxen.

4. Tube wells; plans for drilling 2,000–3,000 tube wells to irrigate about 600,000–700,000 ac. were part of the seven-year plan.

Important projects to increase the irrigated area were under way in the latter 1950s. A dam on the Karaj river, near Tehran: would store 200,000,000 cu.m. and would be used to supply drinking water to Tehran as well as for irrigation. It mas expected to be completed by 1960 and provide also 30,000 kw. of installed electric power. A dam on the Sapidrud river would irrigate 300,000 cu.m. and provide 80,000 kw. of power. Several smaller works were either projected or were under construction.

Farming Methods. — The implements used in farming are primitive; an iron-tipped wooden plow drawn by oxen, donkeys or small mules, and occasionally a small wooden drag or roller to break the clods. Seeding, planting and reaping are done by hand. A light mattock, a long-handled spade and a sickle are the tools used. Threshing is done by drawing a wooden frame fitted with rollers and blades over the grain, usually in a circle; winnowing, by tossing the grain and chaff into the air with a fork.

Crops. — Cereals. — In order of importance the cereal crops grown are wheat, barley and rice. The most important wheat-growing districts are the Urmia plains in Azerbaijan, the Kuchan-Meshed plains in northern Khurasan, and areas in the Kermanshah, Isfahan, Fars and Kerman districts. Wheat is usually sown in the autumn and harvested in the spring, either as an irrigated or rain-fed crop; in the valleys and plains between the mountains it is more usually an irrigated crop sown in the spring and harvested in summer. The average yield is low — less than 1,000 lb. per acre, as against about 2,000 lb. in Great Britain — although in especially favoured regions more than 1,800 lb. per acre has been recorded. Barley is grown in the same areas as wheat and in the same may but is harvested a little earlier. The yield is somewhat higher than that of wheat. Rice is the principal crop of the Caspian provinces, where the climate?unsuitable for wheat, is very favourable for rice cultivation. It is grown elsewhere on a small scale wherever there is sufficient water. The fields are plowed in winter or early spring and flooded at the end of April. The seed is sown in May and the crop is harvested in August or September. The average yield is somewhat more than 1,000 lb. of husked rice per acre. Small quantities of millet (or sorghumj and some maize are grown.

Vegetables.—Beans, French beans, lentils, onions, tomatoes, carrots. peas, cucumbers and, in fact, most vegetables found in temperate and subtropical climates are grown both as summer and winter crops, generally irrigated. Potatoes were introduced at the beginning of the 19th century by Sir John Malcolm. There is no reliable estimate of the average vegetable crop.

Fruits and Nuts.—There is an exportable surplus of raisins, almonds and apricots; excellent peaches, apples, cherries, figs, dates, olives. oranges, lemons, grapes and melons are also grown. Nuts are found in many districts, the pistachios and walnuts being particularly good. Citrus fruits are grown at Shiraz and on the Caspian coast, the estimated crop being about 100,000 metric tons a year. Melons and watermelons are grown in most districts; the Isfahan melon is particularly celebrated. There are many varieties of grape and wine is made in many parts of the country. Dates are a staple food on the Persian gulf and Makran coast. The production of noncitrus fruits has been estimated at more than 1,000,000 tons a year, and between 4,000 and 8,000 tons of dried apricots, nearly 40,000 tons of raisins, 4,000 tons of pistachios and 6,000 tons of shelled almonds are produced annually.

Industrial Crops.—Cotton is the most important of the industrial crops. It is grown by irrigation in many parts of the country and particularly in Azerbaijan, Tehran, Mazanderan, Khurasan, Kermanshah, Fars and Khuzistan. It is estimated that the total production of ginned cotton in 1952 was about 20,000 metric tons, a somewhat lower output than before World War II. Three types are grown—Filistani, a long-staple cotton; American short staple; and a local short staple, which is hardier than the other two. Silk is produced by the breeding of silkworms in the Caspian coast area. Sugar beets, the growing of which was encouraged by Riza Shah, are an important crop. They are grown mainly in Khurdsan, near Meshed; round Tehran; and in the Kermanshah and Shiraz areas. Cane sugar is an old but neglected crop. Jute is indigenous to Mazanderan but the production is small. Tea is a comparatively recent introduction; plantations were developed in Lahijan and the area rose after 1932 from about 700 ac. to 24,000 ac. in the early 1950s. Production is about 7,000 tons. Tobacco is extensively grown. The crop is all purchased by the government and processed by the tobacco monopoly. The figure for production (1,000 lb. per acre) appears to be high. The cultivation of the opium poppy has been much restricted and in 1946–47 its cultivation was prohibited; the order. honever, was not enforced. Gum tragacanth is collected in the hill country from Kerman to Kermanshah; gum arabic near Shiraz and elsewhere.

TABLE II.—*Agricultural Production*
(In thousands of metric tons)

Crop	1934–38	1952	1953	1954	1956
Wheat	1,869	2,041	2,245	2,800	2,300
Barley	793	840	820	1,066	800
Rice	423	420	500	659	350
Cottonseed	69	70	86	....	....
Cotton (ginned)	34	36	43	63	60
Tea	0.6	4	4	4	6
Tobacco	1.F	13	18	....	....

Livestock.—The most important livestock are sheep and goats, which are not only the principal means of subsistence for the nomadic tribesmen but the chief suppliers of milk and meat to the peasants, who derive most of their cash income from the sale of animal products. Wool is the raw material of the carpet industry, lambskins from the karakul flocks are an important export, and tribal tents are made from goats' hair. Though sheep and goats are found everywhere the largest numbers are raised by the tribes who depend on the seasonal vegetation in the mountain pastures. Good natural grazing land is uncommon and it is probable that the country is overstocked and that controlled grazing and the growing of special grazing crops will be necessary if serious soil erosion, already threatened, is to be checked. Cattle are of increasing importance because of the rising consumption of milk and milk products in the towns. The general quality of dairy cows is low, but in Sarab (Azerbaijan) and Gulpaigan two good breeds have been produced. With help from the U.S. Technical Cooperation mission an extensive livestock improvement program was laid down at mid-century. Oxen are largely used for draught purposes. Horses are of three types: the Turkoman in the north, the Arab in the south and a cross between the two which is the common Persian breed. Mules and asses are of greater importance for transport purposes. Mules (chiefly bred in the southeast, in Luristan, Kurdistan and the Bakhtiari country) are not large but can carry 350 lb. or even more at a good pace 30 mi. in a day. The donkeys are also sturdy and can carry up to 200 lb. Both are used to draw plows and for other similar work. Camels are still widely employed in the waterless areas of central and southeastern Persia. Poultry are found in nearly every village and particularly in the north where they are of increasing importance as food for the peasants and in the dependent urban areas.

TABLE 111.—Livestock
(In thousands of head)

Forests.—It is estimated that 44,000,000 ac. or about 11% of the total area of Persia is forest land, which may be divided into four main groups. The most important, though not the largest (8,000,000 ac.), is the Caspian forest, extending along the Caspian coast and the seaward slopes of the Elburz chain to northeastern Azerbaijan. About half consists of dense forest of high quality. In the whole area it has been estimated that there is a growing stock of 315,000,000 cu.m. of timber. The varieties found are walnut, Siberian elm, boxwood, oak, beech, hornbeam, elm, maple and others. The second group comprises the oak-tree forests of the Zagros mountains, stretching from Kurdistan in the northwest through Luristan to eastern Fars and covering about 25,000,000 ac. Only about one-tenth of this is dense and productive forest; the remainder is open forest of low grade. The dominant tree is the Persian oak, but ash, maple, wild pistachio, almond and other fruit trees are found. In the limestone forests of the northeast, from Bujnurd to the southeastern slopes of the Elburz, the principal tree is the juniper but small maples and hawthorn are also found. From Khurasan to Kerman and northern Fars is a scattered group of pistachio forests in which wild (inediblej almonds also are found. In addition to these four, other important groups are the small subtropical forests in the Persian gulf-Makran area and desertic forests of scrub round the Dasht-i-Kavir and the Dasht-i-Lut. Much damage has resulted from grazing sheep and goats, from charcoal burning and other human depredations. A forestry organization was established in 1949 whose functions are forest administration, including education and research; establishment of forest and timber industries; demarcation and survey; and the purchase of waste lands for reafforestation.

Fisheries.—Although several thousand persons are engaged in the fishing industry in the Persian gulf, the industry was quite unorganized and no data were available in 1957. Much of the fish caught is consumed fresh in the coastal areas but there is an appreciable export trade in dried and salted fish to Iraq, India and Arabia. The fishing on the southern coast of the Caspian sea with the two bays of Pahlavi and Gurgan was from 1928 to 1952 in the hands of the Société Mahie Iran, a joint Persian-Soviet concern. In Jan. 1953 Persia refused to renew the concession.

In 1956 a company was formed with two-thirds capital from the seven-year plan organization and one-third from Japanese interests to exploit the Persian gulf fisheries.

INDUSTRY

Out of a population of more than 18,000,000 the number of industrial workers in the late 1950s was about 150,000 plus an estimated 200.000 engaged in the carpet industry, in hand-loom weaving and in the hand production of hosiery and knitwear. Thus,

although a great impetus was given to the development of industry by Riza Shah, whose aim was to make Persia self-sufficient in some measure, industry is still less important than agriculture. Although most modern industry is artificial, in the sense that it was deliberately created by the government, it depends in the main upon indigenous raw materials and was able from the first to draw upon some existing technical skill. Most of the industries started by Riza Shah were grouped under the Industrial and Mining bank, which was. in effect, a holding corporation and an industrial bank which controlled more than 100 factories and a number of mines. This bank was liquidated in 1949 and all its industries with their assets and liabilities mere taken over by the seven-year plan administration and reorganized into groups under specialized corporations. There were also a few industrial plants outside the seven-year plan administration but owned by the government, as well as some private industries.

Textiles. — In 1948, when the government owned two cotton textile plants at Behshahr in Mazanderan and at Shahi, there were 200,000 spindles and 2,240 power looms in the country. Private enterprise raised these totals to 276,000 spindles and 3,360 looms by 1954. The government then had under construction another plant with 10,000 spindles and 340 looms and had ordered two more plants totalling 60,000 spindles. The government looms produced 19,700,000 m. of cotton fabrics in 1953–54. The total production increased from an estimated 70,000,000 m. in 1948 to about 110,000,000 m. in 1953, of which more than a third was produced on hand looms. Cotton yarn production rose from 11,000–12,000 tons to 18,000–20,000 tons in the same period. There were privately-owned factories at Isfahan (10,000 workers) Tabriz, Meshed, Shiraz and elsewhere. Woollen textile plants were all privately owned; they comprised 26,130 spindles and 460 power looms and produced annually about 2,700 tons of yarn, over 2,000,000 in. of cloth and 500,000 blankets. The government-owned jute factory at Shahi produced jute bags, mats, ropes, etc., from raw material partly locally produced and partly imported from India. A second plant was ordered in 1953. The Silk Industry corporation was established under the seven-year plan to encourage the production of natural silk on the Caspian coast, thus reviving an industry which had flourished in the 17th and 18th centuries. At Resht there was a breeding station and a silk-reeling plant which could handle about 250 tons of cocoons a year; there was also a silk-reeling and weaving plant at Chalus. The total capacity was estimated at about 1,000,000 m. of fabric and 30,000 pr. of stockings annually but actual production in 1949–50 was only about half this amount.

Carpets. — Although the demands of the export trade caused some reduction in the artistic standard of Persian carpets, this deterioration applied mainly to the "factories" established by the foreign dealers. In them the carpets were still hand-woven but the design was modified to suit the country of import, the weave was usually looser and the nap was left longer than in the finer products. Carpets of the finest design, colour and texture were still made by the tribes and in the traditional centres of manufacture, the districts of Tabriz, Hamadan, Bijar, Senna, Sultanabad, Kashan, Shiraz and Kerman. World demand had fallen and the industry was no longer so important in the Persian economy as in 1925–26 when 10,000 metric tons of carpets were exported. In 1949 the export was 3,536 metric tons but production and the quantity exported showed some increase between 1949 and 1955.

Food Processing. — In 1954 the government owned nine rice-cleaning plants, and there were a number which were privately owned. The Tea corporation owned six plants of which the largest was at Lahijan. Their ouput, with that of privately-owned plants,' increased from 850 tons in 1938–39 to 4,000 tons in 1952–53. Sugar refining was government owned; production increased from 20,000 metric tons in 1945–46 to 110,000 metric tons in 1954–55. Two additional plants: with a daily capacity of 700 tons of sugar beet, were under construction. Cane sugar was produced at a factory at Varamin. Flour milling was all in private hands; there were about 50 large mills and a great number of village mills, many of them water-driven.

Cement. — The Building Materials corporation owned a cement plant near Tehran which was working much below capacity in the early 1950s. In 1953 and 1954 two additional cement plants were being built to increase the total capacity from 300 to 800 tons a day. There was a refractory brick factory at Aminabad.

Electricity. — In 1954 generating capacity was about 125,000 kw., excluding 72,000 kw. in the southern oil fields. Under the seven-year plan an increase of 400,000 kw. in capacity was planned for the early 1960s, by the harnessing of water power (of which the total potential was estimated at 2,500,000 kw.) and the installation of thermic plants.

Mining. — A mining law of 1952 reserved exploitation of deposits of hydrocarbons and radioactive materials to the state; other categories of minerals could be developed either by the government or by private enterprise. Great impetus was given to the mining industry by exploration carried out under the seven-year plan. Red oxide, sulphur, salt, copper, chromite, lead and iron ores amounting to about 86,000 tons (with a value of 253,000,000 rials) were exported in 1953–54; in 1938–39 the only export was 6,000 tons of red oxide. Among other projects was one to develop the iron deposits at Shamsabad and the coal in Kerman.

Other Industries. — By the mid-1950s other industrial establishments included an army munitions plant near Tehran which comprised a group of factories including both chemical works and machine shops. Some government ammunition plants had also been converted to make a variety of nonmilitary articles. The glass industry flourished under private ownership. Tanneries, soap and oil-extraction plants, a match industry which filled local demand and exported to neighbouring countries, cardboard and paper factories were also working. Craft industries, for which Persia has been renowned for many centuries, continued to exist: the cotton printing of Isfahan; the pottery, mosaic, faience and tilework of Isfahan and Tehran; the repoussé and carved silverwork of Shiraz, Zenjan and Isfahan; the wood carving of Abadeh and Gulpaigan. In spite of the influence toward commercialization which the import of foreign, machine-made goods had upon these national industries, the creative instinct and pride of craftsmanship were by no means extinct.

Oil.—Eratosthenes of Alexandria (c. 276–*c.* 194 B.C.) appears to have been the first to mention petroleum or its allied products in the region of the Persian gulf (Sir Arnold Wilson, *The* Persian *Gulf* [1928]) and later travellers recorded its existence in Persia. The first project for its exploitation dates from 1896 when the shah granted a concession for a small area in the province of Mazanderan to a Persian. This was acquired by a Georgian adventurer named Khostaria in 1916. Meanwhile William D'Arcy in 1901 obtained a concession covering 480,000 sq.mi. which was afterward transferred to the Anglo-Persian (Anglo-Iranian) Oil company (A.I.O.C.). This concession was cancelled by the shah in 1932 but a new concession covering 100,000 sq.mi. in southwestern Persia was signed in 1933 with a period of 60 years. In 1944 the Persian government decided to postpone consideration of all further oil concessions until after the war. A written promise was given by the Persian prime minister to the Soviet government in 1946 to introduce a bill permitting the formation of a Soviet-Persian oil company to exploit the resources of northern Persia, but the bill was rejected in 1947 by the *majlis*. The movement against the foreign exploitation of Persian oil was then directed against the Anglo-Iranian Oil company, a supplemental agreement which would have given additional benefits to Persia was rejected and the 1933 concession was cancelled in 1951, in spite of a clause in it which stipulated that arbitration should be sought in case of any dispute between the company and the government. A bill for the nationalization of the oil industry was brought in and passed and the National Iranian Oil company was set up to take over the A.I.O.C.'s interests. All British employees of the company were withdrawn in Sept. 1951.

Under the earlier A.I.O.C. concession the royalties to the Persian government varied within fairly wide limits. During the nine years ending in 1928 they averaged £708,000. In 1929 they were £1,437,000, in 1930 £1,288,000, but in 1931 they dropped to £306,872, an amount which the Persian government would not accept; this led to the cancellation of the concession and its replace-

ment by that of 1933. The revenues of the Persian government from this source from 1933 to 1949 are shown in Table IV.

TABLE IV.—*Revenue* to the Persian Government From *the* Anglo-Iranian *Oil* Company
(In thousands of pounds sterling)

Year	Revenue	Year	Revenue
1933	1,785	1944	4,464
1934	2,159	1945	5,623
1935	2,192	1946	7,130
1936	2,828	1947	7,104
1937	3,444	1948	9,172
1938	3,307	1949	13,489
1939–43	20,271	1950	14,000

The output of crude oil rose from 83,000 metric tons in 1913 to 7,200,000 metric tons in 1933. During the war years it dropped to 6,705,000 metric tons (1941) but in 1949 reached 27,247,933 metric tons.

Under the National Iranian Oil company's administration production and refining were greatly reduced and exports practically ceased. In Oct. 1954, an international consortium of eight oil companies reached an agreement with the government which promised the revival of the industry (see History above). The output of crude oil during 1955 was 15,780,000 metric tons and, under the agreement, was to be about 71,000,000 tons during the first three years. In 1955 the N.I.O.C. signed contracts with a British and French firm for a 10-in. products pipeline from the southern oilfields to Tehran (920 km.).

COMMUNICATIONS

Railways. — Until 1927 when work on the new railway system was begun, no railway construction had been undertaken except a five-mile line from Tehran to the shrine of Abdul Azim which was completed in 1887 and an extension of the Russian system from Julfa to Tabriz built in 1916. (This finally became Persian property in 1935.) Riza Shah decided for political and economic reasons to create a railway system which would comprise four main lines: (1) a north-south line from Bandar Shah on the Caspian through Tehran to Bandar Shahpur on the Persian gulf; (2) a northwest line from Tehran to Tabriz to connect with the Russian line to Julfa; (3) a northeast line to link Tehran with Meshed with possible extensions beyond; (4) a southeast line from Qum to Kerman. Work on the trans-Iranian (north-south) was begun in 1927 in two sections and the line was opened for traffic in 1938. The length of the northern section (Tehran to Bandar Shah) is 286 mi.; that of the southern (Tehran to Bandar Shahpur) is 574 mi. Of the northnest line to Tabriz only the section to Mianeh (272 mi.) had been completed in 1952.

The northeast line to Meshed was completed in 1957 and, although the newly laid track was then said to be defective, some service was inaugurated. The southeast line had been completed from Qum to Kashan (61 mi.). The gauge of these lines is 4 ft. 8½ in.; steam and diesel locomotives are used. The gauge of the Tabriz-Julfa line (91 mi.) is 5 ft.

Roads. — The important land routes which passed through Persia linking east with west in ancient times fell into decay with the opening of the seas to navigation. The Safawid shahs restored the road system in the north and west during the 16th and 17th centuries but it was not maintained, and natural obstacles and tribal unrest made travel in Persia a precarious and dangerous undertaking. These conditions persisted until World War I when roads fit for light motor traffic were built by the Russian and British armies in the northwest, southwest and east. When Riza Shah came to power. however, there were still only two main routes suitable for motor traffic (Tehran to the Iraq border at Qasr-i-Shirin and Tehran to Shiraz) totalling less than 1,200 mi. and indifferently surfaced. As a part of his policy of centralization and tribal control Riza Shah initiated a plan of road construction in which appreciable progress had been made by 1939. During World War II the important supply routes uere further developed and improved by the occupying forces, although there was some deterioration afterward. Under the seven-year plan, however, a scheme was started which aimed to reconstruct or build by linking existing sections six principal north-south and six principal east-west roads connecting the main cities of Persia and aggregating nearly 8,000 mi.

Inland Waterways. — The only navigable river of importance is the Karun, which is navigable by light-draught vessels between Khorramshahr and Ahwaz (112 mi.), below which are rapids which are negotiable only with difficulty during the low-water season (August to November).. Above Ahwaz it is navigable again almost to Shustar. The river mas used by vessels of the Anglo-Iranian Oil company and there was a separate service from Khorramshahr to Ahwaz operated by a British company.

Seaports. — Khorramshahr (Mohammerah) is the principal port at the head of the Persian gulf. It is situated on the north bank of the Shatt-al-Arab at its confluence with the Karun. A jetty built in 1938 was extended in 1942 to provide berthing space for six or seven ships. The depth of the channel is from 2½ to 3 fathoms. A branch of the railway connects the port with Ahwaz. The port of Bandar Shahpur was erected after the construction of the railway by the reclamation of a mud flat in the Khor Musa about 45 mi. from the sea. It was designed by Riza Shah to give an all-Persian outlet for the railway, the Shatt-al-Arab being in Iraqi territory. There are two jetties with a capacity for berthing five ships. Abadan on the Shatt-al-Arab was the principal oil port of the Anglo-Iranian Oil company. Bandar Mashur on an extension of the Khor Musa is also an oil port of importance. Bushire is an ancient port about 140 mi. S. of the mouth of the Shatt-al-Arab. It was formerly the principal point of entry for the Isfahan and Shiraz areas but has lost much of its trade. Ships anchor from three to seven miles offshore and cargo is discharged by lighter. Other Persian gulf ports frequented by trading dhows and pearling vessels are Lingeh, Jask and Charbar.

Bandar Pahlavi (formerly Enzeli) was the principal Caspian port for many years but it is now not greatly used. Bandar Shah was built in 1926 as the terminal of the railway but both this port and Nawshahr are subject to much silting. All Caspian ports were extensively used during World War II.

Civil Airports. — The principal airports are at Tehran (Mehrabad) and Abadan, where runways suitable for large four-engined aircraft are available. There are smaller aerodromes at all the principal towns. The main international air lines have services to Tehran. The Iranian Airways company maintains a system of internal air services as well as services to Pakistan and middle east countries.

Posts and Telecommunications. — These are administered by the ministry of posts, telegraphs and telephones (P.T.T.). The telegraph line from Tabriz through Tehran to Bushire was formerly part of the Indo-European system which connected London and India. The line now forms part of the national system of about 11,000 mi. which covers most of the country. Outlying districts are being brought into the network by the use of small radio sets. Long-distance telephone land lines were constructed by the Allied armies and later taken over by the government. They link Tehran with the southwest oil field area, the main ports in the Persian gulf and Iraq. One follows the trans-Iranian railway through Qum and Ahwaz, to Bandar Shahpur, Khorramshahr and thence to Basra; the other follows the main highway through Kazvin, Hamadan and Kermanshah to Baghdad. There is no national radiotelephonic network but international communication by telephone is available from Tehran to most parts of Europe and the British Isles and, by relay through Berne, Switz., with the United States. There is also a point-to-point service with Karachi, Pak. Radiotelegraphic communication is available to all parts of the world. Radio broadcasting is operated and maintained by the ministry of P.T.T.; programs are handled by the department of propaganda and information.

Postal services are under the general post office department of the ministry of P.T.T.; mail is distributed by private motor-truck contractors to places not directly served by the railway. Horse-mounted couriers deliver mail to villages off the main roads. An internal air mail is operated by the Aero club and serves the principal cities.

FINANCE

Currency and Weights and Measures.—The legal monetary unit is the rial. the nominal equivalent of the older kran, which it superseded under a law of March 1932. The rial, which is subdivided into roo dinars, has a value of 0.07322382 g. of gold. One hundred rials make a pahlavi, the equivalent of £1 sterling in gold. In 1944 silver coinage was authorized and 1-, 2-, 5- and 10-rial pieces were issued. There are also notes for j, 10, 20, 50, roo, 500 and 1,000 rials issued by the Bank Melli Iran. The equivalents of the old and the new currency are 1 shahi = j dinars; 1 kran = 1 rial; 10 tomans = 1 pahlavi. A sum of 10 rials is in common usage still referred to as a *toman*, the equivalent in the old currency of 10 krans.

The metric system of weights and measures has been officially adopted but in the country districts old local standards still prevail.

The old short linear measure was the gereh, equalling just over 2.j in. or a little more than 6.35 cm. Sixteen gereh made one zar or gaz. somewhat over 41 in. The unit for long distances was the farsakh, which was the distance a laden horse or mule would cover in one hour; on level ground one farsakh equalled about $3\frac{1}{2}$ mi. or j.6 km. but it varied in different parts of Persia. One farsakh is today considered to be equal to 6 km.

Measures of area on the old system varied considerably. The major measure was the jarib, equalling 1,067 square zar and therefore equalling rather more than 1,000 sq.m. or $\frac{1}{4}$ ac.

The standard older weights were: 1 kharvar = about 650 lb. or 300 kg. (a donkey load) = 100 man; 1 man = about 6.5 lb. or 3 kg. (but very variable) = 40 seer; 1 seer = 16 miskal.

Banking.- he banking system was introduced into Persia in 1888 when the New Oriental Banking corporation of India opened branches in the principal towns. In the following year a concession for the establishment of a state bank was granted to an English group under Baron Julius de Reuter which took over the business of the New Oriental Banking corporation. The Imperial Bank of Persia, thus formed, had the right of issuing bank notes in the Persian currency to a total value of £800,000. Its name was changed to the British Bank of Iran and the Middle East in 1949. In 1952 all branches in Persia were closed down.

A Russian bank, a subsidiary of the Russian State bank, was also founded in 1889 but this Persian branch, with all its assets and liabilities. was transferred by the Soviet government to Persia in 1921 and became the Bank-i-Iran. In 192j a new Soviet bank, the Russo-Persian, was established to help trade between the two countries.

In 1930 the right to issue notes was transferred from the Imperial Bank of Persia to the Persian National bank, the Bank Melli Iran. which had been founded in 1927, with capital derived from the value of crown jewels and domains and other government assets including the Bank-i-Iran. In 1950 the bank had 81 branches and 32 sub-branches and the pawnbroking office had 11 branches. In 1943 the issue department of the bank and its accounts were separated from the banking department. In 1932 the Bank Melli was authorized to issue notes up to an amount of 90,000,000 rials plus an additional 250,000,000 rials in notes of large denominations (1,000 rials). Further increases were authorized in 1934, 1936 and in July 1951. At the end of 1949–50 the bank had slightly more than 111 tons of gold worth 4,032,000,000 rials in the issue department and exchange amounting to 1.718,000,000 rials. Monetary reserves in the banking department amounted in 1950 to about 460,000,000 rials in gold and more than 2,000,000,000 rials in exchange. The law of 1932 required that reserves of gold and silver, whether in the form of coins or bullion, together with convertible foreign exchange, should be held equal to the whole amount of the notes issued and the nickel coins in circulation. In 1934 at least 60% of the notes issued were to be covered by gold or silver coins and bullion. In 1940 the value of the crown jewels was counted to make up the deficit when an increase in the note issue mas authorized. Increases after that date were rapid but from 1944 to 1950 100% ratio of reserve to notes issued was maintained. A new note cover bill was passed in July 1954. The compulsory cover for the note issue was lowered from 43.8% to 40%; $87\frac{1}{2}$% of the cover to be gold and $12\frac{1}{2}$% foreign exchange convertible into gold.

Other banks are the Agricultural bank and the Building bank, which branched off from the Bank Melli in 1930, and the Mortgage Bank of Iran, which was founded in 192j under the name of the Bank Pahlavi, in which are deposited army pension funds. The first privately owned bank, the Bank Bazargani Iran (the Commercial Bank of Iran), was registered in 1950. In Dec. 1946 it was decreed that all banks carrying on business in Persia must deposit at least 15% of their sight deposits and 6% of their time deposits with the Bank Melli. In 1949 another decree required the foreign banks operating in Persia to deposit at least 55% of all their deposits with the Bank Melli and, at any time the remainder of their deposits exceed 225% of their capital and reserves in Persia, all excess deposits must be deposited with the Bank Melli. A new banking law was passed in 19jj involving increased supervision by the Banks Supervisory board but foreign banks were allowed to operate on the same condition as Persian banks if given prior approval.

Taxation and Revenue.—Until 1899 there was a system of tax farming which led to many irregularities and abuses, and although this was abolished then it was not until 1906 when the constitution was set up that any real improvements were made. A ministry of finance was created and a U.S. mission introduced reforms. They were followed by a Belgian mission and in 1911 Morgan Shuster, with American assistants, attempted further reorganization as treasurer general. After less than a year in office he was succeeded by a Belgian who remained until 1918. In 1922 A. C. Millspaugh, another U.S. citizen? was appointed and remained until 1927. During his term of office considerable order was brought into the tax system; antiquated and inequitable taxes were abolished and new taxes introduced; the revenues were increased and a deficit was turned into a handsome balance. In 1943 Millspaugh returned with a large staff but, following a disagreement with the government, he resigned in 1945.

The bulk of the revenue is derived from indirect taxes (because of their ease of collection). In the financial year March 1954–March 1955 out of a total revenue of 9,511,000,000 rials only 10.2% (976,000,000 rials) came from direct taxation. The total expenditure was 13,500,000,000 rials (£50,000,000) the deficit being met largely from U.S. aid.

Up to the year 1941–42 great efforts were made to balance the budget, and loans from the Bank Melli were confined to those necessary for financing development and productive projects. The disruption caused by the war caused a fall in revenue and an increase in expenditure so that the government debt to the bank which in March 1940 was 1,986,000,000 rials had increased to about 4,936,000,000 rials by March 1946. In March 1954 it had reached over 17,000,000,000 rials owing partly to the loss of the oil revenue.

Actual figures of revenue and expenditure for selected years between 1939 and 1957 are given in Table V.

TABLE V.—*Revenue end Expenditure*
(In millions of rials)

Year	Revenue	Expenditure	Year	Revenue	Expenditure
1939–40. .	1,920	1,829	1951–52. .	8,000	10,000
1945–46. .	4,978	4,932	1954–55. .	9,511	13,500
1948–49. .	7,532	7,614	1956–57. .	15,000	19,000

Items of expenditure for the years 1945–46 and 1950–51 are shown in Table VI.

TABLE VI.—*Items of Expenditure, 1945–46, 1950–51 and 1955–56*
(In millions of rials)

Government department	1945–46		1950–51		1955–56	
	Expenditure	Percent of total	Estimated expenditure	Percent of total	Estimated expenditure	Percent of total

TRADE

Internal Trade.— Because of lack of transport, storage and credit facilities there is no easy flow of commodities between producers or importers and consumers, and there is always a great divergence between wholesale and retail prices. In towns the bazaar, both a wholesale and retail institution, is the principal point of assembly, storage and breaking of bulk. It is departmentalized to a striking degree. retailers specializing in one kind of goods concentrating in one section oi it. In Tehran department stores are beginning to appear. In villages a few shops or peddlers supply the needs of a scattered population in sugar, tea, cotton piece goods, kerosene. cigarettes, etc.

Foreign Trade.— The basic law regulating foreign trade is the Foreign Trade State Monopoly act of 1932 as amended by acts of 1941 and 1942. By it control of foreign trade is vested in the government which can (1) itself engage in the import or export of certain goods; (2) grant a monopoly for the import or export of certain goods to a particular private or public agency; (3) allow the public to engage in public trade subject to certain regulations. Partly as a consequence of these regulations merchants either establish themselves in Tehran or have agencies there. Under a law of 1942 chambers of commerce operate in Tehran and in provincial centres where the volume of trade justifies their existence.

Before the Russian Revolution Persia was, economically. largely dependent upon Russia. which took 69% of Persia's exports and sent 58% of its imports. The violent change in Russia's attitude toward Persia aiter the revolution combined with the world economic situation of the 1920s brought Persia almost to bankruptcy. but a series oi new agreements with Russia. the development of the Anglo-Iranian Oil company, and improved internal communications and internal security imposed by Riza Shah's rule helped to stabilize the situation.

Measures of control. also. were introduced which enabled the country to maintain a precarious but favourable balance of trade in the decade preceding World War II.

The principal articles of export are: fruit and dried fruit. skins and hides, wool and hair, casings, cotton, gums, carpets and petroleum products; of import: sugar. tea, coffee and cocoa, paper and cardboard. silk, cotton and woollen textiles, iron and steel, copper and brass (manufactured), machinery and machine tools, electrical appliances, motor vehicles, rubber tires. Table VII shows the value of imports and exports at five-year intervals from 1900 to 1949.

TABLE VII.—*Imports and Exports, 1900–55*
(In thousands of rials)

Year	Imports	Exports	Year	Imports	Exports
1900	355,380	147,323	1934	648,792	513,747

PERSIA, CAMPAIGNS IN, a series of military operations in World War I whose primary purpose was to protect India. At the outbreak of the war Persia declared its neutrality, but there is no doubt that Germany had prepared plans for attacking India across Persia. using the Turkish army. Germany also hoped to embarrass Russia and Great Britain by forcing Persia into the war on its side. Ii Persia would come in, the claim that Islam was on the side of the Central Powers might have brought in Afghanistan. Before Turkey declared war, however, the government of India took the precaution of sending troops to the Bahrein Islands. After the outbreak of hostilities, this force defeated the Turks and occupied Basra, thus protecting the refineries of the Anglo-Persian Oil Company. Ltd. The battles between the Allied and Turkish forces swayed back and forth until the Russian collapse in 1917. After that. the British, who had recruited a native iorce to restore order in south Persia. defeated the Turks and moved into western Persia in order to provide further protection for India. Thereafter, the British troops were used to quell internal striie in Persia until a stable government could be restored in the summer of 1918.

PERSIAN ART. Pictorial art flourished in Persia beiore Islam. ior although no traces of frescoes or illuminations have come down to posterity from the Sassanian period (*c.* A.D. 224–651), it is known from other evidence that that great age of Iranian culture included painting among its many creative activities. Ernst Herzield traced to Sassanian models the motifs (dancing girls. huntresses. animal figures, floral decorations of various kinds) of the fragments of ornamental wall paintings which came to light in the course of excavations made at the caliph's palace at Samarra (9th century). At about the same time illumination must have come into favour at Baghdad, probably through the Manichees. Some knowledge of their book painting was gained through the discoveries made by Sir A. Stein and by the German expeditions to Turfan.

PAINTING AND CALLIGRAPHY

The Persian contribution to painting and calligraphy began in the Moslem era. and the form in which it first appeared was that of book production. The share of Persia in the development of this art in the Islamic countries dates from beiore the beginning of the Abbasid period (750). Toward the end of the 7th century in the two oldest centres of culture in Iraq — Basra and Kufa — beautiiul Koran manuscripts in Kufic execnted on parchment were common, though at first they had no extraneous decoration. but produced their effect solely by the heavy lapidary style of the archaic character. In the 8th and 9th centuries this branch of Islamic art reached its first period of splendour under the powerful stimulus imparted by the caliphs of Baghdad; and the masters of the Kufic who flourished at that time (*c.* 800) include not only a number of Arabs, but also the Persian Khoshnam of Basra. More important. however. was the part played by calligraphers of Iranian origin in the development of the various forms of the *naskhi,* the round correspondence character. a-hich early began to take a dominant place beside the vertical script. The inventor of the decorative *thuluth,* which derived from this. is said to have been Ibrahim Segzi of Sijistan, and his pupil Ustad Ahwal Segzi has the reputation of having been the first. under the caliph Ma'mun. to elaborate and discuss rules of calligraphy. He in turn was the teacher of the celebrated Ibn Moqla. who brought the *naskhi* into general use in place oi the Kufic and is regarded as the

greatest authority on all the principles of the art. Ibn Moqla's school produced, among other famous pupils, Ibn al-Bawwab, Hasan al-Sirafi (d. 979), who was of Mazdaic origin, and the Buyid prince Fana-Khusru (d. 982), reputed to be a descendant of the Sassanian kings.

The Baghdad School.—The first extant works of the Baghdad school of painting date only from the 12th century, when the Seljuk period had already begun, but in their content and their artistic tendencies they go back unmistakably to older traditions, and continue with little change until the middle of the 13th century. They include scientific treatises (by Dioscorides, Galen and others) translated from the Greek by Nestorian scholars or based on ancient models, with explanatory illustrations; Arabic versions of the Bidpai fables (Kalila va Dimna) which were imported from India; and the anecdotes of Hariri, then in great favour, in which the bold jests and witty conceits of Abu Sa'id of Serruj were illustrated. These three types of text were all equally well adapted to direct the artist to the study of nature and to emphasize the importance of problems of composition and colour, and the works of this school are veritably astonishing in their wealth of colour shading and their forcible depiction of their subjects. To what extent Persian masters are represented is not exactly known; but the circumstance that the *minai* pottery of Rayy (Rhages) (*c.* 1200) borrowed the Baghdad style of painting suggests that the whole tendency had already spread from Mesopotamia to centres in Iran.

As early as about the 10th century, paper had supplanted parchment, not only in secular works but also in copies of the Koran and other religious texts, its manufacture having gradually spread from Samarkand to all the countries of Islam. Ornamental decoration of manuscripts, from which for religious reasons figures were excluded, also made continual strides, and soon the craft of the illuminators and gilders began to break away from that of the calligraphers and painters and to develop on its own lines. Kufic was now no longer used except in chapter headings and title pages; elsewhere the script employed was either one of the many variants of *naskhi,* or a decorative script representing a more graceful and stylistic development of the vertical character.

The Ilkhan Period.—The Mongol invasion in the 13th century proved unexpectedly fortunate for the art of book production in western Asia. Hulagu and his successors not only took pains to promote it in every possible way, but also brought it into contact with the highly developed painting of the far east, and directed it toward new subjects, with the important effect of immensely enlarging the painters' outlook. The main tendency was now to the pictorial representation of historic events and legendary episodes, in world histories conceived on a large scale like Rashid al-din's and the principal result of acquaintance with the works of the Chinese masters of the Sung period was to enhance the feeling for landscape. In manuscripts of the early 14th century the strong foreign stimuli are seen combining with older traditions, and in course of time there developed a new Persian-Mongol style of painting which reached a high standard in the two capitals of the Ilkhans, Baghdad and Tabriz. The profane texts were now no longer in Arabic, but generally in Persian, and the whole art of miniature painting was soon iranized when the great national epic of Firdausi and other poems, such as those of Nizami and Khwadju Kirmani, became increasingly common in illustrated and often sumptuous copies. New and effective uses were found for devices of composition, and, moreover, the arrangement of the verses in vertical columns, which could be broken up wherever desired, made possible a much more intimate and aesthetically satisfying conjunction of picture and text than had been known previously. Heroic scenes from the *Shah-Nama,* sentimental themes from *Khosrau and Shirin, Laila and Majnun,* etc., were then for the first time expressed in characteristic forms.

Of Arabic texts there were at this period mainly the cosmography of Qazwini and a few astronomical treatises, which seem to have been produced with loving care in western Turkestan. To the Baghdad school of calligraphy belongs the credit of developing, about 1300, the lapidary style of the Kufic Korans into the round writing, and bringing this to the ripest degree of ornamental beauty in majestic variants. In the production of the magnificent Korans of the age of the Ilkhans, with their large size and their few and incomparably imposing lines of script in black and gold, Persian masters were in first line concerned; and they carried to Tabriz and Samarkand the new principles for the decoration of the holy book, especially the rich arabesque illumination.

The Timurid Schools.—When Timur altered the whole political complexion of western Asia, a highly productive centre arose at his capital of Samarkand. His chief secretary, Amir Mohammed Badr ud-din, gained a reputation as a master of all forms of writing, and two of the great emperor's grandsons, Ibrahim Mirza and Baisonqur Mirza, were famous calligraphers. At Timur's court there came into favour, through the stimulus of far eastern models, the separate sheet bearing a light ink sketch, sometimes with some touches in gold and colour, to be pasted on cardboard and collected in albums. The traditional miniature illustration in body colour found in this period a new and prosperous evolution in the schools of Herat and Shiraz.

Baisonqur Mirza, who unfortunately met with an early death in 1434, earned much honour by founding at Herat an academy in connection with his library; for years it employed 40 calligraphers, besides numerous illuminators and painters. In this academy the Persian texts were no longer written in *naskhi,* but in *nastaliq,* an offshoot of the old cursive character, invented by the celebrated Mir Ali of Tabriz. All the 40 masters of Herat were directly or indirectly his pupils, and toward the end of the century the style of calligraphy invented by him found its most splendid representative in Sultan Ali of Meshed (d. 1513), the protégé of the famous poet and minister Mir Ali Shir Newai and friend of the great poet, Jami.

The preference that painters displayed for subjects drawn from the national literature, and the enthusiasm with which they steeped themselves in the magic of their native countryside, give to Persian painting of this period a romantic note which often chimes with the atmospheres found in contemporary western Gothic. In the east, however, the purely decorative and impersonal character of the pictures continued, and Shiraz rivaled with Herat in the same line, but using a colour scheme of its own.

It was at this time that the harmony between picture and text reached the highest imaginable degree of perfection, and the leaves of the extant manuscripts are astonishing in the skill with which the painters fitted their subjects into spaces allotted to them quite arbitrarily by the calligraphers. Meanwhile at the beginning of the 14th century the backgrounds were still carefully coloured red or yellow; subsequently a rich blue became general, and it was not until the end of the period that a gold background came into favour. The incidental landscape is generally of a steppelike character; jagged rocks, isolated trees, and little brooks rippling among stones and bordered by growing flowers, are the essential features of almost all open-air scenes, and only occasionally is the mysterious atmosphere of the forest or the luxuriance of a flower garden depicted. The highly effective motif of a tree in blossom, which is often used in smaller pictures, is obviously taken from Chinese models of the Ming period. Under the Timurids direct contact with the far east became increasingly frequent.

Behzad of Herat.—An undeniable weakness of Timurid painting lies in the diagrammatical conventionalizing of the figures, the spiritless treatment of the heads, and the absence of expression in the movements. In this respect no progress can be seen throughout the whole development of the art, which in other directions is so astonishing; and the appearance of a completely revolutionary personality was needed before a change could be brought about and new paths indicated. This personality was found in the genius Behzad of Herat, who is rightly honoured as the greatest master of Persian painting. Behzad understood how, even in his most populous compositions, to differentiate every single figure in countenance and bearing; his palette was extraordinarily rich, especially in warm, full tones, and this enabled him to individualize his portraits by the employment of numerous colour nuances for costumes and even for flesh. He was also a reformer in the treatment of landscape, which appears more naturalistic in his pages than in those of his forerunners, and in the choice of subject a markedly

realistic note is likewise seen. Moreover, it was he who revolted against the dictation of the calligraphers, and admitted no text at all, or only a few lines of verse in one corner, in the pages he illustrated; even a number of double-page miniatures by his masterly hand can be seen.

Behzad, who was born before 1450 and died after 1520, represents the zenith of the Timurid and the opening of the Safawid period in Persian painting. He was head of the Herat academy until 1506, when Shah Ismail took him to Tabriz, made him his chief librarian, and covered him with honours. Only a few extant works are indisputably by his hand. Both in Herat and in Tabriz he had many pupils, who carried his style far and wide in Persia, western Turkestan and India; and even in the 16th century his name was already so famous that his art was imitated on every side, while later on pages of the most various origins were furnished with his signature to enhance their value.

The Tabriz School.—The next generation of painters in Tabriz is dominated by the highly gifted Sultan Mohammed, who exercised a commanding influence in the whole field of art at the court of Shah Tahmasp. In collaboration with other masters he illustrated de luxe editions of the Persian epics, several of which have come down to posterity; but for the most part he preferred genre subjects and portraits, which were produced as single sheets and were designed to be bound in volumes together with specimens of the handwriting of famous calligraphers. He opened new fields of activity to the painters by bringing lacquer bindings into fashion, and also by inducing them to design patterns for textiles and knotted carpets to be made at the royal factories. Some of the studies for the celebrated hunting and animal rugs of the 16th century were made in his studio, as were also a few velvets and silk brocades with figure subjects.

From the end of the 15th century an immense impetus had been given to Koran decoration at Tabriz. It was here that the picturesque division of the title pages into star- or medallion-shaped fields and borders with a reciprocal pattern or a cartouche design was devised, and this again brought about a revolution in the style of Persian carpetmaking. The ornament grew richer and more complicated; to the arabesque were added slender floral twines in a profusion of lines, palmettes, rosettes and cloud patterns.

In Behzad's time Shah Mahmud of Nishapur came to eminence as a master of the *taliq* script and later Mir Ali of Tabriz, "the royal scribe" (d. 1559). Many other calligraphers and illuminators heard the call of the Ottoman rulers and founded a school of book decoration at Constantinople, which adhered closely to the tradition of Tabriz; they were accompanied by painters like Shah Quli and Wali Jan.

The Isfahan School.—Late in the 16th century, when all the artistic forces of Persia were once more being concentrated at the new capital, Isfahan, under the powerful impulse communicated by Shah Abbas the Great, there arose also in Isfahan a new and important centre for the art of book production in all its various forms. Mir Imad al-Husni (d. 1618) and Riza 'Abbasi competed in calligraphy for the royal favour, while others sought to attract attention by animal figures ingeniously constructed out of pious mottoes and similar jests, or by a perfect mastery of the *skikasta,* a complic'ated script so full of flourishes as to verge on illegibility. In painting there is a link with the schools of Herat and Tabriz in the person of Ustad Mohammedi, who was undoubtedly the first to put his observations of nature on to paper in the purest ink-wash technique without any reference to a text. His successor as head of the painters' guild at Isfahan was Riza 'Abbasi, whose signature, genuine or doubtful, is frequently met with; it is still not established beyond dispute whether this artist is identical with Xga Riza, who is thought to be of an older generation. Be that as it may, it was he who filled the albums of Persian and Indian collectors with his gay, sure-handed colour sketches and drawings in red chalk on the most everyday subjects, and with carefully executed pages in rich colour; and he ultimately became so much admired as almost to overshadow, for a time, the fame of Behzad. He likewise gave a new impulse to the illustration of manuscripts, and his elegant, fashionable style gained him a great influence in the other decorative arts also; wall paintings, figural tiles and lacquered doors in the garden palaces of Isfahan clearly show the mark of his atelier. Riza's best pupil, and his bosom friend, was Mu'in, one of whose extant works is a portrait of his master. The style created by the latter was still a living force at the end of the 17th century, when Shah Abbas II's effort for an assimilation to European painting had already failed, as is shown by the fact that of the young artists he sent to Rome only Mohammed Zaman gained some reputation.

In the 18th century European paintings and engravings were slavishly copied, and Nadir Shah's expeditions to India introduced transitory influences of the Mogul school. At the beginning of the 19th century an enormous impetus was given to lacquer painting, though only as an ordinary bazaar industry, and decoration also took the form of large canvases. Since the end of the 19th century the growing interest for Persian miniatures has called into existence a considerable number of workshops for the production of fakes, where single pages and even complete manuscripts are concocted in the style of any old master or period. This somewhat questionable development has at least the advantage of maintaining some contact with the masterpieces of the past. (E. K.)

ARCHITECTURE, CERAMICS, TEXTILES, METALWORK

As with painting and calligraphy, a certain strain of decorative skill dating from the Islamic conquest permeates all other forms of Islamic art generally known as Persian, but pre-Islamic influences are not absent, and such Sassanian motives as twinned animals facing each other appear constantly.

Architecture.—In architecture, the love of barrel-vaulted porches can be traced directly to Sassanian palaces and were the chief motives of the great mosques where they were flanked by twin minarets in the design of which appears that emphasis on height which is universally Persian. A second characteristic was the use of a dome with two shells, the outer onion-shaped and supported on a high drum, and the swelling slight in early examples but more pronounced later. Daring ingenuity of construction marks all these vaults and domes. The stalactite *(see* STALACTITE WORK) corbels, elaborate intersections of curved surfaces, delicate groined lines and scalloped forms display great skill and differ widely from similar Islamic buildings elsewhere.

The progress of architecture from the Seljuk domination continues to a rich climax in the 16th and 17th centuries.

During the 18th century there developed rich and delicate wooden construction including slim columns, intricate cornices treated with lavish carving and inlays used frequently in the exquisite formal gardens so important to Persian life. The Moslem love of surface ornament led to dominance of plane surfaces covered with tiles so that walls, vaults, domes and minarets glowed with blue-greens and turquoise, rose and yellow. In no other style has applied colour become such an integral part of architectural design. *(See* ISLAMIC ARCHITECTURE; TILE.)

Ceramics.—Springing from the most ancient Mesopotamian development of pottery Persian ceramics developed in about the 13th century into one of the most exquisite of all arts. The pottery body was coarse because of the available clay but the glazes were developed to a high degree of perfection and the coloration, especially the blues ranging from turquoise to cobalt, became world famous. Sassanian, Parthian and Byzantine influences lent vigour and charm. By the 14th century floral ornament became more important and the designs were freer and less formal. Vases were decorated in low relief and covered with monochrome blue glaze. During the 16th century the Chinese influence made itself felt and became strong in the 17th century not only in design but in methods of manufacture and at the same time Persian influences were felt in China. Tiles were of course an important phase of the ceramic industry. *(See* POTTERY AND PORCELAIN: *Persia* and *the Near East;* MOSAIC.)

Textiles.—Church treasuries throughout Europe reserve textiles that are obviously of Asiatic origin showing the same Sassanian and Byzantine influences felt in Persian ceramics. Lions, eagles and imaginary beasts enclosed in geometric patterns form the decoration on a material of woven silk and sometimes gold and silver. Prior to the 13th century these textiles came from different parts

of the Islamic world but later from Turkey and Persia, the Turkish development appearing in conventionalized ornament and the Persian from the 18th century onward showing greater complexity in formality and realism, and influenced eventually by Chinese elements as a result of the Mongol domination.

Rugs are the most important of Persian textiles, the best of them, which date from the 16th and 17th centuries, displaying amazing delicacy in technique and great decorative skill in design with rich soft colours marvelously adapted to the texture. *(See* EMBROIDERY; TEXTILES; RUGS AND CARPETS; BROCADE.)

Metalwork.—The Persians were aesthetic craftsmen in metal and their delicate inlaying of silver and gold into copper and steel of intricate geometric and naturalistic ornament shows decorative genius and the greatest of technical facility. The motives in this work were similar to those used in ceramics and textiles.

A rinceau or branching scroll ornamented with sharp pointed spearlike leaves was widely used. Much of this artistry was employed, of course, in the decoration of arms and armour and although there is a definite resemblance between the work of Turkey and Persia, the Persian far surpasses with its richness and delicacy. *See* METALWORK, DECORATIVE; SILVERSMITHS' AND GOLDSMITHS' WORK; *see* also references under "Persian Art" in the Index volume. PERSIAN BERRIES are the seed-bearing fruit of species of *Rhamnus* which are, or were, cultivated in France, Spain, Italy, the Levant and Persia.

The Persian berry proper is derived from R. *amygdalinus,* R. *saxatilis* and *R. oleoides.* The berry, gathered when unripe, has a greenish-yellow colour, but when older it is black and gives an inferior result in dyeing. Though their use declined. Persian Berries were still employed in modern times by calico printers for the production of "steam" orange, olive and green effects. In dyeing property they closely resemble quercitron bark and contain, as their main constituent, xanthorhamnin, $C_{34}H_{42}O_{20}$, a glucoside of rhamnetin. $C_{16}H_{12}O_7$. (A. G. P.)

PERSIAN GULF. The Persian gulf (as here described) is the shallow trough which extends 500 mi. from the Shatt-al-Arab in a southeasterly direction to the Musandam peninsula in Oman. There the Hormuz strait separates it from the Gulf of Oman. But "the gulf" is a term frequently used to include all the waters of the approaches (the Gulf of Oman and the Hormuz strait) as well as of the Persian gulf itself and. indeed, historically it is impossible to differentiate between them. The breadth of the Persian gulf varies from 50 mi. at the entrance, the Hormuz strait, to 140 mi. at the head and 200 mi. at its widest part. On either side lie the Persian and Arabian plateaus. the former nearer to the coast and with a quick rise through a series of limestone ranges. On the western side the rise is much more gradual to the central uplands of the Arabian peninsula.

In the Persian gulf the depth of water rarely exceeds 50 fathoms and, generally speaking, increases more rapidly from the Iranian than from the Arabian shore; on the pearl banks. which occupg about one-third of the area, the depth is less than 20 fathoms. At the head the 20-fathom line lies about jo mi. from the entrances to the rivers. Near Ras Musandam, however. a depth of 100 fathoms is reached. Off the Arabian coast, and especially north of Bahrain, a white clayey bottom is found; on the pearl banks it is sand, coral or rock. Off the Iranian coast it is generally mud.

The shores vary in character from the precipitous and rugged cliffs of the Musandam peninsula, with its broken outline, caverns and small sandy beaches, to the marshes and mud flats at the head of the gulf. Between these southern and northern limits on the Arabian side the shores are, in general, low and sandy with reefs and shoals extending up to jo mi. from the coast. On the Trucial coast there are narrow creeks and shallow lagoons with low, rocky islands sometimes surrounded by coral reefs.

There are many shoals, islets and reefs of? the shore of the Qatar peninsula; from its western base (Dohat as-Salwa) the coast trends toward the northwest, forming the western shore of the Bahrain gulf, with several small bays and low, sandy headlands. From Qatif, at the northern end of the Bahrain gulf, to the entrance to Kuwait bay the coast is low and sandy with reefs extending more than 20 mi. from the shore. The head of the gulf is formed by the deltas of the Shatt-al-Arab, the Karun, the Khor Musa and the Hindian; it consists of mud flats, swamps, and marshy plains. The Iranian shore from Ras Bahrgan (a headland formed by the delta of the Hindian) sweeps to the northeast for 30 mi. and then turns southeastward. It is low and sandy almost to Bushire where there is a swampy stretch north of the town. South of Bushire the coast is fringed by mountain ranges which sometimes leave a strip of plain only one or two miles in width; wide bays are formed where valleys open between the mountains and there are stretches of marsh and mud flats.

From Lingeh to Bandar Abbas (96 mi.) the coast has an east-northeasterly trend. crossing the ends of several mountain ranges and the valleys between them. There are mangrove swamps and mud islands in the western half of the Clerence strait, which separates Qishm (q v.) island from the mainland, and on the mainland opposite. Bandar Abbas, on the coast. lies in a bare, sandy, littoral plain backed by mountains rising to the peak of Kuh-i-Ginau (7.783 ft.) 17 mi north-northwest of the town. From Bandar Abbas to Minab the coast is fringed by mud flats and is low and swampy. The Minab river waters a fertile district of orchards and date groves. Southeast of the river the coast forms the shore of the Gulf of Oman. A coastal road runs from Bushire to Lingeh and a dry-weather track thence to Bandar Abbas. (K. C. B.)

Geology.—The Persian gulf and its continuation, the alluvial plain of Mesopotamia, together form a depressed zone lying between the stable tableland of Arabia and the folded ranges of southwestern Iran, the so-called Zagros system. It is a shallow sea. nowhere with depths of more than 60 fathoms, and is in no sense a "rift valley" such as the Red sea. The rocks forming its shores are of recent or young Tertiary age and are mostly sandstones, marls, limestones and gypsum. Locally Eocene and Upper Cretaceous limestones are exposed. and the Hormuz series, in part Cambrian, appears associated with intrusive salt bodies. Relics of raised beaches up to 150 ft. above sea level are locally preserved.

The strike of the folds throughout the length of the Iranian coast is parallel to the shore line. A number of anticlinal structures form prominent ranges. such as Kuh-i-Bang. Kuh-i-Mund, Shahin Kuh. The greatest folding movement is of late Pliocene age. The marked swing of the strike between Lingeh, Bandar Abbas and Jask shows the influence of Oman which projected as a buttress toward the advancing fold waves of the Zagros system.

The headland of Oman, the Ru'us al-Jibal. consists of massive limestones of Permian to Lower Cretaceous age. These were strongly folded in middle Cretaceous time and the complex played a passive part during the later Pliocene folding of Iran. The inlets in the Ru'us al-Jibal are drowned valleys indicating a relative depression of the land of about 1.500 ft.

The Arabian coast of the gulf is mostly very flat and featureless. Between Kuuait and Qatif it is composed of an extended sheet of horizontal or very gently folded calcareous sandstones and limestones probahly of Pliocene to Pleistocene age. Bahrein island and Qatar peninsula are elongated domes exposing Eocene

limestones and marls. The water of the copious springs of Bahrein and of the wells of Qatar is artesian.

The numerous islands of the eastern half of the gulf are formed of intrusive salt plugs. Salt is only exposed in a few islands, Qishm, Henjam, Hormuz, etc., but its presence under the other islands may be assumed. On the Iranian mainland there are a great number of these plugs, which in some cases built great salt mountains rising to nearly 4,000 ft. above the surrounding plain, as at Kuh-i-Namak in Borazjan (Dashtistan). The salt masses are 4 to 6 mi. in diameter and appear as intrusions.

(P. Z. C.)

Minerals.--On the Arabian side of the gulf, other than oil, minerals do not exist in significant quantities. In Oman some coal of poor quality has been found and copper exists in the mountains of the interior. Red ochre exists in several islands (notably Hormuz and Abu Musa) and is profitably worked. Salt is found in unlimited quantities on many islands, particularly Hormuz and Qishm, and large amounts are exported. Iron, as haematite and pyrites, is widely scattered in the Hormuz series. Sulphur has been worked near Lingeh on the Iranian coast. Gypsum of good quality is widely distributed.

Tides.—Great variations occur in the type of tide, the diurnal type being usual in the south and semidiurnal in the north. The rise of the spring tides varies between 6 ft. at Bushire and Bahrein and 11 ft. at Kuwait and Bandar Abbas. The tidal streams everywhere in the Persian gulf are erratic and the information about them is unreliable.

The Arabian Coast.—The promontory which terminates in Ras Musandam is known as Ru'us al-Jibal (the mountain tops) and forms part of the territory of the sultan of Muscat and Oman and dependencies (Gwadar and Dhofar) whose frontier on the eastern side is at Ras Sha'am. Southwestward of this point the coast is known as the Trucial coast (formerly the Pirate coast) and is occupied by a number of independent sheikhdoms, Ras al-Khaimah, Umm al-Qaiwain, Ajman, Sharja, Dubai and Abu Dhabi, whose rulers have been in treaty relations with the British government since 1892. The small territory of the sheikh of Fujairah on the eastern shore of the peninsula became independent of Sharja in 1901 but its ruler was not recognized as independent until 1952 when he accepted the same engagements as the Trucial coast sheikhs. Sharja, which formerly included what are now the independent sheikhdoms of Ras al-Khaimah and Fujairah, was until recent times the largest and most important town on the coast; its place has now been taken by Dubai. A British political agency was established at Sharja about 1823; it was transferred to Dubai in 1954.

Before 1835 there was no restriction on war at sea between the sheikhs but in that year they were induced by the British authorities to sign a maritime truce for six months to cover the pearling season. It was renewed annually until 1843 when, the benefits having become manifest to all, it was prolonged for ten years. In 1853 a treaty of peace in perpetuity was concluded which accepted British intervention in case of aggression by sea, but it has been British policy not to interfere in the quarrels of the sheikhs on the mainland. They have been left also to administer their territories in their own manner. In 1892 an "exclusive" agreement was signed by which the sheikhs bound themselves not to enter into relations with any other government than the British without the latter's consent and similarly not to grant concessions. In return British good offices were promised in the event of unprovoked aggression.

The Qatar peninsula forms a sheikhdom which has been in relations with Great Britain since 1882, but it was not until 1916 that they were put on the same footing as those of the Trucial sheikhdoms. The southern frontier of Qatar extends from the Khor al-Odaid (which is claimed by Abu Dhabi) to a point north of Salwa. which is in Saudi territory (neither this frontier nor the landward frontier of the Trucial sheikhdoms and Oman, where they march with Saudi Arabia, had been defined in 1954 in spite of attempts to reach agreement dating back 20 years). There begins the western shore of the gulf containing the Bahrein Islands which terminates at Qatif.

The Bahrein group of islands is ruled by a sheikh whose relations with the British government are governed by a series of agreements dating back to 1880 and containing provisions similar to or identical with those binding the Trucial sheikhs. The headquarters of the British political resident is in Bahrein, to which it was transferred from Bushire in 1946.

The coast of the extensive Hasa province, in which lie the valuable oil fields of Saudi Arabia, stretches for about 300 mi. from Salwa to the southern boundary of a neutral zone in which Saudi Arabia and Kuwait share the rights. This zone, which extends about 70 mi. inland, has a coastline 50 mi. long. Kuwait harbour, which stands on the southern shore of a deep bay, gave the place importance before the discovery of oil in 1938. Late in the 19th century the ruler, who enjoyed semiautonomy under the Turkish empire, frequently requested British protection. This was finally agreed and a treaty of friendship was concluded in 1899. A British political agency has been established in Kuwait since 1904 and relations with the British government are similar to those of other gulf sheikhdoms. Between Kuwait and Iran is a narrow corridor giving Iraq access to the gulf.

The Iranian Coast.—From the Shatt-al-Arab the northern and eastern coasts of the gulf are Iranian territory, which extends to the small port of Gwatar on the shore of the Gulf of Oman. The inhabitants are either Iranians or Arabs who, by domicile and intermarriage, have lost nearly all their racial and most of their social characteristics but retain a dialect of Arabic as their mother tongue.

Islands.—The islands lying off the Arabian coast to the east of the Qatar peninsula belong to Abu Dhabi, with the exception of Sini which was occupied by Persia in 1887, the Tamb Islands which belong to Ras al-Khaimah, and Abu Musa which belongs to Sharja. The ownership of some of the islands and shoals between Bahrein and the mainland is claimed by Saudi Arabia but the question was unsettled at the end of 1954. Saudi claims to islands off Kuwait and the neutral zone have also been made. All the islands off the Iranian coast are Iranian, except those already mentioned, and Iran has claimed ownership of the Tamb Islands and of Abu Musa.

Climate.—From the earliest times the climate of the gulf has been denounced by travellers of every nationality, and residents have gained some gloomy satisfaction from recording daily temperatures in their letters and reports; but modern housing and amenities have done much to make it more bearable and less unhealthful.

Temperatures vary as follows:

	Mean (° F.)	Minimum (° F.)	Maximum (° F.)
Kuwait	55 (Jan.) to 94 (Aug.)	36 (Dec., Jan.)	117 (June, Aug.)
Khorramshahr	55 (Jan.) to 93 (Aug.)	30 (Jan.)	120 (July)
Bushire	57 (Jan.) to 91 (Aug.)	32 (Jan.)	115 (Aug.)
Bahrein	61 (Jan.) to 92 (Aug.)	41 (Jan.)	103 (July, Aug.)
Jask	67 (Jan.) to 91 (July)	42 (Jan.)	113 (June)

Relative humidity is high everywhere, reaching 84% at Bushire and 80% at Bahrein. Rainfall is considerably higher on the Iranian than on the Arabian coast; mean annual values, calculated over varying periods give: Kuwait, 4.8 in.; Khorramshahr, 8.4 in.; Bushire, 10.9 in.; Bahrein, 2.9 in.; and Jask, 4.7 in. The number of days of rainfall vary from an annual average of 21 days at Khorramshahr to 7 days in the southern part of the gulf.

The prevailing wind is the northwester known as the shamal; it varies in direction from north to north-northwest on the Arabian coast and from northwest at the head on the Iranian side to west-northwest, west and southwest at the southern entrance of the gulf. Squally shamals of short duration occur in winter; in summer they may rise to gale force and last for a week. The southeasterly or easterly wind known as the qaus and the southwesterly (the *suhaili*), which usually follows it, are feared by the natives, as the latter blows directly into nearly all the otherwise sheltered anchorages.

Vegetation.—Throughout the islands and coastal fringes of the gulf vegetation is exceedingly sparse and varies considerably in amount and in its incidence according to the extent of the winter rains and the nature of the country. The most conspicuous family

of indigenous plants is the Chenopodiaceae of which at least three species are found. All are eaten by camels. "Harm" (*Zygophyllum album*) and "shanan" (*Suueda sp.*) grow abundantly on the Trucial coast and varieties of the acacia are widespread. The date palm flourishes in Oman and in Hasa. and the quality of the dates from these tno districts is especially esteemed. From the Shatt-al-Arab in southern Iraq dates are exported in large quantities. They are also grown in Bahrein and on the Trucial coast and in small quantities on oases in the hinterland. Extensive fertile patches on which agriculture is possible are found near Bandar Abbas and on the Mund river in Laristan, on the Batina coastal strip on the Gulf of Oman, and in Hofufin Hasa. Elsewhere small quantities of cereals, vegetables and citrus fruits are grown where conditions are favourable.

Livestock. — Although fast losing its former importance as a means of transport, the camel is still bred extensively on the Arabian coast, and the Omani strains are famous for speed and for comfort.

Other domestic animals are the horse and the ass; flocks of sheep and goats are kept. Many of the islands are almost entirely barren, but some wild goats, black and gray partridges and pigeons are found in hilly districts and some gazelle on the plains. Gazelle, hares, the lesser bustard (houbara) and sand grouse also are found on the mainland. The animals on the Arabian coast are distinguished for their very light coloration.

Fish.—About 200 varieties of fish are known to exist in the gulf including the seer (Scomberomorus commersonii), known there as the surmai, and mullet, seabass, members of the horse-mackerel family, the Indian shad, several species of sea perch and sea bream, and varieties of the sardine; sharks abound including the harmless Rhineodon. or whale shark, the largest of all fishes. There are many kinds of brilliant reef fishes; rays and sting rays are also found including the giant devil ray which has been reported to attain a span of 24 ft. Porpoises and swordfish are common, and the narnhal is sometimes seen. Sharks are caught with hook and harpoon, and the flesh is dried and exported to the interior; the dried fins and tails go to China and the oil is locally used for smearing boats. The edible fish are mostly caught by trap or stake net or from small boats. Dried fish is the staple diet in Makran, the land known to the ancients as that of the ichthyophagi. There is a modest export trade in dried and salted fish to India and Iraq The Iranian government started a sardine-canning factory at Bandar Abbas, but it ceased production before 1945.

The **Pearling** Industry. — The Great Pearl bank is situated in the waters of the great bight between Sharja and the north of the Qatar peninsula and southwest of a line from this point to Jazirat Abu Ali off the Arabian coast. Pearls are also found in small quantities off the Iranian coast north of Lingeh and near Kharag Island.

Average depths are from 10 to 15 fathoms. but in places they reach 20 fathoms or more. The majority of the pearling fleet is based on the Trucial coast where the oil industry had not by 1955 yet offered more alternative employment. The principal season for the fishery is during the four months May to August with the first ten days of September. Within the main area more than zoo banks are knoan where the average depth is about 8 fathoms and the extreme 14 fathoms. The longest time a diver can remain under water is about one and a half minutes, but few exceed one minute. Although the industry has declined enormously since the introduction of the culture pearl, it is still of some importance. No reliable figures exist enabling a comparison between present and past trading to be made.

Lights and Buoys. — The government of India established about 1912 an efficient system of lighting and buoying, which was maintained after World War I by the Basra Port directorate which after 192j levied a charge on vessels entering the Shatt-al-Arab to meet the cost. This administration continued until 1948 when it was taken over by the British ministry of transport. For financial reasons responsibility was transferred in 1950 to a nonprofit-making company. the Persian Gulf Lighting service, with a board of management in London. The Iranian government has more than once since 1929 shown a disposition to assert its authority by assuming responsibility for lighting and buoying the Iranian. coast and islands.

Currency. — In Iranian ports the Iranian currency alone is legal. The Indian rupee is in general use in Kuwait, Bahrein, Qatar and the Trucial coast, but in the interior and in Muscat only the Maria Theresa dollar is accepted.

The British Bank of the Middle East (formerly the Imperial Bank of Iran) has branches in Bahrein. Kuwait, Qatar, Dubai, Sharja. Abu Dhabi and Muscat; the Eastern bank has branches in Bahrein and Qatar. In Kuwait. a Kuwait National bank was formed in 1952 with a board of Kuwaiti merchants and a British manager.

Posts. — The postal services which were formerly administered by the India government came under the British general post office in Kuwait, Bahrein and Dubai after India became independent in 1947. In Doha (Qatar) the postal service mas under the British political officer. British stamps, surcharged, being used except for the internal post in Bahrein for which the ruler issues his own.

Telecommunications. — Bahrein has radio and radio telephone communications with London, New York, Kuwait, Doha and Muscat. There are radio stations at Sharja and Dubai.

Internal telephone systems have been installed in Bahrein, Kuwait and Doha.

Air Services. — Scheduled services to Kuwait and Bahrein are (mid-1950s) provided by B.O.A.C.. Middle East Airlines, Cyprus Airways, Iraqi Airways; to Kuwait, also by Misrair, Iranian Airways, Air Liban. Syrian Airways and Kuwait National Airways; Bahrein. Qatar and Sharja are served also by the Gulf Aviation company.

Shipping. — Apart from the tankers that serve the Iranian and Arabian oil fields, eight shipping lines have regular services to the gulf calling at Kuwait, Bahrein, Khorramshahr and southern Iranian ports.

Economy. — The prosperity of the sheikhdoms was transformed by the discovery and exploitation of oil which, directly and indirectly, affords the main source of revenue. Oil was not yet in production on the Trucial coast at the beginning of 1955, but strikes at Bahrein (1934), Kuwait (1946) and Qatar (1949) and the refinery at Bahrein, processing large quantities of crude oil from the Saudi Arabian fields on the mainland, had already brought wealth in which less fortunate neighbours shared to some extent. Kuwait, with a revenue of about £55,000,000 in 1953, was by far the richest of these states; Qatar, formerly dependent on a desert economy, had a revenue of £6,500,000 in 1953/54 and Bahrein, where the access of wealth was less spectacular, about £4,000,000 in the same year.

Trade of Kuwait and ***Bahrein***
(In thousands of pounds sterling)

	Imports		Exports	
	1926	1953		1953
Kuwait	448	22,350*		22,500*
Bahrein	1,622	14,525*	1,155	7,253*

*Excludes imports and exports by the oil companies and the governments.

Trade figures for Qatar are not available. Dubai, importing goods to the value of about £2,500,000 in 1953, does trade not only with the interior but with southern Iranian ports.

The main articles imported are clothing. textiles, household goods, tea, coffee, sugar, rice, flour and other foodstuffs, motor vehicles and spare parts, building materials and luxury goods of all kinds.

HISTORY

The history of the gulf before the 4th century B.C. is based on scraps of evidence provided by inscriptions. and on deduction from other records of a much later date. It appears to be certain, however. that from the very earliest times the Arabian shores of the gulf, the southwestern plains of Persia and the Sumerian territories of Ur were inhabited by a Semitic people.

There is evidence that a seafaring race lived in "Magan" (which

may be synonymous with Oman) about 2600 B.C., and that communication betneen India and southern Iraq existed at an even earlier period. The Babylonians (7th century B.C.) certainly navigated the waters of the gulf and may have traded direct with India. For our first certain record we are indebted to Nearchus, the admiral of Alexander the Great, who brought his fleet from India at the end of Alexander's successful campaign in 326 B.C. Writers of this period indicate the existence of maritime trade between the gulf and the far east.

Eratosthenes (c. 276–*c.* 194 B.C.) and other writers describe Gerrha, "a city five miles in circumference." on the Arabian coast opposite Bahrein as an important centre of trade in spices and other products of southern Arabia which were carried by land to Mecca, Medina and Petra and by land or sea to Babylon. Bahrein was even then famous for its pearls. Later the Persian gulf route seems to have suffered a decline and trade from the east was carried through the Red sea. Gerrha, however, remained important until the days of Pliny (A.D. 23–79). About A.D. 116 the Romans under Trajan reached the gulf but left no mark there.

Moslem Conquests. — From that time records are scanty until after the rise of Islam in the 7th century, when the Arab conquests brought Persia and the whole of the western coast of the gulf, including Oman, under Moslem rule.

By the middle of the 9th century Siraf, on the Dashti coast, had become the most prosperous port, and it was visited by Chinese trading vessels. Basra, too, with its suburb Ubulla, was a centre of Arab sea trade. The stories of the voyages of Sindbad the Sailor are evidently based on records of Arab travel in the 9th and 10th centuries.

Hormuz became the most prosperous trading centre some time in the 14th century. Indigo was then an important export and the country on the mainland (the Minab district) was rich in wheat, barley, rice and sugar. Mineral products were gold, silver, copper, iron, cinnabar and salt. Marco Polo (end of the 13th century) had visited the island and described its immense trade with India. The Arabs held this trade until the coming of the Portuguese early in the 16th century.

The Portuguese. — The emergence of the two stable empires of Turkey and Persia at the end of the 15th century had restored the security of the land routes through Mesopotamia which had been destroyed by the Mongol invasions. But by 1515 Alphonso d'Albuquerque had secured Hormuz, closed the gulf to other shipping and diverted almost all the Indian and far eastern trade, for nhich Hormuz was the entrepôt, around the Cape of Good Hope. Throughout the 16th century the Portuguese held control in the waters of the gulf, and all trade with Basra and other ports, including Muscat. passed through Hormuz. But their ruthlessness and greed made them many enemies and, about the middle of the century, their supremacy was disputed by the Turks. Toward the end of it both Dutch and English adventurers began to consider the commercial possibilities of the east.

The Dutch and the English. — English interest in eastern trade was small during the middle ages, and merchants dealt through Venice which held a monopoly in business with the Levant. But this declined after the, capture of Constantinople by the Turks (1453) and was extinguished after the discovery of the Cape route. Antwerp then superseded Venice as the entrepôt of eastern commerce and the minds of the Dutch, who were forced to trade via Lisbon, turned toward direct communication with the east. In 1602 a number of rival companies was combined in the Dutch East India company which consolidated victories already gained over the Portuguese in India.

In 1592 the English Levant company extended its interests to the Indian ocean, and in 1600 the East India company was formed. Fourteen years later, the possibilities of trade with Persia being perceived, a firman was obtained from Shah Abbas and Jask was selected as the most suitable port in the gulf. The Portuguese opposed the project violently, but their behaviour having aroused the hostility of the shah he launched an expedition against Hormuz in which English help, unwillingly given in response to his threats and promises, enabled him to expel the Portuguese from Hormuz in 1622.

Gombrun on the mainland became the port of Persia and was renamed Bandar Abbas. For a century and a half it remained the principal trading centre of the East India company on the shores of the gulf. During the whole of this period the English company had to contend with the commercial rivalry of the Dutch, who did not finally abandon the struggle until 1766 when their last foothold, on Kharag Island. was destroyed by the Persians.

There is evidence that pirates from the coast of Oman harried shipping as early as the 9th century. and they probably remained a constant menace. In the 17th century they were certainly active and in 1698 the English, the Dutch and the French reached an agreement to share the policing of the waters of the Red sea, the Persian gulf and the approaches to India. But this arrangement appears to have been stillborn and the responsibility was gradually assumed by the English alone.

In 1763 the shah granted a firman to the East India company in which the English agent was described as "Governor-General for the English nation in the Gulf of Persia"—a reflection of the change in the company's status in India and of their commercial supremacy in the gulf—and a virtually exclusive liberty of trade was given. Their factory was established at Bushire in the same year. During this century, however, as a result of a series of revolutions and internal chaos, Persia ceased to be the predominant state of the gulf region. Bahrein was lost to the Utub Arabs from Kuwait, and a new force appeared in the sultan of Muscat who established himself on the Persian coast soon after his seizure of power in 1793. In 1798 the company reached an agreement with the sultan which was the beginning of a close political liaison which developed as time went on.

Thus the active hostility of the Portuguese and the Dutch, the depredations of Arab and other pirates, the decay of Persian authority with its resultant lack of a predominant power in the region, and the threat from France, against which the agreement with Muscat was specifically directed, together forced upon the agents of the company the assumption of political and administrative control in the gulf which was developed in a more positive form in the 19th century.

The 19th Century. — The intrigues of the French and the aggression of Russia had, on the whole, an adverse effect on British relations with Persia. On the Arabian coast the rise of the Wahhabis in Nejd and their advance to the shores of the gulf in 1800 introduced a new and disturbing factor there. Their defeat and expulsion by an Egyptian army in 1818 was regarded with even greater concern by the British authorities. But the Wahhabis recovered their lost power and were back on the coast in 1830; their precarious hold there was not finally lost until 1869. During their periods of ascendancy the Wahhabis occupied the oasis of Baraimi (Buraimi) on the western borders of Oman from which they launched ferocious attacks on the sultan's dominions and levied tribute upon them. They also encouraged the piratical activities of the Juwasim of Sharja, who became such a menace to shipping that British expeditions were sent from India to destroy their strongholds in 1809 and 1819. In 1820 a general treaty of peace was signed by all the sheikhs of the coast and by the sheikh of Bahrein. This treaty prohibited "plunder and piracy" at sea but was no bar to regular hostilities between the signatories. A treaty of perpetual peace in 1853 put an end to piracy as a regular calling in the gulf, and the "Pirate coast" became the Trucial coast. By agreements concluded between 1838 and 1856 the sheikhs gave undertakings to prohibit the use of their ships for the carriage of slaves and gave consent to the seizure and confiscation by British ships of any vessels found to be contravening their orders in this matter. The British government thus voluntarily assumed responsibility for putting a stop to this traffic as far as it was possible to do so at sea, having gradually been forced by the course of events to undertake the policing of the gulf in the interests of all users. British intervention was. however, confined to maritime affairs even during operations in support of the sultan of Muscat in his long struggle with the Wahhabis and the Juwasim. Military forces were landed to deal with pirates at their bases, but they never penetrated inland, and the British government steadfastly refused to become involved in the

internal affairs of the sheikhdoms or the sultanate or in their squabbles among themselves, so long as these did not threaten the peace at sea. Thus boundaries between the sheikhdoms, at no time clearly defined, fluctuated, and their landward frontiers depended rather upon the limits of the grazing grounds of the tribes owing their allegiance than upon any recognized line. The Wahhabis, during their years of power, levied tribute and exercised military control of varying extent from the Baraimi oasis until they were finally expelled in 1869.

In the waters of the gulf and on its eastern shore Persian authority was still negligible. In 1869 an exclusive agreement was concluded between the Trucial sheikhs and Great Britain by which the sheikhs undertook neither to enter into agreements with nor to make concessions to any other government. This alarmed the Turks who then sought to strengthen their position at the head of the gulf. Hasa was occupied in 1871 and a small detachment of troops was established at Doha on the east side of the Qatar peninsula. Kuwait, though virtually independent, was regarded both by the Turks and the British as under the exclusive influence of the Porte. The use of Kuwait as a regular port of call by British steamers, which began about this time, made the Turks fear a diminution of the trade of Basra, and they made a feeble attempt to establish a firmer position there.

Sheikh Mubarak, who became the ruler in 1896, repeatedly sought British protection. Russian attempts to obtain a railway concession linking the Mediterranean with the Persian gulf (which might have resulted in Russia's gaining territorial rights in Kuwait) caused the British government in 1899 to enter into an agreement with the sheikh similar in scope to the exclusive agreement mentioned above.

20th Century.—The Russians who attempted to gain a footing at the head of the gulf were followed by the Germans. who obtained a concession for an extension of the Anatolian railway to Baghdad and Basra in 1903. By an agreement with Turkey in 1913 Great Britain gained representation on the board of the railway and the right to control any extension south of Basra. By the same agreement Kuwait was recognized as an autonomous *qaza* of Turkey, and the Turkish government accepted the validity of the agreements between the sheikh and Great Britain. Turkey also abandoned all pretensions to sovereignty over Bahrein, Qatar, Muscat and the Trucial coast and recognized the British right to continue their time-honoured work of policing, lighting and buoying the waters of the gulf. The limit of Turkish authority was defined by a straight line roughly marking the southern boundary of the province of Nejd which included the coastal district of Hasa. Meanwhile Abd ul-'Aziz ibn Sa'ud had reconquered the Wahhabi capital, Riyadh; in 1902, and drove the Turks out of Hasa in 1913, thus bringing the Wahhabi power to the coast again. He was warned, however, that no attempt to interfere with Qatar or the Trucial sheikhdoms would be countenanced by the British government, and in treaties concluded later with Great Britain he formally agreed "to maintain friendly and peaceful relations" with them and with Kuwait and Bahrein.

The importance of the gulf to Great Britain was enhanced by the discovery of oil in the Persian province of Arabistan (Khuzistan) by a British concessionaire in 1907, and Abadan became the oil port on which British naval squadrons in the Indian ocean relied for fuel during World War I. Basra was occupied in 1914 to cover the oil fields, and the Mesopotamian campaign followed. Elsewhere in the gulf the mar brought no immediate changes.

The reappearance of the Wahhabi power on the coast, however, and Ibn Sa'ud's unwillingness to be restricted by a formula more precise than that quoted above aroused some misgiving, particularly as the landward frontiers of Qatar, the Trucial sheikhdoms and Muscat had never been defined. Negotiations with Ibn Sa'ud about these frontiers, initiated in the early 1930s. had failed, and in 1955 the questions of the frontier with Abu Dhabi and that of the ownership of the Baraimi oasis were referred ta arbitration.

Except for the inevitable shortage of foodstuffs and consumer goods, World War II hardly touched the gulf. The move of the headquarters of the British political resident from Bushire to Bahrein which had been decided upon several years earlier took place in 1946, but no other administrative changes took place until, as a result of the constitutional changes in India, the responsibility for gulf affairs was taken over by the British foreign office from the government of India in 1917.

Some modification in British policy occurred after that date. Efforts were made to encourage methods of sound administration and justice and to improve education and health services by the appointment of British advisers without, however, affecting the internal independence of the rulers. In 1950 a small force known as the Trucial Oman levies, paid from British funds, was established with headquarters at Sharja to assist in the maintenance of internal security. After the arrival in 1952 of a Saudi amir at Baraimi over which Ibn Sa'ud claimed rights, on the grounds of the Wahhabi occupation which was terminated in 1869, the duties became extended to include the protection of the Trucial sheikhdoms against external aggression.

PERSIAN LANGUAGE: see IRANIAN LANGUAGES.

PERSIAN LITERATURE. The term Persian literature is used to describe those productions written in the Persian language as it emerged, much transformed in grammar and vocabulary, some three centuries after the Arab conquest of Iran in the mid-7th century A.D., when Islam had displaced Zoroastrianism as the predominant religion of the country. This literary language, commonly called modern Persian, later spread into Afghanistan, Turkey and above all Moslem India, giving rise to significant subsidiary literatures in those lands. The growth of a literature in modern Persian mas gradual, and few documents have survived to illustrate its earliest phase. Arabic had supplanted the national language as the prestige literary medium and many Persians made important contributions to Arabic literature, even centuries after the rebirth of Persian letters. The first specimens of modern Persian are in verse; prose literature appears more than a century later.

POETRY

Earliest Period.—The beginnings of Persian poetry are associated with the rise of the partially independent Persian dynasties which sprang up in the eastern provinces with the weakening of the central administration of the caliphate. The earliest name mentioned by Persian literary historians is that of 'Abbas of Marv, who is stated to have composed in A.D. 800 a panegyric in honour of Harun al-Rashid's son al-Ma'mun. The fragments of this poem quoted in the anthologies are now regarded as spurious; but the Arab geographer Ibn Khurdadhbih (*c.* A.D. 836) cites a Persian verse by a certain Abu Taqi al-'Xbbas ibn Tarkhan which looks genuine, and possibly this al-'Abbas is to be identified with 'Abbas of Marv. Clusters of poets gathered at the courts of the Tahirids (A.D. 821–873) and the Saffarids (A.D. 878–900), flattering their princely patrons in the language best known to them, but though their names are known their talents cannot be estimated, so little of their output having survived.

The unification of the eastern provinces under the Samanids (A.D. 875–999) provided employment and scope for many Persian poets, some of whom were patronized by the princes of other contemporary dynasties—the Buwaihids (A.D. 932–1055), Ziyarids (A.D. 928–1042) and Farighunids (A.D. 980–1010). The advent of the Samanid dynasty ushered in, indeed, a veritable renaissance of Persian letters. Proud of their Persian blood, they welcomed to their twin capitals Bukhara and Samarkand many scholars and poets. Nasr II (913–943) was immortalized by his favourite encomiast Rudagi (*q.v.*), the first truly great poet of Islamic Persia. It is possible to trace in the surviving fragments of these early

poems most of the literary forms which developed later. The qasida or formal ode, used especially in panegyric, and the ghazal or lyric, found suitable for poems of love and wine, stem directly from Arabic literature, which lent the Persians most of their prosodic patterns. The *mathnavi* or rhyming couplet, employed in epic and didactic poetry, was also known to the Arabs, though despised by them, but the *ruba'i* or quatrain, the shortest of all Persian poetic forms, universally famous through the verse of Omar Khayyam and his translator Edward FitzGerald (*qq.v.*) and popular with all Persian poets and men of letters, was unknown to them.

The Epic.—With Persian princes once more on the throne of Persian kingdoms, memories were revived of the ancient glory of pre-Islamic Iran as recounted in the Pahlavi writings. Nuh II (976–997) ordered his laureate Daqiqi to put into Persian verse the *Khvatay-namak* ("Book of Kings"), and the poet set to mork upon this congenial task but had not progressed very far when he died in the prime of life. The great undertaking was carried forward by Firdausi (*q.v.*), who brought it to a triumphant conclusion by 1010. His *Shah-nama,* though spurned at first by the Ghaznavid Mahmud (998–1030) who had overthrown the Samanids, soon won universal popularity as the national epic of Iran; repeatedly copied in fine and exquisitely illustrated manuscripts, it continued to be recited by professional rhapsodes down to modern times. Other poets soon sought to emulate the success of Firdausi; none came anywhere near to equaling his achievement, though numerous epics on heroic and romantic themes have been preserved. The nearest rival to Firdausi is Nizami (*q.v.*) who died about 1202; he composed five epic poems on a variety of topics, including the legendary exploits of Alexander the Great, the life of the Sassanian emperor Bahram Gur and the Bedouin romance of Laila and Majnun. Asadi completed in 1066 a heroic epic on the loves and wars of Rustam's ancestor Garshasp. A little earlier Fakhr al-Din As'ad Gurgani wrote his charming *Vis u Ramin,* later put into Georgian, a poem based on a Sassanian story which strongly resembles the legend of Tristan and Iseult. In due course the epic was pressed into service as a handmaid of historiography. Thus, Hamd Allah Mustaufi. otherwise famous as a historian and a geographer, having produced a revised edition of the *Shah-nama,* proceeded to compose the *Zafar-nama,* a gigantic poem reviewing the course of events from the birth of Mohammed down to the year 1331. The exploits of Timur, and later of the Safavids. were duly made into epics, while it is interesting to mention one of the last ambitious projects of this genre—the *Jarj-nama* composed in honour of George III by a Persian living in India, telling the political history of that country from its discovery by the Portuguese up to the British conquest of Poona in 1817. The Koranic story of Joseph and Potiphar's wife inspired a succession of poets: the first of the series is even attributed to Firdausi's old age, but the ascription has been hotly contested by modern scholars. while the finest treatment was that of Jami (*q.v.*), who gave a mystical interpretation to the tale.

Panegyric.—Panegyric, which forms an important branch of all eastern literatures, is less apt to interest the average western reader, but Persian qasidas merit the attention of all Persian students for the mastery of language and expression displayed by the best-known practitioners. This important genre, already perfected in Arabic especially by al-Mutanabbi (*q.v.*), could be as lucrative to the poet as it was pleasing to his patron; the richer and more powerful the prince, the more numerous his train of encomiasts. Sultan Mahmud of Ghazni created the congenial atmosphere for Farrukhi, Minuchihri, Asadi and 'Unsuri to display their virtuosity; their artful productions paved the way for the court poets of the Seljuk Sultan Sanjar (1118–57)—Mu'izzi, the "prince of poets"; Adib Sabir; and, most highly esteemed of all qasida writers, Auhad al-Din Anvari (*q.v.*), whose elegy describing the sufferings of his countrymen while Sanjar was held captive by invading Ghuzz tribesmen has been brilliantly translated into English as The *Tears* of Khorassan first by William Kirkpatrick and then by E. H. Palmer. Contemporary with Anvari was his greatest rival Khaqani (*q.v.*), court poet to the Shirvanshah of northwestern Persia. Khaqani, being erudite in most branches of Islamic learning and a supreme master of Persian lexicography, composed in a forbiddingly obscure style and thus endeared himself to the later crop of commentators. Indeed it was held to be far from a fault in the panegyrist to write obscurely; rather it highly flattered his patron to be supposed equal to understanding the learned references of his poet. Every succeeding dynasty attracted and rewarded its circle of panegyrists, and all the Mogul emperors of India liked to have their exploits celebrated in Persian verse. Nor has the panegyric by any means vanished, though its themes tend to be national and party-political rather than personal. In general, though the lengthy passages of servile flattery make tedious reading in the countless products of the classical age, many qasidas contain vivid and beautiful descriptions of natural scenery and great occasions which more than atone for the stretches of boring bombast.

Didactic and Mystical Poetry.—The origins of didactic poetry, ever popular in a country abounding in proverbs, saws and maxims, may be traced back to Firdausi and his times. Abu Shakur of Balkh, favourite of the Samanid Nuh I (943–954), wrote a didactic poem called *Afarin-nama* of which only fragments have survived, but sufficient to establish it as the parent of such famous works as the *Bustan* of Sa'di (*q.v.*); while Firdausi's *Shah-nama* abounds in sententious wisdom pithily expressed. Religious and mystical poetry was a natural outgrowth of moralizing didactic; the Isma'ili Nasir-i Khusrau (*q.v.*) composed an abundance of ethical and religious poems, while the mystics Abu Sa'id ibn Abi 'l-Khair (d. 1049) and 'Abd Allah Ansari (d. 1089) employed the quatrain to express mystical ideas. The first great mystical epic, the Hadiqat *al-haqiqa,* was composed in 1130 by Sana'i of Ghazni, who thus set a fashion which many later poets followed; he wrote a number of shorter epics as well. all of a religious character, and many odes and lyrics containing passages of great mystical insight and beauty. His immediate successor Farid ud-din 'Attar wrote numerous epics on religious and mystical themes, the most famous being the *Mantiq ut-tair* which FitzGerald abridged into his *Bird-Parliament;* mention may also be made of his *Ilahi-nama* and *Asrar-nama,* in which mystical teaching is illustrated by lively and well-told anecdotes. 'Attar in addition composed many odes and quatrains, and in prose an extensive and valuable book of memoirs of the saints. After Sana'i and 'Attar came Jalal-ud-din Rumi (*q.v.*), who died in 1273 having passed most of his life in Konya; his *Mathnawi i ma'nawi,* which draws upon his predecessors, is by far the greatest mork of its kind, while in his lyrics and quatrains he reached astonishing heights of pure poetry entitling him to be ranked with the world's great mystical poets. His contemporary Sa'di (*q.v.*), who has always been the most popular moralizing poet of Persia (though in his lyrics he displays a higher poetic gift), will always live by his *Bustan* and *Gulistan*—the latter a graceful miscellany of rhymed prose interspersed with passages in verse. Jami's Baharistan and Qa'ani's *Parishan* are among the books written in emulation of the *Gulistan,* which has been translated into many languages.

Lyric Poetry.—While the *ghazal* played a minor part in Arabic literature because of the greater popularity of the qasida, Persian poets from Rudaki onward showed increasing fondness for the shorter poem. By Sana'i's time the convention of the *takhallus* (the poet's pen name signed in the concluding couplet) had been established and remained thereafter the distinguishing mark of the lyric. Whereas the qasida sometimes ran to as many as 100 or more couplets in monorhyme, the *ghazal* seldom exceeded 12 and settled down to an average of seven. This art form was brought to perfection by Hafiz (*q.v.*) in the 14th century, but it was practised thereafter by almost all the Persian poets including those of India and has continued to be popular in modern times.

End of the Classical Period.—Contemporary with Hafiz were 'Ubaid i Zakani (d. 1370), the most talented satirist of Persia, Ibn Yamin (d. 1368), admired for his occasional verse, Khvaju of Kirman (d. 1352), who composed romantic *mathnavis* in emulation of Nizami, and Salman i Savaji (d. 1378), panegyrist to the Jala'irid rulers of Baghdad. The golden age of Persian poetry came to an end with the Timurids, and Jami (*q.v.;* 1414–92) is generally regarded as the last of the classics; he distinguished himself in

all branches and was also a notable prose writer. The Safavids, who gave a powerful impulse to painting and architecture. found poetry in a slow decline, though every generation brought its crop of imitators; the outstanding authors are Sa'ib of Tabriz (d. 1677), laureate to 'Abbas II, and, in the 18th century, Hatif of Isfahan (d. c. 1784). Under the Qajar dynasty (19th century) lived Qa'ani of Shiraz (d. 1853), considered by some the most brilliant and melodious of all the poets of Persia, though rather indifferent in his choice of subjects.

Persian Poetry in India. — The extension of Moslem rule in India gave rise to an Indian school of Persian poetry, founded by Amir Khusrau (d. 1325) who lived at the court of the Khilji kings of Delhi and composed brilliantly and extensively in all genres. Thereafter all the Mogul emperors had their laureates, such as Faidi (d. 1590). 'Urfi (d. 1590), Nau'i (d. 1610) and many others. These poets refined and complicated the familiar conceits to such a point that "Indian poetry" became synonymous with obscurity and artificiality.

PROSE

The foundations of Persian prose, as of poetry, were laid in the time of the Samanid dynasty. In 963 Bal'ami, vizier of Mansur I, published an abridged translation of the famous annals of Tabari (*q.v.*). About the same time a band of theologians from Transoxiana made a Persian version of Tabari's other great work, his commentary on the Koran, thus proving that Persian was a fit medium for sacred as well as profane writing. Mansur I also commissioned the first Persian book on medicine, the pharmacopoeia of Abu Mansur Muvaffaq of Herat. The application of Persian to philosophy and science, which involved the coining of an extensive and subtle technical vocabulary, ranks among the outstanding achievements of Abu 'Ali ibn Sina or Avicenna (*q.v.*) whose formative years were passed at the Samanid court.

The Two Styles. — The two translations of Tabari mentioned above set a norm of simple and pure Persian style which has seldom been surpassed. A more artificial type of prose, under the influence of the *saj'* ("rhyming prose") of the Arabs, was introduced by Hamid al-Din of Balkh whose Maqamat, composed in 1156 in imitation of the Maqamat of al-Hariri (*q.v.*), proved that Persian was fully equal to all the complications of scholastic Arabic. The "battle of the styles" continued to be fought out down the succeeding centuries; the taste of the Mongol conquerors encouraged involved and bombastic prose, satiation with which caused a reaction toward archaic simplicity. This polarity has continued to characterize prose writing ever since.

History. — Of all branches of prose writing, history has always been the most popular and every dynasty of kings and princes has had its circle of professional chroniclers. The anonymous history of Sistan, composed in the middle of the 11th century, was quickly followed by the history of the Ghaznavids by Baihaqi (d. 1077) in 30 volumes (only a sixth has survived). The Seljuk dynasty found a notable historiographer in Ravandi whose massive *Rahat al-sudur* was written c. 1203. The famous vizier Nizam al-Mulk (d. 1092) left a political testament called *Siyasat-nama* which has great importance as a historical source; as a guide to rulers it belongs to the same tradition, going back to Sassanian days, as the *Qabus-nama*, "Mirror of Princes," composed in 1082 by Prince Kai-Ka'us of the Ziyarid house. The advent of the Mongols ushered in a golden age of historiography. 'Ata Malik Juvaini's *Tarikh i* Jahan-gusha, completed in 1260, is a masterpiece of majestic prose and has great historical value, for its author held high office under the Mongols whose conquests he celebrated. Juzjani was another personal witness of the Mongol invasion, and his *Tabaqat* i Nasiri is especially interesting for its account of the events which occurred in Afghanistan and India. The history of Vassaf, completed in 1312, continues the authentic record of this critical period, but its usefulness is somewhat marred by its inflated style. Along with regional and dynastic histories. Persia has produced a number of universal histories on the grand scale, and the most valuable of these was written during the Mongol period: the *Jami'* al-tawnrikh of Rashid al-Din Fadlullah (*q.v.*), who drew upon Chinese and European as well as Islamic sources. The output of histories large and small continued undiminished through the ensuing centuries, and mention may be made here only of a few outstanding works. The career of Timur i Lang (Tamerlane) and the exploits of his successors in the 15th century are told by Sharaf al-Din 'Ali Yazdi and 'Abd al-Razzaq Samarqandi. Mirkhwand (Mirkhond, *q.v.*), who died in 1498, laboured for many years upon his elephantine history of the world, the *Raudat al-safa'*, much used by early European historians of Islam. Khwandamir (Khondamir), his grandson, abridged this massive work and also compiled the *Habib* al-siyar tracing the emergence of the Safavid dynasty. The life and times of 'Abbas the Great (*q.v.*) were described by Iskandar Munshi, and later Nadir Shah, Karim Khan Zand and the Qajars had their own chroniclers. Many local and provincial histories of great value also exist; while Moslem India yielded a rich crop of general and special works, most of which were described and partly translated in the eight volumes of Sir H. M. Elliot's Hzstory of India (1867–78).

This extensive historical literature is supplemented by many biographical works, particularly of poets, such as the *Lubab al-*albab of Muhammad 'Aufi (d. 1232) who also compiled a valuable encyclopaedia of stories; the Tadlzkirat al-shu'ara' of Daulatshah, completed in 1487; and the *Atash-kada* of Lutf 'Ali Beg (d. 1781). Nur Allah Shushtari (executed in 1610) composed an important biographical dictionary of mystics and Shi'ite martyrs, and Jami's Nafahat *al-uns* contains valuable notices of the leading Sufis down to his times.

Geography. — Many of the Arabic-writing geographers of the 9th and 10th centuries were Persian, and the oldest geography in the Persian language is the anonymous *Hudud al-'alam*, written toward the close of the 10th century. Nasir i Khusrau, famous otherwise as poet and theologian, left a curious travelogue (*Safar-*nama) of his journey (1046–52) from Merv across Persia. Mesopotamia and Palestine to Egypt and back to Balkh. Of special importance is the geography of the Mongol period which forms a part of the *Nuzhat* al-qulub, a cosmographical work completed in 1430 by Hamd Allah Mustaufi who also compiled an important history, the Tarikh i *guzida*. Toward 1420 Hafiz i Abru finished and dedicated to Shahrukh his untitled geography in which certain Persian provinces are described along with an epitome of their histories. Many valuable additions to Mustaufi are found in Amin Ahmad Razi's Haft *iqlim* (completed in 1594), an encyclopaedia of geography and biography. In the 19th century the impact of western knowledge stimulated the writing of new universal and local geographies, and the diaries of the shah Nasr-ed-Din (*q.v.*) recording his visits abroad are both entertaining and informative.

Theology and Mysticism. — Arabic was in general preferred by Persians writing on theology, but many important books were also composed in Persian. Nasir i Khusrau wrote extensively on Isma'ili ideas, as did Nasir al-Din Tusi (1201–1274) during his Isma'ili period; he is best known in Persia for his ethical manual Akhlaq *i* Nasiri. The first Persian handbook of Sufism was composed toward 1050 by Hujviri of Ghazni; 'Abd Allah Ansari of Herat (d. 1089) wrote down his *Munajat* or private litanies in charming rhymed prose interspersed with poetry. Mohammed Ghazali whose main output in the fields of jurisprudence, theology and mysticism was in Arabic, enriched Persian literature with his *Kimiya i* sa'adat on the mystical life and doctrine. His brother Ahmad Ghazali (d. 1126) wrote a beautiful essay on the theme of the Lover and the Beloved. and Suhravardi Maqtul (executed in 1191) composed a series of mystical allegories in Persian in addition to his many Arabic books. These are but a few titles out of a very extensive literature, including in the 19th century, the writings of the Babis and Baha'is.

THE MODERN PERIOD

In the 19th and the first half of the 20th century western thought and the demand for social and constitutional reform had their effect on Persian literature. The first signs of a new spirit may be traced back as far as Qa'im-Maqam Farahani (d. 1835), a vigorous stylist in prose and verse. and Amir Kabir (d. 1852). The idea of the novel as an instrument of social criticism sprang from Hajji Baba (1824) by James Morier (*q.v.*), which when first

translated into Persian (by Ahmad i Kirmani, Calcutta, 1905) passed muster for some time as an original composition. It was under the influence of this work that Zain al- 'Abidin (d. 1910) wrote his searing *Siyahat-namah i Ibrahim Beg.* Translations of foreign romances, such as the works of Alexander Dumas, Jules Verne and Jurji Zaidan, stimulated the growth of the historical novel celebrating the splendour of ancient and medieval Iran; mention may be made of the *Dastan i Shams u Tughra* of Mohammed Baqir Khusravi (1909), the *Ishq u sultanat* of Musa Nathri (1919) and the *Dam-gustaran* of San 'ati-zada (1920–25). The first successful experiment with the short story was made by Jamalzada in his *Yaki bud yaki nabud* (published in Berlin, 1922); his lead was followed by many writers, of whom the most noted are Mohammed Hijazi (b. 1900, who also composed plays, essays and novels), Buzurg 'Alavi (b. 1908), Sadiq Chubak, Jalal Al i Ahmad and above all Sadiq Hidayat (d. 1951). The last-named author, who was a learned antiquarian and folklorist, came into great prominence as the inventor of the "new style" which brought into literature many words and idioms previously current only in colloquial speech. His most famous novel *Bufi kur (The Blind Owl)*, translated into English and French, attracted wide interest. The followers of this fashion were generally left wing in politics, and their writings provoked much controversy.

The work of the first modernist poets, such as Adib i Pishavari (d. 1930), Adib al-Mamalik (d. 1917) and Iraj-Mirza (d. 1926), although important, was overshadowed by that of later writers. The earliest revolutionary poet was 'Ishqi, murdered in 1924; the latest was Lahuti (d. 1957), who spent the latter half of his life in the U.S.S.R. The most eminent of the "conservative" poets mere Malik al-Shu'ara, mentioned above, and the remarkable woman writer Parvin i I'tisami (d. 1941). Though Sir Mohammed Iqbal (d. 1938) was an Indian, his Persian poetry has been accepted into the canon of the national literature. Many poets rose to prominence after World War II, among them Parviz Natel Khanlari (b. 1914, editor of the literary magazine *Sztkhan),* Mohammed Hussein Shahriyar (b. 1904), Gulchin, Fereydun Tavallali (b. 1917) and Yasimi. Their work exhibited the increasing influence of western contemporary styles.

The extent of the modern renaissance of Persian letters is strikingly shown by the remarkable advance in book production. Not only were the Persian classics being edited in a scholarly manner—and much credit for this belongs to Mirza Mohammed of Qazvin—but a constant flow of original writings came from the presses in elegant and attractive print. The output was all the more astonishing since the reading public was still severely restricted by the low literacy figures, which, however, progressively rose as new schools and colleges were built.

The Press.—An important part in the modern literary movement has been played by the press, which has provided a forum for political and sociological discussion, for new literary criticism and for poetry on political and other new themes. The first Persian newspaper in Teheran appeared in the reign of Fath 'Ali Shah (1797–1835). Certain organs founded abroad by exiles or expatriates exercised real political influence during the long years of struggle for a modern constitution; Istanbul, Calcutta, Cairo, Paris, London and Berlin all contributed at various times and in various ways. After the revolution of 1905–08 newspapers proliferated in Persia itself, and the number of titles runs into hundreds; the competition of wireless did not sensibly diminish the flow.

From the purely literary standpoint, the press rendered the language more pliant, simple and popular. Daily papers revealed the talents of 'Xli Akbar Dakhau (d. 1956), good poet and excellent reporter imitating in his satires the humorous speech of the bazaars; the poet laureate Malik al-Shu'ara' Bahar (d. 1951); and many others. Magazines, especially those devoted to literature and social comment, were also produced in great numbers, some fugitive and some more firmly established; through this medium many essayists and writers of short stories first appeared before the public. The Persian press had by the mid-20th century become as competent and influential as that of any comparable country.

BIBLIOGRAPHY.—The most complete survey of Persian literature is E. G. Browne's, *A Literary History of Persia,* 4 vol., 2nd ed. (1929). Other comprehensive surveys are C. A. Storey, *Persian Literature: a Bio-bibliographical Survey,* vol. i, 2 parts (1954) and Zabihollah Safa, *Tarikh i adabiyat dar Iran,* 2 vol. (1956–57). The Persian literature of India is fully described by Muhammad Abdu'l Ghani in *A History of Persian Language and Literature at the Mughal Court,* 3 vol. (1929–30) and *Pre-Mughal Persian in Hindustan* (1941). An extensive account of Persian poetry is Shibli Nu'mani's *Shi'r al- Ajam,* 5 vol. (1907–1924), and the development of Persian prose style is traced by Muhammad Taqi Bahar in *Sabk-shinasi.* 3 vol. (1940–1944). Shorter works include I. Pizzi, *Manuale di Letteratura persiana* (1887) and *Storia della poesia persiana,* 2 vol. (1894); P. Horn, *Geschichte der persischen Litteratur* (1901); A. E. Krymski, *Istoriya Persii, yeya literatury i dervisheskoi theosofii,* 3 vol. (1906–1917); R. Levy, *Persian Literature* (1923); and A. J. Arberry, *Classical Persian Literature* (1958).

Among anthologies of Persian literature in translation are H. Massé, *Anthologie persane* (1950); A J. Arberry, *Persian Poems* (1954). Most of the foregoing works contain extensive bibliographies which may be consulted for further details on individual schools and authors.

(V. F. M.; A. J. Ay.)

PERSIGNY, JEAN GILBERT VICTOR FIALIN, Duc de (1808–1872), French statesman, was born at Saint-German Lespinasse (Loire) on Jan. 11, 1808, the son of a receiver of taxes. A strong Bonapartist, he planned the attempt on Strasbourg in 1836 and that on Boulogne in 1840; he took a prominent part in securing the election of Louis Napoleon to the presidency.

Persigny plotted the restoration of the empire, and was a devoted servant of Napoleon III. He succeeded Morny as minister of the interior in January 1852, and later became senator. He resigned office in 1854, being appointed next year to the London embassy, uhich he occupied (but for a short interval, 1858–59) until 1860. when he resumed the portfolio of the interior. The growing influence of Rouher caused his resignation in 1863, when he received a dukedom. He tried in vain to see Napoleon before his taking command in 1870, and the breach was widened when both were in exile. Persigny died at Nice, Jan. 11, 1872.

BIBLIOGRAPHY.—*Mémoires du duc de Persigny,* ed. by *H.* de Laire d'Espagny, his former secretary, 2nd ed. (1896); Delaroa, Le *Duc* de *Persigny,* a eulogistic life (1865); and Emile Ollivier's *Empire libéral* (1895).

PERSIMMON, the English name for the trees and fruit of the botanical genera *Diospyrus.* The oriental persimmon *D. kaki* is an important fruit in China and Japan where it is known as kaki. It was introduced into France and other Mediterranean countries in the 19th century and grown to a limited extent there. Introduced into the United States a little later, it is grown commercially on a small scale in California. It is grown throughout the gulf states of the U.S., mainly in home gardens. The fruit is 2 to 3 in. or more in diameter, yellow to red in colour, somewhat resembling a tomato in appearance. The trees will tolerate winter temperatures only to about 0° F.

The native American persimmon *D. virginiana* is a small tree, occasionally up to 40 ft. in height, and is native from the gulf states north to central Pennsylvania and Illinois and from the Atlantic coast west to the prairies. The fruit is 1 to 2 in. in diameter, usually rather flattened, and dark red to maroon in colour. Most fruits contain several rather large, flattened seeds. Until soft ripe, the persimmon is extremely astringent. When the flesh has become fully soft, the astringency disappears and the fruit develops a rich flavour. Considerable quantities are gathered from the wild and utilized. **A** number of superior kinds have been named and propagated to a limited extent, but are not grown commercially. (J. R. Mag.)

PERSIS (mod. Fars; *q.v.*), the southwestern part of Iran (Persia), named from the inhabitants, the Iranian people of the Pārsa (Fars); their name was pronounced by the Ionians *Persai,* with change from a to e, and this form has become dominant in Greek and in the modern European languages. The natural features of Persis are described very exactly by Nearchus, the admiral of Alexander the Great (preserved by Arrian *Indic.* 40 and Strabo xv, 727). The country is divided into three parts, of very different character and climate: the coast is sandy and very hot, without much vegetation except date palms; it has no good harbours, and the climate is very unwholesome; the population is

scanty. About 50 mi. from the coast rise the chains of the mountains, through which some steep passes lead into the interior valleys (called κοίλη Περσίς, Strabo, xv, 729), which lie about 5,000 ft. above the sea. There the climate is temperate, the country watered by many rivers and lakes. the soil fertile, the vegetation rich, the cattle numerous. These regions, which were thickly populated, form the real Persis of history. "This land Persis." says Darius, in an inscription at Persepolis. "which Ahuramazda has given to me, which is beautiful and rich in horses and men, according to the will of. Ahuramazda and myself it trembles before no enemy." The third part is the north, which belongs to the central plateau, still much higher, and therefore rough and very cold in the winter. Toward the northwest it borders on the Median district of Paraetacene (about Isfahan); toward the north and northeast it soon passes into the great desert, of which only the oasis of Yezd (*q.v.*) (*Isatichai* in Ptolem, vi, 4, 2) is inhabitable. In the east, Persis proper is separated by a desert (Laristan) from the fertile province of Carmania (Kerman), a mountainous region inhabited by a Persian tribe. To Carmania belonged also the coast. with the islands and harbours of Hormuz and Bandar Abbas. In the west Persis borders on the mountains and plains of Elam or Susiana. For the ancient topography *cf.* Tomaschek. "Beiträge zur historischen Topographie von Persien," in *Sitzungsber.* der Wiener Akademie, *phil. Cl.* cii, cviii, cxxi.

The Persians are not mentioned in history before the time of Cyrus; the attempt to identify them with the Parsua, a district in the Zagros chains south of Lake Urmia, often mentioned by the Assyrians, has been argued. Herodotus i, 125, gives a list of Persian tribes: the Pasargadae (at Murghab), Maraphii, Maspii, Panthialaei (in western Carmania), Derusiaei, Germanii (*i.e.,* the Carmanians) are husbandmen. the Dahae (*i.e.,* the "enemies.!' a general name of the rapacious nomads, used also for the Turanian tribes), Mardi. Dropici, Sagartii (called by Darius Asagarta, in the central desert; cf. Herod. vii, 85) are nomads. The kings of the Pasargadae, from the clan of the Achaemenidae. had become kings of the Elamitic district Anshan (probably in 596, *cf.* CYRUS). When. in 553, Cyrus, king of Anshan, rebelled against Astyages, the Maraphians and Maspians joined with the Pasargadae; after his victory over Astyages all the Persian tribes acknowledged him, and he took the title of "king of Persia." But from then only the inhabitants of Persia proper were considered as the rulers of the empire, and remained therefore in the organization of Darius free from taxes (Herod. iii. 97). Carmania. with the Sagartians, the Utians (called by Darius *Yautiya*), and other tribes, formed a satrapy and paid tribute (Herod. iii, 93); the later authors therefore always distinguished between Carmania and Persis. Names of other Persian tribes, partly of doubtful authority. are given by Strabo xv, 727,[1] and Ptolem, vi, 4 and 8.

The Persians of Cyrus (see PERSIA: History) were a vigorous race of husbandmen. living in a healthful climate, accustomed to hardship. brave and upright. Many stories in Herodotus (especially ix, 122) point the contrast between their simple life and the effeminate nations of the civilized countries of Asia. They were firmly attached to the pure creed of Zoroaster (cf. Herod. i, 131 sqq. and the inscriptions of Darius).

When Darius had killed the usurper Smerdis and gained the crown, a new usurper. Vahyazdata, who likewise pretended to be Smerdis, the son of Cyrus, rose in Yautiya, but was defeated in two battles by Darius's generals and put to death (Behistun inscription). Cyrus had built his capital with his palace and tomb, in Pasargadae (*q.v.*). Darius founded a new city about 30 mi. farther south on the left bank of the Pulwar, near its confluence with the Kur, with a large terrace, on which his magnificent palace and that of his son Xerxes were built. As Pasargadae was named after the tribe in whose district it lay, so the new capital is by the Persians and Greeks simply called "the Persians"; later authors call it Persepolis (*q.v.*), "the Persian city."

Both in Persepolis and Pasargadae large masses of gold and silver from the tribute of the subject nations were treasured. as in Susa and Ecbatana. Rut Persis lies too far off from the centre of the Asiatic world to be the seat of government. Like Arabia and similar countries. it could exercise a great momentary influence in history and produce a sudden change throughout the world; but afterward it would sink into local insignificance. So the Persian kings fixed their residence at Susa, which is always considered as the capital of the empire (therefore Aeschylus wrongly considers it as a Persian town and places the tomb of Darius there). After the reign of Xerxes. Persis and Persepolis were used only for special, mostly ceremonial, occasions and certain palaces in Persepolis remained in part unfinished. But the national feeling of the Persians remained strong. When Alexander had won the victory of Arbela. and occupied Babylon and Susa, he met (in the spring of 330) with strong resistance in Persia, where the satrap Ariobarzanes tried to stop his progress at the "Persian gates," the pass leading up to Persepolis. There Alexander set fire to the cedar roof of the palace of Xerxes as a symbol that the Greek war of revenge against the Persians had come to an end. Our best information tells us that he soon had the fire extinguished (Plut. *Alex.* 38); the story of Thais is a pure fiction, and we may well believe that he repented the damage he had done (Arrian. vi. 30, 1).

Alexander had planned to amalgamate the former rulers of the world with his Macedonians; but his death was followed by a Macedonian reaction. Peucestas, the new satrap of Persis, followed the example of Alexander, and thus gained a strong hold on his subjects (Diod. xix. 48); nor did Seleucus. to whom the dominion of the east ultimately passed (from 311 onwards), disdain the aid of the Persians; he is the only one among the Diadochi who retained his Persian wife, Apame, daughter of Spitamenes. Seleucus and his son Antiochus I Soter tried to introduce Hellenism into Persis. Of Greek towns which they founded there we know Alexandria in Carmania (Plin. vi 107; Ptol. vi 8, 14; Ammian. Marc. 23, 6, 49), Laodiceia in the east of Persis (Plin. 6, 115), Stasis, "a Persian town on a great rock, which Antiochus, the son of Seleucus, possessed" (Steph. Byz. *s.v.*), Xntiochia in Persis, founded apparently by Seleucus I and peopled by Antiochus I with immigrants called together from all Greece, as we learn from a *psephisma* passed by "boule and demos" of this town in 206 in honour of Magnesia on the Maeander. But at the same time we find in the centre of Persis in the district of Istakhr (the town which succeeded Persepolis) a local dynasty with Persian names (Bagadates I, Vahuberz, Artakhshatr, Autophradates I), and the still unexplained title Fratadara. On their coins in Aramaean Pehlevi which begin about 250 B.C., they have Persian features and wear the headdress of the satraps; on the reverse is the fire altar with the image of Ahuramazda hovering above it and the standard of the empire. They must have been recognized as vassals by the Seleucids; but a story preserved by Polyaenus (vii 30) narrates how one of them, Oborzos (Vahuberz), allured 3,000 settlers (evidently Greek settlers) into a fertile plain and annihilated them at night. Another story (Polyaenus vii 39) relates how, in the same way, a general of Seleucus (evidently Seleucus II 247–225) destroyed 3.000 Persian rebels with his Macedonian and Thracian troops. Thus the Seleucid supremacy was restored, but the dynasty of the Fratadaras was suffered to continue. When in 221 Molon, the satrap of Media, rebelled against Antiochus III, his brother Alexander, satrap of Persis, joined him, but they were defeated and killed by the king. Persis remained a part of the Seleucid empire down to Antiochus IV Epiphanes, who at the end of his reign restored once more the authority of the empire in Babylonia, Susiana and Persis; perhaps a battle, in which the satrap Numenius of Mesene (southern Babylonia) defeated the Persians on the shore of Carmania on sea and land (Plin. vi 152), belongs to this time. But after the death of Antiochus IV (164) the Seleucid empire began to dissolve. While the central provinces, Media and northern Babylonia, were conquered by the Parthians, Mesene, Elymais and Persis made themselves independent.

Persis never became a part of the empire of the Arsacids, although her kings recognized their supremacy when they were

[1] To the Pateiskhoreis belongs the lance-bearer of Darius, "Gobryas (Gaubaruva) the Pâtishuvari," mentioned in his tomb inscription they occur also in an inscription of Esarhaddon as Patushara, east of Media, 'in Choarene at the Caspian gates; the Kyrtii are the Kurds.

strong (Strabo xv 728, 736). From the *Periplus of the Erythraean Sea* (33–37) we learn that their authority extended over the shores of Carmania and the opposite coasts of Arabia. On their coins they now wear Parthian dress and have the title of king (written *malkâ*, pronounced *shdh*). Among their names we find Darayav (Darius), probably the founder of a town, Darabjird, in southern Persia, his son Artaxerxes (according to a fragment of Isidore of Charax in Lucian, *Macrob.* **15**, murdered by his brother Gosithres at the age of 93 years), Narses, Manucihr and others. From the traditions about Ardashir I we know that at his time there were different petty kingdoms and usurpers in Persis; the principal dynasty is by Tabari called Bāzrangi. The coins demonstrate that Hellenism had become quite extinct in Persis, while the old historical and mythical traditions and the Zoroastrian religion were supreme. It is highly probable that at this time the true form of Zoroastrianism and the sacred writings were preserved only in Persis, whereas everywhere else (in Parthia, in the Indo-Scythian kingdoms of the east and in the great propagandist movement in Armenia, Syria and Asia Minor, where it developed into Mithraism) it degenerated and was mixed with other cults and ideas. So the revival of Zoroastrianism came from Persis When Ardashir I the son of a king of Istakhr began to subdue the other Persian dynasts and in A.D. 224 defeated and slew the Parthian king, Artabanus, his aim was religious as well as political. The new Sassanid empire which he founded enforced the restored religion of Zoroaster (Zarathushtra) on the whole of Iran.

The new capital of Persis was Istakhr on the Pulwar, about 9 mi. above Persepolis, now Hajjiabād, where already the predecessors of Ardashir I had resided. It was a great city under the Sassanids, of which some ruins are extant and was important also in early Islamic times. But it shared the fate of its predecessor; when the empire was founded the Sassanids transferred their headquarters to Ctesiphon. (ED. M.; X.)

PERSIUS (in full, AULES PERSIUS FLACCUS) (A.D. 34–62), Latin poet whose satires, written under the influence of Stoic philosophy, reach a higher moral tone than any other work of their kind in classical Latin literature and are also remarkable for the author's individual use of language. According to the *Life* attached to his poems in the manuscripts, Persius was born at Volaterrae in Etruria (hence his Etruscan name Aules, often latinized as Aulus), of a family of equestrian rank. Having lost his father when he was about six years old and his stepfather a few years later, he went to Rome at the age of 12 to study under Remmius Palaemon and the rhetorician Verginius Flavus. At the age of 16 he began a close friendship with the Stoic philosopher L. Annaeus Cornutus, whose pupil Lucan was also to show himself to be a generous admirer of all that Persius wrote. Another friend from his early youth was the lyric poet Caesius Bassus, and his friendship with Thrasea Paetus (whose wife Arria was a relative of his) lasted for some ten years. Later he met the younger Seneca, but was not attracted by his mind.

His reading of the tenth book of Lucilius revealed to Persius his vocation, and he began to write his own book of satires. He wrote slowly, however, and left his book unfinished at his premature death. Cornutus then suppressed all that Persius had written except the book of satires, in which he made some slight alterations before handing it over to Bassus for editing. On publication, it had an immediate success.

Persius is said to have been gentle in disposition, girlishly modest, good-looking and affectionately devoted to his mother, sister and aunt. To his mother and sister he left a considerable fortune.

The six satires, which amount only to 650 lines, are composed in hexameters; but what appears as a prologue, in which the poet ironically asserts that he writes to earn his bread, not because he is inspired, is in choliambics.

The first satire, which censures the literary tastes of the day as reflecting the decadence of national morals (this theme is not unlike that of Seneca in *Epistulae morales*, 114), contains a vivid description of a poet reciting his own work, a scathing account of literary conversation at a dinner party and an interesting passage deriding specimens of bland mythological writing and languishing style. Here Persius writes real satire, treating what he himself has seen with understanding. whereas the remaining five satires in his book are in fact philosophical discussions on themes often handled by Seneca. Satire ii discusses what we may justly ask from the gods; satire iii, those who live wrongly though they know the right and those who have not been enlightened by philosophy; satire iv, the necessity of self-knowledge for public men (*cf.* Plato. *Alcibiades I*); satire v, the Stoic doctrine of freedom (introduced by friendly allusions to the teaching of Cornutus); and satire vi, the proper use of money.

In earnestness and moral purpose Persius rises far above the political rancour or good-natured persiflage of the earlier Roman satirists on the one hand and the rhetorical indignation that Juvenal was later to display on the other. He seems, as it were, a forerunner of the great Christian apologists. His thought, however, is often very difficult to follow. and the meaning of his powerful expressions is sometimes far from clear. He seeks brevity at all costs, and he is clumsy in his management of dialogue so that it is often hard to know where one speaker is supposed to leave off and another to begin. Frequently his metaphors are strained and his colloquialisms jarring. He takes not only characters but also whole phrases, thoughts and situations from Horace, despite his great difference from Horace in ideals, temperament and technique.

Yet Persius can write with natural simplicity and genuine eloquence (as in ii, 61–75; iii, 23–43; and v, 26–29) and occasionally has passages memorable for their realism or for their metaphor: for instance, *nescit quid perdat et alto Demersus summa rursus non bullit in unda* (iii, 33–34: "he does not know what he is losing and, drowned in the depths, sends not a bubble back to the surface") or *dum veteres avias tibi de pulmone revello* (v, 92: ". . . while I pluck your old grandmother's notions from your breast").

The *Life* states that before the publication of the book of satires some lines were removed from the end so that it should appear to have been completed; this may mean that an unfinished sentence or paragraph had to be omitted. Cornutus is also said to have suppressed an offensive allusion to the emperor Nero's literary taste, changing the original *auriculas asini Mida rex habet* ("King Midas has ass's ears") to *auriculas asini quis non habet?* ("Who has not ass's ears?"; i. 121).

BIBLIOGRAPHY.—Modern editions of the satires: S. G. Owen, 2nd ed. (1908; with Juvenal); O. Jahn, 4th ed., rev. by F. Leo (1910; with Juvenal); S. Consoli, 2nd ed. (1911); G. G. Ramsay, with Eng. trans. (1918); and W. V. Clausen (1956). Editions with commentaries include: I. Casaubon (1605; new ed. with additions by F. Dübner, 1833); O. Jahn, with scholia (1843); C. F. Heinrich (1844); B. L. Gildersleeve (1875); J. Conington, rev. by H. Nettleship, with Eng. trans. in prose, 3rd ed. (1893); G. Némethy (1903); J. van Wageningen, with Dutch trans. (1911); F. Villeneuve (1918); and N. Scivoletto (1956). English verse translations: John Dryden (1693); and J. Tate (1930).

PERSON, OFFENCES AGAINST THE. This expression is used in English law to classify crimes involving some form of assault or personal violence or physical injury, *i.e.*, offencesaffecting the life, liberty or safety of an individual: but it is also extended to certain offences which cannot technically be described as assaults, such as criminal libel. The bulk of the offences thus classified, so far as their definition or punishment depends upon statute law, are included in the Offences Against the Person Act 1861, in the Criminal Law Amendment Acts, and in the Children Act 1908. The classification in these statutes is not scientific. The particular offences dealt with by the acts above named are discussed under their appropriate titles, *e.g.*, abortion,

assault, bigamy, homicide, rape, etc. In the Indian penal code most of the offences above referred to fall under the head "offences against the human body." In his *Digest* of *the* ***Criminal Law*** Sir James Stephen includes most of these offences under the title "offences against the person, the conjugal and parental rights and the reputation of individuals."

United States.—In the United States, such crimes as fall under the classification of offences against the person in England, are crimes by common law or statutes in the different States, but sometimes without any such general classification in the statutes.

PERSONAL ACCIDENT INSURANCE: **see** CASUALTY INSURANCE.

PERSONALITY. In defining personality the psychologist employs the two indispensable ideas of integration and uniqueness. While the various other concepts and principles of psychology refer to one or another segment of behaviour, personality invariably signifies, for one thing, the functinning of the whole person, and, for another, the unique organization of the individual that distinguishes him from his fellows. In accounting for a personality it therefore becomes essential to know how the person, in expressing his needs and his social relationships, functions as a recognizable unity with distinctive traits, drives, attitudes and habits which enable or prevent his attaining an adequate adjustment to his environment and to himself.

In the early 19th century James Ward in England stressed the individualistic orientation of the psychology of personality; in Germany, Wilhelm Stern adopted a similar standpoint in his personalistic approach. In conventional psychology textbooks personality is placed at the top of the conceptual hierarchy: the lower-order concepts lead systematically to "personality" as the most complex and inclusive.

There is a point of view, dating from about 1950, according to which personal experience is only one aspect of psychology; other aspects refer to other levels of behaviour. From this standpoint "psychology" would have to be replaced by the collective phrase "behavioural sciences" or, more simply, by the single term "humanics." Thus a reflex action, such as the blink of the eyelid in response to a sudden visual stimulus. would be regarded as behaviour at the physiological or neurological level, whereas a marked like or dislike of some other person, say a brother or sister, would fall directly within the domain of "personality" (more strictly. psychodynamics or idiodynamics; *see* below).

There is no unanimity of thought regarding personality in subhuman organisms, though, on the whole, psychologists tend to reserve the term, with or without sufficient justification, for the human species. Character (q v.), as distinguished from personality, usually involves moral and other normative judgments. It is therefore used only sparingly in U.S. psychology, although in European writing the term often is equated with "personality." Values, like any other data, are for the scientist a part of nature. Good and bad (as qualifiers of character, etc.) are always to be designated as belonging to a specific ethical frame of reference, not necessarily that of the observer or his social group.

Observation *v.* Explanation.—To find one's way in this area of scientific research one must keep constantly in mind the difference between observation and explanation. There are, on the one hand, data observed and reported and, on the other, concepts or theories set forth for explanatory purposes. While the concepts usually are presented as derived from observed data. as often as not the particular data selected for observation reflect the observer's theoretical bias. Progress in this field is a matter of gradually achieving, through continuous experimentation, a core of concepts that can be generally accepted and a related set of observational methods. In the process of attaining this end. hypothetical constructs must be freely entertained; otherwise it would not be possible to draw broad and significant inferences from a limited number of observations. At the same time techniques for gathering data must be fully exploited and new methods constantly devised. Only in this way will a body of agreed-upon theory be achieved eventually. Hence in this account the methods of observing personality will first be described, followed by a survey of personality theory.

METHODS OF OBSERVATION

Methods of observation may be conveniently divided into subjective, objective and projective. In brief, the subjective methods aim to evaluate what has been called opinion behaviour—what the subject believes about himself or others; the objective methods stress overt behaviour—the gross verbal, physical and social responses made unself-consciously in adaptive situations; the projective methods tap the implicit (unconscious) aspects of personality—those motor, perceptual and dynamic sets or trends that enter into the subject's every response, particularly affective or emotional ones. These three approaches are not, however, as mutually exclusive as the abbreviated exposition below may seem to imply. In actual practice they overlap. In expert application, for purposes of clinical diagnosis or experimental research, their overlapping in the given case reflects the unique organization of the subject's personality.

Subjective Methods.—In the subjective methods the subject himself discloses what he knows about himself. He makes himself an object of observation and reports his finding to the psychologist. Among the techniques used here are: the autobiography, elements of the life or case history, some types of interview and the so-called inventory method in which the subject reports about himself on a standardized questionnaire or check list. That these self-reports have the advantage of direct relevance and broad scope—who should know better than the person himself or have access to more facts about him than he does?—is readily appreciated; but these advantages are obviously counterbalanced by conscious or unconscious deception of self and others. It is therefore essential to include in such subjective methods control or stabilizing devices that help to identify at least the more obvious deceptive reports.

Objective Methods.—The objective methods of observation depend not upon the subject's own statements about himself but upon his overt behaviour as revealed to others who serve as examiners, observers or judges. Here are included not only verbal behaviour but physiological responses (blood pressure, heart rate, etc.), which may be recorded by special instruments, and adaptive or expressive physical or social responses (*e.g.*, intelligence tests). Objective observations may be made in the natural state (*e.g.*, the interview) by attending less to what the subject says about himself and more to his nonverbal, adaptive responses such as his stance, the amount rather than the content of his verbalization, nervous manifestations such as fidgeting, etc. Again, miniature life situations may be created in the laboratory for the single individual or for small groups that interact with each other under conditions defined by the investigator. Sometimes such observations are made through one-way observation screens or mirrors, and cinematic records of these observations may be obtained. Microphones may also be used to record verbal responses.

As will be noted, even in such objective methods of observation as those just described the verbal response of the subject may still play an important part. The difference between these records and the self-reports mentioned among the subjective methods lies in the treatment of the obtained data. In the objective approaches the verbal behaviour of the person is not necessarily construed at its face value. Instead it is treated much like any other behaviour; *e.g.*, movements of the limbs or of the internal organs. In such a frame of reference the verbal output of the subject is analyzed quite apart from his own conscious intent to communicate information about himself. The subject has merely behaved in a certain way under the given stimulating conditions. The quantity, form and content of his utterances may then be submitted to measurement and analysis. In the second quarter of the 20th century new techniques for the systematic analysis of verbal behaviour were contributed by a group of specialists devoted to the fields of semantics and information theory. (*See* also SEMANTICS; INFORMATION THEORY.)

Projective Methods.—The projective methods of appraising personality differ from both the subjective and the objective by approaching personality indirectly. Neither the person himself nor the examiner takes the subject as an object of direct observation; instead the subject is requested to behave in an offhand man-

ner—merely to exercise his imagination, to let himself go without self-criticisms or adaptive intent. In other words, he is encouraged to "project" himself and thus to reveal the implicit or unconscious content of his personality. The earliest of the projective methods employed on a systematic basis was that of word association, introduced by Francis Galton in 1879. Stimulus material is provided by individual words to which the subject responds with the very first word that comes to his mind as he hears the stimulus (see also ASSOCIATION, MENTAL). Sigmund Freud modified Galton's word association method into the free association technique for analyzing dreams, etc., as an aid to psychotherapy and personality research. Here the person responds to his own previous responses, *e.g.,* images from his own reported fantasies or dreams. In the ink blot method of Hermann Rorschach the subject is asked to tell what the blots look like to him. Responses provide clues to the subject's usual perceptual approach to real objects in terms of his habits, interests, needs and abilities. Another projective method is the Thematic Apperception test, in which the subject is invited to tell stories in response to pictures that he is shown. Finally may be mentioned the Rosenzweig Picture-Frustration study. Cartoonlike drawings that portray a series of everyday frustrating social situations serve as the stimuli for the subject, who is asked to supply (in the blank caption box above the head of the frustrated person) the first verbal response that comes to mind. As will readily be seen, all these projective techniques encourage the person to respond in terms of his own bias, with a minimum of external stimulation, since their common aim is to assay that bias. The methods of assessing personality are discussed in detail in PSYCHOLOGICAL TESTS AND MEASUREMENTS: Tests of Personality and Temperament.

STRUCTURE OF PERSONALITY

Observational methods having thus been surveyed, it is now in order to consider representative concepts that have been used for purposes of explanation or prediction. These range from the physiological or organic to the phenomenological or purely psychological.

PERSONALITY TYPES

The concept of personality type makes two assumptions: (1) that personalities are divisible into two or more groups each of which excludes the other and (2) that in each type are to be found certain mutually dependent and interrelated traits or patterns of response that can be inferred from each other. This theory has an obvious appeal because of its simplicity. As a result of experience and experiment, however, the view, while still having its adherents, is rarely entertained in its simple form. Even as abstractions personality types have a very limited usefulness and often contribute more to prejudice and to hasty generalization than to sober judgment or real knowledge.

Humoural Types, **Temperament** and the Endocrines.—Historically, type theories go back to Galen with his four humours—blood, phlegm, choler (yellow bile) and melancholy (black bile)—from which the four temperaments—sanguine, phlegmatic, choleric and melancholic—were derived. While this essentially pre-Socratic humoural psychology was long ago abandoned, the words denoting the four types have been absorbed into occidental language. Moreover, the essential idea that bodily disposition, or perhaps even predisposition, determines difference in temperament still has its exponents. The humours themselves have been replaced by the secretions of the endocrine glands.

Personality is an organismic unity, embracing both physiological and psychological manifestations. Biological maladjustments can lead to serious disturbances in the mental and emotional life of the person, and, conversely, mental upsets can disturb physiological functioning. Both the autonomic nervous system and the endocrine glands participate in such control. For example, overactivity of the thyroid gland results in nervousness, irritability and insomnia, in addition to the usual physical symptoms. Underactivity of the thyroid will bring about sluggishness, apparent mental deficiency, indifference to emotional stimuli, and so on. Again, the endocrine secretions of the sex glands have much to do with typical masculinity and feminity of personality as well as physique. Boys showing emotional and recreational interests below those typical of their chronological age have increased markedly in maturity upon receiving injections of male hormone. The pituitary, parathyroids and adrenals also affect personality traits (see also ENDOCRINE GLANDS). Various studies have attempted to relate phases of blood chemistry, such as acid-base balance, calcium-potassium ratio and sugar tolerance, to personality variables. While some of the experiments have returned encouraging results, none can be said conclusively to have proved a correlation between the physical and the psychological measurements. It must be emphasized that the positive findings with respect to endocrine glands relate mainly to instances in which glandular function was distinctly above or below normal. Interpretations of normal personality trends in terms of endocrine function must in the 1960s be regarded as highly speculative. A similar restriction applies to the data with respect to autonomic nervous system function.

Morphological or Physical Types.—A second chief theory of types depends upon the conformation of the human body—of its component parts or tissues. These morphological or physical types are then regarded as giving rise to, or being correlated with, types of personality. This theory is found in general terms as early as Hippocrates in Greece. In the 19th century a notable contribution was made in France by L. Rostan, who distinguished digestive, muscular and cerebral types. Around 1885 A. de Giovanni founded his school of clinical anthropology in Padua. His pupil G. Viola, utilizing the earlier work of the German Friedrich W. Beneke, and Viola's pupil S. Naccarati conducted detailed anthropometric studies with specified indexes for measuring the dimensions of physique and relating them to each other. The German psychiatrist. Ernst Kretschmer (*q.v.*) at about the same time nas led by his work with mental patients to develop a threefold physical classification: pyknic. asthenic and athletic. The pyknic is characterized by a broad trunk and relatively short limbs, round face. usually with a tendency to gain weight in middle age; the asthenic has a narrow trunk, shoulders and hips, long limbs, long narrow face and is generally lean; the athletic has broad shoulders and trunk, narrower hips, well-proportioned limbs and good muscular development. Kretschmer found a marked predominance of the cyclothymic temperament among pyknics; *i.e.,* they tended toward extremes of gaiety and depression. By contrast the asthenics were introverted, shy. serious and ranging in temperament from hypersensitive to phlegmatic and dull. This latter pattern he called schizothymic. The athletic physique was found to be intermediate in temperament. Kretschmer's views were attacked on the grounds, first, that it is impossible to classify most persons in any of his three physical groupings with any degree of accuracy and, second, that there are too many exceptions to the expected temperamental relationships when physical classification seems fairlv definite.

A considerable improvement on Kretschmer's work appeared in the research of W. H. Sheldon. In his approach the arbitrary classification of individuals into physical types was replaced by three ratings (on a seven-step scale) on three extreme physical patterns: the ectomorphic (resembling Kretschmer's asthenic), the mesomorphic (athletic) and the endomorphic (pyknic). Sheldon next reported three patterns of temperament (cerebrotonic, somatotonic and viscerotonic) and found that the physical and temperamental types agreed in a rather large proportion of cases. While this quantitative development might be expected to appeal to psychologists, Sheldon's conclusions have not been fully confirmed and have been looked upon with some doubt.

Psychological Types.—It was in psychiatry and philosophy that the third chief doctrine of types first emerged. As representative in the 20th century, the views of C. G. Jung and E. Spranger may be cited. Jung coined the terms introversion and extraversion to describe what he considered to be contrasting types.

Introversion was characterized as directing attention and interest inward, with a tendency to excessive daydreaming and introspection and to careful balancing of considerations before reaching a decision. Extraversion was characterized by outgoing-

ness in attention and interest, responsiveness to external stimuli, especially other persons, and impulsiveness. Recognizing that the postulation of only two types failed to do justice to the rich variety of observable patterns, Jung subdivided introverts and extraverts according to the relative dominance of four psychological functions — sensation, thinking, feeling and intuition. But subsequent research has placed most persons somewhere between the type extremes. The theory is useful mostly in calling attention to certain poles of personality and in providing a framework for noting certain trends.

Another widely influential type theory was that of E. Spranger. He began by emphasizing the "dominant value direction" of the individual and held that for purposes of analysis it was convenient to assume the existence of pure or ideal types, one corresponding to each of six major values: theoretical, economic, aesthetic, social, political and religious. This classification was developed into a scale of values by Gordon W. Allport, P. E. Vernon and Gardner Lindzey whereby, as in Sheldon's advance over Kretschmer, the subject is assigned a rating for each of the values.

Types, Traits and Factors

As is now apparent, the concept of types has a limited validity. Its two basic assumptions do not gain strong confirmation from empirical studies. These indicate that a "normal distribution," ranging from one extreme to the other, is likely to be found for any one trait associated with a supposed type, whereas the type concept assumes a piling up of subjects at the two extremes (bimodally). Again, while certain traits are found clustered together interdependently as the type concept implies, the organization is not always of one sort. The peculiar way in which each person has organized the traits of the so-called typed has not been taken into account.

For these reasons there has been a gradual shift from interest in types to interest in traits, singly and in their interrelationships. One of the most influential trait theories in the second quarter of the 20th century was that of G. W. Allport, who defined the trait as a psychophysical disposition acquired in the course of experience on the basis of a biological *Anlage*. Allport described traits as arranged in a hierarchy in the individual, some having a cardinal importance in relation to other subordinate ones. He strongly insisted on the existence of individual and even unique traits that might be found in only one person but still demanded to be included in any system of personality. He likewise stressed the individualized organization (congruence) of traits in every person —a view that contrasts with the universalized organization of traits in the type concept. This emphasis on individuality, adapted by Allport from Stern's personalistic psychology, was opposed by him to the exclusive interest of academic, experimental psychology in the generalized or average man. Following Wilhelm Windelband, Allport therefore wished to add the idiographic orientation to the nomothetic (universalized) orientation of general psychology. An almost simultaneous approach to traits developed in England, where Charles Spearman's work on human abilities, including intelligence, was applied to the field of personality. Important contributions were made there by Cyril Burt and later by Hans Eysenck, and by L. L. Thurstone, R. B. Cattell and J. P. Guilford in the United States.

Factor analysis is essentially a method of statistics, a branch of mathematics, employed for the systematic reduction of raw scores, obtained from a variety of tests, to a minimum number of basic elements. These latter are disclosed through the study of correlations between test scores. As applied to personality, the method begins with the administration of many tests to a group of subjects whose scores are then correlated. The correlation coefficients are next scrutinized to reveal which of the tests are presumably tapping similar or identical factors. Once the factor analysis has been completed it is possible to devise "pure factor tests" based not only on the crude knowledge that gave rise to the initial tests but on the refined knowledge disclosed by the factorial studies. It has been contended that factor analysis does not deliver what it claims: the factors derived by the method are held to depend too heavily on the original selection of tests, which are, of course, only a selection from a limitless number of possibilities; and, again, the factors themselves, once derived, have an uncertain psychological significance which is dubiously aided by the use of letters to designate them or by the arbitrary assignment of trait names that it is hard to justify on psychological, grounds. Moreover, the various exponents of factor analysis employ somewhat different mathematical procedures, especially in the critical last phases and, accordingly, bring forth different sets of factors among which it is no easier to choose than among more a priori personality theories. Finally, it has been argued, by Allport and others, that factor analysis does not allow for individuality; the technique radically assumes that all persons reflect a common mold.

To supplement the conventional method of factor analysis, in which scores on a group of subjects are correlated with each other test by test, an inverse method of factor analysis was introduced by Burt and developed by William Stephenson. In it persons, each of whom has achieved a variety of test scores, are correlated with each other. Such person-to-person correlation is, in a sense, a new expression of the earlier typologies, here reapproached on a more empirical — a sophisticated statistical — basis. Moreover, inverse factor analysis has been used not only for relating the several test scores of an individual subject obtained at any given stage, but, taking into account the variability of personality in time, it has been used to compare the assemblage of scores received at one time with those acquired at another. These novel efforts in the use of factor analysis to study individuality are, however, still controversial as to method and meaning.

BIOLOGICAL AND CULTURAL DYNAMICS

The concepts or inferred variables thus far considered refer primarily to the structure of personality — the patterns or other modes of organization that account for the several forms of behaviour that are recognizably personal. In contrast to this approach is one that stresses dynamics; *i.e.*, the forces or drives that direct the personality toward various ends and that secondarily may become attached to certain structures or patterns of function.

Psychoanalytic Theory

This dynamic orientation is, again, a very ancient one; classical writers, like Plutarch, who devoted themselves to biography or morals implicitly used some sort of dynamic theory of personality, and the same is even more obviously true of the great poets, dramatists and novelists of nearly every age. But the 20th century understanding of personality dynamics received fresh vigour and acquired a theoretical formulation from the writings of the psychologist Sigmund Freud, the founder of psychoanalysis. His interest in the raw, often fantastic data of experience in the individual case led Freud to explore not only dreams but other wayward and seemingly haphazard behaviour, such as slips of the tongue. Thus he developed the theory that both dreams and these other "lawless" or accidental acts were, like neurotic symptoms, the product of psychic determinism at an unconscious level. The concept of the unconscious became for him the basic one. Just as during sleep, when the ego is not on the alert, the nonconscious forces of personality come into obvious play, so, he asserted, they are present also in the waking state and at every weak point — in fatigue, emotional states and conflict — break through the conventional mask worn by the conscious ego. Much energy is expended by the ego to keep these untamed and unwanted elements of personality from gaining access to consciousness. It was, in fact. in the study of these mechanisms of ego-defense in the neuroses, particularly hysteria, that Freud first came to grips with the unconscious forces of personality *(see* also Ego; Defense Mechanisms). A few years later these initial studies were followed by his masterpiece *The Interpretation of Dreams* (1900). In psychoanalytic therapy the aim is to circumvent the ego-defenses by the method of free association in the presence of an analyst who permits and, in fact, encourages the patient to disregard in that setting the conventional social ameni-

ties. This therapy is a kind of re-education of the personality in which the repressed becomes expressed, the unconscious conscieus and the disintegrated integrated. While beginning with the neuroses and with dreams, Freud soon went on to apply the same methods of study and the same concepts to the history of civilization, to the various products of culture—religion, art, literature. etc.—and to the social practices of modern life. The influence of this theory of personality has been considerable, partly, no doubt, because it is itself a reflection of the period of social conflict and tension that contributed to its birth.

Freud based his study of personality on his medical background and hence tended to present his views as biological generalizations with universal application for homo sapiens wherever found. The unconscious drives of which he wrote and which he discovered in his patients were to him universal instincts modified, to be sure, by family upbringing and social education, but nonetheless rooted in the biology of man. The paradox is that, as compared with other psychiatrists of his time, Freud made much more of environmental factors than they and tended to oppose, by his insistence on psychotherapy, their fatalism. But subsequent criticism has tended to emphasize Freud's implicit belief in the fatalism of the' unconscious itself and of its inevitable repetition—as in the classical Oedipus Rex of Sophocles. which Freud invoked in naming the oedipus complex. True, the environment has power, it has an effectiveness in Freud's theories; infants can be fixated, adolescents are subjected to intolerable conflicts, etc., and neurosis results. But these influences of the culture are largely negative: they can misshape the personality by deflecting it from the biological goals to which it naturally strives. The positive shaping forces of the culture were scarcely considered in Freud's theories. He was alert to the negative features of religion, which he considered a group neurosis; of art, which he analyzed as a compromise expression of conflict in the artist's personality, etc. The more positive aspects of these cultural phenomena were neglected or ignored by him.

It became the major emphasis in the so-called neo-Freudian schools of Karen Horney, Harry Stack Sullivan (*qq.v.*) and Erich Fromm to compensate for Freud's overemphasis on universal biological forces in personality. In fact, many of Freud's concepts, particularly those concerned with sexuality, were repudiated or radically revised by them. The formative influences of culture have been studied and the findings of social anthropology (*q.v.*) have been invoked to support this newer orientation by showing that different cultures produce different effects on the personalities that develop within them. A healthful ferment has been added to the orthodox Freudian view. (See also PSYCHOANALYSIS.)

Social Influences on Personality

At this point it is in order to interrupt the exposition of the various concepts offered to explain personality by introducing a summary of general conclusions concerning the role of social influence in the formation and functioning of personality. One such conclusion concerns the importance of infancy in determining basic adult reactions. The child's first experience with any class of stimuli must inevitably have disproportionate significance for his future development. Foremost among such patterns are those concerned with attitudes of security and insecurity. If the child feels wanted, loved and understood, he will tend to be secure in social situations outside the home. Rejection in the family situaticn engenders insecurity and either withdrawal or hostility subsequently. If, again, the child learns to bow to firm authnrity in the home, his attitude toward firm governmental authority may become submissive. If, on the other hand, he is subjected to excessive or to inconsistent discipline and so rebels, he is likely to carry over similar rebellious attitudes into his relations with school teachers. employers and government.

The family is important in molding personality not only because so many parent-child relationships are prototypes of adult situations, but also because the child there unconsciously assimilates many attitudes and social expectations. Children are extraordinarily sensitive to vocal inflection, facial expression and other muscle tensions of which adults may be quite unaware. Sarcastic remarks about labour unions, Negroes, people who are too aggressive and those who are not ambitious enough have their effects on the child listener. The division of society into men v. women, bosses v. workers, leaders v. followers becomes sacrosanct to him and he develops a rigid concept of how people ought to act when they assume a certain role. Moreover, parents impose standards of behaviour by threats or punishment. Much of this learning goes on before the acquisition of language; *i.e.*, it is unconscious and deeply implanted. Sexual experimentation for example, is normal to young children, but severe punishment may cause the child not only to abandon habits of sexual play but also to forget (repress) that he ever thought of such acts.

The school system has a strong influence on the growing child's personality. Occasional arbitrary discipline. overrigid work assignments and the necessity for treating diverse individuals alike in crowded classes are examples of undesirable practices Good teachers, on the other hand, may become models whom the child will imitate. The content of education is also significant. Narrow, nationalistic, prejudiced teaching in history and social studies not only misleads the child but gives him an outlet for repressed hostility that tends to fixate his manner of thinking on a low level. Finally, the competitive system of grading, with its emphasis on invidious personal comparisons, is open to criticism.

Economic conditions have been shown to have a significant effect on the personalities of both children and adults. Poverty, for example, tends on the whole to distort personality development. The alleged beneficial effects of hardship have. for moralistic reasons, been largely overrated. To note this point is not to suggest that maladjusted personalities are never found in the upper economic brackets; obviously they are. But on a percentage basis the child in a better-class home has a better chance of reaching maturity with a well-balanced personality.

Values, ethics and character standards are all functions of social influence. With respect to these complex variables the child at birth appears to be a blank slate. Potentially he may be molded to satisfy his biological need for security by selfishly protecting his interests in the face of competition, or he may learn to gain the very same end by altruistically sharing aith and receiving from others. His later view of human nature and ethics will follow as a rationalization fitted, as verbalization becomes possible, to justify the unconsciously learned patterns of social behaviour. One thus sees that ideas of right and wrong, beliefs as to the proper ways of behaving socially, or gaining one's ends, etc., come originally from behaviour patterns that have been inculcated or have been acquired from observation and imitation of those in closest contact with the growing child. The improvement of the intimate environment and the education of children is therefore held to be one of the chief avenues for developing more mature personalities.

Experimental Psychodynamics

The cultural critique of Freud within psychoanalysis itself was supplemented by a critique on grounds of scientific method from the ranks'of academic psychology. Since Freud's findings were largely based on his clinical work with neurotic patients, it was reasonable to ask whether his concepts would stand up under experimental scrutiny, At the same time opportunity might be taken to probe the general applicability of Freud's theories to normal persons. (Freud himself regarded his theory as a psychology of the normal and the abnormal indiscriminately.) What resulted was not, however, merely a critique of Freud: it reflected the autochthonous conceptual orientation of the research centres that performed the experimental work and led to a development that may be conveniently called experimental psychodynamics. In most of these investigations the aim was to study personality with a dynamic theoretical basis borrowed from or based on the insights of Freud but intended to offer new and more rigorous concepts for handling the same psychological data.

Carl Jung (*q.v.*), who was for a time a close associate of Freud, conducted what may be regarded as the earliest studies in experimental psychoanalysis, presented in his book on the word associa-

tion method (1906). But the first concerted program of this sort was conceived and conducted at the Harvard Psychological clinic about 25 years later. In that laboratory, beginning around 1930. Rosenzweig instituted an experimental program devoted to the clarification of psychoanalytic principles such as repression. This work led to a set of concepts under the heading of frustration theory that took frustration as a key concept for analyzing personality dynamics. The program of research resulted in the construction of the Picture-Frustration study, mentioned above. By combining detailed investigations of biography and projective methodology with frustration theory, this view was later broadened to include growth and creativity in its theory of personality. Henry A. Murray, in another departure, formulated a theory of personality in which the concept of need was made pivotal. In collaboration with Christiana D. Morgan he developed the Thematic Apperception test, cited above. Through the use of a wide variety of experiments. tests and interviews, supplemented by a diagnostic council of the principal investigators who all worked with the same subjects, the effort was made both to fathom personality dynamics in the momentary cross section and to reconstruct in selected instances the longitudinal life history. The result appeared in Explorations in Personality (1938).

At the Yale Institute of Human Relations a research program was pursued with a different ground of conceptualization. Behaviourism (*q.v.*) was the point of view there prevalent, and concepts of learning (*q.v.*) theory played the crucial role in the work of this group (Clark Hull, John Dollard, Neal Miller, Robert Sears and O. H. Mowrer). An interpretation of aggression as instigated by frustration was formulated and published (1939); the process of psychotherapy, including psychoanalysis, was reconceptualized with the principles of learning as a basis (1950). More fundamental even were the numerous studies of animal behaviour (*q.v.*), especially of the white rat, in controlled situations with dynamic significance (*e.g.*, fear, anxiety, conflict), some of which mere planned as analogues of human psychodynamic principles (*e.g.*, regression). In soviet psychology, nhich historically initiated the behaviouristic approach, this emphasis is carried to an exclusive consideration of social conditioning, on the one hand, and organic, physiological function, on the other, the dynamic theories of psychoanalysis and of existentialism (see below) being completely rejected. One here sees how personality theory is, in part, an expression of cultural forces. From the soviet standpoint, psychoanalysis, and even more so existentialism, rationalizes the unhealthy individualism of capitalistic culture.

Self-Realization and the Self-Concept

A fruitful source of concepts for understanding personality has been psychotherapy (*q.v.*). While other psychologists, as above noted. worked with psychodiagnostic devices (*e.g.*, projective methods) or attempted to unravel motivation through experiments in the animal laboratory, a third group utilized the interaction of therapist and patient with actual human problems posed for solution. Freud was, of course, the pioneer in this field of work in his special domain of psychoanalysis, but in psychology proper Carl Rogers led the way. Beginning with a minimum of theory, Rogers recorded and studied therapeutic interviews of neurotic or merely troubled clients in an effort to discover objectively what changes occurred and how they were effected. By systematic exploration of this kind he was eventually led to a view of personality in which the so-called self-concept was pivotal and in which self-realization in the process of normal and abnormal development came under close scrutiny. Rogers was led to the theory that the individual normally has a drive toward self-development nhich when impeded by conflict leads to symptoms of disorder. The opportunity to review these blocks to growth in a permissive therapeutic situation proved an important means toward overcoming them, quite apart from any theoretical interpretation of the behaviour such as that given in Freudian psychoanalysis. The relationship between therapist and client was in itself salutarv.

This conceptualization of the therapy of the neurotic in terms of autonomous growth was reinforced from other directions. For example, the neurologist Kurt Goldstein. first in Germany and later in the United States, studied cases of brain injury by inquiring in each instance how the individual adapted to his defect and managed somehow to cope or come to terms with it. Even in such grave situations, the capacity of the human organism for self-correction was shown to be remarkable. according to Goldstein's findings. Abraham Maslow, working at the other extreme with normal and gifted persons, tried to throw light on the process of self-actualization. What, he asked, contributes in fortunate cases to successful self-expression and what, on the other hand, defeats such an outcome? From these diverse directions contributions have been made to a better understanding of the dynamics of frustration, gron th and creativity.

In the theory of personality that Rogers gradually achieved from his investigations of psychotherapy, the concept of the self played a leading part. Moreover, he was concerned less with his onn concept of the subject's self than with the subject's self-concept. Changes in psychotherapy were interpreted as changes in this self-concept—in the way the client (or patient) modified his view of himself. The so-called real environment—if we leave aside that part of it nhich, as a minimum requirement for life, supplies the biological necessities—is important from the psychological standpoint only in the measure that and in the way that it is filtered through the subject's perception of it and of himself in relation to it. For this reason, the therapist in seeking to change personality works very largely with the client's own concept of himself, nhich, of course, in turn involves his feelings of relationship with others.

It is thus appropriate to consider. at least briefly, this concept of self. It is inferred by the psychologist that the new-born infant has no conception of himself. It is only in the course of the first pear or tno of life that the sense of personal identity is acquired. The baby's earliest interest in his own mirror image, for example, is often regarded as pointing to the dawn of this awareness. But there are, of course, many ramifications and dimensions of the subject's self-identity. and attempts have been made to trace the changes in the self-concept (or sense of identity) from infancy through childhood and adolescence to maturity and after. Closely connected with the achievement of a stable self-concept is the degree of security that the person has achieved by virtue of earlier experience. If in the earliest months of life the child has been made to feel secure, he more readily develops a stable sense of his own identity which stands him in good stead in bringing to fruition the potentialities of his personality and in utilizing the opportunities of his environment. It has been demonstrated. for example, that the image which the person has of his own body—the body image—is an important nucleus of his conception of self. If the body image is defective by virtue of a "real" or imagined crippling, an element of permanent instability may enter the self-concept. But, of course, the current secure or insecure situation in nhich the person has to exist is likewise important in reinforcing or impairing the sense of identity. One dimension of this influence is the feeling of hope or hopelessness that may affect the self-concept in profound ways.

This approach to personality via the self-concept seems to many psychologists to refer back to older philosophical speculations; *e.g.*, those of German idealism. To some extent this criticism is doubtless valid. and it has led many investigators to avoid this form of personality theory and to prefer a more behaviouristic variety. But it should not be overlooked that in the hands of the. psychologist the self-concept is rarely treated as a thing-in-itself. As mentioned above, the records of therapeutic interviews and the products of projective techniques are employed as data to which appeal is made before interpretations are given about the self-concept in the specific case. The psychologist never accepts a pure introspection as final; he treats subjective reports like other phenomena of nature—as data for analysis to support the explanatory concepts he employs.

Phenomenology and Idiodynamics

The point of view of Rogers has been sometimes designated "phenomenological"—a term that gained currency beginning with

G. Husserl (see PHENOMENOLOGY). Starting as a branch of epistemology, European phenomenology strongly influenced developments in experimental psychology, particularly the studies of perception that gave birth to the German school of Gestalt psychology. While various theoreticians have given different interpretations to phenomenology, all have agreed in using the term to denote a discipline devoted to the analysis of immediate experience. As such, this discipline challenges the common-sense concept of the real world, the external environment as conceived by the biologist, and attempts to examine systematically the subject's knowledge of his world as an interdependent aspect of his self-knowledge. Rogers in his psychotherapeutic studies was little influenced by the more technical aspects of philosophical phenomenology. These are more clearly discernible in the approach of "existential psychiatry." This orientation, dating from the second quarter of the 20th century, concerned itself initially with experiences of the schizophrenic and other mental patients, but its avowed implications extend to all the data of personality.

Among the Gestalt psychologists, Kurt Lewin made important experimental and theoretical contributions which belong in the frame work of phenomenology. He generally ignored the remote history of the individual and subordinated it to the analysis of the momentary psychological situation. This cross section was analyzed with the aid of "field theory" in concepts adapted from the physical and mathematical sciences (vector analysis and topology; *qq.v*). Lewin's aim was the prediction of specific behaviour that uent beyond the statistical or actuarial objective. He maintained that psychology must posit and work within a different space from that employed by the physicist — a psychological or "hodological" space with properties of its own. Though purporting to bear directly on problems of personality dynamics, Lewin's work had more immediate influence on social psychology (group dynamics) than on the psychology of the individual.

A last conceptual approach that belongs under the general heading of phenomenology is idiodynamics. In this view the personality is conceived as an idioverse — an individual universe of psychological events (experiences) — which can be categorized and analyzed to show temporal and motivational consistencies. The universal norms of general psychology and the group norms of cultural anthropology here give way to individual norms in terms of which the personality operates and is to be understood. But this view has been advanced as but one approach to a composite science of psychology; as a complement to the several other dimensions of a complete analysis of personality.

INTEGRATION OF CONCEPTS

The foregoing survey of concepts, ranging from the organic to the strictly psychological (subjective, phenomenological), may be interpreted in one of two ways: (1) as indicating, if taken at face value, the broad gamut of competing diversity in the field of personality theory; (2) as portraying the multidimensional nature of personality (and of psychology) which, of necessity, approaches the person — the human organism — at diverse but complementary levels or axes. On this latter view a composite set of levels must be plotted in a complete chart of personality; each level provides working concepts for specific problems related to it. See also under such related subjects as ADJUSTMENT (IN PSYCHOLOGY); MOTIVATION, etc.

(S. RG.)

PERSONAL PROPERTY, one branch of the main division of the common law of property, the other being "real property." The division of property into real and personal represents in a great measure the division into immovable and movable, incidentally recognized in Roman law and generally adopted since.

Personal estate is divided in English law into chattels real and chattels personal; the latter are again divided into choses in possession and choses in action (see CHATTEL).

Interest in personal property may be either absolute or qualified.

There are several cases in which. by statute or otherwise, property is taken out of the class of real or personal to which it seems naturally to belong. By the operation of the equitable doctrine of conversion money directed to be employed in the purchase of land, or land directed to be turned into money, is in general regarded as that species of property into which it is directed to be converted. An example of property prima facie real which is treated as personal is an estate *pur autre vie*, which, since 14 Geo. II, *c.* 20, s. 9, 1740–41 (now replaced by the Wills act 1837, s. 6) is distributable as personal property in the absence of a special occupant. Examples of property prima facie personal which is treated as real are fixtures, heirlooms, such as deeds and family portraits. (See further LAW OF SUCCESSION.)

The terms heritable and movable of Scots law in a general sense correspond with the real and personal of English law. Movable or personal property is, in Scots law, subdivided into corporeal and incorporeal movables. Corporeal or physical things, not being land or attached to land, are movable property. Incorporeal things, or rights, are said to form movable property when they do not affect land, and are not similar to rights affecting land in having a tract of future time. By the Titles to Land Consolidation (Scotland) act 1868, s. 117, heritable securities are movable as far as regards the succession of the creditor, unless executors are expressly excluded. They still, however, remain heritable *quoad fiscum*, as between husband and wife, in computing legitim, and as far as regards the succession of the debtor. Annuities, as having *tractum futuri temporis*, are heritable, and an obligation to pay them falls upon the heir of the deceased. At common law an obligation to pay money was, after the term of payment, considered heritable in the person of the creditor as having a tract of future time. Bonds containing such obligations, except where the creditor's executors are excluded, are now movables in the creditor's succession.

See the Scots act of 1661, cap. 32 and the Conveyancy (Scotland) act 1924, s. 22 (1).

The law in the United States agrees in most respects with that of England. Chattels real include all estates in land less than freehold. Legislation in some states has, however, made terms for years and estates *pur autre vie* real property. Title deeds are generally regarded as personalty inasmuch as their importance is less than in England, due to the Land Registration acts. Shares in some of the early American corporations were, like New River shares in England, made real estate by statute, as in the case of the Cape Sable company in Maryland (Schouler, *Law of Personal Property*, i). Otherwise, shares of stock, like other choses in action, are regarded as personalty.

PERSONATION, in English and American lam, a form of fraud consisting in a false representation by one person (by words or conduct) that he is another person living or dead. It is not an offense by the common law unless the representation is made on oath under circumstances constituting the offense of perjury, or unless the representation if not made on oath is made under circumstances amounting to a common-law cheat. See also FRAUD; ELECTORAL SYSTEMS.

PERSPECTIVE is the method used in drawing to portray three dimensions on a two-dimensional surface.

History. — Artists have been experimenting since the Stone Age in their attempts to express a feeling of space and solidity. A reindeer herd was etched on a fragment of bone 15,000 years ago, and the illusion of distance was created by showing the legs and antlers as if seen beyond the fully sketched animals of the foreground. The artist of ancient Egypt discovered that his main perspective problem was showing a single important object in the necessary three dimensions. This he expressed in his own way by drauing a combination of plan and side view. A Pharaoh carrying a circular tray of sacrificial offerings was drawn in this manner.

The top view of the tray is shown in half by means of a semicircle. On this half-tray is the sacrificial food as it would appear when viewed from above. This stylized method of expressing a third dimension persisted in Egyptian drawing for 3,000 years.

In America, northwest Indian artists developed a unique method of showing the front view together with both the left and right sides of a person or an animal. The creature was drawn as if it were split down the back and then flattened out like a hide. Each side of the head and body thus became a profile facing the other.

Chinese artists created landscapes that had excellent feeling of distance and space by skillfully arranging the natural contours of land; water and foliage. When buildings were drawn it was necessary to show the parallel horizontal lines of the construction. Isometric drawing was used. Isometric drawing is a simulation of perspective drawing wherein parallel lines are drawn parallel, instead of converging as in true perspective. Often foliage was used in the drawing to crop these lines before they extended far enough to cause the building to appear warped. These isometric arrangements made an attractive pattern of interposing line.

The early European artist used a perspective which was an individual interpretation of what he saw rather than a fixed mechanical method. It was not until the first half of the 15th century that the Italian painters made perspective drawing an exact science by the use of the horizon line and the vanishing point.

At the beginning of the Italian Renaissance the mathematical laws of perspective were discovered by a Florentine architect, Filippo Brunelleschi (1377–1446), who worked out some of the fundamental principles. Masaccio (1401–*c.* 1428) began using the method and within a short period brought about an entirely new approach in painting. A style was soon developed using configurations of architectural exteriors and interiors as the background for religious paintings. This gave the new science the opportunity to expand freely. One of Brunelleschi's contemporaries Paolo Uccello (1397–1475) compiled these principles into book form and in doing so became the original authority in the field of perspective projection.

In modern times, perspective has an important part in the work of artists as well as in idea presentations of architects, engineers, landscape specialists and industrial designers. It furnishes an opportunity to view the finished product long before it is begun.

Technique. — The simplest perspective drawing that can be made is a single horizontal line across the paper (fig. 1**[A]**). The word horizontal in itself suggests the natural horizon (*i.e.*, the distant line where the earth or sea apparently meet the sky). By drawing this horizontal line the artist has created the illusion of space and distance as far as the eye can see. A sailboat added and a few clouds above the line complete a picture of the sea in the distance meeting the sky. If the sails of the boat shut from view a segment of the horizon, this places the horizon farther in the distance than the boat, as in fig. 1(B).

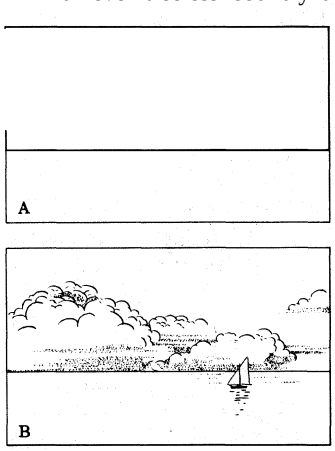

FIG. 1. — THE SIMPLEST PERSPECTIVE DRAWING (SEE TEXT FOR FURTHER EXPLANATION)

In a level treeless country a distant mountain range may be seen beyond the horizon (fig. 2[A]). The curve of the earth's surface is so gradual that it gives the impression of being flat. Yet mountains can be seen beyond this curvature. The superstructure of ships at sea can be sighted long before the hull is seen. A distant island appears to rise out of the sea as it is approached. The horizon therefore is seen as a continuous line between the observer and distant objects. This line is curved. but the curvature is so slight it is usually ignored in drawing.

The colours of distant objects are softened by the atmosphere into bluish tones. This atmospheric colour effect in itself creates an impression of distance and is called aerial perspective.

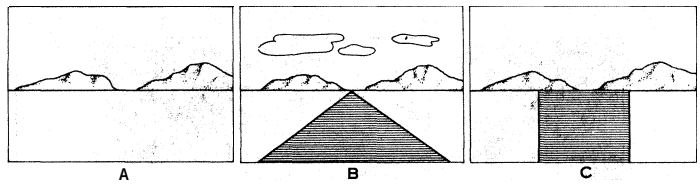

FIG. 2. — A HIGHWAY ACROSS LEVEL COUNTRY

A highway built across the plain may be drawn as two straight lines meeting at a point on the horizon (fig. 2[B]). These lines represent the two curbs which are uniformly parallel throughout their lengths. Why are the curbs drawn as converging lines rather than parallel lines, as in fig. 2(C)?

Fig. 3 shows the top view of a person standing in the centre of the highway. For him to see both curbs near his feet his eyes must take in a wide area at the section marked AA. Twenty feet beyond, at section BB, he sees the same width but it appears considerably narrower than at **AA.** As he looks beyond to CC it appears still narrower and when he looks as far as he can in the distance, to the horizon line, he sees that the width has narrowed to a mere point. Beyond this point no more highway is visible. This point is called the vanishing point.

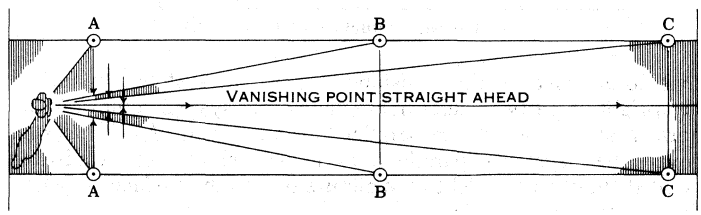

FIG. 3. — AS DISTANCE INCREASES, THE HIGHWAY DIMINISHES IN BREADTH

The side view of the same situation is shown in fig. 4. The person must look down in order to see the highway near his feet **at** section A. To look at B, the section 20 ft. beyond A, it will be necessary to raise his eyes. This is also true for section C, and so on, until he is looking straight ahead along a line that is level with his eyes. He is then looking directly at the vanishing point of the highway. Fig. 5 illustrates how level highway appears to rise to eye level at the horizon.

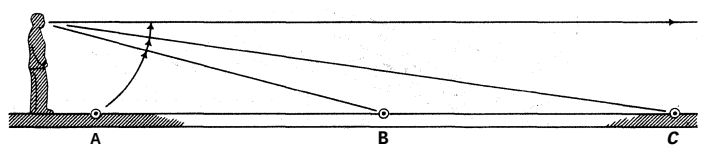

FIG. 4. — THE HIGHWAY APPEARS TO RISE

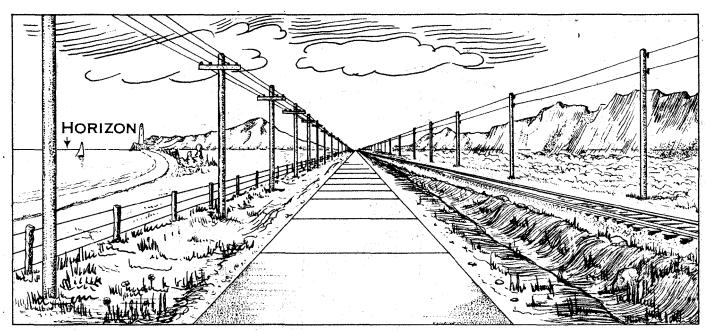

FIG. 5. — PARALLEL LINES MEET AT THE HORIZON

Two conclusions may be drawn: (1) The natural horizon and the artist's eye level are at the same height. This is true whether he is lying on the ground or sketching from an airplane. The horizon seems to rise to meet the eye level. (2) The vanishing point of a system of horizontal parallel lines is always on the horizon line. There can be systems of parallel lines in a picture

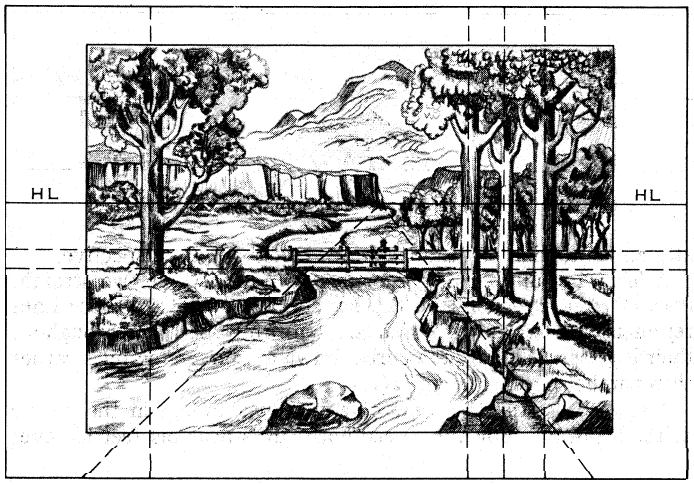

FIG. 6. — THE PERSPECTIVE OF NATURE

that do not meet at the vanishing point. One system is made up of upright or perpendicular lines. The other system comprises the horizontal lines which are parallel to the horizon. A general rule covers these systems. parallel lines do not converge to a vanishing point if they are parallel to the picture plane (the surface on which the picture is executed).

In nature (see fig. 6) there are very few square corners but man's most common form of construction is the box. Houses and furniture. books and skyscrapers. all are modifications of box designs. A solution for most perspective problems may be derived from a proper understanding of the box. The drawing of curved forms,

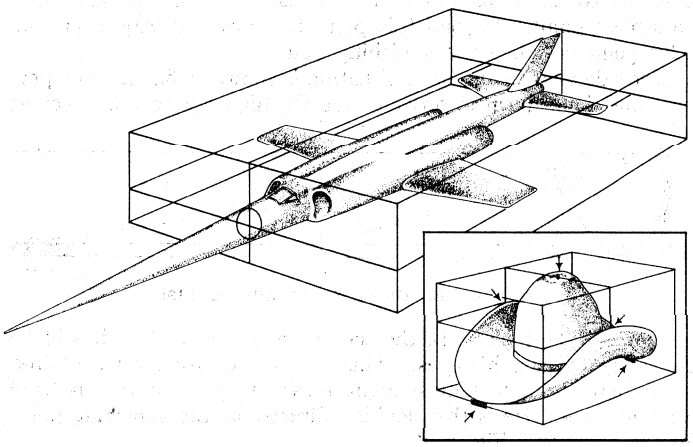

FIG. 7. — CURVED SHAPES FIT INTO BOXES

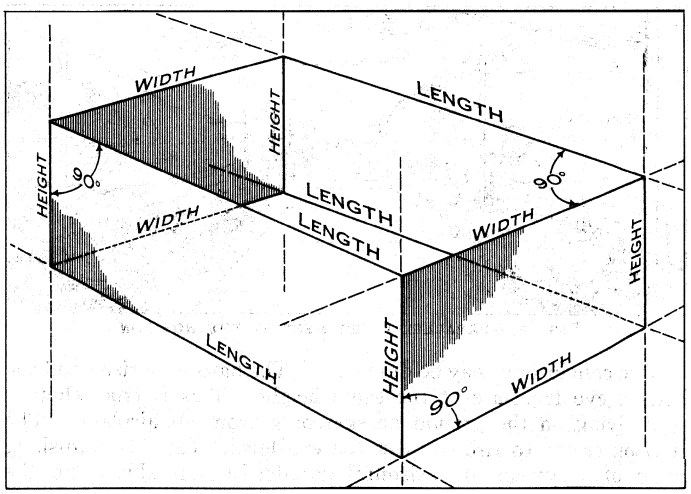

FIG. 8. — THE CONSIDERATION OF PERSPECTIVE IN A BOX

such as shoes, hats, automobiles and airplanes, becomes simplified when these objects are fitted into boxes (fig. 7).

The box has two upright sides, a top, a bottom and two ends—six planes in all (fig. 8). There are 8 corners where 3 planes meet at right angles to one another and 12 edges where 2 planes join. These 12 edges or intersections of the planes are represented in the drawing as lines which will be referred to in groups of four: length lines, width lines and height lines.

One-Point Perspective. — To draw a box in one-point perspective, two lines may be drawn converging at a horizon line. as in the case of the highway (fig. 2). Let a section represent the bot-

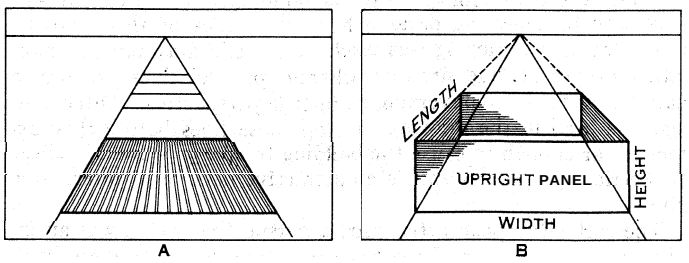

FIG. 9. — PERSPECTIVE AS SHOWN ON A HIGHWAY AND A BOX

tom of the box (fig. 9[A]). Upright end panels can be placed on the section lines (fig. 9[B]). The top and the sides can be represented by drawing two upper length lines from the top corners of the near panel to the vanishing point. The height of the far end panel is determined by the intersection of the length lines with the verticals or height lines.

The entire projection may be inverted so that the vanishing point is below the object depicted. as in Masaccio's "Trinity" at S. Maria Novella, Florence. In Florence 70 years later Leonardo da Vinci (1452–1519) painted his famous "Last Supper" using the one-point perspective. All the perspective lines of the room lead to the vanishing point at the head of Christ

Two-Point Perspective. — If the box is rotated slightly the vanishing point of the length lines will move along the horizon

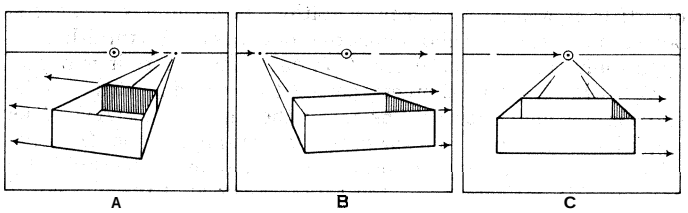

FIG. 10. — POSITION DETERMINES VANISHING POINTS

accordingly (fig. 10[A]), until it passes out of the picture, although it will still remain on the horizon line. As the width lines move they are no longer parallel to the plane of the picture and it is necessary to establish a vanishing point for them. This point is also on the horizon line (fig. 10[B]). In two-point perspective there are two vanishing points: one for the width lines and one for the length lines. If the box is rotated farther until the newly established point coincides with the central position of the original vanishing point, the length lines will be parallel to the picture plane, and the box is again in the position of one-point perspective, having been rotated 90° (fig. 10[C]). The distance between the vanishing points in two-point perspective is governed by a simple ratio. In order to understand this it is necessary to become further acquainted with the use of the picture plane. (*See* fig. 11.)

Perspective Projection. — The picture plane is represented as an upright transparent surface. The artist stands facing it on a level plane called the

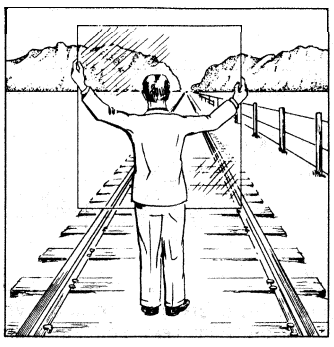

FIG. 11. — THE PICTURE PLANE

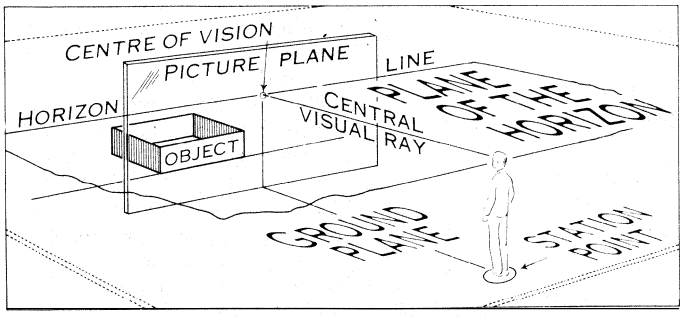

FIG. 12.— THE PERSPECTIVE ARRANGEMENT

ground plane. He looks through the picture plane at the object, also resting on the ground plane (fig. 12). In this instance, the object he wishes to draw is the box. The ground line (GL) is the line where the picture plane rests on the ground. The artist stands on the station point (SP) and sees the scene before him from an eye level viewpoint, called the eye. When he looks directly at the picture plane (along a line perpendicular to it) he is looking along a line called the central visual ray (CVR) which lies on a plane called the plane of the horizon.

Everything that can be seen above this plane is said to be above eye level; everything seen below this plane is below eye level. The central visual ray intersects the picture plane at a point called the centre of vision (CV). (See fig. 13.) A horizontal line drawn through this point is the horizon of the picture. It is the line where the plane of the horizon intersects the picture plane. If the

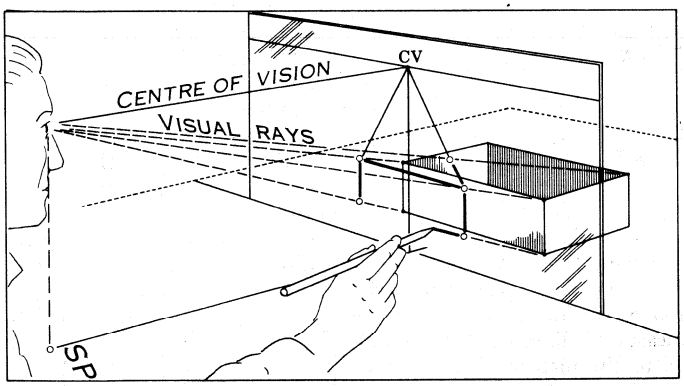

FIG. 13.— THE USE OF THE PICTURE PLANE

artist is seated, the horizon is lowered; if he views the object from a stepladder. the horizon raises accordingly. The object also may be raised and the picture plane may be moved closer to the artist or back against the object. These arrangements allow a great deal of freedom.

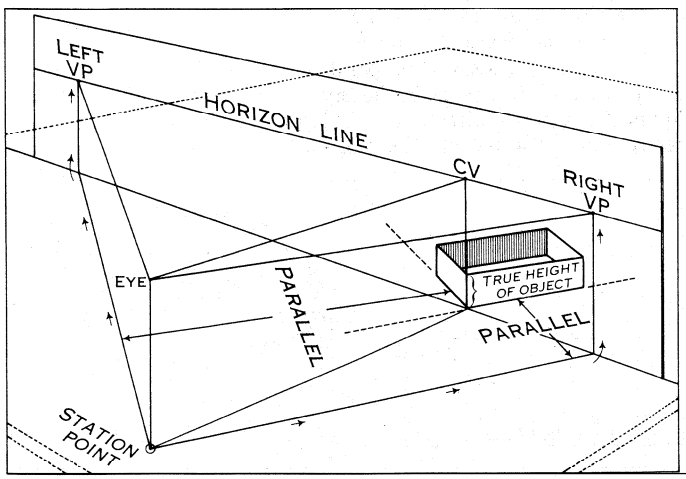

FIG. 14.— LOCATING VANISHING POINTS

According to theory the artist can now locate all the necessary points and lines of the object and draw them where the visual rays (VR) show them on the picture plane. The centre of vision becomes the vanishing point of a drawing in one-point perspective.

The two-point perspective arrangement can be made by rotating the object (fig. 14) to the desired view. For convenience the picture plane is placed against the corner of the object. By doing this the height is actually on the picture plane in true measurement. In this way the process of projection is made simpler and easier to visualize.

The station point is chosen at any desired distance from the object and the view from any desired height above the ground. When the eye height is established, two lines from the eye are extended parallel to the two sides of the box. The two lines form a right angle and each meets the picture plane on the horizon line. The points where they intersect the horizon line are the left vanishing point (LVP) and right vanishing point (RVP). The same points can be reached by drawing the two lines on the ground from the station point to the picture plane and then up to the horizon line (indicated by arrows. fig. 14). Then it is necessary to get all this arrangement flattened down onto one sheet of paper. The picture plane may be visualized as being moved toward the station point (fig. 15[A]). The ground line remains in the new position but the plane is folded down (fig. 15[B]) so that it is lying on the ground (fig. 15[C]). The top edge of the picture plane is ignored. The plane remains in its original position touching this trace (fig. 15[C]).

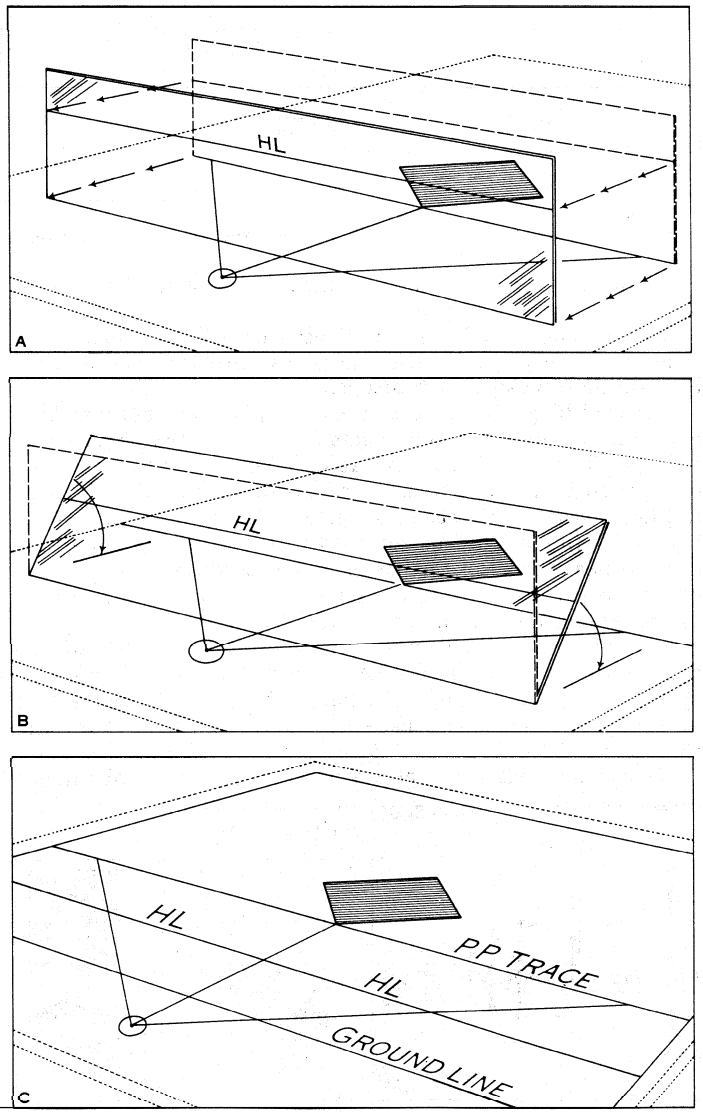

FIG. 15.— TWO-DIMENSIONAL ARRANGEMENT

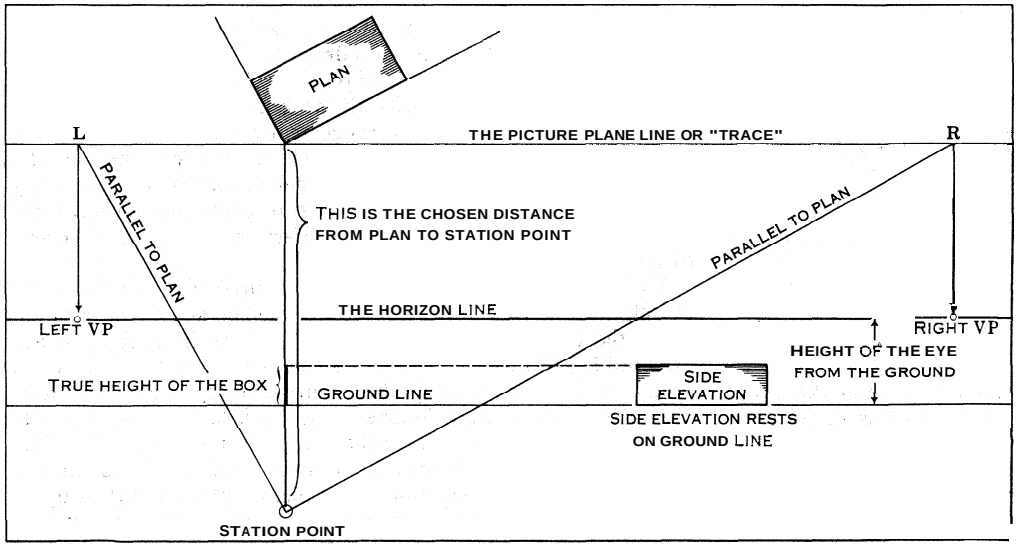

FIG. 16. — COMPLETE PERSPECTIVE ARRANGEMENT

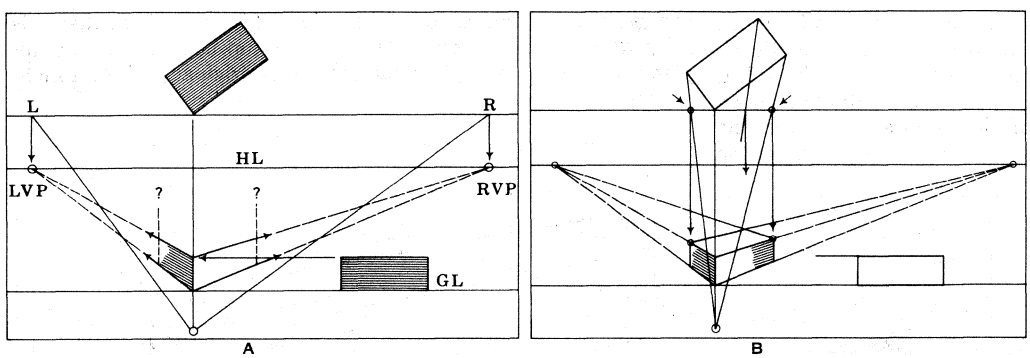

FIG. 17. — PERSPECTIVE PROJECTION

All three-dimensional units can then be translated into a two-dimensional surface (fig. 16).

This method is called the architect's or office method. It is found to be adaptable to most perspective problems and it is the basis for most perspective projections.

The vanishing point is located by dropping perpendicular lines from the previously located points L and R to the horizon (fig. 17[A]). The side elevation is placed so that it rests on the ground line. A horizontal line from the top of this elevation to the central line gives the true height of the box. Lines from the top and bottom of this height line extended to the vanishing points will give the near corner of the box in true perspective, with the sides of the box extending to the vanishing points. It is then necessary to find where the sides of the box actually end.

A line is drawn from the station point to the right-hand corner of the plan. It intersects the picture plane at a point indicated by the arrow (fig. 17[B]). A line is drawn to the left corner in the same manner. The space between the two arrows measures the extent of the box as it would be seen on the picture plane. Perpendicular lines from these arrows drawn downward through the sides of the box cut the sides off at the correct place. The perspective picture is completed by drawing lines to the vanishing points from the established corners of the box.

Division of Space. — If a line divided into equal parts is drawn in perspective, the parts become smaller as they recede (fig. 18). The simplest division is two equal parts. A square, rectangle or line may be divided into halves by the use of intersecting diagonals (fig. 19).

The point of intersection becomes the central point and a line drawn through this point parallel to the sides is the line of division.

When the rectangle is drawn in perspective this method of dividing still holds true; the true centre is the point where the diagonals intersect.

These divisions in turn may be subdivided into quarters and then into eighths and sixteenths, if desired.

When the space cannot conveniently be subdivided into halves, another method may be used. To divide a rectangle into three equal parts with vertical lines (fig. 20), it should be first divided by length lines into three parts.

A diagonal is then drawn. If the vertical lines are drawn where the diagonal intersects the length lines the correct spacing is obtained.

Fig. 21 is an example of a façade with seven columns drawn in perspective. Irregular divisions also can be projected in the same manner. These methods follow the principle of dividing measurable lines (*i.e.*, lines parallel to the picture plane) and of translating these measurements into corresponding divisions on the receding perspective line.

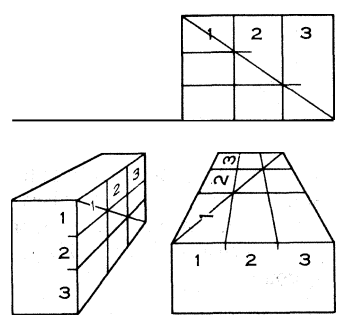

FIG. 20.—SUBDIVISIONS

There is another method of subdivision in perspective in which a high or low vanishing point is used. It can be understood by drawing a fence in which all the posts lean at the same angle along the line of the fence (fig. 22). The posts will be parallel to one another and will all point to a vanishing point in the sky (or below the horizon if leaning in the opposite direction). This point will be somewhere directly above (or below) the vanishing point of the fence. To

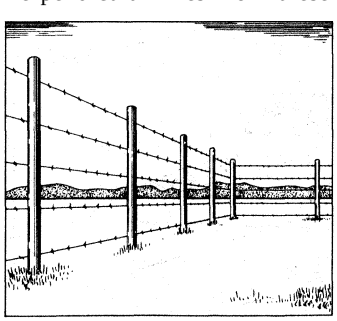

FIG. 18. — EQUAL SPACING

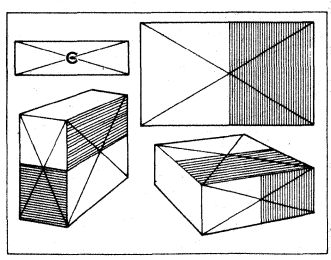

FIG. 19. — HALVES AND CENTRES

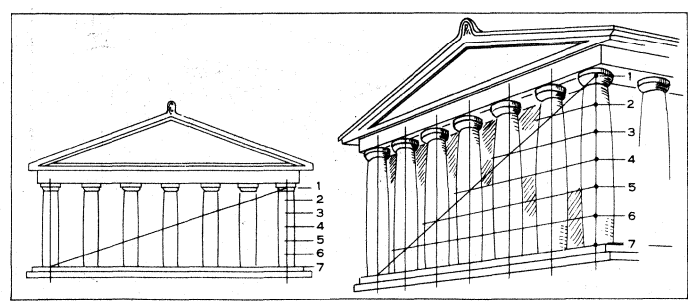

FIG. 21. — FACADE IN PERSPECTIVE

verify this, tilt the posts more and more until they finally lie end to end on the ground. It will be found that their vanishing point has moved down in a perpendicular line until it is the same as the vanishing point of the original fence. Using the draftsman terminology. this perpendicular line on which the vanishing points fall is the vanishing trace of the vertical plane of the fence. An axiom applied to this form of projection is that parallel lines in a plane have their vanishing points in the vanishing trace of the plane.

If the diagonal drawn between the first two posts is extended to

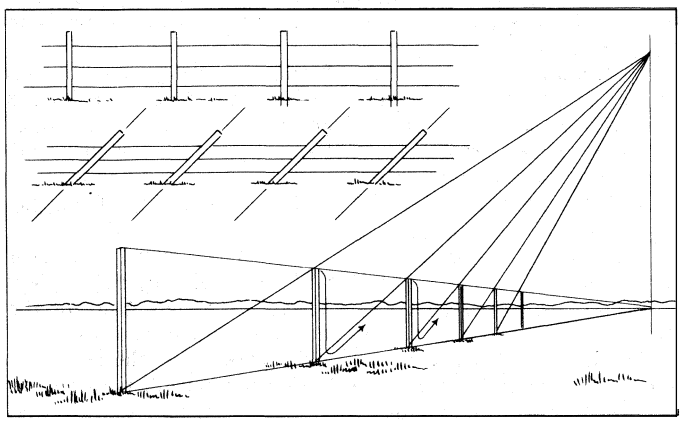

FIG. 22.— CONTINUOUS SPACING

intersect the vanishing trace, the successive posts can be located by the use of this point of intersection as the common vanishing point of all the diagonals.

Perspective projection is a growing science which has not been fully developed. A number of methods other than here shown are in use; each has its advantages.

PERSPIRATION. Perspiration is an inclusive term referring to any water. either in vapour or visible form, which is given off by the normal skin. There are two sources: the epidermis and the sweat glands. The average adult loses about 500 g. of water vapour via the transepidermal route every 24 hours. This type of water loss is called insensible perspiration and involves no chemicals besides water. The mechanism of loss is obscure, but it would appear that the water loss, which is constant, is associated with the growth and aging process of the epidermal cells as they form keratin.

Only factors affecting the epidermal cells have an influence on the rate of epidermal water loss.

The common usage of the word perspiration disregards the above vapour loss and relates it solely to the secretion from the eccrine sweat glands. These glands are distributed over the entire skin surface of man. Totaling approximately 2,000,000 in number, they show marked regional differences in density. The palm and sole may present over 2,500 per square inch, whereas the back may have fewer than 500 per square inch. Each gland is a simple coiled tubular unit. The secretory coil is deep in the dermis and from it the sweat duct extends up through the dermis and epidermis.

The sweat pore is not visible except on the palms and soles. The glands provide surface water for evaporative cooling of the body under heat stress, 540 cal. being lost per litre of sweat evaporated. In cool environments the glands remain entirely at rest.

However, once the skin temperature or body temperature becomes elevated. many of the glands are instantly stimulated to secrete. This stimulation is caused by autonomic nerves which are under control of the thennoregulatory centre of the hypothalamus of the brain. In areas which have been denervated (*e.g.,* by sympathectomy, or by neural changes in leprosy) sweating does not take place. The total sweat rate may range from zero to 2,000 g. per hour. Often sweating rates are excessive since only the sweat which evaporates cools the body. Eccrine sweat is about 99% water, the chief solute being sodium chloride. The more efficiently the gland functions. the lower the salt content is. Very little salt is present in the sweat of acclimatized persons, so that a normal person rarely needs salt supplementation of his normal diet despite high sweating rates. Similarly vitamin supplementation is unnecessary since only trace amounts are lost. Eccrine sweating of the palms. soles and to a certain extent elsewhere is under a different neural control, reflecting emotional tension rather than thermal stress; *e.g.,* the cold sweat of shock or motion sickness.

Closure of the sweat pores with subsequent extravasation of trapped sweat into the skin is the cause of prickly heat, a common summer ailment.

Apocrine sweat is a second type formed in human skin. It arises from apocrine sweat glands, most of which are in the armpits and appear at puberty as an offshoot of the hair follicles. Very small amounts of sweat are continuously formed and stored in these glands, later to be expelled in response to emotional rather than thermal stimuli.

The expulsive force is provided for by a sheath of muscular tissue enveloping the glands. Apocrine sweat is a whitish odourless liquid which contains considerably more solid material than eccrine sweat. Surface bacteria of the skin act on the lipid content of this sweat to form odorous unsaturated fatty acids, thus accounting for the distinctive "underarm odour." In rare instances apocrine sweat may contain unusually large quantities of pigment, a condition called chromidrosis. Such reddish-brown sweat is normally produced by the apocrine sweat glands of the hippopotamus.

PERTAB (PARTAB) **SINGH,** SIR (1844–1922), maharaja of Idar, Indian soldier and statesman, belonging to the Rahtor Rajputs of the Jodha class, was born in 1844, the son of Maharaja Takht Singh, ruler of Marwar (or Jodhpur). In 1878 and again in 1879 he was chief minister of Jodhpur. In the following year he accompanied the British mission to Afghanistan, and on his return he carried out many reforms and administered Jodhpur with remarkable success. He visited England to take part in the celebration of the 1887 Jubilee of Queen Victoria's reign. He served on the staffs of Sir William Lockhart and General Elles in the Tirah and Mohmand expeditions in 1897–98, was slightly wounded, was mentioned in dispatches, and promoted to the rank of full colonel.

When it was decided to send a force from India to China in 1900 to relieve the foreign embassies besieged in Peking, Sir Pertab Singh at once offered the services of the Jodhpur Lancers, and himself accompanied them. From Queen Victoria he received the honour of knighthood and Order of the Bath and the Star of India; from King Edward VII the distinction of aide-de-camp; and the University of Cambridge gave him the degree of LL.D. From his own state of Jodhpur he obtained the title of Maharaja-Dhiraj.

In 1901 he succeeded to the rulership of the state of Idar.

He relinquished his position as maharaja of Idar in 1911 in favour of his adopted son Daolat Singh, in order to resume the regency of Jodhpur which he had previously held on the death of his brother in 1895, but this time for his grandnephew Summair Singh, then 13 years of age. When World War I broke out Sir Pertab, though he had reached the age of 70, went to France for service in the field with his young ward, then only 16, and commanded the Jodhpur Lancers. In the later stages of the war he served with them in Egypt and Palestine.

Sir Summair Singh died in 1918, two years after receiving ruling powers, and Sir Pertab again became regent, assisted by a

council. Sir Pertab Singh died on Sept. 4, 1922.

PERTH, EARLS AND DUKES OF. The Scottish title of earl of Perth was bestowed upon James, 4th Lord Drummond (d. 1611), in 1605. His ancestor Sir John Drummond (d. 1519) had been created Lord Drummond in 1488.

James, 4th earl and 1st duke of Perth (1648–1716), opposed the duke of Lauderdale, and after his retirement in 1680 James was one of the committee of seven which managed Scottish affairs. He was made justice-general and extraordinary lord of session in 1682, and was lord chancellor of Scotland from 1684 to 1688. As a convert to Roman Catholicism after the death of Charles II, he stood high in the favour of James VII and II. Perth, who is credited with the introduction of the thumbscrew, was very unpopular with the Scottish people, and during the Revolution of 1688–89 he was imprisoned at Stirling. Released from captivity in 1693 he joined James VII at St. Germain, and was made duke of Perth, a titular dignity only.

His son JAMES (1675–1720) and his grandson JAMES (1713–1746) fought for the Stuarts. The titular dukedom became extinct in 1760.

The 1st duke's brother, JOHN (c. 1649–1714), earl of Melfort, rose to favour under Charles II about the same time as his brother; like him, too, he became Roman Catholic in 1686. In 1684 he was made secretary of state for Scotland; in 1686 he was created earl of Melfort by James VII, and during his reign he took a leading part in Scottish affairs.

He died in Paris on Jan. 25, 1715.

GEORGE (1807–1902), nominally 6th earl of Melfort, in 1853 obtained a reversal of the various attainders, and his own recognition as earl of Perth and Melfort.

The succeeding earl (the 15th) was his kinsman, William Huntly Drummond, Viscount Strathallan (1871–1937), who was in turn succeeded by his half-brother, Sir James Eric Drummond.

PERTH, the capital of Western Australia, is situated in the southwest of the state on ground rising 200 ft. from the right bank of the Swan river about 12 mi. N.E. from its mouth where lies its port, Fremantle (*q.v.*). Established in 1829, Perth was constituted a city in 1856. The population of the city in 1954 was 97,350; that of the metropolitan area with suburbs (including Fremantle) was 348,647, 54.5% of the total population of the state.

BY COURTESY OF WESTERN AUSTRALIA TOURIST & PUBLICITY BUREAU

ST. GEORGE'S TERRACE IN PERTH. THE COMMERCIAL, BANKING AND PROFESSIONAL STREET OF THE CITY

Besides being the political and administrative centre, Perth, with Fremantle, is by far the most important centre for trade, commerce, banking, etc., in the state. Its first newspaper was founded in 1831. It is the terminus and departure port for the principal railway routes of a hinterland stretching far inland and its airport became international in 1952. There are regular air services to and from Johannesburg and Singapore.

The climate is of the Mediterranean type, warm to hot and sunny, with occasional hot winds from inland, and winter rains. The average annual temperatures range from 73.5° F. to 55.5° F., with some days over 100° F.; the mean daily hours of sunshine average 7.8 and the rainfall 34.9 in. falling during 122 days, mainly from May to October inclusive.

Though many of the streets are still narrow, the city has been largely rebuilt and the metropolitan area now extends more than 20 mi. east and west along the northern side of the river, though the southern side also is being increasingly occupied. Perth contains some of the finest terraces, avenues and buildings in Australia (*e.g.*, St. George's terrace and Forrest place). The public buildings include two cathedrals, government house, the houses of parliament, the university (established in 1913), the observatory, a branch of the royal mint and a hospital begun in 1939, the first part of which was opened in 1948. A new causeway over the Swan was opened in 1952.

The city owns about 5,700 ac. of lands devoted to parks, recreation grounds, etc., and including the beautiful King's park (1,018 ac.) overlooking the city and river from the west. The water supply is derived from artesian bores (450 to 2,000 ft.) and, chiefly, from the Darling ranges.

The largest reservoir, Canning dam, has a capacity of 20,550,000,000 gal.

PERTH, a city, royal and large burgh and county town of Perthshire, Scot., about 22 mi. W.S.W. of Dundee by road. Pop. (1961) 41,199. Area 6.1 sq.mi. It is on the right bank of the Tay, between the meadows of the North Inch and those of the South Inch, both laid out as public parks. On the left bank of the river (crossed by three bridges) Kinnoull hill rises 729 ft. The Perth bridge, which crosses the Tay just below North Inch, has nine arches and was built by John Smeaton in 1766–71. The city has long been famous for its dye works. Other industries include whisky blending, the making of glassware (and particularly of gauge glasses), jute, carpet and linen manufacture. Perth is the centre of a prosperous agricultural area, with sales which attract buyers from all parts of the world.

Notwithstanding the importance of Perth in former times (it was the capital of Scotland until *c.* 1452), almost the sole relic of the past is the church of St. John the Baptist. The original building is believed to have been erected in the time of Columba, but the present choir was built c. 1440 and the nave *c.* 1490. In 1598 the church was divided into two churches and a third was inserted between them in the 18th century, but under Sir Robert Lorimer the whole was restored to its original form as a World War I memorial (1925–28). There, in 1559, John Knox preached his famous sermon in denunciation of idolatry, as a result of which the Dominican, Carthusian, Franciscan and Carmelite friaries were destroyed. The castle, palace and fortress have also disappeared. The tombstone of James I and his queen, who, though the king was murdered in the Dominican, were buried in the Carthusian monastery (destroyed in 1559), was afternard removed to St. John's church.

During the period between the beginning of the 12th century and the reign of James II many of the Scottish parliaments were held in a building (demolished in 1818) where the Freemasons' hall now stands. The supposed house of Catherine Glover, the "Fair Maid of Perth," still stands in Curfew Row. James VI's hospital, founded in 1569 on the site of the Carthusian monastery, was converted into workmen's dwellings. A 19th-century replica of the Mercat (market) cross, which in 1668 replaced one destroyed by Oliver Cromwell, stands opposite the city hall.

Public buildings include St. Ninian's Episcopal cathedral (1850–90); the city chambers; the county buildings (1808–20); the art gallery and museum (1935), which incorporates as its principal feature the Marshall memorial (1824) and contains the museum of the Black Watch, the collections of the Literary and Antiquarian society and the Perthshire natural history museum; and the Sandeman public library, founded by a bequest of Professor Sandeman of Owens college, Manchester. The general (convict) prison for Scotland was originally erected in 1812 as a depot for French prisoners.

Northwest of the city are the military barracks (1793–94). The burgh grammar school, supposed to date from the 12th century, was amalgamated with the Perth academy (1807) and Sharp's institute (1860).

History.—During the time that it was occupied by the Romans, a period estimated at 320 years. the city was called Victoria: its present name probably derives from the Celtic Abertha ("at the mouth of the Tay"). On the conversion of the original Pictish inhabitants and the dedication of the first church to St. John the Baptist, the town was designated St. Johnstoun, and it continued to be known indifferently by this name and that of Perth down to the 17th century. Perth is stated to have been a burgh in 1106 and was made a royal burgh by William the Lion in 1210.

During the Scottish Wars of Independence its fortifications were strengthened by Edward I (1298). Robert Bruce several times ineffectually attempted to seize it, but in 1311 he succeeded in scaling the walls during a night attack. This was the fourth and most brilliant of the seven sieges which the city sustained. Taken by Edward III in 1335, it was recaptured in 1339. In 1396 the combat between the Clan Chattan and the Clan Quhele, described in Sir Walter Scott's *Fair Maid of Perth,* took place on the North Inch in the presence of Robert III and his queen, Annabella Drummond.

The Dominican friary (Blackfriars) was the scene of the murder of James I by Sir Robert Graham, instigated by Walter, earl of Atholl, in 1437 In consequence Perth lost its status as capital, in which it had succeeded to Scone, and the parliament courts were transferred to Edinburgh in 1482.

Gowrie house (on the site now occupied by the county buildings) was the scene of the mysterious "Gowrie conspiracy" against James VI in 1600. The town was taken by the marquess of Montrose in 1644, by Cromwell in 1651, and was occupied by Viscount Dundee in 1689.

In 1715 the Old Pretender was proclaimed king at the Mercat cross, and the chevalier himself appeared in the city in the following January, only to leave it precipitately on the approach of the earl of Argyll.

PERTH, ARTICLES OF, a series of five articles on rites, authorized by a general assembly of the Scottish church at Perth, Scot., in 1618. The articles. approved by the Scottish parliament in 1621, were passed at the insistence of James I, who used them as a point in his campaign to bring the independent Church of Scotland under royal influence.

They required kneeling at communion; the observance of Easter and Christmas; confirmation by bishops; communion at home for the dying and child baptism on the first Sunday after birth.

See also JAMES I.

PERTH AMBOY, a city in Middlesex county, N.J., U.S., at the mouth of the Raritan river, on Raritan bay and Staten Island sound, 29 mi. S.W. of New York city.

It is strategically located on the fringe of the two major metropolitan areas of the east, Philadelphia and New York. Connecting these areas with the city are an elaborate highway system, four rail lines and a harbour for ocean-going ships.

Local industry is well diversified and produces steel, nonferrous metals, petroleum products, building materials, chemicals, paints, lead, printing and electrical goods, clothing, food products and cigars.

Despite its industrialization the city stresses residential living and supports numerous parks and recreation and play areas. Public utilities (electricity and water) are municipally owned.

Perth Amboy was settled in the late 17th century and from 1684 to 1702 was the capital of the colony of East Jersey. The original name, Amboy, is of Indian origin. Later Perth was added in honour of an early proprietor, the earl of Perth. A city charter. one of the first in New Jersey, was granted in 1718. The last royal governor of the colony, Benjamin Franklin's son William, resided in the city in the governor's house (Westminster house, erected in 1764), which is one of a number of colonial buildings still standing.

The city was occupied by the British in 1776–77 and later evacuated when Gen. George Washington's troops seized northern New Jersey.

For comparative population figures *see* table in NEW JERSEY. *Population.* (W. L CA)

PERTHES, FRIEDRICH CHRISTOPH (1172–1843), German publisher. nephew of Johann Georg Perthes (*q.v.*), was born at Rudolstadt, on April 21, 1772. In Hamburg, where he settled in 1793 as an assistant to the bookseller B. G. Hoffmann, he started in 1796 his own bookselling business. and in 1798 he entered into partnership with his brother-in-law Johann Besser.

In 1810–11 Perthes issued *Das deutsche Museum,* to which many of the foremost publicists of Germany contributed. In 1821 he transferred his business in Hamburg to his partner and went to Gotha, where he established what ultimately became one of the first publishing houses in Germany.

As a result of his initiation, the Union of German Booksellers in Leipzig was founded in 182 j. When the foundation stone of the building of the union was laid in 1834, he was made an honorary freeman of Leipzig. Perthes died at Gotha May 18, 1843.

His *Life* was written by his son, Rlemens Theodor Perthes (1809–1867), professor of law in the University of Bonn and author of *Das deutsche Stnatsleben vor der Revolution* (1845) and *Das Herbergwesen der Handwerksgesellen* (1856).

PERTHES, JOHANN GEORG JUSTUS (1749–1816), German publisher, was born at Rudolstadt on Sept. 11, 1749 In 1785 he founded at Gotha the business that for many years bore his name (Justus Perthes). In this he was joined in 1814 by his son Wilhelm (1793–1853). On the death of Justus at Gotha on May 2, 1816, Wilhelm took entire control of the firm. He laid the foundation of the geographical branch of the business by publishing the *Hand-atlas* (1817–23) of Adolf Stieler. The business passed to his son Bernard Wilhelm Perthes (1821–57), who was then associated with August Petermann and Bruno Hassenstein (1839–1902); and subsequently to his son Bernard (1857–1919).

The firm published the *Almanach de Gotha,* a statistical. historical and genealogical annual (in French) of the various countries of the world; and the elaborate *Geographisches Jahrbuch,* produced under the editorship of Ernst Behm (1830–84), on whose death it was continued under that of Hermann Wagner.

A new edition of Stieler's atlas (ed. by H. Haack) was published in 1925.

PERTHSHIRE, an inland county of Scotland, bounded north by the counties of Inverness and Aberdeen; east by the county of Angus; southeast by the Firth of Tay and the counties of Fife and Kinross; south by the counties of Clackmannan and Stirling; southwest by the counties of Stirling and Dunbarton; west by the county of Argyll and northwest by the county of Inverness. It is the fourth largest county in Scotland, its land area being 2,493.4 sq.mi. Pop. (1961) 127,018. By far the greater part is mountainous and, including those on the borders of Inverness-shire and Argyllshire, there are at least 50 mountains exceeding 3,000 ft. in height. The most familiar are Ben Lawers (3,984 ft.) near Loch Tay, Ben More (3,843) east of Crianlarich, Ben Lui (3,708) on the Argyllshire border, Schiehallion (3,547) southeast of Loch Rannoch, Ben Vannoch (or Bein Mhannach; 3,125) west of Loch Lyon, and Ben Chonzie (3,048) near the head of Glen Almond. Four of the many hills of lesser altitude have been made famous by Sir Walter Scott's *The Lady of the* Lake—Ben Ledi (2,873), Uam Var (or Bheag; c. 1,600) near Callander, Ben Venue (2,393) and Ben A'an (1,326). The Ochil hills divide Perthshire from the counties of Clackmannan, Kinross and Fife.

The chief river is the Tay, which rises on the Argyllshire border and discharges into the North sea off Buddon Ness, after a course of 120 mi., being thus the longest river in Scotland. Its headwaters are the Fillan and Dochart, and among its affluents are, on the right, the Bran, Almond and Earn, and, on the left, the Lpon, Tummel rising in Argyllshire and receiving the Garry on its left, and Isla. The Earn flows out of Loch Earn and enters the Firth of Tay 6½ mi. below Perth. The Forth, the principal natural boundary of the county on the south, properly belongs to Stirlingshire, in which it rises, but its leading left-hand affluents are Perthshire rivers, namely the Teith, the Goodie, issuing from the Lake of Menteith, and the Allan, rising in the Ochils near Sheriffmuir. All the lochs are narrow, scarcely one exceeding a mile in width. Loch Ericht, belonging partly to Inverness-shire. is about 15 mi. long. Loch Tay (14½ mi.). situated about the centre,

is the largest in the county. In the south are the series of lochs which *The Lady of the Lake* has rendered famous—Loch Vennachar (4½ mi.), Loch Achray (1¼ mi.), Loch Katrine (about 8 mi.); to the west of Aberfoyle is Loch Ard (3 mi.) and to the east Lake of Menteith (1½ mi.). Nearly all the glens possess striking natural features, among them, from south to north, being Glens Artney, Almond, Dochart, Ogle, Lochay, Lyon, Garry, Shee, Bruar and Tilt; the Trossachs, Killiecrankie, Birnam and Leny are among the loveliest passes in the Highlands. The low-lying country is represented mainly by Strathmore, Strathallan, Strathearn, Strathbraan, Strathtay and Strathfillan, but more particularly by the fertile alluvial belts of the Carse of Gowrie, a raised marine platform on the northern shore of the Firth of Tay, and the Carse of Stirling.

History.—In 83 Agricola explored the lands beyond the Forth and in the following year penetrated to the Grampians. The growing lawlessness of the southern Picts and their frequent raids in the more settled country in the south later compelled the attention of the emperor Severus. But though he led a strong army to the shores of the Moray firth, he was unable effectually to subdue the tribesmen. There were several Roman forts in the county such as those at Bochastle, Dalginross, Bertha, Fendoch and Gourdie as well as a legionary fortress at Inchtuthil; along the Earn there were many signal stations.

When the Romans finally withdrew from Britain, the Picts established their capital first at Abernethy and then at Forteviot. Abernethy was the centre of the Celtic church after the conversion of the natives by Ninian, Palladius and other missionaries in the 5th and 6th centuries. On the burning of Forteviot by the Norsemen in the 8th century, the seat of Pictish government was removed to Scone. In the latter half of the 9th century, Dunkeld—to which Kenneth MacAlpin had brought some of the relics of Columba from Iona—became the scene of monastic activity.

The Danes periodically harried the land, but suffered a crushing defeat at Luncarty in 961. In 1054 Macbeth was defeated at Dunsinane by Siward, earl of Northumberland, who had invaded Scotland in the interest of his kinsman, Duncan's son, who, on the death of the usurper three years later, ascended the throne as Malcolm III. With Malcolm's accession the Celtic rule of the monarchy of Scone came to an end. Perth became the capital at the beginning of the 12th century and remained the capital until 1452; from that time the history of the county is merged in that of the county town, with the exception of such isolated incidents as the removal of the coronation stone from Scone to Westminster in 1296, the defeat of Robert Bruce at Methven in 1306, the battle of Dupplin Moor in 1332, the victory of Viscount Dundee at Killiecrankie in 1689 and the indecisive contest at Sheriffmuir in 1715. Among non-Roman archaeological remains are the hill fort on Dunsinane; the ship barrow of the Vikings at Rattray; weems (or earth houses) in the parishes of Monzie, Alyth and Bendochy; standing stones near Pitlochry; and an extraordinary assemblage of sculptured stones at Meigle.

Agriculture, Industries and Communications.—The arable land is chiefly in the drier regions of the east and southeast, the soil for the most part being fertile. Light soils prevail in the lower undulating districts; clay and alluvial land occur in the Carse of Gowrie, the Carse of Stirling and the lower reach of Strathearn below and above Bridge of Earn. The best heavy carse land is rich, and produces heavy crops of wheat, potatoes, sugar beet, beans, timothy and silage crops. The principal cereal crop in Perthshire is oats—extending to 11,000 ac. in the mid-1950s. Wheat occupied about 6,300 ac. and barley more than 10,000. The county exports a big tonnage of seed potatoes, over 20,800 ac. being under this crop in the mid-1950s. Turnips and swedes occupied 16,200 ac. and sugar beet 1,660. The county specializes in the growing of small fruit, being the main raspberry-growing county in Scotland.

There are many herds of pedigree livestock, particularly of the Shorthorn and Aberdeen Angus beef breeds. On the hills Blackface sheep are carried, and on many of the foothill farms herds of breeding beef cows are now established.

The rivers and lochs abound with good salmon and trout. Hardly any of the streams have suffered pollution from industries.

The deer forests, of which the largest four cover about 90,000 ac., are frequented by red and roe deer, and on the extensive moors and in the woods are found grouse, pheasants, partridge, capercaillie, woodcock, ptarmigan and hares. The ancient Caledonian forest has practically disappeared from the county except the Black wood of Rannoch (of native Scots pine) and oak woods in the valleys which used to be cut as coppice for tanning bark. Large-scale afforestation with European larch was carried out by the dukes of Atholl from the end of the 18th century. Forestry has been and is an important part of the economy of many estates in the county. From 1921 through the 1950s the Forestry commission planted over 30,000 ac., mainly with conifers, in almost 20 forests including the Queen Elizabeth National Forest park near Aberfoyle. There is a training school for foresters at Pitlochry. The census of woodlands of 1947–49 gave a total woodland acreage of 150,372, about 9½% of the total land area.

In the valley of the Tummel river is the greatest hydroelectric power development in Scotland. The Tummel and its tributaries are harnessed in six hydroelectric stations with an installed capacity in the latter 1950s of about 240,000 kw. and an average annual production of 600,000,000 units of electricity; further developments were expected to add another four small stations and increase the total estimated annual output of the valley to 660,000,000 units. In the Breadalbane district lying between Loch Earn, Loch Tay and Glen Lyon, eight power stations were planned with a total capacity of 118,500 kw. and an estimated average annual output of 384,000,000 units of electricity. The first section of this group went into operation in Dec. 1955. This is the Lawers scheme, which has a 30,000-kw. generating station at Finlarig on the shores of Loch Tay. This station is fed from Lochan na Lairige, a loch on the high pass between Loch Tay and Glen Lyon where a dam was built. The turbine operated in the latter 1950s under a gross head of 1,362 ft., the highest head of the North of Scotland Hydro-Electric board's stations.

Dyeing and bleaching works are in Perth and its vicinity. Flax and jute mills are at Blairgowrie and Rattray and cotton mills at Stanley, Deanston and Perth. Woollens, linen, jute and tartan are woven at Dunblane, Alyth, Auchterarder, Aberfeldy and Pitlochry. Whisky is distilled at Pitlochry, Aberfeldy and Blackford, while Perth is a centre for blending and bottling. Tay fishing, especially salmon, is famous.

The British railways main line to Aberdeen enters the county near Dunblane and runs in a northeasterly direction via Perth. At Perth a line runs eastward to Dundee. The Stirling to Oban line crosses the county from Dunblane to Tyndrum. The main line to Inverness runs northward from Perth. On the east side the line from Edinburgh Waverley runs via Kinross to Perth. The West Highland line to Mallaig skirts the west of the county.

Population and Administration.—The population in 1951 was 128,029 and Gaelic and English were spoken by 2,318 persons, of whom one spoke Gaelic only. The city and royal burgh of Perth (40,487) is the only large burgh. There are 11 small burghs: Aberfeldy (1,528), Abernethy (676), Alyth (2,071), Auchterarder (royal burgh, 2,435), Blairgowrie and Rattray (5,379), Callander (1,728), Coupar-Angus (2,175), Crieff (5,477), Doune (834), Dunblane (2,985), Pitlochry (2,383). There are five county districts.

With Angus the county forms the sheriffdom of Perth and Angus, with a sheriff substitute presiding at Perth and Dunblane. For parliamentary purposes it was divided into the Perth and Western divisions (the latter including Kinross), each returning one member. There are secondary schools at Perth, Crieff, Blairgowrie, Aberfeldy and Callander. Trinity college in Glenalmond and Strathallan are well-known boys' schools.

PERTINAX, PUBLIUS HELVIUS (A.D. 126–193), Roman emperor, the son of a charcoal burner, was born at Alba Pompeia in Liguria. From being a teacher of grammar he rose

through many important offices, both civil and military, to the consulate, which he held twice. Chosen, at an advanced age and against his will, on Jan. 1, 193, to succeed Commodus, he was himself assassinated in a mutiny of the soldiers, on March 28, 193.

PERTZ, GEORG HEINRICH (1795–1876), German historian, the first general editor of the *Monumenta Germaniae historic* for which he laid down the determining principles. Pertz was born in Hanover, March 28, 1795, and was a pupil of A. H. L. Heeren at Gottingen. In 1823 he became secretary of the archives in Hanover, in 1827 royal archivist and in 1842 chief librarian in Berlin. In 1832 Pertz founded the *Hannoverische Zeitung* to promote Baron von Stein's ideas; he also sat in the Hanoverian second chamber. His enduring work, however, was done on the *Monumenta Germaniae.* This owed its inception to Stein but behind it lay a scholarly need, a new pride in the German past and a romantic interest in the middle ages. In 1819 the work was begun under the auspices of the newly founded Gesellschaft für altere deutsche Geschichtskunde, supported by funds from both Prussia and Austria. Stein invited Pertz to help in 1819 and he journeyed through Europe examining manuscripts and making many finds. In 1823 Stein entrusted him with the 'general direction of the work, which was to be a critical edition of writings on German affairs (*Scriptores, Leges, Diplomata, Epistolae* and *Antiquitates)* from *c.* 500–1500. The first two volumes (Carolingian narrative sources), largely Pertz's work, came out in 1826 and 1829 and by 1873, when he was superseded, more than 20 volumes had appeared. Pertz also wrote a life of Stein (6 vol., 1849–55) but his gift was for research rather than for creative work and his biographies had less merit than his editions. He died in Munich. Oct. 7, 1876.

PERU, a republic on the western side of South America. Its area is estimated officially to be 496,222 sq mi., which makes it the third largest South American country. following Brazil and Argentina. Along the Pacific ocean it extends in a general southeasterly direction from 3° 16' S. to 18° 21' S., with a seacoast of about 1,400 mi.. but east of the Andes it reaches north to the equator. Peruvian territory borders on Ecuador and Colombia on the north, Brazil and Bolivia on the east and Chile on the south. Often in the past the territorial interests of these neighbouring countries conflicted with that of Peru, and lengthy negotiations resulted. Indistinctly defined boundaries were of little importance so long as all the territories involved had colonial status. The establishment of sovereign states, however, changed the situation fundamentally. Such factors as contradictory royal decrees, as well as the lack of accurate geographic knowledge of the areas concerned and the later economic development of certain previously unimportant frontier zones, combined to make the problem of modern boundary delimitation a complex one indeed. The frontier between Spanish and Portuguese interests along the upper Amazon, determined by the treaty of San Ildefonso in 1777, was revised by a treaty between Peru and Brazil in 1851 and further modified in 1909 by a treaty which involved Bolivia in addition to Peru and Brazil. While Peru has settled most of its frontier problems with Brazil amicably, violence has marked the boundary disputes with its Spanish-speaking neighbours, culminating in open warfare in the case of Chile and Ecuador.

The more-than-a-century-old frontier dispute with Ecuador was terminated in 1942 by a settlement on the whole favourable to Peru. In the west it retained the areas around Tumbes and Jaén which Ecuador had claimed, while in the east it was confirmed in its rights of possession to those parts of Ecuador's former claim containing navigable affluents of the Marañón and the Amazon. Despite the official settlement, however, the frontier zone remains a potential trouble spot, while Ecuador continues to clamour for access to the important waterways. In the north Peru's common boundary with Colombia follows the Putumayo river to the edge of the Leticia Trapezium, Colombia's southernmost extension, and around it to the south and east to the confluence of the Yavari (Javari) and the Amazon. The boundary then leads up the Yavari to its source, south along the water parting between the Ccayali and the Yurua, and then irregularly to the southeast to the confluence of the Heath and the Madre de Dios. It ascends the Heath in a southerly direction to its source, continuing by an irregular line to the shore of Lake Titicaca, crossing the lake in a southeasterly direction to the Desaguadero, and thence southwest to Chile's northernmost point at 17° 30′ S. The boundary with Chile, after 46 years of bitter dispute, was finally settled in 1929, largely through the mediation of the United States. The line was drawn from the Pacific to the Bolivian border parallel to and 10 km. N. of the Arica-La Paz railway.

Physical Characteristics. — The tremendous mountain system known as the Cordillera de los Andes forms the backbone of Peru. It trends roughly north-northwest and south-southeast, and divides the country longitudinally into three sharply contrasted regions: (1) the coastal zone, a dry strip from 10 to 100 mi. wide; (2) the sierra, a series of great mountain chains with their associated mountain knots, high plateaus and deep valleys; and (3) the montaña, the hot, moist low country to the north and northeast beyond

PERUVIAN CHILDREN OVERLOOKING THE VALLEY OF THE VILCANOTA RIVER NEAR CUZCO

the mountains, consisting in part of slopes and foothills and in part of true Amazonian lowland.

With the exception of a small area near the Ecuadorean boundary. the entire coastal strip is a desert. It is crossed by about 50 streams, most of them intermittent and all of them exceedingly variable in rate of flow. Only about ten of them regularly reach the sea throughout the year. These stream valleys with their rich alluvial soils and their water for irrigation are the site of most of Peru's commercial agriculture and of the densest population clusters. The sierra is approximately 250 mi. wide in the south, narrowing to about 150 mi. in the north. It contains a number of distinct mountain chains, in part parallel to one another or stepped, trending in general with the coast line. On the east is the Cordillera Oriental, on the west the Cordillera Occidental. the main watershed. No other mountains are continuously so lofty (some more than 20,000 ft.) near a coast which drops off to such abyssal depths (20,000 ft. and more). Much of the area between the

mountain chains is occupied by plateau surfaces of gentle to moderate relief known as puna, varying in elevation from more than 13,000 ft. in the south to less than 10,000 ft. in the north. Longitudinal valleys with their tributaries create a gigantic maze of ramifying wild gorges.

Between sierra and montafia lies a transitional zone, the ceja de la montafia ("eyebrow of the montaiia"). The contrast between sierra and montafia on the east, in topography, climate and vegetation, is one of the most abrupt and spectacular on earth. The sierra is dry and cold. The montafia is covered with dense tropical forest, long impenetrable except for rivers and a few short trails to gold and rubber camps.

Coastal Zone.—The littoral of Peru may be conveniently divided into three sections: (1) The southern coast from the Paracas peninsula (about 14° S.) almost to the Chilean border has in large part the aspect of a high wall. This steep escarpment is the seaward aspect of a coast range that exceeds 3,000 ft. in elevation and has a width of 15 to 30 mi. Behind it lies a rocky, dissected surface which rises gradually toward the Andean foothills. (2) The central section irom Paracas to Trujillo (about 8° S.) is without a coast range, though isolated hills are found and a number of small islands occur offshore. The Chincha Islands are famous for their production of guano. Along this part of the coast the slope of the Andes to the sea is continuous and terminates commonly in a low cliff. The alluvial ribbons along the valley floors are devoted to a variety of irrigated crops, among which cotton, sugar cane, rice and alfalfa are most important. (3) North of Trujillo the coastal strip widens to more than 100 mi. as the shore line leaves the vicinity of the Andes. Three minor highlands surmount the coastal plain, and an extensive region of sand dunes is found around Sechura (5° 36' S.). Although of considerable actual and greater potential importance as an agricultural district, the area is most noted for its long-continued production of petroleum from several fields around Talara (4° 35' S.).

Sierra.—The southern Cordillera Oriental, a grandiose wilderness of craggy peaks and ridges, mostly snow covered, loses its high mountain character north of Cerro de Pasco; the extensive puna has no parallel in the north, and the volcanic cones of the Cordillera Occidental, so marked a topographical feature in the south, are entirely absent north of Lima.

Sections of the sierra may be briefly summarized as follows: In southern Peru the puna or altiplano is overshadowed on the east by the Cordillera Oriental (Real) and on the west by the Cordillera Occidental. It is a vast intermontane basin, roughly 500 by 100 mi., sloping gently to the south, very high, cold and dry. Upon it, ranges of low hills alternate with alluvial tracts, salt swamps and many lakes, the largest of which is Titicaca. At an altitude of 12,507 ft., Lake Titicaca is 125 by 35 mi., with an average depth of 100 ft. (maximum about 892 ft.). Well-defined on the east, the bordering scarps of this great tectonic depression are concealed on the west by thick lava flows. Near the lake, crops of barley, quinua (quinoa) and potatoes are grown, while the western part of the plain is pastoral, covered with grass and occasional stretches of bushy growth. Puno is the only large town. Seen from the western slopes of the Cordillera Occidental, the even sky line of the lava plateau is broken by a series of volcanic peaks, some eroded, some symmetrical. They are isolated, snow capped, dormant or extinct, 19,000 to 20,000 ft. in height (Coropuna, 21,696 ft.). Earthquakes are frequent throughout this area. The bordering scarps of the altiplano converge on the north at the Nudo de Vilcanota (14° 26' S.). In the valley of the Huatanay, 11,207 ft. high, is the ancient city of Cuzco. In this beautiful, luxuriant valley enclosed by mountains the Incas founded their great empire. Between 12° and 14° S. the heart of the sierra is a wilderness of gorges with cliffed sides, some more than 6,000 ft. deep. Into these it is usually impossible to descend. The valley of the Apurímac is spectacular, its highly coloured walls with tufts of cactus reaching from fever-ridden floor to snowy peaks. Between 10° and 12° S. the puna is called the Pampa of Junin. It has many lakes, the largest of which is Lake Junin (Chinchaicocha), 14 by 6 mi., altitude 13,560 ft. From it the Mantaro flows south across the plain—a deep, silent, swift-flowing stream. The chief activities on this plain are mining and pastoral, the only crops, potatoes and quinua. North of the Pampa of Junin is the Cordillera de Huayhuash, as the Nudo de Cerro de Pasco is now called, a desolate mining region. North of this, the western chain is divided in two, Cordillera Negra, toward the west, and Cordillera Blanca, so called because of its snowcaps. The latter (8° 43' and 9° 53′ S.) is about 100 mi. long, its average height 15,000 ft. and its highest peak, Huascarán (22,205 ft.), a laccolith of granodiorite. Inhabitants are few, Indians living on slopes and valley moraines in small groups of huts like animal burrows. The Cordillera Negra (8° 43' S. and 10° 11′ S.) is about 110 mi. long and about 14,000 ft. high (maximum 14.764 ft.). The bare, dark gray rocks and even sky line contrast with the sharp peaks of the Cordillera Blanca. It is an unbroken wall without practicable passes. Between the two ranges lies the fertile valley of the Huaraz (Huarás), averaging 25 mi. in width, one of the most thickly settled parts of the sierra. The river flows north through a series of basins each with its town—Recuay, Huaraz, Yungay, Caraz, Huaylas—strung like beads upon a thread, responding to the presence of good soil, water and favourable climate. Temperate-zone crops are raised in the upper reaches of the valley and tropical in the lower, known as the Callejón de Huaylas. At 8° 40' S. the Huaraz, now called Santa, cuts the Cordillera Negra at right angles and crosses the desert to the Pacific. Two great rivers, the Marañón and Huallaga, rise on the northern slopes of the Cordillera de Huayhuash. The valley of the Marañón, 500 mi. long (4° 30′–10° 20′ S.), and for most of that distance more than a mile deep, is east of the Cordillera Blanca and parallel to it. In the rainy season the Marañón is impassable. It cuts the Cordillera Oriental at the Pongo de Manseriche (4° 25' S.) and flows toward the Atlantic. The valley of the Huallaga, farther east than the Marañón, is more open and populated. Huánuco, in the upper valley, communicates by a good road with Cerro de Pasco. The Huallaga cuts the eastern chain at the Pongo de Aguirre (6° 30' S.). North of 8° S. the cordilleras gradually subside. There are no more snowy peaks. The plateau levels commonly lie at 7,000 to 9,000 ft. above the sea. The ancient town of Cajamarca is the agricultural centre of the northern sierra.

Throughout the length of the Peruvian Andes there are 27 practicable passes, most of them more than 12,000 ft. high. The highest in use, between Antabamba and Cotahuasi, is 17,400 ft. above sea level, whereas the lowest, the Porculla pass in the far north near Piura and Olmos, is only 7,072 ft. high.

Montaña.—This area, which covers more than half of the nation's territory, is virtually unexplored. Yet its economic possibilities are very great and its vast timber, mineral and possible petroleum resources will benefit the national economy when an improved system of transportation makes the region accessible. Except for a series of mule trails, an automobile road, opened in 1943 to connect Lima via Huánuco with Tingo Maria on the Huallaga and with Pucallpa on the Ucayali, provides the only contact by land between the coastal area and the montafia proper. From Pucallpa a three-day trip downstream by boat gives access to Iquitos, the chief centre of Peruvian Amazonia.

A project of the utmost importance for the opening up of the montafia zone was launched in 1953 when the U.S. Le Tourneau interests reached an agreement with the Peruvian government according to which they undertook to clear and develop approximately 1,000,000 ad. of jungle in the Pachitea river region. This project involved the construction of a stretch of road to connect with one of the existing east-west highways.

Climate.—The three major climatic controls in Peru are latitude, the ocean and relief. The latter, in its twin aspects of elevation and exposure, is the most important. Climatic change is far more rapid from east to west than from north to south. A few hours of ascent from the west coast will bring a change from a temperate marine desert climate to a very cold, brilliantly illuminated tropical highland. A similar ascent from the equatorial lowland up the eastern border valleys brings even more rapid contrasts. Rainfall. which is heavy in the east, increases to a certain height, then decreases from east to west across the sierra. Easterly winds sweep across the warm lowlands of Amazonia, filled

with moisture. Confronted by the Andes, they are forced to rise, undergo adiabatic cooling, and heavy rains result. The annual rainfall on the low eastern slopes probably exceeds 150 in. Swollen streams give rise to the world's greatest river system. Along the Pacific coast the Humboldt or Peru current flows northward, bringing cool water both from higher latitudes and from the depths of the sea. Prevailing south and southwest winds, cooled by the ocean and saturated with moisture, rise over the coast and the Andean foothills and produce widespread fogs (*garúas*) and low stratus clouds, which are especially characteristic of the southern coast in winter. Occasional violent summer rains causing widespread damage occur at irregular intervals, especially along the northern coast. They are correlated with as yet unexplained changes in the part of the Humboldt current which veers out to sea and allows a broad belt of warm water from the equatorial countercurrent to flow south along the shore.

Climatic provinces are distinguished chiefly by variations in rainfall. From east to west, montafia and ceja de la *montaña* (the higher eastern slopes) have precipitation throughout the year, heaviest in summer. Sierra rainfall, confined to summer, diminishes both in quantity and in length of season toward the south. The rainfall of the higher western slopes resembles that of the sierra, the amount of precipitation diminishing with altitude.

1. The immediate coast zone, though desert, has a cool, damp climate with small annual and diurnal variability. Mean annual temperatures at the north average about 10° F. wanner than those at the south (Paita 75° F., Mollendo 65° F.). The western slopes below 4,000–6,000 ft., though averaging about the same, have greater diurnal ranges of temperature. This uniformity, interrupted by no storms and no sudden changes of temperature, is very monotonous, especially since the skies, as far north as 8° S., are covered with clouds during more than half the year, though the total annual rainfall is less than two inches.

2. The summer rain zone is an extremely complex province. It includes, besides the western slopes above the rainless zone already described, the summit region at about 15,000 ft., desolate, high plateaus. intermontane basins and deep canyons, whose climates range from equatorial to frigid. Climates in Peru depend primarily on altitude; deep valleys are tropical to semitropical, depending on depth, valley trend, slope and exposure. Mean annual puna temperature averages about 50° F., with greater diurnal than annual range. With an average relative humidity of 50%, the mean annual rainfall is 2j in. in the south, where it is confined to summer, reaching 40 in. in the north, where precipitation occurs in spring, summer and autumn, overlapping the equatorial rainfall type. Snowfall occurs south of about 7° S. above 12,000 to 13,000 ft. Because of aridity the snow line is very high. Heat in deep sierra valleys is so great and rainfall so slight that often the narrow floors are semidesert; while 4,000 to 6,000 ft. above those same floors rainfall may exceed 80 in. Similarly, high-level basin stations have less rainfall than surrounding mountains and irrigation is often necessary.

3. Maximum rainfall is on the eastern slopes between 4,000 and 8,000 ft. elevation. Rainfall may be different on opposite sides of a single valley, so that the eastern walls may be grassy, the western, forest-covered. The mean annual temperature is about 72° to 75° F., with a negligible range.

4. Constant evaporation takes place above the great Amazonian wilderness (the area of which equals half that of Europe) and this moisture is precipitated, to be once more vaporized and condensed. Excessively high relative humidity is maintained throughout the year, so high that salt dissolves and matches will not ignite unless kept in airtight boxes. Rainfall averages considerably more than 100 in., with winter minimum. The mean annual temperature probably averages 78° F., with a range of 3" F.

Hydrography. — The cordillera supplies three systems of drainage. The first flows toward the Pacific, the largest of these streams (Santa) is the only one to cross the Cordillera Occidental. The second flows toward the Atlantic, including such vast tributaries of the Amazon as the Marañón, Huallaga, Mantaro and Apurimac. These quick-flowing streams pass through narrow pongos (gateways) and then join the sluggish jungle streams of Amazonia, whose branches spread out over half a continent before reaching the Atlantic, nearly 3,000 mi. a ay. The third is that of Lake Titicaca, an inland system complete in itself, fed by perpetual snow. The Desaguadero river, a shallow stream, empties into Lake Aullagas (Poopó), thence into a series of salares (salt swamps) to the south, where its waters eventually evaporate.

(H. J. Bn.; M.T. Bi.; K.L.L.)

Vegetation. — The division of the territory into three contrasting regions applies logically to Peru's plant life:

1. Costa, mostly a narrow, dry stretch of coastal plain, consists of desert and semidesert types of vegetation. Species of *Capparis*, associated with algarroba (Prosopis *chilensis*), various other trees and shrubs, grasses, numerous herbaceous annuals and some tuberous plants predominate. Other types of habitats, such as wet sea cliffs, brushy riverbanks and seashore formations, add diversity to the area, while northnard, principally in the department of Tumbes, a green parklike landscape, with many kinds of trees and shrubs, columnar cacti and small annual grasses, occurs.

2. Sierra, a diversified region embracing the western slopes, high Andean regions and valleys lying between the main Andean chain, varies in width from 1jo to 250 mi. In southern Peru the western slopes of the Andes are marked by a shrubby zone of Franseria and *tola* (*Lepidophyllum*) with altitudinal belts of desert at the lowest elevations to columnar cacti higher up, finally to *tola* heath from 11,500 to 12,000 ft. Northward the flora of the western Andean slopes is richer because of the less arid climate. In central and southeastern Peru between 11,500 and approximately 12,200 ft., above the limit of agriculture, the puna zone predominates. Most of the *puna* plants consist of perennial herbs, characterized by such rosette and cushion plants as *Werneria, Azorella* and Distichia; the treelike bromeliad, Puya raimondii, occurs there. Farther north exists the Jalca, whose extensive essentially treeless paramos correspond to the *puna* formation with similar types of plants. South of 11° lat. in the inter-Andean valleys, with their moister climate, there are more shrubs, especially on the higher slopes where many shrubs hold their leaves all year instead of shedding them periodically as on the lower slopes affected by a drier climate. In the inter-Andean Huallaga river section, with dry climate, occur various columnar cacti, pepper tree (Schinus *molle*), *Fourcroya* and many other kinds, depending upon the altitude. To the north in the inter-Andean valley of the Marañón river the increased humidity effects a corresponding change in vegetation, ranging from treeless or grass steppes and cacti on the upper slopes to sparsely forested formations in the lower and main portion of the valley.

3. Montana, or eastern slopes, embrace an area of dense forest, which begins at the tree line on the eastern slopes of the Andes and continues eastward into the tropical lowlands of the interior. There is encountered the richest and most luxuriant display of plant life. The lower tropical part, the montafia proper, extends up to approximately 5,500 ft., about the limit of tropical agriculture. Vegetable ivory (Phytelephas), cabinet woods, dyes, medicinal and fibre plants grow in this area. On the more elevated part of the eastern slopes, the ceja, between 5,500 and 11,000 ft. altitude, the predominant vegetation consists principally of trees and shrubs with firm, leathery, evergreen foliage, a response to the cooler climate. There occur an abundance of tree ferns, members of the heath (Ericaceae) and sunflower (Compositae) families, and such genera as barberry (Berberis), *Fuchsia, Vallea* and *Calceolaria*. In this area, likewise, abound many epiphytic flowering plants and ferns. (J. A. Sk.)

Fauna. — The fauna, too, divides naturally into that of the coast, of the high Andes and of the Amazonian lowland. There is little life on the coast except for vast numbers of sea birds, which feed in the teeming waters of the Humboldt current. The Andes are the principal home of the American cameloids, the domestic llama and alpaca and the wild vicuña. Rodents include. the rabbit-sized mountain *vizcacha* and, formerly, the chinchilla (now more abundant as an introduced form in North America than in its native region). The montane condor descends to the seacoast for carrion. The life of the tropical lowland is that of the Amazon basin in general. (See Amazon: Vegetation and Fauna.) (X.)

HISTORY

Ruins of vast edifices at Tiahuanaco just south of Lake Titicaca, at Cuzco and at Ollantaytambo appear to have been erected by sovereigns with unlimited command of labour. Of their origin nothing is known, for they are entirely unlike the later Inca structures. Settlement of the Cuzco valley by the Incas or "people of the sun" probably took place in the 13th century. They already possessed a considerable civilization, and an empire dating from the victories of Pachacutec Inca about a century prior to Huayna Cápac, the Great Inca, who died in 1526, one year before Francisco Pizarro first appeared. The consolidated empire extended from the Ancasmayo river north to Quito to the Maule in Chile. (See INCA.)

In March 1526 a contract for the conquest of Peru was signed by Pizarro, Diego de Almagro and Hernando de Luque. In 1527 Pizarro landed at Tumbes. The next year he went to Spain, and in 1531 returned to Tumbes with his brothers. The civil war between Huáscar and Atahuallpa, sons of Huayna Cápac, had been fought out in the meanwhile, and the victorious Atahuallpa was at Cajamarca, whither Pizarro with 183 men made his way. On Nov. 15, 1532, after a friendly welcome from the Inca, Pizarro treacherously seized him. In Feb. 1533 Almagro arrived with reinforcements. In spite of fulfilling an agreement to provide a vast ransom in gold and silver, the Inca Atahuallpa was murdered on Aug. 29, 1533; in November Pizarro entered Cuzco. He allowed Manco, the legitimate son of Huayna Cápac, to be solemnly crowned. Almagro then undertook an expedition to Chile, and Pizarro founded the "City of the Kings" (Lima) on Jan. 18, 1535. A dispute arose between Francisco, Juan and Gonzalo Pizarro and Almagro as to the limits of their respective jurisdictions; Almagro was defeated near Cuzco in 1538 and executed. His adherents recognized his young half-caste son, a gallant youth generally known as Almagro the Lad, as his successor. Bitterly discontented, they conspired at Lima and assassinated Francisco Pizarro on June 26, 1541. Meanwhile, Vaca de Castro had been sent out as governor by Charles V. On Sept. 16,1542, he defeated Almagro the Lad and beheaded him at Cuzco.

Civil Wars.—The "New Laws" code was enacted in 1542 whereby grants of estates (encomiendas), on which the inhabitants were bound to pay tribute and give personal service, reverted to the crown on the death of the holder. Blasco Núñez Vela was sent out in 1544 as first viceroy of Peru to enforce the New Laws. Their promulgation aroused a storm among the conquerors. Gonzalo Pizarro rebelled and entered Lima on Oct. 28, 1544. The viceroy fled to Quito, but was followed and killed in Jan. 1546. The New Laws were revoked. Pedro de la Gasca, first president of the court of justice of Peru, arrived in 1547, and in April 1548 defeated and executed Gonzalo Pizarro near Cuzco. La Gasca made a redistribution of encorniendas to the loyal conquerors, which caused great discontent, and left Peru before his scheme was made public in Jan. 1550. Don Andrés Hurtado de Mendoza, marquess of Cañete, entered Lima as viceroy on July 6, 1555, and ruled with an iron hand for six years. All leaders in former disturbances were sent to Spain. Magistrates were ordered to execute all turbulent individuals. Unemployed persons were sent on distant expeditions, The viceroy came to an agreement with Sayri Túpac, son and successor of the Inca Manco, and granted him a pension. Schools and towns were founded, wheat, vines, olives and European domestic animals introduced. From this time there was a succession of viceroys until 1824. The splendour of their entourage was unexcelled. Meanwhile, in the sierra, Indians were being exterminated in an extravaganza of destruction.

Viceroyalty.—Don Francisco de Toledo (viceroy 1569–81), fearing that the little court of the Inca Tupac Amaru might prove rebellious, beheaded the last of the Incas at Cuzco in the year 1571. Toledo's Libro de *Tasas* fixed taxes on the Indians, exempting all under 18 and over 50, and imposed, in addition to the tribute, the mita, or forced labour in mines and farms.

The Spanish authorities, although desiring to protect the people, were unable to restrain distant officials and the country was depopulated by the illegal methods of enforcing the mita. Moreover. the colonies suffered from the strict trade monopoly of Spain and from the arbitrary proceedings of the Inquisition. Between 1581 and 1776, 59 heretics were burned at Lima. and there were 29 autos-da-fé. In 1780, Tupac Amaru II. a descendant of the Incas, rose in bloody revolt. He was brutally executed the following year, and the rebellion was finally crushed in 1783.

Peru Independent.—Meanwhile the Creoles (American-born Spaniards) had long been shut out from all important official positions. Peru was still the centre of Spanish power in South America, though New Granada (Colombia) in 1740 and Rio de la Plata (Argentina) in 1776 had been created independent viceroyalties. As military strength was concentrated at Lima, the more distant provinces, Chile and Buenos Aires, were first to declare themselves independent, in 1818 and 1816. But destruction of the viceroy's power in Lima was essential to their continued independent existence. A fleet fitted out at Valparaiso, commanded by Thomas Cochrane, later 10th earl of Dundonald, convoyed the Argentine and Chilean army under command of the Argentine general, José de San Martin (*q.v.*), to the coast of Peru in Sept. 1820. San Martin was enthusiastically received, and after the viceroy had withdrawn, the independence of Peru was proclaimed at Lima (July 28, 1821). The young republic honoured San Martin by giving him the title of protector.

Though Lima was now in patriot hands, strong viceregal forces remained in the interior. To discuss united action in eliminating this last stronghold, Simón Bolivar (*q.v.*), the man who had triumphantly swept Spanish colonial power from the northern sector of South America. met with San Martin at Guayaquil. Ecuador, in July 1822. Two months later San Martin resigned his protectorate and left the country, the government falling successively to the congress, Pres. José de la Riva Agüero, and then to Bolivar. In two memorable battles, at Junin on Aug. 6, 1824, under Bolivar's command and at Ayacucho on Dec. g, 1824, under that of the Colombian general Antonio José de Sucre, the Spanish forces were decisively defeated. Spanish power in Peru (and in South America) was at an end. Upper Peru was given the name of Bolivia, in honour of the liberator, and declared an independent republic in 182 j. Bolivar ruled Peru with absolute powers until Sept. 1826.

Early Presidents.—Gen. José de la Mar, who commanded the Peruvians at Ayacucho, was elected president in Aug. 1827, but was deposed and Gen. Agustin Gamarra, chief of staff in the patriot army at Ayacucho, was elected third president in Aug. 1829. From 1829 to 1844 Peru painfully experimented with independence. The officers who fought at Ayacucho were all-powerful and settled political differences by the sword. Three men during that period are conspicuous: the generals Agustin Gamarra, Felipe Santiago Salaverry and Andrés Santa Cruz. Gamarra never accommodated himself to constitutional usages, but attached to himself many loyal and devoted friends. Born at Lima of pure Basque descent, Salaverry joined the patriot army before he was 15 and displayed audacious valour in many a hard-fought battle. Andrés Santa Cruz was an Indian, his mother a lady of high rank, and he was very proud of his descent. Unsuccessful as a general in the field, he nevertheless possessed remarkable administrative ability and for nearly three years (1836–39) realized his dream of a Peru-Bolivian confederation. But the strong-handed intervention of Chile on the ground of assistance rendered to rebels ended in the defeat and overthrow of Santa Cruz. After this, except for the administrations of Gen. Ramon Castilla (1845–51 and 1855–62), revolution succeeded revolution for the spoils of office. In 1849 regular payment of interest on the public debt was begun, steam lines were established along the Pacific coast and a railway was built from Lima to Callao. A dispute with Spain, arising from indemnity claims for injuries to Spanish subjects, precipitated actual war in 1864, when Spain suddenly seized the Chincha Islands. In the naval war which ensued, Peru received active aid from Chile and support from Ecuador and Bolivia. Actual hostilities ended with a heavy Spanish bombardment of Callao in May 1866, but a formal truce was not mdde until 1871, followed eight years later by a treaty of peace. In 1868 Col. José Balta became president. With the vast sums of money raised from guano and nitrate deposits at his disposal, he began the construction of public works. principally railways, on a gigantic scale. He was succeeded in 1872 by Manuel

Pardo, the country's first civilian president, an honest and enlightened individual who was sincerely concerned with promoting education and literature and with carrying out governmental reforms. Yet the reckless expenditures on the part of his predecessor doomed Pardo's best endeavours to failure, and the country was all but bankrupt when Gen. Mariano Prado took over the reins in 1876.

War **of the** Pacific.—Peru and Bolivia, alarmed at continued Chilean encroachments in the desert of Atacama, signed on Feb. 6, 1873, a treaty of defensive alliance. On Feb. 14, 1879, Chile, in the course of a dispute over Bolivia's right under treaty to levy an export tax on nitrates, occupied the Bolivian port of Antofagasta, and on April 5 declared war on Peru (see PACIFIC, WAR OF THE). When President Prado went abroad to secure aid, Nicolás de Piérola usurped his power and had himself elected president in 1879. Several attempts on the part of the United States to mediate in the dispute failed. Chile refused to deal with President Piérola, but sanctioned a provisional government set up in 1861 under Francisco Garcia Calderon. When the latter, however, failed to meet Chile's demands. he was exiled. The occupation of Lima by Chilean forces continued for almost three years and serious harm resulted to the city and its cultural institutions. The university was looted and the National Library destroyed. Finally, Gen. Miguel Iglesias, who favoured accepting the Chilean terms, was elected president, and on Oct. 20, 1883, a treaty of peace was signed at Ancón. Chilean soldiers, however, were not withdrawn from Peruvian territory until 1884 when the treaty was ratified. The chief conditions imposed by Chile were: unconditional cession in perpetuity of Peru's nitrate province of Tarapacá; possession for a period of ten years of the provinces of Tacna and Arica, after which time a plebiscite should decide whether the territory was to remain under Chilean rule or should revert to Peru. As Iglesias' name was linked to these harsh peace terms, his presidency was short lived and he was forced out of office in 1885.

(M.T. Bl.; K.L.L.; X.)

Peru After 1883.—Economically, politically and culturally, Peru was slow to recover from the conflict. For the remaining years until the turn of the century the presidency was occupied chiefly by military men. In the field of international affairs, the border dispute with Ecuador flared up once again, while the failure on the part of Chile to honour the agreement by holding a plebiscite in Tacna and Arica in 1894 opened old wounds in Peru's leadership and population. A final settlement of the vexing problem was not reached until 1929 when a treaty concluded with the aid of the United States assigned Tacna to Peru and Arica to Chile, imposing compensatory payments upon the latter.

Nicolás de Piérola who took power in 1895 initiated a system of reforms designed to lead the country along the road of recovery. His plans for building up the national economy included the exploration of some of the country's virtually untapped rubber and petroleum resources in the eastern jungle regions. Among the men who held the presidency during the next 25 years, most of whom ruled the country without excessive regard for democratic principles, Augusto B. Leguia should be mentioned. He started his first four years of office in 1908 with certain reforms but in 1919 revealed increasingly authoritarian methods. His attempt to serve for a third term was foiled in 1930 by a rebellion which broke out at Arequipa under Gen. Luis M. Sanchez Cerro. Elected president in Oct. 1931 Sánchez Cerro met with considerable internal opposition and frequently had to resort to emergency powers. His severest critics belonged to Apra (Alianza Popular Revolucionaria Americana), a political party and social group which advocated a pro-Indianist, anti-imperialist doctrine.

The ideological groundwork for Apra had been laid by the writer and intellectual Manuel González Prada (1844–1918) whose analysis of the causes of Peru's defeat in the disastrous War of the Pacific and its subsequent decadence led him to radical conclusions. His work was carried on by two prominent disciples: José Carlos Mariitegui, and especially Victor Raúl Haya de la Torre who. while exiled from Peru in 1923, created the Apra movement in Mexico and remained its leader. Mariátegui, a brilliant economist and historian who ideologically stood further left than Haya de la Torre, eventually parted company with his former associate and unsuccessfully challenged his leadership. Mariátegui died in 1930. Haya de la Torre proposed to achieve national reforms by uniting students and labour, "intellectual and manual" workers. He was jailed in 1932 and his party was outlawed for plotting against the government. One year later President Sánchez Cerro was assassinated, and Gen. Oscar R. Benavides was appointed by congress to complete the unfinished presidential term. In 1934 Peru returned to Colombia the Leticia Trapezium occupied by Peruvian forces in 1932 in violation of an existing treaty.

In 1936 congress, rather than face the possible electoral triumph of an Apra-backed presidential candidate, challenged the legality of the elections, entrusting Benavides with absolute powers and the mandate to continue in office. Benavides retired in 1939 and was succeeded by Manuel Prado y Ugarteche, the first civilian in a decade to fill the nation's highest post. Peru, though declaring strict neutrality at the outbreak of World War II, soon espoused the Allied cause and opposed the axis, and even the Apristas overcame their anti-U.S. bias in a reappraisal of their position prompted by world developments.

Free elections held in June 1945 returned a coalition government which was headed by José Luis Bustamante y Rivero. In this coalition, called the Democratic front, in which they held three cabinet posts, the Apristas at first wielded considerable power which reflected a substantial increase in popular support. The three Apra members relinquished their cabinet posts, however, and the party temporarily lost support when President Bustamante was overthrown in 1948 and Gen. Manuel A. Odria came to power. Once again Apra, which since 1944 had been known as the People's party, was outlawed and Haya de la Torre was forced in 1949 to seek refuge in Colombia's embassy in Lima. Peru demanded his surrender as a common criminal, while Colombia regarded him as a political refugee and therefore entitled to asylum. The matter was submitted to the International Court of Justice for arbitration. The decision of the tribunal did not clarify the issue entirely, and Haya de la Torre remained in the Colombian embassy until direct negotiations between Peru and Colombia finally resulted in his departure for Mexico at the beginning of April 1954. Odria, elected for a six-year term in 1950, at once turned his attention to economic reconstruction. and at the close of the year Peru's trading balance was active for the first time since 1946. In 1951 Peru signed the General Agreement on Tariffs and Trade. Government projects envisaged irrigation schemes and a new road-building plan, including one which would help develop the eastern slopes. In 1952 Peru banned exports of strategic materials to Russia and its satellites and in March 1953, imports from the same countries, giving as a reason for this measure an unfavourable balance of trade with the areas concerned. The five economic and cultural agreements which Odria concluded with Pres. Getúlio Vargas of Brazil and which were made public in Aug. 1953 were interpreted in many quarters as designed to counterbalance Argentina's growing hemispheric influence. Budget and trade deficits in 1954 were controlled with the aid of sizable U.S. loans from the Chase National bank, the U.S. government and the International Monetary fund. During 1954 the century-old border dispute with Ecuador, which was thought to have been settled at Rio de Janeiro in 1942, flared up once again. There were charges and countercharges; minor clashes along the common boundary and a verbal exchange at the Caracas conference, hut no lasting settlement was reached. In November Panamanian whaling vessels were impounded by Peruvian coast guards for violating the terms of an agreement between Peru. Ecuador and Chile which. while allowing each other's operations in any sector of a zoo-mi. strip from the shore. banned outsiders from it. Once more a formal protest by Ecuador in 1955 accusing Peru of aggressive designs, this time before the Council of American States, proved unfounded when investigated.

Odria. who had ruled eight years with absolute powers but who had undoubtedly benefited the country by his liberal economic policies, relaxed his political controls somewhat during his final year, authorizing free elections to be held on June 17, 1956. Women, were given the vote for the first time in the nation's history. In a three-way contest which saw Hernando de Lavalle, the candidate

supported by Odria, trailing the other t o by a wide margin, Manuel Prado y Ugarteche, president from 1939 to 1945, was again elected to the country's highest office.

POPULATION AND SOCIAL CONDITIONS

Population. — By 1953 there had been an estimated increase of more than 2,000,000 in population since the official census of 1940, which showed a total of 7,023,111 inhabitants. Ten years later, on Dec. 31, 1950, this figure had risen to 8,605,549, reaching at the end of 1953 a total of 9,125,750. In considering these figures it must be borne in mind, of course, that the number of persons covered by actual census methods was approximately 10% lower and that the balance was computed from census omissions and the inhabitants of the eastern jungle regions. In 1940, for instance, inhabitants counted by census were 6,207,967, while census omissions amounted to 465,144 and the jungle population was calculated at 350,000. Most of the country's economic life is concentrated along the coast where the most densely populated areas are located and where slightly more than one-third of the country's population can be found. According to ethnic origin, roughly 46% of Peru's population is of pure Indian stock, 53% is either white or mestizo, while the dark and yellow races (the latter chiefly Chinese and Japanese) contribute about 1%.

Several million Indians of Quechua stock, constituting by far the majority of Peru's Indian population, live in the highlands, while roughly 500,000 of the Aymara group live in an area of which Lake Titicaca is the centre, and a few hundred thousand of a more primitive tribe inhabit the eastern zone.

In contrast with the Indians of Mexico who share actively and prominently in national affairs, the Peruvian sierra Indian leads a relatively isolated existence perpetuating his languages, customs and rituals. Some cultivate their own land, while others work as labourers. The village has retained its traditional closely knit character and, though individual ownership of the soil has become the rule, the community will collectively defend its interests in case of emergency. The Indians build their own homes, usually plain adobe huts with thatched roofs, and make their clothing out of rough homespun for which chiefly sheep and llama wools are utilized. Mainly such traditional subsistence plants as potatoes, quinua and oca are groan by time-honoured methods of agriculture. Native languages and rituals still play important roles, though bilingualism is on the increase and Catholicism has long been accepted as the official religion.

Between 10% and 15% of the population is white, chiefly of Spanish stock. These share with the mestizo element the control of Peru's political and economic fortunes. Slaves brought in under colonial rule account largely for the small number of Negroes found today exclusively in the coastal zone. Chinese immigration received its strongest impetus by the arrival of labourers who reached Peru between 1849 and 1874, whereas Japanese colonies are a 20th-century phenomenon. Germans, Italians, Spaniards, British and North Americans have enriched the national mosaic.

Cities. — Table I shows departments and capital cities, along with their population figures according to the census of 1940 and the official estimates for Dec. 31, 1953.

Unlike Mexico City, Bogotb (Colombia), and other capitals established on the sites of old Indian strongholds, Lima was chosen by the Spaniards to be Peru's capital city rather than Cuzco, the ancient centre of the Inca empire, located in the Andes. The founding of Lima shortly after the feast of the Epiphany gave it its alternate name, "City of the Kings."

Lima and its seaport of Callao are the two most important centres. Official estimates at the end of 1953 placed their respective population figures at 964,800 and 108,600. The country's population is densest in this area, which is regarded as the political, economic and cultural hub of the nation. Lima and Callao were the only departments to increase their populations by more than 50% during the period covered by Table I; other increases as a rule did not go beyond 25%. Third comes Arequipa (103,422), distributing centre for southern Peru, followed by Cuzco (59 918), victim of a violent earthquake in 1950 which damaged four-fifths of the city. Trujillo (50,930), Chiclayo (43,000) and Piura (26,400) in the northern sector of the coastal zone figure prominently in the country's agriculture, chiefly as producers of Peru's main export crops, cotton and sugar.

Iquitos (45,200), important Amazon river port and trading point, stands out in the tropical jungle of eastern Peru. Grouped in a crescent around the departments of Lima and Callao are Ica, Huancavelica, Huancayo. Cerro de Pasco, Hubnuco and Huaraz,

TABLE I.—*Population of Peru by* Departments

Department	Capital	Census 1940, adjusted	Population est., end of 1953
Amazonas	Chachapoyas	89,560	112,754
Ancash	Huaraz	465,135	582,366
Apurimac	Abancay	280,213	350,836
Arequipa	Arequipa	270,996	339,206
Ayacucho	Ayacucho	414,208	519,225
Cajamarca	Cajamarca	568,118	712,139
Callao	Callao	84,438	128,987
Cuzco	Cuzco	565,458	708,701
Huancavelica	Huancavelica	265,557	332,486
Huánuco	Huánuco	276,833	347,335
Ica	Ica	144,547	180,978
Junín	Huancayo	500,161*	480,418
La Libertad	Trujillo	404,024	505,852
Lambayeque	Chiclayo	199,660	249,982
Lima	Lima	849,171	1,362,100
Loreto	Iquitos	321,341	406,485
Madre de Dios	Puerto Maldonado	25,212	32,189
Moquegua	Moquegua	35,709	44,708
Pasco	Cerro de Pasco	*	147,046
Piura	Piura	431,487	540,237
Puno	Puno	646,385	809,509
San Martin	Moyobambs	120,913	152,010
Tacna	Tacna	37,512	46,966
Tumbes	Tumbes	26,473	33,145
		7,023,111	9,125,750

*The figure quoted for Junfn included, at the time of the 1940 census, the population of Pasco which was then one of Junín's provinces. The Departamento de Pasco was established on Nov. 27, 1944.

guarding the land approaches to the capital. Structurally and architecturally Peruvian cities have largely preserved their colonial flavour. A central plaza contains public and religious buildings, streets follow a rectangular arrangement and most houses adhere to a colonial style with central patios, tile roofs and wrought-iron grills and balconies.

Public Health and Social Welfare. — The five years between 1948 and 1953 witnessed an over-all reduction in infectious disease by almost 30%. Approximately an equal number of cases of tuberculosis and malaria (more than 17,000 each) were reported in 1953, whereas the toll taken by whooping cough was said to have been slightly lower and outbreaks of dysentery, syphilis, typhoid and paratyphoid were substantially controlled.

To combat disease and look after the sick, the country had, in 1928, 45 hospitals, all of them charity hospitals. In 1953 there were 120 hospitals, public as well as charity, and private clinics, in addition to a growing number of antitubercular and antivenereal dispensaries, and to dental and first-aid stations. Social security and social insurance schemes aided the individual in meeting the cost of sickness, childbirth and disability and in protecting him against the hazards of old age. There were homes for orphans, the aged and the blind. Conscious of the close link between housing and national health, the government, helped by inter-American and Pan-American agencies, was undertaking extensive housing developments. The national budget for 1953 set aside slightly less than $4,500,000 for expenditures in health and social welfare, indicating a reduction of over $500,000 from the 1951 budget. Peru's birth rate was 33.5 per 1,000 persons on June 30, 1953, and the death rate was 11.3 per 1,000.

EDUCATION AND CULTURAL CONDITIONS

Education. — The budget for 1953 assigned almost $18,000,000 to national education. Standing fourth in the order of expenditures, its budgetary allotment was slightly below that of national defense. Primary education is free and obligatory for children from 6 to 14. In 1953 there were 11,769 elementary schools with 27.361 teachers and 1,046,836 pupils; and 318 secondary schools with 5,786 teachers and 83,344 pupils. While about 88% of all primary schools are public, almost two-thirds of the secondary ones are operated by private institutions, frequently with religious affiliation, or maintained by colonies of foreign residents. Trade

schools, emphasizing agricultural, industrial or commercial subjects, numbered 167 in 1953, with a teaching staff of 2,545 and 23,239 students. Next to Mexico, Lima became the earliest centre of Spanish power in America. The University of San Marcos was founded at Lima in 1551 and the first printing press was set up in that city in 1584, about half a century after it had been introduced into Mexico and half a century before it was to appear in the regions north of the Rio Grande. In addition to the National University of San Marcos, which reported an enrolment of 8,176 in 1953, there are three small national universities at Trujillo, Arequipa and Cuzco (in order of student enrolment) and a Pontifical university at Lima. The total university enrolment for 1953 was given as 12,805.

Literature and the Arts.—Peru's earliest literary documents relate to the colourful details of its conquest recorded in chronicle form by some of Pizarro's associates, such as Pedro Cieza de Léon and Francisco de Jérez. The first native-born chronicler, and one of the most renowned, was Garcilaso de la Vega (*q.v.*), known as "el Inca" (1539–1616), son of a Spanish conqueror and an Inca princess, thus fusing two races and two cultural traditions. His *Comentarios reales,* published in 1609 and 1617 (Eng. trans. of part I by Sir Clements R. Markham, 2 vol., London, 1869–71), are an indispensable reference work for the history as well as the cultural and social institutions of the Inca empire. The 17th and 18th centuries were somewhat static culturally in Lima, with strict censorship impeding importation of foreign books and all but stifling genuine literary expression at home. The elegant, somewhat laboured prose of Juan de Espinosa Medrano, "el lunarejo," the picaresque poetry of Juan del Valle y Caviedes and the learned products of the scholar and linguist Pedro de Peralta y Barnuevo illustrate some of the literary activity of this period. The publication in 1773 of a prose work, *Lazarillo de ciegos caminantes,* marked the timid beginnings of the novel, while the discovery, in 1781, of *Ollantay,* a play in Quechua dealing with an Inca subject, posed the question of its true date of origin.

In the wake of romanticism. Ricardo Palma (1833–1919), one of Peru's most renowned names. created a new literary genre in his delightful *Tradiciones peruanas,* in which he examined the country's colourful past, combining, in a light style, a sprinkling of historical truth with a dash of gossipy fiction.

The disastrous War of the Pacific turned Manuel González Prada, scion of a traditional Lima family, into a radical champion of political, social, aesthetic and orthographic reform. Of those who followed his reforms, mention should be made of José Santos Chocano (1875–1934), the poet who, in revealing America's tropical landscape in *Alma América,* proposed to share the hemisphere poetically with Walt Whitman, and Enrique López Albujar whose *Cuentos andinos* assured his fame as a prose writer. The generation born after the War of the Pacific included Francisco Garcia Calderón, essayist, José de la Riva Agiiero, historian, Victor Andrés Belaunde, student of international affairs, Ventura Garcia Calderón, the gifted short-story writer, and the sensitive poet José Gálvez. A reaction against Chocano is found in the poetry of José Maria Eguren, complex, introspective and divorced from life, often regarded as marking the beginning of Peru's modern verse. Subsequent writers revealed an intermingling of aesthetic and social objectives. Such poets as Alberto Hidalgo and particularly César A. Vallejo combined poetic sensitivity and elegiac melancholy with a keen social awareness; prose writers such as the essayist José Carlos Mariátegui, the literary critic Luis Alberto Sánchez and the historian Jorge Basadre showed, in addition to painstaking research in their respective fields, the same passionate concern with social reform. It was no longer the picturesque and colourful but primarily the social aspect of the Indian which inspired Vallejo and César Falcón in writing such novels as El *Tungsteno* and *Pueblo sin Dios,* violent protests against white exploitation, in the vein of the *Indianista* novel *Aves sin nido* (1889) by Clorinda Matto de Turner. Social protest became the keynote of the works by modern writers. Among these. Ciro Alegría (b. 1909) stood out; his novels. one of mhich, El *mundo es ancho y ajeno* (Eng. trans. by H. de Onís, *Broad and Alien is the World;* New York, 1941; London, 1942), received a literary prize in 1941, combine the quest for social justice with a high degree of artistic accomplishment.

There is a deeply ingrained popular tradition in Peruvian music and dance and a variety of rhythms, folk tunes and native instruments are used to celebrate religious festivals or to commemorate historical or political events. Such modern composers as Carlos Sánchez Málaga and Roberto Carpio, in reviving and adapting the anonymous folk material to the resources of modern harmony, are paying tribute to their native land and its cultural pattern.

As in literature and music, an emphasis on genuinely native subject material prevails in modern Peruvian art. While the foremost name is José Sabogal, whose canvases convey the essential spirit of his country and capture its peculiar charm, the art of Camilo Blas and Julia Codesido reflect the same deep and sympathetic insight into the region and its people.

Religion.––While Roman Catholicism is the official faith and its instruction is compulsory in the state schools, other religions are constitutionally sanctioned. The government makes all ecclesiastical appointments, subject to the Vatican's approval. and pays the church salaries. The bishopric of Cuzco was established in 1537, the see of Lima in 1541. In 1953 there were four ecclesiastical provinces, four vicarages and two prefectures in Peru. Each one of the provinces (Lima, Cuzco, Arequipa and Trujillo) comprised one archdiocese and from one to five dioceses. A total of 4,012 Catholic churches and chapels and 308 convents, monasteries and religious dwellings were counted throughout the country. Among the sierra Indians a blending of Catholic practices and native ritual is not infrequent.

ECONOMIC CONDITIONS

Transportation and Communication.— The country's railway network is made up of a number of relatively short lines mhich link inland mining and industrial centres with coastal points. The total mileage in 1953 was approximately 2,610, almost one-half of which (1,259) was controlled by the Peruvian corporation, owner of the two main systems, Central and Southern railways, while 586 were government operated and 765 belonged to smaller private interests. Peru's rail system, begun in 1851, received a powerful impetus 25 years later'with the completion of the Central and Southern railways project under the direction of the U.S. engineer, Henry Meiggs. Both railways are of a standard gauge, and the Central line is said to be the world's highest railway to operate on such a gauge. The Central provides the northern route between the mining country and the coast, while the Southern line not only connects the Cuzco area with southern ports, but extends to the shores of Lake Titicaca, opening up an increased flow of traffic to Peru's southeastern neighbour Bolivia. Negotiations to substitute a rail service for the steamers which have been operating between Puno and the Bolivian port of Guaqui were begun in 1955. Freight carried on Peruvian railways in 1953 amounted to 4,308,809 metric tons, an increase of almost 775,000 tons since 1949, while the passenger traffic of 5,439,201 for 1953 was 350,000 lower than that recorded in 1949.

Good highways play a vital role in a country like Peru, the rail system of which is not equal to the exacting demands made by the rugged terrain. At the end of 1953 more than 15,000 mi. of roads were available for satisfactory use by automobiles, with additional stretches under construction. More than 10% were asphalt roads (1,684 mi.), not quite 6,300 mi, hard-surface roads and the remaining 7,200 mi. were earth roads of less durable calibre. Of central importance in the country's road system is the Peruvian sector of the Pan American highway which supplies a territory not covered by rail service. Following the Pacific coast line it runs for more than 1,900 mi. from Tumbes on the Ecuadorean border to Tacna on the frontier with Chile, linking Lima en route to such coastal points as Piura, Chiclayo and Trujillo in the north and Ica. Nazca and Moquegua in the south.

From this chief north-south artery, a constantly growing number of roads issue in a general easterly direction to facilitate communications between the mining and agricultural areas and the coast. One such road joins Lima to Pucallpa, and connects by river launch with the Amazonian port of Iquitos. Another im-

portant highway goes to Puno on Lake Titicaca, via Arequipa. and still others are between Nazca and Abancay, and between Cajamarca and Chachapoyas. The maintenance and improvement of existing roads and the construction of new ones have an important place in the national budget and foreign loans are utilized for those purposes. In Aug. 1955, $5,000,000 was received from the International bank for highway maintenance. The virtual doubling in the number of motor vehicles counted during 1953 (91.989) as compared with the figure for 1949 (46,225) partially accounted for the aforementioned drop in railway passenger traffic, and reflected the continuous improvement in Peru's road conditions.

In 1953 a total of 10,477 steamships with a registered tonnage of 13,465,185 entered Peruvian ports. Of these vessels 7,185 accounted for 2,044,801 registered tons and flew the Peruvian flag, while 3,292 (11,420,384 registered tons) were of foreign origin: U.S. 840; Denmark 390; Norway 371; Great Britain 356; Chile 202; and Germany 181. In 1953 Peru's merchant marine had 15 steamships, of 20,002 registered tons.

The country's chief port is Callao; modernized with the aid of an International bank loan in 1951, its dock facilities handle 75% of Peru's imports and 20% of its exports. Other ports of note include Chimbote, a splendid natural harbour and particularly important in connection with the Santa valley project, the oil port of Talara near the northern tip and Matarani-Mollendo, the most convenient gateway to southern Peru. Among the smaller ports are Paita. Salaverry and Pisco.

Foreign telegraph and cable services are furnished by the West Coast of America Telegraph Co., Ltd., and All America Cables and Radio, Inc. The latter also gives international radiotelephone service. The government operates a domestic telegraph network. Three companies, controlled respectively by U.S., British and Swedish interests, share in the public telephone service for differerent areas. In 1952 there were 58 broadcasting stations functioning throughout the country, as compared with 8 in 1937.

Air Lines.—The Faucett Aviation company is Peru's foremost domestic air line. In 1953 it made 7,902 flights, covered 2,432,279 mi., served 127,115 passengers and carried almost 341 tons of mail and more than 9,839 tons of freight. Two smaller companies, the Mercantil Air Co. (Camsa) and Peruvian Air Transports (Tapsa), serve the eastern regions, while Army Air Transports (Tam) is operated by the Peruvian air force to fill in commercial service gaps on certain routes.

Among the international air lines which link Peru to outside points are Pan American-Grace Airways (Panagra) and Braniff Airways, as well as a number of others with less regular services. Peruvian air lines operate exclusively inside the country. The establishment of the Peruvian Corporation on Airports and Commercial Aviation (Corpac) in 1946 by the government, to improve existing facilities in addition to opening up new ones, marked a milestone in the history of Peru's civil aviation. Limatambo's modern airport terminal, one of Corpac's prize projects, is generally regarded as the finest of its kind in South America.

Commerce. — Peru's chief exports consist of agricultural commodities, petroleum and other minerals; its imports are chiefly capital goods, equipment for transportation and consumers' goods. Exports in 1953 accounted for a total value of 3,752,227,000 soles, constituting a 30% increase over the figures for 1950 (2,886,761,000 soles). During the same period, the value of its imports jumped from 2,867,427,000 to 4,945,247,000 soles. Despite a steady increase in the volume of foreign trade the balance was continually unfavourable from 1947, except for 1950, when exports exceeded imports by almost 20,000,000 soles. In evaluating the widening gap between exports and imports it must be borne in mind, of course, that some of the latter, such as surplus foodstuffs and machinery, are linked to U.S.-financed loans which tend to lessen the immediate strain on foreign exchange reserves. Table II shows Peru's foreign trade picture from 1951 to 1953 quoted in millions of soles.

World War II brought Latin America increasingly into Peru's trading picture at the expense of the European countries. In 1953, while supplying about 6% of Peruvian imports, South and Central America took roughly 25% of that country's exports, which was

just slightly less than all the European countries. including Britain, combined. More than half of Peru's import needs were met by the U.S. which received more than one-third of its exports. In order of value, Peru's foremost export commodities roughly ranked as follows in 1953: metallic minerals led the list with 33% (see below on mining for details), closely followed by cotton with 32%. Sugar stood third with 18%, petroleum and its derivatives contributed 6%, silver and gold 5%, wool 4% and fish 2%. While sugar exports showed an upward trend in 1953, cotton lost some ground. Lead and copper exports rose considerably over the preceding year, and the development and exploitation of rich iron-ore deposits helped to expand the nation's mineral potential. Peru's chief imports in 1953 included machinery and motor vehicles (40%), foodstuffs, drinks and tobacco (15%), metal manufactures (13%), textiles (8%), chemical and pharmaceutical products (7%) and paper, fats, rubber and hides.

Agriculture. — Agriculture is the backbone of Peru's economy, providing a livelihood for over half its "economically active" population. In 1953 the total area under cultivation measured 1,717,160 ha.. surpassing by about 20,000 the figure recorded for 1952. Nonetheless, some foodstuffs had to be imported in order to offset the insufficiencies in domestic food production which the rise in the birth rate made acute. Cotton and sugar led the export list and the reforms in agricultural methods were reflected chiefly in these two commodities. Cotton, in 1953, covered an area of 204,992 ha., which yielded a crop of 256,458 metric tons. Among its three foremost varieties, 80% was Tangüis, grown in the central valleys around Lima, while the remaining 20%, Pima and Karnak, originated in northern Peru. The second big export product, sugar, is grown chiefly north of Lima in the coastal valleys near Trujillo and Chiclayo. The area under cultivation in 1953 was 55,041 ha., and the total sugar output, 626,373 metric tons. In addition to cotton and sugar, the irrigated coastal area yields rice, which has long been a favourite staple food among the population and is also exported. The rugged sierra produces wheat, corn, barley, oats, potatoes and alfalfa, while in the eastern montaña region relatively small quantities of sugar, tobacco, coffee, cocoa and bananas are grown. Rubber occurs in the Amazon basin. Peru's total agricultural output in 1953 was valued officially at 6,896,389,023 soles, approximately 18% for cotton, 18% for potatoes, 14% for vegetables, 13% for sugar, 7.5% for fruit and the balance in minor items such as maize, rice, wheat, barley, coffee, etc. The coca leaf, which has found wide acceptance among the sierra Indians because of its effect as a stimulant, is grown chiefly in the east.

Economic aid is extended to needy farmers by the Farm and Livestock Development bank, a government agency. Further help and expert counsel are available from the Cooperative Interamerican Service for Food Production (S.C.I.P.A.), a joint organization set up by the U.S. and Peru in 1943 for the purpose of furthering food production through modern agricultural machinery and, in general, improved farming methods.

Guano and Fishing. — The great fertilizer which stimulates the country's cotton and sugar growth is guano, deposited by aquatic birds on Peru's offshore islands and collected under a government monopoly by the Compania Administradora del Guano. The chief

producers are the cormorants that feed on anchovies from the Humboldt current. The year 1953 witnessed an all-time high in the extraction of guano, 260,797 metric tons. The commodity is not used for export any longer. as domestic needs absorb the existing supplies almost completely.

The Humboldt current supplies the country with foodstuffs that are inexpensive for domestic use and valuable for the export market. The total catch of fish in 1953 was 111,731 metric tons. a threefold increase in the annual output over 1948. Bonito, tuna and swordfish are among the principal varieties found. Fish and fish products contributed 2% to Peru's list of exports in 1953. The U.S. is by far the most important market and absorbs more than two-thirds of Peru's exports of fish.

Animal Husbandry. — Most of the country's stock raising is carried on in the sierras. The regions around Lake Titicaca and Cuzco are noted for their sheep, while cattle breeding takes place in different parts of the sierra, and alpacas and llamas are raised at higher altitudes. Wool figures as one of the country's minor export articles. In 1953 alpaca and sheep wool together accounted for close to 5,400,000 kg., valued at about 138,000,000 soles. Official estimates in 1953 gave the following livestock figures: sheep 16,189,700; cattle 3,412,500; llamas, alpacas and hybrids 3,388,300; goats 2,282,700; hogs 1,346,000; horses, mules and donkeys 1,089,600. The country's meat production is inadequate for domestic consumption and large quantities of frozen beef have been imported, mainly from Argentina. The government endeavours to achieve self-sufficiency by offering economic aid and technical advice through the Farm and Livestock Development bank.

Mining.—Second to agriculture in Peru's national economy, mining contributed close to 40% of the value of exports in 1953. A new mining code enacted in 1951 gave fresh incentive to outside capital and resulted in a substantial increase in production. Examination of the 1948 and 1953 statistics for Peru's leading metallic minerals, zinc, lead and copper, shows that the production of the first two increased by roughly 150%, while the copper output almost doubled during the five-year period. The Cerro de Pasco region in the central Andes constitutes the focal point for the nation's mining activities, the Cerro de Pasco corporation being the country's chief producer of zinc, lead, copper, silver and gold. There are substantial vanadium and bismuth deposits, in addition to antimony. tungsten and molybdenum. Deposits of manganese have been discovered in the southern department of Puno, but communication problems complicated their exploitation in the mid-1950s. Both gold and silver of great value for the country's export market are either extracted independently or as by-products from the mining of other metallic minerals, such as zinc, lead and copper. Peru stands fourth among the silver-producing nations of the world.

Coal is mined in Lima, Junin, Pasco, Ancash and La Libertad and preliminary figures covering the 1953 production of bituminous coal and anthracite gave a total of more than 210,000 metric tons. Ancash anthracite accounts for one-third of this figure and a value of close to 16,000,000 soles. The exploitation of rich iron-ore deposits near Marcona in southern Peru got under way in 1953 and preliminary figures for the first year of operation showed an estimated output of 853,500 metric tons valued at roughly 225,000,000 soles. Table III records the rise in the production of leading metals between the years 1948 and 1953 showing the widening gap between zinc and lead on one hand and copper on the other.

TABLE III.—*Production of Peru's Leading Metals*

Metal	1948	1951	1952	1953
Gold, g.	3,457,534	4,922,748	4,072,801	4,261,593
Silver, kg.	288,911	540,552	571,873	611,205
Zinc, metric tons.	58,842	101,300	127,845	139,102
Lead, metric tons	48,538	82,350	95,773	114,508
Copper, metric tons	18,069	32,304	30,448	35,401
Iron, metric tons.	...	...	...	853,553

Petroleum. — Though potentially rich oil fields are suspected in various parts of the country and chiefly in the Puno region. as well as in the montaña sector, actual exploitation is almost exclusively limited to the northern coast. Nearly 16,000,000 bbl. of crude oil were produced in 1953 (a drop of 400,000 since 1952), approximately 70% of which was by the International Petroleum company (affiliated with Standard Oil of New Jersey). less than 30% by the Lobitos company and about ½% by the government-controlled Compania Petrolera Fiscal and the Ganso Azul company. The last mentioned is the only company to operate in the Amazonian region. A constant rise in domestic consumption was responsible for a marked drop in petroleum exports of about one-third after 1949. Legislation passed in March 1952 was designed to attract foreign capital to assist in opening up the country's untapped oil wealth and operations began around Talara and in the montaña.

Manufacturing. — Textiles dominate the industrial scene by a wide margin. pointing to the country's foremost raw materials, as an ever-growing number of cotton, woollen and rayon fabrics come from domestic looms. Mineral refining establishments likewise play a large part, reflecting another important item on Peru's list of raw materials. Other industries which steadily gain in volume and importance include leather and leather goods, hollow ware, paper and paper products, chemicals and pharmaceuticals, as well as fish and meat canneries. flour mills, furniture, tire, soap and paint factories. The operation of sugar mills provides a by-product, bagasse, which is utilized to make paper. The numerous construction projects in progress during the 1950s placed the manufacture of cement and building materials high on the industrial list. The Compania Peruana de Cemento Portland is the principal, and the oldest, company engaged in the manufacture of cement, but other companies have been established to supply the growing market. Much of the timber needed for the making of furniture, chiefly cedar and mahogany, is derived from the jungles, east of the Andes and moved by way of the Amazonian river port of Iquitos. Manufacturing is concentrated mainly around Lima, Callao and Arequipa, though industries have been developing also in Trujillo and Chiclayo. Altogether, industrial expansion is bound to be gradual because of the limited home market and the keen competition from imports but the Industrial bank promotes local industry by offering long-term loans at low interest rates.

Foreign Investment. — Foreign direct investments in the mid-1950s were estimated at approximately $400,000,000. U.S. companies accounted for roughly 75% of this total. Mining and petroleum constituted by far the largest investment areas, and manufacturing, agriculture, trade and transportation followed far behind. More than half of the British holdings, which amounted to approximately 17% of the total, were in the field of transportation, while minor interests were found in petroleum, manufacturing, trade and finance and agriculture. Italian investments were in transportation, trade and finance and manufacturing, while Japanese holdings were mainly concerned with cotton growing. French interests were co-operating in the development of the Santa valley and the setting up of an iron and steel industry at Chimbote. As a result of President Odria's economic policies in eliminating trade controls and freeing the exchange rate, foreign investment experienced a boom and the development of natural resources advanced notably.

GOVERNMENT; DEFENSE; FINANCE

Government. — The country's chief executive is its president who holds office for six years, but cannot be re-elected immediately. Two vice- residents and a cabinet of 12 assist him in his duties. The legislative authority belongs to congress which is composed of 54 senators and 156 deputies. In accordance with the constitution of 1933 and its subsequent amendments, presidential elections are held every six years when direct popular vote determines the country's government. It is the president's privilege to select his cabinet and to provide congress with panels of names which are to guide members of the legislature in-appointing justices for supreme court duty and in filling high church positions, in the last case, subject to Vatican approval. Voting, hitherto compulsory for all literate male citizens between 21 and 60, was extended during the presidential elections in 1956 to include women for the first time.

Senators and deputies are elected also by popular vote, the

former in the departments, the latter in the provinces. In 1945 the senate was increased from 48 to 54 members; the number of deputies from 140 to 156. Congress sits for four months each year and its deliberations are translated into action by 12 ministries: interior (which includes police, postal and telephone service), foreign affairs, justice and worship, public education, finance and commerce, war, navy, aviation, development and public works, public health and social welfare, agriculture, labour and Indian affairs.

Army, Navy and Air Force.—Military conscription is the law of the land and, in theory, every male Peruvian citizen is obliged to serve 2 years in the active army, 10 years in the reserve army and 20 years in the national guard. The draft, however, is not usually enforced, and the active army numbers approximately 30,000 men, consisting in the main of volunteers. Army, navy and air force are U.S.-trained and. following World War II. their equipment underwent a substantial expansion and modernization, chiefly through purchases from the U S. and Britain. The president is the supreme commander of the nation's armed forces. exercising his authority through the secretaries of war, navy and aviation.

The three branches of the armed services figured in the 1953 budget with record expenditures, as 392,861,000 soles (or 16% of the total) applied to the army, 92,458,000 soles (almost 4%) to the navy and 116,749,000 soles (nearly 5%) to the air force.

Finance.--Whereas from 1949 to 1952 there were annual budget surpluses (the 1952 surplus was 8,750.964 soles), rising expenditures reversed the trend in 1953 and produced a deficit of 286,300,000 soles. Direct taxation increased steadily until in 1953 it made up 34% of the total taxes, while import and export duties accounted for the balance. Fiscal expenditures for 1953 amounted to 2,446,232,184 soles, and the most important government departments contributed roughly the following percentages: finance and commerce 21%; interior 17%; war 16%; education 15%; development and public works 7.6%; public health and social welfare 3 6%.

The total public debt (external, internal, floating and short term) at the end of 1953 was 1,859,194,890 soles, which constituted a rise of more than 250,000,000 soles over the 1952 figure. The total money supply, which at the end of 1952 had been approximately 3,200,000,000 soles, reached close to 3,800,000,000 soles by the end of 1954.

A debt readjustment plan submitted by the Peruvian government to the U.S. Foreign Bondholders Protective council was accepted by that body, and a similar settlement was reached with the British Council of Foreign Bondholders.

Currency.—The monetary unit of Peru is the sol. The official par value, which had been 6.5 soles per $1, was suspended in Nov. 1949, and a system which provided for two separate and fluctuating rates of exchange was established. These two free exchange rates were the certificate rate, which applied to exchange certificates resulting from the sale of export earnings to the Central bank, and the draft rate. During the first half of 1959 the average rate was 27.14 soles to the U.S. dollar.

The Banco Central de Reservas functioned as the central bank of Peru after the 1920s when it was set up with the standard functions of a central bank. It had the customary credit control powers, the note issue privilege and served as financial agent for the government. The rediscount rate of the central bank was set at 6% in 1947.

(K. L. L.)

PERUGIA (anc. *Perusia*), a city and archiepiscopal see of Italy, the capital of the province of Perugia in Umbria situated 1,444 ft. above sea level. Pop. (1951) 40,039. The town is finely situated upon a group of hills nearly 1,000 ft. above the valley of the Tiber. Its outline is very irregular; from the centre of the town, at the junction of several ridges. parts of it extend for a considerable distance along their summits, being divided from one another by deep valleys. This is the extent enclosed by the mediaeval walls; within them are considerable remains of the lofty terrace malls of the Etruscan period. The so-called Arco di Augusto is a town gate with a Decorated superstructure of the Etruscan period, bearing the later inscription *Augusta Perusia;* above this again is a Renaissance loggia. Five other gates of the Etruscan period can still be traced.

The citadel was erected by Pope Paul III in 1540–46, after the plans of Antonio da Sangallo the younger, and demolished in 1860. On one side of the Piazza del Duomo stands the cathedral of San Lorenzo, a Gothic structure of the 14th and 15th centuries, in the plan of a Latin cross; on the other the Palazzo Comunale with two fine Gothic façades (1297, completed in 1429–43), with the figures of the Perugian griffin and the Guelph lion above the outside stair; and in the centre the marble fountain constructed in 1277–80 by Arnolfo di Cambio, and adorned with statues and statuettes by Niccolo and Giovanni Pisano. In the Palazzo Comunale is the Pinacoteca Vannucci, with an important collection of Umbrian pictures, of ceramics, and illuminated mss. On the decoration of the Sala del Cambio, close by, Perugino put forth the full force of his genius. San Domenico, a Gothic edifice originally designed by Giovanni Pisano but rebuilt in 1614, contains the monument of Pope Benedict XI, and in its east front a large Gothic window with 15th century stained glass. San Pietro de' Cassinensi (outside the Porta Romana) is a basilica with nave and aisles, founded at the end of the 10th century, remarkable for its conspicuous campanile, its ancient granite and marble columns, its walnut stallwork of 1535 by Stefano de' Zambelli da Bergamo and its numerous pictures (by Perugino, etc.). The oratory of S. Bernardino has an early Renaissance polychrome façade, richly sculptured, of 1457–61, by Agostino d'Antonio di Duccio of Florence. S. Severo contains Raphael's first independent fresco (1505). The circular church of S. Angelo, with antique columns in the interior, probably dates from the 5th century. The university dates from 1307, and has faculties of law, science and medicine; it had 499 students in 1938–39. It contains an important museum of Etruscan and Roman antiquities. Three miles to the S.S E., lay the Etruscan necropolis. The large tomb of the Volumni (2nd century B.C.) hewn in the rock, with its carved cinerary urns, is interesting. (*See* E. Galli, *Il Museo Funerario del Palazzone all' Ipogeo dei Volunni*, 1921.)

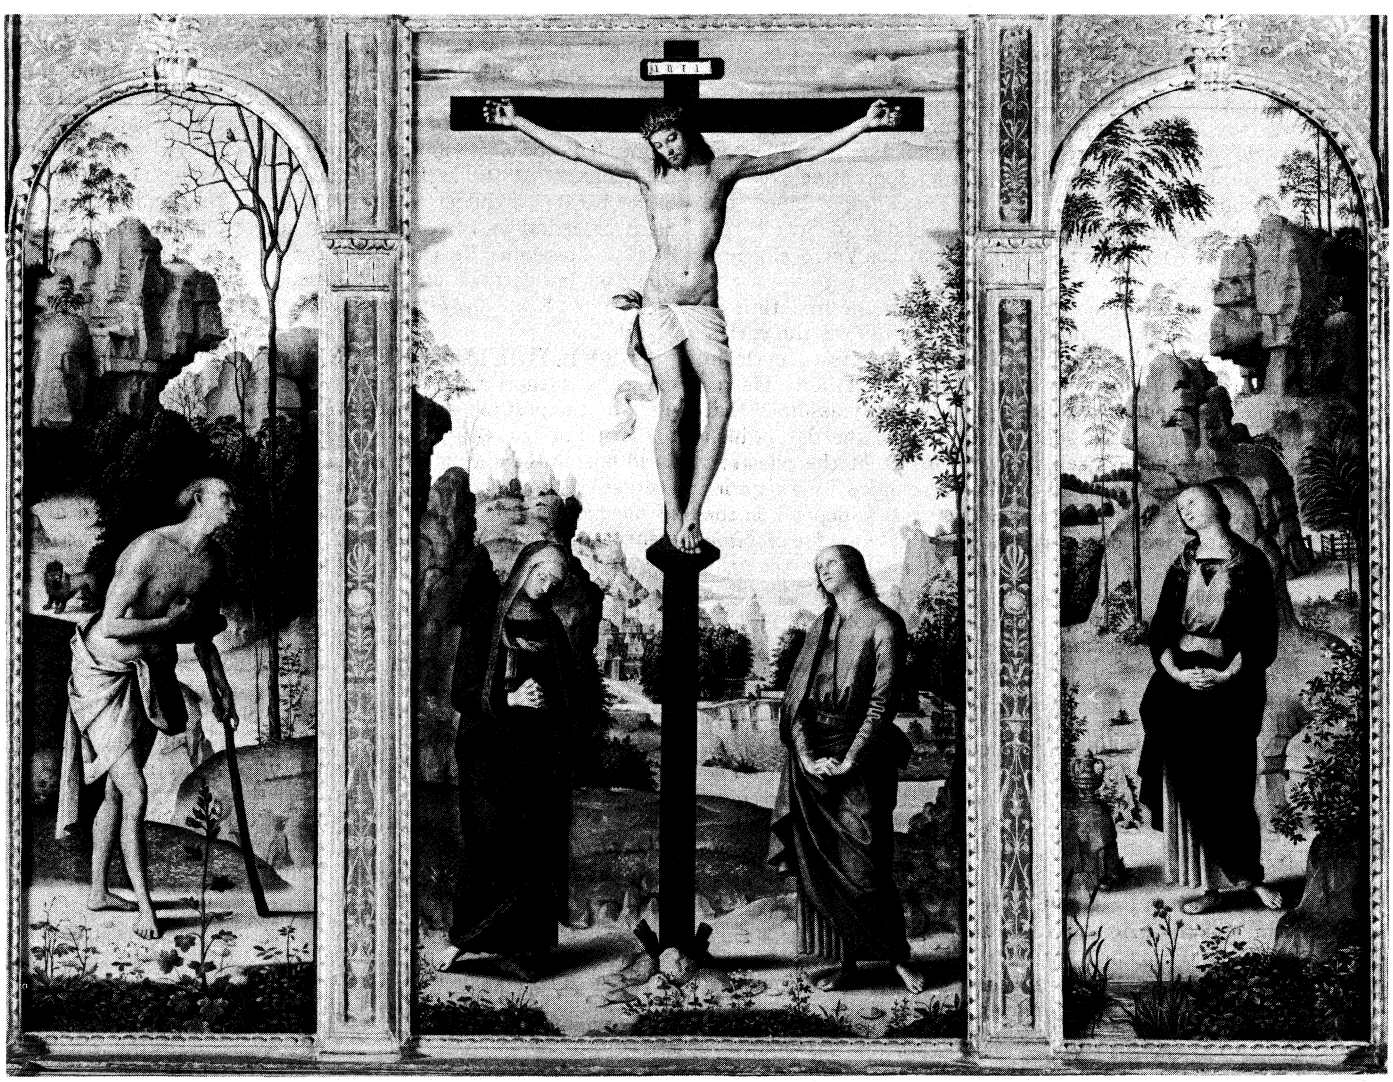
The ancient Perusia first appears in history as one of the 12 confederate cities of Etruria. It took an important part in the rebellion of 295 B.C. and was reduced, with Vulsinii and Arretium, to seek for peace in 294. In 216 and 205 it assisted Rome in the Hannibalic war; in 41–40 B.C., L. Antonius took refuge there, and it was reduced by Octavian after a long siege. A number of lead bullets used by slingers have been found in and around the city. The city was burnt, we are told, with the exception of the temples of Vulcan and Juno—the massive Etruscan terrace walls, naturally, can hardly have suffered at all. It must have been rebuilt almost at once, but is hardly mentioned except by the geographers until the middle of the 6th century.

In the 9th century, Perugia passed under the popes; but for many centuries the city continued to maintain an independent life, warring against many of the neighbouring lands and cities. It remained true for the most part to the Guelphs. On various occasions the popes found asylum within its walls, and it was the meeting place of the conclaves which elected Honorius II (1124), Honorius IV (1285), Celestine V (1294), and Clement V (1305); but when papal legates sought to coerce it by foreign soldiers, or to exact contributions, they met with vigorous resist-

ance. In the 15th century power was at last concentrated in the Baglioni family. Gian Paolo Baglioni was lured to Rome in 1520 and beheaded by Leo X; and in 1534 Rodolfo. who had slain a papal legate, was defeated by Pier Luigi Farnese, and the city, captured and plundered by his soldiery. was deprived of its privileges. The citadel was begun six years later. In 1797 Perugia was occupied by the French; in 1832, 1838 and 1854 it was visited by earthquakes; in May 1849 it was seized by the Austrians; and, after a futile insurrection in 1859, it was finally united to Piedmont in 1860. (T. A.)

PERUGINO (PIETRO DI CRISTOFORO VANNUCCI) (*c.* 1450–1523), Italian artist, the principal painter of the Gmbrian school and the master of Raphael. was born at Città della Pieve, near Perugia, from which city he takes his name. Giovanni Santi, Raphael's father. says that Perugino and Leonardo da Vinci were "of an age." It is known that Leonardo was born in 1452 and entered the guild in Florence in 1472, in which year Perugino was also registered; it is likely, therefore. that he was born about 1450. On the other hand, G. Vasari implies that he was born in 1445 or 1446, but this seems less likely than Santi's date. Nothing is known for certain of his early training, but he may have been a pupil of Fiorenzo di Lorenzo in Perugia and of Piero della Francesca in Arezzo, in which case he would have been a fellow pupil of Luca Signorelli. Certainly the two men were acquainted, and an occasional influence from Signorelli is visible in Perugino's work, notably in the direction of an increased hardness of drawing (*e.g.*, "Crucifixion and Saints"; Uffizi gallery, Florence). In Florence he almost certainly worked in the shop of Andrea del Verrocchio. where Leonardo was then also active.

The first certain work by Perugino is a "Saint Sebastian" at Cerqueto, near Perugia, the sole survivor of a series of frescoes in the church, recorded as having been signed and dated 1478. This already shows much of his typical style, and he must have made a considerable reputation by that date, since he is next recorded in 1478–79 in Rome, working in old St. Peter's for Pope Sixtus IV. These frescoes are lost. but the same pope employed him on the fresco decoration of the Sistine chapel. and his name occurs in the documents of 1481 and 1482. Several of his frescoes have been destroyed — most notably those on the altar wall, thrown down to make way for Michelangelo's "Last Judgment" — but his most important work there, the "Giving of the Keys to St. Peter." is fundamental to his development. It shows the apostles ranged in the foreground. watching Christ hand the keys to Peter; in the background is a centrally planned building. of the type then much in favour among advanced architects. It symbolizes the Old Dispensation, since it represents the Temple at Jerusalem, and the giving of the keys is a symbolic representation of the New, or Christian, Dispensation. The artistic importance of this fresco is very great, for it is simple and lucid in arrangement, and the first glance reveals the main action; by comparison, the frescoes by Botticelli in the same series appear both crowded and incomprehensible. It was Perugino's main claim to fame that he insisted on the qualities of simplicity and clarity that were to characterize the High Renaissance and, in particular, the work of



BY COURTESY OF THE NATIONAL GALLERY OF ART, WASHINGTON. D.C.. MELLON COLLECTION

"THE CRUCIFIXION WITH THE VIRGIN. SAINT JOHN. SAINT JEROME AND SAINT MARY MAGDALEN." BY PIETRO PERUGINO. IN THE NATIONAL GALLERY OF ART. WASHINGTON, D.C.

his pupil Raphael. It cannot be denied that among Perugino's very numerous works there are several that are less lucid and simple than insipid and vacant, but his not infrequent sentimentality should not obscure his merits and his historical importance.

Immediately after completing his work in the Sistine chapel, Perugino went back to Florence, where he was given a commission to work in the Palazzo della Signoria, and in 1491 he was invited to sit on the committee concerned with finishing Florence cathedral; in the same year he signed and dated the triptych now in the Villa Albani, Rome. There are several signed and dated works from the next decade, some of the principal ones being the "Madonna and Saints" (1493, Uffizi) and the same subject. also of 1493, in Vienna; in 1494 he painted a portrait of Francesco delle Opere (now in the Uffizi), which shows that he must have been well acquainted with Flemish portraits of the later 15th century, since the influence of Hans Memlinc is unmistakable. The "Pietà" (1495; Pitti. Florence) shows the calm resignation which his style was capable of expressing.

Between 1493 and 1496 he painted a fresco in the convent of Sta. Maria Maddalena de' Pazzi, in Florence. This takes up the entire wall surface. facing the entrance, of a room in the cloister. The roof is vaulted, so that the wall is divided into three bays by the corbels supporting the vaulting; below the corbels Perugino painted piers and made it seem that the room is in fact an open loggia, looking out on an extensive and beautiful Umbrian landscape, with the Crucifixion taking place in the central bay and the two side bays occupied by gently mourning saints. For the church of S. Pietro in Perugia he painted, between 1496 and 1498. a very large altarpiece of 15 panels. The central "Ascension" is now in the museum at Lyons, France, and other important parts are in the museum at Nantes, France, and in St. Gervais, Paris. A virtually identical "Ascension" is in Sansepolcro cathedral. In 1499 he was supposed to complete an altarpiece for the Certosa at Pavia, parts of which are now in the National gallery, London, and are an epitome of motives derived from Florentine art—the central Madonna owes a good deal to Fra Filippo Lippi, the archangel Michael derives from Donatello's statue of St. George, and the Raphael and Tobias is of a type used by the Verrocchio and Pollaiuolo workshops.

On Feb. 25, 1499, Perugino's name occurs for the first time in the records of the guild of bankers at Perugia; but, as the earlier books have been lost, the commission to paint a fresco cycle in their Sala del Cambio may well have been given earlier. He received the final payment in 1507; but it is generally assumed that the frescoes were completed shortly after 1500, the date which appears opposite Perugino's self-portrait on one of the pilasters. The ceiling is decorated with an Apollo surrounded by allegories of the planets. It has been shown that these scenes depend on the illustrations in Johannes de Spira's astrolabe tables, *Astrolabium planum* in *tabulis ascendens* (1494), and it is thought that the iconography of the whole Sala was planned by Francesco Maturanzio, a professor of rhetoric in Perugia. He certainly wrote the Latin verses which accompany the main fresco fields, representing allegorical figures of virtues and the principal exemplars of each virtue in classical antiquity or the Christian embodiment of it. The importance of these frescoes in the history of art lies in the fact that the young Raphael was Perugino's pupil around 1500 and probably had his grounding in fresco technique there. The figures of Fortitude and Horatius Cocles are often attributed to him. At about this date Perugino also painted an "Ascension" (Vatican), in which the sleeping soldier is sometimes attributed to Raphael; and the "Marriage of the Virgin" (Caen, France) is usually dated about 1503–04, since it seems to be the prototype of Raphael's finer "Sposalizio" (1504; Brera, Milan).

From this time Perugino's art began to decline, since he frequently repeated his earlier compositions in a routine manner. Vasari says that the critical Florentines began to lampoon him, and Perugino replied that they had once praised his work, and, if he now gave the same designs, they had no right to blame him. It is certainly true that the "Chastity" (now in the Louvre. Paris) was commissioned in 1503 by Isabella d'Este and was delivered only in June 1505, after a great many letters had passed between all concerned, at which time Isabella expressed herself as satisfied, but only moderately so. In fact, Perugino left Florence about 1505 and began to retire, working principally for the less critical public of Umbria. In 1508 he made a temporary comeback by painting roundels on the ceiling of the Stanza d'Eliodoro in the Vatican; but the commission for the room went to his pupil Raphael, who, in the few years after leaving Perugino's shop, had proved himself incomparably the greater artist. It is a curious fact that one of Perugino's last commissions was the completion in 1521 of some frescoes in S. Severo, Perugia, which had been begun years earlier by Raphael. He was still working in Feb. 1523, when he died of the plague at Fontignano, near Perugia, and was buried in a field there. The fresco of the "Nativity," in the National gallery, London, comes from Fontignano and is generally supposed to be Perugino's last work.

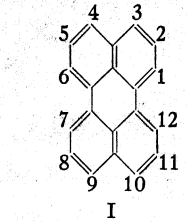
PERUZZI, BALDASSARE TOMMASO (1481–1536), architect and painter of the Italian Renaissance. probably was born at Siena. He was a man of varied attainments, but his architecture, characterized by extreme simplicity and delicacy. was superior to his painting. A contemporary of Raphael and Donato Bramante, he first appeared in 1501 as a painter of frescoes in the chapel of S. Giovanni in Siena cathedral. His first architectural work was the Villa Farnesina (1509–11), for Agostino Chigi, which contains frescoes by Raphael and one—the "Story of Medusa"—by Peruzzi himself. In 1516 or 1517 he produced his best frescoes, those for the Cappella Ponzetti in Sta. Maria della Pace. On Raphael's death in 1520 Peruzzi was appointed architect for St. Peter's, jointly with Antonio Sangallo, the younger. About 1523 he built the classical portal of S. Michele in Bosco near Bologna. The Palazzo Ossoli (1525) and the Palazzetto Spada, both in Rome. have been attributed to him; also the Palazzo Albergati in Bologna. At the sack of Rome (May 1527) he escaped to Siena, became architect to the republic in July and architect to Siena cathedral in 1529. His most important building was the Palazzo Massimo alle Colonne (1535), in Rome. He died in Rome on Jan. 6. 1536. and was buried in the Pantheon.

See W. W. Kent, *The Life and Works of Baldassare Peruzzi of Siena* (1925). (M. S. B.; X.)

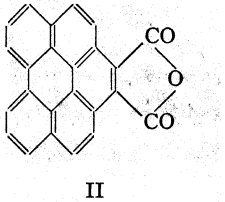
BERVIGILIUM VENERIS, the vigil or nocturnal festival of Venus, a short Latin poem. The occasion, author, date and place of composition are unknown. The poem probably belongs to the 2nd or 3rd century A.D. It describes in admirable if slightly florid poetry the springtime awakening of the world through the goddess. It consists of 93 trochaic septenarii, divided into groups of unequal length. A famous imaginative reconstruction of the manner of its writing is found in Pater's *Marius the Epicurean.*

See Editio princeps *(1577)*; many modern editions, either alone (as G. Bucheler, J. W. Mackail, C. Clementi, R. W. Postgate) or with Catullus; also in the *Anthologia Latina (see* ANTHOLOGY).

PERYLENE, an aromatic hydrocarbon present in small amounts in the highest boiling fractions of coal tar. It crystallizes in golden-yellow plates and has a melting point of 273°–274° C. Perylene, $C_{20}H_{12}$, has also been isolated from a sulfur dioxide extract of a petroleum distillate. Its dilute solutions have an intense blue fluorescence. The structure (I) of perylene is indicated by its formation from naphthalene and from 1:1′-dinaphthyl by heating with aluminum chloride and from 1:8-diiodonaphthalene by heating with copper. This is confirmed by synthesis from 9:10-bischloromethylanthracene.



I



II

Perylene has, to a certain degree, the character of a diene and

reacts with maleic anhydride in boiling nitrobenzene (*i.e.*, under oxidizing conditions) to give 1:12-benzoperylene-dicarboxylic anhydride (11), which may be decarboxylated to 1:12-benzoperylene, also a minor constituent of coal tar. Oxidation of perylene with chromic acid gives the 3:10-quinone, derivatives of which occur naturally as pigments in aphids. (J. W. CK.)

PESARO (anc. PISAURUM), a city and seaport of the Marche, Italy, the capital of the province of Pesaro and Urbino, situated on the coast of the Adriatic 37 mi. N.W. of Ancona. Pop. (1951) 34,647. Upon the Coles S. Bartolo, the Villa Imperiale, the foundation stone of which was laid by the emperor Frederick III, was built by the Sforza; it was decorated with fine stucco ceilings and wall paintings and pavements of majolica plaques.

A new palace was begun in 1530 by the Genga for Eleonora Gonzaga but it was never finished. The city walls were in 1830 transformed into a public promenade.

Other buildings erected there include a palace originally built in 1455–65 for the Sforza, and restored by Francesco Maria della Rovere in the 16th century, where various antiquities. pictures and a fine collection of majolica from the old Urbino and other manufactories were preserved; and the fortress of Rocca Costanza (built by Costanzo Sforza in 1474, Laurana being the architect). Pesaro is the centre of a rich agricultural district and is also a sea bathing resort.

Destroyed by Vitiges the Goth, the town was restored and strengthened by Belisarius, and afterward along with Ancona, Fano, Senigallia and Rimini formed the Pentapolis Maritima. In the course of the 13th century Pesaro was sometimes under the government of the popes, sometimes under that of the emperors; but the Malatesta family, which first took root in the city about 1285, gradually became the real masters of the place. In 1445 they sold their rights to Francesco Sforza; and in 1512, through the influence of Julius II, the Sforza were supplanted by his nephew Francesco Maria, duke of Urbino. Pesaro became the residence of the dukes of Urbino till the death of Francesco Maria II in 1631, when it reverted to the states of the Church.

PESCADORES (P'ENG-HU LIEH-TAO). a group of 64 islands of volcanic and coral origin in Formosa strait separated from Taiwan (Formosa) by the 30-mi.-wide P'eng-hu or Pescadores channel. Land area 49 sq.mi.; gross area more than 1,000 sq.mi. The largest islands are P'eng-hu, Pai-sha (connected with P'eng-hu by causeway), Yu-weng and Pa-chao. Relief is low, less than 300 ft. above sea level, and coral reefs are common. The islands are washed by the warm Kuro Shiwo (Japan) current and the climate is frost free. Mean monthly temperatures range between 59.5° F., in February and 82° F., in July. Except for summer, prevailing winds are northerly and frequently of gale force. Almost all of the 38 in. of annual rainfall falls between June and September.

Soils derived from basalt are sandy; those from coral reefs, droughty: natural vegetation is sparse.

Rich fishing grounds nearby explain the Portuguese-derived name Pescadores (fishermen's islands).

The population (1956) was 85.926, consisting primarily of Chinese from neighbouring Fukien province. More than half of the inhabitants reside on P'eng-hu island (site of P'eng-hu, the principal town).

Fishing and farming are the major occupations. Although 59% of the land is arable, poor soils and high winds make cultivation difficult. Millets, fruits (some exported), corn, sweet potatoes and peanuts are the chief crops.

The islands were occupied by the Dutch (1622–24), by the French and ceded to Japan (1895–1945). The islands, long a dependency of Formosa (*q.v.*), became one of the 16 hsien of Taiwan province in 1950. (S.S. G.)

PESCARA, FERNANDO FRANCESCO DAVALOS, MARQUIS OF (1489–1525), Italian ***condottiere,*** was born at Naples, of Spanish origin. At the age of six the boy was betrothed to Vittoria Colonna (*q.v.*), and the marriage was celebrated in 1509. In 1512 he commanded a body of light cavalry on the Spanish side at Ravenna.

When Francis I invaded Italy in 1524, Pescara was appointed as lieutenant of the emperor to repel the invasion. There was much discontent in the ill-paid army, but the tenacity, patience and tact of Pescara triumphed over all obstacles. On Feb. 24, 1525, he defeated and took prisoner Francis I by a brilliant attack. He destroyed the superior French heavy cavalry by assailing them in flank with a mixed force of harquebusiers and light horse. He died at Milan on Nov. 4. 1525.

BIBLIOGRAPHY —The life of Pescara was written in Latin by Paolo Giovio and is included in the ***Vitae illustrium virorum,*** printed at Basle (1578) Giovio's Latin ***Life*** was translated ***by*** L. Domenichi (1551). ***See*** also Mignet, ***Rivalité de François Ier et de Charles Quint*** (1875), which gives references to authorities.

PESCARA, a river and town of Italy. The river is formed by the confluence of the Gizio and Aterno, flowing into the Adriatic at Pescara (pop.. 1951. 47,907), the capital of the province of that name. This town occupies the site of ancient Aternum. In this valley, 22 mi. from the sea, was the site of the ancient Interpromium, a town belonging probably to the Paeligni.

PESELLINO (FRANCESCO DI STEFANO [GIUOCHI]) (1422–1457), Florentine painter of the early Renaissance. He was brought up by his grandfather, the painter Giuliano il Pesello (1367–1446), and worked as his assistant until Giuliano's death, when he became associated with Fra Filippo Lippi. In 1453 he went into partnership with Piero di Lorenzo di Pratese and during this period began, for the church of S. Trinità at Pistoia, the altarpiece of the Trinity that later was moved to the National gallery, London. It was left unfinished at his death on July 29, 1457.

Pesellino excelled in the execution of paintings on a small scale and is famous for his *cassone* pictures, intended for the decoration of marriage chests, in which he illustrated, in charming tapestrylike designs, an old legend or tale; several of these are in the Gardner museum, in Boston. A number of works by Pesellino may be seen in galleries in the United States; among these are the National Gallery of Art, Washington, D.C.; the Metropolitan Museum of Art, New York city (a fine panel of the Madonna and saints); and the Museum of Art of Toledo, O.

PESETA. The monetary unit of Spain, the peseta is divided into 100 centimos. In its modern form it was introduced by a law of Oct. 19, 1868, although coins of that name date back at least to the currency reform of 1772–86.

PESHAWAR, a municipal town, tehsil, district and division in West Pakistan. The town is situated near the left bank of the Bara river. 11 mi. from Jamrud and the entrance to the Khyber pass, and 1,04j mi. from Karachi. Pop. (1951) 151,776 including 42,061 in the cantonment area. Formerly it was enclosed within a protective wall, with 16 gates, enclosing an area of j sq.mi., but this has been partially removed to allow for expansion. The cantonment, 2 mi. W. of the city, is the largest military headquarters on Pakistan's western frontier and its proximity to the Khyber pass gives it great strategic importance. The university of Peshawar is situated about j mi. from the town. For many centuries the Powindahs, or Afghan traveling merchants, led their caravans every autumn to Peshawar from Kabul, Bukhara and Samarkand bringing horses, wool, woolenstuffs, silks. dyes, gold thread. fruits, precious stones, carpets and posteens (sheepskin clothing). It is still an important trading centre. The chief cottage industries are the manufacture of copper utensils and leather goods, especially chappals. Peshawar tehsil (pop. [1951] 386,293) covers an area of 460 sq.mi.

PESHAWAR DISTRICT (area 1,548 sq.mi.; pop. 1951, 903,230), apart from the area covered by low hills at Cherat in Nowshera tehsil. consists mainly of highly irrigated plains. The inhabitants are mostly Pathans with some Hindkis, Awans forming the most numerous Hindki tribe. (K. S. AD.)

History. — References to the district of Peshawar occur in early Sanskrit literature and in the writings of Strabo. Arrian and Ptolemy. It once formed part of the ancient Buddhist kingdom of Gandhara and the area is still studded nith crumbling stupas. Rock edicts of Asoka are to be found at Shahbazgarhi and Mansera. Purushapura (the ancient name for the town) was the capital of Kanishka's dominions. Between the 15th and 16th centuries the district was occupied by Pathan tribes from what is now Afghan-

istan. The Mogul emperors always found difficulty in maintaining their authority over these tribes. Peshawar was a favourite residence of the Afghan dynasty founded by Ahmad Shah Durani. and there Mountstuart Elphinstone came as ambassador to Shah Shuja in 1809. A few years later Ranjit Singh crossed the Indus, and after much hard fighting Sikh authority was firmly established under Gen. Paolo di Avitabile in 1834. In 1849 Peshawar passed to the British. In the years before the formation of Pakistan the Peshawar valley was seriously disturbed by the activities of Abdul Ghaffar Khan, founder of the "Red Shirt" movement *(see* INDIA: *History: Political Assassination, 1923–32*). After Pakistan was established he led the Pathan separatist movement and the agitation for a Pushto province. He was arrested near Peshawar in 1956. (C. C. D.)

PESNE, ANTOINE (1683–1757). French painter of historical subjects and portraits and court painter in Berlin, was born on May 23, 1683, in Paris. After being taught by his father, Thomas Pesne, and his maternal great-uncle, Charles de Lafosse, Pesne later studied at the Paris academy, where he was influenced by the leading French portraitists, Hyacinthe Rigaud and Nicolas de Largillière. In Rome and Naples, and particularly in Venice, where he studied with Andrea Celesti, Pesne developed a marked colouristic talent. The elegant style of his early portraits was greatly influenced by the paintings of his countryman Jean Raoux, as well as by Dutch masters and the elegant pastels of the Venetian artist Rosalba Carriera.

In 1707 Pesne's full-length portrait of the Prussian ambassador to Venice, von Kyphausen, attracted the attention of Frederick I of Prussia; and the artist was appointed court painter to the royal court of Berlin, where he remained, except for short intervals, from 1710 until his death on Aug. S, 1757. Pesne became the portraitist of the court and of the aristocracy and eminent personages of Brandenburg-Prussia. When Frederick II came of age, Pesne was able to give full scope to his colouristic gifts in mythological and allegorical ceiling paintings and murals, decorating the interiors of the palaces at Rheinsberg, Charlottenburg, Berlin and Potsdam. He continued to paint portraits, some of which achieve by their brushwork and brilliant colouring an almost impressionistic effect reminiscent of Renoir. Of special interest are the various representations of Italian and French dancers and actresses whom Frederik II engaged for the Berlin Opera. They are in the style of Watteau, but as the first European painter to give these portraits an individual character, Pesne developed here the most famous side of his work.

BIBLIOGRAPHY.—C. F. Forster, article on Pesne in Thieme-Becker, *Allgemeinen Lexikon der Bildenden Künstler,* vol xxvi, p 467 ff. (1932); E. Berckenhagen *et al., Antoine Pesne,* with introduction by G. Poensgen (1958); catalogue of the Pesne bicentenary memorial exhibition in Berlin (Nov. 1957). (G PN.)

PESO. The monetary unit of several Latin-American countries and the Republic of the Philippines, the peso is divided into 100 centavos. It was first coined by Ferdinand and Isabella, who reformed the Spanish coinage system in 1497, but it became common only under Charles I (the emperor Charles V) (1516–56).

Under the monetary reform of 1772–86 the peso, which was originally divided into eight reales, became the basis of the silver coinage of the Spanish empire, and in the Americas was called piece of eight or Spanish milled dollar. It was the prototype of the U.S. silver dollar. which under the first coinage law of the United States (1792) was defined as a coin approximating closely the Spanish American peso of 1786 in weight and fineness and hence in value.

When most of the Spanish colonies in America gained their independence in the second and third decades of the 19th century, they maintained the peso as the basis of their currencies. Subsequently all of the countries introduced the decimal system in their coinage, following the practice of the United States, and in several countries, the name peso was changed to a local name. In Peru, for example, it was renamed sol in 1863; in Venezuela, bolivar; in Ecuador, sucre; in El Salvador, colón and in Costa Rica, colon. In Panamá the name of the local currency unit became balboa; in Honduras, lempira; in Guatemala, quetzal; in Nicaragua, córdoba; and in Bolivia, boliviano. In 1943 Paraguay changed the name from peso to guarani.

The severe fall in the value of Latin-American currencies during the depression of the 1930s was caused primarily by the serious decline in raw material prices. which formed the chief exports of these countries.

To prevent further deterioration of their exchanges, many countries tied their currency to the U.S. dollar and a so-called dollar area was formed, embracing, besides the U.S. and Canada, most of the countries of Middle America and the Caribbean, within which U.S. currency came to move freely and to form the basis of the various national currencies. In the countries of South America, which were not included in the dollar area, currencies fluctuated, on the whole, more than those of the dollar-area republics. Venezuela, as a result of large exports of petroleum, proved an exception.

PESSANHA, CAMILO (1867–1926), the representative in Portuguese poetry of symbolism at its purest and most genuine and the chief precursor of so-called "modernist" poetry. He was born in Coimbra, Sept. 7, 1867, the son of an undergraduate and a girl of the lower classes. He went to the grammar school in Coimbra and entered the faculty of law at the university there, concluding his studies in 1891. After being employed as an assistant to the public prosecutor in Mirandela, he was appointed head of the philosophy department at the Liceu at Macao. He went to this colony in China in 1893 and remained there. apart from two or three visits home, until his death in 1926. From the beginning Pessanha assumed oriental customs, including the opium habit, attracted to them by his somewhat passive temperament. He learned Cantonese and was one of the last Portuguese men of letters to speak the Chinese language, from which *inter alia* he translated some elegies, Oito *Elegias Chinesas,* accompanied by a preface that demonstrates his knowledge of oriental literature. He also collected Chinese *objets d'art* which he bequeathed to the Museu Machado de Castro in Coimbra. His writings on China, in particular the *Introdução a um Estudo sobre a Civilização Chinesa* and the *Elegias,* were collected in *China* (1943). Although he began to write verse in Coimbra, Pessanha was virtually unknown until 1916 when his poetry. which unites the purest symbolist spirit with the most modern poetic technique, was made known to a new generation in the pages of a progressive review. *Centauro.* Collected in the volume, *Clepsidra* (1920), his poetry became a kind of breviary for the modernist poets. Musical. subtle, penetrated by the mystery of oriental poetry, Camilo Pessanha is one of the most lyrical of Portuguese poets.

See A. Dias Miguel, *Camilo Pessanha* (1956); Ester de Lemos, *A "Clepsidra" de Canzilo Pessanha* (1956); *J.* Gaspar Simões, *Historia da Poesia Portuguesa do seculo XX* (1959). (J. G. Ss.)

PESSIMISM, a word coined in modern times (from Latin *pessimus,* worst) to denote an attitude of hopelessness toward life and toward existence, coupled with a vague general opinion that pain and evil predominate in the world; the antithesis of "optimism," which denotes an attitude of general hopefulness, coupled with the view that there is a balance of good and pleasure in the world. To describe an attitude as pessimistic need not, however, mean that it involves no hope at all: it may locate its objects of hope and of appraisal in a region beyond ordinary experience and existence; and it may also direct such hope and appraisal to the complete cessation and cancelling of existence.

Unsystematic pessimism is a reflection of material circumstances, of bodily health or of general temperament; it is characteristically expressed in the language of *Ecclesiastes* that "all is vanity." There are, however, systematic forms of pessimism, both philosophical and religious. The Orphic-Pythagorean view of the world was one of qualified pessimism, fleshly existence being regarded as a periodic penance undergone by the impure or guilty soul, until it can at last be freed from the "cycle of becoming" by ceremonial purification or by philosophical contemplation. This same qualified pessimism in regard to fleshly existence and experience is found in Platonism, for which things in this world necessarily deviate from and fall short of their ideal exemplars and for which (as in the *Phaedo)* fleshly tendencies and experiences only represent hindrances in the carrying-out of activities which

will be fully performed after death. Eastern pessimism (of a qualified sort) may be illustrated in Buddhism. where all conscious personal existence is held to involve pain or ill. where the cause of such ill lies in personal striving or desire and where positive appraisal is directed to a consummation (nzrvana) which involves the cessation of striving and of conscious personal existence. It is similarly represented in the main currents of Hindu thought, with the additional thesis that the world is not only painful and evil but also illusory. A qualified pessimism is, of course, deeply characteristic of Christianity, where our world is a fallen world, in which human reason and will are corrupted, and where it is only by redemptive action coming from beyond the world and fulfilling itself in another order that such ills can be rectified.

Philosophical pessimism was strong in the 19th century and was represented in the systems of Arthur Schopenhauer and Karl Robert Eduard von Hartmann. Schopenhauer presented a synthesis of Kantianism and Buddhism, the Kantian thing-in-itself being identified with a blind irrational will behind phenomena; our world, being the manifestation of such an unhappy will, must itself be unhappy. In the first half of the 20th century critical philosophy tended to steer clear of the whole issue of optimism versus pessimism; feeling themselves incompetent to make many general assertions about the world, philosophers were particularly unwilling to make general assessments of its goodness or badness. A qualified pessimism in regard to the world and to human nature was, however, characteristic of several theological systems (*e.g.*, the theologies of Karl Barth, of Emil Brunner and of the Dutch neo-Calvinists Herman Dooyeweerd and D. H. T. Vollenhoven). Perhaps the most uncompromisingly pessimistic system ever developed is that of the existentialist philosopher Martin Heidegger for whom death, nothingness and anxiety are central topics of interest and for whom the highest possible act of human freedom is a coming to terms with death.

PESSINUS (PESSINOUS, PESINOUS), an ancient city of Galatia in Asia Minor, situated on the lowest southern slope of Mt. Dindymus. The ruins, discovered by Texier, lie around the village of Bala-Hissar, 8 or 9 mi. S.E. of Sivri-Hissar. Originally a Phrygian city, it became the capital of the Gallic tribe Tolistobogii and the chief commercial city of the district. It contained the most famous sanctuary of the mother of the gods (Cybele), who here went by the name of Agdistis and was associated with the god Attis, as elsewhere with Sabazius, etc. Her priests were also princes, who bore rule not only in the city (the coinage of which, beginning about 100 B.C., was for long issued by them) but also in the surrounding country, deriving a large revenue from the temple estates; but in the time of Strabo (A.D. 19–20) their privileges were much diminished. Some time before the year 164 B.C. Pessinus fell into the power of the Gauls, and the membership of the priestly college was then equally divided between the Gauls and the old priestly families. Like Ancyra and Tavium, Pessinus was Romanized first and Hellenized afterwards. Only about A.D. 165 did Hellenic ways and modes of thought begin to be assumed; before that we find a deep substratum of Celtic feeling and ways, on which Roman elements had been superimposed without filtering through a Hellenic medium. Christianity was introduced late; it cannot be traced before the 4th century. When Galatia was divided into two provinces (A.D. 386–395) Pessinus was made the capital of Galatia Secunda or Salutaris, and it became a metropolitan bishopric. After the 16th century it disappears from history.

PESSOA, FERNANDO ANTÓNIO NOGUEIRA (1888–1935), the greatest literary figure in Portuguese "modernism," the movement which gave Portuguese literature of the first half of the 20th century its European significance. He was born in Lisbon on June 13. 1888. His father died when Pessoa was five and his mother married the Portuguese consul in Durban. and in 1895 took him to South Africa uhere he was educated. In 1903 he uas outstandingly successful in the entrance examination of Cape Town university, winning the Queen Victoria prize for English style. In 1905 he returned to Portugal, and enrolled at the Curso Superior de Letras in Lisbon in 1906 but ceased to follow the courses there in the following year and sought openings in commercial life, in which he displayed much initiative but a total absence of tact. He eventually settled down as foreign correspondent for various commercial firms in Lisbon. Though he tried at different times to fend for himself, he always returned to lodgings, first with an aunt and later with his half sister. A bachelor and not particularly sociable, he preferred the acquaintanceship of fellow solitaries in the cafés to the solid joys of a settled family life. A doleful existence, though sublimated by his intelligence and tempered by nostalgic evocations of his childhood, lies behind his work, most of which was unpublished at the time of his death in Lisbon, Nov. 30, 1935.

In the previous year Pessoa had published his first book in Portuguese, Mensagem. All that was known of his work at his death were some booklets of poems in English—a language which Pessoa, who was virtually bilingual, wrote with ease—Antinous and 35 Sonnets (1918) and Inscriptions (1920), collected in three volumes under the title English Poems (1921); some literary and political manifestoes—Aviso por Causa da Moral (1923) and Interregno (1928); his editorship of the review *Athena* (1924–25) and his frequent contributions to the avant-garde reviews, especially Orpheu (1915), the organ of the modernist movement in which Pessoa, with Mario de Sá-Carneiro and José de Almada Negreiros, was a leading spirit. The posthumous edition of his complete works consists of eight volumes; the poems are grouped under the various names or pseudonyms which the poet employed during his lifetime, each name purporting to represent one of the different personalities which he felt to exist within himself: the personality and the style can vary, therefore, according to whether a poem is signed by Fernando Pessoa himself, "Alberto Caeiro," "Álvaro de Campos" or "Ricardo Reis." The most important volumes in the collected edition are Poesias de Fernando Pessoa (1942), *Poesias de Álvaro de Campos* (1944), *Poemas de Alberto* Caeiro (1946) and Odes de Ricardo *Reis* (1946), in addition to the *Mensagem* of 1934. Examples of his prose writings as a critic and thinker of a paradoxical spirit can be found in the collection entitled *Páginas* de Doutrina *Estética* (1946). A good selection of his work, with an introduction, is in A. Casais Monteiro, Fernando *Pessoa* (1945).

(J. G. Ss.)

PESTALOZZI, JOHANN HEINRICH (1746–1827), Swiss educator, revered in Switzerland because of his tireless efforts to aid poor, orphaned and helpless children, was born at Zürich on Jan. 12, 1746. Active even in his student days in Zürich in social and political reform, he early earned a reputation as champion of the underprivileged and exploited. He established (1774) an orphanage, where he attempted to teach neglected children the rudiments of agriculture and simple trades that they might lead productive, self-reliant lives. This philanthropic experiment failed in 1780, and Pestalozzi, in a period of despair, wrote what can be considered a key to his philosophy, *The* Evening *Hour of a Hermit,* a profound and moving series of reflections and aphorisms.

During the next decade he published a widely read four-volume novel, *Leonard and Gertrude,* which delineated and publicized his ideas on social, moral and political reform. When the town of Stans was destroyed and the inhabitants massacred during the Napoleonic invasion of 1798, Pestalozzi collected several dozen destitute children and cared for them under most arduous and pitiful conditions.

In 1805 Pestalozzi founded at Yverdon his famous boarding school. which flourished for 20 years. was attended by students from every country in Europe and was visited by hundreds of the most important figures of the time. Pestalozzi's overarching educational principle, elaborated in Now Gertrude Teaches Her *Children* (1801), was "sense impression": accurate, clear thinking is dependent upon accurate observation of actual objects; words and

ideas thus have meaning only when related to concrete things. The Yverdon curriculum, therefore, emphasized such pupil activities as drawing and writing. singing, physical exercise, group rather than individual recitations, models, collections. map making and field trips. Carefully graded instruction, allowance for individual differences, and ability groupings were novel features. An important undertaking was the teacher-training department. Educators journeyed to Yverdon to study "the method." carried Pestalozzi's ideas throughout Europe and America and established scores of Pestalozzian schools. Froebel and Herbart learned much from Pestalozzi. as did Ritter, the geographer. The object-lesson approach used in a highly successful Pestalozzian school in England, conducted by Charles and Elizabeth Mayo, was adopted in the United States (1861) by the Oswego Normal school and became the guiding principle in the United States' foremost teacher-training institution.

Pestalozzi's greatest influence was upon Prussia. The German philosopher Fichte, indeed, told a Germany prostrated at Jena that only through a strong educational system based upon Pestalozzian principles could the country expect to recover. Pestalozzi died at Brugg on Feb. 17, 1827.

There are several German editions of Pestalozzi's collected works. His writings referred to above. and Letters on Early Education, have been translated into English.

Walch, *Pestalozzi and the Pestalozzian Theory of Education* (1952), contains an excellent bibliography. (J. C OD.)

PÉTAIN, HENRI PHILIPPE BENONI OMER JOSEPH (1856–1951), French soldier and "chief of state" (1940–44), was born on April 24, 1856, at Cauchy-à-la-Tour in the Pas-de-Calais. He was trained as a professional soldier at Saint Cyr and at the École de Guerre and filled the various staff posts until 1914. When World War I broke out he was already 58, had not served outside France and had known no active service. Yet, in conflict with the prevailing staff theories of the need to maintain the offensive at all costs, he had evolved views of his own about the value, in modern warfare. of defensive strategy provided that infantry were supported by the co-ordinated fire power of artillery. These were to prove correct once the war in France had become one of attrition.

He was put in command first of an infantry regiment. then (on Oct. 25, 1914) of the 33rd army corps in Artois. He distinguished himself during the offensive near Arras in May 1915, and in June was given command of the 2nd army as a full-ranking general. Four months later he launched the offensive in Champagne. which cost the French 80,000 killed and 100,000 sick and wounded but achieved only moderate success. In 1916, when the Germans opened the attack on Verdun, he was given the task of stopping it at all costs. He showed skill and energy in organizing, deploying and supplying his forces, and although the operation cost France about 350,000 men he held Verdun. This made him a popular hero, and he was appointed chief of the general staff in April 1917 and commander in chief in May. The morale of the French troops had deteriorated, and it became his special task to stop mutiny. By a combination of repression and reform of grievances, he again succeeded, so that the French army was ready to meet the final German offensive of 1918. After March 1918, with Foch as generalissimo to co-ordinate French. British and United States forces, Pétain was in charge of the operations assigned to the French armies. He prepared the offensives of August and September and was responsible for pushing the Germans back to the Ardennes.

His achievements during World War I were, therefore, great: and between the wars, as the veteran "saviour of Verdun" and as a *maréchal* de France, he came to be regarded as a high military authority. He served as vice-president of the supreme war council (1920–30), as French commander in chief against Abd el-Krim (1925), as war minister in Gaston Doumergue's cabinet (1934) and as ambassador in Madrid (1939–40). After the deaths of the marshals Foch and Joffre, he dominated French military policy and remained a firm advocate of defensive strategy. The construction of the Maginot line, the obsession of the high command with defense and the neglect of the new factors introduced by the development of the tank and of the aeroplane were the main consequences of this strategy. Successive governments and public opinion alike welcomed a policy designed to be thrifty with French lives in the event of another war. The costs of extensive re-equipment and modernization of the armed forces were shirked, in favour of lavish expenditure on static fortifications and defenses.

These conservative military doctrines had their counterpart in political conservatism. Marshal Pétain made no secret, during the period of popular front government of 1936, of his contempt for parliamentary government, of his antipathy to Socialist ideas or of his preference for dictatorial regimes which brought strength and prestige to their countries. R'hen World War II broke out in 1939 he was, at the age of 83, a natural focus of hopes for those who believed that the strong government needed for war might be used to overthrow the parliamentary regime of the third republic.

The rapid collapse of the French forces in 1940 was, in most respects, the consequence of the outdated principles on which they had been organized and of the lack of mechanized equipment needed to meet the superior weight and mobility of the German army. In the moment of defeat France turned to the veteran marshal, whose name still represented victory although his attitude had long been defeatist. In May the premier, Paul Reynaud recalled him from Spain, and on June 16 Pres. Albert Lebrun asked him to form a new ministry. His task was, amid conditions of almost complete disorganization and military defeat, to make a speedy armistice with Germany. This he accomplished by June 22; and two days later he completed a similar convention with Italy. By the terms of these armistices his government was left in charge of the French fleet and colonies and was allowed to maintain an "armistice army" of not more than 100,000 men at home. France was divided into two zones; the northern part and the Atlantic coastline remaining under German military occupation, the southern part and the Mediterranean coastline being under the direct administration of the French government. On July 10 the national assembly, specially summoned at Vichy to ratify the terms of the armistices, granted him emergency powers until a "new constitution" could be promulgated. (See FRANCE, History.) He made himself "chief of state," with at first Pierre Laval and then Pierre Etienne Flandin as his prime minister.

From July 1940 until the liberation of France in 1944, Pétain served as chief of state for the governments of Vichy and prolonged his authoritarian regime by constantly postponing promulgation of the new constitution. He became the object of a cult and of much adulation. His aim was to keep France out of the war and to hold Germany as closely as possible to the terms of the armistice which, when it had failed to defeat Great Britain and become deeply engaged in Russia, proved increasingly favourable to France. But this involved him in a certain amount of active collaboration with Germany, and after 1942 the pressure of German demands on French labour and supplies intensified. In 1941 Admiral Jean Darlan replaced Laval as premier; but Laval returned to power in April 1942 and remained the real ruler at Vichy until it collapsed. It seems probable that because of senility and illness Pétain ceased to understand fully what was happening, and much was done in his name of which he was unaware. Yet, by remaining in office even after the ardent collaborationists assumed power at Vichy in Jan. 1944, he became implicated in responsibility for their betrayals of French national interests. He left Vichy for Belfort in Aug. 1944 and Belfort for Sigmaringen in September but voluntarily returned in April 1945. For his whole behaviour after 1940 he was put on trial by the provisional government under Gen. Charles de Gaulle and was condemned to military degradation and death (Aug. 1j, 1945). The sentence was changed to life imprisonment. He was imprisoned first at Portalet, then on the fle d'Yeu in a fortress, whence, after prolonged illness, he was moved to a villa in Port-Joinville a month before his death. He died on July 23, 1951, an acutely contro-

versial figure in French politics: while many regarded him as a traitor, others idolized him as a patriot who had "stood by a stricken France" and had sacrificed himself in its cause.

PETALITE, a mineral species consisting of lithium aluminum silicate, is an important source of lithium (*q.v.*), the lightest metallic element. It was discovered in 1800 as cleavage masses in an iron mine on the island of Utö, near Stockholm, where it is associated with lepidolite and spodumene, also ores of lithium, and tourmaline. It is mined in Southern Rhodesia, in the Federation of Rhodesia and Nyasaland and in the territory of South-West Africa, U. of S. Af. In the United States it occurs in Maine, hlassachusetts and Wyoming.

The formula of petalite is $LiAl(Si_2O_5)_2$. In form, the monoclinic crystals approach spodumene (*q.v.*), which is also a lithium aluminum silicate with the formula $LiAl(SiO_3)_2$. There is a perfect cleavage parallel to the basal plane, and the mineral usually occurs in platy cleavage masses; because of this it was named from the Greek *petalon* (a leaf). The hardness is 6.j and the specific gravity 2.4 (that of spodumene being 3.16). The mineral is colourless or occasionally reddish, varies from transparent to translucent and has a vitreous lustre.

PETER, ST., the Apostle who is referred to in the New Testament by several names. Most commonly he is called Peter, but we also find Simon, Simon Peter, Cephas, and once Symeon. We may infer that the Apostle's name was the common Hebrew "Symeon" (שִׁמְעוֹן) which was generally rendered by the Greek "Simon" (Σίμων); he also received the title "Cephas" (כֵּיפָא) which was Graecized according to the sense of "stone" or "rock" into "Peter" (Πέτρος). There is no certain evidence that either "Cephas" or "Peter" was already in use as a proper name. The bestowal of the name Cephas is mentioned by Mark in connection with the sending forth of the twelve (iii. 16), by Matthew in connection with Peter's confession at Caesarea Philippi (xvi. 18), and in the fourth gospel in connection with the first call of Simon near the scene of John's baptizing (i. 42).

Prominence of St. Peter.—The gospels agree in representing St. Peter as the most prominent of the disciples during the ministry of Jesus. He is mentioned by Mark 23 times, by Matthew 24 times, by Luke 27 times, by John 39 times, and 182 times in the whole of the New Testament. Together with the sons of Zebedee, he formed an inner circle among the disciples, and was constantly in the company of the Master. Thus he is mentioned as present on several notable occasions such as the raising of Jairus' daughter (Mark v. 22 sqq. and parallels), the Transfiguration (Mark ix. 2 sqq. and parallels), and in the Garden of Gethsemane (March xiv. 32 and parallels). Early tradition (Papias) makes Peter the ultimate source of the Marcan narrative, to which Matthew and Luke were indebted. If so, the frequency of Peter's appearances may be partly explained; but it is Matthew rather than Mark who exalts Peter, and there is no reason to doubt that he was indeed the leader of the Twelve.

Early History.—Of his earlier history nothing is known. In Matthew xvi. 17 he is called "Simon Barjona" (*i.e.*, Simon Son of Jonas), whereas in John i. 42 and xxi. 15 he is referred to as "Simon son of John." Jonas and John are quite distinct names, but among Greek-speaking Christians the confusion would not be difficult. He was married and lived in a house at Capernaum with his brother Andrew and his mother-in-law (Mark i. 29). His occupation was that of a fisherman, and Luke says he was in partnership with James and John.

Call of St. Peter.—The synoptic gospels describe the call of Peter to discipleship as taking place by the Lake of Galilee (hlark i. 16 *sqq.*, Matt. iv. 18 sqq., Lk. v. 1. sqq.). No explanation is given of the suddenness of the call or of the ready response which it evoked. But the fourth gospel represents the earliest disciples of Jesus as previously disciples of John the Baptist and as leaving John to follow Jesus. One of these disciples was Andrew, who brought his brother Simon to Jesus with the announcement, "We have found the Messiah," and Jesus received him with the words "Thou shalt be called Cephas," which is by interpretation Peter. It is difficult to accept this account wholly as it stands, for the synoptic gospels make it plain that the disciples did not at first regard their Master as the promised Messiah; but it may embody a genuine tradition that the disciples had been connected with John's work, and thus explain why on a later occasion Peter was so ready to obey the call of Jesus. On the other hand it is possible that the account of the fourth gospel is coloured by a desire to minimize the importance of the Baptist save as a forerunner of the Christ. It is not improbable that a rival sect of the Baptist persisted to the end of the first century (Acts xviii. 25), and it was for that reason that the author of the fourth gospel omitted to mention John's independent work, and represented him as surrendering his disciples to Jesus.

Mark and Matthew agree closely in their accounts of the call of Simon and Andrew, and both quote the saying, "I will make you fishers of men." Luke has a good deal of non-Marcan material, and his account difiers considerably. He places the visit to Capernaum and the healing of Simon's mother-in-law before the call to Simon, and he connects the call with the story of the miraculous draught of fishes which appears in the fourth gospel after the resurrection (John xxi.). If the story of the miraculous draught arose from the prophecy that Peter should catch men, Luke's arrangement is in a sense justified. According to John the catch numbered 153—probably men of every race whom Peter was to attract by his teaching.

Confession of St. Peter.—Of the incidents during the ministry in which Peter played a prominent part it is only possible here to deal with one in detail. Critics attach considerable importance to the account of Peter's confession at Caesarea Philippi (Mark viii. 27 sqq., Matt. xvi. 13 sqq., Luke ix. 18 sqq.). According to all three synoptic gospels, at a comparatively late date in the history of the ministry Peter, in answer to a question of Jesus, acknowledged him to be the Messiah. Jesus then spoke of his coming passion, and Mark and Matthew add that Peter brought upon himself a severe rebuke by protesting against such an unwelcome development. The gospels make it clear that this was a turning-point in the history of the ministry and in the education of the Twelve. Matthew emphasizes the importance of the occasion by the insertion of a remarkable paragraph concerning Peter. "And Jesus answered him, Blessed art thou Simon Barjona, because flesh and blood did not reveal it to thee, but my Father in Heaven. And I say to thee that thou art Peter and upon this rock I will build my church, and gates of Hades will not prevail against it. I will give thee the keys of the kingdom of the heavens, and whatsoever thou shalt bind on earth shall be bound in the heavens, and whatsoever thou shalt loose on earth shall be loosed in the heavens." Here difficulties multiply, but two points seem clear. (1) Peter is to have unique importance in the future corresponding to the unique insight which he has displayed; he is the rock on which a new ecclesia will be founded to triumph over death. (2) Peter will have unique authority to admit to the new ecclesia and to legislate for its members. We must consider these points in greater detail. (1) Peter has received a definite revelation from Heaven, and his confession does not reflect the opinion of men (cf. Gal. i. 16). In virtue of this insight he is to become the foundation of "my church," that is, of an ecclesia comparable with the old Israel which is frequently referred to in the Old Testament as "the congregation" (Heb. קָהָל LXX. ἐκκλησία).

C. Taylor (Sayings *of the Jewish* Fathers) quotes a remarkable rabbinic parallel: When the Holy One wanted to create the world, he passed over the generations of Enoch and of the flood as unsound; but when he saw Abraham who was going to arise he said, Lo I have discovered a rock (petra) to build and to found the world upon. Therefore he called Abraham "rock" (שׁוּר), as it is said, "Look unto the rock whence ye are hewn." In what sense Peter is to be the foundation of the new ecclesia is perhaps

explained in the following words: "Peter will bear witness to the resurrection, and against the Church thus encouraged to face death the gates of Hades (Death. not Hell) will not prevail."

(2) Peter will receive the keys of the kingdom and will have unquestioned authority to bind and to loose, that is to legislate for the community. As to the keys, Is. xxii. 20–23 should be studied, and, for a Christian parallel, Rev. iii. 7. Two ideas seem to be combined: a chief steward bears the keys of a house as the sign of his authority, and a teacher of truth has the means of admission to the kingdom of Heaven (*cf.* Luke xi. 52 where the lawyers are blamed for taking away the key of knowledge). St. Peter will have authority in the new church such as Eliakim had in the old; and, as the ideal Scribe, St Peter will admit many to the kingdom by his teaching. It is remarkable that in Matt. xviii. 18 a similar power of binding and loosing is bestowed upon all the disciples (B T D. Smith, *St Matthew,* pp. 151, sqq.)

Opinions differ as to the authenticity of this saying addressed to Peter. The use of *ecclesia* for the Christian Church as a whole seems to reflect later usage (cf. Matt. xviii. 17 where the word means a local congregation); and the whole passage implies a reverence for St Peter such as might be felt by the second generation of Christians, especially by some community (?the Church of Antioch) which regarded him as its founder. John vi. 68 records another confession of Peter which is perhaps the Johannine equivalent of the synoptic "Thou art the Christ."

St. Peter and the Resurrection.— The New Testament implies that St. Peter was specially famous in the early church as a witness to the resurrection of Jesus St. Paul (I. Cor. xv. 5) mentions an appearance to Cephas first among the evidences of the resurrection. The "young man" of Mark xvi. thus instructs the women at the tomb, "Go tell his disciples and *Peter* that he goeth before you into Galilee and there ye shall see him"; from which we may infer that Mark intended to relate an appearance in Galilee at which Peter was specially prominent. Luke testifies to a belief in an early appearance to Simon (xxiv. 34), although he does not describe it and it does not fit easily into his scheme. It is xery strange that the description of this appearance has dropped out of the synoptic tradition, for it seems to have belonged to a very early stratum. The omission may be variously explained. The original ending of Mark is almost certainly lost. Luke and John adopted the belief that the disciples stayed in Jerusalem after the crucifixion, and both were therefore bound to omit a story of an early appearance in Galilee. Matthew seems to have deliberately preferred an account of an appearance to all the disciples on a mountain, perhaps because he thought it evidentially superior. But it is very probable that the appendix to St John (ch xxi) reproduces a late version of the half-forgotten story; and, so far as me can judge, the apocryphal gospel of Peter ended with a similar account. In the Johannine narrative Jesus appears to seven disciples, and Peter is prominent. The apocryphal account begins, "And I Simon Peter. .·. ." It has been suggested that the story of Jesus' walking on the water (Mark vi. 48 and parls) is another version of the same incident, for Matthew represents Peter as acting in a similar way on that occasion, jumping out of the boat to meet Jesus. (Matt. xiv 29, *cf.* Joh xxi. 7)

Later History and Death.— The last chapter of the fourth gospel is important as containing what is certainly the earliest reference to the death of St Peter. Three times Jesus tests his love which three times he had denied, and three times entrusts to him the pastoral duty to "feed my sheep." The sheep (or lambs, *v.* 15) are doubtless members of the early Church dependent upon Peter's teaching for their spiritual food. So we have a further testimony to the Apostle's great reputation as a teacher, and a suggestion that his life was devoted to pastoral rather than to missionary work The reference to his death is to us obscure, though probably it was clear enough to the original readers of the gospel. "Verily verily I say unto thee, when thou wast young thou didst gird thyself and walkedst whither thou wouldest; but when thou shalt be old thou shalt stretch forth thy hands and another shall gird thee, and bear thee whither thou wouldest not Now this he spake signifying by what manner of death he should glorify God." The inference seems to be that the life of St. Peter was prolonged to an age at which he was unable any longer to attend to himself, that he lived under some kind of restraint, and that his death was somehow connected with these circumstances. To the Church it was a martyrdom by which he glorified God, but the words do not necessarily imply more than that Peter died of old age, bearing bravely its infirmities and indignities. Clement of Rome (*Ep.* 5 Πέτρος μαρτυρήσας) perhaps implies more than this, but the tradition that Peter was crucified rests upon a misunderstanding of the words "thou shalt stretch forth thy hands" (*i* e., to allow another to gird thee), and has nothing but a respectable antiquity (Tertullian and Origen) to commend it.

The first part of the Acts is largely a record of Peter's doings, and from these chapters it appears that for some time after the Ascension he was the acknowledged head of the Jerusalem church His prominence brought him into collision with the Jewish authorities, and twice he was arrested by the priests (iv. 3, v. 18, possibly a doublet). Accompanied by John he made a journey to Samaria to see the results of Philip's preaching, and thus he was concerned in the earliest expansion of the Church (viii. 14 *ff.*). At a later date he travelled further afield, visiting Lydda, Joppa and Caesarea. At Caesarea he baptized Cornelius, and thus it was Peter who admitted the first Gentile to the Church, though Cornelius was no heathen (x. 1 *ff.*). Returning to Jerusalem Peter met criticisms of his policy by relating his experiences, and he was successful in convincing his critics; but it must not be assumed that either St. Peter or the other authorities had as yet any idea of dispensing with circumcision as generally necessary to salvation. There followed (at what interval we do not know) a persecution by Herod in which Peter was arrested, and a famine in which the Jerusalem church, weakened economically by socialistic experiments, suffered severely.

The famine probably continued after Herod's death, and Peter may have been present throughout, for "another place" to which he departed (xii. 17) may mean no more than another house. If he was present during the famine he must have met Saul and Barnabas when they brought relief from Antioch (xi. 30), and this may be the meeting described in Gal. ii. 1 *ff.* at which an agreement was reached between Paul and the senior Apostles on the question of preaching to the Gentiles. This is the view of Sir William Ramsay, and it has the great advantage that it acquits St. Paul of the charge that in writing to the Galatians he omitted to mention one of his visits to Jerusalem.

Peter's last appearance in Acts is in connection with the Council of Jerusalem where he stands up to champion a liberal policy towards the Gentiles. The veracity of the author of Acts has been questioned here, for in Gal. ii. 11 St. Paul discloses the fact that even after the agreement reached at Jerusalem Peter vacillated in his policy towards the Gentiles. If the encounter at Antioch took place after the Council at Jerusalem of Acts xv. then Peter's weakness is as hard to understand as is the obstinacy of the Jewish party. But if Ramsay's view be accepted it is much easier to reconstruct the history of events. At an informal conference in Jerusalem Peter and other leaders were persuaded to sanction an approach to the Gentiles, but not all the Jerusalem party consented nor indeed had they been consulted. The exact terms on which Gentiles might be admitted were not decided. Later, at Antioch, Peter encountered strong conservative opposition and began to waver, but at the subsequent council at Jerusalem he recovered courage enough to state his own convictions, the Jewish party were compelled to bow to the logic of facts, and the whole question was settled. Such a course of events is not inconsistent with what we know of St. Peter's character.

There are one or two hints in the New Testament as to St. Peter's later history. I. Cor. i. 12 mentions a party of Cephas at Corinth, and some have supposed that this implies a residence of St. Peter at Corinth as a consequence of which a party of his admirers was formed. But this is by no means certain, and the evidence of Dionysius of Corinth (c. 170) is too late to give substantial support to the belief.

If the first Epistle of Peter be genuine—and to some extent even if it be not—it furnishes some information about the Apostle's subsequent activities. It may suggest a ministry in Asia

Minor (i. 1), and it implies a residence in "Babylon." Babylon has been very commonly taken to mean Rome (Rev. xvi. 19, xvii. 5, etc.), and, if so, we have very early evidence of St. Peter's residence in the capital of the Empire. The belief that Peter lived in Rome goes back to Irenaeus (3 I. i.), Clement of Alexandria (*Comment. on* I. Peter), and Tertullian (*Scorp.* 15). Some hold that it is implied by Clement of Rome who couples the names of Peter and Paul as "champions nearest to us" (I. Ep. v.), and by Ignatius who says to the Romans, "I do not command you as Peter and Paul" (ad. *Rom* iv)

Irenaeus states that Mark acted as Peter's assistant in Rome, and this tradition receives support from I. Pet. v. 14 and from Papias (Euseb. H.E. iii. 39, 15).

Thus the evidence that St. Peter was at Rome is strong though not conclusive.

Early tradition (Origen, Clementines, Eusebius, Apostolic Constitutions and Jerome) also connects Peter with Antioch of which church he was said to have been the first bishop. Whether this belief was more than an inference from Gal. ii. 11 we do not know.

Nothing definite is known about the Apostle's death. Tertullian states that he was crucified under Nero, and Origen adds that at his own request he was crucified head downwards. But this testimony is late, and we have seen that Joh. xxi. suggests rather that Peter's sufferings were those of old age and restraint upon his liberty. Clement's reference to Peter's fate is very vague. If the Apostle was the author of I. Peter it is almost certain that he lived to a later date than the reign of Nero (see PETER, FIRST EPISTLE OF). Early in the third century the grave of Peter and Paul was shown in the Vatican (Euseb. H.E. 2. 25, *Acta* Petri 84), and the relics were moved to the catacombs in AD. 258. Whether or not they were genuine we have no means of judging.

(P. G.-S., X.)

PETER I., called "the Great" (1672–1725), emperor of Russia, son of the tsar Alexius Mikhailovich and Natalia Naruishkina, was born at Moscow on May 30, 1672. His earliest teacher (omitting the legendary Scotsman Menzies) was the dyak, or clerk of the council, Nikita Zotov, subsequently the court fool, who taught his pupil to spell out the liturgical and devotional books on which the children of the tsar were generally brought up. After Zotov's departure on a diplomatic mission, in 1680, the lad had no regular tutor. From his third to his tenth year Peter shared the miseries and perils of his family. His very election (1682) was the signal for a rebellion. He saw one of his uncles dragged from the palace and butchered by a savage mob. He saw his mother's beloved mentor, and his own best friend, Artamon Matvyeev, torn, bruised and bleeding, from his retaining grasp and hacked to pieces. The haunting memories of these horrors played havoc with the nerves of a supersensitive child. The convulsions from which he suffered so much in later years must be partly attributed to this violent shock.

During the regency of his half-sister Sophia (1682–1689) he occupied the subordinate position of junior tsar, and after the revolution of 1689 Peter was still left pretty much to himself. So long as he could indulge freely in his favourite pastimes—shipbuilding, ship-sailing, drilling and sham fights—he was quite content that others should rule in his name. He now found a new friend in the Swiss adventurer, François Lefort, a shrewd and jovial rascal, who not only initiated him into all the mysteries of profligacy (at the large house built at Peter's expense in the German settlement), but taught him his true business as a ruler. His mother's attempt to wean her son from his dangerous pastimes, by forcing him to marry the beautiful but stupid Eudoxia Lopukhina (Jan. 27, 1689), was a disastrous failure. Peter practically deserted his consort about a year after their union.

The death of his mother (Jan. 25, 1694) left the young tsar free to follow his inclinations. Tiring of the great lake at Pereyaslavl (he had seen the sea for the first time at Archangel in July 1683) he returned to Archangel on May 1, 1694, to launch a ship built by himself the year before. Shortly afterwards he nearly perished in a storm in an adventurous voyage to the Solovetsky Islands in the White Sea. From the first the lad had taken an extraordinary interest in the technical and mechanical arts, and their application to military and naval science. He was taught the use of the astrolabe (which Prince Yakov Dolgoruki, with intent to please, had brought him from Paris) by a Dutchman, Franz Timmerman, who also instructed him in the rudiments of geometry and fortifications.

Peter had begun to build his own boats at a very early age, and the ultimate result of these pastimes was the creation of the Russian navy. He had already surrounded himself with that characteristically Petrine institution "the jolly company," or "the company," consisting of his personal friends and acquaintances. "The company" was graduated into a sort of mock hierarchy, political and ecclesiastical, and shared the orgies and the labours of the tsar. Merit was the sole qualification for promotion, and Peter himself set the example to the other learners by gradually rising from the ranks. In 1695 he had only advanced to the post of "skipper" in his own navy and of "bombardier" in his own army. The disreputable Lefort, for the sake of his own interests, diverted the young tsar from mere pleasure to serious enterprises, by persuading him first to undertake the Azov expedition, and then to go abroad to complete his education.

Creator of **the Russian** Navy.—By this time the White Sea had become too narrow for Peter, and he was looking about him for more hospitable waters. The Baltic was a closed door to Muscovy, and the key to it was held by Sweden. The Caspian remained; it had for long been a common saying with foreign merchants that the best way of tapping the riches of the Orient was to secure possession of this vast inland lake. But so long as the Turks and Tatars made the surrounding steppes uninhabitable the Caspian was a possession of but doubtful value. The first step making for security was to build a fleet strong enough to provide against the anarchical condition of those parts; but this implied a direct attack not only upon the Crimean khan, who was mainly responsible for the conduct of the Volgan hordes, but upon the khan's suzerain, the Turkish sultan. Nevertheless Peter did not hesitate. War against Turkey was resolved upon. and Azov, the chief Turkish fortress in those regions, which could be approached by water from Moscow, was attacked from July 8 to Sept. 22. On Nov. 22, Peter re-entered Moscow. His first military expedition had ended in unmitigated disaster.

Immediately after his return he sent to Austria and Prussia for as many sappers, miners, engineers and carpenters as money could procure. He meant to build a fleet strong enough to prevent the Turkish fleet from relieving Azov. The guards and all the workmen procurable were driven, forthwith, in bands, to fell timber in the forests of the Don, and the shipwrights worked day and night, turning out scores of vessels of all kinds. Peter himself lived among his workmen, himself the most strenuous of them all, in a small two-roomed wooden hut at Voronezh. By the middle of April two warships, twenty-three galleys, four fireships and numerous smaller craft were safely launched. On May 3, "the sea caravan" sailed from Voronezh, "Captain Peter Aleksyeevich" commanding the galley-flotilla from the galley "Principium," built by his own hand. The new Russian fleet prevented the Turks from relieving Azov by sea; and on July 18 the fortress surrendered. Peter thereupon established a new naval station, named Taganrog, at the head of the Sea of Azov.

Turkey was too formidable to be fought single-handed, and it was therefore determined to send a grand embassy to the principal western powers to solicit their co-operation against the Porte. On March 10, 1697 this embassy, under the leadership of Lefort, set out on its travels. Peter attached himself to it as a volunteer sailorman, "Peter Mikhailov," so as to have greater facility for learning ship-building and other technical sciences. As a political mission it failed utterly, the great powers being at that period far more interested in western than in eastern affairs. But personally Peter learnt nearly all that he wanted to know—gunnery at Konigsberg, shipbuilding at Saardam and Deptford, anatomy at Leyden, engraving at Amsterdam—and was proceeding to Venice

to complete his knowledge of navigation when the revolt of the ***stryeltsy,*** or musketeers (June 1698), recalled him to Moscow. This revolt has been greatly exaggerated. It was suppressed in an hour's time by the tsar's troops, of whom only one man was mortally wounded; and the horrible vengeance (September–October 1698) which Peter on his return to Russia wreaked upon the captive musketeers was due not to any actual fear of these antiquated warriors, but to his consciousness that behind them stood the reactionary majority of the nation who secretly sympathized with, though they durst not assist, the rebels.

Peter's foreign tour had more than ever convinced him of the inherent superiority of the foreigner. Imitation had necessarily to begin with externals, and Peter at once fell foul of the long beards and Oriental costumes which symbolized the arch-conservatism of old Russia. On the 26th of April 1698 the chief men of the tsardom were assembled round his wooden hut at Preobrazhenskoye, and Peter with his own hand deliberately clipped off the beards and moustaches of his chief boyars. The ***ukaz*** of the 1st of September 1698 allowed as a compromise that beards should be worn, but a graduated tax was imposed upon their wearers. The wearing of the ancient costumes was forbidden by the ***ukaz*** of the 4th of January 1700; thenceforth Saxon or Magyar jackets and French or German hose were prescribed. That the people themselves did not regard the reform as a trifle is plain from the numerous rebellions against it. By the ***ukaz*** of the 20th of December 1699 it was next commanded that henceforth the new year should not be reckoned, as heretofore, from the 1st of September, supposed to be the date of the creation, but from the first day of January, *anno domini.*

The Great Northern War.—The year 1700 is memorable in Russian history as the starting-point of Peter's long and desperate struggle for the hegemony of the north. He had concluded peace with the Porte (June 13, 1700) on very advantageous terms, in order to devote himself wholly to a war with Sweden to secure for Russia her proper place on the Baltic. The possession of an ice-free seaboard was essential to her natural development; the creation of a fleet would follow inevitably upon the acquisition of such a seaboard; and she could not hope to obtain her due share of the trade and commerce of the world till she possessed both. All the conjunctures seemed favourable to Peter. The Swedish government was in the hands of an untried lad of sixteen; and the fine fleets of Denmark, and the veteran soldiers of Saxony, were on the same side as the myriads of Muscovy. It seemed an easy task for such a coalition to wrest the coveted spoil from the young Charles XII.; yet Peter was the only one of the three conspirators who survived the Twenty-one Years' War in which they so confidently embarked during the summer of 1701. He was also the only one of them who got anything by it. Charles's "immersion in the Polish bog" (1702–1707), as Peter phrased it, enabled the tsar, not without considerable expense and trouble, to conquer Ingria and lay the foundations of St. Petersburg (Leningrad).

In these early days Peter would very willingly have made peace with his formidable rival if he had been allowed to retain these comparatively modest conquests. From 1707 to 1709 the war on his part was purely defensive; Charles would not hear of peace till full restitution had been made and a war indemnity paid, while Peter was fully resolved to perish rather than surrender his "paradise," Petersburg. After Pultava (June 26, 1709), Peter, hitherto commendably cautious even to cowardice, but now puffed up with pride, rashly plunged into as foolhardy an enterprise as ever his rival engaged in. The campaign of the Pruth (March to July 1711) must have been fatal to the tsar but for the incalculable behaviour of the omnipotent grand vizier, who let the Russian army go at the very instant when it lay helpless in the hollow of his hand. Even so, Peter, by the peace of the Pruth, had to sacrifice all that he had gained by the Azov expedition fifteen years previously. On receiving the tidings of the conclusion of the peace of Nystad (August 30, 1721), Peter declared, with perfect justice, that it was the most profitable peace Russia had ever concluded. The gain to Russia was, indeed, much more than territorial. In surrendering the pick of her Baltic provinces, Sweden had surrendered with them the hegemony of the north, and her pretensions to be considered a great power.

Reforms.—The Great Northern War was primarily a training school for a backward young nation, and in the second place a means of multiplying the material resources of a nation as poor as she was backward. During the whole course of it the process of internal domestic reformation had been slowly but unceasingly proceeding. Brand-new institutions on Western models were gradually growing up among the cumbrous, antiquated, worn-out machinery of old Muscovy; and new men, like Menshikov, Goloykin, Apraksin, Osterman, Kurakin, Tolstoy, Shafirov, Prokopovich, Yaguszhinsky, Yavorsky, all capable, audacious, and brimful of new ideas, were being trained under the eye of the great regenerator to help him to carry on his herculean task. At first the external form of the administration remained much the same as before. The old dignities disappeared of their own accord with the deaths of their holders, for the new men, those nearest to Peter, did not require them. "The Administrative Senate" was not introduced till 1711, and only then because the interminable war, which required Peter's prolonged absence from Russia, made it impossible for him to attend to the details of the domestic administration. Still later came the "Spiritual Department," or "Holy Synod" (January 1721), which superseded the ancient patriarchate. It was established, we are told, "because simple folks cannot distinguish the spiritual power from the sovereign power, and suppose that a supreme spiritual pastor is a second sovereign, the spiritual authority being regarded as higher and better than the temporal."

The official birthday of the Russian empire was Oct. 22, 1721, when, after a solemn thanksgiving service in the Troitsa Cathedral for the peace of Nystad, the tsar proceeded to the senate and was there acclaimed: "Father of the Fatherland, Peter the Great, and Emperor of All Russia." Some Russians would have preferred to proclaim Peter as emperor of the East; but Peter himself adopted the more patriotic title.

Towards the end of the reign the question of the succession to the throne caused the emperor some anxiety. The rightful heir, in the natural order of primogeniture, was the little grand duke Peter, son of the Tsarevich Alexius, a child of six; but Peter decided to pass him over in favour of his own beloved consort Catherine. The ***ustav,*** or ordinance of 1722, heralded this unheard-of innovation. Time-honoured custom had hitherto reckoned primogeniture in the male line as the best title to the Russian crown; in the ***ustav*** of 1722 Peter denounced primogeniture in general as a stupid, dangerous, and even unscriptural practice of dubious origin. The ***ustav*** was but a preliminary step to a still more sensational novelty. Peter had resolved to crown his consort empress, and on Nov. 15, 1723 he issued a second manifesto explaining at some length why he was taking such an unusual step. The whole nation listened aghast to the manifesto. The coronation of a woman was in the eyes of the Russian people a scandalous innovation, and the proposed coronation was doubly scandalous in view of the base origin of Catherine herself. (See CATHERINE I.) The ceremony took place at Moscow on May 7, 1724.

During the last four years of his reign Peter's policy was predominantly Oriental. He had got all he wanted in Europe, but the anarchical state of Persia at the beginning of 1722 opened up fresh vistas of conquest. The war which lasted from May 1722 to September 1723 resulted in the acquisition of the towns of Baku and Derbent and the Caspian provinces of Gilan, Mazandaran and Astarabad. The Persian campaigns wore out Peter's health. A long and fatiguing tour of inspection over the latest of his great public works. the Ladoga Canal. during the autumn of 1724, brought back another attack of his paroxysms, and he died after terrible suffering. on Jan. 28, 1725.

Character.—Peter's claim to greatness rests mainly on his recognition of the requirements of the Russian nation and his own obligations as its ruler. It would have materially lightened his task had he placed intelligent foreigners at the head of every department of state, allowing them gradually to train up a native bureaucracy. But he was determined that, at whatever cost,

hardship and inconvenience, Russia should be ruled by Russians, not by foreigners; and before his death every important place in his empire was in the hands of capable Russians of his own training. Even in his most sweeping reforms he never lost sight of the idiosyncrasies of the people. He never destroyed anything which he was not able to replace by something better. He possessed, too, something of the heroic nature of the old Russian *bogatuirs*, or demigods, as we see them in the *skazki* and the *builinui*. His expansive nature loved width and space.

No doubt this last of the *bogatuirs* possessed the violent passions as well as the wide views of his prototypes. All his qualities, indeed, were on a colossal scale. His rage was cyclonic: his hatred rarely stopped short of extermination. His banquets were orgies, his pastimes convulsions. He lived and he loved like one of the giants of old. There are deeds of his which make humanity shudder, and no man equally great has ever descended to such depths of cruelty and treachery. Yet it may generally be allowed that a strain of nobility, of which we occasionally catch illuminating glimpses, extorts from time to time an all-forgiving admiration. Strange, too, as it may sound, Peter the Great was at heart profoundly religious. Few men have ever had a more intimate persuasion that they were but instruments for good in the hands of God.

(R. N. B.)

PETER II. (1715–1730), emperor of Russia, only son of the Tsarevich Alexius, was born on Oct. 18, 1715. From his childhood the orphan grand duke was kept in the strictest seclusion. On May 18, 1727 Peter II., according to the terms of the supposed last will of Catherine I., was proclaimed sovereign autocrat. The education of the young prince was entrusted to the vice-chancellor Osterman. Menshikov, who lodged Peter II. in his own palace on the Vasily island, had intended to marry him to his daughter Maria; the scheme was frustrated by his fall (Sept. 21, 1727). Peter fell into the hands of the equally unscrupulous Dolgoruki, who carried him away from Petersburg to Moscow, where he was crowned on Feb. 25, 1728. He was betrothed to Catherine, second daughter of Alexis Dolgoruki, but on the day fixed for the wedding (Jan. 30, 1730) the emperor died of small-pox.

PETER III. (1728–1762), emperor of Russia, only son of Charles Frederick, duke of Holstein-Gottorp, and of Anne, eldest surviving daughter of Peter the Great, was born at Kiel on Feb. 21, 1728. In December 1741 he was adopted by his aunt, Elizabeth Petrovna, as soon as she was safely established on the Russian throne, and on Nov. 18, 1742 was received into the Orthodox Church, exchanging his original name of Karl Peter Ulrich for that of Peter Fedorovich. On Aug. 21, 1745, by the command of his aunt, he married the princess Sophia Augusta Frederica of Anhalt-Zerbst (Catherine Alekseyevna). The union between a prince who physically was something less than a man and mentally little more than a child, and a princess of prodigious intellect and an insatiable love of enjoyment, was bound to end in catastrophe. But there is no foundation for the stories of Peter's neglect and brutality. Even when Peter III. succeeded Elizabeth on Jan. 5, 1762, he paid off Catherine's debts, without inquiring their origin. He gave her a magnificent establishment and great domains. His infidelities Catherine took as a matter of course, provided her own loae affairs were not interfered with.

Peter's foreign policy reversed that of Elizabeth. He had not been on the throne for two months when he made pacific overtures to the king of Prussia, whom he habitually alluded to as "the king my master.', Peter's worship of Frederick resulted in a peace (May 5) and then (June 19) in an offensive and defensive alliance between Russia and Prussia, whereby Peter restored to Prussia all the territory won from her by Russia during the last five years, and engaged to defend Frederick against all his enemies. This was followed up by a whole series of menacing rescripts addressed by Peter to the court of Vienna, in which war was threatened unless Austria instantly complied with all the demands of the king of Prussia. Finally he quarrelled with Denmark, and the Russian army received orders to invade Denmark by way of Mecklenburg. But before the actual collision took place news came of the coup d'état at St. Petersburg, by which Catherine (see CATHERINE II.) succeeded to the throne of Russia. From July 9 to July 17 Peter was in custody at the castle of Ropsha. His end is uncertain, but the evidence points to his murder (July 17, 1762) by Alexis Orlov, Theodore Baryatinski, and several other persons still unknown.

See R. N. Bain, *Peter III., Emperor of Russia* (London, 1902); V. A. Bilbasov, *History of Catherine II.* (Rus.), vol. i. (Berlin, 1900).

(R. N. B.)

PETER (PEDRO), the name of several Spanish kings.

PETER I., king of Aragon (d. 1104), son of Sancho Ramirez, recovered Huesca from the Mohammedans in 1096.

PETER II., king of Aragon (1174–1213), son of Alphonso II., and Sancia, daughter of Alphonso VIII. of Castile, had a very parked and curious personal character. As a Spanish prince he was a crusader, and took a distinguished part in the victory over the Almohades at the Navas de Tolosa in 1212. His lands to the north of the Pyrenees brought him in touch with the Albigenses and in 1213 he fought against Simon de Montfort's crusaders, moved not by sympathy with the Albigenses, but by hostility to the conquering intervention of the north under pretence of religious zeal. A favourer of the troubadours, he combined great personal valour with the most lax morality. He was killed at the battle of Muret (Sept. 12, 1213).

See J. Forster, *Chronicle of James I. of Aragon* (Trans. London, 1883); F. Darwin Swift, *Life and Times of James the First the Conqueror* (Oxford, 1894).

PETER III., king of Aragon (1236–1286), son of James the Conqueror and Yolande, daughter of Andrew II. of Hungary. Through his marriage with Constance, daughter of Manfred of Beneventum, he claimed Naples and Sicily from Charles, duke of Anjou, thus beginning the strife of the Angevin and Aragonese in southern Italy. His conquest of Sicily earned him the surname of "the Great." He repelled an invasion of Catalonia by the French king and died Nov. 8, 1286.

See Ramon de Muntanez, *Chronica . . .* ed. R. Lanz (Stuttgart, 1844, Fr. trans. by Buchon, Paris, 1824–28. Coll. des chroniques nationales); O. Cartellieri, *Peter von Aragon u. die Sizilianische Vesper* (Heidelberg, 1904).

PETER IV., king of Aragon (d. 1387), son of Alphonso IV. and Teresa d'Enteca, known as "The Ceremonious" by the rigid etiquette he enforced, and as "he of the dagger" because he wounded himself in cutting to pieces the so-called "charter of the Union" which authorized the rebellions of his nobles. His life was spent in warfare. He routed his nobles at Epila (1348), reannexed the Balearic islands, was engaged in conflict with Peter the Cruel of Castile until the accession of Henry of Trastamara (1369), conquered Sicily in 1377 and ceded it to his son Martin (d. 1410). He was three times married: to Mary, daughter of the king of Navarre; to Eleanor, daughter of Alphonso IV. of Portugal; to Eleanor, daughter of Peter II. of Sicily, by whom he had a daughter, Eleanor, whose marriage with John I. of Castile carried the crown of Aragon to the Castilian line.

See Zurita *Anales de Aragon* (Saragossa, 1610).

PETER, "the Cruel," king of Castile (1333–1369), son of Alphonso XI. and Maria, daughter of Alphonso IV. of Portugal, began to reign at the age of 16. Controlled at first by his mother, he emancipated himself with the encouragement of the minister Albuquerque, against whom he turned under the influence of his

mistress, Maria de Padilla, the one woman of his harem of whom he never became tired. In 1354 he was coerced into marrying Blanche of Bourbon, and deserted her at once. Imprisoned in the period of turmoil that ensued, he escaped from Toro to Segovia, and from 1356–66 he was master, and was engaged in continual wars with Aragon. It was at this time that he perpetrated the series of murders which made him odious, earning the reputation of monstrous cruelty indicated by his title. In 1366, attacked by Henry of Trastamara, he fled and took refuge with the Black Prince, who reinstated him. When the Black Prince left Spain, disgusted by his ally's ferocity, Peter was overthrown by Henry, with the aid of du Guesclin, in whose tent he was murdered March 23. 1369.

See P. Lopez de Ayala, *Crónicas de los reyes de Castilla* . . . (Madrid, 1779–80, 2 vols.); P. Mérimée, *Histoire de Don Pèdre I.*, roi *de Castille* (Paris, 1848; Eng. trans., 1849).

PETER I. (1844–1921), first King of the Serbs, Croats and Slovenes, was the eldest son of Alexander Karagjorgjević, who had been elected as Prince of Serbia on the expulsion of the Obrenovid dynasty in 1842, and was therefore grandson of Kara George, the first leader of Serbian independence. His father lost his throne in 1858, and withdrew to Austria, where Peter grew to manhood. Accused of conspiring against Prince Michael Obrenovid (1868), Prince Alexander transferred himself to Switzerland, and Peter made Geneva his headquarters for many years.

In 1870 he joined the French Army as a volunteer, and served with distinction in the campaign against Germany. In 1876 he joined the Bosnian insurgents against Turkey and fought under the assumed name of Peter Mrkonjić, leaving behind him a legend which had its influence on the young revolutionaries of a later generation. In 1882 he, the exiled Pretender, and not the newly proclaimed King of Serbia, was invited to attend the coronation of Tsar Alexander III., who resented Milan's dependence upon Vienna; and it was very largely due to the Tsar's personal influence that in 1883 Peter married Zorka, daughter of Prince Nicholas of Montenegro. For a time he lived at Cetinje, but after his wife's death in 1890 he again lived in Geneva.

In 1903 shortly after the murder of King Alexander and Queen Draga by a military gang, Peter was unanimously elected King of Serbia and though he was gravely embarrassed at home by the political interference of the regicides, and abroad by the odious circumstances to which he owed his accession, he set himself steadily to work for constitutional government, his tact, self-effacement and liberal outlook forming a marked contrast to the attitude of Serbia's previous rulers and contributing to the rapid political consolidation which followed the upheaval of 1903. In June 1914 ill-health forced him to entrust Crown Prince Alexander with the regency, and condemned him to a passive rôle during the World War. But the simplicity of his life, his stirring proclamations to his soldiers and the visits which he paid to the trenches in a half crippled condition, did much to encourage Serbian resistance; and he shared the privations of the great retreat across Albania, lying in a litter. After the war and his election as "king of the Serbs, Croats and Slovenes," he lived mainly in retirement at Topola and died on Aug 16, 1921. (R. W. S.-W.)

PETER, FIRST EPISTLE OF. The Epistle is addressed to the elect who are sojourners of the dispersion (*diaspora*) in Pontus, Galatia, Cappadocia, Asia and Bithynia. The term "dispersion" suggests scattered Jews, but references in the epistle to their previous benighted state (i. 14, ii. 9–10, iv. 3) seem rather to imply that the recipients were Gentiles, and if so, the word "dispersion" is used metaphorically for Christians scattered among the heathen. The primary purpose of the writer seems to have been to strengthen the courage of these Asian Christians who were faced with persecution, and to enjoin on them such conduct as would remove all excuse for the common confusion between Christianity and crime.

The questions of date and authorship are closely connected, for many critics have maintained that the contents of the epistle imply a date subsequent to the death of St. Peter. (a) References to persecution occur in i. 6, ii. 12, iv. 12–19, v. 9; the recipients are undergoing a "fiery trial"; they have to bear reproaches, and to endure an evil reputation; they may "suffer" as do thieves and murderers, although it is not clear that death is the inevitable penalty; so severe is the trial that it must mark the beginning of the end; persecution is general, and not confined to the provinces addressed. These are very similar conditions to those implied in Pliny's letter to Trajan, and therefore it is argued that I. Peter belongs to the same period and was written long after the Apostle's death.

It is true that if we accept the tradition of Peter's death under Nero it is very difficult to suppose that these conditions existed during his lifetime. There was certainly no general persecution before Nero, and our only real authority (Tacitus) gives no hint that the Neronian persecution extended beyond the city of Rome where it was due to local causes. Systematic religious persecution was so strange to the easy tolerance of Rome that most scholars think that a considerable time must be allowed for the policy to have developed. Ramsay thinks that the Flavian emperors began systematic persecution after the Jewish war; others believe that there was nothing serious in the provinces before the reign of Domitian (81–96), and Professor Merrill (Essays *in* Early Christian History) is sceptical even about that. But the evidence of the Apocalypse seems decisive that Rome persecuted systematically in the time of Domitian, at least in Asia. I. Peter appears to have been written at a time when the conditions reflected in Pliny's letter were just coming into being; the imperial authorities were manifesting hostility due to a lack of understanding, but there had been few if any martyrdoms, and the author betrays none of the ferocious resentment against Rome which characterizes the Apocalypse, indeed he still entertains a respect for the authorities not unlike that of St. Paul (I. Pet. iii. 13). There is no allusion to the Emperor-worship which caused trouble in Domitian's time. On these grounds it seems possible to date the epistle roughly. The terminus ad quem is fixed by the full development of the Domitian policy. If Ramsay is right in connecting persecution with the Jewish war, 70 is the *terminus* a quo; if not, 85–90 is the most probable date, but the epistle must be considerably earlier than the Domitian portions of the Apocalypse. (b) It is generally agreed that the epistle has close affinities with some other early Christian works, notably the Epistle to the Romans (*q.v.*), the Epistle to the Ephesians (*q.v.*), the Epistle of James (*q.v.*), and the Epistle of Polycarp. Unfortunately the dates of some of these works are uncertain, and it is not agreed on which side is the dependence. The majority of scholars allow that in the case of Romans the dependence is on the side of Peter, and the balance of opinion favours the priority of Ephesians, though not of James. If so, the author of I. Peter wrote at a time when Romans and Ephesians were well known at least in his neighbourhood. If the Pauline authorship of Ephesians is rejected the inference must be that I. Peter was written at a time when a pseudo-Pauline epistle had had time to gain currency, and that could hardly be earlier than the second century. But, as we have seen, there are difficulties in dating I. Peter after the Apocalypse. If Ephesians be a genuine work of St. Paul then I. Peter may have been written at any time after St. Paul's imprisonment. If James is dependent on I. Peter then we have an additional argument for the early date of I. Peter. The objection that Peter would not be likely to quote Paul is only forcible on the old Tübingen theory of a life-long feud between them. (c) The theology of I. Peter is simple and bears marked resemblances to that which finds expression in the early speeches in Acts. Its "Paulinism" has been much exaggerated. Jesus is the promised Messiah, and "the Spirit of Christ" is the spirit which was in the prophets. His suffering for sin had rescued the elect, and his endurance was an example for Christians faced with persecution. After death Jesus preached to "the spirits in prison." The source of Christian life is to be found in belief in God and in baptism. Christians are a royal priesthood, a holy nation, destined at the end of the world, which is close at hand, to inherit the promises. Church organization as it appears in this epistle is very simple and primitive; there are elders who shepherd the flock, but there is nu trace of a developed organization. There is nothing in these facts to preclude a belief in the Petrine author-

ship of the epistle. If, in spite of tradition to the contrary, St. Peter survived the days of Nero and lived subsequently in Rome, he may well have been acquainted with some of St. Paul's letters, particularly with one written to the Romans and with another written during the Apostle's imprisonment in the city. Re may have lived to see the beginnings of that persecuting policy uhich wrought such havoc in the time of Domitian and which we find fully established in the days of Pliny. Nor is the language difficulty serious. St. Peter had lived for many years among Greek-speaking communities, and he would doubtless employ an amanuensis. I. Peter was the first of the Catholic epistles t~ secure a place in the canon of Scripture, and it seems to have been widely accepted by the end of the second century. It is, however, omitted from the Muratorian canon which probably represents the opinion of Rome about AD. zoo. The omission may have been accidental, and Zahn would emend the text.

PETER, SECOND EPISTLE OF. This epistle claims to have been written by "Simon (or Symeon) Peter, a servant and Apostle of Jesus Christ" The author, after a preliminary exhortation, declares his desire to testify again to the power of Jesus. He bases his testimony partly on his own experience "in the holy mount," and partly "on the word of prophecy." The mention of prophecy leads him to deal with the question of false prophets who are accused of false doctrine and immoral practices. In this section (ii. 1–22) is included almost the whole of the epistle of Jude (q *v.*). The author then deals with the expectation of the *Parousia* which some were beginning to doubt. This is the main object of the letter, to attack the false prophets and to defend the certainty of the *Parousia* of the Lord.

As I Peter was the first of the Catholic Epistles to be admitted into the canon, so II. Peter was the last. It was accepted at Alexandria in the third century, thence it passed into the canon of the church of Constantinople; but not until the fourth century was it accepted at Rome, and the Syrian church admitted it in the sixth century.

The cumulative weight of the following objections to its authenticity is generally held to disprove its claim to Petrine authorship:— (a) Origen, the first to mention it as Petrine, admits that its authorship was disputed. (b) The style, language and thought not only differ from I. Peter but from the rest of the New Testament. (c) References to immorality associated with false teaching seem to belong to a date much later than that of the Apostle Peter. (d) The incorporation of Jude makes Petrine authorship improbable. (e) The attribution of scriptural authority to the Pauline epistles (iii. 16) points to a date not earlier than the second century.

It is impossible to say when or where the epistle originated. For the date, a *terminus* a *quo* must be fixed by (1) the prevalence of an immoral gnosticism; (2) the attainment by the Pauline epistles of a quasi-scriptural authority: (3) the use made of the epistle of Jude, and perhaps of the Apocalypse of Peter. The *terminus ad quem* is the use of the epistle by Origen. We may say that the most probable date for its composition is the middle of the second century.

It may have been written in Egypt, where it first appears; or, as Deissmann thinks, it may have originated in Asia Minor.

The theology of II. Peter is suggestive of a late date Christ is referred to as "our God and Saviour," and the fatherhood of God seems to be understood only in reference to the Son. The work of Christ was the redemption of the elect, and this redemption awaits its consummation in the *Parousia.* The present world will be destroyed by fire, and the wicked, whether angels or men, will be finally condemned; then will begin a new era of happiness for the elect.

PETERBOROUGH, a city and port of entry of Ontario, Can, and capital of Peterborough county, situated 7j mi. N E. of Toronto, on the Otonabee river and the Canadian National and the Canadian Pacific railnays. The population (1951) was 38,272.

The five falls of the Otonabee at this point, nith a total descent of jo ft., furnish power for a large and increasing nurnber of manufacturing establishments. nhile its canalization as part of the Trent canal gives communication nith Lake Ontario and Georgian hay. Peterborough is the centre of Canada's watch and clock industry, has a cereal and flour mill and manufactures electric machinery, dairy equipment, knitted goods, health foods and canoes.

PETERBOROUGH, a city in the separate administrative county of the Soke of Peterborough, Northamptonshire, Eng., 41 mi. N.E. of Northampton by road. Pop. (1951) 53,417. Area, 15.7 sq.mi. It is on the western border of the fen country astride the Sene river. which is navigable to the sea by ships of 400 tons burden. It is the focus of important rail and road services and a great ecclesiastical, commercial and agricultural centre. There are railway and engineering works. factories for textiles and beet sugar. and numerous smaller industries, Many inhabitants are employed at the large brickworks at Fletton, in the belt of Oxford clay on the south side of the tonn, in Huntingdonshire

A village called Medeshamstede ("the settlement in the meadows") was there in 655 when Peada king of the Middle Angles, founded the Benedictine abbey of Sts. Peter. Paul and Andrew. Its name nas changed to Burgh between 992 and 1005 after Abbot Kenulf had made a wall around the minster, but the town was not a borough until the 12th century. The burgesses received their first charter from "Abbot Robert," probably Robert of Sutton (1262–73). Peterborough mas created a city by letters patent in 1541. Until the 19th century the dean and chapter. who succeeded the abbot as lords of the manor, appointed a high bailiff, and the constables and other borough officers were elected at their court leet, but the borough was incorporated in 1574. Among the privileges claimed by the abbot as early as the 13th century nas that of having a prison for felons taken in the soke and borough. In 1576 Bishop Scamble sold the lordship of the hundred of Nassaburgh, coextensive nith the soke, to Queen Elizabeth I, who gave it to Lord Burghley. and from that time until the 19th century he and his descendants, marquesses of Exeter, had a separate jail in I'eterborouph. The city sent two members to parliament for the first time in 1547, but the number was reduced to one in 1885, and in 1918 representation of the city was merged with that of the county.

Weaving and wool combing were carried on in the town in the 14th century.

The cathedral of St. Peter is the third church to occupy the site. The first, founded by Peada about 655, was destroyed by the Danes in 870; the second was accidentally burned donn in 1116 (foundations of the Saxon choir may still be seen). The present building dates from the first half of the 12th century, with some later nork, and presents a splendid picture of the transition through the various Norman styles to Early English. Most of the oolitic limestone used was quarried at Barnack, 8 mi. N.W. of the city.

The first portions to be rebuilt by Abbot John de Sais after the fire of 1116 were the choir and the transepts. Two bays of the nave had been completed and the central tower begun. This was finished by Abbot William de Waterville (1155–7j). Abbot Benedict finished the nave to the west transepts, which are the work of Abbot Andrew (1195–1200).

The magnificent west façade was put up in the early 13th century, its porch being added about 1370. The painted nooden ceiling of the nave. with its lozenge-shaped divisions, is Norman and is probably the oldest in England.

In 1270 a Lady chapel nas built but mas pulled down to provide material for the repair of the cathedral which lay almost in ruin after Cromwell's men had stripped the lead from the roof, burned stalls, screens and other noodnork and smashed the stained-glass windows. Finally, in the late 15th century "the new building" was added at the east end an ambulatory nith fan vaulting. Among the most important restoration works later

undertaken was the rebuilding of the central tower (1883), which had become insecure.

Catherine of Aragon was interred in the north choir aisle in 1536. A monument in the south choir aisle marks the place where the body of Mary, queen of Scots, lay after her execution at Fotheringay (1587) until it was removed (1612) to its final resting place in Westminster abbey.

Remains of other monastic building include the great gateway from the market place erected by Abbot Benedict (1177–93). Over it was the chapel of St. Nicholas. Immediately north of it is the chancel of the chapel of St. Thomas Becket, the nave of which provided material for the parish church of St. John the Baptist. On the south side of the precincts is the gateway (*c.* 1302) known as the Knight's gateway. The cloisters were ruined by Cromwell's men but still retain old doorways, etc., in the outer walls. Ruins of the refectory and the infirmary remain.

The old parish church of St. John the Baptist was situated to the east of the cathedral, but was rebuilt on its present site in the market square in 1401–07. East of the church is the old tonn hall (1671); modern buildings housing city and county administration were erected 1929–33 in Bridge street. In 1939 a new building to house an art gallery was erected adjoining the museum, which has a good varied collection of local antiquities, etc.

Educational establishments include the King's school, founded by Henry VIII in 1541 and Deacon's school, founded by Thomas Deacon in the 18th century.

Peterborough has an important agricultural show in July. The Bridge fair (first Tuesday, Wednesday and Thursday in October) dates from 1439. There is a Wednesday market (miscellaneous) and a vegetable and fruit market on Saturdays.

The city of Peterborough is a noncounty borough within the administrative county of the Soke of Peterborough, the usual functions of a noncounty borough council being exercised throughout the city area by the city council. City and county councils combine to form the Peterborough Joint Education board as the local education authority for the administrative county and to vest police powers in the Peterborough Combined Police authority. Quarter sessions for the Liberty of Peterborough are held in the city.

PETERBOROUGH AND MONMOUTH, CHARLES MORDAUNT, 3RD EARL OF (c. 1658–1735), English soldier and statesman, son of John Mordaunt, created Viscount Mordaunt of Avalon and Baron Mordaunt of Reigate, in 1659, and Elizabeth Carey. He served in the Navy and then became a Whig and keen opponent of James II. In Holland in 1686 he proposed to William of Orange the invasion of England; and, later, when William was king, Mordaunt was made a privy councillor, first lord of the treasury. and earl of Monmouth. Against the king's wishes, he introduced a bill for triennia! parliaments in 1693, and in 1697 he was sent to the Tower on the ground of complicity in Sir John Fenwick's conspiracy. Soon after, on the death of his uncle, Henry Mordaunt, he became earl of Peterborough.

In the reign of Anne he drew down on himself in 1702 the censure of the Commons for his action in trying to secure the return of his nominee at Malmesbury, and was sent off in 1705 to command an expedition in Spain. He besieged Barcelona and in 1706 entered Valencia in triumph. It is difficult to understand the action of Peterborough during this campaign, unless on the supposition that he was out of sympathy with the movement for placing the Austrian prince Archduke Charles on the throne of Spain. He was recalled to England to explain his conduct and joined the Tories in 1707.

The differences between the three peers, Peterborough. Galway and Tyrawley, who had served in Spain, caused angry debates in the Lords, but the majority declared for Peterborough, and votes of thanks were passed to him in 1708. He next went to Vienna, where he engaged the ministry in pledges of which they disapproved. Nevertheless, he was made a Knight of the Garter. With the accession of George I. Lord Peterborough's influence was gone, and he died at Lisbon on Oct. 25, 1735.

Short in stature and spare in habit, he was of fierce and turbulent disposition. He is said to have seen more kings than any man in Europe, and the point of Swift's lines on "Mordanto" consists in a description of the speed with which he hastened from capital to capital. He was eloquent in debate and intrepid in war, but his influence was ruined by inconsistency and his want of union with his colleagues. His first wife, Carey, daughter of Sir Alexander Fraser of Dores, Kincardineshire, died in 1709. In 1722 he secretly married Anastasia Robinson, a famous singer of great beauty and sweetness; but she lived apart from him (regarded as his mistress), and it was only shortly before his death that she was acknowledged as the countess of Peterborough.

BIBLIOGRAPHY.--*See* the life by William Stebbing (1890), and *War of the Succession in Spain,* by the Hon. Arthur Parnell (1905). The earlier lives are founded on the memoir of Capt. George Carleton (1728). which was dismissed as a fictitious narrative inspired by Swift, in the *Eng. Hist. Rev.* (1891), vi. 97–151.

PETER CHRYSOLOGUS, SAINT, (c. 4001406–c. 450), Latin father and doctor of the church. Little is known with certainty of his life. He was born at Imola in northern Italy and about 433 became bishop of Ravenna, the residence of the western Roman emperor. Peter was a zealous pastor, who preached regularly to his flock and, with 'the aid of the empress regent Galla Placidia, promoted the construction of church buildings. He was a close friend of Pope Leo the Great and was revered in both the east and the west for his eloquence and orthodoxy. In 448 Eutyches, the Monophysite heresiarch. appealed his condemnation to Peter as well as to Pope Leo. Peter's kindly reply withheld judgment but counseled obedience to the bishop of Rome. Soon afterward he retired to Imola and there died about 450. Many of his homilies survive, together with the letter to Eutyches. In the standard collection of 176 sermons, however, made in the 8th century, several are unauthentic, while other genuine homilies probably exist among the works of other authors. His sermons are short and popular, stressing the fundamental Christian doctrines and the duties of Christian life. They are not profound, original or elegant, but they reflect the needs and ideals, the virtues and vices of the times. The appellation *Chrysologus* ("Golden Orator") arose later, probably to create a western counterpart to the east's John Chrysostom. He was given the title of doctor of the church in 1729. His feast day is Dec. 4.

See G. Ganns, *Saint Peter Chrysologus: Selected Sermons* (1953).
(JN. SR.)

PETER CLAVER, SAINT (PEDRO CLAVER) (1581–1654), missionary to the Negro slaves in Spanish America, was born at Verdu, Catalonia. in 1581 and entered the Society of Jesus in 1602. While studying at the college of Palma in Majorca he was inspired by the holy lay brother St. Alphonsus Rodriguez to volunteer for the missions of New Spain. In 1612 he was sent to Cartagena (in modern Colombia). where he was ordained in 1616. At Cartagena. the chief slave market of the new world, every month slave ships disembarked 1.000 or more Negro slaves. The condition of these poor wretches aboard ship and in the slave pens was horrible beyond description, and the new priest, declaring himself "the slave of the Negroes forever," dedicated his life to them. Accompanied by interpreters and carrying food and medicines, he boarded every incoming slave ship and constantly visited the slave pens, befriending and defending the oppressed, nursing the sick and dressing their sores, teaching religion and baptizing them. His heroic labours met with strong opposition: and even ecclesiastics lent their ears to charges of indiscreet zeal. Claver persevered for 38 years, baptizing, according to reliable estimates, 300.000 slaves.

He died at Cartagena Sept. 4, 1654. Pope Leo XIII canonized him on Jan. 15, 1888, and on July 7, 1896, declared him the patron of all Catholic missions to Negroes. His feast day is Sept. 9.

PETER DES ROCHES (d. 1238), bishop of Winchester under John and Henry III, was a Poitevin by extraction. He received the office of chamberlain toward the close of Richard's reign, and under Richard's successor became an influential counsellor. In 1205 he became bishop of Winchester, and though his

election was disputed, it was confirmed by Pope Innocent III, who honoured Peter by consecrating him in person. None the less, the bishop stood by his royal patron during the period of the interdict and during the struggle with the barons. In 1213 he was made justiciar in succession to Geoffrey Fitz Peter. At the battle of Lincoln (1217) Peter led a division of the royal army and earned some distinction by his valour; but he played a secondary part in the government so long as William Marshal held the regency. After Marshal's death (1219) Peter led the baronial opposition to Hubert de Burgh, with varying success. At first the justiciar was successful. In 1221 Peter meditated going on crusade; 1223–1224 saw his party broken up by Hubert's energetic measures. In 1227 he was himself dismissed from his office and left England to join the crusade of the emperor Frederick II. He was absent from England until 1231; but in the meantime enhanced his reputation both as a soldier and diplomatist. After the fall of de Burgh he kept in the background, but offices and honours were heaped on his dependants. This foreign party triumphed over the revolt which was headed by Richard Marshal in 1233. But the primate, Edmund Rich, denounced Peter as a mischief maker, and demanded his dismissal. Peter was permitted to leave the country with a pardon (1235); he conciliated Gregory IX by rendering efficient aid in a war with the citizens of Rome (1235); and in the next year returned without molestation to his see. Peter died in 1238, and was buried at Winchester.

PETERHEAD, a small burgh and seaport in the Buchan district of Aberdeenshire, and the most easterly town in Scotland, 32 mi. N.N.E. of Aberdeen by road. Pop. (1951) 12,763. The town is built of locally quarried red granite. A statue to Marshal F. E. J. Keith (*q.v.*), born in 1696 at Inverugie castle, 2 mi. N.W., was presented to the burgh in 1868 by William I of Prussia. There is much local trade from the port, which is an important station of the herring fisheries and head of a fishery district, with a large herring fleet which has been converted from steam fishing drifters to modern wooden dual-purpose vessels. The north and south harbours lie between the town and Keith-Inch, an island suburb, and the isthmus dividing them is pierced by a canal; in the north harbour there is a graving dock and a patent slipway. The breakwater, enclosing about 400 ac. of water (the Harbour of Refuge), has been built partly by convict labour; and prisoners from the same prison. Salthouse Head, still quarry the stones for it.

The town and lands belonged of old to the abbey of Deer, but when the abbey was erected into a temporal lordship in the family of Keith the town passed to the earl marischal, with whom it continued till the forfeiture of the earldom in 1716. It was bought in 1720 by an English building company, which failed, and then by the Merchant Maidens' hospital of Edinburgh, which is still the overlord. Peterhead, made a burgh of barony in 1587 by George Keith. 5th earl marischal, was the scene of the landing of the Old Pretender on Christmas day, 1715. In addition to granite quarrying and polishing, now almost extinct, the leading industries are shipbuilding, fish curing, fish and vegetable canning, woollen manufactures and light engineering.

PETERLOO, or the Manchester massacre, a name given to a meeting held on Aug. 16, 1819, in St. Peter's fields, Manchester. Its object was to demand the reform of parliament and it was attended by about 60,000 persons, including an unusually large proportion of women and children. None were armed and their behaviour was admittedly wholly peaceable, but the magistrates, who were in a nervous condition, ordered the Manchester yeomanry to seize the speakers immediately after the meeting had begun. The yeomanry, who were untrained Manchester businessmen, did not confine themselves to arresting the leaders, but made a general attack upon the audience, crying "Have at their flags," and cutting them down with the edge as well as the flat of their sabres. The chairman of the bench of magistrates thereupon ordered the 15th hussars and the Cheshire yeomanry also to charge the crowd, and in ten minutes the place was cleared except for bodies, "some still groaning, others with staring eyes, gasping for breath; others will never breathe more; all silent save for those low sounds and the occasional snorting and pawing of steeds." The numbers of killed and wounded were disputed; 600 authenticated cases are known. The indignation caused by the behaviour of the yeomanry and its endorsement by the government contributed largely to the ultimate success of the reform movement.

A Peterloo medal, now rare, was struck, bearing the legend "The wicked have drawn out the sword, they have cut down the poor and needy and such as be of upright conversation" (Ps. xxvii, 14).

See *Memoirs of* H. *Hunt, Esq.* (1820–22); S. Bamford, *Passages in the Life of a Radical* (1893); *F. A.* Bruton, *Story of Peterloo* (1919), *Three Accounts of Peterloo* (1521). (R. W. P.)

PETER MARTYR, a name commonly used in English for (1) ST. PETER MARTYR (d. 1252), killed by Cathars; (2) PIETRO MARTIRE D'ANGHIERA (1457–1526), Italian historian; and (3) PIETRO MARTIRE VERMIGLI (*q.v.*).

PETER NOLASCO, SAINT (PIERRE NOLASQUE) (c. 1189–1256), founder of the order of Our Lady of Ransom (de Mercede), commonly called Mercedarians, was born of noble parents at Mas-Saintes-Puelles in Languedoc. The facts of his life are obscure and controversial. Declining to marry, he dedicated himself to God's service among the poor and abandoned. The belief that he took part in the Albigensian campaign or was tutor to James I, king of Aragon, has been doubted. He uent to Spain, where the Moors held many Christians in slavery. Peter spent his patrimony ransoming them and got others to contribute. Later he determined to found a religious institute whose primary object would be the ransoming oi Christian slaves. The extent of Raymond of Peñafort's influence on the founding of the order has been disputed by the Dominicans and Mercedarians, and consequently the date of ceremonial foundation in Barcelona is variously given as 1218, 1223, 1228 and 1234. The documento de *los sellos,* a notarial act, treating of Our Lady's simultaneous apparitions, commanding the founding of the order, to Peter himself, Raymond and James I, has been proved a forgery. Peter twice went to Africa to redeem slaves. He resigned his offices of master general and ransomer some years before his death at Barcelona on Dec. 24/25, 1256. He was canonized in 1628, and his feast day is Jan. 28.

PETER OF BLOIS (PETRUS BLESENSIS) (c. 1135–*c.* 1205), French writer, the son of noble Breton parents. mas born at Blois. In 1167 he went to Sicily. where he became tutor to the young king William II, and keeper oi the royal seal. He made many enemies and soon asked permission to leave the country, returning to France about 1170. Peter entered the employ of Henry II of England about 1173. He became archdeacon of Bath and soon aiterward chancellor, or secretary, to Richard, archbishop of Canterbury, and to Richard's successor, Baldwin, being sent on two occasions to Italy to plead the cause of these prelates before the pope.

After the death of Henry II in 1189, he was for a time secretary to his widow, Eleanor, in Normandy; he obtained the posts of dean of Wolverhampton and archdeacon of London. He died some time after March 1204.

Peter's writings fall into four classes, letters, treatises, sermons and poems. His Epistolae, collected at the request of Henry II, are an important source for the history of the time; they are addressed to Henry II. and to various prelates and scholars, including Thomas à Becket and John of Salisbury. His treatises include De Ierosolymitana peregvinatione *acceleranda,* an exhortation to take part in the third crusade, and *Dialogus* inter *regem Henricum* II et *abbatem Bonaevallensem;* his extant sermons number 65 and his poems are unimportant. Peter's works were printed in several collections, including the Patrologia of J. P. Migne and the *Historiae francorum* scriptores of A. Duchesne. Of separate editions the best are by Pierre de Goussainville (1667) and J. A. Giles (1846–47).

PETER OF COURTENAY (d. 1219), emperor of Rumania (or Constantinople), was a son of Peter of Courtenay (d. 1183), and a grandson of the French king, Louis VI. Having, by a first marriage, obtained the counties of Nevers and Auxerre, he took for his second wife Yolande (d. 1219), a sister of Baldwin and Henry of Flanders, who were afterward the first and second emperors of the Latin empire of Constantinople. Peter accompanied his cousin, King Philip Augustus, on the crusade of 1190. fought against the Albigenses and was present at the battle of Bouvines in 1214. When his brother-in-lam, the emperor Henry, died without sons in 1216, Peter was chosen as his successor. Consecrated emperor at Rome, in a church outside the walls, by Pope Honorius III on April 9, 1217, he borrowed some ships from the Venetians, promising in return to conquer Durazzo for them; but he failed in this enterprise, and sought to make his way to Constantinople by land. On the journey he was seized by the despot of Epirus, Theodore Angelus, and, after an imprisonment of two years, died, probably by foul means.

PETER OF SAVOY (*c.* 1203–1268), earl of Richmond, younger son of Thomas I (Tommaso), count of Savoy, was born at Susa. After spending several years as an ecclesiastic, he resigned his preferments, and in 1234 married his cousin, Agnes, daughter and heiress of Aymon II, lord of Faucigny. On the invitation of the English king, Henry III, who had married his niece, Eleanor of Provence, Peter went to England in 1240, and was created earl of Richmond, receiving also large estates and being appointed to several important offices. During several visits to the continent of Europe Peter increased his possessions in the Vaud district, and, returning to England in 1252, he became associated with Simon de Montfort, retaining at the same time the king's friendship. He was employed by Henry to negotiate with the pope and Louis IX of France, but supported Earl Simon in his efforts to impose restrictions upon the royal power. He went over to Henry's side in 1260, and was consequently removed from the council. In 1263 he left England, and when his nephew, Boniface, count of Savoy, died in the same year he assumed the title of count of Savoy. This was also claimed by another nephew, Thomas; but Peter compelled the inhabitants of Turin to submit to him and secured possession of the county. He died on May 16 or 17, 1268. Peter gave his name to the Savoy palace in London.

PETERS or PETER, **HUGH** (1598–1660), English Independent clergyman, was educated at Trinity college, Cambridge, where he graduated M.A. in 1622. He took Anglican orders, and was appointed lecturer at St. Sepulchre's, but his unorthodox opinions drove him to the continent, where he remained till 1635. In that year he sailed for America, where he already had connections, and he became minister at Salem! Mass. He played a leading part in the affairs of the colony and in the founding of Connecticut. Returning to England as agent for the new colony in 1641, he became involved in political matters. He was chaplain to the force of adventurers in Ireland, served in Lord Forbe's expedition and in the campaigns of 1645 and 1646, and by his eloquence is said to have materially assisted the parliamentary cause.

Although an influential leader of the Independents, Peters was disliked by the presbyterians. He supported the army in its quarrel with parliament, and in 1649 he accompanied Cromwell to Ireland and was present at the fall of Wexford; also the battle of Worcester. Appointed chaplain to the council of state (1650), he preached at Whitehall continually during the protectorate, and gained much influence. In 1652–53 he protested against the Dutch war, and was severely reprimanded. Soon after he retired from public life. At the Restoration he was specially exempted from the Act of Indemnity, tried for abetting the execution of Charles I, found guilty and executed on Oct. 16, 1660.

PETERS, KARL (1856–1918), German explorer, one of the founders of German East Africa, was horn at Neuhaus on the Elbe on Sept. 27, 1856. He visited London to study English principles of colonization and on returning to Berlin founded the Society for German Colonization in 1884. The same year he went to the coast of east Africa where he made treaties in favour of Germany with native chiefs. A further expedition led by Peters under the auspices of the German East Africa company in 1887, avowedly for the relief of Emin Pasha, extended the sphere of German influence. Peters reached Uganda early in 1890 and concluded a treaty with the king, but without the support of the German government. This treaty was declared void as an agreement had been reached between Germany and Great Britain by which Uganda was left in the British sphere. Back in Germany Peters published in 1891 an account of his expedition, *Die deutsche Emin Pasha Expedition (New Light on Dark Africa).* He was imperial high commissioner for Kilimanjaro in 1891, but in 1897 was deprived of his comtnission for misuse of official power in his treatment of the natives; he was reinstated in 1906. From 1899 to 1901 he explored the Fura district and Macombe's country on the Zambezi, with a view to commercial exploitation, and described his discovery of ancient cities and deserted gold mines in *Im Goldland des Altertums (The Eldorado of the Ancients;* 1902). Peters died at Woltorf, near Brunswick, on Sept. 10. 1918.

See H. T. Schorn, Dr. *Carl Peters* (1920).

PETERSBURG, a city of southern Virginia, U.S., 23 mi. S. of Richmond on the Appomattox river. In 1646 Ft. Henry was built at the falls of the Appomattox, the site of the present city. Maj. Peter Jones became commander of the fort in 1675; from him, directly or indirectly. Petersburg seems to have derived its name. In 1733 Col. William Byrd II surveyed the site but it was not until 1748 that an act of the colonial legislature estahlished the town of Petersburg. In 1784 Petersburg, Blandford, Pocahontas and Ravenscroft were combined and incorporated as one tonn, Petersburg During the American Revolution it was captured by British troops under William Phillips and Benedict Arnold on April 25, 1781 On May 20 Cornwallis arrived nith his army and a few days later began the campaign that was to end with his surrender at Yorktown

Petersburg was the scene of prolonged and bitter fighting during the American Civil War. In June 1864 following his costly failure to defeat Gen Robert E. Lee at Cold Harbor, Gen. U. S. Grant moved his army to the south side of the James. The southern approaches to Richmond nere blocked by Petersburg and Grant's efforts to take the city developed into a virtual siege that lasted for 10 months. On April 2, 1865, his defenses crumbling and his army in danger of destruction, Lee ordered a withdrawal from Petersburg. Richmond was evacuated on April 3 and the mar was all but over. (See also PETERSBURG CAMPAIGN.)

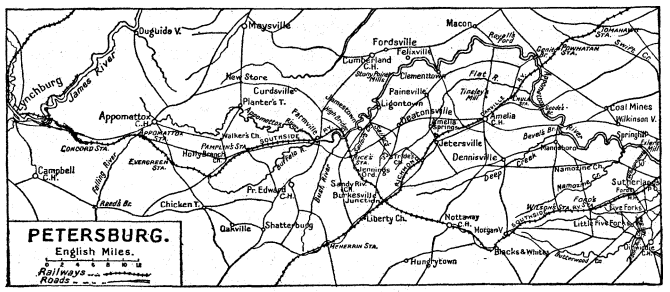
Petersburg National Military park. which embraces portions of the battlefield, is only one of many historic sites in and around Petersburg. Centre Hill mansion. built in 1823, was an antebellum show place; it now houses an important collection of Civil War relics. Bristol parish church in Blandford, built in 1737, has been restored. Adjoining it is the Confederate cemetery.

Petersburg has more than historic importance; it is a progressive city engaged in a long-range, comprehensive program of modernization and improvement. Its industrial output includes cigarettes and other tobacco products, optical lenses and frames, trunks and hand luggage, wearing apparel and Fiberglas boats. Nearby Hopewell has large plants producing industrial chemicals, paper and allied products and synthetic fibres. Petersburg has a council-manager form of government, in effect from 1920.

Virginia State college and Central State hospital lie just outside Petersburg Ft. Lee, the U S. army quartermaster training command, is one-half mile east of the city. For comparative population figures *see* table in VIRGINIA. *Population.* (M. **BR.**)

PETERSBURG CAMPAIGN (1864–65). The name of Petersburg is associated with operations in the American Civil War, which formed the sequel of the Wilderness Campaign (q *v.*) and the last act in the struggle between the armies of Grant and *Lee* for supremacy. Petersburg and Richmond, Virginia, connected hy rail and covered north, east and south by 40 mi of entrenchments, formed the salients of a vast fortress, into which reinforcements and supplies could be poured from the rear by means of the James canal, the Virginia Central, the Lynchburg, the Dan-

ville and the Weldon railroads—the latter bringing up to Petersburg from Wilmington (225m. distant) the cargoes of blockade runners. Petersburg became a strategic point as soon as Grant determined to carry the army of the Potomac—defeated at Cold Harbor on the Chickahominy (see WILDERNESS CAMPAIGN)—south of Richmond, and, being joined by Butler's Army of the James (momentarily checked in the Bermuda Hundred peninsula



LEE'S RETREAT

by a small army under *Beauregard*), to operate from the east, depending on the James river as his line of supply. The policy of the Confederate president was to employ Robert *E.* Lee's army to protect his capital. Petersburg was nearer than Richmond to the navigable part of the James river—City Point is only 10m. distant—and the capture of Petersburg would involve the fall of Richmond and the capitulation or flight of Lee's army.

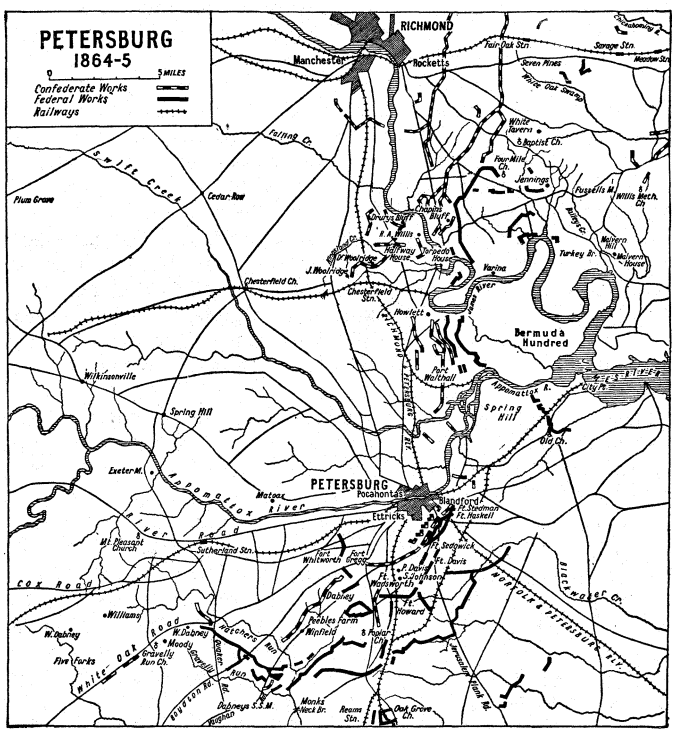
As early as June 9, 1864, while the main armies were still north of the James and Petersburg was garrisoned by a brigade under Gen. *Wise*, a Federal expedition from the Army of the James approached the city. The column on the City Point road discovered strong earthworks, and that on the Jerusalem Plank road experienced a repulse: the total force of the Federals was 4,500, and *Wise's* brigade (2,400) had been quickly reinforced from *Beauregard's* central position at Bermuda Hundred. A week later a more serious attempt was made to break through the defences, while Gen. Lee's main army was detained north of Richmond. Grant detached the II. and XVIII. Corps under Generals Smith and Hancock, who were to unite and operate along the City Point railroad and capture the outer line of works about 2m. from Petersburg while a demonstration was made along the Norfolk railroad by cavalry under Kautz. On June 1j Smith attacked and captured five redans before Hancock came up, and when next day Burnside's corps (IX.) arrived and Gen. Meade assumed control of the three corps, he attacked again at 6 P.M. On June 17 Warren's (V.) corps arrived, and Meade made a third assault with two corps (V., IX.). On June 18 the attack was renewed with three corps (II., V., IX.) late in the afternoon, and the results of the four days' fighting were so far satisfactory that ground was won which could be entrenched and held against any sortie of the Petersburg garrison. Probably on June 18 the town of Petersburg might have been captured by Meade, for at this crisis Lee was in temporary eclipse.

It was late on June 17 when Beauregard, who had for three days valiantly held his main lines south of Richmond with some 14,000 infantry against three Federal corps, succeeded in convincing Lee that the main army was in the wrong place. But when at last the Confederate leader was aroused to a sense of his danger he soon filled every road with divisions marching to save Petersburg: they marched all night; they slept in the trenches on arrival, and on June 19 these reinforcements convinced Meade that his main attack between the Appomattox river and the Jerusalem Plank road was delivered a day too late. At a cost of 10,000 casualties Meade had gained half a mile of ground, but the Confederates in falling back had concentrated, and now that the new plan of operations was exposed and the main bodies were again face to face the power of defensive tactics reasserted itself.

Yet June was not to close without adding some 8,000 men to the Federal casualties, for in addition to daily losses by sharpshooting along the front, over 5,000 men fell or were captured in operations directed against, the southern railroads. Grant. had resolved to deprive his enemy of these lines of supply: his plan was to prolong his line of investment westward and construct redoubts (such as Fort Davis, Fort Stedman and Fort Sedgwick) as a continual menace to the Confederate garrison and a defence against sorties, while his cavalry and portions of five corps (II., V., VI., IX. and XVIII.) engaged in enterprises which it was hoped would tempt Lee to fight outside his works. A decisive victory in the field, a successful assault on the defences between Richmond and Petersburg, or the complete destruction of the railroads, would precipitate disaster to the South, and of these three methods the last would be the surest in its effects. But such a method was necessarily slow. Wilson's cavalry (5,500) destroyed 30m. of the Lynchburg or South Side railroad, and 30m. of the Danville railroad, together with Burkesville junction and Ream's station on the Weldon railroad; but Wilson was caught by the Confederate cavalry 100m. from Petersburg and escaped only by destroying his wagons and limbers and abandoning 12 guns. Even the Virginia Central railroad could not be held by the Federals after Sheridan with the main body of the cavalry had been called back to White House on the Pamunkey to escort a great convoy.

By the end of June the whole of the rival forces were concentrated about the Richmond-Petersburg defences, and Gen. *A. P. Hill* had already sallied out on June 21 to drive the II. Corps from the Weldon railroad. Federal policy and Federal strategy, surmounting the crisis of Cold Harbor, were, however, at last in unison. Grant had a free hand in respect both of his dispositions and his resources in men and money, and had resolved to use unsparingly the resources placed at his disposal.

On July 25 Grant resolved to weaken the enemy on his front by a demonstration north of the James, and accordingly moved a corps (II.) and two cavalry divisions across the river to Malvern hill under cover of Foster's corps (X.). But *Lee* possessed the inner line, and the Federal detachment found two cavalry divisions in its front, and the Richmond defences had been



strengthened by three divisions of infantry. The expedition then returned to take part in a fresh enterprise, which ended disastrously to the Federals. A Confederate redan faced Burnside's IX. corps 100yds. distant, and this strong work was to be destroyed by mining operations. The mine was fired and produced a crater 150ft. long, 60ft. wide and 25ft. deep, into which the Federals poured. But the troops could be got no farther before the Confederate counterattack was upon them, and Burnside's corps lost 4,300 men.

In Aug. Sheridan was detached to operate against Early in the

Shenandoah valley, and in order to prevent *Lee* reinforcing *Early* another demonstration against Richmond was planned. But *Lee* again strengthened his left and the result of the fighting was a loss to the Federals of nearly 3,000 men. Meanwhile another attack on the Weldon railroad by Warren's corps was met by *A. P. Hill* on Aug. 20, and the possession of the railroad cost the Federals 3,000 men. A further attempt on this railroad by Hancock's II. Corps and Gregg's cavalry division at a point 3m. south of Ream's Station was foiled by *A. P. Hill*, now aided by *Hampton's* two cavalry divisions, and the Federals here lost 2,372 men and nine guns. The Confederates, therefore, still retained possession of the railroad to a point within one day's hauling by wagon to Petersburg. During Sept. another Federal enterprise north of the James with two corps (X. and XVIII.) resulted in the capture of Fort Harrison near Chaffin's Bluff, and when *Lee* reinforced his left and counter-attacked his troops were repulsed with heavy loss. The Federals lost over 2,000 men and failed in the attempt to take Fort Gilmer, Confederate gunboats below Richmond aiding in the defence. While this operation was in progress on the Confederate left under Grant's personal supervision *Lee* was apprised of attacks on his extreme right at Peebles farm by four divisions, which captured a Confederate redoubt covering the junction of two routes to the south-west. *A. P. Hill* prevented a further advance of the enemy by a vigorous counter-attack which caused Warren and Parke (IX.) a loss of 2,000 men, of whom nearly three-fourths allowed themselves to be captured; for the ranks, since the losses of the May battles, had been swamped with drafted and substitute recruits of poor quality and almost insignificant training. The Federals had, however, by these operations pushed their entrenchments beyond the Weldon railroad westward and established new works within a mile of the Confederate right. At the end of Oct. Grant resolved to make a serious effort to bring the South Side railroad within his lines and deprive the enemy of this important line of supply. Parke (IX.), Warren (V.) and Hancock (II.) took each some 11,000 infantry with four days' rations on pack animals. Gregg's cavalry (3,000) were attached for the operation, and both Grant and Meade accompanied the troops. *A. P. Hill* encountered this force with three divisions (14,000) and Hampton's cavalry (5,500), and he contrived to hold two corps with one division and attack Hancock (II.) with his main body. The Federals were stopped when 6m. from the railway.

Lee meanwhile had been called to Chaffin's Bluff, where again Butler was demonstrating with the Army of the James on the approaches to Richmond. But *Longstreet* signalized his return to duty with the Army of Northern Virginia by driving Butler off (Oct. 27). In Dec., however, Warren contrived to evade *A. P. Hill* and destroy the Weldon railroad at a point on the Meherrin river 40m. from Petersburg.

There seemed now little to tie *Lee* to the lines he had so painfully constructed, for his army was without coffee, tea or sugar, and though of foreign meat they had 3½ million rations and of bread 24 million rations in reserve, the troops lived chiefly on cornbread. *A. P. Hill* on the right held on from Hatcher's Run to Fort Gregg, whence *Gordon* and *Anderson* prolonged to the left as far as the Appomattox river, and *Longstreet* continued the line northwards along the Bermuda front across the James as far as White Oak swamp (37m. in all). The winter was very severe, and the continual trench-work and outpost duty overtaxed the patriotism of *Lee's* 50,000 infantry and stimulated desertion. Supplies were brought in by wagons, as the rolling stock on the railways was worn, and on Feb. 5, 1865, Gen. Gregg moved out to the Boydton Plank road to intercept the Confederate convoys. Gregg failed to locate the wagons, and *Lee*, hearing of the expedition, sent out a force which drove him back. Sheridan, after driving *Early* from the Valley in Oct., destroyed the railways about Staunton, Charlottesville, Gordonsville and Lynchburg, and even rendered the James canal useless as a line of supply.

Grant recalled Sheridan to the main army in March, and at the end of the month prepared for a turning movement westward with the object of drawing *Lee* out of his lines. *Lee* had anticipated such an attempt, and had resolved to abandon his lines and unite with Johnston in North Carolina, but the roads were **not** yet in a state for the movement of artillery and wagons, and it was to gain time that he now ventured upon a bold offensive stroke—a night attack upon a strong point in the Federal right called Fort Stedman—the success of which might cause Grant to call in the detachments on his left and so facilitate the proposed movement of the Confederates towards Danville. Gen. *Gordon* was selected to conduct the operation and his corps was strongly reinforced for the occasion. The opposing lines east of Petersburg were only 150yds., and the sentries of each side 50yds. apart. *Gordon's* men dashed across the intervening space at 4:30 A.M. on March 25, surprised the garrison and occupied Fort Stedman, but when daylight broke and the Federal guns could be brought to bear the fort was found to be untenable. Parke's corps (IX.) recaptured the work at a cost of 1,000 men, and *Gordon* fell back, leaving nearly 2,000 men in the hands of the Federals.

At this time Sherman visited Grant at City Point and proposed to move at the end of ten days on Burkesville junction and so cut off *Lee* from Danville and Lynchburg; it was while Sherman was preparing for this operation that Grant finished the campaign. Secure behind his formidable entrenchments, Grant had no fear for his base on the James river, and transferred large bodies of troops to his left without *Lee's* knowledge. Sheridan was instructed on March 29 to gain the enemy's right and rear, moving by Dinwiddie Court-House and across Hatcher's Run. But the Confederates were on the alert and quick to extend their right. Sheridan got into a flat country of dense forest, tangled undergrowth, streams and swamps, and the soil of clay and sand was impassable for wagons and guns until he had corduroyed the route. On March 29 *Lee* perceived that the object of Grant was to seize the routes south of the Appomattox river, by which a movement south-west could be made to unite with Johnston's army, and he endeavoured to cover these roads, including the South Side railway, without losing his hold upon his works about Richmond and Petersburg, but in such a contest it was evident that numbers must prevail.

Sheridan's cavalry had reached Five Forks on the White Oak road on March 31, and on his right Humphreys and Warren (II. and V.) held the Confederates to their works along Hatcher's Run astride the Boydton Plank road; yet *Lee* was able to concentrate his three cavalry divisions, and supported them by *Pickett's* five infantry brigades. Sheridan was attacked and driven south as far as Dinwiddie Court-House; but Humphreys and Warren held their ground (action of White Oak ridge) at a cost of 2,000 men. *Pickett* and the cavalry fell back to Five Forks during the night and hastily entrenched, for he had been ordered to defend this position; since the Boydton Plank road could no longer be held, the possession of White Oak road and the South Side railway became necessary for the flank movement which *Lee* had resolved to attempt. Grant meanwhile had ordered Warren to support Sheridan in an attack on *Pickett* at daybreak. Sheridan advanced on April 1 and at 3 P.M. issued his orders for attack, explaining verbally a diagram he had prepared for the use of divisional commanders. *Pickett* held a front of 2m. with a division of cavalry on either flank and *Rosser's* cavalry guarding the baggage behind Hatcher's Run, and when attacked at 4 P.M. he was with *Rosser* 1½m. in rear. Before *Pickett* was made aware of a battle being in progress his left was destroyed. *Lee* seems to have made no arrangements to support him in this direction. *Pickett's* position on the right was finally carried by Sheridan's cavalry dismounting and storming the entrenchments frontally. *Pickett's* routed brigades were rallied at the South Side railroad, but the Confederates had lost White Oak road, and unless *Lee* was capable of a vigorous counterstroke on his extreme right it was evident he must also lose the South Side railroad.

But a crisis was approaching. Sheridan's success at Five Forks induced Grant to deliver a general assault on April 2. The Confederate lines were bombarded all night, and on April 2 with Wright's corps (VI.), Grant attacked the weakest part of *Lee's* line and broke through, losing 1,100 men in 15 minutes. *A. P. Hill* was killed and his corps broke and was cut off from Peters-

burg. At the same time Parke's corps (IX.), on the right of the VI, attacked the eastern front near Fort Stedman but was repulsed; then Humphreys' corps (II.) on the left attacked a Confederate division and forced it to retreat to the South Side railroad, where at Sutherland station a final attack dispersed it. Wright, supported by Gen. Ord (commanding the Army of the James), afterwards won the strong redoubts called Fort Whitworth and Fort Gregg, and thus in a day the Confederate right had been destroyed from Five Forks to a point some two or three miles west of the Weldon railroad; 10m. of works had been abandoned, and if Grant had been able to press his advantage at once the campaign must have ended. But Grant was not aware of the enemy's plight, and so resolved to wait until the morrow before completing his victory.

Meanwhile *Lee* perceived that the hour had come at last when Richmond must fall, and at 3 P.M. he had issued orders for the march of the remains of his army to Lynchburg via Amelia Court-House, a march which evidently must partake of the character of a forlorn hope, hastily planned ill prepared, and undertaken by troops whom the disasters and hardships of the past six months had weakened physically and morally. Yet if *Lee* had negotiated *a* peace on April 2 military history would have lost one of the finest examples of the strategic pursuit. *Lee's* proposed movement involved the transfer of the army and its baggage 100m. on bad roads across the front of an enemy, and nothing but mischance could prevent the Federals intercepting *Lee's* columns by a shorter route and seizing the South Side railroad, on which supplies were to be forwarded from Lynchburg to meet the retreating army at Appomattox station, Pamplin's station or Farmville station. The Appomattox river must be crossed two or three times at its bends. Various creeks and swamps must be bridged, and the bridges destroyed after crossing. The wagons must move on separate roads so as to be covered by the columns during marches and combats and the infantry were to follow the artillery on the roads *Longstreet*, *Gordon* and *Mahone's* division from Richmond all crossed the Appomattox at Goode's bridge. *Ewell* from Richmond crossed the Appomattox by the Danville railroad bridge north of Goode's bridge. *Anderson* commanded the flank guard which moved south of the Appomattox with *Fitzhugh Lee's* cavalry. *Lee* gained a day's start by moving at 8 P M., for Grant was making preparations to attack the entrenchments next day (April 3), but the start was lost in waiting for President *Davis* and the Government to escape from Richmond. Sheridan's cavalry got in touch with *Lee's* flank-guard early on April 3 near Namozine creek, and at nightfall the Federal advance-guard was at Deep creek. On April 4 Sheridan reached the Danville railroad at Jetersville, and on April j. when *Lee* had halted at Amelia Court-House on the railroad to get supplies, the Federals had three corps (II., V., VI.) in support of Sheridan 8m. nearer than *Lee* to Sailor's creek, the point where he must again cross the Appomattox.

Interception was now a *fait accompli,* though neither side suspected it. *Lee* was unaware of the enemy's proximity. and Grant believed that *Lee* would remain at Amelia Court-House, but *Lee* mbved west, crossing Flat creek at sunset on April 5, to the Lynchburg railroad (*Longstreet,* marching all night, reached Rice's station at sunrise on April 6), while the Federals moved northward on the same day to attack *Lee* at Amelia Court-House, and on discovering *Lee's* evasion the three Federal corps effected a wheel to the left and advanced on Deatonsville after bridging Flat creek. Meanwhile the Federal cavalry had located and destroyed a convoy at Painesville, but had in turn been attacked by *Fitzhugh Lee's* cavalry and driven back on the main body at Flat creek. The rearguard of *Lee's* army was *Gordon's* command, which was at Amelia springs at 8 A.M. on the 6th of April. *Lee's* army stretched out for 15m., and when its advance-guard was at Rice's station its rearguard was still at Amelia Court-House. Rice's station is 62m. from Lynchburg. Here *Longstreet* waited all day for *Anderson, Ewell* and *Gordon* to close up, and then at night he moved 8m. to Farmville station (68m. south-west of Richmond), where 80,000 rations had been railed from Lynchburg; then *Longstreet* crossed the Appomattox, and on April 7 moved forward towards Lynchburg, covered by *Fitzhugh Lee's* cavalry. Meanwhile the remainder of *Lee's* army had been practically destroyed within a few miles of the point where *Longstreet* had halted. Sheridan's cavalry and two corps (II., VI.) had caught it entangled with the trains of the army attempting the passage of Sailor's creek; and Ord would even have attacked *Longstreet* (whom he had located late at night) had his march been delayed.

Complete disorganization and demoralization seem to have taken hold of the Confederates on this fatal day, and *Lee* was once more in eclipse. The Federal cavalry headed the column, the infantry attacked it, and *Ewell* became the victim of tactical envelopment after *Anderson* had been defeated and *Gordon* had failed to save the trains of the army. Surrender or massacre being the alternatives, *Ewell* surrendered, and here in fact the career of the army of Northern Virginia ended, as Grant plainly saw, for at 5:30 P.M. he addressed a demand to *Lee* for his capitulation. But *Lee* clung to his diminished forces for another 48 hours. *Longstreet* in crossing at Farmville had burnt the bridges and thus delayed the pursuit; but *Gordon* and *Mahone,* who had crossed at High bridge (the railroad bridge), failed to check Humphreys' corps (II.), and so were compelled to take up a position of defence on the north bank until darkness enabled them to slip away. *Lee* was with this remnant of the army. Meanwhile Sheridan with the cavalry and two corps (V., XXIV.) had hastened along the South Side railroad, seizing the supplies waiting for *Lee* at Pamplin's Station, and then moving on another 12m. to Appomattox station. At nightfall he found that he was astride the enemy's line of operation, which was also his line of supply, and so *Lee* would be compelled to give battle or capitulate on the morrow.

Lee, quitting Farmville heights on the night of April 7 changed the order of march during the next day, so that *Gordon* (8,000) was in the van and *Longstreet* (15,000) furnished the rear-guard. *Ewell's* corps u-as now represented by 300 effectives. The cavalry still numbered some 1,600 sabres. *Lee's* column was pursued along the Lynchburg road by two Federal Corps (II., VI.), which marched 26m. in 18½ hours. and at midnight halted within 3m. of *Longstreet,* who had entrenched near Appomattox Court-House, facing east and covering the road on which *Gordon's* corps and the cavalry was to press forward to Lynchburg at daylight. But *Gordon* on the morning of April 9 found Sheridan's cavalry in his front, and in accordance with plans made overnight he commenced an attack, driving the Federals back until he encountered at 10 A.M. two corps of infantry (V., XXIV.) under Ord, who had marched 29m. in order to support Sheridan at the crisis; and when at the same moment *Longstreet* was threatened by Humphreys and Wright (II., VI.) the situation had arisen which *Lee* considered would justify surrender, an event which had been anticipated on both sides as the result of the fighting about Farmville on April 6 and 7.

The closing operations from March 29 to April 9 were all in favour of the Federals, but, nevertheless, the historian counts their losses during this period at nearly 10,000 in the five corps and cavalry which constituted Gen. Grant's field army. On April 9, at the Appomattox Court-House. the two leaders exchanged formal documents by which 2.862 officers and 25,494 enlisted men were paroled, all that remained in the field of some 55,000 Confederates who were drawing rations on Feb. 20 as the army of Northern Virginia. (G. W. R.)

PETER'S PENCE or ROMESCOT, a tax of a penny on every hearth. formerly paid annually to the popes, now represented by a voluntary contribution made by the devout in Roman Catholic churches. Its date of origin is doubtful. The first written evidence of it is contained in a letter of Canute (1031) sent from Rome to the English clergy. At that time it appears to have been levied on all families possessed of land worth 30 pence yearly rental out of which they paid one penny At the Norman Conquest it appears to have fallen into arrears for a time, for William the Conqueror promised the pope in 1076 that it should be regularly paid The threat of withholding Peter's pence proved more than once a useful weapon against recalcitrant popes in the hands of English kings. Thus in 1366 and for several years after it was

refused on the ground of the pope's obstinacy in withholding his consent to the Statute of Praemunire. The tax was fairly regularly paid by the English until 1534, when it was abolished by Henry VIII.

PETER THE HERMIT, a priest of Amiens, Fr., was one of the preachers whose eloquence attracted pilgrims to take part in the first crusade. Legend was to credit him with the role which in fact was played by Pope Urban II—that of founder and organizer of the whole movement. But the work of Peter (who may have attempted a pilgrimage to Jerusalem before 1096) was more limited; he preached in northern France, from Berry through Champagne and the Meuse valley and so to the Rhine. His success was spectacular; his very donkey became an object of popular devotion. The thousands of peasants who took the cross at his bidding were joined by no great men; but they set out for the east, and their journey to Constantinople, preceding that of the princes, formed the first act of the first crusade. Peter himself led one section of the popular expedition. which arrived at Constantinople in July 1096. There he joined the only other section which had succeeded in reaching Constantinople—that of Walter the Fenniless—and he crossed to the Asiatic shore in the beginning of August. In spite of his warnings, the pilgrims began hostilities against the Turks. and Peter returned to Constantinople. In his absence the army was cut to pieces by the Turks, and he was left in Constantinople without any followers during the winter of 1096–97 to wait for the princes. He joined their ranks in May 1097 and marched with them through Asia Minor to Jerusalem. Thereafter he played a subordinate part in the history of the crusade. Early in 1098 he attempted to escape from the privations of the siege of Antioch—showing himself, as Guibert of Nogent says, a "fallen star." In the middle of the year he was sent by the princes to invite Kerbogha to settle all differences by a duel; and in 1099 he appears as treasurer of the alms at the siege of Arca (March) and as leader of the supplicatory processions in Jerusalem that preceded the battle of Ascalon (August). At the end of the year he went to Laodicea and sailed west. Albert of Aix records that he died in 1151, as prior of a church of the Holy Sepulchre that he had founded in France.

A popular belief which made Peter the instigator of the first crusade passed from the pages of Albert of Aix (writing *c.* 1130) and William of Tyre into the French vernacular epic poems on the first crusade.

See H. Hagenmeyer, *Peter der Eremite* (1879), French trans. (1883); S. Runciman, *History of the Crusades,* vol. i (1951).

PÉTION DE VILLENEUVE, JEROME (1756–1794), French writer and politician, was the son of a *procureur* at Chartres. He became an avocat in 1778. In 1789 he was elected a deputy to the Tiers Etat for Chartres and showed himself a radical leader. He supported Mirabeau on June 23, and was elected president on Dec. 4, 1790. On June 15, 1791 he was elected president of the criminal tribunal of Paris. After the last meeting of the assembly on Sept. 30, 1791 Robespierre and Pétion were made the popular heroes and were crowned by the populace with civic crowns. Pétion was elected on Nov. 16, 1791, mayor of Paris in succession to Bailly. On Aug. 3, 1792, at the head of the municipality of Paris, Pétion demanded the dethronement of the king. He was elected to the Convention for Eure-et-Loir and became its first president. L. P. Manuel's proposal that the president of the Assembly should have the same authority as the president of the United States, was rejected, but Pétion got the nickname of "Roi Pétion," which contributed to his fall.

His jealousy of Robespierre allied him to the Girondin party. He was elected in March 1793 to the first Committee of Public Safety; and he attacked Robespierre, who accused him of knowing and keeping secret Dumouriez's project of treason. His name was among those of the twenty-two Girondin deputies proscribed on June 2. He escaped to Caen and raised the standard of provincial insurrection against the Convention; and, when the Norman rising failed, he fled to the Gironde. At last, a month before Robespierre's fall in June 1794, he committed suicide.

See *Mémoires inédits de Pétion et mémoires de Buzot et de Barbaroux, précédés d'une introduction par C. A. Dauban* (1866).

PETITION, a term meaning generally a prayerful request for redress by a person aggrieved. It may be made in Great Britain to the crown or its officers, or to either house of parliament or in certain cases to courts of justice.
