It is appropriate that this
15th edition of the Encyclopædia Britannica
be regarded as a memorial
to its Publisher, William Benton (1900–1973).
Though he would have rejected the idea
of the Britannica as the vision or the work of one man,
it is a fact that his faith and inspiration
were necessary to its conception,
and his dedicated determination and guidance
were necessary to its completion.

Helps for the reader

Important information to assist the reader in the efficient use of this edition of the *Britannica* has been provided as follows:

1. The use of the *Propædia* is dealt with in the section *How to use the Propædia* in the *Propædia* volume, pages 8–9, and in the *Table of contents* in the *Propædia* volume, pages 10–16.

2. The use of the *Micropædia* is dealt with in sections entitled *How to use this volume*, opposite page 1 in volumes I–X; *Introduction* to the addenda in the *Micropædia* in volume X, pages 910–911; *Maps in Encyclopædia Britannica*, with glossary and abbreviations of geographical terms, in volume X, pages 1027–1031.

3. The use of the *Macropædia* without reference first to either the alphabetical list of subjects in the *Micropædia* or to the topical list of contents in the *Propædia* is not to be encouraged.

4. The initials at the ends of *Macropædia* articles are those of contributors, whose names are provided in the list entitled *Initials of Contributors and Consultants to the Macropædia* in the *Propædia* volume, pages 7–106; a list of *Names of Contributors and Consultants to the Macropædia* is printed in the *Propædia* volume, pages 107–123.

Foreword

The Fifteenth Edition of the *Encyclopædia Britannica* represents a revolution in encyclopaedia making. It began with the organization of the Board of Editors in 1947.

The Board's task was to engage in long-range planning. This necessarily involved criticism, favourable and unfavourable, of *Britannica* as it then was. That encyclopaedia was based on the Fourteenth Edition, published in 1929. Annual printings were kept up-to-date by changes that took into account the most important new developments.

Britannica could claim at that time to be the best encyclopaedia in English; but the process of annual revision was necessarily partial. Articles were eliminated and new ones substituted. Alterations were made in other articles. But the encyclopaedia as a whole could not be reexamined. Single articles were changed, but other articles connected in some way with them, which might run into hundreds, often could not be. The relations among the articles became in some fields more and more tenuous. Hence the possibility of understanding those fields through planned reading in *Britannica* became more and more remote.

The program of annual revision led to a compilation of accurate articles. In the nature of the case it could not lead to an encyclopaedia edited in accordance with a plan. The excellence of *Britannica*, which was undisputed, rested on the authority of the scholars who wrote the articles. As 1929 receded, it became more and more difficult to discern the plan on which the encyclopaedia was based.

It soon became clear to the Board of Editors that *Britannica* had, or could have, two functions: it was a reference work, and it could be an educational instrument. Although information is often confused with education, a moment's reflection will convince the reader that they are not the same. Facts are indispensable to education, but the possession of any quantity of facts does not guarantee that understanding which alone deserves to go by the name of education.

The Board of Editors found that the reference function of *Britannica* was on the whole well performed. If one wanted to discover the birthday of Marie Antoinette or obtain a summary of the work of Isaac Newton, one could do so and be confident of the accuracy of the information received. It was harder to discern Marie Antoinette's place in history and the background and consequences of the Newtonian revolution.

In short the Board's problem was how to make *Britannica* more than a "hunt-and-find" book, how to make it an instrument of education. Nobody wanted to sacrifice the reference function. *Britannica* had to continue to furnish correct, up-to-date information. Was it possible, while maintaining *Britannica*'s standing as a reference work, to make it a means of understanding?

The problem is illustrated by the "topical" encyclopaedias, which present subjects to be learned, but from which it is frequently hard to gain information.

The Board, after many years of debate, came to the conclusion that *Britannica* should be both informational and educational.

The Board decided that the reference function should be carried out by a number of volumes giving, in capsules of 750 words or less, statements of fact about the subject and indications showing where further information about it could be found in the set. One who wanted the answers to questions of fact could find them in these reference volumes. These volumes would also show the reader where he might locate places in *Britannica* that gave him the chance for systematic study.

Chances of this kind would be offered in the larger articles in the set, contained in other volumes, all assembled according to a plan designed to lay the circle of learning open to the reader. This plan evolved from the studies that Warren E. Preece, then Secretary of the Board of Editors, began as early as 1961.

These principles having been adopted, the question became one of execution. No such encyclopaedic venture had ever been attempted. There were no models to imitate and no horrible examples to shun. Clearly, the cost of the enterprise, involving the organization and writing of more than 42 million words, would be staggering.

At this point the character of the Publisher, Senator William Benton, was decisive. Although he believed that *Britannica* was already a work of which he and his associates could be proud and although he was under no pressure to publish a new edition, his own standards led him to conclude that he must do what he could to make *Britannica* better still. As a member of the Board of Editors he had taken part in all the meetings that had led to the new program. He committed the company to its realization, and never wavered. It is distressing that he did not live to see the completion of a project to which he devoted so much time and effort and which he justly regarded as one of the great contributions he had made to the cause of education in the course of a long and distinguished career.

Having authorization to proceed, the Board of Editors faced a new order of questions: What was the plan to be? The Board spent several years debating this issue, making experiments, and reviewing preliminary drafts

by various hands. Between 1965 and 1968 Mortimer J. Adler, a member of the Board of Editors, worked out the scheme of the new encyclopaedia. In addition to his celebrity as a philosopher, Dr. Adler had been the moving spirit in the publication by Britannica of *Great Books of the Western World* and had had the responsibility for the *Syntopicon*, a task that had required him to organize and present the vast range of knowledge in *Great Books*. The architectural design of the Fifteenth Edition as developed by Dr. Adler in consultation with the Board of Editors was approved. His own description of it follows on page 5. Dr. Adler became Chairman of the Editorial Planning Committee in 1966, Chairman of the Editorial Executive Committee in 1969, and project manager thereafter. It is safe to say that without his learning, imagination, and drive the Fifteenth Edition might never have been started or brought to completion.

After the formulation of the plan came its execution. This responsibility was assumed by the Editor, Warren E. Preece, who had been variously Secretary of the Board of Editors, Editor, General Editor, and, again, Editor. The breadth of his education, his clear conception of what an encyclopaedia ought to be, his wide acquaintance in the learned world, and his ability to build up a devoted editorial staff made possible the completion of a task the magnitude of which would have overwhelmed a less capable and less dedicated man.

The result is a revolution in encyclopaedia making. This work combines the reference and educational functions. The reference function, and the index function, too, is performed by ten volumes called the "Micropædia." The educational function is carried out in two ways: through an introductory volume called the "Propædia," which is an outline of knowledge and guide to the *Britannica*, and through 19 volumes called the "Macropædia," made up of more extended treatment of fields of human knowledge and major topics of human interest. These three—the *Propædia*, the *Micropædia*, and the *Macropædia*—are designed to meet the encyclopaedic needs of the reader, whatever they may be.

The Board of Editors is proud to have had a part in one of the great publishing ventures of our time. The Board believes that the Fifteenth Edition is an important step toward the goal all its members share, a learning society.

Editor's preface

Bibliographically, the volumes that follow this preface constitute the Fifteenth Edition of the *Encyclopædia Britannica*. For the first time in more than four decades, the editors of this work have determined that the times require an encyclopaedia so new and so fundamentally different from those that have gone before it that the practice of annually revising the printing of the previous year would have to be replaced by a one-time return to the preparation of a totally new and newly numbered edition.

To understand the importance of such a step requires some understanding of the nature of encyclopaedias, some knowledge of the history of this encyclopaedia in particular, and some insight into what it was about the state of knowledge in the world that appeared to make changes of the order herein offered a necessity.

The First Edition of the *Britannica* appeared serially, beginning in 1768 and culminating in three bound volumes in 1771. For more than 150 years after that, the set was sporadically revised in new numbered editions as were required in the view of its editors. Each of the editions varied in the amount and kind of change introduced in it. The Third, for instance, was the first edition in which articles were prepared by working authorities in the fields of knowledge to be covered, rather than by editors who abstracted from the learned literature of the day. The Ninth brought an almost wholly new orientation, requiring that its articles be longer and deeper and systematically arranged. The Eleventh marked a return to a combination of relatively long "systematic" articles supported by thousands of shorter and more specific entries.

By 1929, and the appearance of the Fourteenth Edition, it had become clear to almost everyone that the system of numbered editions, revised in a major way only erratically and supplemented by new material only occasionally, could no longer meet the demands of a serious encyclopaedia and its users. A new policy, called "continuous revision," was instituted, under which articles were assigned to academic specialists for periodic review, were then scheduled for revision on the basis of the needs suggested by advisory reports concerning them, and new versions of them were introduced into the set as required by the subject matter and permitted within the limited flexibility allowed by the alphabet and the state of printing technology.

Clearly, the system was an improvement over that which it replaced. In each of the last several years, annual revision programs have seen the introduction into the set of from three to eleven million words of new or substantially revised material. To note that the present set, by its very nature, constitutes a temporary return to the earlier practice of extensive change as implied by renumbered editions is not, therefore, to assert the end of the program of continuous revision that worked so well that for more than 40 years no two editions of the *Britannica* were ever completely similar, and so effectively that despite an increase of knowledge almost without parallel, successive users of this reference work have had at their disposal a collection of volumes that provided in balanced and thorough fashion a continuing account of the size and shape of the expanding world of knowledge.

Works, at first encyclopaedic in spirit and content, and, later, in form, have existed throughout the world almost since the development of the written word. Before the name itself had been created, men were trying to capture within the confines of written pages the content and organization of the knowledge at their disposal as they understood it. Every seriously intentioned encyclopaedia has been based on—has been a reflection of—the quantity and quality of the scholarship of its time and the degree to which it was disseminated among men. Obviously, much of this year's *Britannica* simply could not have been written for the Eleventh Edition of the set published 1910–11; hardly any of the scientific theory that was to lead to either the nuclear bomb or the conquest of space had been formulated and much of it had been only guessed at by a handful of advanced workers in each of the fields involved; quantum mechanics as a name had little currency; psychoanalysis and Marxism were barely at the threshold; Russia was still the domain of a tsar, Hitler was hardly known even in his own city, and Sun Yat-sen was leading a revolution in China. World War I had not been fought. In art, in literature, in music, in economic theory, in medicine, in almost every aspect of man's mental and technological activity it was, beyond dispute, a world almost unrecognizable today. And it is no denigration of the Eleventh Edition to note now that it reflected its world so perfectly that it has value today as little more than a historical novelty of interest largely to sentimentalists and those whose work requires that they know and understand the scholarship of an earlier age.

Only 18 years later, when the Fourteenth Edition appeared, there was a different—neither necessarily better nor worse—world to be contended with. A World War had cut gashes across the globe, redrawing the political boundaries of many of its lands and testing the political loyalties of many of its peoples. Communism had become a force to be dealt with and there was new knowledge at large. Not everyone accepted Freud's explana-

tions of themselves, but few could doubt the reality of his influence. Scientific theory had changed. Depression on a vast scale was about to test man's understanding of his economic systems and to demonstrate (if demonstration was required) that the nations of the world would have to exist (if they were to exist at all) interdependently. In Germany, Hitler was only a few years away from a political victory that would influence history until long after his death.

Indisputably, an encyclopaedia suitable to the world of 1911 would have been found to have only little relevance to the world of 1929, and even less to that of 1974. There are limits after which the mere addition of new information at the ends of old articles cannot be made to suffice. There are periods after which it must be recognized that what once seemed to be truths may have been at best little more than half-truths. There are times when only a totally new statement of the past as currently understood and the present as now glimpsed will meet the requirements of a general encyclopaedia. A *Britannica* that set out seriously to report the general state of intellectual knowledge in 1974 could, for instance, hardly assign 30 of its pages to a study of Chivalry, 30 to an analysis of Heraldry, and three to the legal position of pornography, obscenity, and censorship. Even if it were possible to do so, it would be little more than quaint to treat each new year's exploits in space as simple chronological continuations of Columbus' explorations of the Atlantic. It is not irrelevant to note here that in the last several printings of the Fourteenth Edition, there was but one article dealing with acclimatization. It was 3,800 words long and was supported by only three references elsewhere in the set. When the editors and the experts with whom they worked in preparing this Fifteenth Edition reexamined the same subject, they found that a single article was required but, that man's present understanding of the phenomenon would demand the further support of 43 additional references elsewhere in the set.

First work on this edition of the *Britannica* began, as has been pointed out elsewhere, in 1947 with the appointment of a Board of Editors under the leadership of Robert M. Hutchins. It took on a new seriousness and a new immediacy a few years later, when innovative developments in printing technology opened the way to more extensive annual revisions, thus making it more necessary than it had been before that the set's editors have a set of goals and criteria against which such annual printings could be planned. It continued in an even more serious way after 1957 when Dr. Hutchins and the late Lord Crowther, then vice-chairman of the Board, led investigations into what a totally new encyclopaedia—one planned, for instance, as if it had no earlier versions with which to comport—might be like. It moved further forward from 1961 and 1964 when the Center for the Study of Democratic Institutions in California undertook to determine the ways in which it might prove to be (or, equally, not to be) the case that conditions in the world had changed to the extent that such a genuinely new encyclopaedia was (or, equally, was not) required. At a more immediate level, planning began in earnest in 1966, with the appointment of an enlarged staff of senior editors and advisers to work out the topical contents of a new set under the direction of an Editorial Planning Committee established especially for that purpose.

Elsewhere in this volume, the Director of Planning, who was Chairman of that committee, has described the basic intellectual document on which the contents of the present set find their foundation—*i.e.*, the outline of the traditional body of knowledge which at some level of generalization must be included within the pages of any serious general encyclopaedia.

The editor of the First Edition of the *Britannica* wrote in his preface that only to the extent that it was useful could it, or any other set of similar volumes, lay claim to the approbation of mankind. Every succeeding editor of the set has accepted the dictum as his own. The question that had to be answered before work on the new set could begin in full seriousness had to do, then, with what it would mean in the last quarter of the 20th century for an encyclopaedia to be as useful—or, even, more useful—in its time, as its predecessors had been in theirs.

Though encyclopaedists frequently debate the question of utility in terms of whether their works should be "alphabetical" or "topical" in organization, the fact is that the argument misses the point. In itself, knowledge does not exist in either a topical or an alphabetical form and knowledge can be organized only in a method that is both topical and alphabetical. By implication, then, what is at stake to the editors of encyclopaedias has to do only with the presentation of knowledge which traditionally has tended to be either topical or alphabetical.

What seems to be the more important issue surrounding the question is the degree to which knowledge is to be either fragmented or synthesized around some organizing principle. In the so-called "alphabetical" presentation, the editorial effort is usually on finding the smallest part or parts into which the segments of the whole of the circle of knowledge can be broken. Such works are likely to be long on short entries, on articles that focus wherever possible on a single—or at the very most on a few—aspect of larger topics. They are sometimes called "look-it-up" books because their organization makes it more or less simple for the user to equate a topic about which he desires factual information with a plausible matching title and then go directly to the volume containing such a title within its segment of the alphabet. The problem with such sets is that they imply that these small bits of knowledge will either be meaningful and intelligible in themselves or that, if they are not, the reader will (1) already know the background necessary to understand the relation of each to the whole or (2) be willing to

go to another article to secure that background information. What usually happens, instead, is that the reader assumes that a smattering of knowledge is better than nothing at all and proceeds as if background information, relationships, contexts, are all of no consequence. It is as if the significance of the reoccupation of the Rhineland in the period between the two World Wars could be understood without any prior knowledge of the history that had led to the demilitarization of the zone in the first place.

Experience indicates that contemporary encyclopaedia users use, or on separate various occasions would like to use, encyclopaedias in three ways.

First, there are the occasions on which a reader desires to look something up—the "something" in such cases being more often than not quite limited in its scope—the size of the whale, the feeding habits of the robin, the achievements of Rudolf Virchow, or the circumstances surrounding the discovery of radium.

Second, the user may turn to an encyclopaedia for information about a broader, but still relatively limited, subject. He may, on such occasions, be more interested in the causes of the war in Vietnam than in the casualty statistics of the Tet offensives that were a part of that war; he may want to know how interest rates can be used to control the volume of currency in circulation rather than how to define compound interest; he may be interested in a broad survey of French literature and not necessarily—at the time, at least—in the date or occasion of the publication of a book by Camus.

Third, users may on occasion seek that genuine understanding that in itself somehow defines what the world means by the word education. On such occasions, his interest is in neither the size of the whale nor the taxonomic characteristics of the family to which the lion belongs, but in an insight into what has been known and conjectured about the whole sweep of life on Earth. In such instances the reader is interested not in zoology or botany (or biology which is the older combination of both) but in an understanding of the objects of studies of all of the sciences as they relate to something grander than the disciplines themselves.

Starting, then, with the decision that an encyclopaedia is nothing at all if it is not a summary statement of the traditional knowledge of the culture that has produced it, and that utility is in fact the name of the unit in which encyclopaedias must inevitably be measured, it was clear that any new edition of the *Britannica* would have to set out to meet all three of these functions and do so without detracting from the degree to which it also met the others.

The three-part organization of the present encyclopaedia, into *Propædia, Macropædia,* and *Micropædia,* seemed almost to suggest itself as the obvious solution to the problem thus posed. It must be emphasized here that although there are circumstances in which each user will wish to exploit only one of the several ways in which the set may be utilized, and although each of the three parts might appear to lend itself superlatively, if not exclusively, to one or another of the uses, the fullest value of the set is to be attained only in the utilization of the whole. The Fifteenth Edition of the *Encyclopædia Britannica* is not three encyclopaedias; it is one encyclopaedia specifically planned to be usable in three different ways.

A written statement of editorial policies to govern the construction of the Fifteenth Edition began with an enumeration of goals expressed in terms of the qualities for which the *Britannica* so long had been famous that its name had become almost a generic word meaning "encyclopaedia":

> The existing *Britannica* is marked, to a greater or lesser degree, by six encyclopaedic qualities that must be attained to an even greater degree in the new *Britannica*:
>
> a. *Authoritativeness:* Whether it speaks in its own voice, or in that of its contributors, the new *Britannica* must speak from and with authority;
>
> b. *Comprehensiveness:* The proper scope of a general encyclopaedia is the whole circle of learning. The presence of all parts of that circle must be a demonstrable characteristic of the new *Britannica*;
>
> c. *Encyclopaedic brevity of condensation:* A general encyclopaedia is a summary statement of learning. In the new *Britannica* even the longest articles on even the most major subjects should be less lengthy than books or treatises on the subject and must be scaled so as to be commensurate with the purposes of an encyclopaedic survey;
>
> d. *Accessibility:* By the imaginative use of an alphabetical arrangement of articles, a useful alphabetical index, internal cross-referencing, and other devices, the contents of the new *Britannica* must be efficiently available to its users;
>
> e. *Accuracy:* No matter how clearly the new *Britannica* manifests its other qualities, it will fail to the extent that inaccuracy renders its contents undependable;
>
> f. *International orientation:* While the new *Britannica* is uniquely a product of the culture of the West, it must not be parochially Western in its view of learning.

In connection with the point just made, the editors note with some pride that in their determination to secure the best authorities and the best writing skills available anywhere in the world, they have produced a version of this set in which for the first time in its more than 200 years of publication, only about one-half of its authors have been drawn from the country within which the enterprise is owned and largely directed. Articles on subjects spread across the whole of the broad spectrum of knowledge have been assigned to experts without regard to their place of origin, of residence, or of occupation. The entry on electric power is by a member of the Japanese Atomic Energy Commission; that on nuclear fusion is by a Russian, and that on defense expenditure by an Englishman. An Australian has written on Vladimir Nabokov, a Canadian has written on the history of Rome, and a German has written on the history of China.

Earlier studies of the rate at which new information is being produced and the degree to which specialization is producing a kind of deleterious academic frag-

mentation felt even in the faculties of major universities, suggested that the utility of the new *Britannica* would in the end be measured in part by the degree to which it could maintain its superiority in terms of the qualities mentioned above and, at the same time, achieve new qualities based on these new realities.

First, it was clear that knowledge is proliferating at rates, and specialization is developing in ways such that a general encyclopaedia can no longer hope to be useful (if, indeed, it ever had been) to the specialist in his own field. It is a fact of which no encyclopaedist can possibly be ignorant that the finite and limited pages available in a general encyclopaedia for the treatment of any given subject make the bound volumes of such sets inappropriate sources of information for the professional reader in his own field. It was assumed, therefore, that although all readers of the *Britannica* might be specialists—or have the interests of specialists—in some area of knowledge, they will turn to a general encyclopaedia only as generalists interested in fields outside of their own.

A consequence of grave editorial importance followed from such a conclusion. It was clear that although many years of almost worldwide experimentation in mass education had produced an educated readership hardly even imaginable to earlier editors of the *Britannica,* they had in many cases also produced a readership so specialized that workers in all fields found it increasingly difficult to communicate with each other across fields. It must also be noted that the proliferation of education for all had not necessarily raised the *general* educational background of all. A general encyclopaedia can exist, *Britannica*'s editors were warned by more than one academic, only if it can find a language with which to keep some kind of communication common to all, open to all.

The new objectives of the new *Britannica* were described in the statement of editorial policy as follows:

1. Readability by, and intelligibility to, the curious, intelligent layman. Although the user of the *Britannica* may be, and frequently will be, a specialist in some field of knowledge, it is assumed that he will never turn to its pages to meet his own needs within that field. The user is therefore presumed to be, on every occasion of use, a curious, intelligent, but nonspecialist reader. While the specialist must not be offended by the encyclopaedia's treatment of his own specialization, that treatment should not attempt to be adequate to his needs within it;
   a. Articles should, therefore, be positioned at a level of generality above that of purely specialized detail and should be characterized by an appropriately reduced density of detail rather than by an apparent determination to pack everything known about a subject into an allotted space.
   b. Further, articles should not assume detailed background knowledge on the part of the reader: if forced to choose between more facts unexplained and fewer facts explained, the treatment should always tend toward the latter.
   c. Finally, in the treatment of certain subjects that are by their nature irreducibly difficult and technical or communicable only in a language understood solely by specialists, at least some portion of the article should be readable to the layman to whom, at a minimum, the significance and general bearings of the subject must be made comprehensible.
2. Integration and coherence. As a summary report of the whole circle of learning, the new *Britannica* will function efficiently only to the degree that its treatment of the subjects that make up that circle is consistent, coherent, and integrated.
   a. Subjects that are related to each other, as parts of a whole or as wholes encompassing parts, must be treated so that their relationships to each other and to their wholes are manifest to the reader.
   b. Subjects that are alike in kind, quality, or scale should be treated alike and at a similar scale.
3. Controlled fragmentation and duplication. To the extent that the circle of learning is seamless, any survey of it consisting of more than one article is destined to be marked by some degree of fragmentation and therefore some degree of duplication. An overriding goal of the new set is to achieve a minimum of fragmentation and a maximum control of duplication.
   a. Although any given subject may be treatable in several contexts, its major treatment should be developed in one article rather than in several separate and unconnected articles. Articles dealing with subjects demanding treatment in different contexts must, therefore, be planned with this requirement in mind.
   b. Complex subjects that call for unity of treatment should be developed in articles dealing with them as wholes rather than in disconnected articles about their parts; and in such cases the consolidated article, whenever possible, should be oriented toward detailed treatment of its subsidiary parts. The unity of the subject and the interconnections of its parts should be the controlling principle in the consolidated treatment.
4. Objectivity and neutrality.
   a. Articles should be so written that they avoid expressions of bias or prejudice on any matter about which a respectable and reasonable difference of opinion exists.
   b. Further, in all areas in which the scholarly world acknowledges significant and reputable differences of opinion, diverse views concerning such differences should be fairly presented, though the majority or accepted view may be so designated.
5. Topical as well as alphabetical accessibility to the contents of the set. By combining topical and alphabetical accessibility, the new *Britannica* will function more effectively as an educational instrument and an ordered statement of learning to be read and studied as well as a reference tool containing information so organized that it can be easily "looked up."
   a. The aim of topical accessibility is to serve the needs of the reader who asks "What can I learn from study in the encyclopaedia and how can I learn it?"
   b. In offering an answer to this question, topical accessibility can provide a systematic outline of the whole circle of learning, so structured that the parts can, if the reader desires, be reassembled as a whole.

Against the background of these considerations and the broad statements of policy growing from them, an expanded group of senior editors and university advisers met almost daily to create an outline of knowledge on the basis of which a list of all of the topics

requiring treatment in a general encyclopaedia could subsequently be prepared and the treatment of them assigned as appropriate to one or another of the sections of the set. Of more interest to encyclopaedists than to lay readers, the meetings today seem notable as one of the few known instances in which senior editorial people representing all of the fields of knowledge could meet regularly to discuss the disposition of that knowledge within—as it were—a circle, and could relate their actions to decisions made concerning the whole of the circle rather than the individual parts as represented by the specialties of the editors and advisers involved. It was at no time the intention of those involved in the process that the evolving outline should represent a particular system of knowledge and none of the staff of this reference work would want to argue that knowledge can be organized in only one way; that any monolithic system can be made to serve the needs of a general encyclopaedia. Nor would any want to argue that the outline that evolved from their sessions necessarily constitutes the best such outline. All that was hoped for, and what was achieved, was the construction of a workable and defensible outline, one that, without contentiousness, would set forth in some orderly way the major topical rubrics that must ultimately be dealt with in a general encyclopaedia.

On the basis of advice from experts not previously associated with the development of the outline itself, the first draft of that document was revised and the editors next began to compile a list of the articles that would be required in order to deal in some appropriately balanced way with all of the topics named in the statement of intentions—then the working name of the "Outline of Knowledge." Predictably, it was found that there were instances in which several rubrics might find their best treatment combined in but a single article; that in other instances, sections or even subsections of single rubrics might require treatment in several articles. The important consideration was that wherever possible fragmentation and duplication be eliminated, and that wherever this was impossible, they be, at the very least, rigorously controlled.

In a drastic departure from past *Britannica* practice, each projected article was then outlined as to its content. The purpose of such outlines—each author was informed—was to assure that all of the circle of knowledge would be covered somewhere in the set on the one hand, that wherever possible each of its parts would receive its major treatment in only one place, and that each of its parts would be treated on a scale determined by all of the other parts. As authorities, authors were, of course, given wide latitude in reordering the presentation of the material called for by their outlines, and much latitude in reevaluating the amount of space to be assigned to each of the topics for which they were to accept responsibility.

Senior editors were required to nominate as potential contributors for each of their own articles three authors whose work they had read and could interpret as indicating that the nominee, in addition to being an expert in the subject matter involved, could—and equally importantly, presumably would be willing to—write for the curious, intelligent lay reader. It was further required that in every case at least one of the contributors nominated be from a country other than the United States.

The processes and policies described so far had their greatest influence in connection with the development of the 19 volumes of the current edition of the *Britannica* that became known as the "Macropædia." The articles in these volumes total 4,207. But long before any of the work on this part of the set had been seriously considered, it had been recognized that such volumes and such articles could, in fact, be used satisfactorily only if a way could first be found to lead the reader from what might be a very general or, in some instances, a very specific interest to an article either less, or more, general in concept. The role of the Outline of Knowledge in leading the reader from some general interest in a whole field of knowledge to the separate arcs under which segments of the circle are dealt with in the *Macropædia* is considered in the preliminary pages of the "Propædia" section of this volume.

As to the other side of the coin, it has long been recognized that the educational values of general encyclopaedias could be enhanced, could, in fact, be realized at all, only if readers could be brought to use an index as their first point of entry into the set. Every editor's file contains instances of complaints that a given topic is not dealt with in a set, when all that the reader really means is that it is not dealt with in an article bearing the name under which he had expected to find it, and that he has not yet troubled himself to refer to the index—where, as often as not, he might find several references to his topic of interest. In planning this Fifteenth Edition of the *Britannica,* it was assumed that one solution to the problem might lie in making the index volumes a uniquely indispensable key to the whole, on the one hand, and a valuable source of reference information about the subject being researched on the other. It may, then, be asserted that the reader who turns first to the appropriate part of the *Micropædia* will learn immediately whether or not the subject in which he is interested is treated in the set and, even more importantly, will find there much of the so-called "reference data" concerning that subject and may indeed—if his point of interest was specific in nature—find there the answer to the question that led him to the book in the first place. In such cases he will, obviously enough, need to look no further, though hopefully the short *Micropædia* article may succeed in arousing his interest to the point at which he will wish to learn more. In such cases, he will find how the subject is treated in the set, where in the *Macropædia* his topic of interest is dealt with in its more general aspects, where else in the *Micropædia* he will find further related data. In addi-

tion to serving as an index to the whole of the set, the *Micropædia* will, then, be seen to constitute in itself a 10-volume source of encyclopaedic information.

The editors believe that no other arrangement of the whole of the circle of knowledge to be dealt with in the confines of a general encyclopaedia can serve so well the varied uses to which encyclopaedias are put by those who turn to them.

Several more practical editorial decisions and developments flowed naturally from the same series of considerations that had led to the decision to proceed with the creation of an entirely new edition of the *Britannica* in the first place. They are considered here in an order that does not necessarily reflect the editor's sense of their importance:

1. In a world characterized by academic and professional specialization, it is not uncommon for the author of an encyclopaedic article to find it necessary to refer to workers, living or dead, whose names may be unknown to his lay readers no matter how well educated they may be in other fields. *Britannica* authors were asked, therefore, to identify, whenever such identification appeared to be reasonably necessary, all names not the "common property" of all educated readers. Because such identification so frequently has involved the designation of a nationality and a status within an academic discipline (*e.g.*, "eighteenth-century French mathematician") it has sometimes seemed that the internationalism proclaimed in the statement of editorial policy was in danger of being violated in the execution of that policy. Such, of course, was not the intention of the editors, who were well aware that such phrases normally constitute the minimal identification with which dictionaries of biographies begin their articles. That men and women may be born in one country, practice in another, and die in a third, or may follow careers that do not lend themselves to unique description makes the device difficult but does not render it unuseful.

2. Although the editorial policies set out for the set as a whole could not always be met in the case of mathematics, which remains both a subject matter and a language in itself, two devices have been introduced in the effort to make science articles in general more intelligible to the lay reader. In the first place, wherever possible, equations and formulas have been verbalized or "written out" as statements in words as well as a series of letters and symbols; in the second, such equations have, in many of the mathematics articles, been removed from the text of the article (where their places have been taken by more generalized statements in "natural" language) to boxes, where they remain available to the reader able to utilize them.

3. In logic, it is possible to make only one assumption about the language capabilities of the *Britannica* user. Since this encyclopaedia, though it is available in many countries throughout the world, is printed only in an English-language edition, it has been assumed that all users of the set must inevitably share the ability to read in that language with some degree of fluency. Many, of course, speak other languages; many more read other languages. Nonetheless, since English is the only language known for certain to be understood by the *Britannica* user, *Britannica* authors and editors have been at pains to limit the use of non-English words and phrases and to provide translations or paraphrases of such wherever their use has been unavoidable.

4. Importantly, in assuming that the specialist turns to a general encyclopaedia for information only about fields in which he is not a specialist, the editors accepted, as well, the corollary that the *Britannica* user should be required to deal in general only with the language and the literary conventions of the literate man and woman, and not with those of the specialist. The editors recognize that technical language and technical conventions have a valid utility within each academic specialty. They provide a precision and a unique method of communication between people who work within that specialty. They may, however, be confusing and uninformative to the reader from another specialization. Since a general encyclopaedia cannot deal in the vocabulary and literary conventions of all specialties, it was determined that it should, wherever possible, deal in the vocabulary and conventions of none. Professional jargon has been eliminated where possible and its terms defined wherever its elimination was impossible.

5. Bibliographies at the ends of articles in which they have been included have in general been lengthened for the benefit of the reader who wishes to read more deeply in the subject matter involved. At the same time, they have, by design, been annotated so that the lay reader might know in advance the likelihood of his deriving benefits from turning to any given work. Authors have been urged to avoid the inclusion of titles likely to exist only in small numbers of rare copies carefully guarded in but one or two libraries throughout the world.

6. The use of place names and personal names in an encyclopaedia prepared for distribution in many countries has always been a particular problem to the editors of general encyclopaedias. Whether to use the name of a country or a city preferred within the place itself, or one generally used in other countries is a problem that admits of no easy solution. On the advice of experts who have consulted with *Britannica* on the problem, this edition of the *Britannica* uses place names as recommended by the boards of geographic place names in the United States and the United Kingdom. Exceptions to this general rule are few, and are limited to cases in which the recommended name would have little meaning in most of the world in which the *Britannica* is used. Similarly, in the case of personal names, it was tempting to rule simply that such names will be in the forms as used by the persons whose names they are or were, and this rule was, in fact, adopted, save for certain exceptions in which the result would fall strangely on too many ears. Thus, though the contem-

porary Russian composer is officially Dmitry Dmitriyevich Shostakovich, he is known in the *Britannica,* as he is in most of the West, as Dmitry Shostakovich; the earlier Russian composer Pyotr Ilich Chaykovsky remains, as in past editions, Peter Ilich Tchaikovsky; and a figure such as King Saud is known thus, as he was in the newspapers, while his father is Ibn Sa'ūd. A constant effort has been made to retain the level of such exceptions to the barest minimum. In the case of Japanese names, as in Japan, the family name is stated first, and the given name last.

7. The older *Britannica* custom of publishing an atlas in the final volume of the set has been abandoned in the conviction that maps belong where they will be most useful to the reader—*i.e.*, throughout the set in proximity to the articles that depend on them for clarity.

8. The use of diacritics, the transliteration of non-Latin alphabets, and the translation of certain non-English languages have been standardized on the basis of rules worked out over a three-year period by *Britannica* editors and advisers.

9. Tables and charts have been used extensively in the *Micropædia* volumes. Geographical statistics, including demographic factors, economic reports, and other similar data, are thus to be found for each country in convenient boxes (accompanied by a picture of the flag of the country) with each *Micropædia* country article. Special large charts providing bases for international comparisons of such data are published in a separate section at the end of Volume X of the *Micropædia.*

10. Finally, it is expected that most readers will find the new lists of major works appended to the biographies of most workers in the arts of great reference value, but the editors would be the first to concede that the definition of "major" is not easy to agree on.

Because it will be asked, it may be said here that all *Britannica* entries after editing are returned for approval to the men and women who first submitted them. Changes required by objections to the editing are seriously considered and, when they involve matters of factual accuracy, or do not violate established editorial policy or stylebook rules, are incorporated in revisions prior to printing. In that fortunately small number of instances in which authors have felt for reasons of their own that the results were still unacceptable to them, the proposed entries have been submitted to a recognized peer of the author and, when such advisers have said that the manuscript was factually accurate and would reflect credit on both the *Britannica* and its contributor, the entry was printed without identification of the author.

The preparation of a general encyclopaedia containing more than 42 million words in 30 volumes obviously has to be the work of more than a single man, a single committee, or a single staff. In the case of the Fifteenth Edition of *Encyclopædia Britannica,* that work involved (in addition to its late publisher whose faith and investment were indispensable, and others listed in appropriate places in this volume) the efforts of an editorial staff of hundreds, an advisory staff of more than 200, and more than 4,000 contributors. It is tempting to list at least all those who as staff members made significant contributions to the outcome of the work. It is also impossible to yield to the temptation.

One must, however, pay particular credit and express particular thanks to Philip W. Goetz and Donald E. Stewart, each of whom brought to the work more than 20 years of encyclopaedic experience that on more than one occasion provided the expertise necessary to keep success from becoming failure. As executive and managing editors respectively, they directed the efforts of all the editors and supervisors whose work was crucial to the completion of the entire project. In England, Christopher H.W. Kent, as Deputy Editor for London, performed with similar distinction his own role with that part of the editorial staff located there.

As assistant project manager, Normand LaJoie worked effectively to assure that the normal reluctance of editors and writers to complete manuscripts for release to printers on time did not impede the achievement of publication dates; Raymond Majesty served as always as a worker of miracles in looking after all of the difficult operations that must be done early if articles are later to appear in proper alphabetical order on pages in volumes, both with numbers that do not yet exist, and that paper and printing are all to come out in proper sequence at the end and on time. Mrs. Anne Long, as Executive Secretary to the Editor, coped with more problems than she should have had to, and did so always with good humour, good grace, and great intelligence.

In citing the few who can be listed above, the editors are equally aware of the tremendous dedication and abilities and efforts of the many who must simply now be listed opposite.

Outline of Knowledge
and
Guide to the Britannica

The circle of learning

"The alphabetical system of arrangement," observed the Editors of the Eleventh Edition of the *Encyclopædia Britannica* (1910–11), "with its obvious advantages, necessarily results in the separation from one another of articles dealing with any particular subject." The addition of an alphabetical index can do no more than give the reader "assistance in obtaining information under headings which are not themselves the titles of articles in the Encyclopaedia." Consequently, "the student who desires to make a complete study of a given topic must exercise his imagination if he seeks to exhaust the articles in which that topic is treated." This result is certainly a serious defect in the system for anyone who feels—as did the Editors of the Eleventh Edition—that an encyclopaedia should not be merely a "storehouse of facts," but should also be "a systematic survey of all departments of knowledge." To remedy this defect, the Editors constructed a "Classified Table of Contents," which they believed to be "the first attempt in any general work of reference at a systematic subject catalogue or analysis of the material contained in it."

Remarkable as it was at the time, this Table of Contents did not fully succeed in achieving its objective of overcoming the defects of an alphabetical organization of encyclopaedic articles by means of a topical presentation of their content. A quick glance at the twenty-four major categories into which the Table of Contents was divided will reveal that the alphabet was still the thread on which the parts were strung: I. Anthropology and Ethnology; II. Archaeology and Antiquities; III. Art; IV. Astronomy; V. Biology; VI. Chemistry; VII. Economics and Social Science; VIII. Education; IX. Engineering; X. Geography; XI. Geology; XII. History; XIII. Industries, Manufactures and Occupations; XIV. Language and Writing; XV. Law and Political Science; XVI. Literature; XVII. Mathematics; XVIII. Medical Science; XIX. Military and Naval; XX. Philosophy and Psychology; XXI. Physics; XXII. Religion and Theology; XXIII. Sports and Pastimes; XXIV. Miscellaneous. In each of these categories, the only further subdivisions involved the distinction of general from particular subjects, and the distinction of both of these from biographical entries. Under each of these headings, titles of the encyclopaedia's articles were listed in strictly alphabetical order.

In planning this Fifteenth Edition of *Encyclopædia Britannica,* the present Editors, while deciding to retain the alphabetical ordering of the articles themselves, as printed in the set, sought to improve upon the effort their predecessors had made to overcome the defects of an alphabetical organization by giving the reader a truly topical, and totally nonalphabetical, Table of Contents. It would serve the purpose that the Editors of the Eleventh Edition had in mind, which was to enable the reader to "make a complete study of a given topic"—that is, a department of knowledge or field of learning.

It may be asked why it was not thought better to abandon the alphabetical principle entirely and construct a purely topical encyclopaedia, in which all the articles would be assembled, volume after volume, according to some general schema for the organization of human knowledge. The answer is two-fold. First, a purely topical organization of the articles themselves cannot avoid the appearance of a certain tendentiousness or arbitrariness in the editorial commitment to one rather than another organizing schema or set of principles. The reader is, therefore, provoked to ask: Does this order, volume by volume, and article by article, reflect the only right or proper exposition of the whole of human knowledge?

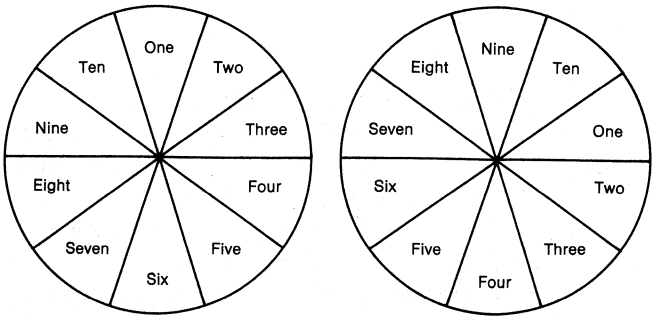
Second, a purely topical encyclopaedia provides its readers with only one mode of access to its contents. This may be alleviated somewhat, perhaps, by the addition of an alphabetical index; but an index, by its very nature, serves the purpose of enabling the reader to look up *particular* items of information; it does not provide a general and systematic mode of access to the contents of the encyclopaedia.

The basic plan of the new *Britannica,* therefore, aims to give its readers access to its contents by both the topical and the alphabetical mode. General and systematic topical access is provided by the Outline of Knowledge contained in this volume, called the "Propædia" because it is a kind of preamble or antechamber to the world of learning that the rest of the encyclopaedia aims to encompass. Alphabetical access is provided not only by the alphabetical ordering of the long articles in the *Macropædia,* but also by the shorter entries in the *Micropædia,* which are likewise arranged alphabetically.

Unlike the Classified Table of Contents in the Eleventh Edition, which was alphabetically organized by categories and subjects, the Outline of Knowledge in this Fifteenth Edition is a purely topical presentation of the contents of the articles in the *Macropædia.* It is, therefore, reasonable to ask how such a purely topical outline of encyclopaedic content avoids the tendentiousness or arbitrariness that is attributable to an encyclopaedia in which the articles themselves are topically rather than alphabetically arranged. Does not the Outline of Knowledge here presented reflect, perhaps even conceal, a commitment to one set of organizing principles rather than another? Does it not embody biases or preconceptions that are not universally acceptable?

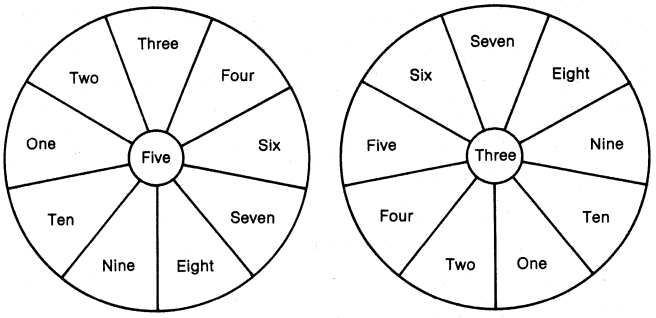
It is hardly possible to say "No, not at all" to these

questions. Two points, however, can be made affirmatively that tend to reduce or alleviate whatever degree of arbitrariness remains unavoidable in a topical outline of the whole of human knowledge. One is that the Outline of Knowledge, while conceived by the Editors, was constructed and corrected in the light of detailed recommendations, directions, and analytical contributions from scholars and experts in all the fields of knowledge represented. A list that includes the advisers who worked with the Editors in the construction of the Outline of Knowledge follows Part Ten of the *Propædia.*



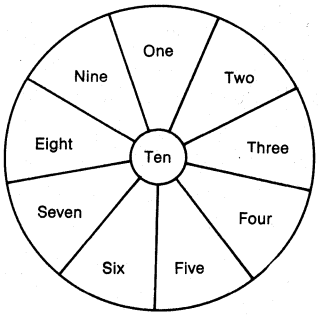
The second point is that the Outline of Knowledge is conceived as a circle of learning. To say that the contents of an *en-cyclo-paedia* form a circle of learning is more than a literal transliteration from Greek to English. In Greek or English, reference to the circle introduces a powerful metaphor, the understanding of which should help the reader to overcome whatever arbitrariness still resides in the Outline of Knowledge in spite of determined efforts on the part of all concerned to minimize this defect. A circle is a figure in which no point on the circumference is a beginning, none is a middle, none is an end. It is also a figure in which one can go from any point, in either direction, around the circumference; in addition, one can go across the circle from any point to any other; or, by any number of transecting lines, starting from a given point, one can go to any number of other points on the circumference, near or far.

The ten parts into which the Outline of Knowledge is divided are disposed not along a finite straight line beginning at this point and ending at that; they are disposed rather as segments of the circle. While it is true that, in this arrangement, one part may lie next to another and at some distance from still another, it is also true that, since the circle can rotate around its axis, any one of the ten parts may be regarded as standing at the top of the circle, or at the left or right side of it, or at the bottom. In other words, with the circular arrangement of the parts, and with the rotation of the circle, the reader can begin anywhere in the circle of learning and go from thence to adjacent parts around the circle; or, moving along interior transecting lines, he can go from any part across the circle to parts that are not adjacent on the circumference.



This view of the Outline of Knowledge can be represented in a number of diagrams. The first pair of diagrams shows the ten parts of the outline as segments of the circle. (For a synopsis of the subject matter covered in each part, and its various divisions and sections, the reader is referred to the Table of Contents set forth on pages 10–16 of this volume. The titles of the ten parts are given in the box below.)

Part One. Matter and energy	Part Seven. Technology
Part Two. The Earth	Part Eight. Religion
Part Three. Life on Earth	Part Nine. The history of mankind
Part Four. Human life	Part Ten. The branches of knowledge
Part Five. Human society	
Part Six. Art	



In the first pair of diagrams, below, Part One is placed at the top of the diagram to the left, and Part Nine is at the top of the diagram to the right, to illustrate the effect achieved by rotating the circle.

The second pair of diagrams, following, places one of the ten parts at the centre of the circle with the remaining nine parts as segments of the circle formed by lines radiating from the centre. The point being made here is that any part can occupy the central position—the place in the circle of learning at which one begins, going thence in all directions to the remaining nine parts. To illustrate this, Part Five occupies the centre in the diagram to the left; Part Three, the centre in the diagram to the right.

Finally, the diagram below offers still another approach to the circle of learning. In this diagram, Part Ten occupies the central position; and here there is only one diagram rather than a pair of diagrams because the reason for placing Part Ten in the central position applies to it alone and to none of the other nine parts.

The reason for this special placement of Part Ten stems from the one organizing principle to which the Editors were explicitly committed in planning and producing this new *Britannica.* Briefly stated, that principle involves a distinction between (a) what we know about the world of nature, of man and society, and of human institutions *by means of* the various branches of learning or depart-

ments of scholarship; and (b) what we know about the branches of learning or departments of scholarship—the various academic disciplines themselves. For the most part—there are a few exceptions—Parts One through Nine represent man's knowledge of nature, of man and society, of human institutions, and their history. In clear contradistinction, Part Ten mainly covers the disciplines themselves—the branches of knowledge or fields of scholarship—by which man inquires into, thinks about, or comes to have knowledge of the world in which he lives. Part Ten examines the nature, methods, problems, and history of the various branches of knowledge or scholarly disciplines, the actual content of which is set forth in Parts One through Nine.

Thus, for example, Section 10/34 in Division III of Part Ten examines the nature, methods, problems, and history of the biological sciences; but the knowledge of life that the biological sciences afford is outlined in Part Three. Or, to take another example, Section 10/41 in Division IV of Part Ten examines historiography and the study of history; but the actual history of mankind, achieved by the methods of historical inquiry, is outlined in Part Nine.

There are, however, three departments of learning that are exclusively treated in Part Ten—both with regard to the nature and history of the disciplines themselves and also with regard to the knowledge or understanding afforded by these disciplines. They are logic (in Division I of Part Ten), mathematics (in Division II), and philosophy (in Division V). The reason for this exceptional treatment of these three disciplines is given in the Introductory Essay to Part Ten.

The special character of Part Ten thus explains the diagram in which it occupies the centre of the circle of learning, but that must not be interpreted as attributing prime importance to it. This diagram simply indicates the special function Part Ten performs in relation to the other parts. It alone stands in close relation to all the rest; there are varying degrees of relatedness among the other parts. For example, Parts Three and Four, dealing with Life on Earth and with Human Life, are closely related; Parts Four and Five, dealing with Human Life and with Human Society, are also closely related; but Part Four has a different relatedness to Part Three, on the one hand, and to Part Five, on the other. In the presentation of the Outline of Knowledge, the headnotes and the cross-references give the reader an indication of these interrelationships.

Anyone who is in a position to compare the classified list of articles in the Eleventh or even the Fourteenth Edition with the Outline of Knowledge will be persuaded, the Editors think, that whereas the immediately preceding editions of *Britannica* represented a 19th- and early 20th-century view of the state of human knowledge, the new *Britannica,* in its Fifteenth Edition, is an encyclopaedia that reflects the many changes and innovations in man's knowledge and understanding that are emerging at the end of this century and will continue into the next.

The reader's attention should be called to two further points about the Outline of Knowledge. The first is that it serves as a table of contents only for the 4,207 longer articles in the 19 volumes of the *Macropædia.* It does not cover or refer to the shorter entries in the 10 volumes of the *Micropædia,* or *Ready Reference and Index.* Those ten volumes should always be consulted first if the reader wishes to look up any *specific* point of information by alphabetical means. As indicated in the explanation of how to use the *Propædia,* which follows, the Outline of Knowledge in this volume should be consulted for a different purpose—not to look up a specific point of information which can be found by alphabetical means, but to study a whole segment of human knowledge, or to examine a field of learning, which is here topically outlined so that the reader can discover what he can learn from *Britannica* about that area of knowledge.

The second point to be mentioned is, in the view of the Editors, of singular importance, for it distinguishes the Fifteenth Edition of *Britannica* from all preceding editions. The Outline of Knowledge presented in this *Propædia* volume, which serves as a topical survey of the contents of the articles in the *Macropædia,* was constructed *before* those articles themselves were named, outlined, commissioned, written, and edited. The outline served as the basis for determining what articles should be written, what their scope should be, how they should be related to other articles, and so on. It was, therefore, in origin a table of *intents* rather than a table of *contents.* It represented the intentions of the Editors in laying down a comprehensive plan for producing a new encyclopaedia, appropriate to the state of human knowledge and learning at the end of the 20th century and looking forward to emergent developments in the century to follow. What was originally, or in the planning stage of the work, a Table of Intents, then subsequently became, after the writing and editing of the articles was completed, a Table of Contents that tries to reflect accurately and faithfully the actual content of the articles. In many cases, the articles departed from the original outline and the outline was therefore revised to accord with the improvements of it by the contributors of those articles.

All preceding editions of *Britannica,* as most other encyclopaedias, have been constructed from classified lists of articles. Such classified lists may vary from one edition to another, as they have from the First Edition of *Britannica* through the Fourteenth, but the variations are relatively minor as compared with the fact that they are all the same in form—nothing but classified lists of articles, as exemplified by the one presented in the Eleventh Edition, already referred to. In sharp contrast to such editorial procedures, the Fifteenth Edition has the distinction of being planned not in accordance with a classified list of articles, but rather in the light of an orderly topical outline of the whole of human knowledge, in the form of the circle of learning that is an *en-cyclo-paedia.*

MORTIMER J. ADLER
Director of Planning

How to use the Propædia

The purpose of the Propædia

As its title indicates, the Outline of Knowledge is intended to serve as a topical guide to the contents of the *Macropædia,* enabling the reader to carry out an orderly plan of reading in any field of knowledge or learning that he may wish to study in some depth. The *Propædia*'s Table of Contents gives the reader an overview of the Outline of Knowledge as a whole; the Introductory Essays for each of the ten parts illuminate the major concerns of that part of human knowledge; the headnotes that are affixed to parts, divisions, and sections prepare the reader for his examination of the subjects being covered there; and the outlined presentations of these subjects, accompanied by volume and page references to the places in the *Macropædia* where the subjects are treated, enable the reader to carry on for himself a course of study that may be more or less extensive and detailed in accordance with his own interests and desires.

The *Propædia,* or Outline of Knowledge, helps the reader to answer for himself the question that, in its most general form, is as follows: *What can I learn from the Britannica concerning one or another area of human knowledge?* More specifically, the question, for example, might be: *What can I learn about the Earth?* or *What can I learn about art?* The reader's interest may be even more specific, as the following questions indicate. In the field of the Earth sciences, his question might be: *What can I learn about the Earth's constituent minerals and rocks?* or *What can I learn about weather and climate?* In the field of art, his question might be: *What can I learn about the theory and classification of the arts?* or *What can I learn about music?*

If the reader will now glance at the *Propædia*'s Table of Contents on page 10, he will see that the questions just used as examples have been drawn from the 241 headings in the Table of Contents. The first pair of questions about the Earth and art are taken from the headings of Part Two and Part Six, respectively. The more detailed questions about the Earth are taken from the headings of Sections 214 and 224; and the more detailed questions about art are taken from the headings of Sections 611 and 624. Thus, each of the 241 headings in the Table of Contents can be used to complete a question of the form, *What can I learn from Britannica about .....?* On the other hand, if the reader is interested in a particular subject, he should consult the *Micropædia.* The subject will be treated briefly there. In addition, directions are given for finding places in the *Macropædia* where that subject is treated at greater length or in broader contexts.

The difference between the *topics,* which are the basic elements in the *Propædia,* or Outline of Knowledge, and the *subjects,* which are the component entries in the *Micropædia,* will become clear at once to anyone who examines a page of the *Propædia's* outline and a page of the *Micropædia.*

The structure of the Propædia

Each of the 10 parts, 42 divisions, and 189 sections that make up the *Propædia,* or Outline of Knowledge, is marked in the Table of Contents by a heading or title, which is followed by the number of the page on which that unit of the *Propædia* begins. This structure affords the reader three main options: (1) he can turn to one of the parts as a whole and examine the contents of that part; (2) he can select a particular division of one of the parts and examine the contents of that division; or (3) he can focus on a single section or several sections of such a division, and examine the contents of that section or those sections.

If the reader exercises the first option and considers one of the ten parts as a whole, he will first encounter an Introductory Essay that acquaints him with the major concerns and character of that part of human knowledge. That essay is followed by a headnote that summarizes the content of the part, calls attention, where needed, to the relation of that part to other parts, briefly indicates the content and titles of the several divisions of the part, and gives the page on which each division begins. A thorough examination of the part as a whole will involve him in examining its subordinate divisions and sections.

If the reader exercises the second option and wishes to examine one division of a part, he will be aided by a headnote that summarizes the content of the division he has selected for examination, briefly indicates the content of the sections in that division, and gives the page on which each section begins. A thorough examination of the division as a whole will involve him in examining its subordinate sections.

If the reader exercises the third option and wants to consider one or more sections within a division, he will be aided by a headnote that summarizes the content of the section or sections that he has selected for examination. The section headnote is followed by an outline of the subjects covered in that section. A thorough examination of the section will involve the reader in examining the subjects it comprises, as set forth in the outline.

The sectional outlines

The sectional outlines present, in an orderly arrangement of topics, subjects that are treated in articles in the *Macropædia.* The major subjects in each sectional outline are indicated by capital letters ("A," "B," etc.). There are always at least two major subjects, but there may be many more in a given section. When it is necessary to subdivide a major subject, up to three additional levels may appear in the outline; the first is indicated by Arabic numerals; the second by lower-case letters; and the third by Roman numerals, as shown below:

A. The action of the hydrosphere and atmosphere on the Earth's surface features
   1. Weathering: the disintegration and alteration of rocks at or near the Earth's surface
      a. Processes involved in weathering
         i. Physical processes; *e.g.*, freeze–thaw cycles, crystal-growth pressures

Attached to each topical statement of a particular subject in the sectional outline are listed, in the three columns to the right of the statement, the pages on which the reader will find a treatment or treatments of that subject in the *Macropædia.* The significance of these three kinds of references is explained below.

Although the principal purpose of the sectional outlines is to provide references to articles in the *Macropædia* wherein

this or that subject is treated, the structure of the outlines sometimes requires the topical statement of subjects that do not call for such references. These topics often serve as cross-references to subjects to which references are attached, in other parts of the given sectional outline or in other sectional outlines. Still other topics that are not accompanied by references serve as headings for a set of related subjects grouped in subordination under them. Such topics indicate what is common to the subordinate topics. These, as well as other topics, are often followed by the phrase *with special attention to,* which informs the reader that the topics following do not necessarily exhaust the subject under consideration.

The references

The three columns aligned to the right of each topic in the sectional outlines contain the volume and page numbers of the *Macropædia* articles that, in whole or part, treat the subjects stated in the topic, as illustrated at the bottom of this page. Each of the three columns has a special reference function.

The first column usually contains references to whole articles, the titles of which are given, as well as volume and page references. In the case of articles whose scope covers outline topics in two or more sections, divisions, or even parts, the reference will be to the pages in the article relevant to the topic at which the title is aligned.

The second column contains references to important article sections, the references being given by the page location at which the section cited begins and the page location at which it ends.

The third column contains references to passages that are smaller than article sections, the references being given in the same way as in the case of column two. All references to biographical and to geographical articles are listed in the third column.

In the second and third columns, when two or more article sections or two or more smaller passages are cited, the references are usually arranged in volume and page order; and the distinct references are separated by a slash. However, when the title of an article has been listed in the first column at a particular topic, references to portions of this article at lower-level topics are listed before any other references in the second column.

In the second and third columns, the page references indicate the segment of the page at which the passage cited begins and the segment of the page at which it ends. The segments that are signified by the letters a, b, c, and d, refer to the top, upper-middle, lower-middle, and bottom portions, respectively, of the left column of text on a page. The letters e, f, g, and h, refer to the corresponding portions of the right column of text.

a	e
b	f
c	g
d	h

The word *passim* following a reference in the third column indicates that the material in an article that is relevant to a topic is diffused throughout the treatment of a broader subject rather than being a concentrated treatment of the topic.

Since the content of the biographical and geographical articles that are included in the *Macropædia* does not influence the structure or content of the sectional outlines, the titles of such articles are not listed in the first column. The titles of all other articles appear at least once and sometimes more than once in the first column of references attached to the sectional outlines; however, the titles of biographical and geographical articles are listed alphabetically at the end of parts, divisions, or sections, when their content is relevant to the subject matter covered in the part, division, or section to which they are appended.

Table of contents

Part One. **Matter and energy**
Introduction. *The universe of the physicist, the chemist, and the astronomer* by Nigel Calder *page 17*

Division I. Atoms: atomic nuclei and elementary particles 20
111. The atomic nucleus; elementary particles 21
112. The structure and properties of atoms 27

Division II. Energy, radiation, and the states and transformation of matter 29
121. Chemical elements: periodic variation in their properties 30
122. Chemical compounds: molecular structure and chemical bonding 36
123. Chemical reactions 41
124. Heat, thermodynamics, and the nonsolid states of matter 45
125. The solid state of matter 49
126. Mechanics of particles, rigid bodies, and deformable bodies: elasticity, vibrations, and flow 52
127. Electricity and magnetism 55
128. Waves and wave motion 59

Division III. The universe: galaxies, stars, the solar system 63
131. The cosmos 64
132. Galaxies and stars 66
133. The solar system 70

Part Two. **The Earth**
Introduction. *The great globe itself* by Peter J. Wyllie 76

Division I. The Earth's properties, structure, and composition 79
211. The planet Earth 79
212. The Earth's physical properties 80
213. The structure and composition of the Earth's interior 84
214. The Earth's constituent minerals and rocks 85

Division II. The Earth's envelope: its atmosphere and hydrosphere 92
221. The atmosphere 92
222. The hydrosphere: the oceans, freshwater bodies, and ice masses 94
223. The motions of the sea and the forces that cause them 97
224. Weather and climate 99

Division III. The Earth's surface features 104
231. Physical features of the Earth's surface 104
232. Features produced by geomorphic processes acting on the Earth's surface 108

Division IV. The Earth's history 115
241. Origin and development of the Earth and its envelopes 115
242. The interpretation of the geological record 119
243. The eras and periods of geological time 123

Part Three. **Life on Earth**
Introduction. *The mysteries of life* by René Dubos 127

Division I. The nature and diversity of living things *page 130*
311. Characteristics of living things *131*
312. The origin of life and the evolution of living things *132*
313. The classification of living things *135*

Division II. The molecular basis of vital processes *144*
321. Chemicals and the vital processes *145*
322. Metabolism: bioenergetics and biosynthesis *150*
323. Vital processes at the molecular level *152*

Division III. The structures and functions of organisms *154*
331. The cellular basis of form and function *155*
332. The relation of form and function in organisms *157*
333. Coordination of vital processes: regulation and integration *161*
334. Covering and support *164*
335. Nutrition: the procurement and processing of nutrients *167*
336. Gas exchange, internal transport, and elimination *168*
337. Reproduction and sex *172*
338. Development: growth, differentiation, and morphogenesis *175*
339. Heredity: the transmission of traits *179*

Division IV. Behavioral responses of organisms *182*
341. Nature and patterns of behavioral responses *182*
342. Development and range of behavioral capacities: individual and group behaviour *184*
343. Evolution of behaviour *189*

Division V. The biosphere: the world of living things *189*
351. Basic features of the biosphere *190*
352. The community: a collection of interacting populations *192*
353. Hazards of life in the biosphere: disruptions and death *195*
354. Patterns of life in the biosphere *196*
355. Man's place in the biosphere *200*

Part Four. Human life
Introduction. *The cosmic orphan* by Loren Eiseley *206*

Division I. Stages in the development of human life on Earth *209*
411. The order of primates and the emergence of Hominidae *210*
412. Quaternary Hominidae *211*
413. The evolution of man *213*
414. Human heredity: the races of man *215*

Division II. Human health and diseases *217*
421. Human health *217*
422. The structures and functions of the human body *220*
423. Human disease: its manifestations, recognition, and treatment *227*
424. Diseases and disorders of the human body *230*
425. The practice of medicine and the care of health *238*

Division III. Human behaviour and experience *241*
431. General theories of human nature and behaviour *242*
432. Antecedent conditions and developmental processes affecting a person's behaviour and conscious experience *243*

433. Influence of the current environment on a person's behaviour and conscious experience: attention, sensation, and perception *page 246*
434. Current internal states affecting a person's behaviour and conscious experience *251*
435. Persisting capacities that integrate human behaviour and conscious experience *254*
436. Development of a person's potentials: learning and thinking *256*
437. Persisting inclinations that guide and organize human behaviour and conscious experience *259*
438. Personality and the self: integration and disintegration of the person as a whole *261*

Division IV. Communication and language *263*
441. Methods and forms of communication *264*
442. Language *265*

Division V. Aspects of man's daily life *273*
451. The means of subsistence *273*
452. Leisure and play *275*

Part Five. Human society
Introduction. *Man the social animal* by Harold D. Lasswell *280*

Division I. Culture *283*
511. The development of human culture *283*
512. The variety of sociocultural forms *286*

Division II. Social organization and social change *294*
521. Social structure and change *294*
522. The group structure of society *297*
523. Social status *303*
524. Collective behaviour and mass society *305*
525. Human populations: urban and rural communities *307*

Division III. The production, distribution, and utilization of wealth *311*
531. Economic concepts, issues, and systems *311*
532. Human wants and their economic expression *314*
533. Markets, pricing, and the mechanisms for distributing goods *315*
534. The organization of production and distribution *316*
535. The distribution of income and wealth *325*
536. Macroeconomics *328*
537. Economic growth and planning *330*

Division IV. Politics and government *332*
541. Political theory *333*
542. Political institutions: the structure, branches, and offices of government *340*
543. The functioning of government: the dynamics of the political process *342*
544. International relations: peace and war *346*

Division V. Law *352*
551. Philosophies and systems of law *353*
552. Branches of public law, substantive and procedural *357*
553. Branches of private law, substantive and procedural *363*
554. The profession and practice of law *369*

Division VI. Education page 371
561. The aims and methods of education 371
562. Education around the world 372
563. The organization of education 377

Part Six. Art
Introduction. *The world of art* by Mark Van Doren 381

Division I. Art in general 383
611. Theory and classification of the arts 383
612. Experience and criticism of works of art 386
613. Nonaesthetic contexts of art 389

Division II. Particular arts 393
621. Literature 393
622. Theatre 400
623. Motion pictures 404
624. Music 407
625. Dance 414
626. Architecture, garden and landscape design, and urban design 417
627. Sculpture 421
628. Drawing, painting, printmaking, and photography 423
629. Arts of decoration and functional design 428

Part Seven. Technology
Introduction. *Knowing how and knowing why* by Lord Ritchie-Calder 434

Division I. The nature and development of technology 437
711. Technology: its scope and history 438
712. The organization of human work 441

Division II. Elements of technology 444
721. Technology of energy conversion and utilization 444
722. Technology of tools and machines 448
723. Technology of measurement, observation, and control 449
724. Extraction and conversion of industrial raw materials 454
725. Technology of industrial production processes 458

Division III. Major fields of technology 462
731. Agriculture and food production 463
732. Technology of the major industries 469
733. Construction technology 474
734. Transportation technology 477
735. Technology of information processing and of communication systems 482
736. Military technology 489
737. Technology of the urban community 492
738. Technology of Earth and space exploration 495

Part Eight. Religion
Introduction. *Religion as symbolism* by Wilfred Cantwell Smith 498

Division I. Religion in general 501
811. Diverse views about religion 501
812. Religion as an object of study; religious experience and phenomenology 511

Division II. The particular religions page 517
821. Prehistoric religion and primitive religion 518
822. Religions of ancient peoples 520
823. Hinduism and other religions of India 525
824. Buddhism 529
825. Indigenous religions of East Asia: religions of China, Korea, and Japan 532
826. Judaism 536
827. Christianity 539
828. Islām 555
829. Other religions and religious movements in the modern world 558

Part Nine. The history of mankind
Introduction. *The point and pleasure of reading history* by Jacques Barzun 560

Division I. Peoples and civilizations of ancient Southwest Asia, North Africa, and Europe 563
911. Early peoples and civilizations of Southwest Asia and Egypt, the Aegean, and North Africa 563
912. Peoples of ancient Europe and the Classical civilizations of the ancient Mediterranean world to AD 395 570

Division II. Peoples and civilizations of medieval Europe, North Africa, and Southwest Asia 578
921. Western Europe, the Byzantine (Eastern Roman) Empire, and the states of eastern Europe from AD 395 to *c.* 1050 578
922. The Empire of the Caliphate and its successor states to *c.* AD 1055 583
923. Western Christendom in the High and later Middle Ages (*c.* 1050–*c.* 1500) 585
924. The crusading movement, the Islāmic states of Southwest Asia, North Africa, and Europe, and the states of Eastern Christendom from *c.* 1050 to *c.* 1480 592

Division III. Peoples and traditional civilizations of East, Central, South, and Southeast Asia 595
931. China to the beginning of the late T'ang (AD 755) 596
932. China from the beginning of the late T'ang (AD 755) to the late Ch'ing (*c.* 1839) 598
933. Inner (Central and Northeast) Asia to *c.* 1750 600
934. Japan to the Meiji Restoration (1868), and Korea to 1910 602
935. The Indian subcontinent and Ceylon to *c.* AD 1200 604
936. The Indian subcontinent from *c.* 1200 to 1761, and Ceylon from *c.* 1200 to 1505 606
937. The peoples and civilizations of Southeast Asia to *c.* 1600 608

Division IV. Peoples and civilizations of sub-Saharan Africa to 1885 610
941. West Africa to *c.* 1885 611
942. The Nilotic Sudan and Ethiopia from *c.* AD 550 to 1885 612
943. East Africa and Madagascar to *c.* 1885 612
944. Central Africa to *c.* 1885 613
945. Southern Africa to *c.* 1885 614

Division V. Peoples and civilizations of pre-Columbian America 615

951. Andean civilization to *c.* AD 1540 *page 616*
952. Meso-American civilization to *c.* AD 1540 *617*

Division VI. The modern world to 1920 *618*
961. Western Europe from *c.* 1500 to *c.* 1789 *620*
962. Eastern Europe, Southwest Asia, and North Africa from *c.* 1480 to *c.* 1800 *628*
963. Europe from 1789 to *c.* 1920 *631*
964. European colonies in the Americas from 1492 to *c.* 1790 *642*
965. Development of the United States and Canada from 1763 to 1920 *644*
966. Development of the Latin American and Caribbean nations to *c.* 1920 *649*
967. Australia and Oceania to *c.* 1920 *654*
968. South Asia under the influence of European imperialism from *c.* 1500 to *c.* 1920 *655*
969. Southeast Asia under the influence of European imperialism to *c.* 1920 *657*
96/10. China from 1839 until the onset of revolution (to *c.* 1911), and Japan from the Meiji Restoration to *c.* 1910 *659*
96/11. Southwest Asia and North Africa (*c.* 1800–1920), and sub-Saharan Africa (1885–*c.* 1920) under the influence of European imperialism: the early colonial period *660*

Division VII. The world since 1920 *662*
971. International movements, diplomacy, and war since 1920 *663*
972. Europe since *c.* 1920 *666*
973. The United States and Canada since 1920 *672*
974. Latin American and Caribbean nations since *c.* 1920 *675*
975. East Asia: China in revolution, the era of Japanese hegemony, and the influence of the United States in the 20th century *680*
976. South and Southeast Asia: the late colonial period and the emergence of new nations since 1920 *683*
977. Australia and Oceania since 1920 *686*
978. Southwest Asia and Africa: the late colonial period and the emergence of new nations in the 20th century *687*

Part Ten. The branches of knowledge
Introduction. *Knowledge become self-conscious* by Mortimer J. Adler *692*

Division I. Logic *694*
10/11. History and philosophy of logic *695*
10/12. Formal logic, metalogic, and applied logic *697*

Division II. Mathematics *699*
10/21. History and foundations of mathematics *700*
10/22. Branches of mathematics *703*
10/23. Applications of mathematics *719*

Division III. Science *725*
10/31. History and philosophy of science *726*
10/32. The physical sciences *729*
10/33. The Earth sciences *735*

10/35. Medicine and affiliated disciplines *741*

10/36. The social sciences and psychology *page 746*
10/37. The technological sciences *751*

Division IV. History and the humanities *753*
10/41. Historiography and the study of history *753*
10/42. The humanities and humanistic scholarship *756*

Division V. Philosophy *760*
10/51. The nature and the divisions of philosophy *760*
10/52. History of philosophy *767*
10/53. Philosophical schools and doctrines *772*

Introduction to Part One:

The universe of the physicist, the chemist, and the astronomer

by Nigel Calder

"Give me matter and I will build a world from it." For 200 years since the philosopher Immanuel Kant uttered it, physicists, chemists, and astronomers have striven to make good that boast. That they can now tell an almost unbroken story of events from the birth of the universe to the origin of life on Earth is the result of many cumulative lifetimes spent in careful observation and experiment. Yet even amid this success in updating the first verses of Genesis, new questions nag. Why does familiar matter adopt the forms it does? Are the laws of nature that are known to us enforced throughout the vast, tumultuous universe? What unimaginable worlds of fire or blackness can nature conjure up, quite different from our own?

When men presume to take the fire of the Sun and put it experimentally in a bottle, they forfeit all hope of certainty and repose. Yet the great quest for control over nature starts gently enough. A child at play with building blocks or sand or a rubber ball is a human mind engaged in discovering how matter behaves. Experiments with the rubber ball, for example, reveal laws of reflection. The child finds that the ball will come back to him only if he projects it accurately at a right angle to a flat surface (wall or floor); otherwise it bounces away from him and another child may grab it and interrupt the research program.

If all grown-up children had abandoned this kind of play the human species would still believe that the Earth was at the centre of the universe, that the planets were propelled by angel-power, and that thunder was the voice of God. But some adults retained the boundless inquisitiveness of the young. Isaac Newton, not the most modest of discoverers, likened himself to a child playing on the seashore. Critics nowadays refer scathingly to the "expensive toys" of the physicists who want many millions of dollars to build a particle accelerator. Not unfairly—a particle accelerator, for all its awesome complexity and cost, is simply a modern way of continuing the experiments with the rubber ball, to see what happens when the ball is very small and travels almost at the speed of light.

By strange paths, play leads to far-reaching results. After the discovery that an electric current creates magnetism, Michael Faraday made a note to look for electricity from magnetism. He played repeatedly with magnets and wires until, ten years later, he discovered electromagnetic induction. Today, giant turbogenerators confirm his discovery 60 times a second, as they feed electric power to our factories and kitchens. In James Clerk Maxwell's hands, Faraday's ever-changing electric currents transformed themselves into mathematical equations predicting the existence of waves that travelled at the speed of light—indeed *were* light and invisible radiations of a similar kind, including radio waves. Other researchers who were unwittingly taking atoms to pieces came up with a beam of electrons, which inventors turned into a magic pencil; today those waves and electrons enable lesser men to preen themselves on television screens in 260,000,000 homes.

In this latter part of the 20th century, a word-association test for "physicist" may very well evoke "bomb." By coincidence, investigators of the nature of matter and energy stumbled upon a way of breaking open the storehouse of energy in the nucleus of the atom, just as the human species was entering a period of unprecedented warfare. The swarms of nuclear-powered submarines that cruise with nuclear-tipped, city-killing missiles are a grim enough outcome of the "game." The fact remains that the heart of physics itself is not directed to any such purpose, but is an open, cooperative effort by scientists of all nations to understand the material universe we live in.

We inhabit an electric world. It is true that gravity stops us from falling headfirst into the abyss of space; true also that the daylight that powers all life comes from the nuclear reactor that we call the Sun. But of the great set of natural forces known to the physicist—gravitational, nuclear, and electromagnetic—the last, electromagnetism, is the chief governor of events on Earth.

It operates so discreetly, though, that when men started rubbing amber on their sleeves and found it attracted dust, or considered the seeming magic of the north-pointing lodestone, nothing suggested that these were more than curiosities. There was laughter when Benjamin Franklin said that lightning was electric—until he proved it. Nothing suggested that the colour, quality, and chemical behaviour of all familiar matter would be explained by research in electricity and magnetism. But that is in the nature of physics: you ponder the falling of an apple and realize what holds the planets in their courses; you look to see what happens when you pass electric currents through a gas and, in due course, you find out what holds a stone together and why grass is green.

A series of discoveries in the late 19th and early 20th centuries illuminated the hidden mechanisms of our electric world like star shells on a dark night. Diligent work by chemists had shown that all matter was composed of vast numbers of atoms, different for each chemical element and capable of combining in predictable ways to make molecules and crystals. Indeed there was a remarkable pattern in the so-called "periodic table": when the chemical elements were listed by weight it turned out that elements 3, 11, and 19 . . . all had similar properties; 4, 12, and 20 . . . were also very much alike, and so on.

This pattern made sense only when the physicists discovered the construction of atomic matter. An atom consists of a heavy nucleus surrounded by a number of lightweight electrons exactly neutralizing the electric charge on the nucleus. The electrons group themselves around the nucleus in "shells," like the layers of an onion, each shell being capable of accommodating a definite number of electrons. The outward face of the atom, its outermost shell of electrons, is crucial in determining its chemical behaviour. The number of electrons to be fitted in depends on the charge on the nucleus. In some elements, the metals, there are only one or two easily detachable electrons in the outermost shell. Other elements, the most reactive nonmetals, fall short by only one or two electrons of a complete outermost shell. These "surplus" and "missing" electrons create a supply-and-demand situation in which atoms combine chemically by exchanging or sharing electrons. The repetition of chemical properties throughout the periodic table arises as one shell of electrons is completed and the next one begins to fill.

The mechanisms sketched in these last few sentences ac-

count for almost all the chemical behaviour of all the matter on Earth. The electrical and magnetic behaviour of materials also depends on the arrangements of electrons in their atoms and, in some cases, on the combined effects of many atoms packed together in a crystal. The strength of the chemical bonds formed by electrons, and the related forces between molecules, determine whether materials are solids, liquids, or gases; and they help to fix the strength and flexibility of solids, but in this case the explanations are complicated by the invisible flaws that exist in all materials. The colour of materials is explicable by the "jumps," from one position to another in the vicinity of an atom, which the rules allow an electron to make, as the atom, molecule, or crystal absorbs or emits light of particular energy, or colour. Make the same electrons in vast numbers of atoms "jump" the same way simultaneously and you have a very intense laser beam.

Light and its invisible counterparts—radio waves, infrared, ultraviolet, and X-rays—are the purest form of energy. These "electromagnetic radiations" are created by the jerking of electrons, sometimes quite gently as in a radio antenna and sometimes very fiercely as when a beam of fast-moving electrons is suddenly halted by the target in an X-ray tube. The normal "jumps" of electrons in atoms are of intermediate intensity. All these radiant forms of energy can travel through empty space, for example from the Sun to the Earth.

But energy can readily change from one form to another. Sunlight captured by green leaves is converted into the chemical energy of plant-stuff. Coal is plant-stuff buried millions of years ago when continents collided, and a boiler can convert the chemical energy of coal into a scalding jet of steam that turns the blades of a turbine—these are forms of kinetic energy, the energy of directed movement. Using Faraday's trick, the turbine can generate electrical energy. At the end of this chain of transformations, you can switch on the electrical energy and reconvert it to light energy, thereby enjoying the benefits of sunlight after the Sun has set.

The vibrations of sound and the gravitational energy of water about to cascade down a mountainside are other forms of energy. Sooner or later, though, a shout dies away, water comes to rest, the light from your electric bulb is absorbed in the wallpaper. Where has the energy gone? It has been taken up in those random motions of atoms and molecules that we call heat. All energy degrades to meaningless heat eventually.

Unless there were continuous supplies of new energy, life and indeed all interesting activity in the universe would quickly cease. For example, your brain is kept going, as you read these words, by food—chemical energy produced by sunlight falling on the Earth just in the past few months. Those new supplies of energy come from the transformation of matter into energy.

The Sun is a very ordinary star, lying in the suburbs of a galaxy consisting of about 100,000,000,000 stars; we see the rather flat cross section of the galaxy as the Milky Way, a brushstroke of light across the night sky. There is nothing special, even, about our Galaxy; it is just one of vast numbers of galaxies scattered like ships in a great ocean of space.

The universe is a battleground between gravity and nuclear forces. To make a star, gravity sweeps together a mass of hydrogen gas; it becomes hot and nuclear reactions begin. The nuclei of hydrogen atoms combine together to make heavier elements almost, but not quite, as heavy as the sum of the hydrogen nuclei that went into them. The little bit of matter that is lost is converted into a relatively immense amount of energy. It would blow the star apart but for the strenuous restraint of gravity. A balance is struck and the size and brightness of a star depends on its mass and on how much of its nuclear fuel has been burned. Fortunately, our star, the Sun, is a slow-burner; nevertheless, inexorable physical changes billions of years from now will make the Sun grow to fill the whole of our sky and swallow the Earth.

In a star more massive than the Sun, this "burning" of nuclear fuel proceeds faster and culminates in a vast explosion called a supernova. In the explosion, nuclear reactions proceed apace and make all the different chemical elements. The diverse atoms, heavier than hydrogen, of which our own bodies are constructed, were made in stars that exploded before the Sun was formed. Some of the heavy material was left swirling around the newborn Sun and made the Earth. Radioactive energy stored in some of the elements provided an internal source of heat for the Earth that accounts for volcanoes, earthquakes, and the slow movements of continents. Sunlight stirred the materials on the surface of the Earth into chemical activity. Eventually this activity became organized in peculiar ways, and life began.

So far, so good. But there are new mysteries that are "out of this world," in the sense that matter and energy are involved in events far more violent than anything normally encountered on Earth or even in the Sun. The paramount questions with which physicists are now wrestling can be paraphrased as follows: Why is hydrogen the raw material of the universe? Experiments with the nucleus of the hydrogen atom—the proton—are undertaken in the big accelerators that transform the stuff of the atomic nucleus into bizarre, short-lived particles. These particles have properties, similar to electric charge, called the hypercharge and the baryon number. For example, the proton itself has, besides an electric charge of $+1$, a hypercharge of $+1$ and a baryon number of 1. However the particles may transform themselves in violent interactions, the totals of charge, hypercharge, and baryon number do not change.

Attempting to find out why this partial order remains amid the confused varieties of nuclear matter, theorists are led to the idea that the particles we see consist of combinations of other, quite different particles that they have named quarks. An early success of this theory was the prediction of the existence of a new combination, a particle called the omega minus that eventually turned up in 1964 during an experiment with the big machine at the Brookhaven National Laboratory, Long Island, N.Y. The quarks themselves have not been discovered at the time of writing.

The next big leap in understanding may well come when the theory of how small pieces of matter behave is blended with the theory of gravity, which at present concerns the huge pieces of matter that make up our universe of galaxies, stars, and planets. With such a "unified" theory physicists may at last be able to answer that question about the raw material of the universe—why hydrogen? At the same time we shall perhaps come to understand why matter was formed in the "big bang" with which (as many astronomers now suppose) the universe came into existence some 10,000,000,000 years ago; why the "big bang" was not merely a "big flash."

Even so fundamental an advance would not exhaust the opportunity for fresh discovery in the physical sciences. Another set of pregnant problems results from very strange objects recently discovered in the sky, namely "hot" galaxies, quasars and pulsars. The quasars, in particular, are compact objects of such extraordinary energy that existing laws of physics seem scarcely able to account for them. The pulsars, which flash many times a minute, are also very odd, but less baffling. They are evidently remnants of exploded stars that have collapsed to the enormous density of the material of the atomic nucleus. If an ocean liner were compressed to the density of a pulsar it would be no bigger than a grain of sand.

The evidence of the pulsars encourages a further idea—one of the strangest in the whole history of man's study of matter and energy. In a pulsar, nuclear forces prevent collapse to even greater densities. But if the collapsed star were even more massive, gravity would be stronger and it would overwhelm even the nuclear forces. Then there would be nothing to stop the process until the whole star had collapsed to smaller than a peanut. Through the intense gravitational field thus set up no light could escape and the star would in effect disappear from the universe. Only its gravity would remain, like the grin of the Cheshire Cat in *Alice in Wonderland,* and if a space traveller ran into one of these "black holes" he too would be drawn to the same invisible kernel, there to disappear forever—or at least until the laws of physics change.

The possibility that such black holes exist holds out a hope of explaining the quasars as objects of this kind from which material somehow "bounces" out. But that is only a little comfort, when scientists have now to reexamine the theory of gravity which they thought Einstein had cleared up 60 years ago, and to work out the implications of a universe peppered with black holes where the familiar laws of nature are unlikely to apply. There is even the uncomfortable suggestion that our whole universe may be just a big black hole in someone else's universe! Physics, the master science, cannot evade these new battles of the mind.

Part One. Matter and energy

The outlines, and the articles and parts of articles referred to, in the thirteen sections of Part One are concerned with the work of all the physical sciences. The subject matter of the several Earth sciences is dealt with in Part Two, and that of the biological sciences is treated in Parts Three and Four.

Three further points should be noted about the scope of Part One and its relations to other parts.

The sciences of physics, chemistry, and astronomy have themselves been the object of historical and analytical studies regarding their nature, scope, methods, and interrelations. Part Ten, on the branches of knowledge, is concerned with such studies of the intellectual disciplines. The outline and the articles referred to in Section 10/32 of Part Ten deal with the sciences of physics, chemistry, and astronomy and treat their history, their nature and scope, and their principal problems and interrelations.

The design and operation of observational and experimental instruments are important in the development of the physical sciences. The treatment of scientific instrumentation is placed in Section 723 of Part Seven, on technology.

Accounts of the several kinds of mathematics used in observation and experiments, and in the derivation and application of physical theories, are set forth in Division II of Part Ten.

The three increasingly complementary physical sciences of physics, chemistry, and astronomy strive for knowledge and for organizing theories about matter in all its dimensions, from subatomic particles to the cosmos, about all the states of matter, all the forms of energy, and all the interrelations of matter and energy.

The outlines and the articles referred to in the two sections of Division I deal with modern advances in subatomic and atomic physics.

The outlines and the articles referred to in the eight sections of Division II treat chemical elements; chemical compounds; chemical reactions; heat, thermodynamics, and the nonsolid states of matter; the solid state of matter; the mechanics of particles, rigid bodies, and deformable bodies; electricity and magnetism; and waves and wave motion—both in general and with regard to particular waves, such as light waves and sound waves.

The outlines and the articles referred to in the three sections of Division III treat the cosmos; galaxies and stars; and the solar system.

Division I. Atoms: atomic nuclei and elementary particles 20
II. Energy, radiation, and the states and transformation of matter 29
III. The universe: galaxies, stars, the solar system 63

Division I. Atoms: atomic nuclei and elementary particles

The outlines, and the articles and parts of articles referred to, in the two sections of Division I deal with modern advances in subatomic and atomic physics.

The outline and the articles referred to in Section 111 treat the experimental evidence for and the theories about the atomic nucleus and the many kinds of elementary particles. The section treats the components, structure, and general properties of atomic nuclei, and such nuclear phenomena as radioactivity, nuclear fission, nuclear fusion, and the effects of the passage of radiation through matter.

The outline and the articles referred to in Section 112 deal with modern theories of the structure and properties of atoms. The section first deals with scientific evidence for the existence and the nature of the atoms of matter, with models of atomic structure, and with the wave-mechanical theory of the electronic structure of the atom. It further treats atomic weights, atomic spectra, X-rays and atomic structure, the concept of antimatter, and the fundamental physical constants.

Section 111. The atomic nucleus; elementary particles 21
112. The structure and properties of atoms 27

Section 111. The atomic nucleus; elementary particles

[for Part One headnote see page 20
for Division I headnote see page 20]

The articles and parts of articles referred to in Section 111 deal with nine main subjects: A, the structure of the atomic nucleus and general nuclear phenomena; B, isotopes; C, radioactive nuclei; D, the neutron; E, nuclear reactions; F, nuclear fission; G, nuclear fusion; H, subatomic particles; and I, the effects of radiation on matter.

The outline of subject A begins with the general properties and the components of all atomic nuclei. It then covers the relationships between nuclear masses and nuclear binding energies; the properties of nuclear states; the theories of nuclear structure and binding force; and general nuclear phenomena and reactions. At the end, it treats the formation and evolution of the atomic nuclei in the universe.

Subject B is isotopes, an isotope being one of two or more atomic species of the same chemical element that have different atomic weights. The outline first deals with the classification of isotopes, the isotopic composition of the elements, and their formation by nuclear reactions. It then treats the effects of isotopic substitution on the physical and chemical properties of substances and the chemical and physical separation of isotopes by mass spectrometry and other methods. Finally, it deals with those applications of radioactive and stable isotopes in medicine, physics, chemistry, and geology that are treated in Part Seven.

The outline of subject C begins with the nature of radioactive emissions, the types of radioactivity, and the natural and artificial sources of radioactivity. Dealing with the energetics and kinetics of radioactivity, it covers energy release associated with radioactive decay; the nuclear models used to explain the behaviour of nuclear binding; and the rates of radioactive transitions.

The outline of subject D, the neutron, begins with the properties of neutrons and their role as components of the atomic nucleus. It next deals with the sources of neutrons and with their manipulation and control. Finally, it treats the nuclear reactions produced by neutrons and the methods and apparatus used for neutron detection.

The outline of subject E begins with the classification of nuclear reactions—first according to the kind of bombarding radiation or particles, and then according to nuclear processes involved or according to their products. It next treats the energy relationships of nuclear reactions and the theories and models of nuclear reactions.

Subject F is the splitting of atomic nuclei by nuclear fission. The outline deals first with the general phenomena of nuclear fission, covering the spontaneous and induced fission reactions, the products of nuclear fission, and the energy released in fission. It next deals with fission chain reactions and their control. Finally, it treats the different models used in theories of nuclear fission.

Subject G is nuclear fusion. The outline begins with the general phenomena of fusion, the process in which two or more atomic nuclei combine to form a heavier atomic nucleus. It deals next with fusion reactions, covering their general types and energy yield and their occurrence in the Sun, stars, and hydrogen bombs. Finally, it treats the basic conditions required for the operation of a thermonuclear reactor and the possible approaches to controlled fusion.

Subject H is subatomic, or elementary, particles, the fundamental units of matter and energy. The outline begins with the development of the concept of subatomic particles and the discovery of their several kinds. It goes on to the four basic forces associated with particle interactions, to the various systems for classifying the elementary particles, and to the relation of the particles to conservation laws and symmetry. The outline further treats the sources of the unstable elementary particles; the relations of weak interactions to strong and electromagnetic interactions; the existence of undiscovered particles suggested by contemporary theoretical ideas; the reactions of elementary particles with atoms; and theories of nuclear structure and forces that involve the elementary particles.

The outline of subject I, the effects of radiation on matter, begins with the fundamental processes involved when energetic particles interact with or pass through matter. It then deals with the secondary and tertiary physical, chemical, and biological effects of radiation. It goes on to the significance of radiation-induced changes in fundamental biological processes and in various technological fields. Finally, the outline treats the use of the fundamental processes of energy transfer for the detection and characterization of nuclear and elementary processes themselves.

Section 112. The structure and properties of atoms

[for Part One headnote see page 20
for Division I headnote see page 20]

The articles and parts of articles referred to in Section 112 deal with six main subjects: A, the atomic nature of matter; B, atomic weights; C, atomic spectra and the electronic structure of the atom; D, X-rays and atomic structure; E, the concept of antimatter; and F, the fundamental physical constants.

The outline of subject A first deals generally with the nature of the atom as consisting of the nucleus, a tiny but massive core, surrounded by electrons, the arrangement and behaviour of which determine atomic interactions. After dealing with early speculations about the atomic nature of matter, the outline treats the modern scientific evidence for the existence and nature of atoms. It then treats developments in atomic theory, covering the Rutherford nuclear model, the Bohr–Sommerfeld atomic model, and the contemporary wave-mechanical theory of the electronic structure of the atom.

The outline of subject B treats the variations in atomic weight as a result of variations in isotopic composition; the significance of atomic weights in chemical analysis and chemical technology; the atomic weight scales; and the chemical and physical methods for determining atomic weights.

Subject C is atomic spectra and the electronic structures of the atom. After dealing with the significance and interpretation of atomic spectra, the outline treats various theories of the origin of atomic spectra in quantized electronic transitions.

The outline of subject D covers general X-ray phenomena; the theory of X-rays and their spectra; the detection and measurement of X-rays; their applications in biological, medical, industrial, and scientific fields; and the diffraction of X-rays by crystals.

Subject E is antimatter, comprising elementary particles that have the mass and charge of electrons, protons, or neutrons—their counterparts in ordinary matter—but for which the charge is opposite in sign. The outline deals first with the general properties of antimatter and with the production of antiparticles in high-energy collisions. It next treats the invariance of the laws of physics under charge conjugation—an operation in relativistic quantum mechanics that transforms every particle into its antiparticle. Finally, it deals with speculations about the possible existence and role of antimatter in the universe.

Subject F is the fundamental physical constants. The outline covers early measurements of such quantities as the velocity of light and the Newtonian gravitational constant; such modern measurements as that of the gyromagnetic ratio and the moment of the proton; the interrelationships among the constants; and the ways leading to official adoption of values for fundamental constants.

Division II. Energy, radiation, and the states and transformation of matter

[for Part One headnote see page 20]

Division I dealt with modern advances in subatomic and atomic physics.

The outlines, and the articles and parts of articles referred to, in the first three sections of Division II treat, respectively, chemical elements, chemical compounds, and chemical reactions. The last five sections of this division are concerned with heat, thermodynamics, and the nonsolid states of matter; with the solid state of matter; with the mechanics of particles, rigid bodies, and deformable bodies; with electricity and magnetism; and with waves and wave motion.

The outline and the articles referred to in Section 121 first treat the periodic law of the elements and then give separate treatment to each of the groups of the chemical elements in the long form of the periodic table. The outline then deals with other ways of classifying the elements and with the occurrence and abundance of the elements in nature.

Section 122 first deals with the development of the theory of molecular structure and of the theory of chemical bonding. After dealing with classifications of chemical compounds, the section treats the inorganic chemical compounds and the major groups of organic compounds.

Section 123 is concerned with theories and classifications of chemical reactions; with the energy changes in chemical reactions; with the rates of chemical reactions; with the mechanisms of chemical reactions; with such major types as acid–base, oxidation–reduction, and photochemical reactions; and with the principles of chemical synthesis.

Section 124 first deals with the principles of thermodynamics and the nature of heat. After dealing with the gaseous state and the liquid state of matter, the section treats solutions and solubility; physical effects at surfaces; the plasma state of matter; the properties of matter at extreme conditions; and transport phenomena.

Section 121. Chemical elements: periodic variation in their properties 30
122. Chemical compounds: molecular structure and chemical bonding 36
123. Chemical reactions 41
124. Heat, thermodynamics, and the nonsolid states of matter 45
125. The solid state of matter 49
126. Mechanics of particles, rigid bodies, and deformable bodies: elasticity, vibrations, and flow 52
127. Electricity and magnetism 55
128. Waves and wave motion 59

Section 125, dealing with the solid state of matter, first sets forth descriptive studies of modern crystallography and the general theory of the crystalline solid state. It goes on to deal with ionic crystals and with metals. Finally, it treats semiconductors and insulators and the glassy or amorphous state of matter characteristic of noncrystalline solids.

Section 126 is concerned with the mechanics of particles, rigid bodies, and deformable bodies. It first deals with the principles of classical mechanics and with relativistic mechanics in inertial systems of reference. The section further treats the stress dynamics of elastic materials; vibrations of elastic bodies; fluid mechanics, including gas dynamics; and rheological phenomena of deformation and flow.

Section 127 is concerned with electricity and magnetism. The section first treats the static electric charge and moving charges and electric currents. It goes on to deal with the phenomena and theories of magnetism. After treating the theory of fields in physics, it deals with the electromagnetic field and the theory of electromagnetic radiation and with relativistic electrodynamics.

Section 128 first deals with general wave phenomena and the theory of wave motion. It then treats electromagnetic waves, including separate coverage of light waves; the focussing and imaging of waves; and sound waves.

Section 121. Chemical elements: periodic variation in their properties

[for Part One headnote see page 20
for Division II headnote see page 29]

The articles and parts of articles referred to in Section 121 deal with the chemical elements—the substances that cannot be decomposed into simpler substances by ordinary chemical processes. They treat four main subjects: A, the periodic law of the elements; B, the groups of elements in the long form of the periodic table; C, other classifications of the elements; and D, the occurrence and abundance of the elements in nature.

The outline of subject A begins with the discovery in the mid-19th century of the fact that the chemical elements show a periodic recurrence of properties when they are arranged in an order approximating that of increasing atomic weight. It goes on to the 20th-century discovery that the order of the elements in the periodic system is that of their atomic numbers—the integers characteristic of the elements that are equal to the positive electrical charges of the atomic nuclei expressed in electronic units. The outline next deals with the early and the current tabular arrangements based on the periodic law, which brings elements with similar properties into juxtaposition. Finally, it treats developments in modern atomic physics and in the theory of quantum mechanics that yield an understanding of the electronic structure of atoms and an explanation of the periodic law in such terms.

The outline of subject B first involves separate treatments of each of the groups of chemical elements in the long form of the periodic table: hydrogen, the alkali metals, the alkaline-earth metals, the boron group elements, the carbon group, the nitrogen group, the oxygen group, the halogen elements, the noble gases, the zinc group, the transition elements, the rare-earth elements, and the actinide elements.

The outline of subject C deals with other classifications of the elements or groups of them, such as their division into metals, semimetals, and nonmetals, stable and radioactive elements, or native and combined elements. It then deals with the man-made elements called transuranium elements.

The outline of subject D treats estimates, obtained primarily from spectroscopic evidence and from chemical analysis of meteorites and terrestrial matter, of the relative abundance of the elements.

A. The periodic law of the elements: the systematic classification of the elements on the basis of their chemical and physical properties and atomic structures

1. Historical development of the periodic law: the grouping of the elements in the order of their atomic weights; in the order of their atomic numbers
2. The arrangement of the elements in various forms of the periodic table; the usefulness of the long form of the table
3. The relationship of the electronic structure and configuration of the atoms to the periodic table
4. Periodicity in properties of the elements: the metals, the semimetals, the nonmetals, the transition elements, the transuranium elements

Section 122. Chemical compounds: molecular structure and chemical bonding

[for Part One headnote see page 20
for Division II headnote see page 29]

The articles and parts of articles referred to in Section 122 deal with five main subjects: A, molecular structure; B, chemical bonding; C, classifications of chemical compounds; D, inorganic chemical compounds; and E, organic chemical compounds.

The outline of subject A treats the history, development, and experimental and theoretical bases of the theory of molecular structure. The outline first deals with early concepts of molecular structure and with quantum-mechanical and electrostatic approaches to the theory of molecular structure. It goes on to treat molecular bonds and shapes, the time-dependency properties of molecules, and the relation of molecular structure to the properties of bulk matter. After dealing with the procedures for the determination of molecular structures, the outline treats the theory and the types of molecular spectra.

Subject B is the chemical bonding that holds atoms together in various kinds of associations, such as those in molecules, crystals, and metals, and which results when the electron structure of an atom is altered sufficiently to link it with the electron structure of another atom or atoms. The outline first deals with the general development of the theory of valence, or chemical bonding, covering the early electronic theory of valence and the later quantum-mechanical treatment of bonding. It deals next with other bonding effects such as hydrogen bonding and bonds in electron-deficient compounds. It goes on to the development of techniques for experimental observations of chemical bonding. Special treatment is then given to various kinds of anomalous molecular structures and molecular fragments with apparently anomalous valences, such as free radicals, carbenes, carbanions, and carbonium ions.

Subject C is the various systems of classification of chemical compounds—pure substances made up of identical molecules containing atoms of two or more elements. The article referred to deals with the methods chemists have devised for rationally organizing the mass of information about the millions of known chemical compounds. It treats, among the most useful schemes for their classification, those based on the elemental composition of the compound; those based on the types of bonds that exist in molecules between their component atoms; and those based on the varieties of chemical reactions they undergo. It also refers to other classifications—one based on the physical state of a pure substance—as gas, liquid, or solid; and one based on the source of a compound—as natural or synthetic.

Subject D is inorganic chemical compounds, defined as compounds of the chemical elements other than carbon. The outline first deals with the nomenclature of binary, ternary, and coordination compounds. It goes on to treat the structural classification of inorganic compounds; methods of preparing inorganic compounds; and reactions of inorganic compounds.

Subject E is organic chemical compounds. Articles are first referred to that separately treat the properties of twenty-one major groups of organic compounds. The outline then covers the preparation and purification of organic compounds; their general physical properties; and the reactions of organic compounds.

Section 123. Chemical reactions

[for Part One headnote see page 20
for Division II headnote see page 29]

The articles and parts of articles referred to in Section 123 deal with eight main subjects: A, general considerations regarding chemical reactions; B, energy changes in chemical reactions; C, the rates of chemical reactions; D, the mechanisms of chemical reactions; E, acid–base reactions and equilibria; F, oxidation–reduction reactions; G, photochemical reactions; and H, chemical reactions and chemical theory in the synthesis of chemical compounds.

The outline of subject A begins with basic concepts and major theories concerning chemical reactions—processes of change during which either two or more substances change or one substance changes into at least two other substances. It then deals with the methods of classifying chemical reactions. The articles referred to here treat the principal kinds of chemical reactions, classified according to the relationship between the starting materials and the final product. Articles referred to at B, C, and D treat the reactions that are classified according to the energy changes involved, to the rates involved, and to the mechanisms involved.

The outline of subject B treats the classification of chemical reactions according to the energy changes involved; the significance of activation energy in chemical reactions; and the thermodynamic relations in chemical reactions.

The outline of subject C first treats the factors that affect the rates or direction of chemical reactions; the factors that affect the kinetic order of the reaction; the factors that affect the extent of the reaction; and complex reactions. It further covers the experimental methods for studying chemical kinetics and kinetic studies as a means of elucidating reaction mechanisms.

Subject D involves detailed studies of the changes in bonding patterns of molecules involved in chemical reactions. The outline covers the factors that influence the course or overall route of change in the reaction; the energy changes through single-stage and multi-stage processes; the factors that reveal the mechanism of a reaction; the classification of reaction mechanisms; and selected mechanisms of the principal types of reactions.

The outline of subject E begins with the general properties of acids and bases and with theoretical approaches to the definition of these compounds that react to form salts. It goes on to the detailed studies of acid–base reactions and of the quantitative aspects of acid–base equilibria. The outline ends with the experimental study of acid–base reactions and equilibria.

Subject F is oxidation–reduction reactions—a large and diverse body of processes, some as common and familiar as fire, the rusting of metals, respiration, and photosynthesis. The outline first deals with major classifications of oxidation–reduction reactions. It then treats definitions of oxidation and reduction and theoretical aspects of these reactions. After treating electrochemical reactions, it deals with oxidation–reduction reactions in biological systems and in combustion and flames.

Subject G is photochemical reactions—chemical processes initiated by visible, infrared, or ultraviolet radiation. The outline covers the photochemical process, beginning with the absorption of a quantum of electromagnetic energy by an atom or molecule; the experimental methods used in photochemistry; and the applications of photochemical processes in synthetic chemistry, in radiation chemistry, and in the studies of the atmosphere and of biological processes.

Subject H is chemical synthesis, the construction of complex chemical compounds from simpler ones. The outline deals with factors involved in the technique of chemical synthesis. It first treats factors that affect the choice of a specific synthetic path and the factors that affect the choice of reaction conditions. The outline then indicates that the isolation, purification, identification, characterization, and analysis of products are treated in Section 122.

Section 124. Heat, thermodynamics, and the nonsolid states of matter

[for Part One headnote see page 20
for Division II headnote see page 29]

The articles and parts of articles referred to in Section 124 deal with eight main subjects: A, the principles of thermodynamics; B, the gaseous state; C, the liquid state; D, solutions and solubility; E, physical effects at surfaces; F, the plasma state of matter; G, the properties of matter at extreme conditions; and H, transport phenomena. The solid state of matter is dealt with in Section 125.

The outline of subject A, after dealing with the first and second laws of thermodynamics, treats heat, covering the definition and theories of heat, heat transfer in matter, and the relation of heat to entropy, work, and changes of energy in a system. The outline of A further treats thermodynamic relations in simple systems; the third law of thermodynamics; the effects of applied forces on simple systems; steady rate processes; and statistical thermodynamics.

The outline of subject B begins with the nature and properties of a gas. It then treats the thermodynamic approach to gases in terms of bulk measurable properties, and the particle-description approach, which deals with how the individual properties of the particles collectively give rise to the observed behaviour of a gas.

The outline of subject C treats the behaviour and properties of liquids at equilibrium, the molecular structure of liquids, and then the transport and the acoustical, electrical, magnetic, thermodynamic, optical, and surface-tension properties of liquids.

The outline of subject D treats the general classes of solutions; the composition ratios of solutions and the equilibrium, colligative, and transport properties of solutions; the thermodynamic and molecular aspects of solvent and solute interactions; general theories of solution; and the effects of temperature and pressure on the solubility of solids and gases.

Subject E is the physical effects that occur at surfaces. The outline deals first with phenomena of tension at the surfaces of liquids and with phenomena of adsorption, in which substances attract to their surfaces molecules of gases or of solutions with which they are in contact. It goes on to the tribological phenomena of friction and lubrication. Finally, it deals with colloids, treating irreversible colloidal systems, including such things as emulsions, foams, and pastes; and reversible colloidal systems, including solutions of soaps and dyes.

The outline of subject F, the plasma state of matter, begins with basic plasma properties and parameters. It goes on to treat elastic and inelastic collisions of plasma particles; radiation from plasmas; the formation of plasmas; the behaviour of plasmas in magnetic and electric fields; and the fluidlike behaviour of plasmas. Finally, it treats the existence of natural plasmas in intergalactic space, in the Sun and stars, and on Earth.

The outline of subject G treats the properties of matter at low temperatures; the special properties of matter at high temperatures; and the effects of high pressure on the physical, chemical, electronic, and magnetic properties of matter.

The outline of subject H begins with the kinetic molecular theory of the transport properties of gases, liquids, suspensions, and polymers. It goes on to treat the equations relating transport properties and the rates at which mass, energy, and momentum are transported; the hydrodynamic aspects of transport; and transport in macrosystems.

Section 125. The solid state of matter

[for Part One headnote see page 20
for Division II headnote see page 29]

The articles and parts of articles referred to in Section 125 deal with six main subjects: A, crystals and crystallography; B, the theory of the crystalline solid state; C, ionic crystals; D, metals; E, semiconductors and insulators; and F, the glassy or amorphous state of matter.

The outline of subject A treats crystal symmetry and classification in terms of the patterns of atoms in crystals; the diffraction of X-rays, electrons, and neutrons by crystal structures; the processes of crystal growth; the effects on the properties of crystals of imperfections and dislocations in their structures; and the effects of temperature, pressure, and alloying on the strength and hardness of crystals.

The outline of subject B first deals with the classification of solids based on their electronic structure and bonding, and with the elastic, plastic, and thermodynamic properties of solids. It next treats the electronic structure of solids. Finally, it treats the principal types of magnetic behaviour exhibited by solids, and the interaction of light with solids.

Subject C is ionic crystals, crystals composed of ions so arranged that the positive and negative charges alternate and balance one another, so that the overall charge of the crystal is zero. The outline covers the bonding in ionic crystals; the principles and methods that are used in the study of their structure; and the thermal, dielectric, electrical, and optical properties of ionic crystals.

The outline of subject D begins with structural aspects of metals and alloys, the explanation of the thermal and electrical conductivity of metals in terms of the free-electron model, and the effects of interaction of the conduction electrons with the crystal lattice. It goes on to lattice vibrations, which affect many of the properties of a metal, and to phenomena at the surface of metals that involve an understanding of the forces that hold electrons within metals. It next deals with superconductivity in metals, covering the thermal, magnetic, and electromagnetic properties of superconductors. Finally, it treats magnetic phenomena in metals.

Subject E is semiconductors and insulators, which offer more resistance than metals to electric charges moving through them. The outline first deals with the general properties of semiconductors and insulators and with the mechanisms of conduction. It next treats the chemical and physical approaches to electrical conduction in semiconductors. Finally, it deals with the principles involved in semiconductor applications, including optical and electrical effects.

Subject F is the glassy or amorphous state of matter characteristic of noncrystalline solids, such as glass, plastics, and gels, which do not have a definite lattice pattern of their atoms and molecules. The outline covers the effects of temperature and composition on the properties of glasses; their structure and their mechanical, chemical, optical, and electrical properties.

Section 126. Mechanics of particles, rigid bodies, and deformable bodies: elasticity, vibrations, and flow

[for Part One headnote see page 20
for Division II headnote see page 29]

The articles and parts of articles referred to in Section 126 deal with six main subjects: A, the principles of classical mechanics; B, relativistic mechanics in inertial systems of reference; C, the stress dynamics of elastic materials; D, vibrations of elastic bodies; E, fluid mechanics, including gas dynamics; and F, rheological phenomena—deformation and flow.

The outline of subject A deals first with the fundamental parameters and concepts of classical mechanics—matter, space, motion, and time. It goes on to treat its three branches—statics, concerned with systems of objects in equilibrium; kinematics, concerned with the description of motions apart from considerations of mass and force; and kinetics, concerned with a particle's motion in relation to forces acting on it, and involving Newton's laws of motion, the concepts of impulse, momentum, work, and power, and the concepts of energy, energy conservation, and the conservation of momentum. It then treats the mechanics of nonrigid bodies; motion in a rotating frame of reference, such as the Earth; and the mechanics of complex systems, exemplified by the rotation of spinning tops and gyroscopes.

The outline of subject B deals with relativistic mechanics in inertial systems of reference. It begins with the mechanical foundations of special relativity and goes on to relativistic kinematics. It then treats the relationship between gravitational mass and inertial mass.

The outline of subject C begins with the stress–strain relationships involved in the phenomenon of elasticity. It then treats the different character of elasticity in viscous and crystalline bodies; the elastic constants; and the mathematical theory of elasticity.

The outline of subject D, vibrations of elastic bodies, treats the nature of vibrations; the sources of energy of vibrators; the types of vibrational waves; and the behaviour of materials undergoing vibration.

Subject E is fluid mechanics, the science concerned with gases and liquids at rest or in motion. The outline begins with the mechanical and thermodynamic properties of fluids. After dealing with the basic equation of fluid statics, which deals with forces exerted on a fluid to hold it at rest, the outline goes on to hydrodynamics and aerodynamics, treating first the simple case of frictionless (nonviscous) one-dimensional fluid flow, and then proceeding to the more general cases of the flow of a viscous fluid and flows in which the compressibility of a fluid exerts influence on the character of the flow.

Subject F is rheological phenomena and involves general studies of deformation, changes in bodily size or shape, and general studies of flow, the continuous change of deformation with time. The outline begins with continuum mechanics, covering the kinematics of deformation and flow and the balance of forces and torques they involve. It goes on to mathematical accounts of stress-deformation relations in different media and of the strength of materials against fractures. Finally, it treats the application of molecular theories in explaining the rheological phenomena of deformation and flow.

Section 127. Electricity and magnetism

[for Part One headnote see page 20
for Division II headnote see page 29]

The articles and parts of articles referred to in Section 127 deal with six main subjects: A, the static electric charge; B, moving charges and electric currents; C, magnetism; D, the theory of fields in physics; E, the electromagnetic field and the theory of electromagnetic radiation; and F, relativistic electrodynamics.

The outline of subject A begins with the general phenomena of static electricity, treating the basic laws of electrostatics; the electrostatic field; the electric dipole; electrostatic energy and force in nuclear and atomic structure and in chemical bonding; and electricity in the atmosphere. It next deals with the electrostatics of dielectrics and capacitors, with high-voltage phenomena, and with electrical fields and potential distributions in two and three dimensions. At the end, indication is made of the sections in Part Seven that treat the measurement of electrostatic forces and fields and the application of electrostatics in science and technology.

Subject B is moving charges and electric currents. The outline treats direct electric current; the conduction of electricity; alternating electric currents; the primary effects and properties of electric fields and currents; and the effects of electricity on matter.

The outline of subject C, magnetism, begins with the general phenomena of magnetic systems. It goes on to treat the magnetic effects of steady electrical currents; the motions of charged particles in magnetic and electrical fields; and the magnetic effects of varying currents. Finally, it treats the general properties of magnetic materials and the classification of substances as either permanent magnets or as substances varyingly susceptible to magnetization.

Subject D is the theory of fields in physics—a field being defined as a continuous distribution of some observable and measurable quantity in space and time controlled by a law that permits calculation and prediction. The outline begins with general considerations about the mathematics of field theory. It goes on to the distinction between material and nonmaterial fields and the distinction between scalar, vector, and tensor fields. It next gives examples of fields in ordinary space from various branches of physics, such as mechanics, electromagnetics, and hydrodynamics. Finally, it treats fields with distributions in more than three dimensions, dealt with in thermodynamics, the theory of general relativity, and quantum mechanics.

Subject E is electromagnetic radiation—the propagation of energy through space by means of time-varying electric and magnetic fields. The outline begins with the classical theory of radiation. The major article referred to carries the history from early theories of light to James Clerk Maxwell's electromagnetic wave concept; it then goes on to the orderly arrangement of radiation, called the electromagnetic spectrum, according to wavelength or frequency, the spectrum ranging from the longest known radio waves, through microwaves, light, and X-rays, to extremely short-wavelength gamma rays and cosmic rays. The outline then treats the quantum theory of radiation, covering the evidence for the particle nature of electromagnetic radiation; the wave–particle duality of the photon; the interaction of electromagnetic radiation with atomic and molecular structure; and the relation of electromagnetic radiation to quantum theory and relativity. The outline concludes with the mathematical formulation of electromagnetic theory, covering Maxwell's equations for electromagnetic fields and radiation; the transmission of radiation in free space; wave equations in space bounded by conductors; the scattering of electromagnetic waves; electromagnetic waves in material media; and antennas.

The outline of subject F, relativistic electrodynamics, treats electrodynamics in four-dimensional notation and applications of relativistic principles in the treatment of electromagnetic and nuclear force fields of relativistic particles.

A. The static electrical charge

1. General phenomena of static electricity
   a. The basic laws of electrostatics that relate the interaction of charged bodies at rest
   b. The electrostatic field
   c. The electric dipole: a system of two equal but opposite charges at a fixed separation from each other
   d. Electrostatic energy and force: in nuclear and atomic structure; in chemical bonding
   e. Electricity in the atmosphere: atmospheric currents, thunderstorms, lightning
      [see also 212.C., 221.A.4., and 224.B.2.b.iv.]

Section 128. Waves and wave motion

[for Part One headnote see page 20
for Division II headnote see page 29]

The articles and parts of articles referred to in Section 128 deal with five main subjects: A, general wave phenomena and the theory of wave motion; B, electromagnetic waves; C, light waves; D, the focussing and imaging of waves; and E, sound waves.

The outline of subject A begins with the general properties of waves and then deals with their types, classified principally by the medium supporting the transmission of wave motion and by the motion of particles in a wave. After treating the general theory of waves, the outline covers the principle of superposition of waves; the behaviour of waves at boundaries or interfaces; the diffraction and interference of waves; and the interaction of waves with matter.

The outline of subject B begins with the general properties of electromagnetic waves and with the properties of waves according to regions in the electromagnetic spectrum. It goes on to the sources of incoherent electromagnetic waves—of radio waves; of microwaves; of infrared, visible, and ultraviolet waves; of X-rays; and of gamma rays. It next treats the sources of coherent electromagnetic waves, covering the types of lasers and the types of masers. Finally, it deals with the transmission of electromagnetic waves through matter, through space, and by wave guides and transmission lines.

The outline of subject C begins with the analysis of light as a wave motion. It goes on to the measurement of the velocity of light; to the interference of light; to diffraction phenomena; and to polarization, the properties of light that depend on the vectorial character of the amplitude of the wave. It next treats the properties and behaviour of light waves based on James Clerk Maxwell's equations of electromagnetic theory; the interaction of light with matter; and the quantum theory of light. Finally, it treats the separation of light into its constituent wavelengths and the analysis of light spectra, and the sources of light.

The outline of subject D, the focussing and imaging of waves, begins with geometrical optics, covering reflection and refraction, the tracing of a refracted ray at a surface, the optical properties of lenses, and image brightness. Dealing with optics and information theory, the outline treats the characterization of an optical system by impulse responses and transfer functions; the concept of partially coherent light; optical processing; and holography, an image-formation process using the principles of interference.

The outline of subject E first treats the general nature and properties of sound waves, the characteristics of shock waves, the many sources of sound waves, and the instruments for the detection and reception of sound. It then indicates the sections in Part Seven that treat the applications of acoustics. Finally, it gives separate treatment to the physical aspects of musical sound, covering the special properties of musical sound and the production of sound waves by the various types of musical instruments.

Division III. The universe: galaxies, stars, the solar system

[for Part One headnote see page 20]

The outlines, and the articles and parts of articles referred to, in the three sections of Division III deal with the subject matter of cosmology and cosmogony, of astronomy, and of astrophysics.

Accounts of the complex instrumentation involved in these disciplines are set forth in Section 723 of Part Seven. Historical and analytical studies of the nature and scope of astronomy and astrophysics are set forth in Section 10/32 of Part Ten.

The outline and the articles referred to in Section 131 first treat the structure, properties, and basic data of the universe, and the known and postulated components of the universe. After dealing with the phenomena and theories of gravitation, the section covers celestial mechanics and the treatment of the space-time continuum in the special and general theories of relativity. Finally, it treats theories about the origin and dynamic evolution of the universe as a whole; theories about the formation and evolution of the components of the universe; the time scale of the universe; and speculations about the possible fate of the universe.

Section 132 deals first with the external galaxies, treating their classification and distribution, their physical properties, and their radio and X-ray emissions. It goes on to separate treatment of the Milky Way system, of star clusters and stellar associations, and of stars.

Section 133, after a general survey of the solar system, separately treats the Sun, the planets, including the Earth as a planet, and the Moon.

Section 131. The cosmos 64
132. Galaxies and stars 66
133. The solar system 70

Section 131. The cosmos

[for Part One headnote see page 20
for Division III headnote see page 63]

The articles and parts of articles referred to in Section 131 deal with five main subjects: A, the structure and properties of the universe; B, gravitation; C, celestial mechanics; D, properties of the space-time continuum; and E, the origin and evolution of the universe.

The outline of subject A begins with basic data for the universe, treating estimates of its chemical composition; the overall structure and behaviour of the universe, especially evidence that it is expanding; the age of the universe; the structure, number, and distribution of galaxies; and the description of the universe in terms of the space-time continuum. It next deals with the components of the universe: with distant galaxies, the Local Group of galaxies, and intergalactic space, treated in detail in Section 132; with quasi-stellar sources (quasars), pulsars, and X-ray sources, separately treated in articles referred to in this section; and with postulated or hypothetical components of the universe, such as neutron stars, black holes, and objects composed of antimatter.

The outline of subject B, gravitation, begins with developments leading to gravitational theory and to Newton's law of gravity. It goes on to the later introduction of potential theory, which allows practical as well as theoretical investigation of gravitational variations in space and of anomalies owing to the irregularities and shape deformations of the Earth. It next treats modern field theories of gravity and gravitational fields in the general theory of relativity. Finally, it treats the acceleration of gravity on the Earth's surface and the methods of measuring the gravitational constant, G.

The outline of subject C begins with the scope and history of celestial mechanics, covering Kepler's laws of planetary motion and Newton's general laws of motion and gravitation in classical astronomy; modern mathematical methods; and the use of electronic computers and of space probes and satellites to perform experiments in celestial mechanics. It goes on to the problem of the motions of two gravitationally attracting bodies and to various kinds of perturbations that cause the orbits of natural and artificial satellites to deviate from ellipses. It concludes with the classical problem of three bodies—the problem, for example, of determining the motion of the Moon in the gravitational fields of the Sun and the Earth—and with its modern generalization, the *n*-body problem, where *n* may have any integral value.

Subject D is relativity theory, concerned with measurements of the laws of nature made by different observers moving relative to one another. The outline deals first with the theories and experiments in electromagnetism that led to Einstein's special theory of relativity, and with the consequences of that theory. It goes on to Einstein's later general theory of relativity, which arose from the need to extend the new space and time concepts of the special theory from the domain of electric and magnetic phenomena to all of physics and, particularly, to the theory of gravitation. The outline treats the various kinds of experimental confirmation of the general theory and the further modification of classical concepts of space and time entailed by the general theory of relativity.

Subject E is cosmogony—that is, theories of the origin and evolution of the cosmos, or universe. The outline begins with different theories about the origin and evolution of the universe as a whole. It goes on to theories about the formation and evolution of components of the universe—of galaxies, of stars, and of the solar system. It concludes with a consideration of the methods for determining the time scale of the universe and with speculations about the remote future of the universe.

Section 132. Galaxies and stars

[for Part One headnote see page 20
for Division III headnote see page 63]

The articles and parts of articles referred to in Section 132 deal with four main subjects: A, galaxies in general; B, the Galaxy, or Milky Way system; C, star clusters and stellar associations; and D, the stars.

The outline of subject A begins with the statistical properties of galaxies, treating their classification, by structure or by the type of stars providing most of their light; their distances from Earth; and their distribution over the sky and in space. Dealing with the physical properties of galaxies, the outline treats their stellar populations and the variation of stellar properties with location in galaxies; the rotation of spiral galaxies; and the masses of galaxies. Finally, it treats radio emissions from galaxies and evidence of X-ray emissions from galaxies.

The outline of subject B begins with basic data about the Milky Way—the galaxy in which the solar system and all stars visible to the naked eye are located. It covers such things as methods for measuring galactic distances, stellar velocities, and the ages of the Galaxy's components; nebulae as components of the Galaxy; the interstellar medium and matter; the sources of radio waves, of infrared radiation, of X-rays, and of gamma radiation; and the properties of galactic and solar cosmic rays and their interactions with the interstellar medium, the solar wind, and the Earth's geomagnetic field. The outline deals next with galactic structure and dynamics, covering the geometry of the Galaxy, its spiral structure, the magnetic fields in it, and its rotation. Finally, the outline treats cosmological theories about the formation and evolution of the Galaxy.

Subject C is star clusters, organizations of stars held together by the mutual gravitational attraction of the members, which are physically related through common origin; and, related to star clusters, groups called stellar associations, which are loose groupings, in space, of stars of common origin, without sufficient total mass in the group to remain together as an organization. The outline deals first with the two general classes of star clusters—globular clusters, which are old systems containing thousands to hundreds of thousands of stars closely packed in a symmetrical, roughly spherical form; and open clusters, containing from a dozen to many hundreds of stars, usually in an asymmetrical arrangement. It goes on to the characteristics of stellar associations and then to the relationships and significance of the clusters and associations in the Galaxy as a whole. Finally, it treats what is known of star clusters in galaxies external to the Milky Way system.

Subject D is stars—massive, self-luminous objects, emitting

radiation derived from internal energy sources. The outline begins with the identification and nomenclature of the stars and with modern astronomical maps and catalogs. Dealing with observable stellar characteristics, the outline covers stellar positions and motions; the apparent luminosity of the stars; and a star's spectrum as containing information about its temperature, chemical composition, and intrinsic luminosity. Dealing with derived, or calculated, stellar characteristics, it covers intrinsic stellar brightness; stellar masses, diameters, and temperatures; and the average characteristics of main-sequence, or dwarf, stars. The outline goes on to variable stars—geometric variables, stars from which the amount of light reaching the observer alters because of changes in the stars' positions; and intrinsic variables, stars that have total energy outputs that fluctuate with time. The outline next deals with important generalizations concerning the nature and evolution of stars, made from correlations between observable properties and from certain statistical results. Dealing with stellar structure, it treats the variations of temperature with depth in stellar atmospheres; calculations of the internal structure of stars; and calculations of energy generation in stars. Finally, dealing with stellar evolution, the outline treats the life history of a typical star, together with estimates of stellar ages; the formation of chemical elements in stars; and the probable fate of a star—as white dwarf, pulsar, or black hole.

Section 133. The solar system

[for Part One headnote see page 20
for Division III headnote see page 63]

The articles and parts of articles referred to in Section 133 treat five main subjects: first, A, a survey of the solar system as a whole; and then, separately, B, the Sun; C, the planets and their satellites; D, the Earth as a planet; and E, the Moon.

The outline of subject A begins with the size of the solar system, which is defined as extending to the orbit of the outermost known planet, Pluto, and with a comparison of distances within the solar system to interstellar distances. It goes on to a general comparison of the properties of the nine major planets and of the thirty-one satellites of six of them. It next covers other constituents of the solar system: the minor planets, or asteroids; the comets; meteors, meteorites, and tektites; and the components of the interplanetary medium. It next treats the regularities and the interactions among various bodies in the solar system and concludes with the two general types of theories about the origin of the solar system.

The outline of subject B begins with the Sun's surface layers and their features that are characteristic of the quiet Sun. It treats the photosphere, the visible luminous surface of the Sun; the chromosphere, the Sun's inner atmosphere, forming a transition zone

between the photosphere and the corona; and the corona, the luminous, high-temperature, rarefied gas envelope of the Sun. The outline goes on to the active Sun, to solar features that occur with increased frequency during the active phase of the solar cycle. It treats centres of activity, areas of localized strong magnetic fields at the Sun's surface; the nature of sunspots and sunspot cycles; and such other features as faculae, prominences, flares, and coronal condensations. In conclusion, the outline treats energy generation in the solar interior and the evolution of the Sun, the various kinds of solar radiation, and solar–terrestrial relationships and interactions.

Subject C is the planets and their satellites. The articles referred to separately treat Mercury, Venus, Mars, Jupiter, Saturn, Uranus, Neptune, and Pluto. The Earth as a planet is subject D.

The outline of subject D begins with the distance of the Earth from the Sun, the orbital motion of the Earth around the Sun, and the rotation of the Earth on its axis. It then deals with the effects of the Earth's orbital position and speed on astronomical observations, articles being referred to that separately treat astronomical parallax and the aberration of light. Finally, indication is made of the sections in Part Two that treat the Earth's origin; its atmosphere, hydrosphere, and surface features; the structure and composition of its interior; and its physical properties.

The outline of subject E begins with the basic data for the Moon—its shape, radius, mean density, and varying brightness. After dealing with the apparent and actual motion of the Moon, it treats the basic gravitational properties and gravity anomalies of the Moon. It goes on to the physical nature of the Moon, covering knowledge of lunar craters, lunar lineaments, lunar soil and other surface material—knowledge gained by observations from Earth and space vehicles, from remote lunar photography, from manned lunar landings, and from close-up photographs. It next treats evidence concerning, and theories about, the origin and evolution of the Moon. Finally, it deals with the Sun–Earth–Moon system, covering the relative motions of the Sun, Earth, and Moon; eclipses of the Sun and Moon and the related phenomena of occultation and transit; and the causes and character of tides in the Earth's hydrosphere, atmosphere, and lithosphere.

Introduction to Part Two:

The great globe itself

by Peter J. Wyllie

We all have a sense of awareness and appreciation of the Earth; we all admire the scenery. One of the rewards of studying and understanding the Earth is the development of this sense to a greater extent. This development brings us closer to nature, closer to an awareness of some transcendental power, closer to God if we choose to define God in these terms. To "commune with nature" is to seek peace, but of course the Earth is not always peaceful and benevolent; sometimes it is powerful and savage. Even cities, the culmination of man's domination of the landscape, are not immune to the ravages of nature. They have been devastated by floods, wracked and ripped by tornadoes and hurricanes, ruined by ash or lava from volcanoes, and demolished by earthquakes. These events, too, we wish to understand.

Man's appreciation of the Earth begins with physical contact. This immediate experience of the senses is followed by the spiritual desire and need to understand where the Earth and its human observers came from, and why. The third stage of appreciation comes from scientific analysis and interpretation. Before we examine the relationship between man and the Earth in more detail, we should consider our position in the solar system and the universe.

Human civilization has developed and flourished in a small niche in space. Our home is perched on the surface of a sphere, enormous to us but tiny compared to the universe, that spins around its axis once each day while moving at a fantastic speed around the Sun, completing an orbit once each year. Although normally unaware of it, we too are spinning and moving at the same speed as the Earth, but we are held securely on the surface by the gravitational attraction of the mass of rocks beneath us.

The Sun, a huge globe of burning gas, provides the energy that fuels the activities and processes of our immediate environment, the boundary layer between the rocky surface of the Earth and the fluid envelope of air and water that separates the Earth from the starkness of space. The air and water nurture life and simultaneously protect it from the potentially damaging radiation and particles that approach the Earth from other parts of the solar system and beyond.

A view of the Earth from space differs markedly from what we see from within our own restricted environment at the Earth's surface. From where we stand, it appears that the Sun, the Moon, and the stars are moving in great arcs around the Earth, and it was once believed that this was the way of the universe. Man on his world was surely the centre of all things. But we know now that this is only a relative picture; although the Moon does orbit the Earth, the Earth-Moon system moves around the Sun, which is itself speeding through the universe.

We exist because the Earth exists, and we claim the Earth as our own by referring to it as Mother Earth, the universal provider. The Earth provides all of our material needs and satisfies some of our spiritual needs: "I will lift up mine eyes unto the hills, from whence cometh my help." A day in the mountains, at the seashore, or in the countryside sharpens that sense of awareness of the Earth which was compared above with an awareness of God.

Since he first appeared on Earth, man has wondered at nature's awesome beauty, and trembled at its indomitable power. The dread engendered by the physical experience of nature on the rampage, in storms, floods, or earthquakes, has shaped the development of primitive religions. Mystical or sacred attributes were assigned to natural objects and phenomena, and ceremonies were devised to honour and placate the unknown powers. Modern man has become increasingly insulated from his natural surroundings, partly because he is separated from them by masses of concrete, partly because scientific investigation tends to dispel the mystery of nature. This is not to imply that no problems remain to be solved, but we have learned enough to be reasonably sure that all are ultimately explicable in terms of rational science. Therefore, we no longer feel the need to populate the sky, mountains, trees, and winds with gods, spirits, and souls. But we can still enjoy the sensuous and spiritual appreciation of the Earth, and retain or rediscover the intimacy with our natural surroundings that was experienced by primitive man.

One of the appealing aspects of Earth study is that wherever we go, our favourite subject is right there with us. There is always something new to be seen, to be admired, or to be examined in detail. While travelling in a commercial airliner, a meteorologist can examine the upper portions of the clouds as a change from his normal ground-based view and can track the flight right through the fronts and the high- and low-pressure regions charted on the newspaper weather map in his lap. An oceanographer flying over the coastline can see at a glance the large-scale patterns in the waves rolling shoreward, and the effect of coastal prominences on these patterns. A geologist peering through the plane window can examine the distribution of hills and valleys laid out below him, gaining a bird's-eye view to supplement the pattern of features that he had previously seen only on maps. These pleasures are not reserved for the professional Earth scientist. Anyone can observe the Earth and Earth processes in action, almost anywhere.

Man is a curious species; he needs to know how and why things happen. The simple, visual pictures of nature are beautiful, awe-inspiring, and on occasion terrifying, but they can be more satisfying if they invoke a series of additional images. Just as one's appreciation of any work of art is enhanced by knowing something of the artist and his position in art history, so one's appreciation of nature's pictures is enhanced by knowing something about natural history. For a full appreciation of the splendour of mountain peaks rising abruptly from the plains, reaching for the puffs of cloud that ride above them, we need to know something of the processes that raise mountains—or were they always there? We need to know something of the winds that carry moisture from the oceans to the skies, because we see that the clouds come, change their shapes, and then disappear. We can gain a great deal by learning a little about the scientific approach to appreciation of the Earth. And it is not at all difficult for the nonprofessional to read about and to understand many of the necessary concepts.

Two of the most troublesome concepts are time and size —dimensions that distinguish the Earth sciences from any other Earth-bound subject. It is very difficult for us to grasp the meaning of the statement that the Earth formed 4,600,-

000,000 years ago. Similarly, the enormous volume of water in the oceans or the volume of rocks in a mountain range almost defy comprehension. We have been considering the Earth and scenery as it is exposed to us at the present. But when we study the Earth, we realize that the present scenery is merely a transient feature in the immense span of geological time. Early students of the Earth were hampered by the belief that the Earth was only a few thousand years old. Many of them were seeking answers to two recurrent questions that we find throughout human history. How and when was the Earth formed? How and when was man formed? Attempts to answer these questions are responsible for many myths and religions in various cultures, both ancient and modern.

In the early part of the 19th century the study and interpretation of rocks led geologists to conclude that the Earth must be of far greater antiquity than the age implied by a literal interpretation of the Bible. They realized that the layers of rock now exposed at the surface contain records of the history of the Earth during the times that each layer was formed. One major branch of the Earth sciences is devoted to the discovery, translation, and interpretation of the "record of the rocks." Many rock layers enclose fossils, and these remnants of animals and plants serve as illustrations in the historical book of nature, making it possible to trace the development and changes of species through time.

Fossil hunting has been a popular pastime for many generations. With a little experience and a little knowledge, an amateur fossil hunter can add interpretation to his discoveries. From a few fossil shells and corals in a limestone, he can reconstruct in his mind's eye the whole flourishing community of life that once existed on a coral reef, now frozen into the rock record. A piece of coal, with fossil imprints of leaves, ferns, and other plant remains from which the coal was formed, can conjure up a picture of a luxuriant swamp of 300,000,000 years ago, populated by strange beasts long since vanished from the Earth. The history of the Earth, the evolution of life, and the origin of man, at least in part, are preserved in the rocks. It is here that fundamentalists still supporting "creationism" will find much evidence for the evolution of life forms, if they care to examine it. This aspect of Earth study has almost universal appeal. Earth history and human history overlap in archaeology, and the records of early civilizations exposed in excavation sites always excite public curiosity.

The scientific approach to the appreciation of nature informs us that the key to interpretation of the past history of the Earth from the record of the rocks lies in processes occurring at the present time. These processes have been grouped into great cycles. Two of the most important are the hydrologic cycle, concerned with the circulation of water, and the mountain-building cycle.

The oceans constitute a vast reservoir for the hydrologic cycle. The atmosphere and the oceans are in constant motion, driven by the energy from the Sun and the rotation of the Earth. Masses of humid air, carrying water that has evaporated from sun-drenched tropical oceans, migrate to cooler latitudes where the water is precipitated as rain or snow, and thus returned to the ocean reservoir either directly or indirectly, over or through the ground. The moving air masses and ocean currents bring to the continental masses rain or drought, heat or cold, making them hospitable, habitable, or uninhabitable for human colonies. Minor changes in atmospheric circulation have converted fertile plains to barren deserts and caused major changes in the development of ancient civilizations.

The hydrologic cycle shapes our local environment. The features that we know collectively as scenery are produced mainly by flowing water, although ice, wind, and solar energy also contribute. The force of gravity and the rivers together carry the products of weathering downhill to the ocean reservoir. The average rate at which the surface of the land is being worn down and the land dispersed into the oceans is a trivial 1.5 inches per 1,000 years, but the dimension of geological time gives significance to small numbers. At this rate, all of the continents would be worn down to sea level within 20,000,000 years. This means that during the 4,600,000,000 years since the Earth was formed, the continents could have been worn down to sea level at least 200 times. By now there should be no land rising above sea level, but we still see high mountains.

The mountains exist and persist because the effects of the hydrologic cycle are offset by the mountain-building cycle. Forces within the Earth cause large regions of the surface to rise very slowly, imperceptibly in human terms. Imperceptible, that is, until an earthquake signals an abrupt movement in the continuing process of mountain building. While some parts of the Earth rise other regions sink. This slow rhythm has been termed "the pulse of the Earth." Although we do not understand the details of what is happening within the Earth, we are now confident that internal forces are responsible for shaping the major features of the Earth's surface, such as the distinction between continents and ocean basins, and the persistence of mountain ranges on the land and beneath the ocean. The detailed sculpture of the surface results from the conflict between the mountain-building cycle and the hydrologic cycle.

The internal forces do more than cause the land surface to rise and fall; they cause the land to move sideways, as well. It is now generally believed by most scientists that the continents drift. There is persuasive evidence that the surface of the Earth is covered by a small number of very large shell-like plates, about 60 miles thick, across which the continents are scattered rather like logs frozen into the ice on a lake. The rigid shells of rock slide over the Earth's interior, carrying the continents with them, and grinding against each other along their edges like ice floes. The plate boundaries are sites of geological activity: earthquakes and volcanoes are concentrated along them. Because of these movements, supercontinents have been rifted apart, and ocean basins have opened, expanded, and closed again as continents collided. Continental collisions have thrust up great mountain ranges such as the Himalayas. The continents are drifting still at rates of an inch or two per year: the Atlantic Ocean is increasing in size, and the Pacific Ocean is becoming smaller. Most people are fascinated by the theory of continental drift. The theory is aesthetically pleasing, and it also has practical applications.

What stokes the subterranean fires that drive the Earth's engine, causing continental drift, mountain building, volcanic eruptions, and earthquakes? We have no satisfactory answer to this question, but we do know that an enormous amount of energy is involved in the activity along the plate margins. One major earthquake releases more energy than a hydrogen bomb. Modern man is a powerful animal, thanks largely to his exploitation of the Earth for materials

and energy, and he dominates the landscape like no species before him. He feels reasonably secure in his command of the environment while sitting in the city, because the landscape is largely a product of his industry, and it is clearly subservient to his wishes and his computer-operated control panels. But when the Earth releases a minute fraction of its internal energy in a major earthquake, man becomes helpless. All control is lost while the surface of the Earth rises and falls in solid waves.

Man cannot live in harmony with his environment during an earthquake. It has become clear, however, that he must learn to do so at other times if he is to avoid the dire predictions of those who evaluate such factors as projected world populations, the material and energy resources of the Earth, projected rates of consumption of these resources, and the volume and toxicity of waste materials discarded. We live in a restricted environment with finite space and resources, and we have become a force producing major modifications in the environment at rates very rapid compared with normal rates of Earth evolution. Social decisions about the continued exploitation of the Earth should be made with full information about the problems, and social decisions are based on votes, in theory at least. This alone is sufficient reason for any intelligent person to inform himself about the Earth, quite apart from the fascination of the subject, because his future depends upon it.

Part Two. The Earth

The outlines, and the articles and parts of articles referred to, in the thirteen sections, grouped in four divisions, of Part Two treat the Earth's properties, structure, and composition; its atmosphere and hydrosphere; its surface features; and its history.

Several points about the relations of this part to other parts should be noted. The consideration here of the Earth's physicochemical properties presupposes the physical and chemical knowledge and theories set forth in Part One. Knowledge of the Earth is in turn presupposed by Parts Three, Four, and Five, which are concerned with Life on Earth, Human Life, and Human Society, respectively. The several Earth sciences have themselves been the objects of historical and analytical studies concerned with their nature, scope, methods, and interrelations. These studies are set forth in Section 10/33 of Part Ten. The instrumentation used in the Earth sciences is dealt with in Section 723 of Part Seven.

The outlines and the articles referred to in the four sections of Division I treat the orbital motions and the figure of the Earth; its physical properties; the structure and composition of the Earth's interior; and the Earth's constituent minerals and rocks.

In Division II the subjects are the Earth's atmosphere; its hydrosphere; the motions of the sea; and weather and climate.

In Division III the subjects are the basic physical features of the Earth's surface and the features produced by geomorphic processes acting on the Earth's surface.

In Division IV the subjects are the origin and development of the Earth and its envelopes; the interpretation of the geological record; and the eras and periods of geological time.

Division I. The Earth's properties, structure, and composition 79
II. The Earth's envelope: its atmosphere and hydrosphere 92
III. The Earth's surface features 104
IV. The Earth's history 115

Division I. The Earth's properties, structure, and composition

The outlines, and the articles and parts of articles referred to, in the four sections of Division I treat the Earth as a planet; the Earth's physical properties; the structure and composition of the Earth's interior; and the Earth's constituent minerals and rocks.

The outline and the articles referred to in Section 211 deal with the orbital motions of the Earth and with the figure of the Earth.

Section 212 treats the Earth's gravitational properties; the Earth's magnetic, electrical, thermal, and mechanical properties; and the properties of Earth materials and their deformation.

Section 213 treats the basic divisions of the solid Earth; the causes, distribution, magnitude, motion, and energy of earthquakes; and the geophysical and geochemical evidence used to infer the structure and composition of the Earth's interior.

Section 214 treats the mineral constituents of the Earth; the rocks that comprise the Earth's crust; and the geochemical distribution of elements in the Earth.

Section 211. The planet Earth 79
212. The Earth's physical properties 80
213. The structure and composition of the Earth's interior 84
214. The Earth's constituent minerals and rocks 85

Section 211. The planet Earth

The articles and parts of articles referred to in Section 211 deal with two main subjects: A, the orbital motions of the Earth; and B, the figure of the Earth.

The outline of subject A treats the orbital motions of the Earth —the revolution of the Earth about the Sun and the rotation of the Earth on its axis. The outline goes on to treat the forces and dynamical effects related to the rotation of the Earth.

The outline of subject B begins with the definition of the figure

of the Earth as the size and shape of a hypothetical surface, called a geoid, the mean sea-level surface and its continuation under the land. It goes on to the historical development of improved approximations to the Earth's figure. It next deals with the methods used before and since satellite measurements for establishing a world geodetic system. Finally, it treats current definitions and values in international reference systems, and recent developments in geodesy.

Section 212. The Earth's physical properties

[for Part Two headnote see page 79
for Division I headnote see page 79]

The articles and parts of articles referred to in Section 212 deal with six main subjects: A, the Earth's gravitational properties; B, the Earth's magnetic properties; C, the Earth's electrical properties; D, the Earth's thermal properties; E, the Earth's mechanical properties; and F, the properties of Earth materials and their deformation.

The outline of subject A begins with the factors that determine the gravitational field at the Earth's surface, especially the effects of the Earth's rotation and of its increase in density toward its centre. After dealing with the three principal systems for measuring the gravitational acceleration of the Earth, the outline goes on to inferences about the properties of the Earth's interior based on interpretations of gravity data. Here, it first treats the theory of an isostatic balance between the elevation of the Earth's surface and the density of the rocks below. It then deals with local, regional, and large-scale irregularities in the gravitational field.

The outline of subject B begins with the mapping of the Earth's main magnetic field in terms of the elements of intensity, dip, and declination, and with the secular variations in that field. It goes on to treat the periodic solar and lunar daily magnetic variations; the geomagnetic disturbances of large amplitude called magnetic storms; and transient variations caused by electric currents on or near the Earth's surface. It next deals with theories of the origin of the main geomagnetic field, theories that also try to account for its secular variation. It concludes with efforts to determine the behaviour of the Earth's magnetic field through geological time, from the study of ferromagnetic rocks.

The outline of subject C, the Earth's electrical properties, treats the currents produced by the motion of charged particles in the Earth's ionosphere; the variation with depth of the electrical properties of the solid Earth; and electric currents within the Earth, those induced by variations in the geomagnetic field and those generated by the Earth's core.

The outline of subject D, the Earth's thermal properties, first deals with the sources of the Earth's heat, the heat generated at the time of the Earth's formation and the heat produced by radio-

active decay. It goes on to the transmission of heat from the Earth's interior to its surface and to the geological aspects of heat flow, with emphasis on volcanic activity.

The outline of subject E begins with the indirect evidence used to determine the basic internal mechanical properties of the Earth—density, pressure, incompressibility, rigidity, and gravitational intensity. It goes on to the Earth's departures from spherical symmetry and from perfect elasticity. Finally, it treats the response of the Earth to stresses of long duration, involving possible large-scale flow of Earth materials.

1. Definition of gravity: the factors that determine the gravitational field at the Earth's surface
   a. The hydrostatic figure of the Earth: effects of the Earth's rotation and density distribution on gravity
   b. The reference ellipsoid and standard gravity: approximations to the Earth's average gravitational field
   c. Gravity anomalies: free-air, Bouguer, and isostatic anomalies
   d. Harmonic analysis of gravity: the mathematical representation of the Earth's gravitational field
2. Measurement of gravity: the methods of gravimetry and astrogeodesy; analysis of perturbations of the orbits of artificial satellites
   [see also 723.D.2.d]
3. Interpretation of gravity data: inferences about the Earth's interior
   a. Isostasy: the approximate balance between the elevation of the Earth's surface and the density of the rocks below
   b. Variations in the gravitational field
      i. Local irregularities: their relation to small-scale density differences and their use in geophysical prospecting
      ii. Regional irregularities; their relation to crustal structure
      iii. Large-scale irregularities: their relation to global tectonics

B. The Earth's magnetic properties
[see also 127.C.]

1. The Earth's main magnetic field
   a. Elements of the geomagnetic field: definition of magnetic intensity at the surface of the Earth
   b. World magnetic surveys and magnetic observations
   c. Variations in the main magnetic field: the geomagnetic secular variation
      [see 4.b., below]
2. Transient and short-term geomagnetic fields
   a. Solar and lunar daily magnetic variations
   b. Magnetic storms and substorms: large-amplitude geomagnetic disturbances caused by increased solar activity
   c. Electromagnetic induction and telluric currents: geomagnetic field variations caused by electric currents induced within the Earth
3. Origin of the geomagnetic field
   a. The main geomagnetic field: evidence that the Earth's core is the source of the geomagnetic field

Subject F is the properties of Earth materials and their deformation. The outline first deals with the properties of rocks determined from empirical observation and laboratory tests, covering volumetric, mechanical, thermal, electrical and magnetic, hydraulic, and optical properties. Dealing with the deformation of materials in the Earth's crust, the outline treats stress and strain in rocks; the various types of rock folding; fracture in rocks, including various kinds of faults; the superposition of strains produced by the tectonic events of different ages; and the deformation of ice in ice sheets and glaciers.

Section 213. The structure and composition of the Earth's interior

[for Part Two headnote see page 79
for Division I headnote see page 79]

The articles and parts of articles referred to in Section 213 deal with four main subjects: A, the Earth's concentric layers; B, earthquakes; C, the distribution of elements in the Earth's interior; and D, the indirect evidence used to infer the structure and composition of the Earth's interior.

The outline of subject A begins with the basic physical properties and zonal structure of the Earth. It goes on to treat the basic divisions of the solid Earth, covering the different composition of the markedly differentiable shells, called the crust, the mantle, and the core, and of the transitional zones between them.

The outline of subject B treats the natural and artificial causes of earthquakes; the distribution of earthquakes; and the magnitude, motion, and energy of earthquakes.

Subject C, the distribution of elements in the Earth's interior —in its core, mantle, and crust—is dealt with in detail in the next section, Section 214.

Subject D involves the indirect evidence used to infer the structure and composition of the Earth's interior. The outline deals first with geophysical evidence, especially that afforded by seismic wave velocities, but also other geophysical evidence, such as the Earth's moment of inertia and its density distribution. It then deals with geochemical evidence, covering investigations of geochemical equilibria at high temperatures and pressures; the composition of meteorites that may correspond to rocks forming the Earth's interior; and evidence from crustal igneous rocks derived from the upper mantle.

Section 214. The Earth's constituent minerals and rocks

[for Part Two headnote see page 79
for Division I headnote see page 79]

The articles and parts of articles referred to in Section 214 deal with three main subjects: A, the mineral constituents of the Earth; B, the rocks that comprise the Earth's crust; and C, the distribution of elements in the Earth.

The outline of subject A begins with the chemical composition, internal structure, and external morphology of crystals, subjects that involve major means for determining the identity of mineral species and varieties. It goes on to the classification of minerals in terms of structure and composition, the physical properties of minerals, and the occurrence of minerals in nature. It concludes with the responses of the Earth as a chemical system to change in physical factors, covering geochemical equilibria at high temperatures and pressures and geochemical equilibria at low temperatures and pressures.

Subject B is the rocks that comprise the Earth's crust. The outline first covers the three broad classes of rocks—the igneous rocks that have crystallized from molten silicate solutions within or above the Earth's crust; the sedimentary rocks deposited by glaciers and ice sheets, wind, or water, or produced by biogenic processes; and the metamorphic rocks of the Earth's crust which formed by the physicochemical alteration of pre-existing rocks. For each of these classes of rocks, the outline treats the modes of formation, the physical and chemical properties, the principal types, and their distribution. It concludes with the rock associations formed in different environments of the Earth's crust: in the oceanic regions, in the stable continental regions, in the continental borderlands, in the island arcs, in the major mountain ranges, and in the piedmont regions adjacent to mountain regions.

Subject C involves the determination of the relative and absolute abundances of the chemical elements in the Earth and its various parts. The outline first deals with estimates, made from the studies of the composition of the Sun, other stars, and the Moon, about the overall abundances of the elements in the universe. Treating the terrestrial abundances, the outline covers the distribution of chemical elements in the Earth's core; in its mantle; in the Earth's crust, with particular reference to the various kinds of mineral fuels (coals, petroleum, oil shales, and natural gas); in soils; in the hydrosphere; and in the atmosphere. An article referred to deals separately with the physiological concentration of elements,

defined as the accumulation of an element in concentrations greater than those in the surrounding environment as a result of the physiological processes of plants and animals. At the end, it treats the geochemical cycle, an overall concept of the migration of elements throughout the atmosphere, the hydrosphere, and the solid Earth.

A. The mineral constituents of the Earth	MINERALS **12**:233–245		
1. Crystallography: the chemical composition, internal structure, and external morphology of crystals	CRYSTALLOGRAPHY **5**:339–347	**12**:234a–236a / **1**:707f–709a / **7**:213a–215a / **7**:219b–221b / **12**:94f–95c / **13**:561c–562a / **15**:319c–321b / **19**:1139h–1140f	**3**:833f–836d *passim* / **3**:845g–846a / **4**:700d–703c *passim* / **5**:333h–334d / **14**:284d–287d *passim* / **16**:752a–754g *passim*
2. Classification of minerals in terms of crystal structure and chemical composition [see also 122.D.]		**12**:236b–239f	
a. The principal nonsilicate minerals			
i. Native elements	NATIVE ELEMENTS **12**:853–858	**12**:236f / **3**:845c–846c / **7**:971b–h	**8**:237a–c
ii. Sulfides, including arsenides and antimonides [see also 4.c., below]	SULFIDE MINERALS **17**:785–791	**12**:236g–h	
iii. Sulfosalts		**12**:236h–237a	
iv. Oxides and hydroxides		**12**:237a–g / **7**:970c–971b / **7**:975b–c	
v. Halides		**12**:237g–238a	
vi. Carbonates	CARBONATE MINERALS **3**:833–838	**12**:238a–b	**3**:1023f–1024c
vii. Nitrates and iodates		**12**:238b	
viii. Borates		**12**:238c–d	
ix. Sulfates		**12**:238d–g	**6**:1133h–1134h *passim*
x. Chromates		**12**:238h	
xi. Phosphates, including vanadates and arsenates	PHOSPHATE MINERALS **14**:284–288	**12**:238h–239a / **7**:976a–b / **13**:129b–c / **14**:289b–g	
xii. Tungstates and molybdates		**12**:239a	
b. The silicate minerals	SILICATE MINERALS **16**:756–764	**12**:239b–f	
i. Silicate structure and composition: the basic structural units, the silica tetrahedra and octahedra; the substitution in silicate structures of ions other than silicon		**16**:756f–757b	
ii. Isolated or double tetrahedral group silicates: minerals with silicate tetrahedra that are unconnected or connected by groups of two		**16**:757h–759b / **13**:561g–562a	
iii. Chain silicates: minerals with silica tetrahedra that are connected together in single or double chains		**16**:759b–761a / **1**:707f–709a / **15**:319c–320b	
iv. Sheet silicates: minerals with silica tetrahedra that are connected together in two-dimensional sheets		**16**:761a–g / **12**:94f–95c	
v. Framework silicates: minerals with silica tetrahedra that are connected together in three-dimensional frameworks		**16**:761h–763e / **7**:213a–d / **19**:1139h–1140g	**7**:219b–221b *passim*
3. The physical properties of minerals; *e.g.*, hardness, cleavage, specific gravity, and magnetic, electrical, optical, and thermal properties		**12**:239f–242f / **4**:704c–f / **7**:215b–216h / **7**:221c–f / **13**:562a–c / **19**:1141c–f	**7**:969d–976e *passim* / **12**:93f–94d / **14**:284d–287d *passim* / **16**:752a–754g *passim* / **17**:786g–789g *passim*

	articles	article sections	other references
4. The occurrence of minerals in nature		**12**:242f–244f	
a. The major rock-forming mineral groups		**16**:636h–637c	**16**:757h–763e *passim* ·
i. The olivines; *e.g.*, forsterite, fayalite	OLIVINES **13**:560–564	**7**:973d	**16**:757h–758a
ii. The pyroxenes; *e.g.*, augite, jadeite	PYROXENES **15**:318–322		**7**:972h–973a /**16**:759b–760c
iii. The amphiboles; *e.g.*, hornblende, tremolite	AMPHIBOLES **1**:707–710		**7**:972g–h /**16**:760e–761a
iv. The micas: *e.g.*, muscovite, biotite	MICAS **12**:93–96	**16**:761a–g	
v. The feldspars; *e.g.*, orthoclase, albite	FELDSPARS **7**:212–218	**7**:971h–972c	**16**:762a–e
vi. The feldspathoids; *e.g.*, nepheline, leucite	FELDSPATHOIDS **7**:218–222	**7**:973b–c	**16**:762f–g
vii. The silica minerals; *e.g.*, quartz, tridymite	SILICA MINERALS **16**:751–756	**7**:973e–975b	**12**:52g–53c /**16**:761h–762a
viii. The clay minerals; *e.g.*, kaolinite, illite	CLAY MINERALS **4**:700–706	**7**:1033g–1034f/ **16**:1018g–1020c	
ix. The carbonates; *e.g.*, calcite, dolomite [see A.2.a.vi., above]			
x. The zeolites; *e.g.*, natrolite, heulandite	ZEOLITES **19**:1139–1143		**16**:763a–e
b. The occurrence of mineral associations		**12**:243b–244f/ **13**:562d–563h/ **14**:287a–288d/ **16**:754h–756a/ **16**:763e–764g	
i. In igneous and metamorphic rocks		**12**:243b–e/ **3**:836h–837a/ **9**:202c–203c/ **12**:4f–g/ **13**:562d–h/ **15**:949f–950a/ **19**:1142d–e	**1**:709a–710a/ **7**:221f–222h *passim*/ **9**:220d–g /**9**:229f–g/ **11**:486e–487a/ **16**:763e–764d *passim*
ii. In ore deposits		**12**:243e–g/ **13**:666d–g/ **17**:790a–c	
iii. In sedimentary rocks and precipitates		**12**:243g–244b/ **3**:837b–f/ **4**:705b–e/ **8**:296d–297b/ **19**:1142f–g	**11**:24g–25b /**16**:469a–c/ **16**:763f–g
iv. In the Moon, planets, and meteorites		**12**:244b–f/ **12**:44h–45c/ **13**:562h–563d/ **16**:764d–g	
c. Ore deposits: concentrations of metals and metalliferous minerals [see also 724.C.3.]	ORE DEPOSITS **13**:661–671		
i. The nature, genesis, and classification of ore deposits		**13**:663b–667d/ **12**:243e–g/ **17**:790a–c	**6**:706f–707d /**9**:225b–c
ii. Earth processes involved in the formation and distribution of ore deposits; *e.g.*, magmatic concentration; hydrothermal processes		**13**:667d–671e	**6**:706h–707d /**9**:224h–225c
iii. Metallogenic epochs and provinces: the occurrence of episodes of mineralization throughout geological time		**13**:671e–h/ **6**:13a–b	
iv. The occurrence and distribution of ore deposits		**1**:641g–642b/ **4**:570d–f/ **9**:894f–895b/ **10**:728a–b/ **11**:922b–c/ **15**:521b–f/ **18**:455f–g/ **18**:1034h–1035b/ **19**:1147c–e	**4**:808c–d /**8**:237b–c /**13**:71e–h/ **16**:776h–777a
d. Minerals of gem quality; *e.g.*, beryl, corundum, diamond	GEMSTONES **7**:969–976	**10**:164g–165c	**3**:845d–846b *passim*/ **16**:754d–f

	articles	article sections	other references
5. Geochemical equilibria			
a. Geochemical equilibria at high temperatures and pressures	GEOCHEMICAL EQUILIBRIA AT HIGH TEMPERATURES AND PRESSURES **7**:1022–1028		**12**:244f–245d *passim*
i. Relevant thermodynamic principles: *e.g.*, phase diagrams, the phase rule [see also 124.A.]		**7**:1023c–1024c / **8**:868d–870c / **14**:204f–205h / **15**:949d–f	
ii. Phase equilibria in mineral systems; *e.g.*, equilibria in systems of one, two, or more components		**7**:1024c–1026g / **3**:838a–c / **9**:209e–210a / **9**:210h–211e / **14**:205h–210c / **15**:321b–322e	**12**:1b–2a
iii. Areas of application of high-temperature–high-pressure studies; *e.g.*, phase transitions in the Earth's interior; geological thermometry and barometry		**7**:1026h–1028a / **1**:710b–e / **7**:216h–218c / **9**:210a–h / **12**:95f–96b / **13**:563h–564e / **14**:288d–g / **15**:949f–950a	**3**:846a–c / **6**:50e–55c *passim* / **7**:221f–222h *passim* / **9**:223h–224b / **12**:52d–53d / **13**:665e–669g *passim* / **16**:757a–b / **16**:764a–d
b. Geochemical equilibria at low temperatures and pressures	GEOCHEMICAL EQUILIBRIA AT LOW TEMPERATURES AND PRESSURES **7**:1028–1035		**12**:244f–245d *passim*
i. Principles and techniques: thermodynamic fundamentals and geochemical diagrams [see also 124.A.]		**7**:1028f–1032b / **14**:204f–210c	
ii. Geochemical equilibria of significance in nature; *e.g.*, equilibria of carbonates in water		**7**:1032b–1035c / **3**:836d–h / **3**:838d–f / **6**:1133d–1135a / **7**:735b–737h	**3**:1023f–1024d
B. The rocks that comprise the Earth's crust		**16**:763e–764a	
1. The igneous rocks: the predominant solid constituents of the Earth that form through the cooling of molten or partially molten material at or beneath the Earth's surface	IGNEOUS ROCKS **9**:201–213		**13**:909h–910b
a. Properties of igneous rocks		**9**:201f–206d	**7**:1055c–f
i. Chemical composition		**9**:201h–202c	**6**:704b–705g
ii. Mineral composition		**9**:202c–203c	**12**:243b–c
iii. Textures and fabrics		**9**:203c–204g	
iv. Structural features; *e.g.*, clastic structures, flow structures, fractures, inclusions		**9**:204g–206b	**15**:918e–f / **15**:920c–f
v. Colour and specific gravity		**9**:206b–d	
b. Classification of igneous rocks		**9**:206d–208d	
i. According to mineralogy and texture		**9**:206d–208b	
ii. According to chemical composition		**9**:208c–d	
c. Formation of igneous rocks [see also 212.D.4.]		**9**:208e–211e	
i. The nature of magmas		**9**:208e–209a / **9**:222g–224h / **19**:507d–508b	**9**:227c–d
ii. Crystallization from magmas: influence of melt temperature and pressure; phase equilibria in silicate melts; Bowen's reaction series		**9**:209a–210h / **7**:1027c–g	
iii. Effects of volatile constituents and late magmatic processes		**9**:210h–211e / **9**:224h–225e	**15**:961f–h
d. Occurrence of igneous rocks		**9**:211e–213e	
i. Distribution and abundance of igneous rocks		**9**:211h–212b	
ii. Rock kindreds, or associations, and petrographic provinces: groups of rocks of similar mineralogy and chemical composition		**9**:212b–f	

	articles	article sections	other references
iii. Diversification of magmas: mechanisms of magma generation		**9**:212f–213e	
e. Principal families of igneous rocks			
i. The intrusive igneous rocks that result when magma cools and solidifies below the surface of the Earth; *e.g.*, granite, gabbro, diorite	IGNEOUS ROCKS, INTRUSIVE **9**:219–227		**6**:50f–51h *passim* / **15**:920c–f
ii. The extrusive igneous rocks that form from magma that erupts at the surface of the Earth; *e.g.*, basalt, rhyolite, andesite	IGNEOUS ROCKS, EXTRUSIVE **9**:213–219	**19**:504d–505a	**14**:528f–h
iii. The pyroclastic igneous rocks that form from deposits of explosive volcanic eruptions; *e.g.*, pumice, tuff, scoria	IGNEOUS ROCKS, PYROCLASTIC **9**:227–233	**19**:503f–504d	**9**:208b
2. The sedimentary rocks of the Earth's crust: rocks that were deposited by or precipitated from ice, wind, or water, or produced by biogenic processes	SEDIMENTARY ROCKS **16**:463–474	**13**:479h–480f	**7**:1056a–b / **13**:909c–f
a. Classification systems		**16**:464d–467b	
i. Clastic rocks		**16**:464h–466c / **16**:214g–216d	
ii. Nonclastic rocks		**16**:466c–467b	
b. Properties of sedimentary rocks		**16**:467c–469e / **4**:1110c–1111e / **8**:295e–298b / **10**:980b–982a / **11**:24f–25d / **16**:635b–636e / **16**:765e–766a	
i. Texture		**16**:467c–468e / **10**:980d–982a / **16**:213g–214e	**4**:1110c–g
ii. Mass properties; *e.g.*, cementation, colour, density, elasticity, porosity		**16**:468f–469a / **16**:635g–h	**4**:1111c–d / **16**:765e–g
iii. Geochemical properties		**16**:469a–c / **3**:837b–f / **8**:296d–298b / **10**:980b–d / **16**:214e–f	**6**:705h–706d / **11**:24h–25b / **16**:635d–g / **16**:763f–g
iv. Fabric		**16**:469d–e / **16**:636c–e	
c. Sedimentary structures		**16**:469e–471a / **16**:635h–636b / **16**:766a–c	**8**:295f–296c
i. External stratification		**16**:469e–g	**16**:766a–b
ii. Bedding and bedding planes		**16**:469g–470e / **16**:213c–g	**8**:295f–296b
iii. Deformation structures		**16**:470f–471a / **15**:918g–h	
d. Sedimentary environments		**16**:471b–472h / **10**:983a–984b / **16**:636e–g / **16**:766c–767d	**16**:459d–461d *passim*
i. Marine environment		**16**:471e–472a / **6**:1135h–1137g / **8**:298d–299e	**10**:983h–984b / **11**:499e–f
ii. Mixed marine and nonmarine environment		**16**:472a–c	**10**:983d–g
iii. Nonmarine environment		**16**:472c–472h / **6**:1135c–h	**4**:1111e–1112f *passim* / **10**:983c–d
e. Distribution of sedimentary rocks through time		**16**:472h–474b / **6**:1138h–1139e / **16**:767e–h	
i. Rock type variation		**16**:472h–473d / **16**:637c–e	
ii. Rates of accumulation		**16**:473d–f	
iii. Sedimentary models: inferences concerning the mode of emplacement and the sources of sedimentary deposits		**16**:473f–474b / **6**:1135b–1138g	**16**:766c–767d *passim*
f. Principal types of sedimentary rocks			
i. Conglomerates, tillites, and other heterogeneous clastic rocks	CONGLOMERATES AND BRECCIAS **4**:1109–1113		**16**:465b–e

	articles	article sections	other references
ii. Quartzose sandstones and arkoses	SANDSTONES **16**:212–216	**4**:731h–732b	**16**:465e–466b
iii. Graywackes	GRAYWACKES **8**:295–299		
iv. Shales	SHALES **16**:634–638	**13**:536c–539g	
v. Loess	LOESS **11**:24–28		**8**:176d–e/**19**:844g–h
vi. Limestones and dolomites	LIMESTONES AND DOLOMITES **10**:979–985		**3**:837b–e/**16**:466c–h
vii. Evaporites [see also 724.B.1.c.ii.]	EVAPORITES **6**:1132–1139	**4**:731f–g/ **5**:1091b–c/ **16**:193h–194b/ **16**:195h–196a/ **19**:34h–35b	**13**:669f–g/**14**:553h–555c
viii. Siliceous rocks	SILICEOUS ROCKS **16**:765–767		
ix. Phosphorites	PHOSPHORITES **14**:288–290		
x. Coals [see C.4.a., below]			
3. The metamorphic rocks of the Earth's crust: rocks that have formed by the physicochemical alteration of pre-existing rocks	METAMORPHIC ROCKS **12**:1–10		**7**:1056f–1057a/**13**:910b–d
a. Formation and classification of metamorphic rocks	ROCK METAMORPHISM, PRINCIPLES OF **15**:947–952	**12**:2e–4e	
i. Types of metamorphism; *e.g.*, contact, regional, hydrothermal, progressive and regressive		**15**:948c–g/ **12**:3a–e/ **6**:26c–d/ **12**:52d–53g	**12**:243d–e
ii. Grades of metamorphism: the degree to which metamorphic changes have occurred		**15**:948g–950e	
iii. Temperature and pressure of metamorphism		**15**:950e–951b/ **7**:1027a–c	
iv. The origin of metamorphic texture and structure		**15**:951b–952b	
v. Metamorphic differentiation		**15**:952b–c	
vi. The alteration of limestones and dolomites to form marbles	MARBLES **11**:486–487		
vii. Types of metamorphic rocks; *e.g.*, schist, slate, gneiss, hornfels		**12**:3f–4e	
b. Physical and chemical characteristics of metamorphic rocks		**12**:4f–6g	
i. Metamorphic minerals		**12**:4f–g/ **15**:949f–950a	**16**:763g–764a
ii. Rock composition		**12**:4g–5e	**6**:706e–f

Division II. The Earth's envelope: its atmosphere and hydrosphere

[for Part Two headnote see page 79]

The outlines, and the articles and parts of articles referred to, in the four sections of Division II treat the Earth's atmosphere; its hydrosphere; the motions of the sea; and weather and climate.

The outline and the articles referred to in Section 221 treat the structure, composition, and physical properties of the atmosphere; and the large-scale motions of the atmosphere.

Section 222 treats the types and the distribution of waters in the Earth's hydrosphere; the physical and chemical properties of seawater; the geochemistry of freshwater; and the hydrologic cycle, the group of paths through which the water in nature circulates and is transformed from one state to another.

Section 223, on the motions of the sea and the forces that cause them, treats the interactions between ocean and atmosphere; the kinds of waves in the hydrosphere; and the distribution and causes of surface and subsurface ocean currents.

Section 224, on weather and climate, treats the condensation of water in the atmosphere, producing clouds, fogs, and precipitation; weather disturbances—cyclones and anticyclones, thunderstorms, and lightning, tornadoes, hurricanes, and typhoons; weather forecasting; and the statistical aggregates of weather called climates.

224. Weather and climate 99

Section 221. The atmosphere

[for Part Two headnote see page 79]

The articles and parts of articles referred to in Section 221 deal with two main subjects: A, the structure, composition, and physical properties of the atmosphere; and B, the large-scale motions of the atmosphere.

The outline of subject A begins with a general description of the regions of the atmosphere, the several layers that are characterized by the pattern of vertical distribution of temperature. It goes on to the chemical reactions and physical processes that occur in the homosphere, the layer of generally uniform composition below an altitude of about 60 miles, and in the heterosphere, above an altitude of 60 miles, where diffusive separation results in a variation of chemical composition with height. An article referred to gives separate treatment to the ionosphere, the upper region that overlaps the mesosphere, thermosphere, and exosphere, in which most of the atoms and molecules have become ionized or electrically charged. The outline next deals with the exosphere, the outermost layer of the atmosphere that grades into interplanetary space, and gives separate treatment to the Van Allen radiation belts, zones of charged particles trapped in the magnetic field of the Earth, which were discovered after the first Earth satellite and space probes.

The outline of subject B—winds and storms—begins with the resolution of winds into zonal (east–west), meridional (north–south), and vertical components and with the relation of winds to pressure, temperature, and the Earth's rotation. After dealing with jet streams, which are high-velocity, narrow air currents in the upper troposphere and the stratosphere, the outline covers the westerlies of mid-latitudes, tropical wind systems, including trade winds and tropical disturbances such as hurricanes and typhoons; stratospheric and mesospheric wind systems; and the mean meridional circulations of the atmosphere. It concludes with broad causal questions about the driving mechanisms for the general circulation of the atmosphere: the energy balance and the transport of heat and momentum.

Section 222. The hydrosphere: the oceans, freshwater bodies, and ice masses

[for Part Two headnote see page 79
for Division II headnote see page 92]

The articles and parts of articles referred to in Section 222 deal with four main subjects: A, the distribution of water in the hydrosphere; B, the physical and chemical properties of seawater; C, the geochemistry of freshwater; and D, the hydrologic cycle.

The outline of subject A covers all the types of waters in the hydrosphere, the Earth's aqueous envelope: saltwater bodies;

freshwater bodies, including groundwater contained within the pores of rocks; and the various kinds of ice formations. Articles are referred to that give separate treatment to gulfs and bays, to groundwater, to ice sheets and glaciers, to icebergs and pack ice, and to river and lake ice.

The outline of subject B treats the dissolved inorganic and organic substances that are the principal constituents of oceans and seas; and the physical properties of seawater.

The outline of subject C treats the geochemical processes that determine the composition, properties, and changes in the freshwater on and below the Earth's land surfaces.

Subject D is the hydrologic cycle—a group of paths through which the water in nature circulates and is transformed from one state to another, and consisting of various complicated processes of precipitation, evaporation, interception, transpiration, infiltration, percolation, retention, detention, overland flow, throughflow, and runoff. The outline first deals with the role of evaporation in the hydrologic cycle, covering evaporation from water surfaces, soils, snow, and ice, and from transpiration—the evaporation of water from the leaf cells of plants. Dealing next with the role of water vapour in the hydrologic cycle, the outline covers the distribution of water vapour in the atmosphere; vapour release by condensation; and precipitation and its distribution. It next treats the factors that affect the surface runoff cycle and the groundwater cycle, and the role of ice in the hydrologic cycle. Finally, an article is referred to that deals separately with the practical uses of the hydrologic sciences in determining the available water resources and the global annual water balance, and in the development, management, and protection of water resources in the light of demographic trends.

Section 223. The motions of the sea and the forces that cause them

[for Part Two headnote see page 79
for Division II headnote see page 92]

The articles and parts of articles referred to in Section 223 deal with three main subjects: A, ocean–atmosphere interaction; B, waves in the hydrosphere; and C, the circulation of the oceans.

The outline of subject A begins with basic quantities involved in ocean–atmosphere interaction—the supply of energy to the ocean by direct and scattered solar radiation, the amount of heat flow from the interior of the Earth through the ocean floor, and the water budget comprised of the various items of input, output, and water storage of the hydrologic system. It goes on to air–sea transfer processes—the vertical transport of water vapour and heat at the sea surface. Finally, it treats oceanic turbulence, the random motions distinguished from and superposed on waves or ocean currents.

The outline of subject B first deals with surface waves, waves at the air–sea interface, covering the theory of simple shallow-water and deep-water waves and the properties of complex wind-generated ocean waves and tsunamis, or seismic sea waves. It goes on to internal waves, which are not noticed at the surface but occur at sharp internal interfaces or gradual transition zones between layers of water of different densities. Finally, it deals with tides—the daily fluctuation of elevation of the water surfaces of oceans, seas, and the larger lakes of the world. The outline covers the causes of tides; the mathematical and dynamical analyses of tidal motion; and the methods of tidal prediction that are useful to navigation and coastal engineering.

Subject C is the system of ocean currents through which the great water masses on the Earth's surface are interconnected. The outline first deals with the distribution or general pattern of currents throughout the world's oceans. It goes on to the forces that cause ocean currents or modify their motions—wind friction at

the sea surface, pressure gradients, and the Coriolis effect of the Earth's rotation. It next deals with systems of surface currents in different regions of the Earth and with subsurface currents dependent on differences of temperature, salinity, or sediment concentration. Finally, it treats the influence of ocean currents on weather and climate.

Section 224. Weather and climate

[for Part Two headnote see page 79
for Division II headnote see page 92]

The articles and parts of articles referred to in Section 224 deal with four main subjects: A, condensation of water in the atmosphere; B, weather disturbances and storms; C, weather forecasting; and D, climate.

Subject A involves two processes that return water from the atmosphere to the Earth in the hydrologic cycle. The outline begins with the different indices of the water vapour content in the atmosphere. It then deals with the processes of condensation that change water from its vapour state into a liquid or a solid. Separate articles are referred to that treat dew; frost; and the formation, classification, weather effects, and artificial modification of clouds and fogs. The outline then treats precipitation, covering its origin, its principal types—drizzle, rain, and freezing rain; snow; and sleet and hail—and the world distribution of rainfall. Finally it deals with the effects of precipitation, such as erosion caused by raindrop impact or by surface runoff.

The outline of subject B begins with the formation, structure, and distribution of cyclones and anticyclones and the development of their associated frontal systems. It goes on to treat the causes, types, and physical characteristics of thunderstorms. It concludes with weather disturbances in the tropics, such as monsoon depressions, hurricanes, and typhoons.

The outline of subject C, weather forecasting, begins with the worldwide synoptic weather service, which provides the fundamental information upon which weather maps are constructed, comprising such elements as air pressure, temperature, humidity, wind speed and direction, and cloud heights. It goes on to deal with the physical and dynamical principles involved in relatively reliable short-range weather predictions from such data, and with the methods used to obtain long-range weather predictions. After a review of many important practical applications of weather forecasting, the outline concludes by referring to an article that gives separate treatment to the long history of weather lore.

Subject D is climate, regarded as comprising the total experience of weather and atmospheric behaviour over a number of years in a given region, and specified by the average values of the various climatic elements as well as their extreme ranges. The outline begins with the several factors that generate climate. It then deals with small-scale climatic variation, covering seasonal changes, local effects, and the effects of urban concentration on global climate. It goes on to treat various classifications of climatic types; their distribution in the world; and their effects on marine and terrestrial organisms, on vegetation and crops, and on the life of man. The outline next deals with microclimates—climates in small areas, within a very few feet above and below the Earth's surface and within the canopies of vegetation. It goes on to climatic changes—long-term oscillatory fluctuations and progressive changes. It treats the evidence for the several orders of climatic change through geological time and the characteristics of each such change. Finally, it treats theories of the causes of climatic variation and projections of future climates.

Division III. The Earth's surface features

[for Part Two headnote see page 79]

The outlines, and the articles and parts of articles referred to, in the two sections of Division III deal with the basic physical features of the Earth's surface and with the features produced by geomorphic processes acting on the Earth's surface.

The outline and the articles referred to in Section 231 treat the vertical relief of the Earth's surface; the stable platform regions of the continents; the continental terrace or continental margins; the oceanic deeps; coral islands, coral reefs, and atolls; mountain ranges and mountain belts; and oceanic ridges.

Section 232 treats the action of the hydrosphere and the atmosphere on the Earth's surface features; the effects of actions from the biosphere, exosphere, and lithosphere on the Earth's surface features; the characteristic features of the Earth's major environments; and basic concepts in the theory of landform evolution.

Section 231. Physical features of the Earth's surface 104
232. Features produced by geomorphic processes acting on the Earth's surface 108

Section 231. Physical features of the Earth's surface

[for Part Two headnote see page 79]

The articles and parts of articles referred to in Section 231 deal with seven main subjects: A, the vertical relief of the Earth's solid surface; B, the stable platform regions of the continents; C, the continental terrace; D, the oceanic deeps; E, coral islands, coral reefs, and atolls; F, mountain ranges and belts; and G, oceanic ridges.

The outline of subject A first deals with the distribution of land and sea on the Earth's surface, the average elevation of the continents, and the classification of coastlines. It then deals with the physiography of the seven continents and four oceans.

The outline of subject B begins with the size, distribution, characteristics, and age of the continental shields, the ancient parts of a continent on which younger sedimentary rocks were deposited. It then covers the distribution and types of plateaus and of basins; the rift valleys produced by faulting (displacement of the Earth's crust); and the several kinds of water bodies occupying fault-bounded structural depressions.

Subject C is the continental terrace, which includes the comparatively shallow submarine plain called the continental shelf and the much steeper zone, called the continental slope, which merges with the deep-sea floor. The outline first deals with the composition, structure, and origin of the continental terrace. It then treats the so-called submarine canyons that incise the continental terrace, covering their nature and distribution and the theories that have been proposed regarding their origin.

Subject D is the ocean basins. The outline treats the composition of the oceanic crust; such features of the ocean floor as mid-ocean ridges, trenches, and fracture zones; and explanations of the origin of ocean basins in terms of new concepts of plate tectonics and sea-floor spreading.

Subject E is coral islands, coral reefs, and atolls. The outline treats the reef-building organisms; modes and geographic distribution of reef accumulation today; reefs of the geological past and their environmental significance; factors involved in reef growth; and the several theories of reef development.

The outline of subject F covers the major types of mountains; the major mountain systems that align to form mountain belts; the geology, structure, and origin of long, curved chains of islands called island arcs; and the rock types comprising the folded mountain ranges and island arcs.

Subject G is oceanic ridges—elongated elevations on the ocean bottom rivalling the subaerial mountain systems in magnitude. The outline covers the classification, properties, origin and growth, and distribution of oceanic ridges.

Section 232. Features produced by geomorphic processes acting on the Earth's surface

[for Part Two headnote see page 79
for Division III headnote see page 104]

The articles and parts of articles referred to in Section 232 deal with four main subjects: A, the action of the hydrosphere and atmosphere on the Earth's surface features; B, the effects of actions from the biosphere, exosphere, and lithosphere on the Earth's surface features; C, the characteristic features of the Earth's major environments; and D, theories of landform evolution.

The outline of subject A covers the effects on the Earth's surface features of weathering and soil formation; of gravitational processes producing various types of Earth movements, such as rockfalls and landslides; of rivers and the associated drainage systems of streams and their tributaries; of wind transport of rock and mineral material; of marine processes; of glacial processes; and of lacustrine processes.

The outline of subject B begins with the physiographic effects of various biological processes. It covers the effects of plants and organisms on rock weathering and soil formation; the effects of animal trails, tracks, and burrows on the erodability of Earth materials and on sediment yield; the effects of vegetation type and density on sediment yield; the direct and indirect effects of man's action on the Earth's surface features; and the effects of extraterrestrial and volcanic-tectonic processes.

Subject C is the characteristic features of the Earth's major environments. The outline covers the fluvial environment; the lacustrine environment; the estuarine environment; the marine environment; the desert environment; the glacial environment; the polar environment; the tropical environment; the temperate environment; and such aspects of the subterranean environment as geysers, hot springs, fumaroles, and caves and cave systems.

Subject D is theories of landform evolution, a term applied to all changes in the Earth's surface features throughout time, broadly caused by the interaction of the opposing processes of

relative uplift on the Earth's surface and downwearing by weathering and erosion. The article referred to covers basic concepts involved in the theory of landform evolution—the concept of uniformitarianism; the concept of the cycle of erosion; the concept of morphogenetic regions; the concept of dynamic equilibrium; and the concept of entropy.

ii. Karst topography: hummocky terrain resulting from subsurface cavern development and consequent slumping of the ground surface		**3**:1028h–1029c	
D. Basic concepts in the theory of landform evolution	LANDFORM EVOLUTION **10**:624–634		
1. The concept of uniformitarianism: that the processes operative on the Earth's surface in the geological past did not differ in kind from those that are operative today [see also 242]		**10**:625d–626f / **18**:857d–859f	
2. The concept of the cycle of erosion: that landforms progress through a series of well-defined stages with time, culminating in a planar erosion surface termed a peneplain		**10**:626f–628g	**8**:873h–874c
3. The concept of morphogenetic regions: that the influence of climate on landform development is so profound that regions of similar landforms may be defined solely on a climatic basis		**10**:628g–630b	
4. The concept of dynamic equilibrium: that landforms reflect a balance between the processes now operative upon them and the degree to which their rock type and structure resist these processes		**10**:630b–633a / **14**:434g–435d	
5. The concept of entropy: that landforms reflect the most probable of all possible alternative states in nature; that their development is well matched by stochastic or random-based models [see also 124.A.]		**10**:633a–634e

Division IV. The Earth's history

[for Part Two headnote see page 79]

The outlines, and the articles and parts of articles referred to, in the three sections of Division IV deal with the origin and development of the Earth and its envelopes; the interpretation of the geological record; and the eras and periods of geological time.

The outline and the articles referred to in Section 241 treat the origin and development of the lithosphere, of the atmosphere, and of the hydrosphere; the formation and growth of the continents and of the mountain ranges and belts; the theory of continental drift; and the theory of sea-floor spreading.

Section 242 treats the stratigraphic, the paleontological, and the paleogeographical interpretations of the geological record; the relative and absolute dating of the Earth's history; and the reconstructing of the geological history of the Earth.

The articles referred to in Section 243 treat the rocks, the life, and the environments in Precambrian time and in the Lower Paleozoic, Upper Paleozoic, Mesozoic, and Cenozoic eras.

Section 241. Origin and development of the Earth and its envelopes 115
242. The interpretation of the geological record 119
243. The eras and periods of geological time 123

Section 241. Origin and development of the Earth and its envelopes

[for Part Two headnote see page 79]

The articles and parts of articles referred to in Section 241 deal with seven main subjects: A, the origin and development of the lithosphere; B, the origin and development of the atmosphere; C, the origin and development of the hydrosphere; D, the formation and growth of the continents; E, the formation and growth of mountain ranges and belts; F, the theory of continental drift; and G, the theory of sea-floor spreading.

The outline of subject A covers theories of the origin of the Earth and theories about the evolution of the crust, the outer part of the Earth, from the mantle that underlies the crust.

The outline of subject B begins with the relation of the development of the Earth's atmosphere to the origin of the solar system and the development of other planetary atmospheres. It goes on to speculations about the original atmosphere of the Earth and hypotheses about the evolution of the present terrestrial atmosphere. It also deals with the effects of man's activities on the heat balance or composition of the atmosphere.

Subject C is the origin and development of the hydrosphere.

The outline begins with speculations about the early oceans and about the transition stage from about 3,500,000,000 to 1,500,000,000 years ago. It goes on to the modern chemical view of the oceans as a steady-state system in which rates of inflow of materials into the oceans equal rates of outflow, resulting in a nearly fixed seawater composition. It next treats evidence concerning the evolution of the hydrosphere-atmosphere derived from the analysis of the mass and distribution of sedimentary rocks that have been deposited from the oceans during geological time. Finally, it deals with the evidence for limits on past variations of seawater composition.

Subject D is the formation and growth of the continents. The outline begins with the processes that govern crustal development—exogenic processes, including weathering and the formation of sedimentary rocks, and endogenic processes, including magmatism, metamorphism, and tectonism. It goes on to deal with the types and evolution of endogenic regimes, which are regular combinations of endogenic processes, appearing in each interval of geologic time in definite zones, the effects of which characterize the continents. Finally, it treats the various lines of geophysical evidence for a long-term stability in the relations between endogenic regimes and deep-seated Earth processes.

The outline of subject E begins with the relation of the distribution of mountain belts to the movements of large plates of the Earth's crust postulated in the new theory of plate, or global, tectonics. It goes on to such generalizations as are possible about the highly varied composition and structure of the tectonic mountain belts. It next deals with the geosynclinal hypothesis of mountain building—namely, that mountain belts form at the site of long, narrow, sediment-filled troughs called geosynclines. Finally, it treats stages in the development of mountain systems.

Subject F is the theory of continental drift—the theory that the continents have undergone, during geologic time, large-scale horizontal displacements relative to each other and to ocean basins. The outline, after reviewing the history of the controversy about the concept of continental drift, deals with the main lines of evidence, in addition to the apparent matching of continental margins, currently thought to favour the hypothesis of continental drift. It first treats geological data, such as recently discovered matches between ancient rocks on now separated continents, and fossil discoveries showing identical species of plants and animals, strictly adapted to living on land or in freshwater, on both sides of large marine barriers. It goes on to paleomagnetic data that indicate polar wandering and reversals of the geomagnetic field, and to evidence that the ocean floors are geologically young. The outline also treats the claims of the geological theory called plate tectonics to suggest what mechanisms could have generated the displacements of continental drift.

Subject G is the theory of sea-floor spreading—the theory that the ocean basins are expanding or contracting as a result of the outward spreading of a newly generated oceanic crust from the mid-ocean ridges. The outline, after reviewing the development of the concept of sea-floor spreading, deals with the evidence for it, covering the anomalously high values of heat flow over mid-ocean ridges; the linear magnetic anomalies that parallel the mid-ocean ridges and their relation to geomagnetic reversals; and data about the age and distribution of marine sediments. Finally, it treats the structural elements of the sea-floor spreading model and the hypotheses about the causes of sea-floor spreading in plate tectonics theory.

A. The origin and development of the lithosphere
[see also 213.A.]

1. Theories of the origin of the Earth
[see also 133.A.7.]

a. Homogeneous accretion: that the Earth formed slowly from metal and silicate particles and was originally cool and unmelted and of relatively uniform composition

b. Inhomogeneous accretion: that the origin of the Earth was a sequential process, the formation of a metallic core followed by the accretion of an overlying silicate mantle

c. Single-stage accretion from primordial material: that the Earth formed so rapidly that melting of the outer layers occurred with the subsequent gravitational segregation of core from mantle

2. The evolution of crust from mantle: processes involved in the geochemical differentiation of the Earth's outer layers

B. The origin and development of the atmosphere
[see also 133.A.7. and 221.A.]

1. The relation of the development of the Earth's atmosphere to the origin of the solar system and the development of other planetary atmospheres

2. The original atmosphere of the Earth

a. Evidence from the atmospheric abundances of the noble gases and the theory of planetary origins

b. Anoxic state of the original atmosphere: evidence that the Earth's primitive atmosphere was devoid of oxygen

3. Evolution of the present terrestrial atmosphere

a. Additions to the atmosphere: escape of volatile components from the Earth's interior; gases produced by radioactive decay
[see also 111.C.]

Section 242. The interpretation of the geological record

[for Part Two headnote see page 79
for Division IV headnote see page 115]

The articles and parts of articles referred to in Section 242 deal with five main subjects: A, the stratigraphic interpretation of the geological record; B, the paleontological interpretation of the geological record; C, relative and absolute age dating; D, the paleogeographical interpretation of the geological record; and E, the reconstruction of the geological history of the Earth.

The outline of subject A begins with descriptions of the layered rocks of the Earth's crust and the general character of the rock record. It goes on to deal with stratigraphic classifications and their historical development, and with the criteria for the correlation of layered deposits. It further treats the problems of stratigraphic nomenclature and problems about stratigraphic boundaries.

The outline of subject B begins with the nature of fossils and of the fossilization process. It goes on to treat the fossil record, first in the Precambrian, and then in the post-Precambrian, wherein the record extends from the occurrence and evolution of the Protista to the occurrence of plants and mammals. The outline next deals with the fossil record as showing the history of most major groups of animals and plants and as affording evidence concerning the causes and principal factors involved in the extinction of certain groups. Finally, it deals with the paleontological criteria for the correlation of layered rocks, treating index fossils, assemblages, and especially pollen stratigraphy, which gives the record of the chronological and geographical distribution of fossil pollen and spores in the Earth's strata.

Subject C is the assignment of a chronology to the Earth's history. The outline begins with relative dating—the determination of sequences in the Earth's history by the correlation of data about rock ages and the fossils contained in rocks. It goes on to deal with the meaning of absolute age and with the requirements for absolute dating. It first treats the principles and methods of radiometric dating and the definition of time zero and the sources of error in radiometric dating. Dealing with non-radiometric dating, the outline treats geological processes taken as absolute chronometers, involving methods based on weathering and erosional processes; and biological processes taken as absolute chronometers, involving methods based on tree rings and corals. Finally, it treats applications of absolute dating for the establishment of the geological time scale, in determinations of the ages of the Earth, meteorites, and the Moon, and in the determination of sea-floor spreading rates.

The outline of subject D treats the factors involved in the reconstruction of former environments, and the use, for such reconstruction, of data supplied by stratigraphy, paleontology and paleoecology, structural geology and geophysics, and petrology and geochemistry.

Subject E is the reconstruction of the geological history of the Earth based on the worldwide correlation of the accumulated evidence from the geological record.

Section 243. The eras and periods of geological time

[for Part Two headnote see page 79
for Division IV headnote see page 115]

The articles and parts of articles referred to in Section 243 deal with the several periods of geological time in A, Precambrian time; B, the Lower Paleozoic Era; C, the Upper Paleozoic Era; D, the Mesozoic Era; and E, the Cenozoic Era. The rocks, the life, the stratigraphy, and the environments are separately treated for each period.

Introduction to Part Three:

The mysteries of life

by René Dubos

We take for granted the existence of life on Earth. Yet, as far as we now know, life exists nowhere else in the solar system, its origin is still a mystery, and its effects on our planet have been little short of miraculous. Without life the surface of the Earth and its atmosphere would be very different from what they are now. We are both spectators and actors in a continuing performance where life is both author and producer, and for which the Earth serves as an ever-changing stage.

Cataclysms give us now and then a glimpse of what our planet would look like without life. In 1883, a series of stupendous volcanic eruptions destroyed two-thirds of Krakatoa Island in the Malay archipelago and covered what was left of it with a thick layer of lava. All living things were killed, not only on Krakatoa itself, but also on the neighbouring islands that were in the path of the tidal wave generated by the explosion and of the volcanic fallout. What had once been a luscious tropical forest suddenly became a gray and lifeless landscape, as desolate as the surface of the Moon.

Pictures taken of Krakatoa in the months following the disaster help us to realize that what we regard as the surface of the Earth is less a geological structure than a living mantle. Our planet would be drab and dusty, an insignificant object in space, if it were not for the myriad of living forms that have generated its atmosphere and its soil out of gases and rocks. In fact, the phrase "life on Earth" is somewhat misleading because the surface of the Earth as we experience it, with its entrancing diversity and colourful warmth, is literally a product of biological activities—a creation of life.

Krakatoa remained a desolate landscape for a long time after the 1883 volcanic explosion. But progressively the wind and the sea brought back to its sterilized surface a multiplicity of living things, some of which managed to establish a permanent foothold on the lava. Today, the island harbours once more a rich flora and fauna, not very different from that of the native forest of the Malay archipelago.

There is a paradox in the marvellous resiliency of nature. On the one hand, all individual forms of life are extremely delicate. And yet life itself has been capable of prevailing over brute physical forces for several billion years, and has generated immensely diversified ecosystems that have remained viable even under the most inhospitable conditions. Life probably emerged from inanimate matter, but it is now more powerful than inanimate matter.

All biological phenomena are of practical importance because they determine the characteristics of the Earth's surface and therefore affect the quality of human life. Men have always been concerned with the contributions that living things make to their immediate environment and to the global economy; they have wondered how the flora and fauna become more or less stabilized under normal conditions, and manage to reestablish stable ecosystems after cataclysms; in our times they worry to what extent living things can be disturbed or eliminated by urbanization and industrialization without thereby threatening human welfare.

But the phrase "life on Earth" also raises other questions of a more philosophical character, questions that have been in the minds of humble uneducated people even before they became the preoccupation of scholars. In the universe at large, lifelessness is the rule, life the puzzling exception. How do living things differ from inanimate matter? How did they originate? And can life be created *de novo*? Is man qualitatively different from the rest of the living world or merely a higher, or the highest, specimen in its evolution, the paragon of animals?

It is clear from the geological record that life has been at home on the Earth for immense periods of time. The types of fossils found in rock formations indicate that all major groups of animals and plants were already represented by recognizable ancestors some 400,000,000 years ago. Furthermore, microscopic structures closely related to the present forms of blue-green algae have been found in geologic formations that are even very much older—some 3,000,000,000 years old. Since these fossils of algae-like organisms have a complex cellular organization, it can be assumed that they had been preceded by simpler forms, and that the origin of life is more ancient than the oldest traces of it which have been detected. In fact, there is no way to know when life first appeared on Earth, because its earliest manifestations were certainly so minute, fragile, and undifferentiated that none of them have survived as fossils.

There is a peculiar fascination to the phrase "the origin of life" because it means different things to different men, and reaches into the deepest layers of their beliefs. For the religious man, it implies the mysteries of divine creation—whether expressed as biological species in their final forms, or as the potentialities posited by Aristotelian philosophers and medieval theologians. For the student of myths, it evokes Aphrodite emerging fully developed from the foam of the sea. The myth may have a factual basis if it is true, as it is commonly believed, that the cradle of life was to be found in the primitive oceans. For the modern scientist the phrase "origin of life" refers to the kind of chemical reactions that first generated complex organic molecules and assembled them in such a manner that they could duplicate themselves—thus converting inanimate matter into living substance.

Whatever the mystical or rational basis of a person's beliefs, there is a universal poetic quality in the thought that life once arose from matter, and has been perpetuating itself ever since. But the only real clue to the origin of life is that all its forms—at least all the living things we know—have many physicochemical characteristics in common. In particular, they all transfer their hereditary endowment from one generation to the next through the agency of a peculiar kind of molecule known as nucleic acid, the now famous DNA. This uniformity of fundamental structure holds true irrespective of the size, shape, and complexity of the organism—whether it be microbe, plant, animal, or man. Indeed, the similarity in structure of the genetic apparatus throughout the living world is so perfect that it cannot possibly be a matter of chance. The conclusion seems inescapable that all the living forms that now exist have had a common origin.

The simplest hypothesis to account for the origin and evolution of life is that all biological phenomena are caused by the physicochemical forces that govern the inanimate world. Some scientists believe, indeed, that there is nothing

very unusual in the emergence of a living molecule from matter. According to them, it is probable that life repeatedly emerged *de novo* on Earth and that it is still emerging today somewhere in the cosmos. By making the reasonable assumption that one of the living forms that appeared on Earth proved more vigorous than the others, it is easy to account for the single origin of all surviving species. If an entirely new genetic form of life were to appear today on Earth, it would have no chance of success, because it could not compete with the established form and all its variations.

The hypothesis that life is nothing more than a special manifestation of ordinary physicochemical forces has the merit of being economical of thought; in addition, it is supported by the fact that all biological phenomena go hand in hand with the kind of reactions observed in the inanimate world. But even if we grant that living phenomena always obey physicochemical laws, this does not constitute decisive evidence that life is merely an expression of these laws. Other theories are conceivable. One of them, rarely voiced because it is not scientifically fashionable, is that some unknown principle runs like a continuous thread through all living forms and governs the organization of their physicochemical processes. The illustrious Danish physicist Niels Bohr, for example, suggested that "the very existence of life must be considered an elementary fact, just as in atomic physics the existence of a quantum of action has to be taken as a basic fact that cannot be derived from ordinary mechanical physics."

Uncertainties concerning the fundamental nature of life and its origin would disappear if it were possible to generate at will self-reproducing molecules from inert material. Some experimental findings have recently been quoted as evidence of this possibility.

A fully developed virus, which had been naturally produced by a living organism, was separated into its component parts by chemical procedures. When these separate parts were tested for biological activity, they were found to be inert, that is, they were unable to multiply in a susceptible organism. This biological activity was restored, however, when the parts of the virus were chemically reassembled in the test tube under the proper conditions. Spectacular as this achievement is from the chemical point of view, it does not constitute—as has been claimed—the production of life *de novo*. Since the virus first had to be produced by a living organism, and since its reassembled parts showed activity only when introduced into a living susceptible organism, all the biological machinery essential for its reproduction had to be provided by preexisting life.

In a completely unrelated kind of experiment, several complex molecules similar to those found in living things have been produced in the laboratory by exposing simple chemicals to the kind of radiation that probably existed in the primitive atmosphere. But this chemical feat does not constitute production of life *de novo* because the molecules so produced have not been assembled—*organized*—in a way enabling them to duplicate themselves and to develop. An organic molecule, however complex and similar to the kind found in living things, still belongs to the realm of inanimate matter if it cannot reproduce and evolve.

To become "living," an assembly of biogenic molecules must contain the information needed for its further development and must be able to transmit this information to its progeny. Even in its simplest manifestations, life is historical; it embodies the past and carries instructions for the future.

More than a century ago, the French physiologist Claude Bernard gave a clear formulation of the now classical view that the earmark of a living thing is not the chemical composition of its parts but their organization. He wrote: "Admitting that vital phenomena rest upon physicochemical activities, which is the truth, the essence of the problem is not thereby cleared up; for it is no chance encounter of physicochemical phenomena which constructs each being according to a preexisting plan, and produces the admirable subordination and the harmonious concert of organic activity.

"There is an arrangement in the living being, a kind of regulated activity, which must never be neglected, because it is in truth the most striking characteristic of living beings. . . ."

In this celebrated passage, Bernard used the word "arrangement" to denote the interdependence and integration of the structures and properties of any given living organism. But biological organization applies also to the ecological system of which the organism is a part. All living things, without exception, depend on other living things for their survival and development. Furthermore, the higher the organism is on the evolutionary scale, the more exacting is its dependence on a complex web of life.

One of the major trends of evolution has thus been the emergence of more and more complex ecosystems, exhibiting high degrees of integration. But, paradoxically, an opposite trend can also be detected as one ascends the evolutionary scale—namely, a trend toward freedom or at least toward increasing independence of the individual organism within the constraints of the ecosystem. Freedom becomes more and more apparent as one proceeds from the protoplasmic jelly of biological beginnings to warm-blooded animals roaming in the wild, and finally to man who modifies his environment according to his views of the future. In a real way, evolutionary development is associated with the gradual insertion of more and more freedom into matter and into individual lives.

In the *Outline of Knowledge,* Part Three, concerned with life on Earth, is placed between Parts Two and Four, concerned, respectively, with the Earth itself and with human life. This positioning is reasonable enough, but one could read into it an assumption that reaches far deeper than the logical ordering of concepts and facts. The tacit assumption is that human life has emerged from the inanimate matter of the Earth through the same kind of evolutionary continuum that links all the other living forms in a great chain of being. In reality, the theory of evolution does not provide decisive evidence for this assumption. What is *known* of biological evolution applies only to the anatomical structures and physiological functions of organisms that have lived in the past or are living now. The steps from matter to life, and from life to consciousness, have not yet been shown to have taken place through the kind of mechanisms that account for the evolutionary changes of anatomical structures or physiological functions. There exists a continuum from one form of life to another, but extending this continuum to inanimate matter on the one hand, and to human consciousness on the other, is a matter of faith rather than of scientific knowledge.

Even the most cursory observation of nature reveals that all living forms are conditioned by environmental forces,

and that reciprocally they shape the environment, thereby contributing to the triumph of life. But it must be realized that the word "life" encompasses different kinds of relations to nature. At its lowest level, "life" implies, as mentioned above, the deterministic and blind chemical reactions through which an organism—simple or complex as it may be—transmits its distinctive characteristics to its descendants and reacts adaptively to its environment. At its highest, "life" involves man's consciousness and free will and refers to the deep reality of the world within and the affirmation of the individual self, irrespective of the external world.

There is no way at present to link these two extreme and apparently incompatible manifestations of life—biological determinism and human freedom. Yet both are real, and both have been immensely influential in giving the present characteristics to our planet.

The surface of the Earth reflects the activities of countless living things. Even though these operate chiefly through blind, deterministic mechanisms, life introduces on Earth a degree of order, organization, and diversity not found anywhere else in the cosmos, not even in the movements of the celestial bodies. Man emerged, not on the bare planet, but in this orderly and diversified biological world. As soon as he achieved his identity as *Homo sapiens,* he began to insert his free will into ecological determinism. For good or evil, he has now become the most powerful influence in changing the face of the globe. His conscious choices will determine not only his own fate, but also the fate of life on Earth.

Part Three. Life on Earth

The outlines, and the articles and parts of articles referred to, in the twenty-three sections of Part Three, grouped in five divisions, present results of the studies of life on Earth made in the many complementary biological sciences.

The outlines and the articles referred to in the three sections of Division I deal with the nature, origin, evolution, and classification of living things.

The three sections of Division II deal with the molecular level of biotic organization, treating the chemical transformations and the exchanges of energy that occur in vital processes.

The outlines and the articles referred to in the nine sections of Division III deal first with life at the cellular level, and then with life at the organismic level. The treatment of the latter covers the relation of form and function in organisms; the coordination of vital processes; the several organ systems involved in the performance of fundamental vital functions; biological development; and heredity.

The three sections of Division IV deal with the behavioral responses of organisms. They treat the nature and patterns of behavioral responses; the development and range of capacities for individual behaviour and for group behaviour; and the evolution of behaviour.

The five sections of Division V deal with the biosphere—the world of living things as a single system of biotic and environmental interactions and interdependencies. They treat the basic features of the biosphere—the levels of organization, energy flow, and cycling of matter in the biosphere, and the interactions of the biotic and the abiotic components of an ecosystem; the properties of the biological populations and biological communities, the components of the biosphere; the hazards of life in the biosphere; the patterns of life in the biosphere; and man's place in the biosphere.

Several points about the relations of Part Three to other parts should be noted.

The separation of Part Three from Part One, on matter and energy, and from Part Two, on the Earth, reflects a traditional division of labour among the natural sciences. However, the separation is not rigid. The borderline disciplines of biophysics and biochemistry appear throughout Part Three, especially in Division II, concerned with the molecular basis of vital processes. That the Earth's atmosphere and hydrosphere are favourable to life is reflected throughout Part Three, especially in Division V, which is concerned with the biosphere and with ecosystems.

Some fundamental biological knowledge of man is involved in the treatment throughout Part Three of what is common to all life and to all animals. And Section 355, the last section of Part Three, deals with man's place and activities in the biosphere. However, what is specific to human life, human health, and human behaviour is separately dealt with in Part Four, on human life.

The biological sciences have themselves been the object of historical and analytical studies. Such studies are dealt with in Section 10/34 in Part Ten, which treats the historical development of the biological sciences; the methodology, scope, and conceptual structure of biology as a whole; and the several component disciplines at the different levels of biological research.

The design and operation of observational and experimental instruments are important in the development of the biological sciences. Such scientific instrumentation is dealt with in Section 723 of Part Seven.

Division I. The nature and diversity of living things 130
II. The molecular basis of vital processes 144
III. The structures and functions of organisms 154
IV. Behavioral responses of organisms 182
V. The biosphere: the world of living things 189

Division I. The nature and diversity of living things

The outlines, and the articles and parts of articles referred to, in the three sections of Division I deal with the nature, the origin and evolution, and the classification of living things.

The outline and the articles referred to in Section 311 treat the general conception of life; the distinctive properties of living things; and the investigation of extraterrestrial realms.

Section 312 first deals with hypotheses about the origin of life and with stages in the emergence of life, and with major trends in the phylogeny of plants and of animals. It then treats the theory of evolution, the process of evolution, the process of speciation, and the course of evolution.

Section 313 first deals with the principles, procedures, and criteria for systematically classifying organisms in a hierarchical arrangement. Thereafter, articles are referred to that separately treat major groups of the plant and animal kingdoms.

Section 311. Characteristics of living things 131
312. The origin of life and the evolution of living things 132
313. The classification of living things 135

Section 311. Characteristics of living things

[for Part Three headnote see page 130
for Division I headnote see page 130]

The articles and parts of articles referred to in Section 311 deal with three main subjects: A, the general conception of life; B, life on Earth, the distinctive properties of living things; and C, the investigation of extraterrestrial realms.

The outline of subject A first deals with various approaches to the definition of life. It goes on to issues in the controversy about the adequacy of physics and chemistry to explain living phenomena. Finally, it treats the successive and emergent levels of biotic organization.

The outline of subject B first deals with the common occurrence of nucleic acids and of metabolic and genetic regulators in all living things. It goes on to treat metabolism, the process of self-maintenance; homeostasis, the maintenance of dynamic equilibrium through built-in steady-state controls; and the processes of reproduction and development. It next deals with variation among organisms and the adaptation of organisms through the operation of natural selection. Finally, it treats responsiveness, which is the range of sensory and behavioral reactions to external stimuli.

The outline of subject C treats the notion of extraterrestrial life; the search for life beyond the Earth and its significance; an exobiological survey of the solar system; and speculations about the possible characteristics of intelligent life beyond the solar system.

Section 312. The origin of life and the evolution of living things

[for Part Three headnote see page 130
for Division I headnote see page 130]

The articles and parts of articles referred to in Section 312 deal with five main subjects: A, stages in the emergence of life; B, the theory of evolution; C, the process of evolution; D, the establishment of species and the process of speciation; and E, the course of evolution.

The outline of subject A begins with various hypotheses about the origin of life. It goes on to modern hypotheses, constructed by extrapolations from modern cosmogony, chemistry, molecular biology, and experimental biochemistry. Here, it first treats steps in the production of chemical precursors; the earliest living systems; and evidence in the geological record concerning the antiquity of life. It then deals with the adaptive radiation of organisms, treating the methods of phylogeny; the probable main lines of descent; major trends in the phylogeny of plants; and major trends in the phylogeny of animals.

The outline of subject B begins with the history of evolutionary theory. Dealing with the evidence for evolution, it covers facts explicable by the theory of evolution—similarities among living organisms with regard to structure and function, suggesting descent with modifications from a common ancestor; facts about the spread of organisms from their centres of evolutionary origin; and facts about the fossils in the Earth that suggest the relationships of living organisms during their evolution. Finally, the outline treats generally the modern synthetic theory of evolution, which regards statistical transformations of populations as resulting from complex genetic mechanisms and mutations combined with natural selection of better-fitted variants.

Subject C is the process of evolution. The outline first deals with the mechanism of natural selection, involving individual variation within a population, and with the maintenance of selective advantages through an increase in the capacity for survival and reproduction. It goes on to the theory of gene mutations as providing the heritable variations in the evolutionary process. Articles referred to next separately treat, as instances of natural selection in action, the adaptive and survival functions of biological coloration, of mimicry, and of biological polymorphism, the frequent occurrence of several distinct forms within a population. Finally, it treats, as factors affecting the rate of evolution, the effects of environmental change and of the conquest of a new medium, and the significance of nonadaptive or adaptively neutral features.

Subject D is the establishment of species and the process of speciation. After reviewing the history of various concepts of species, the outline proceeds to the modern biological concept, which has reproductive isolation of a group of organisms, the mechanism by which species integrity is maintained, as the key criterion. It treats various situations in which this species concept is difficult to apply—for example, to asexual species and fossil species, definable only morphologically. It next deals with the properties of species, especially with the various isolating factors that restrict random mating, and with the role played by gene flow in maintaining species characteristics over large areas. Finally, it treats the evolution of species and the relationship between species and other taxonomic categories.

The outline of subject E first deals with the major steps of evolution, the progressive development of life forms, and the spread of organisms from water to land. It then treats various patterns of evolution.

A. Stages in the emergence of life

1. Hypotheses about the origin of life: as a result of a supernatural event; by spontaneous generation from nonliving matter; as co-eternal with matter and having no beginning; by a series of progressive chemical reactions on the early Earth
2. Steps in the production of chemical precursors of life
   a. Formation of the Earth's primitive reducing atmosphere: the cosmic distribution of the elements and the composition of life
   b. Production of simple organic molecules: effects of radiation and lightning on inorganic compounds in the early oceans
   c. Production of long-chain molecules consisting of repeating units; *e.g.*, the joining together of amino acids to form proteinlike molecules
   d. Origin of the genetic code: the first functional relationship between molecules with the ability to replicate themselves (polynucleotides) and molecules with catalytic properties (enzymes)

Section 313. The classification of living things
[for Part Three headnote see page 130
for Division I headnote see page 130]

The articles and parts of articles referred to in Section 313 deal with ten main subjects. Subject A is biological classification. The remaining nine subjects, B through J, involve modern taxonomy, the distinguishing, ordering, and naming of living things.

The outline of subject A begins with the objectives and the history of biological classification. Going on to the taxonomic process, it treats the prerequisites of classification; the collecting, preserving, and labelling of suitable specimens; the various cri-

teria for systematic classification; and the steps involved in the construction of a classification. Finally, it treats the concepts and methods involved in current systems of classification.

Subject B is the unique life form called the virus, characterized by relatively small size, simple composition, and the need to grow in a living cell.

The taxonomy of intermediate organisms is set forth in the following subjects: C, the monerans, such as blue-green algae and bacteria, which lack differentiated nuclei; and D, the protists, organisms such as algae, protozoans, slime molds, and fungi.

The taxonomy of the plant kingdom is set forth in the following subjects: E, nonvascular plants, such as mosses, which lack specialized conducting systems; and F, vascular plants.

The taxonomy of the animal kingdom is set forth in the following subjects: G, the invertebrates, or animals without backbones—the lower invertebrates, such as sponges; the lophophorates such as brachiopods; and the schizocoelomates, such as mollusks and annelid worms; H, the arthropods, such as scorpions, spiders, crustaceans, and insects; I, the enterocoelomate invertebrates, such as echinoderms and tunicates; and J, vertebrate animals, or animals with backbones—fishes, bony fishes, amphibians, reptiles, birds, and mammals.

Division II. The molecular basis of vital processes

[for Part Three headnote see page 130]

The outlines, and the articles and parts of articles referred to, in the three sections of Division II deal with the molecular level of biotic organization and set forth theories of the chemical transformations and the exchanges of energy that occur in the distinctively vital processes treated in Section 311 of Division I.

The outline and the articles referred to in Section 321 treat the inorganic milieu of living systems; the organic chemicals that participate naturally in life processes; and substances, such as drugs, alcohol, antiseptics, and biocides, which modify vital processes.

Section 322 treats photosynthesis, which initiates energy conversion in the biosphere; metabolism; and the nitrogen cycle.

Section 323, concerned with vital processes at the molecular level, deals with five main subjects: the biochemical constituents, properties, and functions of cell membranes; bioelectricity, the generation or action of electric currents in biological processes; the nature and transmission of the

323. Vital processes at the molecular level 152

nerve impulse; muscle contraction, the conversion of chemical energy to mechanical energy; and bioluminescence, the conversion by organisms of chemical energy to light energy.

Section 321. Chemicals and the vital processes

[for Part Three headnote see page 130
for Division II headnote see page 144]

The articles and parts of articles referred to in Section 321 deal with six main subjects that fall into three groups. The first group (subjects A and B) concerns the inorganic chemical milieu of living systems and the organic chemicals participating in life processes. The second group (subjects C, D, and E) concerns the chemical substances, other than food, that can produce significant changes in life processes: drugs; ethyl alcohol; and biocides and biorepellents. The last subject, F, is the selective concentration of chemicals by organisms.

Subject A involves the biochemical significance of inorganic chemicals that are favourable to life and life processes.

The articles referred to in connection with subject B deal with the biological significance and the classification of organic chemicals that are constituents of living matter and active in vital processes. The outline first treats the principal components of living cells—carbohydrates, lipids, and proteins and peptides. It goes on to adenosine triphosphate, the major carrier of chemical energy, and to nucleic acids. It also treats biological pigments and coloration, enzymes, vitamins, hormones, and other chemicals of biological significance—alkaloids, steroids, isoprenoids, and terpenes.

The outline of subject C, drugs, begins with the sources and development of drugs and with the general aspects of drug action. It goes on to treat the absorption, distribution, metabolism, and excretion of drugs. It next treats the classification of drugs in terms of the organ systems they affect, covering drugs affecting the cardiovascular system, the muscle system, the central nervous system, the digestive system, the excretory system, the autonomic nervous system, the reproductive system, the immune response system, and the histamine response system. Finally, it deals with drugs directed against disease-causing organisms—antibiotics and chemotherapeutic drugs.

The outline of subject D first deals with the physiological and psychological effects of alcohol. It then treats the social conditions of alcohol consumption, alcoholism, and other contemporary alcohol problems and controls.

The outline of subject E, biocides and biorepellents, covers antiseptics and disinfectants; biocides directed by man against plant and animal pests; and the biotoxins produced by micro-organisms, animals, and plants.

Subject F is the selective concentration of chemicals by organisms. The outline treats the different kinds of chemicals selected by animals and plants to be constituents of organic compounds or mineralized skeletal materials; and the adaptive significance of metabolic waste products that accumulate within certain plants as the chemical basis for repulsion.

5. Nucleic acids	NUCLEIC ACID **13**:328–330	**10**:895b–d	**2**:995b–c
a. General features: nucleic acids as long chain compounds consisting of repeating structural units called nucleotides; types of nucleic acids		**13**:328e–g / **7**:985h–986f / **19**:164d–165c	**13**:330e–333h *passim*
b. Deoxyribonucleic acid (DNA): a major constituent of the hereditary material of calls		**13**:328g–329h / **7**:985d–h	**11**:1045a–e
c. Ribonucleic acid (RNA): a substance primarily associated with protein synthesis in cells		**13**:329h–330c	**11**:1045e–h / **19**:166a–c
6. Biological pigments and coloration	COLORATION, BIOLOGICAL **4**:911–929		
a. The expression of colour: the genetic, physiological, and environmental control of coloration; long-term coloration changes, as in seasonal changes and in changes due to aging		**4**:911g–913b	
b. The structural and biochemical bases for colour		**4**:913b–923g	
i. Structural colour: the effects of reflection, interference, and scattering and their reinforcement by the presence of pigment		**4**:913d–914c	
ii. Pigments; *e.g.*, carotenoids, quinones, flavonoids, porphyrins		**4**:914c–923g / **14**:363f–364d / **15**:760a–e	**1**:934a–b / **2**:1116d–h / **2**:1123c–d / **3**:974d–e / **14**:369b–370a *passim* / **15**:93e–95c *passim*
c. The adaptive value of biological coloration; *e.g.*, camouflage, advertising coloration		**4**:923g–929d	
7. Enzymes	ENZYME **6**:896–902	**3**:1004f–1005b	
a. Historical background and importance		**6**:896b–897d	
b. General properties: classification, chemical nature, coenzymes, and nature of catalysis		**6**:897d–898f / **15**:95d–96e	**13**:333f–g
c. The nature of enzyme-catalyzed reactions; *e.g.*, specificity, mechanisms, inhibitors, effects of temperature and pH (a measure of the degree of acidity or alkalinity)		**6**:898f–901c / **2**:1031e–1032b	
d. Enzyme flexibility and allosteric control; *e.g.*, regulation of enzymatic activity		**6**:901d–902e	
8. Vitamins	VITAMIN **19**:488–493		**11**:835g–h
a. General characteristics of vitamins		**19**:488c–489d / **13**:405h–406e	**13**:419d–420d
i. Nomenclature and the biological significance of vitamins; *e.g.*, the regulation of metabolic reactions		**19**:488c–e	
ii. Sources of vitamins and vitamin requirements of living things		**19**:488f–h	**13**:420d–422a *passim* / **1**:909d–f
iii. Results of vitamin deficiencies and the evolution of vitamin-dependent organisms		**19**:488h–489d / **2**:1135e–1136c / **13**:409d–411e	
b. Water-soluble vitamins (vitamin C and the B vitamins): properties, functions, and metabolism		**19**:489e–490f	**2**:1135g–h / **13**:409e–g / **13**:410f–411e
c. Lipid-soluble vitamin groups (the A, D, E, and K vitamins): properties, functions, and metabolism		**19**:490f–491h	**3**:23b–c / **13**:409g–410f
d. Vitamin-like substances: choline, myoinositol, para-aminobenzoic acid (PABA), carnitine, lipoic acid, and bioflavinoids		**19**:491h–492c	

	articles	article sections	other references
e. Methods used in vitamin research to determine vitamin requirements and vitamin sources		**19**:492c–493c	
9. Hormones	HORMONE **8**:1074–1087		
a. General features of hormones: relationship between endocrine regulation and neural regulation; the evolution of hormones		**8**:1074c–g / **6**:840d–841a	**2**:996b–c
b. The hormones of vertebrates		**8**:1074h–1085f / **15**:96f–97g	**6**:841a–845f *passim*
i. Hormones of the pituitary gland; *e.g.*, growth hormone, ACTH, TSH, vasopressin		**8**:1074h–1078e / **15**:97b–f	**5**:642b–d / **6**:841a–c
ii. Hormones of the thyroid gland; *e.g.*, thyroxine		**8**:1078f–1079g / **15**:96f–g	**5**:642a–b / **6**:842b–d
iii. Parathormone of the parathyroid glands		**8**:1079g–1080b	
iv. Hormones of the pancreas: insulin and glucagon		**8**:1080c–1081b / **15**:96h–97b	**6**:843g–h
v. Hormones of the adrenal glands; *e.g.*, adrenaline, aldosterone		**8**:1081b–1083c / **17**:682c–d / **17**:684f	**6**:844c–h
vi. Hormones of the reproductive system; *e.g.*, estrogens, androgens		**8**:1083c–1084g / **17**:682a–b / **17**:684c–e	**6**:845c–d
vii. Hormones of the digestive system; *e.g.*, gastrin, secretin		**8**:1084g–1085b / **6**:842h–843f	
viii. Secretions of endocrine-like glands; *e.g.*, kinins, melatonin, thymosin		**8**:1085b–f	
c. The hormones and hormone-like substances of invertebrates: neurohormones, molting hormones, and pheromones		**8**:1085f–1086f	**6**:845f–846g *passim*
i. Hormones of insects		**8**:1085f–1086c / **4**:1012h–1013c / **6**:845h–846e	**5**:641e–642a / **9**:611h–612c / **13**:747c–e
ii. Hormones of crustaceans		**8**:1086c–e / **6**:846f–g	**5**:316d–e
iii. Other invertebrate hormones		**8**:1086e–f	**5**:961d / **6**:845g–h
d. The hormones of plants		**8**:1086g–1087h / **8**:1109f–1110a / **14**:504e–h	**5**:668f–669a / **5**:670c
i. Growth promotors: auxins, gibberellins, and cytokinins		**8**:1086g–1087e	**8**:443b–c
ii. Growth inhibitors: abscisic acid and ethylene		**8**:1087e–h	
10. Other natural products			
a. Alkaloids	ALKALOIDS **1**:595–607		
b. Steroids and sterols	STEROIDS **17**:677–688		**14**:193h–194b
c. Isoprenoids and terpenes	ISOPRENOIDS **9**:1043–1049		
C. Drugs: chemicals administered to an organism to change its physiological state or to combat pathogens	DRUG AND DRUG ACTION **5**:1041–1048		
1. Sources and development of drugs		**5**:1041a–c / **1**:595b–d / **11**:848h–849c	**12**:842a–d / **14**:191a–199d *passim*

Section 322. Metabolism: bioenergetics and biosynthesis

[for Part Three headnote see page 130
for Division II headnote see page 144]

The articles and parts of articles referred to in Section 322 deal with three main subjects: A, photosynthesis; B, metabolism; and C, the nitrogen cycle.

The outline of subject A begins with the biological importance of photosynthesis—the photochemical reaction in which green plants capture and use solar light energy to convert water, carbon dioxide, and minerals into oxygen and energy-rich organic compounds. The outline then covers the factors that influence the rate and the energy efficiency of photosynthesis; the site and the mechanism of the photosynthetic process; the photosynthetic pigments; the energetics of photosynthesis; and the metabolic path of carbon in photosynthesis.

Subject B is metabolism, which encompasses all the molecular processes by which an organism acquires, uses, and replaces the energy it needs for growth, for maintenance, and for the activities of life. The outline begins with the catabolic processes by which complex molecules are fragmented. It goes on to the combustion of food materials and the conservation of part of the energy in them, treating the oxidation of molecular fragments and biological energy transduction. The outline next deals with the anabolic processes by which are synthesized chemicals essential to life, such as carbohydrates, lipids, amino acids, nucleic acids, and proteins. Finally, dealing with the regulation of metabolism, the outline treats the sensitive adjustments of the flux of nutrients relative to the needs of cells under relatively constant environmental conditions, and the less immediately responsive adjustments that allow the cell to cope with severe changes in the chemical milieu.

Subject C is the nitrogen cycle—a complex sequence of natural processes, important in the balance of the biosphere, by which inorganic nitrogen is converted to nitrates, consumed and metabolized by organisms, and returned to an inorganic state. The outline refers to nitrogen fixation, the process by which atmospheric nitrogen is converted into the form of nitrogen most available to plants, nitrate; and to micro-organisms that nitrify and denitrify.

b. Coarse control: the less immediately responsive adjustments that allow the cell to cope with severe changes in the chemical milieu, as when diet is changed or the hormonal balance altered

C. The nitrogen cycle: the process of nitrogen fixation; the role of micro-organisms in nitrification and denitrification

Section 323. Vital processes at the molecular level

[for Part Three headnote see page 130
for Division II headnote see page 144]

The articles and parts of articles referred to in Section 323 deal with five main subjects: A, the cell membrane; B, bioelectricity; C, the nerve impulse; D, muscle contraction; and E, bioluminescence.

The outline of subject A begins with the biochemical constituents and properties of cell membranes and with their function in the life of the cell. It goes on to treat the movement of water across cell membranes, and the role of selective permeability of membranes in the regulation and control of the movement through them of substances other than water.

Subject B is bioelectricity—the generation or action of electric currents in biological processes. The outline treats the range and types of biopotentials; the factors required to establish a bioelectric potential; the specialized properties of excitable cells; the electrical changes induced in stimulated cells; and the bioelectric effector organs in fishes such as eels, in endocrine systems, and in central nervous systems.

The outline of subject C, the nerve impulse, treats the structure of the nerve cell, or neuron; the characteristics of artificially stimulated nerve fibres; the nature and transmission of the nerve impulse; and the ways by which the nerve impulse is studied.

Subject D is muscle contraction—the conversion of chemical energy to work. The outline begins with contractile or motile activity of some type as a characteristic of all living things. It goes on to deal with the striated, or skeletal, muscle in higher animals, treating the structure and levels of organization of the muscular system; nerve–muscle communication; the physical aspects of muscle contraction; the energy transformations and metabolic pathways supporting energy events; and the molecular basis of contraction. The outline next treats the structure, organization, mechanical properties, and metabolic activities of the involuntary cardiac muscles. Finally, it treats the many nonstriated, or smooth, muscles, which form the visceral musculature of vertebrates, but which perform both bodily and visceral movements in lower animals such as worms.

Subject E is bioluminescence—the conversion by organisms of chemical energy to light energy. The outline first treats the significance of bioluminescence in studies of behaviour and of metabolism, and the use of the luminescent reaction of the firefly in biological research. It then treats the range and variety of bioluminescent organisms and the biochemical events involved in light emission.

A. The cell membrane: the barrier between the cell and its environment and between structures within the cell

1. The nature of membranes
   a. Biochemical constituents of membranes
   b. Properties of membranes; *e.g.*, electrical properties
2. Compartmentalization of the cell: protection, by membranes of limited permeability, of internal structures, or organelles, from the activities of other organelles and from the activities of the ground substance of the cell
3. Movement of water across cell membranes: osmosis
4. Movement of solutes through membranes in response to a concentration gradient
   a. Methods of studying permeability: measurement of the rates of uptake or exit of solutes from cells
   b. Factors that influence permeability; *e.g.*, molecular size and electrical charge of the substance being transported; membrane structure
   c. Facilitated diffusion: the concept of a mobile carrier that combines with the substance and carries it through the membrane; exchange diffusion as a special case of facilitated diffusion
5. Movement of solutes through membranes independent of concentration gradients
   a. Active transport: metabolically linked (*i.e.*, energy-requiring) transport across a membrane

	articles	article sections	other references
b. Pinocytosis: engulfment by a cell of a droplet of the medium surrounding it and the formation of a membrane-bounded body (vesicle) that can be carried into and across the cell		**11**:884e–g	
B. Bioelectricity: the range of phenomena that occur in the generation or action of electric currents in biological processes, as signalling in nerves or triggering of physical processes in muscles	BIOELECTRICITY **2**:998–1000	**6**:607e–609b	**12**:970a–974b *passim*

Division III. The structures and functions of organisms

[for Part Three headnote see page 130]

Division I dealt with the nature, origin, evolution, distinctive properties, and classification of living things. Division II dealt with the molecular level of biotic organization.

The outlines, and the articles and parts of articles referred to, in the nine sections of Division III deal with life at the cellular level and at the organismic level.

Section 331, concerned with the cellular basis of biological form and function, treats cell theory and cell classification, the design of cells, the functional aspects of cells in life, the cell cycle, and fertilization.

Section 332, concerned with the relation of form and function in multicellular organisms, treats the basic structure and levels of biological organization; the classification, organization, and main function of the tissues of plants and of the tissues of animals; plant organs and organ systems; and animal organs and organ systems.

Section 333, concerned with the coordination of vital processes, treats homeostasis, the maintenance of steady states in biological systems; reception and processing of sensory information; invertebrate and vertebrate endocrine systems; invertebrate and vertebrate nervous systems; and the phenomena of biological periodicity.

Section 334 treats integumentary systems, skeletal systems, and muscular systems.

Section 335 treats the basic features of nutrition, the production of food in green plants, and digestion and digestive systems.

Section 336 treats respiration and respiratory systems, circulation and circulatory systems, and elimination and excretory systems.

Section 337 treats the several forms of reproduction and their comparative adaptive significance; the origin and adaptive significance of sex and sexuality; reproductive systems in plants; and reproductive systems in animals.

Section 338 first deals with the nature, scope, types, and general systems of biological development. It goes on to the constituent processes of development—growth, morphogenesis, and differentiation. It then treats plant development and animal development, aging and decline in animals, and, finally, specialized patterns of development.

Section 339 deals with heredity. It treats the Mendelian laws; the gene–chromosome theory of heredity; the interaction of heredity and environment; heredity in the evolutionary process; and various applications of genetics.

Section 331. The cellular basis of form and function 155
332. The relation of form and function in organisms 157
333. Coordination of vital processes: regulation and integration 161
334. Covering and support 164
335. Nutrition: the procurement and processing of nutrients 167
336. Gas exchange, internal transport, and elimination 168
337. Reproduction and sex 172
338. Development: growth, differentiation, and morphogenesis 175
339. Heredity: the transmission of traits 179

Section 331. The cellular basis of form and function

[for Part Three headnote see page 130
for Division III headnote see page 154]

The articles and parts of articles referred to in Section 331 deal with five main subjects: A, cell theory and classification; B, the design of cells; C, functional aspects of cells in life; D, the cell cycle; and E, fertilization.

The outline of subject A, after dealing with the historical background of cell theory, treats challenges to and revisions of the cell theory in the light of new knowledge. Dealing with the classification of cells, the outline treats comparisons between cells and viruses, and between procaryotic and eucaryotic cells; tissues as providing a functional classification of cells; the cells and tissues of animals and of higher plants; and comparisons between animal cells and plant cells.

The outline of subject B begins with the cell as a molecular system and treats the macromolecules and the small molecules in cells. It then treats the sizes, shapes, and morphological elements of cells.

The outline of subject C begins with the cell's internal environment and the cell matrix, and with the functions of the cell's surface membrane. It goes on to the interplay of nucleus and cytoplasm and to the kinds of cell movement. Finally, it treats the evolution of multicellular life—the means by which cells can combine, communicate, and contribute to the survival of societies of cells.

Subject D is the cell cycle—the doubling of a cell in size by growth, and then the division into two cells, which double in size and again divide. The outline begins with the characteristics of the growth process. It then treats the stages and products of the two kinds of nuclear division: mitosis, which distributes replicas of the parent chromosomes to the daughter cells; and meiosis, which produces daughter cells with half the number of chromosomes of the parent cell.

Subject E is fertilization—the fusion of male and female sex cells to form the primary nucleus of an embryo. The outline treats the characteristics of the mature egg; the events of fertilization; the biochemical analysis of the events of fertilization; and the structural and behavioral accessories to fertilization.

Section 332. The relation of form and function in organisms

[for Part Three headnote see page 130
for Division III headnote see page 154]

Section 331 dealt with the individual cell and with the cellular basis of biological form and function. Section 332 initiates the presentation of knowledge about multicellular organisms, which is continued in the remaining sections of Division III.

The articles and parts of articles referred to in Section 332 deal with five main subjects: A, basic structure and levels of organization; B, the tissues of plants; C, the organs and organ systems of plants; D, the tissues of animals; and E, animal organs and organ systems.

The outline of subject A first treats such general features of biological form and function as the differences of energy flow in living and nonliving structures; the nonrandom character of living structure; and the significance of Newton's laws of motion, of static forces, and of simple machines to biological systems. It then deals with the biomechanical limitation of body sizes and the determination of basic body patterns. It next treats the incorporation of simple mechanisms into complex systems for the transformation of certain types of energy. Finally, it treats evolutionary changes in form and function, dealing especially with the emergence of increasingly more orderly and complex levels of biotic organization.

The outline of subject B first deals with the relatively undifferentiated tissues of nonvascular plants, such as fungi and lichens, which lack true roots, stems, leaves, and organized conducting systems. It goes on to treat well-differentiated tissues in vascular plants: first, the formative, cell-producing tissues called meristems; and then the mature tissues—dermal (protective) tissues, vascular (water- and food-conducting) tissues, and the fundamental or ground tissues composing the axis of most plants.

Subject C is the organs and organ systems of plants, such as the

shoot system and the root system. The outline first treats the development of organs in vascular plants, covering the growth and tissue organization of the stem, the leaf, and the root. It then deals with the physiology of the organs in vascular plants, and the structural adaptations of organs and organ systems to meet the needs of the whole autotrophic (self-nourishing) organism. It goes on to the varieties of shoot, root, and reproductive systems. After dealing with the analogues of stem, leaf, and root in nonvascular plants, the outline concludes with the evolution of plant organs and organ systems as disclosed in the fossil record.

The outline of subject D, after referring to anatomical and embryological classifications of animal tissues, proceeds to a functional classification. It treats tissues used for assimilation, storage, transport, and excretion; coordinating tissues, nervous and sensory tissues, and endocrine tissues; tissues for support and movement, such as those of bone and muscle; reproductive tissues; hemopoietic tissues, which produce the cellular components of blood; and the various kinds of tissue fluids, such as lymph and cerebrospinal fluid.

The outline of subject E begins with the characteristics of the several specialized organ systems relating the organism to the environment primarily; those serving cell metabolism primarily; and those serving genetic continuity primarily. It goes on to the functional interdependence, coordination, and control of the organ systems. It next deals with the embryonic origins of individual systems and their appearance during development. Finally, it treats the evolution of organ systems as disclosed in the fossil record.

Section 333. Coordination of vital processes: regulation and integration

[for Part Three headnote see page 130
for Division III headnote see page 154]

The articles and parts of articles referred to in Section 333 deal with five main subjects: A, the maintenance of steady states in biological systems; B, information reception and processing; C, endocrine systems in animals; D, nervous systems in animals; and E, biological periodicity.

The outline of subject A begins with the nature of homeostatic systems, treating the comparison of self-regulatory devices in mechanical and biological systems, the pattern that identifies a homeostatic system, and the limits of homeostatic regulation. It goes on to treat the different homeostatic processes; their coordinated control for homeostasis in the organism as a whole and in natural biological communities; and the origin and evolution of homeostasis. The outline next deals with the individual adjustments to gradual changes in the environment—adaptive responses, collectively called responses of acclimatization, to environmental changes in temperature, illumination, humidity, salinity, and pressure. Finally, it deals with dormancy, an inactive state accompanied by a lower than normal rate of metabolism and a mechanism used by some organisms to avoid stressful environmental conditions. It treats the general adaptive value of dormancy, the environmental variables that can cause it, and the types of dormancy states and associated mechanisms in different kinds of organisms.

The outline of subject B begins with two classifications of sensory systems—one, according to the surface or internal location of the receptors; the other, according to the various types of stimuli, into photoreception, thermoreception, chemoreception, mechanoreception, and sound reception. It then treats the evolution of sensory systems, and sensory information as involving interactions between adjacent sense cells and sensory neurons.

The outline of subject C begins with the general characteristics and functions of hormonal coordination. It goes on to the structure and function of vertebrate endocrine systems and of invertebrate endocrine systems. Finally, it treats the comparative, adaptive, and evolutionary aspects of endocrine systems.

The outline of subject D begins with the comparison of chemical and nervous regulation. It then treats the cytoplasmic responsiveness to a stimulus, or irritability, common to every living cell; organelle systems, which channel responsiveness at the subcellular level within more complex protozoans; and nervous systems, which channel responsiveness at the cellular level within multicellular organisms. The treatment of invertebrate nervous systems covers theories of the evolutionary origin of the nervous system; the diffuse nervous systems found in coelenterates; and the trend, in the evolution of nervous systems, toward concentration, centralization, and cephalization of the nervous functions. The treatment of vertebrate nervous systems begins with the central nervous system, including the brain and its components, the spinal cord, the brain coverings, cavities, cerebrospinal fluid, and the neuroglia, or non-nervous tissue. It goes on to the peripheral nervous system, in which smooth muscles, heart muscle, and glandular tissues are innervated. The outline of subject D further treats the embryonic development, the evolution, and the biodynamics of the vertebrate nervous system.

Subject E is the biological clock: rhythmicity of organismic activity. The outline begins with rhythms, such as those of breathing or of heartbeat, that are without apparent external correlates. It goes on to rhythms definitely correlated with natural geophysical cycles—solar-day, lunar-tidal, monthly, annual or seasonal, and epochal rhythms. Finally, it attempts to analyze the nature and mechanisms of biological rhythms, and the factors that affect biological periodicities.

Section 334. Covering and support

[for Part Three headnote see page 130
for Division III headnote see page 154]

The articles and parts of articles referred to in Section 334 deal with three main subjects: A, the body covering; B, the body skeleton; and C, the body musculature.

The outline of subject A begins with the major common functions and adaptive character of the coverings, or integuments, of organisms. It goes on to treat the poorly defined integuments of

lower, nonvascular plants; the structure and organization of the integuments of higher, vascular plants; and the cellular components and noncellular coatings of the invertebrate integuments. It next deals generally with the vertebrate integumentary system, the only boundary covering to attain the complexity of an organ system, providing not only protection from the environment for the tissues beneath it, but also a sensory grid for communication with it. It treats not only the character and relations of the two skin layers, the epidermis and the dermis, but the wide array of derivatives and appendages that have appeared among the various classes of vertebrates. It then covers, comparatively and descriptively, the integuments of various classes of vertebrates in the order of their position on the evolutionary scale. Finally, it treats the embryology, evolution, and biodynamics of vertebrate skin.

The outline of subject B first deals with the major functions of the body skeleton: the primary supportive function and, in some animals, its role in providing protection, facilitating movement, and aiding certain sensory functions. It goes on to the principal types of skeletal elements: so-called hard, cuticular structures, semirigid structures, connective tissue, hydrostatic structures, elastic structures, and buoyancy devices. The treatment of the invertebrate skeleton covers the skeletomusculature of a mobile coelenterate, such as a sea anemone or a jellyfish; of earthworms; of arthropods, such as insects and spiders, and of echinoderms, such as the starfish. The treatment of the vertebrate skeleton covers the variations associated with each vertebrate class and with particular problems of adaptation; the embryology of vertebrate skeletons; the vertebral column and thoracic skeleton; and the appendicular (limb) skeleton. Finally, the outline deals with joints in vertebrates and invertebrates and with the properties and development of bone.

The outline of subject C begins with the several roles played by muscle systems in animal life and with the arrangement and gross function of muscle tissues. It goes on to the characteristics of simple contractile systems and to the kinds of complex contractile tissues, varying in the rates of contraction they undergo. Finally, it treats the comparative structure and function and the evolution of invertebrate and vertebrate muscle systems and muscle system variations among classes of vertebrates.

Section 335. Nutrition: the procurement and processing of nutrients

[for Part Three headnote see page 130
for Division III headnote see page 154]

The articles and parts of articles referred to in Section 335 deal with three main subjects: A, the basic features of nutrition; B, the production of food in green plants; and C, the procurement and processing of nutrients by animals.

The outline of subject A begins with the distinction in mode of nutrition, basic in the food cycle of the biosphere, between autotrophic organisms, those that can make their own organic substances from inorganic nutrients; and heterotrophic organisms, those that require a supply of organic nutrient compounds from other living organisms. After dealing with the nutritional evolution of living organisms, the outline goes on to essential nutrients—the compounds that cannot be synthesized by an organism and must be supplied in food. It treats the determination of essential inorganic and essential organic nutrients, and the comparative magnitudes of the requirements for different types of nutrients. Finally, it treats syntrophism—the nutritional interrelationships in which the immediate or end products of metabolism of one organism may provide essential nutrients for another.

Subject B is the production of food in green plants. The outline treats the components and products of photosynthesis; the evolution of photosynthesis; the factors affecting the rate of photosynthesis; the mechanisms of photosynthesis; and the process of photosynthesis, producing carbohydrates through the agency of chlorophyll.

Subject C is the procurement and processing of nutrients by animals. The outline, after again referring to the contrast between autotrophs and heterotrophs, deals with the different ways of obtaining nutrients—by absorption directly from the environment and by the ingestion of bulk food. It then goes on to the alimentary system in animals other than man. It first deals with the organization, function, and special adaptations in invertebrate digestive systems, covering vacuolar, channel-network, saccular, and tubular digestive systems. The treatment of the basic structure and functions of vertebrate digestive systems covers the oral cavity, the teeth, and the pharynx; the esophagus and the stomach; the small intestine, pancreas, and liver; and the large intestine. Finally, the outline treats the embryology, the evolutionary development, and the biodynamics of vertebrate digestive systems. The outline concludes by indicating that the human alimentary system is treated in Section 422.

Section 336. Gas exchange, internal transport, and elimination
[for Part Three headnote see page 130
for Division III headnote see page 154]

The articles and parts of articles referred to in Section 336 deal with six main subjects: A, gas exchange and breathing; B, circulation; C, the transport system in animals; D, transport of materials in plants; E, elimination; and F, excretion.

The outline of subject A begins with the biological significance of breathing and with the varying composition and physical characteristics of water and air in the environment, which affect the range of respiratory problems faced by aquatic and terrestrial animals. It goes on to the basic types of respiratory structures, covering insect respiration by tracheae, the gill breathing of invertebrates and vertebrates, and lung breathing in higher animals. It further treats the dynamics of respiratory mechanisms; the control of respiration; and the processes of adaptation to special conditions, such as prolonged submersion in water or activity at high altitudes.

The outline of subject B begins with the biological significance of circulation and with a comparison of the circulation of blood in animals with the movement of fluids through plants. It goes on to circulation and transport patterns, covering the streaming movement of fluid cytoplasm in single cells and the major roles and modes of circulation in multicellular animals. It next deals with the fluid media involved in circulation, covering the evolu-

tionary origins of circulating fluids; plasma, the fluid part of the circulating medium; the formed elements of the circulating fluid; and lymphocytes and lymph in vertebrates.

The outline of subject C begins with invertebrate circulatory systems, covering circulation in sponges and coelenterates, circulation in acoelomates, such as flatworms, and circulation in coelomates, such as mollusks. Dealing with the vertebrate circulatory system, the outline treats the common ancestral plan, evolutionary trends, and modifications of circulatory systems among the classes of vertebrates. It further treats coronary circulation; the embryonic development of the circulatory system; and the biodynamics of vertebrate circulation.

The outline of subject D begins with general features of the two main transport systems in highly developed land plants. Then, after dealing with the structural basis of plant transport, it treats xylem transport, phloem transport, and vascular transport.

The outline of subject E first deals with the distinction between types of waste-disposal processes, the biological significance of elimination, and the distinction between metabolic and nonmetabolic wastes. It then treats specific elimination mechanisms—the alimentary canal, the respiratory system, and the kidney; and nonspecific mechanisms for the elimination of heat, toxic substances, and particulate wastes. Finally, after a comparative overview of elimination schemes at the different levels of biotic organization, the outline treats the utilization of the waste products of all living systems in the various ecological cycles.

Subject F is animal excretion—the term confined here to the elimination of the nitrogenous by-products of metabolic processes. The outline first treats the role of osmotic pressure in the excretory system; the homeostatic role of that system in regulating the water–salt balance; and the principal excretory structures. It then treats the five main types of excretory organs in the higher invertebrates, and the structure, function, and evolution of the excretory systems in the different classes of vertebrates.

Section 337. Reproduction and sex

[for Part Three headnote see page 130
for Division III headnote see page 154]

The articles and parts of articles referred to in Section 337 deal with four main subjects: A, the forms of reproduction and their comparative adaptive significance; B, the nature and role of sex; C, the reproductive system in plants; and D, the reproductive system in animals.

The outline of subject A, after distinguishing the levels of reproduction, first treats the replication of virus molecules at the expense of host molecules, and reproduction in single-celled organisms. Dealing with multicellular organisms, it treats vegetative, or asexual, reproduction; sexual reproduction; and variations of gametic reproduction, such as parthenogenesis. Finally, it treats the evolutionary significance of the different modes of reproduction.

The outline of subject B first deals with the distinctions between sex, sexuality, and reproduction. It then treats certain nuclear exchanges, or recombinations, in viruses and bacteria that are sexlike in character; the adaptive and evolutionary significance of sex; and the superiority of the sexual mode of reproduction in producing and controlling the variations on which natural selection comes to bear. Dealing with the origin of sex and sexuality, the outline covers the evidence for the early evolution of sex cells; the development of specialized reproductive tissues and of associated structures for delivering functional sex cells at the appropriate time and place; the process of mating; and the elaboration of courtship behaviour that facilitates mating between potential partners. It next deals with the forms and functions of secondary sex differentiation and with seasonal or periodic sexual cycles. Finally, dealing with the determination of the sex of individuals, the outline treats the decisive determination of the sex, in most species of animals, by means of chromosomal distribution at the time of fertilization; abnormal chromosome effects; the effects of parthenogenetic development; and the environmental and hormonal influences on sex determination.

The outline of subject C begins with the different effects in plants of asexual systems and sexual systems. It goes on to treat the sex organs of bryophytes (liverworts and mosses); the complex variations of sex organs in tracheophytes, in which the union of sex cells results in individuals or tissues called sporophytes; and variations in reproductive cycles. Finally, it treats the physiology of reproduction and the influence of internal and environmental factors on the maturation of sporophytes and gametophytes.

Subject D is the reproductive system in multicellular animals, exclusive of man. The outline begins with general points about the evolution of animal reproductive systems and about the synchronization between the total behaviour of animals and their reproductive activity. Dealing with the reproductive systems of invertebrates, the outline treats the characteristics of gonads (sex organs) at the several levels of invertebrate life; the mechanisms that aid in the union of gametes (male or female reproductive cells); the specializations associated with parthenogenesis; and provisions for the developing embryo. The treatment of the reproductive systems of vertebrates covers the gonads, structures associated with them, and their products; adaptations for internal fertilization; the role of gonads in hormonal cycles; and the provisions for the developing embryo.

Section 338. Development: growth, differentiation, and morphogenesis

[for Part Three headnote see page 130
for Division III headnote see page 154]

The articles and parts of articles referred to in Section 338 deal with seven main subjects. The first three concern development generally: A, the nature and scope of development; B, the constituent processes of development and their control; and C, development and evolution. The next two subjects involve more detailed treatment of D, plant development, and E, animal development. Subject F is aging and decline in animals. Subject G is specialized patterns of development.

The outline of subject A begins with the definition of development as the series of progressive, nonrepetitive changes that occur during the life history of an organism—a definition that distinguishes development from the essentially repetitive metabolic maintenance processes on the one hand, and from the sequence of many life histories that constitute evolutionary changes on the other. The outline goes on to the scope of development, conceived as encompassing all the processes concerned with carrying out the genetic instructions encoded in DNA (deoxyribonucleic acid). It next deals with the main types of development and with the general systems of development—the development of single-celled organisms, the closed system of animals, the open system of plants, and asexual and sexual development. Finally, it treats chemical, environmental, and nutritional factors that influence development.

The outline of subject B first deals with three constituent processes of development: growth, an increase in cell numbers or in cell size; morphogenesis, the processes by which parts of a developing system come to have a definite shape or to occupy particular relative positions; and differentiation, the processes that yield functionally specialized tissues and place them in different regions. The outline then treats the mechanisms that control and integrate the three developmental processes.

Subject C is development and evolution. The outline treats the length and timing of the reproductive phase and the recapitulation of ancestral stages; the adaptability and canalization resulting in the development of relatively invariant organisms; and genetic assimilation, the Darwinian interpretation of the inheritance of acquired characteristics.

The outline of subject D, plant development, begins generally with types of life cycles and with the alternation of generations as independent phases of the life cycle. It goes on to the preparatory events—the formation of sex cells, pollination, and fertilization. It then deals with the early development, from fertilized egg (zygote) to seedling, treating embryo formation, the independent dormant stages, and the germination of the seeds and fruits of higher plants. The treatment of the later development covers the continuation of organ formation and the development of the shoot and root systems and their derivatives. Finally, the outline treats the coordination of shoot and root development; the determination of mature form and the attainment of reproductive capacity; the seasonal adaptations of plants; and plant senescence and death.

The outline of subject E, animal development, first treats the preparatory events; embryo formation and embryonic adaptations for the maintenance of the developing embryo; and the primary and secondary organ rudiments. The outline next deals with the development of mature organs and organ systems, treating them by reference to their source in the outermost, the middle, and the innermost primary germinal layers. It concludes with the postembryonic development that brings the newborn to mature functional and reproductive capacity.

Subject F is aging and decline in animals. The outline begins with the natural history of aging, treating the relation of it to reproduction, species differences in longevity and aging, and the inheritance of longevity. It then deals with senescence in mammals, covering changes in body composition, metabolism, activity, and structural tissues; tissue cell loss and replacement; the limited growth potency of dividing cells; and changes in tissue and cell morphology. It next treats the aging of genetic information systems, of immunological systems, and of neural and endocrine systems. It next deals with external environmental agents that affect aging, and with internal metabolic causes of aging. The outline further deals with the life-span in human beings, subhuman animals, and plants. At the end an article is referred to that treats death.

Subject G involves the results of special physiological and embryological studies that supplement knowledge of the general course of development. The outline covers the modes, processes, and range of biological regenerative capabilities; healing processes and scar tissue formation; aberrant development—plant and animal malformations; twinning and multiple births; cell and tissue cultures; and the development of transplanted tissues and organs.

Section 339. Heredity: the transmission of traits

[for Part Three headnote see page 130
for Division III headnote see page 154]

The articles and parts of articles referred to in Section 339 deal with seven main subjects: A, basic features of heredity; B, Mendel's experiments and their significance; C, the physical and chemical bases of heredity; D, the combined action of heredity and environment in producing an organism; E, changing heredity; F, heredity and evolution; and G, heredity and applied science.

The outline of subject A deals with early speculations on the nature of heredity; the biological bases of heredity; and the distinction between genotype and phenotype.

The outline of subject B begins with the discovery and universality of Mendel's laws of inheritance. It then treats apparent exceptions to Mendelian inheritance, such as those posed by the discovery of polygenic inheritance and of inheritance of characters from the cytoplasm of the germ cell.

The outline of subject C begins with the concept and the physical reality of the gene, and with the proofs of the gene–chromosome theory of heredity. It goes on to recent functional and structural analyses in genetics, touching upon the nature of the genetic material, the way information is encoded in the genes, and the mechanisms that translate this information into the developmental processes of an organism.

The outline of subject D treats theories of preformation and epigenesis; the genetic causes of diseases and defects; and the genetic and environmental components of heritability.

Subject E involves the need for occasional deviations (mutations) from the precision of the copying mechanism of the hereditary material.

A. Basic features of heredity

1. Early speculations on the nature of heredity; *e.g.*, views on the relative contributions of the female and male parents, the blood theory of heredity
2. The biological bases of heredity; *e.g.*, origin of the sex cells (gametes)
3. The distinction between genotype and phenotype: the interaction of heredity and environment in the development of organisms; the noninheritance of acquired characteristics

B. Mendel's experiments and their significance

1. The deduction of the rules governing inerhitance by following the changes of one easily visible trait at a time; the distinction between dominant and recessive traits; the mechanism and ratio of gene transmission as stated in Mendel's laws
2. Universality of Mendel's laws: their application to the inheritance of many kinds of characters in most organisms; the lack of clear-cut dominance or recessiveness in many of the traits of organisms
3. Apparent exceptions to Mendelian inheritance
   a. Polygenic inheritance: quantitative inheritance depending upon the cumulative action of many genes, each of which produces a small effect
   b. Cytoplasmic inheritance: the transmission of a trait by a component of the cytoplasm of the cell
   c. Sex-linked inheritance: traits affected by genes carried on the sex chromosomes
   d. Reduced viability of certain mutant individuals: lethal and sublethal effects

C. The physical and chemical bases of heredity

1. The gene–chromosome theory of heredity and its development
   a. Early views on the transmission of heredity
   b. The relation of genes to chromosomes
      i. Chromosomes as carriers of heredity
      ii. The parallel between the behaviour of chromosomes and genes during maturation of the sex cells: segregation of genes as a consequence of segregation of chromosomes

Subject F is heredity and evolution. The outline begins with the basic concepts of population genetics: of a Mendelian population as one in which matings among individuals can occur; of a gene pool as the sum of the genes carried by individual members of the population; and of gene frequency as a measure of genetic equilibrium. It then treats the interaction of the genetic processes in Mendelian populations with natural selection and Darwinian fitness; the biological consequences of the several varieties of natural selection; the genetics of race and species differences; and the origin of new species.

The outline of subject G begins with legal applications of genetics, as in disputed paternity cases, and with the genetic counselling sought by prospective parents. It goes on to the effects of outbreeding on the vigour, viability, and fertility of the offspring, and to different theories concerning the ways by which hereditary variability is maintained in populations of sexually reproducing species. Finally, it treats genetic improvements of selected organisms, such as domestic animals.

Division IV. Behavioral responses of organisms

[for Part Three headnote see page 130]

Several of the sections in Division III dealt with the structure and internal functioning of organisms. The outlines, and the articles and parts of articles referred to, in the three sections of Division IV deal with the external actions and reactions of living things in relation to changes in their environment.

Section 341 first deals with patterns of stereotyped responses in plants and animals—unlearned behavioral reactions of organisms to some environmental stimulus. It goes on to the diversity, the classification, and the components of animal behaviour. It then treats hormonal and nervous control of behaviour.

Section 342 deals with the development and range of behavioral capacities. It first treats basic behavioral activities of individuals, such as food procurement, locomotion, and aggressive behaviour. It goes on to the types of animal learning and the behavioral and physiological aspects of animal learning. It then deals with the behaviour of animals in groups, treating animal communication, the kinds of animal societies, and the dynamics of animal social behaviour.

Section 343 deals with the evolution of behaviour. It treats evidence for the genetic determination of behaviour; phyletic patterns in the evolution of learning; and the evolutionary origins and evolutionary consequences of behaviour patterns.

Section 341. Nature and patterns of behavioral responses 182
342. Development and range of behavioral capacities: individual and group behaviour 184
343. Evolution of behaviour 189

Section 341. Nature and patterns of behavioral responses

[for Part Three headnote see page 130]

The articles and parts of articles referred to in Section 341 deal with three main subjects: A, patterns of stereotyped response; B, diverse conceptions of behaviour; and C, hormonal and nervous control of behaviour.

The outline of subject A begins with plant movements, covering tropic movements, nastic movements, nutation, and other autonomous movements. Going on to animal movements, the outline treats reflex and reflexlike activities, such as kineses, which are undirected velocity changes caused by changes of intensity in the stimulus; taxes, which are oriented locomotory reactions to various kinds of stimuli, such as moisture, heat, or light; and the characteristics and varieties of instinctive behaviour. The outline ends with photoperiodism, responses of organisms to relative length of light and dark periods, exemplified in plants by flowering, fruit-set, and abscission, and in animals by bird migration.

The outline of subject B begins with the diversity of animal behaviour and with several ways of classifying it. It then deals with the components of animal behaviour—various kinds of

stimuli initiating selective responses, and kinds of internal drives and motivations that initiate, control, and redirect behavioral changes.

The outline of subject C first deals generally with the interaction of the endocrine and nervous systems in the control of behaviour. It treats hormonal influences on such animal activities as migration, territoriality, or sexual behaviour. It then treats the nervous system in relation to behaviour—its role in receiving information, processing it in the brain and spinal cord, and initiating the appropriate response.

Section 342. Development and range of behavioral capacities: individual and group behaviour

[for Part Three headnote see page 130
for Division IV headnote see page 182]

The articles and parts of articles referred to in Section 342 deal with three main subjects: A, basic behavioral activities of individuals; B, higher behavioral characteristics of individuals; and C, the behaviour of animals in groups.

The outline of subject A treats food getting, locomotion, avoidance behaviour, aggressive behaviour, behaviour related to habitat, and behaviour related to reproduction.

The outline of subject B begins with the types of learning, the periods of sensitization during which organisms can perceive and change their behaviour as a result of their perceptions. It first treats habituation; and then, dealing with associative learning, it treats classical conditioning, trial-and-error learning, latent learning, insight learning, imitation, tool use and construction, perceptual learning, and imprinting. The outline then treats stimulus–response and cognitive mechanisms and the neurophysiological mechanisms involved in animal memory and learning.

The outline of subject C begins with distinctions between groups of social animals and groups of nonsocial ones, and with the signs of sociality. Dealing with biocommunication as a common feature of social behaviour, the outline covers the role of information, the functions and processes of animal communication, and the development and evolution of communication. The treatment of the range of social behaviour covers parental societies; societies with sexual bonds; nonfamilial social bonds, arising from spacing or swarming; and certain interspecific associations, such as symbiotic associations. Finally, the outline treats the advantages and disadvantages of animal social behaviour; the factors in its development; and the evolution of sociality.

ii. Group courtship as a way to synchronize breeding and to perpetuate the genetic superiority of the most dominant males		**16**:941a–e / **15**:689e–g	
c. Nonfamilial social bonds: social behaviour in associations not necessarily related by parental or sexual bonds		**16**:941e–942h	**3**:928b–c / **5**:911g–h
i. Spacing: the distinctions between aggregations of colonies and interactions between unrelated and unmated individuals requiring personal space or territory		**16**:941e–942a	
ii. Swarming: communal mating displays of arthropods, especially fireflies, and vertebrates such as birds; hordes of migratory locusts; flock formation in birds; herds and packs of mammals; troops among primates		**16**:942a–h / **4**:765h–766e / **10**:478d–f / **11**:403h–404a	**2**:72b–d / **10**:745g–746a / **14**:83g–h / **15**:688c–e / **19**:806a–b
d. Interspecific associations: symbiosis; complex asocial associations among animals such as flies, other insects, and birds around army ants or driver ants; mixed flocks of mammals and birds		**16**:942h–943e / **14**:838e–f	**2**:1049c–1051f *passim*
4. Dynamics of social behaviour		**16**:943e–945f	
a. A comparison of the disadvantages and the advantages accompanying social behaviour		**16**:943e–945a	
i. Disadvantages: utilization of energy and interference with activities necessary for life (*e.g.*, eating); increase in susceptibility to disease and predation and in chances for conflict		**16**:943e–g	
ii. Advantages: combining of desirable genes that might not otherwise get together, care and teaching of young, selection of habitat and shelter, avoidance of small hazards such as excessive cold, removal by grooming of parasites, and protection against predators		**16**:943g–945a	
b. Factors in the development of social behaviour: instinct and learning		**16**:945a–d / **4**:1018b–e / **10**:735g–736h	**9**:628g–629e / **10**:744c–746a / **14**:84f–g
c. The evolution of sociality: social behaviour as an adaptive advantage [see 343.C.2.d.]			

Section 343. Evolution of behaviour

[for Part Three headnote see page 130
for Division IV headnote see page 182]

The articles and parts of articles referred to in Section 343 deal with three main subjects: A, evidence of the genetic determination of behaviour; B, the influence of experience on behaviour; and C, evolutionary origins and evolutionary consequences of behaviour patterns.

The outline of subject A treats the evidence of genetic determination of behaviour afforded by selection in domestic animals and by behaviour in hybrids.

The outline of subject B first deals with learning in invertebrates and the evolution of neural structures. It then treats general features of learning in vertebrates, and a comparison of the higher animal groups in terms of the exceptional features of their learning ability.

The outline of subject C first deals with the evolutionary origins of communication, as exemplified in display behaviour, mimicry, displacement activities, or ritualization. It then treats aggressive, reproductive, migratory, and social behaviour as factors of greater or lesser influence in evolution.

Division V. The biosphere: the world of living things

[for Part Three headnote see page 130]

Division I of Part Three dealt with the nature, origin, evolution, distinctive properties, and classification of living things. Divisions II, III, and IV dealt with life at the molecular, cellular, organismal, and behavioral levels.

The outlines, and the articles and parts of articles referred to, in the five sections of Division V deal with the world of living things taken as a single system of biotic and environmental interactions and interdependencies.

Section 351 begins with the levels of organization within the biosphere and with the energy flow and the cycling of matter in the biosphere. It then deals with the interactions of the biotic and the abiotic components of an ecosystem—a collection of integrated biological communities taken together with the nonliving factors in their environments.

Section 351. Basic features of the biosphere 190
352. The community: a collection of interacting populations 192
353. Hazards of life in the biosphere: disruptions and death 195
354. Patterns of life in the biosphere 196
355. Man's place in the biosphere 200

Section 352 begins with the properties of biological populations, groups of interacting individuals of the same species; and of biological communities, which contain interacting populations of two or more species. It next treats the positive and negative intraspecific and interspecific biotic reactions in populations and communities. It then treats the structure, functioning, growth, and classification of biological communities.

Section 353 first deals with the ecology of disease and then treats the diseases of plants and the diseases of animals.

Section 354 treats terrestrial and aquatic biocycles; factors that affect the distribution of organisms; and the regional differentiation in faunal and floral distribution.

Though what is specific to human life is the subject of Part Four, the last section of Part Three, Section 355, deals with man's place in the biosphere. It treats the qualities that set man apart in the biosphere; the influence of the human species on the modification of the environment; plant and animal domestication and breeding; and the conservation of natural resources.

Section 351. Basic features of the biosphere

[for Part Three headnote see page 130
for Division V headnote see 189]

The articles and parts of articles referred to in Section 351 deal with two main subjects: A, the biosphere; and B, the ecosystem, the most inclusive unit in the biosphere. Less inclusive units, populations and communities, are dealt with in Section 352.

The outline of subject A begins with the preconditions of the biosphere—the physical and chemical facts about the Earth and the solar system that facilitate life in both the aquatic and terrestrial realms. It then sets forth the levels of organization within the biosphere: populations, made up of interacting and interdependent individual organisms of the same species; communities, composed of two or more interacting and interdependent populations; and ecosystems, more or less self-contained units of interaction between several communities and their environments. The outline next deals with the patterns of energy transformations and transfers in the biosphere. Finally, it treats the cyclic flow of the chemical materials needed for life, covering the carbon and oxygen cycles, the nitrogen cycle, the sulfur cycle, the water cycle, and the sedimentary cycles of essential minerals.

The outline of B begins with a historical review of the ecosystem concept. It goes on to the biotic components of the ecosystem—producer, consumer, and decomposer organisms linked in great food chains. It next treats the limiting effects and the influence in ecosystems of eleven abiotic components, such as pressure and temperature, water, or fire; the influence of organisms on the atmosphere, hydrosphere, and lithosphere; and the variable subregional microclimates. The outline next deals with productivity in ecosystems as a function of the rates in which energy is fixed, transformed, transferred, and reused. Finally, it treats the features of the ecosystem as disclosed by the use of models, and the stages in the development of ecosystems.

Section 352. The community: a collection of interacting populations

[for Part Three headnote see page 130
for Division V headnote see page 189]

Section 351 dealt generally with the hierarchical structure of the biosphere. The articles and parts of articles referred to in Section 352 deal in more detail with the components of the biosphere. They treat three main subjects: A, biological populations, made up of interacting and interdependent individual organisms of the same species; B, biotic interactions, the dynamic processes in the large ecological units of populations and communities; and C, biological communities, composed of two or more interacting and interdependent populations.

The outline of subject A begins with the factors that determine the distribution in biological populations of age, sex, and genetic difference, and with the reproductive and death rates that determine population densities. It goes on to the types of population growth, and to the causes and extent of fluctuations in relatively stable populations. Finally, it treats the four main types of movements—migration, emigration, dispersion, and dispersal.

Subject B is the biotic interactions that constitute the principal stabilizing, connective linkages among the various species contained in a biological community. The outline first deals with negative, or competitive, and positive, or cooperative, interactions of individuals within a species. It goes on to the range and types of interactions among members of different species, classified mainly by their effect of enhancing or reducing survival or reproduction in the species involved. The treatment of negative interactions covers such things as herbivory, predation, parasitism, and types of competition between two species utilizing a common, limited resource (such as food, space, or moisture). The treatment of positive interactions covers commensalism, an interaction in which one species benefits, without harming the other, with respect to such things as the attainment of nutrients, space or support, shelter or protection, and transport; and mutualism, associations of two different species bringing benefit or gain to both. Finally, the outline deals with the population effects of interactions, covering the effects on the numbers and thus on the state of rareness or commonness of different species, and the effects on the qualities of individuals in the populations and thus on evolutionary developments.

Subject C is the biological community, which consists of all of the organisms that live together in a given environment and, in various ways, affect one another. Dealing with the structure of communities, the outline treats the process of stratification and zonation that distribute the organisms of a community vertically and horizontally; the phenomena of periodicity correlating community activities with diurnal, lunar, seasonal, and annual changes; the interactions of species in communities competing for food sources, light, soil, space, and other resources; the position and function of a species in the community in relation to other species, or the niche of a species; and the special characteristics of ecotones—the marginal, intergrading areas between adjoining major communities, exemplified by the seashore ecotone. The outline goes on to community functioning, the energy flow in a community through the trophic levels of the food chain: producers (synthesizing plants), consumers (ingesting animals), and reducers or decomposers (bacteria and fungi). The outline next deals with the stages in the development of communities, terminating in the relatively stable communities called climax communities. It goes on to the grouping of communities into larger systems called landscapes, which consist of a pattern of ecosystems related to one another. The outline concludes with the various criteria used by ecologists to classify communities.

Section 353. Hazards of life in the biosphere: disruptions and death

[for Part Three headnote see page 130
for Division V headnote see page 189]

The articles and parts of articles referred to in Section 353 deal with three main subjects: A, the ecology of disease; B, hazards to plants; and C, hazards to animals.

The outline of subject A begins with general conceptions of disease and of death. It goes on to the metabolic defects and environmental hazards involved in noncommunicable disease. The treatment of contagious disease covers the multifactorial concept of it; diseases endemic in particular regions; diseases that occur in sporadic epidemics; and the processes that yield immunity, defense against biotic invasion.

The outline of subject B begins with the nature and economic importance of plant diseases. It goes on to the causes and stages of disease development and spread and to the variable factors affecting diagnosis of plant diseases. It next treats various kinds of noninfectious-disease-causing agents and various kinds of infectious-disease-causing agents. Finally, it deals with the principles of disease control—the disinfection of plants and seeds; eradication of an established disease agent through crop rotation and other methods; protection of the host; host resistance and selection; and therapy.

Subject C is hazards to animals other than man. (Human disease is treated in sections 423 and 424 of Part Four.) The outline begins with the historical development of veterinary medicine, the economic consequences of animal diseases, and the development of modern epidemiology as the medical aspect of ecology. It goes on to the methods for the detection, diagnosis, and treatment of animal disease. The treatment of particular animal diseases and disorders covers those that arise from bacterial infection or insect infestation; those that arise from interspecies competition and predation; and various kinds of noninfectious diseases and disorders. Finally, the outline deals with the methods of disease prevention, control, and eradication.

Section 354. Patterns of life in the biosphere

[for Part Three headnote see page 130
for Division V headnote see page 189]

The articles and parts of articles referred to in Section 354 deal with four main subjects: A, the terrestrial biocycle; B, the aquatic biocycles; C, the distribution of living things; and D, biogeographical regions and their inhabitants.

The outline of subject A first treats the land environment as a medium for life; the contrasts between terrestrial and aquatic ecosystems; and limiting factors to living on land. It goes on to descriptions of the major terrestrial communities of the Earth, called biomes, which, though they include animals, are identified from characteristic vegetation forms. It next deals with the major terrestrial life forms, classified first by habitat as soil organisms, rooted plants, animals and plants attached to the major rooted plants, and animals that move freely above the ground; and classified next by their niche or operating role in an ecosystem as producers, consumers, and decomposers, or reducers. Finally, it deals with productivity in terrestrial ecosystems—the processes by which plants and animals convert nutrients into their own kind of body substance.

The outline of subject B first deals with water as a medium for life, with the limiting factors to life in water, and with the major marine and inland divisions of the aquatic environment. Dealing with the ocean as a biological environment, the outline covers the

processes of zonation that distribute aquatic organisms vertically and horizontally; the major aquatic life forms, such as the benthos, the plankton, and the nekton; the modes of adaptation to marine conditions; and the productivity of marine communities, as judged by biological oxygen consumption or by nutrient concentration. The treatment of inland communities covers lacustrine, or standing-water, communities and riverine, or flowing-water, communities. Finally, the outline deals with boundary ecosystems, covering estuaries—the marine–freshwater border ecotones—and life along seacoasts, called the neritic habitat.

The outline of subject C first deals with broad distribution patterns and with the processes that bring about patterns within local ranges as well as large-scale patterns of distribution—regional and global. It goes on to the distinction between active, self-initiated dispersal of organisms and such passive dispersals as plant seeds carried by wind or animals, or surface organisms carried by oceanic currents; and to the dispersal abilities and environmental factors that lead to the effective colonization of new areas. Finally, it deals with hypotheses in biogeography concerning the centres of evolutionary origin of species and the environmental, geological, and human influences on their subsequent spread.

The article referred to on subject D treats the biogeographical world maps that set forth regional differentiations in faunal and floral distribution. It also describes the various biogeographical regions of the Earth, which are based on average patterns of distribution of present plant and animal species.

Section 355. Man's place in the biosphere

[for Part Three headnote see page 130
for Division V headnote see page 189]

Though what is specific to human life, health, and behaviour is separately dealt with in Part Four, on human life, this last section of Part Three deals with man's place in the biosphere. The articles and parts of articles referred to in Section 355 deal with four main subjects: A, the qualities that set man apart in the biosphere; B, the role of man in the biosphere; C, the utilization of organisms by man; and D, the conservation of natural resources.

The outline of subject A treats the structural, physiological, and behavioral characteristics that give man, despite his many dependencies on the biosphere, unique versatility for action in it.

The outline of subject B begins with the influence of man on the modification of the environment—in different types of mobile societies, in transitional sedentary societies, and in contemporary urbanized society. It goes on to the influence of the environment on the modification of the human species. It then treats man's attempts to correct heritable defects and to change genetic endowment.

Subject C is man's utilization of other living things in the biosphere. The outline begins with the domestication of plants and animals in accordance with the interests of man. It goes on to plant selection and breeding, plant growing, and the control of natural factors in support of cultivated plants. It next deals with the nutrient, industrial, medical, educational, scientific, and aesthetic uses of plants. The outline goes on to treat the cultivation of animals and the major uses of animals—as food, in industrial processes, for medicines, as labourers, in various sports, in education and research, and as pets. The outline closes with the maintenance of public and private collections of live and preserved animals and plants, articles being referred to that treat zoological gardens and aviaries, aquariums, and botanical gardens and arboretums.

Subject D is the conservation of natural resources. The outline begins with the nature and scope of conservation management. Dealing with concepts operative in conservation management, it treats the central concept of the total environment as a natural resource; the concept of rational use and sustained yield; multiple use and restoration; and issues arising from short-term versus long-term views. After dealing with the history of conservation, it goes on to the types of natural resources, using the principle of cycling time as the distinction between renewable and nonrenewable resources. It then treats resources considered to be renewable but with widely different cycling times; resources consumed by use; and resources with exhaustible sources of supply but reusable after recycling. The treatment of the management of nonliving resources covers soil ecosystem resources, water resources, air resources, and fuel and mineral resources. The treatment of the management of living resources covers wildlife management, fisheries management, multiple-use management, and agricultural management. The outline next deals with the arrangements for the management of resources that are international in character. Finally, dealing with problems created by mismanagement of resources, it treats environmental pollution, including noise pollution; soil depletion and erosion; alterations of patterns of evaporation, distribution, and availability of water; and the introduction into biological communities of foreign plants and animals that create pest problems and epidemics. It concludes by treating trends in resource conservation.

Introduction to Part Four:

The cosmic orphan

by Loren Eiseley

When I was a young lad of that indefinite but important age when one begins to ask, Who am I? Why am I here? What is the nature of my kind? What is growing up? What is the world? How long shall I live in it? Where shall I go? I found myself walking with a small companion over a high railroad trestle that spanned a stream, a country bridge, and a road. One could look fearfully down, between the ties, at the shallows and ripples in the shining water some 50 feet below. One was also doing a forbidden thing, against which our parents constantly warned. One must not be caught on the black bridge by a train. Something terrible might happen, a thing called death.

From the abutment of the bridge we gazed down upon the water and saw among the pebbles the shape of an animal we knew only from picture books—a turtle, a very large, dark mahogany-coloured turtle. We scrambled down the embankment to observe him more closely. From the little bridge a few feet above the stream, I saw that the turtle, whose beautiful markings shone in the afternoon sun, was not alive and that his flippers waved aimlessly in the rushing water. The reason for his death was plain. Not too long before we had come upon the trestle, someone engaged in idle practice with a repeating rifle had stitched a row of bullet holes across the turtle's carapace and sauntered on.

My father had once explained to me that it took a long time to make a big turtle, years really, in the sunlight and the water and the mud. I turned the ancient creature over and fingered the etched shell with its forlorn flippers flopping grotesquely. The question rose up unbidden. Why did the man have to kill something living that could never be replaced? I laid the turtle down in the water and gave it a little shove. It entered the current and began to drift away. "Let's go home," I said to my companion. From that moment I think I began to grow up.

"Papa," I said in the evening by the oil lamp in our kitchen. "Tell me how men got here." Papa paused. Like many fathers of that time, he was worn from long hours, he was not highly educated, but he had a beautiful resonant voice and he had been born on a frontier homestead. He knew the ritual way the Plains Indians opened a story.

"Son," he said, taking the pattern of another people for our own, "once there was a poor orphan." He said it in such a way that I sat down at his feet. Once there was a poor orphan with no one to teach him either his way, or his manners. Sometimes animals helped him, sometimes supernatural beings. But above all, one thing was evident. Unlike other occupants of Earth he had to be helped. He did not know his place, he had to find it. Sometimes he was arrogant and had to learn humility, sometimes he was a coward and had to be taught bravery. Sometimes he did not understand his Mother Earth and suffered for it. The old ones who starved and sought visions on hilltops had known these things. They were all gone now and the magic had departed with them. The orphan was alone; he had to learn by himself; it was a hard school.

My father tousled my head; he gently touched my heart. "You will learn in time there is much pain here," he said. "Men will give it to you, time will give it to you, and you must learn to bear it all, not bear it alone, but be better for the wisdom that may come to you if you watch and listen and learn. Do not forget the turtle, nor the ways of men. They are all orphans and they go astray; they do wrong things. Try to see better."

"Yes, papa," I said, and that was how I believe I came to study men, not the men of written history but the ancestors beyond, beyond all writing, beyond time as we know it, beyond human form as it is known today. Papa was right when he told me men were orphans, eternal seekers. They had little in the way of instinct to instruct them, they had come a strange far road in the universe, passed more than one black, threatening bridge. There were even more to pass and each one became more dangerous as our knowledge grew. Because man was truly an orphan and confined to no single way of life, he was, in essence, a prison breaker. But in ignorance his very knowledge sometimes led from one terrible prison to another. Was the final problem then, to escape himself, or, if not that, to reconcile his devastating intellect with his heart? All of the knowledge set down in great books directly or indirectly affects this problem. It is the problem of every man, for even the indifferent man is making, unknown to himself, his own callous judgment.

Long ago, however, in one of the Dead Sea Scrolls hidden in the Judaean Desert, an unknown scribe had written: "None there be, can rehearse the whole tale." That phrase, too, contains the warning that man is an orphan of uncertain beginnings and an indefinite ending. All that the archaeological and anthropological sciences can do is to place a somewhat flawed crystal before man and say: This is the way you came, these are your present dangers; somewhere, seen dimly beyond, lies your destiny. God help you, you are a cosmic orphan, a symbol-shifting magician, mostly immature and inattentive to your own dangers. Read, think, study, but do not expect this to save you without humility of heart. This the old ones knew long ago in the great deserts under the stars. This they sought to learn and pass on. It is the only hope of men.

What have we observed that might be buried as the Dead Sea Scrolls were buried for 2,000 years, and be broken out of a jar for human benefit, brief words that might be encompassed on a copper scroll or a ragged sheet of vellum? Only these thoughts, I think, we might reasonably set down as true, now and hereafter. For a long time, for many, many centuries, Western man believed in what we might call the existent world of nature; form as form was seen as constant in both animal and human guise. He believed in the instantaneous creation of his world by the Deity; he believed its duration to be very short, a stage upon which the short drama of a human fall from divine estate and a redemption was in progress.

Worldly time was a small parenthesis in eternity. Man lived with that belief, his cosmos small and man-centred. Then, beginning about 350 years ago, thoughts unventured upon since the time of the Greek philosophers began to enter the human consciousness. They may be summed up in Francis Bacon's dictum: "This is the foundation of all. We are not to imagine or suppose, but to *discover,* what nature does or may be made to do."

When in following years scientific experiment and observa-

tion became current, a vast change began to pass over Western thought. Man's conception of himself and his world began to alter beyond recall. " 'Tis all in pieces, all coherence gone," exclaimed the poet John Donne, Bacon's contemporary. The existing world was crumbling at the edges. It was cracking apart like an ill-nailed raft in a torrent—a torrent of incredible time. It was, in effect, a new nature comprising a past embedded in the present and a future yet to be.

First, Bacon discerned a *mundus alter,* another separate world that could be drawn out of nature by human intervention—the world that surrounds and troubles us today. Then, by degrees, time depths of tremendous magnitude began, in the late 18th century, to replace the Christian calendar. Space, from a surrounding candelabrum of stars, began to widen to infinity. The Earth was recognized as a mere speck drifting in the wake of a minor star, itself rotating around an immense galaxy composed of innumerable suns. Beyond and beyond, into billions of light years, other galaxies glowed through clouds of wandering gas and interstellar dust. Finally, and perhaps the most shocking blow of all, the natural world of the moment proved to be an illusion, a phantom of man's short lifetime. Organic novelty lay revealed in the strata of the Earth. Man had not always been here. He had been preceded, in the 4,000,000,000 years of the planet's history, by floating mollusks, strange fern forests, huge dinosaurs, flying lizards, giant mammals whose bones lay under the dropped boulders of vanished continental ice sheets.

The Orphan cried out in protest, as the cold of naked space entered his bones, "Who am I?" And once more science answered. "You are a changeling." "You are linked by a genetic chain to all the vertebrates. The thing that is you bears the still aching wounds of evolution in body and in brain. Your hands are made-over fins, your lungs come from a creature gasping in a swamp, your femur has been twisted upright. Your foot is a reworked climbing pad. You are a rag doll resewn from the skins of extinct animals. Long ago, 2,000,000 years perhaps, you were smaller, your brain was not so large. We are not confident that you could speak. Seventy million years before that you were an even smaller climbing creature known as a tupaiid. You were the size of a rat. You ate insects. Now you fly to the Moon."

"This is a fairy tale," protested the Orphan. "I am here, I will look in the mirror."

"Of course it is a fairy tale," said the scientists, "but so is the world and so is life. That is what makes it true. Life is indefinite departure. That is why we are all orphans. That is why you must find your own way. Life is not stable. Everything alive is slipping through cracks and crevices in time, changing as it goes. Other creatures, however, have instincts that provide for them, holes in which to hide. They cannot ask questions. A fox is a fox, a wolf is a wolf, even if this, too, is illusion. You have learned to ask questions. That is why you are an orphan. *You are the only creature in the universe who knows what it has been.* Now you must go on asking questions while all the time you are changing. You will ask what you are to become. The world will no longer satisfy you. You must find your way, your own true self."

"But how can I?" wept the Orphan, hiding his head. "This is magic. I do not know what I am. I have been too many things."

"You have indeed," said all the scientists together. "Your body and your nerves have been dragged about and twisted in the long effort of your ancestors to stay alive, but now, small orphan that you are, you must know a secret, a secret magic that nature has given to you. No other creature on the planet possesses it. You use language. You are a symbol-shifter. All this is hidden in your brain and transmitted from one generation to another. You are a time-binder, in your head the symbols that mean things in the world outside can fly about untrammelled. You can combine them differently into a new world of thought or you can also hold them tenaciously throughout a lifetime and pass them on to others."

Thus out of words, a puff of air, really, is made all that is uniquely human, all that is new from one human generation to another. But remember what was said of the wounds of evolution. The brain, parts of it at least, is very old, the parts laid down in sequence like geological strata. Buried deep beneath the brain with which we reason are ancient defense centres quick to anger, quick to aggression, quick to violence, over which the neocortex, the new brain, strives to exert control. Thus there are times when the Orphan is a divided being striving against himself. Evil men know this. Sometimes they can play upon it for their own political advantage. Men crowded together, subjected to the same stimuli, are quick to respond to emotion that in the quiet of their own homes they might analyze more cautiously.

Scientists have found that the very symbols which crowd our brains may possess their own dangers. It is convenient for the thinker to classify an idea with a word. This can sometimes lead to a process called hypostatization or reification. Take the word "Man," for example. There are times when it is useful to categorize the creature briefly, his history, his embracing characteristics. From this, if we are not careful of our meanings, it becomes easy to speak of all men as though they were one person. In reality men have been seeking this unreal man for thousands of years. They have found him bathed in blood, they have found him in the hermit's cell, he has been glimpsed among innumerable messiahs, or in meditation under the sacred bô tree; he has been found in the physician's study or lit by the satanic fires of the first atomic explosion.

In reality he has never been found at all. The reason is very simple: men have been seeking Man capitalized, an imaginary creature constructed out of disparate parts in the laboratory of the human imagination. Some men may thus perceive him and see him as either totally beneficent or wholly evil. They would be wrong. They are wrong so long as they have vitalized this creation and call it Man. There is no Man; there are only men: good, evil, inconceivable mixtures marred by their genetic makeup, scarred or improved by their societal surroundings. So long as they live they are *men,* multitudinous and unspent potential for action. Men are great objects of study, but the moment we say "Man" we are in danger of wandering into a swamp of abstraction.

Surveying our fossil history perhaps we are not even justified as yet in calling ourselves true men. The word carries subtle implications that extend beyond us into the time stream. If a remote half-human ancestor, barely able to speak, had had a word for his kind, as very likely he did, and just supposing it had been "man," would we approve the usage, the shape-freezing quality of it, now? I think not. Perhaps no true orphan would wish to call himself anything but a traveller. Man in a cosmic timeless sense may not be here.

The point is particularly apparent in the light of a recent and portentous discovery. In 1953 James D. Watson and Francis H.C. Crick discovered the structure of the chemical alphabet out of which all that lives is constituted. It was a strange spiral ladder within the cell, far more organized and complicated than 19th-century biologists had imagined; the tiny building blocks constantly reshuffled in every mating had both an amazing stability and paradoxically, over long time periods, a power to alter the living structure of a species beyond recall. The thing called man had once been a tree shrew on a forest branch; now it manipulates abstract symbols in its brain from which skyscrapers rise, bridges span the horizon, disease is conquered, the Moon is visited.

Molecular biologists have begun to consider whether the marvellous living alphabet which lies at the root of evolution can be manipulated for human benefit. Varieties of domesticated plants and animals have been improved. Now at last man has begun to eye his own possible road into the future. By delicate excisions and intrusions could the mysterious alphabet we carry in our bodies be made to hasten our advancement into the future? Already our urban concentrations, with all their aberrations and faults, are future-oriented. Why not ourselves? Is it in our power to perpetuate great minds *ad infinitum?* But who is to judge? Who is to select this future man? There is the problem. Which of us poor orphans by the roadside, even those peering learnedly through the electron microscope, can be confident of the way into the future? Could the fish unaided by nature have found the road to the reptile, the reptile to the mammal, the mammal to man? And how was man endowed with speech? *Could* men choose their way? Suddenly before us towers the blackest, most formidable bridge of our experience. Across what chasm does it run?

Biologists tell us that in the fullness of time over ninety percent of the world's past species have perished. The mammalian ones in particular are not noted for longevity. If the scalpel, the excising laser ray in the laboratory, were placed in the hands of some one man, some one poor orphan, what would he do? If assured, would he reproduce himself alone? If cruel, would he by indirection succeed in abolishing the living world? If doubtful of the road, would he reproduce the doubt? "Nothing is more shameful than assertion without knowledge," a great Roman, Cicero, once pronounced as though he had foreseen this final bridge of human pride—the pride of a god without foresight.

After the disasters of the second World War when the dream of perpetual progress died from men's minds, an orphan of this violent century wrote a poem about the great extinctions revealed in the rocks of the planet. It concludes as follows:

I am not sure I love
  the cruelties found in our blood
  from some lost evil tree in our beginnings.
May the powers forgive and seal us deep
  when we lie down,
May harmless dormice creep and red leaves fall
  —over the prisons where we wreaked our will—
Dachau, Auschwitz, those places everywhere.
If I could pray, I would pray long for this.

One may conclude that the poet was a man of doubt. He did not regret man; he was confident that leaves, rabbits, and songbirds would continue life, as, long ago, a tree shrew had happily forgotten the ruling reptiles. The poet was an orphan in shabby circumstances pausing by the roadside to pray, for he did pray despite his denial; God forgive us all. He was a man in doubt upon the way. He was the eternal orphan of my father's story. Let us then, as similar orphans who have come this long way through time, be willing to assume the risks of the uncompleted journey. We must know, as that forlorn band of men in Judaea knew when they buried the jar, that man's road is to be sought beyond himself. *No man there is who can tell the whole tale.* After the small passage of 2,000 years who would deny this truth?

Part Four. Human life

The outlines, and the articles and parts of articles referred to, in the five divisions and twenty-one sections of Part Four treat stages in the development of human life on Earth; human health and diseases; human behaviour and experience; communication and language; and aspects of man's daily life.

Several points should be noted about the relations of Part Four to preceding and subsequent parts.

The fundamental physical and chemical properties of matter were dealt with in Part One. The treatment of the Earth in Part Two encompassed those properties of the Earth that are supportive of human life. Much fundamental biological knowledge concerning human life was involved in the treatment—in Part Three, Life on Earth—of what is common to all animal life; the last section of Part Three dealt with man's place in the biosphere.

Knowledge of the biomedical and psychological aspects of human life is not wholly separable from, and is germane to, the subjects covered in Parts Five through Ten, which treat human society, the fine arts, technology, religion, the history of peoples and civilizations, and man as logician, mathematician, scientist, historian, and philosopher.

The biological, medical, and psychological sciences have been themselves the object of historical and analytical studies concerned with their nature, methods, and interrelations. These studies are set forth in Sections 10/34, 10/35, and 10/36 of Part Ten. The instrumentation involved in these sciences is dealt with in Section 723 of Part Seven.

The articles referred to in the four sections of Division I treat the taxonomy of the primates and the Quaternary Hominidae; the evolution of man; human heredity; and the races of man.

The articles referred to in the five sections of Division II treat the general conception of human health; the structures and functions of the healthy human body; the manifestation, recognition, and treatment of human disease; the diseases and disorders of the human body; and the practice and profession of medicine.

The articles referred to in the eight sections of Division III set forth discoveries and theories in the psychological sciences concerning human capacities, human behaviour, and human experience.

The articles referred to in the two sections of Division IV deal with the methods and forms of communication; with the sciences of human language and speech; and with the characteristics of the principal languages of world history.

The articles referred to in the two sections of Division V treat first the organization of human work and the provision of the daily necessities of food and drink, clothing, and shelter; and then deal with leisure and play—with man's exercises, games, hobbies, and avocations.

Division I. Stages in the development of human life on Earth 209
II. Human health and diseases 217
III. Human behaviour and experience 241
IV. Communication and language 263
V. Aspects of man's daily life 273

Division I. Stages in the development of human life on Earth

The outlines, and the articles and parts of articles referred to, in the four sections of Division I present studies in historical comparative anatomy that place *Homo sapiens* within a general taxonomy; the theory of the biological evolution of man; and studies, in genetics and physical anthropology, of human heredity and the races of man.

The articles referred to in Section 411 treat the distinguishing characteristics of the order of primates; and then, within that order, the distinguishing characteristics of the family Hominidae, which includes the species *Homo sapiens* and its extinct precursors.

Section 411. The order of primates and the emergence of Hominidae 210
412. Quaternary Hominidae 211
413. The evolution of man 213
414. Human heredity: the races of man 215

Section 412 deals with the evolution of Hominidae during the Early, Middle, and Late Quaternary periods on the evolutionary time scale, extending from around 1,000,000 years ago to around 10,000 years ago. Articles referred to treat *Homo erectus; Homo sapiens;* Neanderthal man; prehistoric Africans; prehistoric Asians; and Cro-Magnon man.

Section 413, dealing with the evolution of man, first treats man's evolutionary relationships to living primates and to fossil primates. It goes on to the discovery, range, and limitations of the hominid fossil record. It next deals with the role of genetics in the evolutionary process, and with conflicting hypotheses concerning the phylogeny of Hominidae. Finally, it treats estimates of the antiquity of man and of the chronology of hominid evolution.

The articles referred to in Section 414 treat heredity in man; survey the nature and origin of human races; and provide a geographical taxonomy of the living races.

Section 411. The order of primates and the emergence of Hominidae

[for Part Four headnote see page 209
for Division I headnote see page 209]

The articles and parts of articles referred to in Section 411 deal with two main subjects: A, the mammal order of primates generally; and B, the distinguishing characteristics of the family Hominidae, which includes man and extinct manlike creatures.

The outline of subject A deals first with the distinguishing characteristics of the primates such as their variation in size, adaptive diversity, and distribution and abundance. It goes on to treat the characteristics of primate natural history and the morphological and functional features of primates. Finally, it treats the evolutionary history of the primates as revealed in the primate fossil record, and the classification of the recent primates into the suborder of prosimians, or lower primates (lemurs, lorises, and tarsiers) and the suborder of anthropoids, or higher primates (monkeys, apes, and hominids).

The outline of subject B deals first with the anatomical, physiological, and biochemical characteristics that distinguish the Hominidae from other primates. It goes on to inferred behavioral characteristics of the hominids, such as their toolmaking capabilities, their use of language, and their social organization. It next deals with the contrasting adaptive patterns of Hominidae and Pongidae (anthropoid apes). Finally, it treats the ecological aspects of hominid origins and the morphological and inferred behavioral characteristics of hominids in the basal Quaternary Period, as well as the controversies concerning their classification.

A. The primates

1. Historical background of primate studies
2. Distinguishing characteristics of the primates: size range and adaptive diversity; distribution and abundance
3. The natural history of primate life: reproduction and the life cycle; growth and longevity; locomotion; ecology and diet
4. Form and function: distinguishing features of the primates and their differences from other mammals
   a. Vertebral column and posture
   b. Hands and feet: manipulative capabilities
   c. Dentition, snout, muzzle, and nose
   d. Brain, nervous system, and sensory perception
   e. Reproductive system
5. Evolution and paleontology
   a. Renewed interest in primate origins
   b. Primate fossil record
6. Classification of the primates: the two main groups or suborders, the prosimians (principally lemurs, lorises, and tarsiers) and the anthropoids (monkeys, apes, and man)

B. The distinguishing characteristics of the Hominidae: their differentiation from other primates
   1. Morphological characteristics

Section 412. Quaternary Hominidae
[for Part Four headnote see page 209
for Division I headnote see page 209]

The articles and parts of articles referred to in Section 412 continue the evolutionary history, carried through the basal Quaternary Period in Section 411, of the family called Hominidae, which includes *Homo sapiens* and his extinct precursors. They treat the evolution of hominids during later epochs of the Quaternary Period: A, during the Early Quaternary; B, during the Middle Quaternary; and C, during the Late Quaternary.

Subject A is Hominidae of the Early Quaternary Period, from 1,000,000 to 400,000 years ago. The outline deals primarily with *Homo erectus*, formerly called *Pithecanthropus* (ape-man). It treats first the history of the discoveries of fossil remains and the geographical distribution, the antiquity, and the distinguishing morphological characteristics of *Homo erectus*. It then deals with such inferred behavioral characteristics as the sites occupied by *Homo erectus*, and his fire using, toolmaking, and food collecting capabilities. Finally, it treats recent controversies concerning the evolutionary relationships between *Homo erectus* and *Homo sapiens*.

Subject B is Hominidae of the Middle Quaternary, from 400,000 to 100,000 years ago. The outline first treats the interpretations, from European and African fossil remains, of the morphological characteristics, especially skull and jaw structure and dentition, of the earliest populations of *Homo sapiens*. It then deals with inferred behavioral characteristics, such as the kinds of sites occupied and toolmaking capabilities.

Subject C is Hominidae of the Late Quaternary, from 100,000 to 10,000 years ago. The outline first deals with human populations from 100,000 to 35,000 years ago, treating the Neanderthal

peoples of Europe and the Mediterranean regions; the prehistoric populations of sub-Saharan Africa; and the prehistoric populations of Asia. The outline goes on to human populations of from 35,000 to 10,000 years ago. It deals primarily with the Cro-Magnon populations of Europe, covering the age and distribution of their remains, as well as their morphological characteristics, their phylogenetic affinities with other European populations, and their culture. Finally, it treats morphological and cultural evidence regarding Asia and the people of the Western Hemisphere.

A. Hominidae of the Early Quaternary: from 1,000,000 to 400,000 years ago
   1. *Homo erectus* (*Pithecanthropus*)
      a. Distribution of *Homo erectus*: discoveries in Asia, Africa, and Europe
      b. Age of *Homo erectus*
      c. Morphological characteristics
      d. Inferred behavioral characteristics
         i. Nature of occupation places: discovery sites
         ii. Evidence of the use of fire
         iii. Toolmaking capabilities: East Asian chopper-tool industries; African Acheulean industrial complex
         iv. Food-collecting techniques
         v. Evidence of ritual
      e. Recent controversies concerning the relationship between *Homo erectus* and *Homo sapiens*
   2. *Homo sapiens*
      [see B.1., below]

B. Hominidae of the Middle Quaternary: from 400,000 to 100,000 years ago
   1. Morphological characteristics of early populations of *Homo sapiens*
      a. Definition of *Homo sapiens*: the distinguishing characteristics of the species
      b. Fossil remains of *Homo sapiens*: skull structure; jaw structure and dentition; postcranial skeleton
      c. The problem of Neanderthal man: morphological diversity among the Neanderthal fossils
      d. *Homo sapiens* fossil remains from Europe: Vertesszőllős man; Swanscombe man; Steinheim man; Fontéchevade man
      e. *Homo sapiens* fossil remains from Africa: Omo man
   2. Behavioral characteristics of early populations of *Homo sapiens*: cultural remains preserved in the fossil record
      a. Occupation places, hunting techniques, and evidence of the use of fire at sites in Europe and Africa
      b. Toolmaking capabilities: stone tools associated with *Homo sapiens*
         i. Acheulean industrial complex: hand-ax cultures
         ii. Clactonian industry: flake tool cultures
   3. Methods for dating *Homo sapiens* sites and the fossils associated with these sites

C. Hominidae of the Late Quaternary: from 100,000 to 10,000 years ago
   1. Human populations from 100,000 to 35,000 years ago
      a. Neanderthal peoples of Europe and the Mediterranean regions
         i. Fossil remains of the ancestors of Neanderthal man: Neanderthals of the third interglacial period
         ii. Neanderthals of the fourth glacial period: habitations, use of fire, diet, stone technology, burial practices, and distribution of skeletal remains

Section 413. The evolution of man

[for Part Four headnote see page 209
for Division I headnote see page 209]

The articles and parts of articles referred to in Section 413 deal with four main subjects: A, man's evolutionary relationships; B, the fossil record of the Hominidae; C, the evolutionary process in man; and D, estimates of the antiquity of man and of the chronology of hominid evolution.

The outline of subject A deals with man's evolutionary relationships to living primates and to fossil primates.

The outline of subject B first deals with the discovery and recognition of *Ramapithecus*, of *Australopithecus*, of *Homo erectus*, and of Neanderthal peoples. It then treats the extent and range of the hominid fossil record.

The outline of subject C treats the role of genetics in the evolutionary process and conflicting hypotheses concerning the phylogeny of Hominidae.

The outline of subject D begins with estimates of the antiquity of man based on myth, folklore, and interpretations of religious beliefs. It then deals with estimates based on data drawn from the history of the Earth and the evolution of life, treating the relative chronologies established from stratigraphy, and the efforts at absolute age dating of fossils by estimates of the relative quantities of radioactive and ordinary carbon in fossil remains.

Section 414. Human heredity: the races of man

[for Part Four headnote see page 209
for Division I headnote see page 209]

The articles and parts of articles referred to in Section 414 deal with three main subjects: A, heredity in man; B, the nature and origin of human races; and C, race populations and their types.

Subject A is the special features of human heredity, heredity having been treated generally in Section 339 of Part Three. The outline begins with the biological basis of human heredity, covering single-factor inheritance and the inheritance of blood types. It goes on to the inheritance of behaviour traits in man, stressing the difficulty of assessing the contributions of heredity and environment. It then treats the applications of human genetics, specific behavioral traits such as intelligence and temperament, and the effects of consanguinity.

Subject B is the nature and origin of human races—subgroups within the human species, *Homo sapiens*. The outline deals first with various classifications of race: with geographical races, very large genetically different human groupings that often correspond with the major continents or great island chains; with local races, which are breeding populations within geographical areas; and with the still smaller subgroups called microraces. As aspects of racial diversity, it deals with genetic adaptations to environment and with deeply entrenched cultural differences. After dealing with old and new hallmarks of race, it treats modern measures of race—single gene traits, metabolic factors, and diseases and congenital defects. The outline next deals with the many causes that lead, through changes in gene pools, to the ongoing evolution of races—the decline and disappearance of some races and the appearance of new races. The outline concludes with problems in the study of racial traits and human genetics.

The outline of subject C, race populations and their types, first deals with the emergence of various human populations as the evolutionary result of biological and cultural selection, and with the prehistoric basis of human races. It then presents a geographical taxonomy of the living races, covering the peoples of Europe, Africa, Austronesia, Asia, India, and the Western Hemisphere.

Division II. Human health and diseases

[for Part Four headnote see page 209]

The outlines, and the articles and parts of articles referred to, in the five sections of Division II treat the general conception of human health; the structures and functions of the healthy human body; the manifestation, recognition, and treatment of human disease; the various diseases and disorders of the human body; and the practice of medicine.

The articles referred to in Section 421 treat the concept of human health; special mechanisms for the maintenance of health during stress; routine factors affecting standard values in human health; and problems associated with the cessation of life.

The articles referred to in Section 422 deal with the structures and the functions of the several organ systems, the proper coordination and regulation of which constitute the health of the human body. The articles referred to separately treat the cardiovascular system; the lymphatic system; the reticuloendothelial system; the respiratory system; the digestive system; the endocrine system; the reproductive system; the excretory system; the supportive-protective system; body cavities and membranes; the nervous system; and the composition and properties of body fluids and tissues.

The articles referred to in Section 423 first treat the general characteristics, causes, and classifications of human disease. They then treat the concepts, principles, and methods of the medical art, in the two stages of diagnosis and therapy.

The articles referred to in Section 424 encompass detailed studies of the diseases of the human body. They treat the symptoms, diagnosis, and treatment of diseases that affect the body as a whole, and of diseases that affect each of the organ systems dealt with in their healthy state in Section 422.

The articles referred to in Section 425 deal with issues relating to the professionalization of the practice of medicine—not only those internal to the profession but also those arising from the educational, economic, social, political, and legal dimensions of institutionalized medicine.

Section 421. Human health

[for Part Four headnote see page 209]

The articles and parts of articles referred to in Section 421 deal with four main subjects: A, the concept of human health; B, special mechanisms for the maintenance of health during stress; C, routine factors affecting standard values in human health; and D, problems associated with the cessation of life.

The article referred to in subject A deals with problems about the definition of human health and with issues about the ranges of normality in health.

The outline of subject B begins with the maintenance of the internal environment and the adaptation of cells to severe stress. It goes on to such bodily defenses against disease as the responses of inflammation and the immunological responses, and to the mechanisms of blood clotting to prevent hemorrhage.

The outline of subject C treats human nutrition and diet; exercise and physical conditioning; the state of sleep and its effects; and the process of aging.

The outline of subject D begins by treating various aspects of dying and death. It then covers the disposal of the dead.

Section 422. The structures and functions of the human body

[for Part Four headnote see page 209
for Division II headnote see page 217]

The articles and parts of articles referred to in Section 422 deal with the physiological basis of human health. They treat the structures and functions of the several organ systems, which, when well coordinated and regulated, constitute the welfare or health of the human body and help to ensure its reproduction.

In dealing with each of the organ systems, the articles referred to treat the structures and functions of the component parts of the system and the contribution of the system as a whole to the body's performance of vital functions. They treat the following 12 subjects: A, the cardiovascular system; B, the lymphatic system; C, the reticuloendothelial system, a network of specialized cells capable of engulfing foreign bodies; D, the respiratory system; E, the digestive system; F, the endocrine system; G, the reproductive system; H, the excretory system; I, the supportive-protective system; J, body cavities and membranes; K, the nervous system; and L, the composition and properties of body fluids and tissues, which refers to material in Section 332.

In addition to the general articles dealing with each of these subjects, more specialized articles are referred to that deal with some of the subtopics. Articles referred to in subject A of the outline treat human blood, blood groups, and blood circulation; in D, the regulation, control, and dynamics of breathing; in E, human teeth and gums, the liver, and the digestion and absorption of food; in F, menstruation, pregnancy, parturition, lactation, menopause, and hormones; in G, human embryology, postnatal development, and the mammary glands; in H, the processes of human excretion; in I, the human skeletal system, the composition and properties of bone, connective tissue, the joints, the bursae, the sinuses, the muscle system, and skin; in K, the composition and properties of cerebrospinal fluid, eye and vision, ear and hearing, and the structures and functions of other sensory receptors.

L. The composition and properties of body fluids and tissues [see 332.D.]			

Section 423. Human disease: its manifestations, recognition, and treatment

[for Part Four headnote see page 209
for Division II headnote see page 217]

The articles and parts of articles referred to in Section 423 deal with three main subjects: A, the characteristics, causes, and classifications of human disease; B, the detection and diagnosis of disease; and C, the treatment of disease. Accounts of diseases and disorders of the body as a whole, of organs and tissues, and of the various organ systems are set forth in the articles referred to in Section 424.

The outline of subject A first deals with problems concerning the definition and relation of health, physical fitness, illness, and disease. After treating the major bodily mechanisms involved in the maintenance of health, the outline goes on to the general or most common signs and symptoms of disease, conceived of as the failure of homeostatic and defensive controls. It next deals with the major categories of diseases based on their presumed etiology. Finally, it treats various classifications of diseases: topographical, by bodily region or system; anatomical, by organ or

tissue; physiological, by function or effect; pathological, by the nature of the disease process; etiological, by the nature of the origin or cause; juristic, by the speed of advent of death; epidemiological; and statistical.

The outline of subject B begins with general considerations about the nature, methods, and stages of medical diagnosis; its relation to prognosis and therapy; its growth with the development of the medical sciences; and its relation to different conceptions of disease. The outline next treats the different stages and methods of the diagnostic process: the elaboration of the patient's individual medical history; the different aspects of the physical examination—visual inspection, tactile palpation, percussive strikings, and auscultation; the many laboratory tests made possible by advances in physiological chemistry and biochemistry; multiphasic health screening, which tests for several disorders simultaneously for early detection of diseases; the uses of radiology for views of internal structures and processes; and the uses of surgical methods to obtain materials for pathological reports. The outline goes on to the importance, components, and uses of the record of a patient's medical history, to the sources of error in diagnosis, and to the procedures of autopsy.

Subject C is the treatment of disease. The outline begins with the general factors considered in the formulation of therapeutic regimens for different kinds of patients. It then covers the major therapeutic techniques, differing mainly in the types of therapeutic actions taken and the types of medication used.

A. Characteristics, causes, and classifications of human disease

1. Problems about the defining of and the relations among health, physical fitness, illness, and disease
2. Mechanisms for the maintenance of health: homeostasis, the maintenance of a constant internal environment; adaptations to stress situations; defenses against microbiotic invasions; repair and regeneration of damaged tissue or cells; clotting of blood to prevent excessive bleeding
3. Common signs and symptoms of disease conceived as the failure of homeostatic and defensive controls: abnormal temperature, pulse, and respiratory rates; increased number of circulating phagocytic white cells; high or low blood pressure; fluid and electrolytic imbalances; abnormal levels of blood sugar, blood urea, nitrogen, and serum protein
4. Categories of diseases based on presumed etiology: diseases originating from genetic constitution; congenital malformations; chemical and physical injuries; hyperreactivity of the immune system; microbiotic invasions; abnormal cell growth; hypersecretion or hyposecretion of hormones; nutritional excess or deficiency; psychogenic disorders; senescence
5. Classifications of disease and their importance: topographical, by bodily region or system; anatomical, by organ or tissue; physiological, by function or effect; pathological, by the nature of the disease process; etiological (causal); juristic, by speed of advent of death; epidemiological; statistical

B. The detection and diagnosis of disease

1. The nature, methods, and stages of medical diagnosis: the continuum of diagnosis–prognosis–treatment; progress in diagnostic arts with progress in medical sciences; concepts of disease affecting diagnosis
2. Direct evidence from the patient
   a. The medical history: the individual patient's delivery of his medical autobiography and the physician's skilled hearing or reading of it; the conjoint analysis of present pain or other symptoms, their location, extensions, and other features; the review of various body systems for specialty problems
   b. The physical examination: the physician's skilled visual inspection of the patient, unaided or aided by instruments; palpation; percussion; auscultations; miscellaneous special investigations
3. Routine laboratory examinations and other tests
   a. Laboratory diagnosis: routine laboratory tests of the many constituents and properties of blood, urine, and feces; special tests of gastric juice, cerebrospinal fluid, and of the functioning of a number of organs

Section 424. Diseases and disorders of the human body

[for Part Four headnote see page 209
for Division II headnote see page 217]

The articles referred to in Section 423 dealt generally with the conceptions of disease and with the medical arts of diagnosis and therapy. The articles and parts of articles referred to in Section 424 set forth detailed accounts of diseases. They deal with 13 main subjects: A, the symptoms, diagnosis, and treatment of diseases not confined or related to specific organ systems, or of diseases of the body as a whole; B, the symptoms, diagnosis, and treatment of diseases affecting any organ or tissue of the body; and C through M, the symptoms, diagnosis, and treatment of diseases that affect the organ systems, the structures and functions of which are treated in the articles referred to in Section 422.

The outline of subject A covers the following subjects: the several kinds and causes of physiological shock; disorders of metabolism caused by nutritional deficiencies, by endocrine diseases, by diseases of the liver and kidney, and by genetic factors; disorders related to nutritional deficiencies and excesses; fluid and electrolyte disorders; infectious diseases; childhood diseases; disorders and injuries caused by physical agents, such as injuries from electrical shock, those from exposure to extremes of temperature or to harmful radiation, and compression and decompression injuries; disorders from dehydration; poisons and poisoning; and allergy and anaphylactic shock.

The outline of subject B deals with the causes, methods of spread, and types of tumours, both malignant and benign; with hyperplasia; and with several kinds of atrophy, or wasting away of tissue.

The remainder of the outline of Section 424 covers the symptoms, diagnosis, and treatment of diseases and disorders of: C, the cardiovascular system and circulation; D, the lymphatic system; E, the respiratory system; F, the digestive system; G, the endocrine system; H, the birth process and genetic inheritance; I, the reproductive system; J, the mammary glands; K, the excretory system; L, the various parts of the supportive-protective system—bones, connective tissue, joints, muscles, and skin; and M, the nervous system, including diseases of the peripheral, autonomic, and central nervous systems, diseases of the eye and ear and other sensory receptors, and headache.

Section 425. The practice of medicine and the care of health

[for Part Four headnote see page 209
for Division II headnote see page 217]

The articles and parts of articles referred to in Section 425 deal with ten main subjects and cover issues that arise from the professionalization of the practice of medicine and from the educational, economic, social, legal, and political dimensions of institutionalized medicine.

Subject A is the educational requirements for the practice of medicine.

Subject B is the fields of specialized medical practice, research, and related disciplines, which are treated in articles referred to in Section 10/35 of Part Ten.

Subject C is the practice of medicine and surgery. The outline first deals with the kinds of professional practice, differentiated by the places and the sponsors of practice, and with the maintenance of professional standards, involving medical ethics, licensing requirements, legal arrangements regarding malpractice, and the custodial role of professional medical organizations.

Subject D is public health services. The outline first deals with the general history of public health and with recent developments in the worldwide and national organization of public health services. It then treats special fields and concerns of public health research and specialization, covering family planning and birth control; eugenics and genetic counselling; and other fields such as environmental health and epidemiology.

Subject E is the characteristics and the organization of hospital facilities and services.

In dealing with public preventive medicine, the outline of Section 425 goes on to cover these subjects: F, the control of air, water, and soil pollution, treated in articles referred to in Section 737; G, the prevention of malnutrition, involving considerations of the world food supply and the world population, and determinations of daily nutrient requirements for man under various conditions; and H, the prevention and control of infection, involving such things as vaccination and immunization, quarantines, antiseptic precautions, and the prevention and control of epidemics.

Subject I is industrial and social medicine. The outline deals first with the aims and functions of occupational health services, the kinds of exposure to disease involved in various occupations, and some representative occupational diseases. It next covers health and safety laws. Here it deals first with the history of health and safety laws through the reforms of the 19th century in regulation of working conditions and child labour, and with more recent legal developments affecting industrial medicine, such as tort liability in industrial accidents and workmen's compensation insurance. It deals next with public welfare in the 20th century, covering unemployment compensation, public assistance, social security, and compulsory national health insurance. Finally, it deals with modern health and safety legislation, treating food and drug laws, industrial safety regulations, and international public health and safety programs.

Subject J is the economics of health and disease. The outline covers the cost and the financing of medical care, and comparisons of private and public health care expenditures in various countries.

Division III. Human behaviour and experience

[for Part Four headnote see page 209]

The articles and parts of articles referred to in the eight sections of Division III set forth the discoveries and theories in the psychological sciences concerning human capacities, human behaviour, and human experience.

Section 431 treats diverse conceptions of man and of his place in the order of nature and examines the conceptual framework for the analysis of human behaviour and conscious experience.

Section 432 deals with the antecedent conditions and developmental processes affecting a person's behaviour and conscious experience. It treats the genetic factors and the environmental antecedents that affect behaviour and experience, and the general characteristics of human behaviour at the different stages of human development.

The articles referred to in Section 433 deal with the capacities by which man receives, organizes, and interprets information about his current environment that influences his behaviour. They treat the following subjects: attention; sensation; perception; the perception of time, of space, and of movement; perceptual illusions and hallucinations; and parapsychological phenomena.

Section 434 is concerned with current internal states that affect behaviour and conscious experience. It treats the determinants and manifestations of activation level; motivational states; emotional states; and transient states affecting behaviour and experience, such as sleep, dreams, hypnosis, fatigue, and intoxication.

Section 435 is concerned with persisting capacities that integrate human behaviour and conscious experience. The articles referred to treat the nature and assessment of human abilities; sensorimotor abilities; intellectual abilities; and the distribution of intelligence.

Section 436 is concerned with the development of a person's potentials by learning and thinking. The articles referred to treat diverse general theories of learning; deal separately with psychomotor, perceptual, and conceptual learning; and then treat memory and forgetting and the theories about and the types of the higher thought processes.

Section 437 is concerned with the persisting inclinations that guide and organize human behaviour and conscious experience. The articles referred to treat personal propen-

438. Personality and the self: integration and disintegration of the person as a whole 261

sities and idiosyncrasies involved in personal styles; the nature, functions, and development of attitudes; and changes of attitude as brought about by persuasion.

The articles referred to in Section 438 set forth those parts of psychology, psychopathology, and psychotherapy that consider the functioning, the integration, and the disintegration of the person as a whole. The articles treat diverse definitions and theories of personality and the self; theories of personality adjustment and maladjustment; and the diagnosis and kinds of psychiatric treatment of psychoses and psychoneuroses.

Section 431. General theories of human nature and behaviour

[for Part Four headnote see page 209
for Division III headnote see page 241]

The articles and parts of articles referred to in Section 431 deal with two main subjects. Subject A is the diverse conceptions of man and of his place in the order of nature. Subject B is the conceptual framework for the analysis of human behaviour and conscious experience. Detailed psychological studies of human behaviour are set forth in the articles referred to in the remaining sections of Division III.

The outline of subject A first treats religious conceptions of man and philosophical conceptions of man that emphasize an essential distinctness of man from all other beings in the order of nature. It goes on to conceptions of man as homogeneous and continuous with the rest of nature, according to which his allegedly distinctive capacities are explicable by evolutionary theory. The outline next deals with controversies about the adequacy of neurological explanations of man's behavioral performances and conscious experience. Finally, it treats problems raised, with regard to general conceptions of human nature, by current parapsychological research and by comparisons made of men with automata in cybernetics and information theory.

The outline of subject B covers these topics: stimulus and response, and the distinction between conditioned and unconditioned responses; the distinction between innate and acquired factors in behaviour; the distinction between observed elements of behaviour and inferred inclinations, powers, or capacities; and the distinction of the cognitive, conative, and affective dimensions of behaviour and experience.

Section 432. Antecedent conditions and developmental processes affecting a person's behaviour and conscious experience

[for Part Four headnote see page 209
for Division III headnote see page 241]

The articles and parts of articles referred to in Section 432 deal with three main subjects. Subject A is genetic endowment as mediating behaviour and experience. Subject B is environmental antecedents that affect a person's present behaviour. Subject C encompasses the general characteristics of human behaviour at different stages of human development.

The outline of subject A first treats the nature–nurture controversy about the relative weights of genetic and environmental factors in their effects on human behaviour. It next deals with genetically mediated individual differences in both bodily and psychological characteristics, and with controversies about whether human groups in relative cultural, economic, or geo-

graphic isolation differ genetically. Finally, it deals with basic innate tendencies, such as reflexes and instincts.

The outline of subject B, environmental antecedents that affect present behaviour, treats ecological factors, cultural conditioning, and early personal socialization experiences.

Subject C is the development of human behaviour. The outline deals with the broad phases of human development and with issues about "sensitive periods" in development. It next treats contrasting conceptions of development, which differ in holding the child to be active or passive, in conceiving development as continuous or as segmented into stages, and as being goal-oriented or open-ended. It goes on to differences between the psychoanalytic and the social learning theories of personality and to differing theories of intellectual development. The treatment of the specific stages in human development covers prenatal growth and development; the effects of the birth experience; and physical and psychological developments during infancy, early childhood and childhood, adolescence, maturity, and old age.

Section 433. Influence of the current environment on a person's behaviour and conscious experience: attention, sensation, and perception

[for Part Four headnote see page 209
for Division III headnote see page 241]

The articles and parts of articles referred to in Section 433 deal with nine main subjects, which fall into four groups. Subject A is environmental conditions influencing behaviour. The next three subjects are: B, attention to the environment; C, sensation; and D, perception. The following three subjects are E, the perception of time; F, the perception of space; and G, the perception of movement. The last two subjects are H, perceptual illusions and hallucinations; and I, parapsychological phenomena.

The outline of subject A first treats the effects on human behaviour and conscious experience of gross physical conditions, of various kinds of stimulus deprivation, and of dietary deprivations. The effects of social conditions are dealt with in Sections 521 and 522 of Part Five.

The outline of subject B first treats problems about the definition of attention, the development of theories of attention, and the classification of attentive phenomena. It then deals with the determinants and physiological mechanisms of attention and analysis of attentive phenomena in terms of information theory.

Subject C is sensation, the reception of information about the environment. The outline first covers general theories about the nature of human sensation, classifications of the senses, and features common to all sense organs. It then separately treats vision; audition; cutaneous (skin) senses, with special attention to the phenomena and the theories of pain; the kinesthetic (motion) sense; vestibular (equilibrium) senses; the sense of taste; and the sense of smell.

Subject D is perception—the process of translating sensory stimulation into organized experience. The outline treats questions about the nature and causal factors of perception; the principles of perceptual organization; and differences in perceptual functioning among individuals, among classes of individuals, and within individuals.

The outline of subject E, the perception of time, treats adaptations to successive events and to periodic change; the perception of sequence and of duration; and the various factors that affect time perception.

The outline of subject F treats the nature of space perception generally; the different kinds of cues for the perception of depth and distance; the interrelation of the senses in space perception; and the social and interpersonal aspects of space perception.

The outline of subject G treats the primary visual cues for perceiving self-motion and the motion of objects, and the auditory, kinesthetic, and vestibular cues for the perception of movement.

The outline of subject H treats the types of illusory experience, such as stimulus-distortion and tactual illusions, and the types of hallucination, such as hypnotic states and sensory defects.

The outline of subject I first deals with the two types of parapsychological phenomena—extrasensory perception, such as telepathy, clairvoyance, precognition, and prophecy; and psychokinetic phenomena, involving the moving of objects by willing or by "poltergeists." It then treats problems raised by various theories of parapsychological phenomena.

b. Perception of sequence: minimum and maximum intervals		**18**:422e–h	
c. Perception of duration: empty and full intervals		**18**:422h–423c / **14**:71e–72a	
3. Factors affecting time perception; *e.g.*, type of activity, level of motivation, personality traits, drugs, sensory deprivation, hypnosis		**18**:423d–424a / **14**:71e–72a / **14**:74d–75a	

F. The perception of space

1. The nature of space perception: man's orientation to his environment
2. Perception of depth and distance: gross tactual-kinesthetic, eye muscle, visual, and auditory cues
3. Interrelations among the senses
   a. Perceptual constancies: "corrections to conform to reality"
   b. Path recognition: navigation in space
4. Social and interpersonal aspects of space perception: territorial behaviour, reason in perception, and nativistic and empiricistic considerations

G. The perception of movement

1. Visual cues for perceiving self-motion and motion of objects
   a. The role of eye movements: saccadic and pursuit movements
   b. Special visual phenomena in motion perception; *e.g.*, relative movement, movement aftereffect, flicker-fusion frequency, stroboscopic effect, movement in depth
2. Nonvisual cues: auditory, kinesthetic, and vestibular cues

H. Perceptual illusions and hallucinations

1. Types of illusory experience
   a. Stimulus-distortion illusions
   b. Perceiver-distortion illusions
   c. Successive contrast illusions: the influence of a "fading trace" on subsequent perceptions
   d. Tactual illusions
   e. Anchor effect: perceptual thresholds and colour, weight, olfactory, and loudness illusions
   f. Intersensory effects: synesthesia; intersensory rivalry and facilitation
   g. Illusions of psychiatric significance
2. Hallucinations
   a. Neurological factors in hallucinations
   b. Types of hallucinatory experience
      i. Direct brain stimulation
      ii. Hallucinations associated with sleep and dreaming
      iii. Excessive excitation, sensory deprivation, and loss of sleep
      iv. Hypnotic states
      v. Sensory defects
      vi. Psychological factors: various "mental sets" conducive to hallucination
      vii. Chemical factors: effects of taking drugs

Section 434. Current internal states affecting a person's behaviour and conscious experience

[for Part Four headnote see page 209
for Division III headnote see page 241]

The articles and parts of articles referred to in Section 434 deal with four main subjects: A, general activation level; B, motivational states; C, emotional states; and D, transient states affecting behaviour and experience.

The outline of subject A deals first with the nature of activation level, its internal determinants, and such indices of it as muscle tension, heart rate, or reaction time. It next treats factors affecting activation level, covering physiological factors such as hormonal condition; the action of drugs; departures from homeostasis; cyclical variations in activity level with the times of the day, months, and seasons; the causes of individual and group differences in level of activity; and the influence of social factors, such as those that arise from competitive conditions or from the degree of involvement in a pursuit of goals. Finally, it treats manifestations of activation level, as in sensory acuity and selectivity, or as in resistance to fatigue or in quality of performance.

Subject B is motivational states—needs and desires that channel a person's behaviour and experience. The outline first deals with diverse theories of motivation, such as the psychoanalytic, the incentive, and the hedonic. It then treats specific human needs and motives, covering such subjects as achievement, anxiety, aggression, and sexual motivation. It next treats situational and interactional factors that affect the strength and the effects of motivation. Finally, it deals with recent developments in and practical applications of motivation theory.

Subject C is emotional states—bodily conditions and feelings accompanying motivation and arousal conditions. The outline begins with problems about the many meanings of the term emotion and about the several approaches to the study of emotion. It then deals with diverse conceptions of emotion and with the facial, vocal, and postural manifestations of emotions.

Subject D encompasses several different transient states that affect behaviour and experience. The outline first deals with sleep, treating the nature and developmental patterns of sleep; psychophysiological variations in sleep; the effects of general and selective sleep deprivation; and the pathology of sleep. It goes on to diverse views of the nature of dreams and to methods of studying dreams and the activities that occur during dreams. It next deals with hypnosis, covering modern theories of hypnosis, the factors involved in hypnosis, and the evaluation of the applications of hypnosis. It goes on to the nature of fatigue and the environmental and personal factors leading to fatigue. Finally, it treats transient states caused by altered body chemistry—those resulting from nutritional deficiencies; from diseases, illnesses, and impairments; from biochemical imbalances; from intoxication; from respiratory alterations; and from drugs.

Section 435. Persisting capacities that integrate human behaviour and conscious experience

[for Part Four headnote see page 209
for Division III headnote see page 241]

The articles and parts of articles referred to in Section 435 deal with five main subjects. Subjects A and B involve general treatments of the nature of human capacities and of the assessment of human abilities. Separate treatment is given to C, sensorimotor abilities, and D, intellectual abilities. Subject E is the distribution of intelligence.

The outline of subject A treats the distinction between native abilities and acquired skills, the general determinants of human ability, and the modifiability of innate potentials.

The outline of subject B treats general problems concerning psychological measurement; the many types of instruments and methods; the development of standardized tests; and the methods used for the assessment of test results.

Subject C is sensorimotor abilities—bodily skills and mechanical abilities. The outline begins with the range and variety of sensorimotor skills and with the complex set of relationships denoted by the term sensorimotor skill. It then treats the simple components of bodily skills; factors that influence the integration of sensorimotor components; and factors that influence the retention of motor skills.

Subject D is intellectual abilities. The outline first deals with diverse definitions of intelligence—biological, psychological, and operational. It next deals with empirical studies of the organization or structure of human abilities, treating, in this connection, controversies about the concept of general intelligence, of primary abilities, and of intelligence as multidimensional. The outline goes on to the percentages of human variation in measured intelligence ascribable to genetic differences and to environmental factors, and to issues about the correlation of intelligence levels with socioeconomic classes. After dealing with the devel-

opment, stages, and decline of intellectual growth, the outline concludes with the influence of computer performances on current theorizing about the nature of human intelligence.

Subject E is the distribution of intelligence. The outline first deals with the statistical characteristics of a theoretical normal distribution, which involves dense clustering around a mean on a Gaussian curve, and with the factors that cause deviations from this normal curve. It next deals with the extremes of mental retardation and superior endowment, treating in each case the different levels of retardation and superior endowment, and their prevalence; their causes; the social adjustments that the retarded and the gifted make; and the special programs devised for them. Finally, the outline deals with group differences in intelligence, treating the measurement and interpretation of differences in intelligence ascribable to age, socioeconomic class, race, occupation, and sex.

A. The nature of human capacities

1. Potentialities, abilities, and aptitudes as distinguished from acquired skills, achievements, learned performance, and knowledge
2. General determinants of human ability: the question of the relative weights of genetic endowment and environmental influences and opportunities
3. The modifiability of innate potentials
[see 436.A.]

B. The assessment of human abilities

1. General problems of psychological measurement; *e.g.*, measurement scales, validity, reliability, scoring, response sets
2. Types of instruments and methods; *e.g.*, psychophysical tests, psychometric tests, written group tests, oral individual tests, self-appraisal, appraisal by others, sociodrama, psychodrama
3. Development of standardized tests: item development and analysis, cross validation, differential weighting, and identification of norms
4. Assessment of test results: factor analysis and its alternatives; profile analysis

C. Sensorimotor abilities: bodily skills and mechanical abilities

1. The range and variety of sensorimotor skills: the complex set of relationships denoted by the term sensorimotor skill
2. Simple components of bodily skills: sensory and motor aspects; *e.g.*, stimulus duration and intensity, reaction time, movement speed, fine and gross motor skills
3. Factors influencing the integration of sensorimotor components; *e.g.*, the quality and quantity of feedback, the duration and placement of instruction and practice
4. Factors influencing the retention of motor skills; *e.g.*, the amount of rhythm involved in the task, the quality of training, incentive conditions

D. Intellectual abilities

1. Diverse definitions and conceptions of intelligence: biological, psychological, and operational definitions
2. Structural theories of intelligence: the controversy about the concepts of general intelligence, specialized abilities, and primary abilities; intelligence as multidimensional; research on creativity
3. The percentages of human variation in measured intelligence ascribable to genetic differences and to environmental factors; issues about their interpretation; correlation of intelligence levels with socio-economic classes; issues about "culture-fair" cognitive tests
4. Development, decline, and stages of intellectual growth: Piaget's overall picture of human cognitive development up to adolescence

Section 436. Development of a person's potentials: learning and thinking

[for Part Four headnote see page 209
for Division III headnote see page 241]

The articles and parts of articles referred to in Section 436 deal with six main subjects. Subject A is diverse theories of human learning. Subjects B, C, and D are, respectively, psychomotor, perceptual, and conceptual learning. Subject E is memory—the retention and the forgetting of what has been learned. Subject F is the higher thought processes.

The outline of subject A begins with problems about the definition of learning, given the range of phenomena called learning. In dealing with the state of learning theories, the outline treats various attempts at comprehensive theories of learning and behavioral theories of learning, such as attempts to discuss the conditions that produce and control behaviour. The outline goes on to major issues in learning theory, covering association and anti-association theories; differences about the role of motivation in learning; the question of whether a basic process underlies the varieties of learning; questions about the stages of learning; the role of memory in learning; and current trends in learning theory. Finally, the outline of A deals with questions about the transfer of training—the positive or negative, the facilitative or impairing, influence of training in one activity on the execution of another activity. It treats the applications in educational practice of assertions and denials that transfer is general and comprehensive. It covers experimental and physiological analyses in connection with issues about the transfer of training.

The outline of subject B first deals with the devices, tasks, and measurements used in laboratory research on human psychomotor learning. It goes on to the phenomena of psychomotor learning. The outline next deals with factors that affect psychomotor learning, such as the complexity of the task, the amount of relevant feedback received in the learning process, the effects of a proportioning of work and rest, the motive and incentive conditions, and the environmental conditions for practice and performance. Finally, the outline treats group differences in psychomotor learning and performing, based on such variables as age, sex, race, and intelligence quotient.

The outline of subject C treats the forms of perceptual learning; the factors influencing perceptual learning; and the adaptation in perceptual learning that results from exposure to contradictory sensory data.

The outline of subject D first treats the nature of concept formation; the factors that influence conceptual learning; and conceptual behaviour at various stages of human development. It then deals with language in relation to concept formation, and with the moot question of concept formation in nonhuman animals and in machines.

Subject E is the retention and forgetting of learned habits and content. The outline treats the adaptive role of remembering and forgetting; the experimental measurement of retention factors; time-dependent aspects of retention; theories of forgetting; correlates of the rate of forgetting; and such abnormalities of memory as amnesia, paramnesia, and hypermnesia.

The outline of subject F, the higher thought processes, begins with the range of psychological activities involved in thinking and with diverse definitions of thinking. It goes on to diverse theories about the roles of the several elements of thinking and to diverse theories concerning the sequence of thought processes. It next treats the motivational aspects of thinking. Finally, it deals with the types of thinking—convergent thinking, problem solving, and divergent thinking—as types of realistic thought determined by goal-directed activities; and with free association, fantasy, dreaming, and pathological thinking as types of autistic thinking, determined by subjective emotional—motivational impulses. The role of language in the higher thought processes is covered in Section 442.

A. Diverse theories of human learning	LEARNING THEORIES **10**:754–759	**6**:408f–409f / **13**:1099g–1101g	
1. Definitions of learning: the range of phenomena included in learning		**10**:754f–755e / **2**:810e–811h / **6**:408g–409f / **10**:749f–751d / **15**:161h–162h / **16**:543c–e	**10**:731a–739d *passim* / **15**:149f–g / **18**:355a–357c *passim*
2. Modern learning theories		**10**:755e–756c / **10**:737c–738c	**14**:992b–c
a. Comprehensive theories of learning: learning viewed as continuous or discontinuous; as a gradual or a one-trial process; as having a relationship to stimulus-response connections, to perceptual understanding, and to reinforcement		**10**:755e–g	
b. Behavioral theories of learning: attempts to discover the conditions that produce and control behaviour; the search for intervening variables and hypothetical constructs to describe the development of learning		**10**:755g–756c	
3. Major issues in learning theories		**10**:756c–759f	
a. Association theories: efforts to determine the synthesizing principles of laws of learning		**10**:756c–757d / **6**:408g–h	**6**:375d–e / **10**:732c–736h *passim* / **13**:1100e–f / **18**:353b–e
b. Anti-association positions: perceptual ability as an organizing principle; the error-factor theory		**10**:757d–h / **13**:1101d–g	**13**:1101a–c
c. The role of motivation in learning, practice, and performance		**10**:758a–b / **6**:408h–409b / **10**:737f–738b	**12**:564g–565c
d. The question of whether a basic process underlies the varieties of learning		**10**:758b–d / **6**:409d–e	**4**:1063a–d
e. The question of stages of learning: the implications of classical conditioning and verbal learning studies		**10**:758d–g / **8**:1137c–f	**13**:1101c–d
f. Remembering and forgetting: the role of memory in learning; the process of information retrieval; the function of proactive and retroactive inhibition in forgetting [see also E., below]		**10**:758g–759c / **10**:738d–739d / **11**:888c–889a / **11**:893c–894h	**1**:439f–g / **15**:162c–f
g. Current trends in learning theory: renewed interest in the study of inherited behaviour; the use of introspective data; the study of individual differences		**10**:759c–f / **6**:409e–f / **13**:1100g–1101a	
4. Transfer of training	TRANSFER OF TRAINING **18**:596–600		
a. Positive, negative, and zero transfer: the influence the learning of one skill has on the learning or performance of another		**18**:596g–597b	
b. Applications to educational practices: formal discipline training and the transfer of logical effectiveness; the role of general principles and identical task elements in the positive transfer of training		**18**:597c–f	**13**:1100b–c
c. Experimental analysis of factors that influence the degree and direction of training: stimulus and response similarity, task similarity, stimulus predifferentiation, transposition, learning to learn, and reversal learning		**18**:597f–599e	**11**:893d–894c
d. Developmental processes related to transfer: age differences in solving reversal-shift problems		**18**:599e–600a	
e. The physiological basis of transfer: cross education and its implications for discovering the neurophysiological foundations of learning		**18**:600a–f	
B. Psychomotor learning [see also 342.B.]	LEARNING, PSYCHOMOTOR **10**:748–754	**16**:544c–545f	
1. Laboratory research in psychomotor learning: devices and tasks that measure skilled behaviour; the validity of psychomotor measurement		**10**:749c–f / **18**:421g–422a	**10**:756c–759f *passim*

3. Meaning [see 442.B.4.]			
4. Types of thinking	THOUGHT PROCESSES, TYPES OF **18**:354–358	**8**:1140h–1142d	**18**:353b–354b
a. Realistic thinking: types of thought determined by goal-directed activities		**18**:355a–357c	**1**:151h–154h *passim*
i. Convergent thinking: processes that utilize a person's abilities to assemble and organize information; *e.g.*, judging, conceptualizing		**18**:355a–356a	
ii. Problem solving: processes utilized in exploring and organizing resources to reach a goal; *e.g.*, trial and error, insight, inductive and deductive reasoning		**18**:356a–f / **11**:72h–73g	**11**:28b–29g *passim* / **15**:147c–g
iii. Divergent thinking: processes that lead to the production of new information or previously undiscovered solutions; *e.g.*, creative thinking		**18**:356f–357a	
b. Autistic thinking: types of thought processes determined by subjective emotional–motivational impulses		**18**:357d–358g	
i. Free association: verbal responses that reflect aroused emotional impulses		**18**:357d–f	
ii. Fantasy: well-organized sequences of thinking in which sensory imagery prevails		**18**:357f–h	
iii. Dreaming: diverse views concerning the significance of autistic thinking during sleep		**18**:357h–358c / **5**:1012a–c / **9**:245d–g	
iv. Pathological thinking: general patterns or categories of thought displayed by persons with behaviour disorders, neuroses, or psychoses		**18**:358c–g / **9**:243g–244a / **11**:889h–890f	**9**:246e–g / **15**:173e–179b *passim*

Section 437. Persisting inclinations that guide and organize human behaviour and conscious experience

[for Part Four headnote see page 209
for Division III headnote see page 241]

The articles and parts of articles referred to in Section 437 deal with three main subjects: A, personal propensities and idiosyncrasies affecting behaviour and experience; B, attitudes; and C, persuasion and change of attitude.

The outline of subject A begins with the concept of personal style, treating its essential characteristics and the influence of tastes and preferences in determining personal style. It then treats individual and group styles, and personal styles in language, expressive movement, and manner of thinking.

The outline of subject B first deals with the definition of attitudes; with concepts related to attitudes; and with the cognitive, conative, and affective components of attitudes. It goes on to the instrumental, noetic, expressive, and ego-defensive functions of attitudes. Finally, it treats the factors involved in the development of attitudes, and the methods of measuring attitudes.

The outline of subject C first deals with the relationship of persuasion to communication and social control and with the distinction between verbal communication, as cause, and associated changes in attitudes and behaviour, as effects. It goes on to diverse theories of persuasion, diverse views concerning the relation between education and persuasion, and diverse views concerning the roles of perception, of motivation, and of emo-

tion in the process of persuasion. It next treats, as the components of persuasion, such factors as source, message, channel, receiver, and destination. Finally, it deals with ways of developing resistance to persuasion.

Section 438. Personality and the self: integration and disintegration of the person as a whole

[for Part Four headnote see page 209
for Division III headnote see page 241]

The articles and parts of articles referred to in Section 438 deal with four main subjects: subjects A and B are definitions of personality and the measurement of personality; subject C is personality functioning and adjustment; and subject D is persisting disturbances of personality.

The outline of subject A deals with diverse definitions and theories of personality, the concept used in psychology to stress the integrated functioning of a person as a recognizable unity with distinctive traits, drives, attitudes, beliefs, and habits. The outline treats various physiological theories that posit types of personality; psychoanalytic theories of personality; social analytic theories; and various current theories, such as role theory and factor analytic studies.

The outline of subject B deals with the methods of assessing personality and the problems of evaluating the results of different techniques of assessment.

The outline of subject C begins with the subjective aspect of personality—the stages in the development and awareness of self. It then treats the several kinds of strains put on adequate personality functioning and the various responses to environmental strains on personality functioning.

Subject D is persisting psychiatric disturbances of personality. The outline first deals with the various kinds of functional and organic psychoses—major disturbances involving loss of self-identity or of insight regarding the disorder. It next treats the several kinds of psychoneuroses, which involve distress and loss of efficiency but not loss of self-identity or insight. The outline goes on to the prevalence of psychiatric disturbances, treating their frequency in the general population and their differential incidence in various subpopulations. Dealing with psychiatric treatment, the outline covers chemotherapeutic treatment; neurophysiological treatment; the various forms of psychodynamic therapy; and the various forms of behavioral therapy and sociotherapy. Finally, it deals with the history of the treatment of the mentally disturbed and with the organization of programs and institutions of mental health to prevent psychiatric disturbances.

Division IV. Communication and language

[for Part Four headnote see page 209]

The outlines, and articles and parts of articles referred to, in the two sections of Division IV deal with the methods and forms of communication and with traditional and modern studies of language.

The articles and parts of articles referred to in Section 441 deal with the general analysis, the theoretical models, the technology, and the types of communication.

The articles and parts of articles referred to in Section 442 treat the nature and functions of language generally; the physiology of speech; phonetics; grammar; semantics; onomastics; the forms of writing; and linguistics, the scientific study of language and language development. At the end, articles are referred to that separately treat thirty-six languages and groups of languages in world history.

Section 441. Methods and forms of communication 264
442. Language 265

Section 441. Methods and forms of communication

[for Part Four headnote see page 209
for Division IV headnote see page 263]

The articles and parts of articles referred to in Section 441 deal with four main subjects: A, the process of communication; B, the technological aspects of communication; C, information systems; and D, the nature and development of public communication through print media.

The outline of subject A begins with the general analysis of communication and with theoretical models of communication—linear-quantitative and dynamic-psychological models. Dealing with the types of communication, it treats nonvocal communication; vocal communication; laughter as a form of communication; the forms and effects of mass communication; and parapsychological forms of communication. Finally, it deals with the psychology of communication, involving efforts to determine the role of communication in the modification of human behaviour.

Subject B involves communication engineering, treated in Section 10/37; and communicating devices, treated in Section 735.

Subject C is information systems. The storage, manipulation, and retrieval of information are dealt with in Section 735. Indication is made of the sections that deal with accounting, inventory control, and medical information systems. The articles and parts of articles referred to in Section 441 treat libraries as information systems, including the "classical" library, the automated library, and the science of library systems; dictionaries and lexicons; encyclopaedias; and atlases and map collections.

Subject D, the nature and the development of public communication through print media, deals with the nature of publishing and the characteristics and development of book publishing, newspaper publishing, and magazine publishing.

Section 442. Language

[for Part Four headnote see page 209
for Division IV headnote see page 263]

The articles and parts of articles referred to in Section 442 deal with five main subjects: A, the nature and functions of language; B, the structure of speech and language; C, written language; D, linguistics; and E, the classification of languages.

The outline of subject A begins with definitions of language, social attitudes about language, and historical and political uses of language. It goes on to the complex nature of language structure and composition, to the nonverbal dimensions of language, and to such variations of verbal language forms as dialects, slang, and pidgin. It next treats the functions of language—in intellectual work and communication, and for the expression of emotions and attitudes. It further treats the relation of language

to culture; the nature of language learning and literacy; writing systems as extensions of language; and the factors operative in linguistic change.

The outline of subject B begins with the physiology of speech, treating the production of voice sounds, the production of speech, and speech disorders. The treatment of phonetics covers standards of pronunciation; articulatory, acoustic, linguistic, and experimental phonetics; and the history of phonetics. The outline next deals with grammar. It treats diverse conceptions of grammar; the development of the study of grammar; the question of grammaticality; models of grammatical description; and features of grammatical analysis. The outline goes on to semantics. Here it first treats philosophical views on meaning, in relation to reference, truth, use, and thought. It then deals with meaning in linguistics, covering semantics in language theory and in language learning, lexicography, and generative semantics. The outline of subject B concludes with onomastics, the study of personal names and place-names.

Subject C is written language: systems of notation. The outline first deals with the nature, evolution and typology, and general characteristics of writing systems. Dealing with specialized forms of written notation, articles are referred to that separately treat hieroglyphics, Braille, cryptology, and shorthand. The outline concludes with the scope, methods, and historical development of the study of writing. It treats the component and cognate disciplines involved in such study; cross-disciplinary studies of writing; and the development of punctuation systems.

Subject D is linguistics—the scientific study of language and language development. The outline first deals with the nature, scope, and historical development of linguistic theory. The treatment of the methodology distinguishes the various linguistic methods concerned with the analysis of language at any given time from the methods concerned with the historical development of language and of language change between successive points in time. Finally, the outline deals with the relationship of linguistics to other disciplines. It treats psycholinguistics, sociolinguistics, linguistic anthropology, linguistic geography, computational linguistics, mathematical linguistics, and the analysis of language by the literary critic, the philosopher, and the educator.

Subject E is the classification of the languages of the world. The general article first referred to treats the methodology of language classification. Articles then are referred to that separately treat thirty-six languages and groups of languages, covering languages spoken in Europe and areas of European colonization; languages of Asia and Oceania; languages of Africa and the Middle East; Indian languages of the Americas; and five extinct languages. At the end the outline treats constructed languages—special international or universal languages, such as Esperanto, Interlingua, or Basic English; and machine languages, such as Fortran or Algol.

Division V. Aspects of man's daily life

[for Part Four headnote see page 209]

The outlines, and the articles and parts of articles referred to, in the two sections of Division V treat the means of subsistence and the forms of play.

Section 451 treats the conditions of work and its environmental and economic effects. It then deals with the daily necessities and with the human actions taken for the satisfaction of the needs for food and drink, for clothing, and for shelter.

In Section 452, articles are referred to that separately treat physical games and sports; the forms of mental exercise and play; and the kinds of hobbies.

Section 451. The means of subsistence 273
452. Leisure and play 275

Section 451. The means of subsistence

[for Part Four headnote see page 209]

The articles and parts of articles referred to in Section 451 deal with two main subjects: A, human work; and B, the daily necessities and the human developments to which they give rise.

The outline of subject A treats the organization and the physical environment of work; diverse conceptions of the effect of technology on man's environment; and the production and consumption of wealth.

The outline of subject B begins with food and drink. It covers man's need for food; the basic foods and drinks; the world's food supply; the preparation of food and drink; ways of partaking of food and drink; and the nonmedicinal uses of drugs. Going on to clothing and adornment, the outline treats the major sources of human clothing; the history of the design and use of clothing and adornment; special types of clothing and body coverings; and various methods for the adornment and decoration of the body. The treatment of shelter deals with the effects of the materials used and with the effects of climate on dwelling styles and designs; the exterior design of buildings and their environment; environmental control within buildings; and the interior decoration of buildings.

Section 452. Leisure and play

[for Part Four headnote see page 209
for Division V headnote see page 273]

The articles and parts of articles referred to in Section 452 deal with four main subjects: A, the creative pursuits of leisure; B, physical exercise and play; C, mental exercise and play; and D, hobbies and avocations.

With regard to subject A, cross-references are made to the sections in Part Five and in Part Six that deal with the various ways in which leisure is creatively pursued.

The outline of subject B begins with the early history, development, and functions of games and other forms of physical exercise. It goes on to deal with Classical athletic games and contests, modern regional games, and modern Olympic Games. It next treats amateurism and professionalism in sports. Articles are then referred to that separately treat major team and competitive sports. Articles are next referred to that separately treat major outdoor recreational activities—camping, sport fishing, sport hunting, mountaineering, and riding and horsemanship. Separate treatment is given to the sports and games of children.

Subject C is mental exercise and play—games, gambling, and mental recreation. After treating the history of games, the outline deals with the history, the theory, the prevalence and control, and the principal kinds of gambling, for example, betting and bookmaking, and lotteries. Articles are then referred to that separately treat games for recreation and gambling—card games, dice games, board and tile games, word and letter games, and mathematical and number games.

The outline of subject D first deals with the evolution and growth of hobbies. It then treats kinds of hobbies—those related to art, such as painting or music; to the past, such as antique collecting; to nature, such as bird-watching; and to handicrafts, such as needlework or woodworking.

d. Hobbies relating to handicrafts: modelmaking, needlework, ceramics, and woodworking		**8**:979c–980g	

Introduction to Part Five:

Man the social animal

by Harold D. Lasswell

We are part of society when we share in comprehensive arrangements for living with one another and for managing the environment. The simplest societies are the primitive bands who to this day live in jungles and deserts, and on isolated mountains and beaches around the globe. The most complex technological societies bind the world's cities together as part of an evolution that, barring catastrophe, is forming a planetary society of mankind.

Whether primitive or civilized, all societies must cope with the parallel problems that are generated by the urgencies of human nature and the necessities of a common life. Arrangements are made for kinship and procreation; for safety, health, and comfort; for producing and consuming commodities and services. Arrangements also develop latent talent into skills of communication, body movement, and environmental management. Institutions specialize in the gathering and dissemination of news and images of the natural and social environment. Some institutions give respect or disrespect to individuals and groups on a temporary or permanent basis, and distinguish between what is considered to be responsible or irresponsible conduct. Government, law, and politics seek to resolve the conflicting demands that arise within or among communities.

At first glance we are less likely to be impressed by the parallels than by the differences among societies. The differences are conspicuous, if we consider, say, a horde of big-city commuters as compared with a band of technologically handicapped people who are continually in search of the next meal. An anthropologist who lived with such a band a few years ago in the rain forests of eastern Bolivia reported that apart from the hammocks they slept in, three-foot digging sticks, and cumbersome long bows and arrows, these naked seminomads carried no material objects with them. Modern urban dwellers usually feel some contempt for these bearers of an Old Stone Age culture and speculate on a possible weakness of the brain to account for their lack of technological progress. Such speculations are dismissed by modern anthropologists as without foundation. As we get acquainted with primitive societies it dawns upon us that they have met some of the same problems that we have by adopting solutions whose ingenuity equals or even excels our own. This may apply, for instance, to arrangements for transmitting political authority from one generation to the next, or for preventing violently aggressive behaviour.

Societies do indeed differ from one another in the degree that they encourage specialization. In the simplest societies everybody does everything, with exceptions that are closely linked to differences of sex and age. On the other hand, many tribes use professional specialists, such as warriors, medicine men, blacksmiths, potters, weavers, musicians, and carvers. The world that we call civilized appeared with the invention of writing. Literacy provides a means of storing and retrieving information without relying exclusively on the memory of the old. Records and education multiply the number of learned professions. Urban civilization marks the emergence of such institutions as the territorial state, formal legislative codes of law, regular taxes, bureaucratized civil and military services, monumental public works, complex systems of taxation, and official records.

One way to bring out the degrees of likeness and difference among societies, whether primitive or civilized, is to compare the priorities that are given to institutions of the same kind. No one doubts that every society must concern itself to some extent with food. It is only in bands of the kind mentioned above that near-total preoccupation with hunger deemphasizes, although without abolishing, all other interests. Where existence is less hard the accumulation of wealth may become the principal value sought, as among some merchant cities and trading tribes. War and preparation for war may take top priority as it did for millennia among the shepherds of Inner Asia and the river-valley agriculturalists who were conquered by herdsmen-warriors. Some agricultural societies emphasize worship and encourage forms of knowledge, like astronomy, that enhance religion. In some societies, notably in East India, the accent is on ritual purity or impurity, and every kin group is assigned a position in the respect system of caste and class.

While priorities may remain stable for generations in a given society, this is not necessarily the case. At one time the peoples of Scandinavia were warriors and brigands. Today we perceive them as among those who are most involved with the values of civil society. In the United States, the early colonizers of New England were heavily oriented toward religion, morality, and political freedom. More recently, the most general trend has been toward secular activities, especially those connected with wealth. Throughout the contemporary world, "development" often carries the connotations of economic modernization, political independence, scientific education and research, personal freedom, and social justice.

Besides allocating priorities, every society strikes a temporary or durable balance between the accumulation and the immediate enjoyment of every value. The modes of accumulation depend on the value in question. Investment in wealth production, for instance, may involve adding fertilizers to the soil, or building an infrastructure of roads and bridges, or inculcating the values of saving and investment. Expanded educational opportunity implies that more per capita hours of teaching and learning, and more physical equipment, are made available, and that the importance of education is successfully communicated. If health opportunities are to be multiplied, it is necessary to add facilities and to spread the practice of personal hygiene. A society cultivates public enlightenment with installations for scientific and scholarly purposes, and for mass communication. Human relations improve as the roles of love, friendship, and loyalty expand in "an era of good feeling," and as social discrimination wanes. Levels of responsible conduct typically rise as opportunities become more available for worship and more people join in formulating and applying moral standards. During a given period the institutions of government, law, and politics sometimes accumulate more support.

The examples mentioned above refer to the "positive" accumulation of a valued outcome. Accumulations may be "negative," as when disasters destroy property, spread epidemics, or interfere with education.

All societies necessarily make arrangements for the sharing of wealth, power, and other values. Among individuals and groups these arrangements exhibit all degrees of equality and inequality. Wealth and income are sometimes widely

distributed. By contrast, they may be monopolized in the hands of a few. Political participation may be dispersed or concentrated. Opportunities may be equalized or monopolized for health, education, and information; or for respect, affection, and responsible conduct.

Characteristic of every society is the attempt to maintain itself by controlling the minds of young and old. People not only hunt or plow, trade or fight. They are also likely to believe in what they do and how they do it. It is not necessarily true that in a system of inequality those who occupy any particular station, however exalted or lowly, entertain any doubts about the justification of the system. A stable society carries on within the framework of a common map of perception, belief, and identity. In such a setting the individual learns from earliest infancy to think, feel, and act in ways that bring positive rather than negative consequences from the social and natural environment. Socialization is the process by which private motivations are channelled into acceptable public acts.

In civilized societies reliance on the results of early education is heavily supplemented by government, law, and politics. The legal system is made up of several sets of authoritative and controlling prescriptions. One set is constitutive. It prescribes "who decides what and how." It centralizes or decentralizes formal and effective power, and it separates power among agencies and groups. Structures may be differentiated to plan, to promote, to legislate, to execute, or to review and appraise. Regulation defines the degree of protection given to the fundamental institutions of every sector of society. Tradition alleges that a legal order is blind to values and practices that lie outside the established beliefs, faiths, and loyalties ("ideologies") of the society with which it is involved. In consequence, legal systems may defend widely different balances between value accumulation and enjoyment, and sharply contrasting patterns of equality and inequality in the sharing of political power, wealth, respect, or any other value. The legal order may protect economic systems whose structures are capitalistic, socialistic, or cooperative; family systems that permit one or more members of the sexes to marry and raise children; religious faiths that exalt monotheism and polytheism; and so on through the infinite variety of human practices.

One set of prescriptive norms is supervisory. Individuals and groups may be given wide latitude to make private contractual agreements or to seek redress of private wrongs. Nonetheless, the decision makers of the community are prepared to play a supervisory role by enforcing common norms if an unsettled private controversy is brought to their notice by the parties. Prescriptions also lay down the principles and procedures to be followed if the body politic organizes and administers a continuing enterprise, of which services of transportation, communication, banking, insurance, and housing are examples. A legal system includes correctional or sanctioning measures to obtain compliance with prescribed norms. Value deprivations are imposed on those who have failed or are expected to fail to comply. Deprivations range in severity from capital punishment, confiscation of property, or life imprisonment, to a light fine or reprimand.

A legal system is stabilized when the effective elements in society perceive themselves as relatively better off by continuing the system than by adopting alternative arrangements. To some extent a legal order may exhibit cyclical fluctuations, as when deviations are tolerated within limits which, if exceeded, generate reform activities that restore the former situation with little change. In a capitalist economy "creeping monopoly" may invade trade unions, employers' associations, or natural resource and industrial enterprises. In a socialist economy "black markets" may introduce "creeping competition." In either case, cyclical movements may restore the original relationship before they have quietly stabilized a structural innovation, or prepared the way for violent revolutionary change.

If the view is correct that worldwide interdependence is increasing, the traditional blindfold of legal systems must be put aside long enough to give explicit consideration to competing value goals and practices around the globe. Interdependence implies that whether they like it or not, the members of an emerging planetary society must take one another into account. Being taken into account implies that beliefs, faiths, and loyalties, as well as overt behaviours, are examined by public and private decision makers. The demand to be better informed about the social environment creates an enormous opportunity and responsibility for those who study society.

We expect anthropologists to provide us with knowledge of primitive societies and other specialists to focus on the processes and institutions of civilized society. Political scientists and legal scholars concentrate on government, law, and politics. Economists specialize in the production and distribution of wealth. The role of educators is relatively clear. So, too, is the role of sociologists who concern themselves with a sector of society, such as the family, social class and caste, professions and occupations, communication, public health, or comparative morals and religion.

Social scientists are continually under pressure to provide a map of the past and probable future impact of the forces that shape society. They are asked, for instance, to explain the causes of war and other forms of violence, and to suggest strategies that lead to "victory" in a specific conflict or to show how war itself may be eliminated as an instrument of public policy. Social scientists are asked for explanations of why an economy experiences inflation, or how it generates changing levels of employment and unemployment. Specialists are expected to discover the sources of alienation that separate young and old or threaten the unity of a family, a school, a church, a political party, or a national state. These examples suggest the wide-ranging demands that confirm the importance of adding to our knowledge of society.

We recognize the existence of a problem when we perceive that our goals are inconsistent with one another or when there are discrepancies between what we want and what we have or expect. In public policymaking, the first step is to answer the question, "Whose values are to be realized?" The social scientist who participates in tackling or solving a policy problem has an option: he may adopt the criteria of a "client" or he may rely on his own values.

The study of social institutions is sometimes affected by diverging norms of professional responsibility. No conflict need arise if a social scientist is personally committed to a line of research that happens to be popular with influential members of the body politic. No anxiety or guilt is felt if the findings are applied by current decision makers. A frequent example is the study of administrative agencies according to their "dollar efficiency" or according to the accuracy and speed of communication between central offices and field stations.

In contrast to this harmonious relationship is the inner and perhaps visible turmoil of social scientists whose research interests are unacceptable to many members of the current establishment. The researchers may want to study the effect of military expenditures on society. The problem may be to find how a given level of military outlay modifies the structure of the civilian economy and influences both the production and delivery of services specialized for health, education, public information, family welfare, and other social outcomes. If the information gathered in the course of a given project is classified as secret, no scientist can lawfully report his findings. Perhaps the investigator will violate the letter of the law in the hope of mobilizing an effective demand for change. But it may be that such a strategy will backfire. Instead of arousing community protest against authority, the revelations may result in established leaders successfully taking advantage of an alleged "breach of security" to suppress inquiry and discussion.

Another complication affecting the social investigator is the degree of genuine consent that he must obtain from those whom he proposes to study. Physicians, surgeons, and biologists confront similar questions when they plan to give a test, run an experiment, administer a drug, or perform an operation. Is it always necessary to explain to a prospective subject the risks he will run? Is the investigator professionally or legally bound to make sure that the language of explanation can be understood by the individual concerned? If a social scientist plans to study the facts of life in a prison or a mental hospital, should he reveal his purpose, even when it would be easier to gain confidence by posing as a fellow prisoner or a fellow patient? Similar issues rise in connection with field studies of primitive tribes, of peasant communities, of foreign societies, and of many other social settings.

In recent times, professional opinion has emphasized the importance of obtaining "shared participation" in the pursuit of knowledge. Many investigators willingly accept the challenge of cultivating group demand for a project and for a hand in data gathering and analysis. At every stage, arrangements are made for laymen to work side by side with professional sociologists, social psychologists, political scientists, and other investigators. As a result, some communities have learned to study themselves, assessing the degree to which they are involved in ethnic and other forms of discrimination. Unusual groups have joined in self-study. For instance, murderers and persons who have survived as targets of murderous assault have cooperated in scientific research on the causes and consequences of murder, and on possible strategies of prevention. Instead of resenting the role of "guinea pig" in science, it is typical for those who choose to participate in programs of self-observation to improve their individual insight while contributing to the enhancement of society's stock of knowledge.

Whether the client or the investigator is the source of the value criteria adopted for a policy problem, questions of value priority are bound to arise. The relative importance of political, economic, and other aims cannot be satisfactorily settled in programs of national or regional development unless the full range of possible goals is considered. It is essential to take timing into account. When a new nation-state first secedes from an empire, political power has top priority. The "ex-colony" tries to ensure its independence of external control, to obtain support from outside powers, and to unify its people. Economic development occupies a high priority position. Other targets seem to be less urgent, such as health, education, the expressive arts, and environmental protection. The allocation of manpower and facilities to various institutions depends on the priority of the specific outcomes in which they specialize.

Social scientists have an indirect influence on priorities by asking questions about them, and also by presenting a factual map of past trends, causes, and future contingencies. Scientists often devise small-scale pretests in order to try out solutions that may eventually be applied on a larger scale.

In adapting to the needs of this interdependent world, the scientists of society require of themselves that they measure the direction and intensity of the value demands of political, economic, ethnic, and all other identifiable groups anywhere on the globe. Acknowledging the perils of a divided and militant world, the most compelling task is to discern and make public the conditions under which a world public order of government and law could become a more perfect instrument of human dignity, security, and welfare. Many small-scale programs show how to reduce the human cost of transforming today's inadequate institutions into more effective systems of communication and organization.

For the first time in history it can be truly asserted that the scientists of society have been provided with technological instruments of sufficient sophistication to assist in meeting the demands that are made upon them. Retrieval and dissemination make it possible to map past, present, and future events. Social analysts know that the key question for the future is to resolve whether or not the spectacularly changing technology of knowledge, and especially knowledge of society, will be in the hands of a limited class or caste that seeks to serve its own advantage. The alternative is to share the control of information widely among all territorial and pluralistic groups. Unless individuals and groups are able to obtain access to comprehensive stocks of information, they will be blind judges of public policy. Without adequate access, their criticism will be dismissed as exercises in ignorance and bias. Critics will be in no position to develop realistic alternatives to the plans of governmental or private monopolists of knowledge. "Knowledge is power"; if there is to be self-control, there must be prompt and total access to information.

The chief novelty about the computer and other technically advanced means of processing and transmitting information is that, in principle, everyone can be given prompt access to a selective "map of the whole." An image of the total deployment of man in space or of the total activities of a corporate enterprise can be made available to everyone from the highest official to the humblest worker. The salient facts can be made vivid, concise, and substantially accurate in images that may be supplemented in whatever detail is desired. The range of possible expenditures for any political, economic, or social program can be summarized and related to its potential impact on society.

Human society has attained an unparalleled height of danger and opportunity. The study of society shares in both. The unprecedented accumulation of knowledge enables us to recognize that the scale of our problems is also without precedent.

Part Five. Human society

All studies of mankind take account of the effect of man's being a social animal. This is true of the treatment in Part Four of man's evolution, his health, his general nature and behaviour, his language, and his daily life. It is also true of the treatments, in subsequent parts, of man's art, his technology, his religion, his history, and his sciences and philosophy.

A special set of interrelated sciences, however, take society and social behaviour as their direct subject of inquiry. The outlines, and the articles and parts of articles referred to, in the six divisions and the twenty-five sections of Part Five are concerned with the complementary work of these social sciences.

The social sciences have themselves been the object of historical and analytical study. These studies are presented in the articles referred to in Section 10/36 of Part Ten. The outline in that section covers the history of the social sciences generally, and the nature, scope, methods, and interrelations of anthropology, sociology, economics, and political science.

The social sciences have become increasingly interdependent and interpenetrating, and no regulative agreement exists about how their distinction should be understood. Nevertheless, the diverse domains are, in practice, distinguishable. The breakdown of Part Five into six divisions reflects the currently operative distinction between cultural and social anthropology, the several branches of sociology, economics, political science, jurisprudence and law, and educational philosophy and science.

Division I. Culture 283
II. Social organization and social change 294
III. The production, distribution, and utilization of wealth 311
IV. Politics and government 332
V. Law 352
VI. Education 371

Division I. Culture

The outlines, and the articles and parts of articles referred to, in the two sections of Division I set forth anthropological accounts of the development and the variety of sociocultural forms.

The articles referred to in Section 511 deal first with primitive and other nonurban cultures and second with the cultures of civilized societies. They then treat issues and general theories about social and cultural change.

Section 512 deals first with diverse theories of culture and with conceptions involved in the analysis of culture. It goes on to treat the major cultural components of human societies, such as social, economic, kinship, and aesthetic systems. Fifty-one articles are then referred to that treat regional cultures in all parts of the world.

Section 511. The development of human culture 283
512. The variety of sociocultural forms 286

Section 511. The development of human culture

The articles and parts of articles referred to in Section 511 deal with two main subjects: A, cultural development; and B, the processes of cultural change.

The outline of subject A begins with the cultures of primitive and nonurban societies, treating the distribution and characteristics of the cultures of hunters and gatherers, of pastoralists and herdsmen, and of peasants and settled agriculturalists. It goes on to deal with the cultures of civilized societies. Here, it first treats early theories, 19th- and early 20th-century theories, and recent theories about the origin and evolution of the cultures of civilized societies. Finally, it deals with the development of modern industrial civilization, treating the nature of modernization; the emergence of modernization in nonmodern societies; the processes of modernization in modern societies; and the patterns of transition to modernity.

The outline of subject B treats the basic concepts of cultural change, and the basic inducements of cultural change, covering various forms of acculturation or cultural adaptation.

Section 512. The variety of sociocultural forms

[for Part Five headnote see page 283]
for Division I headnote see page 283]

The articles and parts of articles referred to in Section 512 deal with four main subjects: A, diverse theories of culture; B, the major cultural components of human societies; C, peoples and cultures of the world; and D, the controversy about the concept of cultural areas.

The outline of subject A, after dealing with various definitions of culture, treats conceptions involved in the analysis of culture. It covers conceptions of the influence of the cultural milieu on the individual; conceptions involved in the comparisons of cultures; conceptions of the causes and forms of cultural adaptation and change; conceptions about patterns and configurations of culture; and conceptions about cultural institutions.

The outline of subject B, the major cultural components of human societies, first deals with social systems. It here treats the varieties of group organization within societies, and the varieties of status organizations, with special attention to class systems, caste systems, and systems containing slavery or serfdom. The outline goes on to economic systems. Here it deals first with the nature of economic systems in nonliterate societies. It then treats the cultural effects of different forms of production; of exchange, distribution, and wealth; of property and property rights; and of different patterns in the changing of economic systems. The outline next deals with the functions, types, and cultural effects of kinship systems and with the cultural effects of different types of aesthetic systems. The outline further indicates other sections that treat, as cultural components, educational systems, belief systems, legal systems, and linguistic systems.

Subject C is the peoples and cultures of the world. Here fifty-one articles are referred to that treat cultures in various parts of the Arctic, North America, Middle America, South America, Europe, the Middle East and North Africa, Asia, sub-Saharan Africa, and Oceania.

Subject D deals with the concern of geographers, anthropologists, and historians with the concept of a "cultural area"—the concept involving a socially or culturally identifiable human population; a "natural" environment; and some postulated, implied, or identified interaction between the two. The article referred to treats the design and purpose of cultural areas, and sketches theories, from the earliest times to the present, about the manner in which cultural areas are determined.

Division II. Social organization and social change

[for Part Five headnote see page 283]

The outlines, and the articles and parts of articles referred to, in the five sections of Division II present general sociological theories of social order and social change, and sociological studies of basic social institutions, social processes, and social problems.

The articles referred to in Section 521 treat the structure of society; the social effects of bureaucratic and industrial specialization; social control; and the process of social change.

Section 522, on the group structure of society, treats the various types of groups; the social effects of racial and ethnic prejudice; some special social problems arising from group structure and various social differences; and social and welfare services.

Section 523, on social status, treats the processes of social differentiation and social stratification, and the varieties of social stratification and social mobility.

Section 524 treats the nature and forms of collective behaviour; the concept of mass society and its characteristics; the formation of public opinion; and the expression of collective behaviour in the form of social movements.

Section 525 treats the determinants, composition, and change of human populations; historical and contemporary theories and policies concerning population; the development of modern cities; and the development of modern rural societies.

Section 521. Social structure and change 294

523. Social status 303
524. Collective behaviour and mass society 305
525. Human populations: urban and rural communities 307

Section 521. Social structure and change

[for Part Five headnote see page 283]

The articles and parts of articles referred to in Section 521 deal with four main subjects: A, the structure of society; B, the social effects of bureaucratic and industrial specialization; C, social control; and D, the process of social change.

The outline of subject A begins with various ways to discern and describe or state fundamental patterns in social affairs. It treats one by one the major models or approaches: the culture-pattern model, the structure-function model, the conflict model, the physical-science model, and the mathematical or logical model. The outline next deals with the types of organized social structures or communities, and it treats, as influencing the organization of communities, kinship or tribal institutions, religion, political and territorial factors, and economic factors.

The outline, after indicating that the social effects of industrialization and modernization have been treated in Section 511, goes on to the social effects of organizational specialization. Here it treats the conception and historical development of bureaucracy; classical and managerial theories of bureaucracy; and recent functionalist and conflict theories of the structure and dynamics of organizations. The outline further deals with the social effects of industrial specialization and automation. Here it treats conceptions of the worker and the manager; the structure of work careers; factors affecting workers' and managers' attitudes and behaviour; and conflict and conflict resolution between labour and management.

The outline of subject C, social control, begins with the process of socialization, treating the aims of socialization, the agencies of socialization, and different views of its effects. It goes on to theories of alienation, covering definitions, causes, and manifestations of alienation and proposed solutions for it. The outline then deals with resocialization and social conversion—the regulation of behaviour that departs from social norms. It treats first the purposes and major forms of the punishment, rehabilitation, and reform of criminals. It then treats resocialization by psychological therapy and by various forms of persuasion.

Subject D is the process of social change. The outline indicates that definitions and broad theories of social change are treated in Section 511. It goes on to the phases of social change—innovation, selection, and integration. It then deals with factors operative in change: ideology, contact with other cultures, environment, demography, art, religion, science, philosophy, economics, and technology.

Section 522. The group structure of society
[for Part Five headnote see page 283
for Division II headnote see page 294]

The articles and parts of articles referred to in Section 522 deal with four main subjects: A, the various types of groups; B, the social effects of racial and ethnic prejudice; C, special social concerns; and D, social and welfare services.

The outline of subject A first deals with two ways of classifying groups: dichotomous or contrasting classifications, and classifications bearing on the nature of membership or interpersonal relations. It goes on to deal with small groups—groups characterized by extensive interpersonal relations. It treats the essential determinants of the small group and the major areas of concern in small groups. Dealing with the modern family, the outline covers the diverse types of families and marital unions; patterns of human sexual behaviour; the history of the Western family; the development and organization of the modern family; and changes in the form and structure of the modern family caused by social and technological developments. The outline next deals with the types, motivation, structure, and political activities of special-interest groups and with the power, strategy, and tactics of pressure groups. Finally, it deals with minorities and ethnic groups. Here it treats the nature of minorities and ethnic groups; the characteristics of cultural diversity; the types of societies with cultural divisions; and the functions of minorities and ethnic groups.

The outline of subject B begins with definitions of race, racism,

ethnic group, and ethnocentrism. It then treats theories about the causes of racial prejudice and discrimination and about the effects of racial discrimination; laws regarding racial restrictions; and issues about the reduction of racial discrimination.

Subject C comprises certain special social concerns involving various groups or categories of people. The outline treats problems and concerns that arise from these social groupings: adolescents, the aged, women, the poor, criminals and delinquents, sexual deviants, prostitutes, drug users, and suicidal persons.

Subject D is social service, afforded by organized public and private activities addressed to human wants and needs. The outline first deals with the historical and modern influences affecting the appearance and characteristics of social and welfare services. It then deals with the various fields of social service. Here it treats family welfare, child welfare, youth welfare, group welfare, disaster relief, community development, medical and psychiatric social services, school social services, and correctional services—probation, parole, and delinquency control.

Section 523. Social status

[for Part Five headnote see page 283
for Division II headnote see page 294]

The articles and parts of articles referred to in Section 523 deal with two main subjects: A, social differentiation and stratification; and B, the varieties of social class and social mobility.

The outline of subject A begins with the distinction between and the interrelation of two concepts—on the one hand, the concept of social differentiation, used to determine individual differences that result in groupings with social significance; and on the other hand, the concept of social stratification, used to express the ranking of social groups in various occupational, prestige, or social power hierarchies. The outline goes on to a broad distinction between biological differentiating factors and differentiating factors that arise from social or cultural conditions. Dealing with the biological factors, it treats sex differentiation, age differentiation, racial differentiation, and intellectual differentiation. Dealing with the process of stratification, the outline treats economic differences as the basis for stratification, and class, status, and power as forms of stratification. Finally, it treats the ways in which the relations between individuals and society are affected by the phenomena of social differentiation and social stratification.

Subject B is the varieties of social class and social mobility. The outline begins with problems about defining social class and about its distinction from and relation to other concepts such as the concepts of caste, of status, and of elites. It goes on to theories of social class—divergent conceptions of the importance of classes in social structure and of the nature of class relationships. It next treats the types, characteristics, and comparisons of modern social classes. Turning to social mobility, the outline treats the nature, determinants, and consequences of social mobility; the idea of a classless society; and, as factors of social immobility, the historical and contemporary forms of slavery, serfdom, and forced labour.

Section 524. Collective behaviour and mass society

[for Part Five headnote see page 283
for Division II headnote see page 294]

The articles and parts of articles referred to in Section 524 deal with four main subjects: A, the nature and forms of collective behaviour; B, mass society; C, the formation of public opinion; and D, the expression of collective behaviour in social movements.

The outline of subject A begins with elementary forms of collective behaviour, such as those exhibited by aimless but agitated milling crowds or by the spreading of rumours. It goes on to major forms of collective behaviour, exhibited in patterns of collective response to disasters, fads or crazes, and collective panic. Finally, it treats different theories concerning the causes and effects of collective behaviour and the means of controlling it.

The outline of subject B, mass society, begins with the origin and evolution of the concept of mass society. It goes on to various uses of the concept—to examine the characteristics of modern, industrial society; to examine the forces responsible for that society; and to determine the influences and effects of those forces on modern man. Finally, it treats certain problems concerning the uses and the scope of the concept of mass society.

The outline of subject C begins with the history and with current conceptions of public opinion. Then, after dealing with personal and environmental factors that affect the formation of public opinion, it treats propaganda, covering its characteristics and components, various theories about it, the measurement of its effects, and the ways of controlling it. Finally, it deals with the influence of public opinion on governmental processes and with the methods of public opinion polling.

Subject D is social movements—purposeful, organized, sustained forms of collective behaviour aiming to effect major transformations of the society and the prevailing culture. The outline begins with the characteristics of social movements. It goes on to treat various types of social movements—movements centred on religious concepts or personalities; humanitarian and reform movements; interest group movements; revolutionary movements; and nationalist movements.

Section 525. Human populations: urban and rural communities
[for Part Five headnote see page 283
for Division II headnote see page 294]

The articles and parts of articles referred to in Section 525 deal with three main subjects: A, the composition and change of human populations; B, the development of modern cities; and C, the development of modern rural societies.

The outline of subject A begins with the major determinants of population—human fertility, human mortality, and migration. After dealing with historical changes in population, the outline goes on to theories of population. Here it first treats the theories of population involved in major economic doctrines. It then deals with modern theories of population, concerned with optimum population size and optimum rates of population growth, and with ecological theories concerning the relationship between human population growth and the conservation of natural resources. Finally, it treats governmental policies regarding population growth and composition; current population projections; and current concerns about the population explosion.

The outline of subject B begins with the initial factors conducive to urbanization—a pattern of increase in the percentage of city-dwellers in a total population. It goes on to the patterns of urbanization in the premodern period and in the modern period, treating, with regard to the latter, the developing structure of urban areas in the 19th and 20th centuries, and the social and political consequences of rapid urbanization. The outline next deals with the technical and social aspects of urban planning and redevelopment. Finally, in dealing with trends in urbanization, it treats the growth of the megalopolis; suburbanization; regional integration; the role of technology in extending the dominance and influence of urban concentrations; the problems of population control in relation to urban growth; and the problems of environmental change arising from pollution and urban climatic change.

The outline of subject C begins with the delineation of modern rural society, treating global variations in the rural–urban continuum and the characteristics of traditional rural societies and of transitional "urbanized" rural societies. It goes on to the major components and determinants of rural society, treating settlement and demographic patterns; kinship structures; economic, technological, and sociocultural influences on modern rural life; rural organization and the dynamic elements in rural society; and rural planning.

Division III. The production, distribution, and utilization of wealth

[for Part Five headnote see page 283]

The outlines, and the articles and parts of articles referred to, in the seven sections of Division III deal with the economic order in human society.

The articles referred to in Section 531 treat basic concepts of economics; the levels of economic analysis; basic issues of economic policy and fact; economic issues predominantly involving political, social, and moral considerations; and the comparison of different economic systems.

Section 532, on human wants and their economic expression, treats the economic analysis of scarcity, utility, and value; and the character and causes of consumer tastes and consumer spending.

Section 533 treats the workings of the market in a mixed economy and of the price system in capitalist economies.

Section 534, on the organization of production and distribution, first deals with the general theory of economic production and distribution. It goes on to deal with the various inputs of the productive process and with institutional arrangements that facilitate production and output. It next treats agricultural economics, international trade, and the role of government in production. Finally, it treats methods of business organization, advertising, the distribution of risk through insurance, and consumer credit.

Section 535 deals with the distribution of wealth and income by categories of the population, and with the routes by which government affects the distribution of wealth and income.

Section 536, on macroeconomics, treats national income and employment theory; international financial equilibrium and disequilibrium; business fluctuations and countercyclical policy; and inflation and deflation.

Section 537 treats the nature and causes of economic growth, and planning for economic growth and stability.

Section 531. Economic concepts, issues, and systems 311
532. Human wants and their economic expression 314
533. Markets, pricing, and the mechanisms for distributing goods 315
534. The organization of production and distribution 316
535. The distribution of income and wealth 325
536. Macroeconomics 328
537. Economic growth and planning 330

Section 531. Economic concepts, issues, and systems

[for Part Five headnote see page 283]

The articles and parts of articles referred to in Section 531 deal with five main subjects: A, some basic concepts of economics; B, the different levels of economic analysis; C, issues of policy and fact; D, economic issues that predominantly involve political, social, and moral considerations; and E, the comparison of different economic systems.

The outline of subject A sets forth eight concepts basic to the descriptive and explanatory studies of economic phenomena.

The outline of subject B presents the concepts of microeconomics, dealing with the economic decisions of individuals, households, and firms; sectoral economics, dealing with the economic arrangements of industries, groups, and regions; and macroeconomics, dealing with the aggregates of income, employment, and price levels in the economy of a nation as a whole.

The outline of subject C sets forth thirteen issues of policy that are the subjects of controversy in economic literature and economic counselling—issues such as the role of money supply and interest rates in the achievement of stable economic growth; the relation of inflation to full employment; diverse views concerning international currency reform; and the relative efficiency of planned and free enterprise economies.

The outline of subject D sets forth eight economic issues that predominantly involve political, social, and moral considerations—issues such as the proper distribution of income and wealth; priorities in the production process; and the optimum rate of economic growth.

Subject E is the comparison of different economic systems. The outline begins with the characteristics that differentiate modern economic systems—the size of the public and private sectors; the kind of ownership of the means of production; the extent of planning; and the ends governing economic activity. It then treats three archetypal economic systems—the pure private enterprise economy; the centrally planned economy; and the mixed economy with various degrees of economic planning. The outline next refers to descriptive accounts of Western-type market economies, of Soviet- and socialist-type economic systems, and of mixed economies in developing countries. Finally, the outline treats economic systems in nonliterate and feudal societies.

Section 532. Human wants and their economic expression

[for Part Five headnote see page 283
for Division III headnote see page 311]

The articles and parts of articles referred to in Section 532 deal with two main subjects: A, scarcity, utility, and value; and B, the behaviour of consumers in satisfying their material wants.

The outline of subject A begins with a general account of the explanations, in classical and modern value theory, of how prices of goods and services are determined. It goes on to the effects, on the value of goods, of the limitations in the supply of economic resources, and to the necessity of allocating these resources among different uses. Turning to the demand side in the analysis of price and value, it treats the concept of utility as reflecting consumer tastes and preferences, and the concept of marginal utility, defined as the amount of additional utility provided by an additional unit of some economic good or service. The outline next deals with the theory of the indifference schedule and diminishing marginal rate of substitution as determinants of demand and consumer behaviour. Finally, it treats, as a factor in the analysis of consumer choice, the amount the consumer has available to spend and the concept of consumer's surplus.

The outline of subject B first deals with national private sector consumption levels. It goes on to deal with factors that influence consumer tastes and spending. Here it treats the effect of the distribution of income and wealth on consumer spending; rationality and irrationality in the formation of consumer tastes; the influence of advertising on consumer taste and spending; and the changing relationship, with the development of new products, between necessities and luxuries. Finally, the outline deals with the protection of consumer interests, treating the scope of consumer protection laws and the development of private consumer organizations in various countries.

Section 533. Markets, pricing, and the mechanisms for distributing goods

[for Part Five headnote see page 283
for Division III headnote see page 311]

The articles and parts of articles referred to in Section 533 deal with two main subjects: A, markets as an economic institution in a mixed economy; and B, the price system in capitalist economies.

The outline of subject A first deals with the classification of markets by reference to the kinds of competition in them. It goes on to the major types of markets—markets for primary commodities, for manufactured goods, for money and capital, and for labour and services. It next treats the counterpart of the market under total economic planning—markets under socialism. It goes on to deal with the historical development of markets and of market theory, the relationship of the market to social welfare and politics, and markets in international trade. Finally, it treats the function of the market in the establishment of equilibrium between supply and effective demand.

Subject B is the price system in capitalist economies. The outline first deals with the theory of the price system as a means of organizing economic activity: as determining, in its workings, what is to be produced, how it is to be produced, and who gets the product. It next deals with limitations on and failures of the price system and with areas in which the price system does not function. Here, it treats price fixing by business; government-established price controls and subsidies, public utilities regulation, and bank interest rate regulation; economic relationships not susceptible to control by prices—"externalities" such as air pollution and highway congestion; and imperfect knowledge on the part of buyers as to alternative uses of their buying power. Finally, the outline treats the role of the public sector in the distribution of goods and services, and the effects on distribution of government budgets.

Section 534. The organization of production and distribution

[for Part Five headnote see page 283
for Division III headnote see page 311]

The articles and parts of articles referred to in Section 534 deal with eleven main subjects that divide into four groups. In the first, there are two subjects: A, the general theory of economic production; and B, the general theory of economic distribution. The second group also has two subjects: C, the inputs of the productive process; and D, institutional arrangements that facilitate production and output. The third group has three subjects: E, agricultural economics; F, international trade; and G, the role of government in production and distribution. The last group contains four subjects: H, methods of business organization; I, advertising; J, the distribution of risk; and K, consumer credit.

The outline of subject A treats the influences determining costs and output in the short run and in the long run.

The outline of subject B treats the relation between the productive process and the incomes derived from it, and the influences affecting the earnings of land, labour, and capital employed in the productive process.

The outline of subject C begins with labour as a factor in the productive process. Here, it first treats the size and quality characteristics of a work force, and its deployment in different industries and occupations. It goes on to the methods of fixing rates of pay; to the differences in the earnings of various occupations; and to changes in the general level of pay. Further topics dealt with are the issues raised by unemployment; the inferior status of migrant labourers; the organization of unions and their influence on the supply of labour, wages, and output; the capital elements in labour—education and training; and the economic role of managers and entrepreneurs. The outline of subject C next deals with physical factors. Here it treats issues about the conservation of natural resources; the economics of land, air, and water use; and the economics of the extractive industries and of the power industry. Finally, the outline deals with capital as a factor in the productive process, treating the development of the theory of capital in the production of goods, and the theory of interest and its relationship to capital.

Subject D is institutional arrangements that facilitate produc-

tion. The outline begins with the basic functions and various forms of money and with classical, neoclassical, and Keynesian theories of money. Dealing with banks and banking, the outline covers the structure of modern national banking systems; the principles and functions of commercial banking systems and of central banks; the various markets for short-term and long-term funds; international monetary institutions; and the nature and functions of government credit agencies. It next treats the use of economic statistics in the measurement and forecasting of national production and output. Finally, it treats the historical development of the business corporation and the structure of business corporations in the United States, Europe, and Japan.

The outline of subject E covers the relationship between agricultural and economic development; efforts to control prices and production in agriculture; the effect of the behaviour of farm prices on the incomes of farmers; the effect of technology on world agriculture; and the various levels of farm organization.

Subject F is the geographical distribution of resources and markets. The outline treats classical and contemporary theories of international and interregional trade; the national and regional factors influencing trade; and international trade arrangements—trade agreements, customs unions, and economic communities.

Subject G is the role of government in production and distribution. The outline treats the theory of public expenditures; the justification of the government's claim to share in resource use; the growth in government spending in the 19th and 20th centuries; and government operation of basic industries.

The outline of subject H, methods of business organization, treats accounting; the short- and long-term management of business funds; personnel administration; the administration and control of production; and the functions, stages, and processes of marketing and merchandising.

The outline of subject I treats advertising—its historical background, purposes, media, strategies, organization, and economic and social effects.

The outline of subject J, the distribution of risk, treats insurance—its nature, purposes, kinds, legal aspects, and historical development.

The outline of subject K treats the types, historical development, and dimensions of consumer credit.

Section 535. The distribution of income and wealth
[for Part Five headnote see page 283
for Division III headnote see page 311]

The articles and parts of articles referred to in Section 535 deal with two main subjects: A, the distribution of wealth and income by categories of the population; and B, the routes by which government affects the distribution of wealth and income.

The outline of subject A begins with the nature and measurement of wealth and income. It goes on to methods of classifying the distribution of wealth and income. Here, it deals first with wages, profits, interest, and rent as accruing to the various factors of production. It then treats their distribution according to the number of persons in various classes of wealth and income. The outline next deals with patterns of wealth and income distribution among various countries and among persons within a country. Finally, it treats the methods of representing the distribution of wealth and the inequality of incomes among the lower, the middle, and the upper income sectors of society.

The outline of subject B begins with the national budget as the program of the government's revenues and expenditures. It treats budget theory, involving cost–benefit analysis and the theory of public goods; alternative approaches to the budget; and the budgetary processes of the United States, the United Kingdom, Japan, and the Soviet Union.

The outline of subject B next deals with the tax system. It treats the nature, purposes, and kinds of taxes; the history and principles of taxation; the effect of progressive and regressive taxes on the distribution of income; issues about the burden of taxation; and the characteristics of national tax systems. The outline then treats the effects on the distribution of income and wealth of the various kinds of governmental subsidies and tax concessions, and the many kinds of welfare programs sponsored and administered by governments.

The outline of subject B goes on to the effects of the financing of budgetary deficits and surpluses. It treats the economics of the public debt; arguments for and against government borrowing; the historical development of government borrowing as a source of government revenue; debt retirement policies; and short- and long-term government policies for the management of the public debt.

Dealing with direct governmental controls over the economy, the outline treats price, wage, and profit controls; antitrust, public utilities, and labour legislation; and war and defense economics.

Finally, dealing with land reform and tenure, the outline treats the economic, social, and political objectives of land reform and the redistribution of land tenure; the different methods of land reform; the criteria for evaluating the success of land reforms; and the historical development of land reform.

Section 536. Macroeconomics

[for Part Five headnote see page 283
for Division III headnote see page 311]

The articles and parts of articles referred to in Section 536 deal with four main subjects: A, national income and employment theory; B, international economic and financial equilibrium and disequilibrium; C, business fluctuations and countercyclical policy; and D, inflation and deflation.

The outline of subject A begins with changes in aggregate output, employment, and prices as constituting the concern of income and employment theory, and with the differences between classical and Keynesian theories of effective demand and of unemployment as guides for government stabilization policies. It goes on to treat the circular flow of income and expenditure. It then deals with the analysis of fluctuations in national income, using several different theoretical models.

The outline of subject B begins with the problems raised by alternative monetary standards and by fixed and fluctuating exchange rates in foreign exchange markets. In relation to these problems it treats movements in the balance of payments and the mechanisms of adjustment; proposals for more flexible international exchange rates; balance of payments accounting; and methods for adjusting to fundamental disequilibrium. The outline of subject B then deals with the international institutions set up to handle payments problems and to deal with economic and financial crises.

Subject C is business fluctuations and countercyclical policy. The outline begins with the statistical study of business cycles—the identification and measurement of cycles, and the determination of their duration and phases. It goes on to treat theories that attribute cyclical fluctuations to external factors, such as harvest fluctuations, movements of group psychology, or political, technological, and demographic changes. It next treats theories attributing cyclical fluctuation to internal factors, such as uncoordinated changes in money supplies and interest rates, overproduction and underconsumption, or investment imbalances. It also covers appraisals of mathematical models. The outline then turns to the types of governmental actions and interventions taken to regulate the economy and minimize cyclical fluctuations. It treats the origin and development of compensatory fiscal policy, relating to taxes and governmental expenditures; and the origin and development of compensatory monetary policy, relating to the financial market, the supply of credit, money, and other financial assets. The outline further treats the theoretical basis of fiscal and monetary policy, and the characteristics of government use of such policies to regulate the economy and reduce inflation.

The outline of subject D treats the definitions and characteristics of inflation and deflation; their effects on a country's economy; and different theories concerning the causes and mechanisms of inflation.

Section 537. Economic growth and planning

[for Part Five headnote see page 283
for Division III headnote see page 311]

The articles and parts of articles referred to in Section 537 deal with two main subjects: A, the nature and causes of economic growth; and B, planning for economic growth and stability.

The outline of subject A begins with the definition of economic growth and with factors that influence it. It goes on to the various theories and models of economic growth, to the practical functions of growth theory and mathematical growth models, and to the social costs and benefits of economic growth. It next deals with special problems of economic growth in developing countries, with various theories of national economic development, and with post-World War II economic advances in Asia, Africa, and Latin America. Finally, it treats the concept and the measurement of economic productivity.

The outline of subject B first deals with the nature of economic planning. It then treats the history, structure, and results of economic planning in Communist countries, in developed non-Communist countries, and in developing non-Communist countries.

Division IV. Politics and government

[for Part Five headnote see page 283]

The outlines, and the articles and parts of articles referred to, in the four sections of Division IV treat general theories of the state and of government; the structure, branches, and offices of government; the functioning of government; and international relations in peace and war.

The articles referred to in Section 541 treat traditional philosophical theories concerning the origin, nature, and ends of the state and concerning the nature, institutions, and operations of government; the national state as viewed in political theory; patterns of political action; and major political concepts, ideologies, and problems.

Section 542, on political institutions, deals first with the overall organization of government, the levels of government, and contemporary forms of government. It then treats the three functional branches of government—legislative, executive, and judicial. Finally, it deals with public administration—the organization of governmental operations.

Section 543, on the dynamics of the political process, first deals with the internal and external security functions of government; its supervisory and regulatory functions; its law enforcement and corrective functions; and its enterprising functions, such as the provision of public health agencies and of educational facilities. It goes on to treat government responsibility for regulating the economy and allocating economic resources. Then, after dealing with the electoral process, it treats the factors that determine stability and instability in government and the methods by which the form of government is changed.

Section 544 first deals with the politics of international relations. It then treats the degrees and kinds of war; modern theories of the causes of war; the consequences of war; the structure of armed forces; and the conduct of war.

Section 541. Political theory 333
542. Political institutions: the structure, branches, and offices of government 340
543. The functioning of government: the dynamics of the political process 342
544. International relations: peace and war 346

Section 541. Political theory

[for Part Five headnote see page 283
for Division IV headnote see page 332]

The articles and parts of articles referred to in Section 541 deal with five main subjects: A, the philosophical conception of civil society, or the political community, including traditional theories of the state; B, the national state as viewed in political theory; C, philosophical theories concerning the nature, institutions, and operations of government; D, patterns of political action as viewed in political theory; and E, political concepts, ideologies, and problems.

Dealing with major themes and theories in traditional political philosophy, the outline of subject A treats diverse theories of the origin of the state; of the nature of the state; of the ends or purposes of the state; of the societal structure of the state; of the kinds of states; of the causes of the rise and decline of states; and of relations among states and nations.

Dealing with the national state as viewed in modern political theory, the outline of subject B treats the properties of statehood, with special attention to the concept of sovereignty, the relations of the state and the individual, and the national state in the international community.

Subject C is philosophical theories concerning the nature, institutions, and operations of government. The outline begins with diverse views of the nature and ends of government and diverse theories regarding the normative classification of the forms of government. It goes on to various conceptions of the limits of political authority and responsibility and to various conceptions of the bases of the legitimacy and authority of government. Finally, it deals with theories of constitutionalism and with modern constitutional governments. Here, it first deals with the origins, with the theories of constitutional government, and with the defining features of constitutional government. It then deals with the methods of constitutional growth, covering the constitutions of Great Britain and the United States; continental constitutionalism; the constitutions of Latin American, African, and Asian states; and the constitutions of the Soviet Union and other socialist states.

Subject D is patterns of political action as viewed in modern political theory. After dealing with political action within small groups, villages, or communities, the outline goes on to political action by organized parties; to the procedures involved in the selection of candidates and party leaders and in maintaining party discipline; and to the structure and functions of parties within various political systems. The outline next deals with political action by nonparty political groups having common interests. The outline treats the types of nongovernmental groups with actual or potential political influence; the role of interest groups in various political systems; and the various means by which interest groups can influence the political process. Finally, the outline of subject D deals with the political influence of public opinion. It treats the historical background of modern public opinion; the ways in which public opinion forms and changes; the influences of public and government; and the methodology of public opinion polling.

Subject E is political concepts, ideologies, and problems. The outline first deals with the concept of political power and with the concept of political rights. It goes on to deal with modern ideologies. Here, it begins with the origins and characteristics of ideology and with the problem of defining it and its relationship to political philosophy. It goes on to the importance of ideology to political systems or movements, and to theories regarding the interplay of ideology and the political process. Articles are then referred to that separately treat current political ideologies and tendencies—anarchism, Communism, Conservatism, Fascism, Liberalism, Marxism, Nationalism, and Socialism. Finally, the outline deals with contemporary issues. It covers the contemporary form of the problem of church and state; the political problems posed by increased urbanization; the problem of international cooperation and integration; the issue of political honesty; problems of communication between government and the public; the issue of centralization of power versus decentralization; the problem of adapting traditional political forms to changing conditions; and the problems about responsive government posed by the increased bureaucratization of governments.

Section 542. Political institutions: the structure, branches, and offices of government

[for Part Five headnote see page 283
for Division IV headnote see page 332]

The articles and parts of articles referred to in Section 542 deal with three main subjects: A, the overall organization of government; B, the branches of government; and C, public administration.

The outline of subject A begins with the levels of government, covering the distinctions and relations among supranational political systems, national unitary and federal political systems, and regional, urban, and rural governments. It goes on to types and models of political systems, here treating classical distinctions between political systems; distinctions based on social, cultural, economic, or psychological factors; distinctions based on the way in which power is obtained and transferred; and distinctions based on the way in which power is exercised and controlled. Finally, dealing with contemporary forms of government, the outline of subject A treats the modern monarchy; the modern dictatorship; the modern oligarchy; and modern constitutional governments—constitutional democracies, republics, and monarchies.

The outline of subject B begins with the concentration of legislative and executive functions in parliamentary rule. It then deals separately with the legislative, executive, and judicial branches of government, treating modes of appointment, tenure, responsibilities, rights, privileges, and immunities for each branch.

Subject C is public administration—the planning, organization, and coordination of governmental operations. The outline treats the historical development of public administration systems; various modern theories of bureaucratic policy and organizational methods; judicial and legislative controls over public administrative agencies; and the organization of such public administrative units as regulatory and investigatory commissions and governmental corporations.

Section 543. The functioning of government: the dynamics of the political process

[for Part Five headnote see page 283
for Division IV headnote see page 332]

The articles and parts of articles referred to in Section 543 deal with four main subjects: A, the types of governmental functions; B, the economic roles of government; C, the electoral processes; and D, the changing of government structures.

The outline of subject A begins with the internal and external security functions of government and with the government's conduct of foreign relations. It goes on to the supervisory function of government—its role in the resolution of conflicts through mediation and the adjudication of suits. It then deals with the regulatory functions of government, involving the establishment and enforcement of standards. It next deals with law enforcement and the corrective functions of government. Finally, it treats the enterprising functions of government, such as the provision of public health and welfare agencies and educational facilities.

The outline of subject B treats governmental responsibility for regulating the economy and allocating economic resources; the types of governmental expenditures; and the sources of governmental income.

The outline of subject C begins with the origins and develop-

ment of electoral processes and with the purpose and importance of elections. It goes on to the types of elections and to the rules for deciding the winners of elections. It then treats the establishment of electoral constituencies; the administration of elections; and various factors that influence voting patterns.

The outline of subject D treats the factors that determine stability and instability in government and the methods, peaceful or violent, by which the form of government is changed.

Section 544. International relations: peace and war
[for Part Five headnote see page 283
for Division IV headnote see page 332]

The articles and parts of articles referred to in Section 544 deal with two main subjects: A, the politics of international relations; and B, war among states.

The outline of subject A, after dealing with the major types of relationships among political regimes, treats the concept of sovereignty. Here it first deals with various theories of the source, loci, and limitations of internal sovereignty. It goes on to treat de jure external sovereignty, the legal equality of states in international law; the de facto elements of sovereign independence; and the formal limitations on the external sovereignty of satellite, client, and puppet states. The outline of subject A next deals with the many kinds of international treaties and agreements, with the aims of foreign policy, and with the functions of diplomacy in the conduct of foreign policy. It further treats the use of intelligence and counterintelligence in the preservation of national security and the conduct of international affairs; the influences of international political parties and movements; and the government-sponsored organizations that affect international relations in nonpolitical—for example, economic or cultural—spheres.

The outline of subject B begins with the degrees and kinds of war. It goes on to the concept of a just war, to modern theories of the causes of war, and to the consequences of war in all dimensions of human life. Dealing with armed forces, the outline treats the organization and structure of armed forces; the various types of soldiers; the historical development of organized military forces; the relationship between the civilian and military sectors of society; and the establishment and maintenance of various branches of the armed forces. Finally, the outline deals with the conduct of war. It first deals with the fundamentals and the development of modern military strategy, including the nature of nuclear strategy; the development of modern military tactics, including the tactics of guerrilla warfare; and the theories, elements, and development of military logistics. It further treats the effects of modern technology on the conduct of war; the effects of economic mobilization on the conduct of war; the effects of psychological warfare on troops and civilians during wartime; and international law relating to the treatment of persons during wartime.

Theories of sovereignty and the social contract between sovereign and society: various loci of sovereignty; limitations on the exercise of internal sovereignty		**17**:309h–311e / **5**:93h–94h / **7**:182h–183e / **9**:779f–780e / **14**:703e–g / **16**:985b–c / **17**:610c–612b	**5**:85e–g / **7**:205a–c / **7**:204a–b / **7**:631f–g / **8**:625c–e / **9**:745b–h / **10**:215a–d / **10**:717a–d / **12**:865a–d / **14**:261h–262d / **14**:267h–268b / **14**:687h–691e *passim*
b. External sovereignty and international law		**17**:311e–313f / **1**:396a–397a / **9**:748f–749g / **17**:614f–615a	
i. De jure sovereignty: the legal equality of states in international law; diplomatic recognition		**17**:311e–312e / **9**:747c–f	
ii. De facto elements of sovereign independence; *e.g.*, political, military, and economic autonomy		**17**:312e–313f / **2**:17h–18a / **8**:1184b–d / **9**:747c–749g / **19**:540e–541a / **19**:541b–c / **19**:545e–h	
iii. Formal limitations on external sovereignty of satellite, client, and puppet states		**17**:311e–g / **3**:305a–306g	
3. International treaties and agreements	INTERNATIONAL AGREEMENTS **9**:730–733	**5**:227a–e / **8**:1184d–1189c / **17**:312b–e	**4**:1085g–h / **5**:56g–58d *passim* / **9**:746c–d
a. Collective security: nonaggression treaties		**6**:1096c–g / **8**:340b–d / **17**:377b–f / **19**:971d–g	**19**:571g–572a / **19**:942d–945g *passim*
b. Treaties terminating wars [see B.4.a.i., below]			
c. Arms limitation and disarmament treaties		**17**:377b–f / **19**:971h–973e	**13**:327d–f / **19**:601d–e / **19**:966e–967f *passim*
d. Territorial treaties regarding the sale or transfer of land; treaties granting rights of access across land			**1**:964d–965a / **9**:749f–g / **13**:947b–d
e. Economic and commercial treaties [see also 534.F.3.]		**9**:732e–g / **1**:318f–319a / **1**:1076a–c / **1**:1077a–h / **5**:378a–379a / **5**:380c–385c / **17**:1085b–e / **18**:561g–563d	**1**:319f–h / **9**:731e–h / **13**:1074c–e
f. Communications and transportation treaties		**1**:396a–399c / **3**:310g–311e	**3**:964h–965h / **13**:947b–d / **15**:432c–g / **18**:91f–h
g. Cultural exchange treaties		**9**:737c–740h	**18**:902c–f
4. Foreign policy and diplomacy		**7**:522h–523h / **16**:77g–78a / **19**:546e–547a	**7**:525b–f / **9**:782g–783c / **15**:1143c–g
a. The aim of foreign policy: the compatibility or incompatibility of national and humanitarian interests		**9**:738d–740b / **16**:863b–864h	**9**:781g–782a / **17**:957h–958b
b. The function of diplomacy in the conduct of foreign relations			
i. Historical development of diplomatic chancelleries and diplomatic foreign services; the diplomat as an espionage or intelligence agent		**5**:809h–813c / **9**:681b–d	**6**:1082c–e / **9**:684c–d / **9**:1145c–e
ii. The education and training of modern diplomats and diplomatic personnel		**18**:904g–h	**9**:749a–b

	articles	article sections	other references
iii. The use of diplomacy in the negotiation of international disputes: public international conferences, arbitration, and mediation; secret diplomacy		**1**:1077a–h / **9**:733d–736a / **18**:896h–898g / **19**:969g–970c / **19**:971h–973e	**4**:402c–f
c. The balance of power as a deterrent to war		**6**:1082b–e / **9**:1144c–1145e / **19**:546e–548c / **19**:566f–572b	**7**:670d–g / **9**:373c–d / **9**:754a–755c *passim* / **9**:762a–e / **9**:764d–768e *passim* / **9**:777h–778d / **9**:781f–h / **9**:783a–c
d. Mutual and unilateral disarmament as a deterrent to war		**18**:897f–898e / **19**:971h–973e	**13**:327d–f / **19**:547h–548b / **19**:552e–553b
5. The use of intelligence and counterintelligence activities in the preservation of national security and the conduct of international affairs	INTELLIGENCE AND COUNTER-INTELLIGENCE **9**:679–686		
a. Historical development of intelligence activities: early intelligence systems; modern national intelligence organizations		**9**:680g–685g / **5**:332e–333f	
b. Sources for and methods of collecting intelligence data		**9**:680b–g / **9**:685h–686e / **5**:331b–332e	**9**:682g–685f *passim*
6. Development of the study of international relations [see 10/36.E.3.g.]			
7. Influences of international law on the conduct of international relations [see 552.B.]			
8. Influences of international political parties and movements; *e.g.*, Pan-Africanism, Pan-Arabism, Pan-Slavism, European federalism		**5**:384c–385c / **9**:732e–g / **9**:769c–773d / **11**:998h–1000d / **14**:679b–680a / **17**:961d–962e / **19**:962g–963g	**7**:204h–205a / **13**:788f / **13**:789e–g / **16**:328h–329a / **16**:541e–g / **16**:966f–973g *passim*
9. Government-sponsored organizations that affect international relations in nonpolitical spheres; *e.g.*, economic, cultural, technological organizations		**1**:396a–e / **1**:399d–e / **2**:1066g–1067a / **5**:378a–384c / **9**:734c–736b / **9**:738d–740h / **9**:749h–750f / **13**:400e–h / **13**:1074c–1075f / **17**:312b–313a / **18**:899b–903c / **19**:547c	**1**:963g–965f / **3**:964h–965h
B. War among states	WAR, THEORY OF **19**:542–548		
1. Degrees and kinds of war		**19**:543b–544a / **2**:14c–15c	**15**:38f–h / **19**:558e–562f *passim*
a. Limited war: armed conflict limited by territory, weapons technology, or issues; conventional war		**8**:460b–462e / **9**:762f–763e / **11**:85h–86g / **19**:541a–e	**9**:758g–760e / **9**:776f–777f / **19**:543f–g
b. Total war: armed conflict with complete mobilization of human and material resources; nuclear war		**19**:543b–e / **11**:86g–87b / **19**:694e–695b	**19**:564f–572b *passim* / **19**:979d–1013e *passim*
c. Ethnic or tribal wars		**13**:846a–f	**6**:171a–e
d. Religious wars: the *jihād*; other wars for religious supremacy		**4**:592h–593d / **7**:629h–631b / **13**:848a–h	**3**:556g–557b / **3**:564g–565e / **3**:566c–e / **5**:298d–299e / **6**:1088b–1090b *passim* / **6**:1090c–e / **9**:914g–h / **11**:224g–225h / **13**:113a–d / **17**:964e–h / **19**:772d–773h *passim*
e. National, regional, and worldwide wars		**6**:1099g–1104b / **17**:964g–965b / **18**:333g–337f / **19**:945b–966d / **19**:976d–1013d	**7**:718f–719a / **19**:549b–551b

Division V. Law

[for Part Five headnote see page 283]

The outlines, and the articles and parts of articles referred to, in the four sections of Division V treat philosophies and systems of law; the branches of public law; the branches of private law; and the profession and practice of law.

The articles referred to in Section 551 treat Western and non-Western philosophies of law; ancient and modern legal systems; and the study of the distinctions and parallels among diverse legal systems.

Section 552, on public law, first deals with laws defining and implementing the authority and power of the state, covering constitutional law and administrative law. It goes on to laws governing the relations between sovereign states, covering international law; the roles of the United Nations and the International Court of Justice; the laws of war; war crimes; and space law. It next deals with criminal law and with military law. Dealing with laws promoting the public welfare, it treats welfare and security programs; health and safety laws; and laws regulating the health, safety, and welfare of workers. It next deals with tax law. Finally, it deals with laws of judicial procedure, treating the organization and administration of the courts in the legal system; criminal procedure; administrative procedure; the jury system; and systems of arbitration.

Section 553, on the branches of private law, first deals with laws governing the right to acquire, hold, and use economic goods, covering property law; copyright, patent, and trademark law; the law of trusts; the law of mortgages; and laws concerning bankruptcy. It goes on to family law and the law of inheritance. It next deals with tort law, governing the redress of injuries to persons and property, to which the state is not a party. Dealing with laws governing economic transactions, it treats the law of contracts; the law of commercial transactions and commercial relationships in agency law; the law of business associations; labour law; and laws governing commercial transportation on land, on water, and in

554. The profession and practice of law 369

the air. Finally, it treats civil procedural law and the law of evidence.

Section 554 treats the history, composition, and general characteristics of the legal profession; the delineation of the lawyer's responsibilities in legal ethics; and the educational requirements for the legal profession.

Section 551. Philosophies and systems of law

[for Part Five headnote see page 283
for Division V headnote see page 352]

The articles and parts of articles referred to in Section 551 deal with three main subjects: A, Western and non-Western philosophies of law; B, ancient and modern legal systems; and C, the study of the distinctions and parallels among diverse legal systems.

The outline of subject A begins with Western philosophy of law. It first deals with the basic problems of the philosophy of law and with the analytical, the sociological and historical, and the ethical approaches to a theory of law or jurisprudence. It goes on to the relationship between law and morality, treating the influence of the principles of natural law and of the idea of justice; the relationship between natural law and positive law; the influence of the idea of the social contract; and 20th-century reactions against the concept of natural law. It next sets forth a historical survey of Western legal theories. Finally, it treats Islāmic, Chinese, and other non-Western philosophies of law.

Subject B is ancient and modern legal systems. Articles are referred to that separately treat primitive law—the legal systems of nonliterate peoples; ancient systems of law—Egyptian, cuneiform, Chinese, Greek, Hellenistic, Roman, and Germanic law; medieval European constitutional, private, and canon law; and modern systems of law—common law, continental civil law, and Soviet and socialist legal systems.

The outline of subject C begins with the historical background of the study of comparative law. It next treats the methods used in the systematic analyses of the laws of various countries. Finally, it deals with the uses of comparative law in national and international law and with its importance in international trade.

Section 552. Branches of public law, substantive and procedural
[for Part Five headnote see page 283
for Division V headnote see page 352]

The articles and parts of articles referred to in Section 552 deal with six main subjects: A, laws defining and implementing the authority and power of the state; B, laws governing the relations among sovereign states; C, laws governing acts viewed as crimes; D, laws promoting the public welfare; E, laws governing taxation; and F, laws of judicial procedure.

The outline of subject A begins with the basic laws governing the organization and functions of the state. It treats the origin and development of constitutional government; a functional comparison and classification of constitutions; the role of constitutional law in establishing the framework and the branches of government; and, as an illustration, the unique role of the Supreme Court in the constitutional law of the United States. The outline next deals with laws governing public administration—the regulation of the organization, powers, duties, and functions of public administrative authorities. It treats the nature of administrative law; the need for legal safeguards over public administration and bureaucracy; the judicial review of administration; and administrative procedures.

Subject B is laws governing the relations among sovereign states. The outline first treats the historical development of international law; the distinctive features and fundamental principles of international law; the subjects of international law; problems of jurisdiction; and the relationship of international to municipal or national law. It next treats the attempt to create a supranational legislative and executive authority—the United Nations; and the attempt to create a supranational judicial authority—the International Court of Justice. It further treats the attempts to impose rules of warfare; to limit and punish war crimes and other crimes against humanity; and to preserve the peaceful uses and exploration of outer space.

The outline of subject C first deals with the principles and doctrines of criminal law in common law and civil law systems, treating the limitations of the definition of criminal conduct and of the applicability of criminal law; the elements of the criminal act; and the recent influence of the behavioral sciences on the development of criminal law. It next treats laws governing offenses committed by members of military forces and by other persons subject to military discipline.

The outline of subject D, laws promoting the public welfare, covers laws providing for general social security and welfare; laws promoting public health and safety; and laws regulating the health, safety, and welfare of workers.

The outline of subject E treats the modern development of tax law; constitutional, political, economic, and other limitations on the taxing power; the administration of tax laws; and the role of the judiciary in tax cases.

Subject F is the laws of judicial procedure. The outline begins with the organization and administration of the courts in the legal system. It treats the function of the courts in the legal process; the structure and organization of trial courts or courts of original jurisdiction; appellate court systems and courts in federal systems; the selection and qualification of judges in civil law and common law systems; the structure and status of the judiciary in countries governed by the Soviet and socialist law system; and diverse views of the judicial function. The outline next deals with the methods and procedures of the law. It treats the stages of criminal procedure (civil procedure is dealt with in Section 553) and the characteristics of administrative procedure. Finally, the outline deals with methods of adjudicating litigious disputes, treating especially the jury system and various systems of arbitration.

Section 553. Branches of private law, substantive and procedural
[for Part Five headnote see page 283
for Division V headnote see page 352]

The articles and parts of articles referred to in Section 553 deal with five main subjects: A, laws governing the right to acquire, hold, and use economic goods; B, laws governing marriage, the family, and succession; C, laws governing the redress of injuries to persons and property, to which the state is not a party; D, laws governing economic transactions; and E, civil procedural law.

The outline of subject A first deals with the historical development of property rights; with the original and derivative methods of acquiring property rights; and with the types of property rights classified by the different types of ownership. Dealing with subdivisions of property law, the outline covers laws concerning tangible property, real and personal; laws protecting intangible or incorporeal property rights, such as copyright, patent, and trademark law; laws concerning the temporal division of property rights in common law and civil law traditions; laws concerning trusts; the law of mortgages; and laws concerning bankruptcy. Finally, the outline treats restrictions imposed upon property ownership in the interests of public welfare, and the political, social, and economic consequences of property rights.

The outline of subject B first deals with laws governing the institution of the family and the relationships among its members. It treats legal definitions of the family; laws concerning the marriage contract, the civil effects of marriage, and the status of married women; laws concerning children and parental obligations and rights; and laws concerning the termination of marriage. The outline then deals with laws concerning the devolution of property by means of inheritance. It treats criticisms and defenses of the right to devise and bequeath property; freedom of testation; the issue of the division of property; the development of laws governing intestate and testate succession; and laws governing the assumption of inherited property.

Subject C is laws governing the redress of injuries to persons and property, to which injuries the state is not a party. The outline first deals with the nature, scope, and historical development of tort law. It goes on to the doctrine of strict liability as compared with negligence liability, and to recent changes in tort liability burden. In a general survey of modern tort law, the outline treats intentional personal injuries, such as battery and assault; intentional injuries to property; injuries resulting from negligent acts, including employers' liability and the manufacturer's liability to the consumer; and injuries done to personality and personal relationships, such as libel and slander and other invasions of privacy, and including interference with economic relationships.

Subject D is laws governing economic transactions. The outline begins with laws governing the making and execution of promises. It treats the historical development of contract law; the rules governing the legal enforcement of contracts in various legal systems; current trends and issues in the law of contract; and the role of contract law in the sphere of economic activity. The outline goes on to the historical development and the principal elements of laws governing commercial transactions, and commercial relationships of agency. It next deals with laws regu-

lating business association, here covering the principal forms of business associations; laws governing the management and control of business entities; laws impinging upon the structure of corporate finance; recent trends in laws governing mergers and consolidations; and laws governing the liquidation of insolvent businesses. The outline next deals with the historical development, scope, and nature of laws regulating relationships between employers and employees. Finally, it deals with laws governing commercial transportation, covering laws regulating the carriage of goods, maritime law, and air law.

The outline of subject E begins with the historical growth of civil procedural law. It goes on to the elements of civil procedure, covering such things as problems of jurisdiction; definitions and limitations of parties to a suit; provisional remedies sought prior to trial; and the actions involved in the commencement of civil action. It next treats the conduct of civil trials, dealing with the law of evidence and the rules governing the determination of questions of fact as a basis of a judgment by the court. Finally, it treats the rendering of judgment in civil cases, and post-trial appeals and other methods of review.

Section 554. The profession and practice of law

[for Part Five headnote see page 283
for Division V headnote see page 352]

The articles and parts of articles referred to in Section 554 deal with three main subjects: A, the profession of law; B, legal ethics; and C, educational requirements for the legal profession.

The outline of subject A begins with the history, composition, and general characteristics of the legal profession. It goes on to the functions served by the legal profession in its private and public roles, and to its different roles in different systems of law. The outline further treats the effect of the political structure on the legal profession; the organization of the legal profession; and the future of the legal profession.

The outline of subject B, legal ethics, first deals with different conceptions, in various countries and legal systems, of the ethical requirements in the practice of law. It then treats the lawyer's moral responsibilities to his client (for example, to protect confidential communications), and his moral responsibility as either public prosecutor or defense attorney in criminal cases.

The outline of subject C treats the history, aims, and different methods of legal education; the examination and qualification of candidates for the bar; prelegal and postgraduate legal education; and current trends in legal education.

Division VI. Education

[for Part Five headnote see page 283]

The outlines, and the articles and parts of articles referred to, in the three sections of Division VI treat the aims and methods of education; educational systems around the world; and the organization of education.

The articles referred to in Section 561 deal with diverse philosophies of education and with experimental findings and theories about the processes of learning and teaching.

Section 562 treats the major types of educational systems existing today; the history of educational practices and institutions around the world; and international educational activities.

Section 563, on the organization of education, treats the phases or levels of education; the preparation and performance of teachers; the economics of education; and the social and political aspects of education.

Section 561. The aims and methods of education 371
562. Education around the world 372
563. The organization of education 377

Section 561. The aims and methods of education

[for Part Five headnote see page 283]

The articles and parts of articles referred to in section 561 deal with two main subjects: A, philosophies of education; and B, the learning process and the teaching science or art.

The outline of subject A begins with the methods and scope of the philosophy of education and with assumptions about human learning common among theorists of education. Turning to various conceptions of the means and ends of education, it first sets forth eight different model theories of the educated person, the differences reflecting basic philosophical positions. It then treats areas of disagreement among educational theorists, covering diverse conceptions about what constitutes knowledge and how it is communicated; diverse conceptions about the purpose of education; and diverse conceptions about controlling student behaviour.

The outline of subject B begins with experimental findings and theories about the processes of learning and thinking. Going on to pedagogy, the outline deals with the components of the teaching situation, treating the elements that modify the learner's behaviour; the psychology of instructional objectives; and curricular strategies that enhance the teaching process. It next deals with traditional and contemporary general theories concerning the role of the teacher in the learning process. Finally, it treats issues about the organization of instruction and about the value of different instructional media.

Section 562. Education around the world

[for Part Five headnote see page 283
for Division VI headnote see page 371]

The articles and parts of articles referred to in Section 562 deal with three main subjects: A, the educational systems of the world; B, the history of education; and C, international educational activities.

The outline of subject A first deals with the factors governing the classification of educational systems. It then sets forth the characteristics of the major types of educational systems in various countries around the world. It treats centralized systems, decentralized systems, joint national and local systems, systems controlled by political parties, and sectarian systems. It also suggests emergent trends in educational systems.

The outline of subject B treats education in primitive and early civilized cultures; education in classical Eastern and Western cultures; education in the Persian, Byzantine, early Russian, and Islāmic civilizations; education in the European Middle Ages; education in Asian civilizations from about AD 700 to the eve of Western influence; European education during the Renaissance and Reformation; European education in the 17th and 18th centuries; Western education in the 19th century; and education in the 20th century—including traditional and experimental educational movements, contemporary Western patterns of education, revolutionary patterns, modernizing Afro-Asian patterns of education, and education in colonies and newly emerging nations.

The outline of subject C treats the nature of international educational relations, the history of such relations, and recent developments with regard to them.

Section 563. The organization of education

[for Part Five headnote see page 283
for Division VI headnote see page 371]

The articles and parts of articles referred to in Section 563 deal with four main subjects: A, the phases or levels of education; B, the preparation and performance of teachers; C, the economics of education; and D, the social aspects of education.

The outline of subject A first covers the historical development, current influencing factors, and major patterns of education at each of the phases or levels of education—preschool, elementary and secondary, and higher education. It goes on to the education of exceptional children, treating the children who are classed as exceptional, the patterns of special education, and the problems of personal adjustment of gifted and mentally or physically handicapped children. It next deals with the historical background of modern adult education; the agencies and institutions involved in it; and the types of adult education. Finally, it deals with vocational training—apprenticeship and employee training.

The outline of subject B begins with the education of teachers, treating pre-service education, certification and appointment, and in-service education. It goes on to deal with the teaching profession. Here it treats the economic and social status of teachers; their functions and roles—for example, as scholar or as parent substitute; the development of professionalism in teaching; and the development of educational associations and teachers' unions.

Subject C is the economics of education. It begins with eco-

nomic analyses of the relationship between investment in education and economic returns to the student and the community. It goes on to the increasing demand for educational services and to the problems of supplying that demand. It next deals with the economic planning of education, treating various approaches to the determination of educational expenditures and to the determination of fees and revenue collection. Finally, it treats economic influences on the balance between different forms of education in developed and developing countries.

Subject D is the social aspects of education. The outline first deals with different conceptions of the social functions of education. It goes on to social, ethnic, political, and economic factors that affect schools in different locales. It next deals with internal factors affecting school practices—teacher–administrator relationships, parent–teacher and teacher–student relationships, and student peer-group relationships. Dealing with the state's interest in education, the outline treats education as a means of inculcating national values and as a means of training government personnel and providing advisers and consultants to those possessing political power. Finally, the outline treats the freedom of the university teacher to choose educational materials and courses of study, and his freedom of critical dissent.

Introduction to Part Six:

The world of art

by Mark Van Doren

Let us imagine if we can a world entirely without art: without story, image, edifice, or significant sound. If we can, for perhaps it is impossible. Such a world might well be invisible, inaudible, ineffable, and intangible. Even if we could see it, hear it, feel it, we would not know we did, at least as men know things. Without the earliest of all arts, language, we would scarcely know of what we were deprived: the privilege, namely, of expressing our satisfaction or dissatisfaction with what had taken place before our eyes. Without the arts of speaking, listening, thinking, counting, and measuring—without the intellectual arts—we could not assess or repossess the experience we had undergone. Without the useful arts we could make nothing, build nothing worthy to contain and shelter our bodies, to be a home wherein our thought might rest. And then without the fine arts—the arts that serve only themselves, that are ends, not means, that justify themselves when they give us nothing but pleasure—we would be shallow and poor of mind, with little or no sense of the world's depth and colour, or of ourselves as creatures for whom the present moment is also past and future. We call these arts fine not because they are better than the others but because they are different, as beauty is different from use—beauty that is its own excuse for being.

None of them is more intimately ours than story. The art of literature is the art of story; there are songs and there are essays long and short, there are histories, there are biographies, there are treatises, sermons, and discussions of everything under the sun, but story is our first and last entertainment—when we are children and when we are too old to care any more what truth is unless it comes in the past tense, with persons reflecting in their lives the peculiar radiance that attends the accidents of time and character. Stories may vary in length from the anecdote to the epic, from the fairy tale to the novel, the imaginary biography, the romance. And they may reach us in many forms: in the theatre, for instance, where they may employ flesh-and-blood actors to convey their meaning or where they may be only flickers of light and shade upon a screen that has no depth save what we give it in our imaginations; where, in other words, they call themselves plays or motion pictures, or where, if music also sounds and dancers whirl and pose, they call themselves ballets.

Nature does not tell stories; only artists do, and in the process they work transformations that measure the distance between matter and mind. In nature, so far as we can know it, there are no beginnings and no ends in the sense familiar to both writers and readers of fiction and drama, or for that matter history, which likewise imposes form upon a welter of events. No matter how simple a tale is, or how complex, how few the words in it or how many, it is a human construction that no animal or plant, and of course no stone, would find in the least degree interesting; whereas human beings hold their breaths until an end is reached. Ends are intelligible as the raw materials of life seem not to be; if life itself does not become intelligible through story, it becomes in some mysterious way both beautiful and clear, and for the time being that suffices.

Each of the fine arts flourishes both in large and in little forms. Just as story has a choice between the brevity of folk tales and the elaboration of epics and romances, so statements about life may be as compendious as a proverb—the wisdom of many and the wit of one—or as bulky as the longest book in numberless volumes. So music—the sound of other worlds—reaches our ears either as simple song or as opera and symphony and other complex forms. There are those who say that the song, like the anonymous fable or tale, is more lasting and important than compositions of great complexity can ever be; and they also say that the lyric poem, at least when it is perfect, as in truth it seldom is, has more to tell us, or at least deeper ways of touching us, than the most tremendous tragedy in five acts or the subtlest comic novel in a thousand pages. When a memorable melody attaches itself to a lyric or a ballad, something indeed does come into existence and hang there as if for perpetuity. Music is the most ineffable of all the arts. It has its own language and it listens to itself; we do not so much hear it as overhear it, nor can we speak very sensibly about what we have overheard. Successful music, powerful music, has an effect upon us that many have tried in vain to describe; it takes us out of ourselves, they say, and perhaps they need to say no more than that. Even then they may be speaking only of the music that is native to them; Eastern music sounds like mere noise to untrained Western ears, and Western music has a monotony, say the Chinese, that Europeans of course deny is there. The same thing is true, though in lesser measure, of all the arts. East and West have different eyes as well as ears, and different thoughts.

The arts of drawing and painting, of etching and lithography, of engraving and decorative design, have covered many surfaces—canvas, plaster, parchment, paper—which no longer show where the artist's hand once worked; for the materials of these arts are perishable, as the marble of sculptors has been, as the bronze, as the wood. Much remains, but more does not. Even the cave paintings of prehistoric France and Africa, hailed by modern man when he discovered them as miracles of survival, may not survive the visits that living people rushed to pay them. Ancient Greek music has failed to survive for a further reason: we do not know how it was written or how it sounded; we are told that it had almost magical powers over those who heard it in its time, but that time is gone, along with the time when paintings adorned the walls and columns of Greek temples and houses. Painting has been for centuries the queen of the arts in Europe. Belgium, the Netherlands, France, Germany, Spain, Italy, and England—each of them in its turn, and sometimes in more than one turn, has enriched the world with shapes and colours that only genius could have foretold, only passion could have brought into being. And that is but half the story; in China long before, in India, in Persia, in Japan, in Russia, the brushes of painters, sometimes tipped with gold, beautified and glorified the palaces of emperors, the tombs of princes, and the dwelling places of great gods. In Egypt for millennia the order of the world was registered in stone and gold, and the written word itself was pictures.

Sculpture, that once was solid and now is full of spaces—or may be—left open by the ingenuity of workers in metal, has changed as architecture has changed. Both arts now cultivate openness: buildings are closed, but the exterior is glass, so that space plays games with itself inside, and the effect

is of a lightness that winds might blow away, except of course that the buildings look lean and strong enough to remain just where they are. It has always been true that architects desired the effect of lightness, as all art does, heaviness being a quality that no mind admires; any building weighs tons, but we are not supposed to think of that; rather indeed we are expected to imagine that brick and stone for once have learned to lie lightly on the earth, which they do not seem to press at all. So with Classical sculpture, from Greek days on; the charm of it was its poise, its grace, its management of idea in marble. So too with Classical architecture; the Parthenon is both massive and weightless, like a ship that might sail yet does not. And always in China and Japan there have been those curled and tapered roofs that still look as if at this very instant in time they are taking wing. The open revolution, then, was only a restatement of what had long been understood though some of its secrets were forgotten.

Abstraction in all the arts, for there is no art from which it is absent, is again a restatement of what has always been true, however feebly it was recognized by schools of artists who had lost contact with reality. Great painting, great music, great poetry, great architecture—great landscape architecture too—have never been strangers to abstraction, just as they have never been slaves to an incomplete understanding of what is meant when we say that art is imitation. It *is* imitation, but of what? Of essences, not accidents; of the truth that is hard to see; of beauty that is basic; of shapes that will not change; of colours that will not fade. And if, say, the great painters of the past, comprehending this, still "copied nature," they did not do so inanely. They did so, on the contrary, with huge effort aimed at the verities that underlie verisimilitude, so that in one sense they were not copying at all; they were extracting essences, they were reducing appearances to the ideas that informed them; they were, in a word, abstracting truth from vessels that contained it. But they did not say they were doing this. They said they were copying nature. And when later on they were taken at their word by painters with inadequate aspiration, the result was woeful insipidity, was mediocrity and flatness. The heroic remedy was warfare against representation as such, was a shortcut to abstraction that could have its weakness too, was a loss, in all but the great revolutionaries, of that contact with Earth which no art ever can be without. Abstract painting at its best—and the worst does not matter—imitates nature at nature's best; is "like" nature after all, for nature is brilliant and strong, and abstract painting convinces us of this even though it dispenses with the particulars with which we used to be fascinated and of which we were quite properly fond.

A world entirely without art would be worse than invisible, inaudible, ineffable, and intangible. It would be a world without temporal dimension, it would be a world that human minds could not remember. Human memory is unique in its capacity not only to recall but also to utilize the past, and to apply it; and better still, to re-create it so that it becomes a part of the present moment, which is more like eternity than anything else we shall ever experience. Human memory is nothing less than the origin of human art.

"The Greeks fabled not unwisely," said Sir Thomas Browne, "in making Memory the mother of the Muses." The memory of man is indeed a wonderful thing, and his richest possession. Not only is it the source of all our arts, it is their record too, stored in the mind of the beholder, the listener. Plato even asked us to conceive "in the mind of man a block of wax, the gift of Memory, and when we wish to remember anything which we have seen, or heard, or thought in our own minds, we hold the wax to the perceptions and thoughts, and in that material receive the impression of them as from the seal of a ring; and we remember and know what is imprinted as long as the image lasts." An artist whose poems or pictures or musical ideas have great power is certainly, we feel, the possessor of a memory that is always at his command, bringing to him at any moment whatever detail he needs, and reminding him too of the knowledge he has, and never forgets, of the way the world is put together, so that he does not misrepresent things as they are. The human race itself can be said to be such an artist, for it has its myths which it keeps alive, its stories that are "so true," someone has said, "that they couldn't have happened." There is such a thing as folk memory, the mother perhaps of all our thoughts and feelings, and the guardian of such wisdom as we have.

A story that cannot be remembered, a song that fades out of the mind, a hero whose name escapes us, a sentence we thought we would never forget but somehow do—such works of art must be defective at the core. But there are others that we could not forget if we tried, and it is those we live with in the company of friends who remember them too. Perhaps the final justification of art is the two-fold pleasure it gives: the pleasure of remembering great and beautiful things that we cannot lose, and the pleasure of sharing them with others who possess them in the same fashion.

There is a limited number of such things, of these greatest of human works of art; by definition there can be no superfluous masterpieces. The ones we have are numerous after all, and no single person can claim to have done justice to every one of them, or can claim to know what further ones are still unborn. Mnemosyne, goddess of Memory and Mother of the Muses, will have the deciding vote as to which ones, now or in the future, will survive the ravages of time.

Part Six. Art

The outlines, and the articles and parts of articles referred to, in the twelve sections of Part Six are concerned with man's creation, experience, and evaluation of works made primarily for aesthetic enjoyment and contemplation. The arts of making things primarily for practical use are treated in Part Seven, on technology.

The articles referred to in the three sections of Division I treat theories about the nature and classification of works of art; the apprehension, interpretation, appreciation, and criticism of works of art; and the nonaesthetic contexts of art—that is, the interaction of the arts with the major institutions of society. Many aspects of aesthetics are involved in the treatment of such subjects; the philosophical discipline of aesthetics, as itself an object of study, is dealt with in Section 10/51 of Part Ten.

The articles referred to in the nine sections of Division II present analytical and historical studies of the particular arts—literature; theatre; motion pictures; music; dance; architecture, garden and landscape design, and urban design; sculpture; drawing, painting, printmaking, and photography; and the arts of decoration and functional design.

Division I. Art in general 383
II. Particular arts 393

Division I. Art in general

The outlines, and the articles and parts of articles referred to, in the three sections of Division I treat the theory and classification of the arts; the experience and criticism of works of art; and nonaesthetic contexts of art.

The first articles referred to in Section 611 treat diverse theories concerning the definition of art and the nature, functions, and effects of works of art, and diverse theories concerning the creation of works of art. The treatment of classification involves such classifications of the kinds of art as those by reference to the intention of the maker or the recipient, to the media used, or to the use and need of performers, or interpreters. The articles referred to at the end of Section 611 treat two ways of characterizing and grouping works of art—by reference to the cultural or social circumstances of their production or the extent and character of their audience; and by reference to criteria of style.

The first articles referred to in Section 612 deal with the experience of works of art, differentiating the factors that affect apprehension, interpretation, and appreciation. The next subject treated is the diverse criteria for the evaluation of works of art, and diverse conceptions of the purposes and methods of criticism. The last subject is scholarship concerning the arts and its relation to other humanistic disciplines.

The first articles referred to in Section 613 treat sociological conceptions, social uses, and social control of art; the relation of the arts to religion and to science and technology; and the place of the arts in education. Further subjects treated are the economics of art, the training and work of the artist, and the preservation and dissemination of works of art.

Section 611. Theory and classification of the arts 383
612. Experience and criticism of works of art 386
613. Nonaesthetic contexts of art 389

Section 611. Theory and classification of the arts

The articles and parts of articles referred to in Section 611 deal with two main subjects: A, general theories and conceptions of art; and B, classification of the arts.

The outline of subject A begins with problems about the definition of art and with diverse conceptions about its scope. It goes on to treat diverse theories concerning the nature, functions, and effects of art, covering mimetic, expressive, and formalist theories of art and pragmatic theories that view art in terms of its effects on its audience or in terms of its being a means to various human ends. Finally, the outline treats theories of the motivation for the production of works of art and theories about factors that are influential in the creative process.

Subject B is the various ways of classifying the kinds of art or of characterizing and grouping particular works of art. The out-

line first deals with the classification of the kinds of art into useful art, fine art intended for enjoyment as an end in itself, and arts that are both useful and fine. It then deals with other ways of classifying kinds of art: by reference to physical differences in the artistic media and in the modes of existence of the work of art; by reference to differing relations to performance and interpretation; by reference to different uses of notational devices; by reference to differing spatial and temporal existence of the works of art; and by reference to the cultural circumstances of their production and to the extent and character of their audience. The outline next deals with the characterization and grouping of works of art by reference to criteria of style. It first treats issues concerning the legitimacy of stylistic criteria and diverse historical and contemporary conceptions of the nature and principal aspects of style in the arts. After covering twelve varieties of style, the outline deals with the dynamics of style, treating diverse theories of the origin, diffusion, change, and duration of styles.

Section 612. Experience and criticism of works of art

[for Part Six headnote see page 383
for Division I headnote see page 383]

The articles and parts of articles referred to in Section 612 deal with three main subjects: A, the aesthetic experience; B, criticism of works of art; and C, scholarship in the field of the arts.

The outline of subject A gives separate treatment to the apprehension, the interpretation, and the appreciation of works of art. It first presents diverse views in aesthetics of the psychological factors involved in the apprehension of art. It goes on to the kinds of influences on apprehension, such as individual temperament, social and cultural conditioning, and acquired attitudes and values. It then treats the levels and types of individual response to works of art. In dealing with interpretation, the outline covers diverse views in aesthetics of the nature and levels of meaning in works of art; the relevance to interpretation of knowledge of the materials, techniques, and conventions of the various arts; diverse views of the roles of symbol and myth in the arts; and the varying uses of symbol and myth in different arts and in particular styles in the history of the same art. In dealing with the appreciation of works of art, the outline treats the factors that affect an individual's appreciation of a work of art, and the relation of evaluation and criticism to appreciation.

Subject B is the criticism of works of art. The outline first deals with the roles of identification, description, interpretation, and evaluation in the criticism of a work of art. It goes on to deal with diverse criteria of evaluation. It covers such criteria as those implicit in the traditional concept of beauty; criteria that involve concepts of unity, complexity, and clarity; criteria related to the meanings and intelligibility of a work; criteria related to a work's social, moral, or religious significance; criteria related to the technical accomplishments of a work; and criteria related to the intention of the artist. The outline next deals with the application of such criteria in the criticism of works of art. It covers diverse views of the functions of critics in relation to the artist, his work, and its public reception; diverse critical methods, critical styles, and critical approaches to the arts; and the factors that affect the quality of criticism.

The outline of subject C first deals with the resources and methods of scholarship in the field of the arts. It next treats the relation of scholarship in the arts to other humanistic disciplines. At the end it deals with the tools and techniques for the conservation and restoration of works of art.

Section 613. Nonaesthetic contexts of art
[for Part Six headnote see page 383
for Division I headnote see page 383]

The articles and parts of articles referred to in Section 613 treat four main subjects: A, the interaction of the arts with social, economic, and cultural institutions; B, the economics of art; C, the training and work of the artist; and D, the preservation and dissemination of works of art.

The outline of subject A begins with the arts and society, taken generally, and covers sociological conceptions of the field of art; the psychological and cultural aspects of the aesthetic function; the social uses of art; the reflection of social forces in art; the social dynamics of artistic creativity; and the traditional and modern milieus in which art is produced. The outline goes on to social control of art, involving censorship and related forms of regulation. It next covers the interrelations of the arts and religion, and the interrelations of the arts with science and technology. Finally, it deals with aesthetic education, treating diverse theories about the role of the arts in education; particular uses of the arts in educational curricula; and the effects of diverse educational systems on the artist and his public.

Subject B is the economics of art. The outline first deals with diverse factors that affect the economic value of a work of art. It next treats the forms of economic support of the arts. Dealing with the art market, the outline covers conceptions of the "art industries"; the role of entrepreneurs in the art marketplace; and the role of critics and scholars in the art marketplace. The outline then treats the forms of remuneration of artists and the legal protection of property rights. It also deals with fraudulence in the arts, such as forgery, piracy, and plagiarism.

The outline of subject C begins with the methods of training artists, by systems of apprenticeship and in formal educational institutions. It next treats the social and intellectual status of artists; special environments for artistic work; and the functions and effects of various professional and honorary societies for the arts. Finally, it treats diverse conceptions of the distinction between the professional and the amateur artist and the influence of amateurs on the development of the arts.

In dealing with subject D, the preservation and dissemination of works of art, the outline covers the roles of libraries, museums, and producing and performing associations; the roles of systems of notation for literature, music, and dance; the roles of industry and commerce; the roles of mechanical and electronic media; the roles played by oral and imitative traditions; and the roles of fairs, festivals, exhibitions, and expositions.

Division II. Particular arts

[for Part Six headnote see page 383]

Division I dealt generally with the theory and classification of the arts, the experience and criticism of works of art, and the interaction of the arts with social, cultural, and economic institutions.

The outlines, and the articles and parts of articles referred to, in the nine sections of Division II treat the particular arts: literature; theatre; motion pictures; music; dance; architecture, garden and landscape design, and urban design; sculpture; drawing, painting, printmaking, and photography; and the arts of decoration and functional design.

In each of the nine sections, articles are referred to that treat such subjects as the nature and scope of the art and its various forms; its media, tools, and techniques; aesthetic problems special to the art; its relations to its audience; and the manner in which its work is presented.

In each section, articles are referred to that treat the primitive, folk, and popular forms of the particular art. Articles are also referred to in each section that treat the characteristics and historical development of the particular art among Western; East, South, Southeast, and Central Asian; African; Eskimo and American Indian; and Oceanian peoples.

Section 621. Literature 393
622. Theatre 400
623. Motion pictures 404
624. Music 407
625. Dance 414
626. Architecture, garden and landscape design, and urban design 417
627. Sculpture 421
628. Drawing, painting, printmaking, and photography 423
629. Arts of decoration and functional design 428

Section 621. Literature

[for Part Six headnote see page 383]

The articles and parts of articles referred to in Section 621 deal with six main subjects: A, the art of literature; B, the techniques of literature; C, kinds of literary composition; D, primitive, folk, and popular literature; E, children's literature; and F, the characteristics and historical developments of literature in particular cultures.

The outline of subject A begins with the nature and scope of literature. It goes on to diverse theories about the composition of literary works, to conceptions of poetry, and to the characteristics of language as the medium of literary composition. It next deals with the nature, elements, and sources of literary themes and with the relation of content to literary form. Dealing with literature and its audience, the outline treats the relation between kinds of literature and the extent or social circumstances of their audiences, and the differing relations of literary works to their audiences according to the manner of presentation. It further deals with the integration of literature with other arts; diverse systems of classifying literary works; and the various kinds of writings on literature.

The outline of subject B first deals with the art of rhetoric, treating the elements of rhetoric; diverse historical and contemporary conceptions of the nature of rhetoric; the uses of rhetoric in different kinds of literature; and the relation of rhetoric to grammar and syntax, to literary diction and style, and to prosody. It next deals directly with prosody, the systematic study of versification and the manipulation of the elements of language that contribute toward acoustic and rhythmic effects in literature. It treats the relation of prosody to other elements of literature, theories of prosody, the elements of prosody, and its uses in verse, prose, drama, and oratory.

Subject C is kinds of literary composition. The outline first treats the characteristics of various kinds of narrative imaginative literature—the epic, the saga, the romance, the novel, the short story, the fable, the parable and allegory, and the ballad; kinds of dramatic or theatrical literature; kinds of lyric literature; and forms of satirical literature. It next treats the major forms of nonfictional prose literature: forms of factual-narrative literature, such as histories and biographies; forms of expository writing, such as the essay and travel literature; forms of argumentative writing, such as the oration and some types of scientific and philosophical writing; and various kinds of journalistic writing.

The outline of subject D begins with the characteristics of

primitive literature. It goes on to the characteristics, the oral transmission, the influence, and the major techniques and forms of folk literature. Finally, it deals with popular literature—relatively simple writings of widespread appeal—treating its relation to other forms of literature and its effects, forms, and techniques.

The outline of subject E treats attempts at definition of children's literature; types of children's literature; and the development of children's literature.

The articles referred to in connection with subject F treat the literature of Western peoples, including the literature of Jewish and Islāmic peoples; the literature of East, South, Southeast, and Central Asia; and the literatures of African, Eskimo and American Indian, and Oceanian peoples.

Section 622. Theatre

[for Part Six headnote see page 383
for Division II headnote see page 393]

The articles and parts of articles referred to in Section 622 deal with four main subjects: A, the theatrical arts; B, the kinds and methods of theatrical production; C, the elements of theatrical production; and D, the characteristics and historical developments of the theatre in particular cultures.

The outline of subject A first treats the nature and origins of the theatre as an art; the special functions and problems of theatrical production; and the special interrelation of theatrical performance and audience. It next deals with directing, covering diverse views of the role of directors; their relation to playwrights, producers, actors, and designers; special problems and techniques of directing; and the history of directing. The outline of the art of acting covers such topics as diverse views of the actor as an artist; the physical, emotional, and intellectual resources of the actor; major problems and styles of acting; the interaction of actor and audience; the training of actors; and the history of acting. After dealing with the roles of other arts in the theatre, the outline concludes by treating theoretical, critical, and descriptive writing about the theatre.

The outline of subject B begins with the diverse kinds of theatrical production, treating kinds defined by the nature of the production itself; kinds defined by their special purpose or audience; kinds defined by the system of production; kinds defined by the controlling artist; kinds defined by their style; and kinds defined by the lack of a unified dramatic structure, such as circuses, pageants, parades, and popular entertainments. The outline then deals with diverse methods of theatrical production, treating procedures for preparation of the production, and the composite aspects and collective methods of theatrical production.

The outline of subject C first deals with the kinds and uses of theatre buildings, stages, and auditoriums, and with the historical development of theatres in Western and non-Western cultures. It goes on to the subject of staging and stage design. It first deals with the elements and principles of composition in staging and with various styles and types of staging in theatrical and other performing arts. It then treats the materials and methods of scenic design, of stage lighting, of stage machinery, of stage sound, of costume design, and of theatrical makeup. Finally, it treats the coordination and interaction of the diverse elements of theatrical production and design and the history of staging and stage design.

The articles referred to in connection with subject D treat the theatre of Western peoples, including Jewish and Islāmic peoples; the theatre of East, South, Southeast, and Central Asian peoples; the theatre of African peoples; the theatre of Eskimo and American Indian peoples; and the theatre of Oceanian peoples.

Section 623. Motion pictures

[for Part Six headnote see page 383
for Division II headnote see page 393]

The articles and parts of articles referred to in Section 623 deal with three main subjects: A, the art of motion pictures; B, the motion-picture industry; and C, the history of motion pictures.

The outline of subject A first treats the essential characteristics of the motion picture; the particular forms and characteristics of motion pictures considered popular; and the problems arising from the distinction between the "art film" and other motion pictures. The treatment of the component arts of the motion picture covers the art of the camera; film editing; the arrangement of cinematic images in time; the use of sound; motion-picture acting; motion-picture design; the techniques and uses of animation; and the styles, techniques, and history of motion-picture directing. The outline goes on to the types of motion pictures, dealing with such classifications as those based on intention, on stylistic or technical considerations, on special audiences, and on genre. Further topics dealt with are special social functions of motion pictures; the special problems of production cost, distribution, and exhibition; the interrelation of motion-picture art and technology; the roles of other arts in motion pictures; and the study and appreciation of motion pictures.

The article referred to on subject B, the motion-picture industry, first treats the types of motion-picture industry. It further treats the economics of the motion-picture industry; the interaction of the motion-picture industry with its social, political, and economic milieu, and with other industries such as the music and publishing industries; and the effects on the motion-picture industry of film festivals and awards.

The article referred to on subject C treats the background, from 1815 to 1895, of the origins of the motion picture; the age of the filmstrip and the one-reeler; the age of the silent feature; and developments in the sound era, from 1928 to the present, including the vicissitudes of the sound film in the age of television.

Section 624. Music

[for Part Six headnote see page 383
for Division II headnote see page 393]

The articles and parts of articles referred to in Section 624 deal with eleven main subjects: A, the art of music; B, the sources of musical sound; C, the elements of music; D, musical notation; E, forms of musical composition; F, musical performance; G, music for the theatre; H, primitive, folk, and popular music; I, jazz; J, the recording and reproduction of music; and K, the characteristics of music in particular cultures.

The outline of subject A begins with diverse conceptions of music as an art and with speculations on the nature of music. It goes on to problems of musical meaning and of musical interpretation. It next deals with the use of music as an adjunct to other human activities and with the integration of music with other arts. Finally, it treats writings about music—theories of music, scholarly writings about music, and music criticism.

The outline of subject B begins with the physical aspects of musical sound. It next treats the human voice as a source of musical sound and historical developments of the art of singing in Western and non-Western cultures. It then deals with the history, technology, and techniques of different classes of musical instruments. Articles are referred to that separately treat percussion instruments, wind instruments, the organ, stringed instruments, keyboard instruments, and electronic instruments.

Subject C is the elements of music, their patterning and modes of organization in compositions. The outline first covers pitch, duration, timbre, harmony, counterpoint, texture, and orchestration and instrumentation. It then treats principles of musical form, types of musical form, and the historical development of characteristic Western and non-Western musical forms.

The outline of subject D treats the history and the methods of Western staff notation; other systems of notation; and the relation of notation to musical performance.

Articles referred to in connection with subject E separately treat the major instrumental forms of music—the sonata, the symphony, and the like—and solo and choral vocal forms.

The outline of subject F begins with general considerations about musical performance, treating diverse conceptions of the role of the performer, the relation of performance to the medium, and the relation of individual temperament and national traditions to performance. It then deals with the historical development of musical performance practice.

The outline of subject G, after general considerations about theatrical music, treats opera, music for theatrical dance, and such forms of musical theatre as musical comedy, operetta, and zarzuela. It then treats incidental music for the theatre, motion pictures, and television. Finally, it treats the history of theatrical music.

The outline of subject H, first dealing with folk music, treats its differentiation from and relation to popular and to "art" music; the formal characteristics and instruments of folk music; and regional and individual styles and varieties of folk music. Dealing with popular music, the outline treats its differentiation from and relation to folk music, "art" music, and jazz; the forms of popular music; and the development of popular music.

The outline of subject I, jazz, treats its differentiation from and relation to folk music, popular music, and "art" music; its emphasis on the performer as creator; its reflection of social and cultural forces; and the development of jazz styles.

The outline of subject J treats the types of music reproduction; the techniques of music recording; the effects of music recording on composition, teaching, criticism, and performance; and the development of music recording.

Subject K is the characteristics and historical development of music in particular cultures. The articles referred to treat the music of Western peoples, including Jewish and Islāmic peoples; of East, South, Southeast, and Central Asian peoples; and of African, Eskimo and American Indian, and Oceanian peoples.

4. Music and its environment: the relation of music to other human activities			
a. The use of music as an adjunct to other human activities; *e.g.*, ritual, social activities		**12**:662d–664b / **1**:243a–d / **12**:729e–h / **17**:150c–g / **17**:237a–c / **19**:851d–852g	**3**:1125f–1126a / **7**:467c / **8**:975a–b / **10**:120c–g / **14**:800d–803h *passim*
b. The integration of music with other arts; *e.g.*, dance, theatre, literature, film		**9**:973d–f / **12**:695g–696b / **13**:578f–579b / **17**:237d–e	**12**:720c–d / **19**:498h–499g / **19**:519f–520b
5. Writings about music			
a. Theories of music: their relation to criticism, to composition, and to the history of music; their relation to philosophical, scientific, and mathematical theories	MUSIC THEORY **12**:746–748	**12**:664b–667d / **8**:647d–648b / **12**:295g–296e / **12**:670g–671c / **12**:672b–673b / **12**:722h–724a / **12**:739h–740c / **18**:741f–742h	**4**:443a–b / **12**:681a–d / **12**:715h–716a / **15**:324f–g / **17**:150g–151a
b. Scholarly writings about music		**1**:669b–e / **7**:469h–470d / **13**:460g–h	**9**:974a–b
c. Criticism of music: conceptions of the nature and functions of musical criticism; the question of objectivity versus subjectivity in criticism; the question of criticism of a work versus criticism of a performance	MUSICAL CRITICISM **12**:722–724		
B. The sources of musical sound			
1. The physical aspects of musical sound: tone, movement, pitch, and timbre	SOUND, MUSICAL **17**:34–39	**8**:647d–e / **18**:741a–f / **19**:848c–849b	**15**:324f–g / **17**:739d–740f *passim*
2. The human voice: techniques, styles, and historical developments of the art of singing in Western and non-Western cultures	SINGING **16**:789–793		**7**:469d–e / **17**:479g–484a *passim*
3. Musical instruments: the history, technology, and technique of classes and specific types of instruments	MUSICAL INSTRUMENTS **12**:729–732	**1**:248f–250e / **7**:469a–c / **9**:974f–975a / **12**:673b–d / **13**:457h–458c / **13**:643h–644d	
a. Idiophonic and membranophonic instruments	PERCUSSION INSTRUMENTS **14**:58–66	**17**:38h–39a / **13**:644g–645a	
i. Idiophones: instruments whose substance vibrates to produce sound; *e.g.*, xylophones, rattles, cymbals, bells		**14**:58g–63e / **1**:249g–250b / **1**:664g–665f	
ii. Membranophones: instruments that emit sound by the vibration of a stretched membrane; *e.g.*, drums, mirlitons		**14**:63f–66e / **1**:250c–e / **1**:664e–f	
b. Aerophonic instruments: instruments that produce sound by the vibration of a column of air	WIND INSTRUMENTS **19**:847–860	**12**:732d–f / **1**:249d–f / **1**:665f–g / **17**:38e–h	
i. Brass instruments; *e.g.*, trumpets, horns		**19**:849b–850c	**17**:38e–f
ii. Woodwind instruments; *e.g.*, flutes, clarinets, oboes, bassoons		**19**:850d–851d	**17**:38f–g
iii. Aerophonic instruments with keyboards: the organ	ORGAN **13**:676–682		
c. Chordophonic instruments: instruments that produce sound by the vibration of struck, plucked, or bowed strings	STRINGED INSTRUMENTS **17**:738–746	**12**:732a–b / **1**:248g–249d / **1**:665h–666a / **17**:38c–e	
i. The lute family; *e.g.*, lutes, fiddles, violins, guitars		**17**:740f–741d / **17**:745h–746f	
ii. The zither family		**17**:741d–f / **17**:745e–h	
iii. The lyre family		**17**:741f–h / **17**:745c–e	

	articles	article sections	other references
iv. The harp family			
v. Stringed keyboard instruments; *e.g.*, the clavichord, the harpsichord, the piano		**17**:741h–742b / **17**:745a–c	
	KEYBOARD INSTRUMENTS **10**:436–446	**12**:732b–c / **13**:645a–b	
d. Electrophonic instruments: instruments that produce sound by electrical, electromechanical, or electronic means; *e.g.*, electric organs, tape recorders, synthesizers, computers	ELECTRONIC MUSIC AND INSTRUMENTS **6**:672–677	**13**:645b–c	**4**:25g–h
C. The elements of music: their patterning and modes of organization in composition	MUSICAL COMPOSITION **12**:715–721	**12**:722h–724a / **12**:725b–726d / **12**:747b–h	
1. Pitch			**17**:36h–38b
a. Interval: the difference in pitch between two tones		**8**:651g–654g / **18**:741b–f	**12**:672f–g / **17**:37d–h
b. Scale: a pattern of pitch relationships expressed as a series of intervals dividing an octave	SCALES, MUSICAL **16**:302–304	**1**:244b–d / **7**:468h–469a / **8**:647d–651b / **18**:741c–f	**4**:25f–g / **9**:974b–d / **12**:672h–673a / **12**:682h–683b / **17**:37h–38b / **17**:152f–153d / **17**:238a–b
c. Tuning and temperament: the organization and modification of systems of pitch relationships	TUNING AND TEMPERAMENT, MUSICAL **18**:741–743	**12**:747h–748g	**17**:37b–c / **17**:739d–f
d. Motive and theme		**12**:716d–e / **1**:244e–f / **4**:24a–c	**1**:663h–664a
e. Mode, melody type, tune family	MODES, MUSICAL **12**:295–298	**8**:654g–655a	**16**:303e–f / **17**:153d–g
2. Duration (time)		**12**:746b–e / **12**:745b–e	
a. Pulse and metre		**12**:745f–746a	
b. Rhythm	MUSICAL RHYTHM **12**:744–746	**12**:716a–d / **1**:244g–245h	**1**:664a–c / **9**:974d–e
c. Tempo		**12**:744h–745a	
3. Timbre			**17**:36g–h
4. Harmony	HARMONY **8**:647–656	**12**:717g–721d	**1**:245h–246c
a. Basic concepts of harmony; *e.g.*, consonance and dissonance, functional harmony, keys, modulation, tonality		**8**:647a–c / **8**:651g–654g / **18**:743b–f	
b. The development and disintegration of harmony as a means of organization in Western music		**8**:647d–651g / **8**:655d–656b / **4**:24c–d / **12**:747h–748e	**12**:708g–715a *passim* / **16**:350f–351d
c. The relationship of harmony to other elements of music; *e.g.*, to melody, to musical form		**8**:654g–655b / **17**:5a–6h	**16**:303g–304b
5. Counterpoint	COUNTERPOINT **5**:213–216	**7**:769b–770a	
6. Texture: monophonic, homophonic, heterophonic, and polyphonic		**4**:24d–f / **7**:769b–770a / **12**:704g–705d	**1**:246c–247h / **5**:214a–215d / **7**:468d–f / **8**:647a–656b *passim* / **12**:716e–717h *passim*
7. Orchestration and instrumentation	ORCHESTRATION AND INSTRUMENTATION **13**:643–647		
a. The nature of orchestration and instrumentation: the art of combining the resources of different instruments in musical composition		**13**:643h–644d	
b. Types of instrumentation: approaches to composition for diverse instruments and combinations of instruments; the development of Western and non-Western instrumentation		**13**:644d–647e	
c. Arrangement and transcription: the adaptation of a composition for instruments other than those for which it was originally written		**13**:647e–h	

	articles	article sections	other references
8. Form in music	MUSICAL FORM **12**:725–729		**7**:468c–d
a. Principles of musical form: the organization and patterning in time of the structural elements of music		**12**:725b–726d / **8**:655b–d	**12**:718c–e
b. Types of musical form		**12**:726d–727c / **12**:718e–719b	
i. Iterative and reverting types; *e.g.*, period (one-part) form, binary (two-part) form, ternary (three-part) form		**12**:726e–h / **17**:5a–6h	**4**:1064g–1065a / **12**:711a–c
ii. Strophic types; *e.g.*, ballad forms, variation form	VARIATIONS, MUSICAL **19**:27–31	**12**:726h–727a	
iii. Progressive or through-composed types; *e.g.*, the motet, the tone poem		**12**:727b–c	
c. The development of musical form: characteristic Western and non-Western forms; 20th-century modifications of traditional forms		**12**:727c–729a / **4**:23d–24a / **8**:655b–656b	**9**:974e–f / **12**:716e–721d *passim*
D. Notation: the encoding of music	MUSICAL NOTATION **12**:732–738		**2**:83g–h
1. Western staff notation: general principles; *e.g.*, the recording of pitch and duration, harmony and rhythm; the use of auxiliary signs for timbre, volume, ornamentation		**12**:733b–736c	
2. Other systems of notation: verbal and syllabic notations, alphabetical notations, numerical notations, graphic notations, and tablatures		**12**:736c–738b / **12**:682e–g	
3. The relation of notation to musical performance		**12**:732h–733a / **12**:738f–h	**4**:443a–b
E. Forms of musical composition *with special attention to*			
1. Instrumental forms		**12**:707b–h / **12**:709g–710b / **12**:711c–h / **13**:644d–647e / **17**:742b–743e / **19**:858g–860f	**16**:237g–h
a. Sonata	SONATA **17**:4–10	**12**:727e–f	**12**:711a–c
b. Symphony	SYMPHONY **17**:909–918		**12**:711c–e
c. Chamber music: music for small ensemble; *e.g.*, duet, trio, quartet, quintet	CHAMBER MUSIC **4**:22–29		
d. Concerto	CONCERTO **4**:1064–1074		
e. Variation forms; *e.g.*, chaconne, passacaglia, variation set	VARIATIONS, MUSICAL **19**:27–31		
f. Fugue	FUGUE **7**:769–770		
g. Forms for electrophonic instruments; *e.g.*, tape music, computer music	ELECTRONIC MUSIC AND INSTRUMENTS **6**:672–677	**12**:714h–715a / **13**:645b–c	
2. Vocal forms	VOCAL MUSIC **19**:497–502	**13**:645c–d	**17**:237e–g
a. Solo vocal forms		**1**:244d–f	**16**:791f–792h
i. Liturgical chant		**19**:497g–498a / **12**:296e–297h / **12**:704g–705a / **17**:151e–152d	**10**:206c–f / **12**:741b–c
ii. Secular song; *e.g.*, chanson, canzone		**19**:498a–g / **12**:705g–706a	**12**:741c–e
iii. "Art song"; *e.g.*, lied, concert aria		**19**:498h–502b	
b. Choral forms	CHORAL MUSIC **4**:442–449		

	articles	article sections	other references
i. Sacred choral forms; *e.g.*, mass, motet, anthem, cantata, oratorio		**4**:443c–445d / **12**:709e–g / **12**:728b–c	
ii. Secular choral forms; *e.g.*, secular cantata, symphonic choral music		**4**:446f–447g	
iii. Occasional choral music: choral forms composed to commemorate an occasion of state; *e.g.*, a royal marriage		**4**:445d–446e	
c. Vocal forms for solo or choral performance		**4**:447g–449h	
i. Madrigal		**4**:447g–449b	
ii. Lied, chanson, and glee		**4**:449b–h	
F. Musical performance	MUSICAL PERFORMANCE **12**:738–744	**12**:724b–d	
1. General considerations about musical performance; *e.g.*, diverse conceptions of the role of the performer; the relation of performance to medium; the relation of individual temperament and national traditions to performance		**12**:738c–740c / **17**:743e–744d / **19**:30e–h	**3**:316f–g / **4**:442f–443a
2. Historical development of musical performance practice		**12**:740c–744e	**4**:447g–448a
G. Music for the theatre	MUSIC, THEATRICAL **12**:695–703		**12**:667d–668a
1. General considerations about theatrical music; *e.g.*, its nature and elements; its role as distinct from the role of concert music; its relation to other elements of theatre		**12**:695g–696b / **5**:986g–987a / **12**:727h–728b / **13**:578f–579b / **13**:593c–f	**4**:966e–g
2. Types of theatrical music		**12**:696b–700g	
a. Opera	OPERA **13**:578–593		**18**:223b–d
b. Music for theatrical dance; *e.g.*, ballet, modern dance		**12**:696b–697c / **2**:646f–h / **5**:454b–c	
c. Musical theatre; *e.g.*, musical comedy, operetta, zarzuela, Nō theatre		**12**:697d–698c / **12**:684a–685g / **12**:687f–689b / **12**:699h–700g / **14**:813g–814c	
d. Incidental and background music; *e.g.*, for the theatre, for motion pictures and television		**12**:698c–699h / **12**:504e–f	**3**:316f–g
3. History of theatrical music		**12**:700h–703g / **12**:709a–e / **12**:713c–e / **13**:579c–593c	**5**:953g–954g *passim* / **12**:403c–405g *passim* / **12**:711h–712c / **15**:258h–259b / **15**:1160a–1161a / **19**:82d–84d *passim* / **19**:517e–520b
H. Primitive, folk, and popular music			
1. Primitive music [see 611.B.4.]			
2. Folk music	FOLK MUSIC **7**:466–470		
a. General considerations about folk music; *e.g.*, its differentiation from and relation to popular music and "art" music; its characteristic methods of composition and transmission; its relation to communal activities		**7**:467a–468b / **12**:668d–669e / **16**:790h–791f	**12**:715f–g / **14**:1034b–1035f *passim* / **19**:31b–c
b. Formal characteristics of folk music: melodic form, rhythm and metre, and scales		**7**:468c–469a	
c. Instruments of folk music		**7**:469a–c / **19**:860e–f	
d. Regional and individual styles and varieties of folk music		**7**:469c–e / **3**:1124f–1125b	**16**:792h–793e

	articles	article sections	other references
3. Popular music	POPULAR MUSIC **14**:807–811	**12**:715a–d	
a. General considerations about popular music; *e.g.*, its differentiation from and relation to folk music, "art" music, and jazz; its origin in urban cultures and composition by professional musicians; its characteristic methods of transmission		**14**:807d–e / **14**:1035h–1037b	**7**:467h–468a / **12**:668g–h
b. Forms of popular music; *e.g.*, popular songs, popular instrumental forms, popular theatrical forms, popular dance forms		**14**:802d–803e	**3**:906b–c / **5**:465e–h / **14**:807f–811g *passim*
c. Development of popular music		**14**:807f–811g	**18**:942e–g
I. Jazz	JAZZ **10**:119–126	**12**:715a–d	**12**:668h–669c / **14**:802f–h / **14**:810d–811a
1. General considerations about jazz: its differentiation from and relation to folk music, popular music, and "art" music; its emphasis on the performer as creator; the importance of improvisation; its reflection of social and cultural forces		**10**:119g–121c / **10**:126d–h	**13**:647g–h
2. Development of jazz styles		**10**:121c–126d	
J. Recording and reproduction of music	MUSIC, RECORDING OF **12**:691–695		
1. Types of music reproduction: mechanical, acoustical, and electrical		**12**:691g–692c	
2. Techniques of music recording: the role of the producer		**12**:693a–e	
3. Effects of music recording; *e.g.*, on composition, on teaching, on criticism, on performance, on musicology		**12**:692c–h / **12**:715a–d / **14**:802d–803h	**3**:316f–g / **12**:667d–668a *passim*
4. Development of music recording		**12**:693e–695f	**17**:51h–60b *passim*
K. Characteristics of music in particular cultures: the historical development of music			
1. The music of Western peoples	MUSIC, WESTERN **12**:704–715	**12**:716e–721d / **12**:740c–744a / **13**:579c–593c	
a. In antiquity		**12**:704c–g / **8**:647d–h / **12**:740c–h

Section 625. Dance

[for Part Six headnote see page 383
for Division II headnote see page 393]

The articles and parts of articles referred to in Section 625 deal with five main subjects. Subject A is the art of dance. A group of three subjects covers major kinds of dance: B, ballet; C, modern dance; and D, primitive, folk, and popular dance. Subject E is the characteristics and historical development of dance in particular cultures.

The outline of subject A begins with the origins, nature, and functions of dance as an art and with questions of meaning and communication in dance. Dealing with the components of dance, the outline covers the special skills and functions of the dancer in diverse kinds of dance; diverse views of the role of the choreographer and the elements and principles of choreographic composition; the arts of costume design, scenic design, and lighting design for dance productions; and the various kinds of musical and verbal accompaniments to dance. The outline goes on to diverse classifications of kinds of dance—classifications based on the training of the dancer, on the number of dancers, on the social or cultural circumstances of the dancer, and on the function of the dance. It further treats systems of dance notation; theoretical, critical, and descriptive writings about dance; and the integration of dance with other arts in the theatre and in motion pictures.

The outline of subject B treats the nature of ballet as an art; certain special problems of ballet; the integration of ballet with other arts in opera, drama, and motion pictures; the major kinds of ballet—traditional, classical, modern, abstract, and expressive ballet; diverse national traditions in ballet; the materials and methods of ballet; and the history of ballet.

The outline of subject C, modern dance, treats the principles underlying modern dance; the kinds, theories, techniques, and methods of modern dance; the integration of modern dance with other arts; and the influence of modern dance on ballet and theatrical dance.

The outline of subject D begins with folk dance. It first deals with general considerations about folk dance, such as its differentiation from and relation to popular dance, ballet, and modern dance; its relation to regional environment and ethnic milieu; and its relation to folklore and folk literature, to daily and seasonal labour, and to sexual interests. It then treats the techniques, forms, and history of folk dance. The outline of popular dance presents similar general considerations and then treats the kinds and techniques, the development, and the dissemination of popular dance.

The outline of subject E deals with the characteristics and with the historical development of dance in particular cultures. It treats the dance of Western peoples, including Jewish and Islāmic peoples; of East, South, Southeast, and Central Asian peoples; and of African, Eskimo and American Indian, and Oceanian peoples.

Section 626. Architecture, garden and landscape design, and urban design

[for Part Six headnote see page 383
for Division II headnote see page 393]

The articles and parts of articles referred to in Section 626 deal with three main subjects: A, the art of architecture; B, garden and landscape design; and C, urban design.

The outline of subject A first treats the elements of design and the principles of composition in architecture; problems special to architecture as an art; the iconography of architecture; and the influence of theoretical, descriptive, scholarly, and critical writings on architecture. It goes on to deal with the aesthetic aspects of the building materials and constructional systems used in architecture; the diverse structural elements and details of buildings; and the several kinds of architectural ornamentation. It next treats the diverse kinds of architecture and building types as determined by different functions. After dealing with the general characteristics of primitive, folk, and popular architecture, the outline concludes with the historical developments of architecture in particular cultures, covering the architecture of Stone Age peoples; of Western, including Jewish and Islāmic, peoples; of East, South, Southeast, and Central Asian peoples; and of African, Eskimo and American Indian, and Oceanian peoples.

Subject B is garden and landscape design. The outline begins with the elements of garden and landscape design, the principles of composition, and the design process. It goes on to the physical components—the materials, methods, and techniques of garden and landscape design. It next treats the kinds of garden and landscape design as determined by diverse formal and contextual criteria and as determined by diverse functions. After dealing with the relation of garden and landscape design to other components of landscape architecture, the outline concludes with the historical developments and general characteristics of garden and landscape design in particular cultures.

The outline of subject C, urban design, similarly treats the elements of urban design and the principles of composition; problems for urban design arising from functional and environmental demands and from economic, social, and political forces; the diverse kinds of urban design; the relation of urban design to other components of landscape architecture; and the development and general characteristics of urban design in particular cultures.

Section 627. Sculpture

[for Part Six headnote see page 383
for Division II headnote see page 393]

The articles and parts of articles referred to in Section 627 deal with two main subjects: A, the art of sculpture; and B, the historical development and the characteristics of sculpture in particular cultures.

The outline of subject A begins with the elements of design and principles of composition in sculpture; with problems special to sculpture, such as issues about what it imitates or expresses, its ways of imitating movement, and the special relation of a work of sculpture to the spectator; and with the iconography of sculpture. It goes on to the materials of sculpture and to the tools, methods, and techniques of sculpture. It next treats the diverse kinds of sculpture, distinguished by their spatial context, by subject matter, or by special uses or functions. Finally, it treats the characteristics of folk and of popular sculpture.

The articles dealing with subject B treat the historical development and characteristics of the sculpture of Stone Age peoples; of Western peoples, including Jewish and Islāmic peoples; of East, South, Southeast, and Central Asian peoples; of African peoples; of Eskimo and American Indian peoples; and of Oceanian peoples.

Section 628. Drawing, painting, printmaking, and photography

[for Part Six headnote see page 383
for Division II headnote see page 393]

The articles and parts of articles referred to in Section 628 deal with four main subjects: A, drawing; B, painting; C, printmaking; and D, photography.

The outline of subject A first deals with the elements of design and principles of composition in drawing and with the surfaces, media, and techniques of drawing. It goes on to the diverse kinds of drawing, determined on the one hand by subject matter and on the other by special uses, such as those involved in animation, caricaturing, cartoon and comic-strip drawing, cartography, and drafting. Finally, it treats the historical developments and the characteristics of drawing in particular cultures.

The outline of subject B first treats the elements of design and principles of composition in painting; special problems, such as that of the representational and the nonrepresentational aspects of painting; the iconography of painting; and the surfaces, media, and techniques of painting. It goes on to related media and techniques, articles being referred to that give separate treatments of mosaic, stained glass, and tapestry. It next treats various classifications of kinds of painting and the characteristics of primitive, folk, and popular painting. Finally, it covers the painting of Stone Age peoples; Western painting, including that of Jewish and Islāmic peoples; the painting of East, South, Southeast, and Central Asian peoples; and the painting of African, of Eskimo and American Indian, and of Oceanian peoples.

The outline of subject C first deals with the characteristics and special problems of printmaking as an art and with the surfaces, media, and techniques of printmaking. It then treats the characteristics of folk and of popular prints and the characteristics of printmaking in particular cultures.

The outline of subject D treats the nature and problems of photography as an art; the aesthetic effects obtained through the equipment, materials, and techniques of photography; the diverse kinds of photography; and the historical development and characteristics of photography in particular cultures.

Section 629. Arts of decoration and functional design

[for Part Six headnote see page 383
for Division II headnote see page 393]

The articles and parts of articles referred to in Section 629 deal with five main subjects: A, the nature and scope of the arts of decoration and functional design; B, the arts of decoration; C, the arts of functional design; D, primitive, folk, and popular arts of decoration and functional design; and E, the characteristics of the arts of decoration and functional design in particular cultures and their historical developments.

The outline of subject A treats the general aesthetic characteristics of the arts of decoration and functional design and the materials, processes, and techniques of these arts.

The outline of subject B treats the kinds of decorative art and the types of decorative objects classified by the materials and the methods used to produce or decorate them. Articles referred to give separate treatment to such arts as pottery, glasswork, metalwork, floral decoration, basketry, enamelwork, and lacquerwork.

The outline of subject C, the arts of functional design, involves a classification of kinds and types of decorative objects according to differences of function. The outline begins with diverse conceptions of the functions of dress design and body decoration and with the historical development and characteristics of dress design and body decoration in particular cultures. It goes on to the characteristics of industrial design as an art; the influence of modern materials and technological processes on industrial design; the diverse kinds of industrial design classified by function; and the historical development of industrial design.

Dealing next with interior design, the outline covers its special aesthetic problems; the integration of interior design and decoration with architecture; the furniture and accessory furnishings used for interior decoration; the diverse kinds of interior design and decoration determined by function; and the characteristics of interior design and decoration in particular cultures. The outline next deals with the design of materials and objects for communication and identification, treating handwriting systems and styles; the several printing arts; advertising art and design; the design of signs and symbols used primarily for identification, such as heraldic design; and the design of various kinds of exhibitions and displays, such as museum and gallery display. Finally, the outline deals with the design and decoration of diverse kinds of specialized functional objects—the design of coins, currency, and medals; of play materials; of decorative mechanical objects, such as automata; and of objects for the military, such as arms and armour.

The outline of subject D covers primitive, folk, and popular arts of decoration and functional design.

Subject E is the historical development and characteristics of the arts of decoration and functional design in particular cultures. The outline covers the arts of decoration and functional design of Stone Age peoples; of Western, including Jewish and Islāmic, peoples; of East, South, Southeast, and Central Asian peoples; and of African, Eskimo and American Indian, and Oceanian peoples.

Introduction to Part Seven:

Knowing how and knowing why

by Lord Ritchie-Calder

Benjamin Franklin defined man as "the tool-making animal." If he had added the phrase "with foresight," he would have adequately described *Homo faber*, man the technologist.

Inventiveness was the indispensable condition for the survival of the human species. Without fur or feather, carapace or scale, ancestral man stood naked to the elements; and without fang or claw or tusk to fight his predators, without speed to elude them, without camouflage to deceive them or the ability to take to the trees like his cousin, the ape, he was physically at a hopeless disadvantage. What he developed to deal with his deficiencies was the capacity to invent. He possessed not only sensory perceptions (though these were less acute than those of many of his fellow creatures), he also possessed imagination and finger-skills. He did not just improvise to meet an emergency as an ape might in using a broken branch as a weapon; he also saw the need for keeping a club handy—he planned ahead. Other creatures had their inherited instincts, their built-in experience. Some, like the beaver or the weaverbird, with their biological tools, could contrive quite elaborate structures; others, like the bees or the ants, could evolve efficient organizations; others, like the squirrel, were provident in the sense of laying in stores. With nimbleness of brain and hand, a combination of gray matter and motor-cells, man could scheme to outreach, with club, or spear or sling, his natural enemies; he could manage nature and escape from the restraints of his environment. He clothed himself in pelts and moved to inhospitable climes, he mastered fire and dared to bring it into his dwelling for heating and cooking, he learned to cultivate and plant the soil, he domesticated animals, and he devised specialized tools like the hoe and the ax to improve the efficiency of his labour.

From earliest time and beginning with the simplest contrivances, every discovery and invention has depended on the fact that the human being is not only a perceptual but also a conceptual creature capable of observing, memorizing, and juxtaposing images. He can make a mental design, a techno-poetic fantasy, even when the means of actually producing it are not available. Seven hundred years ago Roger Bacon could imagine a power-driven ship, a horseless carriage, an airplane, the miniaturized servo-motor, "but one finger in length and one in width," and the bathysphere. The vision cannot materialize, however, unless man has the method. This is the process by which he makes an observation (perceptual); forms a hypothesis (conceptual); experiments to test this "hunch"; formulates a theory to justify his insights; and by further proofs produces "laws" according to which anyone can go on repeating the results. With spoken language, he can transfer experience, father to son, master to apprentice, generation to generation. With written language, he can produce the textbooks that are the ready-reckoners for other innovators who thereby do not have to rediscover Newton's laws or the laws of thermodynamics every few years. This systematic treatment of the arts and crafts is the simplest expression of the meaning of "technology," from the Greek roots *techne*, arts, and *logia*, words. The ancient Greeks had no such combined term because their philosophers divorced manual skills from intellectual pursuits. Plato berated Eudoxus and Archytas when by experiments and recourse to instruments they solved problems that the theorists considered insoluble. He accused them of "making use of matter which requires manual labour and is the object of servile trades."

This intellectual condescension still persists, although individual technologists have won recognition from scientific societies and learned academies. The prejudice is suggested by the acceptance of the term "science *and* technology." Yet both science and technology use the scientific method. Was Leonardo da Vinci, apart from being an artist, a scientist or a technologist? In terms of discovering and testing new knowledge he was a man of science, but his designs for practical innovations outnumbered those of Thomas Alva Edison. Edison, 400 years later, patented over 1,000 inventions. They included major ones, for which he is remembered, but also hundreds of bits of useful hardware, important in their way. He made only one scientific discovery, the Edison effect, which he patented but did not pursue. The rest were derived from scientific knowledge and developments. He saw the profitable relevancies that lesser men missed; he fitted the mental nut to the mental bolt and created things.

Customarily, science, or the scientific hierarchy, is divided into four categories:

Pure, or academic, research is the pursuit of knowledge for its own sake. It is mainly the work of an individual, or the group he leads. The pure scientist has to justify himself only before a jury of his peers. He is judged not by the usefulness but by the integrity of his work. He is the Maker Possible.

Oriented fundamental research is still basic science, that is to say the scientist is still questioning nature, seeking to extend knowledge and understanding, but he is not a free agent indulging his curiosity. He is restrained within a frame of reference. For instance, in studying chemical reactions at high pressures he is not assuming that he is going to discover polyethylene, or if he is studying gases at high temperatures he is not necessarily thinking of jet engines or rockets; but he is compiling data that will be important in a general field and likely to have some foreseen applications. In the big corporations, this is called "speculative research." Such a scientist is likely to have adequate research facilities, endowments, or contracts. He is the Maker Probable.

Applied research is programmed research. The target is specified, and results are expected. The predicted yield is the measure of the support. The scientist is held accountable in the annual report. He is the Maker to Happen.

Development is really technology, but coupling it with research (R and D) keeps it in the scientific hierarchy and away from the "rude mechanicals." It is the transfer of laboratory results, through the pilot plant, to the production line. R and D is far and away the most expensive scientific bracket because large-scale trial and error ("back to the drawing board") involves multimillions of dollars. The R and D scientist is the Maker to Work.

Through the craft guilds and their "mysteries" and their conversion to factory methods, technology had an evolutionary history in many cultures and many lands. Alfred North Whitehead claimed that "the greatest invention of the nineteenth century was the invention of the method of invention." Nowhere was this better demonstrated than at Edison's "invention factory" at Menlo Park, New Jersey, where, starting in 1876, Edison organized the first industrial

research laboratory. In folklore, he is regarded as a "loner," who invented by intuition. In fact, he systematized the process of invention, coordinating and applying relevant knowledge through a hard-worked team that included mathematicians, physicists, chemists, and skilled mechanics. Invention was no longer the private indulgence of the gifted amateur or the rare professional; a techno-methodology had been created to guarantee commercial success. In Edison's case the result was often a "package deal"—not just the incandescent lamp, but the generating plant and the transmission system. In the case of Henry Ford, it was not just the Model T, but the assembly line, which he enlarged to a factory that was one-fifth of a mile long, with a conveyor-belt system that synchronized each stage of construction with the delivery of each part to the operator. He embodied scientific management, with its time-and-motion studies and production engineering.

The feedback system between the know-why (academic science) and the know-how (technology) is recalibrating the time-function of change. A new scientific discovery (explanation of a phenomenon) is seized by the technologists and put to work. In turn the technologists provide the instruments that, with greater refinements and speed, enable the scientists to make further discoveries. An outstanding example is cybernetics. The pencil-and-paper mathematicians had long known the principles of the computer, but they had to wait for the post-World War II electronic engineers to produce the "hardware." Now with instant responses, or nearly so, and vast computer capacities and prodigious "memories," with means not only for numerical calculation but for logical simulation, with feedback (like a burned finger signalling to the brain and the brain withdrawing the finger from the hot plate), scientists are not only able to do calculations so complex that they would not previously have attempted them, but they are also learning, from the engineers, about the nature of systems, including the systems of nature itself. Cybernetics deals with the information-processing aspects, as distinguished from the energy-transforming aspects, of all systems regardless of their physical nature. This has facilitated the development of automatic control, telecommunications, and computing; it is applicable also to systems engineering, economics, and neurophysiology.

Though we acknowledge the truth of Whitehead's aphorism, his essentially engineering approach to technology is too restrictive. Every advance in the practical arts from hunting to food-gathering to cultivation, to animal husbandry, to irrigation, to mining, and on through construction, transportation, food-processing, heating, power generation, lighting, communications, military engineering, and clinical medicine has produced social and cultural changes. The Neolithic Revolution was as climacteric as the Industrial Revolution. Moreover, the preoccupation with Western technology ignores the cultural origins of many major innovations and forgets that, historically, the European Dark Ages (not so dark as is often supposed) coincided with Golden Ages of material advances in China, India, and pre-Columbian America. Only in recent years have historians (Singer, Crombie, Lynn White, Hall, Needham, Forbes, and others) given serious attention to these facts. The anthropologists, looking at cultural influences, have been similarly remiss. Economists have been preoccupied with the "production function" and sociologists with the social effects of innovation (from television to freeways) and with work-force redundancy. The present distortions, produced by rapid technological change, obscure the fact that civilization itself derived from excess production and redundancy. When agriculture surpassed subsistence, fewer tillers were required to support the cities, with their artisans (specializing in other forms of production), their priesthoods, their scholars, their soldiery and warrior-kings, their tithe-gatherers, their merchants, and their money-changers. Technological displacement today, whether it is called unemployment, underemployment, leisure, or nonwork, similarly calls for social readjustments to find nonmanufacturing expressions of human capacities.

No explanation of the intrinsic or historic attributes of technology can convey the love-hate overtones that the term has acquired. In the ogre sense of the word, it has become a threat to lives and livelihoods and to the total environment. In the efficiency sense, it is hailed as the methodological solution of all our problems from government administration to the production of miracle grains to abolish hunger. Some, like Jacques Ellul and B.F. Skinner, claim that we are already the hostages of our man-made environment: the first maintaining that technology has taken over all of man's activities and not just his productive activities; the second, that autonomous man, with free will and freedom and dignity, is now an anachronism and has to be intentionally controlled by the "technology of behaviour."

Obviously this usage is stretching the meaning of "technology" beyond the foregoing derivations and descriptions—the etymology; the cultural origins; the scientific precedents; the nuts-and-bolts and something popularly promoted to capital letters as "The Machine." This usage expands even Harold Lasswell's accommodating version: "The ensemble of practices by which one uses available resources to achieve values." It is more consistent with the French *la technique,* which refers to any complex of standardized means for attaining predetermined ends. Thus it would apply to organization, government institutions, systems of politics or religions, or anything which reduces spontaneous or impulsive behaviour to a rationale. As was said of *la technique* of wartime operational research, "it ran the war by numerical thinking instead of gusts of emotion."

In adventurously exploring the three divisions and fifteen sections of the encyclopaedia's treatment of technology of which this introduction is, hopefully, the appetizer, the reader will find other interpretations and probably produce his own. In common usage, however, the preoccupation is with "The Machine" and the effects of its products on our lives.

Resentment against the replacement of men by machines goes back beyond Ned Ludd and the machine-wreckers of the Industrial Revolution, but present-day attitudes are of a different order of magnitude. They derive from the speed and scale of change. Hahn and Strassmann's laboratory discovery of uranium fission in 1938 was transformed into a nuclear bomb in 1945. If there is no nuclear war, history will consider the Manhattan Project, which produced the bomb, as important as the bomb it produced. It is the archetype of the crash program in which men, materials, and methods are mobilized to attain an objective in a given time. Man on the Moon by 1970 was another example, with

the time-target beaten by six months. The time-lapse between a fundamental scientific discovery and its practical application has been reduced from centuries to decades to years to months. Since World War II, we have had the Atomic Age, the Cybernetic Age, the Space Age, and now the Bioengineering Age, in which not only by organ transplants but also by the deliberate manipulation of genes it may be possible to engineer the nature of man himself. Thus in the growing up of the postwar generation there have been four major epochs nearly as significant as the Stone Age, the Iron Age, the Renaissance, and the Industrial Revolution. At the same time there has come the shocked awareness of the effects on the environment of the wastes of technology. Again this is a matter of scale and lack of prescience. (The ore miners and metal workers of Cyprus and Asia Minor were polluting the Mediterranean with heavy metals 5,000 years ago, but the effects were insignificant compared with volcanic debris). When people complain, however, of "interference with the environment" they should be mindful that such interference has been the *sine qua non* of the survival of *Homo sapiens*. Moreover, when we try to get rid of our guilt-sense about the effects of misused technology and reject the gadgeting we ashamedly enjoy, we should not go too far and "throw out the baby with the bathwater." We cannot go back to the apes nor even to Arcadia.

The great problem is how to force ebullient technology and its transnational expansion to produce human well-being, not just in the quantity of artifacts but in improving the quality of life, including redressing of the mischief in the environment. This requires an enlightened and informed society that knows what it wants and is not cult-ridden or crash-programmed into accepting what it does not want or need. This cannot be achieved through programmed learning nor the technology of behaviour nor systems engineering. We are back with the know-why as the initiator and the monitor of the know-how.

Part Seven. Technology

The outlines, and the articles and parts of articles referred to, in the three divisions and fifteen sections of Part Seven treat the nature and development, the elements, and the major fields of technology.

Several points should be noted about the relations of this part to other parts.

Technology involves applications of the knowledge of nature dealt with in Parts One, Two, and Three, and in turn has an influence on the development of that knowledge. It has a major role in relation to human communication and man's daily life, treated in Divisions IV and V of Part Four. It has structuring impact on the cultural, social, economic, political, legal, and educational life of man, dealt with in Part Five; and a conditioning effect on the development of the fine arts, dealt with in Part Six. To a degree, technological developments affect developments in the religious life of man, dealt with in Part Eight. Technology is a major dimension in the history of mankind, the subject of Part Nine.

The branches of technology and of engineering have themselves become the subject of historical and analytical studies. Those studies are presented in Section 10/37 of Part Ten.

In the present part, the outlines and the articles referred to in the two sections of Division I treat the nature, scope, and history of technology, and the organization of human work.

Division II deals with technical processes not specific to any of the major fields of technology. The outlines and the articles referred to in the five sections of Division II treat the technology of energy conversion and utilization; the technology of tools and machines; the technology of measurement, observation, and control; the technology involved in the extraction and conversion of industrial raw materials; and the technology of industrial production processes.

Division III deals with the major fields of technology, differentiated by the various human needs, purposes, products, and services that have elicited technological development. The outlines and the articles referred to in the eight sections of this division treat the technology of agriculture; the technology of the major industries; construction technology; transportation technology; the technology of information processing and of communication; military technology; the technology of the urban community; and the technology of Earth and space exploration.

Division I. The nature and development of technology 437
II. Elements of technology 444
III. Major fields of technology 462

Division I. The nature and development of technology

The outlines, and the articles and parts of articles referred to, in the two sections of Division I treat the scope and history of technology, and the organization of human work.

The outline and the articles referred to in Section 711 treat the origins and the nature of technology; the mutual dependence of science and technology; diverse evaluations of the broad effects of technology on human life; the impact of technology on the various spheres of contemporary life in both developed and developing countries; and the history of technology.

Section 712 treats the stages in the development and organization of human labour; applications of scientific method to managerial functions; and the relations between man and machine in industrial production.

Section 711. Technology: its scope and history 438
712. The organization of human work 441

Section 711. Technology: its scope and history

[for Part Seven headnote see page 437
for Division I headnote see page 437]

The articles and parts of articles referred to in Section 711 deal with two main subjects: A, general conceptions or definitions of technology; and B, the history of technology.

The outline of subject A begins with the origins and nature of technology, and with its relationships to science. It goes on to diverse evaluations of the effects of technology, covering views that technology is morally neutral, broadly detrimental, or broadly beneficial. It next treats the relations between contemporary technology and the institutions of the underdeveloped regions, in the context of the high probability of technology's continuing presence and growth. Finally, it treats the impact of technology on the economic, political, military, educational, artistic, and social spheres of contemporary life.

The article referred to on subject B, the history of technology, begins with technology in the ancient world, covering Stone Age technology, the technology of the first urban revolution, and the technological achievements of Greece and Rome. It then deals with the development of technology from the Middle Ages to 1750, covering medieval advances and the emergence of Western technology, and with advances in power technology and the subsequent development of industries during the Industrial Revolution. It concludes with 20th-century technology, covering early developments, Space Age technology, and the environmental problems of technological society.

Section 712. The organization of human work

[for Part Seven headnote see page 437
for Division I headnote see page 437]

The articles and parts of articles referred to in Section 712 deal with three main subjects: A, the stages in the development of human labour; B, applications of scientific method to managerial functions; and C, the relation between man and machine in industrial production.

The outline of subject A begins with the organization of work in the prehistoric world, in the ancient world, and in the medieval world. It goes on to the changes in production techniques from the 16th to the 18th century that laid the foundations of modern industrial production. Finally, it deals with mass production—the organization of labour by product rather than by process. It treats the early stages of mass production; the general principles of mass production; planning for mass production; major examples of it; increased mechanization and automation; recent uses of robot devices; and the psychological, social, and economic effects of mass-production techniques.

The outline of subject B first deals with operations research—the application of scientific method to the management of organized systems. It treats first the origin of operations research in World War II and the essential characteristics of operations research. It goes on to the phases of operations research—formulating the problem, constructing models, deriving solutions from models, testing the model and the solution, and implementing and controlling the solution. It then treats the techniques associated with such prototype problems as allocation, inventory, replacement and maintenance, and queuing. The outline of subject B next deals with systems engineering—the effective utilization of scientific and technological knowledge in planning and designing new systems. It treats the development of systems engineering and its relation to operations research; systems-design techniques, tools, and procedures; and possible future applications of systems engineering.

The outline of subject C treats the effects, on the individual and on society, of the rationalization of work, and the efforts to design machines, tools, and work environments with consideration for the capabilities and limitations of man.

Division II. Elements of technology

[for Part Seven headnote see page 437]

Division I was concerned with the nature and effects of technology as a whole. The outlines, and the articles and parts of articles referred to, in the five sections of Division II deal with technical processes not specific to any of the major fields of technology. The technologies of the major fields are dealt with in Division III.

The outline and articles referred to in Section 721 deal with the technology of energy conversion and utilization.

Section 722 treats hand tools, machines and machine components, and machine tools.

Section 723 deals with the technology of measurement, observation, and control, covering the technical dimension of observational and experimental work in the empirical sciences. The articles referred to treat the theory of measurement; the units and standards of measurement; the principles and processes by which instruments of measurement operate; the most common types of measuring instruments; instruments used for observing and recording; special instruments and apparatus used in scientific research; major systems of measurement and observation; and instrumentation and control systems.

Section 724 is concerned with the extraction and conversion of industrial raw materials. As a broad context for the many articles referred to in this section, which treat man's uses of the world's physical and biological resources, the outline first deals with the identification, distribution, and management of natural resources. It goes on to the technology of the extraction industries and then to many products of the primary conversion of raw materials.

Section 725, on the technology of industrial processes, treats the techniques of materials processing; metallurgy; the technology of materials handling in the production process; and the technology of packaging.

Section 721. Technology of energy conversion and utilization 444
722. Technology of tools and machines 448
723. Technology of measurement, observation, and control 449
724. Extraction and conversion of industrial raw materials 454
725. Technology of industrial production processes 458

Section 721. Technology of energy conversion and utilization

[for Part Seven headnote see page 437
for Division II headnote see page 444]

The articles and parts of articles referred to in Section 721 deal with five main subjects: A, the major types of energy useful to man; B, devices and techniques for the utilization of energy; C, devices for the conversion of energy; D, devices for energy concentration and control; and E, devices for the unlimited production of free energy.

The outline of subject A covers thermonuclear reaction, nuclear fission, and radioactivity as primary energy sources; solar, geothermal, and wind and water energy as recurring energy sources; and such non-recurring energy sources as coal, gas, and petroleum.

The outline of subject B covers devices for utilizing muscle energy, such as levers and pulleys; devices for utilizing wind and water energy, such as windmills and turbines; devices for utilizing gravitational energy, such as pendulums; devices for utilizing strain and compression energy, such as steam engines and pumps; devices for utilizing magnetic and electrical energy, such as magnets and electric motors; devices for utilizing rotational energy, such as centrifuges and gyroscopes; devices for utilizing heat energy, such as heat exchangers and refrigeration equipment; devices for utilizing chemical energy, such as gasoline engines, rocket engines, and chemical explosives; and devices for utilizing nuclear energy, such as nuclear reactors and radioactive isotopes.

The articles referred to in connection with subject C, devices for energy conversion, treat thermoelectric devices, thermionic devices, magnetohydrodynamic and electrogasdynamic devices, batteries and fuel cells, lamps and other lighting devices, X-ray tubes, and dynamos and generators.

Subject D is devices for energy concentration and control. The articles referred to treat electron tubes, semiconductor devices, and other solid-state devices.

The article referred to on subject E concerns the history of attempts to design so-called perpetual motion machines, devices that would theoretically provide for the unlimited production of free energy.

Section 722. Technology of tools and machines

[for Part Seven headnote see page 437
for Division II headnote see page 444]

The articles and parts of articles referred to in Section 722 deal with three main subjects: A, hand tools; B, machines and machine components; and C, machine tools.

The outline of subject A, after dealing with the early history of hand tools, goes on to the basic types of hand tools—percussive tools; cutting, drilling, and abrading tools; tool auxiliaries; screw-based tools; and measuring and defining tools. It then deals with such power-driven hand tools as electric drills and circular saws, and pneumatic hammers and riveters.

The outline of subject B begins with the basic characteristics and the mechanics of machines, and with the concepts of work, power, and efficiency. It goes on to deal with simple machines, and with machine mechanisms—devices that transmit motion by means of flexible connectors, rigid connecting links, or direct contact. It next treats machine components, such as gears, cams, linkages, belt drives, shafts, and springs. Finally, it deals with devices for friction accommodation and reduction.

Subject C is machine tools—stationary power-driven machines for shaping and forming parts made of metal or other materials. The outline begins with the history, basic characteristics, and principles of operation of machine tools. It then treats basic machine tools, such as shapers and planers, milling machines, and presses; modifications of basic machines, such as turret lathes; special purpose machines, such as gear-cutting machines; and such recent innovations as automatic control of machine tools, and chipless methods of removing metal.

Section 723. Technology of measurement, observation, and control

[for Part Seven headnote see page 437
for Division II headnote see page 444]

The articles and parts of articles referred to in Section 723 deal with eight main subjects: A, the theory of measurement; B, units and standards of measurement; C, the principles and processes by which instruments of measurement operate; D, the most common types of measuring instruments; E, instruments used for observing and recording; F, special instruments and apparatus used in scientific research; G, major systems of measurement and observation; and H, instrumentation and control systems.

At A, indication is made of the section in Part Ten that deals with the theory of measurement, with theories and philosophic problems concerning the determination of quantitative relationships.

The outline of subject B begins with systems of weights and measures, setting standards for the measurement of mass and length. It then treats standards and techniques for the measurement of time.

The outline of subject C first deals with the measurement process, involving conceptual and operational definitions of measurable quantities, and a comparison of such quantities with a reference quantity. It then treats the functional elements of measurement systems; the performance characteristics and sources of error of instruments; and the phases in the evolution of instrument systems.

The outline of subject D begins with the instruments for measuring basic dimensions—length, mass and weight, time, temperature, electric current and other electrical properties, and light intensity. It then deals with instruments for measuring relationships derived from basic dimensions, covering instruments for measuring pressure; for measuring rate of flow; for measuring position by angulation and direction finding; for measuring gravity; for making optical measurements; for measuring nuclear radiation; and for measuring volumetric and mechanical properties of materials, including density, viscosity, and mechanical strength.

The outline of subject E treats optical and electron microscopes, optical and radio telescopes, spectroscopes, and interferometers.

The outline of subject F treats general laboratory equipment, such as filters, mixers, and centrifuges; and research reactors, particle accelerators, mass spectrometers, chromatographs, seismographs, and particle detectors.

Subject G is the major systems of measurement and observation. The outline treats surveying, mapping and cartography, hydrographic charting, oceanographic measurement, meteorological measurement, astronomical observations, navigational techniques and devices, and radiological techniques and devices.

The outline of subject H first deals with instrumentation systems—systems that operate or actuate control devices or record measurements automatically. It treats applications of instrumentation in industry and manufacturing, and also such nonmanufacturing applications as biomedical instrumentation; instrumentation for monitoring air purity and for the detecting and monitoring of pollutants; and automated chemical analysis systems. The outline of subject H then goes on to control systems. It treats the operational characteristics of closed-cycle control systems, or servomechanisms; the major types of control; and the application of control systems in process industries and manufacturing. Finally, it treats telemetry systems—systems for remote monitoring and control.

Section 724. Extraction and conversion of industrial raw materials

[for Part Seven headnote see page 437
for Division II headnote see page 444]

The articles and parts of articles referred to in Section 724 deal with three main subjects: A, the world's physical and biological resources; B, the technology of the extraction industries; C, the primary conversion of raw materials.

As a broad context for the many articles referred to in this section, which treat man's uses of the world's physical and biological resources, the outline of subject A treats the identification, distribution, and management of natural resources.

The outline of subject B deals first with the processes of underground mining and of surface mining and quarrying. The articles next referred to deal separately with the techniques for obtaining coal, salt, stone, metal ores, sulfur, and phosphates. Special treatment is given to the exploration, drilling, and recovery techniques involved in petroleum and gas extraction.

Subject C is the primary conversion of raw materials. The outline deals first with petroleum refining and with coal processing. It goes on to the production of metal ores and metals, articles being referred to that give separate treatment to twenty metals. It next deals with the production of synthetic gemstones and industrial crystals. Dealing with the processing of stone, sand, clay, and gravel, articles are referred to that separately treat glass production and products, and the manufacture of cement, of industrial ceramics, and of bricks and tiles. The outline next deals with the processing of water to obtain such materials as salt, magnesium, oxygen, and hydrogen, and with the processing of air to obtain oxygen, nitrogen, noble gases, and other gases. Finally, it deals with the processing of plant and animal products, articles being referred to that separately treat paper and paper production; wood and wood products; tobacco and other non-food products; leather and hides; furs; natural fibres; pharmaceuticals; oils, fats, and waxes; and the many kinds of plastics and resins.

Section 725. Technology of industrial production processes

[for Part Seven headnote see page 437
for Division II headnote see page 444]

The articles referred to in a subsequent section, 732, give separate treatment to the technologies of the major industries. The articles and parts of articles referred to here in Section 725 deal with the technologies common to many different industrial processes. They treat four main subjects: A, materials processing; B, metallurgy; C, materials handling in the production process; and D, the technology of packaging.

The outline of subject A begins with the preliminary mechanical and chemical processing of raw materials. It goes on to the processes for forming liquid and solid materials into parts or products, and to the kinds of joining and bonding processes. It then deals with the alteration or improvement of the properties of materials, covering the several kinds of thermal processing, the processing of materials in a vacuum, the use of ultrasonic and infrasonic waves, mechanical processing, and chemical processing. Finally, it treats the mechanical, chemical, and electrochemical finishing processes that modify the surfaces of materials.

The major article referred to on subject B, metallurgy, begins with the history of metallurgy. It next deals with the two phases of extractive metallurgy: mineral dressing, consisting of the mechanical operations necessary to separate minerals from worthless material; and process metallurgy, a series of processes, using heat, electricity, or water, by which the impure minerals isolated by mineral dressing are reduced to metal, refined, alloyed, and made available according to specifications. It further treats the principal areas of physical metallurgy: metallography, the study of the constitution and structure of metals and alloys; investigation of the types of corrosion and their prevention; and the methods of inspecting and testing metals and alloys. Metal joining is dealt with separately in an article referred to on welding, brazing, and soldering.

The article referred to on subject C treats the types of materials handling systems; the equipment for materials handling, such as carts, trucks, and conveyors; the modes of transporting materials; and the handling of materials by transfer machines. The technology of storage and warehousing is dealt with in a separate article.

The outline of subject D, the technology of packaging, covers the kinds of packaging materials; the design of retail packages; and the machinery and techniques for packaging and for package testing.

Division III. Major fields of technology

[for Part Seven headnote see page 437]

Division I of Part Seven was concerned with the nature and effects of technology as a whole. Division II dealt with technical processes not specific to any of the major fields of technology. The outlines, and the articles and parts of articles referred to, in the eight sections of Division III deal with the major fields of technology, differentiated by the various needs, purposes, products, and services that have elicited technological development.

The outline and the articles referred to in Section 731, on agriculture and food production, first treat common elements in the technology of agriculture and then treat crop farming, flock and stock farming, hunting and fishing, food processing, food preservation, the quality control of food, food sources and new product development, and the history of agriculture.

Section 732, on the technology of the major industries, first treats the technology of the manufacturing, fabrication, processing, service, and utilities industries. It then deals with industrial research and development, and with the technology of industrial safety.

The subject in Section 733 is construction technology. The outline first deals with the principles, materials, and machinery involved in building construction. It goes on to the technology of such works of civil engineering as dams, bridges, and tunnels. The last subject in the section is prefabrication and shop fabrication.

The subject in Section 734 is transportation technology. The outline first deals with the supporting systems, devices, and vehicles for transportation on roads, on rails, on water, and in the air. It then treats air-cushion machines; traffic control for all the forms of transportation; and the history of transportation.

The subject of Section 735 is the technology of information processing and dissemination. The outline first deals with calculating devices, office machines, and computers. The next group of subjects dealt with includes general information-recording devices; sound recording and reproduction; the technology of photography; and information processing. It further treats the major systems of communication, the major systems of detection and remote sensing, and the electronic components and circuits that make these systems possible.

Section 736, on military technology, treats offensive and defensive delivery and payload systems; military logistics systems; and purely defensive equipment and systems.

Section 731. Agriculture and food production 463
732. Technology of the major industries 469
733. Construction technology 474
734. Transportation technology 477
735. Technology of information processing and of communication systems 482
736. Military technology 489
737. Technology of the urban community 492
738. Technology of Earth and space exploration 495

Section 737, on the technology of the urban community, treats the basic engineering services of the city; the technology of the basic social services of the city; the technological response to new urban problems; and the history of city engineering.

Section 738 deals with the techniques and equipment for land and underground exploration, for undersea exploration, and for space exploration.

Section 731. Agriculture and food production

[for Part Seven headnote see page 437
for Division III headnote see page 462]

The articles and parts of articles referred to in Section 731 deal with nine main subjects. Subject A is the technology of agriculture. The other subjects fall into four groups. In the first there are three subjects: B, crop farming; C, flock and stock farming; and D, the technology of hunting and fishing. The next group also has three subjects: E, food processing; F, food preservation; and G, quality control of food. Subject H is food sources and new product development; and subject I is the history of agriculture.

The outline of subject A begins with farm management, treating the nature and scope of farm management; basic management problems; and management practices on large farms, on small and middle-sized farms, and on farms in developing countries. It goes on to the kinds of farm machinery and means of traction, to the utilization of draft animals, and to the kinds of farm buildings. The outline next deals with soil preparation, management, and irrigation, and with disease and pest control. It goes on to animal and plant nutrition, and to animal and plant breeding. Finally, after covering farming techniques, it treats agricultural technology in relation to weather and to pollution.

The outline of subject B, crop farming, first treats the kinds of horticultural crops and the kinds of cereal crops. It goes on to the history, purposes, and techniques of forest management, and to the major types of forest trees and forest products. Covering the production of other major field crops, articles referred to deal separately with coffee, tea, cocoa, sugar, and tobacco.

The articles referred to in connection with subject C, flock and stock farming, treat cattle, swine, sheep and goat, horse, and other livestock farming; poultry farming; animal feed; and beekeeping.

The outline of subject D treats hunting weapons and methods, the nature, development, and techniques of commercial fishing, and sport fishing equipment and methods.

Subject E is food processing. The outline treats modern practices in processing and producing fruits and vegetables; cereals; bakery products; confectioneries and candies; meat and fish; dairy products; beverages, alcoholic and nonalcoholic; spices, herbs, and flavourings; sugars; oils, fats, and waxes; eggs; and cocoa and chocolate products.

Subject F is food preservation. The article referred to first treats the different methods of preservation—low-temperature preservation, preservation by drying, high-temperature preservation, fermentation and pickling, chemical preservation, and preservation by radiation. It then treats food storage and packaging.

The outline of subject G covers the methods for the evaluation of food quality; the techniques for the control of food quality; and the regulation of food quality by legislation, grading, and inspection.

The outline of subject H covers the history and development of new foods and new food products; the utilization of new food sources; and the development of new market forms of foods and of the food developed for space exploration.

The article referred to at I, on the history of agriculture, extends from the origins of agriculture and the early agricultural societies to the 19th-century power revolution on the farm, and to the scientific agriculture of the 20th century.

Section 732. Technology of the major industries

[for Part Seven headnote see page 437
for Division III headnote see page 462]

The articles and parts of articles referred to in Section 732 deal with ten main subjects. Subject A, previously treated in Section 712, is the principles of the organization of work and of production common to all industries. Subjects B through H are the major kinds of industries. Subject I is industrial research and development. Subject J is the technology of industrial safety.

Subject B is the manufacturing industries. The articles referred to give separate treatment to the technologies of the aerospace industry, the automotive industry, the clothing and footwear industry, and the furniture industry.

Subject C is the fabrication industries. The articles referred to give separate treatment to the technologies of the textile industry, the steel industry, the leather and hide industry, the fur industry, the floor covering industry, the electronics industry, the tool and die industry, the lumber industry, the cutlery industry, and the abrasives industry.

The articles referred to in connection with subject D, the process industries, treat separately the technologies of the chemical industry, the petroleum industry, the paper industry, the pharmaceuticals industry, the plastics industry, the rubber industry, the surface coating industry, the dye and pigment industry, the man-made fibre industry, industrial and residential gases, and the cosmetics and personal care industry.

Subject E is the construction industries. It is given separate treatment in the next section, Section 733.

Subject F is the service industries. The articles referred to treat separately the technologies of the hotel and motel industry; the technology of the restaurant industry, dealt with in Section 451; that of the food service systems; that of book, magazine, and newspaper publishing, dealt with in Section 441; and that of the security and protection industry. The transportation industry is treated separately in Section 734.

Subject G is the utilities industries. The articles referred to separately treat the technologies of the power industry, of the gas industry, and of the telephone and telegraph industries.

Subject H is the merchandising and marketing of consumer goods. The technologies involved in these processes are dealt with in Section 534.

The article referred to on subject I treats the origins of industrial research; the kinds and stages of proprietary research and development; and the placing of research contracts and the granting of patent rights.

The article referred to on subject J deals with developments in modern industrial safety engineering.

A. Principles of organization of work and production [see 712]			
B. Manufacturing industries *with special attention to*			
1. The aerospace industry	AEROSPACE INDUSTRY 1:132–142		
a. Products: flight vehicles (*e.g.*, aircraft, guided missiles, spacecraft); propulsion systems; on-board and ground-support equipment		1:133h–136a	
b. Research and development: design and testing of commercial aircraft; search for new materials and propulsion systems; miniaturization		1:136a–139b	1:131c–f
c. Manufacturing facilities and techniques: fabrication, assembly, product assurance, and maintenance		1:139b–142d	
2. The automotive industry	AUTOMOTIVE INDUSTRY 2:528–535		2:509b–e/ 2:514a–527f *passim*
a. History of the automotive industry: developments before World War I; introduction of mass production; emergence of large-scale business organization; postwar developments		2:528b–531f/ 11:598e–h	7:520g–521g/15:1174f–h

	articles	article sections	other references
b. The modern automotive industry: diversity of the product line; manufacturing processes; sales and service organizations; international operations; economic and social effects		**2**:531f–535g/ **2**:519h–525e	**15**:1182d–e
3. The clothing and footwear industry [see also 451.B.2.]	CLOTHING AND FOOTWEAR INDUSTRY **4**:750–756		
a. Design of clothing and footwear		**4**:752e–753a	
b. Manufacturing processes and equipment		**4**:753a–756a	
4. The furniture industry	FURNITURE INDUSTRY **7**:807–811	**7**:781h–785h	**9**:697e–g
a. Materials: natural wood, plastics, and metals		**7**:808b–f	
b. Furniture production		**7**:808f–811c	
C. The fabrication industries *with special attention to*			
1. The textile industry	TEXTILE INDUSTRY **18**:170–188		
a. Development of the textile industry		**18**:171a–172g	**18**:42f–h/**19**:935h–936c
b. Production of yarn and fabrics		**18**:172g–184c/ **17**:1055h–1057h	**4**:752c/**9**:698c–g
c. Textile finishing processes: bleaching, scouring, mercerization, dyeing, and printing		**18**:184d–187f/ **5**:1102d–1103f	
d. Textile consumption and trade		**18**:187f–188g	
2. The steel industry [see also 725.B.]	STEEL PRODUCTION **17**:637–656	**9**:896g–898c/ **11**:623h–624d/ **18**:41e–42c	**2**:508d–g
a. Raw materials: pig iron, steel scrap, fluxes, oxygen, and refractory materials		**17**:642e–643e/ **4**:570g–571b	
b. Types of steelmaking processes: Bessemer process, the basic oxygen process, the open-hearth process, the electric process		**17**:643e–650h	
c. Finishing processes: solidification, casting, and rolling		**17**:650h–656g	
3. The leather and hide industry	LEATHER AND HIDES **10**:759–764		
a. Raw materials: animal skins and hides		**10**:761b–g	
b. Leather processing: tanning, dyeing, and finishing		**10**:761g–764a	
4. The fur industry	FURS **7**:812–816		
a. Fur processing: fur dressing and dyeing		**7**:815c–816a/ **7**:286d–287g	
b. Furriery: production of fur garments		**7**:816a–c	
5. The floor covering industry	FLOOR COVERINGS **7**:406–411		
a. History of floor coverings and carpet making		**7**:406d–407c/ **16**:16g–24b	
b. Production of handmade and machine-made carpets and rugs; linoleum, cork tiles, and other smooth-surfaced floor coverings		**7**:407d–411a/ **16**:12e–13c	**9**:695c–g
6. The electronics industry		**7**:248f–250g/ **9**:662c–664c	**2**:509e–g/**6**:542f–h/**6**:678b–d
a. Manufacture of electronic components and systems		**6**:690f–691b/ **7**:248f–g/ **15**:433h–434c	
b. Applications of electronic systems; *e.g.*, radio and television communication, sound recording and reproducing, information processing [see 735]			

	articles	article sections	other references
7. The tool and die industry	TOOL AND DIE MAKING **18**:487–489		
a. Fabrication of tools and dies		**18**:487g–489c	
b. Tool and die-making facilities		**18**:489d–e	
8. The lumber industry	WOOD AND WOOD PRODUCTS **19**:921–925	**7**:533h–534e	
a. Principal wood products; *e.g.*, lumber, veneer, plywood, particle board, fibreboard		**19**:921d–h/ **19**:922g–924b	
b. Wood treatment; *e.g.*, drying, preservation		**19**:921h–922g	
9. The cutlery industry	CUTLERY AND TABLEWARE **5**:385–389		
a. Materials used for cutlery and tableware; *e.g.*, plated materials, stainless steel		**5**:386d–387a	
b. Modern fabricating techniques		**5**:387a–388h	
10. The abrasives industry	ABRASIVES **1**:13–17		
a. Sources and uses of natural and manufactured abrasives		**1**:14a–15f	
b. Manufacture of abrasives and abrasive products		**1**:15g–17a	
D. The process industries *with special attention to*			
1. The chemical industry	CHEMICAL INDUSTRY **4**:125–138	**18**:42h–43c	**2**:508a–c
a. Divisions of the chemical industry: the heavy inorganic chemical industry, the fine chemical industry, and the heavy organic chemical industry		**4**:127b–133b/ **4**:113d–g/ **9**:96g–97c	**13**:125c–126a/**13**:822d–823b
b. Finished chemical products; *e.g.*, fertilizers, soaps and allied products, cosmetics, pharmaceuticals, surface coatings		**4**:133b–138a/ **14**:194c–199b/ **16**:915f–919e	
2. The petroleum industry [see also 724.B.2.]	PETROLEUM REFINING **14**:180–189		**14**:173g–174b/**18**:46b–d
a. Petroleum refining processes; *e.g.*, fractional distillation, cracking, reforming		**14**:181c–185b	
b. Petroleum products; *e.g.*, gasoline, kerosine, gas oils, lubricating oils		**14**:185b–187e/ **10**:159d–e	
c. Refinery plants and facilities		**14**:187h–189e	
3. The paper industry	PAPER AND PAPER PRODUCTION **13**:966–976		**5**:995f–996a
a. Development of the papermaking process		**13**:966d–967d	
b. Raw materials: wood and other fibres		**13**:967d–969g	
c. Processes for preparing pulp and for manufacturing paper and paperboard		**13**:969h–974f	
d. Properties and uses of paper		**13**:974h–976h	
4. The pharmaceuticals industry [see also 10/35.C.4.]	PHARMACEUTICALS, PRODUCTION OF **14**:191–199		**18**:47g–48a
a. Production of pharmaceuticals from natural sources and by chemical synthesis		**14**:192a–196g	**7**:350g–351a
b. Preparation of dosage forms; *e.g.*, solutions, dispersions, tablets		**14**:196g–199b	
5. The plastics industry	PLASTICS AND RESINS **14**:510–525		**11**:625a–d/**13**:855h–856h
a. History of the plastics industry		**14**:511c–g	**18**:47c–e

Section 733. Construction technology

[for Part Seven headnote see page 437
for Division III headnote see page 462]

The articles and parts of articles referred to in Section 733 deal with three main subjects: A, general building construction; B, construction of civil engineering works; and C, prefabrication and shop fabrication.

After dealing with the history of construction, the outline of subject A treats the stages of preconstruction planning and surveying procedures. It goes on to the many kinds of building materials, to the methods for testing them, and to the kinds of construction machinery. Articles are then referred to that separately treat construction techniques—carpentry, masonry, steel construction, and concrete construction. The outline then turns to the technologies involved in the construction of component parts of buildings. It first deals with applications of soil mechanics in the laying of different kinds of foundations. It goes on to parts of superstructures, such as bearing walls, floors, and windows. Finally, the outline deals with auxiliary systems and members, covering plumbing, heating, ventilating, and lighting systems; auxiliary members such as elevators, chimneys, locks, and electrical wiring; and the applications of acoustics for the control of noise and for the provision of good hearing conditions.

Subject B is the construction of civil engineering works. Articles referred to separately treat the construction of dams, aqueducts, bridges, tunnels and other underground structures, harbours and sea works, lighthouses, and stadiums.

The article referred to on subject C treats the economics, the advantages, the procedures, the techniques, and the materials of prefabrication and shop fabrication.

Section 734. Transportation technology

[for Part Seven headnote see page 437
for Division III headnote see page 462]

The articles and parts of articles referred to in Section 734 deal with ten main subjects. The first six subjects concern the supporting systems, devices, and vehicles for the major kinds of transportation: A, roads and highways; B, vehicles and devices for road and highway transportation; C, rail transportation; D, stationary conveyance systems; E, water transportation; and F, air transportation. The next three subjects relate to all kinds of transportation: G, air-cushion machines; H, traffic control; and I, safety engineering. Subject J is the history of transportation.

The outline of subject A covers the construction and maintenance of automobile roads and of national highway and expressway systems.

The articles referred to in connection with subject B separately treat harness and saddlery, wagons and carriages, bicycles, automobiles and automotive systems, and trucks and buses.

The outline of subject C covers the history of railroad technology and the construction of the supporting systems and vehicles for rail transportation.

The various kinds of stationary conveyance systems, such as pipelines and conveyor belts, are treated in Section 725, on the technology of industrial processes.

The outline of subject E deals with the history of water transportation, and with the supporting systems and vehicles for water transportation. It begins with oar-propelled, wind-propelled, and power-propelled vessels. It goes on to ship operation, brokering, and charting; to world trade routes and merchant fleets; and to current problems of the shipping industry. Finally, it treats ship design and construction, canals and inland waterways, and harbour works.

Subject F is air transportation. The outline first deals with the types and the construction of lighter-than-air craft and of heavier-than-air craft. It goes on to the design, construction, and operation of airports, problems of air traffic control, and the air transport industry. Finally, it treats space travel, aeronautical and space research, and the history of flight.

The article referred to on subject G treats the design, construction, operation, and applications of air-cushion machines.

The articles referred to in connection with subjects H and I treat the problems of traffic control and of safety engineering for transportation systems on land, on water, and in the air.

The article referred to on subject J treats the history of transportation from the most primitive forms to the modern global transportation network. Future trends in transportation technology are dealt with at the end of the outline.

Section 735. Technology of information processing and of communication systems

[for Part Seven headnote see page 437
for Division III headnote see page 462]

The articles and parts of articles referred to in Section 735 deal with 11 main subjects. Subject A, communication and information theory, is dealt with in Section 10/23 of Part Ten. The last subject, K, is electronics, which has applications in various kinds of communication systems. The other nine subjects are particular aspects of the technology of information processing and of the technology of communication. They fall into three groups. The first group has three subjects: B, calculating devices; C, office machines; and D, computers. The next group has four subjects: E, general information-recording devices; F, sound recording and reproduction; G, the technology of photography; and H, information processing. The last group has two subjects: I, major systems of communication; and J, major systems of detection and remote sensing.

The outline of subject B deals with the earliest devices for performing arithmetic operations, and with modern mechanical and electromechanical calculators.

The outline of subject C, office machines, treats the several kinds of writing and reproducing machines and of calculating and accounting machines.

The outline of subject D, computers, begins with the early and the 20th-century developments in the history of computers. It goes on to deal with basic computer functions and the properties that distinguish computers from calculators. It next treats the types of computers—analogue computers, digital computers, and hybrid computer systems. Finally, after dealing with programming systems and programming languages, it treats the current important uses of computers.

The outline of subject E begins with simple writing implements and such recording devices as typewriters. It goes on to the history of printing and to the types of modern printing machines and processes. Finally, dealing with the production of printing plates, the outline covers the various kinds of mechanical techniques, such as woodcut, etching, and lithography, and the basic processes of photoengraving.

Subject F is sound recording and reproducing devices. The outline first deals with mechanical systems, treating the history, processes, and instruments of phonograph recording. It goes on to deal with magnetic systems, treating the media, the processes, and the instruments involved in tape recording. It next treats optical systems such as motion-picture sound tracks. It goes on to such auxiliary equipment for sound recording and reproduction as microphones, amplifiers, loudspeakers, and speaker systems. Finally, it treats high fidelity concepts and systems.

Subject G is information recording by the production of visual images. Dealing with still photography, the outline covers the history and basic technology of photography, the instrumentation of photography, the photographic processes, special techniques of photography, and the photography industry. Dealing with motion-picture photography, the outline treats professional motion-picture photography, motion pictures for scientific purposes, and amateur motion-picture photography. Finally, the outline treats the principles and applications of holography—a recently invented means of creating a unique photographic image that, when illuminated by a laser beam, organizes the light into a three-dimensional representation of the original object.

The outline of subject H, information processing, treats the primary and secondary information media; information storage and retrieval systems and devices; and the theory and practice of information processing systems.

Subject I is the major systems of communication. Articles referred to separately treat postal systems and equipment; telegraph systems and equipment; telephone and telecommunication systems and equipment; radio communications systems and equipment; television communications systems and equipment; communication satellite systems and equipment; and coding and decoding devices and techniques.

Subject J is major systems of detection and remote sensing. Articles referred to separately treat radar systems and equipment, and sonar systems and equipment.

Subject K is electronic components and techniques. The outline treats the active and passive electronic components, as well as integrated circuits; sensing devices and transducers, including piezoelectric devices; and electronic circuitry.

Section 736. Military technology

[for Part Seven headnote see page 437
for Division III headnote see page 462]

The articles and parts of articles referred to in Section 736 deal with three main subjects: A, offensive and defensive delivery and payload systems; B, military logistics systems; and C, purely defensive equipment and systems.

The outline of subject A deals with primitive and ancient weapons and delivery systems, and with early gunpowder weapons. In treating the development of modern weaponry, the outline covers advances in gunnery; in military small arms; in ammunition; in mines, grenades, and chemicals; in rockets and missile systems; in tanks and armoured vehicles; in naval craft and delivery systems; in aircraft delivery systems; in nuclear warheads and missile delivery systems; and in nonballistic weapons, including chemical, biological, and psychological warfare. The outline concludes with future weapons trends.

The outline of subject B first deals with the history and development of logistics systems from early warfare into the 20th century. It then treats, in dealing with logistics problems in a nuclear age, the stages and the processes of weapon development and maintenance; the logistics problems involved in air, land, and water transport, in supply and maintenance, and in providing ground support services; and the logistics problems posed by the nuclear threat.

Subject C is purely defensive equipment and systems. The outline covers individual protective gear, such as body armour and helmets; early forms of fortification; such modern fortifications as pillboxes, bunkers, bomb shelters, trenches, and coastal batteries; and the development of warning and detection techniques, including antimissile missiles.

Section 737. Technology of the urban community

[for Part Seven headnote see page 437
for Division III headnote see page 462]

The articles and parts of articles referred to in Section 737 deal with four main subjects: A, basic engineering services of the city; B, the technology of basic social services of the city; C, the technological response to new urban problems; and D, the history of city engineering.

The outline of subject A begins with the construction and operation of urban water-supply systems. It next deals with sanitation systems—systems for the disposal of sewage and refuse and for street clearance and cleaning. It goes on to the problems, elements, and new concepts of urban transportation systems. After indicating that the technology of city-to-city transportation systems is dealt with in Section 734, the outline then treats the technology of electric power, covering power generation; the types, design, and construction of power transmission systems; power distribution networks in metropolitan areas; the organization and operation of power systems; and the international aspects of the technology of electric power. Finally, it deals with fire prevention and control, covering the classes of fires, and the equipment and techniques for fire-detection and fire-extinguishing.

The outline of subject B deals first with police technology, covering traffic control technology and crime control technology. It then deals with the design, construction, and maintenance of such recreational facilities as parks and playgrounds, planetariums and aquariums, stadiums, and racetracks.

Subject C is the technological responses to new urban problems. The outline begins with pollution control, treating the types, sources, effects, and control of air pollution; problems about water pollution, and about land and soil pollution; other kinds of pollution such as noise and radiation; and the global aspects of pollution. It then deals with the planning of cities; the systems approach to urban design and construction; and the development of new towns.

The outline of subject D covers the engineering of ancient and medieval cities, the technological development of the modern city, and the engineering problems of the megalopolis, including overcrowding, pollution, and nuclear-reactor dangers.

Section 738. Technology of Earth and space exploration

[for Part Seven headnote see page 437
for Division III headnote see page 462]

The articles and parts of articles referred to in Section 738 deal with the techniques and equipment: A, of surface and underground exploration; B, of underwater exploration; and C, of space exploration.

The article referred to on subject A treats the types and purposes of surface and underground exploration, and the indirect and direct methods of exploration.

The outline of subject B treats the history of underwater exploration; surface and underwater research vessels, such as floating instrument platforms, bathyscaphes, and remote underwater manipulators, and their facilities; the life-support systems that maintain sea-level pressure and maintain ambient pressure; and recent advances and future trends in undersea exploration.

After dealing with the history of space exploration prior to Sputnik I, the outline of subject C deals with the characteristics of space affecting space flight; with the technology of spacecraft subsystems; with launch principles and techniques; and with the mechanics and techniques of space flight. Treating space programs since 1957, the outline covers space launch vehicles, unmanned space probes, manned space programs, the use of Earth-oriented satellites, and current proposed missions and new technology. Finally, it treats research on unidentified flying objects.

Introduction to Part Eight:

Religion as symbolism

by Wilfred Cantwell Smith

There is more to human life than meets the eye. More to oneself; more to one's neighbour; more to the world that surrounds us. There is more to the past out of which we come; and especially, it would seem, more to the present moment, maybe even infinitely more. There is more to the interrelationships that bind us together as persons. And the further we probe, men have always found, the deeper the mystery, or the reward, or the involvement. It is this "more," perhaps, that provides at least one of the bases for human religion. We men have seldom been content to be "superficial," to remain on the surface, to imagine that reality does not transcend our finite grasp; and throughout most of our history on this planet we have ordered our lives, both personal and cultural, in terms of that transcendence.

Yet how is one to point to what one does not visually see? How to resort to a milieu beyond all space? How to talk or to think about what transcends not only words but the reach of the mind? How even to feel about what one does not touch? Man's inherent and characteristic capacity to do these things finds expression through his special relation to symbols. These have proven over the centuries sometimes more, sometimes less, adequate to such a task, but in any case indispensable, and ubiquitous. Such symbols, it turns out, have the power not merely to express men's otherwise inchoate awareness of the richness of what lies under the surface, but also to nurture and to communicate and to elicit it. They have an activating as well as a representational quality, and an ability to organize the emotions and the unconscious as well as the conscious mind, so that into them men may pour the deepest range of their humanity and from them derive an enhancement of the personality. Without the use of symbols, including religious symbols, man would be radically less than human.

Quite diverse types of things have served the purpose: a beaver, the sky, a ceremonial procedure, silence; erotic love, or austere asceticism; the Qur'ān; a historical figure; reason. The variety has been immense, different groups having chosen different things to serve them as symbols, not all equally successful. Virtually universal, however, is that men have found it possible to designate some item from within the visible world and to sacralize it in such a way that it becomes then for them the symbol or locus of the invisible, the transcendent. In Japan, a simple open gateway (*torii*) marks off the shrine precincts: one passes through it, leaving behind psychologically, symbolically, the humdrum ordinary world to enter the sacred space of the temple; and after worship, one again moves through the gate in the other direction, to re-enter now the realm of everyday life, but as a renewed person. Virtually all peoples have set aside some portion of what outsiders would regard as ordinary terrain to serve for them as sacred space, erecting in it temple, church, or shrine whereby is then represented for them, often with great force, quite another dimension of reality.

Similarly with time: the Jew, for instance, sets apart one day in seven, whereby the other six days symbolize the mundane world with its bitter imperfections, perhaps its devastating pain, and at best its transient successes, while the Sabbath creatively represents the inviolate splendour of transcendence—with which therefore the other six days, however bleak, cannot keep him out of touch. Every people has its festivals, weekly or seasonal or occasional, its sacred times when life in its empirical and work-a-day aspects is transcended and life in its timeless dimension is reaffirmed, reactivated: moments when truth, significance, worth are recognized and cultivated—and carried back then into the ordinary world.

Men are somehow aware, if only through imaginative vision or sensibility or our special capacity for hope, not only of what is but also of what ought to be. They have sensed that the *status quo* (nowadays, the *fluxus quo*) is not the final truth about man or the world. They have felt, to take one example, that social justice and concord, personal righteousness, health, joy, stand over against the current observable condition of strife, loneliness, wickedness, poverty, and sorrow not as fancy against truth, wishful and irrational dreaming against reality, but in some fashion *vice versa*—as a norm by which the present imperfect world is judged, in some sense a truth in relation to which empirical actuality is in some sense an error. This too has been affirmed symbolically. One rather common way of doing so has been by representing a more perfect world elsewhere. Some have located their utopias chronologically in the past ("Once upon a time"; or Golden Age theories, as in Greece and India); or in the future (millennialisms, a coming just ruler, secular ideas of progress, a life after death); or geographically, somewhere else (the medieval Irish "Isle of the Blessed" in the then inaccessible Western Sea); or high above the sky (heaven, the heaven of heavens); or in a domain beyond time (Paradise); or in another realm than this universe (a metaphysical order, idealist realities).

However it be symbolized and articulated, a moral dimension to human life has been perceived and affirmed. Man has been aware not only of the profitable and the disadvantageous but also of the better and the worse, and has been inspired by some power to pursue the better; he has known that some actions are right, some wrong, and that it matters. At most times and most places, morality has been an integral part of the religious complex (although situations have on occasion arisen when the two have become historically dislocated—when a given form of religion has seemed not good; or to put it another way, when man's sense of what is worthwhile, and the inherited symbols by which worth used to be formulated, have no longer converged).

If the panorama of man's religious life is, in its outward form, selected mundane data symbolizing the more than mundane, then the task of the student of religion is to know those data but to consider them not in themselves but in their role in men's lives. Our concern is not primarily the doctrines and scriptures and prayers and rites and institutions; but rather, what these do to a man. Not the tribal dance, so much as what happens to the African dancing; not the caste system, so much as what kind of person the Hindu becomes within it, or without it; not the events at Sinai, so much as what role the recounting of these events has played in both Jewish and Christian life over the centuries since; not the Qur'ān so much as what the Qur'ān means to a Muslim.

In illustration, let us consider as an example a statue of the Buddha, and take note specifically of one small part of it, the pose of the right hand. Among several such stylized poses used throughout the Buddhist world, we may choose just

one, the *abhaya mudra* ("fearlessness pose"), in which the right arm is somewhat raised, that hand held straight up, palm facing out. Over and above the more universal significance of such a gesture (power, authority, benediction), in the Buddhist case this represents also an incident from the life of the Buddha, in which reputedly a wild elephant charging him and his group was stopped in its tracks when the Teacher raised his hand so, and became tame. The gesture gives artistic expression, then, to the Buddha's fearlessness in the face of the threat, and also to his conferring of fearlessness, and of grounds for fearlessness, on his disciples: his serene triumph over danger.

To say that this particular feature of sculpture symbolizes for Buddhists the overcoming of fear is to indicate not merely that it depicts an event in someone else's life, but also that it effects a change in one's own—since, to repeat, symbols not only represent but activate. The animal in its fury in the remembered anecdote may itself be taken as symbolic, representative of the pressures and assaults of life, which faith in the Buddha gives one the inner resources to withstand: the passions, for instance, to which such faith bestows on one the power quietly to say "no." To understand this particular item in the religious life of Buddhists, accordingly, is to know the history of how a Japanese emperor or a Thai merchant or a Chinese peasant through contemplating it in some nearby temple has had his life transformed, his fear removed, his personality healed. A parallel may be observed of the role in the lives of Christians, over the centuries, of the story of Christ's stilling of the tempest. His words, "Peace, be still!" read in the Lesson, and the portrayal of the scene in stained-glass windows, have served to symbolize, for men of faith, on the one hand Christ's power over the elements in his own life, and on the other hand the power that their faith in Him has in their lives, they have then found, to confer peace, to quell storms.

A special sort of symbolization, developed characteristically in, for instance, the Western world but by no means only there, has been the conceptual. A few recent philosophers have itched to legislate that concepts must be used to refer only to the sensible or phenomenal world; that it is illegitimate to use them symbolically to refer to a transcendent order. It would be manifestly stultifying to apply so austere a restriction to art or to most other human pursuits, apart from the natural sciences (from which these men have learned it). Such an orientation has seemed to work rather well with the "objective" world—better, with the objective facets of the world (at least, until one raises moral questions about atomic bombs or ecology); but it appears stubbornly to misunderstand life in its distinctively human form.

One of the most powerful symbols in human history has, without question, been the *concept* "God." This concept, like other religious and other human symbols, has demonstrably meant different things to different persons and groups and ages; yet it is hardly too drastic an oversimplification to suggest that the concept has on the whole at least subsumed, integrated, deepened, and made operationally effective in the lives of many hundreds of millions of persons and in the life and social cohesion of many thousands of communities their awareness and their potential awareness of the entire range of transcendence with which they are surrounded or endued—of grandeur, order, meaning, aspiration, awe, hope, virtue, responsibility, rapport, integrity, worth, renewal. The highest, deepest, most comprehensive that they were capable of attaining, individually and socially, was organized, focussed, and nurtured in and through this concept. (Given the distinction, observed by all believing theorists, between God and men's ideas of God, such theorists may themselves make this same point by saying that God has used the idea of God to enter men's lives; that the concept has served as a sacrament. More recent developments, with the concept "God" no longer serving so effectively, as a symbol, for many, will be touched on below.)

Although correlative conceptualizations are virtually worldwide and history-long, this particular concept was developed in its most powerful and characteristic form in the Near East and has permeated, at times dominated, the civilizations that have emerged from there to cover almost half the planet, especially the Islāmic and the Judaeo-Christian. The Indian counterpart has been in many respects closely similar; in many, subtly different. China and Japan, although also employing symbolic concepts richly, have tended toward other religious and cultural patterns than this particular one.

Even so major a symbol, however, as the concept "God," however all-embracing it may seem, is in the end significant not in isolation but within a whole system of ideas, practices, values, and the like, forming a pattern of which it is no doubt the keystone but not the totality. Certainly minor symbols like the pose of the right hand in a piece of sculpture or medium ones like the ceremonial holiness of the Sabbath, however significant they have been in the lives of many millions of persons, derive their meaning and their power from each being one item within a large pattern of symbolic structures, such as the Buddhist complex or the Christian.

And even these great complexes, each of which has an elaborate and ever-changing history, constitute systems to be understood not in themselves, as structures to be looked at, but rather in terms of the ambience that they make available for men and women to live within. "In order to understand Buddhists, one must look not at something called Buddhism, but at the universe, so far as possible through Buddhist eyes." It is not the symbols themselves that one must grasp, so much as the orientation that they induce: how the whole complex of symbols enables those who live in terms of it to see a sunset, a broken marriage, prosperity, the onset of cancer, one's election to public office.

The religious history of the Hindu community is a history, in part, of traditional ceremonial and ideological and sociological patterns. Yet in more significant part it is a history, however difficult this may be to discern, of fortitude and of quiet humaneness, of a conviction that life is worth living and death worth dying, that goals are worth striving for, that the immediate is caught up in the eternal. The Buddhist metaphors have served to kindle in the mind and heart of the Buddhist the perhaps unconscious awareness that one's own fortune is not a reason for gloating, or one's neighbour's fortune, for envy; that knowledge is more important than wealth, and wisdom than knowledge; that the world is to be appreciated and not merely exploited; that one's fellow is to be treated as an end, not merely as a means; that sorrow is not a reason for despair. Islāmic law, theology, architecture, and the rest have been symbols that at their best have crystallized and nurtured, for Muslims, the courage and serenity, the sense of order and the aspiration to justice, the forbearance, the humility, the participation in community, that the Islāmic system traditionally inspired. Christian symbols have given both form and actuality, among Christians,

to many things, including for instance the ability of human suffering to become redemptive.

Of course, religious symbols and sets of symbols have been used also for mean and destructive purposes. Man's wickedness, and not only his capacity for virtue, has been expressed and even encouraged by his symbol systems, at times. Through them he has found his freedom, his transcendence of the immediately given, his ability to move beyond being merely an organism reacting to its environment; but sometimes he has used these destructively, or has become a victim of their inherent ambiguities. Nothing has turned a society into a community so effectively as religious faith: to share common symbols is about the most powerful of social cohesions. And yet few gulfs have been greater than those that separate differing religious communities, few hostilities so fierce as those between groups whose symbols differ.

Religious symbols do not raise man above the human level; only to it.

A final word about history. The history of religion has at times been mistaken for the history of its symbols; but this is superficial. The same symbols have discernibly changed their meanings over time, and indeed from person to person, and even within one person's life; also, persisting or widespread orientations and perceptions have been expressed in strikingly different symbolizations. The true history of religion is more deeply personalist—not in the sense of individualist: the personal is also the social, and especially so in the religious realm. The true history of religion, not yet written, is the history of the depth or shallowness, richness or poverty, genuineness or insincerity, splendid wisdom or inane folly, with which men and women and their societies have responded to such symbols as were around them. It is also, however, the tale, and to some degree this can be told, of when and in what fashion they have forged new symbols, or neglected or found themselves unable to respond to old. And nowadays it is also the story of how they deal or fail to deal with a plurality of symbolisms.

A man's faith is in some sense the meaning that his religious symbols have for him; but more profoundly, it is the meaning that life has for him, and that the universe has, in the light of those symbols. For religious symbols do not "have" meanings of their own; they crystallize in various ways the meaning of the world, of human life. There is a history of their varying ability to do this, at various times and places (or of men's varying ability to have them do it). How new symbols or patterns of symbols emerge is too complex or controversial a question to be summarized here; but how they develop once launched, how they are reinterpreted (sometimes radically) over the centuries, how their success in pointing beyond themselves often gives way to a rigidity and narrowness in which they or their institutions are prized or defended simply in themselves; how iconoclastic movements arise, to shatter the symbols (literally, smashing idols; or figuratively, attacking concepts and mores), whether in the name of something higher or out of misunderstanding, and often both; saddest of all, how a time may arrive when the symbols no longer serve a community, no longer communicate a transcendent vision, and then a profound malaise settles on the society and life comes to seem without meaning, and men become alienated from each other and even from themselves and from the world in which they live—all this the historian can trace.

In recent Western history an aberrational tendency has arisen to imagine that human life is fundamentally or naturally "secular," and that religion has been an added extra, tacked on here and there to the standardly human. This now appears to be false. Rather, the various religious systems have expressed varying ways of being human. The historian cannot but report that it has been characteristic of man to find that life has meaning and to formulate that meaning in symbolic ways, whether grotesque or sublime.

Part Eight. Religion

The outlines, and the articles and parts of articles referred to, in the eleven sections of Part Eight set forth studies of religion in general and studies of the particular religions. The ways in which religion is related to studies of human society, the fine arts, the history of civilizations, and science and philosophy are dealt with in Parts Five, Six, Nine, and Ten.

The articles referred to in Section 811 of Division I treat diverse views of the nature, purpose, validity, and value of religion. Those referred to in Section 812 deal with problems and methods of the empirical, comparative, and phenomenological study of religion and religious experience, in efforts to discern, describe, and understand religious phenomena.

The outlines and the articles referred to in the nine sections of Division II deal with the particular religions of mankind, in different cultural stages, historical eras, and world areas.

Division I. Religion in general 501
II. The particular religions 517

Division I. Religion in general

The outlines, and the articles and parts of articles referred to, in the two sections of Division I deal with diverse views of the nature, purpose, validity, and value of religion, and with the problems, methods, and results of the empirical, comparative, and phenomenological study of religions and of religious experience.

The articles referred to in Section 811 treat divergent views of the nature and characteristics of religion; views of the meaning of religion and religious phenomena from within the particular religions; views and attitudes concerning religion or religious beliefs and claims from positions outside the particular religions; the history, themes, and problems of the philosophy of religion; and the nature of theology, its relation to the history of religions and to philosophy, its religious and cultural significance, and its themes and functions.

The articles referred to in Section 812 deal with the basic problems and methods of the descriptive study of religion including the criteria used to classify the particular historical religions, which are treated separately and descriptively in Division II; the relation of religion to other spheres of human experience; the nature, elements, and varieties of religious experience; and the basic patterns of religious thought, action, and association.

Section 811. Diverse views about religion 501
812. Religion as an object of study; religious experience and phenomenology 511

Section 811. Diverse views about religion

The articles and parts of articles referred to in Section 811 deal with five main subjects: A, divergent views of the nature and characteristics of religion; B, views of the meaning of religion and religious phenomena from within the particular religions; C, views and attitudes concerning religion, or religious beliefs and claims, from positions outside the particular religions; D, the philosophy of religion; and E, theology.

The outline of subject A begins with the givenness of religion as a fact of human experience, culture, and history. It then treats views of religion as the relation between man and the supernatural; views of the inner attitudes and dispositions characterizing religion and of the human faculties or functions involved in religion; and views of the prescribed or institutional character of religion.

The outline of subject B begins with views of the origin of religious beliefs, practices, and institutions. It goes on to views of the nature of the divine or sacred and its relation to the world and to men. Here, it first treats views about the knowability, the essence, the personal character, and the unity of the divine or sacred. It next treats views of the transcendence or immanence of the divine or sacred and the relation of the divine or sacred to the universe. After dealing with views of the approachability of the divine or sacred by man, it treats views of the divine or sacred as concerned and active with respect to human welfare, or as hostile or destructive toward men. Turning to views of the significance of religious beliefs and practices for men, the outline covers views of the dispositions and behaviour required of man by or toward the divine or sacred; views of the role of religion in human life; affirmations or rejections of the religious value of formal observances and institutions or prescribed dispositions; affirmations or rejections of the truth or value of imaginative expressions of religious beliefs and doctrines; divergent views concerning the initiating or decisive source of religious assent, volition, or action; and views about the criteria of true belief and right action. Finally, the outline of subject B treats diverse positions taken by particular religions with regard to the truth or worth of other religions, and criticisms of religion from within the particular religions.

Subject C involves views and attitudes concerning religion, or religious beliefs and claims, from positions outside the particular religions. The outline begins with the positions of atheism and agnosticism and with philosophical views rejecting some or all religious beliefs and claims as false or worthless. It goes on to treat various naturalistic explanations of the origin and development of religious beliefs and practices. It next deals with views that acknowledge some validity in religion in general or in particular beliefs and practices. Finally, the outline treats modern alternatives to traditional religious beliefs, practices, and institutions with special attention to Existentialism, secular religion, and Marxism.

The article referred to on subject D treats the history, themes, and problems of the professional discipline of the philosophy of religion, as well as the common or typical views about and attitudes toward religion.

The article referred to on subject E deals with the nature of theology, its relation to the history of religions and to philosophy, its religious and cultural significance, and its various themes and functions.

Section 812. Religion as an object of study; religious experience and phenomenology

[for Part Eight headnote see page 501
for Division I headnote see page 501]

Section 812 treats the results of empirical, comparative, and phenomenological studies of religions and religious movements, which are covered separately and historically in the nine sections of Division II. The articles and parts of articles referred to in Section 812 deal with four main subjects: A, basic problems and methods of the descriptive study of religion; B, the relation of religion to other spheres of human experience; C, the nature, elements, and varieties of religious experience; and D, the basic patterns of religious thought, action, and association.

The outline of subject A deals first with the problem of defining religion and discerning religious phenomena, with questions about neutrality and subjectivity in the study of religion, and with the history of the study of religion. It next treats the diverse approaches to the understanding of religion in general and of the particular religions. It then treats the uses and principles of various classifications of religions; the distinction between the religions of primitive and civilized cultures; and the classification of secular movements and ideologies among the religions of the modern world.

The outline of subject B deals with the role and position of religion in relation to such other spheres of human experience as magic, art, morality, philosophy, science, and society.

The outline of subject C first deals with the significance of the elucidation of religious experience for the study of religion. After treating the nature, marks, and structure of religious experience, it deals with questions about the cognitive import or objective validity of religious experience. It goes on to the distinction between immediate and mediated religious experience and to the means of preparation for religious experience. Finally, it treats the situational contexts and forms of expression of religious experience and the types of religious experience and religious personality.

The outline of subject D begins with the concept of the sacred, or holy, and with issues about viewing finite things and beings as sacred. Dealing with natural objects or forces viewed as manifestations or bearers of the sacred, the outline covers the worship and veneration of cosmic powers or forces; the worship or veneration of celestial and terrestrial objects, forces, and dimensions; the role of natural substances or objects in religious beliefs and practices; the role of animals and plants in religious beliefs and practices; and modern philosophical and scientific versions of the sacredness of nature or of natural things. Dealing with human conditions, qualities, activities, or institutions viewed as sacred, the outline covers beliefs and practices regarding the dead; the veneration of kings and heroes; passage rites; religious dietary laws and customs; the holding sacred of social institutions or groups of people; and the sacredness of the soul or mind. Next dealt with are the several kinds of religious communities and the several kinds of religious personages, such as the priest, the prophet, the saint, the monk, the diviner, the shaman, and the mystic. The articles referred to that deal with the intellectual expression of religious thought treat creeds and confessions, doctrines and dogma, theology, sacred scriptures, and myth. Those dealing with precepts and codes of action treat asceticism, celibacy, nonviolence, and birth control. Those dealing with religious worship treat purification rites, sacraments, sacrifice, prayer, ceremonial and ritualistic objects, and religious dress and vestments. The last matters that are dealt with are religious symbolism, art, and iconography; religious education; religious celebrations and commemorations; and witchcraft.

Division II. The particular religions

[for Part Eight headnote see page 501]

Division I dealt with diverse views concerning the nature, purpose, validity, and value of religion, with the methods and results of the empirical and comparative study of religions, and with the distinctions and criteria used to classify the particular historical religions. The outlines, and the articles and parts of articles referred to, in the nine sections of Division II treat the particular religions of mankind, in different historical eras and world areas.

The articles referred to in Section 821 deal first with studies reconstructing the beliefs and practices of prehistoric religion and then with studies of the historical primitive religions in major world areas.

The articles referred to in Section 822 treat the religions of ancient peoples and civilizations: Near Eastern religions; Iranian religions; Greek, Roman, and Hellenistic religions; Slavic, Celtic, Germanic, Baltic, and Finno-Ugric religions; and the religions of pre-Columbian American civilizations.

The articles referred to in Section 823 deal primarily with the history; with the intellectual, spiritual, and imaginative expressions; and with the beliefs, practices, and institutions of Hinduism but also with Jainism, Sikhism, and Parsiism.

The articles referred to in Section 824 deal with the history; with the intellectual, spiritual, and imaginative expressions; and with the beliefs, practices, and institutions of Buddhism.

The articles referred to in Section 825 treat the indigenous religions of East Asia and deal with the characteristics and development ot Chinese religion, with Confucianism, with Taoism, and with the religions of Korea and Japan.

The articles referred to in Sections 826, 827, and 828 deal,

Section 821. Prehistoric religion and primitive religion 518
822. Religions of ancient peoples 520
823. Hinduism and other religions of India 525
824. Buddhism 529
825. Indigenous religions of East Asia: religions of China, Korea, and Japan 532
826. Judaism 536
827. Christianity 539
828. Islām 555
829. Other religions and religious movements in the modern world 558

respectively, with the three major monotheistic religions: Judaism, Christianity, and Islām.

The articles referred to in Section 829 present studies of new religious movements among tribal peoples and deal also with Negro cults in Western cultures, with theosophical and Spiritualist groups, and with modern offshoots of Islām.

Section 821. Prehistoric religion and primitive religion

[for Part Eight headnote see page 501
for Division II headnote see page 517]

The articles and parts of articles referred to in Section 821 deal with two main subjects: A, prehistoric religion; and B, primitive religion.

The outline of subject A first deals with the materials from which inferences are drawn about prehistoric religion and with the methods for their interpretation by analogy with modern primitive religions. Dealing with the major inferred beliefs and practices, the outline covers burial customs and cults of the dead; cannibalism; sacrifices; hunting rites and animal cults; female fertility deities; and shamanism, sorcery, and magic. Finally, it treats inferences about the religions of various prehistoric cultural stages: food-gathering, hunting, and pastoral-agricultural.

The outline of subject B first deals with the nature, significance, and general characteristics of religion in primitive cultures and with the importance of primitive religion in modern views of man's nature and of religion. Treating primitive world views, the outline covers distinctions between the sacred and profane; dynamistic, demonistic, and theistic views of the sacred; animism; primitive cosmogonies and cosmologies; and primitive views of man's nature, origin, vocation, and destiny. It goes on to myth, symbolism, and art and iconography in primitive religion. Dealing with primitive practices and institutions, it covers various kinds of sacrifice and kinds of purification and passage rites; worship centred on natural objects or forces; totemism; ancestor and hero worship; and the roles of asceticism, shamanism, divination, and spiritualistic practices. Finally, the outline treats the primitive religions of the major world areas.

Section 822. Religions of ancient peoples

[for Part Eight headnote see page 501
for Division II headnote see page 517]

The articles and parts of articles referred to in Section 822 deal with nine main subjects: A, religions of the ancient Near Eastern peoples; B, religions of the Iranian peoples; C, Greek religion; D, Roman religion; E, religions of the Hellenistic world; F, religions of the early peoples of eastern and central Europe; G, religions of the ancient Celtic and Germanic peoples; H, religions of the early peoples of northeastern Europe; and I, the religions of pre-Columbian American civilizations.

The accounts of these particular religions cover such topics as the historical development of the religion; its literature, mythology, art, and iconography; and its beliefs, worship, practices, and institutions.

The outline of subject A first deals with characteristics of the ancient Near Eastern religions. Then the articles referred to separately treat Mesopotamian religions, those of the Sumerians and Akkadians; Egyptian religion; the religions of the ancient peoples of Asia Minor; Syrian and Palestinian religions; and religions in the Arabian Peninsula.

The outline of subject B begins with general characteristics of the Iranian religions and then gives separate treatment to Zoroastrianism and to Mithraism.

Subjects C and D are ancient Greek religion and ancient Roman religion, including their historical development, their mythology, and their practices and institutions.

The outline of subject E begins with the general characteristics of Hellenistic religions. It then covers mystery religions, Gnosticism, Manichaeism, Hellenistic religious philosophies, and quasi-scientific and magical cults.

The outline of subject F covers the Scythian religion, the religions of the Sarmatians and associated peoples, and the religion of the pre-Christian Slavic peoples.

Subject G is the religion of the Celts and the religion of the Germanic peoples.

Subject H is the religion of the Baltic peoples and the religion of the Finno-Ugric peoples.

Subject I encompasses the Inca, Mayan, and Aztec religions.

Section 823. Hinduism and other religions of India

[for Part Eight headnote see page 501
for Division II headnote see page 517]

The articles and parts of articles referred to in Section 823 deal with four main subjects. The first three are concerned with Hinduism. Subject D is other religions in India, besides Buddhism (covered in Section 824).

The outline of subject A, the history of Hinduism, covers the major developments and periods from the prehistoric and protohistoric periods to contemporary Hinduism.

Subject B is the intellectual, spiritual, and imaginative expressions of Hinduism. The outline first deals with Hindu sacred literature: the primary Vedic scriptures, post-Vedic Sanskrit literature, and regional sacred literatures. Separate treatment is given to Hindu mythology and to the integral role of philosophy in Hinduism. Finally, the outline treats the characteristics, varieties, literature, and methods of Hindu mysticism.

Subject C is the beliefs, practices, and institutions of Hinduism. The outline first deals with common characteristics of Hindu belief about God or the sacred, about the universe, and about man. It next deals with the forms of Hinduism: Vedism and Brahmanism, Vaiṣṇavism, Śaivism, Tantrism, and Śāktism. It also treats folk Hinduism and its regional variations, and ethical, social, and nationalistic movements in modern Hinduism. The outline goes on to deal with sacrifice and worship, the sacred places and times of Hinduism, and the relationship between ritual practices and social status in Hinduism. The treatment of the cultural expressions of Hindu values and ideas covers the traditional religious function of Indian art generally and the characteristic symbolism and iconography expressed in the particular arts. Finally, the outline deals with the relations of Hinduism to other religions of Indian origin, to Islām, and to Christianity.

The outline of subject D covers Jainism, Sikhism, and Parsiism, including their history, beliefs, and practices and institutions.

Section 824. Buddhism

[for Part Eight headnote see page 501
for Division II headnote see page 517]

The articles and parts of articles referred to in Section 824 deal with three main subjects: A, the history of Buddhism; B, the intellectual, spiritual, and imaginative expressions of Buddhism; and C, the beliefs, practices, and institutions of Buddhism.

The outline of subject A begins with the cultural context for the origin of Buddhism and with the life, work, and teachings of the founder of Buddhism. The account of the development of Buddhism in India covers the early councils, early sectarian schisms, the period of expansion, and the decline of Buddhism in India. The outline next deals with the history of Buddhism in Central Asia and China; in Korea and Japan; in Tibet and the Himalayan kingdoms; and in Ceylon and Southeast Asia. It concludes with the response of Buddhism to Western colonialism and to the challenges of the modern age.

Subject B is the intellectual, spiritual, and imaginative expressions of Buddhism. Articles are referred to which separately treat Buddhist sacred literature—the religious texts and manuals of all major forms of Buddhism; Buddhist mythology, its religious roles, functions, types, and recurrent themes; the role in Buddhism of philosophy; and the universal characteristics, regional variations, goals, and techniques of Buddhist mysticism.

The outline of subject C begins with the traditional Buddhist beliefs and doctrines concerning the nature of reality, the path to salvation or release, Nirvāṇa as the goal of its Eightfold Path, the Threefold Refuge, and Buddhist views of the gods, spirits, and demons. It goes on to the doctrinal variations in the Theravāda and Mahāyāna versions of Buddhism and to various forms of esoteric Buddhism. The account of Buddhist religious practices and institutions covers those that are universal or widely prevalent, as well as the regional variations. The outline next treats the religious and cultural role of Buddhist art; the modes and canons of symbolic representation; and the specific characteristics of Buddhist architecture, sculpture, painting, and literature. Finally, the outline treats the relationship of Buddhism to other religions and its relationship to nationalist movements in the contemporary period.

Section 825. Indigenous religions of East Asia: religions of China, Korea, and Japan

[for Part Eight headnote see page 501
for Division II headnote see page 517]

The articles and parts of articles referred to in Section 825 deal with five main subjects: A, the characteristics and development of Chinese religion; B, Confucianism; C, Taoism; D, the religions of Korea; and E, the religions of Japan

The outline of subject A begins with the distinction between and relationship of the folk religions and the literate religions in China. It goes on to treat the history of religion in China, after which it covers traditional concepts concerning the relation of the individual to the cosmos and to society. The account of ritualistic practices and institutions covers rites of passage in family religion, rites connected with shrines and temples, the rites of Imperial worship and state religion, and the practices of sects and secret societies. Finally, the outline treats Chinese religious symbolism and mythology.

The outline of subject B first deals with the history of Confucianism, from its origin in the life and teachings of Confucius to its current demographic and social aspects. It goes on to the Confucian Classics, covering divination and poetic texts; basic texts on Confucius and Mencius; history texts; and texts on rites. The outline further treats the basic beliefs and doctrines of Confucianism; its influence on all aspects of Chinese culture; and its relation to non-Chinese religions and philosophical schools.

The outline of subject C, Taoism, first deals with the history of Taoism, from the teachings of Lao-tzu and Chuang-tzu in *c.* 4th–3rd century BC to the present. After dealing with Taoist literature, the outline treats the basic doctrines of philosophical Taoism; the basic beliefs, practices, and institutions of religious Taoism; variations in belief and practice in folk Taoism; and the contribution of Taoism to science and the arts.

The outline of subject D begins with the history of Korean religion from prehistoric times to the present, including the influence of Chinese, Japanese, and Western religions. It goes on to treat religious literature and mythology, general beliefs and doctrines, and the practices and institutions of Korean religion.

The outline of subject E, the religions of Japan, begins with the nature and types of Japanese religion and with the broad history of Japanese religion. It then treats separately the indigenous Shintō religion and the traditional and modern roles of Buddhism, Confucianism, and Christianity in Japan. Finally, it treats Japanese religious art and symbolism; Japanese mythology; the political and social roles of religion in modern Japan; and the place of Japan in world religion.

Section 826. Judaism

[for Part Eight headnote see page 501
for Division II headnote see page 517]

The articles and parts of articles referred to in Section 826 deal with three main subjects: A, the history of Judaism; B, the intellectual, spiritual, and imaginative expressions of Judaism; and C, the beliefs, practices, and institutions of Judaism.

The outline of subject A begins with the biblical era, from the pre-Mosaic period to the Persian period of return and restoration, 6th–4th century BC. It goes on to the Greek and Roman periods in the Hellenistic era and to the Talmudic era in Palestine and Babylonia, witnessing the foundations of rabbinic Judaism. It then treats the European and Islāmic phases of rabbinic Judaism in the medieval era. Finally, it covers the modern era, from about mid-18th century to contemporary Judaism.

The outline of subject B first deals with the biblical literature. It then treats the Qumrān literature (Dead Sea Scrolls) and the Talmud and Midrash, ancient commentaries and interpretive writings regarded as sacred or normative. Articles are then referred to that separately treat Judaic exegesis and hermeneutics, the literature of Jewish mysticism, Jewish philosophy, and biblical, Talmudic, and folk myth and legend.

The outline of subject C begins with basic Judaic beliefs and doctrines concerning God, concerning the Jewish people and the divine convenant with it, concerning man in relation to God and God's world, and concerning the future age of mankind and the world. The treatment of basic practices and institutions covers individual and familial practices; synagogue and other public institutional practices; the roles of the rabbinate and of general councils and conferences; sacred times and the cycle of the religious year; sacred places—the land of Israel and Jerusalem; and the sacred language—Hebrew. After treating present-day forms of Judaism, the outline deals with Judaic art and iconography; the influence and modification of the traditional anti-iconic principle; the uses of ceremonial objects and symbols; and the characteristics of Jewish architecture, painting, music, and literature. It then treats the relation of Judaism to religions of non-biblical origin and to Christianity and Islām, and the influence of Judaism on Western culture and civilization.

Section 827. Christianity

[for Part Eight headnote see page 501
for Division II headnote see page 517]

The articles and parts of articles referred to in Section 827 deal with ten main subjects. The first group of four subjects covers the history of Christianity: A, the history of Christianity to the schism of 1054; B, the history of the Eastern Orthodox Church from the schism of 1054 to the present; C, the history of the Roman Catholic Church from the schism of 1054 to the present; and D, the history of Protestantism. The next group of two subjects concerns things common or predominant among the various traditional forms of Christianity; E, intellectual, spiritual, and imaginative expressions of Christianity; and F, the beliefs, practices, and institutions of Christianity. The last group of four subjects concerns the differences among the forms of the Christian religion: G, the major traditional forms of Christianity: Eastern Orthodoxy, Roman Catholicism, and Protestantism; H, the major forms of Protestantism; I, ecumenism; and J, variations of the traditional forms of Christianity.

The outline of subject E treats the biblical literature and its interpretation; ante-Nicene and post-Nicene patristic literature; creeds and confessions of faith; writings of post-patristic theologians, reformers, and church leaders; Christian mystical literature; Christian philosophy and anti-philosophy; and Christian myths and legends.

Subject F is the beliefs, practices, and institutions of Christianity. The outline begins with general issues—about the right way of understanding the essential nature of Christianity, and about the nature of and criteria for the unity of the church. In dealing with beliefs or doctrines common or predominant among the various traditional forms of Christianity, as it does next, the out-

line first treats doctrines concerning God, dealing with such matters as the nature of God, the self-revelation of God, Christology, eschatology, the role of the Holy Spirit in the church, and the Trinity. The outline then goes on to treat doctrines concerning intermediary beings, powers, or principles; doctrines concerning the physical world; doctrines concerning man; and doctrines concerning the church and the normative role of Scripture, tradition, creeds, and confessions. The outline next deals with various approaches to church polity and with the significance of discipline and canon law in the organizational development of the church. Considering the church as a worshipping community, the outline covers such topics as the importance, forms, and variations of the eucharistic liturgy; the sacraments; and the liturgical year. It goes on to monasticism; the saintly life; the major eras, regions, and schools of Christian art; and the expression of Christian faith and themes in particular arts. Dealing with attitudes concerning the relation of the Christian community and the individual Christian to the world, the outline first treats the relations of the church to the political, socioeconomic, intellectual, educational, and cultural orders. It then treats diverse tendencies in the understanding of marriage and the family; diverse approaches to the understanding of Christian personal and social ethics; and attitudes toward the religions of pagan antiquity, toward Judaism, toward Islām, toward the religions of Asia, and toward modern primitive religions. Finally, the outline deals with other tendencies affecting traditional institutional Christianity: the esoteric tradition involving arcane disciplines and Gnostic groups; and recent trends toward secularization.

Subject G is the major traditional forms of Christianity. The articles referred to separately treat the major differentiating beliefs, practices, and institutions of Eastern Orthodoxy; of Roman Catholicism, including the Eastern rite churches in communion with Rome; and of Protestantism.

Subject H is the major forms of Protestantism. The articles first referred to separately treat the distinctive creedal statements, practices, and institutions of Lutheran churches, of Reformed and Presbyterian churches, and of the Anglican Communion. The outline goes on to the characteristics that have traditionally distinguished the Free churches from Lutheran, Reformed, and Anglican churches. Articles referred to then give separate treatment to the major Free churches: Baptists, Disciples of Christ, Congregationalists, Methodists, Friends, and Unitarians and Universalists.

The outline of subject I deals first with the nature and history of the ecumenical tradition in Christianity—the varying relations of particular forms of Christianity toward one another at different times. It then treats current ecumenical associations and agencies and the controversy about them.

Subject J is variations of the traditional forms of Christianity and special new forms. The outline first deals with traditional Eastern churches separated from the Orthodox Eastern Church —the Syrian, East Syrian, Armenian, Coptic, and Ethiopian churches—and with other deviant or eclectic churches in the East. It next treats the Eastern rite churches within the jurisdiction of the Roman Catholic Church and various kinds of separatist churches, especially the several kinds of so-called Old Catholic churches. The outline next deals with variants of Protestantism, treating separately Holiness churches; Pentecostal churches; millenarian churches, such as Adventists and Jehovah's Witnesses; old-line Protestant sects, such as the Mennonites, the Moravians, and the Brethren; various Fundamentalist and evangelical churches; and Negro versions of traditional Protestantism. The outline concludes with new forms that are tangentially related to traditional Christianity, such as New Thought, Christian Science, and Mormonism.
