Jackson, Andrew

A military hero and the seventh president of the United States, Jackson was the first man to win the presidency primarily through his appeal to the mass of the voters and by means of a skillfully planned national campaign rather than through the support of the political leaders of the seaboard states. As president, he initiated little significant legislation, but he was a forceful president who exercised vigorously the power and authority of his office; and, with the collaboration of a coterie of astute advisers, he transformed a political faction into a truly national political organization, the Democratic Party, which may be described as the first modern political party in the history of the United States.

Andrew Jackson, oil painting by John Wesley Jarvis, c. 1819. In the Metropolitan Museum of Art, New York.

He was born on March 15, 1767, at the Waxhaw settlement of the western frontier of the Carolinas. The area was in dispute between North Carolina and South Carolina, and both states have claimed him as a native son. Jackson maintained that he was born in South Carolina, and the weight of evidence supports his assertion. The Waxhaw area offered little opportunity for formal education, and what little schooling Jackson received was interrupted by the British invasion of the western Carolinas in 1780–81. In 1781 he was captured and imprisoned for a time by the British. Shortly after he was captured, he refused to shine the boots of a British officer and was struck across the face with a sabre. His mother and two brothers, Hugh and Robert, died during the closing years of the war, direct or indirect casualties of the invasion of the Carolinas. This sequence of tragic experiences fixed in Jackson's mind a lifelong hostility to Great Britain.

Early career

After the end of the U.S. war of independence, Jackson studied law in an office in Salisbury, North Carolina, and was admitted to the bar of that state in 1787. In 1788 he went to the Cumberland region as prosecuting attorney of the western district of North Carolina—the region west of the Appalachians, which was soon to become the state of Tennessee.

When Jackson arrived in Nashville, the judicial seat of the district, the community was still a frontier settlement exposed to the danger of Indian raids, with a fluid social structure, no well-established political institutions, and a volatile economy in which virtually every investment had the character of a speculation. As prosecuting attorney, Jackson was principally occupied with suits for the collection of debts. He was so successful in these litigations that he soon had a thriving private practice and had gained the friendship of landowners and creditors. For almost 30 years Jackson was allied with this group in Tennessee politics.

Marriage

Jackson boarded in the home of Col. John Donelson, where he met and quickly became attracted to the Colonel's daughter, Mrs. Rachel Robards. Her marriage with Robards was a stormy one, which seemed destined to end in separation or divorce even before she met Jackson. In 1790 Robards sought a divorce by legislative enactment in Virginia, but the legislature merely empowered Robards to sue for divorce. Jackson and Mrs. Robards believed the legislature had granted the divorce and in 1791 they were married. Robards, however, did not sue for divorce until 1793 and then obtained it on the grounds of desertion and adultery. When Jackson and his wife learned the true state of affairs, they were remarried quietly in Nashville. Until the death of Mrs. Jackson, nearly 40 years later, political opponents did not hesitate to make unflattering insinuations about events leading to his marriage. Although it appears to have been a happy union, gossip concerning it kept Jackson perpetually on the defensive.

Jackson was a successful lawyer, but he was too restless and his interests too varied to be confined to a career as an attorney. The expanding economy of frontier Tennessee encouraged adventures in trade and in land speculation, and Jackson became involved in both. He invested heavily in land and horses and also raised cotton. The course of his investments was an unsteady one. At times he appeared to be financially secure; on other occasions, he was hard pressed by debt.

Tennessee politics. His interest in public affairs and in politics had always been keen. He had gone to Nashville as a political appointee, and in 1796 he became a member of the convention that drafted a constitution for the new state of Tennessee. In the same year he was elected as the first representative from Tennessee to the national House of Representatives. He refused to seek re-election and served only until March 4, 1797. These were the closing months of President George Washington's administration, and the chief event of Jackson's brief service in the House was the debate over the response to Washington's farewell address. In a speech in the House, Jackson criticized Washington because of the latter's support of Jay's Treaty, which Jackson believed did not contain adequate guarantees that Great Britain would not violate the rights of American ships on the high seas during the wars of the French Revolution. He was one of 12 representatives who voted against sending a cordial reply, thanking Washington for the address.

Jackson returned to Tennessee, vowing never to enter public life again, but before the end of the year he was elected to the United States Senate. His willingness to accept the office reflects his emergence as an acknowledged leader of one of the two political factions contending for control of the state.

Jackson resigned from the Senate in 1798 after an uneventful year. Personal financial pressures were the immediate cause of his resignation, but he appeared ill at ease in national politics and was unhappy in being separated from his family. Soon after his return to Nashville he was appointed a judge of the Superior Court (in effect, the supreme court) of the state, serving until **1804,** when financial difficulties again forced him out of public life.

In **1802** Jackson was elected major general of the Tennessee militia, a position he still held when the War of **1812** opened the door to a command in the field and a hero's role. In the intervening years, though he was nominally out of politics, Jackson maintained his old associations with many of the active political leaders of the state. It was during this period that he renewed his acquaintance with Aaron Burr, whom he had met and admired when they served together in Congress. For a time, Jackson appeared to be willing to aid Burr in the latter's nebulous scheme for the conquest of Texas. Later, when he began to suspect that Burr entertained treasonable intentions of establishing an independent republic, Jackson withdrew his support. He was not fully convinced of Burr's guilt, however, and he appeared as a defense witness in Burr's trial for treason in **1807.**

Military feats. In March **1812,** when it appeared that war with Great Britain was imminent, Jackson issued a call for **50,000** volunteers from the state to be ready for an invasion of Canada. After the declaration of war, in June **1812,** Jackson offered his services and those of his militia to the United States. The government was slow to accept this offer, and, when Jackson finally was given a command in the field, it was to fight against the Creek Indians, who were allied with the British and who were threatening the Southern frontier. In a campaign of about five months, in **1813–14,** Jackson crushed the Creeks, the final victory coming in the Battle of Tohopeka (or Horseshoe Bend) in Alabama. The victory was so decisive that the Creeks never again menaced the frontier, and Jackson was able to impose upon them a treaty whereby they surrendered to the federal government an estimated **23,000,000** acres **(9,000,000** hectares) of land, comprising about one-fifth of the state of Georgia and more than three-fifths of the present state of Alabama. The campaign against the Creeks thus opened a vast new area to settlement and established Jackson as the hero of the West.

War of **1812**

In August **1814,** Jackson moved his army south to Mobile. Though he was without specific instructions, his real objective was the Spanish post at Pensacola. The motive was to prepare the way for U.S. occupation of Florida, then a Spanish possession. Jackson's justification for this bold move was that Spain and Great Britain were allies in the wars in Europe. At Mobile, Jackson learned that an army of British regulars had landed at Pensacola. In the first week in November, he led his army into Florida and, on November **7,** he occupied that city just as the British evacuated it to go by sea to Louisiana. Jackson then marched his army overland to New Orleans, where he arrived early in December. A series of small skirmishes between detachments of the two armies culminated in a major battle on January **8, 1815,** in which Jackson's forces inflicted a decisive defeat upon the British army and forced it to withdraw from Louisiana. The news of this victory reached Washington at a time when morale in the capital was at a low point. A few days later, news of the signing of a peace treaty between the United States and Great Britain on December **24, 1814,** at Ghent, Belgium, reached Washington. The twin tidings of victory and peace brought joy and relief to the American people and made Jackson the hero not only of the West but of a substantial part of the nation.

Florida campaign

After the close of the war, Jackson retained his commission in the army and was named commander of the southern district. The chief duty of the army in that district was to defend southern Georgia against possible raids by Indians from the Spanish colony of Florida; and Jackson entrusted the command of the troops in the field to subordinates while he retired to his home at the Hermitage, near Nashville. From that congenial environment, he was ordered back to active service at the end of December **1817,** when unrest along the border appeared to be reaching critical proportions. The instructions given Jackson were vague, probably purposely so, and it was well-known in Washington that Jackson hoped to gain Florida for the United States. As could have been expected, he ordered an invasion of Florida immediately after taking active command of the troops. He captured two Spanish posts and, before returning to the United States, appointed one of his subordinates military governor of Florida. These bold actions brought an immediate and sharp protest from Spain and precipitated a Cabinet crisis in Washington. The staunch defense of Jackson by Secretary of State John Quincy Adams, both in the Cabinet and in a note to Spain, saved Jackson from censure and hastened the acquisition of Florida by the United States.

Presidential prospects. Jackson's military triumphs led to suggestions that he become a candidate for president, but he disavowed any interest in seeking the presidency, and political leaders in Washington assumed that the flurry of support for him would prove transitory. The campaign to make him president, however, was kept alive by his continued popularity and was carefully nurtured by a small group of his friends in Nashville, who combined devotion to the general with a high degree of political astuteness. In **1822** these friends manoeuvred the Tennessee legislature into a formal nomination of their hero as a candidate for president. In the following year this same group persuaded the legislature to elect him to the United States Senate—a gesture designed to demonstrate the extent of his popularity in his home state. By December **1823,** when he reached Washington to assume his new duties, Jackson had become an open and formidable contender for the presidency.

In the election of **1824** four candidates received electoral votes. Jackson received the highest number, the other three being John Quincy Adams, William H. Crawford, and Henry Clay. Since no one had a majority of the electoral votes, the House of Representatives was required to elect a president from the three with the highest number of votes. Crawford was critically ill and the actual choice was between Jackson and Adams. Clay, as speaker of the House, was in a strategic and perhaps decisive position to determine the outcome. Adams was elected on the first ballot. When he appointed Clay secretary of state—then regarded as the second most powerful office in the government—it seemed to admirers of Jackson to confirm rumours of a "corrupt bargain" between Adams and Clay. Jackson's friends persuaded him that the popular will had been thwarted by intrigues, and he thereupon determined to vindicate himself and his supporters by becoming a candidate again in **1828.**

Election of **1828**

The campaign to elect Jackson president was resumed almost as soon as Adams took office. Skillful politicians flocked to the support of Jackson, whom they recognized as the man of the future, and Adams' efforts to provide leadership were frustrated by factional opposition. In **1828** Jackson defeated Adams by an electoral vote of **178** to **83** after a campaign in which personalities and slander played a larger part than in any previous national election in the history of the United States. But Jackson's hour of triumph was soon overshadowed by personal tragedy. During the campaign his opponents had resurrected the charges that his marriage had been irregular and this may have hastened a decline in his wife's health. Worn-out and defeated in her long effort to avoid the glare of public life, Mrs. Jackson died at the Hermitage on December **22,1828.**

"Jacksonian Democracy." The election of **1828** is commonly regarded as a turning point in the political history of the United States. Jackson was the first president from the area west of the Appalachians, but it was equally significant that the initiative in launching his candidacy and much of the leadership in the organization of his campaign also came from the West. The victory of Jackson indicated a westward movement of the centre of political power. He was also the first man to be elected president through a direct appeal to the mass of the voters rather than through the support of a recognized political organization. His victory was regarded by contemporaries and by historians as the triumph of political democracy, and the political movement of which he was the central figure is commonly described as the "Jacksonian Democracy."

Jackson was the beneficiary of a rising tide of democratic sentiment which was evident in nearly every part of the United States. The trend toward greater political democracy, aided by the admission of six new states to the union, five of which had manhood suffrage, along with the extension of the suffrage laws by many of the older states, weakened the power of the older political organizations and opened the way for the rise of new political leaders skilled in appealing to the mass of voters.

Not the least remarkable triumph of the Jacksonian organization was its success in picturing its candidate as the embodiment of democracy, despite the fact that Jackson had been aligned with the conservative faction in Tennessee politics for 30 years and that in the financial crisis that swept the West after 1819 he had vigorously opposed legislation for the relief of debtors. In terms of personal qualities, however, he was well cast in the role of the champion of democracy. He had been born on the frontier and had risen to fame as the defender of the frontier against its traditional enemies—the Indians, the British, and the Spanish. He was a man of limited education and no pretense to inherited social position. He was the epitome of the self-made man, the ideal admired by hundreds of thousands of his fellow citizens and one they hoped to emulate.

The new presidential personality

As the victory of Jackson reflected the emergence of new forces in U.S. politics, so Jackson himself brought to the presidency a new set of personal qualifications that were to become the standard by which presidential candidates would be judged for the remainder of the 19th century. He was the first president since Washington who had not served a long apprenticeship in public life and had no personal experience in the formulation or conduct of foreign policy. His brief periods of service in Congress provided no clue to his stand on the public issues of the day, except perhaps on the tariff. On even that issue, his position was ambiguous, for he would only say that he favoured a "judicious" tariff and that manufactures "properly fostered and protected" were important to the defense of the nation.

Jackson approached the problems of the presidency as he had approached all other problems in life. He met each issue as it arose, and in the White House he exhibited the same vigour and determination in carrying out decisions that had characterized his conduct as commander of an army in the field. He made it clear from the outset that he would be the master of his own administration, and, at times, he was so strong-willed and decisive that his enemies referred to him as "King Andrew I" and to his administration as the "reign" of Andrew Jackson. Strong leadership did not guarantee consistency in planning a comprehensive policy. In retrospect, certain fundamental principles that affected his decisions may be discerned, such as the maintenance of the strength of the Union, a distrust of inflation and of paper money, and a conviction that concentrations of power—particularly of "moneyed power"—were dangerous. His practice of acting upon each question as he met it often made it difficult for even his friends to predict the decisions he would make; and on at least one major issue—that of states' rights—his actions on successive problems in which this principle was involved were clearly inconsistent.

The first term. When Jackson was inaugurated on March 4, 1829, it was the first time in more than a quarter of a century that the advent of a new president reflected the repudiation of his predecessor. Hundreds who had worked for the election of Jackson hoped this would mean that incumbent officeholders would be replaced by friends of the new president, and within a few weeks the process of removing opponents of Jackson to make way for supporters had begun. Some years later, in the U.S. Senate, William L. Marcy of New York defended the principle of "rotation of office" with the aphorism, "To the victors belong the spoils." Rotation in office, however, did not begin with Jackson, nor did he utilize this practice so extensively as was charged. In eight years as president, Jackson removed fewer than one-fifth of all federal officeholders.

Jackson was in poor health when he became president, and few believed that he would have the strength or inclination to seek a second term. The question of the succession was, therefore, certain to attract early attention. One obvious candidate was Vice President John C. Calhoun from Jackson's native state of South Carolina. Another was Martin Van Buren, Jackson's first secretary of state. The harmony of the new administration was marred from the outset by the rivalry between Calhoun and Van Buren. When Jackson learned, in 1830, that during the Cabinet debates in 1818 Calhoun had urged that he be censured for his invasion of Florida, he concluded that he could no longer trust Calhoun. From that time, Van Buren was generally recognized as the probable successor of Jackson as president.

Threats to federal authority

The feud between Jackson and Calhoun assumed crucial importance in 1830 when Calhoun openly espoused the cause of South Carolina in its opposition to a high protective tariff. Feeling in South Carolina was so intense that there were covert threats that the state would attempt to prevent collection of the tariff within its borders. To make his own position clear, Jackson used the occasion of a Jefferson Day dinner to offer the toast, "Our federal union, it must be preserved." The meaning of the toast was clear to all who heard it, including Calhoun. When Calhoun, obviously shaken, followed with the toast, "The union, next to our liberty most dear," the conflict between the two men was evident to all. The issue of the tariff drifted unresolved, however, until 1832, when congressional leaders sought a compromise in the form of a moderate reduction of the tariff. South Carolina was not satisfied and in reply adopted a resolution declaring the tariffs of 1828 and 1832 null and void and prohibiting the enforcement of either within its boundaries after February 1, 1833. Jackson accepted the challenge, denounced the theory of nullification, and asked Congress for authority to send troops into South Carolina to enforce the law. The President believed the tariff to be too high, however, and urged Congress to reduce the tariff rates it had enacted a few months earlier. On March 1, 1833, Congress sent to the President two companion bills. One reduced tariff duties on many items. The other, commonly called the Force Bill, empowered the president to use the armed forces to enforce federal laws within a state. Public opinion outside South Carolina appeared to favour the compromise. Later in the month, South Carolina repealed its nullification ordinance, but at the same time it declared the Force Act null and void. The vigour with which Jackson responded to nullification in South Carolina may be explained, in part, by his deep dislike of Calhoun, but personalities alone do not explain the position of either man. Jackson was devoted to the Union, Calhoun to South Carolina and the doctrine of states' rights.

Whatever the motives, Jackson had preserved the integrity of the Union against the most serious threat it had yet faced. In contrast, he was remarkably complacent when Georgia defied the federal government. In 1829 Georgia extended its jurisdiction to about 9,000,000 acres of land that lay within its boundaries but was still occupied by Indians. The Indians' title to the land had been guaranteed by a treaty with the United States. The Indians appealed to the federal courts. In two separate cases, the Supreme Court ruled against Georgia, but Georgia ignored those decisions and continued to enforce its jurisdiction within the territory claimed by the Indians. In contrast to his strong reaction against South Carolina's defiance of federal authority, Jackson made no effort to restrain Georgia; and those close to him felt certain that he sympathized with the position taken by that state. He was spared, however, the embarrassment of making any public statement about the controversy between the court and Georgia, because neither party asked him to intervene.

Re-election in 1832. In the meantime, Jackson acquiesced to the pressure of friends and sought a second

Bank issue

term as president. As the election of 1832 approached, Jackson's opponents hoped to embarrass him by presenting him with a new dilemma. The charter of the Bank of the United States was due to expire in 1836. The President had not clearly defined his position, but he was increasingly uneasy about the bank as then organized. More significant in an election year was the fact that large blocs of voters who favoured Jackson were openly hostile to the bank. In the summer of 1832, Jackson's opponents rushed through Congress a bill to recharter the bank, thus forcing Jackson either to sign the measure and alienate many of his supporters or to veto it and appear as a foe of sound banking. Jackson's Cabinet was divided between friends and critics of the bank, but the obviously political motives of the recharter bill reconciled all of them to the necessity of a veto. The question before Jackson actually was whether the veto message should leave the door open to future compromise.

Few presidential vetoes have caused as much controversy in their own time or later as the one Jackson sent to Congress on July 10, 1832. A long document of more than 7,000 words, much of it argued that the bill was premature or attacked certain details in the legal status of the bank. At the opening of the message and again near the end, Jackson conceded the value of a national bank, "so organized as not to infringe on our delegated powers or the reserved rights of the states." Judged by comments made prior to the introduction of this bill in Congress, there were many friends of the bank who could have agreed with a large part of the veto message. Portions of the message, however, took more controversial ground. Jackson began with the charge that the stockholders would gain a windfall of $7,000,000 through increased value of their stock if the bill became law. In a closing paragraph, he revealed the basic cause for his opposition to the existing bank, asserting that "the rich and powerful too often bend the acts of government to their selfish purposes."

As anticipated, the Senate upheld the veto. Jackson's opponents rejoiced, believing that he had given them an issue on which they could defeat him. They had seriously underestimated the strength of the coalition which opposed the bank. Westerners, many of whom had been suspicious of all banks since the Panic of 1819, were joined in their opposition to the bank by bankers, especially in New York, who were jealous of the special advantages enjoyed by the bank, by businessmen and speculators who desired an expansion of credit to encourage a more rapid development of the economy, and by labouring men, especially in New York, who looked upon Jackson as their champion. That motley coalition rallied behind Jackson; and in November they re-elected him by a margin which was more decisive than the one by which he had been elected in 1828.

Subsequent financial policy

The veto of the bill to recharter the bank was the prelude to a conflict over financial policy that continued through Jackson's second term. After Jackson's re-election, Nicholas Biddle, president of the bank, initiated a policy of calling in loans and contracting the volume of notes issued by the bank, ostensibly because it was necessary to prepare for the time when the charter would expire. Jackson and his associates were convinced that Biddle was seeking to create a panic in order to force Congress to recharter the bank. The administration met this threat by refusing to deposit funds of the federal government in the bank and, instead, deposited them in banks all over the country, an action that Jackson believed would minimize any effort by the bank to control the volume of bank notes in circulation but that also stimulated an inflationary trend. Friends of the bank countered with congressional resolutions affirming belief in the solvency of the bank and censuring Jackson; but these had no other effect than to persuade Jackson that Biddle was using political influence to preserve the bank.

While the "bank war" raged, Jackson and his advisers had developed a theory of business cycles, in which paper money was the villain that caused alternate periods of inflation and depression. If the circulation of paper could be restricted and the proportion of gold and silver to paper increased, the cycle could be brought under some measure of control. Wage earners and those with fixed incomes would then receive some protection against periodic disaster. These were the very groups, Jackson believed, that usually were not adequately represented in the government and whose champion he should be.

Efforts to persuade Congress to enact legislation limiting the circulation of bank notes failed, but there was one critical point at which Jackson was free to apply his theories. Nearly all purchasers of public lands paid with bank notes, many of which had to be discounted because of doubts as to the continuing solvency of the banks that issued them. Partly to protect federal revenues against loss and partly to advance his concept of a sound currency, Jackson issued the Specie Circular in July 1836, requiring payment in gold or silver for all public lands. This measure created a demand for specie that many of the banks could not meet; the effect of bank failures in the West spread to the East, and by the spring of 1837 the entire country was gripped by a financial panic. The panic did not come, however, until after Jackson had had the pleasure of seeing Van Buren inaugurated as president on March 4, 1837.

Later years

Upon leaving the presidency, Jackson retired to his home, the Hermitage. He was virtually an invalid during the remaining eight years of his life, but he continued to have a lively interest in public affairs. Friends of earlier years, party leaders, and aspiring young men made the Hermitage a mecca where they hoped to renew friendships or to receive the counsel and blessings of the former President. He died at the Hermitage on June 8, 1845.

Jackson's influence. Jackson had left office more popular than when he entered. The widespread approval of his actions exercised a profound effect on the character of U.S. politics for half a century. The success of Jackson appeared to be a vindication of the new democracy. Powerful voices still questioned the wisdom and even the morality of democracy in 1829; there were few who would question it openly in 1837. Jackson had likewise established a pattern that future candidates for the presidency attempted to imitate. Birth in humble circumstances, experience on the frontier, evidence of being close to the mass of the people, a devotion to democracy, and, if possible, some military exploits were all valuable assets for any candidate who hoped to succeed.

The intensity of the political struggles from 1825 to 1837 led to the revival of the two-party system, which had been in abeyance since 1817. Jackson never thought of himself as a master politician, but he and his associates proved themselves the most skillful political leaders of that generation. When Jackson was elected president in 1828, he was the candidate of a faction rather than of a party. When he retired from the presidency he left a vigorous and well-organized Democratic Party as one of his legacies to the future.

BIBLIOGRAPHY. The standard biographies of Jackson are J.S. BASSETT, ***The Life of Andrew Jackson,*** 2 vol. ***(1911;*** rev. ed., 1916; 1 vol., 1931, reprinted 1967); and a two-volume work by MARQUIS JAMES: ***Andrew Jackson: The Border Captain*** (1933) and ***Andrew Jackson: Portrait of a President*** (1937). The best study of the election of 1828, emphasizing the political skill of the men who organized Jackson's campaign, is ROBERT V. REMINI, ***The Election of Andrew Jackson*** (1963). An excellent study of politics in the Jacksonian era is R.P. MCCORMICK, ***The Second American Party System: Party Formation in the Jacksonian Era*** (1966).

(H.W.Br.)

Jackson, "Stonewall"

One of the leading generals of the Confederacy during the U.S. Civil War, Stonewall Jackson ranks among the most skillful tacticians in military history.

Thomas Jonathan Jackson was born at Clarksburg, Virginia (now West Virginia), on January 21, 1824. The early death of his father, who left little support for the family, and his mother's subsequent death shortly after her remarriage, caused the boy to grow up in the homes of relatives. He had little opportunity for formal education in his early years, but he received an appointment, in 1842, to the U.S. Military Academy at West Point. After a slow start, he graduated 17th in his class and was commissioned as a second lieutenant assigned to artillery. He joined his regiment in Mexico, where the United States was then at war. In the Mexican War he first met Gen. Robert E. Lee, who later became the commanding general of the Confederate armies, and it was here that Jackson first exhibited the qualities for which he later became famous: resourcefulness, the ability to keep his head, bravery in the face of enemy fire. At the end of the fighting in Mexico, having been promoted to first lieutenant and to the brevet rank of major, he was assigned to the occupation forces in Mexico City.

"Stonewall" Jackson, 1883.

"Deacon Jackson"

Finding service in the peacetime army tedious, he resigned his commission and became professor of artillery tactics and natural philosophy at the Virginia Military Institute in **1851.** Though he worked hard at his new duties, he never became a popular or highly successful teacher. A stern and shy man, he earned a reputation for eccentricity that followed him to the end of his career. During the ten years at VMI, his first wife, Eleanor, died. She was the daughter of the Rev. George Junkin, president of Washington College. Three years later Jackson married Mary Anna Morrison, daughter of a North Carolina minister. Meanwhile, he began to investigate religion, a search that began with Roman Catholicism, evolved into a personal code of ethics, and culminated in an affiliation with the Presbyterian Church. His strong sense of duty and moral righteousness, coupled with great devotion to the education of cadets, earned for him the derisive title "Deacon Jackson" and comparison with Oliver Cromwell.

Upon the outbreak of the Civil War he offered his services to his state of Virginia and was ordered to bring his VMI cadets from Lexington to Richmond. Soon after, he received a commission as colonel in the state forces of Virginia and was charged with organizing volunteers into an effective Confederate army brigade, a feat that rapidly gained him fame and promotion. His untimely death only two years later cut Jackson down at the height of an increasingly successful career, leaving unanswered the question of his capacity for independent command, which his rapid rise suggests he might have achieved.

Jackson's first assignment in the Confederate cause was the small command at Harpers Ferry, Virginia (now West Virginia) where the Shenandoah River flows into the Potomac. His mission was to fortify the area and hold it if possible. When Gen. Joseph E. Johnston took over the Confederate forces in the valley, with Jackson commanding one of the brigades, Jackson withdrew to a more defensible position at Winchester.

Battle of Manassas

In July **1861** the invasion of Virginia by Federal army troops began, and Jackson's brigade moved with others of Johnston's army to unite with Gen. P.G. Beauregard on the field of Bull Run in time to meet the advance of Gen. Irvin McDowell's Federal army. It was here that he stationed his brigade in a strong line, withholding the enemy against overwhelming odds—an incident that earned him the famous sobriquet "Stonewall." The spring of **1862** found Jackson again in the Shenandoah Valley, where his diversionary tactics prevented reinforcements being sent to Federal army general George B. McClellan, who was waging the peninsular campaign against Richmond, the Confederate capital. Jackson's strategy possibly accounted for Lee's victory later in the Seven Days' Battles. Lee, then chief military adviser to Confederate president Jefferson Davis, suggested to Jackson that he use his troops to attack Federal troops in the valley and thus threaten Washington. By rapid movement, Jackson closed separately with several Federal units and defeated them. In April he struck in the mountains of western Virginia; then on May **24–25** he turned on Gen. Nathaniel P. Banks and drove him out of Winchester and back to the Potomac River.

He then quickly turned his attention to the southern end of the valley, defeating the Federals at Cross Keys, Virginia, on June **8,** and at Port Republic on the next day. Lee then brought Jackson's troops by road and railroad to Richmond to envelop the right wing of McClellan's army. But Jackson arrived a day late and his reputation lost some of its lustre, possibly because of his lack of experience in large-scale action; nevertheless, McClellan was beaten back and was ordered to evacuate the peninsula.

Lee at once joined Jackson against the Federal forces regrouping under Gen. John Pope. He sent Jackson, by a wide encircling movement to attack the rear of Pope's forces and bring on the Second Battle of Bull Run, in which Pope was soundly beaten. Lee next crossed the Potomac for the "liberation" of Maryland. To protect Richmond, Lee detached Jackson to capture Harpers Ferry, which he did in time (September **13–15)** to rejoin Lee at Antietam. After his return to Virginia, Lee divided his army into two corps, Gen. James Longstreet commanding the first and Jackson, now a lieutenant general, the second. At Fredericksburg, Virginia, in December, Jackson was in command of the Confederate right when Federal general Ambrose E. Burnside's rash attack was easily repulsed and he was crushingly defeated.

Death

In April, Gen. Joseph Hooker, Burnside's successor, attempted to turn the Confederate position on the Rappahannock River, south of Washington. There the seemingly invincible team of Lee and Jackson made its boldest move. Leaving a small detachment to meet Federal troops on the Rappahannock, Lee moved his main body, including Jackson's corps, to meet Hooker's threatened envelopment in the woods of Chancellorsville. He then divided his army again, keeping only **10,000** men to demonstrate against Hooker's front, and he sent Jackson to move secretly around Hooker's right with his entire corps. The manoeuvre was completely successful. On the evening of May **2,** Jackson rolled up the flank of, the unsuspecting Federal forces. Then, in the moment of victory, tragedy struck. Jackson, who had ridden forward to organize the pursuit, was accidentally shot down by his own men when he returned at dusk and was seriously, but not mortally, wounded. Although his left arm was amputated successfully, pneumonia set in and he died on May **10, 1863,** at Guiney's Station. Lee could not replace him; for while Jackson had lost his left arm, Lee had, indeed, lost his right arm.

That Jackson was the ablest of Gen. Robert E. Lee's generals is rarely questioned. The qualities of the two men complemented each other, and Jackson cooperated most effectively. In him were combined a deep religious fervour and a fiercely aggressive fighting spirit. He was a stern disciplinarian, but his subordinates and his men trusted him and fought well under his leadership. A master of rapid movement and surprise tactics, he kept his intentions sometimes so veiled in secrecy that often his own officers did not fully know his plans until they were ordered to strike.

Ja'far ibn Muhammad

Ja'far ibn Muhammad, often called Ja'far aṣ-Ṣādiq (the Trustworthy), was the sixth *imdm*, or spiritual head, of the Shi'ah (those Muslims who regard ʿAlī, Muhammad's son-in-law, and his descendants as divinely appointed successors of the Prophet Muhammad), and he was the last to be recognized as *imām* by all the Shi'ite sects. He was a leading authority on Hadith (sayings attributed to Muhammad), much quoted by the orthodox (Sunnī) as well as Shi'i Muslims. He is also credited with having had an outstanding knowledge of the physical and the occult sciences.

Life

Born in Medina (Arabia) in AH 80 (AD 699–700) or AH 83 (AD 702–703), he was the son of Muhammad al-Bāqir, the fifth *imdm*, and great-grandson of the fourth caliph, ʿAlī, who is considered to have been the first *imām* and founder of Shi'ism (Arabic Shi^{c}at ʿAlī, the party of ʿAlī). On his mother's side, Ja'far was descended from the first caliph, Abii Bakr, whom Shi'ites usually consider a usurper. This may explain why he would never tolerate criticism of the first two caliphs.

There is some doubt whether the Shi'ite conception of an infallible religious leader, or *imdm*, was really formulated before the 10th century, except possibly in some sort of "underground movement." But the Shi'ites certainly felt that the political leadership of Islām exercised by the caliph should belong to the direct descendants of ʿAlī. Moreover, this political leadership was not clearly separated from religious leadership; and to the end of the Umayyad regime, the caliphs sometimes preached in the mosque, using the sermon to reinforce their authority. Consequently, after his father's death, sometime between 731 and 743, Ja'far became a possible claimant to the caliphate and a potential danger to the Umayyads.

The Umayyad regime was already threatened by other hostile elements, including the Persians, who resented Arab domination and the spread of Shi'ism throughout Iran through a mixture of religious, racial, and political motives compounded the opposition. The successful revolt of 749–750 that overthrew the Umayyads, however, was under the leadership of the ʿAbbāsid family, descended from one of the Prophet's uncles; and they, not the family of ʿAlī, founded the new ruling dynasty.

The new caliphs were, understandably, worried about Ja'far. Al-Manṣūr (ruled 754–775) wanted him in his new capital, Baghdad, where he could keep an eye on him. Jaʿfar preferred to stay in Medina and reportedly justified this by quoting a saying he ascribed to the Prophet that, though the man who leaves home to make a career may achieve success, he who remains at home will live longer! After the defeat and death of the ʿAlid rebel Muhammad ibn ʿAbd Allāh in 762, however, he thought it prudent to obey the Caliph's summons to Baghdad. After a short stay, however, he convinced al-Manṣūr that he was no threat and was allowed to return to Medina, where he died in 765.

Character, ideas, and significance

A just assessment of Ja'far is made difficult by later Shi'ite accounts, which depict every *imdm* as a sort of superman. He undoubtedly was both politically astute and intellectually gifted, keeping out of politics and not openly claiming the imamate. A pious family man, Ja'far had ten children—seven by two wives and three by concubines. He entertained generously, gathering around him learned pupils including Abii Hanifah and Mālik ibn Anas, founders of two of the four recognized Islāmic legal schools, the Hanafite and Mālikite; and Wāṣil ibn ʿAtaʾ, founder of the Mu'tazilite school—which advocated that grave sinners could not be judged to be either believers or nonbelievers and used methods borrowed from Hellenistic philosophy. Equally famous was Jābir ibn Hayyān, the alchemist known in Europe as Geber, who credited Ja'far with many of his scientific ideas and indeed suggested that some of his works are little more than records of Jaʿfar's teaching or summaries of hundreds of monographs written by him. One scholar has made a convincing attempt to show that the bulk of the works ascribed to Jābir were actually written some centuries later. As to the manuscripts of half a dozen religious works bearing Jaʿfar's name, scholars generally regard them as spurious. It seems likely that he was a teacher who left writing to others.

Various Muslim writers have ascribed three fundamental religious ideas to him. First, he adopted a middle road about predestination, asserting that God decreed some things absolutely but left others to human agency—a compromise that was widely adopted. Second, in the science of Hadith, he proclaimed the principle that what was contrary to the Qurʾān (Islāmic scripture) should be rejected, whatever other evidence might support it. Third, he described Muhammad's prophetic mission as a ray of light, created before Adam and passed on from Muhammad to his descendants.

Shi'ite divisions date from Jaʿfar's death. His eldest son, Ismāʿīl, predeceased him, but the "Seveners," represented today chiefly by the Ismāʿīlīs (followers of Ismāʿīl)—argued that Ismāʿīl merely disappeared and would reappear one day. Three other sons also claimed the imamate; of these, Mūsā al-Kāẓim gained widest recognition. Shi'ite sects not recognizing Ismāʿīl are mostly known as "Twelvers"; they trace the succession from Ja'far to the 12th *imām*, who disappeared and is expected to return at the Last Judgment.

BIBLIOGRAPHY. D.M. DONALDSON, *The Shi'ite Religion* (1933), contains the only biographical account of any length on the subject. FAZLUR RAHMAN, *Islam* (1966), is an excellent, general study of Islām that puts Shi'ism and Ja'far ibn Muhammad in proper perspective—written in clear, simple language.

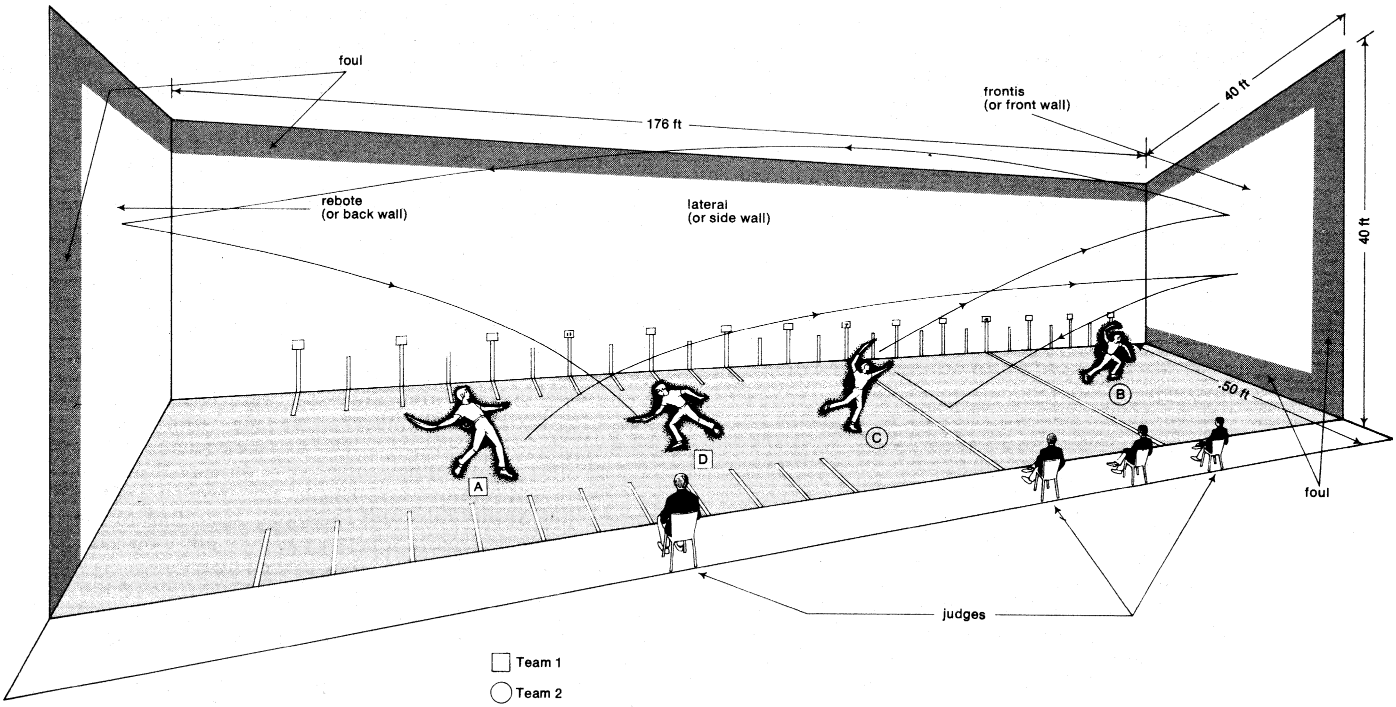
Jai Alai

Jai alai is a ball game of Basque origin played in a three-walled court with a hard rubber ball that is caught and thrown with a cesta, a long, curved wicker scoop strapped to one arm. Called *pelota vasca* in Spain, the Western Hemisphere name jai alai (Basque "merry festival") was given the game when it was imported to Cuba in 1900. It is generally accepted that jai alai developed from a form of handball, and it is presumed that the availability of a lively ball made possible by the introduction of rubber to Europe from South America permitted players to speed up the game. The next step, it is thought, was the introduction of the *guante*, a simple leather glove worn on the right hand, which in turn led to the use of a flat wooden bat, or *pala*. A tapestry by Goya (1746–1828) in the Prado Museum, Madrid, called "Juego de Pelota," depicts such a bat in use on a one-walled court. Later the *guante* developed into a catching and throwing device leading finally to the evolution of the cesta, or wicker basket, at first a short implement but now about 2½ feet (76 centimetres) long, gracefully curved and efficient, with which the player can catch the ball and hurl it with tremendous power and speed. Each cesta is custom made of Pyrenees Mountain reeds woven over a light, ribbed frame of Spanish chestnut; a leather glove sewn to the outside holds the player's hand securely. The *pelota* (Spanish "ball") is a little smaller than a baseball and harder and heavier than a golf ball. It is made of hand-wound virgin rubber with a few final turns of linen or nylon thread and covered with two layers of hardened goat skin, the outer layer of which can be replaced. In play, speeds of 150 miles per hour are not uncommon. Professional players have worn protective helmets in the United States since 1967.

History and development of the game

The modern three-walled playing court, or cancha, averages about 175 feet long by 50 feet wide and is 40 feet or more high. The walls and the floor are made of special high-impact material to withstand the pounding of the ball.



Jai alai court.
Adapted from F. Menke, *Encyclopedia of Sports*

The spectators sit in tiers along the open side with the front of the court to their right, the side wall directly in front of them, and the back wall to their left. The entire plant is the fronton; some Basque frontons date from as early as 1785. The game is played professionally in ten frontons in Spain: five in the Basque country, of which the one in Guernica is the finest; two in Barcelona; and one each in Palma de Mallorca, Zaragoza, and Madrid. It is also played in southern France and in Milan, Italy. In the Western Hemisphere it is popular in Mexico, where there are two frontons in Mexico City and one each in Acapulco and Tijuana. It was played in the United States in the 1920s and 1930s, first in Chicago and then in New Orleans, but in both places it was withdrawn after the gambling laws were changed to ban betting on the game; it was demonstrated without wagering in New York in 1938. The Miami fronton, with 5,100 seats, the world's largest, was the only one in the United States when Florida adopted a law in 1935 permitting pari-mutuel wagering on the sport. Since that time professional courts have been established at Tampa, West Palm Beach, Daytona Beach, Orlando, and Dania. The game formerly was popular in Cuba and there are two frontons in the Philippines. Except for the United States, where there are only two frontons for amateurs, it is a popular amateur sport wherever it is played professionally.

First-class players traditionally have come from the Basque country. Outstanding contemporaries include Juan Cruz Bustinduy (playing name Juaristi) and Francisco Asis in the front court and Ramon Soroa and Tomás Cortajarena in the back court. Most players reach their top form in their late 20s or early 30s but one of the greatest of all time was Erdoza Menor who played until he was in his 50s, dropping dead on the court of a heart attack. Management of the fronton in Miami supports training schools in Spain for the development of young players, the one at Guernica having graduated many of the world's greatest. There is also a school at Miami where promising young amateurs may receive four or five years of training for a professional career.

Principles of play

The principles of the game are basically those of handball and are very simple. The ball is served against the front wall and must land in a designated serving zone; the opposing player in the case of singles, or one of the opposing partners in doubles games, must catch and return the ball before it touches the floor more than once. The ball must be caught and thrown in one continuous motion. The object is to bounce the ball off the front wall with such speed and English (spin) that the opposition cannot return it and loses the point. Play continues until the ball is missed or goes out of bounds. The ball is out of bounds if it strikes the area clearly marked in red around the front wall, strikes the overhead screen above the court or any other area marked in red or outside the foul line. If a player stops his throw because another player is in front of him, interference may be called, and the point will be played over.

The basic game played outside the United States, *partidos,* is a match singles or doubles game to 10 to 40 points. Betting is on the eventual outcome of the game, at any time during the game. As the points fluctuate, so does the spread of the odds. The American game is adapted to the pari-mutuel system. Six to eight one- or two-man teams compete for five to seven points. Two players or teams play for one point, the losing side retiring from the court and the winning side continuing to play until it loses a point and is retired or wins enough points to win the game; playoffs determine second (place) and third (show) positions. Betting is the same as at horse races, each player being identified by a number that is called his "post position." Under the American Qualifying Point System eight post positions (players or teams) play for five points. Play follows the usual elimination system until three positions have made three points each; the three then play off for win, place, and show places. The popular ***quiniela*** wager, in which the bettor picks two players or teams to finish first and second, in either order, was originated for jai alai wagering in the 1930s by Richard I. Berenson (1893–1967), former president of the Miami fronton. The *quiniela* has since flourished at horse races. dog races, and other events throughout the world. The ***quiniela*** was followed by the *perfecta,* in which the bettor must pick first and second in that order. Horse racing's daily double, the selection of the winners in two different events, has become popular in jai alai; and a Big Q., picking the ***quiniela*** in two events, has been introduced. (L.S.B.)

Jainism

Jainism is both a philosophy and a religion of India. Along with Hinduism and Buddhism, Jainism is one of the three major religions that developed within the Indian civilization. The name Jainism derives from the term Jina ("conqueror," or "victor^{m}")—applied to the 24 great religious figures on whose examples the religion is centred—and its followers are known as Jainas or Jains. There are two principal sects: Svetiimbaras and Digambaras (see below History and background).

NATURE AND EXTENT OF JAINISM

Both Jainism and Buddhism arose in about the 6th century BC in protest against the orthodox Vedic (early Hindu) ritualistic cult of the period. Jainism was founded by Vardhamiina Mahiivira, a contemporary of Siddhārtha Gautama, the founder of Buddhism; according to Jaina traditions, however, he was but the 24th of the Jinas, or Tirthankaras (makers or builders of a crossing), and was preceded by Pārśvanātha, who died 250 years before Mahiivira's Nirvāṇa (final extinction). Pārśvanātha is historical; hardly any solid historical information regarding early doctrines and religious organization survives. Jainism continues to be a living faith in India, with more than 2,000,000 adherents, who extend over nearly all the Indian states but are concentrated mainly at present in western India and Uttar Pradesh, Mysore, Madhya Pradesh, and Mahārāshtra. Jainism has practically no following outside the country of its birth.

The core of Jaina ethics is the doctrine of ahimsd, or noninjury to all living creatures. Jainism does not espouse belief in a creator god but does divide the universe into two independent eternal categories of *jīva* and ajiva ("life" and "nonlife"). The ideal is that perfection of man's nature, to be achieved predominantly through the monastic and ascetic life. Its distinctive philosophic contribution is the doctrine of naya ("point of view") and the logical position of anekdntavdda (the "many sidedness of reality"), which holds that it is impossible to make an absolute assertion about anything. In the fields of art and architecture, languages and literature (in Priikrit, Sanskrit, Apabhramia, Tamil, Kannada, and Old Gujarati), astronomy, logic, mathematics, grammar, and dramaturgy, Jaina accomplishments are significant.

HISTORY AND BACKGROUND

Concepts of Jina and Tirthankara

Early background and traditional accounts (before 6th century AD). The terms Jina ("conqueror"), Buddha ("enlightened one"), and arhat ("deserving worship") were commonly used by both early Buddhists and Jainas to refer to those who had achieved spiritual liberation. The founders of Jainism were also called Tirthankaras (makers of a tirtha, "ford," or a place to cross over).

The 24 *Tīrthaṅkaras.* Jainas believe that 23 Tirthankaras preceded Mahāvīra in this cosmic age. Similarly in the next cosmic age, which will be an ascending order of happiness, another 24 Tirthankaras will live. Thus in the Jaina conception of time as endless, Jaina doctrine has no beginning or end. Modern scholarship, however, regards only the last two Tirthankaras, Pārśvanātha and Mahāvīra, as historical figures.

Belief in the 24 Tīrthaṅkaras evolved gradually. The *Kalpa-sūtra*, a Jain canonical text, describes the lives of Ṛṣabhanātha (first Jina), Ariṣṭaneminātha (22nd), Pārśvanātha, and Mahāvīra in detail, whereas the lives of the remaining 20 Tirthankaras are given in a standard form probably not of historical value. This portion (*Jinacarita*, "Lives of Jinas") of the above text seems to have been added and edited about the 4th century AD.

The role of Jainas in Indian society. Since, traditionally, most Jainas have been engaged in trade and commerce, wealthy and influential Jaina merchants have played important roles throughout Indian history in many fields. Jaina emphasis on ahimsd and prohibition of the eating of meat and certain other kinds of food may also have gradually influenced other Indian religions, including both Hinduism and Buddhism.

Early sectarian *and* other institutional developments. Jamāli, Mahiivira's son-in-law (according to later literature), led the first schism (nihnava) in Jainism during the Jina's lifetime. Seven more schisms followed, and out of the last, led by Śivabhūti (c. AD 80), gradually evolved the two principal sects, the Śvetāmbara ("white-robed") and the Boṭika or Digambara ("sky-clad," or naked). The split occurred 609 years after Mahiivira (in AD 83 according to the Śvetāmbaras, and in AD 80 according to the Digambaras; others give the dates AD 82 and 79), mainly over the question of whether monks should wear clothes or remain naked. A further difference was the Digambaras' belief that women cannot attain salvation.

'Sectarian schisms

Digambara traditions enumerate 28 different *ācārya*s (spiritual leaders) up to 683 years after Mahāvīra (*i.e.*, AD 156). Sometime afterward Ācārya Arhadabali convened a council of monks, and various groups (samghas) of monks were then organized.

During Mahiivira's lifetime his followers lived mainly in the ancient kingdoms of Videha, Magadha, and Anga in east India and westward as far as Kāśī (modem Vārānasi) and Kosala. Jaina influence soon spread also to Daiapura (Mandasor) and Ujjain. Bhadrabāhu I (170 years after Mahāvīra) went to Nepal, according to the Svetiimbaras, and to Sravana-Belgola in South India during 12 years of famine, according to the Digambaras.

In about the late 2nd century BC, King Khiiravela of Kaliṅga (modem Orissa state) professed Jainism, excavated Jaina caves, and set up Jaina images and memorials to monks.

Images of the Tirthankaras found at Mathura and datable to the Kuṣāṇa period either depict the Jina in a standing attitude and unclothed or, if seated in the crossed-legged posture, are sculptured in such a way that neither garments nor genitals are visible. Though the Śvetiimbara–Digambara differences had already originated in the Kuṣāṇa age, it would appear that at this time both sects worshipped nude images of Tīrthaṅkaras. The earliest known image of a Jina with a lower garment, the standing Ṛṣabhanātha discovered at Akota in Gujarāt state, has been dated to the latter part of the 5th century AD, the age of the last council at Valabhi. This suggests that the Valabhi council marked the final separation of the two sects.

King Samprati, the grandson of the Mauryan emperor Aioka, is said to have given great patronage to Jainism by facilitating Jaina travel in South India beyond the Deccan. Tamil literary classics such as *Maṇimekhalai* and *Silappadikaram* attest to the high degree of Jaina influence in South India itself.

Early teachers

In about the 1st century BC the renowned Jaina teacher Kālakācārya (the "black teacher") invited the Scythian tribe known as the Śakas to western India and Ujjain (possibly from Śakasthāna in Sindh) to overthrow King Gandabhilla, abductor of his sister, who was a Jaina nun. The same Kālakācārya is said to have travelled as far abroad as Suvarṇadvīpa in Southeast Asia (probably Annam in Vietnam) and is credited with having written the *Mūlaprathamānuyoga* texts, now lost, which were re-edited by Arya Raksita in about the 2nd century AD.

Arya Vajra was another renowned teacher who appears to have supported *caityavāsa* (dwelling by monks in temples), a practice that later led to corruption among the Śvetāmbaras. An inscription of about the 1st century AD at Son Bhaṇḍāra cave (Rājgīr, Bihār state) shows that Ācārya Vaira (Vajra) excavated two caves that were suitable for dwellings of monks and in which Jaina images were installed for worship.

By the Gupta age (AD 320–600), Jainas had become stronger in central and western India than in their homeland, Magadha; but they were also patronized by the Gupta emperors of Magadha.

Further historical developments. From the 5th century to the 12th, the Ganga, Kadamba, Caulukya, and Rāṣṭrakūṭa dynasties of South India accorded royal patronage to Jainism. Many Jaina poets of great repute flourished under patronage of Rāṣṭrakūṭās of Mānyakheṭa (Malkhed). Virasena wrote his monumental commentaries on *Ṣaṭkhaṇḍāgama* under Jagattuṅga and his successor; Jinasena and Gunabhadra composed the great epic *Mahāpurāna* at the time of King Amoghavarṣa, a follower of

Jainism; and Mahāvīrācārya wrote a work on mathematics. King Amoghavarṣa was himself the author of Ratnamdlikii, a work that became popular with all sects. Puṣpadanta composed his famous *Mahāpurāṇa* in Apabhraṃśa under the patronage of ministers of Kṛṣṇa III.

From about 1100 Jainism gained ascendancy in the court of the Caulukyas of Gujarāt, especially during the reigns of Siddharāja and Kumārapāla, both of whom held in high respect their contemporary, Hemacandra Aciirya, a versatile and prolific Jaina author and monk.

From about the 7th century the Śvetāmbara order gained strength in Gujarāt and Rājasthān due to royal patronage and the activities of such great monks as Haribhadra Siiri, Udyotana Siiri, Vādin Deva Siiri, Abhayadeva Siiri, Hemacandra Aciirya, and others. The Śvetāmbara order of monks divided into several gacchas (subgroups) during the 11th and later centuries. Hiravijaya Sūri and his pupils of the Tapāgaccha received special respect from the Mughal emperors Akbar and Jahāngīr.

The Sthānakavāsīs

In about the 16th century Loṅkāsāha started a subsect of Śvetāmbaras known as Sthānakavāsīs in western India and claimed that image worship is not sanctioned by the scriptural *Āgama*s (canons); furthermore, he denied the authority of certain canonical works of later origin that do refer to image worship. In the 18th century Aciirya Bhikṣu organized Teriipantha, a subsect of Loṅkāsāha's *ga*ccha. Tulasi Ganin, the present leader of Teriipantha, has organized a group known as the Anuvrata Samgha. In the 16th century a Digambara named Tāraṇuasvāmin organized the Tiiranapantha sect, which repudiated image worship.

Of 84 gacchas of Śvetāmbara monks and lay followers that developed after the 7th–8th century AD, few have survived. The most important today are the Kharatara (mainly in Rājasthān state), Tapā, and Añcala gacchas. The Digambaras are also divided into Vīsāpanthīs and Terāpanthīs (founded by Banārasīdāsa in 1626). Other important Digambara *saṃgha*s, already noted, are Nandi, Kāṣṭhā, Drāviḍa, and Sena. In modern times the great Svetiimbara leader was Ācārya Vijayānanda Siiri, called Ātmārāmajī, whose great-grandpupil, Muni Punyavijaya, reorganized Jaina bhandaras (manuscript libraries) and planned critical editions of all the Jaina canonical texts on modern principles. He published three texts and was preparing others but died in 1971. Malvania, his co-editor, was expected to edit the remaining texts.

MYTHOLOGY

Lesser gods are classified into four main groups: *bhavanavāsī*s (gods of the house), vyaniaras (intermediaries), *jyotiṣka*s (luminaries), and vaimdnikas (astral gods). These are each subdivided into several groups with indras (chiefs) at the head, *lokapāla*s (guardians of the cardinal points of the universe), armies of gods, and queens of indras. Vyantaras, for example, are divided into *yakṣa*s (vegetation spirits), *bhūta*s (ghosts), *piśāca*s (fiends), *rāksaṣa*s (demonical beings), *kinnara*s (half-horse, half-human), gandharvas (celestial musicians), and others. Such deities also played an important role in ancient Indian folk worship; the Jaina, Buddhist, and Hindu religions assimilated them into their pantheons and rituals.

Besides these, certain other gods and goddesses are mentioned in various Jaina texts, including four gatekeepers of the rampart of the Jambudvipa and four goddesses—Jayā, Vijayā, Jayantā, and Aparājitā. A list of 64 *dikkumārī*s (maidens of the directions), who act as nurses when the Tirthankara is born, includes several goddesses that suggest Hindu influence or borrowing from some common ancient Indian heritage.

These deities are, however, assigned a position subordinate to the Tirthankaras and other liberated souls (siddhas) who are called devddhidevas (Lords of Gods). Next in order to the Tīrthaṅkaras (arhats) and siddhas are the Jaina ascetic souls called *ācārya*s (leaders of groups of monks), *upādhyāya*s (readers who teach sacred texts), and sddhus (monks in general). These five constitute the *pañca-parameṣṭhin*s (five chief divinities). The 24 Tirthankaras along with certain other souls including 12 cakravartins (world conquerors), 9 *vāsudeva*s (counterparts of Hindu Kṛṣṇa [Krishna] Vāsudeva), 9 *bala*devas (counterparts of Hindu Balarāma), constitute a list of 54 *śalākāpuruṣa*s or *mahāpuruṣa*s (great souls) to which are later added 9 prati-vdsudevas (enemies of *vāsu*devas), making a grand total of 63. Jaina texts often deal with the lives of these *śalākāpuruṣa*s. Other figures such as nine ndradas, 11 rudras, and 24 *kāmadeva*s (gods of love) show Hindu influences. Bāhubali, the son of the first Tirthankara, Ṛṣabhanātha, is said to be the first of the *kāmadeva*s (see also HINDU MYTHOLOGY).

DOCTRINES OF JAINISM

The notion of the wheel of time

Time and the universe. Time is eternal and formless. It is conceived as a wheel with 12 spokes called *ārās* or ages: six make an ascending cycle, the other six a descending one. The ascending cycle (*utsarpiṇī*) shows man's progress in knowledge, age, stature, and happiness in each age, while the descending cycle (*avasarpiṇī*) reveals a gradual deterioration in the state of everything. The two cycles joined together make one rotation of the wheel of time, or one halpa (20×10^{14} *sāgaropama* years).

The world is infinite. It was never created. Its constituent element—the six substances (dravyas) or five magnitudes (astikdyas) together with time—are soul, matter, time, space, and the principles of motion and rest. These are eternal and indestructible but their conditions change constantly.

Space (*ākāśa*), all pervasive and formless, provides accommodation to all objects of the universe and is divided into the space of the universe (*lokākāśa*) and that of the non-universe (*a-lokākāśa*), the latter having no substance in it. The universe is conceived as a figure with legs apart, arms akimbo, slender, circular, and flat at the waist. The whole is enveloped in three atmospheres called *vāta-valaya*s (wind-shields) and described as dense and thin.

Through the centre of the universe runs the region of mobile souls (trasa-jiva *nāḍī*) in which all living beings, including men, animals, gods, and devils, live. At the lowermost point of this region is the seventh hell of most acute pains and tortures. Above it is the sixth hell and so on until the first and mildest hell is reached. In the lower world (adholoka) the uppermost region, called *ratna*prabhd, is also the seat of gods of two classes, *bhavanovāsī*s and vyantaras or *vāṇamantara*s.

Above the central region (*madhyaloka*) is the upper world (*ūrdhvaloka*) of two parts, containing 16 heavens and 14 celestial regions. On top of the universe (*lokākāśa*) is the *siddha-śīlā*, a crescent-shaped flexible slab or place of large dimensions on which liberated souls live after leaving earthly bodies.

Jiva and ajiva. Jainism is dualistic. It sees reality as constituted of two separate eternal entities: soul or living substance (*jīva*) and nonsoul, or nonliving substance (ajiva). The *ajīva* or matter is made up of five basic factors (*astikāya*s): motion (*dharma*), rest (adharma), space (*ākāśa*), gross matter (pudgala), and time (*kāla*). All these are eternal (without beginning); all but the souls (jiva) are without life; all but gross matter (*pud*gala) are noncorporeal. Motion and rest do not exist by themselves, are prerequisites of the other substances, with respect to matter, and effect the conditions of motion and rest. These five substances are accompanied by time, which is eternal and one.

The essential characteristic of the souls is consciousness or mental function (*cetanā*). Nonliving substance (ajiva) causes souls to assume bodies and become involved in corporeal functions.

Kinds of life

Jiva or the life principle, in its pure state, possesses the qualities of unending perception, limitless knowledge, infinite bliss, and infinite power. The souls, infinite in number, are divisible in their embodied state, into two main classes, immobile (*sthāvara*) and mobile (trasa), according to the number of sense organs they possess. The first group consists of immeasurably small particles of earth, water, fire, and air, as also the vegetable kingdom, and has only one sense, that of touch; the second group includes bodies that have two, three, four, or five sense organs. The Jainas believe that the four elements (earth, water, air, and fire) also are animated by souls. Besides, the universe is full of an infinite number of minute beings, *nigodas,* which are slowly evolving.

The soul is formless and cannot be perceived by senses. A soul is not all-pervasive but can, by contraction or expansion, occupy various proportions of space. Like the light of a lamp in a small or a large room, it can fill both the smaller and larger bodies it occupies. But the soul is not identical with the body.

Matter (pudgala) has the characteristics of touch, taste, smell, and colour. Its essential characteristic is lack of consciousness. The smallest unit of matter is the atom (*paramāṇu*), which is eternal and indivisible.

The elements of nature--earth, water, fire, and air—are gross manifestations of matter, the subtlest form of which is the atom, paramdnu. Heat, light, and shade are forms of fine matter.

Dharma, or (the medium of) motion, though filling the entire universe, is imperceptible; adharma is similarly the medium of rest.

Ākāśa, or space, another ajiva substance, is nonmaterial and infinite and provides space for the existence of all other entities. Time (*kāla*), also an *ajīva* substance, consists of innumerable eternal and indivisible particles of "noncorporeal substance" that never mix with one another but fill the whole universe.

Karman. All phenomena are said to be linked together in a universal chain of cause and effect. Every event has a definite cause behind it. By nature each soul is pure, possessing infinite knowledge, bliss, and power. But these faculties are restricted from the beginningless time by foreign matter coming in contact with the soul. Fine foreign matter producing the chain of cause and effect, of birth and death, is karman, a substance, a fine atomic particle (*sūkṣma-pudgala-paramāṇu*), and not a process as in Hinduism. To be free from the shackles of karman, one must stop the influx (samvara) of new karmans and eliminate the acquired ones.

Acquired karmans can be annihilated through a process called *nirjarā,* which consists of fasting, not eating certain kinds of food, control over taste, resorting to lonely places, mortifications of the body, atonement and expiation for sins, modesty, service, study, meditation, and renunciation of the ego.

*Guṇa-*sthdnas: stages of the soul's growth

A soul passes through various stages of spiritual development before becoming free from all karman bondages. These stages of development (gunasthdnas) involve progressive manifestations of the innate faculties of knowledge and power and ate accompanied by decreasing sinfulness and increasing purity.

Due to the connection of *jīva* with karmic matter, the souls obtain different kinds of bodies. These embodied souls bear different colours or tints (*leśyā*), varying according to the merits or demerits of the particular being. This doctrine of *leśyā*s, peculiar to Jainism, seems to have been borrowed from the Ājīvika doctrine of six classes (*jātis*) of bodies, expounded by Gośāla Maṅkhaliputta, in the age of Mahāvīra. The six *leśyā*s in Jainism are, in the ascending order of man's spiritual progress: black, blue, gray, fiery red, lotus-pink (or yellow), and white.

Theories of knowledge as applied to salvation. In Jaina thought, four stages of perception-observation, will to recognize, determination, and impression—lead to a subjective cognition (*mati-jñāna*), the first of five kinds of knowledge (jtidna). The second kind of knowledge is *śruta-jñāna*, derived from both scriptures and general information. Both *mati-* and *śruta-jñāna* are mediate cognition (*parokṣa-jñāna*), based on external conditions. Immediate knowledge (*pratyakṣa*) is of three kinds: avadhi (supersensory perception), *manaḥ-paryāya* (thought reading), and kevala (the final cognition revealing past, present, and future), a stage of omniscience accompanied by freedom from the karmans obstructing knowledge and by direct experience of the soul's pure form unblemished by matter.

Knowledge is said to be the innate attribute of the soul, whose chief characteristic is *cetanā* (consciousness), which consists of both knowledge (*jñāna*) and intuition (*darśana*). But worldly souls obscured by the veil produced by destructive karmans do not enjoy infinite knowledge, power, and bliss.

Yoga (physical and meditative discipline), according to Jainism, is the cause of *mokṣa*, or liberation. Yoga consists of knowledge of reality as it is (*jñāna*), faith in teachings of the Tīrthaṅkaras (*śraddhā*), and character or cessation from doing evil—right conduct leading to release from karman bondage (cdritra). Yoga is thus equated with the three jewels (ratna-traya) of right belief, right knowledge, and right conduct (see INDIAN PHILOSOPHY; LOGIC, HISTORY OF).

Concept of *ahiṃsā*

Jaina ethics. Jainism advocates an attitude of equality and designates the whole pattern of religious conduct and philosophical thought that helps to develop such an attitude as bambhacerdim (brahmacarydni, conduct leading to the Brahma or the pure soul) religious life. This attitude finds expression in the principle of nonviolence or noninjury (ahimsd). Even in the domain of philosophical thought, it is this principle of equality and noninjury to others (both psychologically and physically) that has given rise to the attitude of nonabsolutism in thought (*anekāntavāda* or syddvdda), which respects opposite viewpoints regarding the same object.

Two separate courses of conduct are laid down for the ascetics and the householders (laymen). In both cases, the code of morals is based on the doctrine of *ahiṃsā*. Since thought is considered the father of action, violence in thought (*bhāva-hiṃsā*) merely precedes physical injury (*dravya-hiṃsā*). Violence in thought is then the greater and more subtle form of violence, arising from passionate ideas of attachment and aversion, due to men's negligence (pramdda) in their behaviour. Jainism enjoins avoidance of all forms of injury (himsd), physical or otherwise, whether committed by mind, body, or speech.

The three jewels. Right faith (*samyag-darśana*), right knowledge (*samyag-jñāna*), and right conduct (*samyak-*cdritra) are the three jewels (ratna-traya). Right faith includes freedom from doubts and desires, steadfastness, brotherhood toward fellow believers, and the propagation of Jaina principles among others (prabhdvand).

Right faith leads to calmness or tranquillity; detachment; kindness; renunciation of pride of birth, beauty of form, wealth, scholarship, prowess, and fame. Right faith leads to perfection only when followed by right conduct.

There can be no virtuous conduct without right knowledge, which consists of clear distinction between the self and the nonself. Knowledge of scriptures is distinguished from inner knowledge. Knowledge without faith and conduct is futile. Without purification of mind, all austerities are mere body torture. Right conduct is thus spontaneous, not a forced mechanical quality. Attainment of right conduct is a gradual process, and a householder can observe only partial self-control; when he becomes a monk, he is further able to observe more comprehensive rules of conduct.

Consequences of doctrines on social practices of Jainas. Emphasis on *ahiṃsā* is responsible for Jains' avoiding such professions as agriculture and the sale and manufacture of arms, instruments, and intoxicants. Jaina involvement in trade and commerce has resulted in a fairly high percentage of literacy among them. Belief in the equality of all souls allows Jains, unlike Hindus, to eat with anyone. Admission to the ascetic orders was open to everyone irrespective of caste, class, or nationality.

Jain castes

Perhaps during the medieval period, several castes arose among the Jains as among the Hindus. It must however, be noted that the caste system is not followed by Jaina monks but by the laity only. Some caste names (mainly occupational) are common with Hindus, some are named after places, while others are exclusively Jain. Though features of the Hindu caste system such as hierarchy also appear in Jaina castes, social differentiation is not nearly so marked. Some castes are common to both Śvetāmbaras and Digambaras, while others are exclusive to one or the other (see also CASTE SYSTEMS).

RITUAL PRACTICES AND RELIGIOUS AND SOCIAL INSTITUTIONS

The monastic orders and their practices. Śvetāmbaras acknowledge two classes of monks: (1) Jina-kalpins, who wander naked and use the hollows of their palms as alms bowls, and (2) sthavira-kalpins, who retain minimal possessions such as a robe, an alms bowl, *rayoharaṇa* (sweeping duster), and mukha-vastrikii (a piece of cloth held over the mouth to strain out insect life). A monk must obey "the great vows" (mahdvratas) to avoid injuring any form of life, lying, stealing, sexual intercourse, possessions, and taking meals at night (which increases the possibility of injuring minute insects and small creatures); and his conduct is regulated in all details by specific ordinances. Monks are expected to suffer with equanimity such hardships as those imposed by travel, theft, famine, and political disturbances. Exceptions are allowed in emergencies, since a monk who survives a calamity can purify himself by confession and by practicing even more rigorous austerities.

A junior monk must pay full respect to elders. An *uvajjhāya* (upddhyiiya) is the chief reader and instnictor of a group of monks. An dyariya (dcrirya), or *sūri*, is the head of a group of monks. A *gaṇin,* a monk of a few years' standing, is next in order of rank.

Among the Digambaras, a full-fledged monk remains naked, though there are lower grade monks who wear a loincloth and keep with them one piece of cloth not more than one and a half yards long. Digambara monks use a rayoharana (duster) of peacock feathers, live in monasteries or apart from human habitations, beg and eat food only once a day, and do not use an alms bowl.

Eight essentials noted for the conduct of monks include three guptis—protection of mind, speech, and action—and five kinds of vigilance over behaviour (samiti). The six *āvaśyaka*s (obligations) include equanimity (*sāmāyika*); praise of 24 Jinas (*caturviṃśatistavana*); obeisance to Jinas, teachers, and scriptures (vandana); atonement (pratikramana); resolution to avoid sinful activities (*pratyākhyāna*); and meditation in a straight but not rigid posture, without moving (kdyotsarga).

Kinds of vows

Religious disciplines of laity. The life of a lay votary or a householder is only a preparatory stage to the rigorous life of an ascetic. The lay votary (*śrāvaka*) is enjoined to observe eight *mūla-guṇa*s (primary qualities, variously listed and usually including the avoidance of meat, wine, honey, fruits, roots, and night eating), and 12 vows: five *aṇuvrata*s ("little vows"), three gunavratas, and four *śīkṣāvrata*s. The *aṇuvrata*s are primary vows of abstinence from gross violence, gross falsehood, and gross stealing; contentment with one's own wife; and limitation of possessions.

The *guṇavrata*s and *śīkṣāvrata*s (collectively called *sila*-vratas) are supplementary vows to strengthen and protect the five anuvratas. They involve avoidance of unnecessary travel, harmful activities, and the pursuit of pleasure; fasting and diet control; offering of gifts and service to monks, poor people, and fellow believers; and voluntary death if observance of vows becomes impossible.

The *sāmāyika* (equanimity), a very important obligatory observance for both monks and laity, is for the attainment of equanimity of mind through atonement and resolve not to slacken in spiritual practice, especially cessation of blameworthy activities and concentration on the blameless ones. It may be performed in one's own house, in a temple, in a *poṣadha-śālā* (fasting hall), or before a monk.

Eleven *pratimā*s, or stages of spiritual progress of a householder, are given. The word pratimd (literally, "statue") is also used in specific sense to designate the meditation posture of standing at ease and avoidance of movement, night eating, and sexual pleasure. The *pratimās* represent partly a theoretical graduation of spiritual level and partly the possibility of choice. Medieval writers conceive pratimii as a regular progressing series, a ladder leading to higher and higher stages. The last two stages imply renunciation of the world and manhood.

Sacred times and places. Festivals and fairs. The principal Jaina festivals are connected with the five auspicious events (paiica-kalyiinakas) in the life of each Tīrthaṅkara. Especially popular are those commemorating the lives of Mahāvīra, Ṛṣabhanātha, and Pārśvanātha; these mark the occasions of (1) descent in the mother's womb (*garbhādhāna,* cyavana), (2) birth (janma), (3) renunciation (*dīkṣā*), (4) attainment of omniscience (*kevala-jñāna*), and (5) death and final emancipation of a Jina.

The festival of Pajjuṣaṇa

The most popular festival of the Jainas is Paryuṣaṇa, or Pajjusana, in the month of Bhiidrapada (August–September). Pajjuṣaṇa literally means (1) pacification by forgiving and service with wholehearted effort and devotion and (2) staying at one place during the monsoon. On the last day of the festival, the Jainas distribute alms to the poor and take out a Jina image in a car that moves through the streets in a procession. During the festival, annual pratikramana, or confession, is performed to remove all old ill-feelings about conscious or unconscious misdeed.

Twice a year, for nine days, during the months of Caitra (March–April) and Āśvina (September–October), a fasting ceremony known as *olī* is observed. These are also the *aṣṭāhnika* (eight days) festivals corresponding to mythical celestial worship of Jina images.

On the full-moon day in the month of Kiirttika (October–November), on the same day as the Hindus celebrate Dīwālī (the festival of lights), Jainas also commemorate the Nirvāṇa of Mahiivira by lighting lamps. Five days later is Jñāna-Pañcamī, which the Jainas celebrate with temple worship and especially with worship of the scriptures in manuscript form.

The full-moon day of Caitra (March–April) is celebrated with great pomp by a large number of pilgrims on Mt. Satrunjaya, sacred to the first Tīrthaṅkara. Mahiivira Jayanti, marking the birth date of Mahiivira, is celebrated all over India by the Jainas.

In common with Hindus, Jainas celebrate Holi (the festival of spring), the Makara-Saṃkrānti (January 14, sun's entry into Capricorn), and the Navariitri ("nine nights"). In South India Jainas also often celebrate such Hindu festivals as Poxigal, Kiirttika, Yugādi, Gauri, and Navarātrī (see also ***HINDUISM***).

Pilgrimages and shrines. The erection of shrines and donation of copies of religious manuscripts are regarded as pious acts. Almost every town or village inhabited by Jainas has at least one Jaina shrine; some of them have become places of pilgrimage. Lists of such Jaina shrines have been composed, and the most noteworthy shrines are offered adoration in daily worship (caitya-vandana).

Places of pilgrimage were created at sites marking the principal events (kalyanakas) in the lives of Tīrthaṅkaras. Sameta Sikhara or Parasnath Hill in Bihiir, Satrunjaya and Girnar hills in Kāthiāwār, are among such famous ancient places of pilgrimage. Riijgir in Bihiir is an old temple site associated with Mahāvīra's travels, and Sravana-Belgola in Mysore is especially famous for the 57-foot-high stone statue of Bāhubali (called Gommateśvara) installed in the 10th century.

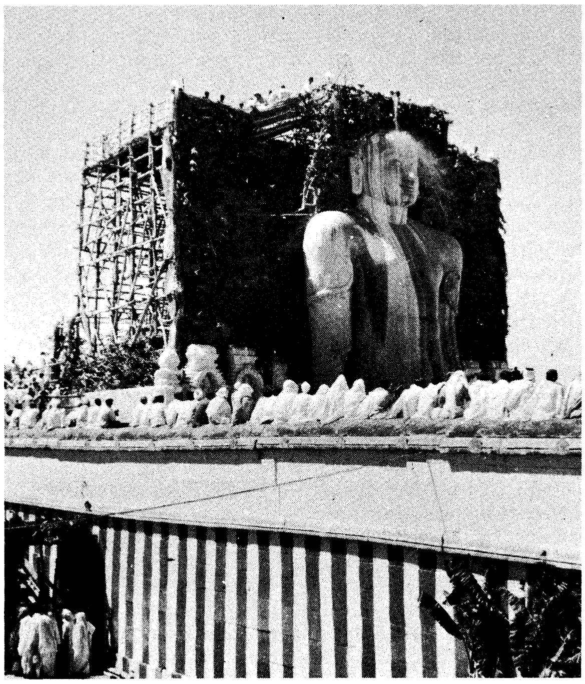
The shrines at Dilwāra, Mt. Abii, are examples of very fine chiselling of marble (the earliest built in the 11th century). An imposing shrine built on a complex plan was erected at Ranakpur in the 15th century. Kesariaji in Rājasthān and Antarikśa Pārśvanātha in Akola district, Miihiirashtra, are famous places of pilgrimage.

Cave temples

Cave temples in Udayagiri and Khandagiri, Orissa, were excavated by Khāravla in about the late 2nd century BC. At Riijgir, Bihiir state, are two adjacent cave temples, one known as Son Bhandiira.(c. 1st century BC or AD). Some Jaina caves exist at Bāwā Pyārā Math (Junagadh), Dhāṅk, and Talājā in Saurashtra, at Ellora in Mahārāshtra (c. 9th–10th century AD), at Aihole in Karṇataka (c. 7th century, along with a beautiful shrine built by Ravikirti), and at Mangi Tungi and Ter in Mahārāshtra. Caves at Sittānnavāsal in Tamil Nadu dating from the 7th century AD are famous; they contain some beautiful wall paintings probably completed during the 10th century AD.

The Jainas, especially the wealthy, also maintain small domestic shrines. some of which contain excellent examples of wood carving and bronze casting.

Temple worship and observance. Temple worship is mentioned in early texts that describe gods worshipping Jina images and relics in heavenly eternal shrines (*śāśvata*-caitya). Worship (*pūjā*), closely associated with *āvaśyaka* (obligatory rites), is not merely restricted to ado-



Ceremony of anointing the colossal image of the Jaina saint Bāhubali (called Locally Gommateśvara) at Sravana-Belgola, India.

James Burke—LIFE Magazine © Time Inc.

ration of the Jina image but is offered to all liberated souls, monks, and the holy writ (*śruta*). Though Tīrthaṅkaras remain unaffected by offerings and worship, the person offering *pūjā*, remembering the virtues of the Jina, imbibes them, and attains to a degree of tranquillity. Daily worship includes recitation of the names of the Jinas; and idol worship through bathing the idol and making offerings of flowers, fruits, perfumes, and lamps. Only Svetiimbaras decorate images with clothing and ornaments. The worshipper also chants hymns of praise and prayers and mutters the sacred formula (*japa*). In front of the Jina, eight auspicious symbols (*aṣṭamaṅgalas*) are designed with rice and other things. Jaina rituals including idol worship, passage rites (see below), and consecrations of images and shrines show considerable Hindu influence. Rituals connected with different *vratas* ("vows") and penances are detailed in later Jaina texts.

The Digambara author Kundakunda and others laid more emphasis on mental culture (*bhāva-pūjā*) than on idol worship (*dravya-pūjā*). Meditation and observance of the various vows of either a householder or an ascetic lead to man's spiritual uplift through successive stages of perfection called the 14 *guṇasthānas*.

Other practices and institutions. Domestic rites and rites of passage. Ancient Jaina literature is silent about domestic rites and rites of passage (marking the main points in human life). The passage ritual is modelled mainly on the 16 Hindu *saṃskāras* (rites of passage). The rites include conception, birth, first meal, naming, tonsure, wearing of sacred thread, beginning of study, marriage, and death. Post-cremation ceremonies, especially the draddhd of *pitṛ-tarpaṇa*, offerings of water to deceased ancestors, are not uniformly practiced by Jainas all over India.

Status of women. Even though monks are warned against contacts with women, who are said to be the source of many impurities, the position of women was never very low in Jaina society. Mahiivira allowed females to enter the ascetic order; rules of conduct and spiritual practice were practically identical for monks and nuns. Women were, however, given a position subordinate to monks in the church hierarchy. Originally womanhood was no bar to salvation; the Svetiimbaras believe that the 19th Tīrthaṅkara, Mallinātha, was a princess. Women as well as men perform Jaina rituals.

Welfare institutions. Jainas are renowned for such various types of munificence as taking a large group on a pilgrimage, famine relief, relief to Jaina widows and the poor, and maintaining shelters (*pañjarapola*) for old animals to save them from being butchered (an act of *ahiṃsā*). Vijaya Vallabha Siiri, the centenary of whose birth occurred in 1970, organized charities to promote the education of poor Jainas through founding the Mahiivira Jaina Vidyalaya with several branches. The institution has also undertaken to publish critical editions of canonical works. Some leading houses of Digambara and Śvetāmbara merchants have encouraged research and publication in various branches of knowledge, of which the Bhiiratiya Jñānapīṭhā at Vārānasi and the L.D. Institute of Indology at Ahmadābād are especially noteworthy. The latter institution, engaged in publishing *Āgamakośa*, a collection of the canonical writings of Jainism, and other works, collects, preserves, and centralizes in the institute various Jaina manuscript collections and is also building up a corpus of microfilms of rare manuscripts from other collections.

JAINA LITERATURE

Canonical literature. Jaina canonical scriptures do not belong to a single period, nor can a single text be deemed free from later revision or additions. The sacred literature preserved orally from the time of Mahiivira was first systematized in a council at Pātaliputra (Patna) about the end of the 4th century BC, and again in two later councils, at Mathura under Ārya Skandila and at Valabhi under Ārya Nāgārjuna, in the early 3rd century AD. The fourth and last Jaina council, at Valabhi c. AD 454 or 467, is said to be the source of the existing Svetiimbara Jaina canon, though some textual commentators insist that the present reading is in accordance with the Mathura council of Ārya Skandila.

The Svetiimbaras follow an extensive canon (*Āgama*) as the source of their system, said to be based upon compilations from discourses of Mahiivira by his direct disciples. The Digambaras believe that the genuine canon is lost but that the substance of Mahāvīra's teachings is contained in the writings of ancient religious figures such as Vattakera, Umāsvāti, Śivārya, Kuṇḍakuṇḍa, Samantabhadra, and Virasena.

Śvetāmbara canon

The Svetiimbara canon consists of 45 *Āgamas*: 11 Ariga ("parts") texts—a 12th, the *Dṛṣṭivāda*, is not extant—12 *Upāṅga* (subsidiary) texts, four *Mūla-sūtras*, six *Cheda-sūtras*, two *Cūlikā-sūtras*, and ten *Prakīrṇakas* (mixed, assorted texts). The Ariga texts contain several dialogues mainly between Mahāvīra and his disciple Gautama presumably recorded by another disciple Ārya Sudharmā, who transmitted the teachings to his own disciples.

According to modern scholars, the *Ācārāṅga-* and *Sūtrakṛtāṅga-sūtras* of the Aiiga texts and the *Uttarādhyayana* of the *Mūla-sūtras* are among the oldest parts of the canon. One of the Cheda-siitras, the *Daśāśrutaskandha*, concludes with *Pajjosavaṇakappo*, or *Kalpa-sū*tra, which recounts the lives of Jinas with an appendix offering rules for monastic life and a list of eminent monks.

Bhadrabāhu I (170 years after Mahiivira) is credited with authorship of some metrical commentaries called Niryuktis. Other commentaries on the *Āgamas*, known as *Bhaṣyas*, were composed mainly during the Gupta age (AD 320–600) and also during the 6th and 7th centuries, in Prākrit language. During the medieval period, explanatory commentaries in Sanskrit were also composed. Haribhadra, Śīlāṅka, Abhayadeva, and Malayagiri are the best known authors of such commentaries.

Digambaras give canonical status to two works in Prākrit: the Karmaprdbhyta—"Chapters on *Karman*"—and the *Kaṣāyaprābhṛta*—"Chapters on *Kaṣāyas*." *Karmaprābhṛta* (also called *Ṣaṭkhaṇḍūgama*) was composed by Puṣpandanta and Bhiitabalin on the basis of the now lost *Dṛṣṭivāda*. It deals with the doctrine of *karman* and is said to have been composed in the 7th century after Mahiivira. The *Kaṣāyaprābhṛta* by Gunadhara, also based on *Dṛṣṭi*vdda, composed in the same age, deals with *kaṣāyas* (passions), such as attachment and aversion, which defile and bind the soul. A later commentary by Virasena (9th century AD) on the first five books of the *Karmaprābhṛta* and another commentary by Virasena and his pupil Jinasena on the *Kaṣāyaprābhṛta* receive similar respect from the Digambaras.

Digambaras also value the Prākrit works of Kuṇḍakunda (c. 1st or 2nd century AD), including the *Pravacanasāra* (on ethics), the *Samayasāra* (on fine entities), the *Niyamasāra* (on Jaina monastic discipline), and the six *Prabhṛtas* ("chapters") on various religious topics.

Of similar importance are the *Mūlācāra* of Vaṭṭakera, the *Kārttikeyānuprekṣā* of Kumāra, or Kārtikeya (between 6th and 13 centuries AD), and the *Tattvarthādhigama-sūtra* of Umāsvāmin, or Umāsvāti, whose work is claimed by both the Śvetāmbaras and Digambaras. The *Tattvārthādhigama-sūtra*, composed early in the Christian era, is the first work in Sanskrit on Jaina philosophy dealing with logic, epistemology, ontology, ethics, cosmography, cosmogony, etc., and had commentaries on it including one by Umāsvāti himself.

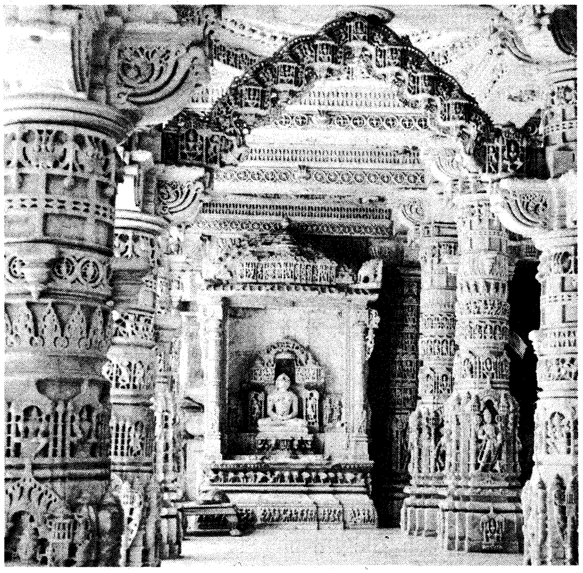
Philosophical and other literature. Among noncanonical Jaina writers on philosophy, besides Umāsvāti and Kundakunda, may be noted Mallavādin I (4th century AD); Siddhasena Divākara (c. 5th century AD); Haribhadra Sūri (*c.* 8th century); Samantabhadra (before *c.* 5th century); Akalanka (c. 8th century); Siddharṣi Ganin (10th century); Śāntisūri (11th century); Vidyānandin (*c.* 8th–9th century); Anantakirti (10th century); and Māṇikyānandin (11th century); Prabhācandra (11th century); Vādi Deva Sūri (12th century); and Ācārya Hemacandra (12th century). Among later authors, especially noteworthy is Upādhyāya Yaśovijaya (c. 17th century), a versatile scholar and author of several works on philosophy.

Noncanonical Śvetāmbara and Digambara compositions are very extensive, covering a very wide range of subjects and composed in Prākrit, Sanskrit, and Apabhraṃśa as well as Old Western Rājasthānī or Gujarati, and Old Kannada. They include works on dramaturgy, epics and *purāṇas*, plays, poems, works on yoga, dictionaries, music, medicine, grammar, mathematics, astrology, fables and fiction, ballads and hymns, and rituals.

RELIGIOUS SYMBOLISM AND ICONOGRAPHY

Image worship was introduced at an early stage, perhaps even during the first century following the death of Mahāvīra. He himself apparently neither prohibited nor prescribed worship of images of himself or of other Tīrthaṅkaras.

By courtesy of the Government of India Tourist Office, London



Interior of a Jaina temple, showing the Tirthankara image enshrined. Dilwāra Temple, Mt. Abū, India, 13th century AD.

Descriptions of stiipas (reliquaries for the bones and ashes of saints), commemorative pillars, and tree shrines (*caityavṛkṣa*s) first appear in Jaina texts, which also refer to the worship in the heavens by gods of images of the four legendary Śāśvata-Jinas (eternal victors) and of costly relic boxes. Mention is also made of *śilāpaṭa*s, which apparently were stone plaques or reliefs placed on lion thrones underneath trees, such as those associated with *yakṣa* worship, and also depicted on Buddhist reliefs from Bharhut (2nd century BC). The *śilāpaṭa*s appear to be the prototypes of the later Jaina *āyāgapaṭa*s (tablets of homage) from Mathura, which show representations of *stūpa*s, caitya-pillars surmounted by elephants, and dharmacakras (the wheel of the law) and the *aṣṭamaṅgala*s (eight auspicious symbols). Later *āyāgapaṭa*s show a Jina attended by two nude disciples, the figure of the monk Kanha Samana with his devotees, or the figure of a noblewoman with attendants.

*Āyāgapaṭa*s and *aṣṭamaṅgala*s

The earliest known Tirthankara image that can be positively identified as such is the highly polished Mauryan period torso from Lohanipur, near Patna (Bihār). The Mauryan ruler Samprati (grandson of the emperor Aśoka) was well-known for his patronage of Jainism. Numerous Tīrthaṅkara images in the sitting (*padmāśana*) and the standing (kdyotsarga) postures dating from the early Christian centuries have been uncovered in the excavations of a Jaina *stūpa* at Kaṅkālī Ṭīlā, Mathura. The earliest images of Tirthankaras are all nude. The various Jinas are distinguished by inscriptions giving their names carved on the pedestals, but later iconographic devices such as cognizances (*lāñchaña*s) or recognizing symbols for each Jina did not evolve until about the 5th century AD.

Worship of the 16 principal Jaina Tantric goddesses, the Mahāvidyās, was introduced probably in the Gupta age. From the 6th to the 11th century a common pair of attendants was employed in sculpture for all the Tirthankaras, but from about the 9th century the 24 different *śāsanadevatā*s (*yakṣa-yakṣiṇī*s) were evolved to attend each Tirthankara. The names of many of the attendants (such as Īśvara, Brahmā, and Kali—also the names of Hindu deities) suggest Hindu influence, while others (Vajraśṛṅkhala, Vajrāṅkuśa, and Bhrfikuti—the names of figures from Buddhist mythology) show Buddhist influence.

Illustrated manuscripts

The religious merit that accrues from hearing and reading Jaina texts encouraged the careful and loving preservation of illustrated manuscripts. The miniature paintings on palm-leaf and paper manuscripts preserved in the Jaina *bhāṇḍāra*s (monastery libraries) provide a continuous history of the art of painting in western India from the 11th century up to the present. The lives of the Jinas and legends of Jaina saints provide a framework for the artists to depict gods and goddesses, throne rooms and village interiors, gardens, and temples. Religious symbols such as the *aṣṭamaṅgala*s (eight auspicious symbols) and the 14 dreams of the mothers of the Tirthankaras frequently appear in paintings.

In addition to the miniatures, and to painted wooden book covers that often show mythological scenes, paintings on cloth are also known. Wall paintings are found on cave shrines at Sittānavāsal (Tamil Nadu state) and at Ellora.

Jaina temples generally contain a number of metal images of various types and metal plaques showing auspicious symbols. Metal images of the Jinas are also kept by pious Jains for home devotion. Among the earliest known bronzes are one of Pārśvanātha in the Prince of Wales Museum of Western India, Bombay, which can be dated c. 1st century BC, and a group of bronzes from Chausa in Bihār in the Patna Museum (1st-3rd centuries AD).

JAINISM AND OTHER RELIGIONS

Jainism and Hinduism. Hindus regard Jainism along with the beliefs of Buddhists and *cārvākas* (materialists) as ndstika-darfana (nonorthodox points of view) since they do not believe in either Vedic (Hindu scriptural) authority or the existence of a creator god.

Both the Jainas and the Hindus believe in the doctrine of karman, as the basic principle of *saṃsāra* (the chain of birth and death) and rebirth. Late Hindu dietary restrictions, especially among the Vaiṣṇavas (followers of the Hindu god Viṣṇu), may have been the result of Jaina influence on Indian society. The application of *ahiṃsā* to the political sphere in India's struggle for independence by the great saint and political leader Mahatma Gandhi was a further extension of Mahāvīra's doctrine of *ahimsd* to all spheres of life. Gandhi had great regard for Shrimad RZjachandra, a versatile genius of high spiritual attainment. Born in 1867, in a small village in Saurashtra, Shrimad RZjachandra died in 1900 at the age of 33. A great saint, thinker, and writer, RZjachandra was perhaps the greatest and the best known Jaina layman of modern times, who believed more in practice than in theory. Spiritually a very advanced soul, he was above narrow sectarian differences and dogmas and believed in the equality of all religions which led to realization of the Pure Self (dtman). Though he preached *ahimsd,* one of his published letters shows that he attached supreme value to the principle of truth. Mahatma Gandhi regarded him as one of his gurus. Both preached truth and nonviolence, both often practiced self-mortification (fasts, etc.), but while RZjachandra was eager to leave this miserable body and the world, Gandhi wanted to realize God through service of humanity, especially of the poor and the downtrodden.

Jainism and Buddhism. Both Jainism and Buddhism revolted against Brahmanical division of class by birth and the sacrificial killing of animals. Both assimilated common Indian conceptions of deities, such as Indra, Brahmā, and the *yakṣa*s and symbol worship of such objects as the *stūpa, dharma-cakra,* caitya-trees, *ratna-traya.*

Among the elements in common with Buddhism should be noted the 32 attributes of a *mahapuruṣa* ("great man"), the iconic similarity in the type of a seated Buddha with a seated Jina, the worship of the *stūpa,* and the *dharma-cakra.* Both Mahiivira and Buddha obtained the highest knowledge while meditating under a tree.

Jainism and Islām. In reference to Muslim influence on Jainism, one scholar has suggested that the conception of *āśātanā*s—activities that are unfitting or indecent in a temple—reveals a notion of the sanctity of the temple that is more evocative of Muslim *barakah* (holiness) than of any traditional Jaina attitude. The most obvious influence of Islām is seen, however, in the Śvetāmbara Loṅkāsāha's repudiation of image worship as something without canonical support. A parallel sect, the Tāraṇapantha, also arose among the Digambaras.

The Jaina influence at the Mughal court of Akbar is a bright chapter in Jaina history. Hiravijaya Sūri, then leader of the Śvetāmbara Tapā *gaccha,* was invited and honoured by Akbar. His disciples and some other monks also received respect from the Mughal emperors Jahāngīr, Shāh Jahān, and even Aurangzeb. Akbar issued a *firmān* (decree) prohibiting animal slaughter near the Jaina sites at Gimar, Satrunjaya, Ābū, Rājgīr, and Parasnath hill during Pajjuṣaṇa festival. Jahiingir also issued *firmdns* for protection of Satrunjaya and Aurangzeb gave a *firmān* in favour of Shantidas Sheth of Ahmadābād, donating proprietor-rights over Mt. Satrunjaya. Mughal influence in different schools of Indian painting is well-known to art historians, and Jaina miniature painting was not free from it.

Jainism and other religions. Zoroastrian influence on Jainism is not certain. The Jainas in South India came in contact with Christianity in the early centuries AD, though there was no significant modification of either religion as a result of such contact.

(U.P.S.)

Jalāl ad-Din ar-Rūmī

Jaliil ad-Din ar-Riimi, called Mawlānā (Mevlāna; "Our Master"), was the greatest Ṣūfī—Islāmic mystic—poet in the Persian language; he is famous for his lyrics and for his didactic epic *Masnavi* ("The Spiritual Couplets"), which has been called "the Qur'ān in Persian." The work widely influenced Muslim mystical thought and literature—the number of commentaries and translations in the different Muslim languages is almost beyond number.

Jalāl ad-Din was born—probably on September 30, 1207, in Balkh (modern Afghanistan). His father, Bahā' ad-Din Walad, was a noted mystical theologian, author, and teacher. Mainly because of the threat of the approaching Mongols, Bahā' ad-Din and his family left their home town in about 1218. According to a legend, in Nīshāpūr, Iran, the family met Farīd od-Din 'Aṭṭār, a Persian author of mystical epics, who blessed young Jaliil ad-Din. After a pilgrimage to Mecca and journeys through the Near East, Bahā' ad-Din and his family reached Anatolia (Riim, hence the surname Riimi), a country that enjoyed peace and prosperity under the rule of the Turkish Seljuq dynasty. After a short stay at Laranda (Karaman), where Jaliil ad-Din's mother died and his first son was born, they were called to the capital, Konya, in 1228. Here, Bahā' ad-Din Walad taught at one of the numerous *madrasahs* (religious schools); after his death in 1231 he was succeeded in this capacity by his son. Early life

A year later, Burhān ad-Din Muhaqqiq, one of Bahā' ad-Din's former disciples, arrived in Konya and introduced Jaliil ad-Din deeper into some mystical theories that had developed in Iran. Burhān ad-Din, who contributed considerably to Jalāl ad-Din's spiritual formation, left Konya about 1240. Jalāl ad-Din is said to have undertaken one or two journeys to Syria (unless his contacts with Syrian Ṣūfī circles were already established before his family reached Anatolia); there he may have met Ibn al-'Arabi, the leading Islāmic theosophist whose interpreter and stepson Ṣadr ad-Din al-Qunawi was Riimi's colleague and friend in Konya.

The decisive moment in Rūmī's life occurred on November 30, 1244, when in the streets of Konya he met the wandering dervish—holy man—Shams ad-Din ("Sun of Religion") of Tabriz, whom he might have first encountered in Syria. Shams ad-Din can not be connected with any of the traditional mystical fraternities; his overwhelming personality, however, revealed to Jalāl ad-Din the mysteries of divine majesty and beauty. For months the two mystics lived closely together, and Rūmī neglected his disciples and family so that his scandalized entourage forced Shams to leave the town in February 1246. Jalāl ad-Din was heartbroken; his eldest son, Sultan Walad, eventually brought Shams back from Syria. The family, however, could not tolerate the close relation of Jalāl ad-Din with his beloved, and one night in 1247 Shams disappeared forever. It has recently been established that he was indeed murdered, not without the knowledge of Riimi's sons, who hurriedly buried him close to a well that is still extant in Konya.

Principal works

This experience of love, longing, and loss turned Riimi into a poet. **His** mystical poems—about 30,000 verses and a large number of *robāʿīyāt* ("quatrains")—reflect the different stages of his love, until, as his son writes, "he found Shams in himself, radiant like the moon." The complete identification of lover and beloved is expressed by his inserting the name of Shams instead of his own pen name at the end of most of his *ghazal*s (love poems). The *Dīvān-e Shams* (The Collected *Poetry* of Shams) is a true translation of his experiences into poetry; its language, however, never gets lost in lofty spiritual heights or nebulous abysses of speculation. The fresh language excels by its strong rhythms and sometimes assumes forms close to popular verses. There would seem to be cause for the belief, expressed by chroniclers, that most of this poetry was composed in a state of ecstasy, induced by the music of the flute or the drum, the hammering of the goldsmiths, or the sound of the water mill in Meram, where Riimi used to go with his disciples to enjoy nature. He found in nature the reflection of the radiant beauty of the "Sun of Religion" and felt flowers and birds partaking in his love. He often accompanied his verses by dancing.

A few years after Shams ad-Din's death, Riimi experienced a similar rapture in his acquaintance with an illiterate goldsmith, Ṣalāḥ ad-Din Zarkiib. It is said that on one day, hearing the sound of a hammer in front of Ṣalāḥ ad-Din's shop in the bazaar of Konya, Riimi began a whirling dance. The shop owner became one of Riimi's closest and most loyal disciples, and his daughter became the wife of Riimi's eldest son. This love again inspired Jalāl ad-Din to write some poetry. After Ṣālāḥ ad-Din's death, Ḥusām ad-Din Chelebi became his spiritual love and deputy. Riimi's main work, the *Masnavī-ye* Ma'navi ("Spiritual Couplets"), was composed under his influence. Ḥusām ad-Din had asked him to follow the model of the poets ʿAṭṭār and Sanāʾi who had laid down mystical teachings in long poems, interspersed with anecdotes, fables, stories, proverbs, and allegories. Their works were widely read by the mystics and by Riimi's disciples. Jalāl ad-Din followed Ḥusām ad-Din's advice and composed nearly 26,000 couplets of the Masnavi during the following years. It is said that he would recite his verses even in the bath or on the roads accompanied by Ḥusām ad-Din, who committed them to paper. The Masnavi, which shows all the different aspects of Ṣūfism in the 13th century, often carries the reader away with loose associations of thought, so that one understands what subjects the master had in mind at a particular stage of his life. The work reflects the experience of divine love; both Ṣalāḥ ad-Din and Ḥusām ad-Din were, for Riimi, renewed manifestations of Shams ad-Din, the all-embracing light. Thus he called Ḥusām ad-Din Diyn' al-Haqq (Light of the Truth); *ḍiyāʾ* is the Arabic term for sunlight.

After completing the Masnavi, Riimi continued writing for a short while. He always remained a respected member of Konya society and his company was sought by the leading officials as well as by Christian monks. He died on December 17, 1273. Ḥusām ad-Din became his successor and was in turn succeeded by Sulṭān Walad, who organized the loose fraternity of Riimi's disciples into Mawlawiyah, known in the West as the Whirling Dervishes because of the mystical dance that constitutes their principal ritual. Sulṭān Walad's poetical accounts of his father's life are the most important source of knowledge of Riimi's spiritual development.

Besides his famous poetry, Riimi has left a small collection of occasional talks as they were noted down by his friends; in the collection, known as *Fīhi mā* fihi ("There is in it what is in it"), the main ideas of his poetry recur. There also exist some letters directed to different persons. It is impossible to systematize his ideas, which at times contradict each other; and changes in the use of symbols often puzzle the reader. His poetry is one of the most human expressions of mystical experiences in which each reader can find his own favourite ideas and feelings—from enthusiastic flights into the heavens to matter-of-fact descriptions of daily life. Riimi's influence on Turkish cultural life can scarcely be overrated; his mausoleum, the Green Dome, today a museum, is still a place of pilgrimage for thousands.

BIBLIOGRAPHY. AFZAL IQBAL, *The Life and Thought of Mohammad Jalal-ud-din Rumi*, 2nd ed. rev. (1964), is the only English biography of Rūmī; unfortunately it is not too critical. A full evaluation in a Western language is still lacking. Biographical notes are found in the numerous translations of Rūmī's works by R.A. NICHOLSON and A.J. ARBERRY, chiefly in the latter's *Discourses of Rūmī*, a translation of the *Fīhi mā fihi* (1961).

(An.Sc.)

Jamaica

Jamaica, a parliamentary state, is the third largest island in the Caribbean Sea. It has a total land area of 4,244 square miles (10,991 square kilometres) and is about 146 miles long, 51 miles wide at its greatest width, and 22 miles wide at its narrowest point. It is situated some 100 miles due west of Haiti, 90 miles south of Cuba, and 310 miles northeast of Cape Gracias a Dios, Nicaragua, the nearest point on the American continent. The island's population was over 1,800,000 in the early 1970s. The national capital is Kingston.

Christopher Columbus, who discovered the island in 1494, called it Santiago, but the original Amerindian name of Jamaica, or Xaymaca, has persisted. Columbus considered it to be "The fairest isle that eyes have beheld," and many travellers still regard it as one of the most beautiful islands in the Caribbean.

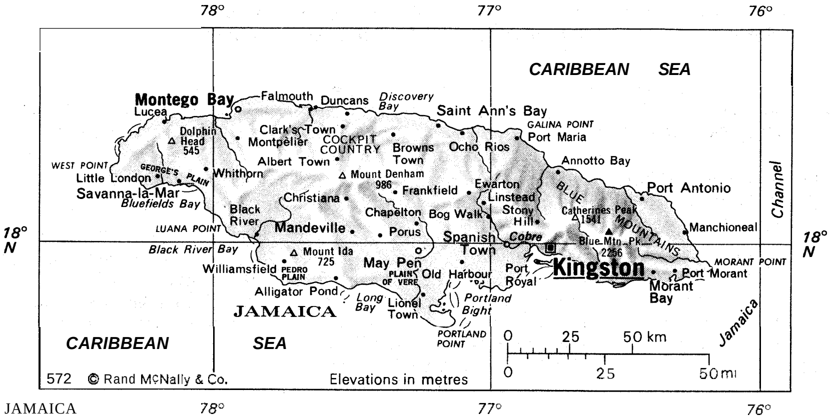
Although agriculture remains the major employer of labour, industry—notably bauxite mining—and tourism are the main contributors to the national income. Jamaica has made great strides since its independence in 1962 and is one of the most rapidly developing countries in the world. Adherence to constitutional government and the rule of law are traditional, and the national motto, "Out of Many, One People," describes a multiracial society whose integration is profound and enviable. (For an associated feature, see CARIBBEAN SEA.)

THE LANDSCAPE

The natural environment. Relief features. In general, the topography consists of coastal plains encircling an island that is bisected from east to west along its length by mountains and plateaus. The mountains form the chief physical feature. Almost half of Jamaica's surface is over 1,000 feet above sea level. The chief range rises in the east to Blue Mountain Peak at 7,402 feet (2,256 metres) and then loses altitude as it sweeps westward. The mountains contribute to the great diversity of scenery for which the island is famous, ranging from the stunted, elfin forests of the highest peaks to the dry, sandy, cactus-growing areas of the south. There are damp, tree-fern rain forests and wide, flat, alluvial plains. Located chiefly on the south side of the island, the principal plains are: Liguanea Plain in Kingston and St. Andrew; Rio Cobre and St. Dorothy plains in St. Catherine; the Vera Ma Hollis Savanna (plains of Vere) in Clarendon; George's Plain in Westmoreland; and Pedro Plains in St. Elizabeth. The rolling limestone hills and plateaus in the central and western areas include the unusual, trackless karst (a limestone region broken by ridges, depressions, and caverns) region of the Cockpit Country, covering 500 square miles of the interior.

Jamaica's mountains

Drainage and soils. There are some 120 rivers and streams, with numerous tributaries issuing from ravines in the mountains. Few are navigable for any great distance, because of their rapid descent from the mountains; in times of flood they are violent torrents. Some of the larger rivers have alluvial plains in their lower valleys and some have deltas. The Black River is navigable by small boats for about 17 miles from its mouth.



JAMAICA

More than half of the island's surface is covered with white limestone that overlies yellow limestone, beneath which are older metamorphic rocks (compact rocks formed by heat and pressure) and igneous rocks (formed by the cooling of molten material). The upland areas are mostly covered with bare rock or soils of little depth and are very susceptible to erosion. The alluvium of the coastal plains is composed chiefly of deep loam (a friable mixture of clay, silt, and sand) and clay. The valley floors are covered with residual clays.

The climate. The tropical climate is influenced by the sea and is characterized by little change in seasonal temperature, although the mountains cause regional variations. Because the island lies between the subtropical high-pressure and the equatorial low-pressure belts of the Atlantic Ocean, the northeast trade winds are dominant and blow throughout the year. Along the coasts, breezes blow onshore by day, and offshore at night. During the winter months, from December to March, cold winds known locally as "northers" reach the island through the wide, open trough of the North American plains.

Variations in temperature range from 90° F (32" C) on the coasts to 40° F (4° C) on the peaks. Kingston, at sea level, has an average daily maximum temperature of 88" F (31° C) and an average daily minimum of 71° F (22" C). At Stony Hill, at 1,400 feet, the maximum and minimum means are 86° F (30" C) and 68° F (20" C).

Rainfall

Rains are seasonal, falling chiefly in May and October, although thunderstorms in the summer months, from June to September, can bring heavy showers. The average annual rainfall is 77 inches, but regional variations are considerable. The mountains force the trade winds to deposit more than 200 inches a year on the northern parishes of Portland and St. Thomas, while little precipitation occurs on the hot, dry savanna lands of the southern and southwestern plains. Jamaica is susceptible to hurricanes during the summer but has not been struck since 1951. Earthquakes have caused serious damage only twice—in 1692 and 1907.

Vegetation and animal life. The richness and diversity of Jamaica's trees and plants constitute one of its chief glories, though it has changed considerably through the centuries. The island was completely forested in the 15th century, except for small agricultural clearings. The great timber trees were cut down for building purposes by the European settlers, and the plains, savannas, and mountain slopes were cleared for cultivation. Many new plants were introduced: the food plants—including sugarcane, bananas, and citrus and other tropical fruits—were almost all introduced to the island.

Jamaica has few indigenous quadrupeds. The coney, a member of the rodent family, once very numerous and prized as food before the European immigration, is now extremely scarce. The mongoose, a small carnivore that feeds on rats and snakes, is widespread but was introduced in 1872 from India. The 25 species of bats are the most numerous of the mammals. The native crocodile is now in danger of extinction. There are no poisonous snakes. The main freshwater fish is the mountain mullet; there are four species of crayfish.

Rich birdlife

More than 200 species of birds have been recorded, including 25 endemic species, such as the streamertail hummingbird, which is the national bird. The bird population also includes species found both in the West Indies and in America and birds that migrate to Jamaica, either in the winter or in the summer.

The landscape under human settlement. ***Rural settlement.*** With the emancipation of the island's black slaves in 1838, a large proportion of the freed population—often with the aid of nonconformist missionaries—left the large plantations. They moved to the hills where land was plentiful and created their own villages and communities. This migration laid the foundation of the present pattern of rural settlement, and many of the villages retain their original character.

Urban settlement. Most of the cities and chief towns are located on the coastal plains, where the main commercial crops are grown. Kingston, the national capital, is located on the southeastern coast. It stands on the Liguanea Plain with the sea to the south and the St. Andrew Mountains, which form part of the ranges of the parish of St. Andrew, to the north. It is the commercial, administrative, and cultural centre of the island and the focus of its transportation services. Spanish Town, the old capital, is 11 miles west of Kingston. The other important towns—Montego Bay, Ocho Rios, and Port Antonio—are centred on the north coast. Their fine white-sand beaches and unparalleled mountain scenery make them popular tourist resorts.

THE PEOPLE

Origin of the population

The aboriginal Arawak Indians were exterminated by the Spanish colonists by the time the English invaded the island in 1655. The Spaniards themselves disappeared as a population element shortly afterwards. With the large-scale introduction of African slaves to work the sugar estates, the English settlers were soon greatly outnumbered. Today the population is predominantly African and Afro-European in origin, with minority elements originating from the United Kingdom, India, China, Syria, Portugal, and Germany.

Languages. English is the official language, but a local dialect, Creole, is also widely spoken. It is basically English in vocabulary and grammar but contains features derived from a variety of African languages, as well as from Spanish and French. Creole is not bad English but a dialect of much value and charm.

Religions. Freedom of worship is entrenched in Jamaica's constitution. The majority of the population belongs to the Church of England, which was the established church of the country until 1870. There is also a large number of Baptists and Roman Catholics. Nearly every Christian denomination and sect is represented, and the Jewish community is one of the oldest in the Americas. There is a Hindu community, a Muslim mosque, and a branch of the Ethiopian Orthodox church. Some of the popular and revivalist sects base their beliefs on Christianity, but their forms of worship differ widely from those accepted by most orthodox churches. The central feature of the Pocomania sect, for example, is spirit possession; the Cumina sect has rituals characterized by heavy drumming, dancing, and spirit possession.

Population trends. The population is unevenly distributed over the island. The coastal lowlands are the most densely populated regions, especially in the Kingston metropolitan area, which has a population of over 500,000.

The rate of natural increase of the population continued to decline in the 1960s. In 1971 the birth rate fell to 34.8 per thousand from its previous level of 42.4 per thousand in 1960. This rapid decline was due in part to an intensified family-planning program. The death rate also continued to fall, from 8.8 per 1,000 in 1960 to 7.4 per 1,000 in 1971, largely because of increased access to medical facilities and the spread of public-health education. The infant mortality rate fell by more than one-third during the 1960s.

Emigration

During the 20th century there has been considerable emigration to Panama, Cuba, Central and South America, and the United States. Emigration during the 1960s was particularly high and reached a level of 30,000 a year. In the first half of this period there was much emigration to the United Kingdom, but numbers declined sharply after the passage of restrictive immigration legislation in 1967. The United States is now the chief outlet for Jamaican emigrants, followed by the United Kingdom and Canada.

HISTORY

The Spanish period. Jamaica was discovered by Christopher Columbus in 1494, during his second voyage to the New World. More than 15 years were to pass, however, before colonization was attempted. The Spanish government was disappointed in the country's lack of gold, and Jamaica became a neglected part of the property of the Columbus family. Its chief value to Spain was as a supply base; its settlers were mainly engaged in cattle-ranching.

In 1655 the island fell to a British invasion force and became the first colony in the Americas to be captured by a formal British expedition.

The British period. Two important features of the early British period were the activities of the Maroons and of the buccaneers. The Maroons—whose name probably derives from the Spanish *cimarrón,* meaning "wild" or "untamed"—were freed or escaped slaves who had taken to the thick woods and mountains at the time of the British invasion. Organized, armed, and encouraged by the Spanish, they harried the invaders with guerrilla-warfare tactics and were to prove a thorn in the side of the British for almost 150 years. The buccaneers—who preyed on Spanish ships—operated mainly from their base at rich and corrupt Port Royal. By their relentless attacks on Spanish Caribbean cities, they kept the Spaniards occupied at a time when Britain was unable to spare a fleet for the protection of its West Indian colonies.

The importation of African slave labour, begun by the Spaniards, continued under the new regime. It grew steadily in volume as sugar production increased in extent and value. By the 18th century, Jamaica, like other sugar colonies, had become one of the most valuable of colonial possessions.

Crisis of 1865

The abolition of the slave trade in 1807 and full emancipation 31 years later caused the collapse of the plantation system. This, together with other factors, including unemployment, heavy taxation, and droughts, produced a crisis in 1865 that changed the old social and economic patterns for all time. In October 1865 an uprising in the easternmost parish of St. Thomas, known as the Morant Bay Rebellion, was put down with terrible severity. The scandalous handling of the crisis by the British governor, Edward Eyre, led to his recall. Before leaving, however, he induced the frightened House of Assembly to vote for its own extinction. In its place a crown-colony form of government, in which the governor wielded the only real executive or legislative power, was established by an act of the British Parliament in 1866.

By 1938 dissatisfaction with the crown-colony system, sharpened by the hardships and suffering brought on by a worldwide economic depression, erupted in serious and widespread rioting. These events resulted in the formation of the first lasting labour unions as well as of political parties linked to them. A growing demand for self-determination also became apparent.

Transition to independence. The constitution of 1[illegible] provided for a two-party House of Representatives, the appointment of ministers, and universal adult suffrage. Further constitutional advances took place in 1953 and 1957, and full internal self-government was obtained in 1959. In 1958 Jamaica had become a founding member of the Federation of the West Indies, from which it seceded in 1961. On August 6, 1962, Jamaica became an independent nation with full dominion status within the Commonwealth.

THE NATIONAL ECONOMY

Jamaica's economy is essentially an open one, with heavy dependence on primary exports and on imports of manufactures and capital goods. There is active foreign economic participation, especially in the export sector (bauxite and alumina) and in tourism.

Natural resources. Among the minerals found on the island, bauxite, gypsum, silica sand, ceramic clays, marble, and limestone are of commercial interest. The bauxite is found in an area of about 1,000 square miles in central Jamaica; the gypsum and marble are in eastern Jamaica; clays are in the west; and limestone is found throughout the island. An estimated 19 percent of the island's total area consists of forests, about half of which are government owned.

Sources of national income. ***Agriculture, forestry, and fishing.*** Agriculture continues to be the main basis of the island's economy, engaging about 36 percent of the total labour force. The two major crops are sugar—with its by-products of rum and molasses—and bananas. Other important crops are citrus fruit, coffee, pimentos, cocoa, and ginger.

Local forestry production is insufficient to meet the country's needs; about 90 percent of the wood, cork, and paper consumed is imported. It is anticipated that afforestation programs now being pursued will provide the basis for eventual self-sufficiency.

The annual catch of fish amounts to about 35,000,000 pounds (16,000,000 kilograms); the island shelf is the traditional fishing area. Mechanized boats sail about 60 miles southwest of Jamaica to Pedro Bank.

Mining and quarrying. Since 1952 the mineral industry has played an increasingly significant role in the country's economic development and is considered to be the most rapidly expanding sector of the economy. Jamaica is the world's largest producer of bauxite; production in 1970 equalled 11,800,000 tons. Bauxite was mined in the early 1970s by one Canadian and three United States companies, which have also undertaken the manufacture of alumina (a product made from bauxite that is used for making aluminum). In 1969 mining, quarrying, and refining accounted for about 13 percent of the national income. The production of silica sand is absorbed by local glass-container manufacture, while most of the gypsum is mined for export. Cement is largely used in local construction.

Bauxite production

Industry. Manufacturing is increasingly important, both in providing employment and in satisfying the increasing demand for manufactured goods. Food processing is the most important manufacture, followed by metal products. Other significant categories are sugar, rum, and molasses processing, textile manufacturing, printing, chemical production, and cement and clay products. Industrial growth has been stimulated by the activities of the Jamaica Industrial Devellopment Corporation, a statutory body that administers the incentive laws that provide concessions such as the duty-free importation of machinery and equipment and income tax exemption to foreign and local investors.

Increasing reliance was placed on tourism in the 1960s. In 1969 this industry was second only to bauxite as a dollar earner. The traditional attraction of Jamaica to the tourist is the warm climate and good beaches.

Electricity is supplied from both private and public sources. Public generation of electricity is mainly by steam turbines. Privately owned generating plants supply the power needs of the sugar, cement, bauxite, and alumina industries.

Finance. Financial services are dominated by commercial banks that are mainly subsidiaries of Canadian, British, and American banks. Savings and credit services are also offered by life-insurance companies, building societies, and credit unions. The central bank, called the Bank of Jamaica, founded in 1960, is empowered to control money and credit and to promote economic development. The Development Finance Corporation provides loans for industry, housing, and tourism. There is a Small Business Loan Board, and local securities are also sold. The monetary unit is the Jamaican dollar (Jam$1 = $1.20 U.S.; Jam$2 = £1 sterling on May 1, 1971).

Foreign trade. The principal exports are bauxite, alumina, agricultural products, and clothing. Widely varied imports include food, beverages, tobacco, manufactured goods, fuel oil, fertilizer, and machinery. The United States, the United Kingdorn, and Canada are the leading trade partners. The European Economic Community is an important source of imports. Jamaica is a member of the sterling area and of the Commonwealth preferential-trading system.

Management of the economy. ***The Public and private sectors.*** The economy is based on private enterprise. The government uses monetary and fiscal policies to achieve maximum benefits for the economy as a whole. The mining and tourist industries, as well as much of the manufacturing sector, are financed by foreign capital. The government follows economic: policies that serve to foster the highest possible rate of growth consistent with the country's social development.

The largest sources of government revenue are income tax, customs duties, and excise duties. Development loans are raised by the government in London, New York, and locally.

Trade unions and employer associations. In 1971 there were more than 40 trade-unions, of which the most important were the Bustamente Industrial Trade Union (affiliated with the Jamaican Labour Party) and the National Worker's Union (affiliated with the People's National Party); there are about ten employers' associations.

Contemporary economic policies. The government is attempting to achieve the highest possible rate of growth consistent with the attainment of the goals of its social development policy. Emphasis is being laid on attempts to achieve a wider distribution of the benefits of development, on fiscal and monetary stability, and on the maintenance of conditions conducive to a high level of investment by the private sector.

Transportation. Generally, the transport systems either follow the coastline or cut across the central mountains from north to south.

Roads and highways. The road system at the start of the 1970s consisted of more than 2,680 miles of main roads, about 1,900 of which were paved. There are also about 7,000 miles of secondary roads. The main roads encircle the island, loop into the plains areas, and cross the mountains at three major north-to-south crossings. Public passenger services are available outside the capital which itself has a regular bus service. There are also taxi and limousine services.

Railways. There are 205 miles of railway routes, parts of which have been in existence since 1845. The main line runs northwest from Kingston to Montego Bay via Spanish Town, May Pen, and Montpelier. From Spanish Town, a branch line runs to Annotto Bay and Port Antonio by way of Bog Walk, where a short line branches to Ewarton.

Air and water transport. There are scheduled international air services at the two major airports of Palisadoes, near Kingston, and Montego Bay. These airports also handle scheduled domestic flights and an air-taxi service. Port Antonio and Ocho Rios have licensed aerodromes, and there are 40 other airstrips throughout the island.

Jamaica has 16 seaports in use. Kingston, Montego Bay, and Port Antonio are the principal ports. Regular passenger and cargo services are maintained with the United Kingdom, Canada, and the United States. There are also shipping lines to continental Europe, South America, the Caribbean, Australia, and New Zealand.

ADMINISTRATION AND SOCIAL CONDITIONS

Government structure. Under the Jamaica (Constitution) Order in Council of 1962, by which the island achieved independence, the monarch of the United Kingdom is titular head of state. A Jamaican governor general is chosen by the monarch on the advice of the prime minister. The prime minister is appointed by the leading political party from its parliamentary members. The legislature is a bicameral parliament consisting of a House of Representatives and a Senate. The House has 45 to 60 members, who are elected by universal adult suffrage. The speaker and deputy speaker are elected by the House from its members. The Senate has 21 members, who are appointed by the governor general—13 in accordance with the advice of the prime minister and eight on the advice of the leader of the opposition party. The president and deputy president are elected by the Senate from among such of its members as are not ministers or parliamentary secretaries. The principal instrument of policy is the Cabinet, which consists of the prime minister and at least 11 other ministers, of whom at least two or three must be members of the Senate. The Privy Council is limited to advising the governor general on the exercise of the royal prerogative of mercy and on the discipline of government officers.

Legislature

The island is divided into 14 parishes, two of which are amalgamated as the Kingston and St. Andrew Corporation. Local affairs in the other parishes are administered by individual parish councils. Their size varies between 13 and 33 members, who are elected by universal adult suffrage. Members of the House of Representatives hold ex-officio seats on parish councils, and the mayors of those parish capitals that enjoy mayoral status are the chairmen of their councils.

The two political parties are the Jamaica Labour Party and the People's National Party. General elections are held every five years.

Justice. The judiciary comprises a supreme court, a court of appeal, and resident magistrate's (parish), petty sessional, coroner's, and juvenile courts. There is also a traffic court. The legal and judicial system is based on English common law. The attorney general is the government's principal legal adviser. There is a director of public prosecutions.

The police. The constabulary force consists of about 80 officers and 3,000 other men and women. Its responsibilities include immigration and the registration of aliens. There is a criminal investigation department and a telecommunications branch, as well as water police and mounted detachments. Among the various police auxiliaries are the special constabulary force and the district constables.

The armed forces. The Jamaica Defense Force is organized into regular and part-time, or national reserve, elements. The regular forces include army, air force, coast guard, and logistics units. The air wing operates both helicopters and light aircraft; the Coast Guard is equipped with fast patrol boats. The National Reserve includes army units, an air squadron (using mainly privately owned aircraft), and small marine units.

Education. A substantial part of the annual budget goes to the Ministry of Education. Considerable sums are devoted to the School of Agriculture, the School of Arts and Crafts, and the University of the West Indies, the main campus of which is at Mona, a northeastern section of Kingston. Education is provided by government-owned, government-aided, and private schools, some of which are run by religious bodies. The Ministry operates more than 750 primary schools, 16 junior secondary schools, and 40 secondary schools, as well as a number of vocational centres, technical institutes, technical high schools, and teacher-training colleges.

Health and welfare services. Medical care is provided by 27 public hospitals, including the University College Hospital, and about 150 health centres and clinics. There are four private hospitals. Highly successful programs of insect control and malaria eradication have been undertaken, and periodic inoculations against tuberculosis, polio, diphtheria, whooping cough, and tetanus are given.

Welfare programs

The Ministry of Youth and Community Development undertakes community services through the Social Welfare Commission and various voluntary groups. There are a number of commissions and committees concerned with social services, including the Social Welfare Commission and the Council of Voluntary Social Services, which is a coordinating body affiliated with 35 voluntary organizations. The government operates a compulsory National Insurance Scheme that covers all gainfully employed persons between 18 years old and retirement age.

Housing. Much attention has been paid to housing, and there are many large development schemes in both urban and rural areas, especially in the Kingston and St. Andrew suburbs. Although the government undertakes many types of housing schemes, its chief concern is with low-income projects.

Social and economic divisions. A study of family income distribution in the early 1960s indicated that 20 percent of the families enjoyed about 56 percent of the total household income.

The outstanding feature of the social structure is the degree of harmonious coexistence among people of different ethnic and cultural backgrounds. This is largely explained by the wide degree of racial intermixture, as well as by the common exposure to a Western-oriented value system. Rigidities in the class system are being gradually erased by measures which seek to increase social mobility through the expansion of opportunities in education and in ownership of property.

CULTURAL LIFE AND INSTITUTIONS

The arts. There is a vigorous and productive art movement in Jamaica, stemming from the 1930s and 1940s. The works of Jamaican novelists may be read in several languages. Jamaican artists have exhibited successfully abroad, and local art shows are a regular part of life. The Institute of Jamaica, an early patron and promoter of the arts, sponsors exhibitions and awards. It also runs the Jamaica School of Art.

The Jamaica Library Service and the University of the West Indies contribute to the promotion of the arts. There are many successful commercial galleries and one run by the Contemporary Jamaican Artists Association. The steadily increasing number of Jamaican art patrons indicates the involvement of the society with its own cultural identity.

There are many active theatre and musical groups. The National Dance Theatre Company, formed in 1962, has earned international recognition; its annual dance season is one of the most eagerly awaited events in the cultural calendar. Much of the country's artistic expression finds an outlet in Festival, sponsored annually by the government as part of the independence celebrations. While the festival has many features of the traditional Caribbean type of carnival, it is much wider in scope. In addition to street dancing and parades, there are also exhibitions of arts and crafts, and literary, theatrical and musical competitions.

Folk traditions

The concern with Jamaica's cultural tradition is evident in an artistic and cultural awakening accompanied by a keen search for roots in folk forms, which are based chiefly on the colourful, rhythmic intensity of an African heritage, with overtones of unique multiracial influences. Folk music, stories, and dances are being systematically sought out and recorded. The important aesthetic elements in some of the revivalist cults, notably Pocomania, are recognized, and modern dance and drama employ many of the folk expressions that might otherwise have disappeared.

Press and broadcasting. Jamaica has one daily morning paper and one afternoon tabloid. There are a number of periodicals, magazines, and journals and five weekend newspapers. There are two radio stations, one of which is a publicly owned corporation that also operates a television service.

PROSPECTS FOR THE FUTURE

The future development of the Jamaican economy depends to a large extent upon agricultural development. Agriculture, in the early 1970s, was expected to continue to employ the largest percentage of the labour force and to remain for some time one of the mainstays of the economy. More and more of the unused land was expected to be put into production, although further agricultural investment was needed for this to take place. As technology is increasingly applied to Jamaican industry, it was anticipated that future development would tend to require larger amounts of capital rather than of labour. The government, meanwhile, has emphasized the expansion of educational opportunities and in the course of the 1970s was expected to pay particular attention to primary education and to adult literacy training. Tourism and light manufacturing were both estimated to have a potential for further expansion.

Jamāl ad-Din al-Afghānī

Jamāl ad-Din al-Afghani (1838/39–97), Muslim politician, political agitator, and journalist whose belief in the potency of a revived Islamic civilization in the face of European domination significantly influenced the development of Muslim thought in the 19th and early 20th centuries. Afghānī considered Islām the potential source of Muslim solidarity and political strength and to this end devoted most of his life.

Early career in Afghanistan, Istanbul, and Egypt

Very little is known about Afghānī's family or upbringing. Despite the appellation Afghani, which he adopted and by which he is known, some scholars believe that he was not an Afghan but a Persian Shi'ite (*i.e.*, a member of the Shi'ah, one of the two major divisions of Islām), born in Asadābād near Hamadan in Persia. An appreciable part of Afghani's activities took place in areas where Sunnī Islām—the other major division of Islām—was predominant, and it was probably to hide his Persian and Shi'ite origin, which would have aroused suspicion among Sunnis, that he adopted the name Afghani. As a young man he seems to have visited, perhaps in order to extend and perfect his theological and philosophical education, Karbalā' and an-Najaf, the Shi'ite centres in southern Mesopotamia, as well as India and perhaps Istanbul. The intellectual currents with which he came in contact remain obscure, but whatever they were they made him into a religious skeptic at an early date. Only from about November 1866, when Afghani appeared in Qandahār, Afghanistan, can evidence he pieced together to form a consecutive and coherent picture of his life and activities. From the death in 1863 of the famous Dōst Mohammad Khān, who had ruled for more than 20 years, Afghanistan had been the scene of civil wars occasioned by the quarrels of his sons over the succession. In 1866 one of these sons, Shir ʿAlī Khān, was established in the capital, Kābul, but two of his brothers, Mohammad Afdal Khān and Mohammad A'zam Khan, were threatening his tenure. In January 1867 Shir ʿAlī was defeated and ousted from Kābul, where Afdal and, upon his death shortly afterward, A'zam reigned successively in 1867–68. At the end of 1866 A'zam captured Qandahār and Afghani immediately became Aʿẓam's confidential counsellor, following him to Kābul. He remained in this position until A'zam was in turn ousted by Shir ʿAlī, who succeeded in regaining his throne in September 1868.

That a foreigner should have attained so quickly such a position was remarked upon in the contemporary accounts; some scholars speculate that Afghani (who then called himself Istanbuli) was, or represented himself to be, a Russian emissary able to obtain for A'zam Russian money and political support against the British, with whom Aʿẓam was on bad terms. When Shir 'Ali succeeded in regaining the throne, he was naturally suspicious of Afghani and expelled him from his territory in November 1868.

Afghani next appeared in Istanbul in 1870, where he gave a lecture in which he likened the prophetic office to a human craft or skill. This view gave offense to the religious authorities, who denounced it as heretical. Afghani had to leave Istanbul and in 1871 went to Cairo, where for the next few years he attracted a following of young writers and divines, among them Muhammad 'Abduh, who was to become the leader of the modernist movement in Islām, and Sa'd Pasha Zaghlūl, founder of the Egyptian nationalist party, the Wafd. Again, a reputation of heresy and unbelief clung to Afghani. The ruler of Egypt then was the khedive Ismāʿīl, who was both ambitious and spendthrift. By the mid-1870s his financial mismanagement led to pressure by his European creditors and great discontent among all his subjects. Ismāʿīl tried to divert their wrath from himself to the creditors, but his manoeuvres were clumsy, and, in response to French and British pressure, his suzerain, the Ottoman sultan, deposed him in June 1879. During this period of political effervescence, Afghani attempted to gain and manipulate power by organizing his followers in a Masonic lodge, of which he became the leader, and by delivering fiery speeches against Ismāʿīl. He seems to have hoped to attract thereby the favour and confidence of Tawfiq, Ismāʿīl's son and successor; but the latter, reputedly fearing that Afghani was propagating republicanism in Egypt, ordered his deportation in August 1879.

Activities in India and elsewhere

Afghani then went to Hyderābād and later, via Calcutta, to Paris, where he arrived in January 1883; his stay there contributed greatly to his legend and posthumous influence as an Islamic reformer and a fighter against European domination. In Paris, Afghānī, together with his former student 'Abduh, published an anti-British newspaper, *al-ʿUrwat al-wuthqā* ("The Indissoluble Link"), which claimed (falsely) to be in touch with and have influence over the Sudanese Mahdi, a messianic bearer of justice and equality expected by some Muslims in the last days. He also engaged Ernest Renan, the French historian and philosopher, in a famous debate concerning the position of Islām versus science. He tried unsuccessfully to persuade the British government to use him as intermediary in negotiation with the Ottoman sultan, Abdülhamid II, and then went to Russia, where his presence is recorded in 1887, 1888, and 1889 and where the authorities seem to have employed him in anti-British agitation directed to India. Afghani next appeared in Iran, where he again attempted to play a political role as the Shāh's counsellor and was yet again suspected of heresy. The shāh, Nāṣer od-Din Shāh, became very suspicious of him, and Afghani began a campaign of overt and violent opposition. Again, in 1892, his fate was deportation. For this, Afghani revenged himself by instigating the Shāh's murder in 1896. It was his only successful political act.

From Iran, Afghani went to London, where he stayed briefly, editing a newspaper attacking the Shāh and urging resistance to him and particularly to the tobacco concession that had been granted to a British subject. He then went to Istanbul, in response to an invitation made by an agent of the Sultan's. The Sultan may have hoped to use him in pan-Islāmic propaganda, but he soon aroused suspicion and was kept inactive, at arm's length and under observation. He died in Istanbul. His burial place was kept secret, but in 1944 what was claimed to be his body, owing to the mistaken impression that he was an Afghan, was transferred to Kābul, where a mausoleum was erected for it.

BIBLIOGRAPHY. A. ALBERT KUDSI-ZADEH, *Sayyid Jamāl al-Din al-Afghani: An Annotated Bibliography* (1970). NIKKI R. KEDDIE, *An Islamic Response to Imperialism* (1968), includes the main writings of Afghani in translation together with a long introduction dealing with his life and ideas. ELIE KEDOURIE, *Afghani and 'Abduh: an Essay on Religious Unbelief and Political Activism in Modern Islam* (1966), sets forth and examines much new evidence on which a radical re-evaluation of Afghānī's role and significance is based. HOMA PAKDAMAN, *Djemal-ed-Din Assad Abadi, dit Afghani* (1969), contains a large number of documents by and about Afghānī and is a useful supplement to the works of Keddie and Kedourie.

James I the Conqueror, of Aragon

James I of Aragon, one of the great Spanish monarchs of the Middle Ages, took a leading part in the reconquest (Reconquista) of Spanish lands from the Muslims, adding new territories within the peninsula to his own dominions and opening up the sea routes for overseas conquests. He thus initiated the Catalan–Aragonese expansion in the Mediterranean that was to reach its zenith in the last decades of the 14th century.

Birth and early life

The son of Peter II of Aragon and Mary of Montpellier, James was born at Montpellier, France, on February 2, 1208. When Peter, allied with the Albigensian heretics, died fighting against the crusaders sent against them at the Battle of Muret, James was only five years old and was at Carcassonne, France, in the hands of the crusaders' leader, Simon de Montfort. James was released in April 1214 and recognized as sovereign in Aragon and Catalonia; placed under the protection of the Knights Templars at Monzón, he was cared for and educated by them. The regency was exercised by his great-uncle, Count Sancho of Roussillon (in Aragon, now in France), until 1218, when Sancho resigned in the face of opposi-

Archivo Mas, Barcelona

tion from some Aragonese and Catalonian nobles. The ensuing rebellions, during which the King often found himself in great danger, formed a hard school for the forging of his character. Fearless already as a youth, he fought an Aragonese noble in hand-to-hand combat, took part in the siege of the port of Castejón in 1222, and three years later tried to seize another port.

In 1227 James took over the effective government of his kingdoms and at once began the first of his great campaigns of reconquest—that of the Balearic Islands. Majorca was captured in December 1229, and the occupation was rounded off in 1235 by the conquest of Ibiza by the Bishop of Saragossa. Thenceforward, the islands were a bulwark to defend the Catalan coasts and a base from which trade and political expansion could be launched eastward.

Wars of reconquest against the Muslims

In 1233 James began a second war of reconquest—against the Saracen rulers of the Kingdom of Valencia. The campaign lasted three long years and suffered various interruptions before the capital itself was captured in 1238. The occupation of the kingdom was completed later with the capture of other towns, and in 1244 James signed, with Alfonso X of Castile, a treaty by which the boundaries of their respective kingdoms were delimited in the newly conquered areas.

James I married twice. In 1221 he married Leonor, daughter of Alfonso VIII of Castile, but he later divorced her and in 1235 married the daughter of Andrew II of Hungary, Yolande, by whom he had many children. In 1248 and 1262 he divided his realms among his sons but only succeeded in causing virulent civil strife. In the second division, his elder son, Peter, received Aragon, Valencia, and Catalonia, and his younger son, James, received the Balearic Islands, Roussillon, and other Pyrenean counties that he was to hold in fief from Peter. This division of realms among his heirs was not James's only political blunder. By the Treaty of Corbeil (1258) he renounced his claims to territories in the south of France, thus abandoning the traditional policy that the Catalan dynasty had hitherto pursued across the Pyrenees. He was, however, able to develop relations and promote trade with the states of North Africa; and, with a clear view of the future, he married his principal heir, Peter, to Constance of Sicily, thus making it easy for the latter kingdom to be added in later years to the crown of Aragon. Always a chivalrous soldier, James helped his son-in-law Alfonso X of Castile to suppress the rebellion of the Moors in the Kingdom of Murcia (1266); he also set out on a crusade to the Holy Land (1269), though this was a failure. He died at Valencia on July 27, 1276.

Assessment

A soldier of extraordinary courage and great gifts of leadership, James was a stout man, strong and handsome; he has been criticized for his many love affairs that caused him to be described as an "home de fembres" ("lady's man"). On balance, his reign was very beneficial. The important code of maritime law called the *Llibre del consolat del mar* was compiled; the Kingdom of Valencia received its own legal system; various cities, including Barcelona, acquired their own civic administrations; and the Cortes—the representative assembly—came into being. The King protected men of letters, inspired the chronicle that bears his name (though he did not himself write it), and brought his different peoples to a degree of political and cultural maturity that can reasonably be described as admirable.

BIBLIOGRAPHY. The chief source for James I's reign is his chronicle, called the *Libre dels feyfs esdeuenguts en la uida del. molt alt senyor Rey, en Jacme lo Conqueridor*. The latest edition is by J.M. DE CASACUBERTA, *Crdnica*, 9 vol. (1926–62); and there is an English translation by JOHN FORSTER, *The Chronicle of James I., King of Aragon, Surnamed the Conqueror*, 2 vol. (1883), for which PASCUAL DE GAYANGOS provided a historical introduction and footnotes. FERRAN SOLDEVILA has written three fundamental works on James I: *Els primers temps de Jaume I* (1968), an exhaustive biographical study of the King's early years; *Vida de Jaume I el Conqueridor* (1958), covering the King's whole life; and *Jaume I, Pere Gran: Els grans reis del segle XIII.*, 2nd ed. (1965), a general study of the reign.

(E.Sa.)

James I of Great Britain

England's first Stuart king, reigning from 1603 to 1625, James I also ruled Scotland as James VI from 1567. A strong advocate of royal absolutism, he promoted peace in Europe and colonial expansion in America and began disputes with Parliament that finally erupted into civil war in the reign of his son, Charles I.

Proclaimed king

James was born in Edinburgh Castle on June 19, 1566, the only son of Mary, Queen of Scots, and her second husband, Henry Stewart, Lord Darnley. Eight months later his father died when his house was destroyed by an explosion. After her third marriage, to James Hepburn, earl of Bothwell, Mary was defeated by the rebel lords and abdicated the throne. James, one year old, became king of Scotland on July 24, 1567; Mary left the kingdom on May 16, 1568, and never saw her son again. During his minority James was surrounded by a small band of the great Scottish lords, from whom emerged the four successive regents, the earls of Moray, Lennox, Mar, and Morton. There did not exist in Scotland the great gulf between rulers and ruled that separated the Tudors and their subjects in England. For nine generations the Stuarts had in fact been merely the ruling family among many equals, and James all his life retained a feeling for those of the great Scottish lords who gained his confidence.

The young King was kept fairly isolated but was given a good education until the age of 14. The course had been rather narrow, mainly three languages, Greek, French, and Latin, always set within a biblical (chiefly Old Testament) framework. His mother's books provided him with an introduction to the French poets. More useful than all his tutors' teaching was the library, of classical, religious, and, to a lesser extent, historical writings that his tutors, George Buchanan and Peter Young, assembled for him.

In his youth King James wrote poetry, with energy but slender talent. His works included a long translation from the French of Guillaume de Salluste, Seigneur du Bartas, a Gascon Huguenot, and in the whole series of the King's verse there is only one reference to Scottish scenery, to the cloud-topped Cheviot Hills. The young sovereign impressed his Scottish subjects considerably with his great knowledge.

When he grew to manhood he was slender and of average height. He was constantly on horseback and loved the chase, hunting dogs, and horses, activities that endeared him to the people of Scotland. Later, however, his English subjects noticed his weak and spindly legs and his narrow jaws, which made it difficult for him to eat.

Even as a young man, he liked to influence those around him, an outgrowth of his conception of his great position. From the time he grew up his most salient quality was his pleasure in giving, accompanied, unfortunately, by an absence of any money sense. Through his life he also had a deep desire for peace.

Dispute with Presbyterians

Though he opposed the attempts of Presbyterian ministers to undermine royal authority in Scotland, James was always a convinced doctrinal Presbyterian. In his later years he would be described in general terms as an Anglican; but he never desired to introduce the English creed into his native country. It is clear that he considered his differences with the Presbyterian ministers in the years of his Scottish reign as political rather than doctrinal. Their form of rule was ultimately theocratic and therefore incompatible with his idea of monarchy.

He retained through life a vivid belief in the power and enmity of the devil and was deeply harassed by this belief. Uncommunicative and brooding, he always kept to himself. He was very sure of his decisions. He was only 15 when he arranged for the execution of the Regent Morton on the charge of murdering his father, Darnley. In 1600 he became annoyed at the opposition of John Ruthven, the earl of Gowrie, to his tax proposals and was, in fact, disturbed by the very proximity of the Gowrie family, and, in August of the year, at the Gowrie home, the earl and his brother, Alexander, were killed in mysterious circumstances. James claimed that his life had been threatened and the killings occurred in the ensuing struggle, but the Gowrie conspiracy has never been satisfactorily explained.

In August 1589, James was married to Anne, the daughter of Frederick II of Denmark who, in 1594, gave birth to their first son, Prince Henry. Throughout his life, however, James exhibited little interest in the opposite sex. It seems that he never had a mistress and was interested in women only as the wives and mothers of his male friends. The first friend who influenced him greatly was his cousin Esmé Stuart, seigneur of Aubigny, whom he created duke of Lennox. James was no traveller and relied on Lennox for information about the French court.

From early manhood James's policy was determined by his need to remain on good terms with the childless Elizabeth of England, in order to ensure his claim as heir to the English throne. When his mother, who had been a prisoner in England for 20 years, was executed at Fotheringhay in 1587, he lodged only a formal protest. He realized that he was in no position to attack the English polity and that it would not be in his best interest to do so.

Daemonologie

In 1597, in Scotland, he published a treatise *Daemonologie*, which gives a clear idea of his fear of the spirit world, and two years later he brought out a first small, private edition of the ***Basilikon Doron,*** described as "His Majesties instructions to his dearest sonne Henry the Prince." Somewhat narrow in scope, the examplars are drawn almost entirely from Scotland, and the theological passages are of low intensity.

In this part of the reign the administration of the realm was carried on with the King's full consent by a group known as the Octavians. There were certain difficulties with the Kirk, the (Presbyterian) Church of Scotland, but the King showed himself both cool and crafty. Because the Kirk had no power to reward, its influence in the King's circle was slight. It was also clear that his conflict with the Church of Scotland was without danger; it did not call upon James's small store of physical courage.

In the last years of the reign of Queen Elizabeth, a private correspondence began between King James and Sir Robert Cecil, Queen Elizabeth's secretary of state, who was to serve him after his accession. A sense of the glory of kingship bound James to the King of France and to the King of Spain, England's traditional enemies. This highly defined sense of identity with others of his estate led James to believe that he could bring England peace, as indeed he was to do in 1604 by speedily ending the war with Spain.

King of England

When Elizabeth died in 1603, King James set out for England, leaving the ministers to whom he was long accustomed in their posts in Scotland. During the later part of his reign he returned to Scotland only once, in 1617. Throughout his reign in England he received Scotsmen at his court, but they were not liked in his southern kingdom. Shortly after he moved to England, he ceased marital relations with his wife. Though he appreciated the Queen's concern for masques and pageantry, he disliked her recurring interest in Roman Catholicism and did not wish her to influence his children's minds. Still he always remained courteous to her as the King of Denmark's sister. She died in 1619.

The happiest period of James's rule was the nine years between his accession to the English throne and the death of Cecil, whom he created earl of Salisbury. He never had another minister who was both experienced and powerful. In the later portion of his reign his two successive favourites, Robert Carr, who became Viscount Rochester and earl of Somerset, and George Villiers, who was created duke of Buckingham, exerted an extraordinary influence over the King.

But James was not appreciated in England as he had been in Scotland. He hardly understood the rights or the temper of the English Parliament, and thus came into conflict with it. He had little contact with the English middle classes, and he suffered from the narrowness of his horizons. Elizabeth had travelled throughout her country and played her part before the nation; the crowds along the roadside all could hear her calculated loud asides. But James was domestic; perhaps his outdoor servants, his huntsmen, and the keepers of his hunting lodges were the only members of the rural working class with whom he came in contact. In his later years his judgment faltered. The King had a sympathy, which his countrymen found inexplicable, for the Spanish ambassador, Diego Sarmiento de Acuña, the count of Gondomar. When Sir Walter Raleigh, who had been released from the Tower of London and a death sentence and had gone to Guiana in search for gold, came into conflict with the Spaniards, then at peace with England, Gondomar persuaded James to have Raleigh beheaded. The King's last decisive action, also a result of Gondomar's influence, was the arrangement of Prince Charles's journey to Madrid to seek a Spanish princess in marriage.

Death

The Duke of Buckingham began an enmity with Prince Charles, who became the heir when his brother Prince Henry died in 1612, but in the course of time the two formed an alliance from which the King was quite excluded. In the last 18 months of the reign the King, in effect, exercised no power; Charles and Buckingham decided most issues. James died at his favourite country residence, Theobalds, in Hertfordshire, on March 27, 1625.

James II of Great Britain

The last Stuart monarch of the direct male line, James II was king of Great Britain from 1685 until his forced "abdication" in the so-called Glorious or Bloodless Revolution of 1688. That revolution', engendered by James's Roman Catholicism, permanently established the supremacy of Parliament as the ruling power of England.

James II was born at St. James's Palace, London, on October 14, 1633, the second surviving son of Charles I and Henrietta Maria. He was created duke of York in January 1634. During the Civil War he lived at Oxford—from October 1642 until the city surrendered in June 1646. He was then removed by order of Parliament to St. James's Palace, from which he escaped to the Netherlands in April 1648. He rejoined his mother in France in early 1649. Joining the French army in April 1652, he served in four campaigns under the great French general Turenne, who commended his courage and ability. When his brother, Charles II, concluded an alliance with Spain against France in 1656 he reluctantly changed sides, and he commanded the right wing of the Spanish army at the Battle of the Dunes in June 1658.

Heir presumptive

At the restoration of his brother Charles to the English throne in 1660, James was lord high admiral and did much to maintain the efficiency and improve the organization of the navy. He also showed considerable interest in colonial ventures; it was on his initiative that New Amsterdam was seized from the Dutch in 1664 and renamed New York in his honour. He commanded the fleet in the opening campaigns of the Second and Third Dutch wars. This was to be his last taste of active military command until 1688. In politics he was a strong supporter of the Earl of Clarendon, whose daughter Anne he married in September 1660. Both before and after marriage he had the reputation of being as great a libertine as his brother. But in 1668 or 1669 he was admitted to the Roman Catholic Church, though, on his brother's insistence, he continued to take the Anglican sacraments until 1672, and he attended Anglican services until 1676. Charles II also insisted that James's daughters, Mary and Anne, be raised in the Protestant faith.

James's conversion had little effect on his political views, which were already formed by his reverence for his dead father and his close association with the High Church Party. James, in fact, was always more favourable to the Anglican Church than was his Protestant brother. He welcomed the prospect of England's re-entering the European war on the side of the Dutch; and he consented to the marriage of his elder daughter, Mary, to William of Orange in 1677. For most of his life James was the spokesman of the conservative Anglican courtiers, who believed that his views on monarchy and Parliament coincided with theirs, who found his formal and humourless nature more congenial than Charles's slippery geniality, and who respected his frank acknowledgment of his religious beliefs.

In view of the Queen's childlessness, however, the conversion of the heir presumptive to the throne roused great alarm in the general public. James resigned all of his offices in 1673 rather than take an anti-Catholic oath imposed by the so-called Test Act and thus made his position known publicly. Later that year, his first wife having died, he gave further offense by marrying a Roman Catholic princess, Mary of Modena. By 1678 James's Catholicism had created a climate of hysteria in which the fabricated tale of a "Popish Plot" to assassinate Charles and put his brother on the throne was generally believed. From 1679 to 1681 three successive Parliaments strove to exclude James from the succession by statute. During this crisis James spent long periods in exile at Brussels and Edinburgh. But owing largely to his own tenacious defense of his rights, the exclusionists were defeated. In 1682 he returned to England and resumed the leadership of the Anglican Tories, whose power in local government was re-established and increased by the "remodelling" of the borough corporations and the government of the counties in their favour. By 1684 James's influence on state policy was paramount, and when he finally came to the throne on February 16, 1685, with very little overt opposition or even criticism, it seemed likely that the strong support of the Anglicans would make him one of the most powerful of the 17th-century British kings.

Accession

The new royalist Parliament that assembled in May 1685 voted James a large income and there seemed no reason why he should not in time secure adequate toleration for his coreligionists. But unsuccessful rebellions led by the Duke of Monmouth in England and the Duke of Argyll in Scotland, in the summer of 1685, marked a turning point in his attitude. James's distrust of his subjects, conceived in the turbulent 1670s, was at once sharpened. The rebellions were put down with great ferocity, the army was considerably increased, and the new regiments were granted to Roman Catholic officers who had had military experience abroad and whose loyalty was undoubted. This last act of policy provoked a quarrel between King and Parliament, which was prorogued in November 1685, never to meet again. In 1686 the division between the King and his former allies, the Anglican Tories, deepened. After many of them had been replaced, the judges of King's Bench in the collusive action *Godden* v. ***Hales*** found in favour of the king's power to excuse individuals from the Test oath; Roman Catholics were admitted to the privy council and later to the high offices of state. A commission for ecclesiastical causes was set up to administer James's powers as supreme governor of the Anglican Church, and its first act was to suspend Henry Compton, bishop of London, one of the most outspoken critics of royal policy.

Religious policy

In 1687 James intensified his Roman Catholic policy and dismissed his Anglican brothers-in-law Clarendon and Rochester. Magdalen College, Oxford, was given over for the use of Roman Catholics, and a papal nuncio was officially accredited to St. James's. In April James issued the so-called Declaration of Indulgence suspending the laws against Roman Catholics and Protestant dissenters alike; in July he dissolved Parliament, and in September he launched an intensive campaign to win over the Protestant dissenters and with their aid secure a new Parliament more amenable to his wishes.

What those wishes were is still not clear: some of his utterances suggest a genuine belief in religious toleration as a matter of principle; others point to the establishment of Roman Catholicism as the dominant if not the exclusive religion of the state. This confusion may well reflect the state of James's own mind, which undoubtedly deteriorated in the years 1687–88, and some of his assertions, accusations, and threats at this time verge on the insane.

The unexpected news that the Queen was pregnant (November 1687), establishing the prospect of a Roman Catholic succession, had great effect on most Protestants; while a wholesale "remodelling" of borough corporations, lord lieutenancies, deputy lieutenancies, and magistracies that winter inflamed the majority of the nobility and gentry, whose political and social power suffered by it. Ever since the spring of 1687 many English leaders had been in touch with William of Orange, the husband of the heiress presumptive and the champion of Protestant Europe against Louis XIV. The spark was touched off by James himself, when he re-issued his Declaration of Indulgence on May 7, 1688, and on May 14 ordered it to be read in the churches. The Archbishop of Canterbury and six of his bishops petitioned James to withdraw the order. Their petition was subsequently published, and James made the mistake of prosecuting its authors for seditious libel. Meanwhile, on June 20, in slightly mysterious circumstances, the Queen gave birth to a son.

The "Glorious Revolution"

On July 10 the seven bishops were acquitted—a tremendous defeat for the government—and that same day seven leading Englishmen sent a letter inviting William of Orange to lead an army to England and call a free parliament to arbitrate on the legitimacy of the Prince of Wales. By September William's intentions were obvious, but James declined Louis XIV's offer of assistance for fear of the reaction in England; in any case he was confident in the ability of his forces to repel invasion. William sailed in late October, under cover of the general war that had by then broken out in Europe, evaded the English fleet, and landed at Tor Bay on November 15, 1688. In the subsequent "campaign," James's Protestant officers deserted to the enemy in such large numbers that he dared not commit the army to a pitched battle. This, together with the defection of his daughter Anne, finally shattered his nerve. He attempted to flee to France but was intercepted at Kent on December 21; 12 days later he was allowed to escape. On February 22, 1689, the Convention Parliament declared that James had abdicated, and next day offered the crown to William and Mary. The Scots Parliament followed suit in May.

In March 1689 James landed in Ireland, and a Parliament summoned to Dublin acknowledged him as King. But his Irish–French army was defeated by William at the Boyne (July 11, 1690), and he returned to France. William's generals reconquered Ireland the following year. In Ireland James had shown none of his former military ability and he now aged rapidly, falling increasingly under the influence of his pietistic wife. He became daily more absorbed in his devotions, and his more aggressive supporters soon came to regard him as something of a liability. The Treaty of Rijswijk between England and France (1697) removed his last hopes of restoration, and he died at Saint-Germain on September 16, 1701.

BIBLIOGRAPHY. F.C. TURNER, *James II* (1948), is the definitive biography and a very good one. MAURICE ASHLEY, *The Glorious Revolution of 1688* (1966), is brief but the best modern account. LORD MACAULAY, *History of England,* ch. *4–10* (1849–65), is biassed and in some respects out-of-date, but it is still the most detailed factual account.

(J.P.K.)

James, Henry

Henry James's career was one of the longest and most productive—and most influential—in American letters. A master of prose fiction from the first, he practiced it as a fertile innovator, enlarged the form, and placed upon it the stamp of a highly individual method and style. He wrote for 51 years—20 novels, 112 tales, 12 plays, several volumes of travel and criticism, and a great deal of literary journalism. Beyond his craft, he made himself a formidable figure in the transatlantic culture. He recognized and helped to fashion the myth of the American abroad—the encounter of the New World with the Old—and incorporated this myth in the "international novel" of which he was the artisan and master. His fundamental theme was the innocence of the New World, the corruption—and wisdom—of the Old, and the clash between the two. In his vision of an exuberant and democratic America confronting an alien aristocratic culture he had a troubled and prophetic sense of America's coming-of-age and the moral problems the United States would encounter as a world power in the 20th century.

Early life and works. James was born April 15, 1843, in New York City, just off Washington Square, which would give its name to one of his celebrated short novels. Although often characterized as a New Englander, he was actually a child of the Hudson Valley and, unlike the rural writers of Concord, was firmly rooted in an early urban America. His grandfather, an Irish immigrant who went to Albany just after the American Revolution, amassed one of the largest fortunes in the state; and while this was divided among numerous children, there was sufficient to give the future novelist a comfortable childhood. He was named for his father, Henry James (1811–82), a brilliant conversationalist and religious visionary, much influenced by Swedenborg and concerned in his writings with man's relation to God. The younger Henry was a second son; and he and his older brother, William (1842–1910), founder of psychological study and research in America and philosopher of pragmatism, were taken abroad as infants. In the ensuing two decades they crossed and recrossed the Atlantic, were schooled by tutors and governesses, and spent their preadolescent years in the then still parochial Manhattan. Returned to Geneva, Paris, and London during their teens, the James children acquired languages and an awareness of Europe vouchsafed to few Americans in their time. This phase of the novelist's life is vividly recorded in the autobiographies he wrote late in life, ***A Small Boy and Others*** (1913) and ***Notes of a Son and Brother*** (1914), in which he showed the roots of his precocious cosmopolitanism as well as early, vivid impressions of "old New York."

Education and travel

Henry James was a shy, book-addicted boy who assumed the role of quiet observer beside his active elder brother. From the first he was content to be "simply literary." On the eve of the Civil War the James family

Early short stories

settled at Newport, R.I., and there, and later in Boston, Henry came to know New England intimately. A back injury suffered as a volunteer fireman at Newport caused him to lead a sedentary life for some years and diminished his sense of guilt at his recoil from the fratricidal Civil War. (Years later, in a short story, he would portray a young pacifist, prepared to die for his beliefs, thereby proving himself a good soldier.) For a few months he entertained the illusion that he should have a professional career; in 1862, when he was 19, he enrolled at the Harvard Law School, but devoted his study time to Sainte-Beuve, Balzac, and Hawthorne. His first story appeared anonymously two years later in the New York *Continental Monthly.* His second tale, dealing with civilian life during the Civil War, appeared in *The Atlantic Monthly* in 1865 when he was 22. By this time he was reviewing books regularly in the *North American Review;* and when William Dean Howells became editor of the *Atlantic,* James found in him a friend and mentor who published him regularly. Between them, James and Howells inaugurated the era of American "realism." By his mid-20s James was regarded as one of the most skillful writers of short stories in America. Critics, however, deplored his tendency to write of the life of the mind, rather than of action. The stories of these early years show the leisurely existence of the well-to-do at Newport and Saratoga. They contain within them echoes of George Sand, Balzac, and Mérimée. His English model was George Eliot, his American, Hawthorne. His apprenticeship was thorough. He wrote stories, reviews, and articles for almost a decade before he attempted a full-length novel. There had to be also the traditional "grand tour," and James went abroad for his first adult encounter with Europe in 1869. In England he met Ruskin, Rossetti, William Morris, Leslie Stephen, and Darwin; he journeyed thence to Italy, which he had never visited as a boy. The Italian experience was profound, and he returned there repeatedly during his lifetime. His first important novel was set in Rome; and the Italian cities figure in his major works. While he was in England his beloved cousin Minny Temple, to whom he had formed a deep but reticent attachment, died. This shock, and the high emotion of his "passionate pilgrimage," provided much of the experience that would figure in works such as *The Portrait of a Lady* of his middle period and *The Wings of the Dove* of his final years. His year's wandering in England, France, and Italy set the stage for a lifetime of travel, always along the familiar and well-beaten paths of these countries. James never married. By nature he was friendly and even gregarious, but while he was an active observer and participant in society, and in his own literary world, he tended, until late middle age, to be "distant" in his relations with people and was careful to avoid "involvement."

Career—first phase. Recognizing the appeal of Europe, given his cosmopolitan upbringing, James made a deliberate effort to discover whether he could live and work in the United States. He spent 1870 to 1872 in Boston, during which he published his first significant American-European tale, "A Passionate Pilgrim," recording in it a deep yearning for historic England; and an early novel of Boston life, *Watch and Ward.* Two more years in Europe, mainly in Rome, and a winter of unremitting hackwork in New York convinced him that he could write better and live more cheaply abroad. Thus began his long expatriation—heralded by publication in 1875 of *Roderick Hudson,* the story of an American sculptor's struggle by the banks of the Tiber between his art and his passions. It was in effect James's "portrait of the artist as a young man." Simultaneously with this novel, James brought out *Transatlantic Sketches,* his first collection of travel writings, and a collection of tales. With these three substantial books, he inaugurated a career of authorship (hitherto confined to magazine writing) that saw some 100 volumes through the press during the next 40 years.

Paris and London international novels

During 1875–76 James lived in Paris, writing literary and topical letters for the *New York Tribune* and working on his novel *The American.* He sought out the Russian novelist Ivan Turgenev, whose work appealed to him, and through Turgenev was brought into Flaubert's *cénacle,* where James got to know Edmond de Goncourt, Zola, Daudet, and the then still unpublished Maupassant. James admired the intensity of the French writers, deplored their "unclean" subjects, and felt closest to Turgenev. From the Russian cosmopolite he received confirmation of his own view that a novelist need not worry about "story," that in focussing on character, he would arrive at the life experience of his protagonist. Much as he liked France, James felt he would be an eternal outsider there, and late in 1876 he crossed to London. There, in small rooms in Bolton Street off Piccadilly, he wrote the major fiction of his middle years. In 1878 he achieved international renown with his story of an American flirt in Rome, *Daisy Miller.* In England he was promptly taken up by the leading Victorians and became a regular at Lord Houghton's breakfasts, where he consorted with Tennyson, Gladstone, Browning, and others. A great social lion, James dined out 140 times during 1878 and 1879 and visited in many of the great Victorian houses and country seats. Elected to London clubs, publishing his stories simultaneously in English and American periodicals, mingling with Meredith, Robert Louis Stevenson, Edmund Gosse, and other writers, a familiar in the studios of Whistler and Sargent, he established himself as a significant figure in Anglo-American literary and artistic relations, along with his friend the poet and essayist James Russell Lowell, who in the 1880s was Washington's minister to the court of St. James's.

James's reputation was founded on his versatile studies of the "American girl." In a series of witty tales he pictured the "self-made" girl, the flirt, the bold, brash American innocent who insists upon American standards in European society. James ended this first phase of his career by producing his masterpiece, *The Portrait of a Lady,* a study of a young woman from Albany who brings to Europe her narrow provincialism and pretensions, but also her sense of her own sovereignty, her "free spirit," her refusal to be treated, in the Victorian world, merely as a marriageable object. As a picture of Americans moving in the expatriate society of England and of Italy this novel has no equal in the history of modern fiction. It is a remarkable study of a band of egotists while at the same time offering a shrewd appraisal of the American character. It embodies the national myth: an ideal of freedom and equality hedged with historical blindness and pride; a self-interest which often takes generous form; a sense of hurt when this generosity is interpreted as a wielding of power. James's understanding of power in personal relations was profound.

Novels of the 1880s

Short fiction of the second phase

Second phase—reformers and revolutionaries. Feeling that he had shot his bolt with his international novels and tales, James turned to new subjects during his second phase. In the 1880s he wrote two novels dealing with social reformers and revolutionaries, *The Bostonians* and *The Princess Casamassirna.* In the novel of Boston life James analyzed the struggle between conservative masculinity embodied in a Southerner living in the North and an embittered man-hating suffragette. *The Bostonians* remains the fullest and most rounded American social novel of its time in its study of cranks, faddists, and "do-gooders." In *The Princess Casamassima* James exploited the anarchist violence of the decade and depicted the struggle of a man who toys with revolution and is destroyed by it. These novels were followed by *The Tragic Muse,* in which James projected a study of the London and Paris art studios and the stage, the conflict between art and "the world." The novel raised the curtain on his own "dramatic years," 1890–95, during which he tried to win success on the stage. His dramatization of *The American* in 1891 was a modest success; but an original play, *Guy Domville,* produced in 1895, was a failure, and James was booed at the end of the first performance. Crushed and feeling that he had lost his public, he spent several years seeking to adapt his dramatic experience to his fiction. The result was a complete change in his storytelling methods. In *The Spoils of Poynton* (1897), *What Maisie Knew* (1897), *The Turn of the Screw* and *In the Cage* (1898), and *The Awkward Age* (1899) James began to use the methods of alternating "picture" and dramatic scene, close adherence to a given angle of vision, a withholding of information from the reader, making available to him only that which the characters see. The subjects of this period are the developing consciousness and moral education of children, principally young girls—in reality James's old international theme of innocence in a corrupting world, transferred to the English setting.

Final phase. The experiments of this "transition" phase led James to the writing of three grandiose novels at the beginning of the new century, which represent his final—his "major"—phase, as it has been called. In these novels James pointed the way for the 20th-century novel. He had begun as a Balzacian realist who describes minutely his crowded stage. He ended by leaving his stage comparatively bare, and showing a small group of characters in a tense situation, with a retrospective working out, through multiple angles of vision, of their drama. In addition to these technical devices he resorted to an increasingly allusive style, which became dense and charged with symbolic imagery. His late "manner" derived in part from his dictating directly to a typist; and in part from his unremitting search for ways of projecting subjective experience in a flexible prose, the sort of writing Proust would do after him in France. At the same time he extended his original subject from the narrow study of personal and interpersonal dilemmas to a view of society and civilization within which his characters struggle for self-identity and survival.

The three novels of the "major" phase

The first of the three novels was ***The Ambassadors,*** written in 1901 but published in 1903. This is a high comedy of American-European manners, of a middle-aged American who goes to Paris to bring back to a Massachusetts industrial town a wealthy young man who, in the view of his affluent family, has lingered too long abroad. The "ambassador" in the end is captivated by civilized Parisian life. The novel is a study in the growth of perception and awareness in the elderly hero, and it balances the relaxed moral standards of the Continent against the parochial rigidities of New England. The work is important not only for the story it tells, but for the way in which it is told, largely through the perceptions of the hero and the unfolding of his experiences.

The second of this series of novels was ***The Wings of the Dove,*** published in 1902, before ***The Ambassadors,*** although written after it. This novel, dealing with a melodramatic subject of great pathos, that of an heiress doomed by illness to die, avoids its cliche subject by focussing upon the characters surrounding the unfortunate young woman. They intrigue to inherit her millions. Told in this way, and set in London and Venice, it becomes a powerful study of well-intentioned humans who, with dignity and reason, are at the same time also birds of prey. In its shifting points of view and avoidance of scenes that would end in melodrama, ***The Wings of the Dove*** demonstrated the mastery with which James could take a tawdry subject and invest it with grandeur. His final novel was ***The Golden Bowl*** (1904), a study of adultery, with four principal characters; the first part of the story is seen through the eyes of the aristocratic husband and the second through the developing awareness of the wife.

The three novels transcend mere "plot" and "character" or the melodrama of their themes; in the comedy of ***The Ambassadors,*** in the soap-opera plot of the ***Wings,*** and in the high drama of the ***Bowl,*** James wrote a continuous picture of a flawed civilization that could preserve itself only by recognizing human privacy and freedom and the significance of moral and spiritual "controls." James's late novels are "philosophical" studies not only of Western society's modes of survival; they embody a social ethic that suggests that man in the West must cultivate the molds and traditions—however defective—that have shaped him out of chaos, and cherish the artifacts and forms by which he lives.

While many of James's tales were potboilers written for the current magazines, he achieved high mastery in the ghostly form, notably ***The Turn of the Screw,*** and in such remarkable narratives as "The Aspern Papers" and "The Beast in the Jungle"—his prophetic picture of dissociated 20th-century man lost in an urban agglomeration. As a critic James tended to explore the character and personality of writers as revealed in their creations; his essays are a brilliant series of studies, moral portraits, of the most famous novelists of his century, from Balzac to the Edwardian realists. His travel writings, ***English Hours, Italian Hours,*** and ***A Little Tour in France,*** portray the backgrounds James used for his fictions. Both in his light comedies and his tragedies, James's sense of the human scene was sure and vivid; and in spite of the mannerisms of his later style he was one of the great prose writers and stylists of his century.

James as a critic

Visit to America

In his later years, James lived in retirement in an 18th-century house at Rye in Sussex; he was called "Master" by Conrad, Ford Madox Ford, Max Beerbohm, and the younger Edwardians; and while he had a limited public after the 1880s he became the symbol of the literary establishment, the fount and oracle of the "modern novel." On completion of ***The Golden Bowl*** James in 1904–05 revisited the United States. He had lived abroad for 20 years, and in the interval America had become a great industrial and political power. James returned to the scenes of his childhood and youth in New York and in New England, travelled south to Florida and west to California; he lectured as he went on "The Lesson of Balzac," and was much in demand by literary and cultural organizations. His observation of the land and its people led him to write, on his return to England, a poetic volume of rediscovery and discovery, ***The American Scene*** (1907), prophetic in its vision of urban doom, spoliation and pollution of resources, and filled with misgivings over the anomalies of a "melting pot" civilization. The materialism of American life, the new age of advertising and public relations, the annihilation of America's modest past—the constant emphasis on "here-and-now"—deeply troubled James. On his return to England he set to work to shore up his own writings, and his own career, against this ephemeral world. He devoted three years to rewriting and revising his principal novels and tales for the highly selective "New York Edition" published in 24 volumes. He included 12 of his 20 novels and 66 of his 112 tales. The tales are grouped thematically rather than chronologically, as in Balzac's *Comédie humaine.* For this edition James wrote 18 significant prefaces, which contain both reminiscence and exposition of his theories of fiction. As theorist, he explains his use of a "central intelligence" in certain of his novels to provide maximum illumination of the human and psychological history he is recording; and he explains also his preference for a realism in which the story is narrated through successive scenes with minimal use of the old-fashioned omniscient author. In both his theory and practice James was a votary of aesthetic beauty infused with moral value; he believed in man's intellectual and reflective power, his sentience and "awareness," his ability to explore and grow in the understanding of his inner world. In this way he anticipates some of the insights of modern psychology. In his late work he is a dedicated solipsist, determined to reach as deeply as possible into man's inner life, and arrive at the integration of the self.

Travel writings and essays

During the Edwardian years James also revised his travel writings. The most important are included in ***English Hours*** and ***Italian Hours.*** His literary essays remain grouped in the volumes in which they originally appeared, ***French Poets and Novelists*** (1878), ***Partial Portraits*** (1888), ***Essays in London*** (1893), and ***Notes on Novelists*** (1914). Some of his art essays are included in ***Picture and Text*** (1893). Many of his fugitive pieces remain uncollected in the journals in which they originally appeared. He was also a remarkable letter writer, believing that correspondence, in the hands of a stylist, belongs to the highest forms of literary expression. Thousands of his holograph letters survive in the major libraries of the West, and notably in the Houghton Library at Harvard where the James family papers were deposited. While many letters are social and trivial, a certain proportion are highly documentary in their picture of life abroad and as a record of literary relations.

Honours came to James belatedly. He received degrees from Oxford and Harvard; he was elected to the National Institute of Arts and Letters and in 1905 to the American

Academy of Arts and Letters; and on becoming a British subject in 1915—throwing his moral weight into Britain's struggle in World War I—he received the Order of Merit from King George V. James died Feb. 28, 1916, and his ashes were taken to America and buried in the James family plot in Cambridge Cemetery, where the headstone describes him as "interpreter of his generation on both sides of the sea."

Reputation. James's public remained limited during his lifetime. Since the revival of interest in his work following centenary observances of 1943 he reached an ever-widening audience; his works were translated in many countries and he was recognized in the late 1960s as one of the subtlest craftsmen who ever practiced the art of the novel. His rendering of the inner, the "phantasmagoric," life made him a forerunner of the "stream of consciousness" movement in the 20th century. In his originality, distinction of style, and inventiveness he is the prototype of the disinterested American artist and a "novelist's novelist." Since mid-20th century he has acquired the status of a classic and also of a "culture-hero." Earlier hostility in the United States, because of his expatriation and abandonment of citizenship, has largely disappeared; and there exists a singular unanimity in English and American criticism in seeing him as a large creative figure who began as a "representationalist" and ended in the camp of the moderns as impressionist and symbolist. Writers as different as James Joyce and Graham Greene, Conrad and Virginia Woolf, were influenced by him; and the modern school of fictional criticism regards him as its supreme theorist, deriving from him much of its fundamental terminology.

MAJOR WORKS

NOVELS: *Roderick Hudson,* 1875; *The American,* 1877; *Watch and Ward,* 1878; *The Europeans,* 1878; *Daisy Miller,* 1878; *Confidence,* 1879; *Washington Square,* 1880; *The Portrait of a Lady,* 1881; *The Bostonians,* 1886; *The Princess Casamassima,* 1886; *The Reverberator,* 1888; *The Tragic Muse,* 1890; *The Other House,* 1896; *The Spoils of Poynton,* 1897; *What Maisie Knew,* 1897; *In the Cage,* 1898; *The Awkward Age,* 1899; *The Sacred Fount,* 1901; *The Wings of the Dove,* 1902; *The Ambassadors,* 1903; *The Golden Bowl,* 1904; *The Ivory Tower,* 1917 (unfinished); *The Sense of the Past,* 1917 (unfinished).

SHORT STORIES: *A Passionate Pilgrim and Other Tales,* 1875; *An International Episode,* 1879; *The Madonna of the Future and Other Tales,* 1879; *The Diary of a Man of Fifty,* 1880; *The Siege of London,* 1883; *Tales of Three Cities,* 1884; *The Author of Beltraffio,* 1885; *Stories Revived,* 1885; *The Aspern Papers,* 1888; *A London Life,* 1889; *The Lesson of the Master,* 1892; *The Real Thing and Other Tales,* 1893; *The Private Life,* 1893; *Terminations,* 1895; *Embarrassments,* 1896; *The Two Magics: The Turn of the Screw, and Covering End,* 1898; *The Soft Side,* 1900; *The Better Sort,* 1903; *Julia Bride,* 1909; *The Finer Grain,* 1910; *The Outcry,* 1911 (based on an unproduced play).

PLAYS: *Daisy Miller,* 1883; *The American,* 1891; *Theatricals,* 1894 (two comedies, *Tenants* and *Disengaged); Guy Domville,* 1895; *Theatricals: Second Series,* 1894 *(The Album* and *The Reprobate); The High Bid,* 1908.

TRAVEL SKETCHES: *Transatlantic Sketches,* 1875; *Portraits of Places,* 1883; *A Little Tour in France,* 1884; *English Hours,* 1905; *The American Scene,* 1907; *Italian Hours,* 1909.

LITERARY AND ART STUDIES: *French Poets and Novelists,* 1878; *Hawthorne,* 1879; *The Art of Fiction,* 1884; *Partial Portraits,* 1888; *Picture and Text,* 1893; *William Wetmore Story and His Friends,* 1903; *The Question of Our Speech,* 1905 (and "The Lesson of Balzac," two lectures); *Views and Reviews,* 1908; *Notes on Novelists,* 1914; *Notebooks,* 1947.

AUTOBIOGRAPHICAL: *A Small Boy and Others,* 1913; *Notes of a Son and Brother,* 1914; *The Middle Years,* 1917.

BIBLIOGRAPHY. LEON EDEL, *The Life of Henry James,* 5 vol. (1953–72), is the only full-length biography of the novelist. It is based on his unpublished correspondence, diaries, and other documents and treats all the stages of his development as artist and his career in the United States and abroad. A concise biography, largely critical, by F.W. DUPEE, *Henry James,* was published in 1951. A valuable collection of biographical anecdotes is SIMON NOWELL-SMITH, *Legend of the Master* (1947). S. GORLEY PUTT, *Henry James: A Reader's Guide* (1966), is a useful survey of James's novels and tales. A complete bibliography of James's writings, listing his unsigned work in periodicals as well as all editions of his novels and tales, *A Bibliography of Henry James,* by LEON EDEL and DAN H. LAURENCE, was issued in the Soho Bibliographies (1957; rev. ed., 1961). A valuable early survey of James's work is PELHAM EDGAR, *Henry James: Man and Author* (1927). The first important treatment of the late novels is in PERCY LUBBOCK, *The Craft of Fiction* (1921); a later work, based on the then unpublished *Notebooks,* was F.O. MATTHIESSEN, *Henry James: The Major Phase* (1944); see also FREDERICK C. CREWS, *The Tragedy of Manners: Moral Drama in the Later Novels of Henry James* (1957); and STEPHEN SPENDER, *The Destructive Element: A Study of Modern Writers and Beliefs* (1935). Important essays on James may be found in EDMUND WILSON, *The Triple Thinkers* (1938); R.P. BLACKMUR, *The Lion and the Honeycomb* (1955); F.R. LEAVIS, *The Great Tradition* (1948), which places James with Conrad and George Eliot as the major novelists of the English tradition; and in LIONEL TRILLING, *The Liberal Imagination* (1950), containing a study of *The Princess Casamassima.* A comprehensive evaluation of James as critic was published by RENE WELLEK, "Henry James's Literary Theory and Criticism," in *American Literature,* 30:293–321 (1958). DOROTHEA KROOK, *The Ordeal of Consciousness in Henry James* (1962), is a measured study of James's mental processes in his fiction. A great many specialized studies of James are listed in the annual bibliographies of the *Publications of the Modern Language Association.*

(L.Ed.)

James, William

William James, eminent American psychologist and philosopher, was leader of the movement known as Pragmatism, which stresses the role of action in the formulation of belief. Although deeply concerned with experiential religious faith, James represents a reaction against all monistic absolutisms, such as that of his friend, Josiah Royce, an American Idealist.

William **James.**

Home environment

Early life and education. James was born in New York City on January 11, 1842. He was the eldest son of Henry James, an idiosyncratic and voluble man of pungent wit and vigorous writing style, whose philosophical interests attracted him to the theology of Emanuel Swedenborg. One of William's brothers was the distinguished Henry James, novelist and critic and one of the most influential theorists of fiction in the English-speaking world. The elder Henry James had begun as a theological student but had developed at Princeton Theological Seminary an "antipathy to all ecclesiasticisms which he expressed with abounding scorn and irony throughout all his later years." Both his physical and spiritual life were marked by restlessness and wanderings, largely in Europe, that affected the training of his children at school and their education at home. Building upon the works of Swedenborg, which had been proffered as a revelation from God for a new age of truth and reason in religion, the elder James had constructed a system of his own that seems to have served him as a vision of spiritual life. This philosophy provided the permanent intellectual atmosphere of William's home life, to some degree compensating for the undisciplined irregularity of his schooling, which ranged from New York to Boulogne, France, and to Geneva and back. The habits acquired in dealing with his father's views at dinner and at tea carried over into the extraordinarily sympathetic yet critical manner that William displayed in dealing with anybody's views on any occasion.

Medical training

When James was 18 years of age he tried his hand at studying art, under the tutelage of William M. Hunt, an American painter of religious subjects. But he soon tired of it and the following year entered the Lawrence Scientific School of Harvard University. From courses in chemistry, anatomy, and similar subjects there, he went to the study of medicine in the Harvard Medical School; but he interrupted this study in order to accompany the eminent naturalist Louis Agassiz, in the capacity of assistant, on one of his most important explorations, an expedition to the Amazon. There James's health failed, and his duties irked him. He returned to the medical school for a term and then during 1867–68 went to Germany for courses with the physicist and physiologist Hermann von Helmholtz, who formulated the law of the conservation of energy; with Rudolf Virchow, a pathologist; and with Claude Bernard, the foremost experimentalist of 19th-century medicine; and with others. At the same time he read widely in the psychology and philosophy then current, especially the writings of Charles Renouvier, a Kantian Idealist and relativist.

The acquaintance with Renouvier was a focal point in James's personal and intellectual history. He seems from adolescence to have been a delicate boy, always ailing, and at this period of his stay in Germany he suffered a breakdown, with thoughts of suicide. When he returned home in November 1868, after 18 months in Germany, he was still ill. Though he took the degree of M.D. at the Harvard Medical School in June 1869, he was unable to begin practice. Between that date and 1872 he lived in a state of semi-invalidism in his father's house, doing nothing but reading and writing an occasional review. Early in this period he experienced a sort of phobic panic, which persisted until the end of April 1870. It was relieved, according to his own statement, by the reading of Renouvier on free will and the decision that "my first act of free will shall be to believe in free will." The decision carried with it the abandonment of all determinisms—both the scientific kind that his training had established for him and that seems to have had some relation to his neurosis and the theological, metaphysical kind that he later opposed in the notion of "the block universe." His revolutionary discoveries in psychology and philosophy, his views concerning the methods of science, the qualities of men, and the nature of reality all seem to have received a definite propulsion from this resolution of his poignant personal problem.

Interest in psychology. In 1872 James was appointed instructor in physiology in Harvard College, in which capacity he served until 1876. But he could not be diverted from his ruling passion, and the step from teaching physiology to teaching psychology—not the traditional "mental science" but physiological psychology—was as inevitable as it was revolutionary. It meant a challenge to the vested interests of the mind, mainly theological, that were entrenched in the colleges and universities of the United States; and it meant a definite break with what Santayana called "the genteel tradition." Psychology ceased to be mental philosophy and became a laboratory science. Philosophy ceased to be an exercise in the grammar of assent and became an adventure in methodological invention and metaphysical discovery.

With his marriage in 1878, to Alice H. Gibbens of Cambridge, Massachusetts, a new life began for James. The old neurasthenia practically disappeared. He went at his tasks with a zest and an energy of which his earlier record had given no hint. It was as if some deeper level of his being had been tapped: his life as an originative thinker began in earnest. He contracted to produce a textbook of psychology by 1880. But the work grew under his hand, and when it finally appeared in 1890, as *The Principles of Psychology*, it was not a textbook but a monumental work in two great volumes, from which the textbook was condensed two years later.

Major work in psychology

The *Principles*, which was recognized at once as both definitive and innovating in its field, established the functional point of view in psychology. It assimilated mental science to the biological disciplines and treated thinking and knowledge as instruments in the struggle to live. At one and the same time it made the fullest use of principles of psychophysics (the study of the effect of physical processes upon the mental processes of an organism) and defended, without embracing, free will.

Interest in religion. The *Principles* completed, James seems to have lost interest in the subject. Creator of the first U.S. demonstrational psychological laboratory, he disliked laboratory work and did not feel himself fitted for it. He liked best the adventure of free observation and reflection. Compared with the problems of philosophy and religion, psychology seemed to him "a nasty little subject" that he was glad to have done with. His studies, which were now of the nature and existence of God, the immortality of the soul, free will and determinism, the values of life, were empirical, not dialectical; James went directly to religious experience for the nature of God, to psychical research for survival after death, to fields of belief and action for free will and determinism. He was searching out these things, not arguing foregone conclusions. Having begun to teach ethics and religion in the late 1880s, his collaboration with the psychical researchers dated even earlier. Survival after death he ultimately concluded to be unproved; but the existence of divinity he held to be established by the record of the religious experience, viewing it as a plurality of saving powers, "a more of the same quality" as oneself, with which, in a crisis, one's personality can make saving contact. Freedom he found to be a certain looseness in the conjunction of things, so that what the future will be is not made inevitable by past history and present form; freedom, or chance, corresponds to Darwin's "spontaneous variations." These views were set forth in the period between 1893 and 1903 in various essays and lectures, afterward collected into works, of which the most notable is *The Will to Believe and Other Essays in Popular Philosophy* (1897). During this decade, which may be correctly described as James's religious period, all of his studies were concerned with one aspect or another of the religious question.

His natural interest in religion was reinforced by the practical stimulus of an invitation to give the Gifford Lectures on natural religion at the University of Edinburgh. He was not able to deliver them until 1901–02, and their preparation focussed his labours for a number of years. His disability, involving his heart, was caused by prolonged effort and exposure during a vacation in the Adirondacks in 1898. A trip to Europe, which was to have taken up a sabbatical year away from university duties, turned into two years of invalidism. The Gifford Lectures were prepared during this distressful period. Published as *The Varieties of Religious Experience* (1902), they had an even greater acclaim as a book than as articles. Cautious and tentative though it was, the rich concreteness of the material and the final summary of the evidence—that the varieties of religious experience point to the existence of specific and various reservoirs of consciousness-like energies with which we can make specific contact in times of trouble—touched something fundamental in the minds of religionists and at least provided them with apologetic material not in conflict with science and scientific method. The book was the culmination of James's interest in the psychology of religion.

Career in philosophy. James now explicitly turned his attention to the ultimate philosophic problems that had been at least marginally present along with his other interests. Already in 1898, in a lecture at the University of California on philosophical conceptions and practical results, he had formulated the theory of method known as Pragmatism. Originating in the strict analysis of the logic of the sciences that had been made in the middle

Early work on Pragmatism

1870s by Charles Sanders Peirce, the theory underwent in James's hands a transforming generalization. He showed how the meaning of any idea whatsoever—scientific, religious, philosophical, political, social, personal—can be found ultimately in nothing save in the succession of experiential consequences that it leads through and to; that truth and error, if they are within the reach of the mind at all, are identical with these consequences. Having made use of the pragmatic rule in his study of religious experience, he now turned it upon the ideas of change and chance, of freedom, variety, pluralism, and novelty, which, from the time he had read Renouvier, it had been his preoccupation to establish. He used the pragmatic rule in his polemic against monism and the "block universe," which held that all of reality is of one piece (cemented, as it were, together); and he used this rule against internal relations (*i.e.*, the notion that you cannot have one thing without having everything), against all finalities, staticisms, and completenesses. His classes rang with the polemic against absolutes, and a new vitality flowed into the veins of American philosophers. Indeed, the historic controversy over Pragmatism saved the profession from iteration and dullness.

Meanwhile (1906), James had been asked to lecture at Stanford University, in California, and experienced there the earthquake that nearly destroyed San Francisco. The same year he delivered the Lowell Lectures in Boston, afterward published as *Pragmatism: A New Name for Old Ways of Thinking* (1907). Various studies appeared —"Does Consciousness Exist?" "The Thing and Its Relations," "The Experience of Activity"—chiefly in *The Journal of Philosophy;* these were essays in the extension of the empirical and pragmatic method, which were collected after James's death and published as *Essays in Radical Empiricism* (1912). The fundamental point of these writings is that the relations between things, holding them together or separating them, are at least as real as the things themselves; that their function is real; and that no hidden substrata are necessary to account for the clashes and coherences of the world. The Empiricism was radical because until this time even Empiricists believed in a metaphysical ground like the hidden turtle of Hindu mythology on whose back the cosmic elephant rode.

James was now the centre of a new life for philosophy in the English-speaking world. The continentals did not "get" Pragmatism; if its German opponents altogether misunderstood it, its Italian adherents—among them, of all people, the critic and devastating iconoclast Giovanni Papini—travestied it. In England it was championed by F.C.S. Schiller, in the United States by Dewey and his school, in China by Hu Shih. In 1907 James gave his last course at Harvard. In the spring he repeated the lectures on Pragmatism at Columbia University. It was as if a new prophet had come; the lecture halls were as crowded on the last day as on the first, with people standing outside the door. He was feted and photographed; he himself describes the visit as the "high tide of my existence." Shortly afterward came an invitation to give the Hibbert Lectures at Oxford University. These lectures, published in 1909 as *A Pluralistic Universe,* state, in a more systematic and less technical way than the *Essays,* the same essential positions. They present, in addition, certain religious overbeliefs of James's, which further thinking—if the implications of the posthumous *Some Problems in Philosophy* may be trusted—was to mitigate. These overbeliefs involve a panpsychistic interpretation of experience (one that ascribes a psychic aspect to all of nature) that goes beyond radical Empiricism and the pragmatic rule into conventional metaphysics.

Home again, James found himself working, against growing physical trouble, upon the material that was partially published after his death as *Some Problems in Philosophy* (1911). He also collected his occasional pieces in the controversy over Pragmatism and published them as *The Meaning of Truth* (1909). Finally, his physical discomfort exceeded even his remarkable voluntary endurance. After a fruitless trip to Europe in search of a cure, he returned, going straight to the country home in Chocorua, New Hampshire, where he died on August 26, 1910.

Philosophy of world and man

Significance and influence. It is still too early to estimate James's significance and influence. In psychology, his work is of course dated, but it is dated as is Galileo's in physics or Darwin's in biology because it is the originative matrix of the great variety of new developments that are the current vogue. In philosophy, his positive work is still prophetic. The world he argued for was soon reflected in the new physics, as diversely interpreted, with its resonances from Charles Peirce, particularly by Albert Einstein, Bertrand Russell, and the Danish quantum physicist Niels Bohr—a world of events connected with one another by kinds of next to next relations, a world various, manifold, changeful, originating in chance, perpetuated by habits (that the scientist calls laws), and transformed by breaks, spontaneities, and freedoms. In human nature, James believed, these visible traits of the world are equally manifest. The real specific event is the individual, whose intervention in history gives it in each case a new and unexpected turn. But in history, as in nature, the continuous flux of change and chance transforms every being, invalidates every law, and alters every ideal.

James lived his philosophy. It entered into the texture and rhythms of his rich and vivid literary style. It determined his attitude toward scientifically unaccepted therapies, such as Christian Science or mind cure, and repugnant ideals, such as militarism. It made him an anti-imperialist, a defender of the small, the variant, the unprecedented, the weak, wherever and whenever they appeared. His philosophy is too viable and subtle, too hedged, experiential, and tentative to have become the dogma of a school. It has functioned rather to implant the germs of new thought in others than to serve as a standard old system for others to repeat.

For the James–Lange theory of emotions, see EMOTION: *Emotion as bodily sensation: James–Lange theory;* for his philosophy, see PRAGMATISM: *James.*

MAJOR WORKS

PSYCHOLOGY: *The Principles of Psychology,* 2 vol. (1890); *Talks to Teachers on Psychology: and to Students on Some of Life's Ideals* (1899).

PHILOSOPHY AND RELIGION: *Is Life Worth Living?* (1896); *The Will to Believe and Other Essays in Popular Philosophy* (1897); *Human Immortality* (1898); *The Varieties of Religious Experience* (1902); *The Sentiment of Rationality* (1905); *Pragmatism: A New Name for Old Ways of Thinking* (1907); *A Pluralistic Universe* (1909); *The Meaning of Truth* (1909); *Some Problems in Philosophy* (1911); *Essays in Radical Empiricism* (1912).

OTHER WORKS: *The Literary Remains of Henry James* (1885), containing some of his father's views on life.

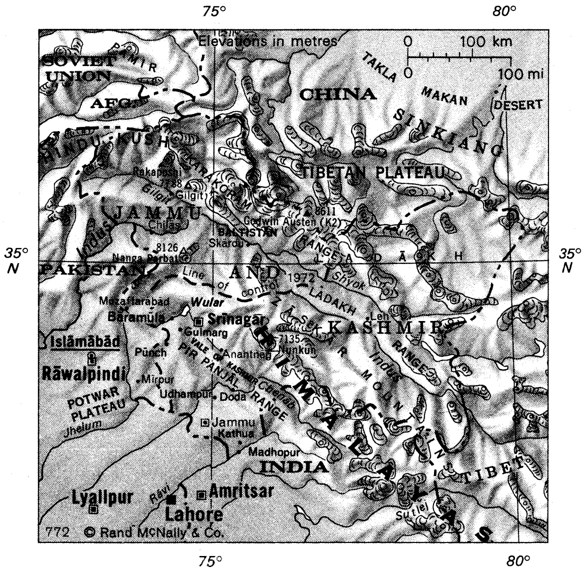
BIBLIOGRAPHY. The best and most comprehensive biography, richly documented, is still RALPH B. PERRY, *The Thought and Character of William James,* 2 vol. (1935), which should be supplemented by the following: *The Letters of William James,* 2 vol., ed. by his son, HENRY JAMES (1920), valuable as a historical and biographical source; *The Philosophy of William James, Drawn from His Own Works,* with an introduction by HORACE M. KALLEN (1925); GAY WILSON ALLEN, *William James* (1967), a sympathetic popularization; and HENRY JAMES, *Notes of a Son and Brother* (1914). See also HENRI BERGSON'S provocative chapter on James in *The Creative Mind* (1946); T. FLOURNOY, *La Philosophie de William James* (1911; Eng. trans., 1917); and C.H. GRATTAN, *The Three Jameses* (1932, reprinted 1962).

(H.M.K.)

Jammu and Kashmir

The territory of Jammu and Kashmir, situated in the northern part of the Indian subcontinent in the vicinity of the western Himalayan mountain range, has been in dispute between India and Pakistan since the partition of India in 1947. Formerly one of the largest princely states of India, it is bounded on the northwest by Afghanistan, on the north by the Sinkiang-Uighur Autonomous Region of China, on the east by Tibet (the Tibetan Autonomous Region), on the south by the Indian states of Himachal Pradesh and the Punjab, and to the west by Pakistan's Northwest Frontier Province and Punjab Province.

The territory has an area of 86,023 square miles (222,798 square kilometres); it is divided by a "line of control,"



JAMMU AND KASHMIR

agreed on in 1972, that leaves an area of 32,358 square miles (83,806 square kilometres) in the north and west to Pakistan and the remainder, amounting to 53,665 square miles (138,992 square kilometres), under Indian control. Repeated United Nations attempts to settle the dispute by holding a plebiscite have been unsuccessful: a plebiscite has not been held, and the dispute has been further complicated by Chinese incursions into the territory from the north.

The population of Jammu and Kashmir is believed to be about 5,900,000; the inhabitants of the Indian sector were estimated to number 4,600,000 in 1971, and those of the Pakistani sector were estimated at 1,300,000. The administrative capital of the Indian sector is Srinagar in summer and Jammu in winter; the administrative capital of the Pakistani sector is Muzaffarābād. The Vale of Kashmir, located in the Indian sector, is renowned for its beauty and fertility. (For associated physical features, see HIMALAYAN MOUNTAIN RANGES; INDUS RIVER; and KARAKORAM RANGE; for further historical background, see INDIAN SUBCONTINENT. HISTORY OF THE.)

History. Buddhism and Hinduism penetrated Jammu and Kashmir at an early date; from the 9th to the 12th century AD, the region appears to have achieved considerable prominence as a centre of Hindu culture. It was brought under Muslim rule in the 14th century, and it remained so for some five centuries until Sikh and then Dogra (hill Rājput) rulers assumed control in the 19th century. (The Sikhs are a religious community of northern India.)

Raja Gulab Singh

The state of Jammu and Kashmir, in its contemporary form, dates from 1846, when, by the treaties of Lahore and Amritsar at the conclusion of the First Sikh War, Raja Gulab Singh, the Dogra ruler of Jammu, was created maharaja (ruling prince) of an extensive but somewhat ill-defined Himalayan kingdom "to the eastward of the River Indus and westward of the River Rāvi." For the British the creation of this princely, protected state helped to safeguard their northern flank in their advance to the Indus and beyond during the latter part of the 19th century; the state thus formed part of a complex political buffer zone interposed by the British between their Indian empire and the empires of Russia and China to the north. For Gulab Singh, confirmation of title to these mountain territories marked the culmination of almost a quarter of a century of campaigning and diplomatic negotiation among the petty hill kingdoms along the northern borderlands of the Sikh empire of the Punjab.

Boundaries. Some attempts were made in the 19th century to define the boundaries of the state, but precise definition was in many cases defeated by the nature of the country and by the existence of huge tracts lacking permanent human settlement. In the far north, for example, the maharaja's authority certainly extended to the Karakoram Range, but beyond lay a debatable zone on the borders of the Turkistan and Sinkiang regions of Central Asia, and the boundary was never demarcated. There were similar doubts about the alignment of the frontier where this northern zone skirted the district known as Aksai Chin, to the east, and joined the better known and more precisely delineated boundary with Tibet, which had served for centuries as the eastern border of the Ladākh region of what is now Jammu and Kashmir. The pattern of boundaries in the northwest became clearer in the last decade of the 19th century, when Britain delimited boundaries in the Pamir region in negotiations with Afghanistan and Russia. At this time Gilgit, always understood to be part of Kashmir, for strategic reasons was constituted as a special agency in 1889 under a British agent.

Counterclaims of India and Pakistan. As long as the existence of the state was guaranteed by the United Kingdom, the weaknesses in its structure and along its peripheries were not of great consequence; following the withdrawal of the United Kingdom from South Asia in 1947, however, they became apparent. By the terms agreed upon for the partition of the Indian subcontinent between India and Pakistan, the rulers of princely states were given the right to opt for either Pakistan or India or—with certain reservations—to remain independent. The maharaja of Kashmir, Hari Singh, initially believed that by delaying a decision he could maintain the independence of Kashmir, but, caught up in a train of events that included a revolution among his Muslim subjects along the western borders of the state and the intervention of Pathan tribesmen. he signed an Instrument of Accession to the Indian Union on October 26, 1947. This was the signal for intervention both by Pakistan, which considered that the state was a natural extension of Pakistan, and by India, which intended to confirm the act of accession. Localized war continued during 1948 and was terminated through the agency of the United Nations in a cease-fire, which took effect in January 1949. In July of the same year, India and Pakistan defined a cease-fire line that divided the administration of the territory. This left Jammu, together with part of the districts of Pūnch and Mirpur, the Vale of Kashmir, and the LadHkh region, under Indian control and western Pūnch (which, together with Muzaffarābād and part of Mirpur, formed Azad Kashmir), Gilgit, and Baltistān under Pakistan's authority. Regarded merely as a temporary expedient, this partition along the cease-fire line still existed in the early 1970s, though warfare between the two contestants was briefly resumed in 1965 and again in 1971, despite the many proposals made to end the dispute.

The 1947 to 1949 hostilities

Chinese interests. The conflicts within the state were heightened by tensions at the periphery when a manifestation of Chinese power created an additional problem. After the Chinese Communist conquest of Tibet and the resurgence of Chinese power in Sinkiang, on the border with the Soviet Union, Chinese forces penetrated into the northeastern parts of Ladākh; by 1956–57 they had completed a military road through Aksai Chin to provide better communication between Sinkiang and western Tibet. The belated discovery of the existence of this road by Indian patrols led to border clashes. Indian refusal to negotiate with China on the alignment of the Ladākhi boundary in this area was in contrast with the willingness of Pakistan to reach a settlement with China on the course of the Karakoram boundary that lies within Pakistani-administered Kashmir.

The seven geographic zones

Physical geography. Physiographically, the territory comprises a number of zones that are closely associated with the structural components of the western Himalayas. From southwest to northeast these zones consist of the plains, the foothills, the Pir Panjāl Range, the Vale of Kashmir, the central Himalayan zone, the Upper Indus Valley, and the Karakoram Range.

The plains. The narrow zone of plains country in Jammu and Pūnch is characterized by interlocking sandy alluvial fans (fan-shaped accumulations of debris) that have been deposited by streams discharging from the foothills and by a much-dissected pediment (eroded bedrock surface) covered by loams and loess (wind-deposited silt) of the Pleistocene Epoch (about 10,000 to 2,500,000 years old). Rainfall is low, amounting to about 15 or 20 inches (380 to 500 millimetres) a year, and it occurs mainly in the form of heavy but infrequent showers in the summer (June to September), when the monsoon winds blow. The countryside has been almost entirely denuded of trees, and thorn scrub and coarse grass are the dominant forms of vegetation.

The foothills. The foothills of the Himalayas, rising from 2,000 to 7,000 feet (600 to 2,100 metres) comprise an outer zone and an inner zone. The outer zone consists of sandstones, clays, silts, and conglomerates, influenced by Himalayan folding movements and eroded to form long ridges and valleys (duns). The inner zone consists of more massive sedimentary rock, including red sandstones of the Miocene Epoch (about 7,000,000 to 26,000,000 years old), that has been folded, fractured, and eroded to form steep spurs and plateau remnants. River valleys are deeply incised and terraced, and faulting has produced a number of alluvium-filled basins, such as those of Udhampur and Pūnch. Rainfall increases with elevation, and the lower scrubland gives way to pine forests at higher altitudes.

The Pīr Panjāl Range. The Pir Panjiil Range constitutes the first mountain rampart associated with the Himalayas. It has an average crest line of 12,500 feet, with individual peaks rising to 15,000 feet. Consisting of an ancient rock core of granites, gneisses, quartz rocks, and slates, it has been subject to considerable uplift and fracturing and was heavily glaciated during the Pleistocene Epoch. The range receives considerable winter snowfall as well as summer rain and has extensive areas of pasture above the tree line.

The Vale of Kashmir. The Vale of Kashmir is a deep, asymmetrical basin lying between the Pir Panjiil and the central Himalayan ranges at an average altitude of 5,300 feet (1,600 metres). During the Pleistocene Epoch it was occupied at times by a lake, known as Lake Karewa, and is now filled by lacustrine sediments and alluvium deposited by the Upper Jhelum River at elevations of up to some 6,000 feet above sea level. Soil and water conditions vary considerably, and the climate is characterized by an annual rainfall of about 30 inches, some of which is derived from the summer monsoon winds and some from winds associated with winter depressions. Temperatures are modified by altitude; average minimum temperatures of about 11" F (—12" C) occur in January and average maximum temperatures of 99" F (37" C) in July. Up to 7,000 feet, woodlands of deodar (Indian cedar), blue pine, walnut, willow, elm, and poplars occur; from 7,000 to 10,500 feet coniferous forests with fir, pine, and spruce are found; from 10,500 to 12,000 feet birch is dominant; and above 12,000 feet there are meadows with rhododendrons, dwarf willows, and honeysuckle.

Forests and woodlands in the Vale of Kashmir

The central Himalayan zone. Geologically complex and topographically immense, the central Himalayan zone has ranges reaching more than 20,000 feet and deeply entrenched, remote valleys. The region was heavily glaciated in the Pleistocene Epoch, and remnant glaciers and snowfields are still present. The zone receives some rain from the Indian monsoon winds in the summer months, and the lower slopes are forested, but the mountains, nevertheless, constitute a climatic divide, representing a transition from the monsoon climate of the Indian subcontinent to the dry, continental climate of Central Asia.

The Upper Indus Valley. The valley of the Upper Indus is a well-defined feature that follows the geological strike (structural trend) westward from the Tibetan border to the point where it rounds the great mountainous mass of Nringa Parbat to run southward in deep gorges cut across the strike. In its upper reaches it is flanked by gravel terraces; each tributary builds an alluvial fan out into the main valley. The town of Leh in the Indian sector stands on such a fan, 11,500 feet above sea level, with a climate characterized by almost total lack of rainfall, intense insolation (exposure to the Sun's rays), and great diurnal and annual ranges of temperature. Life depends on meltwater from the surrounding mountains, and vegetation is alpine (above the limit of tree growth), growing on thin skeletal soils.

The Karakoram Range. The great granite-gneiss massifs (mountain masses) of the Karakoram contain some of the world's highest peaks, including K2, or Mt. Godwin Austen, with an altitude of 28,250 feet (8,611 metres); at least 30 other peaks exceed 24,000 feet. The range, which is still being glaciated, rises starkly from dry, desolate plateaus characterized by extremes of temperature and shattered rock debris. The Karakoram region is aptly named the "roof of the world."

The great mountain peaks

Animal life. Wild animals include ibex, urial (a species of wild sheep with a reddish coat), the Kashmir stag, black and brown bears, and many game birds, including vast numbers of migratory duck.

The people. *Rural settlements.* Physiographic diversity is matched by the considerable differences that occur in the forms of human occupation of the country.

In the plains and foothills, agricultural settlements have resulted from colonization movements from the Punjab extending over a long period; both the people and their culture are similar to those of adjacent parts of the Punjab and other lowlands to the west. Where alluvial soils and the availability of water for irrigation make agriculture possible in the *dūn*s and lower valleys, population densities of 300 to 400 per square mile (120 to 150 per square kilometre) are sustained by crops of wheat and barley, which are gathered in the spring (*rabīʿ*) harvest, and of maize and millet, gathered in the late summer (*kharif*) harvest, as well as by the keeping of livestock. The upper sections of the valleys support a sparser population who depend on a maize, cattle, and forestry economy in which seasonal migration to higher pastures in the spring is necessary for the production of milk and clarified butter, or ghee, for southern lowland markets. In winter the hillmen return to lower areas to work in state forests and timber mills. Agricultural hamlets and nucleated villages predominate, and towns such as Jammu and Udhampur function essentially as market centres and administrative headquarters for the rural populations and estates in the vicinity.

Jammu and Pūnch. Jammu, winter capital of the maharajas and second city of the state, with a population in 1971 of more than 155,000, was traditionally the seat of Dogra power and serves a largely Hindu population. Of the total population of Jammu—1,500,000 in 1961—approximately 1,000,000 were classed as Hindus; of these the greater part live in the southeastern territories. Culturally, ethnically, and linguistically, they are closely related to the Hindus in the Punjab state of India, many speaking the Dogri language. The majority of the 63,000 Sikhs recorded at the 1961 census also live in Jammu. To the northwest, however, the proportion of Muslims increases, with Muslims constituting a dominant majority in western Pūnch. Here cultural and economic ties are closer with Riiwalpindi (the interim capital of Pakistan since 1959) and the Punjab province of Pakistan, and the inhabitants have consistently opposed Hindu–Dogra rule.

Kashmiris of the Vale and highlands. The Vale of Kashmir with its surrounding highlands (Kashmir proper) has always retained something of its own individuality. Of the 2,000,000 Kashmiris in the Vale, the vast majority—about 90 percent—are Muslims: culturally and ethnically, links are closest with the northwestern highlands. The Kashmiri language is influenced by Sanskrit and belongs to the Dardic group of Aryan languages, spoken by the various hill tribes of Gilgit in the northwest; physical traits of the population suggest early connections in the same direction.

The Kashmiri language

The people of Ladākh and Baltistān. Across the main Himalayan divide, the people are as different as the landscape. Ladākh (sometimes called "little Tibet"), to the northeast, is thinly populated; its 10,000 inhabitants are of Tibetan racial stock and language (Ladakhi) and hold the Buddhist faith, while Baltistrin to the north, with its administrative centre at Skiirdu, is inhabited by people of similar stock who have been converted to Islām.

Administration and social conditions. Before its division, the territory of the state as a whole was composed of the provinces of Jammu, Kashmir, and the border states—Ladiikh, Baltistān, and the Gilgit Agency. Jammu, with Pūnch, is divided into the districts of Jammu, Kathua, Udhampur, Riijauri, Mirpur, and Doda. Kashmir is divided into the districts of Anantniig, Bāramūlla, Astor, Muzaffariibiid, and Srinagar. Muzaffariibiid and part of Mirpur and Pūnch comprise the state of Azad (meaning "free") Kashmir, which is under the protection of Pakistan, while Baltistiin, Astor, and the Gilgit Agency are administered directly by Pakistan. Ladiikh, Jammu, Srīnagar, Kathua, Udhampur, Rājauri, Anantnāg, Bāramūlla, Doda, and part of Pūnch form the Indian state and are represented in the Lok Sabha (House of the People, or lower house) of the Indian Parliament as the state of Jammu and Kashmir.

The bicameral legislature

The Indian state. Under the constitution of Jammu and Kashmir, as amended in 1965, the governor of the state is appointed by the president of India. The legislature consists of two houses: the Legislative Assembly of 100 members, representing constituencies; and the Legislative Council of 36 members. The state sends four elected representatives to the Lok Sabha and two members, nominated by the governor, to the Rajya Sabha (Council of States, or upper house).

The High Court consists of a chief justice and two or more other judges appointed by the president of India.

Education is free, and there were more than 4,000 educational institutions in the early 1970s. The university at Srinagar was founded in 1948. There is an efficient medical service with dispensaries scattered throughout the state. In spite of its height, the Vale of Kashmir is not healthful, and in the past there have been considerable outbreaks of cholera and other infectious diseases, although the incidence of these has been much reduced.

Azad Kashmir. The government, with headquarters at Muzaffarābād, was first set up in 1947. It is under a president, assisted by a State Council of 12. The state has its own High Court. Pakistan maintains control over the state through the Ministry of Kashmir Affairs.

Education at its lower stages is free. In addition to primary, middle schools, and high schools, the state has several colleges, at one of which students follow degree courses. There are several hospitals and many more dispensaries and first-aid posts.

The Gilgit Agency and Baltistān. Although both are administered by the government of Pakistan through political agents, these two areas are governed as separate units because of the difficult mountain terrain and the lack of communications between them. Gilgit town is the headquarters of the Gilgit Agency, and Skārdu is the administrative centre in Baltistiin. In the two areas there are a number of primary schools, middle schools, and high schools, as well as several hospitals, dispensaries, and first-aid posts.

Agricultural crops

The economy. The majority of the Kashmiri population is occupied in agriculture of diverse kinds, each adapted to local conditions. Rice, the staple crop, is planted in May and harvested in late September. Maize, millet, pulses (plants such as peas, beans, and lentils), cotton, and tobacco are—with rice—the main summer crops; wheat and barley are the chief spring crops; many temperate fruits and vegetables are grown in areas adjacent to urban markets or in well-watered areas with rich organic soils. Lake margins are particularly favoured, and intensive cultivation of vegetables is practiced in reclaimed marshland or on artificial floating gardens. The pressure of population on land is everywhere apparent, and all available resources are utilized. The lakes and rivers provide fish, water chestnuts, power (for example, near Bāramūlla, 25 miles east of Srinagar), and transport and are a tourist attraction. The mountains supply many kinds of timber, pasture for sheep and dairy cattle, and such snow-sports centres as that at Gulmarg, 14 miles south of Bāramūlla.

The region has mineral resources, including several small coalfields and bauxite deposits in the Udhampur district, but these are virtually unexploited.

Between 1947 and the early 1970s the installed electric-power capacity, originally 4,000 kilowatts, was increased tenfold. All the principal towns, including Leh, were electrified, and hydroelectric and thermal generating plants have been constructed to provide power for industrial development based on local raw materials. Land reforms have been undertaken, grain production was increased, and the quantity of major exports—timber, fruits, and handicraft products—was vastly expanded since 1947. Improvements have also been made in facilities for tourist traffic, although here the potential has barely been tapped.

Srinagar possesses many specialized agricultural markets, retail shopping centres, and associated industries. The industries are essentially developments from rural crafts—with handloom weaving of local silk, cotton, and wool, carpet weaving, wood carving, leatherwork, and other village industries organized on a factory basis in an urban context. Such industries, together with silverwork and copperwork and jewelry, were stimulated by the presence of the royal court and the tourist trade but also owe something to the important position achieved by Srinagar in west Himalayan trade. The city acts as an entrepôt for the products of the Punjab on the one hand and of High Asia (the region east of the Karakoram, Pamirs, and Ladākh ranges) on the other; routes run northwestward into Gilgit via the Raj Diangan Pass and northeastward via the Zoji La (pass) to Leh, Ladakh and beyond.

The economy of Ladākh and Baltistān

Cultivation in Ladiikh and Baltistiin is restricted to such main valleys as those of the Indus and Shyok rivers, where it consists of small irrigated plots of barley, buckwheat, roots, and sown grass situated amid desert surroundings. Pastoralism is a vital feature of the economy since animals are necessary for human survival. Herds of yak and flocks of goatlike sheep provide not only animal products but also means of transport between the widely dispersed settlements and monasteries. Grazing rights are subjects of important litigation; small townships are basically caravansaries (inns for the overnight accommodation of caravans) located at points where herders and traders can obtain provisions and grazing prior to undertaking the next stage of their journey through some of the loftiest passes and over some of the most barren terrains on Earth. Political troubles have unfortunately reduced the volume of this transit trade, as well as the benefit that Ladakhi settlements such as Leh once derived from it.

Transportation. Under three five-year plans, the Indian central government has made a huge investment in developing almost 3,700 miles of highways and communications. As a result of the India–Pakistan dispute over Kashmir, the blocking of the Jhelum Valley route, which runs for 200 miles from Srinagar to Riiwalpindi, made it necessary to transform the longer and more difficult Banihāl Pass cart road into an all-weather motor road linking Jammu with the Vale. This necessitated the construction of one of the longest tunnels in Asia—the Jawahar Tunnel. In the early 1970s there were schemes for extending rail communications from the railhead at Miidhopur in the Indian Punjab into the Vale.

The Kashmir problem. In the early 1970s, after a quarter of a century, the "Kashmir problem" remained intractable. Although there was a clear Muslim majority in the state before the 1949 partition and its economic, cultural, and geographic contiguity with the Muslim-majority area of the Punjab could be convincingly demonstrated, the accidents of history have resulted in a division of territory that has no rational basis. Pakistan has been left with territory that, although basically Muslim in character, was thinly populated, difficult of access, and economically underdeveloped. The largest Muslim group, situated in the Vale of Kashmir and estimated to number more than half the population of the entire state, lies in Indian-administered territory, with its former outlets via the Jhelum Valley route being blocked.

Pakistan has been frustrated in its attempts to use the waters of the Indus, Jhelum, and Chenāb rivers granted to it under the Indus Waters Treaty (1960), since their upper catchments lay in territories outside its control. Indeed, apart from the improvement of communications linking Gilgit and Baltistān with military bases in the Northwest Frontier Province and the extension of administration into these highland areas, not a great deal of development has been possible.

India, on the other hand, has acquired the lion's share of both territory and population and with them substantial linguistic, racial, and religious problems. Only 18 percent of the population in the Indian sector may be classed as literate. There were still movements in the early 1970s seeking independence for the state from both India and Pakistan. Thus, a strong military presence became necessary in the Indian sector, in part to support the administrative structure of the state, in part to confront the forces of Pakistan along the cease-fire line, and in part to confront Chinese forces on the northeastern frontiers.

BIBLIOGRAPHY. A good introduction to the physical landscapes of the western Himalayas is provided by HELMUT DE TERRA and T.T. PATERSON, *Studies on the Ice Age in India and Associated Human Cultures* (1939); and by KENNETH MASON, "The Glaciers of the Karakoram and Neighbourhood," *Rec. Geol. Surv. India*, 63:214–278 (1930). General geographical accounts are contained in KAZI S. AHMAD, *A Geography of Pakistan* (1964); D.N. WILBER *et al.*, *Pakistan: Its People, Its Society, Its Culture* (1964); RAM NANDAN, "Jammu and Kashmir," *Focus*, 13:1–6 (1962); and HARALD UHLIG, "Hill Tribes and Rice Farmers in the Himalayas and South-East Asia," *Trans. Inst. Br. Geogr.*, 47:1–23 (1969)—the latter develops an interesting account of the complementary relationship between hill folk and valley folk in the mountainous environment of Kashmir and of interlocking systems of transhumance. P.N.K. BAMZAI, *A History of Kashmir* (1962); and K.M. PANIKKAR, *The Founding of the Kashmir State: A Biography of Maharajah Gulab Singh, 1792–1858* (1953), provide sound accounts of the formation of the state of Jammu and Kashmir under British political protection. The development of political conflicts in the postwar period is dealt with by a number of authors. ALASTAIR LAMB, *Crisis in Kashmir, 1947–1966* (1966), analyzes the recent history leading to partition and contains a comprehensive bibliography; the recurrent discussions between India and Pakistan are chronicled in the *United Nations Official Records of the General Assembly* and . . . *of the Security Council;* the historical background to the Chinese occupation of parts of Ladākh is presented in MARGARET W. FISHER, LEO E. ROSE, and ROBERT A. HUTTENBACK, *Himalayan Battleground: Sino-Indian Rivalry in Ladakh* (1963). The influence of the diverse physical environments on the political problems are dealt with in R.C. MAYFIELD, "A Geographic Study of the Kashmir Issue," *Geogrl. Rev.*, 45:181–196 (1955); ALI TAYYEB, *Pakistan: A Political Geography* (1966), and by NANDAN (*op. cit.*); while the economic issues and consequences are indicated in P.N. DHAR, "The Kashmir Problem: Political and Economic Background," *India Quarterly*, 7:143–162 (1951); and in INDIA, MINISTRY OF INFORMATION AND BROADCASTING, *India: A Reference Manual* (annual).

(W.Ki.)

Jansen, Cornelius Otto

Cornelius Jansen, leader of the Roman Catholic reform movement known as Jansenism, by the force and scholarship of his writings brought about a reappraisal of the church's piety and role in national and international politics. His emphasis on the doctrine of grace and a scholarly interpretation of the Bible, as well as his antipathy to the Jesuits (who had become influential politically), earned for him the unmerited reputation as being sympathetic to Protestantism.

Education and early desires for reform

Born at Acquoi, near Leerdam, Holland, in 1585, the son of Jean Otto, he entered the University of Louvain, in Flanders, in 1602 to study theology. According to the custom adopted by the humanists of the Renaissance, Jansen took a Latin name, Cornelius Jansenius. His teacher, Jacques Janson, taught the doctrine of the theologian Michel de Bay, called Baïus, who died at Louvain in 1589. According to the latter, man is affected from his birth by the sin of Adam, his ancestor. His instincts lead him necessarily to evil. He can be saved only by the grace of Christ, accorded to a small number of the elect who have been chosen in advance and destined to enter the Kingdom of Heaven. This doctrine, inspired by certain writings of the great North African theologian St. Augustine (354–430), attracted Jansen, as well as another student who had come to study at Louvain, a Frenchman named Jean Duvergier de Hauranne (1581–1643), who was to become a leader of the Jansenist movement. The two young men became friends in Paris, where Jansen went in 1604. They decided to revive the theology that they believed the doctors of the Sorbonne (theological faculty) had reduced to subtle and vain discussions of Scholastics (medieval philosopher-theologians). Jansen and Duvergier thought that it was necessary to render to God the homage owed by men. According to them, the pride of the Renaissance savants had alienated Christians from the Jesus who loved the simple and the humble.

Jansen, engraving by Jean Morin (1600–1650)

By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd.

In 1611 Jansen followed his friend Duvergier to the home of the latter's parents, located in the outskirts of Bayonne. The bishop of the city entrusted to Jansen the direction of the episcopal college there from 1612 to 1614. For three years afterward the young Dutchman, with Duvergier, dedicated himself to the study of the writings of the early Church Fathers. In 1617 Jansen returned to Louvain, where he directed the college of Ste.-Pulchérie, created for Dutch students.

A violent dispute had arisen at Louvain between the disciples of Baïus and the Jesuits, who considered as dangerous the doctrines of this theologian condemned by Pope Pius V (reigned 1566–72) in 1567. Jansen then undertook a thorough study of the works of Augustine by which Baïus had been inspired. He read them, he declared, ten times consecutively. But he devoted himself most particularly to the texts drafted by Augustine to combat the doctrine of the British monk Pelagius (fl. 405–418) who had upheld that, in spite of the fault committed by Adam, man continues to be entirely free to do good and to obtain salvation by means of his own merits. Jansen then began his great work, the *Augustinus*. For him, the divine grace that alone can save man is not due at all to his good actions. It is, he claimed, a gratuitous gift by means of which Christ leads the elect to eternal life, but the multitude, "the mass of perdition," is doomed to damnation. Thus, men are predestined to obtain grace or to suffer condemnation. In reality, Augustine had not envisaged the fate of human beings with such great rigour. He had even proclaimed the power of man's free will at the time when he was engaged in the struggle against the Manichaeans, religious dualists originating in Persia who believed in the omnipotence of Satan. But Augustine had then been constrained to enclose the liberty of man within strict limits, in order to refute the affirmations of Pelagius, who had radically reduced the value of the divine grace obtained by Jesus on the cross.

The basis of Jansenism: the *Augustinus*

Jansen was so fascinated by Augustine's treatise against the Pelagians that he apparently lost sight of Augustine's works against the Manichaeans.

Jansen also wrote his commentaries on the evangelists and on the Old Testament—notably on the Pentateuch, the first five books of the Old Testament—as well as a "Discourse on the Reformation of the Inner Man." He was likewise the author of pamphlets directed against the Protestants.

Having acquired the degree of doctor in theology at Louvain, Jansen became the rector of that university in 1635, and in 1636 he became bishop of Ypres. The Jesuit scholar René Rapin asserted in his book on the history of Jansenism, *Histoire du Jansénisme* (Paris, 1861), that Jansen had obtained his mitre (bishop's headpiece) as a result of the personal intervention of the king of Spain, Philip IV (1605–65). This sovereign had recognized him for having published a pamphlet entitled *Mars Gallicus* in which he violently criticized the policy of the French cardinal and prime minister de Richelieu (1585–1642), who had contracted an alliance with the Dutch Protestants against Spain. A short time after his elevation to the episcopate, on May 6, 1638, Jansen died of the plague. After his death, in 1640 the friends of the deceased published at Louvain the work he had dedicated to St. Augustine, under the title *Augustinus Cornelii Jansenii, Episcopi, seu Doctrirza Sarzcti Augustini de Humanae Naturae, Sanitate, Aegritudine, Medicina adversus Pelagianos et Massilienses* ("The Augustine of Cornelius Jansen, Bishop, or on the Doctrines of St. Augustine Concerning Human Nature, Health, Grief, and Cure against the Pelagians and Massilians"—the latter being Semi-Pelagians).

This book had cost its author 22 years of effort. In the epilogue Jansen declared: "I leave my work to the judgment of the Roman Church . . . I retract all that she will decide that I ought to (must) retract."

Condemnation of Jansen

In the terms of a bull (papal document) of March 6, 1642, Pope Urban VIII (reigned 1623–44) forbade the reading of the *Augustirzus*, which had been published without the authorization of the Holy See and was based on the doctrine of Baïus, already condemned. Five propositions that Nicolas Cornet, syndic (lay administrator—representing the papacy—of property held by the Franciscan monastic order that, according to its rules, was not allowed to hold property) of the Faculty of Theology of Paris, claimed to have discovered in the *Augustinus* were condemned by a bull of Pope Innocent X (reigned 1644–55), published on June 9, 1653, and by a constitution of his successor, Alexander VII (reigned 1655–67). The bishops of France were required to make all of the priests, monks, and nuns sign a formulary conforming to the pontifical decisions. But Duvergier de Hauranne, who had become an abbt (one who has the right to wear the dress of a parish priest) of Saint-Cyran, had taught the doctrine of Jansen to the nuns of the abbey of Port-Royal. This convent (a base for Jansenism) became a focus of resistance against the Jesuits, who, having obtained the pontifical decisions in their favour, intended to impose them. From that time, a conflict began between the Jesuits and Antoine Arnauld, a disciple of "Monsieur de Saint-Cyran" (Duvergier de Hauranne) who called himself an Augustinian. The Jesuits, however, called him a Jansenist. According to them, the doctrine of Arnauld was that of Jansen and not of St. Augustine. Blaise Pascal wrote *Les Provinciales* ("Provincial Letters") in 1656 and 1657 to defend Antoine Amauld. The latter was condemned by the Faculty of Theology of Paris, which taught at the Sorbonne.

In 1709 Louis XIV ordered the dispersal of the nuns of Port-Royal des Champs into diverse convents, and he had the abbey destroyed in 1710. In 1723 followers of Jansen's views established an autonomous Jansenist Church at Utrecht, Holland, which still existed in the late 20th century. (See also OLD CATHOLIC CHURCHES).

BIBLIOGRAPHY. SAINTE-BEUVE, *Port-Royal* (in French), 3rd ed., vol. 1, ch. 11 (1867), studies Jansen's theological concepts and those of the abbé of Saint-Cyran, and includes the correspondence between the two men, which later inspired the editing of the *Augustinus*. MARC ESCHOLIER, *Port-Royal* (1965; Eng. trans., 1968), explains the relationship between Jansen and Saint-Cyran, and discusses the theological theses supported in the *Augustinus*, by Jansen.

(M.M.E.)

Japan

The island country of Japan (Nihon) lies off the east coast of Asia. It consists of four main islands—from northeast to southwest these are Hokkaidd, Honshii, Shikoku, and Kyūshū—and of numerous smaller islands, having a total land area of 143,818 square miles (372,488 square kilometres), with a total population of over 105,000,000 people. Japan is bounded to the west by the Sea of Japan, which separates it from the eastern shores of the Soviet Union and North and South Korea; to the north by La Perouse Strait (separating it from the Soviet island of Sakhalin) and the Sea of Okhotsk; to the northeast by the Kuril Islands (part of the Soviet Union); to the east and south by the Pacific Ocean; and to the southwest by the East China Sea, which separates it from the People's Republic of China. The national capital, Tokyo, which has a population of 9,000,000 inhabitants, is the most populous city in the world.

Aspects of Japanese life

Complexity is the keynote of life in Japan—a nation possessing an intricate and ancient cultural tradition, yet one that, especially since World War II, has emerged as a modern industrial giant. The juxtaposition of old and new is apparent in all phases of Japanese life. A characteristic sensitivity to natural beauty and a concern with form and balance are evident in such cities as Kyōto and Nara, as well as in Japan's ubiquitous gardens. Tokyo, however, symbolizes the impact of rapid westernization upon many aspects of Japanese life. The agricultural regions are characterized by well-ordered rice fields and fruit orchards, whereas the industrial belt along the Pacific coast of Honshū produces smoke and other wastes that pollute Japan's air and rivers. The time-honoured code of social behaviour is being challenged by new attitudes and values, creating an element of tension in city life.

Japan's spectacular industrial growth—the greatest of any nation since the 1940s—has brought the country to the forefront of the world economy. It is the world's principal shipbuilder and is one of the major producers and exporters of manufactured goods, including steel, synthetic rubber, and electrical products. An important feature of the burgeoning economy is the prevalence of large, quasi-monopolistic industrial companies. Although Japan is capable of becoming the world's most prosperous nation, in the early 1970s it was plagued by inflation and a growing shortage of skilled labour. It was hoped that continued cooperation between government and business interests would introduce solutions to these problems and that Japan would maintain its rate of growth to the benefit of all its citizens (see city articles KYOTO, NAGOYA, OSAKA-KOBE METROPOLITAN AREA, and TOKYO-YOKOHAMA METROPOLITAN AREA). For related physical features see CHINA SEA; JAPAN, SEA OF; and OKHOTSK, SEA OF. For history, see JAPAN, HISTORY OF. For cultural aspects, see ASIAN PEOPLES AND CULTURES; EAST ASIAN CULTURES; DANCE AND THEATRE, EAST ASIAN; LITERATURE, EAST ASIAN; MUSIC, EAST ASIAN; VISUAL ARTS, EAST ASIAN; JAPANESE LANGUAGE; JAPANESE MYTHOLOGY; JAPANESE PHILOSOPHY; and JAPANESE RELIGION.

This article is divided into the following sections:

I. The landscape

THE NATURAL ENVIRONMENT

Relief features. The mountainous character of the country is the outcome of recent orogenic (mountain-building) forces, as evidenced by the frequent occurrence of violent earthquakes, volcanic activity, and signs of change in levels along the coast. There are no sizable structural plains and peneplains (large land areas shaped by erosion), which usually occur in more stable regions of the Earth. The mountains—which cover about 85 percent of Japan's land surface—are for the most part in a youthful stage of dissection in which steep slopes are incised by dense river-valley networks. Rivers are mostly torrential, and their valleys are accompanied by series of river terraces that are the result of movements in the Earth's crust. Recent volcanoes are juxtaposed with old and highly dissected ones. The shores are characterized by elevated and depressed features such as headlands and bays, which display an incipient stage of development.

The mountains are divided into many small land blocks that are separated by lowlands or deep saddles; there is no long or continuous mountain range. These land blocks are the result of intense faulting (movement of adjacent rock masses along a fracture) and warping (bending of the Earth's crust), the former process being regarded as dominant. One consequence is that mountain blocks are often bounded by fault scarps and flexure slopes that descend in step formation to the adjacent lowlands.

Coalescing alluvial fans—cone-shaped deposits of alluvium that run together—are formed where rivers emerge from the mountains. When the rivers are large enough to extend their courses to the sea, low deltaic plains develop in front of the fans; this occurs most frequently where the rivers empty into shallow and sheltered bays, as in the deltas of eastern Kantō, Nōbi, and Osaka. In most places, however, fan surfaces plunge directly into the sea and are separated by low, sandy beach ridges.

Dissected plains are common in the lowlands. Intense disturbances have caused many of the former alluvial fans, deltas, and sea bottoms to be substantially uplifted to form flat-topped uplands such as those found in the Kwanto Plain (Kantb-heiya). Not infrequently the uplands have been overlain with volcanic ash, as in the Kwanto and Tokachi plains.

In addition, Japan is truly a land of volcanoes. Violent eruptions are frequently experienced, and at least 40 volcanoes have been active within historical time. New volcanoes born during the 20th century include Shōwa-shinzan (Shdwa Volcano) on Hokkaidb and Myōjin-shō off the Beyoneisu-retsugan (or Bayonnaise Rocks) in the Pacific. The abundant hot springs are mostly of volcanic origin. Many of the gigantic volcanoes are conical in shape (*e.g.*, Fujiyama [Fuji-san]), while others form steep lava domes (*e.g.*, Dai-sen and Unzen). Conspicuous shield volcanoes (broad, gently sloping volcanic cones such as Mauna Loa on Hawaii Island) are rare, and extensive lava plateaus are lacking. One of the characteristics of the volcanic areas is the prevalence of calderas (large, circular, basin-shaped volcanic depressions), especially in the northeast and southwest, many of which are occupied by lakes, such as Kutcharo, Towada, and Ashino.

Japan's mountains have been influenced by the orogenic formation of six mountain arcs off the Pacific coast of Asia. They are, from northeast to southwest, the Chishima Range of the Kuril Islands; the Karafuto Mountain system of Sakhalin Island; the Northeast, Southwest, and Shichito–Mariana ranges of Japan; and the Ryukyu Island formations. The four major landform areas of Japan—Hokkaidō Island, Northeastern. Central, and Southwestern regions—have developed as a result of the formation of these arcs.

Four major landform regions

The Hokkaidb Island region was formed by the coalescence of the Chishima and Karafuto arcs. The backbone of the region runs from north to south. The Chishima arc enters Hokkaidb as three volcanic chains with elevations of over 6,000 feet; these are arranged in ladder formation and terminate in the heart of the region. Chief components of the mountain system are the Kitami-sanchi (Kitami Mountains) in the north and the Hidaka-sammyaku (Hidaka Mountains) in the south.

The Northeastern Region nearly coincides with the northeastern mountain arc and stretches from southwest Hokkaidō to central Honshii. Several rows of mountains, lowlands, and volcanic zones are well oriented to the general trend of the insular arc of this region, which is convex toward the Pacific Ocean. The eastern highlands zone of the Kitakami and Abukuma ranges on the east coast are oblique to the general trend; they are chiefly composed of older rocks, and plateau-like landforms survive in the centre. In the western zone, the formations conform to the general trend and are composed of a basement complex overlain by thick accumulations of young rocks that have been subjected to mild folding. The Ōu-sammyaku, capped with towering volcanoes that form the Nasu volcanic zone, is separated from the coastal ranges by the Kitakami–Abukuma lowlands to the east and a row of basins in the west.

The Central Region of Honshii Island is dominated by the overlapping of the Northeast, Southwest, and Shichito–Mariana mountain arcs. It contains Japan's highest mountain, Fujiyama, which rises to 12,388 feet (3,776 metres), and its broadest width of 168 miles (270 kilometres). The trend of the mountains, lowlands, and volcanic zones intersects the island almost at right angles. The most notable physical feature is the Fossa Magna, a great rift lowland that traverses the widest portion of Honshii from the Japan Sea to the Pacific. It is partially occupied by hills, mountains, and volcanoes of the Fuji volcanic zone. Intermontane basins are sandwiched between the lofty central mountain knots of the Akaishi, Kiso, and Hida (Japanese Alps) ranges to the west and the Kantō-sammyaku to the east. The shallow structural basin of the Kwanto Plain, which stretches to the east of the Kantō-sammyaku, is the most extensive lowland of Japan and contains the capital city of Tokyo in its centre. Another lowland, the Ndbi-heiya, surrounding Nagoya, reaches northwestward across the narrowest portion of Honshū to Biwa-ko (Lake Biwaj and Tsuruga-wan (Tsuruga Bay) on the Sea of Japan.

The Southwestern Region of southern Honshii, Shikoku, and northern Kyiishii generally coincides with the southwest mountain arc, and the general trend of highlands and lowlands is roughly convex toward the Japan Sea. The region is divided into the Inner Zone, which was formed by complex faulting, and the Outer Zone, which

was formed by warping. The Inner Zone is chiefly composed of granite, Paleozoic (between 225,000,000 and 570,000,000 years old), and volcanic rocks, which are arranged in complicated juxtaposition. The Outer Zone, consisting of the Akaishi, Kii, Shikoku, and Kyūshū mountain groups, in contrast, is characterized by a regular zonal arrangement from north to south of crystalline schists, Paleozoic, Mesozoic (between 65,000,000 and 225,000,000 years old) and Tertiary (between 2,500,000 and 65,000,000 years old) formations. The outstanding surface features of the Inner Zone present a highly complex mosaic of numerous fault blocks, while those of the Outer Zone are continuous except where the sea straits separate them into the four independent groups. The Inland Sea (Seto-naikai) is the region where the greater amount of depression has resulted in the invasion of sea waters. The northern edge of the Inner Zone is studded with the gigantic lava domes of the Dai-sen volcanic zone, which, together with volcanic Asb-zan, bury a considerable part of the western extension of the Inland Sea in central Kyūshū.

The Nansei Islands Region constitutes the main portion of the Ryukyn arc, which penetrates into Kyūshū Island as the Kirishima volcanic zone and terminates at Asb-zan. The influence of the arc is also seen in the trend of the many elongated islands off western Kyūshū, including Koshiki, Gotb, Hirado, and Tsushima islands.

The islands of the Shichito–Ogasawara region, far to the east of the Ryukyu arc, are comprised of volcanoes resting on the submarine ridge of the Shichito–Marina arc and the Ogasawara, or Bonin, Islands, which include Peel Island and Iwo Jima.

Drainage and soils. The increasing demand for freshwater because of the rice culture, industrialization, and urbanization is a serious problem. Difficulties of supply lie in the paucity of natural water reservoirs, the swift runoff of the rivers, and the engineering difficulties of constructing large-scale dams in the rugged mountains.

Major rivers of Japan

Japan's rivers are generally short and swift-running, and are supplied by small drainage basins. The most significant rivers are the Teshio and Ishikari rivers of Hokkaidō; the Kitakami, Tone, Shinano, Kiso, and Tenryii rivers of Honshii; and the Chikugo, the largest river of Kyūshū. Some of the rivers from the volcanic areas of northeastern Honshii are acidic and are useless for irrigation and other purposes.

Biwa-ko (Lake Biwa), the largest in Japan, covers 268 square miles of southern Honshii. All other lakes of considerable size are in the northeastern half of the country. Most of the coastal lakes, such as Kasumi-ga and Hamana on Honshii's east coast, are former drowned valleys the bay mouths of which have been dammed by sandbars. Inland lakes such as Biwa, Suwa, and Inawashiro of Honshii occupy tectonic depressions of recent fault origin. Lakes of volcanic origin, including Kutcharo of Hokkaidd and Towada and Ashino of Honshii, outnumber all other types.

The soils of Japan are customarily divided from northeast to southwest into a weak podzolic (soils with a thin organic mineral layer over a gray leached layer) zone, a brown-earth zone, and a red-earth zone. There are some local variations. The northern half of the Tbhoku area of northern Honshii is included in the brown forest soil area. The northern tip of Hokkaidb is classed as a subzone of the podzolic soils; the remainder of the island is included in the subzone of the acidic brown forest soils; and most of western Honshii is a transitional zone. Yellow-brown forest soils extend along the Pacific coast from southern Tdhoku to southern Kyiishii, while red and yellow soils are confined to the Seinan Islands.

Kuroboku soils (black soils rich in humus content) are found on terraces, hills, and gentle slopes throughout Japan, while gley (sticky, blue-gray compact) soils are found in the poorly drained lowlands. Peat soils occupy the moors in Hokkaidd and Tdhoku. Muck (dark soil, containing a high percentage of organic matter) and gley paddy soils are the products of years of rice culture. Polder soils (those reclaimed from the sea) are widely distributed, and immature volcanic ash soils are found on the uplands. The widespread reddish soils are generally regarded as the products of a former warm, humid climate.

Climate. Japan's present climate is influenced by the country's latitudinal extent, the surrounding oceans, and the neighbouring Asian landmass, whereas local climatic variations are the result of relief features. In winter, the high pressure zone over Eastern Siberia and the low pressure zone over the western Pacific result in an eastward flow of cold air (the winter monsoon) from late September to late March that picks up moisture over the Sea of Japan. The monsoon deposits its moisture as rain or snow on western Japan and brings dry, windy weather to the east. The pressure systems are reversed during the summer, and air movements from the east and south (the summer monsoon) from mid-April to early September bring warmer temperatures and rain. Cyclonic storms and frequent and destructive typhoons occur during the late summer and early fall, especially in the southwest.

The effects of ocean currents

The warm waters of the Kuroshio (Japan) Current, which corresponds to the Gulf Stream of the Atlantic, flow along Japan's eastern coast as far as latitude 35° N. The Tsushima Current branches from the Kuroshio Current off southern Kyiishii and washes off the west coast of Honshii and Hokkaidd; it is this current that lends moisture to the winter monsoon. The counterpart of the Labrador Current, the cold Oyashio (Chishima) Current, flows southeastward from the Bering Sea along the east coast of Hokkaidd and northeastern Honshū. Its waters meet those of the Kuroshio Current, causing dense sea fogs in summer, especially off Hokkaidb.

The chief physical feature to affect climate is the mountainous backbone of the islands. The ranges interrupt air flow from the west and east and cause the gloomy weather and heavy snows of winter along the Sea of Japan coast and the bright and windy winter weather along the Pacific. Temperatures and annual precipitation are about the same on both coasts, but they drop noticeably in the mountainous interior.

Temperatures are generally warmer in the south than in the north, and the transitional seasons of spring and fall are shorter in the north. At Asahikawa, on Hokkaidō, the minimum temperature in January, the coldest month, is 16° F (—9° C) and the maximum temperature in August, the hottest month, is 70" F (21° C), with an annual average temperature of 43" F (6° C). At Tokyo, the minimum temperature is 39° F (4° C), the maximum 81° F (27" C), and the annual average 59° F (15" C). Inland from Tokyo, Matsumoto is cooler, with an annual average temperature of 52° F (11° C); whereas the annual average of 57" F (14" C) occurs on the Sea of Japan at Kanazawa. The warmest temperatures occur on Kyūshū and the southern islands; at Kagoshima, the minimum annual temperature is 45° F (7° C), the maximum 81" F (27" C), and the average 63" F (17° C).

Precipitation in the form of rain and snow is plentiful throughout the islands. Maximum precipitation falls in the early summer, and the minimum occurs in winter except on the Sea of Japan coast, which receives the country's highest snowfall. The summer rainy season occurs through June and July; it is known as the ***baiu*** ("plum rain") because it begins when the plums ripen. Torrential rains accompany the typhoons.

Rainfall patterns vary with topography, but most of the country receives more than 40 inches of precipitation annually. The smallest amount of precipitation occurs on Hokkaidb, where only 37 inches fall annually at Obihiro, whereas the mountainous interior of the Kü-hantō (Kü Peninsula) of central Honshū receives more than 160 inches annually. Varying amounts of snow fall on Japan. From November to April snow blankets Hokkaidb, northern and interior Honshii, and the west coast.

Vegetation and animal lie. Much of the original vegetation has been replaced by agriculture or by the introduction of foreign species to the islands. Semitropical rain forest prevails in the Nansei and Ogasawara islands and contains various kinds of mulberries, camphor, oaks, and ferns; madder and lianas are found as undergrowth. In the Amami-ō-shima (Amami-o Islands) this type of plant life occurs only on lowlands, but it grows at higher altitudes southward.

Vegetational regions

The laurel forest zone of evergreen, broad-leaved trees extends from the southwestern islands northward to the lowlands of northern Honshii. Camphor, pasania, oak, tea, and holly are typical trees, and various kinds of ferns grow as undergrowth. In the Ryukyu Islands this type of vegetation also occurs as far north as Amami-6-shima, where it is mixed with the semitropical forest and grows to the top of the islands. In Kyūshū, the evergreen zone reaches to over 3,300 feet, but its altitudinal limit decreases northeastward across Honshii. In general, camphor dominates in the littoral lowlands; pasania, in sunny and well-drained sites; and oak, in the foggy and cloudy inlands. In the southwestern Hondo region (Honshii, Shikoku, and Kyiishii) are ficus, fanpalm, and treefern, as well as xerophytic plants (plants adapted to arid conditions). Stands of Cycas are found in the Gotbretto (Gotō Islands) off western Kyūshū, as well as in southern Kyiishii and the Ryukyu Islands. The coastal dunes are dominated by pine trees.

Deciduous broad-leaved forests develop in the higher and northward portions of the laurel forest zone. In Kyūshii, this type of forest occurs above 3,300 feet, but it gradually descends northward to meet the shoreline in northern Honshii. Its upper limit reaches 6,000 feet in Shikoku and 5,000 feet in central Honshii. The representative trees are beech, katsuratree, maple, oak, and birch; while various kinds of bamboo grasses grow as undergrowth. The trees have been occasionally replaced by larch, false cypress, false arborvitae, Japanese cedar, Japanese red pine, Japanese black pine, and other coniferous species. Natural stands of cedar occur above 2,300 feet on Yaku-shima. The deciduous zone extends into western Hokkaidb, where beeches terminate at the southwestern peninsula and, further northeastward, is replaced by basswood and maple. Some stands of conifers are mixed with the representative forests of this zone.

Coniferous trees are found in the north and eastern periphery of Hokkaidd up to 2,300 feet above sea level. Sakhalin spruce, Sakhalin fir, blue fir, and Yezo spruce are mixed with such deciduous trees as birch, oak, and maple and dense undergrowth of mosses and lichens. Coniferous trees are mixed with deciduous vegetation in southwestern Hokkaidb and occur in the higher portion of central Honshū and Shikoku.

High-altitude small shrubs, the creeping pine, and alpine plants grow in the high mountain knots of central Honshii above 8,000 feet. This zone gradually descends northward to Hakkōda-san, in northern Honshii, at 4,600 feet and to Daisetsu-zan, in central Hokkaidd, at about 3,600 feet.

The cherry tree, celebrated for its blossoms, is planted all about the country. The first day of the flowering of the cherry trees in Yoshino is regarded as the advent of spring.

Animal life

Except for bats, the land mammals of Japan are of species distinct from those of the neighbouring Asian continent. Bears, wild boars, badger, foxes, deer, and monkeys (including the Japanese macaque) were once abundant; but their numbers have been considerably reduced in the 20th century. Antelope, hares, weasels, and ptarmigan are found in the higher mountains.

Japanese waters are inhabited by whales, dolphins, porpoises, and fish such as salmon, sardines, sea bream, mackerel, tuna, trout, herring, grey mullets, smelts, and cod. Crustaceans include crabs, shrimp, prawns, and oysters and are important as food; mussels and oysters are raised commercially. The rivers and lakes abound in trout, freshwater crabs, and crayfish.

Reptiles include sea turtles, freshwater tortoises, sea snakes, and lizards. Most of the snakes, including the five-foot long Japanese rat snake, are harmless. Toads, frogs, and newts are common; and a giant salamander of Kyiishii and Honshii attains a length of five feet.

More than one-third of Japan's birds are water birds—shore birds, gulls, and auks (black and white diving seabirds). Other water birds include grebes, albatrosses, shearwaters, herons, storks, ibis, ducks, geese, swans, and cranes. The cormorant is sometimes trained to catch fish. There are about 150 species of songbirds, as well as vultures, hawks, falcons, pheasant, quail, owls, and woodpeckers.

THE LANDSCAPE UNDER HUMAN SETTLEMENT

Traditional regions. The concept of regions in Japan is inseparable from the historic development of administrative units. Instead of dividing the country into geographical units based on one physical feature, such as a drainage system or a lake region, care was taken to include various physical features in the larger administrative units so as to create a well-balanced geographic whole. Many of the ancient terms for administrative units have survived in the form of place names, and some are still relevant in the 20th century.

The origin of Japan's regions

The Taika reforms of AD 646 firmly established the concept of regions in Japan. The ri (roughly corresponding to the later village community) was established as the basic social and economic unit, and the more than 700 *gun* were the smallest political units to be governed by the central government. The *gun* were grouped to form 60 kuni, the largest political units, which were ruled by 'governors appointed by the central government. Each kuni was composed of maritime plains, interior basins, and mountains to constitute a more or less independent geographic entity. Several adjacent kuni that were linked by a trunk road or a convenient sea route were grouped into a *dō*; the term signified both the route and the region. The core region of the country was called the Kinai, or the land adjacent to the shifting Imperial capitals, which included Naniwa and Fujiwara.

During the Nara (710–784) and Heian (794–1185) periods, the region of Honsha to the east of the three great mountain barriers of Arachi, Fuwa, and Suzuka north, east, and southeast of Biwa-ko was called Kantō (*kan*, "barrier"; tii, east); and that to the west Kansai (kan, "barrier"; sai, "west"). As the empire's frontier shifted to the northeast, Kantb came to indicate the region to the east of Hakone barrier, and Kansai gradually came to include limited areas near the capital of Kybto as far as Osaka and present Kbbe. Northern areas that had not come under direct control of the central government were called Yezochi, "the land of non-subjugated people."

A third regional system was applied after the 10th century, in which kuni were amalgamated according to their distance from Kybto. The larger units were kingoku, or proximate kuni; Chiigoku, or intermediate kuni; and *en*goku, or remote *kuni.* Mutsu and Dewa in northeastern Honshū and islands such as Sado, Oki, Tsushima, and Iki were termed *henyō*, or peripheral, lands. The name of the present Chiigoku district is taken from this regional system.

After the Meiji Restoration in 1868 Hokkaidb was divided into eleven kuni, and Mutsu and Dewa were broken into seven kuni after the traditional manner of the 7th century. These divisions were only in recognition of geographic entities, and administrative power was not endowed to them.

In 1871 the feudal system was dissolved and the ken, or prefectural, system was established. At first the newly born prefectures were mostly fiefs for the formal feudal lords who were appointed as governors. There were three *fu* (urban prefectures) of Tokyo, Osaka, and Kybtb and more than 300 ken. During the next 20 years there were frequent changes in the *ken* pattern, both through amalgamation and partition. By 1888 there were 43 ken, three fu, and one *dō* (major region) of Hokkaidb. Okinawa was officially given the status of ken in 1879, and in 1893 the Santama area was transferred from Kanagawa-ken to Tokyo to insure a better water supply for the city. In 1943, Tokyo was given the status of to, or capital city, thus completing the present to-dd-fu-ken system.

Modern regional units

By the 20th century there was a need for larger regional divisions. By 1905 the Ministry of Education had established a system of eight chihii (major regions). The pattern is locational and is so arranged as to divide Japan from northeast to southwest. The chihii are Hokkaidb; Tbhoku, including Aomori, Iwate, Akita, Yamagata, Miyagi, and Fukushima prefectures of northern Honshii; Kantb, including Ibaraki, Tochigi, Gumma, Saitama, Chiba, and Kanagawa prefectures and Tokyo-to of the Kwanto Plain in eastern Honshii; Chiibu, including Niigata, Toyama, Ishikawa, Fukui, Yamanashi, Nagano, Gifu, Shizuoka, and Aichi prefectures of central Honshii; Kinki, including Shiga, Kyoto-fu, Osaka-fu, Nara, Hyōgo, Wakayama, and Mie prefectures of west central Honshii; Chiigoku, including Tottori, Shimane, Okayama, Hiroshima, and Yamaguchi prefectures of western Honshii; Shikoku, including Tokushima, Kagawa, Ehime, and Kbchi prefectures of Shikoku Island; and Kyūshū, including Fukuoka, Saga, Nagasaki, Kumamoto, Oita, Miyazaki, and Kagoshima prefectures of Kyiishii Island as well as the prefecture of Okinawa of the Ryukyu Islands, which, upon its return to Japan in 1972, began to appear in official publications as a ninth chihd.

Another system used by some governmental agencies is a modification of the chihd system. Chūbu-chihō is subdivided into Hokuriku (Niigata, Toyama, Ishikawa, and Fukui prefectures), Tōsan (Yamanashi, Nagano, and Gifu prefectures), and Tōkai (Shizuoka, Aichi, and Mie prefectures). This system is devised so as to group prefectures of similar geographic characters into one *chihō* and consequently is more effective for illustrating regional contrasts and comparing statistics.

Since 1950 there has been a tendency to adopt the Seto-uchi area (surrounding the Seto-naikai; Inland Sea) as a distinct entity because of its regional homogeneity and internal coherence. By this system, Chiigoku and Shikoku regions are amalgamated and then subdivided into San-in (Tottori and Shimane prefectures), Seto-uchi (Okayama, Hiroshima, Yamaguchi, Kagawa, and Ehime prefectures), and Nankai (Tokushima and Kōchi prefectures).

Since 1920 Japan's pattern of industrialization has been reflected in the terms *omote nihon* ("obverse Japan"), *ura nihon* ("reverse Japan"), and the Taihei-yb (Pacific

Ocean) belt. *Omote nihon* refers to the progressive and growing status of the Pacific coast, and *ura nihon* connotes the stagnant economic conditions of the Sea of Japan coast. The string of industrialized and urbanized areas along the seaboard lowlands of the Pacific between Kantb-chihb and northern Kyūshū comprise the Taihei-yb belt, which includes all the Japanese cities of more than 1,000,000 population except Sapporo in Hokkaidb.

Rural and urban settlement patterns. Since the late 19th century, economic and social changes have affected even the most remote rural villages, but many things Japanese have survived. In the villages, many features that are in common with those of other Asian villages are well preserved. Autonomous and cooperative systems of agricultural practices and rituals, as well as mutual assistance among the villagers, have been handed down to the present. An autonomous rural unit, generally known as a *mura*, consists of some 30 to 50 or more households. Now called an *aza*, this unit should not be confused with the administrative terms *mura* or *son* in use after 1888.

Rural settlement patterns

Most of the rural settlements are of age-old origin, and their histories are lost in time. Historically traceable settlements owe their origins largely to land reclamation after the 16th century. They are commonly called *shinden*, or "newly reclaimed field," but in terms of social structure they do not radically differ from the older settlements.

Considerable local difference is evident in the settlement pattern. Some villages are agglomerated, as are those of Kinki-chihb; some are dispersed, as in northeastern Shikoku; some are elongated, such as those on the rows of sand dunes in the Niigata-heiya (Niigata Lowlands) and on the natural levees of deltas; while others are scattered on the steeper mountain slopes. These differences are only superficial; without exception, the inhabitants are bound together to form a firm village community.

No village is regarded as purely rural. Those that are near to industrialized urban centres include commuters and industrial workers. The more remote settlements send out seasonal labourers during the winter months. The villages of Hokkaidb are based on commercial agriculture, and each household has direct contact with a nearby town.

Fishing villages were absent in Tbhoku-chihb until the beginning of the 17th century, when northward movement began. They were originally dependent upon nearby rice-producing villages; although some dried, salted, or smoked fish found more distant markets. The fishing villages are most numerous in the southwest, where an exchange economy has long been in practice. Mountain villages that depend solely on mountain products other than rice are exceedingly rare. Many of them were founded after the 17th century, when lumber, charcoal, and other such products found markets in the growing towns on the plains. There are some purely hunting villages *(matagi)* in the mountainous interior of western Tbhoku.

Japan's urban centres

Urban settlement is generally of recent origin. Except for the former capital cities of Nara, Kybto, and Kamakura, no sizable town of any significance appeared before the 16th century. Most of the provincial capitals, or *kokufu*, of ancient Japan were only administrative centres that contained official residences and were not developed towns. After the latter part of the 16th century, influential temples and feudal lords began to build towns by gathering merchants and craftsmen close to their headquarters. The power of the feudal lords stabilized when they built *joka-machi* (castle towns), which were located so as to command and control the main transporation routes and surrounding areas; the majority of Japan's important cities, including Tokyo, have developed from them.

Next in importance were the port towns, such as Hakata and Sakai, which have experienced more vicissitudes than the castle towns. In addition, some of the religious towns have grown to a considerable size, as in the case of Ise, Kompira, and Zenkōji. Under the Tokugawa shogunate regime (1603–1867), peaceful conditions fostered nationwide pilgrimages on a scale unknown in the preceding period, and temple and shrine towns such as Kyōto and Nara flourished.

Urbanization actually began in the late 19th century with the growth of the international ports of Kbbe, Yokohama, Niigata, Hakodate, and Shimoda and the naval bases of Yokosuka, Kure, and Sasebo. Industrialization ushered in the rapid growth of Japanese cities, and some of the industrial towns (*e.g.*, Yawata, Niihama, Kawasaki, and Amagasaki) were founded in response to economic development. Most of the former castle towns, and especially those along the Taihei-yb belt, have been expanded directly or indirectly by industrialization. In Hokkaidb and in southern Kyiishii raw materials and power resources have attracted a limited number of industrial plants, which alone are responsible for the existence of cities such as Tomakomai, Muroran, Nobeoka, and Minamata.

Japanese cities are bewildering mixtures of old and new, East and West. Oriental congestion exists side by side with the most modernized business centres and industrial establishments; and unsatisfactory sewage systems are a formidable menace in ever-expanding cities of skyscrapers, subways, and underground plazas. Other serious problems are the shortage of housing, land subsidence (sinking) on the seaboard lowlands, and the anticipated menace of earthquakes and floods.

II. People and population

GROUPS HISTORICALLY ASSOCIATED WITH THE CONTEMPORARY COUNTRY

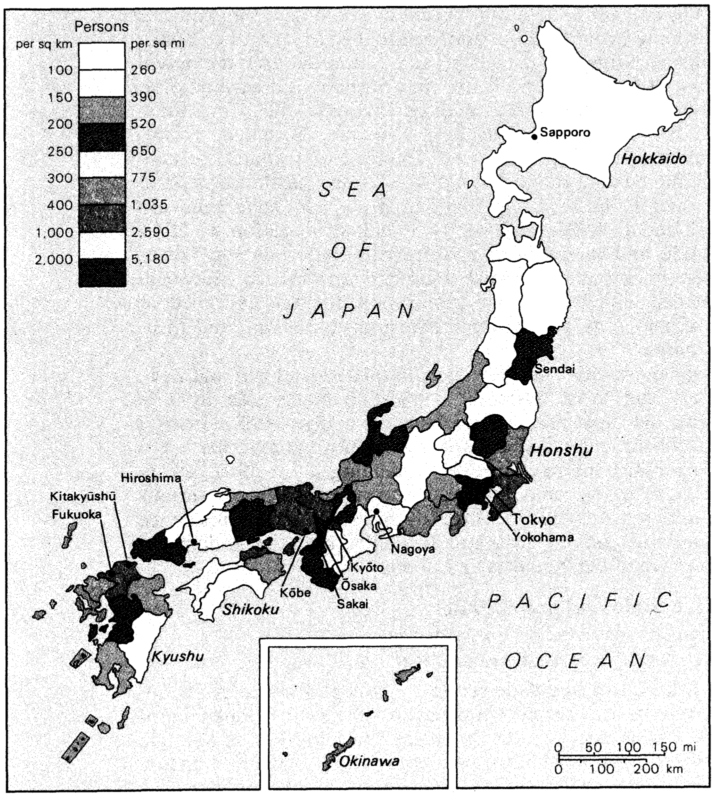
Ethnic and linguistic groups. Except for the Ainu, indigenous Caucasoid people who survive in limited numbers in Hokkaidb, the Japanese are regarded as a single ethnic group. The foreign community, which numbers less than 1,000,000, is comprised largely of Koreans and Chinese. Physically, the Japanese are classified as a branch of the Mongoloid race and are closely akin to the peoples of eastern Asia. Their general physical characteristics are black, straight hair; medium-coloured skin; dark-brown to black-brown eyes; scanty body hair; and height of about five feet two inches for adult males. In terms of blood types, type B is dominant all over Japan; regional differences include 0-type in northeastern Honshii and A-type in Chiigoku, Shikoku, and Kyiishii.

Japanese is the national language, and Ainu is almost extinct. The Japanese language is generally included in the Ural-Altaic linguistic group and is especially akin to Korean, although the vocabularies differ. The introduction of Chinese characters and literature in the 4th century AD greatly enriched the Japanese vocabulary. At first Chinese characters themselves were used to write Japanese, but in the 9th century a syllabary, known as *kana*, was developed from them. Since then, the *kana* has been used for written Japanese, together with some 3,000 to 5,000 Chinese characters. After World War II, the number of Chinese characters was reduced to less than 2,000, and spelling was standardized with pronunciation. Romanization was also introduced at the elementary school level.

The distribution of Japanese practically coincides with the territory of Japan; it is also spoken as a second language in Taiwan and Korea, and in Japanese communities outside of Japan. It is used by more than 100,000,000 people. Standard Japanese was established in the late 19th century through national education and increased communication. Although there are many local dialects, standard Japanese is understood throughout the country.

The dialects of the Japanese language

Japanese is broadly divided linguistically into the two major dialects of Hondo and Nantb. The Hondo dialect is used throughout Japan and may be divided into three major subdialects of the east, west, and Kyiishii. The Eastern, or *bandō*, subdialects were established in the 7th and 8th centuries as the *azuma* ("Eastern") language. After the 17th century there was a vigorous influx of the Kamigata (Kinai) dialect, which was the foundation of standard Japanese. The Eastern dialect extends westward to eastern Hokuriku, Tbsan, and Tbkai, and its boundary line with the Western dialects can be drawn approximately southward from Itoigawa on the Sea of Japan to Hamana-ko (Hamana Lake) on the Pacific coast.



Population density of Japan.

Among the Western dialects, Kinki dialect was long the standard language of Japan, although the present Kamigata dialect of Kydto–Osaka is of recent origin. The Izumo dialect along the Sea of Japan is presumed to be the original Japanese language.

The Kyiishii dialects have been placed outside the mainstream of linguistic change of the Western dialects, and retain the 16th-century forms of the latter. They extend as far south as Tane and Yaku islands.

The Nantb, or Okinawa, dialects are used by islanders from Amami-ō-Shima (Amami-ō Island) in Kagoshima Prefecture as far west as Yonaguni-jima (Yonaguni Island) by a total of more than 1,000,000 people. Long placed outside of the mainstream of linguistic change, they strongly retain their ancient forms.

Religious groups. In Japan, Shintbism—an indigenous folk religion—various sects of Buddhism, and Christianity exist together with new religions (Shinkd Shiikyb); no one of the religions is dominant, and each is affected by the others. For example, one person or family may believe in several Shintb gods and at the same time belong to a Buddhist sect. Intense religious feelings are generally lacking except among the adherents of some of the new religions.

Shintbism and Buddhism

Shintbism is a polytheistic religion in which men as well as natural objects are enshrined as gods. Some of the Hindu gods and Chinese spirits have also been introduced and Japanized. Each rural settlement has at least one shrine of its own, and distinguished men of each historical period are enshrined. Until the Meiji Restoration of the 19th century attempted to impose Shintdism on all of Japan, the religion coexisted comfortably with Buddhism. The amalgamation of these two religions gave birth to a special religion known as Shugen-dd.

Buddhism was officially introduced into the Imperial Court from Korea in AD 552. Direct contact with central China was maintained, and many sects were introduced. In the 8th century Buddhism was adopted as the national religion, and national and provincial temples, nunneries, and monasteries were built throughout the country. In the early 9th century, the Tendai and Shingon sects were introduced by Japanese monks; they still exert some influence in remote areas of Japan. Most of the Buddhist sects that have retained a strong influence are those that were modified in the 13th century by Japanese monks such as Shinran, who established the Jddo Shinshii sect, and Nichiren, who founded the Nichiren sect.

In the 1970s, Buddhism was classified into 12 major sects and almost 60 branches. Chief among them are the Jōdo Shinshii, Sōtō, Shingon, Jbdo, Rinzai, Nichiren, and Tendai sects.

Christianity was introduced into Japan in the 16th century by Spanish Roman Catholic missionaries and was well received both as a religion and as a symbol of European culture. Roman Catholicism was banned by the Tokugawa regime in 1637. Inaccessible and isolated islands and the peninsula of western Kyūshū contained "hiding Christian" villages until the ban was lifted by the Meiji government in 1873. Russian Orthodox, Roman Catholic, and Protestant missionaries came to Japan thereafter, and by the 1970s there were over 800,000 Christians.

The new religions were founded after the mid-1800s. Most of them have their roots in Shintōism, but their religious creeds have been influenced by Buddhism and Christianity. The Sbka-gakkai ("Value Creating Society") is a military nationalistic religion that claimed 10,000,000 adherents in 1962 and has elected members to the legislature. Other cults are the Tenri (Celestial Laws), Konko (Heavenly Light), and the House of Growth.

DEMOGRAPHY

Nothing is more misleading than the widespread belief of an overpopulated Japan. Although more than 105,000,000 people live in a land of 143,818 square miles with an average population density of about 744 persons per square mile, the increase of population since the 19th century has kept pace with economic development, and the standard of living has steadily risen. Japan's density is exceeded by only a few countries, such as South Korea, The Netherlands, and Belgium, despite the fact that more than 80 percent of the country is occupied by inhospitable mountainous areas. The congested concentration of population within the limited plains and lowlands is its distinguishing characteristic. The increased population of the 20th century has been absorbed into the ever-expanding urban areas, while the rural districts have remained constant or have declined. In the rural lowland areas, the density is generally less than 1,000 per square mile, lower than the densest portions of the Mekong Delta, some parts of Java, and the Ganges Delta.

Population growth trends

Japan has experienced spectacular growth since 1868, when the population numbered about 34,000,000. This increase is directly related to slow but steady urban growth; the development of Hokkaidō, Tbhoku, and southern Kyūshū; and the introduction of commercial agriculture. In 1897, when induatralization first began, the population numbered more than 42,000,000. From 1898 to 1918 growing industrial cities and mining towns absorbed a large population, as did Hokkaidd and the sericultural (silkworm raising) rural districts.

In 1920, when the first precise census was conducted, the population numbered 56,000,000. Between 1919 and 1945 Tokyo, Osaka, Nagoya, and northern Kyūshū developed as the nation's four major industrial districts. At the same time, some of the smaller cities that had failed to invite industrialization lost their ability to absorb a growing population, and some of them declined. By 1940 the population had grown to almost 72,000,000, or more than double that of 1868. During World War II, there was a'marked migration to the rural areas to avoid aerial bombing, and some cities such as Osaka were reduced to one-third their size. After 1945, the repatriated population of nearly 9,000,000 and the temporarily explosive increase in the birth rate caused abnormal growth.

The rapid rehabilitation of industry after 1950 has resulted in the continuing concentration of population in the Pacific coastal areas, which contained about 40 percent of the population in the early 1970s. The expansion of the Keihin area is not confined to Tokyo, Yokahama, and their adjacent suburbs, but extends to a much wider circle. The same is true of the Hanshin (Osaka-Kbbe) and Tyūkyō (Nagoya) areas, although northern Kyūshū remains somewhat stagnant. Rural areas outside of the direct in-

fluence of urbanization are subjected to a marked decline. Adult males migrate to the Pacific coast, and many of those who remain at home periodically leave as temporary labourers, creating a constant outflow of population from the mountainous areas and isolated islands. In many places, emigration is so marked that the remaining population cannot maintain a balanced communal society, and whole settlements are abandoned.

A striking demographic feature that has developed since World War II is the decline of birth and death rates in response to improved health conditions and birth control measures. In the 1920s, the birth rate was about 34 per thousand and the death rate was about 20 per thousand. The rates dropped rapidly after 1950; and in 1970, the birth rate was 18.7 per thousand. The death rate declined after 1947 to less than seven per thousand in 1970—one of the world's lowest. Life expectancy is 70.2 years for males and 75.6 years for females. Between 1970 and 1971 population grew almost 1.2 percent. (Ak.W.)

III. The national economy

Japan's
regional
and world
standing

Japan is remarkable for its extraordinarily rapid rate of economic growth in recent years. During the 1960s, the Japanese economy recorded an average annual growth of nearly 12 percent, which is greater than that of any other industrial country in the world. This spectacular progress was based on a rapid expansion of industrial production, the level of which was about 300 percent higher in 1971 than in 1962. As a result, Japan is the third largest economic power, ranking after the United States and the Soviet Union. It is the world's second or third largest producer of a large number of manufactured goods and the world's principal shipbuilder. Its exports have seen a fourfold increase during the 1960s: they now account for almost 7 percent of the world's total exports. By 1970, exports of manufactured products were more than 4.5 times higher than in 1960, accounting for about 8 percent of the total world exports of manufactures.

Despite its rapid economic progress, however, the country's standard of living is still relatively low when compared with other developed countries. In 1970, the per capita gross national product of U.S. $1,583 was about 15th highest in the world, well below that of other industrialized countries. The standard of living is expected to rise steadily, however; and if subsequent growth continues at its recent rate, Japan could become the world's most prosperous country by 1988.

THE EXTENT AND DISTRIBUTION OF RESOURCES

Mineral resources. Although Japan's mineral deposits are fairly diverse, with a few exceptions the reserves are small and production is inadequate to meet more than a small part of domestic requirements. The quality of the minerals mined is often poor, and since deposits are widely scattered the extractive industry is characterized by a large number of small and relatively inefficient mines that do not lend themselves to the application of modern, large-scale mining methods. Coal, copper, zinc, lead, and silver are among the most important minerals, and although a large number of others are mined on a minor scale, there is an almost complete lack of nickel, cobalt, bauxite, nitrates, rock salt, potash, phosphates, and oil.

Coal is the country's most important mineral. In 1970, output amounted to 39,700,000 tons and satisfied just under 45 percent of Japan's total requirements. Japanese coal is of relatively poor quality and difficult to mine. Production costs are high, and more than 70 percent of the country's requirements of coking coal are imported. Production is concentrated in Kyūshū and Hokkaidō, which account for more than 40 percent of total minable reserves. In 1969, these two fields were responsible for 90 percent of the total output. Despite its close proximity to the sea, the Kyiishii field has lost much of its importance because of the gradual exhaustion of the richer seams and the poor quality of the coal mined. During the 1960s, Hokkaidō increased its output by 17 percent. Although this field is some distance from the sea, its seams are thicker than those of Kyiishii, and the use of mechanized, large-scale mining methods have resulted in a relatively high output per man. Minor coalfields include Jōban in Tōhoku, which produces mainly lignite, and Ube in Chūgoku, which is an extension of the Kyiishii field. Total exploitable reserves of coal are estimated at about 3,200,000,000 tons.

Oil deposits are meagre, and estimated resources account for less than 0.01 percent of the world's total. Unless new fields are discovered, the reserves are likely to be exhausted by the 21st century. The oil-bearing belt extends from northern Honshii on the Sea of Japan to the Ishikari-Yiifutsu lowlands in Hokkaidd; virtually the whole of the country's output comes from Honshii, especially from Akita and Niigata prefectures. Between 1960 and 1971 output grew by 48 percent, accounting for less than 1 percent of total imports. Natural gas is produced in Honshii; the two most important fields are in south Kantd and Niigata prefectures. Output grew during the 1960s and early 1970s, but it accounts for only about 15 percent of the country's total gas supply.

Although Japan ranks as the world's third largest steelmaker, after the United States and the Soviet Union, domestic resources and production of iron ore are small. Output of iron ore fell during the 1960s and in 1970 amounted to less than 1 percent of total imports, which come mainly from the United States, Canada, Malaysia, the Philippines, and India. Japanese iron ore is of poor quality and is obtained from small mines, most of which are in Hokkaidō and northern Honshii. The most important producing area is in Iwate Prefecture in Honshii, which accounted for over half of total production in the late 1960s. Total workable deposits are estimated at 34,000,000 tons. Other domestic sources of iron include sand ore, deposits of which are widely distributed along the coast and are estimated at 153,000,000 tons, and iron pyrite sinter, which is a by-product of sulfuric acid plants.

Copper is Japan's most important metallic ore. It is produced in small mines; the larger mines, situated in northeastern Honshū and Shikoku, account for a significant part of total output. In 1970, the country produced copper concentrate with a metal content of almost 120,000 tons. This was far from enough to meet domestic demand, however, and almost 80 percent of the output of electrolytic copper was based on imported ores. Lead and zinc are often found in conjunction with copper; one of the largest producers of zinc is Kamioka, in Gifu Prefecture. During the early 1970s, Japan produced about 280,000 tons of zinc ore (metal content), which provided enough raw material for about half of the country's zinc output. Lead output in 1969 totalled 63,000 tons. Other metallic ores mined include silver, gold, tungsten, tin, antimony, molybdenum, mercury, titanium, vanadium, and manganese. Japan also has large sulfur deposits.

Agricultural resources. Because of the country's mountainous terrain, the supply of agricultural land is limited. Since the early 1960s, the cultivated land area has decreased slightly and accounts for about 15 percent of the total. The soil, largely infertile and immature, requires careful husbandry and fertilization. Soil erosion is a serious problem in many parts of the country. Timber resources, however, are extensive. In the late 1960s, forest land covered some 64,000,000 acres, of which more than 25,000,000 acres consisted of coniferous forest and 33,000,000 acres of broad-leaved forest. A sizable proportion of the forests is inaccessible or is suitable only for fuel wood.

About 67 percent of the total forest area is in private hands, and much of it is distributed among a large number of relatively small holders. The rest is publicly owned; it is in these areas that large-scale reafforestation has taken place. The output of logs fluctuated slightly during the 1960s, and in 1970 accounted for only about 6 percent more than in 1960.

Hydroelectric resources. As a result of its climate, Japan has considerable water resources. It also has an extensive network of rivers that can be used for irrigation, although flooding is a serious problem in many parts of the country. As a result of the mountainous terrain, the ample hydroelectric potential is distributed in an uneven fashion. Hydroelectric development is largely concentrated in central Honshii along the Shimanto, Tenryu, Tone, and Kiso rivers, in Tbhoku, and some parts of Kyiishii. This pattern of distribution ensures that the country's hydroelectric capabilities are well located in relation to the important industrial areas, which tend to be deficient in coal. In 1970, a total of 80,089,000,000 kilowatt-hours of hydroelectricity were generated, accounting for roughly 22 percent of the total supply. Between 1958 and 1970, output increased relatively slowly and further development is unlikely to be rapid. Although it is estimated that only about 40 percent of the total potential has been developed, the best sites are already utilized, and further additions to capacity could be increasingly expensive. Most plants cannot operate at full capacity for more than a few months of the year because of seasonal variations of rainfall and the difficulty of constructing adequate storage facilities.

SOURCES OF NATIONAL INCOME

Agriculture **and** fishing. Agricultural production, including forestry and fishing, accounted for about 8 percent of the net national income in 1970. Output in this sector grew considerably less rapidly than national output as a whole during the 1960s, and its share in the total experienced a spectacular decrease. Despite a rapid increase in yields, agricultural output per man is considerably less than in other sectors of the economy; although farming contributes only 8 percent of the nation's total output, it employs more than 17 percent of the total working population. Japanese agriculture is characterized by a large number of small and often inefficient farms. In 1970, the farmland area of nearly 15,000,000 acres was shared by 5,300,000 farm households. In the early 1970s nearly 3,000,000 rural households owned less than two acres, and many farmers had to rely on outside occupations for a substantial part of their income. Larger farms are generally found in Hokkaidō, where units of 25 to 50 acres are not uncommon. Approximately 48 percent of the cultivated area is devoted to the country's principal crop, rice. Other important farm products include wheat, barley, potatoes, soybeans, and tea.

The government's agricultural policy

The main objectives of the government's agricultural policy have been to encourage self-sufficiency in the more important commodities, to enlarge the size of the average holding, and to close the gap between rural and urban incomes. The central feature of this policy is an artificially high producer rice price, which is roughly twice as high as the world market price. This has succeeded in raising farm incomes and has led to a rapid rise in the production of rice. The boost in output, however, coincided with a drop in per capita consumption, and the government is faced with a growing surplus of expensive and often poor-quality rice. In spite of strong opposition from the farming lobby, the situation forced a re-examination of official policy and the producer rice price was not increased in 1969. Other measures announced or under consideration in the early 1970s included the provisions of incentives to cut rice acreage and to expand the production of those commodities such as fruits, vegetables, and tobacco that are in strong demand and that can be produced on a competitive basis. It is also planned to press for a further increase in the size of the average operating unit; the average holding will be about four acres by 1977, which is still small by advanced agricultural standards, however.

Japan has for some time been the second largest fishing nation in the world after Peru. In 1970, its total catch of 9,300,000 tons amounted to 28 percent more than that of its nearest rival, the Soviet Union. In spite of its dominant international position, the Japanese fishing industry faces a number of serious problems, which are partly the result of structural weaknesses within the industry and partly a matter of disputes with other marine nations over fishing rights and limits. The result of these and other adverse factors is that between 1960 and 1970 Japan's catch grew by only 50 percent as against an advance of about 72 percent for the world as a whole. Despite the efforts of the government to create larger and more efficient units, small and medium-sized enterprises and individual fishermen still account for the bulk of the total output. In 1967 there were 15 large fishing enterprises that accounted for 18 percent of total output. The middle layer of the industry was made up of some 10,000 smaller units that were responsible for just over 40 percent; and at the bottom of the scale there were about 250,000 fishing households that supplied the remainder. Since the early 1960s exports of fishery products grew erratically, while imports showed a steady increase. Much of the fishing fleet consists of small boats.

Mining and quarrying. Mining is a slow-growing and unimportant branch of the economy. In 1970 output was only 1 percent higher than in 1960, with the result that its share in the net national product declined from almost 2 percent to less than 1 percent. Well over half of the value of mining production is accounted for by coal, followed by copper, limestone, oil and natural gas, lead and zinc, sulfur, silver, and gold. The greatest problems are faced by the coal industry, which has been suffering from the competition of cheaper foreign coal and from a rapid shift to oil since World War II. Despite the closure of a large number of uneconomic pits and a fairly rapid growth in productivity, this competition has had an unfavourable effect on the financial results of most coal mining companies and the government has repeatedly found it necessary to aid the industry. In 1969 the government adopted a new coal rehabilitation program that rejected suggestions of nationalization and proposed financial assistance and the granting of interest-free loans. Other aspects of the program, which was planned to close in 1973, include government aid to meet producers' deficits that result from the cutting of the price of domestic coal to a level that is competitive with imports, rationalization of the industry and the distribution network, and greater cooperation among producers. In contrast, the situation in the second largest branch of the industry, copper mining, is relatively healthy, and most of the country's copper mines tend to be fairly profitable.

The faltering extraction industry

Manufacturing and power production. One of the most spectacular features of Japan's economic development since World War II has been the rapid advance of manufacturing. Between 1950 and 1960, the index of manufacturing production recorded a growth of about 180 percent, and by 1971 the figure was nearly three times higher than that of 1960. Apart from this remarkable quantitative growth, the 1960s also saw tremendous progress in terms of quality, variety, and efficiency. As a result, Japan is now one of the top three industrial nations in the world and is a greatly feared competitor whose products are in increasing demand. It has been the world's principal shipbuilder since 1956 and is a major producer of crude steel, synthetic rubber, aluminum, sulfuric acid, plastics, cement, passenger cars, refined copper, and cotton yarn. It has some of the world's largest and most advanced industrial plants; in 1968, for example, eight of the world's 11 largest blast furnaces were to be found in Japan.

Although all important branches of manufacturing recorded some advance since the early 1950s, the most spectacular progress was seen in the production of iron and steel, machinery, petrochemicals, and advanced electronic products. The index of production in the iron and steel industry was about three times higher in 1971 than in 1960, with crude steel output reaching 88,557,000 tons. The advance in machinery production was even faster, because of the grqwing demand for industrial equipment and the boom in sales of automobiles, television sets, and a large number of other durable consumer goods. Growth in the chemical industry was also impressive; and in 1971, output was about three times as large as in 1960—an advance that was mainly caused by the rapid development of the petrochemical industry. Some of the older industries, however, advanced relatively slowly. The lumber and wood industry, textiles, and foodstuffs failed to match the expansion in manufacturing as a whole.

Reasons for industrial growth

One of the principal reasons for Japan's highly satisfactory industrial performance has been the high level and rapid growth of capital investment. Between 1961 and 1970 the country devoted about one-third of its national income to investment, well over half of which was accounted for by capital equipment. The boom in equipment investment provided the iron and steel and machine-building industries with a rapidly growing home market, allowed for a spectacular increase in productive capacity and in the scale of operations, and led to a rapid replacement of old machinery. This, in turn, resulted in a considerable improvement in productivity throughout the economy and enabled industry to grow, despite the increasingly acute shortage of skilled labour that developed during the 1960s. Despite a rapid rise in wages, many sectors of Japanese manufacturing have a formidable advantage over their rivals, a fact that is well illustrated by the country's booming exports and healthy overseas payments position. According to official figures, labour productivity, or output per man, in manufacturing nearly doubled between 1963 and 1969. This was a very much better performance than that seen in other major industrial countries, and it is now estimated that in 1968 Japan's labour productivity was 35 percent higher than that of the United States, the United Kingdom, West Germany, France, and Italy. Another important reason for Japan's strong industrial position in the world is the extensive employment of the latest technological innovations. Official estimates show that about 44 percent of the increase in labour productivity in manufacturing between 1955 and 1965 can be attributed to technological advance.

During the 1960s industry was also characterized by a growing tendency toward tie-ups, mergers, and take-overs among the larger manufacturing and industrial concerns. These actions were made possible by the gradual relaxation and the increasingly flexible interpretation of the country's antimonopoly laws. The authorities have accepted the argument that greater concentration at the top is essential in order to improve efficiency, to make better use of the existing resources, and to increase or maintain international competitiveness. This argument was given additional force by the need to strengthen Japanese enterprises in the face of growing direct foreign investment, made possible under the government's capital decontrol program. In the 1950s, Japan's monopoly watchdog, the Fair Trade Commission, approved about 400 merger applications a year; but by the middle of the 1960s the number of approvals was about 900 a year. The merger of the Yawata and Fuji Steel companies into the Nippon Steel Corporation, which was approved in 1969, will create the world's second largest crude-steel producer after the United States Steel Corporation.

There is also a large number of small and relatively inefficient manufacturing enterprises that use a substantial amount of the scarce labour. In 1968 there were nearly 603,000 manufacturing establishments, of which 522,000 employed less than 20 workers. These occupied about 27 percent of the manufacturing labour force but contributed no more than 12 percent of total output. The larger enterprises, which employed more than 100 but less than 1,000 workers, were responsible for about 40 percent of production and one-third of employment, while the more than 700 giants, each with a labour force of over 1,000, occupied 17 percent of all workers in manufacturing and provided 29 percent of total output. By and large, small firms tend to be more prominent in the less dynamic industries, which produce food, textiles, wood, leather, and clothing.

Between 1960 and 1969, Japan's consumption of energy more than doubled. Despite this rapid increase, however, per capita energy consumption remains low when compared to that of other industrialized countries. The largest single source of energy is oil, which in 1969 accounted for about 66 percent of the nation's total energy supplies.

Since Japan has practically no indigenous oil resources, almost the entire demand is satisfied through imports, an important share of which comes from fields developed by Japanese companies. Crude oil imports grew nearly five and one-half times between 1960 and 1970, although a significant proportion was re-exported in processed form.

Because coal is relatively difficult and expensive to mine, its importance has steadily declined. In 1960 it accounted for roughly 41 percent of gross energy supplies, but by 1970 its share had dropped to 21 percent. During most of the 1960s, coal production was fairly static. Imports, especially of coking coal, are expected to grow; but the share of coal in total energy supplies is likely to continue to shrink.

In 1970, Japan generated almost 360,000,000,000 kilowatt-hours of electric power, which made it the third largest producer in the world. Because of the difficulties of hydroelectric development, more than three-fourths of the total is accounted for by thermal electricity. Although about half of the country's total coal consumption is accounted for by power stations, the late 1960s witnessed a rapid increase in the importance of oil-fired electricity plants. In 1971 there were two commercial nuclear generators in operation with a combined capacity of around 1,300,000 kilowatts, and several others were under construction. It is expected that capacity will rise to about 7,000,000 kilowatts by 1975, a level that could more than double by 1980. By 1985 nuclear stations could supply 30 percent of the nation's electricity needs. Most of the reactors in existence or under construction have been built by the United States, but there are plans to develop a Japanese reactor by the 1980s.

Gas production more than tripled during the 1960s; in 1970 it amounted to 50,899,000,000,000 kilocalories. The fastest growth has been seen in the output of oil gas, which expanded its share of the total from a mere 10 percent to about 50 percent in the early 1970s. In contrast, the output of coal gas showed a timid advance and its importance has been reduced from about 90 percent to 38 percent. In 1970, natural gas production was more than 13 times its 1960 level but provided only 17 percent of the country's total gas supplies. Future increase in gas consumption is expected to be relatively rapid—about 7 percent a year—because of the rapid growth of the urban population and the continuous extension of the gas network. There are over 200 gas companies, three of which account for around 80 percent of total production.

Financial services. Japan's financial system is complex and different from that of other developed countries in a number of important aspects. The Bank of Japan, established in 1882, is the sole bank of issue; it also plays an important role in the determination and enforcement of the government's economic and financial policies. The bulk of the domestic banking business is transacted through the 80-odd commercial banks, of which the 14 city banks (such as Fuji, Mitsubishi, and Sanwa) are the most important. There are also a number of long-term credit banks, some government financial institutions, including the Japan Development Bank and the Export-Import Bank, and several mutual savings and loan banks and credit associations.

A unique banking system

One of the most interesting features of the Japanese financial system is the high degree of interdependence between the central bank, the commercial banks, and industry. Traditionally, industry has relied on banks for a large part of its growing fund requirements, and although the importance of its own capital has increased, private and government financial institutions still account for a substantial part of the total. Since the commercial banks are responsible for most credit extended to industry, their influence on their client companies is considerable. Their active lending policy also means that their liquidity ratios tend to be low by Western standards and that they are forced to rely on call money (money that is readily available to banks as loans) and on large-scale borrowing from the Bank of Japan. The central bank is thereby in a strong position to influence bank operations and to bring about a quick adjustment in the volume of credit through credit ceilings, moral pressure, and other methods. Other sources of finance that are less susceptible to central bank influence include mutual savings and loan banks, credit associations, life insurance companies, and other non-bank financial institutions.

The bond market is relatively undeveloped because the government's low, long-term interest rate policy has made bonds relatively unattractive as compared with the comparatively high level of short-term rates. Individuals and institutional investors tend to buy discount debentures only, which account for less than 30 percent of total issues. Bond buying, therefore, is chiefly confined to banks and other financial institutions, which are expected to purchase government and government-guaranteed bonds according to an unofficial allocation quota. Bond issues have increased because of the high (but gradually decreasing) level of government issues since 1966. Although industrial debentures also have increased, they account for only about 10 percent of the total and their contribution to the supply of industrial funds is small. The secondary bond market has been open since the beginning of 1966, and although over-the-counter transactions have been rising rapidly, about half of the total business is accounted for by trading in financial debentures, mainly by the city banks and the Central Cooperative Bank of Agriculture and Forestry. It is generally accepted that improvement of the efficiency of the bond market is important, but significant progress can not be made without rectifying the imbalance between short and long-term interest rates.

There are nine stock exchanges in Japan; the two most important, Tokyo and Osaka, account for about 95 percent of the total business. Since the mid-1960s foreign investors have taken an increasing interest in Japanese stocks. Although foreign interest subsided a little in 1970, it is expected to be maintained at a relatively high level as long as rapid economic growth continues.

Foreign trade. An outstanding feature of Japan's economic development has been the rapid advance in its overseas sales. During the 1960s the country's exports grew at an average annual rate of about 16 percent, as against a growth of little more than 8 percent in world exports as a whole. The share of exports in the country's gross national product has not changed significantly; in 1970 the figure was some 10 percent, compared with an export ratio of about 30 percent for West Germany and 22 percent for the United Kingdom. From the point of view of individual industries and as a generator of growth, however, exports are much more important than their contribution to the national income would suggest. The growth in exports provided about 14 percent of the increase in the gross national product, and overseas sales accounted for around 20 percent of the country's total iron and steel and automobile production.

Reasons for this spectacular export performance are the growing variety of Japan's industrial output, the shift to products with a relatively high added value, more advanced sales promotion techniques, and Japan's export competitiveness. The rise in labour productivity has enabled industry to absorb much of the rapid rise in wage costs, with the result that on the whole Japan's export prices tend to be lower than those of its principal competitors. Export prices are estimated to be about 13 percent lower than those of the United States and the more important western European countries. Since indications are that the growth in labour productivity will continue to outstrip that of the developed world, the outlook for exports during the early and middle 1970s is highly encouraging.

The 1960s saw a significant change in the composition of exports. In 1958 nearly one-third of the total was accounted for by textile products, but 12 years later their importance had slumped to 12.5 percent. Exports of machinery grew tenfold, and their share of total exports increased to 46.3 percent. Other important export products include metal and metal manufactures and chemicals. Food exports have lost much of their earlier importance; despite a 100 percent increase in their value between 1963 and 1969, they accounted for only 3.4 percent of the total in 1970. The United States, Japan's largest single customer, accounts for nearly one-third of all exports. Southeast Asia is the second largest customer, followed by western Europe. Exports to the Middle East and some African countries have substantially decreased since 1960.

Growth of imports

Imports have grown at an average annual rate of around 15 percent. There is, however, some evidence of a gradual fall in the propensity to import, partly because of the growing ability of Japanese industry to satisfy domestic requirements of manufactured goods and partly because of a shift to products with a higher added value. There are some fears that the rapid rise in the standard of living and the gradual abolition of the remaining import restrictions could speed up the growth of overseas purchases. According to forecasts in the early 1970s, imports of goods and services are likely to record an annual average advance of 15 to 16 percent until 1975, which is comparable to the projected increase in the gross national product. As long as the increase in exports does not fall below expectations, however, such an import growth would continue to yield a trade surplus.

In view of Japan's meagre natural resources, it is not surprising that the bulk of its imports are raw materials, foodstuffs, and fuels. In 1970, metals and other basic raw materials accounted for about 30 percent, fuels almost 21 percent, and food about 14 percent. The largest single category of manufactured goods was machinery and allied products, followed by chemicals. Japan's largest supplier is the United States, which accounts for about 30 percent of its total imports, followed by Australia, Canada, Iran, Indonesia, West Germany, the Philippines, Saudi Arabia, and Malaysia.

MANAGEMENT OF THE ECONOMY

Private enterprise, the role of the government and taxation. Japan's system of economic management is probably without parallel in the world. Although the extent of direct state participation in economic activities is limited, the government's control and influence over business is stronger and more pervasive than in most other free-enterprise countries. This control is not exercised through legislation or administrative action but through constant—and to an outsider almost obsessive—consultation with business and through the authorities' deep indirect involvement in banking. Consultation is mainly by means of joint committees and groups that keep under review, monitor performance of, and set targets for just about every branch and sector of the economy. In addition, there are several agencies and government departments that concern themselves with such aspects of the economy as exports, imports, investment, and prices, as well as overall economic growth. These are staffed by experts, who are not only in constant touch with business but are also close to the minister concerned; they form an integral part of a system that is quick to collate and interpret the latest economic indicators and to respond to changes in the situation. The most important of these agencies is the Economic Planning Agency. Like the Bureau of Statistics, it forms part of the Prime Minister's Office and, apart from monitoring the daily running of the economy, it is also responsible for long-term planning.

The system works well, without any major crises in government-business relations, because of the unusual self-discipline of Japanese businessmen in their dealings with the authorities and the government's deep understanding of the role, needs, and problems of business. The need for large-scale government participation in economic activities is thereby obviated and, unlike many governments in the free-enterprise world, the state appears to be positively reluctant to extend its direct role. The government has monopoly of tobacco and salt, which is operated through the Japan Monopoly Corporation. It also runs the telephone and telegraph services through the Nippon Telegraph and Telephone Public Corporation, while another publicly owned company, the Japan National Railways, is responsible for about two-thirds of rail transport. The government has an interest in air travel, radio, and television. It plays no part in gas production or—except for providing electricity in economically undeveloped areas—in electricity generation.

The government role in banking

The government's economic influence is supplemented by its substantial role in banking. The state owns a number of financial institutions, such as the Japan Development Bank, the Export-Import Bank, the Small Business Finance Corporation, and the Housing Loan Corporation, whose principal objective is to provide finance to private enterprise in areas in which it is considered particularly desirable. The Ministry of Finance and the Bank of Japan have considerable influence over business investment decisions because of the close interdependence of business, the commercial banks, and the central bank. Industry looks to the banks for a substantial part of its investment funds, which are in turn dependent on central-bank financial support.

Tax revenues account for about 85 percent of the government's total income. Japanese taxes can be divided into three main categories: taxes on individuals, on business, and miscellaneous levies. Individuals are subject to progressive income, prefectural, and municipal inhabitant taxes. Income tax is divided into withholding tax, which is deducted at the source of income, and assessment tax, which is payable annually. The local taxes consist of a per capita levy and an income levy. An enterprise tax is sometimes levied on individuals who carry on specified business activities. Businesses are subject to local inhabitant taxes, which consist of a per capita and a corporation levy, enterprise tax, and corporation tax. Other taxes include gift and inheritance taxes, excise taxes levied on a number of consumer goods, and liquor, gasoline, travel, entertainment, securities-exchange, and automobile-acquisition taxes. Income and corporation taxes each bring in about one-third of total tax revenue; the third most important levy, accounting for about 10 percent of the total, is liquor tax.

Trade unions and employers' associations. Japanese trade unions have a relatively short history. Although there were several labour organizations before World War II, trade unions became important only after the United States occupation forces introduced legislation that gave workers the right to organize, to bargain with employers, and to strike. In the early 1970s trade unions had a combined membership of about 11,431,000. Since Japanese trade unions are generally organized on a plant or enterprise basis, their number is relatively large. In 1970, there were a total of nearly 61,000 unions, and in a number of cases there were different organizations for different plants of the same company. The great majority of the enterprise unions are affiliated to federations that are loosely organized on craft lines, such as the Federation of Iron and Steel Workers Unions and Federation of Textile Workers Unions, and to one of the four national labour organizations. They retain much of their independence, however, in dealing with employers. While the craft and national federations formulate general policy, discuss and advise on strategy, and coordinate wage offensives, serious negotiations are usually conducted by individual unions and the employees. One result of Japan's industrial, as opposed to craft, unionism is that demarcation disputes and interunion rivalry for members are relatively rare. Furthermore, if judged in terms of working days lost, Japanese labour relations have been noticeably better than those in other developed countries, such as the United Kingdom, Italy, and the United States.

Four national labour organizations

The national labour organizations are the left-wing and highly political Sōhyō (General Council of Trade Unions), the more moderate and less political Dōmei Kaigi (General Council of Japan Labour Organizations), the Shinsambetsu (National Federation of Industrial Trade Unions), and the Chūritsurōren (Liaison Council of Neutral Trade Unions). Sōhyō is the largest of the four, its membership accounting for some 40 percent of all unionists. Dōmei Kaigi has 17 percent of the total; Chūritsurōren, 10 percent; and Shinsambetsu, only 1 percent of all union members. Sōhyō and Dōmei Kaigi are the two principal rivals; Chūritsurōren often associates itself with Sōhyō, especially when planning the annual "spring labour offensive."

Apart from the political demands of the left-wing unions—such as the ending of the Japan–United States security treaty—labour organizations have been mainly concerned with such questions as wages, prices, and working conditions. Problems of the evolution of a comprehensive industrial policy, of greater centralization, and of the union of the rival national organizations became important during the 1960s mainly because of the trend toward growing concentration in industry and greater cooperation among the various employers' organizations. There is also a growing feeling that in this age of rapid technological progress and change, the ideology-ridden policies of Sōhyb and Dōmei Kaigi are no longer adequate. Although all of the interested parties pay lip service to unification, the pressure for greater cooperation, pragmatism, and professionalism comes mainly from the independent unions in private industries. Many of these seem to feel that the national federations are incapable of self-induced reform and that the initiative for a more modern and united trade union movement must come from those unions that are not fully committed to either side.

Contemporary economic policies and problems. During the 1960s the principal aims of the government's economic policy were rapid growth and the attainment of strong external payments. This policy had three main supports—a high and rapidly increasing level of private equipment investments, a spectacular advance in exports, and growth in private consumption. Subsidiary themes that were regarded as essential for the fulfillment of the two main objectives included a steady shift of agricultural labour to industry, a rapid improvement in labour productivity, rationalization and concentration in industry, and the large-scale import and application of foreign technology. Also part of the program was the relaxation of the strict antimonopoly laws, as well as strong protection of industry against foreign capital intrusions and, in some cases, competition by imports. Judged in terms of its objectives, this policy has been enormously successful. There is, however, less reason for satisfaction over the trend of prices. Between 1960 and 1971, retail prices rose by nearly 100 percent, and there is little doubt that this rapid increase was one of the major reasons for inflationary wage claims and settlements. Another less encouraging aspect of the period was slow growth in public investment. In order to minimize the tax burden, the government's own expenditure has been kept relatively low, with the result that the growth of social capital, which contributes to public as opposed to private affluence, has been far from adequate.

The problem of inflation

As the standard of living rises, the pressure for better social services, education, roads, housing, and transport facilities is likely to grow. It will be necessary to reconcile higher spending in these areas with a rapid growth in private investment, without placing undue strain on the country's resources. It is widely felt that while the fulfillment of these and other social objectives could have some effect on private consumption and investment, it need not significantly affect the rate of overall economic growth. Inflation is the most serious threat to rapid and balanced economic progress. During the late 1960s, the growth in wages tended to outstrip improvements in productivity, a trend that could seriously affect Japanese prices and competitiveness. Because of the growing shortage of skilled labour, the bargaining powers of the unions are likely to strengthen; and if the price spiral is not slowed down, the pressure for a faster increase in wages than in productivity may be very difficult to resist.

Other problems arise out of the impending liberalization of trade and foreign investment. Until the late 1960s, the economy received strong protection against foreign competition through restrictions on imports, nontariff barriers to trade, and strict control of foreign investment. Some of these measures have been abolished or relaxed, but many still remain in force, and, in order to prevent a serious deterioration in trade relations with the developed world, liberalization must be completed by 1980. Although liberalization could lead to a faster increase in imports and a significant rise in the influence of foreign-affiliated enterprises, it must be emphasized that greater direct foreign investment and the accompanying inflow of technology could have a highly beneficial effect on the economy. Another problem that will require close attention is the growing labour shortage; in order to mitigate its effects it will be necessary to shift labour from the agricultural and service sectors into industry, to promote retraining, to encourage labour mobility, and to rationalize industry so as to release labour from the large number of fairly inefficient small enterprises. **(E.I.U.)**

IV. Transportation

OVERALL TRANSPORTATION PATTERNS

Until the latter part of the 19th century, the majority of Japanese people travelled on foot. There were no vehicular means of transportation, except for small wagons, carts, or palanquins (kago) carried by men or animals. The first railway was built between Tokyo and Yokohama in 1872, and others soon followed, though the rugged terrain required the construction of many tunnels and bridges. Iron ships were built at about the same time, and modern ports were constructed. Road construction, however, tended to lag behind the development of other means of transport, resulting in the present congestion.

Japan's great cities attract large numbers of passengers and vast quantities of goods. Tokyo, especially, with a metropolitan population of some 22,000,000 people, is an incomparably large focus for transportation; it is followed by the Osaka metropolitan area, in which the three cities of Osaka, Kōbe, and Kydto together have a metropolitan population of almost 15,000,000. The third largest focus of transportation is Nagoya, with nearly 6,600,000 people living within a 30-mile radius of the city. All of these large urban agglomerations are served by large and internationally known ports. Other cities, such as Kitakyiishu, Fukuoka, Sapporo, Sendai, and Hiroshima, also function as hubs of the transportation network.

Transport networks

The largest volume of intercity or inter-regional transport, in both passengers and goods, moves between the two largest metropolitan regions—by rail, road, coastal waterway, and air. Kyūshū, the third largest island. is connected with Honshū, the largest island, by the world's first undersea railway tunnel (built in 1941) and by an undersea double-decked road tunnel (built in 1958); a huge suspension bridge linking the two is also under construction. A railway tunnel 38 miles long, of which 14 miles runs under the sea, is being built to connect Hokkaidō, the second largest island, with Honshū, and is expected to be completed in 1978. Three large bridges are planned to connect Honshii and Shikoku, the fourth largest island. Many smaller islands near the main islands have also been connected to them by bridges. As a result Japan step-by-step is slowly losing its character as an archipelago.

The Japanese network of telecommunications and of postal services is among the best in the world. Its hundreds of islands, as well as its remotest villages deep in the mountains, are effectively interlinked by these services. In 1971 Japan had about 26,300,000 telephones; 92 percent of the telephone service was automated.

COMPONENT SYSTEMS

Road networks. The development of the road network is retarded in comparison with Japan's general economic progress and in view of its large number of cars. In 1970 there were more than 600,000 miles of public road, but some 200,000 miles were unusable by cars. By the early 1970s, however, some expressways had been built, including the Tōmei Expressway (linking Tokyo and Nagoya) and the Meishin Expressway (linking Nagoya and Kbbe). The metropolitan regions of Tokyo and Ōsaka have a limited-access highway network within their respective built-up areas. In the early 1970s about 2 percent of the gross national product was being devoted to road construction, but the construction of a nationwide network of expressways was expected to require many years. The fact that many roads, both in built-up and in rural areas, are narrow and winding causes additional planning problems. Until the 1920s most Japanese roads were used exclusively for pedestrians, and even horse-drawn vehicles rarely used them. This fact, as well as the limited area of land in proportion to population, affected the pattern of road development considerably. Even in the early 1970s a great number of narrow roads were still being constructed, although a minimum width of at least 13 feet is recommended in built-up areas, except in special cases. In rural areas, footpaths are still in general use, despite the existence of newly built or newly widened motorable roads. Extremely dense networks of footpaths in many mountain areas are used for farming, lumbering, or recreation.

Japanese city street patterns are manifold. Cities such as Kyōto and Nara still preserve the gridiron street pattern of the ancient Chinese city plan, though with modifications in built-up inner parts of the cities. In many rural areas as well, the ancient pattern of land division and the resultant road pattern take the rectangular gridiron form, which is similar to the U.S. township layout in concept and pattern, although it was evolved much earlier and is smaller in size. Feudal towns, especially fortified (castle) towns, have somewhat similar street patterns, though with many modifications for defense purposes. Contemporary Japanese cities and towns still tend to follow an approximate gridiron pattern. Despite this, there are many irregular roads, as well as many modern geometrically curved roads.

Increases in vehicular traffic

The number of four-wheeled motor vehicles and three-wheeled trucks has increased at a phenomenal rate. Numbering only 125,000 in 1935, the number rose to more than 10,000,000 in 1967 and to about 19,472,000 in 1971, a number exceeded only in the United States. Among the world's major countries, Japan has the highest density of motor vehicles per unit area in the plains and in other inhabited areas. Trucks represent a much higher proportion of vehicular traffic than in other major motorized countries; only in 1970 did passenger cars outnumber trucks for the first time. The quantities of freight transported by trucks in the early 1970s surpassed those carried by rail, and the role of the trucking industry was expected to increase still further; the use of large trucks and of containers was also increasing. The use of passenger cars was no longer regarded as a luxury for the majority of people, and commuting to work by car had become an increasingly common practice, resulting in congestion in the big cities and in industrial areas. Railways, however, still played the major role in carrying commuters. No practical solution to the problem of how to reduce the number of cars on the roads has been discovered, though the increase in poisonous exhaust gases and in the noise of the traffic had become topics of daily conversation. The necessity of preserving natural or historical sites or of keeping areas free from traffic noise often proved an obstacle to road construction. At the same time, various technological devices to reduce pollution from automobiles and other problems, as well as to increase efficiency and safety, were under study.

Railways. Despite the competition from road transport, railways play an extremely important role in transporting passengers. In 1970 the total route length of Japanese railroads was 17,000 miles, of which about 7,100 were electrified. Railroads continue to give way, however, to competition from road and air transport.

The first railroad in Japan, which ran from Tokyo to the port of Yokohama, was British financed and was built in 1872 by British engineers. There was strong opposition to its construction, because nationalists feared the expansion of foreign economic and political influence. This opposition was silenced after the completion of the first railroad. After another railroad was built connecting the Osaka area with the port of Kobe (1874) and with Kyōto (1877), Japanese engineers began to build railroads at a rapid rate. The first streetcar line was constructed in Kyōto in 1891, using the electricity from the nation's first power station. In subsequent years, Japan, unlike most other Asian countries, developed quite extensive intra-urban and suburban railroad systems; the period between the two world wars, in particular, was characterized by the construction of many suburban railroad lines to the suburbs to serve the needs of growing numbers of middle-income people. In 1927, the first subway was built in Tokyo's downtown district. Construction of new railroads continued until the outbreak of World War II, but the Japanese defeat and its aftermath prevented further construction for some time. From about 1955 onward, however, railroad construction was resumed. Subway construction, in particular, progressed, and by 1972 Tokyo, Osaka, Nagoya, Sapporo, and Yokohama had subway systems; among these, the Tokyo system was the most extensive, totalling more than 80 miles, of which about 66 miles were underground.

The New Tōkaidō Line

In 1964 the renowned New Tbkaidb Line, a part of Japan National Railways, began operations, providing fully automatic electrified service, for passengers only, on a double-track line between Tokyo and Osaka, at a maximum speed of 130 miles per hour. In 1971, 38 super-expresses, stopping only at Nagoya and Kyōto on the 320-mile route, and 67 limited expresses, which stopped at 11 stations, ran daily between the two cities. 'The railroad had proved highly profitable and had experienced no serious accidents.

In the early 1970s plans were made to introduce freight traffic on the New Tbkaidb Line, as well as to build a nationwide network connecting all major cities, to be called the New Trunk Railway system, based on its method of operation. It was planned to extend the Tokyo to Osaka line to Okayama by 1972 and further westward to Fukuoka in Kyiishii by 1975. Three lines radiating outward from Tokyo were also under construction—to Morioka (and ultimately to Sapporo), to Niigata, and to Narita, respectively. The maximum operating speed was raised to about 155 miles an hour in 1972.

The most serious traffic problem is caused by congestion on railroad transport in the large cities. Most commuter trains are very crowded during rush hours, with some trains carrying twice—and (rarely) three times—the number of passengers for which they were designed. Services are being expanded to cope with the growing demand, with trains running at intervals of only a few minutes and sometimes of only one minute. In Tokyo, a monorail (completed in 1964) operates over a distance of about eight miles between downtown Tokyo and the international airport at Haneda. Monorails are numerous in Japan, but most are primarily used for recreational purposes, as are the cable cars that operate in the mountains. The length of commuting travel time is a serious traffic problem; in rare instances it consumes two hours each way in a working day. In the early 1970s most Japanese railroads, especially local lines, ran at a deficit.

Port facilities. Japan is one of the principal seagoing nations, having engaged in seafaring since early times. In about 1600 the port of Sakai, just south of present-day Osaka, prospered from its trade with China and Southeast Asia. Soon afterward, however, the feudal regime greatly restricted foreign trade by imposing a policy of isolation from the rest of the world—a policy that was to last for about 250 years. As a consequence, no ports engaged in foreign trade with the exception of Nagasaki, which was opened to a limited number of Chinese and Dutch merchants. After Japan reopened its doors to foreign trade in 1858, it was some time before large modern trading ports were developed; Yokohama and Kōbe became the leading trade ports of the new Japan, the former being the outport of Tokyo and the latter the outport for Osaka and Kyoto. Many other modern ports subsequently came into existence.

In 1971 Japan had the second largest merchant fleet in the world; with a total gross tonnage of more than 30,500,000 tons, it was exceeded in size only by the ships registered in Liberia. The Japanese merchant fleet consisted of about 8,850 ships of more than 100 gross tons, of which about 1,400 were oil tankers, including some that were over 250,000 tons in size. In 1969 Yokohama was the leading import port, and Kōbe the leading export port. They were followed by Tokyo, Nagoya, Osaka, Kawasaki, Chiba, Moji, Yokkaichi, and Shimizu (in descending order of importance). Tbkyb-wan (Tokyo Bay), with its four large ports of Yokohama, Tokyo, Kawasaki, and Chiba, handled more cargoes than either

Europoort or the New York Port Authority; for the moment, however, the four ports are under separate management, even though they maintain close mutual cooperation.

Air transport. Both domestic and international air transportation are rapidly increasing in importance. Before World War II, air transportation was considerably restricted, but, since the foundation of Japan Air Lines (JAL), a government-supported private company, in 1953, international flights have proved profitable. In the early 1970s Japan was connected with most major countries in the world both by JAL and by foreign air companies. Domestic flights were also experiencing a boom.

Tokyo is by far the nation's largest single focus of air transport, followed by Osaka. Other major airports are in Nagoya, Sapporo, and Fukuoka. All other metropolitan areas are also connected by air routes. Generally speaking, southwestern Japan is covered by a denser network of air transport than other regions, primarily because of the presence of many islands.

V. Administrationand social conditions

THE STRUCTURE OF GOVERNMENT

The role of the emperor

Constitution **and** government. Japan's constitution was promulgated in 1946 and came into force in 1947; it superseded the 1889 constitution, from which it differed in the following points: first, the emperor is the symbol of the state and of the unity of the people, while sovereign power now rests with the people; second, Japan renounces war as a sovereign right; and third, fundamental human rights are guaranteed as eternal and inviolable. Furthermore, the government is now based on a constitution that aims at maintaining Japan as a peaceful and democratic country in perpetuity.

The emperor has no powers related to government. His major role as emperor consists in such formalities as appointing the prime minister and the chief justice of the supreme court, convoking sessions of congress, promulgating laws and treaties, and awarding of state honours —all with the advice and approval of the Cabinet. Before being appointed by the emperor, the prime minister is first designated by the Diet, the members of which are elected by the people.

Legislative powers are vested in the Diet, which consists of two houses. The House of Representatives, or lower house (Shiigiin), ultimately takes precedence over the House of Councillors, or upper house (Sangiin). The House of Representatives has 491 seats, representing all the 47 prefectures of Japan (including Okinawa); the House of Councillors has 252 seats, representing all prefectures as well as the nation as a whole. The House of Representatives controls the budget and approves treaties with foreign powers. Executive power is vested in the Cabinet, which is organized by the prime minister. If the House of Representatives passes a resolution of no-confidence or refuses to pass a vote of confidence in the government, the Cabinet must resign, unless the House of Representatives is dissolved within ten days. In 1972 there were 12 governmental ministries and five agencies in addition to the Prime Minister's Office. All central-government offices are located in and around the Kasumigaseki district in central Tokyo. An independent constitutional body called the Board of Audit is responsible for the annual auditing of the accounts of the state.

Local government. Japan is divided into 47 prefectures, 43 of which are ken (prefectures proper) but one of which (Tokyo) is a to (metropolis), one (Hokkaidd) a do (territory), and two (Ōsaka and Kyiito) are fu (urban prefectures). (Okinawa, which was under United States administration from the end of World War II until 1972, then became a ken.) Prefectures, which are administered by governors and assemblies, vary considerably both in area and in population. The largest prefecture is Hokkaidd, with an area of 30,314 square miles, while the smallest is Osaka, with 716 square miles. The most populous prefecture in 1970 was Tokyo, which had a population of 11,408,000; the least populated was Tottori, with 569,000. A prefecture is further subdivided into minor civil divisions; these include the city (shi), town (*machi* or *chō*), and village (*mura* or son). All these local government units have their own mayors, or chiefs, and assemblies. Before World War II, there were also counties (gun), consisting of towns and villages but excluding cities within a prefecture. In the early 1970s, however, the county system only survived in the form of statistical units.

An intermediate level of governmental services is formed betweeen the central and prefecture levels: the branch offices of the government that are located in certain cities, which—as regional centres—generally administer several prefectures together. Designated cities (*shi*tei-toshi), which must have populations of at least 500,000 each, are divided into wards (ku). In 1972, there were ten cities in this category—Tokyo, Osaka, Yokohama, Nagoya, Kyōto, Kdbe, Kitakyūshū, Sapporo, Kawasaki, and Fukuoka. A ward has a chief and an assembly, the former being nominated by the mayor and the latter elected by the residents.

Terms of office; constituencies

The political process. Elections. Members of both the House of Representatives and the House of Councillors are chosen by general elections. Members of the House of Representatives serve for a four-year term, but this term may be terminated earlier if the house is dissolved; the 491 seats are contested in 124 different constituencies located throughout Japan. Members of the House of Councillors are elected for a six-year term, with half of the members being elected every three years. The electoral procedure for the House of Councillors differs from that for the House of Representatives in that 100 members out of the total 252 are elected from a national constituency, requiring the participation of voters throughout Japan; the remaining 152 members are elected from 47 prefectural constituencies. The number of seats for each constituency was determined largely by the population density in each area in 1947, with some modifications resulting from the population increase in urban constituencies. Heads of local governmental units, such as prefectures, cities, towns, and villages, are elected by local residents. Universal adult suffrage is available to all men or women who are 20 years old or older.

Political parties. Freedom to organize political parties is guaranteed by the constitution. Since the enactment of the 1947 constitution, many political parties have been organized, have merged, or have been dissolved. In 1971, the Liberal-Democratic Party (Jiyū-Minshutō) was the party in power, representing somewhat conservative elements. Such conservative parties have held power since 1948.

The Japan Socialist Party (Nihon Shakaitii) has long been the largest opposition party, drawing much of its support from labour unions and inhabitants of the large cities. It has a neutralist policy, urging the establishment of a peaceful security system covering Japan and East Asia by means of a treaty between Japan, the United States, the Soviet Union, and China. It opposes the Treaty of Mutual Cooperation and Security concluded between Japan and the United States, which has been upheld by the ruling Liberal-Democratic Party since 1960.

In 1971, the Kdmei Party (Kōmeitō) meaning fair or fair play party, was the second largest opposition party, drawing its main support from the Sōka-gakkai, a religious group belonging to the Nichiren Buddhist sect. Although the party was formed in 1964 under the influence of the Sdka-gakkai, it has renounced any formal ties with it. The Kōmei Party's major policy aim is the establishment of a welfare system and the promotion of "human Socialism." The Democratic Socialist Party (Minshatii) was formed in 1960 by a group from the Socialist Party that was opposed to extreme ideologies. It aims at creating a Socialist society through democratic processes and draws most of its support from the same sources as the Socialist Party itself. The Japan Communist Party (Nihon Kyōsantō) is one of the minor parties, although its influence on political and intellectual developments in society is strong.

The participation of the citizen. Since the late 1960s, the role of the citizen in politics has been often discussed both in journalism and in daily conversation, especially at election time. Many citizens today wish to participate in solving such problems as traffic congestion, waste disposal, air and water pollution, the shortage of parks and playgrounds, and noise control. In many cities there are numbers of commercial and residential streets that have been closed to automobile traffic.

Justice. The judiciary is completely independent of the executive and legislative branches of the government. The judiciary system consists of the Supreme Court, eight high courts, a district court in each prefecture, with the exception of Hokkaidō, which has four, and many summary (informal) courts. Family courts also abound.

The Supreme Court is by any standard the most important one in Japan; it consists of one chief justice and 14 other justices. The chief justice is appointed by the emperor upon designation by the Cabinet, while the other 14 justices are appointed by the Cabinet. The appointment of the justices of the Supreme Court is subject to review in a national referendum, first at the time of the general election following their appointment and then at the general election following the elapsing of a ten-year period. An impeachment system also exists; the court of impeachment consists of members of the House of Representatives and of the House of Councillors. The Supreme Court determines questions of the constitutionality of any law, order, regulation, or official act. Lower court judges are appointed by the Cabinet from a list of persons nominated by the Supreme Court. The appointment term is for ten years, and re-appointment is allowed. All judges of lower courts must retire at the age of 70, according to law.

The Self-Defense Forces

The armed forces. Under its present constitution, Japan cannot maintain armed forces for purposes of aggression; in consequence, national security is maintained by the Self-Defense Forces (Jietai), as well as by the collective security system in which the United States participates. The Self-Defense Forces play a role that is entirely limited to defense and internal security.

Between 1945 and 1950, Japan had no armed forces except for police; after the outbreak of the Korean War, however, the government, at the suggestion of the Allied occupation forces, established a National Police Reserve of 75,000 men and increased the strength of the Maritime Safety Agency to 18,000 men. In the early 1970s, the Self-Defense Forces consisted of ground, maritime, and air forces, under the civilian-controlled National Defense Council; in 1971 they had a total combined strength of 259,000 uniformed personnel. The Ground Self-Defense Force alone had 179,000 uniformed personnel, divided into five armies and 13 divisions; it also had 350 aircraft and more than 100 missile launchers. The Maritime Self-Defense Force had about 38,300 personnel, as well as 210 ships and other vessels totalling 133,000 tons, more than 150 antisubmarine aircraft, and 100 other aircraft. The Air Self-Defense Force had 41,700 personnel, with 970 aircraft and 75 missile launchers. The majority of weapons were supplied by the United States.

The constitutionality of the Self-Defense Forces has often been disputed. The Supreme Court ruled in 1959 that it did not violate the constitution, because its purpose was defensive. United States military bases operated in many parts of Japan under the Treaty of Mutual Cooperation and Security, concluded between Japan and the United States in 1960. The treaty may be terminated one year after either signatory so notifies.

ADMINISTRATIVE SERVICES

Education. A great many educational institutions existed even in the feudal period preceding the Meiji Restoration of 1868, a number of which had been subjected to Chinese cultural influences since ancient times. Numerous private schools (terakoya), mostly in towns, functioned as elementary schools; reading, writing, and arithmetic were taught by unemployed warriors, monks, or others. Provincial lords (daimyd) also established special schools for children of the warrior class. Yet another type of school was operated primarily for the children of wealthier merchants and farmers.

The modern educational system was introduced immediately after the Meiji Restoration. The government set up elementary and secondary schools throughout Japan in 1872, and in 1886 a system providing three to four years of education was inaugurated. The introduction of modern education did not encounter many problems, primarily because it was possible to utilize the educational system already functioning. Free compulsory education was introduced in 1900 and in 1908 was extended to a period of six years. Since 1947, compulsory education has been for a nine-year period, beginning at the age of six.

In the early 1970s the educational system of Japan was organized as follows: kindergarten lasted from one to three years but was not compulsory, being attended by about two-thirds of the children at the age of five; compulsory elementary school lasted six years, compulsory middle school three years, and high school (not compulsory) another three years. Higher education consisted of from two to three years, for junior colleges, and four years, for ordinary colleges and universities; a master's degree could be obtained in two years after earning a bachelor's degree, and a doctor's degree in three years after earning a master's degree. In addition, there are five-year technological colleges (combining high school and junior college education). Public elementary and middle schools are free; a modest fee is required for public high schools and public higher educational schools. About 5 percent of Japan's gross national product is spent on education.

Higher education

Japan is one of the few countries in the world that provide a complete and thorough education for almost all the people. Although neither kindergartens nor high schools are compulsory, attendance at both is fast becoming virtually universal; higher education is also becoming popular. In 1970, there were more than 380 colleges and universities with more than 1,400,000 students and about 480 junior colleges with more than 260,000 students; nearly 30 percent of the attendance in both categories was female. The percentage of freshman students pursuing higher education represented about 20 percent of all students. In higher education, about 75 percent of the students attend private colleges and universities, and 90 percent attend private junior colleges. Slightly more than half of the students in higher education studied the humanities and social sciences. In 1969 Tokyo prefecture had more than 100 out of the national total of 379 institutions of higher education.

The Tokyo Metropolitan Area, including Yokohama and many other satellite cities, had nearly 1,000,000 students of higher education. Such a concentration led to congestion as well as to an active intellectual life. A large project called Academic City, located about 30 to 40 miles northeast of Tokyo near Tsukuba-san (Mt. Tsukuba), is to comprise a large new national university and many national and private research institutes; it is to be completed by 1980.

Educational administration is decentralized, with the Ministry of Education playing a coordinating role. Responsibilities for the budget, curriculum, teacher appointments, and the supervision of elementary and middle schools are in the hands of local educational boards.

Health and welfare services. In the early 1970s, social-welfare services were not yet satisfactorily established, although they had expanded considerably since the end of World War II. In the 1970 governmental budget, about 15 percent of the total was allocated to social welfare, including social insurance, services for the aged and the physically and mentally handicapped; and care for disadvantaged children. Social insurance itself consisted of health insurance, pension insurance, unemployment insurance, and workmen's accident compensation insurance. After 1961 the health-insurance system covered all Japanese people, although the scale of payments varied and in some cases no payments were required. The government had established more than 800 health centres throughout Japan, aiming primarily at improving environmental sanitation and at preventing communicable diseases in their early stages. Out of a total of about 8,000 hospitals in 1970, about 450 were operated by the national government, more than 1,000 by local governments, and the majority by unions, associations, or individuals. Aged people received many services, including medical examinations, home help services, recreational services, and institutional care, as well as varying amounts of financial aid. Local governments are obliged to provide welfare services for the physically handicapped and mentally retarded. Various children's welfare programs also exist—for example, medical-care services are free to expectant mothers and to young children from low-income families. Many voluntary and private associations also provide supplementary services.

Wartime destruction of houses

Housing. The housing shortage has posed major political and social problems. It is due to the following: during World War II, 70 percent of the houses in 70 percent of the major cities in Japan were ruined; constantly rising land prices, especially in and around major cities; the general use of lumber as a building material, requiring earlier replacement than brick or stone; the frequent occurrence of earthquakes, typhoons, and heavy rains bringing floods; the government's inclination to encourage economic growth rather than house construction; rapidly rising standards of living, which create a demand for larger and better houses; and an increase in the number of families, resulting from the breaking up of families into smaller units.

The penchant for living in single family homes may be attributed to the Japanese love of nature, to the influence of the garden-city movement, and to the fashion for imitating the tree-shaded residences of the feudal warrior class. The government and some private construction companies have encouraged construction of multistory apartment houses.

To cope with the housing shortage, a semigovernmental agency, the Housing Loan Corporation, was established in 1950 to finance house construction at low interest rates. In 1955, another semigovernmental agency, the Japan Housing Corporation, was organized; by 1970 it had built almost 700,000 units. Local governments have also built a number of units, mostly of the apartment-house type and primarily for low-income families. Between 1950 and 1970, 13,000,000 units were built; in the early 1970s the number was increasing at an annual rate of more than 10 percent. In 1969, less than 20 percent of the houses built were subsidized by governmental or semigovernmental funds. Generally, the size of housing units is increasing as per capita national income rises.

Police services. Japan's police services are under the supervision and control of the government's police agency, which in 1970 employed about 8,000 persons; the nationwide police services themselves had a strength of about 170,000 persons, all of whom were employed by local governments. Police services operate relatively smoothly; many problems that plague other countries are absent because of Japan's insularity and its uniform ethnic composition. The ratio of arrests of suspects is usually very high; the low ratio of extremely cruel crimes stands in contrast to that of most advanced countries.

SOCIAL CONDITIONS

Wages and cost of living. With Japan's very rapid economic growth, wages have been rising at a rapid rate. In the five years from 1965 to 1970, real wages rose by 50 percent and nominal wages by about 75 percent or more; this was largely due to increases in efficiency of production. In prewar Japan, per capita national income reached a peak of about U.S. $200 just before the outbreak of World War II but fell sharply to less than U.S. $100 in 1946. Recovery was somewhat slow during the first postwar years, but, after about 1950, economic growth was fairly consistent and was accompanied by a rapid increase in wages. In the early 1960s it was debatable whether Japan had joined the ranks of the developed countries; by 1964, for example, gross national product per capita had only reached U.S. $660. By the early 1970s, however, very few contended that Japan was still only a developing country rather than a developed one; gross national product per capita rose to U.S. $1,430 in 1969 and to more than U.S. $1,795 in 1970.

Wage trends

As of 1969, the monthly average income for all employed persons in Japan was 64,300 yen (U.S. $179); male income averaged 75,900 yen, while female income was only 36,800 yen (360 yen = U.S. $1.00; 864 yen = £1 sterling, on December 30, 1970). Wages paid by large enterprises are significantly larger than those paid by small ones. In the case of manufacturing industries, in 1968 workers in large factories with more than 1,000 employees obtained nearly double the wages of those in factories with ten to 19 employes, the ratio being 100 to 58. At the same time, the productivity of workers in the large factories was greater than that of workers in small factories, the ratio being 100 to 37; thus, workers in small factories were better paid in relation to their productivity. Workers in large enterprises are usually provided with relatively good housing and with recreational facilities in return for very low payments.

The cost of living in the early 1970s was generally rising at a rapid rate; this was especially true in large cities, where residents were obliged to pay dearly for their metropolitan amenities. Generally speaking, manufactured goods, such as clothes, machines, and cars, were low priced, and public-transportation fares were low, while food and raw materials were comparatively expensive, as were such utilities as electricity. Land prices were extremely high, primarily because of high population density in both urban and rural areas, though some critics attributed them to the government's indifference. A private house built in an urban or suburban area often costs less than the site. Land prices in some areas in downtown Tokyo are said to be higher than those in any other city in the world. In general, high land prices tend to encourage the prevalence of small apartment houses.

Health conditions. Sanitary conditions had improved considerably by the early 1970s. The average life span of the Japanese people was 70.2 years for men and 75.6 for women (1970). Higher living standards, including better nutrition and better living conditions, as well as progress in medical care, contributed much to the increase in the life span. Numerous hospitals, clinics, and health centres throughout the nation, as well as health education in schools and among the public at large, had virtually eliminated such diseases as typhus, diptheria, and scarlet fever. Tuberculosis and dysentery were much less prevalent than they once were. Smallpox, cholera, leprosy, and rabies had long been practically nonexistent, except for rare cases among tourists. Increases in the so-called "diseases of civilization" had, however, become a serious problem. Apoplexy, high blood pressure, heart ailments, mental disorders, and similar diseases had become principal causes of death, as had traffic accidents. The number of hospital beds available for patients in 1970 was more than 1,300,000, and the number of persons per medical doctor was about 900—making Japan one of the most favoured nations in the world in this respect. Japanese medical practice is usually of the Western type, but classical Chinese techniques are also used.

Changing dietary conditions

In the early 1970s, the Japanese people were obtaining increasingly better food. Although calorie consumption—which averaged about 2,250 daily—was much lower than that of Europeans or Americans, overnutrition causing excess weight had nevertheless become a serious problem. The traditional Japanese food was being replaced partly by Western types of food and partly by Chinese food—to such a degree that the average Japanese no longer regards Western or Chinese food as alien.

Social and economic divisions. During the feudal period, there was a social division of commoners into four classes (warrior, farmer, craftsman, and merchant), with a peer class above and an outcast class (variously called *shinheimin* or *eta*) below. With the possible exception of the outcast class, this social-class system has almost disappeared. In 1959, for example, Crown Prince Akihito married a commoner's daughter. Insofar as a social-class system does persist it has no ethnic basis because all residents in Japan are Japanese, who regard themselves as belonging to one and the same ethnic group. The few exceptions include aliens (non-Japanese citizens) living in Japan—particularly Koreans who came to Japan as labourers before and during World War II—and Japanese citizens of Ainu origin, who are scattered over the island of Hokkaidō. Before World War II there was a tendency to distinguish the people of Okinawa from other Japanese because many of them exhibited minor differences in physiognomy and cultural life, but this tendency has disappeared. Okinawan culture, including its dialect and religion, is now recognized as sharing many traits with Japanese culture and, in some respects, represents a prototype. The ethnic unity of the Japanese is reflected in the fact that, of all the peoples of the world, the Japanese have been the least inclined to intermarry with foreigners. A vernacular word gaijin, which literally means a foreigner or foreigners, is often used in daily conversation; the term implies that gaijin are fundamentally different from Japanese and, as such, cannot understand Japanese culture.

Vast discrepancies between the condition of the rich and poor have been reduced since World War II largely as a result of the agricultural reforms of 1946 to 1950 and of the application of a graduated income tax. Although differences exist in income and property, more than 95 percent of the Japanese regard themselves as in the middle-income group. Most of those in the upper-middle income group own their own homes, usually houses with several rooms surrounded by a garden; those in the lower middle-income group usually live in a one-to-four room house or (in urban areas) in an apartment house. The social attitudes of the Japanese and the absence of strict zoning in urban areas have contributed to the mixed land uses characteristic of Japan's cities; thus, functionally different establishments, such as shops, factories, or houses, are found adjoining one another, so that mixed rather than exclusive social patterns result.

VI. Cultural life and institutions

THE CULTURAL MILIEU

Japan's long history has produced a cultural milieu that differs significantly from that of other countries. In general, this milieu is characterized by an inseparable mixture of traditional Japanese culture with introduced Chinese and Western cultural forms.

Ancient Chinese influences

Prehistoric Japanese culture was subjected to ancient Chinese cultural influences that were introduced some 1,500 years ago. One consequence was the imposition of the gridiron system of land division, which long endured; even today, it is possible to trace the ancient place-names and field division lines of this system. Chinese characters and many other Chinese developments were also introduced. The Buddhist religion, which originated in India and subsequently underwent modification in Central Asia, China, and Korea, also exerted a profound influence on the Japanese cultural life, but in the course of history, the process of Japanization continued. The Japanization of the introduced Chinese culture was greatly accelerated during the 250-year period of isolation that ended in 1868. The climate of Japan, for example, which was much more humid than that of China, led to such cultural adaptations as the use of lumber for building in place of the mud and brick used in China. Similarly, the Chinese characters had only a limited use because they did not fit the Japanese language, which belongs to a completely different family. Another trait of the Japanese life differing from the Chinese is that indoors the Japanese sit on the floor rather than using chairs, and they generally sleep on mattresses and quilts spread on the floor, whereas the Chinese normally use chairs and beds.

After the Meiji Restoration of 1868, Japan began to modernize and to industrialize on the European and U.S. pattern. In the period since then, the United States has exerted a more conspicuous influence on Japanese cultural and social life than has Europe, as a whole. Western cultural traits have been introduced on a large scale through the schools and the mass-communication media, such as the radio, newspapers, and television. Western scientific and technical terms have been widely diffused in translation and have even been re-exported to China and Korea. Today, U.S., English, French, German, or Soviet influences on Japanese culture are in evidence in literature, the visual arts, music, education, science, recreation, and ideology.

Effects of Western influences

Modernization has often been accompanied by cultural changes. Rationalism and Socialism based on Christianity, as well as Marxism, have become inseparably related to everyday Japanese life. Western or Westernized music seems to be preferred to traditional Japanese music at most social levels. Although Japanese Christians form slightly less than 1 percent of the population, Christmas is enjoyed, if not celebrated, quite widely, almost as a folk event. The use of Western dress among the Japanese, in place of the kimono, is widespread, although the kimono tends to be used by young women at celebrations and by a considerable number of male adults and older women for home wear. House construction has also been changed considerably by the introduction of Western architectural forms and functions. In shape, in colour, and in building materials, many Japanese houses today are significantly different from the traditional ones; they now have more modernistic shapes, use more colours, and are more often made of concrete and stucco.

Everyday use of modern transport and of modern communication media has brought Japanese urban life close to that of the West. Japanese forms of recreation are similar to those in other developed countries, although there are some notable differences. Outdoor recreational activities include hiking, mountaineering, skiing (there were more than 10,000,000 Japanese skiers by 1971), skating, golf, swimming, boating, fishing, baseball, tennis, and football (soccer). Indoor recreations include shdgi (a kind of chess), go (a strategy game also similar to chess), Japanese and Western card games, basketball, volleyball, pingpong, bowling, wrestling, *jūdō,* kendd (Japanese fencing), karate, and gymnastics. *Sumō* wrestling is also practiced, or watched, both indoors and out.

ARTS, FOLK TRADITIONS, AND POPULAR CULTURE

The Japanese cultural tradition includes many forms of the fine arts and folk arts. Local variations are found throughout Japan's mountainous archipelago, where most river basins, valleys, or islands have their own specific folklores.

The highly refined traditional arts of Japan include flower arranging (ikebana), the tea ceremony (*cha-no-*yu), painting, calligraphy, dance, music, theatrical plays (Including such forms of drama as Kabuki, a highly stylized form of drama characterized by singing and dancing; *bunraku*, the puppet theatre; N6, the classic form of dance-drama), and gagaku (court music), gardening, and architecture. Delicacy and exquisiteness of form, together with simplicity, characterize traditional Japanese artistic taste. The Japanese tend to view the traditional Chinese arts generally as being too grandiose or showy. The newly introduced Western arts are also felt to suffer from the same flaws, though in a different fashion.

With the advance of modernization, many folk traditions and forms of folklore are rapidly disappearing. The widespread use of common Japanese (the Tokyo dialect) has accelerated this trend, since local cultures are directly related to dialects, which are so diverse that many of them cannot be generally understood. Folk songs, for example, are generally no longer commonly sung except in some remote areas in northern and southwestern Japan. Folk music and dance are related to local life and are often significantly concerned with the local religion (whether animistic, shrine Shintō, or Buddhist), agriculture, or human relations (including the theme of love). Some, however, still enjoy a great popularity, which has been increased through the mass media. On informal social occasions, even in the large cities, folk and popular songs are often sung. Such traditional arts as ikebana, cha-no-yu, and calligraphy are studied and practiced by a great many Japanese; *ikebana* and cha-no-yu, in particular, are popular among young unmarried women, since these are regarded as cultural or aesthetic attributes for future housewives. Traditional Japanese painting, dance, and music have, however, lost much of their traditional popularity, though the poetic forms of haiku and waka continue to flourish.

Changes in social customs

In social life, the arranged marriage (miai-kekkon) is being replaced by the love match, though nearly half of all marriages are still arranged or initiated by parents or other older persons or, sometimes, by friends. Modern (usually Western) popular culture has gained a strong foothold in Japan. Jazz, rock and roll, and the blues are enjoyed by the younger generation, along with half-Westernized or half-Japanized folk and popular songs. Many more or less Japanese songs are sung to the accompaniment of Western musical instruments; at the same time, many more or less Western subjects are treated in Japanese-style drama or song.

In 1971, Japan had 12 national holidays. New Year's Day was traditionally regarded as the most important of these holidays, with millions of people engaging in a kind of pilgrimage that leads to shrines and temples starting at midnight of December 31; several shrines and temples each draw more than 1,000,000 people during the three day New Year holiday season. In addition to the 12 national holidays, there are also such other nationwide festivities as Girls' Day (March 3), which is comparable to Boys' Day (May 5), now celebrated as Children's Day (a national holiday). May Day (May 1) is celebrated by many workers. Many temples and shrines celebrate their own specific festivals, attracting large numbers of people. City, town, and village authorities, as well as local communal bodies, often organize local festivals.

CULTURAL INSTITUTIONS

In addition to its cultural institutions such as libraries, museums, art galleries, theatres, parks, gardens, and schools of various kinds, Japanese department stores also play a role in the dissemination of culture by offering free or low-cost exhibitions.

As of 1970, the National Diet Library in Tokyo (which also included branch libraries), with almost 6,000,000 books, was the single largest library in Japan. In 1968, higher educational institutions, including universities, colleges, junior colleges, and technical colleges, had more than 1,200 libraries, with a total of some 60,000,000 books. Secondary and elementary schools are also equipped with libraries as a matter of course. In addition, in 1968 there were about 725 city, town, or village libraries, some equipped with mobile facilities. The overwhelming majority of library books are in the Japanese language.

Museums

There were nearly 340 museums of all kinds in 1968; these included 55 general museums, as well as 43 science, 83 historical, 77 art, and 4 outdoor museums, as well as 22 zoos, 18 botanical gardens, and 31 aquariums. Museums of all kinds have been increasing in number, as well as in the quantity of their exhibits and in their attendance.

Local governments provide youth educational services, offering more than 5,000 classes on various topics in 1968. Adult education is also conducted by local governments, as well as by private institutions. In 1967 alone more than 4,000,000 adults enrolled in classes in general education, vocational training, technology, homemaking, home economics, arts, physical education, and recreation. Many institutions also help to promote nature studies and recreation; in 1971, these included about 500 public and private youth hostels, about 260 national lodging houses, 21 national vacation villages, 23 national parks, 44 quasi-national parks, and a great many prefectural natural parks.

Miscellaneous schools also function as agencies of cultural dissemination; in 1969 these numbered almost 8,000, plus about 60 branch schools, and had a total enrollment of 1,400,000 students. These schools, which are recognized by the local authorities, offer courses in such subjects as dressmaking, handicrafts, cooking, abacus calculation, foreign languages, driving, and nursing.

PRESS AND BROADCASTING

The role of press and broadcasting has long exerted an important influence in an ever changing Japan.

The press. Japan ranks as one of the major book publishing countries in the world. In 1971 nearly 27,000 different books were published, of which about one-quarter consisted of literary works. Books on the sciences and social sciences are gaining popularity. In the same year, the total number of copies of these books was about 510,000,000. About 2,500 different magazines were published, totalling about 1,700,000,000 copies, with more than half of these copies consisting of weeklies. About half of the book-publishing companies are located in Tokyo, where more than 90 percent of all books are published.

The role of newspapers is of great importance. Major newspapers print both morning and evening daily editions. Their total daily circulation in 1970 was about 53,000,000—an average of two newspapers a day to each Japanese household, more than in almost any other country. In 1970, there were 117 newspaper companies. At least five of them could be regarded as operating on the national level; these five were *Asahi* (with a morning circulation of about 5,700,000); *Yomiuri* (5,400,000); Mainichi (4,600,000); Sankei (1,900,000); and Nikkei (*Nihon Keizai* [1,160,000]). All of these papers also published evening editions, and all had their main headquarters in Tokyo. Some local newspapers also have large circulations—for example, *Chūnichi*, with headquarters in Nagoya, with a circulation of almost 1,900,000. Japan's three largest newspapers rank first, second, and third in the world in circulation, even if morning and evening editions are counted separately. All of these large newspapers are generally considered to maintain high editorial standards.

Radio and Television. Radio and television are used in Japan far more extensively than in any other Asian country and, indeed, than in most other countries in the world. Radio broadcasting began in 1925 with the establishment of Nippon (Nihon) Hōsō Kyōkai, or NHK (the Japan Broadcasting Corporation)—a public corporation financed by license fees that according to law must be paid by television-set owners. NHK broadcasts many quality programs, both on radio and on television; no commercial advertisements are permitted. In 1970 NHK was operating more than 300 AM radio stations on two networks and about 250 FM radio stations, offering stereophonic and other broadcasts.

The first television broadcast was made by NHK in 1952. In 1970, there were nearly 2,000 NHK television stations, broadcasting to practically all parts of mainland Japan, as well as to many isolated islands. NHK has been broadcasting overseas programs such as "Radio Japan" since 1953 and in the early 1970s conducted broadcasts in 23 different languages. Private commercial broadcasting began in 1951 and may have become more popular than NHK; in 1970, there were 13 commercial radio companies, 43 commercial television companies, and 35 combined radio and television companies. The total number of commercial television stations was almost 900, and there were about 150 commercial radio stations. In 1970, television closely followed newspapers as the most important media of commercial advertising; magazine and radio advertising were less significant.

Since World War II, Japanese political trends have always taken a democratic direction, for the most part under strong conservative influence. As a result of Japan's very rapid economic growth, all phases of the society and culture have experienced fundamental changes. In the early 1970s, Japan's gross national product was exceeded only by those of the United States and the Soviet Union. Income and wages were expected to parallel those of the highly developed northwestern European countries before the end of the 1970s, if the rate of economic growth was maintained.

Since prehistoric times, the Japanese nation has often remained secluded from the rest of the world for long periods of time, so that the Japanese have developed their own peculiar culture, though Chinese and Euro-U.S. influences cannot be ignored. As a result, the Japanese became one of the least internationally minded of nations. Under the influence of the mass media and of international exchanges, however, Japan's culture is now undergoing revolutionary change. Regional variations, once extremely conspicuous, are now disappearing. A new and very modern nation seems to be emerging—one that will probably retain many of its traditional cultural traits.

(Y.M.)

BIBLIOGRAPHY. Two good gazetteers of Japan are *Nihon chimei jiten*, compiled by AKIRA WATANABE, 3 vol. (1954–56); and *Nihort chimei daijiten*, compiled by AKIRA WATANABE *et al.,* 7 vol. (1967–68). The *Nihon kokusei-zue,* an industrial digest issued annually, contains physical and economic statistical data with explanations. Recent representative geographical works in English include *A Report on Japanese Natural Resources Prepared in General Headquarters in 1948* (1948), an official document comprised of studies on physical and cultural aspects by Japanese and American scholars; *Regional Geography of Japan,* 2 vol. (1957), the proceedings of a conference of the International Geographical Union; *Japan: Guide Book for the Congress Tours* (the XIth Pacific Science Congress, 1966); and ROBERT B. IIALL, JR., *Japan: Industrial Power of Asia* (1963), which contains a brief analysis of postwar industrial development. Geomorphology is covered by AKIRA WATANABE, "Landform Divisions of Japan," *Bull. Geogr. Surv. Inst., Tokyo,* 2:81–94 (1950–51); climatology is dealt with by EIICHIRO FUKUI, "Climate and Agricultural Land Use in Japan," in *Festschrift Leopold G. Scheidl* (1967); see also Fukui's work, "Climatic Division of Japan," in *Geogrl..Rev., Japan,* vol. 9 (1933); TAKESHI MATSUI, "General Characteristics of the Soil Geography of Japan," *Pedorojisto/Pedologist,* 12:25–36 (1968), contains recent information; YOSHIKATSU OGASAWARA, "Land Use of Japan," *Bull. Geogr. Surv. Inst., Tokyo,* 2:95–119 (1950–51); and *Japartese Cities: A Geographical Approach* (Association of Japanese Geographers Special Publication, no. 2, 1970), discuss many subjects pertaining to these respective fields. The following two government pamphlets (both in English) contain official information: "Statistical Handbook of Japan" (Bureau of Statistics, annual); and "The Japan of Today," compiled by the Ministry of Foreign Affairs (annual). The BUREAU OF STATISTICS, *Japan Statistical Yearbook* (annual), provides the best readily available information source on Japan as a whole. The MINISTRY OF FOREIGN AFFAIRS OF JAPAN, *Japan in Transition: One Hundred Years of Modernization* (1968), gives general descriptions and is illustrated. HISAO AONO and SHOHEI BIRUKAWA (eds.), *Nihon chishi* (1967–), is a comprehensive series dealing with Japan's regional geography by prefectures. EDWARD A. ACKERMAN, *Japan's Natural Resources and Their Relation to Japan's Economic Future* (1953), is a basic source for understanding the economic development. For general background on the economy, see also GEORGE C. ALLEN, *Japan's Economic Recovery* (1958); ROBERT J. BALLON (ed.), *Doing Business in Japan* (1967); RICHARD K. BEARDSLEY (ed.), *Studies on Economic Life in Japan* (1964); ALICE H. COOK, *An Introduction to Japanese Trade Unionism* (1966); WILLIAM W. LOCKWOOD (ed.), *The State and Economic Enterprise in Japan* (1965); and YUTAKA MATSUMURA, *Japan's Economic Growth, 1945–1960* (1961). Detailed current information on various aspects of the economy may be found in publications of the Japanese government, such as the BANK OF JAPAN, *Economic Statistics of Japan* (annual); and the MINISTRY OF AGRICULTURE AND FORESTRY, *Abstract of Statistics on Agriculture, Forestry, and Fisheries* (annual). RYUZIRO ISIDA, *Geography of Japan,* rev, ed. (1969), is concerned with major aspects of the physical, economic, and cultural environment. GLENN T. TREWARTHA, *Japan: A Geography* (1965), also deals with geographical aspects in detail. A detailed field survey of village life from geographical, historical, and social viewpoints is made in RICHARD K. BEARDSLEY, JOHN W. HALL, and ROBERT E. WARD, *Village Japan* (1959). Japan's cities are treated in detail in RONALD P. DORE, *City Life in Japan: A Study of a Tokyo Ward* (1958). The JAPAN CENTER FOR AREA DEVELOPMENT RESEARCH, *Nihon rettd no shōraizō* (1969), is a comprehensive atlas covering geographical, economic, social, and cultural aspects, with explanations in both Japanese and English.

Japan, History of

This article is divided into the following sections:

- I. Ancient and medieval Japan to *c.* 1550
  - Prehistoric Japan
  - The ancient period (*c.* AD 250–710)
  - The Imperial state
  - The Kamakura *bakufu* (1192–1333)
  - The Muromachi (or Ashikaga) shogunate (1338–1573)
  - The period of the "warring country"
- II The early modern history of Japan (1550–1850)
  - Unification
  - The *bakuhan* system
  - The weakening of the *bakuhan* system
  - The Tempō reform and the collapse of the *bakuhan* system
- III. Japan since 1850
  - The Meiji Restoration
  - Imperial Japan
  - After World War II

I. Ancient and medieval Japan to c. 1550

PREHISTORIC JAPAN

Pre-Ceramic culture. It is not known when man first settled on the Japanese archipelago. It was long believed that there was no Paleolithic occupation in Japan, but since World War II several Paleolithic tools have been uncovered. These include both core tools, made by chipping away the surface of a stone, and flake tools, made by working with a stone flake broken off from a larger piece of stone.

It seems likely that the men who used these implements moved to Japan from the Asian continent. At one stage, land connections via what are now the straits of Korea dnd Tsushima made possible immigration from the Korean peninsula, while another connection, via what are now the Sōya and Tsugaru straits, allowed men to come in from northern Asia.

The Paleolithic Age in Japan is variously dated from 30,000 to 10,000 years ago. Nothing certain is known of the culture of the period, though it seems likely that men lived by hunting and gathering, used fire, and made their homes either in pit-type dwellings or in caves. No bone or horn artifacts of the kind associated with this period in other areas of the world have yet been found in Japan. There was no knowledge whatsoever of pottery; hence, the period is referred to in Japan as the Pre-Ceramic or Pre-Pottery era.

Jōmon culture (5th or 4th millennium to c. 250 BC). The Pre-Ceramic period is followed by two Neolithic cultures, the Jbmon and the Yayoi. The former takes its name from the *jōmon* ("cord marks") pottery found throughout the archipelago. A convincing theory dates the period during which Jbmon pottery was used from about 10,000 years ago until the 2nd or 3rd century BC. Of the features common to Neolithic cultures all over the world—progress from chipped tools to polished tools, the manufacture of pottery, the beginnings of agriculture and pasturage, the development of weaving, and the erection of monuments using massive stones—the first two are prominent features of the Jōmon period, but the remaining three do not appear until the succeeding Yayoi period. The manufacture of pottery, however, was highly developed, and the work of Jbmon culture has a diversity and complexity of form and an exuberance of artistic decoration. It is customary to take changes in the type of pottery used as a basis for subdividing the age and to distinguish very early, early, middle, late, and very late periods. It must be remembered, however, that since Jōmon culture spread over the whole of the archipelago, it also developed regional differences, and this combination of both chronological and regional variations gives the evolution of Jbmon pottery a high degree of complexity.

The Japanese Neolithic

The pottery of the very early period includes many deep, urnlike vessels with tapered bases. In the early period, the vessels of eastern Japan become roughly cylindrical in shape, with flat bases, and the walls contain an admixture of vegetable fibre. The middle period saw rapid strides in pottery techniques; the pots produced during this time in the central mountain areas are generally considered to be the finest of the whole Jbmon era. The surface of these generally cylindrical vessels is covered with complex patterns of raised lines, and powerfully decorative projections rise from the rim to form handles. From the middle period onward there is increasing variety in the types of vessels, and a clear distinction developed between high-quality ware using elaborate techniques and simpler pots made for purely practical use. The amount of the latter increases steadily, preparing the way for the transition to Yayoi pottery.

Jōmon dwelling sites have been found in various parts of the country. They can be classified into two types: one, the pit-type dwelling, consisted of a shallow pit with a floor of trodden earth and a roof; the other was made by laying a circular or oval floor of clay or stones on the surface of the ground and covering it with a roof. Remains of such dwellings have been found in groups ranging from five or six to several dozen, apparently representing the size of human settlements at the time. Most of these settlements form a horseshoe shape, with a space in the centre that seems to have been used for communal purposes. Nothing certain is known, however, concerning social or political organization at this period. It can be deduced that each household was made up of several family members and that the settlement made up of such households was led by a headman or magician.

The men of the Jbmon period lived mainly by hunting and fishing and by gathering edible nuts and roots. The appearance of large settlements from the middle period onward has been interpreted by some scholars as implying the cultivation of certain types of crop—a hypothesis supported by the fact that the chipped stone axes of this period are not sharp but seem to have been used for digging soil. Weaving was still unknown, and clothes were probably made of skins or bark. Jewelry included bracelets made of seashells, earrings of stone or clay, and necklaces and hair ornaments of stone or bone and horn. From the latter part of the period, the custom also spread over the whole country of extracting or pointing certain teeth, probably performed as a rite marking the attainment of adulthood.

No especially elaborate rites of burial were evolved, and the dead were buried in a small pit dug near the dwelling. Sometimes the body was buried with its knees drawn up or with a stone clasped to its chest, a procedure that probably had some religious or magical significance. A large number of clay figurines have been found, many representing female forms that were probably magical objects associated with primitive fertility cults.

The Ainu

For years certain scholars have claimed that the men responsible for the Jōmon culture were not of Japanese stock but were ancestors of the Ainu, an aboriginal Caucasian people now found in northern Japan. Scientific investigation of the bones of Jbmon men carried out since the beginning of the 20th century has disproved this theory. The Jbmon people were a particular people who might be called proto-Japanese, and they were spread all over the country. Despite certain variations in character arising from differences in period or place, they seem to have constituted a single stock with more or less consistent characteristics. The present Japanese people were produced by an admixture of certain strains from the Asian continent and from the South Pacific, together with adaptations made in accordance with environmental changes. Linguistic evidence suggests that a people speaking a language belonging to the primitive Ural-Altaic family moved eastward across Siberia and entered Japan via Sakhalin and Hokkaidō. Nothing can yet be proved concerning their relationship with the people of the Pre-Ceramic period, but it cannot be asserted that they were entirely unrelated.

Yayoi culture (c. 250 BC to c. AD *250).* The new Yayoi culture that arose in Kyushu (the southernmost of the four Japanese islands), while the Jbmon culture was still undergoing development elsewhere, spread gradually eastward, overwhelming the Jiimon culture as it went, until it reached the northern districts of Honshu, the largest island of Japan. The name Yayoi derives from the name of the district in Tokyo where, in 1884, the unearthing of pottery of this type first drew the attention of scholars. Yayoi pottery was fired at higher temperatures than Jbmon pottery and was wheel turned. It is distinguished partly by this marked advance in technique and partly by an absence of the proliferating decoration that characterized Jiimon pottery. It developed, in short, as pottery for practical use. It is accompanied by metal objects and is associated with the wet cultivation of rice. Culturally, it represents a notable advance over the Jōmon period and is believed to have lasted for some five or six centuries, from the 3rd or 2nd century BC to the 2nd or 3rd century AD.

In China, the 3rd and 2nd centuries BC corresponded with the period of the unified empire under the Ch'in (221–206 BC) and Han (206 BC–AD 220) dynasties, which had already entered the Iron Age. In 108 BC, Han Wu Ti occupied the Korean peninsula and established Lo-lang and three other colonies. They provided a base for a strong influx of Chinese culture into Korea, which, in turn, spread to Japan. The fact that Yayoi culture had iron implements from the outset, and bronze implements somewhat later, probably indicates borrowings from Han culture. Iron objects rust easily, and comparatively few have been found, but they seem to have been widespread at the time. These include axes, knives, sickles and hoes, arrowheads, and swords. The bronze objects are also varied, including halberds, swords, spears, ***taku*** (small bell-shaped devotional objects from China), and mirrors. The halberds, swords, and spears seem not to have been used in Japan for the practical purposes for which they were evolved in China but to have been prized as precious objects.

Wet cultivation of rice

The wet cultivation of rice, possibly borrowed from southern China, was one of the most important features of Yayoi culture. The earliest Yayoi pottery and sites, discovered in northern Kyushu, have yielded marks of rice husks as well as carbonized grains of rice, which suggests that rice growing was carried on in Japan from the earliest days of the culture. Traces of paddy fields, their divisions marked with wooden piles, have been found close to sites of settlements in various districts, along with irrigation channels equipped with dams and underdrains, showing that techniques of making and maintaining paddy fields were quite advanced.

Generally speaking, the settlements of this period were built on lowlying alluvial land to facilitate the irrigation of the paddies, but at one stage they were built in the hills or on high ground instead. It is not clear whether this was dictated by the needs of defense or whether dry cultivation was being practiced. Much as in the Jbmon period, there were two types of dwelling, the pit type and the type built on the surface; but in addition to these, raised-floor structures now appeared that were used for storing grain.

With the acquisition of a knowledge of textiles, clothing made great strides compared with the Jbmon period. The cloth was woven on primitive looms using vegetable fibres.

The dead were buried in either large clay urns or heavy stone coffins. Both were common in northern Kyushu and neighbouring areas, and similar urns and coffins are also found in Korea, where they probably originated. The graves were usually marked by mounds of earth or circles of stones, but a special type employed a dolmen (a large slab of stone supported over the grave by a number of smaller stones). Since the erection of dolmens was widely practiced in Manchuria and Korea, these, too, are believed to be a sign of an influx of continental culture. Normally, graves occur in clusters, but occasionally one is found apart, surrounded by a ditch and with swords, beads, and mirrors buried along with the dead. Such special graves suggest that society was already divided into classes.

It is natural to suppose that these new cultural elements represent a migration to Japan from Korea or China. Yet it is also certain that the migration was not of an order to change the character of the men who had inhabited the islands from Jbmon times. Although Yayoi culture undoubtedly represents an admixture of new sanguineous elements, it seems likely that the chief strain of proto-Japanese found all over the country during the Jōmon period was not disrupted but was carried over into later ages. This point of view is supported by the accounts of the "men of Wo," found in the Chinese history ***Wei chih.***

Chinese chronicles. Japan first appears in Chinese chronicles under the name of “Wo” (in Japanese, Wa). The Han histories relate that "in the seas off Lo-lang lie the men of Wo, who are divided into more than 100 states, and who bring tribute at fixed intervals." Lo-lang was one of two Han colonies established in the Korean

The "state of Nu in Wo"

peninsula in 108 BC, and it is beyond doubt that the country of Wo was Japan. A Later Han (23–220) history records that in AD 57 the "state of Nu in Wo" sent emissaries to the Later Han court and that the Emperor gave them a gold seal. The "state of Nu," located around what is now Hakata Bay, in Kyushu, was one of more than 100 states into which Wo was divided. This account was confirmed by a gold seal, apparently the identical seal awarded by the Chinese emperor, unearthed on the island of Shikano, at the mouth of Hakata Bay, in 1748. Later, in the latter half of the 2nd century, there was civil war in the state of Wo; a woman called Pimiko (Himiko in Japanese) used her religious authority to pacify the land, and there came into being a union of more than 30 states, which opened communications with the Wei dynasty (AD 220–264) in China. Wei, too, sent emissaries to Wo, and friendly relations between the two sides continued during the first half of the 3rd century. The *Wei chih* contains a detailed account of the route from Lo-lang to the court of the Wo queen in "Yamatai." Scholars are divided as to whether Yamatai was located in northern Kyushu or in the Kinai district. If it was in northern Kyushu, then the union of states was a purely local government, unrelated to the Yamato court of later times, but if it was in the Kinai district, then it would be natural to see it as the ancestor of that court. This would suggest, in turn, that Japan had already achieved a considerable degree of political unification. But it seems most likely Yamatai was a local centre of power in Kyushu and that unification did not take place until a century later.

According to the *Wei chih*, the people of Wo had already reached a fairly high degree of civilization. Society had clearcut divisions of rank, and the people paid taxes. There were impressive raised-floor buildings. The various provinces held fairs where goods were bartered. Since there were exchanges of letters with Wo, it seems, too, that there were already some who could read and write.

THE ANCIENT PERIOD (*c.* AD 250–710)

Date of unification

The Yamato court and the unification of the nation. The question of how the unification of Japan was first achieved and of how the Yamato court, with the *tennō* ("emperor of heaven") at its centre, came into being has inspired many hypotheses, none of which has so far proved entirely convincing. Thanks to Chinese and Korean records, however, it is possible to get at least an approximate idea of the date when unification occurred. The relations that Yamatai had begun with Wei were continued with Chin (AD 265–317), the dynasty that replaced Wei; but following the dispatch of a mission in 266, all records of exchanges cease, and it is not until 147 years later, in 413 during the Eastern Chin dynasty (AD 317–419) in China, that the name of Wo again appears in Chinese documents. It is most likely that the blank period resulted from conditions within Japan that made exchanges with other countries impossible. This period probably saw the collapse of Yamatai and the birth pangs of the united nation that took its place.

It is possible to push the date of unification of the nation back a few decades earlier than 413 because a memorial erected in 414 commemorating the achievements of King Kwanggaet'o (Japanese Hotae) of Koguryd (a Korean state, 37 BC–AD 668), describing the fighting between Wo and Koguryb that took place on the Korean peninsula from the end of the 4th century into the beginning of the 5th century, makes special mention of a great army sent to the peninsula in 391 by Wo that succeeded in subjugating the kingdoms of Paekche, Kaya (or Karak), and Silla. Such military success presupposes a long period of preparation and the prior establishment of a Wo foothold on the peninsula. The 8th-century *Nihon shoki* ("Chronicles of Japan"), one of Japan's two oldest histories, mentions the dispatch of troops by Japan in 369. Displays of strength of this kind would hardly have been possible unless Japan were already unified, and the date of the unification of the country may therefore be set at the middle of the 4th century at the latest.

The rise and decline of the Yamato court. At the time of unification, Japan already seems to have been an extremely powerful nation, as attested by the fact that it took on Koguryb, whch dominated Korea, and established a base for its own power in southern Korea. Paekche, in the west of southern Korea, was a friendly state that paid tribute to Japan, while Kaya (Japanese, Mimana), at the southern extremity of the peninsula, was under direct Japanese jurisdiction. Tributes from these states lined the coffers of the Yamato court and encouraged a marked rise in standards of living. Weavers, smiths, and irrigation experts migrated to Japan from these areas, and the Chinese ideographic script came into Japan at this time, together with Confucian works written in that script.

The Korean rebellion

The Yamato court reached its peak in the eary 5th century and thereafter went into a rapid decline. The main reason was that the states of the Korean peninsula, as a result of shifts in international relationships, broke away from Japan, so that the latter was no longer able to rely on tribute from them. Japan therefore conceived the idea of borrowing the authority of the Chinese court in achieving the subjugation of the Korean kingdoms. Beginning in 421, it sent envoys to the Liu-Sung dynasty (420–479) to ask that the Japanese emperor be granted the title of generalissimo, with military control over the states of Korea. Such envoys were sent on a number of occasions during the Liu-Sung dynasty and continued until 502, during the Liang dynasty (502–557). These attempts proved futile and are themselves evidence of the decline of Japan's military power.

Japan's difficulties abroad were paralleled by an impasse in domestic affairs. The Yamato court was headed by a hereditary emperor, while its members were drawn from the group of powerful *muraji* (clan leader) families, which had been vassals of the emperor from the start, and another group of powerful families, the *omi* (chieftain), which had sworn allegiance during the process of national unification. The highest officers of government were the *ō-muraji* and the *6-omi*, the heads and representatives of those two groups. In time, however, some members of these families began to cool in their allegiance to the emperor or even to plot with the states of Korea. In addition, there were ceaseless struggles involving succession to the throne within the Imperial family itself. As a result, Mimana, Japan's domain in Korea, was captured in 562 by the kingdom of Silla, depriving Japan of a powerful foothold on the peninsula. By the end of the 6th century, Japan had reached a low point in both foreign and domestic affairs.

Introduction of Buddhism

During the declining years of the Yamato court, however, there was one event of the utmost cultural importance: the introduction of Buddhism from the Korean Paekche kingdom. The date of its introduction is traditionally set at either 538 or 552, but it seems likely that Buddhist beliefs had begun spreading among ordinary Japanese at a much earlier date. Buddhism at first was an object of wonder and admiration, a rare item of foreign culture symbolized by its beautiful statuary, its imposing religious paraphernalia, and its majestic temples. The Buddhism that first spread among the Japanese was almost certainly a simple reliance on the magical powers of the religion in seeking various benefits in the present world. True understanding of its doctrines did not come until the time of Shōtoku Taishi (Prince Shōtoku).

The period from the latter half of the 3rd century until the beginning of the 7th century is known to archaeologists as the age of the *Kofun* ("tumulus") culture, for burial mounds were then erected over a wide area, and their shapes and contents (the objects buried with the dead) give a good idea of the material aspects of the everyday life of the time. These include the well-known *haniwa* tomb sculptures.

The idealized government of Shōtoku Taishi. The Yamato court that fell into such desperate straits toward the end of the 6th century was to be resuscitated by efforts made within the Imperial family itself, efforts that in the course of a century reformed the government of the country and set it moving toward formation of a centralized state more suited to the new age. The movement was touched off by the theories of ideal government expounded by Prince Shbtoku, who, as regent for his aunt, the empress Suiko, took charge of the nation in these difficult times. Prince Shbtoku took the Buddhist spirit of peace and salvation for all beings as the ideal underlying his government. He made no move, even, to charge the known murderer of the previous emperor but worked to convince him gradually, through the ideas of Buddhism, of the wrong he had done.

The constitution of 604

The Prince's most striking achievement in the field of domestic government was his establishment of a system of 12 court ranks in 603 and the "Seventeen Article Constitution" in 604. The former, which made clear the relative stations of persons working at the court by giving them caps of different colours, aimed to encourage efficient use of persons of ability and give the court a proper organization and etiquette of its own. The constitution consists of 17 simple articles setting forth the ideals of the state and rules for human conduct. It distinguishes the ruler, his ministers, and the people as the three human elements making up the state and clearly lays down the duties and rights of each; it thus set the pattern of a centralized state presided over by a single ruler, and it provided a kind of basic law of the nation.

Shbtoku's chief achievement in foreign relations was the opening of relations with Sui dynasty (518–618) China. The exchanges between Japan and the Southern dynasties (418–589) in the 5th century had placed Japan in the position of a tributary state. Prince Shdtoku opened relations with Sui on an equal basis, and envoys were exchanged by the two countries. He also sent Japanese students to China to learn directly from Chinese culture, which had hitherto reached Japan via the states of Korea.

Shōtoku was a profound student of Buddhism who gave lectures on the scriptures and himself wrote commentaries. His commentary on the *Lotus Sūtra,* four volumes of which survive in the original draft written by the Prince himself, may be called the oldest written work of known authorship in Japan.

As Buddhism gained ground, imposing temples were built in the Chinese style. The astonishment aroused by these great buildings—often with more than one story and with massive tiled roofs—that were built where there had been only low, thatched houses may well be imagined. A new civilization descended on Japan almost overnight. Of the temples built at the time, all that has survived of most of them are the foundation stones, but the Hbryii-ji, founded in 607 at Ikaruga in present Nara Prefecture, still preserves its ancient wooden structures; indeed, it is the oldest wooden building in the world.

The Taika reforms. The death of Prince Shbtoku, in 629, prevented his ideals of government from bearing full fruit. The Soga family, regaining its former powers, exterminated Prince Shōtoku's son Yamashiro be in 643 and all his family. At the same time, however, the students whom Shbtoku had sent to China were returning to Japan with accounts of the power and efficiency of the T'ang dynasty (618–907), which had overthrown the Sui dynasty and unified China. These accounts impressed on educated men the need to reform the government, strengthen the power of the state, and take every step to prepare against possible pressure from outside.

Abolition of private land-ownership

In 645 Prince Nakano be and Nakatomi Kamatari engineered a coup d'etat within the palace, killing the Soga family and wiping out all forces opposed to the Imperial family. They then set about establishing a system of centralized government with the emperor as absolute monarch at its head. An edict issued in 646 abolished private ownership of land and men by the wealthy families. The land thus taken over by the state was to be parcelled out among all who had attained a certain age, with the right to cultivate, in exchange for which the tenants were to pay a fixed tax. Provisions were also made for a governmental system embracing a capital city and local administration and for defense and communications facilities. A system was also established whereby a kind of "complaints box" was installed at court to give people a chance to appeal directly to the emperor. The main outlines of the reforms were drawn up in about five years. They are given the name Taika reforms after the *nengō* ("year period")—the first such in Japanese history—that was given to the era at that time. In the countries of the Far East, era names are a symbol of an independent nation, a sign that the sovereign's authority is effective.

Not long after the Taika reforms, Japan became involved in a dispute that led it to send troops to Korea. Paekche, whose royal castle had been captured in 660 by the combined forces of T'ang (China) and Silla (another Korean kingdom), called on Japan for help. Japan, which had traditionally been friendly with Paekche, sent a large army; it was crushed, however, in 663, by a combined T'ang and Silla army at the mouth of the Pak River. Japan withdrew entirely and gave up any further intervention on the peninsula. The Japanese ruler of the time, the empress Saimei, went to northern Kyushu and directed operations personally, even though she was already 67 at the time. The Empress was succeeded by Prince Nakano be, who, as the emperor Tenchi, directed his attention to domestic affairs. He built fortifications in Kyushu to prepare for an expected T'ang and Silla invasion and amended the system established by the Taika reforms so as to make it more suitable to the practical needs of the state. His younger brother, Emperor Temmu, similarly devoted his energies to domestic government; he had the Taika reforms set forth in written codes, which comprised *ritsu-ryd* political structure.

The ritsu-ryō system. The *ritsu-ryd* can be divided between *ritsu,* the criminal code, and *ryō,* the administrative and civil codes. A similar system had long been in force in China, and the Japanese *ritsu-ryō* was an imitation of the *lü-ling* of T'ang China and incorporated some of its articles just as they stood. Where different local conditions called for amendment, however, amendments were made without hesitation; it is a good early example of the skill of the Japanese in importing foreign culture.

The Imperial government

The Japanese emperor, for example, was in some respects an absolute monarch who ruled over the whole country as the head of a bureaucracy in the same manner as the emperor of China. Yet at the same time he was also the traditional high priest who maintained peace for the land and people by paying tribute to the gods and sounding out their will. Thus the central government was headed by twin agencies—the Dajōkan (Council of State), which combined within its functions the various practical aspects of administration, and the Jingikan (Office of Deities), which was in charge of the worship of the gods. Prospective bureaucrats were required to study at a central college and to pass prescribed examinations; during their term of office their achievement was subjected to scrutiny once a year, and their rank and position were adjusted in accordance with the results. This was based on the highly developed bureaucratic system of China, yet the *ritsu-ryō* system was not too bound by its provisions to provide special favours for men of high rank and good family. This, too, was a compromise between the new principles of the *ritsu-ryd* system and the old spirit of respect for birth. The provinces were divided into three types of administrative division: the *kuni,* or *koku* (province), the *kōri,* or *gun* (county), and the *sato,* or *ri* (village), to be administered by officials known as *kokushi, gunji,* and *richō,* respectively, The posts of *kokushi* were filled by members of the central bureaucracy in turn, but the posts of *gunji* and *rich6* were filled by members of prominent local families.

The people were divided into two main classes, freemen and slaves. The slaves were the possession of the government, the aristocracy, and the shrines and temples; as such they were obliged to provide unlimited labour, but their total number accounted for less than one-tenth of the population. The majority of the free population were farmers. At the age of six, each male child was apportioned paddy fields that remained his to cultivate for life. A tax was levied on the produce of the paddies, and a head tax was levied on adult males. The paddy field tax was low (about 3 percent of the crop), but the head tax, payable in handicrafts such as silk and hemp, imposed a heavy burden. Moreover, the transport of the goods from the provinces to the capital was the responsibility of the taxed, which involved an enormous labour for those living in distant parts. Adult males were also obliged to give military service and to provide labour for public works at the command of the local *kokushi,* amounting to not more than 60 days per year. Since the government's finances depended on such tribute from the common people, whenever the latter found the burden too much and fled from their registered homes to avoid paying taxes the government felt the pinch immediately.

The lowest ranking freemen were the groups of smiths, tanners, and others engaged in manufacturing. They were mostly the descendants of immigrants who inherited their trades and paid their taxes in the form of manufactured goods or by working for fixed periods in the government workshops.

All land was in principle the property of the state. Most of the land was distributed equally among the people, but, apart from this, land of a certain annual yield was given to bureaucrats and other high-ranking persons as stipends and to Shinto shrines and Buddhist temples as sources of revenue. Land other than paddy fields was left to the individual to use as he pleased. There was a need to open up new paddy fields as a means of providing for a growing population,, but the *ritsu-ryd* system made inadequate provision for this process. In time, the government began to encourage the opening up of new land, and in 743 the system was changed to give permanent private possession of such land to the person who had first put it under cultivation. As a result, the aristocrats and the shrines and temples frantically set about putting land under cultivation in order to increase their own privately owned territories. The principle of public ownership of land provided for in the *ritsu-ryd* system began to crumble, and as it did so the whole system of government grew increasingly shaky.

Shrine and temple aristocracy

THE IMPERIAL STATE

Government and culture in the Nara period (AD 710–784). In 710 the Imperial capital was shifted from Fujiwara to Nara. For the next 75 years, with minor gaps, Nara was the seat of government, and the old custom of changing the capital with each successive emperor was finally discarded. During this period, the centralized government provided for under the *ritsu-ryd* structure worked well, but a still conspicuous feature is the brilliant flowering of culture, especially Buddhist culture. The leaders in its promotion were the emperor Shōmu and his consort, Kōmyō. Immediately on his accession, Shōmu, who from childhood had been given a thorough schooling as future emperor, showed an eager concern to promote the stable livelihood of the people. Convinced that the Buddhist faith was a means to ensuring both the happiness of the individual and peace for the country as a whole, he introduced strong doses of Buddhism into his government.

Official encouragement of Buddhism

One of the measures he took was the founding of the temples known as *kokubun-ji.* Each province was to build a monastery known as *kokubun-ji* and a nunnery known as *kokubun-niji,* each with a seven-story pagoda and each housing a statue of the Sakyamuni Buddha. Each monastery was to have 20 monks, each nunnery 10 nuns, whose constant task would be to recite the scriptures and offer up prayers for the welfare of the nation. Just as the temporal world had its *kokushi* (governors) in each province to attend to its administrative and juridical matters, so the spiritual world would have officially appointed monks and nuns, distributed evenly among the provinces, to attend to the spiritual needs of the people.

The second measure taken by Shōmu was the construction of the Tōdai-ji as *kokubun-ji* of the capital and the installation within it of a huge bronze figure of the Vairocana Buddha as supreme guardian deity of the nation. The casting of the Daibutsu (Great Buddha) was a tremendously difficult task. The Emperor, however, called on the people at large to contribute to the project, in however humble a way, and thereby partake of the grace of the Buddha. The great image that was produced as a result, though damaged in later ages, still stands in the Tddai-ji and is famous the world over as the Great Buddha of Nara.

The marriage of Buddhism and politics that was Shōmu's ideal was to cause trouble in the following era. The temples gradually amassed vast wealth, and the monks acquired high political positions and began to interfere in secular affairs. A movement to counter such abuses arose among the aristocracy, the leaders of the movement being the Fujiwara family, descendants of the Nakatomi Kamatari, who had played such an important role in the Taika reforms. Kamatari and his son Fuhito (later given the surname Fujiwara) had supervised compilation of the codes that comprised the *ritsu-ryb* system and had become prominent figures at court as a new type of bureaucrat-noble. The subsequent progress of the family's fortunes was not always smooth. In particular, the emphasis on Buddhism in government had obliged them to lie low. At the end of the 8th century, however, when it seemed to them that the evils of Buddhistic government were threatening the future of the nation, they set on the throne a new emperor, Kōnin, who had no leanings toward Buddhism. Kōnin's son Kammu, who was of a similar mind, shifted the capital to Heian (present Kyōto) to sever connections with the temples of Nara and re-established government in accordance with the *ritsu-ryb* system.

The cultural flowering centring on Buddhism was an outcome of lively exchanges with other nations. Four times within 70 years the government sent official missions to the court of T'ang, and each time they were accompanied by a large number of students who went to study in China. By this time T'ang had formed a great empire that controlled not only the central plains of China but parts of Mongolia and Siberia to the north and of Central Asia to the west.

Japanese culture, borrowing from the T'ang, whose capital, Ch'ang-an, was a great international city, thus showed in the Nara period marked international flavour. The ceremony of consecration of the Great Buddha of the Tōdai-ji, for example, was conducted by a Brahmin high priest born in India, while the music was played by musicians from all over the Far East. But despite this strongly international flavour, respect was also shown for traditional Japanese ways and outlooks. An outstanding example of this respect is the collection of Japanese verse known as *Manyō-shū* (c. 8th century AD), an anthology of 4,500 poems both ancient and contemporary. The poets range over all classes of society, from the emperor and members of the Imperial family through the aristocracy and the priesthood to farmers, soldiers, and prostitutes, and the scenery celebrated in the verse represents districts all over the country. The poems deal directly and powerfully with basic human themes, such as love between men and women or between parents and children, and are deeply imbued with the traditional spirit of Japan, scarcely influenced at all by Buddhist or Confucian ideas. The anthology had immense influence on all subsequent Japanese culture.

The *Manyō-shū* anthology

The compilation of Japan's two most ancient histories, the *Koji-ki* and *Nihon shoki,* also took place at the beginning of the 8th century. Both works are extremely important, for they draw on oral or written traditions handed down from much earlier times.

Changes in ritsu-ryō government. In 794, as noted above, the emperor Kammu shifted his capital to Heian, cut the ties between government and Buddhism, and revived government in accordance with the *ritsu-ryb.* Commanding that the provisions of the *ritsu-ryb* system be enforced, he also amended those articles that were no longer relevant to the age. Since it was difficult in practice to carry out the allocation of rice fields once every six years, this was amended to once in 12 years. A tighter watch was imposed on corruption among local officials. The original system of raising conscript troops was abolished, and troops were thenceforth selected from among the sons of local government officers and persons of rank. An alien tribe known as the Emishi in the northern districts of Honshu was brought under government control. Those Emishi who submitted to government forces were resettled throughout the empire and quickly assimilated to the existing population.

Buddhism was forbidden to interfere in affairs of state.

but as a religion it was encouraged to fulfill its proper functions. Two brilliant monks, Saichō and Kūkai, were sent to China to study. Each of them, on his return to Japan, established a new sect of Japanese Buddhism: the Tendai sect, founded by Saichō, and the Shingon sect, founded by Kūkai. In the Nara period, Buddhism had been no more than a transplantation of the Buddhism of T'ang China, but the two new sects, though basically derived from China, were reworked in a characteristically Japanese fashion. As headquarters of their new sects, Saichō and Kūkai founded, respectively, the Enryaku-ji (also known as the Hieisan-ji) on Mt. Hiei and the Kongōbu-ji on Mt. Kōya *(ji,* "temple"). The two sects were thenceforth to form the twin mainstreams of Japanese Buddhism.

Decline of *ritsu-ryd* government

After Kammu, successive emperors carried on his policies. and society enjoyed some 150 years of peace. The formal aspects of government, at least, were carefully observed, and the supplementing of the legal codes, the compilation of histories, and the minting of coins all took place frequently in accordance with precedent. The social reality, however, became increasingly chaotic, so that form and actuality were soon travelling along quite different courses. The very foundations of *ritsu-ryb* government had begun to crumble because of the difficulty of finding enough rice fields to distribute to the people and the decline in government revenue resulting from the impoverishment of the masses.

A good example of the split between form and reality is the fact that while, on the surface, appointments to official posts at court were made just as they had always been, real power shifted to other posts that were newly created as the occasion demanded. Typical of such new posts were those of *kurōdo,* a kind of secretary and archivist to the emperor, and the *kebiislzi,* who had total control over the police and the judicature. The two supreme examples of such posts were those of *sesshō* (regent) and *kampaku* (chief councillor). The original role of the *sesshd* was to attend to affairs of state during the minority of the emperor, while the *kampaku's* role was to attend to state matters for the emperor even after he had come of age. Neither post had been foreseen by the *ritsu-ryō* system, which was rooted in the principle of direct rule by the emperor.

The rule of Imperial succession

Around the middle of the 9th century, however, when the emperor Seiwa ascended to the throne at the age of nine, his maternal grandfather, Fujiwara Yoshifusa, became *sesshō.* Yoshifusa's son Mototsune became *sessho* in the time of the emperor Yōzei, then in the reign of the emperor Uda he became *kampaku* in turn. It thus became the established custom that a member of the Fujiwara family should serve as *sesshō* and *kampaku.* In order to become *sesshō* or *kampaku,* it was necessary that the person concerned should marry his daughter into the Imperial family, then establish the resulting offspring as emperor. In other words, an important qualification was that one should be the emperor's maternal grandfather or father-in-law. As a result of this complex system, there were constant struggles at court involving the expulsion of members of other families by the Fujiwaras or wrangling among the Fujiwaras themselves.

One of the most celebrated affairs involving the expulsion of a member of another family by the Fujiwaras was the removal of Sugawara Michizane from his post as minister and his exile to Kyushu. Born into a family of scholars, Michizane was himself an outstanding scholar whose ability in writing Chinese verse and prose was said to rival that of the Chinese themselves. Recognizing his talent, the emperor Uda singled him out for an attempt to break the authority of the Fujiwaras. As part of his plan, he simultaneously appointed Fujiwara Tokihira as his minister of the left and Sugawara Michizane as minister of the right. The Fujiwaras objected strenuously. Tokihira falsely reported to the Emperor that Michizane was plotting treason; the matter was taken up officially, and Michizane was stripped of his ministerial post and his family was sent into exile.

At the end of the 9th century, at Michizane's suggestion, Japan cut off formal relations with T'ang China, perhaps because of the expense involved in sending regular envoys. The practical result, however, was the stimulation of a more purely Japanese cultural tradition.

The culture of the 9th century was a continuation of that of the 8th, insofar as its foundations were predominantly Chinese. The writing of Chinese prose and verse was popular among scholars, and great respect for Chinese customs was shown in the daily lives of the aristocracy. Many Buddhist monks went to China to bring back as yet unknown scriptures and iconographic pictures. Buddhist sculpture and paintings produced in Japan were done in the T'ang style. Japanese touches were, of course, gradually added to these basically T'ang styles, and a new culture was slowly coming into being, but it was not until the 10th century and later that this tendency became a strong current.

Aristocratic government at its peak. From the 10th century and through the 11th, successive generations of the Fujiwara family continued to control the nation's government by monopolizing the posts of *sesshō* and *kampaku,* and the wealth that poured into their coffers enabled them to lead lives of the greatest brilliance. The high-water mark was reached in the time of Fujiwara Michinaga. Four of his daughters became consorts of four successive emperors, and three of their sons became, respectively, the emperors Ichijō II, Suzaku II, and Reizei II. Government during this period was based mostly on precedent, and the court had become no more than a centre for ceremonies. Court ministers were content to perform prescribed rites on prescribed days and were utterly unfitted to deal with any sudden social crisis that might confront them.

The growth of private estates

The *ritsu-ryd* system of public ownership of land and men survived in name alone; land passed into private hands, and men became private citizens. Typical of the new privately owned lands were the *shōen* ("manors"), which developed on the basis of rice fields under cultivation since the adoption of the *ritsu-ryd* system. Since the government encouraged the opening up of new land during the Nara period, the temples and aristocrats with resources at their disposal hastened to develop new areas, and vast private lands accrued to them. The owners of the new lands used one pretext or another to obtain special exemption from taxes, so that the *shōen* gradually became nontaxpaying estates. The increase in such *shden* thus came to pose a serious threat to the government, which accordingly issued frequent edicts intended to check the formation of new estates. This merely served, however, to establish more firmly the position of those already existing and failed to halt the tendency for such land to increase. Since the owners of the *shden* were the same aristocracy and high officials that made up the government, it was extremely difficult to change the situation.

Although the aristocracy and temples around the capital enjoyed exemption from taxes on their *shden,* the same privileges were not available to powerful families in the provinces. These, accordingly, presented their *shden* to members of the Imperial family or the aristocracy, concluding agreements with them that the latter should become owners in name while the former themselves retained rights as actual administrators of the property. Thanks to such agreements the estates of the aristocracy went on increasing steadily and their incomes swelled proportionately. The *shden* of the Fujiwara family in particular reached such vast proportions that it was said that among them they owned the whole country.

While the aristocracy was leading a life of luxury on the proceeds from its estates, the provinces were witnessing the first stirrings of a new power in the land: the warrior, or samurai, class. Younger members of the Imperial family and lower ranking aristocrats who were dissatisfied with the Fujiwara monopoly of high posts would take up posts as local officials in the provinces, where they settled permanently, acquired lands of their own, and established their own power. In order to protect their territories, they began to press the local inhabitants into service and to give them arms, thus building up armed forces of their own. This meant that wherever, in addition, there happened to emerge men of true martial ability, a situation developed where the slightest incident was liable to provoke armed conflict. The risings of Taira Masakado (died 940) in the Kantō district and of Fujiwara Sumitomo (died 941) in western Japan had an enormous effect in lowering the government's prestige and encouraging the desolation of the provinces.

The development of the kana syllabary

The 10th century witnessed the development of a truly Japanese culture, one of the most important contributing factors being the emergence of an indigenous script, the kana syllabary. Until then, Japan had no writing of its own; Chinese ideographs were used partly for their sense and partly for their pronunciation in order to represent the Japanese language, which is entirely different from Chinese. In the natural course of events, however, the educated men and women of the day gradually evolved a system of writing that used a purely phonetic, syllabic script formed by abbreviating a certain number of the Chinese characters. This script, known as kana, made it possible to write the national language with complete freedom, and its invention was an epoch-making event in the history of the expression of ideas in Japan. Thanks to the kana, a great amount of verse and prose in Japanese was to be produced.

Particularly noteworthy in this respect were the daughters of the Fujiwaras, who, under the aristocratic government of the day, became consorts of successive emperors and surrounded themselves with talented women who vied with each other in learning and the ability to produce fine writing. The kana script provided such women with an opportunity to create works of literature. Among such works, the *Genji monogatavi* (*The Tale of* **Gengi)**, a novel by Murasaki Shikibu; and the *Makura-no-sōshi* ("Pillow Book"), a collection of vivid scenes and incidents of court life by Sei Shōnagon, a lady in waiting to the empress Sadako, are masterpieces that hold a place in world, and not merely Japanese, literature. The waka, the native Japanese verse form, was an indispensable part of the daily lives of the aristocracy, and proficiency in verse-making was counted an essential accomplishment for an intellectual. Such circumstances led to the compilation in 905 of the *Kokin-shu,* the first of a series of anthologies of verse made at Imperial command.

The same trend toward the development of purely Japanese qualities became strongly marked in Buddhism also. Both the Tendai and Shingon sects produced a succession of gifted monks and continued, as sects, to flourish. But, being closely connected with the court and aristocracy, they tended to pursue worldly wealth and riches at the expense of purely religious goals, and it was left to the Jbdo ("Pure Land) sect of Buddhism to preach a religion that sought to arouse a desire for salvation in ordinary men. This "Pure Land" Buddhism, which expounds the glories of the paradise of Amida (Amitabha, or Buddha of Infinite Light)—the world after death—and urges all men to renounce the defilements of the present world for the sake of rebirth in that paradise, seems to have offered an ideal hope of salvation for men in the midst of the collapse of the old order. It was a very approachable religion in that it eschewed difficult theories and ascetic practices, teaching that in order to achieve rebirth it was only necessary to invoke the name of Amida and dwell on the marks of his divinity. This same teaching also inspired artists to produce an astonishing number of representations of Amida in both sculpture and painting. The mildness of his countenance and the softly curving folds of his robe contrasted strongly with the grotesque Buddhist sculpture in the preceding age, and represented a much more truly Japanese taste.

The signs of the growing independence of Japanese culture, apparent in every field, were an indication that by now, two centuries after the first busy ingestion of continental culture, the process of absorption was nearing completion.

Government by cloistered emperors (insei) and the rise of the samurai. The powerful authority wielded by the Fujiwaras as *sesshō* and *kampaku* was maintained by their blood relationship on the maternal side to successive emperors; once such a relationship disappeared, their power was bound to weaken. This, in fact, is what happened; the emperor Sanjb II ascended the throne even though he was not born of a daughter of the Fujiwaras, while Michinaga's sons Yorimichi and Norimichi both gave their daughters to be Imperial consorts without obtaining the desired birth of an Imperial prince. As a result of these and other circumstances, the latter half of the 11th century saw real political power pass from the *sesshō* and *kampaku* to the "cloistered emperors"; in other words, to emperors who had-already abdicated and taken Buddhist vows, thus nominally renouncing the world, yet who wielded a very real power behind the scenes. This system, known as *insei* ("cloistered rule"), was perhaps a more natural arrangement insofar as it represented a shift from government by matrilinear relatives of the emperor to government by patrilinear relatives, yet in continuing to treat the actually reigning emperor as a pure figurehead it was no whit better than the old *sesshō–kampaku* system. The cloistered emperor system continued for a long period, the retired emperors Shirakawa, Toba I, and Shirakawa II holding absolute behind-the-scenes power for 43 years, 28 years, and 34 years, respectively.

The power of retired emperors

The system of government by cloistered emperors was inspired by no particular ideal and conformed to no particular rules. The one common feature of each reign was that the emperor became a Buddhist priest and governed in a way that theoretically respected the teachings of Buddhism. In practice, this "Buddhism" was more preoccupied with construction of ostentatious temples than with true belief. Other signs of the same trend were the frequent journeys of retired emperors to worship at distant temples and their edicts strictly prohibiting the killing of living creatures; it did not concern them that such edicts deprived a large number of their subjects of their occupations.

The nominal respect for Buddhism spurred on the secularization of the religion. Properly speaking, the world of Buddhism should have been one in which factionalism could have no part, a world in which nothing counted but wisdom, virtue, and experience. But at this time large numbers of aristocrats were taking holy vows and going to live in the temples, which thus became centres of factionalism and intrigue. Most of the higher positions in the religious world were occupied by members of the Imperial family and former aristocrats. This effectively closed advancement to commoners, and the lower ranking monks in the temples harboured a grudge against their superiors on this account. Whenever some particularly serious grievance arose, they would march in a body on the capital and try to force acceptance of their demands by a direct appeal to the court. Some idea of the nuisance they constituted can be gained from the fact that even the retired emperor Shirakawa—the most powerful of the cloistered emperors—ranked them with the waters of the Kamo River and the dice in games of chance as one of three superhuman forces that he was powerless to control. Nor did the monks hesitate to resort to armed force; it was an age in which a priesthood ostensibly committed to compassion and respect for life in all its forms could openly bear arms and engage in slaughter.

The rise of the warrior class

Another feature of the age was the rise of the warrior class. With the development of government by the cloistered emperors, the more powerful of the samurai, who, as noted above, first established their power in the provinces, gradually gathered in or near the capital, where they acted as military police. Associating with the court nobles and aristocracy, they gradually established a foothold at court. Outstanding among these samurai were the Minamoto family, descendants of the emperor Seiwa, and the Taira family, descendants of the emperor Kammu. The Taira had at first settled in the Kantō district, where they extended their influence over a wide area; but they had suffered a setback in the Taira Masakado rising and had finally lost their hold on the Kantb district as the result of another, later rising by Masakado's descendant Tadatsune. The Minamotos, favourites of the Fujiwaras, had been a prominent family in the capital from the start, but their fame as a warrior clan was greatly heightened in the mid-11th century when after 12 years of hard fighting they quelled a rising by the Abe family in the Tohoku district. Minamoto Yoshiie, who played an important part in the fighting, became the nation's most celebrated warrior, and many powerful clans made voluntary vows of allegiance to him and presented him with land in return for his protection. Yoshiie, however, had no son to match him in military prowess, and the Tairas took advantage of this relative decline to advance their own fortunes again. Taking advantage of the *insei* system as a means to their own political advancement, they curried favour with the retired emperors. Taira Masamori and his son Tadamori served as governors in provinces in western Japan, building up their own power in the area, and aided the retired emperors' temple-building programs by erecting a large number of new temples and pagodas. Tadamori also tried his hand at trade with Sung dynasty China as a means of amassing wealth. In such ways, the social position of the Tairas rose steadily, so that Tadamori's son Kiyomori could take his place alongside the aristocracy.

The Heiji War

Discord between retired emperors and reigning emperors combined with internal differences within the Fujiwara family to split the Imperial family and nobility into two parties, which enlisted the Minamoto family and the Taira family, respectively, on their own sides. The two sides eventually clashed openly in Kyōto in what is known as the Hbgen War (July 1156). The war was on a small scale, the outcome determined by a single night's fighting, yet it was highly significant as showing that the power of the samurai was sufficient to sway the nation's government. In the Heiji War (1159) that followed, the Minamotos were thoroughly defeated, and Taira Kiyomori emerged as the chief power in the land. Although he was a samurai by birth, Kiyomori shared certain of the Fujiwaras' aristocratic tendencies, and the 20-odd years of Taira rule that followed had a special character of their own. He himself became grand minister of state (*dajō-daijn*) at the court, and more than 50 other official posts were filled by members of his family. His daughter became the consort of the emperor Takakura, and the prince born of the union ascended to the throne in his infancy—a return to government by matrilinear relatives of the emperor. Kiyomori's rule also had its more drastic, soldierlike aspects; thus in a single move he swept 42 court officials from their posts and into exile, and he razed to the ground troublesome temples such as the Tōdai-ji and Kōfuku-ji. His repairing of the Inland Sea route and his encouragement of trade with Sung China were measures that would never have occurred to a Fujiwara government.

While the Tairas thrived in the capital, the descendants of the original Minamotos were quietly building up their strength in the provinces. Finally Yoritomo, a descendant in the direct line of the Minamoto family, who grew up in exile at Izu, rallied the Minamotos and sent his younger brothers Yoshitsune and Noriyori to attack Kybto. The final rout of the fleeing Taira forces on the sea off the island of Shikoku put a more or less decisive end to the swing of fortune between Minamoto and Taira.

It also marked an important turning point in Japanese history, since Yoritomo's establishment of a military government, or shogunate, in Kamakura may be seen as the beginning of rule by a samurai class backed up by a feudal system and the end of the ancient monarchical period in which power was in the hands of the court and the aristocracy. The shogunate (or bakufu, from the headquarters of the government) was to hold effective political control in Japan until the restoration of Imperial power in 1867. (T.Sa.)

THE KAMAKURA BAKUFU (1192–1333)

The establishment of military government. The establishment of the shogunate by Minamoto Yoritomo at the end of the 12th century marks the beginning of a new and independent government by the warrior class opposed to the political authority of the civil aristocracy. Yoritomo established his supreme headquarters (bakufu) in Kamakura and entrusted the suppression of the powerful Taira family to his younger brothers Noriyori and Yoshitsune. Meanwhile, he gathered a following in eastern Japan as a foundation for a new military government. As a first step he set up in 1180 the Samurai-dokoro (Board of Retainers), a disciplinary board to control his military vassals. General administration was handled by a secretariat opened four years later and known as the Kumonjo (later renamed the Mandokoro). In addition, a judicial board, the Monchiijo, was set up to handle lawsuits and appeals. Under these institutions, the organization of the bakufu gradually took shape.

***Bakufu* institutions**

In 1185, after the destruction of the Taira family, Yoritomo appointed military governors (shugo) in all the provinces and military stewards (jitd) in both public and private landed estates. It was the job of the shugo to recruit metropolitan guards and keep strict control over subversives and criminals. The jitd collected taxes, supervised the management of landed estates, and maintained public order.

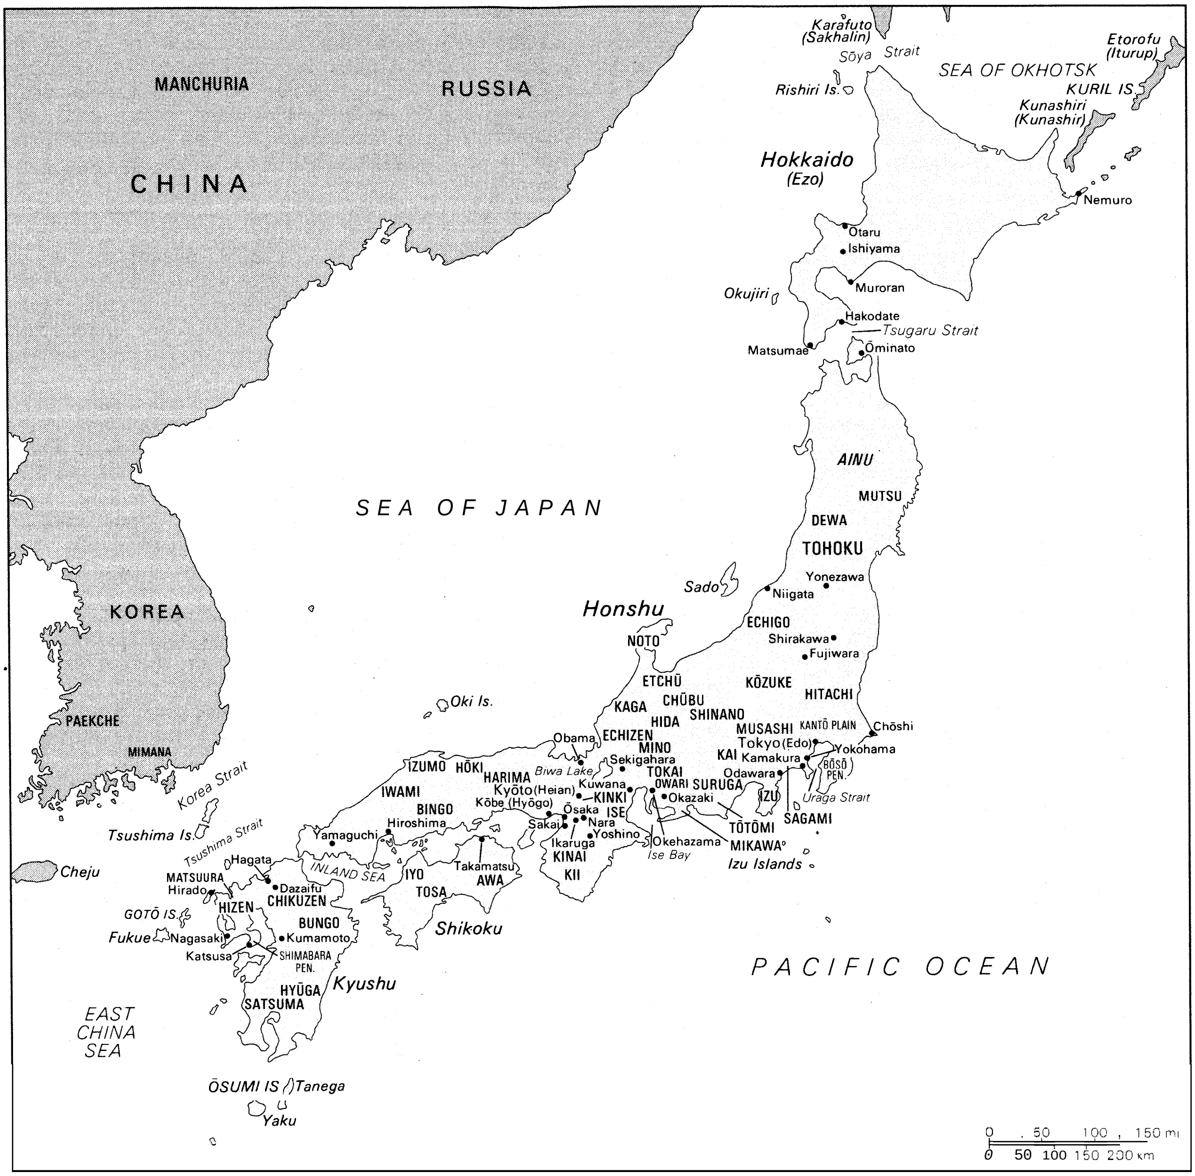
In 1189 Yoritomo finally destroyed the great Fujiwara family of Mutsu Province, which had sheltered his rebellious brother Yoshitsune. Three years later Yoritomo went to Kyōto and was appointed shogun, an abbreviation of seii *taishōgun*) ("barbarian-quelling generalissimo"), the highest honour that could be accorded a warrior. At first the chief base of the *bakufu* lay in the landed estates seized from the Taira family and in the limited administrative revenues from public estates in provinces granted to Yoritomo by the Imperial court. But later the *bakufu* was able to expand its influence over those public estates that were still controlled by the civil provincial governors, as well as the private estates of the civil aristocracy and the temples and shrines.

The regency government. After the death of Yoritomo in 1199, real power in the bakufu passed into the hands of the Hbjb family, from which Yoritomo's wife, Masako, had come. In 1203 Hōjō Tokimasa, Masako's father, assumed the position of regent (shikken) for the shogun, an office that was held until 1333 by nine successive members of the Hbjb family. Taking advantage of disputes among Yoritomo's generals, the Hōjō overthrew their rivals, and after three generations the direct line of descent from Yoritomo had become extinct. Though wielding actual power, the Hōjō family was of low social rank, and its leaders did not aspire to become shoguns themselves. Kujō Yoritsune, a distant relative of Yoritomo, was appointed shogun, while Tokimasa's son Hōjō Yoshitoki (shikken 1205–24) handled most government business. Thereafter, the appointment and dismissal of the shogun followed the wishes of the Hōjō family.

The Jōkyū War

This increasing political power of the military led to a conflict with the aristocracy. Hence, the emperor Toba II, seeing in the demise of the Minamoto family a good opportunity to restore his political power, in 1221 issued a mandate to the country for the overthrow of Yoshitoki, but few warriors responded to his call. A bakufu army occupied Kybto and Toba II was arrested and banished to the island of Oki in an incident known as the Jōkyū War, after the era name Jōkyū (1219–22). The bakufu now set up its headquarters in Kyōto to supervise the Imperial court and to control the legal and administrative business of the western provinces. The estates of the civil aristocrats and warriors who had joined Toba II were confiscated and distributed as rewards among the shogun's vassals. The political power of the bakufu now extended over the whole country.

Meanwhile, the regent Hōjō Yasutoki, to strengthen the base of his political power, reorganized the council of leading retainers into an advisory council known as the Hyōjō-shū. In 1232 the council drew up a legal code known as the Jdei Shikimoku (Jdei Formulary). Its 51 articles set down in writing for the first time the legal precedents of the bakufu. Its purpose was simpler than that of the ritsu-ryd, the old legal and political system of the Heian and Nara civil aristocracy. In essence it was a body of pragmatic law laid down for the proper conduct of the warrior way of life. Distinctive features of the formulary included a strong emphasis upon the lord–vassal relationship and paternal power and a recognition of female inheritance of land; its sway was gradually



Important Japanese historical sites.

extended over the whole country. In 1249 the regent Hōjō Tokiyori also set up a supreme court, the Hikitsuke-shū, to secure greater impartiality and promptness in legal decisions.

The Mongol invasions. The establishment of the regency government coincided with the rise of the Mongols under Genghis Khan in Central Asia. In the space of barely half a century they had established an empire extending from the Korean peninsula in the east and as far west as Russia and Poland. In 1260 Genghis Khan's successor, Kublai, became Great Khan in China and fixed his capital at present-day Peking. In 1271 Kublai adopted the dynastic title of Yüan; shortly thereafter the Mongols began preparations for an invasion of Japan. In the autumn of 1274 a Mongol and Korean army of 25,000 men set out from present-day South Korea. On landing in Kyūshū it occupied the Matsura district of Hizen Province (part of present-day Sago Prefecture) and advanced to Chikuzen. The *bakufu* appointed Shōni Sukeyoshi as military commander, and the Kyūshū military vassals were mobilized for defense. A Mongol army landed in Hakata Bay, forcing the Japanese defenders to retreat to Dazaifu; but a typhoon suddenly arose, destroying more than 200 ships of the invaders, and the survivors returned to South Korea.

The *bakufu* took measures against a renewed invasion. Coastal defenses were strengthened, and a stone wall was constructed extending for several miles around Hakata Bay to thwart the powerful Mongol cavalry. Apportioned among the Kyūshū military vassals, these public works took five years to complete and required considerable expenditure. Meanwhile, the Mongols made plans for a second expedition. In 1281 two separate armies were arrayed: an eastern army consisting of about 40,000 Mongol, North Chinese, and Korean troops set out from South Korea; and a second army of about 100,000 South China troops under the command of the Chinese general Han Bun-ko. The two armies met at Hirado and in a combined assault took Hakata Bay and pressed on to Dazaifu. But again a fierce typhoon destroyed nearly all of the invading fleet, forcing Han Bun-ko to retreat precipitately. The remnants of the invading army were captured by the Japanese; it is said that of 140,000 invaders, fewer than one in five made good their escape. The defeat of the Mongol invasions was of crucial importance in Japanese history. The military expenditure undermined the economic stability of the Kamakura government and led to the insolvency of many of the military vassals. It led to another prolonged period of isolation from China that was to last until the 14th century. Moreover the victory gave a great impetus to a feeling of national pride, and the *kamikaze,* or "divine wind," that destroyed the invading hosts gave the Japanese the belief that they were a divinely protected people.

Samurai groups and farming villages. The Japanese feudal system began to take shape under the Kamakura bakufu. At its inception in the Kamakura (1192–1333) and Muromachi (1338–1573) periods, Japanese feudalism presents a different appearance from that of later eras. In the earlier period feudal warrior landlords lived in farming villages and carried on agriculture themselves, while the central civil aristocracy and the temples and shrines held huge public and private estates in various provinces and wielded power comparable to that of the bakufu. These estates were, in reality, managed by influential resident landlords who had become warriors. They were often the original developers of their districts, becoming officials of the provincial government, agents of the private estates, and military stewards appointed by the bakufu. As leaders of a large number of villagers, they laboured to develop the rice fields and irrigation works in the areas under their jurisdiction, and they and other influential landlords constructed spacious homes for themselves in the villages and hamlets where they lived.

Among these were some who were military vassals of the shogun and others who were connected to the aristocracy or the temples and shrines. The military vassals owed their loyalty to the shogun, for whom they performed public services such as guard duty in Kyōto, where the emperor lived with his court. In return, the shogun not only guaranteed these men the traditional landholdings but rewarded them with new lands. This connection between lord and vassal, on which grants of landownership or management were based, gave Japanese society a distinctly feudal character.

The samurai served on the battlefield and in times of peace engaged in hunting and training in the military arts, nourishing a lugged and practical character. The *kyūba*-no-michi ("the way of the bow and horse"), the samurai ideal of chivalry, grew out of this daily training and the experience of actual warfare. Pride of family name was especially valued, and loyal service to one's overlord became the fundamental morality. This was the origin of the more highly developed code of Bushidd, or Code of Warriors, of later ages.

The status of women in the samurai families was comparatively high; they were allowed to inherit a portion of the estates, a practice that gradually came to be restricted.

Economic changes in the Karnakura period

After the middle of the Kamakura period, the farming villages in which the warriors resided underwent changes as agricultural practices advanced, and other aspects of society were changing as well. Artisans were usually attached to the proprietors of the private estates and progressively became more specialized along with the growth of consumer demand. Centres for metal casting and metalworking, paper manufacture, and other skills appeared in the localities. The exchange of agricultural products, manufactured goods, and other products thrived; local markets, held on three fixed days a month, became common. Copper coins from Sung (960–1279) China circulated in these markets, while itinerant merchants increased their activity. Bills of exchange were also used for payments to distant localities. In the large ports, specialized wholesale merchants appeared who were called *to*-imaru. They served as contractors who stored, transported, and sold goods. Further, it was common for many merchants and artisans to form guilds, known as *zu*, organized under the temples, shrines, or civil aristocrats. Such guilds, which resembled European trade guilds in the Middle Ages, gained special monopoly privileges and exemptions from customs duties.

Introduction of Zen sects

Kamakura culture: the new Buddhism and its influence. During the Kamakura period the newly arisen samurai class came to dominate the ancient civil aristocracy, which continued to maintain the classical culture. Vigorous overseas trade fostered the transmission of Zen Buddhism (in Chinese, Ch'an) and Neo-Confucianism from Sung China. Chinese influences were seen in monochrome painting style (sumi-e), forms of architecture, certain skills in pottery manufacture, and the custom of tea drinking—all of which assisted the formation of the samurai culture and exerted an enormous influence on everyday life.

In matters of religion, the great social changes that took place between the end of the Heian period (794–857) and the early Kamakura period caused the people to demand a simple standard of faith, in place of the complicated teachings and ceremonies of the ancient Buddhism. The warriors of the farming villages, in particular, demanded a religion that would suit their personal experience. Several new Buddhist sects sprang up which eschewed difficult ascetic practices and recondite scholarship. Among these may be included the Jōdo, or Pure Land sect, and its offshoots, the Ikkō and Rinzai sects (see BUDDHISM). The Zen sect sought to open the way to insight by self-effort; hence, it met with a ready response, satisfying the demands of the samurai. At the same time, scholarship and the arts were still deeply linked with esoteric Buddhism, which was a vigorous influence even in Shinto circles.

In scholarly and literary circles, the civil aristocrats of Kyoto confined themselves to the annotation and interpretation of the ancient classics and to the study of precedents and ceremonies. But at the beginning of the Kamakura period, a brilliant circle of waka (poems of 31 syllables) poets gathered around the retired emperor Toba II, and an Imperial selection of poems entitled the *Shin-kokin waka-shū* was compiled. The waka of this period is characterized by the term *yūgen*, which may be described as a mood both peaceful and profound.

Impact of military on the arts

Just before the Jōkyū War the monk Jien (posthumous name Jichin) completed his Gukan-shd ("Jottings of a Fool"). This is the first work of historical philosophy in Japan, and it provides a comprehensive picture of the rise and fall of political powers from the Buddhist viewpoint. Meanwhile, with the rise of the samurai style of life, warriors with a love of scholarship and a delight in waka poetry appeared. One was Hōjō Sanetoki, who collected Japanese and Chinese books and founded a famous library, the Kanazawa Bunko, in the Shōmyō-ji (at what is now Kanazawa). Military epics became popular. The most famous that has come down to us is the anonymously written Heike monogatari ("Tale of Heike"). They were recited throughout the country by Buddhist troubadours called biwa hdshi. After the middle Kamakura period, as Buddhist pessimism grew fainter, various kinds of instruction manuals and family injunctions were composed, while collections of essays such as Yoshida Kenkō's *Tsurezure-gusa* also made their appearance. The new nationalistic fervour found expression in Koken Shiren's *Genkō shakusho* (1332), a 30-volume history of Buddhism in Japan.

In the visual arts the carving of wooden images of famous monks flourished, and, after the middle of the Kamakura period, Chinese styles of the Sung dynasty also began to enter Kamakura wood carving. In painting, in addition to Buddhist themes, picture scrolls (*emaki*-mono) became popular, taking as their themes the history of temples and shrines, the biographies of founders of the sects, and military epics.

Decline of Kamakura society. The later Kamakura period witnessed the breakdown of family solidarity among the samurai (see below).

During the troubled state of society at the end of the Kamakura period, feudal landlords, out of the necessity of defending their own lands, seem to have devoted themselves chiefly to the military arts and to have entrusted the running of agriculture to their household dependents. Moreover, lands were no longer divided among younger sons but were now kept entirely in the hands of the eldest son. Power thus became concentrated in the head of the household, to whom other family members were subordinated in a lord–vassal relationship.

At the same time, major economic changes began to undermine the position of the bakufu vassals. Yet, despite the social crises among the landholders, trade was flourishing. Coins came into increasing circulation, and city styles of living began to be imitated in the country. But the landowners were often unable to meet their expenditures from the income of their limited holdings. Therefore, they borrowed money at high rates of interest from rich moneylenders, and many were forced to surrender their holdings when unable to repay their loans. Thus the gap between rich and poor became marked among the shogun's vassals. In particular, the local military governors, who had the right to raise troops, progressively gained control over the resident landlords, establishing a lord–vassal relationship with them. Moreover, deputies sent out by the heads of families to oversee their distant landholdings often broke with the main family and became vassals of the military governors. This powerful new class of local magnates was called daimyo (domain lords) and soon began to challenge the authority of the Hōjō regents in the *bakufu*.

The Ashikaga, Sasaki, Shōni, and Shimazu families were among the most powerful of the new class. The *bakufu* began to totter, shaken by the disputes between the Hōjō family and the rival military governors. When the And6 family raised a revolt in Mutsu Province at the end of the Kamakura period, the government found it difficult to suppress, partly because of the remoteness of the site of the uprising. In addition, regional unions of small landlords developed in the *kinai* (the five home provinces centred around Kyoto).

Taking advantage of the accumulating weaknesses of the *bakufu*, a movement arose among the civil aristocracy to regain political power from the military. The occasion was provided by the question of the Imperial succession. In the mid-13th century there emerged two competing lines for the succession—the senior line centred on the Jimyō-in monastery in the north and the junior line centred on the Daikaku-ji monastery in the south. In the last half of the century, each side sought to win the support of the *bakufu*. In 1317 the *bakufu* proposed that the two lines serve by turns as emperor, but the dispute did not cease. Finally, in 1318 Prince Takanaru, aged 31, acceded to the throne as Emperor Daigo II.

Dispute over the succession

THE MUROMACHI (OR ASHIKAGA) SHOGUNATE (1338-1573)

The "Kemmu restoration" and the dual dynasties. On the accession of Daigo 11, the retired emperor Uda 11 broke the long-established custom and dissolved the "cloistered" Imperial government. As a result, the entire authority of the Imperial government was concentrated in the hands of a single emperor, Daigo II. A party of young reforming court nobles gathered around the Emperor, who revived the Kirokusho (Records Office) and strove to renovate the government. But to realize his ideal of a true Imperial restoration, it was necessary for Daigo 11 to rid himself of the interference of the *bakufu*. His plans for its overthrow were discovered, however, and he was arrested and exiled to Oki Island. But in the *kinai* area, local leaders, supported by militant Buddhist monks, raised an army to overthrow the *bakufu*. The Imperial forces were led by Prince Morinaga and Kusunoki Masashige, but the decisive victory was brought about by the powerful Kantō families of Ashikaga Takauji and Nitta Yoshisada, discontented vassals of the Hōjō family. In 1333 Takauji successfully attacked the Hōjō headquarters and forced the *bakufu* leaders to commit suicide. Yoshisada meanwhile conquered the *bakufu* in Kamakura. Thus, after 140 years' rule, the *bakufu* government was brought to an end.

Overthrow of the Kamakura *bakufu*

The return of Emperor Daigo II to Kyoto in 1333 is known as the Kemmu restoration. The Emperor immediately set about to restore direct Imperial rule. He abolished the powerful office of *kampaku* (chief councillor) and set up a central bureaucracy. He established the Kirokusho to settle lawsuits in the provinces; a *zasso ketsudansho* (court of miscellaneous claims) to handle minor suits; and a *musha-dokoro* (guard station) to keep order among the warriors in Kyoto. He placed Prince Morinaga in charge of his military forces and set up members of the Imperial family as provincial leaders in the north and east.

Those local warriors, however, who had joined the Imperial forces in the overthrow of the *bakufu* were disappointed in the division of the spoils. A rebel army formed under the leadership of Ashikaga Takauji, and in 1336 it drove the Emperor from Kybto. Takauji set up an emperor from another branch of the Imperial line (the Jimyō-in), while Daigo II and his followers set up a rival court in the mountainous country of Yoshino. For the next 60 years political power was divided between the Daikaku-ji, or southern, court in Yoshino and the Jimyō-in, or northern, court in Kyōto. It remained for Takauji's grandson Yoshimitsu to establish peace (1392) between the two courts; thereafter, the Imperial succession remained with the descendants of the northern court. Throughout the long dispute, however, local warriors attached themselves to the military governors, who increasingly asserted their independence from the central authority, whose power greatly declined.

Division of northern and southern courts

The establishment of the Muromachi bakufu. After the withdrawal of Daigo II to Yoshino, Ashikaga Takauji set up a *bakufu* at Nijō Takakura in Kyōto. But in 1378 Takauji's grandson, the shogun Yoshimitsu, moved the *bakufu* to the Muromachi district in Kybto, where it remained and took final shape. Yoshimitsu, assisted by the successive *kanrei* (deputy shogun) Hosokawa Yoriyuki and Shiba Yoshimasa, gradually overcame the great military governors. He destroyed the Yamana family in 1391, and in 1399, with his power further enhanced by his success in uniting the northern and southern courts, he attacked and destroyed the great military governor Ōuchi Yoshihiro, thus gaining control of the Inland Sea. Yoshimitsu was now raised to the highest office of grand minister of state, or *dajō-daijin*. He constructed the famed Golden Pavilion (destroyed by an arsonist in 1950; rebuilt in 1955) at his country seat in Kitayama, taking great pride in its luxurious display; he also carried on trade and diplomacy with Ming dynasty China under the title of king of Japan.

The Muromachi *bakufu* inherited almost unchanged the structure of its Kamakura predecessor (see above), setting up a Mandokoro, Monchiijo, and Samurai-dokoro. But after the appointment of Hosokawa Yoriyuki as *kanrei* (deputy shogun), this post became the most important in the *bakufu* government. The official business of the Mandokoro was to control the finances of the *bakufu*, and later the Ise family, who were hereditary retainers of the Ashikaga, came to inherit this office. The Samurai-dokoro, besides handling legal judgments, was entrusted with the control of the capital. Leading officials called *shoshi* who held the additional post of military governor of Yamashiro Province (Kyoto Prefecture) were next in importance to the *kanrei*. In local administration, a special administrator was set up in Kamakura to control the 10 provinces of the Kantō area. This office came to be held by heads of the Ashikaga Motouji family. The 11 provinces of Kyushu were controlled by an office known as the Kyushu *tandai*.

Structure of the Muromachi *bakufu*

The finances of the Muromachi *bakufu* could not be met simply from its receipts from the lands under its direct control. So according to their needs, the military governors and stewards of each province were ordered to levy a money tax, either on every unit of land or every household, but this was not fully effective. As a result, taxes were levied from such dealers as pawnbrokers, and sake brewers, who were among the wealthiest merchants of the time. Financial deficiencies were also supplemented by engaging in trade with China. But the foundations of this *bakufu* began to be shaken by the increasing power of the military governors and by the frequent uprisings of local samurai and farmers.

In the Kamakura period, the authority of the military governors was limited to security matters. In the latter half of the northern and southern courts period, their executive power over the areas under their control was increased. As disturbances increased, they gained wide powers of military command. Sometimes the private estates were made depots for military supplies on the pretext of protecting them from the depredations of the samurai, and half their yearly taxes were given to the warriors. This was called the equal tax division, or *hanzei*. Many military governors succeeded to their domains by inheritance, and in cases such as that of the Yamana family a single military governor sometimes held a number of provinces. Thus arose a new class of official known as the *shugo* daimyo.

From the outset, the controlling power of the Ashikaga *bakufu* was weak, and, especially after the death of Yoshimitsu, the tendency for powerful military governors to defect became marked. Hence, as time passed the office of shogun became increasingly impotent.

The rise of commerce and manufacturing

In the villages around Kyoto, the status of farmers rose markedly as agriculture became more highly developed, and commerce and small-scale manufacturing prospered. Also, confederations of the middle and small landlords, or *mydshu,* proceeded apace and often resulted in uprisings. Such confederations appeared where farming by the greater *myōshu* had dissolved and middle and small *myōshu* had established themselves on a wide scale. These smaller landlords endeavoured to defend themselves against the ravages of local warfare, and they formed unions to manage the forests in common and to maintain irrigation works. In such confederations, a leader called the elder, or *otona,* would be selected to carry on village government. Assemblies were held regularly among its members at the village shrine or temple, and regulations were drawn up for the maintenance of the community life.

As self-government became strong in the communities, the resistance of farmers became fierce. After the northern and southern courts dispute, armed uprisings arose among the farming villages, demanding reductions in yearly taxes against the old proprietors and a moratorium on debts owed to the moneylenders. A large-scale uprising of this kind took place in 1428 in the last years of Yoshimitsu's reign. In 1429 an uprising broke out in Harima Province (present Hyōgō Prefecture) aimed at the expulsion of the warriors from the province. In 1441 farmers living around Kydto attacked the pawnbrokers and demanded a moratorium on debts from the *bakufu.* Thereafter, uprisings occurred on a greater or lesser scale almost yearly—testimony to the fading power of the *bakufu.*

Trade between China and Japan. Trade with Ming dynasty China began after the suppression of Japanese piracy. Ashikaga Takauji had sent ships of the Tenryū-ji to trade with the Yüan dynasty. But trade then ceased on account of the internal disturbances, and pirates from the maritime districts of west Japan raided the Korean peninsula and the continental mainland. When Korea came under the control of the Yi dynasty and when the Ming dynasty emerged in China, it requested the *bakufu* to open formal trade relations with the aim of suppressing piracy. Yoshimitsu, both in response to the desires of the merchants and in order to supplement the finances of the *bakufu,* began formal trade relations with Ming China and Korea, repatriating a large number of Chinese who had been taken captive by the pirates. In response, the Ming also began to trade, but under the form of tribute from Yoshimitsu, "King of Japan," to the Emperor of China. In this trade, in order to distinguish between pirate ships and trading ships, seals received from the Ming called *kangōfu* were used. Hence the use of the term *kangd* trade.

The *kangd* trade

The profits of this trade were important to the *bakufu,* but later the control of this trade came into the hands of the Hosokawa and Ōuchi families, under whose protection trading merchants became active in Hagata, Hyōgo, and Sakai. After the Ōnin War (see below), the Ōuchis controlled this trade, but on their destruction the *kangō* trade ceased and piracy again became rife. Trade with Yi dynasty Korea was carried on through the agency of the Sō family of Tsushima, and various domain lords and the merchants of Hagata were actively involved in it, importing cotton and other goods. Japanese traders resided in Pusan and elsewhere in Korea. Also included in the trade with China and Korea were goods imported by Japanese merchants from the Ryukyu Islands, lying between Japan and Taiwan, and dye materials, pepper, and other special products from the South Seas.

The Ōnin War (1467–77). In the reign of the shogun Ashikaga Yoshimasa a general civil war broke out in the area around Kydto, caused by econoniic distress and by a dispute over the Imperial succession. Indeed, severe famines engendered rebellion nearly every autumn, and it is said that during his term as shogun Yoshimasa issued 13 edicts for the cancellation of debts known as *tokuseirei,* or "acts of grace." Lacking children of his own, Yoshimasa at first proposed that his younger brother should succeed him. But when he later fathered a child a quarrel arose over the succession for control of the family. The two chief administrators, Shiba and Hatakeyama, and the great military governors also took sides in the power dispute, with Kosokawa Katsumoto and Yamana Sōzen (also known as Yamana Mochitoyo) at the head. In 1467, the first year of the Ōnin era, fighting broke out between the eastern army of the Hosokawa party and the western army of the Yamana party. The eastern army had the advantage of the support of both the Emperor and the shogun, but the western army, assisted by the Ōuchi family, recovered its power, and fighting continued for 11 years, centred on Kyōto. Destruction around Kyōto was severe, and many large temples and residences were burned. After 11 years of warfare, the fighting spread to the provinces. As a result, the farming villages held conferences and quite frequently mounted armed uprisings in self-defense. The leaders of these armed uprisings were local samurai with roots in the farming villages. Such men frequently established themselves as domain lords (daimyo) during the war disturbances. They formed associations and often mounted uprisings that extended over a whole province and challenged the great military governors. In the autumn of 1485, 36 representatives of the local warriors of southern Yamashiro Province met in the Byōdōin Temple at Uji and successfully demanded the withdrawal of the two Hatakeyama armies. As a result, the southern Yamashiro area became self-governing for more than eight years.

Edicts for cancellation of debts

In these wars, the civil aristocracy and priests lost the income from their private estates. Many of them left the capital, moving to Sakai or Nara or even taking up residence in the castle towns under the protection of local domain lords. This migration assisted in the diffusion of the central culture to the localities. Old traditions were destroyed, but from the ashes a new culture was born.

The shogun Ashikaga Yoshimasa, for example, finally turned his back on a troubled world and set up a country residence in the Higashiyama ward of Kyōto, where he lived in elegance and refinement, paying no attention to matters of government. The political power of the *bakufu* thus became virtually extinct, and real power came into the hands of the chief administrators of the Hosokawa (1490–1558) family. In the 16th century this power then came into the hands of their retainers, the Miyoshi (1558–65) family, until it was finally usurped by their own retainers, the Matsunaga (1565–68) family.

THE PERIOD OF THE "WARRING COUNTRY"

The emergence of new forces. After the Ōnin War, the power of local leaders became increasingly strong, and there were many instances in which the deputies of military governors usurped the domains of their superiors, retainers overthrew their overlords, and branch families seized power from main families. Because of this tendency for "inferiors to overcome superiors" (*gekokujō*), the previous military governors almost completely disappeared from Kyoto and the surrounding provinces, and a new type of domain lord took their place. They are called *sengoku* daimyo ("civil war barons") or feudal lords of the period of warring country.

Until the first half of the 16th century, domain lords in the various localities were thus building up strong military bases. During this period, the provinces held by the domain lords were almost completely free of *bakufu* control. The domain lords included the local leaders among their retainers, taking away their independence by enforcing land surveys and directly controlling the farming villages. Domain lords such as the Imagawa, Date, and Ouchi issued their own laws called *bunkoku-hd.* These provincial laws, while drawing on the samurai laws of the Jōei Formulary and thereafter, also included regulations for farmers, and they applied strict controls over retainers. It was made a principle that inheritance by retainers should be restricted to the main heir alone, and the overlord's permission was necessary for his vassals to inherit property or to marry. In the farming villages the domain lords, in addition to carrying out land surveys, built irrigation dikes and opened new rice fields. In order to concentrate their power they also readjusted the disposition of local fortified strongholds, gathered their retainers into castles, and reorganized roads and post stations to centre on their castle towns.

Growth of cities and trade

Commerce and towns made marked development at this time. Markets also came to be held six times a month and were set up all over the country. Despite the obstructions of the customs barriers, the products of all the districts were available in these markets. In large cities such as Kyoto, commodity exchange markets were set up to handle huge quantities of rice, salt, fish, and other goods; wholesalers, or toiya, specialized in dealings with distant areas. The circulation of coined money also became vigorous, but in addition to the various kinds of copper coin imported from China of the Sung, Yiian, and Ming dynasties, privately minted coins also circulated within the country, giving rise to confusion of exchange rates. The bakufu and domain lords issued laws to prohibit people from hoarding good coins but without effective results. The guilds now showed a strong monopolistic tendency *in* order to protect themselves against new-style merchants who emerged while new guilds were set up in the castle towns (*jōka-machi*) under the direct control of the domain lords. Among the cities of the time, next to Kyōto and Nara, Uji and Yamada outside the gates of Ise Jingū Shrines flourished. Besides these, towns grew up around the castles of the domain lords, such as Navetsu of the Uesugi family, Yamaguchi of the Ōuchi family, Ichijō-dani of the Asakura family, and Odawara of the later Hōjō. As the castles of the domain lords were moved from mountain fortresses to strongholds in the plains, markets were opened outside the castle walls, and merchants and artisans gathered there to live. Harbour towns (*minato-machi*) such as Sakai, Hyōgo, and Onomichi on the Inland Sea, Suruga and Obama on the Japan Sea, and Kuwana and Ōminato on Ise Bay also flourished as exchange centres. Sake brewers, brokers, and wholesale merchants were leading townsmen (machi-shu), and town elders, called otona, were chosen to carry on local government through assemblies. In the trading port of Sakai, for example, an assembly of 36 men drawn from the wholesale guilds carried on the city government. They maintained soldiers and constructed moats and other defenses, and while profiting from the confrontation of the domain lords, they resisted their domination. The Jesuit missionaries (see below) compared Sakai to the free cities of Europe in the Middle Ages and described its flourishing condition in their reports.

The arrival of the Europeans. As the warring domain lords carved out their territories, the central authority ceased to maintain control over overseas trade. Further, Japanese marauders in association with Chinese pirates again became active. At this time, the Spanish and Portuguese made their appearance in the archipelago. In 1543 (according to Japanese sources), the first Portuguese were shipwrecked on the island of Tanega, off southern Kyushu. These were the first Europeans to arrive in Japan, and the art of musket construction they passed on at this time immediately spread to Sakai and other places.

The Jesuit missionaries

In 1549 the Jesuit missionary Francis Xavier arrived in Kagoshima. After missionary work for two years and three months, he left Japan, and thereafter Jesuit missionaries arrived continuously. The missionaries made use of the trade from the Portuguese ships to propagate Christianity, and there were cases in which merchant ships would not enter the ports of domain lords who did not show good will toward missionary activity. Thus, domain lords, seeking the profits of foreign trade and the acquisition of military equipment and supplies, progressively protected Christianity, until finally some domain lords even became Christian converts. Three Kyushu Christian lords—Ōtomo Sōrin, Arima Harunobu, and Ōmura Sumitada—sent an embassy to Rome. Farmers also increasingly became converts under the influence of the social relief work and medical aid that accompanied missionary activity.

The establishment of military culture. While absorbing the traditional culture of the civil aristocracy, the military families that established themselves in Kyoto also introduced the continental culture of the Sung, Yiian, and Ming dynasties, especially the culture associated with Zen Buddhism, thus fashioning a new military family culture. This began with the golden age of the shogun Ashikaga Yoshimitsu at the end of the 14th century. In this period, scholarship and the arts flourished in the five Zen monasteries of Kyoto under the patronage of the shogun. Renga (linked verse) and Nō drama became vigorous. The essence of this culture finds concentrated expression in the Golden Pavilion (Kinkaku-ju) in Yoshimitsu's country estate at Kitayama, now a part of the Rokuon-ji (see above The establishment of the *Muromachi* bakufu). Facing a garden of refined elegance, the Golden Pavilion is built in the Japanese *shinden* style (an ecclesiastical style with Zen influence) in its first and second stories, while its upper story is in the *kara* ("Chinese") style of the Zen sect. This proves that Kitayama culture, while absorbing Zen influences from China, also shows many influences of the native aristocratic culture. In the time of the shogun Yoshimasa, the samurai culture, in addition to even deeper Zen taste, shows a refined appreciation of simplicity and an air of quiet profundity. The Silver Pavilion (Ginkaku-ji) and its garden built by Yoshimasa on his country estate at Higashi-yama (Mt. Higashi; now part of the Jishō-ji) displays the essence of this polished Higashi-yama culture. While adopted by the local domain lords, Higashi-yama culture also gave rise to a new culture centred on the townsmen of Kyoto and Sakai, and is the forerunner of the famed Azuchi–Momoyama and Edo cultures.

Increasing temporal role of the monasteries

In Buddhism, the ancient great temples like the Enryaku-ji became mere shadows of their former greatness with the diminution of their landed estates. Since the Kamakura period, the Rinzai sect had been linked to the upper military families. The Muromachi shogunal family (the Ashikaga) gave special protection to the group of the priest Musō Soseki of this sect, which flourished in the Gozan monasteries (the five most important Zen monasteries) in Kyoto. The monks of the Gozan became advisers to the bakufu in government, diplomacy, and culture, studying the Neo-Confucian philosophy of Chu Hsi that came from China along with Zen, publishing books, and writing poetry and prose in the Chinese style. But the five monasteries became vulgarized because of their excessive links with the political world, and they ceased to prosper as the *bakufu* declined. In contrast, the Myōshin-ji and Daitoku-ji groups arose, and the latter is famous for the monk Ikkyū, who propagated his own teaching. At this time Rennyo (1415–99) of the Ikkō sect came forth from the Kyōto Hongan-ji, teaching his principles in simple phrases and spreading the faith by organizing groups called ka. However, he came under persecution from the Enryaku-ji and fled to Echizen, establishing a school of instruction at Yoshizaki. He then moved to Settsu Province, where at Ishiyama (now a part of Osaka) the Hongan-ji achieved its golden age. While also persecuted, the Hokke (Lotus) sect progressively gained adherents among the warriors and merchants. At this time, the custom of pilgrimages to the holy places of the Buddhist deity Kannon, to the Ise Shrine of Shintō, and to the summit of Mt. Fuji also became popular. Within this trend, a worldly Shinto belief arose, and in the 15th century the scholar Yoshida Kanetomo, while proclaiming Shinto principles, also took the occasion to free Shintō shrines from Buddhist control; he believed that only a deep religious faith could cure the people of their despondency. In the arts the Nō drama developed in the Kamakura period under the influence of agricultural festival dances, and guilds (za) were formed to serve at the ceremonies of temples and shrines and at funeral services From among the four guilds attached to the Kōfuku-ji and the Kasuga Shrine of Yamato Province (present Nara Prefecture), the father and son Kan-ami and Zeami appeared, who under the patronage of the shogun Yoshimitsu laid the foundations for a flourishing Nō drama, bequeathing many masterpieces of chant, which forms the foundation of the art. Kydgen (dialogue play with dance), which developed from the comic elements of *sarugaku*, was performed in the intervals of Nō drama, and, taking its topics from everyday life of the common people, was widely appreciated by them. Traditional Japanese waka verse was also composed, but renga (linked verse) became ever more popular and was enjoyed by the warriors and the common people. After a time, however, renga became overly formal, as the waka did, and lost its freshness; hence, in the "warring country" period the free-style verse called haikai was born.

Developments in architecture and the visual arts

Along with the prosperity of Zen, the *shoin* style of building closely connected with this sect was widely adopted by the military families and civil aristocrats in the construction of their residences, becoming the foundation of present-day domestic architecture. The *shoin* was originally a room in which monks read the Buddhist scriptures. In constructing the shoin, an entrance called *genkan* is built, while within the room straw mats called tatami are laid out, paper-covered sliding partitions are used, and an alcove and shelves at different levels are set up. The custom of hanging a monochrome painting in the alcove and placing flowers or an incense bowl before it also arose at this time. In gardens, a delight was first taken in adding the Zen mood of retreat from the world to the *shinden* style, making symbolic use of streams, flowers, and bushes. Later, even more symbolic gardens were constructed using arrangements only of stones, raked sand, and gravel. The carving of images of the Buddha and the Buddhist paintings that had flourished in the Kamakura period now declined, as did the ancient sects themselves, and new ones arose. Yamato-e painting also declined, and the picture-scrolls lost their freshness. On the other hand, with the increase of interest in Zen, monochrome painting in the Sung and Yüan style was begun by the monks of the Gozan. In the time of Yoshimasa, the great painter Sesshū broke away from imitation of Chinese models and opened new frontiers in monochrome paintings. The father and son Kanb Masanobu and Hisanobu introduced the gentle models of Yamato-e to monochrome painting and became the founders of the succeeding Kanb school. Tea drinking, introduced from Sung China by the Buddhist priest Eisai in the Kamakura period, spread to the warriors and the common people in the northern and southern courts period. In particular, in the time of the shogun Yoshimasa, Jukb came from Nara and began the wabi-cha form of tea ceremony by bringing together the *cha-no-yu* of the civil aristocracy and the cha yoriai of the common people. This new form spread among the warriors and great merchants and was further purified in the "warring country" period by the Sakai merchant Jōō. Together with the development of the tea ceremony, new forms were brought about in the construction of tearooms, flower arrangement, pottery, and Japanese cakes. In the "warring country" period, Higashiyama culture became further diffused among the common people, and as the livelihood and education of the merchants and artisans of the cities reached higher levels they enjoyed Nō and *kyōgen* dramas, the tea ceremony, and renga (linked verse). Fairy stories were also widely enjoyed, being easy to read, and included stories that had been related among the people since ancient times. These became popular not only among the children of the civil aristocracy and warriors but also among those of the townsmen who were educated in temples and shrines. The local domain lords also promoted culture within their domains, enhancing their dignity as lords by building temples and shrines in their castle towns and actively introducing the culture of Kyōto.

Thus, while warfare was rife in the Kamakura and Muromachi periods, these were, nevertheless, eras that gave Japan some of its most distinctive cultural institutions. (T.T.)

II. The early modern history of Japan (1550–1850)

UNIFICATION

The Oda regime. In the 1550–60 period the sengoku ("civil war") daimyo domain lords, who had survived the wars of the previous 100 years, moved into an even fiercer stage of mutual conflict. These powerful daimyo were harassed not only by their mutual conflicts but also by the social development of the common people within their domains. The lords sought to resolve these contradictions by acquiring land and people to widen their domains and, finally, by trying to grasp the leadership of the whole country. To accomplish this purpose, they considered it necessary to control Kybto, the political centre since ancient times. In the midst of these struggles, one such *sengoku* daimyo, Oda Nobunaga of Owari Province in modern Aichi Prefecture, succeeded in entering the capital as the first feudal unifier.

The first feudal unifier

On the emergence of Oda's regime, the feudal disintegration of the previous century began to show a clear tendency toward unification. Oda's bold wars of suppression, which entitled him to be called a military genius, led to a great redrawing of the political map, previously split up among the domain lords of the whole country. In the Kinai district, on which Oda's conquered territory was centred, however, he established control by dividing his new domain among his commanders. Rather than completely abrogating the long-established privileges of the temples, shrines, and local landlords (kokujin), he at first recognized these, regarding them as an important adjunct to the strengthening of his military power and using them as followers in the unification wars. The land surveys aimed at strengthening feudal landownership were at this stage carried out not so much to gain control over the complicated landholding and taxation system of the farmers as to define the size of fiefs (chigyo) of his retainers in order to confirm the extent of their military services and obligations.

The unification policy of the Oda regime was upheld by the separation of the warriors from the farmers, but it could not be fully achieved because of resistance from old political forces. Unification became more clearly established later, during Toyotomi Hideyoshi's regime.

The Hideyoshi regime. Oda was the son of an Owari domain lord, whereas Hideyoshi was the son of a farmer from the same province. Entering Oda's service, Hideyoshi was greatly esteemed for his brilliant talents, and before Oda's death Hideyoshi had become one of his most powerful commanders. After Oda's suicide during the Honnō-ji (a monastery in Kybto) Incident of 1582—when his retainer and commander, Akechi Mitsuhide, rebelled against him—Hideyoshi eliminated many rivals by his superb political judgment and shrewd actions, thus firmly establishing himself as successor. In the footsteps of Oda, Hideyoshi proceeded to unify the whole country at a rapid pace, and, in 1590, all Japan—from Kyūshū in the west to Tohoku in the east—had come under his control. On the pretext of giving rewards for distinguished service, Hideyoshi gave the Kantō domain, formerly of the Hōjō family, to Tokugawa Ieyasu, causing him to move to Edo; this was, in fact, a stratagem to remove the Tokugawa family from the Tōkaidō and Chūbu districts, where its power had been nourished.

The keynote of the Hideyoshi unification policy was its firm establishment in principle of the separation of the warriors and farmers. Thus, the clear-cut contrast between feudal landowners and feudal small farmers (or serfs) became the basic model of the system.

The Taikō land survey

The Taikō land survey played an important part in this process. Taikd was a traditional title for former regents, and it was assumed by Hideyoshi in 1591. The Taikō land survey was carried out over the whole country from 1583 to 1598, just before Hideyoshi's death. As a result of this survey, the complicated connections of rights to landownership that had developed since the Kamakura period were set in order. Landowning relations were now based on *kokudaka—i.e.*, on the actual product of the land. Moreover, this actual product now came within the landlord's grasp in every village, and land taxes were now levied on the village as a unit. This is called the mura-uke, or village responsibility, system. In addition to this definition of the rights held by the farming population, the kokudaka system also applied to the landholdings of domain lords (the chigyd) to be distributed among their retainers. In place of previous land taxes (*nengu*) assessed in money as so many hundred or ten thousand kan of silver, an assessment of kokudaka was made as so many hundred or ten thousand koku of rice, the amount being also used as a standard on which military services were levied in proportion.

During the Taikb land survey, a land-survey register was drawn up in every village, and farmers so registered were recognized in their rights as cultivators to the extent of the land thus registered; in return they were bound to pay land taxes in rice and forbidden to neglect the cultivation of their fields or to move elsewhere. Farmers were thus reduced to rural serfs, tied to the land, and exploited. The promulgation of an order of social-status control in 1591 prohibited people who neither cultivated the land nor performed military service (*i.e.*, the artisans and merchants) from residing in the villages, showing a further advance from the separation of the warriors and farmers to a feudal social class system of warriors, farmers, artisans, and merchants. The order of "sword hunt" (katana-gari), which took away arms from the farmers, was also an important prerequisite for this policy. By establishing the kokudaka system, the Taikō land survey delivered the final blow to the shden system, a system of manors in medieval times, which had already greatly declined. The feudal chigyd system, based on the kokudaka system, was established throughout the country, the domain lords all submitted to the despotic control of the Hideyoshi regime, and the alliance-like relationship between Oda and the former sengoku daimyo changed to a clear lord–vassal relationship.

The political structure of the Hideyoshi regime was not yet fully equipped, however, to be the unified governing authority controlling the whole country. For example, the kurairechi, or lands under its direct control, which were the immediate financial base of the regime, amounted to about 2,000,000 koku. But setting aside those of the metropolitan and surrounding provinces, these lands were in many cases divided among the distant, independent domain lords (tozama daimyo), and the management of these lands was entrusted to them. Such lands were thus not firmly in the grasp of the regime. By contrast, the lands under the direct control of the Tokugawa shogunate amounted to more than 4,000,000 koku, or better than double those of the Hideyoshi regime, and 80 percent of them were managed by officials known as gundai and daikan, who were direct retainers of the shogunate, with only 20 percent deposited with domain lords. This inner contradiction in the political structure of the Hideyoshi regime gave rise to internal power struggles and finally drove Hideyoshi to reckless action such as the Korean expedition (aggressions against Korea in 1592 and in 1597). The Hideyoshi regime collapsed on the failure of that expedition and as the direct result of Hideyoshi's subsequent death. Tokugawa Ieyasu was the strongest candidate to form the next regime.

THE BAKUHAN SYSTEM

The Matsudaira family

The establishment of the system. The ancestors of Tokugawa Ieyasu, the founder of the Edo bakufu, were the Matsudaira, a sengoku daimyo family from the mountainous region of Mikawa Province (in present Aichi Prefecture). The Matsudairas had built up their base as domain lords by advancing into the plains of Mikawa. But when they were attacked by the powerful domain lords of the Oda and Imagawa families from the west and east, Ieyasu's father, Hirotada, suffered the bitter misfortune of losing his domain. Ieyasu became a hostage of the Oda family at a young age, but he was then captured by the Imagawa family and spent 12 years under detention. In 1560 Imagawa Yoshimoto was killed by Oda Nobunaga in the Battle of Okehazama, in which Nobunaga destroyed the Imagama family and confirmed his course of unification, and Ieyasu was finally released. He returned to Okazaki in Mikawa and brought this province under his control. As Oda's ally, he guarded the rear for the advance on Kyōto, and he thereafter fought his own military campaigns, advancing eastward. By 1582 he was a powerful daimyo, possessing, in addition to his home province of Mikawa, the four provinces of Suruga and Tōtōmi (modern Shizuoka Prefecture), Kai (Yamanashi Prefecture), and southern Shinano (Nagano Prefecture).

When Hideyoshi seized the ruling power, Ieyasu at first opposed him. But he then submitted, and, rising to be the most powerful domain lord among Hideyoshi's vassals, he became chief of the five *tairō*, the highest officers of the Hideyoshi regime. After Hideyoshi's death Ieyasu won the Battle of Sekigahara in 1600, in which all daimyo in the country took part, establishing his national supremacy. In 1603 Ieyasu set up the Edo bakufu (more commonly known as the Tokugawa shogunate [1603–1867]) to legalize this position. Control over the domain lords was firmly exercised at this time. On the pretext of allotting rewards after Sekigahara, he dispossessed, reduced, or transferred a large number of opposing daimyo and gave the confiscated lands either to relatives and retainers of the Tokugawa family to establish them as domain lords and to increase their holdings or reserved the lands as the family's domains. In addition, Hideyoshi's son Hideyori was reduced to the position of a domain lord of the Kinki district. Two years after the establishment of the bakufu, Ieyasu relinquished the office of shogun to his son Hidetada, retiring to Sumpu (modem city of Shizuoka) to devote himself to strengthening the foundations of the bakufu. In 1615 Ieyasu stormed and captured Osaka Castle, destroying the Toyotomi family. Immediately afterward, the Buke Sho-hatto (Laws for the Military Houses) and the Kinchū narabi-ni Kuge Sho-hatto (Laws for the Imperial and Court Officials) were promulgated as the legal basis for bakufu control of the domain lords and the Imperial court. In 1616 Ieyasu died.

Completion of the *bakuhan* system

Under the second and third shoguns, Hidetada and his successor, Iemitsu, the bakufu control policy advanced further until the bakuhan system—the government system of the Tokugawa shogunate; literally a combination of bakufu and han (daimyo domain)—reached its completion. By reorganizations in 1633–42 the executive of the bakufu government was almost completed, as represented by the offices of senior councillors (*rojū*), junior councillors (waka-doshiyori), and three commissioners (bugynin) for the temples and shrines of the country, the shogun's capital, and the treasury of the bakufu. Confiscations and reductions were continuously made against the domains, and wide-scale transfers also took place, distributing the strategic districts of Kantō, Kinki, and Tōkaidō among the relatives and retainers of the bakufu, thus keeping the "outside" (tozama) domain lords in check. Along with the rearrangement of the daimyo, the lands under the direct control of the bakufu were also increased at key points throughout the country. The most important cities and mines were also placed under direct bakufu control and used to control commerce, industry, and trade.

The bakufu also revised the Laws for the Military Houses and systematized the *sankin* kdtai (alternative attendance), by which the domain lords were required to pay ceremonial visits to Edo every other year, while their wives and children resided permanently in Edo as hostages. This sankin-kdtai system was unique to Japanese feudalism and never appeared in European feudalism. In addition, the daimyo were forced to assist in such public works as the construction of castles in the bakufu domains, thus being driven into financial difficulties. The bakufu domains now amounted to more than 7,000,000 koku—about one-quarter of the whole country. Of these lands, more than 4,000,000 koku were under its direct control, and 3,000,000 koku were distributed among the hatamoto and *gokenin*, the liege vassals to the bakufu. In addition, because the bakufu had a monopoly of foreign trade and alone had the right to issue currency, it had considerably greater financial resources than did the domain lords. In military strength, it was also far more powerful than any individual daimyo.

In step with the structural organization of the bakufu as the supreme power, the domain governments of the daimyo also progressively took firm shape. The relationship between the shogun and the daimyo was linked with the lord–vassal relationship, based on the feudal *chigyō* system. The land of the whole country belonged to the shogun, who divided this among the domain lords as a special favour, or *go-on*. In return, the domain lords had a duty to provide military and other services to the shogun. This same connection existed between the domain lords and their retainers, and in order to concentrate and strengthen the ruling power of the domain lords, it was necessary for them to tighten this connection. Applying restrictions to the traditional right of the domain warriors to *chigyd*, or subdomains, retainers were supplied with rice stipends *(kuratnai)* in place of *chigyd*, thus increasing their dependence on the domain lord. At the same time, this increased the lands under the direct control of the daimyo, strengthening the economic base of the domain. These were the same methods employed by the *bakufu*. In this way, a hierarchical, feudal *chigyō* system was established by means of the *koku* system, which extended from the shogun and the domain lords to their retainers. This was the fundamental condition that made possible the concentration of ruling power in the hands of superiors, the principal distinguishing feature of the Japanese feudal system.

Control of the villages

Having been inherited from the Oda–Hideyoshi regimes, the control of the farmers, which was the main object of feudal rule, was now further strengthened. The Taikō land survey had recognized the rights of the lower class farmers as the actual cultivators of the land and made them bear the responsibility for the payment of land taxes. While also carried out on this basis, the land surveys of the *bakufu* and the daimyo domains were much more detailed and precise in standards of survey, adopting the policy of extracting the greatest possible tax yield, limited only by the necessity for the farmers to continue to produce. The Tokugawa villages thus differed from those of the preceding ages, which had been controlled by patriarchal landlords, or *myōshu*. The Tokugawa villages were composed of a main core of feudalistic petty farmers, who went under the general title of *hombyakushō* ("farmers proper"). At the same time, the village became an administrative unit of the new feudal regime; and to carry out its functions, a system of village officers was organized in three grades—*nanushi* (or *shdya), kumigashira*, and *hyakushd-dai*. The inhabitants of the towns and villages of the whole country were required to form *gonin-gumi* (five-household groups), or neighbourhood associations, to foster joint responsibility for tax payment, to prevent offenses against the laws of their overlords, to provide one another with mutual assistance, and to keep a general watch on one another. The so-called outer economic controls over farmers were further strengthened: farmers were strictly prohibited from buying and selling land, from absconding from their land, or from changing their occupation; minute restrictions were also applied to keep their clothes, food, and houses as simple as possible. The Keian no O-furegaki (Ordinance of the Keian era) was promulgated by the *bakufu* in 1649, a compendium of *bakufu* policies toward rural administration.

The enforcement of national seclusion. The 1630s also marked an important dividing line in foreign relations with the enforcement of *sakoku*, or national seclusion. The path toward seclusion had been prepared during the formation process of the *bakuhan* system. The seeds of this policy had been sown in trade control and in measures against Christianity by the Oda–Hideyoshi regimes. Driven on by his consciousness of Japan as a "divine country" in his position as feudal overlord, Hideyoshi, though strongly attracted to trade as a source of national wealth and military strength, had issued an order for the exclusion of the missionaries. Ieyasu, even more strongly attracted by profits, made efforts to trade not only with the Portuguese Catholics but also with Protestant Holland and England, protecting trade with the southern regions by granting special licenses, or *shuin-jō* ("red seal license"), to oceangoing merchant ships. But Ieyasu's encouragement of trade was above all aimed at establishing a *bakufu* trade monopoly. In 1604 a special system for the purchase of silk was established, and the Chinese silk imported to Japan by Portuguese ships was sold at fixed prices to the powerful merchants of Kyōto, Sakai, and Nagasaki, who formed a guild and then distributed this silk to the domestic retail merchants. Moreover, under the name of "emperor's silk" (*go-yō ito)*, Ieyasu enjoyed a preferential purchase of a part of the imported silk prior to the said guild's treatment and reaped a huge profit on releasing this to the domestic markets.

As a result of his eagerness for trade, it was natural for Ieyasu to be generous to the propagation of Christianity. But Ieyasu feared that the Christians would link up with the Toyotomi family to resist the *bakufu*, and he took steps to prohibit Christianity before his destruction of the Toyotomi family. An order prohibiting Christianity was promulgated in 1612, and the persecution of its adherents began immediately thereafter. This persecution became much more severe during the reigns of Hidetada and Iemitsu, until finally it became official policy to stamp out Christianity even at the sacrifice of trade. This policy became manifest with the seclusion orders of the 1630s. Thus, in 1635 Japanese were forbidden to make overseas voyages or to return to Japan from overseas, which was a severe blow to traders.

The Shimabara Rebellion

In 1637, in resistance to heavy taxes and the prohibition of Christianity, an uprising took place in the Shimabara Peninsula of Kyūshū, consisting of farmers led by masterless Christian samurai. For five months they put up a fierce fight against the *bakufu* army. Having suffered this bitter experience, known as the Shimabara Rebellion, the *bakufu* thereafter stepped up its strict controls on Christians and attempted to root them out by such means as *fumi-e*, in which one was required to trample on an image of Christ or the Virgin Mary. The system of registration at Buddhist temples, or *terauke-seido*, was begun, and all the inhabitants of the country had to belong as parishioners to a parent Buddhist temple, called a *danna-dera* ("family temple"), which every year had to guarantee that the parishioner was not a Christian. In 1639, when Portuguese ships were completely forbidden to visit Japan, the seclusion orders were fully effective both in name and reality. Only the Dutch and the Chinese were allowed to trade as before, but this trade was also extremely restricted and was confined to the island of Dejima at Nagasaki.

Various views exist as to the influence of national seclusion on the Japanese, but the depth of its impact was probably without parallel in Japanese history. It is an undeniable fact that the vigorous desire of the Japanese to expand overseas prior to the seclusion policy was thenceforth diverted into a negative national character known as *shima-guni konjō*, or insularity. While the seclusion policy was useful in enabling the Tokugawa shogunate to exercise an enduring and stable political dominance for nearly 300 years, this simply resulted in the long continuation of a rigid feudal system to an extent unknown elsewhere in the world. Industry developed and gave rise to a unique popular culture, but it was a limited Japanese feudal culture with no international characteristics.

Status distinction system. Thus, the *bakuhan* system was firmly established in the second half of the 17th century, as determined by domestic and foreign conditions. This establishment of a feudal class structure of warriors, farmers, artisans, and merchants was truly the final consummation of the *bakuhari* system. Distinctions between the statuses of warriors, farmers, artisans, and merchants were strictly enforced, but the distinction between the warriors and the other three statuses was especially strict. Forming barely 7 percent of a total population estimated at 30,000,000, the warriors levied taxes on the farmers, who formed over 80 percent of the population and who thus provided the economic foundation of the system. To symbolize this society, the warriors wore swords in everyday life because the system was maintained by their great military power. While peace lasted for 300 years, it was in fact no more than an armed peace. Another special feature of this society was that, even in family relationships, absolute obedience was demanded from members of the family toward the house head (*ka-chd*). Among the family members, the status of women was especially low, and the idea of *danson-johi* (respect for the male, contempt for the female) was prevalent.

Relations between superiors and inferiors

The establishment of the *bakuhan* system created a need for a new world view and a system of ethics to support it. In these circumstances, the Shintō and Buddhist ideologies of early medieval society were useless. Only the morals of Confucianism, especially the Chu Hsi studies, could provide an intellectual rationalization for the status-oriented social structure of the *bakuhan* system, with its stratified feudal landowning structure headed by the shogun and its attribution of superior status to warriors over the other social classes. The feudal rulers, in particular, demanded Shushigaku ("Chu Hsi studies") because, among the various schools of Confucianism, it was the most systematic as a doctrinal system. The Chu Hsi scholar Hayashi Razan was employed by the *bakufu* and was well suited to the *bakufu* foundation period. He is said to have had a hand in the drafting of all *bakufu* official documents and in the formulation of *bakufu* laws. His political ideas, as seen in his *Honchd hennen-roku* ("Chronological History of Japan") and in the *Honchō tsugan* ("Survey History of Japan"), compiled by his son Gahō, provided a historical justification for the establishment of the Tokugawa shogunate. The role of Chu Hsi studies was to repudiate the revolutionary idea of *gekokujd*, or the overthrow of superiors by inferiors, and to emphasize the idea of *kenshin*, linking this to Confucian moral conceptions. The central moral conceptions of Confucianism were *cha*, or "loyalty," and *kd*, or "filial piety." But in contrast to China, more emphasis was placed on *chū* as a support for feudal lord–vassal relations than on *kb*, which was a family ethic. Chu Hsi studies opposed the world view and logic of Christianity, which gave more importance to God than to the ruler–subject relationship and which also bitterly criticized Buddhism, which had been the ideology of the Middle Ages.

Wang Yang-ming studies (Oybmeigaku) also held a special place in Confucian circles in the early Edo period. These studies were characterized by a strong subjective idealism, but in other aspects they had practical elements. Nakae Tbju, said to be the father of Japanese Wang Yang-ming studies, was so earnest in performing virtuous acts that he was called the sage of Ōmi. One of his followers, Kumazawa Banzan, transformed Wang Yang-ming studies from a means for individual spiritual training to a method for providing the energy for political reformation.

Industries, cities, and culture. With the establishment of the *bakuhan* system, the anarchy of the earlier period ended, bringing in its wake a tendency to domestic peace.

Commercial economy. As a result, industry was promoted and cities developed. This trend took place in the latter half of the 17th century, centred in the Kinki district, where productive power was the most advanced in the whole country. Feudal petty farmers, who went under the general name of *hombyakusho*, now became widespread, and, while paying heavy taxes and performing various kinds of labour services, they sought to enjoy a better standard of living, however slight. In addition to their efforts as cultivators, they reclaimed new lands and produced various commercial crops and handicraft goods for sale in the city markets. Representative of such commercial crops were cotton and rapeseed oil in the Kinki district and silk in east Japan. Communications and transportation also developed for the circulation of such goods. But this circulation of commercial goods among the people was centred on the side roads and waterways rather than on the five great highways constructed by the *bakufu*. As a result of the development of industry and communications, such new-style merchants as wholesalers and brokers came to the fore, and powerful financiers also appeared.

Commercial goods production

As for the cities, the castle towns of the domain lords were the most numerous, but these gradually came to acquire the character of commercial cities. Purely commercial cities and post towns (towns along highways) also arose throughout the country. The cities of Edo, Osaka, and Kyōto, under the direct control of the *bakufu*, were especially developed. When its warrior inhabitants are included, Edo in the early years of the 18th century had a population of more than 1,000,000 and thus became the largest city in the world.

Cultural activities. In this period remarkable artists and masterpieces appeared in the fine arts and crafts. Great artists representative of the culture include Ihara Saikaku in *ukiyo-zdshi* ("tales of the floating world") genre novels, Chikamatsu Monzaemon in *jōruri* (puppet play) drama, and Matsuo Bash6 in haikai (humorous unconventional verse). Saikaku was a townsman who spent all his life in Ōsaka. He first aspired to write haikai, and for more than 30 years he was active as a haikai composer. But his forte was in *yakazu-haikai*, which was a competition to compose as many haiku (the poetic form of haikai) as possible within a fixed period of time. Saikaku set a new record by composing 23,500 haiku in a single day and night—one haiku every four seconds. In 1685 Saikaku gave up haikai and next set out to write *ukiyo-zōshi*, producing about 20 masterpieces in succession, beginning with *Kōshoku ichidai otoko* (1682; *The Life of an Amorous Man*, 1964). Between *1624* and 1643 the *ukiyo-zōshi* novel had transformed the *kana-zōshi* (storybooks written in kana) into an even more thoroughly townsman form of literature after the latter had replaced the previous *otogi-zōshi* ("fairy-tale books") in popularity. The unique spirit of the age can be seen in the world *ukiyo*, which had meant "sad world" in medieval times. Written with a different calligraphic character in *bakuhan* times, it now meant "floating world" and implied cheerfulness. The consistent aim of Saikaku's works was to depict, as accurately as possible, human desire for love and gain, taking the realistic viewpoint that "human beings are bundles of desire equipped with arms and legs." His viewpoint also contained a keen criticism of the warriors as men so bound by social status and moral principles that they could not live a free life.

Matsuo Bash6 remained closely attached to haikai and fashioned it into up-to-date popular poetry. Bashō came from a warrior family, but after becoming a masterless samurai, or *rōnin*, he devoted himself to haikai, while suffering various hardships in his means of livelihood. Bash6 found the existing haikai styles unsatisfying, and he developed a new style called *shōfū* or "Bash6 style." Bash6 proclaimed what he called *makotono* ("true") haikai, seeking the spirit of this poetic form in sincerity and truthfulness. He also brought a new beauty to haikai by the use of small and simple words. He brought about an artistic flowering of the highbrow conceptions of medieval poetry by grafting onto them the commonplace feelings of the Tokugawa people. Rather than repudiating tradition, Bashō's haikai brought it to completion.

During the period 1592–1614 the *Jōrurihime monogatari* (a romantic ballad), drawing on the traditions of the medieval narrative story, was for the first time arranged in the form of dramatic literature accompanied by puppetry and the samisen (a lutelike musical instrument). It continued to develop until the three masters—Takemoto Gidayū as narrator, Chikamatsu Monzaemon as composer, and Tatsumatsu Hachirobei as puppeteer—made *jōruri* the representative form of Tokugawa performing arts.

Gidayū was the son of a farmer, while Chikamatsu, like Bashō, came from a warrior family. Chikamatsu wrote more than 80 *jidaimono*, or historical dramas, and 20 *sewamono*, or domestic dramas of contemporary townsman society, both for *jdruri*. He also wrote more than 30 Kabuki plays. The chief theme running through Chikamatsu's works is the idea of *giri* (or "duty"), which is to be understood not so much as feudal morality enforced from above but rather as the traditional consciousness of honour and dignity in one's motives and position and of social consciousness in human relations. The compositions of Chikamatsu's later years seek the motif of tragedy in the fact that this *giri*, while proof of men's humanity, cannot be thoroughly achieved because of their immorality and lack of principle. Beginning with his *Shinjū*

The idea of *giri*

ten no Amijima (1720; The Love Suicide of Amijima, 1953), the leading male and female characters in his sewamono dramas are unable to keep the postulates of giri in this world and so die by *shinjū* (a suicide pact between lovers) in order to realize their love in a future life. Buddhist elements can be seen in this conclusion, as well as the unresolvable contradictions that faced the townsman in Genroku period society (1688–1703).

Kabuki also established its foundations as Tokugawa drama in this period. The okuni Kabuki, named for the maiden dancer Izumo Okuni, which had been popular at the turn of the 17th century, afterward developed from the ynjo Kabuki, or courtesan style, to the *wakashū* Kabuki, or young-man style. The *wakashū* Kabuki was prohibited by the bakufu moral censors, however, because of widespread homosexuality among its performers, and it developed into the *yarō* Kabuki style, played by adult males distinguished from the *wakashū* by shaven forelocks. At the same time, Kabuki now developed from its previous dancing-act form into a regular drama centred on a dramatic plot with realistic acting. The Kabuki was centred in the cities of Kyoto, Osaka, and Edo. In Kyōto and Osaka Kabuki, the speciality was the wagoto, a drama with a pronounced comical element, centred on love, whereas the popular form of Edo Kabuki was the *aragoto*, which had developed from the *kinpira jōruri*, based on the theme of the heroic tale of Kinpira—son of Sakata Kintoki and one of the leading followers of Minamoto Raiko—and adopted the manners of the *kabukimono*—the rowdy bucks of the age.

The traditional arts of Nō drama, the tea ceremony, and flower arrangement also reached new stages of development in the period. The tea ceremony (*cha-no-yu*)—in particular, became popular and was practiced not only by the shogun and domain lords but also by the newly risen merchants, who used their wealth to become eager collectors of tea-ceremony utensils with historical associations. As the tea ceremony became popular, many schools came into existence, including that of Sen-ke (Sen house), the school of Sen Rikyū, fostering the tendency for the art of the tea ceremony to be monopolized by the house heads of the various schools and for the profession of tea master to develop. This "house head" (*iemoto*) system gradually also spread to flower arrangement and to other arts. One result of this was to inhibit further development of these artistic forms.

Distinctive tendencies also arose in the fine arts and crafts. One representative of this is Ogata Kōrin, who brought decorative painting to completion and bequeathed to posterity many splendid masterpieces in gold lacquer (*maki-e*) and other work. The technique of dyeing and weaving was also improved, and, in Kyōto, Miyazaki Yiizen brought the splendid *yūzen-zome* (rice-paste batik method of dyeing) to completion, while the kimono became even more colourful. In Edo, Ukiyo-e drawing in traditional styles was further developed by Hishikawa Moronobu, who depicted not only the usual courtesans and actors but also vividly portrayed various aspects of the lives of ordinary people. Besides his original drawings, he used the Chinese technique of wood-block printing to satisfy popular demand. Famous centres of pottery production also arose at various places throughout the country.

Changes in ceremonies and daily customs

The old ceremonies of the Imperial court and the various forms of deportment developed in the bakufu were extended to the common people and shaped the manners of the cities and farming regions. Japanese customs in dress, food, and housing became established at this time. The custom changed from eating twice a day to three times a day; in the cities rice became the normal food, and a rich variety of cakes and sweets was consumed.

THE WEAKENING OF THE BAKUHAN SYSTEM

On entering the 18th century, the inner contradictions of the bakuhan system came to the surface and began to show signs of weakness. The finance of the bakufu and domain lords was based on a rice-using economy, in which executives endeavoured to levy taxes—to be paid in kind, mostly in rice, centred on the yearly crop. Rice and other crops were then transported to the great central cities like Edo and Osaka and exchanged into money. This forced the farmer-producers to subsist at a low standard of living and to be as self-sufficient as possible, being able to purchase only iron tools, salt, medicines, and other such goods that they could not produce for themselves. Taxes, however, came to be paid in money to a fair extent, and, because farmers also wanted to widen the scale of their activities and to enjoy a more comfortable life, it was unavoidable that they would show a strong interest in commercial-goods production. But whereas rich farmers profited from commercial-goods production, the vast majority of poor farmers and peasants become more deeply impoverished as a result of their involvement in such production. Squeezed by the merchant intermediaries, who forced them to sell their products cheaply, many were forced to part with their lands.

Rural and urban unrest

Thus, as the commercial economy extended into the farming villages, social divisions arose among the farmers. Tax-paying connections became unstable, and the financial difficulties of the warriors, who existed on the taxes paid by the farmers, were naturally aggravated. Because the level of agricultural technology in the feudal period was generally backward, hundreds of thousands of people starved or left their villages during periodic crop failures and famines, and the abandonment of cultivated land also became conspicuous. The samurai class had long since taken up normal residence in the cities. With the development of the urban way of life, they now suffered from increased expenditures. The bakufu and the domains tried to suppress commercial-goods production, which destroyed the self-sufficient economy of the farmers. But when all such attempts failed, they encouraged such production, seeking to supplement their finances by monopolizing the farmers' commercial goods and selling them themselves. This policy was the monopoly system, a phenomenon that may be termed the merchantization of the feudal lords. Thus, on top of increased taxes, the farmers were deprived of the profits of their commercial goods. Unable to restrain themselves, they violated the strict legal prohibitions with repeated farmer uprisings (*hyakushō* ikki). Meanwhile, the city poor, who were driven to the border line of starvation by the rising price of rice and other commodities, often rioted, plundering and destroying rice shops and pawnshops; these urban riots were called *uchi-kowashi* ("destruction").

The "rice shogun"

Political reform in the bakufu and the domains. Continual political reforms made by the overlords in response to this crisis in the feudal system characterize the latter half of the Tokugawa period. Such reforms began with the eighth shogun, Tokugawa Yoshimune (ruled 1716–45). Yoshimune appointed civilians to official posts in finance and rural administration in order to increase government efficiency. As an emergency policy, he ordered the domain lords to make rice contributions (agemai), which he allotted to the hatamoto to supplement their stipends. More characteristic was his effort to increase tax yields by opening new lands to cultivation and revising the method of taxation. He also sought to bring fresh air into a stuffy, despotic government by such means as setting up complaint boxes, or meyasu-bako, to hear the views of the people and drawing up a part of a legal code, the Kuji-kata O-sadamegaki, which mitigated criminal punishments. He made efforts to control the falling price of rice, earning him the name of "the rice shogun." But when the price of rice rose sharply in a great famine in the 1730s, the common people of Edo attacked the wholesale rice dealers who had cornered the market. This was the first such riot in Edo. Yoshimune's reforms took many twists and turns; but in 1744, the year before his retirement, the receipts of the bakufu both in total land taxes and in tax receipts reached their highest level for the entire Edo period. For this reason Yoshimune was called the "great ruler who restored the bakufu." His success, however, was possibly due to the fact that the disturbances had not yet become very grave, whei-eas the political power of the bakufu was still quite strong.

When Yoshimune's son Ieshige became the ninth shogun, government by the personal attendants of the shogun, which Yoshimune's personal rule had prevented, was revived. Chamberlains, or *soba-ydnin,* who handled communications with the senior councillors, gained strong powers of authority as his spokesmen when they won the Shogun's confidence. One such man was Tanuma Okitsugu, who rose from chamberlain to be senior councillor. Okitsugu delighted in bribery, and he was criticized by an opposition group for corrupting the *bakufu* government. But he was an active reformer who further developed some of Yoshimune's programs. Instead of suppressing the activities of the big-city merchants, Okitsugu used them to promote production; and while advancing the development of the commercial-goods economy, he sought to control it. His ready recognition of the commercial and industrial guilds, or *kabu-nakarna,* seems to have been aimed not so much at gaining contributions (*myōga-kin*) for the treasury as for establishing a controlled commercial-goods circulation, linking the city guilds with the village producers. Okitsugu was criticized by the people for issuing large amounts of debased coinage that caused a rise in prices, but he may have been trying to increase the amount of currency to match the developing commercial-goods circulation.

Okitsugu's progressive political attitude is best revealed in his development of Ezo (present-day Hokkaido) as a precaution against the southward advance of the Russians; he even considered trading with Russia. Various natural disasters occurred in his time, however: a great eruption of Mt. Asama (Asama-yama) in 1783 was followed by a great famine in 1783–87, in which large numbers of people starved to death. In addition, derelict land deserted by its cultivators increased, and the custom of *mabiki,* or infanticide, became common among parents unable to rear their children. Some people became landlords by collecting together the lands of poor farmers; others became powerful merchants. The anti-feudal struggle of the farmers also rose to an unprecedented pitch, until, in 1787, a large-scale riot lasted for three days and threatened to reduce Edo to anarchy. Okitsugu had already been dismissed as senior councillor in the previous year, and Matsudaira Sadanobu, grandson of Yoshimune and the lord of Shirakawa domain (in modern Fukushima Prefecture), was indicated as his successor. But Okitsugu's supporters in the *bakufu* made every effort to prevent Sadanobu's appointment, and for more than six months the political situation remained a complete vacuum. The farmers' riot suddenly changed the situation, however, and Sadanobu was appointed senior councillor.

Natural disasters

Sadanobu is renowned as the director of the Kansei reforms (1789–1801). He rejected Okitsugu's free and easy administration and instituted a policy of retrenchment. He set out to reduce the high prices in the great cities and had a fund established in Edo under the name of *shichibu-tsumikin* (70 percent reserve fund); knowing that land and house rents were high in the shogun's capital because of the heavy *machinyūyō* tax levied on its landlords, he reduced this tax and set aside 70 percent of it as a fund for the relief of the poor. To relieve the hardships of the *bakufu* retainers, he took emergency measures to cancel the debts of the *hatamoto* to the *fudasashi,* the Edo merchants who handled the exchange of their stipends. The farming villages, which were the foundation of the *bakuhan* system, had been devastated in the great famine of the 1780s, so while encouraging the *daikan* (a head official managing the *kuraireichi)* to bring land back into cultivation and to increase the population of the villages, Sadanobu also issued orders that annual rice taxes were to be increased as much as possible.

Sadanobu was a firm admirer of Chu Hsi studies, and he believed that government must be conducted on the basis of Confucian benevolent rule. He established an examination system for promotions among *bakufu* officials and also prohibited all teachings except those of the Chu Hsi school at the Shōheikō, the *bakufu* official college.

Sadanobu's reforms give the impression of an overly severe reaction to Okitsugu's administration; and whereas people at first welcomed them, antipathy gradually increased. Within the *bakufu* also, the O-Ōku, or shogunate domestic quarters, composed of ladies, disliked Sadanobu's reforms and forced him to resign by covert stratagems (the Shogun's favourite mistresses tempted the Shogun to expel him). While Sadanobu was senior councillor, a Russian envoy, Adam Laxman, landed at Nemuro in 1792 and requested trade relations, but the *bakufu* did not give its assent. Sadanobu ordered that plans be drawn up immediately for a coastal defense system centred on Edo Bay (now known as Tokyo Bay), while he himself inspected the coastline of Izu, Sagami, and Bōsō. Because of Sadonobu's resignation (1793), these plans were not carried out; but the *bakufu* councillors of this time were the first to react to the footsteps of the foreign nations advancing on Asia, which now came to be heard through the wall of national seclusion.

In conjunction with the *bakuju* programs, reforms were carried out within the various daimyo domains. A distinctive feature of domain reforms at this time, however, was that they tried to apply stronger regulations and control over the commercial-goods economy of the farmers.

Sadanobu was senior councillor during the reign of Tokugawa Ienari, the 11th shogun. Ienari was restrained by Sadanobu's strict political reforms, but when the latter left the *bakufu* council, the Shogun was able to relax. Even so, Ienari was not completely free while the councillors who had supported Sadanobu's reforms were still alive. During the period 1804–31 these men died one after another, and the *bakufu* government became even more lax than in the time of Okitsugu. Mizuno Tadaakira, a senior councillor in this period, had risen as a personal attendant to Ienari and had business ability. But he welcomed bribery, and the other officials followed his lead, greatly increasing the corruption of the *bakufu.* On the surface, things seemed peaceful, but underneath the stagnation of the feudal system became even more grave. Especially in the farming villages of Kantō, right in the lap of the *bakufu,* homeless ruffians and gamblers continually caused disturbances. The *bakufu* therefore set up an office called the Kantō Torishimari-deyaku (Supervisors of the Kantō District) to strengthen police control of the area, and it ordered the villages of Kantō to form associations to assist this office.

The growth of the northern problem. In the early 1800s foreign relations became a fairly pressing problem, and the situation in Ezo fell into confusion. In 1804 another Russian envoy, N.P. Rezanov, came to Nagasaki to request commercial relations. When the *bakufu* refused this request, his men attacked Etorofu Island. Prior to this, the *bakufu* had relieved the Matsumae domain of eastern Ezo and placed it under its direct control; and in 1807 the *bakufu* also took direct control of both eastern and western Ezo for defensive purposes. In 1808 the English warship "Phaeton" made an incursion on Nagasaki, and three years later the Russian naval lieutenant V.M. Golovnin landed on Kunashiri Island and was arrested by the Japanese. When these incidents were resolved, peace continued for a time in the northern regions, and the *bakufu* relaxed its precautions, returning all Ezo to the Matsumae domain in 1821. In the south, English ships often appeared in Japanese waters after the "Phaeton" incident, and the *bakufu,* in 1825, cancelled the order for the provision of firewood and water (*shinsui-kyūyo-rei*) and promulgated an order for the driving away of foreign ships (*ikokusenuchiharai-rei*). While attempting to preserve the iron law of seclusion to the bitter end, *bakufu* policy had no consistency (to foreign ships it was at times offensive and at times not), and it was utterly powerless when it received the full weight of foreign pressure in about the 1840s.

The Russian attack on Etorofu

New learning and thought. As this weakening of the *bakuhan* system grew more serious, new movements took place in scholarship and culture. In the latter half of the 17th century the Kogaku (Study of Antiquity) school arose; scholars criticized Chu Hsi studies and advocated a return to the original ideals of Confucianism. This view was developed by It6 Jinsai and Ogyū Sorai. Especially in his work *Seidan,* Sorai insisted that the main reason for the financial distress of the warrior class in both the bakufu and the domains was that there was no "system" in things, and that when the warriors left the villages and moved to the cities, they had to buy everything, whereas before they had been able to live self-sufficiently. Various other schools of Confucianism arose, such as Setchū-gaku (Eclectic Studies) and Kōshōgaku (Positivistic Studies). Conflict between the various schools became fierce, and the academic world grew confused. The authority of Chu Hsi studies grew weak, and, at the time of the Kansei reforms the bakufu attempted to reinvigorate them. It issued an order prohibiting all other schools of Confucianism in the college of the *bakufu*, but it had no marked results. At the same time, studies like Confucianism spread remarkably in the provinces, as can be seen from the establishment of domain schools (*hankō*), principally in the later Edo period, for the education of the domain samurai. Thus, learning and culture arose in the domains, accompanied by a growth of scholarship with local colouring. Among such schools, the Kaitoku-db in Osaka was famous as the "townsmen's university." This school was founded by cooperation between Confucian scholars and rich merchants, and both samurai and merchants sat together to hear lectures. It is not surprising that the unique thinker and scholar Yamagata Bantō should have been produced from this rationalized way of study.

New movements also appeared in Shintō, which, with Confucianism and Buddhism, acted as the ideology of popular education. The Confucian scholar Yamazaki Ansai formulated Shintō from the standpoint of Confucianism and proclaimed the Suika form of Shintō. But in the later Tokugawa period popular interest in Shinto grew progressively stronger, centred on the Ise faith. This tendency was spurred on by lectures that explained Shintō in terms easily understood by the common people. Thereafter, Shingaku (Heart Learning) arose, which explained Confucian, Shinto, and Buddhist teachings to the townsmen and farmers. Its founder was Ishida Baigan. Kokugaku (National Learning) was also established against the same social background. Kamo Mabuchi studied the Manyō-shū, the most ancient collection of poetry in Japan, and other ancient writings, urging a return to old ways that had not been defiled by foreign ideas, such as Confucianism and Buddhism. By studying the ancient language of Japan's oldest classic, the *Koji-ki* ("Records of Ancient Matters"), his pupil Moto-ori Norinaga clarified Japan's ancient system of morality, called *kannagara-no-michi* ("way of the gods"). Inheriting Norinaga's explanation of Shinto, called Fukkō Shinto, Hirata Atsutane regarded Japan as the centre of the world; and fiercely upholding the conception of Japan as a divine country (shinkoku), he strongly advocated reverence for the Imperial house. Hirata's thought, along with Mitogaku (school of Mito), provided the ideological foundation for the "Revere the Emperor! Drive out the Barbarians!" (*sonnō-jōi*) movement of the late Tokugawa period.

Western studies

Studies of Euroyean modern science also arose, termed *yōgaku* ("Western learning") or *rangaku* ("Dutch learning"). A great stimulus to the concrete development of Western studies was provided by the publication, in 1774, of the Kaitai *shinsho*, a translation by Sugita Gempaku and others of an anatomical book imported from the Low Countries. Thus, Western studies became progressively more vigorous, centred on medicine. But as the crisis in the feudal system grew more serious, many scholars of Western studies criticized the seclusion policy, making the bakufu nervous. The persecution of Watanabe Kazan, Takano Chōei, and other representative scholars of Western studies in the *bansha-no-goku* incident (1839), which resulted from a conservative plot within the bakufu, seriously undermined Western studies in Japan. Thereafter, as consciousness of the foreign threat grew stronger, Western studies came to place heavy emphasis on the field of military technology.

Other philosophers also appeared who repudiated feudal society. And6 Shōeki, in his *Shizen shin-eidō*, portrayed an ideal society in which all people equally engaged in farming, without social distinctions or exploitations. This shows the extent to which the common people were troubled by the contradiction of feudalism. Even if Shōeki is considered exceptional, other men successively appeared with an anti-feudal world view directly or indirectly influenced by empirical science and Western studies. Miura Baien of Kyushu called his learning Rational Studies (Jōrigaku); it contained a dialectical method of thought. Hiraga Gennai, the son of a foot soldier of the Takamatsu domain, disliked the restricted life of the warrior; he became a masterless samurai (*rōnin*) and thought and acted freely. He advocated that Japan prevent the outflow of gold and silver by promoting domestic production and exchanging these products for foreign goods. Because this view agreed with Tanuma Okitsugu's desire for a production development policy, Hiraga was employed by Okitsugu and sent to Nagasaki. While experimenting with such things as functional dynamos and thermometers, Gennai gave full play to his genius by cultivating sugar and carrots, producing Dutch-style pottery, and surveying and developing mines in various provinces of the country. He also produced masterpieces as a dramatist. An attitude of naïve materialism grew in his thought.

The work of Shiba Kōkan and Yamagata Bantō also appeared at this time. Kōkan is known as the pioneer of etching in Japan; hut he also displayed an evolutionistic attitude, repudiating the feudal status system on the ground that both the emperor and the beggar were similar human beings, thus insisting on human equality. Bantō was chief manager to a rich Osaka merchant and had financial ability. In his work *Yume-no-shirō*, he reconstructed the Japanese history in the age of gods from the world view of natural science. He, too, had a strong feeling for human equality, saying "both in ancient times and at the present, there is no upper or lower among human beings."

Growth of popular knowledge

The common people of the Tokugawa period, by their production and labour, were progressively reared in empirical knowledge, and their self-awareness as human beings became stronger. At the outset of the period only a handful of upper class farmers, such as the shdya or *nanushi*, were literate; by the end of this period, with the exception of the very lowest class, farmers were all at least partly literate. This is also connected with the diffusion of the *terakoya* (temple schools), the educational organs of the common people. But in any case, it reflected the growth in popular knowledge extending over 300 years. This is also shown by the fact that "village conflicts" (*murakata sōdō*) became more fierce in the later part of this period, as the farmers sought to censure the improper acts of village officials and to make the village more democratic. The fact that the leadership in these conflicts was taken by the middle and lower class farmers was a natural phenomenon. In comparison with the present, however, it is undeniable that, in the Tokugawa cities and villages, backward social tendencies were still firmly rooted. The cause of this backwardness may be attributed to the collective abuses brought about by the feudal system, but the role played by such religions as Shintō and Buddhism cannot be overlooked.

Buddhism especially had strong powers of regulation over the lives of the common people. Among the various Buddhist sects in this period, the Jōdo, Jōdo Shin, Zen, and Nichiren made striking advances because their temples were guaranteed in their privileged status by the implementation of the terauke ("temple certificate") system of the bakufu. Besides their previous role in conducting funeral rites and masses, they now had charge of registration and census; thus grafted onto the livelihood of the people, their operation was generally stabilized. The tendency also became strong for the people to seek genze *riyaku—i.e.*, to pray for happiness during their lifetime, such as for commercial prosperity or restoration of health—and not to wait for happiness after their death. In response to this, various ceremonies were conducted and efforts made to swell the financial income of the temples. Among such ceremonies, the most important were *kaichō* and *tomitsuki*. *Kaichō* consisted of allowing the people to worship a Buddhist image that was normally kept concealed and not generally displayed. Gradually this came to be performed by moving the image out to other cities and villages. Tomitsuki was an officially authorized lottery, and in Edo the raffles of the Yanaka Tennō-ji, the Yushima Tenjin, and the Meguro Fudō (better known as the Ryusen-ji) temples were famous. Among the Buddhist priests who profited from the trend of the times, there were some who led loose private lives, providing the Confucian scholars with examples for demanding that Buddhism be stamped out.

Various sorts of popular faiths flourished in the cities and villages. Shugen-do had, as its special characteristic, prayers by itinerant monks (yainabushi) for curing illness or bringing happiness, but in its teachings, while centred on Buddhism, it also contained beliefs drawn from Shintō and elsewhere to meet the religious feelings of the people. A new faith in healing spirits arose from the view that human suffering could be cured only by men who had suffered the same hardships themselves, and in the late Tokugawa period a development took place toward faith in living gods (ikigami) who could respond to the various requests of the common people and who became revered as sect founders (*kyōso*). These included the Kurozumi-kyō sect, founded by Kurozumi Munetada, the Konkō-kyō sect of Kawate Bunjirō, and the Tenri-kyō sect of Nakayama Miki. People like Nakayama Miki reflected the confused social conditions of the late Tokugawa period, and their advocacy of *yo-naoshi*, or relief of the world by social reform, had political undertones. Influenced by the popularity of the cult of Shintō shrines, periodic pilgrimages to Ise, called *okage-mairi* or *nuke-mairi*, became popular. Pilgrimages were also made to Ise by groups of several hundreds of thousands of common people. Among such pilgrims, there were those who had political hopes for *yo-naoshi* in common with the faiths of the sect founders.

Literary styles of the Edo period

The maturity of Edo culture. The early 19th century brought the city culture that had arisen in Edo to full maturity in learning and craftsmanship. This Edo culture was supported by rich townsmen and warriors, and it was also widespread among the townsmen generally. Literary styles took various forms; representative authors are Santō Kyōden in the *sharebon*, or genre novel, Jippensha Ikku in the kokkeibon, or comic novel, and Takizawa Bakin in the yomihon, or regular novel. They examined in detail such things as the townsman's way of life, customs, conceptions of beauty, and ways of thinking. In the world of art, Ukiyo-e came to completion both in form and content and established its position as popular art. Nishiki-e, wood-block printing in many colours, was invented by Suzuki Harunobu and entered its golden age with the prints of sumo wrestlers by Tōshūsai Sharaku and of courtesans by Kitagawa Utamaro. In the last years of the Edo period, the masters of wood-block landscape prints, And6 Hiroshige and Katsushika Hokusai, opened new boundaries and even exerted an influence on foreign art. As a result of links with the city culture, scholarship arose even in local towns and villages, where crafts and products with distinctive local colouring were supported by landlords and merchants. A national culture emerged from these city and local cultures and became the foundation of a modern culture that developed during and after the Meiji period.

But signs of stagnation and corruption also appeared in some aspects of Edo culture—a reflection of the crisis in the *bakuhan* system. The crisis had reached new levels by the third decade of the 19th century. A great famine, lasting several years, dealt a savage blow to the impoverished villages, and farmer uprisings and city riots reached unprecedented peaks. In 1836 an uprising took place in the Gunnai district of Kai Province (Yamanashi Prefecture), then under direct *bakufu* control, and spread westward to the Kuninaka plain across the Sasago pass, by this time numbering more than 50,000 adherents. Dividing into two groups, insurgents attacked the residences of nearly 500 prominent men and for a time reduced the centre of Kai to anarchy. How deeply the bakufu was shocked by this can be seen in the sentencing of 562 persons to crucifixion for their part in the uprising. A year later in the city of Osaka, also under direct *bakufu* control, Oshio Heihachirō, a former city official, raised a revolt to overthrow the officials and rich merchants and to relieve the poor; although the uprising was speedily suppressed, the bakufu was greatly astonished that a former faithful official would lead a revolt. In addition to these domestic disturbances, the European powers began to press more heavily upon Japan. The Opium War (1839–42) arose between the Ch'ing dynasty of neighbouring China and the British, and foreign gains following this war filled the bakufu authorities with a sense of crisis. Tokugawa Nariaki, the lord of the Mito domain, urged the bakufu to make definite political reforms; he called the domestic resistance of the common people the domestic anxiety and the pressure of the foreign nations the foreign anxiety.

Internal and external threats

THE TEMPO REFORM AND THE COLLAPSE OF THE BAKUHAN SYSTEM

Faced by this threatening situation in both domestic and foreign affairs, the chief senior councillor, Mizuno Tadakuni, instituted a reform program; this Temp6 (the name of the year period from 1830 to 1844) reform lasted only from 1841 to 1843, however. Tadakuni set in order the regulations for the government officials and encouraged them to practice frugality and the literary and military arts. He also aimed to restore the farming villages devastated by the great famine. Tadakuni was stricter than earlier reformers in that he planned to force temporary residents in Edo to return to their home villages, and to restrict the commercial-goods production of the farmers to make them produce rice. In order to lower the price of commodities in the cities, he applied detailed regulations to the townsmen. He further ordered that the kabu-nakama, or merchant and artisan guilds, be dissolved because he regarded them as the cause of rising commodity prices. Tadakuni planned to reclaim by military means the Imba swamp (Chiba Prefecture) so that food supplies could be conveyed to Edo from the provinces of Hitachi and Kazusa (Ibaraki and Chiba prefectures) if Edo Bay were blockaded by foreign ships. Plans for the defense of Edo Bay took concrete form and included the seven islands of Izu. Tadakuni also promulgated a land-requisition (*agechi*) order to bring daimyo and hatamoto domains surrounding Edo and Osaka under direct bakufu control; the main object of this was the defense of Edo, but it was also a plan to supplement the finances of the bakufu. The *agechi* order was finally withdrawn, however, in the face of fierce opposition from the daimyo, hatamoto, and people of the domains concerned, and, as a direct result of this failure, Tadakuni was driven from his seat among the senior councillors in 1845. Tadakuni predicted that because of his reforms, the Tokugawa shogunate would keep its government for another 30 years, and it was in fact 30 years after his reforms that the bakufu's downfall took place (1867). In the same Temp6 period, administrative reforms were carried out in many of the domains, and the reforms of the powerful southwestern domains, such as Chōshū and Satsuma, are noteworthy. These reforms adopted the policy of "wealth accumulation and military strength" (*fukoku-kyōhei*); they improved the domain finances, and the resulting surpluses were used to modernize the military armaments of the domains. In the powerful domains of southwestern Japan, middle and lower class samurai came forward as reformers, replacing the previous conservative officials. The way was thus gradually being prepared for the emergence of the leaders of the Meiji Restoration (1868) and of modern Japan.

In 1845, when Abe Masahiro replaced Mizuno Tadakuni as chief senior councillor, various movements appeared that can be called reactions to the Temp6 reform. One of these involved the commissioners for the shogun's capital, with close connections with the Edo merchants, and tried to restore the kabu-nakama guilds. In 1851 an order was finally issued for the revival of the nakama. But the guilds included those (sometimes called *kumiai*) that had arisen since the dissolution of the Temp6 era *kabu-nakama*, and their controlling power over city markets was thus extremely restricted. The confrontation of the city merchants with the village producers and local merchants over monopoly of commercial-goods circulation routes had grown more fierce, and the former had been forced to yield further.

Foreign rivalries in the opening of Japan

Thus, the domestic reaction to the Temp6 reform was comparatively calm, and the major stumbling block facing the bakufu was the foreign problem. The Netherlands, the only European power trading with Japan, saw that if Britain succeeded in forcing Japan to open the country, it would lose its monopoly; so the Dutch now planned to seize the initiative in opening Japan and to thus turn the situation to their own advantage. In 1844 the king of The Netherlands, William II, sent a diplomatic mission urging the bakufu to open the country, but Abe and the bakufu rulers refused this suggestion. Visits by foreign ships, however, increased progressively. In 1844, 1845, and 1846, British and French warships visited the Ryukyu Islands and Nagasaki to request commercial relations. In response, the bakufu, in 1845, established the new office of Kaibo-gakari for coastal defense and various diplomatic posts. The defense system of Edo Bay was also revived, the number of domains on guard duty was increased, and new gun emplacements were built. In 1848 it was decided not to revive the order to drive away foreign ships, which had been rescinded during the Temp6 reform, but that extensive military preparations should be made.

Rumours had long circulated among the various foreign countries that the United States government would send an expeditionary fleet to Japan. In 1846 Comdr. James Biddle of the American East Indian fleet appeared with two warships in Uraga Harbour (Uraga-kō) and held consultations on the question of commercial relations. When refused by the bakufu, he left empty-handed. The United States, however, eagerly desired ports for fuel and provisions for its Pacific merchant and whaling ships and would not give up trying to open Japan. But the bakufu had for so many years kept its place as overlord of the political regime by strictly maintaining the ancestral law of seclusion that it could not muster up the resolution to step forward and open the country. The opening of Japan was thus postponed until the last possible moment as a result of the vacillation of its rulers, and the opening had to be effected unilaterally by foreign pressure, backed by massive naval strength. (K.Ma.)

III. Japan since 1850

THE MEIJI RESTORATION

The term restoration is commonly applied to the political changes that returned power to the throne during the reign of Mutsuhito, who took the reign name Meiji ("enlightened rule," 1868–1912). The slogan return to antiquity (*fukkō*) made it possible to interpret sweeping changes as traditional in motivation. Actually, the Meiji changes constituted a social and political revolution that began before 1868, and political innovations ended only with the promulgation of a constitution in 1889.

Fall of the Tokugawa. The arrival of the foreigners in the 1850s provided a new issue for domestic politics and a new measure for the effectiveness of the feudal administration. When it became clear that the Shogun was unable to protect Japan from the barbarians and that his concessions to them were made in spite of their known repugnance to the Imperial court in Kyōto, the two shogunal boasts of loyalty to and protection for the court proved spurious. The slogan *sonnō-jōi* ("Revere the Emperor! Drive out the Barbarians!") was first raised by men who sought to influence shogunal policy and then taken up by others who wanted to embarrass the Tokugawa. The Shogun's ratification of the Harris Treaty and of others that followed was carried out in the face of strong opposition from the Kydto court, and it brought to the surface antagonisms that had developed during the long years of peace and study. They centred in the Tokugawa house of Mito, which had done much to sponsor Confucian scholarship. The Mito daimyo made vigorous attempts to involve the Kyōto court in affairs of the shogunate with a view to establishing a nationwide program of preparedness. For this he was punished by the head of the Edo council of elders, Ii Naosuke. In 1860 Ii was assassinated by men from Mito and Satsuma, an act that inaugurated years of violence. Many of those who took part were young samurai from Edo; their swords availed little against the foreigners' guns, but they took a heavy toll of political enemies.

Reaction against foreign intervention

Years of extremism followed. The Tokugawa shogunate, anxious to rally support among its feudatories and to help them to prepare their defenses, relaxed its controls and regulations. In many fiefs young enthusiasts tried to push their feudal superiors into a less cautious and more strongly antiforeign position. It soon became obvious to most men that expelling the foreigners by force was impossible. Antiforeign acts provoked stern countermeasures and diplomatic indemnities, which tightened the foreign hold on the country. After the bombardment of Kagoshima and Shimonoseki, there could be no doubt of the foreigners' military superiority. Thereafter, the slogans of antiforeignism and exclusion continued to be used chiefly as a means of obstructing and embarrassing the shogunate. The Edo policy makers were forced to make surface concessions to the antiforeign elements, which aroused the hostility and distrust of the treaty powers. After the arrival of the British minister Sir Harry Parkes in 1865, Great Britain, in particular, began to tire of negotiating with a shogunate that stood between it and the Kyōto court and began to consider ways of dealing directly with the latter. It gradually became clear that ultimate authority lay in Kyōto.

In some fiefs the young extremists found themselves unable to budge their superiors from their conservative positions. From Chōshū (now part of Yamaguchi Prefecture), foreign shipping in the straits of Shimonoseki was shelled in 1863. This drew a foreign bombardment the following year. Samurai opinion grew so vehement that after the fief authorities submitted to Tokugawa discipline in 1864, a swift military coup brought to power, as the daimyo's counsellors, a group of men who had led the radical antiforeign movement. But they were no longer blindly antiforeign; several had secretly travelled to England. Their aims had become national—to overthrow the shogunate and create a new government headed by the Emperor. The same men developed new militia units based on Western training methods and arms. Chōshū became the centre for discontented young samurai from other fiefs who were impatient with their leaders' caution. In 1866 Chōshū allied itself with the great fief of Satsuma in expectation of a Tokugawa attempt to crush all tozama daimyo opponents and erect a centralized despotism with French help.

Anti-Tokugawa alliance

The Tokugawa armies were successfully repulsed at Chōshū in 1866, causing the shogunate to lose power and prestige. The death of Shogun Iemochi in 1866 brought to power as the last shogun Hitotsubashi Keiki (or Yoshinobu), who was aware of the pressing needs for national unity. He spurned suggestions that he seek French help to put down his enemies. When he was urged by a lord of Tosa to resign his powers, he did so rather than risk a full-scale assault by Satsuma and Chōshū, confident that as lord of eastern Japan he would emerge as an important figure in whatever new political organization should develop. But the young Meiji emperor, who had succeeded to the throne in 1867, was guided by several nobles in close touch with leaders of Satsuma and Chōshū, and the last shogun was manoeuvred into a choice between giving up his land, which would risk revolt from his vassals, or appearing disobedient, which would justify punitive measures. Keiki's armies advanced on Kyōto, only to be defeated. Satsuma, Chōshū, and Tosa units, now the Imperial army, advanced on Edo, which was surrendered without a battle; fighting continued to the north until the summer of 1869, but the Tokugawa cause was doomed. In January 1868 the principal lords were summoned to Kybto to learn of the restoration of Imperial rule. The next year the capital was moved to Edo, from this time on Tokyo, and the building of the modern state began.

From feudal to modern state. The Meiji government was dominated by the Satsuma, Chōshū, and court figures who had outmanoeuvred the Shogun. They were convinced that Japan would need a unified national government in order to achieve military and material equality with the Western powers. Most of them, like Kido Kōin and It6 Hirobumi of Chōshū and Saigō Takamori and Okubo Toshimichi of Satsuma, were young samurai of modest rank, but they did not represent in any sense a class interest. Indeed, their measures destroyed that class. In order to gain backing for their policies, they enlisted leaders of fiefs with which they had worked—from Tosa, Saga, Echizen—and maintained their cooperation with such court nobles as Iwakura Tomomi and Sanjō Sanetomi.

Missions to the West

The cooperation of the impressionable young emperor was essential. It was taken for granted that Western strength depended on constitutionalism, which produced national unity; on industrialization, which produced material strength; and on a well-trained military. The new slogan of the day became *fukoku-kyōhei* ("rich country, strong arms"). Knowledge was to be sought in the West, the goodwill of which was essential if the unequal treaties were to be revised. Therefore, a number of missions to the West were organized. In 1871 Iwakura Tomomi led a large number of his fellow government leaders to visit Europe and the United States. The experience gained abroad strengthened convictions already formed as to measures of modernization that would be required.

Abolition of feudalism. The Meiji leaders began with measures to lessen the feudal decentralization on which they blamed much of Japan's weakness. In 1869 the Satsuma, Chōshū, Tosa, and Saga leaders persuaded their daimyo to return their lands to the throne; other lords hastened to follow suit. The court took steps to regularize and make uniform administration in the fiefs, but it appointed the former lords as new governors. In 1871 the governor daimyo were summoned to Tokyo, and feudalism was declared abolished. The approximately 300 fiefs became 72 prefectures and three metropolitan districts; this number was later reduced by one-third. For the most part, the daimyo lost contact with administration, and, although they were rewarded with titles in a new European-style peerage, set up in 1884, their political importance was slight.

It was necessary to end the complex system of social stratification that had existed under feudalism; yet, it was difficult to make arrangements for the samurai, who numbered, with dependents, almost 2,000,000. In 1869 the old hierarchy was replaced with a new and simpler division whereby court nobility and feudal lords were termed aristocracy (kazoku); upper and middle samurai, shizoku; other samurai, *sotsuzoku* (a rank soon abolished); and all others, commoners (heimin), including the previously unlisted pariah groups. The samurai were given pensions equal to a part of their old income. When the regime found these pensions too heavy for its treasury to carry, the pensions were changed to interest-bearing but nonconvertible bonds. During the same years, the samurais' special hairdo was discouraged; the wearing of swords, the former badge of class, was later banned.

Samurai revolts

Many of the bonds were soon squandered, because few warriors had had occasion to develop commercial aptitude, and the inflation that accompanied government expenditures lessened their value greatly. In 1873, moreover, a nationwide conscription was instituted, depriving the samurai of their traditional monopoly of military service. There were a number of samurai revolts, the most serious in the southwest, which had led in the restoration movement and where warriors previously had reason to expect the greatest rewards. Some revolts, as in Chōshū, were expressions of discontent against administrative measures that deprived samurai of their importance, while in Saga the dissidents championed a proposed foreign war to employ samurai.

The last and greatest revolt came in Satsuma (1877), led by the restoration hero Saigō Takamori. The new conscript levies were hard pressed to defeat Saigō, and the government had to enlist former samurai and empty its military academies in order to put down the revolt. But the revolts merely expressed regional discontents and were never coordinated. Even in the case of the Satsuma war, the loyalties of most of the Satsuma men in the central government remained with the Imperial cause.

Fiscal and economic policies. In 1873 land surveys were begun to determine the amount and value of land on the basis of average yield in recent years, and a tax in money of 3 percent of the value was then set as the land tax. Out of the same surveys came certificates of ownership of land for farmers, who were also released from feudal controls. The land measures involved basic changes, and there was widespread confusion and uncertainty among the farmers, frequently expressed by short-lived revolts and demonstrations. The establishment of private ownership, along with measures to promote new technology, fertilizers, and seeds, soon produced a rise in recorded agricultural output. The land tax, supplemented by printed money, was the principal source of the government's income for several decades.

Although hard pressed for money, the government also began a program of industrialization, seen as essential for national strength. Aside from military industries and strategic communications, it was carried out in private hands, although the government set up pilot plants to provide encouragement. Trade and manufacturing benefitted from the new national market and legal security, although unequal treaties made it impossible to protect industries with tariffs until 1911.

Rise of the zaibatsu

In the 1880s fear of excessive inflation resulted in a decision to sell most of the new plants to private investors—usually persons who had close relations with government officials. A small number of individuals came to dominate many enterprises; they were known as the zaibatsu, or financial cliques. With tremendous opportunities and few competitors, the same firms appealed in enterprise after enterprise. Their aims were close to those of the government leaders, and there were often close friendships between them. The House of Mitsui, for instance, had close relations with Meiji leaders, while that of Mitsubishi was founded by a colleague of the restoration leaders.

National loyalties. Equally important for building a modern state was the development of national loyalties. True national unity required the propagation of new loyalties among the masses, previously inarticulate and powerless. The early restoration government, influenced by a Shintō revival, elevated a bureau of Shinto, the state cult, to the highest position in the new political hierarchy and strove to replace Buddhism with a strong cult of the national deities. Christianity was legalized in 1873, with great reluctance, at the urging of the Iwakura mission, and thereafter it seemed important to bolster traditional outlooks without risking foreign condemnation by forcing a state religion upon the Japanese. The education system proved an ideal vehicle for ideological orientation. A system of universal education was announced in 1872. For a time its organization and philosophy were Western inspired; but during the 1880s, as the government leaders saw their countrymen turning to Western ideas and learned of a new nationalist orientation of schooling in Europe, the Japanese system was altered to include emphasis on "ethics," and in 1890 the Imperial Rescript on Education laid out the lines of Confucian and Shintō ideology, which constituted the moral content of later Japanese education. Thus, loyalty to the emperor, who was hedged about with Confucian teaching and Shintō reverence, became the centre of a citizen's ideology. Meanwhile, to avoid charges of indoctrination, the state distinguished between this secular cult and actual religion; in this way, the leaders could permit "religious freedom" while requiring a form of worship as the patriotic duty of all Japanese subjects. This uniform system of mass education was also utilized to project into the nation at large the ideal of samurai loyalty that had been the heritage of the ruling class.

Constitutional movement. It was widely believed that constitutions provided much of the unity that gave Western countries their strength, and Japanese leaders were

Charter oath of 1868

eager to bring themselves abreast of the world in this respect. A government plan (1868) experimented with a two-chamber house, but it proved unworkable because the government leaders preferred to have their own way. The Emperor's charter oath (April 1868), however, committed the government to seek knowledge and wisdom throughout the world, to abandon customs of the past, to allow all subjects to fulfill their proper aspirations, and to allow popular opinion to influence their decisions.

Creation of political parties. To these statements of intent were added protests from below. A democratic movement grew out of a split in the leadership group over government policy. Itagaki Taisuke and other leaders of the Tosa faction combined with members of the Saga fief in 1873. Their demands for a punitive expedition against Korea, the obscurantist government of which had insulted Japanese envoys, had been refused because domestic reforms were to come first, and they resigned their positions. Instead of championing the old order, however, Itagaki and his friends called for a popular assembly so that future decisions would reflect the will of the people (by which they initially meant their fellow samurai) and thus preserve unity. Itagaki and his Tosa followers developed discussion and mutual-help groups and, gradually growing in political confidence and ability, organized themselves on a national basis as the Liberal Party (Jiyū-t6) in 1881. It should be noted that the movement had only a narrow social and regional base at this time and that its purposes were to promote effective national unity rather than tolerance of diversity and dissent.

When the remaining Meiji leaders were asked to submit their opinions on constitutional problems in 1881, Ōkuma Shigenobu, a Saga leader, revealed a relatively liberal draft instead of first submitting it for the scrutiny of his colleagues. He also revealed sensational evidence of corruption in the disposal of government assets on the island of Hokkaido. Ōkuma was forced out of the government and he organized the Progressive Party (Kaishintō) in 1882. Itagaki's Liberal Party had a predominantly rural backing of former samurai and village leaders, many of whom objected to government taxation policies; Ōkuma's party had an urban base and attracted support in the business and journalistic worlds.

Economic distress of the late 19th century

The Meiji contribution. The Emperor promised that a constitution would be instituted in 1889; the parties were urged to await the Imperial decisions quietly. The constitution was prepared behind the scenes by a commission headed by It6 Hirobumi. The period of constitution writing coincided with one of intense economic distress as the government sought to stem the inflation caused by the spending of the 1870s. But deflationary measures caused hardship in the countryside and provided a situation in which party agitation could easily kindle direct action. Several instances of this and severe government repression in the form of police and press controls forced the parties to dissolve temporarily in 1884. Itagaki travelled to Europe and returned more than ever convinced of the need for national unity in the face of Western condescension.

It6 Hirobumi also travelled to Europe for help in preparation of the new constitution. In Germany he found what seemed an appropriate balance of imperial power and constitutional forms that seemed to offer modernity without sacrificing effective control. As a balance to a popularly elected house, It6 first organized a new European-style peerage in 1884. The government leaders, military commanders, and former daimyo were given titles and readied for future seats in a house of peers. A Cabinet system was installed in 1885, and a privy council, designed to judge and safeguard the constitution, was set up in 1888. It6 resigned as premier to head the council.

The constitution was completed by 1889, and elections for the lower house were held to prepare for the initial diet, which met in 1890. The constitution took the form of a gracious grant by the Emperor, and it could be amended only upon Imperial initiative. Its provisions were couched in general terms. Rights and liberties were granted "except as regulated by law." If the diet refused to approve a budget, the previous year's could be followed. The emperor was "sacred and inviolable"; he commanded the armies, made war and peace, and dissolved the lower house at will. Effective power thus lay with the executive, which could claim to represent the Imperial will. The education rescript of 1890 was to guarantee that future generations accept the Imperial will and authority without question. In spite of its antidemocratic features, the constitution provided a much greater area for dissent than had previously existed. The lower house could initiate legislation. Private property was inviolate, and freedoms, even when subject to legislation, were greater than none at all. The budgetary arrangements meant that increased support for the military could be had only with Diet approval. Initially, a tax qualification of 15 yen limited the electorate to about 500,000; this was lowered in 1900 and 1920, and in 1925 universal manhood suffrage came into effect. The government leaders had difficulty controlling and manipulating the lower house, despite their power of dissolution and their resources for intimidation and bribery, thus illustrating that the constitution had altered the political picture. And the party leaders' cooperation with their erstwhile enemies when given a reasonable amount of prestige and patronage showed their large areas of agreement with the Meiji oligarchs.

End of the Restoration

The constitution ended the Meiji Restoration and revolution. The government leaders soon retired behind the scenes to influence the political world as elder statesmen (*genro*) and acted to maintain and conserve the balance of ideological and political institutions they had worked out.

IMPERIAL JAPAN

Foreign affairs. Achieving equality with the Western powers had been one of the major goals since the beginning of the Meiji period. Treaty reform, designed to end the foreigners' judicial and economic privileges provided by extraterritoriality and fixed custom rates, had been attempted as early as the Iwakura mission of 1871; but the Western powers refused to consider it until Japanese legal institutions had been brought into line with those of the West. Japanese attempts at compromise arrangements in the 1880s were denounced by the press and opposition groups in Japan. The treaty provisions for extraterritoriality were formally changed in 1894, after the completion of the Meiji institutional reforms; tariff autonomy came into effect in 1911.

Relations with China. Asian matters took second place to internal problems during most of the Meiji period. In 1874 a punitive expedition was launched against Formosa to chastise the aborigines for murdering Ryukyuan fishermen. This lent support to the Japanese claim to the Ryukyus, which had been under Satsuma influence in Tokugawa times; the islands were incorporated into Japan in 1879 despite Chinese protests. Adventures in Korea, however, although espoused by nationalists and, on occasion, by liberals, were avoided by the government, which was conscious of its need for internal reform and foreign approval. The matter was complicated by a growing Chinese readiness to resist Japanese interference in the affairs of Korea, China's most important tributary state. The Chinese were alert to the danger of Japanese gains. Incidents in 1882 and 1884 that might have led to war with China and Korea were instead settled by compromise. In 1885 China and Japan agreed that neither would send troops to Korea without first informing the other.

Sino-Japanese War (1894–95)

By the early 1890s Chinese influence in Korea was clearly becoming predominant. In 1894 Korea requested Chinese assistance in putting down a rebellion. When the Chinese informed Tokyo of this, Japan quickly rushed troops to Korea and, after the rebellion was crushed, showed no inclination to withdraw. Hostilities between Chinese and Japanese forces broke out first at sea and then in Korea in July–August 1894. The Japanese navy sank or captured much of the northern Chinese fleet, and a peace treaty was negotiated at Shimonoseki between Japan and China on April 17, 1895. Both powers recognized the independence of Korea; China ceded Formosa, the Pescadores Islands, and the Liaotung Peninsula, granted Japan all rights enjoyed by European powers, and made significant new economic concessions; new treaty ports were opened, and Japan received an indemnity of 200,000,000 taels in gold in two installments. A subsidiary treaty of commerce (1896) gave Japan freedom to engage in trade, manufacture, and industry in China's treaty ports and provided for tax exemption within China for all goods so manufactured. Japan thus marked its own emancipation from unequal treaties by imposing even harsher terms on its neighbour. But the European powers were not yet prepared to welcome Japan as a full equal in the imperialist scramble in China. Germany, France, and Russia forced Japan to return the Liaotung Peninsula to China. In 1898 Russia forced China to grant it the lease of that peninsula with its important naval base at Port Arthur. The war thus demonstrated that the Japanese could not maintain Asian military victories without Western sufferance. Nevertheless, the war proved a tremendous source of prestige for Japan and brought the Tokyo government much internal support; it also strengthened the hand of the army in national affairs.

Relations with the West. Instead of accepting Japanese leadership, Korea sought the help of the Russians as a counterweight. During the Boxer Rebellion in China (1900), Japanese troops took a major part in the allied expedition that rescued foreign nationals in Peking, but Russia occupied south Manchuria, thereby strengthening communications with Korea. Realizing the need of protection against a possible combination of European enemies, the Japanese government began talks that led to an Anglo-Japanese Alliance (1902). Each signatory agreed to aid the other in the event of an attack by two or more powers, while remaining neutral if the other was at war with a single power. The Tokyo government was thus prepared to take a firmer line with respect to Russian advances in Manchuria and Korea. In 1904 Japanese ships attacked the Russian fleet at Port Arthur without the formality of a declaration of war. Japanese arms were everywhere successful; the most spectacular victory was in Tsushima Strait, where the ships of Adm. Tog6 Heihachirō destroyed the Russian Baltic fleet. But Japanese armies were strained to their utmost, and it was with relief that Japan accepted the United States president Theodore Roosevelt's offer of good offices for the negotiations that led to peace, signed at Portsmouth, New Hampshire, September 5, 1905. Japanese primacy in Korea was recognized, and Russia surrendered to Japan its economic and political interests in south Manchuria (including the Liaotung Peninsula) as well as the southern half of the island of Sakhalin. The victory over Russia' altered the balance of power in Asia, and Japan's ability to cope with a great European power accelerated the development of nationalist movements in Asia. Within Japan, however, the failure to secure a Russian indemnity to cover the costs of the war made the treaty unpopular.

Russo-Japanese War (1904–05)

Japan as a major military ***power.*** After the conclusion of the war, Japanese leaders now had a free hand to guide the course of reform in Korea, and Korean resistance was met with force. It6 Hirobumi, sent to Korea as resident general, forced through treaties that gave Korea little more than protectorate status and forced the abdication of the Korean king. In 1909 It6 was assassinated, and the following year Korea was formally annexed to Japan. Korean liberties and resistance were crushed under military rule. By the end of the Meiji period, Japan had thus achieved equality with the West and had, in fact, become the strongest military and imperialist power in Asia.

Japan had abundant opportunity to use its new power in the years that followed. World War I found the Western powers fully occupied in Europe. Japan took part in the war in compliance with the Anglo-Japanese Alliance, but generally it limited its participation to the seizure of the German Pacific Islands and the German holdings on the Shantung Peninsula. When China pressed for return of these, the Japanese government presented the so-called Twenty-one Demands in January 1915. China reluctantly agreed to extend the duration of the Manchurian leases and to joint control of steelworks and ironworks in central China. The German Shantung holdings were to be settled by agreement between Japan and Germany at the time of the peace treaty; subsequently, Japan agreed to hand back the territory in return for further commercial privileges. China promised not to alienate harbours in Fukien province to any other power without Japanese approval. But the Chinese resisted group V of the Twenty-one Demands, which would have reduced China to the status of a Japanese ward. Japan had gained abundant opportunity for the exploitation of Manchuria, but the ill feeling aroused by the negotiations, together with Chinese chagrin at failure to recover its losses in the Treaty of Versailles, cost Japan any hope of Chinese friendship. Subsequent Japanese sponsorship of corrupt warlord regimes in Manchuria and North China helped to confirm the anti-Japanese nature of modern Chinese nationalism.

The Twenty-one Demands

Japanese behaviour when the Allies intervened in Siberia in 1918 after the Bolshevik Revolution furthered the impression of Japanese rapacity. One of the principal reasons for a disarmament conference in Washington, D.C. (1922), was an attempt to lessen Japanese influence. A network of treaties was worked out that placed restraints on Japanese ambitions while guaranteeing Japanese security. Japan, Great Britain, the United States, and France concluded a four-power pact that replaced the Anglo-Japanese alliance; a five-power pact (with Italy) for disarmament set limitations for capital ship construction on a ratio of five for Great Britain and the United States to three for Japan. Parallel guarantees against fortifying advanced bases assured Japan of safety in Pacific waters. A nine-power pact would, it was hoped, protect China from further unilateral demands. Japan subsequently agreed to retire from Shantung, and, shortly afterward, Japanese armies withdrew from Siberia and northern Sakhalin. In 1925 a treaty with the Soviet Union extended recognition and ended active hostilities.

The mid-1920s thus saw the end of Japan's great surge forward in the Pacific and brought hope that a new quality of moderation and reasonableness, based on the absence of irritating reminders of inferiority and weakness, might characterize Japanese policy.

Constitutional government. The inauguration of constitutional government in 1890 saw a vigorous and often obstreperous opposition in the lower house of the Diet, and it was probably general determination to prove that parliamentary institutions could work in Japan that forced the party and government leaders to cooperate sufficiently to make the system work. The first Cabinets, led by Yamagata Aritomo, Matsukata Masayoshi, and Itō, attempted to maintain the principle that the government, which in their view represented the emperor, should be aloof from parties and that it was the duty of the lower house to approve government requests. This policy failed because the parties desired to increase their power and patronage and therefore sought Cabinets responsible to the lower house. It was only the Sino-Japanese War that produced the kind of unity the constitution makers had envisaged. In the years that followed, the oligarchs formed alliances with the two parties, usually exchanging a Cabinet seat or two for support in the lower house. These arrangements proved unsatisfactory as party leaders soon raised their sights. In 1898 Itagaki and Ōkuma combined forces to form a single party, the Kenseitō, and, because this ruled out successful administration by a nonparty Cabinet, they were allowed to form a government. But their alliance was of short duration, as long-standing animosities and jealousies enabled antiparty forces among the bureaucracy and oligarchy to force their resignation within a few months.

Lower-house opposition

A discernible division now developed among the dwindling group of Meiji leaders. Yamagata Aritomo dominated the army and much of the bureaucracy. During the two years he held power after the fall of the Kenseitō Cabinet, he strengthened legal and institutional safeguards against political-party rule and secured an Imperial ordinance that service ministers should be career officers on the active list; this gave the army or navy power to break a Cabinet. Partly in reaction, It6 Hirobumi. also of

Chōshū, formed his own political party in 1900, the Rikken Seiyiikai, enlisting most of the former followers of Itagaki. Thereafter, practical political goals of power and patronage softened the hostility between oligarchs and politicians.

After 1901 both It6 and Yamagata retired from active participation in politics; until 1913 Cabinets were led by their protégés Saionji Kimmochi and Katsura Tarō. Basic decisions of politics and policy, however, continued to be made by the core group of elder statesmen, who advised the Emperor on all important decisions and selected prime ministers by rotating power between the two principal factions. Saionji was the last to be recruited into this extraconstitutional body.

Changing political patterns

With the death or enfeeblement of the first generation of leaders, the pattern of political manipulation changed. No subsequent group could match the prestige the Meiji leaders had enjoyed. The Meiji emperor died in 1912 and was succeeded by a son who took the reign name Taishō ("great righteousness," reigned 1912–26); but mental illness prevented him from approximating his father's fame. The growth in prestige and power of businessmen found expression in their control of the political parties and resulted in an increasing role for professional party politicians. The genro's last attempt to seat Katsura in 1912 ended in failure, while his successor, Adm. Yamamoto Gombe, was discredited by scandals in naval procurement. Ōkuma Shigenobu emerged from retirement to head a Cabinet during World War I and was succeeded by a military Cabinet under Gen. Terauchi Masatake. In 1918, however, discontent with Terauchi's reactionary posture and administrative incompetence combined with the rising power of the party professionals to bring about the appointment of Hara Kei (Hara Takashi) as prime minister. Hara was the first nontitled person to hold that office, and his appointment marked the first party Cabinet. His assassination in 1921 cut short his cautious efforts to reduce the power of the military and the bureaucracy and to extend the franchise. After several short-lived Cabinets, a successful party Cabinet was organized in 1924 by Katō Takaaki. The army was reduced in size; moderate social legislation was enacted; and universal manhood suffrage extended the franchise to 14,000,000 voters. Meanwhile, Japan avoided stronger steps in China's civil war and pursued a conciliatory course with Russia, despite demands from nationalists, who utilized alleged outrages in China and a discriminatory United States Immigration Act of 1924 to warn of the futility of appeasing or cooperating with other powers.

Reaction to social movements

But, as the parties grew in power, they tended to look to bureaucrats for leadership. The businessmen who supported the parties and the bureaucrats who led them shared a fear of the social movements that followed industrialization and the importation of foreign ideas. A growing labour movement had already been checked by a special police law introduced in 1900. This was strengthened under Katō in 1925, as conservatives generally began to fear subversion in labour and tenant movements. A small Communist party was organized by a group of intellectuals in 1922, and a general interest in Marxist thought contributed to more fears of subversion. Under the Meiji constitution, party governments had to make their peace with the military, with the house of peers, and with the conservatives close to the throne; whatever ideas for reform they had therefore had to be worked out with the utmost caution. Frequently, the Diet found itself virtually powerless, and this encouraged corruption and disorders in the chamber, which did little to win popular respect for the machinery of representative government. There were no institutional changes that enabled a government to be firmly based on popular support. The Meiji Constitution was so ambiguous in its provisions for the executive that the party prime ministers could achieve little unless they secured, through compromise. the cooperation of forces antagonistic to democratic government.

Social change. Changes in the social and intellectual scene outstripped those in the political. Many of them were related to the development of industry. After the Treaty of Shimonoseki the government utilized the Chinese indemnity to subsidize the Yawata Iron and Steel Works, which were established in 1897 and began production in 1901. Yawata depended on China for its ores. After 1900 Japan's population exceeded the capabilities of domestic food production so that there was need for import of food as well. Growing textile and other consumer-goods industries expanded to meet Japanese needs and to earn credits required for the import of raw materials. Heavy industry was encouraged by government-controlled banks, which provided needed capital. Strategic industries, notably steel and the principal rail trunk lines, were in government hands, but most new growth was in the private sector, albeit somewhat concentrated in the zaibatsu financial and industrial giants.

Social protest

The enlarged urban population produced movements of social inquiry and protest. In 1895 the industrial labour force numbered about 400,000. Several efforts to organize socialist movements speedily met with police repression. Peace preservation laws were passed in 1900 and 1925, and in 1928 it became a capital crime to agitate against private property or Japanese state policy (*kokutai*). In 1903 a small group organized the *Heimin shimbun* ("Commoner's Newspaper"); it published *The Communist Manifesto* and opposed the Russo-Japanese War in the name of the workers of Russia and Japan before being forced to cease publication. The labour and Socialist movements gained strength after World War I, but leadership was usually theoretical and doctrinaire, with little real contact with the workers. Police repression and the difficulties of organizing a labour force of diverse industrial empires such as those of Mitsui and Mitsubishi also retarded the labour movement. Meanwhile, the increasing confidence and power of management came to influence and at times control the political parties. The Katō Cabinet of 1924–26 was sometimes referred to as a Mitsubishi Cabinet.

In the countryside the principal reflection of the new trade patterns was an additional impetus to silkworm production to augment the farmers' income. Farm villages also provided the bulk of the labourers for the new industries, and farm daughters were found in many textile plants. The early 20th century was not a time of agricultural prosperity. Farmers were handicapped by growing fragmentation of holdings and increasing tenantry. The rising number of tenants resulted in the growth of tenant organizations, especially during and after World War I. Government efforts to encourage voluntary reform brought only a law for mediation of disputes in 1924. But a financial panic in 1927 aggravated rural conditions and indebtedness even before the collapse of the U.S. silk market in 1929 spelled disaster for the farmers and workers alike.

The most lasting social changes were found in the great metropolitan centres, where a growing labour force and new middle-income groups were concentrated. The Tokyo–Yokohama area was devastated by the great Kantō earthquake in 1923, and its reconstruction as a modern metropolis symbolized the growth and orientation of the urban society. The currents of enthusiasm during and after World War I were uniformly international and largely U.S. in inspiration. Western music, dancing, and sports became popular, and rising standards of living and expectation produced the need for more and better higher education. The participation of women in office work in the new enterprises and the rise of a feminist movement, however unsuccessful, marked the beginning of changes in the family system.

The educated class grew in numbers and in vigour. Currents of thought included Western-style democracy and the new radicalism of the Soviet Union; the Marxist influence went far beyond the ranks of the struggling Communist Party—which was, in any event, soon crushed by the police. Political liberalism was championed by the University of Tokyo figure Yoshino Sakuzii, who formed student and intellectual groups the title of which—shinjinkai (New Peoples Association)—symbolized the self-conscious break with tradition. Minobe Tatsukichi, a distinguished constitutional theorist, introduced the idea that the emperor was an organ of the state and not the sole source of sovereignty. Such men faced sharp criticism and had, in time, to resign their positions, but they had great influence and symbolized and stimulated advanced currents of thinking.

Attempts to break with tradition

The base for these new currents was precarious. Politically and institutionally, no advances—beyond the universal manhood suffrage of 1925—were scored, while, under the peace-preservation laws of 1928, a special police corps was established to seek out "dangerous thoughts." Economically, the urban classes were dependent upon the continuance of the favourable trade patterns of the 1920s. When the Great Depression at the end of the decade wrecked Japan's foreign markets and removed the possibility of the villagers' augmenting rice income with that of silk and when the irresponsibility and occasional corruption of Diet representatives contrasted with poverty elsewhere in Japanese society, many were prepared to listen to charges that the political-party government, dominated by selfish zaibatsu interests, had neglected Japan's markets in China, imperilled morality and decency at home, and allowed subversive trends to flourish, while the politicians reaped personal gains.

The rise of the militarists. The notion that expansion through military conquest would solve Japan's economic problems gained currency during the Great Depression of 1929. A key argument advanced to support it was that Japan's population had grown from 30,000,000 at the time of the Meiji Restoration to almost 65,000,000 in 1930; each year the problem grew worse, and the imports of needed foodstuffs increased. It was also argued that emigration to many areas was cut off because of discrimination against Oriental peoples. Efforts made by Japan and China to secure a racial-equality clause in the League of Nations covenant had been frustrated by Western statesmen who feared the anger of their constituents. So the argument ran that no recourse could be expected without resort to force.

Military distrust of party government

To these economic and racial arguments was added the military's distrust of party government. The Washington conference had allowed a smaller ratio of naval strength than the navy had desired, and the government of Prime Minister Hamaguchi Osachi in 1930 accepted and gained approval of the London Naval Conference limitations of cruiser strength over military objections. The Katō government had cut the army strength. Many service leaders had also bridled under Japan's moderation during the Chinese Kuomintang northern expedition in 1926 and 1927, and they would have preferred a much stronger stand. The Seiytikai Cabinet under Prime Minister Tanaka Giichi reversed that policy by intervening in Shantung in 1927 and 1928. Tanaka was forced out in 1929 and replaced by Hamaguchi, under whom the policy of moderation returned. It seemed to many that such vacillation earned Japan ill will and expensive boycotts in China without gaining any advantage.

Anti-government thought. Many military leaders resented the restrictions that civilian governments had placed upon them, and their power was considerable. It would be wrong to attribute such views to all or even most of the high command, but enough army officers in particular held this position to furnish a possible focus for dissatisfaction among other groups in Japanese society. The idea of the frugal, selfless samurai was peculiarly useful as a contrast to the stock characterization of the selfish party politician.

These economic pressures and political misgivings were exploited by civilian ultranationalists who opposed parliamentary government as "un-Japanese." Since Meiji times a number of rightist organizations had formed, dedicated to the theme of internal "purity" and external expansion. They sought to preserve what they thought unique in the Japanese spirit and fought against excessive Western influences. Some originated in the Meiji period, when nationalists had felt obliged to work for a "fundamental settlement" of differences with Russia; the Kokuryūkai (Black Dragon or, more accurately, Amur Society) was one such, while others, such as the Seisantō (Productivity Society), were keyed to labour and social problems. The Kokusūikai, or National Purity Society, worked to preserve national purity, while the Ketsumeidan, or League of Blood, was terrorist. Their leaders were against political parties, big business, acculturation, and Westernization, and, by allying with other rightists, they alternately terrorized and intimidated their presumed opponents. A number of business leaders and political figures lost their lives, and the assassins' success in publicizing and dramatizing the virtues they claimed to embody had a considerable importance in the ethos of the troubled 1930s. It is clear, however, that the terrorists never had as much influence as they claimed or as the West believed.

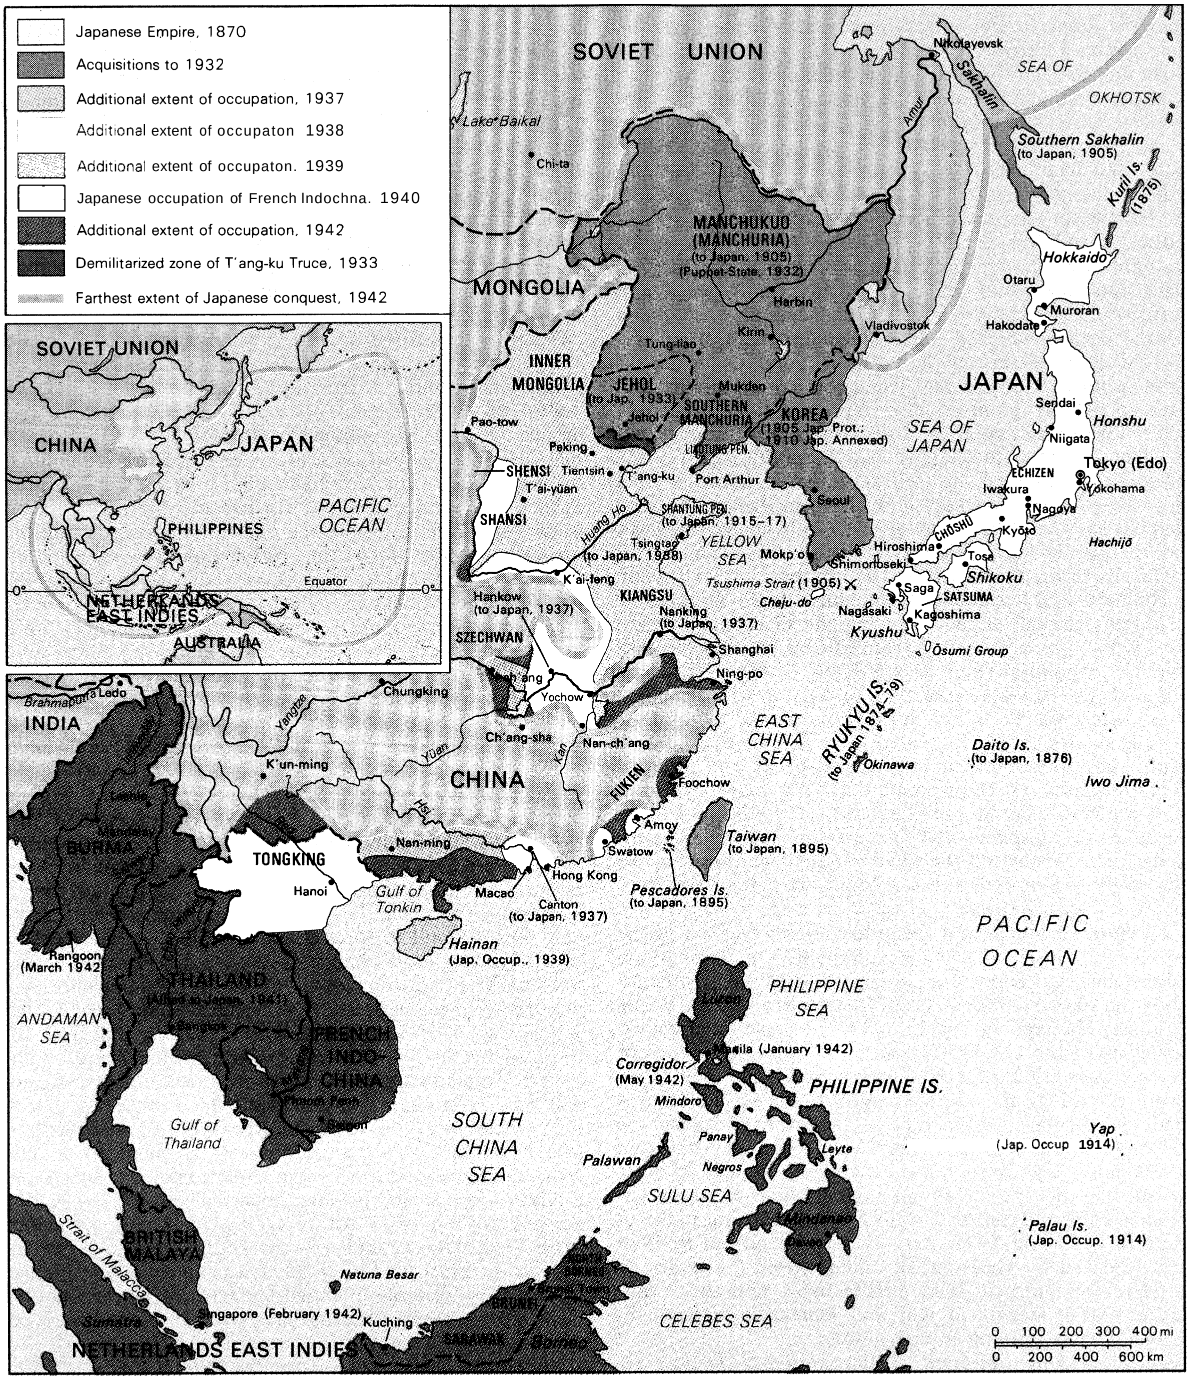
The principal force against parliamentary government was provided by junior military officers. Largely from rural backgrounds, distrustful of their senior leaders, ignorant of political economy, and contemptuous of the urban luxuries of politicians, the officers were ready marks for rightist theorists. Many of them were animated by goals that were national-socialist in character. Kita Tkki, a former Socialist and former member of the Kokuryiikai, wrote in his outline plan for the reconstruction of Japan that the Meiji Constitution should be set aside in favour of a revolutionary regime advised by "national patriots" and headed initially by a military government, which should nationalize major forms of property, limit wealth, end party-government and peerage systems, and prepare to grasp the leadership of a revolutionary Asia. Kita helped persuade a number of young officers to take part in the violence of the 1930s, and in large measure their plots were designed to create a disorder so great that military government would follow.

Aggression in Manchuria

Anti-government acts. The Kwantung Army, which invested the Kwantung (Liaotung) Peninsula and patrolled the South Manchurian Railway zone, provided a rich harvest of officers keenly aware of Japan's continental interests and prepared to take steps to further them. They hoped to place the civilian government in an untenable position and to force its hand. The Tokyo terrorists similarly sought to change foreign as well as domestic policies. The pattern of direct action in Manchuria began with the murder in 1928 of Marshal Chang Tso-lin, the warlord ruler of Manchuria. The action, though not authorized by the Tanaka government, helped bring about its fall. Tanaka's Cabinet, however, dared not investigate and punish those responsible, and this convinced extremist officers that their lofty motives would make retribution impossible. The succeeding government of Prime Minister Hamaguchi showed intentions of restraining military activists and powers, however, and the next plots centred around plans for replacing civilian government altogether; Harnaguchi was mortally wounded by an assassin in 1930. In March 1931 a coup involving highly placed army generals planned to terrorize civilian politicians into a grant of martial law, was abandoned because of disagreement among the principals.

Terrorism and revolts

On September 18, 1931, came the Manchurian incident, which launched aggression in East Asia. A Kwantung Army charge that Chinese soldiers had tried to bomb a South Manchurian Railway train (which arrived at its destination safely) resulted in speedy and unauthorized capture of Mukden, followed by the occupation of all Manchuria. The civilian government in Tokyo could not stop the army, and even army headquarters was not always in full control of the field commanders. Prime Minister Wakatsuki Reijirō gave way, in December 1931, to Inukai Tsuyoshi. Inukai's plans to stop the armies by Imperial intervention were frustrated. In 1932 naval officers took the lead in extremism; a terrorist attack in Tokyo in May took the life of Inukai; the terrorists failed to secure a proclamation of martial law. The army, however, now announced that it would accept no party Cabinet. To forestall its desires for power, the last genro, Saionji, suggested retired Adm. Saitō Makoto as prime minister. Plotting continued, culminating in a revolt of a regiment about to leave for Manchuria. In February 1936 several outstanding statesmen (including Saitō) were murdered; Prime Minister Okada Keisuke escaped when the assassins mistakenly shot his brother-in-law. For sev-



Japanese expansion in the late 19th and 20th centuries.

eral days the rebel unit held much of downtown Tokyo. When the revolt was put down on February 29, the ringleaders were quickly arrested and executed. Therewith, the influence of the young extremists, often referred to as the Imperial Way faction (Kōdō-ha), gave way before that of the more cautious Control faction (Tōsei-ha), which had less sweeping plans for internal reform but shared many of the foreign-policy goals of the young fanatics.

The only possible source of prestige sufficient to thwart the military lay with the throne. The senior statesmen, however, were cautious lest they imperil the Imperial institution itself. The young emperor Hirohito had succeeded to the rule in 1926, taking as his reign title Shōwa. His outlook was more progressive than that of his predecessors; he had travelled in the West, and his interests lay in marine biology (of which the ultranationalists disapproved in one whose role it was to embody the Japanese mystique). The palace advisers feared that a strong stand by the Emperor would only widen the search for victims and might lead to dethronement of the monarch. As international criticism of Japan's aggression grew, many Japanese rallied to the support of their soldiers.

The road to World War II. Each advance by the military extremists gained them a new compromise concession by more moderate elements in the government and brought greater foreign hostility and distrust. Rather than attempt to thwart the military, the government agreed to reconstitute Manchuria as the "independent" state of Manchukuo. The last Manchu emperor of China, Hsiian-t'ung, was first declared regent and then enthroned as emperor in 1934. Actual control lay with the Kwantung Army, however; all key positions were held by Japanese, with surface authority for cooperative Chinese and Manchus. A League of Nations committee recommended in October 1932 that Japanese troops be withdrawn, Chinese sovereignty in Manchuria recognized, and a large measure of autonomy granted to Manchuria. The League called upon member states to withhold recognition from the new puppet state. In March 1933 Japan

Creation of Manchukuo

formally withdrew from the world body. Thereafter, Japan poured technicians and capital into Manchukuo, exploiting its rich resources to establish the base for the heavy-industry complex that was to undergird the new order in East Asia.

Consolidation and expansion. In north China, boundary areas were consolidated in order to enlarge Japan's economic sphere. In early 1932 the Japanese navy precipitated an incident at Shanghai in order to end a boycott of Japanese goods there; but Japan was not yet prepared to challenge other powers for control of central China, and a League of Nations commission arranged terms for a withdrawal in May 1932. Frustrated naval officers returned to Tokyo to carry out the violence that killed Inukai on May 15. A move southward from Manchuria into Jehol in January 1933 led to the T'ang-ku Truce in May, whereby a demilitarized zone was set up between Peking and the Great Wall. This brought the fighting to a temporary close. In 1934, Japan made it clear that it would brook no interference in its China policy and that Chinese attempts to procure technical or military 'assistance elsewhere would bring Japanese opposition.

Further external ambitions, however, had to wait for the resolution of domestic crises. The military revolt in Tokyo in February 1936 marked the high point of the extremist faction and the consolidation of power by the Control faction within the army. Finance minister Takahashi Korekiyo, whose policies had brought Japan out of its depression slump, was killed, and his opposition to further inflationary spending was thus stilled. When further efforts by the palace advisers to defer full power for the military failed, the leadership went to the popular but ineffective Konoe Fumimaro, scion of an ancient court family (June 1937). The same period saw the kidnapping of Chiang Kai-shek by Chinese border armies at Sian in December 1936 and his agreement to consolidate Nationalist and Communist efforts into an anti-Japanese front. To this was added evidence that the Japanese people were not yet prepared to renounce their parliamentary system. In the spring of 1937, general elections showed a startling strength for a new Social Mass Party, which received 36 seats out of 466, and a heavy majority for the two parties (the Seiyūkai and its rival the Minseitō), which had combined forces against the government and its policies. The time seemed ready for new efforts by civilian leaders, but the field armies anticipated them.

The "China incident"

In July 1937 Japanese troops opened fire on Chinese units near Peking; thus began the "China incident." Japanese armies took Nanking, Hankow, and Canton despite vigorous Chinese resistance; to the north, Inner Mongolia and the provinces of Shansi and Shensi were invaded but not fully invested. On discovering that the Nationalist government, which had retired to Chungking in Szechwan, refused to compromise, the Japanese installed a more cooperative regime at Nanking in 1940.

Alliances. Meanwhile, Japan had signed the Anti-Comintern Pact with Germany in November 1936 and later with Italy. This was replaced by the tripartite pact in September 1940, by which Japan was recognized as the leader of a new order for Asia, and the three signatories agreed to assist each other if any one was attacked by a power not then at war. This was directed against the United States, since the Soviets and Nazis were then allied; the Soviet Union was, indeed, invited to join in the tripartite pact later in 1940.

Japanese relations with the Soviet Union were considerably less cordial than those with Germany. The Soviets consented, however, to sell their Chinese Eastern Railway holdings to the South Manchurian Railway in 1935, thereby strengthening Manchukuo. In 1937 the Soviet Union signed a nonaggression pact with China, and in 1938 and 1939 Russian and Japanese armies tested each other in two full-scale battles along the border of Manchukuo. The Soviet–Nazi pact of August 1939, however, was followed by a neutrality pact between the Soviet Union and Japan in April 1941.

The German–Japanese tie was never a close or effective one. Both parties were limited in their cooperation by distance, distrust, and claims of racial superiority. The Japanese were uninformed about Nazi plans for attacking the Soviet Union, and the Germans were not told of Japan's plans to attack Pearl Harbor. Nor, despite formal statements of rapport, did Japan's state structure approach the totalitarianism of the Nazis. A national-mobilization law (1938) gave the Konoe government sweeping economic and political powers, and in 1940, under the second Konoe Cabinet, the Imperial Rule Assistance Association was established to merge the political parties into one central organization; yet, the institutional structure of the Meiji Constitution was never altered, and the wartime governments never achieved full control over interservice competition. The Imperial Rule Assistance Association never succeeded in mobilizing all segments of national life around a leader. The emperor remained but a symbol, albeit an increasingly military one, and no *Fuhrer* could compete without endangering the national polity. Wartime social and economic thought retained important vestiges of an agrarianism and familism that were in essence premodern rather than totalitarian.

Relations with the democratic powers

War in Europe. Japan's relations with the democratic powers deteriorated steadily. The United States and Great Britain did what they could to assist the Chinese Nationalist cause. The Burma Road permitted the transport of minimal supplies to Nationalist forces. Constant Japanese efforts to close this route were successful briefly in 1940, when the British felt they could not risk a second war. But anti-Japanese feeling had strengthened in the United States, especially after the sinking of a U.S. gunboat, the "Panay," in the Yangtze River in 1937. In 1939 U.S. secretary of state Cordell Hull denounced the 1911 treaty of commerce with Japan, and thus embargoes became possible in 1940. Franklin D. Roosevelt's efforts to rally public opinion against aggressors included efforts to stop Japan, but, even after the outbreak of war in Europe in 1939, public opinion in the United States was averse to courting war by stronger measures.

The European war presented the Japanese with tempting opportunities. After the Nazi attack on Russia (1941), the Japanese were torn between German urgings to join the war against the Soviets and their natural inclination to seek richer prizes from the colonial powers to the south. In 1940 Japan had occupied northern Indochina in an attempt to block access to supplies of the Chinese Nationalists, and in July 1941 it announced a joint protectorate with Vichy France over the whole colony. The way was prepared for further moves in Southeast Asia.

The United States reacted to the occupation of Indochina by freezing Japanese assets and declaring an embargo on oil to Japan. The government was faced with the alternatives of withdrawing from at least Indochina and possibly China or seizing the sources of oil production in the Netherlands East Indies. Negotiations with Washington were carried on under the second Konoe Cabinet. Konoe was willing to withdraw from Indochina, and he sought a personal meeting with Roosevelt, hopeful of some U.S. concessions or favour with which he might convince his military leaders. But the U.S. State Department refused to agree to a meeting without prior Japanese concessions. Pressed by his war minister, Gen. Tōjō Hideki, Konoe resigned in October 1941 to be succeeded by Tōjō. Secretary of State Hull refused to agree to Japan's "final offer": Japan would withdraw from Indochina after China had come to terms in return for U.S. promises to resume oil shipments, cease aid to China, and unfreeze Japanese assets. With Japan's decision for war made, the negotiators received instructions to continue to negotiate. Preparations for the opening strike against the U.S. fleet at Pearl Harbor were already in motion. The Japanese military elected to try to establish, through a "new order in East Asia," a co-prosperity sphere in which Japan, as the centre of an industrial bloc comprising Manchuria, Korea, and North China, would draw from the rich colonies of Southeast Asia the raw materials it needed, while inspiring them to friendship and alliance by destruction of their previous masters. But, in practice, "East Asia for the Asiatics," Japan's slogan, turned out to mean "East Asia for Japan."

Preparations for war

World War II and defeat. The attack on Pearl Harbor (December 7, 1941) achieved complete surprise and success. It also unified U.S. opinion and determination to see the war through to a successful finish. The Japanese had expected that, once they fortified their new holdings, a reconquest would be so expensive in lives and treasure that it would discourage the "soft" democracies. Instead, the U.S. fleet was rebuilt with astonishing speed, and the chain of defenses was breached before these riches could be effectively tapped by Japan.

Early successes

The first years of the war brought Japan great success. Japanese troops occupied Manila in January 1942, although Corregidor held out until May; Singapore fell in February, the Netherlands Indies and Rangoon in early March. The Allies had difficulty maintaining communication lines to Australia, and the loss of the British battleships "Repulse" and "Prince of Wales," added to the U.S. Pacific fleet disaster, seemed to promise the Japanese Navy freedom of action. Tōjō grew in confidence and popularity and began to style himself somewhat in the manner of a Fascist leader. But the U.S. Navy had not been permanently driven from the South Pacific. The Battle of Midway in June 1942 cost the Japanese fleet aircraft carrier strength it could ill afford to lose, and the battle for Guadalcanal in the Solomons ended with Japanese withdrawal in February 1943.

After Midway, Japanese naval leaders came secretly to the conclusion that Japan's outlook for victory was poor. When the fall of Saipan in July 1944 brought U.S. bombers within range of Tokyo, the Tōjō Cabinet was replaced by that of Koiso Kuniaki. Koiso formed a supreme war direction council designed as a link between the Cabinet and the high command. It was becoming evident that Japan was losing the war, but no group had a program acceptable to the military leaders. There were also grave problems about breaking the news to the Japanese people, who had been told only of victories. Great fire-bombing raids in 1945 brought destruction to every major city except the old capital of Kyoto; but the generals were still determined to continue the war, confident that a major victory or a protracted battle would be the best way of gaining honourable terms. The Allied talk of unconditional surrender provided a good excuse for continuing the fight.

In February 1945 the Emperor met with a group of senior statesmen to discuss steps that might be taken. When U.S. landings were made on Okinawa in April, the Koiso government fell. The problem of the new premier, Adm. Suzuki Kantarb, was not whether to end the war but how best to do so. The first plan advanced was to ask the Soviet Union, with which Japan was still at peace, to intercede with the Allies. The Soviet government, however, was planning to enter the Pacific war, and reply was delayed while Soviet leaders took part in the Potsdam Conference in July. The Potsdam Declaration of July 26 offered the first ray of light with its statement that Japan would not be "enslaved as a race nor destroyed as a nation."

The atomic bombs

On August 6 and 9 the atomic bombs took their toll of life in Hiroshima and Nagasaki. On August 8 the Soviet Union declared war and on the 9th marched into Manchuria, where the Kwantung Army could offer only slight resistance. The Japanese government attempted to gain as its sole condition for surrender a qualification concerning the maintenance of the Imperial institution; after the Allies agreed to respect the will of the Japanese people, the Emperor insisted on surrender. The Pacific war came to an end on August 14. The formal surrender was signed on September 2 in Tokyo Bay aboard the USS "Missouri."

Military extremists made an unsuccessful attempt to prevent the radio broadcast of the Emperor's announcement to the nation. There were a number of suicides among the military officers and nationalists who felt themselves dishonoured, but the Emperor's prestige and personal will, once expressed, sufficed to bring an orderly transition. To increase the appearance of direct rule, the Suzuki Cabinet was replaced by that of Prince Higashikuni Naruhiko.

Investigators concluded that neither atomic bomb nor Soviet entry was central to the decision to surrender, although they probably helped to advance the date. It was decided that submarine blockade of the Japanese islands had brought economic defeat by preventing exploitation of Japan's new colonies, sinking merchant tonnage, and convincing Japanese leaders of the hopelessness of the war. Bombing brought the consciousness of defeat to the people. Destruction of the Japanese Navy and Air Force jeopardized the home islands. Japan's largest armies, however, were never defeated, and this was responsible for the army's eagerness to fight on. Occupation found Japan's cities destroyed, its stockpiles exhausted, and its plants gutted. The government stood without prestige or respect. An alarming shortage of food and rising inflation threatened what remained of national strength. The time was ripe for changes.

AFTER WORLD WAR II

SCAP and its objectives. Gen. Douglas MacArthur, Supreme Commander, Allied Powers (SCAP), received his orders for the occupation of Japan through U.S. military channels; a Far Eastern Commission made up of Pacific war Allies was to make policy in Washington and provide consultation through an Allied Council for Japan, which sat in Tokyo. In fact the occupation became an American affair, and SCAP grew into a large headquarters, SCAP worked through the Japanese government. In the early years it provided direct instructions frequently, but with time suggestions were made more discreetly.

Purposes of the occupation

Occupation purposes had been held out in general terms in the Potsdam Declaration, with its promises of freedoms and statements of intent to remove undemocratic tendencies; those purposes were defined more precisely in a document that was worked out by the U.S. departments of state, war, and navy. Its emphases were on demilitarization, so that Japan would not again become a danger to peace; on democracy, so that (although the U.S. was not to impose any particular form of government) a responsible Japanese government would guard individual rights; and on encouragement of the Japanese to develop an economy that would be adequate for peacetime needs.

MacArthur responded enthusiastically to the idea of a demilitarized and democratic Japan and utilized the complex pattern of authority under which he functioned to ward off interference from Washington or from the Allies. He rushed constitutional reform to anticipate outside suggestions and first ignored and then delayed moves for partial Japanese rearmament after the Cold War changed U.S. priorities. The occupation measures created an open historical situation in which new forces could and did rise; SCAP measures proved lasting in cases where they coincided with trends already present within Japanese society, and those measures were vital to Japan's recovery as a free society and economy.

The early months of the occupation saw SCAP move swiftly to remove the principal supports of the militarist state. The armed forces were demobilized; State Shinto was disestablished; nationalist organizations were abolished and their members removed from important posts. Also removed from active roles were all persons prominent in wartime organizations and politics, including commissioned officers of the armed services and all high executives of the principal industrial firms. In Tokyo an international tribunal tried General Tōjō and other war leaders, sentencing seven to death, 16 to life imprisonment, and two to shorter terms. Millions of Japanese were repatriated from the former colonies and from Southeast Asia. The Home Ministry, which had controlled wartime Japan through its appointive governors and national police, was abolished, and the Education Ministry was deprived of its sweeping powers to control compulsory education. Because central control and military influence were being attacked by a military government that needed centralized powers in order to be effective, the occupation's role was often contradictory. Geography and economic rationality reinforced the logic of centralization, and many of the moves toward decentralization were modified or reversed a half decade later.

Political reform. SCAP informed leading Japanese citizens that constitutional reform should receive first attention. Between October 1945 and February 1946 a Cabinet committee headed by Matsumoto Jōji prepared revisions of the Meiji Constitution, but the changes were few and superficial. MacArthur's government section rushed a new draft and submitted it to the Japanese government as a basis for further deliberations. Despite the misgivings of conservative statesmen, it was approved by the Emperor and submitted for amendment to the first postwar Diet, which had been elected in April 1946 (in these elections women had voted for the first time). The constitution, slightly modified, was promulgated on November 3, 1946, and went into effect on May 3, 1947. Its preface stated the intention of the Japanese people to ensure peaceful cooperation with all nations and the blessings of liberty for themselves and their descendants. The constitution included a 31-article bill of rights, and Article 9 renounced war as a "sovereign right of the nation" and pledged that "land, sea, and air forces, as well as other war potential, will never be maintained." The Emperor was described as the "symbol of the state and of the unity of the people, deriving his position from the will of the people with whom resides sovereign power." Earlier, on January 1, 1946, the Emperor had renounced claim to divinity. The constitution provided for a bicameral Diet, with the greatest power for a House of Representatives, the members serving four-year terms. The old peerage was dissolved and the House of Peers replaced by a House of Councillors, the members serving six-year terms. The prime minister was to be chosen by the Diet from its members, and an independent judiciary had the right of judicial review.

New constitution

The new constitution thus reversed the Meiji pattern and contributed to responsible government by specifying the locus of executive authority. Despite its hasty preparation and foreign inspiration, it gained wide public support. Although the ruling conservatives desired to revise it after Japan regained its sovereignty in 1952, and an official commission favoured changes in 1964, the decreasing likelihood of mobilizing the two-thirds majority of the Diet necessary to secure approval for changes gradually made the possibility moot. By then, Article 9, with its renunciation of war, had in any case been partially evaded with the ruling that self-defense (hence self-defense forces) was an inherent right.

By a peace treaty that went into effect in 1952, moreover, elements of the political pattern had already changed, and subsequent governments showed their ability to modify by administrative actions a constitution that remained unchanged. Decentralization in some fields had proved expensive and inefficient. The police, for instance, while less centralized than in the days of the Home Ministry, had returned to substantially national organization. Despite the announced goals of local decentralization, changing patterns of communications and administration had shown the logic of incorporating many small units of administration into larger units, a trend particularly marked in the countryside, where villages and towns merged to form a more rational tax structure. Article 9 had been compromised by a decision taken by SCAP to form the National Police Reserve of 75,000 men in 1950, during the Korean War. The force, later (1954) renamed the Self-Defense Forces, came to number 240,000 in the late 1970s.

Nevertheless, the basic principles of the constitution of 1947 enjoyed support among all factions in Japanese politics. Executive leadership was a chief asset of the new institutions. With the abolition of the competing forces that beset the premiers of the 1930s, the postwar prime ministers found themselves in charge of the administration and, with rearmament, of the armed forces as well. Thus, responsible leadership gradually replaced the ambiguous claims of Imperial rule of earlier days.

Economic and social changes. SCAP'S political democratization was reinforced by economic and social changes that were designed to create interest groups prepared to use their new rights to safeguard and protect the new political and economic structure. Changes in the countryside, in industry, and in social legislation all had the same purpose of breaking or weakening the old pattern of hierarchic control that had distinguished the "family-state" ideal of the Meiji leaders.

Agriculture. In agriculture the occupation established a program of land reform to convert tenants into owners. Tenancy had risen after World War I, and only ineffectual measures had been taken against it by the prewar Japanese government, perhaps partly because the political parties were based largely on a rural electorate dominated by landowners. Japan's wartime governments, however, made important changes in land relationships. In their attempts to achieve national unity and equal sacrifice, they had created agricultural associations to collect all rice. Absentee landlords had received a lower rate of payment, and the tenant's relations with his landlord had become much less important. Moreover, peasant sons in the armed services had been able to send home part of their pay, while the shortage of labour had made it possible for many members of farm families to secure gainful employment in factories. Thus, important preliminaries in rural well-being, not least among them the opportunities of the black market, had taken place prior to SCAP's instructions to the Japanese government to prepare a land-reform plan.

SCAP land reform

The government plan proved inadequate in the opinion of occupation authorities, and in the spring of 1946 a SCAP plan was drawn up; it became law in October. By its terms village and prefectural land commissions were elected with tenant, owner-farmer, and landlord representation to select land for purchase and eligible purchasers from among tenants. The government then bought the land at pre-inflation prices and sold it to the tenant. Four years later, the reform had changed the ownership of more than two-thirds of Japan's cultivated acreage, and advantageous tax and price arrangements had enabled the majority of the new owners to pay for their land. The average family holding remained about 2% acres (one hectare), and, in view of the larger population and the change in laws covering primogeniture, there was an increase of the fragmentation of land. Nevertheless, the reform helped produce a striking rise in rural prosperity.

Business. Although initial Allied plans contemplated exacting heavy reparations from Japan, the unsettled state of other Asian countries that were to have been recipients brought reconsideration. With the exception of Japanese assets overseas and a small number of war plants, reparations were very nearly limited to agreements worked out between Japan and each of its Asian victims after the peace treaty signed in San Francisco in 1951.

SCAP and the *zaibatsu*

Similar moderation marked the course of planning for deconcentration of the great ***zaibatsu*** firms. At first, they were considered Japan's chief potential war makers, but they later came to be seen as essential elements in economic recovery. Of 1,200 concerns marked for investigation and possible dissolution in 1948, only 28 were broken up by SCAP, though the major units of the ***zaibatsu*** empires—holding companies—were dissolved and their securities made available for public purchase. New legislation sought to enforce fair trading and to guard against return to monopolies. Taxes on the profits of war wiped out many large fortunes and affected all large concentrations, while capital levy, inheritance, and graduated income taxes were designed to equalize the tax burden. The extension to the business world of the removal of wartime leaders prevented any action by the senior executives of 250 concerns during most of the occupation years. By 1950 extensive changes, although far short of those initially proposed, had taken place in the industrial world. The large banks, however, had not been broken up, and they proved to be the centres for a measure of reconsolidation in the years after the occupation ended.

Labour. The balance of economic power was also affected by measures that produced a strong and vigorous labour movement, which contested with management for political and economic primacy. After the Home and Welfare ministries were dissolved, a new Labour Ministry was established in 1947. The release of all political prisoners, carried out in the early months of the occupation, freed the core of the Japan Communist Party, and most of those released turned their attention to organizing the labour movement, hoping to use it as a path to power. Laws on trade unions and labour relations, modelled on New Deal legislation in the United States, were passed, and soon a strong union movement appeared, led by men with political ambitions. When a general strike was announced for February 1947, with the avowed purpose of overthrowing the government, SCAP issued an injunction against it. Thereafter, occupation policy was concerned with reconstruction and no longer exclusively with liberation, and steps against inflation, political radicalism, and Communist control of labour unions followed. Under the Socialist Cabinet of Prime Minister Katayama Tetsu there was emphasis on labour education, and in July 1948 SCAP ordered the government to take steps to deprive government workers—including members of the communications unions—of the right to strike. A new labour organization, the General Council of Japanese Trade Unions (Sōhyō), was sponsored as a counterweight and gradual replacement for the Congress of Industrial Labour Organizations (Sambetsu), which had become dominated by the left. After 1951, however, Sōhyō too became increasingly anti-government and anti-American. Although some of the occupation measures deprived labour of useful weapons for fighting its way to power, the strength of organized labour, expressed through the Socialist Party, remained significantly different politically from what it had been before the war. The government's failure to carry through a police law designed to curb labour radicalism and sabotage in 1958 demonstrated the powerful support that labour could command in the Diet, in the press, and in public opinion generally.

Labour unions

Social reforms. The social legislation of the postwar era saw energies and hopes long repressed by the Japanese government spring to full flower. The civil code, which had reinforced the power of the male head of the family with numerous legal supports, was rewritten to allow for equality between the sexes and joint inheritance rights. Women were given the right to vote and to sit in the Diet. The abolition of the peerage, which had been created in Meiji days, symbolized the modernization of society.

The years after the peace treaty, which became effective on April 28, 1952, saw a number of changes in the pattern of occupation reforms. The land system remained unaltered, and rural well-being was higher than it had ever been. Industrial reconsolidation reunited many of the earlier financial empires, which required maximum efficiency in order to compete on international markets. Proportionately, however, the old firms had not regained their former power. Social legislation, moreover, had created such strong interest groups that prospects of substantial reversals of the postwar changes seemed slight. For many of the newly liberated generation, the new order was symbolized by the marriage of Crown Prince Akihito and a commoner, Shoda Michiko, in 1959.

International relations. Japan's return to international relations at the end of the occupation found it stripped of its conquests and even deprived of some of its own territory. The Republic of China on Taiwan, the People's Republic of China on the Chinese mainland, the Republic of Korea (South Korea), and the Democratic People's Republic of Korea (North Korea) all possessed military establishments far larger than Japan's Self-Defense Forces. International relations were not destined to be conducted on the pacifist lines envisioned by Article 9 of the constitution of 1947. The United States maintained its occupancy of Okinawa and the Ryukyus, while the Soviet Union occupied the entire Kuril chain in addition to reclaiming southern Sakhalin. The Korean War, which broke out in June 1950, increased the urgency of a peace treaty. Arrangements were worked out between the principal non-Communist allies before and during the command of Gen. Matthew B. Ridgway, who succeeded MacArthur as supreme commander in April 1951.

The peace treaty. The San Francisco Conference that convened in September 1951 to sign the Japanese peace treaty ratified arrangements that had been worked out earlier by John Foster Dulles under the direction of Secretary of State Dean Acheson. Japan recognized the independence of Korea and renounced all rights to Taiwan and the Pescadores, the Kurils, and southern Sakhalin and gave up its rights in the Pacific islands to which it had held mandate under the League of Nations. The Soviet Union attended the San Francisco Conference, but it failed to make its objections to the treaty heard and consequently did not become a signatory. This enabled Japan to retain the hope of regaining at least the Kuril islands closest to Hokkaido—territory that it had not seized in war—through diplomatic efforts.

The San Francisco peace treaty recognized Japan's "right of individual and collective self-defense," which was exercised through the enactment of a security pact with the United States whereby U.S. forces would remain in Japan until Japan could "assume responsibility for its own defense." Japan agreed not to grant similar rights to a third power without U.S. approval. U.S. assistance was extended to the Japanese defense forces, while U.S. units, with the exception of air detachments and naval bases, were gradually removed to Okinawa.

Post-treaty relations. The peace treaty went into effect in April 1952. It made no arrangement for reparations for Japan's Pacific war victims but provided that Japan should negotiate subsequently with the countries concerned. Consequently, effective resumption of relations with the nations of Asia came only after treaties covering reparations had been worked out. These were signed with Burma in 1954, with the Philippines in 1956, and with Indonesia in 1958. In 1956 Japan also restored diplomatic relations with the Soviet Union but without working out a formal treaty of peace. In December of that year, with the Soviet Union no longer invoking a veto, Japan became a member of the United Nations. Subsequently, Japan took an active part in UN meetings and specialized agencies. It also became a contributing member of the Colombo Plan group of nations for economic development in South and Southeast Asia, of the General Agreement on Tariffs and Trade (GATT), and of the Organization for Economic Co-operation and Development (OECD). For many Japanese, their country's return to international status and eminence was symbolized by its acting as host country for the Olympic Games in 1964 and an international fair (Expo 70) at Osaka in 1970. Japan also played a leading role in the creation of the Asian Development Bank in 1965–66.

Reparations treaties

China policy. At the time of the San Francisco treaty, Prime Minister Yoshida Shigeru had intended to delay committing Japan to either of the two Chinas, and the absence of both governments from San Francisco made this seem possible. But John Foster Dulles convinced Yoshida that the treaty would meet opposition in the United States Senate unless some assurance was given that Japan would recognize the Republic of China on Taiwan; thus, Tokyo soon negotiated a peace treaty with that regime but a treaty that did not prejudice possible subsequent negotiations with Peking. A lively trade developed between Japan and Taiwan, and Japanese contributions to the economy of Taiwan were considerable. The treaty also encouraged the development within Japan's Liberal-Democratic Party of a so-called Taiwan lobby. Because Japan's relations with Peking remained tenuous, Chiang Kai-shek was for a time able to hold the Japanese government to its commitments by threatening to cut off Taiwan trade if Tokyo considered developmental loans to the mainland.

Chinese-Japanese trade

Mainland trade relationships developed slowly in the absence of political ties. In 1953 an unofficial trade pact was signed between private Japanese groups and authorities of the People's Republic, the first of a number so negotiated. Together with the industrial countries of western Europe, Japan shortened the list of goods that were under embargo for mainland trade; as late as 1972, however, 167 items remained on that list. In addition to unofficial agreements with Japanese firms designated as friendly by Peking, the 1960s saw the development of an informal, semi-official "memorandum" trade that became increasingly important. But the Peking government made skillful use of trade for political purposes, in the hope of embarrassing or weakening Japan's conservative governments, and intervals of ideological tension and political instability on the mainland were soon reflected in falling levels of trade with Japan. In 1958 China's Great Leap Forward campaign resulted in a temporary closure of all trade with Japan, and in the mid-1960s the Great Proletarian Cultural Revolution also resulted in a severe decline. Nevertheless, Japan gradually became China's most important trading partner.

In 1971 Pres. Richard M. Nixon's announcement of a forthcoming visit to Peking produced a rapid growth in Japanese willingness to compromise ties with Taiwan in favour of closer relations with Peking. The Chinese premier, Chou En-lai, moving with new confidence, now found it possible to attach the sort of conditions that Chiang Kai-shek had earlier worked for in the 1950s by warning that China would not trade with firms engaged in development activities on Taiwan or in South Korea (with which Japan had in 1965 negotiated a treaty establishing diplomatic relations and providing for reparations and assistance). While refusing to deal with Prime Minister Satō, Peking indicated new interest in formal relations with Japan, subject to the revocation of Japan's treaty with Taiwan. Japanese leaders showed themselves increasingly prepared to meet these conditions. The People's Republic was admitted to the United Nations in 1971; in September 1972 Prime Minister Tanaka Kakuei reached agreement with Peking on steps to normalize relations, and simultaneously Japan severed its ties with Taiwan, replacing its embassy with a nonofficial office. Subsequently Japan pursued trade opportunities with the People's Republic vigorously, and in August 1978 the two countries concluded a Treaty of Peace and Friendship that bound both to "perpetual peace and friendship" and pledged them to oppose "hegemony" from whatever source and to foster economic and cultural relations.

Japanese–Chinese Treaty of Peace and Friendship

Postwar politics. After the surrender in 1945, Japanese politics at first returned to the pattern that had been interrupted by the militarist domination of national life. Extremists of the right were discredited by their identification with the lost war. Their major figures were removed from office or arrested, and until 1952, when all but those convicted by the international tribunal were permitted to resume their careers, little rightist organization was possible. Thereafter, some figures of the 1930s re-emerged, but the rightists lacked unity and could offer no program of leadership in Asia. They were handicapped by a decline of influence in the military and business sectors that had formerly supported their activities. Most important, rightist ideology found few listeners among the postwar generation accustomed to new freedoms. Except for a few spectacular incidents, such as the murder of the Socialist leader Asanuma Inajirō in 1960, rightist activities were limited to efforts to revive national holidays, such as February 11 (Foundation Day, for Emperor Jimmu, a campaign that succeeded in 1966), and demonstrations against the Soviet Union and China.

The left fared better for a time. With the release of political prisoners after the war, and with the repeal of the peace-preservation laws that had hampered political organization in prewar days, prominent Communist Party leaders returned to action. Although land reform deprived them of an issue they had used elsewhere in Asia, the postwar years, with their confusion and economic hardship, provided a favourable climate for Communists. A high point of Communist influence at the polls came in the general election of 1949, when Communists placed 35 candidates in the House of Representatives and received nearly 10 percent of the vote.

On the outbreak of the Korean War in 1950, SCAP ordered the removal of Communist leaders from politics. Most chose to go underground, reappearing after the occupation ended. By that time popular sympathy with the Communist cause had declined markedly. The steady rise of living standards, the uncooperative attitude the Soviet Union had shown in negotiating over the Kuril Islands and in fishing treaty discussions, a popular distaste for Communist opposition to the Imperial institution, and widespread dislike of the extremist tactics shown by leftist labour unions—all combined to create an unpromising climate for Communist politicians.

While not reversed, these trends were importantly modified in the late 1960s. The spectacular economic growth of that decade produced great urban migrations that provided promising settings for mass organization and politics, and both conservative-religious (*e.g.*, Komeitō, or Clean Government Party, the political arm of the Sbka-gakkai movement) and radical political movements grew in strength. The conservative government's policy of giving priority to export development over social-welfare measures, though partly justified by a rising standard of living in which all groups shared, did little to alleviate the difficult conditions of life for many of the new recruits to the urban labour force. Communist leaders exploited their possibilities skillfully. In the mid-1960s they broke publicly with Peking to establish an autonomous and somewhat nationalist image, and their student organizations followed a relatively moderate line during anarchic disruptions at the universities in the late 1960s. These policies helped produce large pluralities in many urban elections, as in contests for the House of Councillors, where voter constituencies were large. Nevertheless, the Japan Communist Party remained far from power and found it difficult to establish satisfactory coalition arrangements with the more strongly pro-Peking Japan Socialist Party (Nihon Shakaitb) and other "reformist" elements.

The vicissitudes of right and left made it natural for the prewar moderates to dominate postwar politics. Career diplomats and bureaucrats possessed the ability and command of English to enable them to work with SCAP authorities, and, because they had been out of action since the 1930s, they had not become liable to the removal of militarists from office. Thus, figures of the 1920s and '30s re-emerged, as did also the remnants of the party organizations of those years. The liaison agency, staffed largely by former diplomats, assumed immediate importance. The Cabinet that emerged shortly after the arrival of U.S. forces was headed by Shidehara Kijūrō, who was replaced in May 1946 by Yoshida Shigeru; both were diplomats. In 1947 and 1948 there was an interval of rule under Katayama Tetsu, a Socialist who headed a coalition Cabinet but who was unable to carry out a Socialist program. In 1948 Ashida Hitoshi held office for five months, after which Yoshida returned as prime minister and remained until December 1954, setting a record for modern Japanese prime ministers. Yoshida negotiated the peace treaty and the security pact in 1951 and set Japan's postsurrender course of close cooperation with the United States.

Dominance of Yoshida

Hatoyama Ichirō became a candidate for Yoshida's position, and the Liberal Party was split between their respective followers as a result. The San Francisco treaty and security pact split the Socialist Party into two factions also: the left opposing both the treaty (because it did not include the Communist countries) and the security pact with the United States, the right wing favouring the treaty while opposing the security pact.

Formation of Liberal-Democratic Party

In 1955 the Liberals and Democrats united to form the Liberal-Democratic Party (Jiyū-Minshutō), which thereafter was the dominant party.

After independence. The Korean War marked the turn from depression to prosperity for Japan. As the staging area for the UN effort in South Korea, the country profited from the many services it provided.

Economic growth. The return of independence in 1952 thus found the Japanese economy in the process of growth and change, a process that continued without interruption into the 1960s. Sustained prosperity and consistently high growth rates changed all sectors of life in Japan. The countryside, where farmers had benefitted from the land reform, began to feel the effects of small-scale mechanization and a consistent migration to industrial centres. Agricultural yields rose as improved strains of crops and modem technology were introduced, as household appliances appeared in remote villages, and as the changing, more diversified patterns of food consumption of the cities provided a market for more cash crops, truck (market) garden fruits and vegetables, and meat products. Population control slowed the birth rate, and steady industrial growth brought full employment and even a labour shortage.

Particularly in the 1960s, the structure of the Japanese economy changed in order to concentrate on products of highly advanced technology, which emphasized Japan's need for stable, advanced trading partners instead of the Asian markets for inexpensive textiles that it had earlier developed. Improvements in transportation—*e.g.*, cargo-handling methods and bulk transport by large ore carriers—were removing the disadvantage of the greater distances over which Japan's new materials were moving. Most important of all, a large and growing domestic market was rendering invalid many earlier generalizations about Japan's need for cheap labour and captive Asian markets for inexpensive exports. By the late 1960s Japan had experienced the highest and most sustained growth rates of any country in the world for more than a decade. Japan led the world in shipbuilding, was second in the production of motor vehicles, and was third in steel production.

International policies. Japanese leaders attempting to raise the national income felt their options in international affairs severely restricted by the alliance with the United States, Taiwan, and South Korea, which prevented closer ties with the Soviet Union, China, and North Korea. Prosperity was a universal goal, but international politics proved sharply divisive. Public-opinion polls showed firm agreement against military power and continued horror of atomic or nuclear developments; and it was agreed that the Self-Defense Forces could not be utilized for international or UN causes.

U.S.–Japanese treaty revision

As noted above, restoration of relations with the Soviet Union and membership in the United Nations, both in 1956, were the principal efforts and achievements of Hatoyama Ichirb, who succeeded Yoshida in 1954. Hatoyama was followed by Ishibashi Tanzan in December 1956 and by Kishi Nobusuke in 1957. Kishi, who had been named, though not tried, as a war criminal because of his membership in the Tōjō Cabinet, continued the policies of cooperation with the United States that Yoshida had initiated. But, because of his war record, he was the target of much criticism. In 1958 the Peking government, occupied with its Great Leap Forward, closed all trade contacts with Japan. At the same time, revisions in the U.S.-Japan treaty of mutual cooperation and security were being discussed. A proposed treaty revision, which was to be in force for 10 years, alarmed many Japanese who had felt only slightly involved in the original agreement negotiated at the time of independence. Issues were further complicated by plans for a state visit by Pres. Dwight D. Eisenhower. Originally planned as a follow-up to a visit to Moscow, the visit changed drastically after the Soviet Union shot down a U.S. U-2 reconnaissance plane on May 1, 1960. Eisenhower's trip abroad had begun as a symbol of peace and coexistence; but it now became a strategic tour of U.S. Pacific allies and bases, and its critics charged that it was designed to sustain the falling popularity of the Kishi government. After the Kishi Cabinet used its majority to force the treaty revisions through the Diet, opposition to the Prime Minister, the treaty, and the Eisenhower visit increased steadily. Gigantic student demonstrations shook Tokyo day after day. The treaty survived, but Eisenhower's visit was cancelled, and Kishi resigned in July 1960. In 1970, when the treaty had run its course, both governments were reluctant to see a repetition of the events of 1960; they agreed to invoke its provisions indefinitely, subject to one year's revocation by either party.

Ikeda, Sato, **and their successors.** Kishi was followed by Ikeda Hayato in 1960. A specialist in economic policy, Ikeda set for his country the goal of doubling national income in 10 years. The goal was more than met, as Japan's economy grew at rates of more than 10 percent annually, the highest in the industrialized world. The administration of Pres. John F. Kennedy in the U.S. caught the imagination of many Japanese, and Kennedy's designation of the popular scholar Edwin O. Reischauer as American ambassador further improved Japanese–American relations. By the late 1960s the unpopularity of the war in Vietnam and the turbulence of the world student movements, in which Japanese students played a full role, threatened to disturb American relations again.

The era of Sat0

Satb Eisaku, who became prime minister when Ikeda resigned because of illness in 1964, continued Ikeda's policies and proved an able and resourceful figure until he left office in 1972. In 1965 Japan entered treaty relations with South Korea. At home, Satō worked for continued economic growth and did his best to free Japan from the reminders of defeat that remained. The Bonin (Ogasawara in Japanese) and Ryukyu islands had been left under American occupation by the San Francisco treaty of peace. U.S. military bases on Okinawa (in the Ryukyus) seemed essential to American commitments to South Korea, and they were an important link to American forces in Vietnam: in the late 1960s, Japanese opposition to the Vietnam war made them highly objectionable. Satb's government secured return of the Bonin Islands in 1967, and the retrocession of the Ryukyus became effective in 1972. Satb hailed this as "the end of the postwar era." The U.S. retained bases on Okinawa, but they were now subject to the restrictions that affected other U.S. bases in Japan. Satō resigned in 1972 and two years later was awarded the Nobel Prize for Peace for his role in maintaining Japan's policy against nuclear weapons.

Tanaka scandals

Tanaka Kakuei, Satō's successor, seemed to promise a new stage of Japanese strength. One of his first acts was to take a trip to Peking, on the heels of President Nixon, to reverse Japan's China policy by recognizing the People's Republic. Tanaka reacted to increasing public concern with problems of pollution and overcrowding by calling for the redistribution of industry throughout the Japanese islands. Soon he was being charged with worsening inflation as prices of land throughout Japan rose rapidly. More serious was the effect of the petroleum crisis of 1973 on a country completely dependent on imported oil. Outbreaks of panic buying by consumers brought much reflection on the essential fragility of Japan's economic position; the rapid rise in the price of oil seemed to indicate the end of an era of relatively cheap and abundant resources. Japan next experienced the world recession of the 1970s, and its recovery seemed slower because of the decade or more of exuberant growth that had gone before. The Tanaka era ended in disaster in 1974 with a scandal based on irregularities in the accumulation of his private fortune. Shortly afterward, and worse, it was charged that Tanaka was implicated in improper use of official influence to bring about the selection by Japanese airlines of airplanes manufactured by Lockheed Aircraft Corp.

Tanaka was succeeded by Miki Takeo, the leader of a small faction in the governing Liberal-Democratic Party who won favour while larger factions were in disarray because of the scandals. Miki was determined to pursue full disclosure of the Lockheed affair, and a lengthy investigation and prosecution of Tanaka and his associates was begun by the government; this culminated in the arrest of Tanaka in July 1976 and indictment on a charge of bribery. The economy continued slow. Elections to the Diet in December 1976 brought an end to the Liberal-Democrats' absolute majority, and Miki resigned. The new prime minister was Fukuda Takeo, who had rich experience in many branches of government and was considered a specialist in economic policy. The problems of the Japanese economic turndown proved difficult, however, and combined with party factional differences to bring about Fukuda's defeat in a newly designed party presidential "primary" in November 1978. He was succeeded by Ohira Masayoshi, who announced his intention to continue his predecessors' foreign policies.

Trade policies seemed among the most difficult problems. Domestic consumption was down, inventories were high, and industries were committed to their work forces, with the result that production continued high. There followed a vigorous effort to increase exports, which resulted in Japanese manufacturers' taking larger shares of all foreign markets, including that of the United States. The yen grew stronger at the expense of other currencies, and particularly the dollar, in which most purchases of raw materials were figured. Consequently Japan again saw its import prices diminish, although its manufactures, now more expensive in foreign markets, were rendered less competitive in price. The 1970s produced particularly large Japanese surpluses in Japanese–American trade. Japan was now the largest or second largest trading partner of virtually every country with which it traded. It was investing heavily in other countries, and its manufacturers were building plants throughout the world.

Trade agreement with China

The People's Republic of China was particularly important to Japan's long-range economy, and the Chinese turn from ideological rigidity to pragmatism in the 1970s, after the death of Mao Tse-tung, encouraged increasing numbers of Japanese to seek Chinese markets. In 1978 an eight-year agreement for a total of $20,000,000,000 in industrial contracts was signed with China, and in August Japan and China signed the Treaty of Peace and Friendship referred to above.

Within Japanese politics and opinion, the long-standing polarization over Japan's treaty with the United States was made obsolete by these developments. Although opponents of the treaty had long argued that the American tie and the Japanese Self-Defense Forces threatened to cut Japan off from the People's Republic, Peking now saw both that treaty and those forces as constraints against its Soviet rival and no longer criticized them. The Socialist and Communist ideology of class warfare also lost ground in the atmosphere of general affluence, and the overwhelming majority of Japanese showed that they considered themselves to be members of the middle class. Meanwhile the Liberal-Democrats' dominance had been eroded by movements of population that made Japan increasingly urban. As a result, that government's inclination to attempt revision of the constitution of 1947 had only academic interest in a situation in which it required allies in the Diet to maintain its hairline majority.

The late 1970s thus found the Japanese aware that the shibboleths of the postsurrender decades were obsolete. Japan was not poor but wealthy, not weak but a power in the international economy, not isolated but the largest trading partner of almost every country in the world. This awareness was reflected in a surge of introspection in which writers discussed the role for their country and the nature of their society. What remained was a growing consensus around general principles, summed up by Prime Minister Fukuda in 1978: Japan should adhere to its decision not to become a major military power, and should promote friendly cooperation with all nations and work to accept growing responsibility within the international community. Japan remained unusually dependent upon the stability of the world economy, but that stability in turn was more dependent upon the quality of Japanese participation than it had ever been before.

(M.B.J.)

BIBLIOGRAPHY

Introductory works: Among various critical guides in Western languages, JOHN WHITNEY HALL, *Japanese History: New Dimensions of Approach and Understanding,* 2nd ed. (1966), is the most convenient and skilled presentation of scholarly work in this field. Additions to published materials will be found, though not annotated, in the annual bibliographical issue of the *Journal of Asian Studies.* Generally speaking, Japanese scholars in the field of Japanese history are far more productive than their foreign colleagues, and an idea of how much has been produced is available in JOHN WHITNEY HALL, *Japanese History: A Guide to Japanese Reference and Research Materials* (1954); and HERSCHEL WEBB, *Research in Japanese Sources: A Guide* (1965). Besides general surveys and monographs, the following three compendiums by groups of recognized scholars are suggested for advanced students who are accustomed to reading Japanese: SHOGAKUKAN (ed.), *Zusetsu Nihon bunkashi taikei* ("Illustrated Compendium of Japanese Cultural History"), 2nd ed., 14 vol. (1965–68), a collection of essays arranged in chronological order and with numerous illustrations for the general reading public, the last volume devoted to bibliography and related materials; SABURO IENAGA (ed.), *Iwanami Koza: Nihon rekishi* ("Iwanami's Lectures on Japanese History"), 22 vol. (1962–64), a collection of articles contributed by many authors and arranged in chronological order by periods, well documented and directed to somewhat advanced readers; and KAWADE SHOBO (ed.), *Nihon no rekishi* ("A History of Japan"; 1965–67), composed of 27 volumes written by different authors with 4 volumes devoted to illustrations, in chronological order.

Surveys: Authoritative textbooks in English include EDWIN O. REISCHAUER and JOHN K. FAIRBANK, *East Asia: The Great Tradition* (1960); and JOHN K. FAIRBANK, EDWIN O. REISCHAUER, and ALBERT CRAIG, *East Asia: The Modern Transformation* (1965). Though dated, JAMES MURDOCH, *A History of Japan,* 3 vol. (1903–26, reprinted 1964), is a pioneer work that gives a detailed political history. A later survey is GEORGE B. SANSOM, *A History of Japan,* 3 vol. (1958–63). Shorter excellent interpretive works include SANSOM'S *Japan: A Short Cultural History,* rev. ed. (1962), and *The Western World and Japan* (1950, reprinted 1965); EDWIN O. REISCHAUER, *Japan: The Story of a Nation* (1970) and *The Japanese* (1977); SABURO IENAGA, *History of Japan,* 5th ed. (1961); MIKISO HANE, *Japan: A Historical Survey* (1972); BRADLEY SMITH, *Japan: A History in Art* (1964); MITSUSADA INOUE, *Introduction to Japanese History: Before the Meiji Restoration* (1962); WILLIAM G. BEASLEY, *The Modern History of Japan,* 2nd ed. (1974); and JOHN W. HALL, *Japan from Prehistory to Modern Times* (1970). The JAPAN NATIONAL COMMISSION FOR UNESCO, *Japan: Its Land, People and Culture,* 2nd ed. (1972), is a comprehensive reference work.

Monographs: For further reading, selected monographic works on Japan (in English) are listed below, grouped according to their historical approach. *(Ancient):* GERARD S. GROOT, *The Prehistory of Japan* (1951); J.E. KIDDER, *Japan Before Buddhism,* rev. ed. (1966); ROBERT K. REISCHAUER, *Early Japanese History,* 2 vol. (1937); IVAN I. MORRIS, *The World of the Shining Prince: Court Life in Ancient Japan* (1964). *(Medieval and early modern):* G. CAMERON HURST III, *Insei: Abdicated Sovereigns in the Politics of Late Heian Japan, 1086–1185* (1976); JOHN W. HALL, *Government and Local Power in Japan, 500–1700: A Study Based on Bizen Province* (1966); KAN'ICHI ASAKAWA, *The Documents of Iriki,* rev. ed. (1955); MINORU SHINODA, *The Founding of the Kamakura Shogunate, 1180–1185* (1960); JEFFREY P. MASS, *Warrior Government in Early Medieval Japan* (1974); JOHN W. HALL and JEFFREY P. MASS (eds.), *Medieval Japan: Essays in Institutional History* (1974); JOHN W. HALL and TOYODA TAKESHI (eds.), *Japan in the Muromachi Age* (1977), the outcome of a binational conference held in 1973; DELMER M. BROWN, *Money Economy in Medieval Japan* (1951); YI-T'UNG WANG, *Official Relations Between China and Japan, 1368–1549* (1953); HELEN CRAIG MCCULLOUGH, *The Taiheiki: A Chronicle of Medieval Japan* (1959); CHARLES R. BOXER, *The Christian Century in Japan, 1549–1650,* 2nd ed. (1967), *Fidalgos in the Far East, 1550–1770,* 2nd ed. (1968), and *Jan Compagnie in Japan, 1600–1850,* 2nd ed. (1950, reprinted 1968); GEORGE ELISON, *Deus Destroyed: The Image of Christianity in Early Modern Japan* (1973); H. PAUL VARLEY, *The Onin War* (1967); CONRAD TOTMAN, *Politics in the Tokugawa Bakufu, 1600–1843* (1967); JOHN W. HALL and MARIUS B. JANSEN (eds.), *Studies in the Institutional History of Early Modern Japan* (1968): SUSAN B. HANLEY and KOZO YAMAMURA, *Economic and Demographic Change in Pre-industrial Japan, 1600–1868* (1978); HAROLD BOLITHO, *Treasures Among Men: The Fudai Daimyo in Tokugawa Japan* (1974); RONALD P. DORE, *Education in Tokugawa Japan* (1965); CHARLES D. SHELDON, *The Rise of the Merchant Class in Tokugawa Japan, 1600–1868* (1958); THOMAS C. SMITH, *The Agrarian Origins of Modern Japan* (1959); JOHN W. HALL, *Tanuma Okitsugu, 1719–1788: Forerunner of Modern Japan* (1955); DONALD KEENE, *The Japanese Discovery of Europe* (1952); JOHN A. HARRISON, *Japan's Northern Frontier* (1953); GEORGE A. LENSEN, *The Russian Push Toward Japan* (1959, reprinted 1971); WILLIAM G. BEASLEY (ed. and trans.), *Select Documents on Japanese Foreign Policy, 1853–1868* (1955); GRACE FOX, *Britain and Japan, 1858–1883* (1969); MARIUS B. JANSEN, *Sakamoto Ryōma and the Meiji Restoration* (1961, reprinted 1971); ALBERT CRAIG, *Chōshu in the Meiji Restoration* (1961). *(Modern):* CHITOSHI YANAGA, *Japan Since Perry* (1949); E. HERBERT NORMAN,' *Japan's Emergence as a Modern State* (1940); WILLIAM W. LOCKWOOD, *The Economic Development of Japan: Growth and Structural Change, 1868–1938* (1954); THOMAS C. SMITH, *Political Change and Industrial Development in Japan: Government Enterprise, 1868–1880* (1955); WILLIAM CHAMBLISS, *Chiaraijima Village: Land Tenure, Taxation and Local Trade, 1818–1884* (1965); JOHANNES HIRSCHMEIER, *The Origins of Entrepreneurship in Meiji Japan* (1964); MARIUS B. (Ma.Ka./M.B.J.)

Japan, Sea of

The Sea of Japan is a marginal sea of the western Pacific Ocean, bounded by Japan and the Soviet island of Sakhalin to the east and by the Soviet Union and Korea on the Asian mainland to the west. Its area is 389,100 square miles (1,007,800 square kilometres). It has a mean depth of 4,429 feet (1,350 metres) and a maximum depth of 12,276 feet (3,742 metres).

Physiography and submarine morphology. The sea is almost elliptical, having its major axis from southwest to northeast; to the north it is approximately bounded by latitude 51°45′ N, while to the south it is bounded by a line drawn from the Japanese island of Kyūshū westward through the Gotb-rettb (Gotb Islands) of Japan to the Korean island of Cheju (also known as Quelpart Island) and then northward to the Korean peninsula.

The sea itself lies in a deep basin, separated from the East China Sea to the south by the Tsushima-kaikyō (Tsushima Strait) and Korea Strait and from the Sea of Okhotsk to the north by Sbya-kaikyb (Sbya Strait, or La Perouse Strait) and Tatar Strait, all of which have sill depths of less than about 700 feet. To the east it is also connected with the Inland Sea of Japan by Kanmon-kaikyb.

Component basins

Underwater, the sea is separated into the Japan Basin (about 9,800 to 11,500 feet deep) to the north, the Yamato Basin (8,200 feet deep) to the southeast, and the Tsushima Basin (6,600 feet deep) to the southwest. While a narrow continental shelf with an average width of about 19 miles fringes Siberia and the Korean peninsula, on the Japanese side of the sea there are wider continental shelves with depths at the edge of between about 430 and 1,300 feet, as well as groups of banks, troughs, and basins lying offshore. The banks lying off the coasts of Japan are divided into groups, which include Okujiri Ridge, Sado Ridge, Hakusan Banks, Wakasa Ridge, and Oki Ridge.

Geology and bottom deposits. Yamato Ridge, which has an average depth of about 1,475 feet (450 metres), consists of granite, rhyolite, andesite, and basalt, with boulders of volcanic rock scattered on the seabed. The top of the Korea Plateau is about 3,000 feet below the surface and has a depression in its central part. Geophysical investigation has revealed that, while Yamato Ridge is of continental origin, the Japan Basin and the Yamato Basin are of oceanic origin.

Bottom deposits in the Sea of Japan indicate that earth-born sediments, such as mud, sand, gravel, and fragments of rock, exist down to depths of 650 to 1,000 feet; hemipelagic sediments (*i.e.*, half of oceanic origin), mainly consisting of blue mud rich in organic matter, are found down to depths of about 1,000 to 2,600 feet; and deeper pelagic sediments, consisting of red mud, are found down to a depth of nearly 13,000 feet.

A number of submarine canyons are found on the continental slope, at depths of more than 6,500 feet on the west side of the basin, while those near the islands of Japan lie at depths of only about 2,600 feet.

Argument over the formation of the Sea of Japan has not yet ended, although there is agreement that the four straits that connect the sea either to the Pacific Ocean or to marginal seas were formed in very recent geological periods. The oldest of these straits are the Tsugaru-kaikyb and Tsushima-kaikyō, whose formation interrupted the migration of elephants into the Japanese islands at the end of the Tertiary Period (about 2,500,000 years ago); the most recent is Sōya-kaikyō, which was formed at the end of the Wisconsin Ice Age (60,000 to 11,000 BP) and which closed the route once used by the mammoths whose fossils have been found in Hokkaidb.

Climate. The Sea of Japan contributes greatly to the mild climate of Japan because of the effect exerted by its relatively warm waters; evaporation is especially noticeable in winter, when an estimated 5,000,000,000 tons of water vapour rise as steam fog near the Polar Front (*i.e.*, the frontier between the cold, dry polar air mass and the warm, moist tropical air mass). From December to March the prevailing northwest monsoon wind carries cold and dry continental polar air masses over the warmer waters of the sea, resulting in persistent precipitation in the form of snow along the mountainous coasts of Japan. In summer the southerly tropical monsoon blows from an area of higher atmospheric pressure over the North Pacific onto the Asian mainland, causing dense fog when its warm and moist winds blow over the cold currents that prevail over the northern part of the sea at that season. The winter monsoon brings rough seas and causes coastal erosion as a result of the heavy surf that breaks along the western coasts of Japan. In summer and fall typhoons occasionally occur.

The northern part of the sea, especially off the Siberian coast as well as in Tatar Strait, freezes in winter; as a result of convection, melted ice feeds the cold currents in that part of the sea in spring and summer.

Prevailing currents

Hydrography. The waters of the sea generally circulate in a counterclockwise pattern. A striking contrast occurs between the cooler and relatively fresher water in the western part and the warmer and relatively more saline water in the eastern part. A branch of the Kuroshio Current, the Tsushima Current, together with its northern branch, the East Korea Warm Current, flows north, bringing warmer and more saline water, before flowing into the Pacific through the Tsugaru-kaikyō as the Tsugaru Current, as well as into the Sea of Okhotsk through the Sōya-kaikyō as the Sbya Current. Along the coast of the Asian mainland, on the other hand, three cold currents—the Liman, North Korea, and Central (or Mid-) Japan Sea cold currents—bring cooler, relatively fresh, and turbid water southward.

Economic resources and resource exploitation. Fisheries and mineral deposits form the main economic resources. Fisheries may be divided into pelagic (oceanic) and demersal (sea-bottom) categories. Pelagic fishes include mackerel, horse mackerel, sardines, anchovies, herring, fishes of the salmon and trout family, sea bream, and squid; the demersal category includes cod, Alaskan pollack (bluefish), and Atka mackerel. Seals and whales are also to be found, as well as such crustaceans as prawns and crabs. The fishing grounds are for the most part on the continental shelves and their adjacent waters, as well as in the Polar Front zone and on the submarine banks.

Herring, sardines, and bluefin tuna have traditionally been caught, but since 1946 the fisheries have been becoming depleted. In the late 1970s squid fishing was being carried on in the central part of the sea, salmon fishing in the shoal areas of the north and southwest, and crustaceans were being caught in the deeper parts.

Mineral resources on or in the sea bottom include magnetite sands as well as natural gas and petroleum deposits off Japan and Sakhalin Island.

Commercial and historical importance. As trade increases between Asian countries, the Sea of Japan is being increasingly used as a commercial waterway. While the waters of the sea historically have served to protect Japan from foreign invasions, the southern straits have been the scene of some historical naval battles. On two occasions —in 1274 and 1281—the fleets of Kublai Khan, founder of the Yüan (Mongol) dynasty in China, attempted to cross the straits to conquer Japan, but the conqueror's forces were either destroyed by typhoons or beaten by the Japanese. In 1905, at the battle of Tsushima Strait, the Japanese navy almost completely destroyed the Baltic fleet of the Russian tsar.

Prospects for the future. It is anticipated that increasing international cooperation will result in more effective utilization of the sea's resources. Apart from the development of mineral resources, a system for forecasting oceanic, climatic, and fishery conditions may be developed. The sea may also provide an additional source of energy by harnessing waves created by the winter monsoon. (M.U.)

Japanese Language

Japanese is the language of more than 104,640,000 persons on the islands of Japan, including the Ryukyus. In addition, there are more than 607,000 Koreans and about 51,000 Chinese in Japan who speak the language. Outside Japan a considerable number of people of Japanese parentage can speak the Japanese language with some degree of proficiency; these include 491,000 persons in Brazil, 465,000 in the United States, 45,000 in Peru, and 30.000 in Canada. In Korea and Taiwan the older generations speak Japanese as a second language.

For centuries there have been many dialects in Japan differing from each other to such an extent that some of them are mutually unintelligible. Since the Meiji Restoration, which ended with the promulgation of the Japanese constitution in 1889, the rapid development of elementary education has eliminated illiteracy in the country, and a common written language has been established, based on the dialect of the residential sections of Tokyo. At present, people of the various parts of Japan can speak the common language, although with their own accents, in addition to their own dialects. Since World War II, a common spoken language based on the same dialect of Tokyo has been exerting more and more influence upon the speech of the younger generation all over Japan via radio and especially via television; as a result, the local dialects are disappearing more rapidly than before.

The genetic relationship of Japanese to other languages has not been linguistically established. It is, however, probably related to Korean and possibly to the Altaic languages, which include the Manchu-Tungus, Mongolian, and Turkic families; all have similarities in their phonological and grammatical structures. Some lexical (vocabulary) and other resemblances, however, have been pointed out between Japanese and other East Asian languages and language families—*e.g.*, Austronesian (Malayo-Polynesian), Austroasiatic, Tibeto-Burmese, and Ainu.

Two major dialect groups

Dialects. Japanese can be divided into two major dialect groups: those of the mainland and those of the Ryukyu Islands. The mainland dialects are divided by some scholars into three groups—Eastern, Western, and Kyushu. In other systems, however, they are classified into the Eastern division and the Western division, which is then split into the Kansai (including the Chūgoku and Shikoku dialects) and the Kyūshū dialects. The Tokyo dialect belongs to the Eastern group, Westernized during the last two or three centuries; except for the accent and other features, it is not very different from that of Kybto, a Kansai dialect, which was the most influential central dialect for more than 1,000 years. The peripheral dialects (*e.g.*, the dialects of remote areas—north Tōhoku and Kagoshima of south Kyūshū—as well as the Ryukyuan dialects) are very different from those of Tokyo and Kybto and are incomprehensible in those cities.

There is evidence that there may have been a language spoken by the people of the Yayoi culture in north Kyūshii about 2,000 years ago that became the Proto-Japanese tongue—*i.e.*, the ancestor of all the present-day Japanese dialects. The Yayoi culture with its rice cultivation was brought from the Asian continent to Japan. If it is assumed that the people of this culture also brought the Proto-Japanese language, then it must also be assumed that the language of the remainder (if any) of the Proto-Japanese-speaking people on the Asian continent was extinguished by another language or languages; because there is no evidence of a language on the continent that is not only similar to Japanese but also differs from it enough to reflect the 2,000 years of separation.

A more probable hypothesis is that the Japanese language became separated from Korean 5,000 or more years ago and was spoken in Japan thousands of years before the Christian Era. In that case, Proto-Japanese was probably only one of the Japanese dialects spoken contemporaneously in most of Japan, including Kansai and the area east of it. The Yayoi culture is known to have diffused rapidly eastward from north Kyushu and apparently later stimulated the development of the Tumulus culture in Kinai (*i.e.*, the "Home Provinces," including Yamato, one of the centres of which was the city of Nara). The dialects that were contemporary with and different from Proto-Japanese must have been absorbed during the subsequent 2,000 years by the dialects that branched out from Proto-Japanese.

In the 8th century, however, people noticed that the Eastern dialects were remarkably different from those around Nara (and perhaps also from the Western dialects); some of their peculiarities were recorded. These peculiarities may have been non-Proto-Japanese features, which at that time were still resisting the influence of the central dialects but which have disappeared from the present-day Eastern dialects except for the dialect of a remote island, Hachijb-jima (about 300 kilometres south of Tokyo), that preserves some of the old peculiarities.

The differentiation of social dialects has been slight. but some peculiarities of the speech of the former samurai have been reported in several cities.

Phonological characteristics. Japanese is a polysyllabic language. Simple (*i.e.*, not compound) nouns consist of one or, more often, two or three syllables, to which various particles of one or more syllables are often suffixed. Various "inflectional forms" of simple verbs and adjectives usually consist of two or more syllables and some have various endings or particles or both suffixed as well. ("Inflectional forms" in Japanese are such forms [stems] as negative, preterite, conditional, imperative, and so forth.) The structure of the syllable is rather simple; syllables are ordinarily open (*i.e.*, they consist of one consonant and one vowel that is either short or long, with or without an intervening y after the consonant). The syllable can, however, be closed with a nasal sound (indicated by linguists with the symbol /N/) or a checked sound (conventionally symbolized as /Q/), which then acquire similar phonetic characteristics or become identical to the sound that follows. For example, /N/ becomes m before p, b, m; n before *t,* d, n; *ng* before k, *g, ng;* nasalized i before y; nasalized ũ before w; and so forth. /Q/ is always followed by a consonant and is changed to an implosive *p, t,* k, *s,* etc., which forms a geminate sound (*i.e.*, a double consonant like the t's in English "cattail") with the following explosive consonant. There are five vowels, a, i, *u, e, o,* similar to those of Italian. Short vowels are pronounced very short; the short i and *u* between voiceless sounds are devoiced (pronounced without vibrating vocal cords—voiceless) or omitted in the Tokyo speech. This tendency, remarkable in Tokyo, is less prevalent in some Western dialects.

Structures of the syllable

Japanese has the following consonants: p, t, k, b, d, g, *ts* (ch), *s* (sh), *z* (*j*), m, n, *r,* h, y, w. Basically, any vowel or ya, yu, yo can follow any of the above consonants. But there are restrictions to this rule that include several unacceptable combinations of sounds, among them *ti,* tu, *di,* du, si, *zi,* wi, we, and others. Chi, *tsu,* ji, zu. *shi, ji,* i, e, etc., occur in place of them, respectively. In pronunciation, the Japanese *p,* t, and k are not as aspirated as the

*H = *hiragana: K = katakana; E =* equivalent. Some *kana* undergo a change in pronunciation in specific situations.

†*Tsu* is also used to indicate a doubled consonant. In such cases the *tsu kana* is written slightly below the line (in horizontal texts) or slightly to the right of the line (in vertical texts) and sometimes also in slightly smaller script. Other *kana* are also positioned in this manner when they serve special functions.

‡Romanized m before b, p, and m.

§All five vowels have long forms, which in a Japanese text can be indicated in one of several ways. Romanized long vowels are indicated by macrons, except i, which is written ii.

initial p, t, and k of English (*i.e.*, they are not pronounced with a strong accompanying puff of breath). *B, d,* and *g* are fully voiced (pronounced with vibration of the vocal cords) as in French; g between vowels is usually a nasal *ng* (as in English "sing") in many Kinki (central) and Eastern dialects. Unlike the English sounds (which are formed with the tongue touching the gum ridge behind the upper teeth), t, d, and *n* are articulated against the teeth; ch, sh, and *j* are pronounced with the front of the tongue, not with the tip of the tongue as in English; initial *z* is pronounced like dz in English "adz" in Tokyo; and *r* is a flapped sound like the American t sound in "city."

Pitch accent

The majority of dialects, including those of Tokyo and Kybto, have a word pitch accent. In Tokyo, for example, *hashi* with a high–low accent means "chopsticks," but with a low–high accent pattern it denotes "bridge"; in Kybto, on the other hand, *hashi* means "edge, end with high–high accent, "bridge" with high–low, and "chopsticks" with low–high. There are various patterns of pitch accent, and their geographical distributions are very complicated. The dialects of Tokyo and Hiroshima and those of Kybto and Osaka have patterns quite different from each other. Some dialects in Tōhoku and Kyūshū, among others, have no pitch contrast at all.

It is a common feature of all the dialects, however, that they have no word stress accent (as occurs in English—*e.g.*, háppy, fóreigner, characteristics). The sound of Japanese gives a very different impression from that of English, and it is said to be spoken with even stress and rhythm, as if a metronome were very rapidly ticking off each syllable.

Grammatical characteristics. Nouns have neither number (singular and plural) nor gender (masculine and feminine) and take no article (such as "the," "a," "an"). Case distinctions that show such grammatical features as subject and object are expressed with particles added to the ends of words; for example, *kodomo-ga* "a (the) child (children) [usually nominative]," kodomo-no "of a child," kodomo-o "a child [accusative]," *kodomo-ni* "to a child," kodomo-kara "from a child." Verbs have no person, no number, and no gender and are conjugated with the use of endings—*e.g.,* kaku "write, writes, will write," kakanai "do (does, will) not write," kake "write [imperative]," kakd "I'll write, let's write," kaite "having written, writing," kaita "wrote, has (have) written," kakeba "if . . . write (writes)." Adjectives, which have no number, gender, or case, are also "conjugated" with suffixes—*e.g.,* shiroi "is (are, am) white," shiroku-nai "is not white," skiroku-te "is white, and . . ," shirokatta "was (were) white."

There are no relative pronouns. Demonstrative pronouns have a three-way distinction rather than the two-way division of English "this" versus "that"—*e.g.,* kore "this," sore "that around you," and are "that far from both of us." Personal pronouns have a complex and intricate system: for the 1st person singular (English "I, me, my"), for example, there are watakushi, watashi, *washi,* atakushi, *atashi,* temae, boku, ore, and others; and for the 2nd person singular (English "you, your") there are *anatasa*ma, anata, anta, kimi, *omae, kisama, temē,* and others. The use of these forms depends on such factors as the social relationship of the addresser and the addressee(s) and the degree of intimacy between them, the formality of the speech, and the sex and age of the speaker. Verbs and adjectives also have conjugated forms corresponding to some of these distinctions. For example, kakimasu, kakimasen, *kakimashita* are used instead of kaku, *kakan*ai, kaita, respectively, when the utterance is addressed to those who are superior or not intimate to the addresser. On the other hand, if the person who is the performer of the action kaku ("to write") is a superior to the speaker, then oka-ki-ni naru and *okaki-ni* narimasu are used instead of kaku and kakimasu, respectively. If the action is done for a superior, then okaki *suru* and okaki *shimasu* are used instead.

Order of words in sentences

The predicate stands at the end of a sentence. The subject, the object, adverb, adverbial phrase, and other elements of the sentence precede the predicate and can be omitted when possible. For instance, Kaita. which is a sentence consisting only of a predicate, can be translated as "I (he, they, etc.) wrote (have, has written) it," according to the context or the situation. The complement precedes the copula (a linking verb such as English "is"); *e.g.,* gakusei-da "I (he, they, etc.) am (is, are) a student (students)" is composed of the complement *gakusei* "student" and the copula da "am, is, are." Sentences of the structure A-wa B-da (wa means "as for") have various structural meanings—*e.g.,* Are-wa claigaku-da "That is a university" (daigaku = "university"), Watashi-wa *dai*gakuda "I am for (from, in, etc.) the university," *Gaku*sei-wa gakusei-da "A student is nothing but a student." The expressions that modify a noun directly precede it; *e.g., chiisana hitsuji* "a small sheep," *ōkina ōkami* "a large wolf,"

ōkami-no	kutta	*hitsuji* "the sheep that a wolf ate,"
wolf-[genitive]	ate	sheep

hitsuji-o	kutta	*ōkami* "the wolf that ate the sheep."
sheep-[accusative]	ate	wolf

Vocabulary. Although the greater proportion of the basic Japanese words are native words, a large percentage of the whole vocabulary is composed of Chinese loan elements—comparable to the loanwords from Greek, Latin, and French in English. In early times Japanese apparently borrowed a number of cultural words from Korean, but from the 6th century through the 9th century the direct contact with Chinese culture had a much greater influence on Japanese; the phonology, grammar, and basic vocabulary, however, were not as strongly affected. During those centuries several Sanskrit words entered into Japanese through Chinese in connection with Buddhism—*e.g.,* danna "patron, master" (from danna-*pati*), *hachi* "bowl" (from *pātra*), kawara "tile" (from *kapāla*). Later, in the 12th and 13th centuries, Zen priests introduced several words from Middle Chinese, such as *manjū* "bean-jam bun," *yōkan* "sweet paste," udon "noodle," isu "chair," and futon "bedding." Around the end of the 16th century, Japanese borrowed several words from Portuguese, like pan "bread," kasutera "sponge cake," rasha "woollen cloth," and karuta "cards." During the 18th and 19th centuries the language acquired several words from Dutch—*e.g., buriki* "tinplate," garasu "glass pane," *rappa* "trumpet," and *zuk*ku "duck, canvas."

A large part of the Chinese loanwords in contemporary Japanese are compound terms or derivative words coined in Japan since the Meiji Era; these combine two or more Chinese morphemes (word elements) that were borrowed in ancient times. Kisha "train," for example, is a Japanese compound of this kind that consists of ki "steam" and *sha* "car"; the Chinese equivalent, ch'i ch'e, means "automobile." The newly coined Japanese compound *jidōsha* "automobile" consists of three Chinese loan elements—ji "self," *dō* "to move," and sha "car"—but Chinese has no corresponding compound such as *tzu* tung *ch'e*. Some of these new Japanese compounds have been borrowed back into Chinese through the medium of Chinese characters.

Influence of Chinese characters on word formation

The Chinese characters play a very peculiar but important role in the word formation of written Japanese, which naturally has an influence on the spoken language. Every character usually has two readings: the kun, which is an indigenous Japanese word, and the on, which is an old Chinese loan morpheme. These two readings are closely associated with each other and alternate freely in word formation. For instance, Keid *Daigaku* "Keio University" is abbreviated to Kei-dai, using the original on reading; whereas Waseda Daigaku "Waseda University" becomes *Sō-dai,* formed from the on reading for the indigenous Japanese word wase in Waseda. Wase, which means "early-ripening variety of rice," is shown by a combination of two Chinese characters meaning "early" and "rice," respectively. The on reading of the character meaning "early" is sd, hence Sd-dai.

In the vocabulary of contemporary Japanese, all the words beginning with p- are either onomatopoetic or recent loanwords from European languages—*e.g., pan* "bread (from Portuguese), pen "pen" (from English)

—because the initial p- of Old Japanese has changed into *h*- in Modern Japanese. In addition, there are very few indigenous words ending in a nasal sound. Such phonological peculiarities are now utilized by pharmaceutical and other companies, who coin for their new products names containing a p or a nasal sound so that they sound like something modern or imported. Especially since World War II, commercialism has deluged the language with English and other European words, many of which are short-lived. In general, however, almost all the foreign words have been adapted to Japanese sound patterns (*e.g.*, baiorin "violin," bisuketto "biscuit," *rejā* "leisure"), and only a few have brought new sound combinations such as ti, di (*e.g.*, *pātī* "party," birudingu "building").

Early records of Japanese

History. There is no evidence that the Japanese had their own script before they adopted the kanji (Chinese characters) early in the Christian Era. The earliest records of Japanese consist of several words found in a Chinese book of history, the Wei Chih, of the late 3rd century. A few words written with kanji are found on the swords and the mirrors of the 5th and 6th centuries, but the earliest extant Japanese documents of any length are the Kojiki (712) and the *Manyōshū* (later than 771) of the Nara period. From the 9th century on, records, mainly of the Kyoto dialect and the common written language, abound. The history of the language is usually divided into Old Japanese (to the 8th century), Late Old Japanese (9th–11th centuries), Middle Japanese (12th–16th centuries), and Modern Japanese (from the 17th century). Old Japanese was considerably different from Modern Japanese in phonology, morphology, and vocabulary, but not so much in syntax (the arrangement of words and word elements in sentences).

From Old Japanese to Modern Japanese there have been numerous sound changes, among them the shift of initial p- to h- in most of the modern dialects and the loss of three vowels, usually represented as *ï*, e, and 6. Some remnant of vowel harmony was seen in Old Japanese. In vowel harmony certain vowels are restricted by the language structure from occurring in successive syllables of a word. Thus, in one word root or stem o never co-occurred with o, and rarely with *u* and a; *e.g.*, the -ko ending in *kökö* "here," *sökö* "there" appears as -ku and -ko in *iduku* "where" and *miyako* "metropolis (*miya* "palace"). These words have become koko, soko, doko, *mi*yako in Modern Japanese.

In Old Japanese and Late Old Japanese there was a distinction between "finite" forms (which occur at the end of a sentence as the predicate) and noun-modifying forms of verbs and adjectives—*e.g.*, the finite forms *uku* "receive(s)," oku "get(s) up," shiroshi "is white" differ from the corresponding noun-modifying forms *uku*ru, okuru, *shiroki* (later shiroi). In Middle Japanese the latter began to replace the finite forms (uku, oku, *shiro*shi), which ultimately disappeared from the spoken language. In Old Japanese and Late Old Japanese there was a rule of peculiar syntactic agreement: when the predicate verb or adjective was preceded by a word suffixed with such a particle as *zo* (emphatic), ka (interrogative), and so forth, the sentence was finished with the noun-modifying form instead of the finite form. This syntactic restriction disappeared, however, as the result of the above-mentioned change in syntax. Later, on the analogy of the forms such as ukete "having received" and okite "having got up," ukuru and okuru changed into the present forms—*ukeru* "to receive," *okiru* "to get up."

The on and kun of the kanji

Writing systems. During the several centuries after the adoption of the kanji, the Japanese apparently used classical written Chinese as their formal written language. As they became accustomed to the characters, however, they tried to write Japanese with them, and in the process the on and *kun* of every kanji became established. Each kanji represents a Chinese word or morpheme, which has its own sound and meaning. The on is a Japanese imitation of the Chinese sound; *e.g.*, the 8th-century Chinese forms pat "eight" and tap "answer" became Japanese *pati* and mfu, respectively. The kun of a kanji is an indigenous Japanese word with a meaning similar to that of the Chinese; it is this reading that the Japanese are accustomed to give the kanji. Because the Chinese word pat means "eight," the kun reading of the kanji for this word is ya, which is a Japanese term for eight. The kanji for the Chinese word pa "wave" was read by the Japanese either as pa (an on) or as nami (a kun). When a kanji is used to represent a Japanese syllable by means of its on or *kun* without reference to its meaning, it becomes a kana, a phonogram. For instance, when the kanji for the Chinese word pa "wave" is used for the sound pa in such Japanese words as pana "flower" and *payashi* "fast," it becomes a kana. As early as the 6th century, there are examples of kanji used as kana. Although the Kojiki and the *Manyōshū* of the 8th century are written exclusively in kanji, the language represented is Japanese, not Chinese. The Kojiki, however, uses more kun readings, mixing them with kanji used according to the Chinese syntax, while the *Manyōshū* uses many more kana. This is why kanji used as kana are called *manyōgana* (kana often becomes *-gana* in compounds).

The growing popularity of hiragana

As it was a toilsome task to write Japanese with the kanji (which are squarish and complicated in shape), the Japanese began to write them in such a cursive and simplified way of their own that the symbols retained little or no vestige of their original shape. The resulting syllabic characters, called hiragana, "common kana" (but known as *onnade* "letters for women" in the Heian period), began to appear in the 9th century. These simplified characters were used extensively by women, who wrote many poems, diaries, and novels during that period. There is, however, evidence that men also learned and used the script, although they wrote their diaries in kanji. Parallel with this script another system of syllabic writing developed in the 9th century; it was called katakana (kata "one side, one of a pair"). When the priests of the temples in Nara read Chinese texts, especially Buddhist scriptures, they would translate into Japanese as they went along, and would jot down beside the kanji for their own memory the Japanese particles, endings, and so forth that were lacking in Chinese. This was done with symbols made for private use, mainly symbols formed by abbreviating the strokes of the kanji. Originally every sect, and sometimes every person, had a special system, so that there were various symbols for one and the same syllable. In the 10th century, however, more common features began to appear, indicating that the symbols were becoming more common and popular in use. In this way Japanese began to be written with kanji and katakana intermixed and sometimes only with katakana. In the 15th century, however, the hiragana symbols, which were cursive and fine in shape, became the more popular script; literary works were written in hiragana, while scholarly or practical books were written in katakana. Even some literary works written with kanji and katakana in earlier days were rewritten with kanji and hiragana. The present orthography is in kanji and hiragana, and only European loanwords and onomatopoetic words are written with katakana. Only katakana, however, is used in telegrams and in notes typed or printed with machines in companies and offices.

In the beginning of the Meiji Era, the grammar of the language written with kanji and kana still was archaic, based mainly on that of Old Japanese and early Late Old Japanese. Toward the end of the 1880s, however, famous writers such as Futabatei Shimei, Yamada Bimyō, and Ozaki Kōyō began a successful movement to write in the colloquial style. The orthography, with its thousands of kanji symbols, was difficult to learn and to use. Therefore, after World War II, the government carried out a series of reforms that had been advocated for many years. The kana spelling, based on the sounds of early Late Old Japanese, was changed to conform to the contemporary pronunciation; and the kanji characters, which had been used without restriction, were limited to 1,850 symbols for official and daily use, and their shapes and strokes were greatly simplified.

There also have been a number of advocates of romanization since the Meiji Era, but such a program presents many difficulties. Old Japanese syllables had a much simpler structure than those of the contemporary Chinese, which is a monosyllabic language without word endings. Therefore, many different Chinese words or morphemes became homophones (words pronounced alike) in Japanese as early as the 8th and 9th centuries; *e.g.*, the Japanese imitated the Chinese ***k, k', x*** (and ***g,*** y) sounds with only a single ***k*** sound. Moreover, sound changes in Japanese during the succeeding 12 centuries produced a great number of homophones; for example, the sound sequences ***au*** (from Chinese ***au*** and ***ang), afu, ou,*** and ***ofu*** that were distinct from each other in Old Japanese and early Late Old Japanese have all become the same *ō* today. Accordingly, Japanese now has a great many homophonous kanji, so that the Chinese loan morphemes that clearly convey certain meanings when written with kanji would very often become incomprehensible when romanized. Moreover, kanji have more characteristic configurations than would the same words written with roman letters, and thus enable rapid reading. In addition, a high literacy rate prevails throughout the entire Japanese nation, and the people are presumed to be so accustomed to the kanji and kana that such a great change in writing as romanization would undoubtably encounter very strong resistance.

BIBLIOGRAPHY. TAMAKO NIWA and MAYAKO MATSUDA, ***Basic Japanese for College Students*** (1964); and TEC COMMITTEE ON JAPANESE, ***TEC Japanese: The Basic Course, 2*** vol. (1968–70), are both recommended for learning spoken Japanese. The latter is accompanied by magnetic tapes that record all the utterances in the books in very good standard pronunciation. ELEANOR H. JORDEN and H.I. CHAPLIN, ***Beginning Japanese,*** 2 pt. (1962–63), also has good examples of Japanese sentences. HOWARD HIBBETT and GEN ITASAKA, ***Modern Japanese: A Basic Reader, 2*** vol. (1965), is a good book for learning written Japanese.

ROY ANDREW MILLER, ***The Japanese Language*** (1967), an up-to-date and comprehensive outline of the language with a good selective bibliography, includes chapters on the historical and geographical setting, genetic relationship, written systems, dialects, phonology, loanwords, "special and notable" utterances, and grammar and syntax. THOMAS A. SEBEOK (ed.), ***Current Trends in Linguistics,*** vol. 2, ***Linguistics in East Asia and South East Asia*** (1967), includes very good accounts on various aspects of Japanese linguistics, with selective bibliographies.

The following works are in Japanese: SHINKICHI HASHIMOTO, ***Chosakushū,*** 13 vol. (1946–), includes the most fundamental and comprehensive articles on Japanese and Japanese linguistics. SANKI ICHIKAWA and SHIRO HATTORI (eds.), ***Sekai Gengo Gaisetsu,*** vol. 2 (1955), contains a good outline of Japanese. HIDEYO ARISAKA, ***Kokugo On'inshi no Kenkyū,*** rev. ed. (1957), is a collection of excellent papers treating various phonetic and phonological problems in the history of Japanese; his *Jōdai On'inkō* (1955) is a fundamental detailed study on the sounds of 8th-century Japanese. ***Nihongo no Rekishi*** (1947) contains good concise articles on the various periods of the history of Japanese by several authors. Among the dictionaries, the following are recommended: KOKUGOGAKKAI, *Kokugogaku* ***Jiten*** (1955), a dictionary of Japanese linguistics and philology; KYOSUKE KINDAICHI (ed.), ***Jikai*** (1952), a comprehensive dictionary of Japanese with accent notation; ***Jidai-betsu Kokugo Daiiitsen: Jōdaihen*** (1967) lists exhaustively the vocabulary of Old Japanese; SENKICHI KATSUMATA, ***New Japanese–English Dictionary*** (1954).

(S.Ha.)

Japanese Mythology

Japanese mythology here refers to the indigenous mythology of Japan. Mythological forms and concepts derived from Buddhist or Chinese mythology are presented only insofar as they have influenced the development of indigenous Japanese mythology. This article includes an outline of some of the most important myths in Japanese religion as well as information on their origins, relation to legend, ritual, and art, and their use in politics. The myths of the Ainu people are not included.

SOURCES AND TYPES OF MYTH

Ethnic and social origins. The earliest collection of myths in Japan—the *Koji-ki* (712) and ***Nihon-gi,*** or ***Nihon shoki*** (720)—are by no means examples of purely indigenous religious belief. Even at this early time, the influence of China can be discerned. Both of these documents were written with Chinese characters, and the ***Nihon-gi*** was actually written in Chinese. Chinese ideas also permeate Japan's earliest recorded myths; this influence may be seen, for example, in Japanese notions about Yin and Yang—the division of nature into two separate, opposing categories. Furthermore, even the material that is not obviously Chinese probably had its origin far from the Japanese archipelago.

Diverse ethnic groups

The Japanese islands were inhabited as far back as the Pleistocene Epoch. Subsequently, there took place several waves of immigration from various sources, adding diverse elements to the making of the Japanese people. In earlier times, a north–south interflow of culture along the Pacific coast of Japan had created a "circa-Pacific culture." One ethnic group active in this period, the Ainu, are still found in the northernmost part of the country. Their religions and myths contain many vestiges from the days when they lived primarily by hunting and fishing. One example is their belief that game animals live in human form in another world. They come to this world as animals to be hunted and eaten by people and if the latter pay sufficient homage to their spirits, they go back to their own world with satisfaction, carrying with them gifts from their hunters. The following year they return to reciprocate the favour. This "potlatch" idea is shared by many native tribes in Eurasia and North America.

The Neolithic era lasted fairly long in Japan, where it is specifically called the Jbmon period. Archaeological artifacts from this period include female clay figures, apparently representing the Earth Mother or the goddess of fertility; earthenware decorated with viper patterns that seem to reflect a cult of the serpent; and clay masks that may have been worn by shamans (medicine men). The Japanese islands–with this aboriginal culture then received successive waves of immigrants from the nearest continent (East Asia) and the Pacific. The northern continental area of East Asia consists of steppes and deserts, and lying south of it is an agrarian area with great rivers. There was a process of confluence between the peoples and cultures of the two areas on the continent, and under the pressure of moving ethnic groups there, some of them are believed to have emigrated to Japan via the Korean Peninsula and other parts of the China coast, probably including the Shantung Peninsula.

The Jbmon period was followed by the Yayoi period (c. 250 BC to c. AD 250), in which metal articles began to be used. Around this time agriculture became prevalent in Japan. Small centres of political power emerged in various parts of the country, and finally a fairly large-scale regime headed by a shamanic female sovereign came into being. The most important farm crop in Japan, rice, is believed to have been brought initially from South China, and the religion and myth of the ancient Japanese are notably characterized by rites in which farmers paid homage to their ancestral gods by offering them samples of rice they had grown and praying for a rich crop the following year.

In the subsequent Tumulus (Great Burial) period (*c.* AD 250 to c. AD 500), the Japanese lived in a society composed of clans ***(uji),*** each worshipping its own ancestral gods (called *uji-gami*) and headed by a chief ***(uji-no-kami)*** who both presided over religious rites and held secular power. But this role was gradually divided into a political and a religious function, and those specializing in the latter further split into a group consisting of male shrine priests (called ***megi, hafuri,*** or ***kannushi)*** and another group comprised mostly of strongly shamanic females (called ***miko).*** Some ***miko*** belonged to shrines whereas others did not. The latter included ***ichiko,*** who were active among common people as mediums, through whose mouths the spirits of others, both living and dead, were believed to speak. It was also believed that people were sometimes possessed by the spirits of such animals as foxes, raccoon dogs, and snakes, and had some peculiar mental experiences in that condition. It was held as well that some families were particularly akin to such spirits. Beliefs of this sort are also found in some tribes on the Asian continent, such as the Miao. In Japan, they are apparently survivals from old tribal times. Some ritual dances and music performed by priests and priestesses were later secularized and became the origins of recreational theatricals and dances.

Most of the surviving Japanese myths are recorded in history books written in the early 8th century. They tell of the origin of the ruling class, and were apparently aimed at strengthening its authority. Therefore, they are not pure myths but have much political colouring. Nevertheless, they incorporate many typical folklore patterns, some of which are believed to have originated somewhere far on the Eurasian continent. For example, the story of Susanowo killing an eight-headed serpent and saving princess Inada belongs to the Perseus-and-Andromeda type of tales. One Japanese scholar, Seki Keigo, believes that the story is related to three universal folklore patterns: the Dragon Slayer, the Three Stolen Princesses, and the Twins or Blood Brothers. According to him, the myths concerning Susanowo and Okuni-nushi (hero of the Izumo cycle of regional myths) have the same origin. The original story was that two heroes destroyed a monster and saved a woman; then one of them betrayed the other and killed him; the latter soon came back to life and retrieved the woman by showing some evidence. To understand Japanese myth, it is essential to analyze the process of its making in the above manner and examine its components individually. But until the end of World War II, Japanese scholars were not permitted to analyze Japanese ancient history and myth with complete freedom, and little analytical work was done in that field. After the war, the new cultural freedom led to open research into Japanese mythology and a variety of novel theories about it. None has been established as universally acceptable.

Myths and genealogies

Documentary and ritual sources. Genealogies and mythological records were kept in Japan, at least from the 6th century AD and probably long before that. Even before these materials were written down, professional reciters (katari-be) attached to the great clans preserved traditions by word of mouth. By the time of Emperor Temmu (7th century), it became necessary to know the genealogy of all important families in order to establish the position of each in the eight levels of rank and title modelled after the Chinese court system. For this reason, Temmu ordered the compilation of myths and genealogies that finally resulted in the Koji-ki and Nihon-gi. The compilers of these and other early documents had at their disposal not only oral tradition but also documentary sources such as the "Imperial Sun-Lineage" and the "Ancient Dicta of Former Ages" in the case of the Koji-ki. A greater variety of sources was available to the compiler of the Nihon-gi. While the Koji-ki is richer in genealogy and myth, the Nihon-gi adds a great deal to scholarly understanding of both the history and the myth of early Japan. Its purpose was to give the newly Sinicized court a history that could be compared with the annals of the Chinese. In addition to these two books, there is also the *Kogoshūi* (AD 807), the records of traditions transmitted by the Imbe, a hereditary priestly clan. Other valuable records of early myths are found in provincial gazetteers (*fūdoki*) prepared in the 8th century by the order of the Imperial court. These provide a glimpse of Japanese myths not bent to serve the interests of the court. Mythological legends were also contained in liturgical prayers (norito) that were recited during religious services in the Imperial court.

Myths and rituals

Myths and rituals are closely related to each other. The most important ritual function of the court was to ensure a good harvest of rice. Many ceremonies were performed for this purpose, the most important being the harvest festival, or Niiname-sai.

The ancient Japanese initially did not worship their gods in shrines, but believed that the gods descended onto beautiful conical mountains, high trees, thickets, huge rocks, and other such spots, which were considered sacred. In the spring, the people invited the gods to journey from such places to their villages; in the fall, the gods were sent back. The practice of felling a sacred tree on a mountain, dragging the log down to a village, and erecting it as a mi-hashira (holy pillar) must be connected in some way to this old belief. To people living on a seashore, gods seemed to come from somewhere beyond the sea. At many shrines, the custom is still maintained of carrying a portable shrine back and forth to a beach at festival time.

MYTHIC THEMES AND THEIR CHARACTERS

Cosmology

Imperial court myths. The purpose of the cosmologies of the Koji-ki and Nihon-gi is to trace the Imperial genealogy back to the foundation of the world. In the beginning, the world was a chaotic mass, an ill-defined egg, full of seeds. Gradually, the finer parts became heaven (Yang), the heavier parts earth (Yin). Deities were produced between the two: first, three single deities, and, then, a series of divine couples. According to the Nihon-gi, one of the first three "pure male" gods appeared in the form of a reed that connected heaven and earth. A central foundation was now laid down for the drifting cosmos, and mud and sand accumulated upon it. A stake was driven in, and an inhabitable place was created. Finally, the god Izanagi ("he who invites") and the goddess Izanami ("she who is invited") appeared. Ordered by their heavenly superiors, they stood on a floating bridge in heaven and stirred the ocean with a spear. When the spear was pulled up, the brine dripping from the tip formed the Onogoro, an island that became solid spontaneously. Izanagi and Izanami then descended to this island, met each other by circling around the celestial pillar, discovered each other's sexuality, and began to procreate. After initial failures, they produced the eight islands that now make up Japan. Izanami finally gave birth to the god of fire and died of bums. Raging with anger, Izanagi attacked his son, from whose blood such deities as the god of thunder were born. Other gods were born of Izanami on her deathbed. They presided over metal, earth, and agriculture. In grief, Izanagi pursued Izanami to Hades (Yomi) and asked her to come back to the land of the living. The goddess replied that she had already eaten food cooked on a stove in Hades and could not return. In spite of her warning, Izanagi looked at his wife and discovered that her body was infested with maggots. The angry and humiliated goddess then chased Izanagi from the underworld. When he finally reached the upper world, Izanagi blocked the entrance to the underworld with an enormous stone. The goddess then threatened Izanagi, saying that she would kill a thousand people every day. He replied that he would father one thousand and five hundred children for every thousand she killed. After this, Izanagi pronounced the formula of divorce. Whatever the original meaning of this myth, it seems to be used here to account for the growth of the population of Japan.

Izanagi then returned to this world and purified himself from the miasma of Hades of the seashore. From the lustral water falling from his left eye was born the sun goddess Amaterasu, ancestress of the imperial family. From his right eye was born the moon god and from his nose, the trickster god Susanowo. Izanagi gave the sun goddess a jewel from a necklace and told her to govern heaven. He entrusted the dominion of night to the moon god. Susanowo was told to govern the sea. According to the Koji-ki, Susanowo was dissatisfied with his share and ascended to heaven to see his older sister. Amaterasu, fearing his wild behaviour, met him and suggested they prove their faithfulness to each other by bringing forth children. They agreed to receive a seed from each other, chew it, and spit it away. If gods rather than goddesses were born, it would be a sign of the good faith of the one toward the other. When Susanowo brought forth gods, his faithfulness was recognized, and he was permitted to live in heaven.

Susanowo's pranks

Susanowo, becoming conceited over his success, began to play the role of a trickster at the court of Amaterasu. Such tricksters, found in the myths and tales of many folk, often play the part of ribald anticreators who, in effect, bring forth a countercreation. Susanowo scattered excrement over the dining room of Amaterasu, where she was celebrating the ceremony of the first fruits. His worst offense was to fling a piebald horse into Amaterasu's chamber, a horse he had "flayed with a backward flaying" (a ritual offense). At the sight of this monstrosity, "the women weaving the heavenly garments were so much alarmed that they struck their shuttles (hi) into their private parts and died" (*Koji-ki* I: xv). In another version (Nihon-gi I: **37** and **43**), Amaterasu herself was wounded. According to the *Kogoshūi,* Susanowo broke down the divisions of the heavenly rice fields by filling up the irrigation channels, opening the floodgates, and sowing seed over again. Then he erected rods in the fields, causing the rice to deteriorate. Susanowo's own fields were described as barren (*yase*) places.

Librairie Larousse

Amaterasu, attracted by the laughter of the gods, emerges from her cave. Detail of a woodblock print by Kunisada Toyokuni II (1777–1835).

Enraged at the pranks of her brother, the sun goddess hid herself in a celestial cave, and darkness filled the heavens and the earth. The gods were at a loss. Finally, they gathered in front of the cave, built a fire, and made cocks crow. They erected a sacred evergreen tree, and from its branches they hung curved beads, mirrors, and cloth offerings. A goddess named Ame-no-uzume then danced half-nude. Amaterasu, hearing the 800 myriads of gods laughing and applauding, became curious and opened the door of the cave. Seizing the opportunity, a strong-armed god dragged her out of the cave. This story, like that of the Greek Demeter and other Near Eastern tales, is closely related to winter festivals, during which the barrenness of the land is associated with the grief of the goddess of earth. (Some scholars have wondered why a heavenly deity should do such earthly things as cultivate rice fields and hide in a cave and have speculated that Amaterasu was originally an earth goddess.) But this theme—of the celestial cave—has long been viewed by many scholars as representing a solar eclipse, its prototype being the old solar eclipse myth found among the Austroasiatic peoples of Southeast Asia.

Susanowo on earth

Having angered the heavenly gods and having been banished from heaven, Susanowo descended to Izumo, where he rescued Princess Marvellous Rice Field (**Kushi-inada-hime**) from an eight-headed serpent. He then married the Princess and became the progenitor of the ruling family of Izumo. Susanowo, an evildoer in heaven, became a perfect gentleman after his descent to earth. He made trees grow to provide lumber for boats, palaces, and coffins, and fathered dtoshi-no-kami (god of the harvest) and Uga-no-mitama-no-kami (god of rice), by a daughter of the mountain god. Susanowo was intimately associated with the processes of fertility. Among his many descendants were gods related to water, rivers, cereals, trees, and thunder. The most important member of the family of Susanowo was the god **Ōkuni-nushi,** the great earth chief, who assumed control of this region before the descent to earth of the descendants of the sun goddess. Molested by other gods, he once had died but was revived by the efforts of his mother. After this, he ran away to the netherworld, married a daughter of Susanowo, and returned to the upper world. Tradition says that with the help of **Sukuna-bikona-no-mikoto,** a midget god who had drifted ashore in a tiny boat, **Ōkuni-nushi** governed the country and benefitted the people by establishing the arts of healing.

Before long, Amaterasu, the leader of the celestial gods—the gods of Izumo were known as earthly gods—asked **Ōkuni-nushi** to turn over the land of Izumo, saying that "the land of the plentiful reed-covered plains and fresh rice ears" was to be governed by the descendants of the heavenly gods. After the submission of Izumo, **Amaterasu** made her grandson Ninigi (a word said to represent rice in its maturity) descend to earth. According to the Nihon-gi, Amaterasu handed Ninigi some ears of rice from a sacred rice field and told him to raise rice on earth and to worship the celestial gods. The grandson of the sun goddess then descended to the peak of Takachiho (meaning high thousand ears) in Miyazaki, Kyushu. There he married a daughter of the god of the mountain, named Konohana-sakuya-hime (Princess Blossoms of the Trees). At the time, the father of this princess had offered Ninigi his choice between his two daughters, the other being **Iwanaga-hime** (Princess Rock Durable). It was his fateful choice of beauty over durability that caused the life-span of men and even of emperors to be short from that day forth.

The lost fishhook story

When his wife became pregnant in a single night, Ninigi wondered whether the child was his own. In order to vindicate her innocence, the princess set fire to her room, giving birth to three sons in the fire. The last born was Hikohohodemi-no-mikoto (Fireshade), a hunter. His elder brother, Hoderi-no-mikoto (Fireshine), was a fisherman. On one occasion, they exchanged the implements of their respective ways of life, namely, a bow and arrow for a fishhook. The younger brother then lost his brother's fishhook in the sea. When the elder brother demanded the return of his fishhook, the younger god was compelled to go into the sea to search for it. There he married the daughter of the sea god and returned with the fishhook, which he had recovered with her assistance, and also with two magical jewels that controlled the tides. With the supernatural power of these jewels, he reduced his elder brother to poverty and finally brought him to his knees by means of a flood.

This story of Hikohohodemi-no-mikoto going into the sea to recover a lost fishhook is related to the common folklore pattern of the Lost Fishhook. Similar tales are found widely both in Oceania and on the Asian continent, and the Japanese version particularly resembles those in Micronesia and Indonesia. An interesting fact in this connection is that the descendants of the older of the brothers, Hoderi, who had lost the contest and become a subject of Hikohohodemi, were said to be the ancestors of a Kyushu tribe called the Hayato. This tribe later supplied guards for the fences of the Imperial Palace for many generations; these guards also performed a dance in the court **Daijō-sai** festival, holding shields decorated with a spiral pattern that was said to represent the lost fishhook. Moreover, the Hayato have been considered to share many of the characteristics of southern Pacific peoples.

The pregnant daughter of the sea god came ashore in Miyazaki and gave birth to a child on the beach. The child's name was Ugaya Fukia-ezu-no-Mikoto, later to be the father of the first legendary emperor of Japan, Jimmu. While this is generally regarded as the watershed between the "age of the gods" and the historical age, Jimmu's eastern expedition was also a myth. The story probably reflects the memory of the historical fact that the Imperial clan once moved eastward from Kyūshū to the Yamato province. Similarly, both the story of Prince Yamato-takeru's subjugation of Izumo, Kyūshū, and the eastern provinces during the reign of the 12th emperor, Keikb, and the story of Empress Jingō or Jingii, empress of the 14th emperor, Chiiai, conquering the kingdom of Shiragi in Korea have the air of myth though they are based on the historical memory of an actual Korean expedition and the conquest of domestic provinces. The life of Yamato-takeru was filled with suffering and ended, finally, in tragedy. He has many of the characteristics of the hero of the Western classical epics.

Folk myths and legends. Among the many myths that have been preserved, one seems to be strangely related to the myth of Hainuwele, a deity found in New Guinea. This is the myth of a god from whose sacrificed body various kinds of grains and tubers are produced. In Japan this myth seems to be associated with a group called the "celestial Kuma people," presumably archaic agriculturalists. The sun goddess, one variant of the story reveals, sent the moon god to visit the goddess of food. He was angered when she produced food for him from her mouth and killed her on the spot. From the body of the dead goddess grew millet, panic, rice, wheat, large and small beans, and even cattle and horses. The Kuma people took these things to heaven and offered them to the sun goddess. The latter was pleased and used these cereals as seed in her dry and wet fields.

While myth tells how things came to be and what is behind all things, legends tell about marvellous events in a specific place. Unlike fairy tales, both myths and legends are believed to be true. Because legends tend to flourish in closely knit social groups, the traditional Japanese village was virtually a hothouse for the production of folktales. In the villages, there grew up stories about the ***kappa,*** a goblin with a saucer-like head that holds water. When the water is spilled, the ***kappa*** loses his strength. Known to lurk about rivers, the ***kappa*** often waylays children or horses, killing them by pulling out the intestines through the anus. Another demon in Japanese folklore is the ***tengu,*** a creature with a long, pointed nose who lives in pine trees in the mountains, where he often abducts human beings. Tengu, it seems, were originally worshipped as mountain spirits, but gradually lost status until, partly under the influence of Shugen-dō (an order of mountain ascetics), they came to be regarded as evil goblins. The ***oni*** also were originally regarded as mountain spirits and played the role of farm gods. With the lapse of time, they fell in status, and under the influence of Buddhism finally turned into a sort of fiend.

Tales concerning animals

Many animals have the power to bewitch men. The cat, snake, and badger are especially important in this respect. The fox was a creature familiar to common people as it was commonly found around their villages. Hence, it came to be regarded as a messenger of Inari, one of the most popular deities in Japan. The fox was also said to bewitch people. Sometimes it disguised itself as a beautiful woman and tempted a man, who on coming to his senses some time later would find himself in an open grave or going about on all fours eating leaves, to the astonishment of his friends. Another demon is the earthquake fish, an enormous catfish whose motions cause earthquakes on the land above it. Curiously, many of these demons also have a benign aspect. The ***kappa*** and ***tengu*** sometimes teach people the arts of swordsmanship and healing. The fox has been known to sacrifice itself or its children to help cure its benefactors. The earthquake fish brings employment to impoverished artisans when it destroys buildings in earthquakes.

POLITICAL AND SOCIAL ASPECTS OF MYTH IN JAPAN

While myth in Greece evolved into literature and, in China, into history, in Japan the main collections of myth that have been preserved have been largely political documents. They have established divine origins for the Imperial and paraimperial families, transforming power into authority. In medieval times, the imperial family declined in actual power, and Buddhism and Confucianism came to influence Japanese mythology. Buddhism added stories of saints and ***bodhisattvas*** (Buddhas-to-be) to the already rich store of Japanese legends, while Confucianism added a moralizing touch. Native elements became thoroughly mixed with legendary themes from China and even India. In the middle of the Tokugawa period (1603–1867), there was a revival of interest in what was believed to be pure Japanese mythology. With the restoration of the imperial regime in 1868, this archaizing tendency in Japanese culture was given greater scope. Shintō shrines were purified of all Buddhist accretions and were reorganized under the program of State Shintō—according to which religion and politics were seen as one. Myths were included in the public school curricula and became so sanctified that they could no longer be studied critically. The literal belief in a divine emperor. who was the descendant of the sun goddess and the symbol of the sacred mission of Japan, provided a mythological foundation for the ethnocentric and nationalistic fanaticism that resulted in Japan's expansionism during the 1930s and final defeat in 1945. After World War II, mythology was largely eliminated from school curricula, while Shintō shrines lost their special government protection. More recently, however, attempts have been made to reintroduce the ancient myths into the schools. On the academic scene, scientific research on myths and folklore has been set free from the government's interference and has been stimulated by recent progress in ethnology, archaeology, history of religions, folklore studies, and other related disciplines.

BIBLIOGRAPHY. The two basic sources for knowledge of Japanese mythology are the ***Koji-ki*** and the ***Nihon-gi,*** 8th-century compilations that show Chinese influence but retain the fundamental structure of Japanese myths. The former of these, Japan's oldest written record, was first translated by BASIL H. CHAMBERLAIN as "'Ko-ji-ki' (Records of Ancient Matters)," ***Transactions of the Asiatic Society of Japan,*** vol. *10,* suppl. (1882); and more recently by DONALD L. PHILIPPI as *Kojiki* (1968). Philippi's introduction, notes, and glossary are especially helpful. The ***Nihon-gi*** complements the earlier work in many ways and was translated by W.G. ASTON and published in 1896 as ***Nihongi, Chronicles of Japan from the Earliest Times to A.D. 697;*** originally published in the ***Transactions of the Japan Society,*** suppl. *1,* and reprinted in 1956. Another valuable source is the ***Kogoshiii,*** an account written according to the Imbe clan, a Shintō priestly family; it dates from the early 9th century and has been translated by G. KATO and H. HOSHINO under the title ***Kogoshiii: Gleanings from Ancient Stories,*** 2nd ed. rev. (1925). A good but brief discussion of the topic is E. DALE SAUNDERS' contribution, "Japanese Mythology," in S.N. KRAMER (ed.), ***Mythologies of the Ancient World*** (1961). The standard study is ***Essai sur la mythologie japonaise*** by NOBUHIRO MATSUMOTO (1928). Folklore aspects of the topic may be found in studies in RICHARD DORSON's edition of translated articles by leading Japanese folklorists, entitled ***Studies in Japanese Folklore*** (1963); in KEIGO SEKI, ***Folktales of Japan*** (1963); and in HIROKO IKEDA, ***A Type and Motif Index of Japanese Folk-Literature*** (1971). C. OUWEHAND, *Namazu-e **and Their Themes*** (1964), is a fascinating study of mythic, legendary, and folkloristic components in a collection of 19th-century pictures.

(N.M.)

Japanese Philosophy

The Japanese equivalent for "philosophy" is ***tetsugaku,*** a word coined when Western schools of thought were first introduced into Japan after the Meiji Restoration (1868), the great upheaval that overthrew the shogunate (which had governed Japan for over 250 years), restored Imperial rule, and opened the country to the West. Before the Meiji era, one of the two principal schools of Japanese thought arose from Buddhism and was highly tinged with a religious character and often metaphysical; a second arose from Confucianism and was essentially a system of moral philosophy. From the 18th century on thkre were some independent thinkers who were critical of these two major schools. Since the Meiji Restoration, the philosophies of all of these schools and thinkers have been commonly classed together under the term tetsugaku. In the 20th century the influence of Western philosophy has been decisive among intellectuals, though traditional ways of thinking deriving from Shintō, Buddhism, and Confucianism still prevail among the people.

Earlier philosophical thought

THE RISE OF PHILOSOPHY IN JAPAN

The Buddhism of Prince Shotoku. Recorded Japanese philosophical thought began at the turn of the 6th century, with the writings of ShBtoku Taishi, under whom Japan became a centralized state. He lectured on the Chinese versions of three *sūtras* (classical scriptures) of Mahāyāna Buddhism, the more liberal and metaphysical branch of Buddhism. Certain commentaries on these *sūtras* that are jointly called the Sankyd gisho ("Commentaries on the Three *Sūtras*"—on the *Vimalakīrtinirdeśa-sūtra* and the *Śrīmālādevī-siṃhanāda-sūtra* and on the *Saddharmapuṇḍarīka-sūtra*, or Lotus *Sūtra*) may have been written by Prince Shbtoku. Although they are not works of systematic philosophy, they embody a great many philosophical thoughts that are valuable, whoever the author may have been. These commentaries, which are the oldest works in existence among Japanese classical writings, have been of decisive significance for Japanese Buddhism.

Seminal role of the "Commentaries on the Three *Sūtras*"

Philosophical approach. Shōtoku's procedure was dialectical in the sense that one view is made to neutralize another contrasting view in the interest of a more fundamental affirmation. He envisaged the Absolute to be Voidness (*śūnyatā*) and called it nonduality because Voidness is neither Being nor Nonbeing but is Mother, the source from which wisdom originates.

Shdtoku inherited the idea of the central Buddha from the Lotus *Sūtra*. The Mahāyāna substituted for the historical Buddha the eternal Buddha since Buddha's existence in the early form is not his true and proper mode of being. Buddha's essential (or ultimate) body (dharmakdya) had been regarded as ineffable, being located beyond the phenomenal sphere. Prince ShBtoku, however, considered it to be in the phenomenal sphere.

Prince Shbtoku distinguished source, or origin (hon), from appearance, or manifestation (*shaku*). Only what has its source as beginning (Latin, *principium*) can manifest itself in appearance; and that which does not so manifest itself cannot give evidence of its source.

Perfect-one store and Nirvana through practice

The basis of human existence is called "perfect-one store" (*tathāgata-garbha*). In its transmigration the soul continues to exist without perishing, embraced in the womb, or store, of this perfect one, which is the basis of human existence not only after man has been delivered from defilements but also even while man is still in defilements.

In traditional Buddhist philosophy, the accomplished Nirvāṇa was considered to be complete extinction of the self; but Prince Shbtoku tried to find it in the process of religious practice. The ideal status of a human being thus lies in the realization of the unity with ultimate truth "today"—*i.e.*, in daily temporal existence.

This-worldliness. It is well known that primitive Shintō, the native Japanese religion, was closely tied with agricultural rituals in agrarian villages and that Shintd gods have been symbolized, even up to the present day, as gods of production.

After the Japanese came into contact with Chinese religions, they adopted and absorbed Confucianism, which teaches the way of conduct within a concrete human nexus. Confucianism did not conflict with the Japanese thought patterns of the time.

There were problems, however, in the case of Buddhism. Buddhism declared itself to be a teaching of "otherworldliness." Its central figures have all been monks and nuns, who have freed themselves not only from their families but from any specific human relationships. But the topographical characteristics of Japan, vastly different from those of India, required men to serve their fellows within a specific human nexus. The doctrines of early Buddhism, together with those of the ensuing traditional conservative Buddhism, were despised and rejected by the Japanese under the name of Hīnayāna ("Lesser Vehicle"), whereas Mahāyāna ("Greater Vehicle") Buddhism was particularly favoured and adopted; some schools of Mahāyāna, if not all, advocated comprehending absolute truth within a secular life. In accepting Buddhism, the Japanese selected in particular the branch that asserted their own this-worldliness.

Secular life and the lay believer

This attitude in assimilating Buddhism is clearly shown in the case of Prince ShBtoku, whose selection of the three *sūtras* out of the multitude known in India and China was based entirely upon the Japanese way of thinking. The *Shōman-gyō* (*Śrīmālādevī-siṃhanāda-sūtra*) was originally preached, in compliance with Buddha's command, by Madame Shbman (Śrīmālā, or Glorious Garland), who was a queen and a lay believer. The Yuima-kyb (*Vimalakīrtinirdeśa-sūtra*) has a dramatic composition, in which Yuima (Vimalakirti, or Spotless Fame), a lay believer, gives a sermon to priests and ascetics—reversing the usual order—that commends the seeking of truth in secular life. And according to the *Hokke-kyō* (*Saddharmapuṇḍarīka-sūtra*, or Lotus *Sūtra*), all laymen who faithfully follow any of the teachings of Buddha are expected to be saved. The Crown Prince himself all through his life remained a lay believer, thus emphasizing the necessity for realizing Buddhist ideals within concrete human situations. Shdtoku asserted: "Reality is no more than today's occurrence of cause and effect." Existent beings are already qualified for Enlightenment, and there is no necessity for laymen to seek qualifying actions from Buddhas or from bodhisattvas (who forgo Enlightenment in order to minister to men).

Moral values. Prince Shbtoku esteemed actions and good deeds practiced in the worlds of life and death; for their accumulation eventually admits a person into Buddhahood. The ultimate state of religion is not bestowed upon men by divine entities that transcend them but is realized through practical behaviour within the human nexus. "The mind" of man, he said, "is the origin of all virtues." It is likely that the Prince regarded compassion or love as the basic human value.

Esteem of activity. Prince Shbtoku put special emphasis upon altruistic deeds and considered that Buddhas and bodhisattvas should serve all living beings. Shōtoku permitted the acquisition of wealth "in accordance with the law"; and traces even of Utilitarianism can be noticed in his writings.

The ruler's broad concerns and ideals

Applied to politics, this doctrine means that the ideal ruler should be beyond all the differences of dispositions and interests of the people and yet care for them all—not for the sake of their individual interests but for their ultimate welfare in spiritual communion. Thus, the people follow their ruler in full realization that his high aims are derived from the ultimate truth.

Tolerance. Tolerance was a feature of the thought of Prince ShBtoku. He did not forbid or oppress Shintō but instead put it in its proper sphere of action and kept it alive under the leadership of Buddhism. According to the Prince, there is no innate difference between the saint and the most stupid man. Everyone is primarily and equally a child of the Buddha. "Even heretics are your teachers," he said. In fact, in his eyes, there were no heretics.

Early Confucianism. The first main period in the history of Confucianism in Japan extended from the introduction of Chinese learning at the beginning of the 5th century to the spread of the so-called Sung philosophy of Neo-Confucianism at the beginning of the 13th. In this period, a tremendous influence was exerted by Confucian ethics, political theory, and legal and educational institutions, all based on the universal principle of Tao (Japanese Michi)—the effortless way by which all is done. Confucian studies were inseparably connected with the study of the Chinese language, which in turn was indirectly fostered through the introduction of Buddhism. Moreover, the tradition-oriented philosophy of Confucianism was increasingly patronized by the government as a convenient aid in support of state policy.

Ethical, political, legal, and educational theory

Confucian learning became particularly influential in the second half of the 7th century, when it motivated a series of Imperial rescripts that applied universal laws and legal concepts to human affairs. By the end of the century the resulting Taihō code comprised a total of 17 volumes. In the educational system, Chinese Confucian Classics—on ethics, literature, mathematics, and medicine—constituted the entire curriculum.

NARA AND HEIAN PERIODS

The dominant philosophical development during the two ensuing periods of Japanese history, however, was Buddhist. During the period when the capital of the country was at Nara (710–784), philosophical ideas were maintained and discussed by the so-called Six Schools of Nara: and at the beginning of the Heian period that followed (794–1185), when the capital was at Kyōto, the Tendai and Shingon sects appeared.

Six schools of the Nara period. The six schools, introduced from China, were as follows:

The Risshū, or Ritsu, school held as its main principles the observance of strict monastic discipline and, above all, the correct transmission of the holy orders. The monks of this school adhered strictly to the discipline of conservative (Hīnayāna) Buddhism of the kind that flourishes now in South Asian countries.

The Kusha school, which also taught conservative Buddhism, was based upon the Kusha-ron (*Abhidharmakośa*) composed—about AD 320 to 400—by Vasubandhu, an Indian philosopher.

The Jōjitsu school was based upon the *Jōjitsu-ron* (*Satyasiddhi-śāstra*), written by Harivarman (about AD 250–350). A school of conservative Buddhism, it was adapted to some extent to the doctrine of the "Void."

The Sanron school, derived from the Mādhyamika school in India, stressed the doctrine of "Void." *San-ron* literally means the "Three Treatises," in reference to the treatises upon which the school is based: the *Mādhyamika-śāstra* and *Dādaśamukha-śāstra* of Nāgārjuna, and the *Śata-śāstra* of Āryadeva.

The Hossō school, a kind of Buddhist Idealism derived from the Yogācāra school of India, regarded everything as a manifestation of the fundamental Mind underlying all phenomena.

Emphasis on the interdependence of all things

The Kegon school, based on the *Kegon*, or *Avataṃsaka-sūtra*, revered the Vairocana Buddha as its principal object of worship. It emphasized the interdependent relations of various aspects of actual human existence. According to its concept of interdependent origination, all existences and phenomena are interrelated: even a flower is closely connected with all of the universe and has no separate existence in the metaphysical sense. Also, a person cannot sever himself from the past or the future; and this can be said of everything in the universe, for the Kegon philosophy holds that the universe is motivated by one great compassionate soul. Further, the relationships among individual persons are governed by the theory of interdependence under the surveillance of this one great compassionate soul.

The above-mentioned six schools might be called scholastic because their sphere of influence was limited to the monks and did not extend to the common people in general.

Two sects of the Heian period. At the turn of the 9th century, with the beginning of the Heian period, the Tendai and Shingon sects came to Japan.

Tendai philosophy. The Tendai sect was introduced into Japan by Saichō, whose honorary name was Master Dengyb (Dengyō Daishi). Tendai is based on the *Hokke-kyō*, or Lotus *Sūtra*, and accordingly teaches that all men can become Buddhas and should attempt to do so.

The most remarkable aspect of Tendai is its comprehensive character. It found a place for all Buddhist scriptures, regarding them as comprising a progressive revelation, gradually disclosed by the Buddha during his life, as he found that the intelligence of his listeners ripened.

According to man's common sense, it seems that parts depend on one another and all things depend on the whole. But the so-called complete or perfect teaching (*en-gyō*) of this sect went beyond this doctrine: it taught that the whole and the parts are identical, that the whole cosmos and all of the Buddhas are present in a grain of sand or on the point of a hair. A celebrated maxim of the Tendai states that one thought is the 3,000 spheres (*i.e.*, the whole universe), and the 3,000 spheres are but one thought. That is to say, the relations involved in the simplest thought are so numerous that they imply the existence of the whole universe; man's perceptions and thoughts are thus identical with absolute reality. This teaching leads to certain doctrines of ontology, the nature of Being. There are "three forms of existence": the void, the temporary, and the middle—*i.e.*, all things that exist depend upon their relations. If a thinker tries to isolate them and to conceive of them as having no relations, they become unthinkable and, in fact, nonexistent.

The void, the temporary, and the middle

But as temporary formative parts of the whole, they do exist; and the whole could not realize its true nature if it did not manifest itself in particulars. In this sense all things exist temporarily as phenomenal beings. Things exist or do not exist according to men's view of their relations to the whole, but the middle exists absolutely. Phenomena and the one absolute truth are, if rightly regarded, synonymous. Enlightenment, as obtained by the Buddha himself, is achieved when the significance of each of the three is properly realized.

Shingon philosophy. The Shingon philosophy was introduced by Kūkai, or Master Kōbō (Kōbō Daishi), an early-9th-century scholar. It is likely that he had some contact with Manichaeism (a dualistic movement) and with Nestorian Christianity during his stay in China.

Shingon means "True Word"—*i.e.*, a sacred spell (or mantra); and indeed this sect was interfused with magical elements preserved in the popular beliefs of India. By about 700 Indian Buddhism had become a mixed creed and may have incorporated many Iranian and Central Asiatic elements. This form of Buddhism is called esoteric Buddhism (Vajrayāna). The common people of Japan in those days wanted a religion that was impregnated with magic, and that is why the Shingon sect was so strongly welcomed in Japan.

Cosmotheism

In Shingon there have been definite secret doctrines that could be communicated orally; thus, a person not yet initiated could not claim to understand the explanations. The concept of "the essential self," which had become pivotal in Buddhist philosophy, culminated in the Shingon, the chief idea of which was cosmotheism, which is reminiscent of pantheism though somewhat different from it. In this view, the whole universe is regarded as the body of Vairocana, the supreme Buddha, and is composed of six elements: earth, water, fire, air, ether, and consciousness—in short, matter (comprising the first five elements) and mind (*i.e.*, consciousness). The five elements cannot exist without consciousness; nor can consciousness exist without the five elements. The six elements can be examined from two different aspects, viz., the essential (undifferentiated), or unconditional, aspect and the phenomenal, or conditional, aspect. The former refers to the eternal, unchanging substance; the latter, to the everchanging reality.

The essence of phenomenal things lives in absolute truth (the world of the law), and such things are so perfectly interrelated as never to obstruct (or contradict) one another. It follows that mankind and Buddhas are identical in their essence. Kiikai preached that if one follows this reasoning, the formation of figures with one's hands, the recitation of incantations, and the concentration of one's mind (the three actions of man's body, mouth, and mind) would all be identified with the corresponding actions of Buddha.

In its religious practice, the Shingon philosophy ascribed mystical meanings to specific syllables. For example, the mystical syllable ham is not only the symbol but is the living breath that is itself the living substance penetrating the cosmos. This eternal living substance is called the original principle of Three Mysteries or the Three Mysteries of the original existence or, again, the three bodies of the original existence, because the Three Mysteries are the esoteric actions of doing, speaking, and thinking.

The synthesis of sundry philosophies expounded by Master Kōbō was comprehensive. He was conciliatory and tolerant toward the native faiths of the Japanese populace, and his system incorporated not only Buddhist doctrines but also a considerable amount of pagan thought. According to him, even heathen thoughts can be manifestations of the basic principles of Mahii-Vairocana Buddha.

Kamakura and Muromachi periods

RUDDHIST PHILOSOPHY

The Kamakura period (1192–1333) was a distinctive time in which a patrician society had declined, a beneficed clergy had become corrupt, and a military class had arisen. Under great distress, the people needed a simplification of religious ministrations.

Origins and distinctives of the major sects. To deal with this situation, Zen Buddhism was introduced from China at the turn of the 13th century, and the sects of Pure Land (Jōdō-shū) and of Nichiren were founded at the same time. Thereafter, no new sects were created until the Meiji Restoration, in 1868. The major sects of Japanese Buddhism that are still extant are (1) Tendai, (2) Shingon, (3) Zen, (4) Pure Land (Jbdo, Jōdo Shin, etc.), and (5) Nichiren.

As stated earlier, the Tendai and Shingon sects originated in the Heian period; the Zen, Jbdo, and Nichiren sects arose in the Kamakura epoch.

Pure Land Buddhism. Pure Land (more exactly Pure Realm) Buddhism, as such, was founded in the 1st or 2nd century in India. It was based on the larger and smaller *Sukhāvatī-vyūha-sūtra* and on the *Amitāyurdhyāna-sūtra*, which speak of the Western Paradise of the Pure Land (Sukhāvatī, or Jbdo in Japanese), where believers are supposed to be born after death by virtue of grace for their faith and good works.

Hbnen's homage to Amida Buddha

The Pure Land sect emerged in Japan in the second half of the 12th century through the efforts of Hbnen, a priest who could find no inner certainty nor deliverance from evil in the study of Tendai nor in complex rituals nor in meditations. He therefore turned to the Amitiibha Buddha, who was said to have prepared a blissful realm for all who would call upon his name in simple faith. Hōnen therefore organized his many followers around the chanting of the words *Namu* Amida *Butsu* ("Homage to Amida Buddha"), through which alone their salvation was wrought.

Nichiren sect. A prophet and nationalist of the mid-13th century, Nichiren was born the son of a fisherman. He studied all of the schools of thought widely until he decided for himself what was the true way to deliverance. He first entered the Shingon school and then studied in the Tendai school on Mt. Hiei. There, he concluded that only one scripture is needed, the Lotus *Sūtra* (*Saddharmapuṇḍarīka-sūtra,* or "The Lotus of the Good Law"), and that the deliverance of the country from the sufferings of the time could best be achieved by a vigorous campaign for a return to the Lotus *Sūtra* and the Śākyamuni Buddha. Nichiren claimed that a person could be saved only by the spiritual power of the Lotus *Sūtra*, the gospel of which he alone was entitled to spread.

Nichiren, a born religious demagogue, wandered in various districts of the country, literally banging the drum of his beliefs in all quarters. Because of his rudeness to all other sects and to the government, he soon fell into trouble with the authorities, and his life was thus a long chain of persecutions. It was among the followers of this sect, especially those among the common people in later days, that religious fervour reached its most extreme level.

Zen Buddhism. As a specific form of Buddhism, Zen first appeared in China, where it was a peculiar Chinese version of the kind of Buddhism that had been taken from India by the sage Bodhidharma in or about the year 527. Specifically, it was a variety of the Mahāyāna school that was known as Dhyāna Buddhism, called Ch'an in Chinese and Zen in Japanese. Though the nearest English equivalent of Dhyāna is "contemplation," the term Zen has acquired in Japan a static and even dreamy connotation quite foreign to that of Dhyāna.

Dhyāna, Ch'an, or Zen means immediate insight into the nature of reality, or life. All Zen sects revere the historic sage of the Śākyas (Buddha), believe that instruction from a Zen master may awaken in a disciple the Buddha mind that everyone possesses originally, and believe in expressing religious realization in daily work.

Eisai and Dōgen: Rinzai and Sōtō sects

In 1191 Eisai (or Yōsai) carried Ch'an Buddhism to Japan in a form known as the Rinzai sect (Chinese Lin-chi). Another form, called the Sōtō sect (Chinese Ts'ao-t'ung), was introduced by Dōgen, a disciple of Eisai. Dōgen's magnum opus *Shōbō genzō* ("Essentials of Truth") was a treatise on the philosophy of orthodox Zen Buddhism as expressed in the doctrines of the Sōtō sect. Zen still flourishes today in Japan, where it occurs in its most vital form and where it has had a far-reaching effect upon the national culture.

General teachings of the sects. Japanese Buddhism, as divided into these sects, has been the spiritual basis for Japanese culture for centuries past. Thus, the teachings of the three main sects require more careful study.

Deliverance by *Amitābha's* grace in Jddo *Shinshū*. Hōnen's minor, but most influential disciple, Shinran, a religious leader of the early and mid-13th century, founded, as an outgrowth of Jbdo, the Shin ("True") school—*i.e.*, the True Pure Land sect—which is the one most widely professed by the people in the present day. Shinran admitted the deep-rootedness of sin in human existence and carried the idea of Buddha's grace to an extreme conclusion. For this, and because he married a nun and spent his life as a married priest, he has often been compared to Martin Luther.

Shinran taught that men should realize what calamity is involved in the mere fact of their being alive. All living beings are sinful; indeed, no man can live without committing sins. Sin is thus deeply rooted in human existence: men are all *karma*-bound—*i.e.*, subject to latent sinful powers. Hbnen, Shinran's master, had seen "man with blind eyes, capable of doing nothing." The habitual sins of men, however, were frowned upon by Shinran, who allowed no condoning of them.

He stressed exclusively the salvation of common men by the grace of Amitiibha Buddha (Japanese Amida). One might say, "Men cannot perceive the grace of Buddha." Shinran replies, "It is men's grave sins that prevent them from noticing it." Although men are not aware of it, they are already embraced by the grace of Amitābha. Seeing his age as an especially corrupted one, Shinran held that man cannot be saved from the mundane world without relying upon the original vow of Amitābha. All men—whether they are honest or criminal—are, without any distinction, admitted to Amitābha's Pure Realm. Faith in Amitābha's grace is the one and only condition of admission. All men are equally sinful; and Amitābha is a being of compassionate love of the most sincere kind. There is no conception of punishment by Amitiibha. The Shin sect held that evil men are also rightfully eligible for salvation by Amitiibha Buddha. Earlier, one of Hōnen's sayings had been, "Even a bad man will be received in Buddha's Land, but how much more a good man." Shinran, however, turned this to the reverse: "Even a good man will be received in Amida's land, then how much more a bad man." Elaborating this saying, he argued that, whereas a good man may be able to save himself by his own merit, it is not to be expected that a bad man can save himself. He needs the grace of the Buddha, for he has no other means. Now if even a good man, who does not necessarily need grace, can be saved, how much more a bad man, who cannot be saved except by grace. The sinner has only to believe in the grace of Amitābha and the Pure Realm will be his; thus, faith became the sole requisite for salvation, and all of the other Buddhist moral philosophy was swept away. For Shinran no ceremony was necessary for salvation except genuine faith.

Grace and salvation for good and evil alike

In this connection a controversy occurred among the religions of grace in different traditions. In the Pure Land Buddhism of China and Japan, the relation between faith (shin) and works (gyd) was an issue of heated debate. Many leaders thought that both were necessary. But Shinran said firmly that pure faith alone is enough and that no one should rely upon works. The teaching that wicked persons are eligible for salvation was not intended to encourage bad actions. In fact, such a thought was forbidden as heresy by the Shin sect. On the contrary, out of pure faith good deeds emerge spontaneously. Only through meditating on the thought that men are sinful can they come to feel compassionate toward others; and the attitude of compassion can be founded only upon grace.

Way of action in Nichiren and Zen. It was natural that the Nichiren sect, which was an outgrowth of the Japanese Tendai, also laid an emphasis upon faith and grace.

For Nichiren, everyone who realizes the truth of the fundamental unity of reality is a Buddha, and everyone who lives in accordance with this enlightenment and works to propagate the lotus of truth is a messenger of the primeval Tathāgata (the title used by the historical Buddha). To such a man, all that surrounds him preaches the truth, and the place of his abode is a paradise. Nichiren asserted that the crux of Buddha's thought is revealed in the "Jyuryōbon" chapter ("Duration of Life of the Tathāgata") of the Lotus *Sūtra.* Thinkers of the Nichiren sect have stated that, whereas the Tendai sect, from its rise in China onward, took the standpoint of "action according to principles," Nichiren emphasized "action according to things"—*i.e.*, to the phenomenal world.

The absolute in the phenomenal: reality as dynamic

The method of thinking that seeks for the Absolute in the phenomenal plays an effective role in the Japanese assimilation of the Zen sect as well. For Master Dbgen, impermanence is itself the absolute state and is not to be spurned but esteemed. "Impermanence is the Buddhahood . . . . The Impermanence of grass, trees, and forests is verily the Buddhahood." Buddhahood is time, said Dōgen. He who wants to know Buddhahood may know it by knowing time as it is revealed to him. Inasmuch as time is something in which a person is already immersed, Buddhahood is not something to be sought in the future but is something already realized wherever the seeker is. The ever-changing influx of time is identified with ultimate Being itself. Again and again, Dōgen emphasized that true reality is not static but dynamic.

Way of meditation in Zen. The unique contribution of Zen to higher religion has been the many different methods of reaching and presenting the truth that have been used by the Zen masters.

In the Rinzai sect, practitioners concentrate on specific enigmatic or paradoxical, nonlogical questions called *koans*. These are substantially based upon *mondōs*, or brief dialogues between masters and disciples, which illustrate Zen's peculiar method of instruction—pointing to the truth, the real now, without interposing ideas and notions about it. For the Zen master, the best way for a man to express his deepest experiences is by the use of paradoxes that transcend opposites: "Where there is nothing, there is all." Or, "To die the great death is to gain the great life."

The way of practice in Sōtō Zen went even further than Rinzai Zen. Master Dōgen, like Eisai, made meditation the essential practice, but he rejected koans. Indeed, practitioners should not endeavour to concentrate on anything. Said Master Dōgen, "In meditation, if mind is distracted, don't try to suppress it. Let it be as it is." Sōtō Zen emphasizes silent sitting and meditating on whatever illumination or insight is received while waiting in silence.

Zen Buddhism taught intuitive knowledge of the Absolute. A well-known motto of Zen, "Direct pointing to the mind of man," emphasizes that men originally possess the Buddha mind and need only the actual experience of it—*i.e.*, the master points to the Buddha nature, or to the reality itself. Enlightenment takes place in a "Timeless moment"—*i.e.*, outside of time, in eternity; and it is an act of the Absolute itself, not of man's own doing. "Seeing into one's own nature," another motto of Zen, means that seeing the Buddha mind within one is the same thing as becoming the Buddha—that one then is the Buddha.

The Buddha within man and his daily life

Dōgen identified the practice of meditation (zazen) with enlightenment; the innate Buddha nature, he held, is the a priori basis of the practice that itself embodies enlightenment in the process of a man's endeavour. The Zen disciple does not seek for some Supreme Being above him but, instead, spontaneously finds in himself the Buddha nature as the foundation of his own existence. "Let the light be reflected so that it falls back and irradiates the self," said Dōgen. "Then mind and body will of themselves disappear and the original countenance will become manifest."

Zen dispelled all speculation about the Absolute. The Buddha dwells hidden in all of the inconspicuous things of daily life; and to take those events, just as they happen, is all that enlightenment is. Zen is spiritual freedom, the liberation of man's true nature from the burden of the fixed ideas and feelings about Reality that men accumulate through fear—through the fear, for example, that life will run away from them. The truth to which these events point, however, is radically simple and self-evident.

The changing aspects of the phenomenal world are a self-activity in which the self is mightily set forth, a procreation accomplished not under the compulsion of laws or of blind impulse but in the creative power and freedom of sublime wonder. Dōgen said,

> Being is time, and time is Being. Everything in the world is time at each moment. To practice religious disciplines and to attain enlightenment and to enter into Nirvana are nothing but to ascertain that these events are Being, time, and that all time is all Being. . . . Birth and death is the life of Buddha.

Concepts of time and change. The Japanese views of time and change are reflected in their phenomenalism and in their philosophy of history.

Phenomenalism. One of the main features of Japanese thought has been its attitude in accepting the actuality of the phenomenal world as the Absolute. The Japanese have stressed the intuitively apprehended, sensible concrete rather than the universal or abstract and have emphasized the fluid, incipient character of events. They have thus rejected the concept of an Absolute existing over and above the phenomenal world and have sometimes regarded that world itself as the Absolute. This can be seen as early as in the ancient Shintb belief that spirits reside in all kinds of things. These early Japanese personified all sorts of spirits (other than those of humans), regarding them all as ancestral gods and, in their basic reality, divine. Indeed, this way of thinking has persisted in Shinto down to the present day.

Rejection of the Absolute

This way of thinking also conditioned the reception and assimilation of Buddhist philosophy. Because of this acculturation, the Tendai sect in Japan is not the same as its counterpart in China. Thus, the Tendai scholars in medieval Japan, using the same nomenclature as that employed in continental Buddhism, arrived at a distinctively original system of thought, called Honkaku-hbmon, which asserts that the changing aspects of the phenomenal world are the Buddha.

In the Kamakura period (13th and 14th centuries), amid a prevailing anti-intellectual fideism, Buddhists pointed to the realm of phenomenal existence as the sole source of Enlightenment. This radical shift in outlook, with its aesthetic reverence for nature, exerted a significant influence on art and literature and on the "Code of Warriors" (Bushido).

Philosophy of history. Phenomenal existence, however, has a historical as well as a metaphysical dimension. It was therefore natural that, during the turbulent plague-ridden Kamakura era, when life seemed meaningless, the Japanese would be driven to seek meaning in history. The Chinese conception of history had been influential in Japan, as had Chinese forms of Buddhism. But Japanese scholars modified the notion of history introduced from abroad. Probably the most noteworthy of the many classical historical works produced by these scholars is the *Gukan-shō*, by the poet Jien, chief abbot of the Enryaku-ji of Mt. Hiei around the turn of the 13th century, which demonstrates that the concept of reality held by Japanese Buddhists is seen most clearly in their ideas of history. Jien complained that the age in which he lived was a degenerate one—a feeling that was most keenly experienced in the frequent warring around his time.

Most of the Japanese Buddhist sects have taught, as Jien had, that doctrines should always be made "a propos of

Concept of the three times

the time." Later Mahāyāna Buddhism employed the concept of the three times, the three periods that followed the demise of Lord Buddha. The first 1,000 years was called the "Period of the Perfect Law," when the religion of the Buddha was genuinely and perfectly practiced. The second 1,000 years was called the "Period of the Copied Law," when the religion of the Buddha was practiced only by imitating the practices of the sages and monks of the past. The last period, the "Period of the Latter Law" (*Mappō*), was seen as a time of open degeneration.

These ideas took deep root in Japan. Hence, time was also among the five specific criteria by which Nichiren evaluated proposed doctrines, viz., (1) the teaching of the *sūtra*, (2) the spiritual endowments of the learner ("the propensity"), (3) time, (4) the country in which the doctrine is practiced, and (5) the temporal order of circumstances affecting its practice. In the Tendai sect, Saichō had also regarded the time and the country as important criteria; but Nichiren established them as basic principles, presented in a clear and distinct form.

OTHER MOVEMENTS

Shintō philosophy. In the 15th century, Shintō, which had formerly been nothing but the popular religion of the Japanese, was given a philosophical foundation. The *Shintō* go *busho* (the "Shintō Five Books"; the Shintō "Pentateuch") were probably composed in the 14th century. In the following century Ichijō Kaneyoshi, a syncretic theorist, tried to bring to light the philosophical foundations of the Shintō religion with the help of Buddhist and Confucian thought: and Urabe Kanetomo, an esoteric theoretician, presented theories based on a group of books pretending to transmit direct revelations from the gods (see below *Shintō* revival). The methods of the philosophy of history thus came to be utilized to vindicate Japanese Imperial claims to absolute power and respect by proving the emperor's natural position in the Japanese state organization (kokutai) and his right to this position by reason of righteous succession—a cardinal tenet based upon Shintō tradition.

Confucian philosophy. The second period in the development of Confucianism extended from the diffusion of the Sung philosophy at the end of the 12th century to the rise of different philosophical schools at the beginning of the 17th century. In this period, Confucianist learning was the sole ingredient in intellectual education. The Sung philosophy was imported into and spread through Japan by Zen Buddhist monks, both Chinese and Japanese. Furthermore, its dominant figure, Chu Hsi, was not only venerated as a philosopher but also as a scholar in the philosophy of history, a field which was soon infused with the spirit of the Sung ideology.

Edo period

NEO-CONFUCIANISM

In the Edo (or Tokugawa) period (1603–1867), Confucian thought—or, more accurately, Neo-Confucianism—gradually replaced Buddhism and became the predominant system of thought that influenced the better educated, upper class Japanese, who viewed it, however, as a moral philosophy rather than a religion. As a religion, Confucianism had always been weak; indeed, images of Confucius are found today only in a few of the now-defunct schools founded by feudal lords during the 19th century. But as a philosophy of life, the sayings of Confucius and of his disciple Mencius are still taught to children, and most educated people are able to recite some of them.

The first two periods of Confucian history have already been reviewed (see above Early Confucianism and Confucian *philosophy*). The third period, extending from the beginning of the 17th century to the mid-19th century, saw the rise of schools of Confucian studies (kangaku). In the Edo period, the rigid Tokugawa shogunate, which governed the country, as well as the local feudal lords, found it to their advantage to encourage Confucian studies since they emphasized law and order. Confucian influence thus became stronger with the lapse of time, finally helping to create the mind set of modern Japan.

Three schools. There were three major schools of Confucianism in the Edo period.

The Shushigakuha ("Chu Hsi's school") taught a Rationalistic philosophy. Fujiwara Seika, living at the turn of the 17th century, is regarded as the forerunner of this school. His disciple, Hayashi Razan, was the founder of the governmental school at Edo (present Tokyo), of which his descendants became the hereditary heads. The Shushi school was officially adopted and supported as orthodoxy by the government of the Tokugawa shogunate. Though this school was the most influential of the three, its metaphysical tenets are not discussed here since they reflect those of the parent Chinese school with slight modifications (see CHINESE PHILOSOPHY; CHU HSI).

The Ōyōmeigakuha ("Wang Yang-ming's school") was named after Wang Yang-ming, an early 16th-century Chinese philosopher of the Ming dynasty, who taught a doctrine based on a peculiar Idealism. Among the representative scholars of this school were Nakae Tōju (died 1648); his disciple Kumazawa Banzan, a great reforming administrator; and, in the 19th century, Ōshio Heihachirō, who led a rebellion against the government. Moreover, several leaders of the Meiji Restoration, which overthrew the shogunate and put the Emperor in power, were greatly influenced by its thought (see WANG YANG-MING).

The Kogaku-ha (the School of Ancient Learning) taught a somewhat fundamentalist doctrine, emphasizing the original teachings of Confucius. The name Kogaku (literally "the study of antiquity") refers to a particular branch of Confucian philosophy in Japan, which, opposing the systems of Chu Hsi and Wang Yang-ming, goes back to the original texts of Confucianism, disregarding some or all of the works of later authors. The forerunner of this school was a 17th-century scholar, Yamago Sokō, who wrote extensively on the essential qualities of a knight. Sokō is considered to be the father of Bushido, or the "Way of the Samurai," which stressed frugality, loyalty, filial piety, and acts of great bravery and sacrifice. Ogyū Sorai and his senior contemporary Itō Jinsai, a 17th-century commoner, were the chief representatives of this school.

Original energy as the supreme source

Jinsai and his son. Jinsai ascribed the production of all beings to an original kinetic force called the "original energy" (genki). He wrote: "In the world there is nothing but one Original Energy. . . . For it cannot be said that the world has either beginning or end or [origin by] creation." He thus denied the creation theory of the Chinese Confucianists. "That the light and pure substances collected and ascended to form Heaven and the heavier and turbid ones congealed to form Earth," he wrote, are uncanonical vagaries that originated since the Confucianists of the Han dynasty and are all false. Jinsai aimed constantly at the concrete; and, as much as possible, he reduced to a single concept such notions as matter (ch'i) and principle (li), which the Sung philosophers had always distinguished. In his view, the Supreme Ultimate is nothing but the primordial energy considered as the supreme source of all things. The vital motion is the highest quality of the universe. He said:

> The universe is one great living being. According to the Way of the Universe, there is life but no death; there is collection but no dispersal. Death is the final stage of life; and dispersal is the completion of collection because the Way of the Universe is bent on the giving of life. Although the bodies of the ancestors pass away, their spirit is transmitted to their children who bequeath it to their own progeny. The production of living beings continues infinitely. One can rightly say that they do not die. . . . How could this be unless in the Way of the Universe there were only life and no death?

Jinsai stubbornly refused to admit the existence of evil. "In the Universe . . . there is movement and no quiescence; there is good and no evil. Goodness belongs to the category of life; evil to that of death." Human nature is fundamentally good, he held, although, through lack of culture, this original good disposition eventually may be thwarted by evil passions and bad surroundings. The will, however, is essentially bent toward the good.

Jinsai deplored the situation of the intellectuals of his day, who had divided into different contending camps. He wrote:

> Present-day Confucianists desire more than anything else to attack the Buddhists and to do away with them. The Buddhists by all means desire to attract the Confucianists and conciliate with them. They are like tigers come to grips, like oxen with horns locked.

The human virtues and love

According to Jinsai, the many human virtues can be reduced to four cardinal virtues, which can be further reduced to two important concepts: humaneness (*jen*) and righteousness (i). These, in turn, are but one, *jen*; and *jen*, which is characterized by love (ai both in Chinese and Japanese), is the sum of all virtues. "It is virtue itself, it is the Virtue . . . . But to extol it in one word, it is called Love [*ai*]." Jinsai's thought thus displayed a greater human appeal than earlier scholars. He also admitted that the providence of Heaven underlies the moral order: "The ruling of Heaven is in all things," he wrote, "punishing evil and rewarding good." He believed that the world of reality consists of change and action and that action in itself is good:

> Between heaven and earth there is only one reason: motion without stillness, good without evil. Stillness is the end of motion, while evil is the change of good; and good is a kind of life, while evil is a kind of death. It is not that these two opposites are generated together, but they are all one with life.

It6 Tōgai, Jinsai's son, succeeded his father, and hundreds of students studied under his direction. During his lifetime, in fact, which extended well into the 18th century, the School of Ancient Learning reached the zenith of its influence.

Sorai and his disciple. Ogyū Sorai, a contemporary of It6 Tōgai, was a versatile scholar who stressed the analysis of one's own experience and of that derived from history. Sorai held that the Way (or Truth) was invented by the ancient sage-kings of China and is not natural. By dint of their virtuous lives, however, the ancient kings captured the benevolence of Heaven and skillfully adapted its way to human nature. In his time, quiet sitting and the fostering of reverential love, as practiced by most earlier Chinese Confucianists (around the Sung period), was the customary method of mental training. Sorai ridiculed those Confucianists and said: "As I look at them, even gambling seems to be superior to quiet sitting and fostering reverential love in one's heart." Sorai's approach was rather sociological. He found the pattern of all good in the great examples of antiquity. History, not philosophy; practice, not speculation; sound administration, not discussion—these, he felt, will save the world. The utilitarian view of history in Sorai's system and the program of social reform that he set forth, however, threatened to engulf his philosophy.

Dazai Shundai's naturalism

Sorai's disciple, Dazai Shundai, who flourished in the first half of the 18th century, maintained a ritualistic view of morality. Calling man's natural feelings the real and legitimate feelings, which he defined as "likes and dislikes, sufferings and rejoicing, and anxiety and pleasure," he maintained that

> There is not a single human being devoid of these feelings. . . . Love of one's parents, wife and children is also the same among the noble and the common. Since these feelings are originated in the innate truthfulness of man which is free from any strain of sin or falsity, they are called the real feelings.

Shundai's standpoint was that of a pure naturalism. Believing that human desires should not only be tolerated but also fully expressed, he declared: "I would rather be a master of acrobatic feats. than to be a moralist."

SHINTO REVIVAL

A revival of Shintō, which began in the 17th century, aimed at eradicating Buddhist and Confucian influence. It was supported by philosophical studies of the ancient records that had been made in the 17th and 18th centuries by such philologists as Keichii and Kamo Mabuchi. The greatest leader of "Pure Shintō" was Moto-ori Norinaga, an 18th-century theoretician, who held that the original life of the Japanese represented the primitive purity of mankind. By rejecting all Buddhist and Confucian teachings in metaphysics and ethics as signs of degeneracy, he tried to restore the pure and ideal inheritance of humanity from the divine ages. "The pure mind is the natural mind," he said.

> The Confucian scholars who are most highly esteemed as men of wisdom, and the Buddhist priests who are revered as saints, admire the beauty of stars and flowers, but they pretend never to have taken notice of a beautiful woman. What a deception of mind.

In the first half of the 19th century, a physician, Hirata Atsutane, founded nationalistic Shintō. Being acquainted with Western science and with some elements of Christianity, especially the then-forbidden Catholicism, Atsutane maintained the idea of the Creator who is called the Heavenly-Central Lord.

NEW THINKERS IN BUDDHISM

In the Edo period many thinkers enunciated doctrines critical of former teachings. There arose, for example, the theory that, if a man pursues his own secular vocation with his whole heart and soul, he is practicing nothing other than the ascetic practice of Buddhism.

Suzuki Shōsan's sanctification of vocation

Takuan, an early-17th-century Zen priest, taught that "the law of the Buddha, well observed, is identical with the Law of mundane existence. The Law of mundane existence, well observed, is identical with the Law of Buddha." This idea was especially stressed by Suzuki Shōsan, a contemporary of Takuan, who claimed to be the first man to apply Buddhism to matters of mundane existence. In his book Banmin *tokuyō* ("The Significance of Everyman's Activities"), he discussed problems of vocational ethics. He saw an absolute significance in the pursuit of any vocation, whether that of a warrior, a farmer, a craftsman, a merchant, a doctor, an actor, a hunter, or a priest. To pursue one's own vocation, he reasoned, is to obey the Absolute One, because the essence of Buddhism consists in reliance upon the guidance of the original self or upon "the true Buddha of one's own," and every vocation is a function of this "one Buddha." Thus, he preached to farmers, "Farming is nothing but the doings of a Buddha." To merchants he taught, "Renounce desires and pursue profits single-heartedly. But you should never enjoy the fruit of your labours. You should, instead, work for the good of all others." Since the afflictions of this world, it is said, were predestined in former lives, a man should torture himself by working hard at his vocation in order to redeem the sins committed in his former life.

Even in Zen Buddhism, a critical attitude was expressed toward the founder. Dōgen, for instance, in the 13th century, denounced the theory of "perceiving one's own nature intuitively" as set forth in the *sūtra* of the Sixth Patriarch; *i.e.*, the T'an Ching (or *The* Platform Scripture) of Hui-neng. But Tenkei, his spiritual descendant (early 18th century), rejected Dōgen's opinion as "absurd sheer nonsense." According to the traditional attitude, one's own enlightenment should be conveyed face to face, from master to disciple, and it should be approved by a single master." But Tenkei presented a different interpretation. Since in this phrase "master" means "one's self," and "a single master" likewise means "one's self," the whole phrase, according to Tenkei, means "the attainment of one's own, or true self, by oneself." Thus, a seeker need not practice under the guidance of any teacher, for even by looking at peach blossoms, he can make his self clear to him. In the 18th century the venerable Jiun, the pioneer of Sanskrit scholarship in Japan, likewise stressed the idea of self-enlightenment. but with a rationalistic slant. In his view the essence'of Buddhism lies in the observance of natural law—*i.e.*, of the ten virtues. "Whether a Buddha appears or whether a Buddha does not appear, this world exists, and human beings exist, and these ten virtues will always be manifest along them [*i.e.*, so long as they exist]."

OTHER MOVEMENTS

Shingaku school. The Shingaku (Mental Learning) school was founded by Ishida Baigan, the philosopher of city people, in the first half of the 18th century. Its scholars taught that Mind alone is the basis of religion and attempted to unite the moral teachings of all of the religions and ethical systems then prevailing in Japan, setting forth a humanitarian ethics and encouraging the cultivation of the mind. Teshima Toan, a popularizer of Shingaku, and Nakazawa Dōni, an advocator of naturalism, of the middle and late 18th centuries, respectively, were leaders of this school.

Independent philosophers. There also appeared in the Edo period thinkers who did not belong to any specific tradition. These included Torninaga Nakarnoto, who advocated a relativist philosophy, or "metaphilosophy," in which the philosophical systems of different peoples are studied in the context of their respective historical and cultural settings. He was also the first to trace the development of Buddhist philosophy through history with a critical spirit.

Relativism, Materialism, and the way of nature and labour

Although Japan prior to the Meiji Restoration had no Materialists in the strict sense of the word, there were a few thinkers whose critical spirit and consciousness of ego led them to a skeptical attitude about religious authorities, finally resulting in the repudiation of spiritualism. Several scholars of the 17th and 18th centuries had prepared the way for Materialism, among them the aforementioned Sorai, Shundai, and Nakamoto, and a Rationalist, Miura Baien. And several scholars, such as Andō Shōeki in the mid-18th century, approached a Materialism; but their thoughts were limited to a small circle, and they left little influence.

Andō Shbeki advocated the way of nature and labour. He sympathized with the peasants for their miserable condition and protested against exploitation and oppression by feudal lords. Shbeki appreciated the exaltation of agriculture. He declared, "Direct cultivation and happy eating, direct weaving and happy clothing—there is no Way but this. Talking of thousands of ways is false." Such an outspoken avowal, however, was forbidden by the oppressive government of the Tokugawa shogunate.

Miura's dialectics and Ninomiya's return of virtues

Miura Baien, a younger contemporary of Shbeki, expressed a Rationalist theory of dialectics of his own. The way to understand nature (or the universe), he held, is through dialectics (jdri), the secret of which is to see a synthesis (*gōitsu*) in an antithesis (han), to abandon all one-sided preoccupations, and to make signs real (*chō*-hyd). The Yin and Yang, the all-pervading cosmic principles of ancient Chinese dualism, are antithetical to each other and thus constitute a battle. Though antithetic, however, they can be brought to synthesis. He said:

> The way to see things thoroughly is logic (jdri) and the essence of logic is nothing else but the dialectic of antithesis and synthesis, setting aside all attachments of mind and following the correct signs.

The three elements, then, that comprise the full structure of Miura's *jdri* are (1) the dialectic of things, (2) the prerequisite eliminations of bias and preoccupation, and (3) the empirical test. He also set forth a theory of the origin of price similar to that of his contemporary in England Adam Smith and established a form of Gresham's law on the circulation of bad money. Miura's logic was strongly pervaded by a Positivist and Rationalist spirit that had no respect for authority or tradition, a spirit no doubt influenced by the so-called Dutch learning (*rangaku*), a type of science imported from the West.

The so-called Peasant Sage, Ninomiya Sontoku (earlier 19th century), emphasized man's dependence on both nature and fellowship. From Ninomiya's teaching was derived the *Hōtoku* (literally "to return virtues") doctrines, addressed especially to the agricultural population, which emphasized energy and work. The purport of his teaching was, as he wrote, that "We owe our life and its preservation and enjoyment first to the benefits granted by Heaven and Creation, then to those we receive from our sovereign, our country, our parents, and other sources innumerable." Men have laws and social obligations that compel them to return, in some degree, the benefits received from parents, sovereign, and country; but there are no laws obliging them to render their gratitude for the greater benefits bestowed on them by Heaven. Men are thus prone to forget that requital for the heavenly benefits is their first duty, and so they neglect it. Man must bear in mind the will of Heaven and try to cultivate the Heaven-sent virtues that are in him, and he must work earnestly to promote the progress and development of all creation. Thus Ninomiya viewed human life as a process of cooperation and mutual helpfulness. Because this combination of moral ideas and economic measures lay at the heart of his view, his philosophy bore fruit in practical effects among the peasants.

Period of modern philosophy

The number of original thinkers revealing traces of modern thought in Japan before the introduction of Western civilization was very small; *i.e.*, the few traces of modern thought that appeared in Japan before the Meiji Restoration did so only sporadically, did not develop, and vanished in their incipient stages.

Since the Meiji Restoration in 1868, however, Western philosophy has been liberally and abundantly introduced into Japan. At first, British and American philosophies predominated; but in the course of the 20th century the influence of German philosophy became increasingly strong. Leading Japanese philosophers were especially influenced by recent German Idealism, Phenomenology, and Existentialism. Today, philosophy in the Western sense of the term is taught as a compulsory subject in most Japanese colleges and universities; and Eastern thought, under the name of Indian or Chinese philosophy, is relegated to specialized courses. In order to distinguish Western philosophy from Buddhist and Chinese thought, a new term *tetsugaku* was coined and has come rapidly into use.

MEIJI PERIOD

In 1862 Nishi Amane prepared a lecture on Western philosophy at a governmental institute. Another late-19th-century scholar, Tsuda Masamichi, also developed an early interest in philosophy.

Kato's evolutionism and Fukuzawa's illuminism

The type of thought that first came to the fore was evolutionary philosophy. Hiroyuki Kato, living prior to World War I, was the first man in Japan to construct a system of philosophy of his own. His system was founded on a theory of evolution that denies a divine Creator. Evolution comprises cosmic, inorganic, and organic development, he held; and organic evolution, in turn, comprises that of body, mind, and society. Since all organisms have a constant tendency to preserve and develop their lives, there is a severe struggle for existence throughout the world. Struggle, in fact, is necessarily indispensable, for without it human society might well have remained in its primordial condition. The sole source of right, said Kato, is power. Because morality and law have always been developed through the struggle for existence, true morality is not practicable in a great incomplete society, but only in one that is organized as a state. One generation later, Asajirō Oka, a zoologist, also advocated a distinctive evolutionism of his own.

Fukuzawa Yukichi, one of Kato's contemporaries, put forward a theory of history based on François Guizot and Henry Thomas Buckle, French and British historians, respectively. Fukuzawa stressed that civilization arose neither from upper nor lower strata but was formed by intellectuals of the middle class. This viewpoint was typical of the so-called illuminist group, which advocated a democratic government. "Heaven creates no man above man," he stated, and "no man under man."

In the field of social thought Nakae Tokusuke (pen name Chō-min), a late-19th-century scholar, was an influential political thinker of a clearly Materialistic bent. Nakae, who became famous for his translation of Jean-Jacques Rousseau's Du contrat social, forcefully expressed his atheism and antispiritualism.

Under the leadership of Kōtoku Shūsui, anarchism was also introduced into Japan. On his return from the United States, where he had encountered many American anarchists, Kbtoku advocated commonerism (*heimin-shu*gi), which esteemed the views and rights of the common people against those of the nobles and bourgeoisie. The fact that his group was executed by the state is indicative of the suppression of free thought by its power.

A forerunner of individualism was Takayama Rinjirō (pseudonym Chogyū), who flourished near the end of the 19th century and who, following the theory of T.H. Green, an Hegelian moralist, advocated an ethical theory in which the realization of self is the ideal of man. Rinjirō saw in the person of Nichiren, a 13th-century Buddhist prophet, the ideal embodiment of Friedrich Nietzsche's superman (*Übermensch*).

Enryo's panlogism and Tetsujirō's phenomenalism

At the turn of the 20th century, Inoue Enryo attempted to reform Buddhism and combine it with Western ideas. To Enryo the two Mahāyāna philosophical systems, Kegon and Tendai, represent the ultimate truth. But their emphasis on pure reason (ritai) was close to Hegel's panlogism or panrationalism. As the fundamental structure of the universe, this pure reason, for Enryo as for Hegel, transcends Materialism and Idealism. Enryo argued against Christianity because of its supposedly anti-scientific tenets.

Inoue Tetsujirō, a contemporary of Yiijirb, after studying in Germany, returned to Japan in 1890 and became a full professor of philosophy at the Tokyo Imperial University. Thereafter, the influence of German philosophy became very strong and has remained so until now. Inoue called his philosophical standpoint "the theory of phenomena as reality" (*genshō* soku *jitsuzai ron*). He believed that Immanuel Kant and Eduard von Hartmann, author of a transcendental Realism, were wrong in their attempts to separate the phenomenal world from reality. Inoue's theory is typical of the traditional way of philosophical thinking of the Japanese (see above *Phenomenalism*).

The contributions made by foreign teachers were also significant. The most outstanding of these teachers was the stimulating philosopher Raphael von Koeber, a Russian of German extraction, who visited Japan in 1893 at the suggestion of his teacher Hartmann. Subsequently, the influence of the philosophies of Arthur Schopenhauer, a voluntarist, and of Paul Deussen, a philosopher of biblical and Indian religions, endured for about four decades.

The stronghold of Pragmatism in Japan was Waseda University, a leading private institution. Tanaka Ōdō (original personal name Kiichi), having studied in the United States for nine years, was greatly influenced by the ideas of the Pragmatist John Dewey. Advocating instrumentalism, the view that ideas are instruments for action, Tanaka attempted to make Pragmatism a philosophy of real usefulness in Japan. Calling his philosophy "idealistic experimentalism," he identified the ideal with the real and stressed the impossibility of explaining the overall structure of reality.

The sociopolitical views of Miyake Setsurei (original personal name Yūjirō), an influential critic who flourished prior to World War II, were affected by his esteem for Thomas Carlyle and by Herbert Spencer's organic theory of the state.

TAISHO AND SHOWA PERIODS

Influences of Neo-Kantianism, Phenomenology, Existentialism, and Hegelianism

Imported German *and* Christian philosophy. In the Taishō period (1912–26), German philosophy exerted a great influence. In particular, Neo-Kantianism was influential among the intellectuals. The Marburg school of Neo-Kantianism was known through the works of Paul Natorp, one of its two leading figures, whereas the southwestern (Baden) branch was known mostly through the many Japanese pupils of Heinrich Rickert, an authority in the logic and epistemology of science. Among Rickert's best pupils was Sōda Kiichirō, who wrote, in both Japanese and German, on the philosophy of economics, being the first to attempt to do so in a systematic way. The *Präludien* of Wilhelm Windelband, a leading historian of philosophy, was also enthusiastically read in Japan at the time.

From 1920 onward, Edmund Husserl's Phenomenology, Heidegger's Existentialism, and Hegel's dialectic became increasingly prevalent. These trends represented counter-reactions to the fact that, until then, Anglo-American thought—from John Stuart Mill to John Dewey—had been excessively preoccupied with sociopolitical problems, almost to the exclusion of critical epistemology and metaphysics. The main Kantian philosopher of Japan was Kuwaki Genyoku, who was active prior to World War II. His way of setting forth his thought was not systematic nor logical, however, in the Western sense of the word, and in this respect he inherited a traditional way of thinking of the Japanese.

Hatano Seiichi, a Christian philosopher of the mid-20th century, analyzed the nature of time in his book Time *and* Eternity (1943). According to Hatano, time manifests itself to man in three stages: (1) as natural time, encompassing nature; (2) as cultural time; and (3) as eternity, which is characterized as a community of love (agape') involving selflessness and generosity toward others.

The work of Nishida, Tanabe, and Watsuji

Indigenous creative philosophies. Nishida Kitarō (died 1945) has usually been regarded as the greatest Japanese philosopher since the introduction of Western philosophy. In his maiden work, Zen-no-kenkyfi (1911; Eng. trans., *A Study of* Good, 1960), which was much influenced by the Pragmatist William James, the fundamental concept was "pure experience," by which he meant the direct awareness of things as they are. Thought and thinking are based on this experience. Manifestations of it are multifarious, extending from the perception of colours, or the primitive experience of the infant, to the direct experience of artistic and religious minds. In Nishida's view, all oppositions—like the subject and object of truth and falsehood—must be transcended in a unifying awareness, which alone opens the way to the knowledge of reality.

Tanabe Hajime, another mid-20th century scholar, developed a so-called logic of species, according to which mankind corresponds to a genus, a nation to a species, and an individual (a man) to a particular instance in the logical sense. Holding that, of these three, the species is the most real, Tanube urged that individuals should devote themselves to their nation. In this way a nationalism in which most individual freedoms were subjugated to the cause of the state was justified; and as such this concept was criticized later. Thus, the influence of Hegel, who in like manner especially esteemed the nation of Prussia, was conspicuous.

Tanabe's contemporary Watsuji Tetsurb, a prolific writer of great importance, occupies a unique position in the history of contemporary Japanese philosophy by virtue of his systematic treatment of human existence, which culminated in the formation of a philosophy that was termed an "anthropological ethics." His three-volume Ethics (1937–49) is the most systematic philosophical work that Japan has ever produced. Another work of his, *Ningengaku-toshite-no-rinrigaku* ("Ethics as Anthropology") is an introduction to his *magnum* opus. Key terms in Watsuji's system are ethics (rinri), man (ningen), and existence (*sonzai*). He interpreted the term ningen as signifying "to be in the world." Ethics consists essentially in the relationships involved in contacts between man and man, man and his family, and man and society. Man is not only an individual or a mere social entity but an existent essentially related to the social world in which he lives. Watsuji further explained that society is formed and perpetuated by individuals who deny their own individuality in order to blend into the group consciousness of humanity. In conceiving of society as a great void composed of self-denying individuals, Watsuji was reflecting the concept of the Void in Buddhist Mahāyāna philosophy. Starting from this fundamental principle, he theorized about various aspects of human existence. In his work *Fūdo* (1935; Eng. trans., A *Climate*, 1961), he discussed the influence of climate on human behaviour and culture, claiming that a monsoon climate leads to mercy and benevolence, a desert climate to combativeness, and a temperate climate to rationality and science.

Current types of philosophy. Japanese philosophy was thrown into a chaotic state by World War II, and it is therefore quite difficult to classify its postwar varieties. Three types of philosophy, however, seem to be predominant: German Idealism, also including Phenomenology and Existentialism; Marxism, following the philosophies of Marx, Lenin, and Mao Tse-tung; and Logical Positivism, including the philosophy of science and the philosophy of language. This last tradition, accepted by the younger scholars, is strongly influenced by American thought. With regard to Existentialism, the German philosophers Karl Jaspers and Martin Heidegger and the French philosopher Jean-Paul Sartre are influential. The philosophy of Søren Kierkegaard, which was almost completely neglected before World War II, was introduced into Japan by Watsuji Tetsurō, and under the incentive of his authority it has exerted a great influence.

In nearly all of the universities of Japan, works of Immanuel Kant and G.W.F. Hegel are assigned to philosophy students as almost compulsory reading. Many Japanese intellectuals, however, seek to formulate Marxian justifications. Moreover, there are some thinkers who are still endeavouring to raise traditional Japanese thought to a level of contemporary significance in modern civilization. The problem of philosophy East and West is of great concern to some intellectuals, who are worried about the confrontation between their own tradition and the incoming Western civilization together with leftist agitation.

At present it is difficult to identify those whom history will view as the leading philosophers of the decades since the mid-20th century.

BIBLIOGRAPHY. HAJIME NAKAMURA, *A History of the Development of Japanese Thought from 592 to 1868,* 2 vol. (1967), a history of Japanese philosophical thought up to the Meiji Restoration, explaining it by way of the problem approach; and *Ways of Thinking of Eastern Peoples: India, China, Tibet, Japan,* ed. by PHILIP P. WIENER (1964), a discussion of some major features of Japanese ways of thinking in comparison with those of other Asian peoples and of Japanese philosophy in relation to traditional ways of thinking; MASAHARU ANESAKI, *History of Japanese Religion with Special Reference to the Social and Moral Life of the Nation* (1930, reissued 1963), the most authoritative history of Japanese religion—also discusses the religious background of Japanese philosophy; WILLIAM THEODORE DE BARY (ed.), *Sources of the Japanese Tradirion* (1958), a collection of translations of philosophical and religious passages of classic Japanese works; JEAN HERBERT, *Shinto: At the Fountain-head of Japan* (1967), the most detailed work in English on Shinto; GENCHI KATO, *A Study of Shinto, the Religion of the Japanese Nation* (1926, reprinted 1971), a study of the features and problems of early Shintdism; JUNJIRO TAKAKUSU, *The Essentials of Buddhist Philosophy,* ed. by WING-TSIT CHAN and CHARLES A. MOORE (1947, reprinted 1973), a rather technical work discussing philosophical thoughts of various schools of Japanese Buddhism; JOSEPH JOHN SPAE, *It6 Jinsai: A Philosopher, Educator, and Sinologist of the Tokugawa Period* (1948, reprinted 1967), contains a good description of Japanese Confucianism; KYOSON TSUCHIDA, *Contemporary Thought of Japan and China* (1927), the first attempt in English to describe the philosophical thought of Japanese philosophers since the introduction of Western civilization; GINO K. PIOVESANA, *Recent Japanese Philosophical Thought, 1862–1962: A Survey,* rev. ed. (1968), a work in English that describes recent Japanese philosophy. (H.Na.)

Japanese Religion

Japanese religion is assumed here to consist of the beliefs and practices of the folk religious traditions indigenous to Japan and of those great traditions, such as Taoism, Confucianism, Buddhism, and Christianity, that have migrated to Japan from the Asian mainland and other parts of the world. It also includes Japanese religious groups that are syntheses of these diverse traditions and certain new religions that have arisen in modern times.

NATURE AND TYPES OF RELIGION IN JAPAN

Folk traditions and alien traditions

Japan is a living museum of religions. There exist in it numerous survivals of archaic animism and shamanism (see below *Shintd and shamanism),* indigenous Shinto cults, Confucian ethics and religious Taoism (both of Chinese origin), Christianity, and many syncretistic new religious movements. The essence of Japanese religion may be found in the interaction of two kinds of belief systems: a folk or "little tradition" that is based on blood relations or close community ties and a "great tradition" originally introduced from outside Japan that is adopted by individual or group choice. Japanese belief patterns are complex, multilayered, and syncretistic. These patterns are based both on an indigenous religion centring in the worship of ancestors and on the various kinds of religion brought from outside Japan by missionaries or believers who belong to one of the great traditions or to more advanced folk traditions. Little tradition here refers to the indigenous or folk religion, including Shinto cults (see also SHINTO), which was shaped by ancient geographic and cultural circumstances; great tradition refers to several highly developed religious and philosophical importations such as Confucianism, religious Taoism, Buddhism, and Christianity (see also CONFUCIANISM; TAOISM; and BUDDHISM).

These two kinds of belief systems eventually became intertwined, and Japanese religion thus developed as an integration of many separate elements. At least until the end of the Tokugawa era (1867–68), each family had both a miniature Shintd shrine and a Buddhist altar in the inner part of the house, and ancestral mortuary tablets were placed on or beside the Buddhist altar. Each village, town, or city also had its own local Shintō shrine or shrines, Buddhist temples, several shaman-like magicians, diviners, fortune-tellers or healers, and, since modern times, Christian churches and churches of the other new religions. Recently many new denominations have arisen within Shintō, Buddhism, and Christianity. Even some new religions have come into being. The following table gives statistics for the distribution of religion in Japan in the late 1970s.

Distribution of Religious Affiliations in Japan

religious affiliations	number of members
Shintō	98,352,612
Shrine Shintō	63,564,075
Sect Shinto	6,005,792
New Shintō sects	2,007,295
Buddhism	87,860,100
Tendai groups	5,473,205
Shingon groups	11,854,621
Jōdo groups	21,084,723
Zen groups	9,579,450
Nichiren groups	30,579,306
Nara groups	4,697,963
Others	206,792
Christianity	973,340
Roman Catholic	356,255
Protestant	467,098
Syncretistic sects	14,213,523
Total	201,399,575

These statistics illustrate the curious fact that the total number of individual religious affiliations is much greater than the estimated total Japanese population in the late 1970s of 116,133,000. The discrepancy is explained by the Japanese system of "dual adherent" or "plural belonging," in which a person may participate simultaneously in several religious traditions. As one author has pointed out, in Japan, Confucianism and Shintō have borrowed Buddhist metaphysics and psychology; Buddhism and Shinto have borrowed many aspects of Confucian theory and ethics; and Confucianism and Buddhism, with their many and varied manifestations, have adapted themselves rather thoroughly to Japanese indigenous religion instead of maintaining their own particularities. Although there are exceptions, the characteristic feature of Japanese religion is the coexistence of different religions or heterogeneous religious elements in one family or even in a single person.

HISTORY OF RELIGION IN JAPAN

The major forms of religion during the protohistorical and prehistorical periods (prior to the 6th century AD) were naturism (worship of natural forces), animism (belief that natural objects and living beings possess souls or spirits), and shamanism (beliefs and practices surrounding spirit mediums). After the 1st century AD, however, Chinese civilization began to spread into Japan, mainly into Kyūshū and western Honshū, through the Korean peninsula.

Early historical developments (before the 16th century AD). Up until the 7th century AD the cultural contacts between Japan, Korea, and North and South China resulted in an influx into Japan of a remarkable number of immigrants from these areas. These immigrants brought with them their own beliefs, rituals, and customs. They probably introduced Chinese Confucian ethics and political ideology, as well as the philosophy and metaphysics of the Chinese Taoist thinkers Lao-tzu (traditionally 6th century BC) and Chuang-tzu (4th century BC), among the Japanese ruling classes. They also introduced among the common people some beliefs, rituals, and techniques of Chinese religious Taoism (a complex of rituals and techniques for achieving immortality), Chinese Yin-Yang magic (based on two contrary but complementary principles that pervade all things), and Korean shamanism.

Early Chinese influences

The introduction of Buddhism (a complex variety of religious schools that follow traditions derived from an Indian founder Gautama Buddha, 6th century BC) from China and Korea in the mid-6th century AD played a decisive role in the history of Japanese religion. Prince Shōtoku (AD 573–621), said to be the real founder of Japanese Buddhism, wrote commentaries on three Buddhist *sūtras* (scriptures) and understood the fundamentals of Buddhism. It is doubtful, however, that the doctrines of early Japanese Buddhism were fully understood by the majority of the Japanese people. During the Asuka and Nara periods (AD 593–784) the Buddhist sects or schools became theoretical, philosophical, and devoted to religious discipline. A variety of schools developed, including Sanron (Indian Miidhyamika, a sect that believes the "Absolute" to be inexpressible), Hossō (Chinese Fa-hsiang, a sect that believes in "consciousness only"), Kegon (Chinese Hua-yen, a sect based on the *Avataṃsaka-sūtra*, which holds that all things in the universe are interrelated and that every living being is a potential Buddha), and Ritsu (Chinese Lü or Indian Vinaya, a sect concerned with the ceremony of ordination and rules of monastic discipline) based in large part on Chinese antecedents (see also BUDDHISM and BUDDHISM, HISTORY OF). In general, Buddhism was accepted as an exotic magico-religious cult for the protection of the state, the benefit of public security, and the welfare of the nation. Buddhist rites gradually took the place of the Shintō cults.

At the beginning of the Heian period (AD 794–1185) two new Buddhist sects were introduced and came to dominate the entire period: Tendai (Chinese T'ien-t'ai, an important and highly metaphysical sect based mainly on a sacred text known as the *Lofus Sūtra)*, introduced by Saichō (Dengyō Daishi, AD 767–822) and Shingon (Chinese Chen-yen or Mantrayiina, a highly magical and mystical syncretistic sect) by Kiikai (Kōbō Daishi, AD 774–835). (Such Buddhist leaders are known both by priestly names and posthumous honorary titles.) The Heian period of Japanese religious history was characterized by the following tendencies: (1) the esoteric and magical Mantrayāna Buddhism flourished; (2) belief in the doctrines of the *Lotus Sūtra* (*Saddharmapuṇḍarīka-sūtra*) and of Amida (Sanskrit, Ambitābha and Amitāyus) Buddha spread among all classes; (3) the activities of many *hijiri* (holy men) established popular or folk Buddhism outside the orthodox ecclesiastical system, thus paving the way for a later Buddhism; (4) belief in *goryō*, which originally consisted of the malevolent or angry spirits of the dead, appeared; (5) a consciousness of the Buddhist age of the Latter Law (*Mappō*) emerged; and (6) there was commingling of various religious elements such as primitive shamanism, Shintb, Yin-Yang magic (originally Chinese), and Mantrayiina Buddhism.

Heian and Kamakura Buddhism

At the end of the Heian and the beginning of the Kamakura period (1192–1333), three new Buddhist movements appeared: the Pure Land sects (Jōdo, Shin, Ji, and others all believing in the "Pure Land" or heavenly paradise, of Amida, the compassionate Buddha who saves); Zen (Chinese Ch'an or Indian Dhyāna), both of Rinzai (Chinese Lin-chi) and Sōtō (Chinese Ts'ao-T'ung) varieties; and the Nichiren sect. The Jbdo sect was founded by Genkū (Hōnen Shōnin, 1133–1212), who was the pioneer of Kamakura Buddhism and as a reformer of Japanese Buddhism is sometimes compared with Martin Luther. The Shin sect was founded by Shinran (1173–1262), a pious disciple of Genkū and a great promoter of his teacher's ideas. The Ji sect was founded by Chishin (Ippen Shōnin, 1239–89). The Nichiren sect was founded by Nichiren (Risshō Daishi, 1222–82), who was a revivalist of the Tendai sect. He was a messianic and prophetic politico-religious leader who fought against the Kamakura shogunate. During the transition from the Heian to the Kamakura regimes, the Pure Land sects and the Nichiren sect grew up as ways of bringing salvation to the common people, who were plagued by social disorder and national crisis. Zen Buddhism was introduced from China by Eisai (1141–1215) and some other naturalized Chinese Zen masters of the Rinzai sect and by Dbgen (Shōyō Daishi, 1200–53) of the Sōtō sect. Together with the Pure Land sects and the Nichiren sect, Zen Buddhism played an important role in establishing the spiritual foundation of the warrior class, the bearers of the Kamakura feudal system.

In the Muromachi period (1338–1573) the Pure Land sects and the Nichiren sect became widespread among the common people, while Zen Buddhists became the promoters of fine art and literature. In 1549 St. Francis Xavier arrived at Kyūshū to open the first Christian mission in Japan. He and other Jesuits made numerous ardent converts among the peasants as well as among the feudal lords (daimyo) in a very short time.

During the Tokugawa era and afterward. In a sudden change in Japanese religious policy, Christianity was prohibited on penalty of death from 1616 to 1873, the greater part of the period of the Tokugawa shogunate (1603–1867). At the same time, Buddhist temples and priests were also completely controlled by the Tokugawa regime and priests were required to serve as government registrars as well as performers of funeral ceremonies. The only innovation during the Tokugawa era was the introduction of the Ōbaku (Chinese Huang-Po) Zen Buddhist sect from China by lngen (1592–1673) in 1655.

An important measure of the Tokugawa shogunate was the adoption of Neo-Confucianism, which became the officially authorized basis of national learning and morality. Learning and art as well as indigenous or nationalistic thought gradually began to flourish during this 280-year period of peace and national isolation. Orthodox Neo-Confucianism followed the lines of the Chinese thinkers Ch'eng Hao (1032–85), his brother Ch'eng I (1033–1107), and Chu Hsi (1130–1200), but an idealistic theory of knowledge, conceived by Wang Yang-ming (1472–1529) was also introduced. Several Confucianistic Shinto theories and movements (amalgamations of aspects of Chinese Confucianism and indigenous Japanese traditions) also arose, among which the Mito school played an active role in restoring national unity under Imperial rule. A more radical school promoting the same tendency was the Kokugaku (National Learning) school, which insisted on purging away all alien elements and restoring an "original" Shintō based on the myths in the *Koji-ki* (a classic relating myths, legends, and history of the Imperial court). The Mito school and the Kokugaku school were to become driving forces in the Meiji Restoration in 1868.

Rise of modern religious movements

At the same time, there had appeared several popular ethicoreligious movements, such as the Shingaku (Mental Learning) movement of Ishida Baigan (1685–1744) and the Hbtoku (Recompense or Indebtedness) movement of Ninomiya Sontoku (1787–1856). The Shingaku movement had a great influence within the merchant class, and the Hbtoku movement influenced the peasants.

In the transition from the Tokugawa regime to the Meiji era (1867–68) there appeared several new religious movements that later became independent religious bodies in Sect Shintō—a group of 13 sects, each based on the religious experiences of their individual founders. They may be classified into three categories: (1) denominations of the pure Shintō movement; (2) religious associations of popular mountain asceticism known as Shugen-db; (3) popular new religions founded by charismatic or shamanic leaders from among the common people, including Kurozumi-kyō founded by Kurozumi Munetada (1780–1850), Tenri-kyō (Heavenly Truth) founded by Nakayama Miki (1789–1887), and Konkō-kyō (Golden Light) founded by Kawate Bunjirō (1814–83). These religious movements gradually gained many ardent converts among the masses and became the pioneers of the new religious movements of present-day Japan. From the Manchurian Incident (1931) to World War II several new religious movements appeared but were usually suppressed by the militaristic government. After World War II, in the throes of the political, economic, and cultural ruin of Japan, more than 600 religious movements arose. Some of them were revivals of formerly suppressed sects, while others were new denominations developed from Buddhism, Shintō, Christianity, and the new religions; and some were newly arisen sects. The most significant phenomena of present-day new religions are (1) lay Buddhist movements especially of the Nichiren line, such as Reiyū-kai, Risshō-Kōsei-kai and Sōka-gakkai; (2) the importance of charismatic, shamanic, or prophetic founders or foundresses; (3) syncretistic doctrines; and (4) messianic tendencies.

CHARACTERISTICS AND FEATURES OF JAPANESE RELIGION

In Japan there are several kinds of rites and magico-religious customs that are thought to have originated in Japanese antiquity. The actual content of Japanese religion is not, however, limited to these ancient, indigenous elements. Japan has never been isolated from the Asian continent, from which it borrowed various magical and religious ideas and techniques. These borrowed ethical, magical, and religious elements were then blended, reinterpreted, and resystematized into a unified Japanese religion consonant with Japan's own traditions, which arose out of special sociocultural and historico-geographic circumstances.

Types of primitive Shintō

Shintō and shamanism. Primitive Shintō in ancient Japan should be classified into two categories, each distinguished by its particular notions and practices concerning kami. The term kami (or *-gami*, in combining forms), an ancient Japanese word roughly equivalent to deity or spirit in the sense of the sacred, refers to both mythological and human figures as well as natural objects. It is used in both the singular and plural. The first category of primitive Shintō may be defined as the *uji-gami* type (tutelary or guardian shrine system). It was based on the family or on the Japanese clan system, and within it each family had its own shrine as a central symbol of its solidarity, which was dedicated to an ancestral spirit or socially related kami (deity or deities) who had been worshipped and enshrined successively by their descendants. This type of religion is centred in the family group to the exclusion of other families, so that the main function is to integrate all members of the family into the patriarchal hierarchy of the family system. The heavy emphasis on ancestor worship and filial piety (*kō*) in almost all Japanese religious groups has been connected with the ancient family religious system.

The second category of primitive Shintō may be called the *hito-gami* type (man–god system), based on the close relationship of an individual kami with a charismatic figure, such as a shaman or a medicine man. The more highly integrated state systems, such as the village states or federated village states that appeared in the 3rd century AD, for example, were supposedly ruled by such charismatic or shamanic leaders. This kind of belief is characterized by the strong individuality of both the personal kami and its transmitter, who lived on in the memory of the believers. Those beliefs eventually exerted great influence on the common man. Sincere reverence and pious obedience, regardless of the believers' social origins, were the only prerequisites for gaining the favour of this type of kami.

Due to the rigidity of the ancient Japanese social structure and value system—characterized by the primacy of political values and family-centred religion—there was an increased emphasis upon on (blessings or favours handed down, not only by invisible beings but also by social and political superiors) and *ho-on* (obligation of the recipient to return something for their blessings). The Japanese social structure and value system emphasized human relationships that were strictly controlled and regulated by a patriarch according to the status of each member in the family. The patriarch, however, in turn, was responsible to the higher authorities of the Japanese nation as well as to his ancestors, and even the emperor himself has been and is held responsible by his ancestors for his behaviour. The Japanese way of thinking as it emerged from such a value system left no room for the development of the concept of an "almighty God," such as is found in Judaism, Christianity, and Islām. On the contrary, Japanese kami, as well as men, are not only regarded as independent personalities but also as lowly figures dependent on their superiors in either the divine or the social hierarchy and in need of salvation and help. In this context, the superiors, including human beings and ancestors, were believed to be semi-*kami* (demigods) or even low-ranking kami or Buddhas. Contrary to Chinese Confucian ethics, in Japan filial piety and loyalty (chzi) were respected equally and inseparably. Further, the Japanese people generally accepted the Chinese Confucian philosopher Mencius' (c. 371–289 BC) doctrine that human nature is fundamentally good. Moreover, belief in the spirits of the dead and the idea of an intimate connection between men and kami (involving the deification of human beings) have always been quite widespread and important in Japan.

Transformation of Buddhism

Buddhism **in** Japan. The same Japanese tendency to transform borrowed traditions may be seen in the case of Buddhism. The development of Japanese Buddhism has made it unique among the many forms of Buddhism in the world. Traditional Buddhist teachings concerning the *saṅgha* (monastic order) and *vinaya* (the disciplinary system) were transmitted by missionary efforts from India through China and Korea. But when these teachings were first introduced into Japan they conflicted with the existing social patterns, and inevitable modifications took place in the course of the popularization of the Buddhist religion. Under Prince Shōtoku, Buddhism developed into a religion of the aristocracy with strong lay leadership. At the same time, Shōtoku's emphasis on a text known as the Lotus Siitra promoted a social consciousness that encompassed all classes. The Lotus *Sūtra*'s promise of salvation for all mankind was in sharp contrast to the pre-Buddhistic and shamanistic folk religion. Moreover, the new Buddhist social concern was expressed in the building of temples that served as centres of philanthropic and cultural activities.

In the Asuka and Nara periods (AD 593–784), however, Japanese Buddhism was transformed into the spiritual foundation of the great family or clan system. Ancestor worship became one of Buddhism's most significant functions. Buddhist magic, commingled with Shintō and Chinese Yin-Yang magic, also flourished.

Heian Buddhism, developed in a period of intense commingling of various religious elements, shows a remarkable contrast to the Buddhist sects of Nara. Politically, the transfer of the capital from Nara to Kyōto (784–794) brought about a new mood; one purpose for the transfer was to separate church and state. Religiously, two sects of Buddhism, Tendai and Shingon, were predominant throughout the period. The Lotus *Sūtra*, the fundamental sacred book of Tendai Buddhism, gradually revolutionalized the Japanese idea of human nature; at the same time it came to serve as the foremost text for the atonement for sin and for gaining blessing and for prophecy in an age said to be the final period of the Buddha's law. Many popular practitioners of the doctrines of the Lotus Siitra appeared in the Heian period. Together with the Lotus Siitra, beliefs and practices focussing on Amida (the compassionate Buddha) arose within the Tendai sect in terms of meditation on the mystery of existence and man's ultimate destiny; belief in Amida leads to enlightenment. On the other hand, prayer (reciting praise to Amida) and contemplation on Amida (*Nembutsu*) were regarded as a means of clearing the mind and enabling it to concentrate on the presence of Amida. This also helped spirits to be saved after death by invoking Amida's merciful hand. These beliefs and practices gradually influenced the Japanese people and fostered the establishment of independent Pure Land sects in the latter part of the 13th century.

Shingon Buddhism

The central focus of the Shingon sect is *Dainichi-kyō* or Great Suit Szitra (a Japanese version of the Sanskrit *Mahāvairocanābhisaṃbodhi-sūtra*), which teaches that the phenomenal world is a manifestation of the ultimate reality known as the Great Sun Buddha, who represents two aspects of reality: the *vajra-dhātu* (diamond element) and the garbha-dhiitu (womb element). Together with the Chinese theory of yin and *yang*, the doctrine inspired a metaphysics and cosmology of balanced polarities in the Japanese way of thinking, and in turn contributed to the theoretical systematization of Shintb and the formation of the theory of the manifestation of the prime noumenon or primary reality (honji-suijaku—a theory based on Buddhist notions of incarnation according to which Japanese kami were considered to be manifestations of gods of the Buddhist pantheon, and those Buddhist gods themselves were seen as kami). Shingon theology also supported the theory of "becoming a Buddha in one's own body" (*sokushin-jōbutsu*), following the cosmological and metaphysical theories of the Great Sun Siitra and the *Avataṃsaka-sūtra.* Another focus of the Shingon is the harmonious uniformity of theory and ritual as expressed through activities of the body, mouth, and mind. Theory is expressed concretely in symbolic rituals, while rituals are performed in conformity with metaphysical doctrines.

These theories and beliefs, together with those of the Lotus Siitra and the Amida worship of Tendai Buddhism, were widely accepted not only by all the branches of both sects but also by other Buddhists and laymen. Even in Nichiren and Tendai Buddhism as well as in Shin and Zen Buddhism, the Shingon theory of "becoming a Buddha in one's own body" was accepted, and at the same time Shingon Buddhism accepted belief in Amida for the purpose of securing an individual afterlife.

The initial commingling of primitive shamanism with Yin-Yang magic and Mantrayāna Buddhism appeared in the latter part of the Nara period and developed rapidly in the Heian period. Three major streams emerged in the religious world as a result of this historical cohesion: (1) *Nembutsu*—the Buddhist Pure Land school mixed with Japanese animistic and shamanistic elements; (2) *Shugen-dd*—Buddhist Mantrayāna mixed with Shintb animism and shamanism as well as with Yin-Yang magic and Chinese astrology; (3) Onmyd-dd—religious Taoism mixed with Yin-Yang magic and astrology as well as with Shintb animism and shamanism.

Heian Buddhism in general gradually declined into occult mysticism and ritualism in response to the magico-religious needs of the people and became secularized under the influence of the Imperial family and the nobility. In response to this situation there appeared an informal movement of individuals known as hijiri (holy men) who, as lay Buddhists (ubasoku or upiisaka), resisted secularized and formalized Buddhist institutions. There were two currents in the hijiri movement, one emphasizing the Amidist tradition (following Amida) and the other the Lotus Szitra. These far-sighted hijiri intuitively perceived the religious meaning of the crucial social changes taking place in the transition from the Fujiwara regime to the Kamakura feudal regime and were torn with anxiety. Because they believed that this world was gradually approaching the fateful age of the Latter Law (Mappd), they endeavoured to find a means of self-enlightenment to cope with a hopeless and depraved age, and at the same time they sought salvation for the common people in their everyday life.

Jōdo

Genkii, the founder of the Jōdo sect and a pioneer of the new Kamakura Buddhism, merits the title of Buddhist reformer. His reformation constituted the real Japanization of Buddhism. Genkii insisted that even stupid and obstinate men could be saved; he severely criticized and rejected the old ecclesiastical institutions and the formality and aristocratic bent of traditional Buddhism. He taught that the way to the Pure Land is necessarily through simple faith in Amida's grace, which is called the "easy way" (igyd-dd) of salvation. (This term is in direct contrast with the "difficult way" [nangyd-dd] of moral perfection.) The "easy way" is also called salvation by "other power"—*i.e.,* Amida's power. Genkii's notions exerted strong influence on the reform movements in Buddhism, as well as in Shintō theories during the Kamakura period. For example, Shinran advanced Genkii'~theory several steps. According to Shinran, human nature is originally so sinful and hopeless, and the situation of the later times is so absolutely confused that no one can attain spiritual enlightenment and peace by "self power." Instead, it is necessary to throw oneself on the mercy of Amida's mysterious power. Pushing Genkfi's idea to its utmost limit, Shinran denied not only the formal temple-priest system of his times but also married and reared a family, just as any ordinary citizen or farmer. He also criticized ritualism, magic and divination, and the worship of the old pantheon. His direct descendant, Rennyo (1415–99), promoted the rationalistic tendencies of Shinran and made important advances in the ethicoreligious regulation of everyday life. He stressed the obligations of this-worldly asceticism and of bestowing blessings on the people, as well as giving thanks for Amida's blessings.

Nichiren, who predicted the Mongolian invasions in 1274 and 1281, admonished the Kamakura shogunate for its religious policy at these times of national crisis. Nichiren requested the unification of Buddhism as well as national thought on the basis of the teachings of the Lotus Siitra. He severely attacked the Jōdo sect of Genkū as well as other sects such as Shingon, Zen, and Ritsu. His teaching, focussed on a new interpretation of the Lotus Siitra, was intended to give the people peace and salvation, much like the *Nembutsu* practice of Genkii and Shinran. His apocalyptic, prophetic attitude and his violent attacks on the other Buddhist sects met stern resistance and persecution. Nichiren, however, left a vigorous sect behind him. The most extreme Nichiren group, known as the Fuju-fuse ("No give or take") branch, was severely restricted along with Christianity by the Tokugawa shogunate. The other subsects of Nichiren Buddhism, however, spread among the merchants and craftsmen in Kybto and other areas in the Middle Ages and continued to gain many ardent believers among the masses even in the Tokugawa period.

Developments since the Tokugawa regime

Curiously enough, since the end of the Tokugawa regime, several lay movements of the Nichiren line—for example, Busshb-gonen-kai, Butsuryfi-kyd, Rieyfi-kai, Risshb-Kb-sei-kai, and Sōka-gakkai—developed among the masses and are the most active and prosperous new religious movements in present-day Japan. All of this is in sharp contrast to the Shin sect, which has gone completely back to the level of a monastic religious body and has not given rise to many new religious movements.

Zen Buddhism did not spring up like the systems of Genkii, Shinran, and Nichiren. It was introduced to Japan c. AD 1200, when men's minds were weary of the old religious forms and new sects, national and Japanese, were coming into being; and in this troubled period, the contemplative and mystical doctrines of Zen, along with those of Jddo, Shin, and Nichiren, found truth in immediate experience and spiritual peace and enlightenment through meditation. Zen was accepted as the rule of life for the military class. Bushidd, the Way of Warriors, was formed from a combination of Zen Buddhism and Confucian ethics of loyalty.

The newer Buddhist sects, including imported Zen sects, were either completely Japanese or were transformed into a Japanized Buddhism. Generally speaking, these sects have the following common characteristics: (1) religious theory and form are rationalized and simplified; (2) there is a concentration of religious piety—of faith and devotion; and (3) there is an emphasis on religious practices related to the daily life of the believers and a rejection of excessive speculation and complicated magico-religious ritualism.

Christianity and Neo-Confucianism. In spite of the prohibition of Christianity from 1616 throughout the Tokugawa regime and many persecutions and martyrdoms, the few surviving Japanese Christians went into hiding in several isolated islands and peninsulas in northern Kyūshū, where they maintained their ancestors' faith until 1873. Even today there are about 40,000 of the so-called hidden Christians in these areas. Their faith and practices have been, however, so completely transformed by mixture with Japanese folk religious elements that some scholars say that their faith is not really Christianity but a unique Kirishitanism (*Kirishitan* is the Japanese name for the Christians dating from the 16th century). In this era, when Christianity was prohibited, Buddhism sank into a torpid condition, from which it was awakened only by active measures taken against it in 1868.

The Japanese Neo-Confucian school was founded by Fujiwara Seika (1561–1619) and his pupil Hayashi Razan (1583–1657). The head of the Hayashi family became the hereditary governmental university president. The Wang Yang-ming school of Neo-Confucianism had been taught first by Nakae Tōju (1608–48) and Kumazawa Banzan (1619–91), but this school was in disfavour with the authorities, and its teachers got into trouble for advocating its principles. Confucianism in Japan, however, generally insisted on ancestor worship and filial piety as well as on loyalty, based on the idea of Heaven and righteousness, and it constituted an important stimulus for new Shinto theories. Confucian Shintō was taught by Yamazaki Ansai (1618–82), Deguchi Nobuyoshi (1615–90), and Kikkawa or Yoshikawa Koretaru (1616–94), respectively, and had a strong influence on some feudal lords and the warrior class, as well as on Shintō priests of the period. Orthodox Confucianism and Confucian Shinto, in addition to influencing the warriors' discipline and their service to the existing regime, worked in subtle and unexpected ways toward undermining feudalism and restoring national unity under Imperial rule. The Mito school, founded by Tokugawa Mitsukuni, lord of the Mito fief, with its idea of loyalty to the mikado (emperor), was a representative of this tendency.

In the 18th century Shintō entered a new path and prepared for another revival. All the earlier Shintō theories had depended heavily upon either Buddhism or Confucianism and religious Taoism in interpreting Shintō ideas. In contrast, there then appeared a new Shintōistic school that purged away all alien elements and sought to restore the original religion of Japan—*i.e.*, pure Shintō. The great pioneers of this pure Shintō or Koku-gaku movement were Kamo Mabuchi (1697–1769), Motoori Norinaga (1730–1801), and Hirata Atsutane (1776–1843). They contended that the Japanese people and their Shinto, when purged of all foreign accretions and influences, represented the pure, and therefore the best, inheritance of humanity from the divine ages of Japanese mythology. Hirata pursued the contentions of Motoori to their logical conclusion, and through him the Shintō revival took definite form in vigorous propaganda. Hirata's disciples tried to carry such chauvinistic ideas into practice in the antiforeign and anti-Tokugawa movement of the 19th century. Pure Shintō and the Mito school became the dynamic forces behind the Meiji Restoration of 1868.

Koku-gaku movement

In the Tokugawa era, there appeared two remarkable popular ethicoreligious movements: the Shingaku movement and Hōtoku movement. Shingaku, the result of eclectic borrowing, aimed at uniting the moral teachings of all the religious and ethical systems prevailing in Japan and tempering them with the general principles of humanitarian ethics and mental culture. Shingaku met with great success and developed religioethical principles for merchants. On the other hand, the Hōtoku movement penetrated into the peasant class. Ninomiya, founder of the Hōtoku movement, emphasized the indebtedness of mankind to nature and fellowship among men. He taught that man's nature consists in devotion to the order of nature, which manifests itself in the moral order of human life, especially in the obligations between a lord and his subjects, parents and children, and benefactors and recipients in general.

Modern forms. After the Meiji Restoration of 1868 there were four major religious currents. First, there was the reintroduction of Catholicism and the introduction of Protestantism at the beginning of the Meiji era. Catholicism was accepted by upper class people, while Protestantism was embraced by the lower class samurai (warriors) who had been living in obscurity since the fall of the Tokugawa feudal system. Joseph Niijima was a most remarkable pioneer of Japanese Christian mission works as well as education works. His personality seems to have been formed by the Christian faith mixed with the samurai ethics based on Confucianism. Second, there was strict enforcement by the Meiji government of the separation of Shinto and Buddhism. This policy encouraged by the pure Shintoists resulted in Shintō becoming a kind of established church. Shintō served in the status of both a national cult and a community cult as a focus of the unity of the nation and community. Shrine Shinto was regarded legally not as a religion but as a national moral order. The third major current, Buddhism, after suffering from vigorous suppression, has gradually recovered its role as a family religion and has also promoted positivistic studies of Buddhism under the influence of European Indology and Buddhology. Buddhist priests have become practitioners of the funeral and memorial services based on ancestor worship. Generally Buddhism, together with Shrine Shintō, has maintained the status quo under the strong control of the government. The fourth major current is constituted by Sect Shintō and several new religious movements after the Meiji Restoration (already described above).

An eminent British scholar, Sir Charles Eliot, writing on the characteristics of Japanese religion, has said that the Japanese people are religious, "if religion is taken in the wide sense of devotion to something beyond, or readiness to sacrifice to it earthly welfare and life." In Japan there has survived a very old tradition that identifies religion with government, law, family duties, and festivities. They are to be identified in the strictest sense: religion does not regulate them, they are religion. This was true of the history of Japanese religion, but recently some serious changes have occurred in the religious world view due to rapid social change. The nature of religion and its relationship to rapid social change are important problems for the future of Japan.

JAPANESE RELIGIOUS SYMBOLISM

In Japan religious symbolism is formed from a complex of indigenous and borrowed elements, expressed both in popular forms and in abstract doctrine and iconography. Shintō possesses its own traditional symbolism. In Shintō rites a sacred tree, sacred pole, or mirror is used as a symbol, on which the kami descends or which the kami is believed to "possess." At some shrines chosen persons have played the roles of substitutes of kami or have been possessed by kami. Shinto originally did not offer an explicit moral code; its prayers and sacrifices aimed at obtaining temporal prosperity and indicated no desire for moral or spiritual blessings. Also Shintō does not advocate meditation practices but requires purification rites of all participants in a festival (see also SHINTO).

Maṇḍala and *haniwa*

Visual arts. Buddhism brought from the Asian continent several kinds of meditation techniques and esoteric rituals, as well as symbolic representations such as mandalas (Buddhist ritual meditative drawings) and images of Buddhas, *bodhisattva*s (Buddhas-to-be), and other guardian deities. In pre-Buddhistic ages, various kinds of lay images called haniwa were dedicated on grave mounds to the spirit of the noble dead, supposedly as substitutes for human and animal immolations. The introduction of Buddhist arts as symbols for worship, however, had a revolutionary effect on Japanese arts. From the Asuka period to the Nara period, almost all Buddhist arts were imported or produced by immigrant Korean artists or their descendants. But in the Heian period Buddhist arts became more symbolic and esoteric under the flourishing Mantrayāna Buddhism. At the same time, the cessation of official relations between Japan and China (in AD 894) contributed to the Japanese transformation of imported art styles. The most remarkable result was the new depiction of themes from Pure Land Buddhism in a uniquely Japanese style of picture (yamato-e). In the Kamakura period there appeared a realistic school of Buddhist arts, in contrast to the earlier esoteric and symbolic expressions of the Heian period arts. Under the Ashikaga shogunate in the 14th and 15th centuries several Zen monks engaged not only in religious activities but also in diplomacy and in creative arts such as literature, painting, architecture, gardening, Nō play, tea ceremony, and flower arrangement. Their art and literature were strongly influenced by those of the Chinese Ming dynasty and flourished around Kybto. In the Tokugawa period Buddhist art became formalized, and rather inferior and secular arts and literature were on the rise and appealed to the common people—the so-called *chōnin-geijutsu* (arts and literature for merchants).

Performing arts. Almost all Japanese performing arts originated from ancient magico-religious or shamanic séances; later they became differentiated into Shintd festivals and Buddhist rituals and finally became the theatrical arts such as Nb play, Kabuki, or Bunraku puppet show. Several varieties of popular dramas and dancing arose in the course of the popularization of Mantrayāna Buddhism and the Pure Land sects as a result of their mixture with both the pre-Buddhist shamanic séance and the Ying-Yang arts. Shintb music and dancing called *kagura* also originated from the ancient shaman's séance; they played an important role in ShintB rituals. Foreign music and drama, including Korean, Chinese, and Indo-Chinese music instruments, masks, and dramatic techniques, were introduced in the Nara period; these imported arts were frequently performed at the Imperial court as well as at Buddhist temples during both annual festivals and occasional services. On the common level, puppet dramas and dancing, Nernbutsu-dancing in procession or in circle, masked dances, and narrations with gestures were performed by such figures as lower class Pure Land priests or mountain ascetics (*yamabushi* or *shugen-ja*) and by the blind magico-religious public entertainers.

Manshichi Sakamoto

"Descent of Amida across the Mountains," painting by an unknown artist of the Kamakura period (1192–1333). In the Konkai-Kōmyō-ji, Kamakura, Japan.

Festivals. In Japan there are various annual festivals and special festivals at Shintō shrines, Buddhist temples, and in each family. The festivals represent both elite and popular ways of expressing and celebrating religious symbolism. In ShintB shrines the harvest festival named *niiname* is most important, and in the Imperial court the festival is performed by the emperor himself, who must observe rigid abstinences and purifications. The coronation ceremony named *daijō-sai* is simply the niiname festival performed on a large scale. In Buddhist temples the memorial and celebration services for Buddha Śākyamuni's birth and death and his attainment of Buddhahood and also the memorial days of the founder or founders of each sect are solemnly observed. The most important and universal annual festivals are the New Year festival *Shōgatsu gyōji*, and the Bon festival; the former is performed in a Shintd manner, the latter in a Buddhist manner. But both are said to have originated from agricultural rites mixed with ancestor worship and the belief in spirits of the dead.

Bon and New Year festivals

POLITICAL AND SOCIAL ROLES OF RELIGION IN MODERN JAPAN

There have been three major developments in Japanese religion since the Meiji Restoration (1868). First, as a result of the enforcement of a policy of the separation of Shintb and Buddhism, State Shintō became more and more bureaucratic and chauvinistic; it lost its religious elements and became formalized. Because the Meiji government recognized State Shintb as the foundation of national polity and morality (but not as a religion, in order to explain away article 28 on freedom of religion in the Meiji constitution, which stated that so long as the religious beliefs of Japanese subjects were neither "prejudicial to peace and order" nor "antagonistic to their duties as subjects," freedom of religious belief was to be guaranteed), State ShintB easily became an ideological rationale for nationalism and militarism until the end of World War II. Buddhism, having lost the leadership of the Japanese nation's religious life, became lethargic.

Second, the consequent religious vacuum after the Meiji Restoration was filled by various new religious movements founded by leaders from the lower classes. These movements spread rapidly among the common people who had suffered many social, political, and economic changes. Also at the same time a newly introduced Protestantism and reintroduced Catholicism advanced among the intellectuals and played important roles in the modernization of Japan. From the Manchurian Incident in 1931 until the end of World War II in 1945, all Japanese religions—old and new sects of Shintb, Buddhist sects, syncretistic ones, and Christianity—were severely controlled by the militaristic government and were forced to cooperate in the national war effort in support of the so-called Greater East Asia Co-prosperity Sphere. Some new religious sects such as Omoto and Hitonomichi were even persecuted and completely exterminated by the government under the pretext of offenses against the law of maintenance of the public peace and *lèse-majesté.*

Third, the period after World War II was marked by the appearance and flourishing of several new religious movements, including revivals of the suppressed sects. For example, the Omoto sect revived as Omoto-Aizen-en (Great Foundation of Love of Goodness Garden) and the Hitonomichi as the PL Kybdan (Perfect Liberty Order). Among the new religious movements in contemporary Japan, however, the most conspicuous are the Nichiren sects such as Reiyū-kai (Spiritual Friend's Association) founded by Kotani Kimi (1900–71); Risshō-Kōsei-kai (Integrative Becoming, of Nichirenism), a denomination derived from the Reiyii-kai, founded by Naganuma Myōkō (1889–1957) and Niwano Nikkyb (1906–); Sōka-gakkai (Value Creation Society) founded by Makiguchi Tsunesaburb (1871–1944) and Toda Jōsei (1900–58) and now led by Ikeda Daisaku (born 1928); and other minor Nichiren sects.

Developments since World War II

From the standpoint of the political and social roles of religion, Sbka-gakkai is the most important, not only because it is the fastest growing but because it is as well the most vigorous, dogmatic, belligerent, and self-confident group in Japan. Although Sdka-gakkai denies that it is an independent religious body, insisting that it is merely a lay association within a Nichiren sect (Nichiren-shō-shū), the fact is that its rapid growth, its penetration into labour unions, its recent successes in political activities (through its related Kbmei-t6 Party), and its aggressive methods of gaining converts have drawn Japanese national attention to it as one of the most important sociopolitical religious groups in present-day Japan. Statistics for 1968 show that the total membership of Nichiren-shb-shii is 15,729,636. This represents a remarkable growth, for in 1955 there were only 348,160 believers.

THE PLACE OF JAPANESE RELIGION IN WORLD RELIGIONS

Japanese religion is a typical example of syncretistic religion, which as an entity has become thoroughly Japanized or particularized, in spite of the fact that it is composed of such diverse elements as archaic animistic-shamanistic elements; the Shintō cult; Confucian ethics and metaphysics; Taoistic divination; rituals and astrology; the theories, practices, and rituals of Mahāyāna Buddhism in the premodern periods; and Christian denominations. Moreover, Japanese religion is characterized on the whole as a this-worldly religion. Even Jōdo Buddhist sects, which originally insisted on the denial of this impure world, have been transformed into religious traditions insisting on a this-worldly asceticism quite like the Protestant ethic in the rise of capitalism. This tendency should be recognized as one of the underlying causes of the rapid modernization of Japan since the Meiji Restoration. Non-Japanese often wonder at the fact that a single Japanese can belong simultaneously to two or more religious organizations. Such "plural belonging" illustrates the Japanese tendency to treat foreign culture as a means easily adopted for utilitarian purposes. Recently Japanese Buddhist sects such as Shin and Zen and several new religions such as Tenri-kyb and Sōka-gakkai, however, have promoted missions in foreign countries. They pay attention to foreigners who are interested in the relationship between socioeconomic changes or social crisis and religion. They are searching for new principles of salvation whereby man's humanity may be preserved in increasingly mechanized society.

Almost all Japanese religious organizations, old and new, participated in the International Congress for the Cooperation of World Religions held in Kybto in the fall of 1970 with great enthusiasm in order to discover a new approach to world peace and prosperity and establish greater cooperation among all world religions.

BIBLIOGRAPHY. On the general features of Japanese religions, the most detailed and excellent study is MASAHARU ANESAKI, *History of Japanese Religion* (1930, reprinted 1963). See also his *Religious Life of the Japanese People,* rev. by HIDEO KISHIMOTO (1961). J.M. KITAGAWA, *Religion in Japanese History* (1966), is a good guidebook to understand the Japanese religions, which mainly emphasized the characteristics of ethico-religious movements in connection with their historical contexts. R.N. BELLAH, *Tokugawa Religion: The Values of Pre-industrial Japan* (1957), is a unique study in the sociological analysis of the roles played by the ethico-religious movements in pre-industrial Japan in connection with the Meiji Restoration and the following modernization; also HIDEO KISHIMOTO, *Japanese Religion in the Meiji Era,* trans. into English by J.F. HOWES (1956). On the subject of folk religion, ICHIRO HORI, *Folk Religion in Japan: Continuity and Change* (1968), will be helpful. A very brief but relevant sketch of the history of Japanese institutionalized religions is W.K. BUNCE (ed.), *Religions in Japan: Buddhism, Shintd, Christianity* (1962).

On Shintb, W.G. ASTON, *Shintd: The Ways of the Gods* (1905), is a classic work. D.C. HOLTOM, *The National Faith of Japan* (1938), is also excellent. More recent works include: JEAN HERBERT, *Les Dieux nationaux du Japon* (1965); EDMOND ROCHEDIEU, *Le Shintoïsme et les nouvelles religions du Japon* (1968); and F.H. ROSS, *Shintd: The Way of Japan* (1965).

On Japanese Buddhism, there are many books written about Zen Buddhism or Shin sect from the philosophical and theoretical viewpoints. An excellent general history of Japanese Buddhism is SIR CHARLES ELIOT, *Japanese Buddhism* (1935); as is A.K. REISCHAUER, *Studies in Japanese Buddhism* (1917).

On Japanese Confucianism, see R.C. ARMSTRONG, *Light from the East: Studies in Japanese Confucianism* (1914).

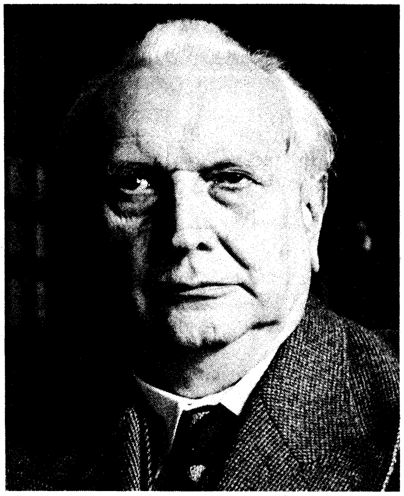
On the contemporary new religious movements, C.B. OFFNER, and H. VAN STRAELEN, *Modern Japanese Religions* (1963); H.N. MCFARLAND, *The Rush Hour of the Gods: A Study of New Religious Movements in Japan* (1967); and H.B. EARHART, *The New Religions of Japart: A Bibliography of Western-Language Materials* (1970), are useful. On the new Buddhist denominations, see W. KOHLER, *Die Lotus-Lehre und die modernen Religionen in Japan* (1963); and KIYOAKI MURATA, *Japan's New Buddhism* (1969).

(I.H.)

Jaspers, Karl

Karl Theodor Jaspers was a 20th-century German philosopher whose intellectual development led him from medicine to psychiatry and psychology and then to philosophy. He played an influential role in establishing the methodological foundations of clinical psychiatry, but his most notable work was in laying the groundwork for the modern philosophy of existence. Together with Martin Heidegger, he was one of the two most important representatives of the German-speaking world in the Existentialist movement. In his later work, as a reaction to the disruptions of Nazi rule in Germany and World War II, he searched for a new unity of thinking that he called world philosophy.

Horst Tappe—EB Inc.



Jaspers, 1968.

Early life and education. Jaspers was born February 23, 1883, in Oldenburg (near the North Sea coast). He was the oldest of the three children of Karl Wilhelm Jaspers and Henriette Tantzen. His ancestors on both sides were peasants, merchants, and pastors who had lived in northern Germany for generations. His father, a lawyer, was a high constable of the district and eventually a director of a bank. He was thus able to provide adequately for his family.

Jaspers was delicate and sickly in his childhood. As a consequence of his numerous childhood diseases, he developed bronchiectasis (a chronic dilation of the bronchial tubes) during his adolescent years, and this condition led to cardiac decompensation (the inability of the heart to maintain adequate circulation). These ailments were a severe handicap throughout his adult life.

Studies in law and medicine

During his early years of schooling, Jaspers never excelled in any subject, yet was known for his independent spirit. His dislike for harsh discipline brought him into constant conflict with the school authorities, and, in fact, he was threatened with expulsion unless he complied with the demands of the authorities. He entered the University of Heidelberg in 1901, enrolling in the faculty of law; in the following year he moved to Munich, where he continued his studies of law, but without much enthusiasm. He spent the next six years studying medicine at the universities of Berlin, Gottingen, and Heidelberg. After he completed his state examination to practice medicine in 1908, he wrote his dissertation *Heimweh und Verbrechen* ("Nostalgia and Crime"). In February 1909 he was registered as a doctor. He had already become acquainted with his future wife, Gertrud Mayer, during his student years, and he married her in 1910.

Research in clinical psychiatry. In 1909 Jaspers became a volunteer research assistant at the University of

Heidelberg psychiatric clinic, a position he held until 1915. The clinic was headed by the renowned neuropathologist Franz Nissl, who had assembled under him an excellent team of assistants. Because of his desire to learn psychiatry in his own way without being regimented into any particular pattern of thought by his teachers, Jaspers elected to work in his own time, at his own pace, and with patients in whom he was particularly interested. This was granted to him only because he agreed to work without a salary.

When Jaspers started his research work, clinical psychiatry was considered to be empirically based but lacking any underlying systematic framework of knowledge. It dealt with different aspects of the human organism as they might affect the behaviour of human beings suffering from mental illness. These aspects ranged from anatomical, physiological, and genetic to neurological, psychological, and sociological influences. A study of these aspects opened the way to an understanding and explanation of human behaviour. Diagnosis was of paramount importance; therapy was largely neglected. Aware of this situation, Jaspers realized the conditions that were required in order to establish psychopathology as a science: a language had to be found that, on the basis of previously conducted research, was capable of describing the symptoms of disease well enough to facilitate positive recognition in other cases; and various methods appropriate to the different spheres of psychiatry had to be worked out.

Jaspers tried to bring the methods of Phenomenology—the direct investigation and description of phenomena as consciously experienced, without theories about their causal explanation—into the field of clinical psychiatry. These efforts soon bore fruit, and his reputation as a researcher in the forefront of new developments in psychiatry was established. In 1911, when he was only 28 years old, he was requested by Ferdinand Springer, a well-known publisher, to write a textbook on psychopathology; he completed the *Allgemeine Psychopathologie* (Eng. trans., *General Psychopathology*, 1965) two years later. The work was distinguished by its critical approach to the various methods available for the study of psychiatry and by its attempt to synthesize these methods into a cohesive whole.

Transition to philosophy. In 1913 Jaspers, by virtue of his status in the field of psychology, entered the philosophical faculty—which included a department of psychology--of the University of Heidelberg. His academic advance in the university was rapid. In 1916 he was appointed assistant professor in psychology; in 1920 assistant professor in philosophy; in 1921 professor in philosophy; and in 1922 he took over the second chair in that field. The transition from medicine to philosophy was due in part to the fact that, while the medical faculty was fully staffed, the philosophical faculty needed an empirical psychologist. But the transition also corresponded to Jaspers' intellectual development.

In 1919 Jaspers published some of his lectures, entitled *Psychologie der Weltanschauungen* ("Psychology of World Views"). He did not intend to present a philosophical work but rather one aimed at demarcating the limits of a psychological understanding of man. Nevertheless, this work touched on the border of philosophy. In it were foreshadowed all of the basic themes that were fully developed later in Jaspers' major philosophical works. By investigating the legitimate boundaries of philosophical knowledge, Jaspers tried to clarify the relationship of philosophy to science. Science appeared to him as knowledge of facts that are obtained by means of scholarly methodological principles and that are apodictically certain and universally valid. Following Max Weber, a sociologist and historian, he asserted that scientific principles also applied to both the social and humanistic sciences. In contrast to science, Jaspers considered philosophy to be a subjective interpretation of Being, which—although prophetically inspired—attempted to postulate norms of value and principles of life as universally valid. As Jaspers' understanding of philosophy deepened, he gradually discarded his belief in the role of a prophetic vision in philosophy. He bent all his energies toward the development of a philosophy that would be independent of science but that would not become a substitute for religious beliefs. Though the resulting system presupposed science, it passed beyond the boundaries of science in an effort to illuminate the totality of man's existence. For Jaspers man's existence meant not mere being-in-the-world but rather man's freedom of being. The idea of being oneself signified for Jaspers the potentiality to realize one's freedom of being in the world. Thus, the task of philosophy was to appeal to the freedom of the individual as the subject who thinks and exists and to focus on man's existence as the centre of all reality.

Development of his basic philosophical themes

The elaboration of these germinal ideas occupied Jasper's thought from 1920 to 1930. During this decade his brother-in-law, Ernst Mayer, himself a philosopher of repute, worked with him. During these years he also enjoyed the friendship of Martin Heidegger. Somewhat later, this friendship broke up because of Heidegger's entry into the National Socialist Party.

In the early years of the 1930s the fruits of his intellectual labour became evident: in 1931 *Die geistige Situation der Zeit* (Eng. trans., *Man in the Modern Age,* 1933) was published; in 1932 the three volumes of *Philosophie (Philosophy,* 1969) appeared—perhaps the most systematic presentation of Existential philosophy in the German language. A book on Max Weber also appeared in 1932.

Conflict with the Nazi authorities. When Hitler came into power in 1933, Jaspers was taken by surprise, as he had not taken National Socialism seriously. He thought that this movement would destroy itself from within, thus leading to a reorganization and liberation by the other political forces active at the time. These expectations, however, did not materialize. Because his wife was Jewish, Jaspers qualified as an enemy of the state. From 1933 he was excluded from the higher councils of the university, but was allowed to teach and publish. In 1935 the first part of his future work on logic, entitled *Vernunft und Existenz* (Eng. trans., *Reason and Existence,* 1955), appeared; in 1936 a book on Nietzsche; in 1937 an essay on Descartes; in 1938 a further work preliminary to his logic, entitled *Existenzphilosophie* (Eng. trans., *Philosophy of Existence,* 1971). Unlike many other famous intellectuals of that time, he was not prepared to make any concessions to the doctrines of National Socialism. Consequently, a series of decrees were promulgated against him, including removal from his professorship and a total ban on any further publication. These measures effectively barred him from carrying on his work in Germany.

Banned from teaching and publishing

Friends tried to assist him to emigrate to another country. Permission was finally granted to him in 1942 to go to Switzerland, but a condition was imposed by the Nazis that required his wife to remain behind in Germany. He refused to accept this condition and decided to stay with his wife, notwithstanding the dangers. It became necessary for his friends to hide his wife. Both of them had decided, in case of an arrest, to commit suicide. In 1945 he was told by a reliable source that his deportation was scheduled to take place on April 14. On March 30, however, Heidelberg was occupied by the Americans.

Disillusioned by the events of these years, Jaspers withdrew more and more into himself. He revised the *General Psychopathology* in an effort to make it represent the high point of a free but responsible search for knowledge of man, as distinct from science, which had betrayed man. He also completed his work on logic, *Von der Wahrheit* ("Of Truth"), the first part of which was intended to throw the light of reason on the irrational teachings of the times. These works appeared in print in 1946 and 1947.

Postwar development of thought. After the capitulation of Germany, Jaspers saw himself confronted with the tasks of rebuilding the university and helping to bring about a moral and political rebirth of the people. He dedicated all of his energies in the postwar years toward the accomplishment of these two tasks. He also represented the interests of the university to the military powers. He gathered his thoughts on how the universities could best be rebuilt in his work *Die Idee der Universität* (1946; Eng. trans., *The Idea of the University*, 1959). He

Collective guilt of the German people

called for a complete de-Nazification of the teaching staff, but this proved to be impossible because the number of professors who had never compromised with the Nazis was too small. It was only gradually that the autonomous university of the pre-Nazi years could once again assert itself in Germany. Jaspers felt that an acknowledgment of national guilt was a necessary condition for the moral and political rebirth of Germany. In one of his best political works, *Die Schuldfrage* (1946; Eng. trans., *The Question of German Guilt,* 1947), he stated that whoever had participated actively in the preparation or execution of war crimes and crimes against humanity was morally guilty. Those, however, who passively tolerated these happenings because they did not want to become victims of Nazism were only politically responsible. In this respect, all survivors of this era bore the same responsibility and shared a collective guilt. He felt that the fact that no one could escape this collective guilt and responsibility might enable the German people to transform their society from its state of collapse into a more highly developed and morally responsible democracy. The fact that these ideas attracted hardly any attention was a further disappointment to Jaspers. In the spring of 1948 he accepted a professorship in philosophy in Basel, Switzerland. In spite of the apparent neglect of Jaspers' ideas of a moral regeneration of the German people, his departure for Basel was regarded as a betrayal by many of the German people. Jaspers himself hoped to find there a peace of mind that might enable him to work through and revise once again his whole approach to the entire field of philosophy.

World philosophy and world union

This revision was guided mainly by the conviction that modern technology in the sphere of communication and warfare had made it imperative for mankind to strive for world unity. This new development in his thinking was defined by him as world philosophy, and its primary task was the creation of a mode of thinking that could contribute to the possibility of a free world order. The transition from existence philosophy to world philosophy was based on his belief that a different kind of logic would make it possible for free communication to exist among all mankind. His thought was expressed in *Der philosophische Glaube* (1948; Eng. trans., *The Perennial Scope of Philosophy,* 1949) and *Der philosophische Glaube angesichts der Offenbarung* (1962; Eng. trans., *Philosophical Faith and Revelation,* 1967). Since all thought in its essence rests on beliefs, he reasoned, the task confronting man is to free philosophical thinking from all attachments to the transient objects of this world. To replace previous objectifications of all metaphysical and religious systems, Jaspers introduced the concept of the cipher. This was a philosophical abstraction that could represent all systems, provided that they entered into communication with one another by means of the cipher. In other words, the concept of the cipher enabled a common ground to be shared by all of the various systems of thought, thus leading to a far greater tolerance than had ever before been possible. A world history of philosophy, entitled *Die grossen Philosophen* (1957; Eng. trans., *The Great Philosophers,* 2 vols., 1962, 1966), had as its aim to investigate to what extent all past thought could become communicable.

Jaspers also undertook to write a universal history of the world, called *Vom Ursprung und Ziel der Geschichte* (1949; Eng. trans., *The Origin and Goal of History,* 1953). At the centre of history is the axial period (from 800 to 200 BC), during which time all the fundamental creations that underlie man's current civilization came into being. Following from the insights that came to him in preparing this work, he was led to realize the possibility of a political unity of the world in a 1958 work called *Die Atombombe und die Zukunft des Menschen* (Eng. trans., *The Future of Mankind,* 1961). The aim of this political world union would not be absolute sovereignty but rather world confederation, in which the various entities could live and communicate in freedom and peace.

Under the influence of these ideas, Jaspers closely observed, during the latter years of his life, both world politics and the politics of Germany. When the efforts toward democracy in Germany appeared to him to turn more and more into a national oligarchy of parties, he wrote a bitter attack on these tendencies in *Wohin treibt die Bundesrepublik?* (1966; Eng. trans., *The Future of Germany,* 1967). This book caused much annoyance among West German politicians of all shades. Jaspers, in turn, reacted to their unfair reception by returning his German passport in 1967 and taking out Swiss citizenship.

In 1968 his physical condition gradually deteriorated, and he died on February 26, 1969. At the time of his death, he had published 30 books. In addition, he had left 30,000 handwritten pages, as well as a large and important correspondence.

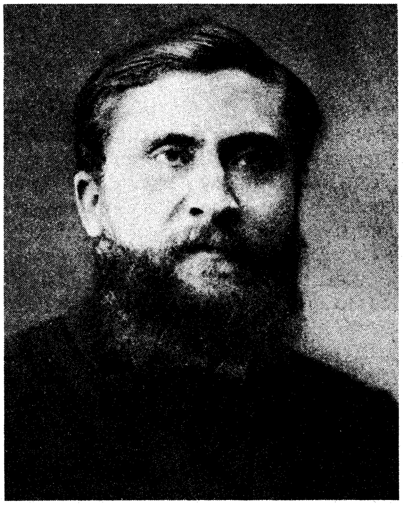
(Ha.S.)

Jaures, Jean

A principal leader of the French Socialist movement prior to 1914, Auguste-Marie-Joseph-Jean Jaurès was a man of enormous literary, philosophical, and historical erudition, as well as of prodigious eloquence. His capacity for self-sacrifice enabled him to put aside his own political beliefs in order to achieve the unification of Socialist factions into a single Socialist party, the Section Française de l'Internationale Ouvriere (SFIO).

H. Roger-Viollet



Jaures

Jaures was born in Castres (Tarn), September 3, 1859, into a lower middle class family that had been impoverished by business failures. He excelled in secondary school and was given a scholarship to attend the École

Normale Supérieure in Paris. After passing his qualifying examination, Jaurbs taught at the lycée of Albi from 1881 to 1883, and from 1883 to 1885 he was a lecturer at the University of Toulouse.

Early political activity

A convinced republican and a brilliant orator, Jaurts was more attracted to politics than to teaching and in 1885 was elected deputy from the Tarn. As he did not yet belong to any party, he took his seat in the centre of the Chamber. His election prompted the parents of the girl he loved, Louise Bois, to consent to their marriage. Madame Jaurès received as her dowry a handsome rural estate of 91 acres. Because his own political creed disclaimed the ownership of private property, Jaurbs was often reproached for his possession of this estate.

As Madame Jaurbs did not share her husband's beliefs, the Jaurbs household was not a happy one. They had two children, Madeleine, born in 1889, and Louis, born in 1898 and killed in action toward the end of World War I. His daughter's first communion brought violent attacks against Jaurès, who was strongly opposed to the influence of the Roman Catholic Church. He felt obliged to explain that, in spite of his own beliefs, he did not have the right to refuse his children a religious upbringing. Jaurts himself had left the church without abandoning his spiritual values.

His wife's indifference, coupled with his own carelessness, explains his untidy personal appearance, which provided his enemies with much material for ridicule. Short and obese, he was described as having the appearance of "a teacher who does not exercise or a fat merchant who overeats." Yet no one ever accused him of vulgarity.

Commitment to Socialism

Defeated in the 1889 elections, Jaurès returned to teaching at the University of Toulouse, and in 1891 he received his doctorate of philosophy. In 1892 he supported the striking miners of Carmaux, and that constituency elected him deputy to the Chamber in 1893. By this time he had become a Socialist, though without accepting all of Marx's ideas. Rather, of the five schools of French Socialism, he chose the least revolutionary, the Independent Socialists, led by Alexandre Millerand. During the campaign on behalf of Capt. Alfred Dreyfus, who had been convicted of treason and given a life sentence at hard labour on the basis of what later turned out to be forged evidence, Jaurks joined those demanding a revision of the trial. His position was not approved by the Marxist Socialists, who did not believe that a Socialist should defend a man who was both an officer and a member of the middle class. His book *Les Preuves,* asking for Dreyfus' retrial and rehabilitation, caused his defeat in the elections of 1898. Temporarily retired from national politics, Jaurès began to compile his monumental *Histoire socialiste de la Révolution française* (1901–07). This work, written "under the triple inspiration of Marx, Plutarch and Michelet," gave new impetus to studies on France's revolutionary period.

In spite of their dispute over the Dreyfus affair, the different Socialist factions became reconciled and held their first joint congress in 1899. But, after Millerand agreed to join the leftist government dedicated to securing the republic headed by René Waldeck-Rousseau, the Socialists divided into two groups: those who refused to cooperate with the government and advocated class war founded the Socialist Party of France (Parti Socialiste de France), and those who preached reconciliation with the state, headed by Jaurès, formed the French Socialist Party (Parti Socialiste Français). At this time Jaurès wrote many articles supporting Waldeck-Rousseau's policy of reform. After his re-election in 1902, he continued to support the leftist bloc within the Chamber of Deputies.

Formation of SFIO

In 1904 Jaurbs was cofounder of the newspaper *l'Humanité,* in which he continued to espouse the principles of democratic Socialism. That same year, the congress of the Second International, held in Amsterdam, condemned Socialist participation in bourgeois governments, thus rejecting Jaurbs's position. He acquiesced in the decision, and in 1905 the two French Socialist parties joined together to form the Section Française de l'Internationale Ouvribre (SFIO). This party remained in opposition to the government, with the result that the reform policies originally advocated by Waldeck-Rousseau were not carried out. Jaurbs's authority continued to grow within the party, though, and, on the eve of World War I, the majority of the SFIO were won over to his reformist ideas.

He fought the supremacy of the German Social Democratic Party in the Second International and, in order to deprive it of its revolutionary reputation, confronted it at the Congress of Stuttgart in 1907 with his formula "insurrection rather than war." This statement, though, did not completely summarize the whole of his political thought; he strove for the adoption of a system that would ensure "peace through arbitration" and recommended a prudent policy of "limitation of conflicts." He therefore opposed colonial expansion, such as the French invasion of Morocco, because it provided a source of international conflicts.

Hostile to the Franco-Russian alliance and suspicious of the Franco-British alliance because it seemed to be directed solely against Gemany, Jaurts became the champion of Franco-German rapprochement; as Germany was France's traditional enemy, his position earned him the hatred of French nationalists. His passion for reconciliation ultimately led to his tragic death: Jaurès was assassinated on July 31, 1914, at the outbreak of World War I, by a fanatic convinced that Jaurès was playing into Germany's hands. Up to the last moment, however, he was actively exhorting the European governments to avert a world war and to settle peacefully the conflict that followed the archduke Ferdinand's assassination at Sarajevo in June 1914. On the very day of his own assassination, Jaurts was considering an appeal to Pres. Woodrow Wilson of the United States for help in solving this crisis.

Aside from his gifts as a political organizer, Jaurès was well-known for his personal generosity, intelligence, and tenacity of purpose. An excellent scholar and polemicist, he wrote throughout his entire career. Apart from *La Guerre franco-allemande 1870–1871* (1908), *L'Armée nouvelle* (1910), which set forth an effective plan for organizing an armed nation and contained a famous study of the concept of the fatherland, and his two doctoral theses, the remainder of Jaurbs's works are collections of articles and speeches.

BIBLIOGRAPHY. Works devoted to Jaurls are very numerous, but the majority of them are polemical. The first Jaurès biography free of partisan preoccupations was HARVEY GOLDBERG, *The Life of Jean Jaurès* (1962). The *Société d'Études Jaurèsiennes* has published a bulletin, beginning in 1960, which keeps up with the state of research in the field, and has undertaken the publication of the *Oeuvres* of Jaurls (1972–). See also PIERRE RIMBERT, *Jean Jaurès: l'évolution vers le socialisme* (no. 14–17 of the OURS series; 1971), which explores new material; and JEAN RABAUT, *Jaurès* (1971).

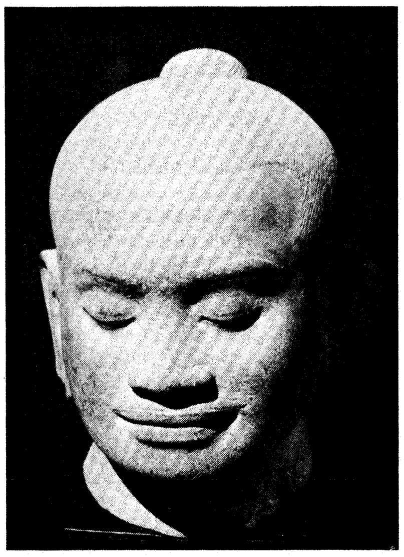
Jayavarman VII

Jayavarman VII, one of the most forceful and productive kings of the ancient Khmer (Cambodian) Empire of Angkor, expanded the empire to its greatest extent and was noted for the magnitude and frenzy of his building activities. He ruled from 1181 to *c.* 1215 (possibly as late as 1219).

Early life

Jayavarman was born in *c.* 1120 (possibly as late as 1125). A member of the royal family, he married a very religious and strong-minded princess named Jayarajadevi, who exerted an important influence on him, both before he gained the throne and during the early years of his reign. Following her death he married her older sister, a very pious and learned woman whom he had previously installed as the head professor in an important Buddhist monastery.

Though practically nothing is known of Jayavarman's childhood and youth, it is clear that during his late 30s and early 40s he settled in the neighbouring kingdom of Champa, in what is now the central region of Vietnam. At the time of the death of his father, King Dharanindravarman II (ruled 1150–60), Jayavarman was engaged in a military campaign in Champa; and after the accession of his brother (or possibly his cousin), Yasovarman II



Jayavarman VII, sandstone sculpture found at Preah Khan, Kampong Svay, Cambodia, 12th century. In the Musée National, Phnom Penh.

(ruled 1160–66), he chose to remain there, returning to Cambodia only when he received word that a palace rebellion was in progress. Although Jayavarman arrived at Angkor too late to prevent the murder of Yasovarman and the accession of the rebel Tribhuvanadityavarman (ruled 1166–77), he decided to remain in his homeland and to await an opportunity to assert his own claim to the throne.

Some 12 years later, when Jayavarman was in his late 50s, that opportunity came as a result of a Cham invasion, which brought about the demise of Tribhuvanadityavarman, the sacking of Angkor, and its subjection to foreign rule. In this situation Jayavarman organized a struggle for independence and in less than five years' time succeeded in driving out the invaders and establishing his hegemony over all his Cambodian rivals. Finally in 1181, at the age of 61, he was crowned king of a reconstituted Khmer Empire and began a brilliant reign of more than 30 years, during which he brought the empire to its zenith, both in terms of territorial expansion and of royal architecture and construction.

Jayavarman's building program

During his reign Jayavarman continued his military activities, bringing Champa, southern Laos, and portions of the Malay Peninsula and Burma under his control. But increasingly he devoted his energies and organizational capacities to the kind of religious and religio-political construction projects that had been carried-onby his royal predecessors. He built a large number of awesome new temples, including the Bayon, a distinctively Mahāyāna Buddhist central pyramid temple designed to serve as the primary locus of the royal cult and also as his own personal mausoleum; personal funerary temples of the Mahāyāna type, which were dedicated to his mother and father; and a series of provincial temples, which housed reduced replicas of the Royal Buddha—*i.e.,* Jayavarman represented with the attributes of the Buddha, the original of which had been set up in the Bayon. He rebuilt the city of Angkor, now known as Angkor Thom, and rebuilt and extended the system of highways, which radiated outward from the Bayon and the royal palace and reached far into the provinces. In addition, he constructed more than 100 rest houses along these roads and built more than 100 hospitals, which he dispersed throughout his kingdom and placed under the protection of Baiṣajyaguru Vaiḍūryaprabhā, the Great Buddha of Healing.

Jayavarman seems to have been obsessed with the need for rapid and extensive construction. For example, the less than careful workmanship evident in the temples attributed lo Jayavarman's reign vividly points to the great haste with which they were built. Some scholars have suggested that the almost frantic sense of urgency associated with Jayavarman's works derived from the fact that, having begun his reign at a relatively advanced age, he felt that his time was short and had to be utilized to the fullest. Others have suggested that Jayavarman's concern to carry through such a vast program of largely Buddhist-oriented construction was greatly encouraged by Jayarajadevi and her sister, both of whom dedicated a tremendous amount of energy toward gaining support for Buddhism and specifically for building Buddhist temples. And finally, if scholars are correct in their surmise that Jayavarman suffered from the dread disease of leprosy, his concern to mitigate his sin and suffering through the accumulation of great merit may have given a still further impetus to his piety and zealousness. Whatever his true motivations, Jayavarman succeeded during his lifetime in creating a legacy that few monarchs in history (Khmer or otherwise) have been able to equal; he was over 90 when he died.

Modern reputation

Despite the importance of Jayavarman VII in the history of the Angkor kingdom, no memory of him was preserved in the later Cambodian chronicles. As a result of 20th-century archaeological studies, however, his name has become well-known in modern Cambodia. In recent Cambodian political rhetoric, particularly during the 1950s and 1960s (the period dominated by Prince Sihanouk), Jayavarman VII became a kind of paradigmatic national hero, who was credited not only with establishing the full greatness of the Cambodian nation but also with bringing into being a welfare state that was motivated by Buddhism and dedicated to serving both the spiritual and the physical needs of the Cambodian people. Scholars, however, have sought to maintain a more balanced view of Jayavarman, recognizing the obvious immensity of his accomplishments but also taking account of the fact that the overweening demands which he placed on the material and human resources of his kingdom were a major factor in its subsequent loss of creativity and its eventual demise.

BIBLIOGRAPHY. The classic treatment, which utilizes all of the available data concerning Jayavarman VII, is found in the chapter devoted to him in GEORGE COEDES, *Pour Mieux comprendre Angkor,* 2nd rev. ed. (1947; abridged Eng. trans. *Angkor: An Introduction,* 1963). In addition, the role of Jayavarman and his work within the broader context of Khmer history are discussed in LAWRENCE PALMER BRIGGS, "The Ancient Khmer Empire," *Trans. Am. Phil. Soc.*, New Series, 41:11–295 (1951); and in CHRISTOPHER PYM, *The Ancient Civilization of Angkor* (1968).

(F.E.R.)

Jazz

Although nobody has ever satisfactorily defined it in technical terms, jazz diverges widely, even violently, from all previous canons of musical composition and performance and is immediately distinguishable. Certainly, it is the most enigmatic of musical forms, never respecting any of the received truths about itself. It is generally accepted, for instance, that all jazz is improvised, which is untrue; that jazz is synonymous with syncopation, which is even more untrue; that jazz owes its idiosyncratic nature to the ingenious subtleties of its rhythmic pulse, whereas for at least the first half of the 20th century the precise opposite was true, its rhythmic conception being extremely rigid and formalized. As jazz is neither purely composed music nor purely extemporized music and as it cannot be accurately notated, a logical positivist would have no difficulty demonstrating that, like the beach of the German philosopher Hegel, which was neither sea nor land, jazz does not exist at all. As jazz is essentially the musical experience of a passing moment, which cannot be repeated in quite the same way, in a sense the most important figure in all its history was Thomas A. Edison, who invented the phonograph.

A loose definition that has served well enough for most of jazz history is that it is a music where the performer plays melodic variations on a given harmonic base against a regular rhythmic pulse; in the 1960s even this definition became unacceptable, because the avant-garde movement dispensed with prearranged harmonic signals, indeed, with any kind of form. Difficulties of definition are aggravated by the fact that the terminology of jazz retains its validity only within the jazz context, so that to describe, say, the leading figures of the harmonic revolution of the 1940s as "Modernists" is to beg the question of Modernism as a movement in the music world at large that has been flourishing throughout the present century. An example is the chord of the minor seventh (for instance, C–E♭–G–B♭), which the standard-bearers of jazz Modernism held aloft like a banner but which in a "classical" music context had long become venerable through the French composer Claude Debussy and the school of musical Impressionists. Indeed, much earlier still, in 1858, the Russian author Ivan Turgenev could make one of his heroes sit at the piano "entranced over minor sevenths." In the same way, other terms, such as traditional, progressive, and classical, have very specialized meanings within the jazz world.

The executant as the composer

Because of the oddly eccentric nature of its whole being, jazz has enjoyed the questionable benefits of definitions that are either tautological—"Jazz music is any music played by jazz musicians"—or confusing to the layman—"Jazz is a matter of lip-technique." What can be said with confidence is that, whereas in more conventional musical areas the artist is fundamentally an executant expressing the findings of the creative mind of the composer, in jazz the performer is usually his own composer. Within the strict meaning of the term, there can be no such thing as a jazz theme, although of course some themes will lend themselves to the jazz idiom more readily than others. The customer unable to acquire the recording of Brahms's *Fourth Symphony* conducted by Herbert von Karajan would probably settle for someone else's recording of that work, but the buyer thwarted in his attempt to buy the jazz musician Duke Ellington's version of "Caravan" might well accept as a substitute anything else played by Ellington. That is why, in jazz, there is at least one truism that has always applied: the performer playing a theme always tries to make it sound not like itself but like himself.

ORIGINS

The birth pangs of jazz are perhaps of more concern to the musicologist, the social historian, and even the anthropologist than the musician. The multiracial origins of jazz are clear enough. Had it not been for the traffic in slaves from West Africa to the United States, jazz would never have evolved, either in the United States or Africa, for jazz is the expression in music of the African native who is isolated both socially and geographically from his natural environment.

The jazz scale

Among the West African tribes supplying victims for the slave trade, music, and especially vocal and percussive music, had developed in a way quite unknown to the academic Western ear. Scales and harmony were purely intuitive, and music was deployed less as an abstract aesthetic gesture than as a specific language conveying subtle shades of meaning and emotion. By varying the pitch of a note or changing the inflection of the voice while uttering a musical sound, the performer could convey far more concrete messages than his sophisticated Western counterpart. If his art was cruder, his function was more practicable. Although most of the prehistory of jazz is speculative, the flexibility of this musical language, unfettered either by conventional ideas of correctness or by precedent, resulted in the unwitting development of a scale utterly original so far as the West was concerned. This scale, in which the third (E in the key of C), or mediant, and the seventh (B in the key of C), or leading tone, were flattened and thereby turned into what are sometimes referred to as "blue notes," became the basis of the language that eventually emerged as jazz. The transfer of these West African tribal traditions to the slave fields, railways, and rivers of the southern U.S. states was of advantage to oppressed and oppressor alike, the slave obviously taking solace in the cultural memory of his own collective past, the slaveowner encouraging work songs in the same spirit as an infantry general might approve of military bands—for the stimulus they gave to work rate. Many of the early examples of primitive vocal jazz relate closely to the labours being performed, and the content of the lyrics is a reminder that not only the cotton plantations but also the levees and railroads of the Deep South were created and maintained by slave labour. Joe "King" Oliver's "Lift 'Em Up Joe" and many of the songs of Huddie Ledbetter (Leadbelly) are examples of the work-song convention surviving as art long after its original functional need had declined.

There was another major influence on the evolution of Afro-American vocal style. If the slave could derive no comfort from the laissez-faire philosophy of his owners, at least he could draw spiritual consolation from their religion. Until the beginning of the 19th century, the established church, by performing a series of comically dishonest intellectual cartwheels, had managed to reconcile Christianity with the possession of slaves, the argument being that, although one Christian must not enslave another, it was acceptable for him to enslave a savage. This meant that the work of the missionary was actually rendered sacrilegious, and throughout the 18th century the absurdity of such an attitude became more and more exposed, until about 1790 the Methodist movement began to address itself to the redemption of the souls of men who until now had not been thought to have possessed any. This missionary campaign flourished for almost 100 years and had one of the most astounding outcomes of any evangelizing crusade in history, one that the Christian Church could never have anticipated. By attempting to convert the slaves to Christianity, the missionaries achieved the Africanization of their own hymnbooks.

Development of the spiritual

By adapting his own ritual music to the liturgy of the Christian Church, by contributing, as a member of a congregation, to the creation of new tunes, or by making his own variations on the existing ones, the slave and his emancipated descendants developed the spiritual to the point where, in the form of hymns, ring shouts, revival chants, camp songs, and funeral songs, it gradually merged into a semi-secular tradition. Significantly, ragtime, that coarse yet disarming bridge between the old songs of slavery and emergent jazz, figured unmistakably in the accompaniment of hymns such as "Good Lord'll Help Me on my Way" several years before ragtime music was published officially under its own name. This vast influence of Africanized church music on the development of jazz underlines one more fallacy about the music, which is that it was always linked irrevocably to the lowlife. Its connections with the brothels of Louisiana and the saloons of Chicago tell only half the story, for jazz has been concerned with sanctity as well as with sin, has been a sacred music as well as a profane one. Its links with Christianity and particularly with the act of worship and the rituals of birth, marriage, and death have proved so durable that they remain unbroken to this day, not only in the person of gospel singers, such as the late Mahalia Jackson and Sister Rosetta Tharpe, but also in more secular figures who insist on the church as their primary source of musical inspiration.

Improvised instruments of the early days

Not all of the early Africanized church music was vocal, although, naturally, any instrumental playing was bound to be crude in conception, execution, and instrumentation. The slave generations obviously had access to neither conventional musical education nor to legitimate orchestral instruments, and, even after the liberation that followed the War between the States, such things as education and conventional musical instruments remained, if not impossible, at least difficult to acquire. The New Orleans pioneer drummer Warren "Baby" Dodds is said to have made his first pair of drumsticks from the legs of a kitchen chair, and the semilegendary cornet player Charles "Buddy" Bolden was seen at times to thrust half a coconut shell, a bathroom plunger, and an old derby hat into the bell of his instrument to do service as mutes. The early jazz artists, it would seem, improvised not only the music they played but also the instruments with which they played it.

A key figure, because he personifies the antipathetic traditions of religious piety and worldly musical wit and also the tensions created by the unorthodoxies of musical education of so many of the pioneer jazz figures, is the pianist-composer-singer Thomas "Fats" Waller. Waller was born into a religious family the head of which was a minister of the Abyssinian Baptist Church and who regarded jazz, to quote his son, "as music from the devil's workshop." Waller, a brilliant natural musician (see below), taught himself the piano and soon developed an outstanding gift for composition. His commercial as well as artistic success was enormous, but it seems reasonable to conclude, both from Waller's own occasional remarks and from the evidence of his love for the organ and the presence in his repertory of Bach, Liszt, and Rimsky-Korsakov, that Waller was a formal musician manqué.

The generation of men such as Bolden created the earliest jazz traditions. Liberated but not freed, cast on to the open labour market for the first time, and endowed with a musical tradition self-formed but speedily secularized, the men of Bolden's time had two problems to face, no less daunting simply because they were mere subconscious anxieties. How were they to arrive at some code of artistic behaviour when making communal music and for whom were they to play the music? Clearly, if jazz were to shed its religious connotations, it must become a functional music, and, equally clearly, if formal music offered neither any precedents for procedure nor even a polite interest, then jazz would have to create its own.

The latter third of the 19th century was a crucial point in the prehistory of jazz—a time when jazz was interacting with church music, with the white commercial world of dances, soirées, drawing-room ballads, and concerts, with opera, with the theatre, with vague occasional wisps from the European tradition, and a time when the Southern Negro was learning how to live with uneasy freedom; during this period the traditions of jazz were slowly forged. It is a period and a process impossible to document with any accuracy, for obvious reasons, and about which even the most basic terms have remained in contention. The institution of ragtime piano playing, for instance, is regarded by many as no more than a subdivision of emerging jazz piano styles, but, by many others, it is regarded as a distinct, separate form, marked out from jazz because its repertory consisted largely of formal, composed works rather than slight themes for improvisation. There also exist several abstruse theories about regional variations in jazz styles. Nobody has ever decided to the satisfaction of anyone else where the "folk" music of, say, the itinerant guitarists of the Southwest ends and jazz proper begins. But, indisputably, by the beginning of the 20th century, a few jazz forms had begun to combine into a recognizable tradition, and the hub of this development was located at the Louisiana seaport of New Orleans, where the dominant form among jazz musicians was the blues.

The blues. Much of the confusion over the identity of the blues has been caused by the word itself, which has had to perform a dual purpose. It has been used for at least 200 years by writers as a synonym for a depressed mood and, more strictly, as a specific musical term, so that misconceptions have been perpetuated that all blues music must by definition be concerned with depressed subjects and even that only depressed musicians play it. Another belief about the blues, that it is the acid test of a performer's improvising ability, is more accurate for reasons intimately connected with its harmonic structure.

The blues as a test of a jazz performer

In jazz, a blues sequence extends over 12 bars, containing three harmonic crisis points, and only these give the improviser hints as to where his melodic variations should go and what kind of musical mood they should imply. The paradox is that, sparse though these are, they have a vast emotional potential for the gifted player to discover, so that, ever since the beginnings of instrumental jazz, a player's ability with a blues sequence has been a guide to his true talent. Perhaps the most extraordinary thing about the blues has been its durability; it has retained its attraction for soloists of all eras and schools, changing with new approaches and movements but remaining intrinsically itself. The Negro composer William Christopher ("W.C.") Handy was an important figure in the development of the blues. He was fundamentally a kind of folklorist-orchestrator who took his themes from the blues performers he heard around him, wrote them down, and harmonized them. Some blues was published before Handy's, but, as a result of his disseminating work, jazz players by the late 1920s were freely improvising and spontaneously inventing melodies on blues chord sequences. His most important compositions were the "Memphis Blues" (1911) and "St. Louis Blues" (1914).

Exploration and improvisation. A close textual analysis of the harmonies employed in the blues since the beginnings of recorded jazz reveals the process of ceaseless embellishment of the original sequence, and this process may stand as a symbol for the whole of jazz history. In effect, the story of jazz has been a saga of harmonic exploration. Most of the jazz pioneers were men without musical schooling or formal knowledge who had to evolve a musical language and harmonic vocabulary by trial and error. They were artists intent on hammering out some formality of procedure, some kind of convention that would reconcile the individual freedom of each player to express himself with the adherence to the demands of the ensemble without which all performances would disintegrate. This is the crowning paradox of the art of jazz: it is at once the art of the individual musician and an almost exclusively communal exercise.

Although jazz criticism has divided the music into three equal categories—traditional, mainstream, and modern—harmonic exploration and the growth of melodic vocabulary have comprised a constant, continuing process in jazz history. New labels have been attached to new styles not when some dramatic advance has been made but when the cumulative weight of several years' findings has caused people to realize that the music has steadily been changing its personality. The three compartments are useful as an approximation, not an arbitrary judgment. As the harmonic vocabulary of the jazz musician has been extended and as the degree of technical sophistication has increased accordingly, so have new conventions been forged, although it is not true that, as one style established itself, others have been superseded. Uniquely and because of the very fast pace of its evolution (covering an advance from primitivism to neoclassicism in little more than half a century), several schools of jazz have existed concurrently.

EARLY JAZZ STYLES

The New Orleans style. The rigid convention of collective improvisation, based on a specific instrumentation, flourished in Louisiana in the early years of the 20th century, and two powerful factors dictating the formulation of the convention were probably the social and the functional. In the social life of the Negro, community music played a more prominent part than perhaps can now be easily comprehended. There was almost no social activity in New Orleans then that did not imply a musical corollary. There was live music for births, weddings, christenings, funerals, picnics, parades, marches, and all kinds of celebrations. A great deal of this music was naturally played outdoors, which may explain the unchallenged dominance of the trumpet over all other instruments. All the early leaders of New Orleans jazz were trumpeters, with the line of succession passing from Bolden, through historically documented musicians such as Freddie Keppard and Joe "King" Oliver, and down to Louis Armstrong. New Orleans also produced brilliant players on other instruments, particularly a school of musicians who effected a limpid, highly attractive clarinet style, but leadership was almost exclusively the preserve of trumpeters like Bolden and Oliver.

Roles of the instruments in New Orleans jazz

In the classic New Orleans style, the trumpet's duty is to state and embellish the melodic line of the theme. The trombone stresses the harmonic root notes, providing also a solidity of resonance on which the other performers may build. Above the trumpet soars the clarinet voice, weaving further variations on the same harmonies. Thus, the three voices, linked yet independent, are able to compile between them the simple triads (chords consisting of a root and the third and fifth tone above it) that were the basis of all jazz harmony at this period of its development. And, as all three were playing together throughout the performance, the band, though small, was able to maintain a surprising degree of volume.

There was a vital reason why the ensemble convention was adhered to so faithfully. In New Orleans or, indeed, anywhere else at that time, there were few musicians capable of playing an extended solo, even had the rules of their game permitted them to do so. Apart from a handful of virtuosos, the idea that a jazz performance should consist of a succession of solos would have been unthinkable for the simple reason that there was no such thing as a succession of soloists. But the musicians were developing at an astonishing rate, and, in retrospect, it can be seen that the classic New Orleans style, rigid as it had to be, was doomed by its very nature: there was no question that, in time, a player or group of players would emerge for whom the constriction of the ensemble was intolerable. When this player arrived, then the whole New Orleans conception of tightly integrated ensemble improvisation would become obsolete. Another reason why the frailty of the New Orleans tradition is more apparent now than in the heyday of that style is the fact that jazz as a musical lubricant to oil the social machine was restricted largely to the New Orleans lowlife. Although the myth-making process has drawn a picture of jazz limited strictly to the brothels and sporting houses of Storyville, the town's bordello district, there were, of course, many instances of the music splashing over into the life of the city at large. Nonetheless, jazz, linked to the Negro performer and the social events of Negro life in the city, retained a connotation of sin and dissipation for many years after the New Orleans pioneers were forgotten. The saxophonist Sidney Bechet, one of the most gifted of all the New Orleans musicians, insisted in his autobiography that the word jazz in its original form of jass was local slang for sexual intercourse, and the evidence in favour of Bechet's assertion seems overwhelming.

Supposed origin of the word jazz

These brothels were thus a link in the jazz musician's economic chain, for many employed hands or, at the very least, a house pianist whose job was to thump out ragtime rhythms against a background of red plush and gilt. The collapse of the Storyville economy was naturally disastrous for the working musician. In 1917 the United States secretary of the Navy decreed that, in view of the repeated fighting and violence involving seamen on leave in the city, the New Orleans red-light district must be closed down. The sense of outrage and the disarming worldliness of the city are reflected in the official statement by the then mayor, Martin Behrman:

> Preterpermitting the pros and cons of legislative recognition of prostitution as a necessary evil in a seaport the size of New Orleans, our city government has believed that the situation could be administered more easily and satisfactorily by confining it within a prescribed area. Our experience has taught us that the reasons for this are unanswerable, but the Navy Department of the Federal Government has decided otherwise.

The theory that the closing of Storyville brought the heyday of New Orleans jazz to an abrupt end is one of those critical platitudes excused by the fact that it is largely true. Jazz did not, however, immediately stop in New Orleans, nor was the migration north of the musicians sudden or absolute, nor had jazz until then been unknown in the North. As early as 1917, the year of the Storyville edict, the Original Dixieland Jass Band, a group of white Southerners with a comically inflated sense of their own importance as musical innovators, had introduced jazz to the patrons of Reisenweber's restaurant in New York and recorded two compositions.

One potent evangelizing factor was the riverboat, which would ply up and down the Mississippi, often with a jazz band aboard. More than one white middle-class jazz pioneer has testified that the first jazz he ever heard came floating across the water from one of these boats as they approached the levee of some Southern port of call. The accessibility of Europe was also a factor at a surprisingly early point in the music's history. In 1919 the Southern Syncopated Orchestra, with Sidney Bechet as its star performer, played in London, there attracting the notice of a Swiss conductor, Ernest Ansermet, who was the first distinguished figure of formal music to react favourably to jazz and to discern in it uniquely vital qualities.

The spread of jazz to Europe

The main force pushing the New Orleans musician north was his need to find employment, and perhaps the most significant sequence of events after the closing of Storyville was that involving Joe "King" Oliver. Early in 1918 Oliver, acknowledged trumpet champion of New Orleans, migrated north to Chicago. By 1920 he had become a popular bandleader there, and two years later, wanting to increase the size of his band, he sent to New Orleans for the most brilliant of his disciples and, indeed, of all the jazz musicians who came out of the city, Louis Daniel Armstrong. From this point on, jazz evolved from a local musical dialect into an international language, proliferating in geographical range and in stylistic variation to a degree that astonished those of the New Orleans founding fathers who lived long enough to watch the process for themselves.

The Louis Armstrong style. Armstrong may partly stand as a representative symbol of the history of the music itself. A trumpeter of freakish gifts, he performed at least three feats—two aesthetic, one sociological—for which he will be remembered as the most influential jazz musician of all time. He took the classic style of his native city and split it at the seams through his limitless ability as an imaginative soloist. The moment his style began to mature, the convention of ensemble playing was outmoded, and he established the primacy of the improvising soloist. Then, having liberated the player from an exclusively team performance, he unwittingly codified the vocabulary of the soloist in a series of famous recordings between 1925 and 1928. These recordings, featuring his groups the Hot Five and the Hot Seven, emphasize the enormous gulf between Armstrong and even the best of his contemporaries. They also show how he summarized all that had gone before and enriched the jazz tradition with a whole range of melodic effects relevant ever after.

The Hot Five and Hot Seven recordings

Several of the performances of the Hot Five and Hot Seven are traditional blues, successively asserting the power of the idiom in a way not to be equalled for at least a generation, until the rise of Charlie Parker. Still more important was Armstrong's success as an evangelist for the jazz cause. By the late 1920s, quickly graduating from the strictly specialist environment of his formative years into being a Broadway and nightclub star, he was the first jazz personality to become a national and then an international figure. Many with no particular interest in jazz were utterly beguiled by his genius. His sense of comedy, his career in Hollywood, his spectacular physical appearance and mannerisms, and, above all, his extraordinary vocal style, all contributed to this process. By using his voice in the same way that other musicians used their instruments, Armstrong, usually dispensing with words and substituting for them an odd, wholly idiosyncratic language of sounds, popularized scat singing. Had he not drifted into the world of entertainment at large, jazz might never have won the widespread currency it did. Although from around 1930 to the end of his life he did not develop as a musician, he never really found himself outflanked by others, his vitality enabling him to retain a hold on his art almost to the end of his life in 1971.

In his failure to develop, Armstrong was typical of most jazz musicians, who have generally become reconciled to the style formulated at a comparatively early time of life. Although the music itself seems to evolve, individuals hardly ever do so. The recorded evidence to support this theory is there, but it is usually overlooked in the hunt for fresh effects and styles. Although Armstrong was to improve vastly in the years following his decision to join Oliver in Chicago, his classic style was already becoming permanent before he had ever left his home town.

Chicago style. Armstrong's arrival in Chicago, added to the burgeoning of the speakeasies of the Prohibition era (the illegal drinking establishment became the 1920s equivalent, so far as the jazz musician was concerned, of the Louisiana brothels of the previous decade), made that city the new centre of jazz. By the mid-1920s it was becoming clear that young, white, imitative musicians were quickly learning the lessons taught by men such as Armstrong. One of the better derivative groups of white musicians was the New Orleans Rhythm

Flowering of white talent

Kings, but the real flowering of white talent began a little later, farther north, in time causing the rise of a new style of playing jazz, which was a compromise between the ensemble tradition of New Orleans and Armstrong's solo power. In Chicago style, the triumvirate of trumpet, trombone, and clarinet was retained, though the saxophone was becoming much more common by the end of the decade. Although performances usually began and ended with a rousing ensemble variation of the theme, the central part of the performance usually consisted of a string of solos.

Because the term Chicago style is neither strictly geographically accurate nor musicologically precise, its umbrella usually covers stylists of widely contrasting or even antipathetic talents. The leading player of the style was Leon Bismarck "Bix" Beiderbecke, a self-taught cornetist and pianist whose pure tone and introspective curiosity about harmonic theory mark him as the exact opposite of Armstrong, whose intuitive style was rooted in a radically different racial background (Bix was middle class, the son of German immigrants).

Beiderbecke's significance

Beiderbecke, whose recordings of "I'm Coming Virginia," "Way Down Yonder in New Orleans," and "Singin' the Blues" have become classics of the genre, was also responsible for one of the most remarkable and apocalyptic of all jazz recordings, the piano solo of his own composition, "In a Mist." In this fragment are strangely fused the honky-tonk beginnings of Bix's early musical life and the subtler overtones of those modern classical composers whose recitals he attended and whose comparatively complex harmony caused him to ask the question: "Why should the jazzman be limited to the simplest triads when his conservatory-trained fellow musician has recourse to so many more variegated effects?" Although this has remained the most vital of all the questions posed by jazz, Beiderbecke did not live long enough to see it answered. He died a young man, technically of pneumonia, actually of frustration, self-neglect, disenchantment—ailments that can destroy any creative artist whose sensibilities far outstrip his technical equipment. Beiderbecke, the first patron saint of jazz, has remained the archetypal figure of the playing fool, the instinctive creator who operated against the frenetic background of illicit stills and gang warfare.

Racial segregation was long the rule in the recording studios, so posterity has tended to have a false view of the mingling of musicians in the 1920s. These players were by no means unaware of each other, as a glance at the recording catalogs of the period might suggest. Armstrong and Beiderbecke, for instance, admired each other's playing. The traffic in ideas was generally one-way, from black to white, but the white musician was occasionally something more than a plagiarist. One of these was the Texan trombonist Jack Teagarden, a musician of remarkable fluency and assurance even at the start of his career in the middle 1920s. After being associated largely with the Chicago-style groups of his first years in the North, Teagarden often worked with Armstrong, to whose All-Stars he belonged during 1947–51. Like Armstrong, he used his voice as a useful second instrument, and, like Armstrong, he retained his creative ability throughout his life. In retrospect, the recordings he made with the young white musicians of the late 1920s and early 1930s show an amazing poise and maturity. The other white Chicagoan who affected the course of jazz history was the clarinetist Benny Goodman. Born in Chicago, he was a child prodigy, a master of Chicago idiom while still in his teens, and destined to lead jazz into new areas.

Strictly speaking, Goodman's clarinet style was hardly original, consisting as it did of a brilliantly executed synthesis of all that had gone before, with particular reference to the limpid fluency of the New Orleans player Jimmie Noone; but Goodman brought to the playing of jazz a technical expertise, an academic intelligence, a speed of thought not heard before. In time his classically based style became ossified, and Goodman himself came to turn more and more frequently to playing Brahms and Mozart; but he remained the most prolific, technically accomplished, and melodically resourceful of the white musicians generally designated as the Chicagoans, though he was later dismissed by some as a peripheral rather than a central figure in jazz history.

LATER DEVELOPMENTS

Hawkins' development of saxophone technique

The emergence of the virtuoso. Throughout the 1920s, techniques were steadily becoming more efficient, thinking more sophisticated, harmonic exploration gradually more daring, so that many styles that were to flower during the soloist's golden age of the 1930s were already being shaped. One of the most gifted of all the musicians in jazz history, Coleman Hawkins, a tenor saxophonist, virtually single-handedly raised the status of that instrument. His work was characterized by a deep, passionate tone, which may be taken as the working definition of "hot" music, by sequences of ingeniously related arpeggios and, above all, by an indefinable sense of form that enabled him to transmute successions of fragmentary phrases into a corporate whole. This sense of form, unteachable but unmistakable when encountered. had already distinguished the truly gifted improviser from the merely talented, and Hawkins, particularly in slower ballads, possessed this gift to a remarkable degree. His outstanding recordings are scattered over five decades. Especially noteworthy are his version of "One Hour," made in 1929, one of the very first recordings by a racially mixed group and one of the very first on which the tenor saxophone in jazz approaches maturity; his famous recording of "Body and Soul" in 1939, a performance so finely constructed that it has long since come to acquire the standing of formal composition; and some sides he made with a cosmopolitan band in Paris in 1937, of which "Out of Nowhere" was a remarkable exposition of the art of romantic extemporization. From 1934 to 1939 Hawkins travelled in Europe, inspiring European musicians to attain fluency in what was at that time an essentially alien art.

The development of jazz piano. There have been deviations of style and approach on all instruments throughout jazz history, giving rise to rival "schools" the differing precepts of which were sometimes the centre of bitter debate, but the case of the piano in jazz is unique in the way that two antipathetic styles emerged and, at least for a time, developed concurrently but independently. These two approaches, embodying contrasting philosophies, were "stride" and "trumpet-style" piano playing. The stride style, whose roots in the early jazz past are obvious enough, is based on the premise that any instrument that makes it possible for the performer to play two or more notes simultaneously and therefore to create a harmonic as well as melodic effect ought to deploy those possibilities as far as is practicable. At their best, the stride pianists have produced work teeming with an orchestral richness, yet they have rarely been the kind of players to produce a single melodic line that might conceivably be transposed to a different instrument. The best stride exponents, pounding out ten-note chords, stressing the rhythmic pulse with great muscularity in the left hand, have been men whose music is full of harmonic possibilities and enchanting rhythmic variation.

Probably the most important stride pianist was James P. Johnson, one of the most resourceful figures in jazz history and a rare personality among the pioneers in that his musical accomplishments enabled him to compose and orchestrate at a period when such abilities were rare. Apart from his purely jazz activities, Johnson wrote some early film music, a tone poem, and a ballet; he also enjoyed great success as a songwriter, producing the "One Hour" that Hawkins (and also Louis Armstrong) recorded so finely and "Runnin' Wild."

Johnson presided over what came to be known as the Harlem group of pianists, whose stride playing in the 1920s made them virtually one-man jazz bands. Johnson's great friend and rival was Willie "The Lion" Smith, and their two unofficial pupils were Thomas "Fats" Waller and Edward Kennedy "Duke" Ellington. In both cases, the stride style underwent the most astonishing changes. Waller is perhaps the only example in all jazz of the pupil outstripping his masters. Apart from the irresistible strength and wit of his piano playing and his gifts as a composer ("Honeysuckle Rose," "Ain't Misbehavin'," "Blue Turning Grey Over You," and literally hundreds of others), Waller, like Armstrong, was a natural buffoon and stage extrovert, capitalizing on these gifts to become a popular as well as a jazz figure. Ellington's subsequent career (reviewed below) was even more remarkable, and both he and Waller acknowledged their stylistic debt to Johnson and Smith. Ironically, although the stride school avoided the dogmatic melodic statement in favour of the implied harmonic one, at least three of its greatest practitioners—Johnson, Waller, and Ellington—were also successful songwriters.

Events eventually overtook the stride school, and its eclipse may be dated from the moment in the late 1920s when Earl Hines, yet another outstanding jazz pianist, who augmented his income by working as a songwriter, saw that, in addition to stating the harmony in the left hand, the pianist might well emulate the single-note instruments, such as the trumpet, in creating with the right hand linear improvisation producing melodic single-note variations on the melody. Probably the two great influences on Hines that helped crystallize his style were the pianist Teddy Weatherford, to whom Hines acknowledged a debt of inspiration, and Louis Armstrong, with whom Hines worked during the Hot Five and Hot Seven period. Armstrong's apparently limitless powers of invention must have shown Hines how the same kind of melodic aphorisms could be produced by a pianist.

Hines's right-hand improvisations

Hines, a pianist of amazing technical command and tireless energy, had a profound influence on the development of jazz piano. His findings eventually led to the eclipse of the stride style, especially when in the early 1940s the new Modernism preferred the pianist with the ability to create right-hand, single-note lines. In the 1930s the most accomplished follower of Hines was Teddy Wilson, after which time the work of pioneer Modernists such as Bud Powell and, later, the Canadian Oscar Peterson showed at least to some degree a corroboration of Hines's methods.

Art Tatum, one of the greatest and most controversial of jazz musicians and pianists, had a style too personal to be categorized. For him, stride and trumpet-style were not so much approaches to piano playing as incidents in the course of a single casual chorus, just two of many effects that Tatum had at his fingertips. Almost totally blind, Tatum developed a technique as unorthodox as it was infallible, so that he became the despair of his fellow musicians. Because of the rococo flourish of his style, Tatum was hardly ever able to integrate his piano playing into the texture of a group and was therefore almost always heard either at the head of a trio or as a solo pianist. Although he began about the time Hines was formulating the principles of trumpet-style piano and lived on to know the violent disputes of the postwar Modernist movement and after, Tatum remained a constant. Toward the end of his life, his playing became, if anything, more florid than ever, but it hardly evolved at all, so complete and subjective was his music. Because of the technical problems presented by Tatum's all-embracing style, he has had virtually no imitators, with the notable exception of Peterson, whose work grew increasingly closer to Tatum's in spirit as the years went by.

Tatum's unorthodox technique

The era of the big bands and swing. In the first years of its history, jazz was confined almost exclusively to small-group collective improvisation, and such a conception as orchestral effect was a refinement that, for obvious reasons in a world populated by musicians illiterate at least in the conventional sense, had to come later. The first musician to make a serious attempt to organize a group of players who might keep, at least in part, to a plan was Ferdinand "Jelly Roll" Morton. Although his career has been more heavily documented and annotated than that of any other jazz musician, his recorded legacy was not large enough to decide whether he was a pioneer or a charlatan. Certainly, his announcement that he "invented jazz in 1902" did nothing to help.

The first indisputable figure in the evolution of orchestral jazz was Fletcher Henderson, an unremarkable pianist whose contribution to jazz lies in his pioneering of methods later universally adopted. Henderson, far better educated than most Negro musicians of his day, formed his own orchestra in 1923, and it became the first to gain wide fame by playing jazz. For several years after, his band employed the best Negro jazz talents, among them, at various times, Louis Armstrong (this was the last time in his life Armstrong was ever hired by a handleader) and Coleman Hawkins. Despite an embarrassment of riches in the solo department, the Henderson band is unique for the way in which its leader experimented with orchestral effects. According to many purists, orchestral jazz is a contradiction in terms, for, if it is true that jazz is improvised music, then it follows that a jazz orchestra cannot exist. Henderson was among the first to see that it is not necessarily improvisation that lends jazz its fierce vitality but the preservation of its spirit. If musicians could play written parts with the same sense of self-discovery as a solo, then the effects need not be anticlimactic, and their solo talents could shape an ensemble into the contours of a jazz performance.

Henderson's contribution to orchestral effects

Henderson also contributed the concept of sections of instruments, comprising three or four voices, playing responses to the solo voice in harmony. The soloist, used to the accompanying figures provided for him, could often space his own improvisation, shape it, and adjust its dynamics to this scored accompaniment. Henderson's harmonic vocabulary and orchestral technique, profound in the jazz context of their period, were naive in the broader musical sense, and, by an irony of fortune, his most revolutionary success happened in the end to somebody else (see below).

Many other bands of merit more or less followed Henderson's example, notably Chick Webb's band from 1926, Jimmie Lunceford's from 1927, and Bennie Moten, whose move from Kansas City eastward in 1926 coincided with the increase in the size of his group. Although none of these orchestras won the national and, in a few cases, the international fame that attended the touring orchestras of the 1930s, they were at least as good, if not much better, than their more exalted contemporaries. One of the main barriers to their being heard on a truly national scale was their colour.

As bands such as Henderson's, Webb's, and Lunceford's moved into the 1930s, the growing complexity of their harmony and technique combined with a more general process of advancing musical curiosity to produce a golden age of solo virtuosity. Some of the virtuosos remained in an orchestral setting, others were in the proliferating small groups. One of the greatest of these soloists was the tenor saxophonist Lester Young, who was associated for many years with one of the finest of all jazz orchestras, the Kansas City-based Count Basie band, which had evolved from Bennie Moten's group after the leader's death. Basie, a stride pianist, amended his style from a flow of harmony to a great plain of silence dotted with exquisite melodic epigrams neatly executed and gathered together a large orchestra that preserved the buoyancy of an improvised act by literally improvising. Many of his most effective orchestrations, such as "One O'Clock Jump," were, in effect, not orchestrations at all but "head arrangements"—that is to say, fragments of improvised music put together by the musicians in a process of trial and error, conned by rote, then gradually becoming a predictable performance. The Basie band, stressing four beats to a bar and retaining, long after others had abandoned it, the four-man rhythm section of piano, double bass, drums, and guitar, set unsurpassed standards of vigour and precision, and in this setting Young, a remarkable soloist, thrived.

Young's contribution to the solo art was twofold. First, he displayed and popularized a peculiar sensibility that paved the way for the Modernists of the following generation. Young is often credited with being the first Modernist, but, strictly speaking, he was a man of his era who did nothing to corrupt the harmonic innocence of his day. His tone, revolutionary in the 1930s in the way it distilled the hot breath of Hawkins' romanticism into something far more sinuous and oblique, set the styie for saxophonists for a generation to come. In this way he contributed

Lester Young's contribution

an alternative approach to the instrument: ever after, an apprentice could follow either Young or Hawkins, but not both. Jazz saxophone playing was thus immeasurably enriched. His other achievement was to demonstrate a new way of building an improvised solo, by using little-used chords, such as the minor sixth, by showing how silence could help a solo, by breaking down an arpeggio so that unusual intervals could express conventional harmonies, and by perfecting an ingenious series of false fingerings so that the player could produce different densities of sound on the same note. While the Modernists of a later age added to the jazz language by their increased harmonic scope, Young created a new vocabulary for the soloist within the conventional apparatus.

Many imponderables contributed to the astonishing upsurge of popularity of the big bands in the 1930s. The end of Prohibition in 1933 was a large factor; it altered the social habits of a nation and deprived jazz musicians of their biggest potential source of employment. By 1934 jazz had to find a new audience, and by a happy coincidence it reached a stage of sophistication that made the capture of a new audience possible. Benny Goodman formed his first organized orchestra in 1934, and, after an unsuccessful beginning touring the nation's dance halls, stumbled on the truth that others were soon quick to discover: that a new generation of young people was ready to patronize jazz-oriented dance bands. Jazz, though admittedly in a somewhat bowdlerized form, took to the ballrooms of the day.

Goodman and the swing age

In 1935 at the Palomar Ballroom in Hollywood, Goodman found all the factors of the swing age: massed audiences, fans clustered around the bandstand, enthusiasm for individual musicians, pressures changing bandleaders into brand names. Soon, Goodman was the "King of Swing," a Hollywood film star, a millionaire, an international celebrity. Naturally, others followed, among them a rival clarinetist, Artie Shaw, also Tommy and Jimmy Dorsey. Goodman ensured his success by recruiting the semi-retired Fletcher Henderson as chief arranger and by incorporating within his large group a smaller one (at first, a trio, later, a quartet), comprising the first racially mixed group ever to tour nationally in the United States — Goodman and drummer Gene Krupa being white, pianist Teddy Wilson and vibraphonist Lionel Hampton being Negroes.

The swing age culminated in Goodman's 1938 concert at Carnegie Hall. Then, with orchestras hit by the wartime draft and running costs rising all the time, it petered out, losing its jazz connotations. By 1941, with the hysterical career of Glenn Miller, it ran into the quicksands of commercialism. Perhaps the jazz purist would commend Goodman's career as a bandleader for discovering a hitherto obscure Midwestern guitarist, Charlie Christian, the first guitar virtuoso to use electrically amplified equipment, although others had pioneered this method. He was one of the few stars of the swing era psychologically and musically equipped to make the leap into the Modernist era of the 1940s; his early death ended a brilliant career.

Until this time, jazz had been more or less diatonic (adhering to the natural scale), restricting itself, for the most part, to cycles of resolving dominant seventh chords. The Modernist movement of the 1940s thrust it forward into unexplored realms of chromaticism (use of harmonies built on notes not in the key of the piece), which split players and devotees into for-or-against armies and caused the advanced spirits to forgo the allegiance of mass audiences, which was never recovered.

Charlie Parker's influence

Modernism. The origins of the Modernism of the 1940s, or "bebop," as it was then onomatopoetically known, are confused. One of its leaders, John Birks "Dizzy" Gillespie, said it was a device to shake off white plagiarists, but its most gifted practitioner, Charlie Parker (known to many as Bird), explained it in strictly technical terms. By evolving a system of substituted chords superimposed on the original ones and by playing in double the time of the tempo being asserted by the rhythm section, Parker, an alto saxophonist of extraordinary gifts, changed the face of jazz. His early death was symbolic of the tragic involvement of many jazz musicians of his generation with drug addiction. Although technically he made jazz more complex, emotionally he cleansed it, and his famous blues recordings looked back to Armstrong's achievements with the Hot Five, in spirit, if not in method. Parker could not have realized it, but he was making, on behalf of jazz, the last great appropriation of musical territory. To use an American pioneer analogy, after jazz had moved harmonically westward for a half a century, Parker took it to the sea. This caused heart-searching among those who inherited Parker's findings. Among his disciples was the trumpeter Miles Davis, who in 1956 made the first coherent attempt to escape from the cage of "discord to resolution," a method so persistently explored that the men of Davis' generation felt its usefulness to be ended. In an album called *Kind'* of *Blue,* Davis substituted modal (scales not based on the major and minor) patterns for the more conventional harmonic ones, the first step in a process that was to characterize jazz thereafter. The theories of men such as Davis seemed to be negatively proved by the tenor saxophonists John Coltrane and Sonny Rollins, for, in the playing of both these men, the number of harmonic changes being crammed into each theme was so big that the music was in danger of being choked to death. One possible solution came from the alto saxophonist Ornette Coleman, who abandoned all rules of discord and resolution, time signatures, and keys, in his formulation of "Free Form," which in effect was no form at all. That jazz was not yet reduced to such extremes was suggested by a few of Ornette Coleman's contemporaries, who continued to raise the technical and inventive standards of jazz. These included the pianist Oscar Peterson, the drummer Buddy Rich, the tenor saxophonist Stan Getz, and the guitarist Wes Montgomery, all of whom attained high standards of performance.

Much avant-garde jazz of the 1960s was committed art, in the sense that its creators insisted vigorously on their music as an artistic expression of racial protest, but all that their polemic suggested was that, in accusing society of anarchic tendencies, they had induced those tendencies in their own music and that art committed to a good cause is not necessarily good art.

The role of Duke Ellington

Throughout its history jazz has been abstract, in the sense that, subconsciously informed though it may be by race memory, it has been guided less by concrete or living factors than by the mathematical precision of the march from discord to resolution, the soloist being like a man working out an algebraic equation. For this reason Duke Ellington is unique, in that he has moved toward that ideal where authentic jazz performances may reflect the nuances of personality of some outside object or person. Ellington has thus attempted to make his music measure up to a constant dual standard, for not only has he meant it to be fine jazz but also intelligible program music.

Nothing comparable has been attempted in jazz by anyone else, although the work of "progressive" jazz musicians such as Thelonius Monk and the Modern Jazz Quartet in the 1950s and 1960s hinted at extramusical connotations through the relentless Europeanization of its theme titles; and the Dave Brubeck Quartet made occasional gestures of a similar nature. Ellington has attempted to make his jazz mirror the people and places that led him to the extreme sophistication of his old age. After his graduation from the Harlem group of pianists and his recruitment of a quintet, the Washingtonians, he moved steadily forward to orchestral mastery, increasing the size of his group as his palette became broader. In 1939 he recruited an orchestral assistant, Billy Strayhorn, but by this time he was already far along the road to a technique enabling him to embrace a far wider range of sound than jazz musicians normally aspire to.

By using his orchestra as an instrument on which to perform his feats of orchestrating brilliance and by assimilating the talents of each individual member of that organization as a saxophonist might acquaint himself with the workings of every key on his instrument, Ellington welded together a group inimitable by any standards. The rich impressionism of his early works, in the late 1920s, slowly evolved into the thumbnail sketches of the

1930s. In 1943 came *Black, Brown and Beige,* a musical history of the Negro in the United States, after which Ellington scarcely stopped pouring out fresh works—some whole, some mere fragments, all of them informed by the romanticism of his view of the world.

Among his most remarkable achievements are many popular songs, such as "Sophisticated Lady" and "Mood Indigo," whose instrumental structure has not prevented them from becoming world famous. Of his more ambitious projects, he has composed *Perfume Suite,* the sound track for the film *Anatomy of a Murder,* jazz versions of Tchaikovsky's *The Nutcracker* and Grieg's *Peer Gynt, Liberian Suite, The Far East Suite,* and, possibly his masterpiece, *Such Sweet Thunder* (1957), a series of 12 Shakespearean vignettes that demonstrate Ellington's working method. By settling on the stylistic idiosyncrasies of each soloist, Ellington attempts, in this work, to express his own idea of a dramatic character; thus, the elegiac fervour of his greatest soloist, the saxophonist Johnny Hodges, became the voice of Cleopatra, the stratospheric range of trumpeter William "Cat" Anderson the dementia of Hamlet, the cold academic hauteur of clarinetist Jimmy Hamilton's tone the patrician disdain of Caesar.

Blues singers

Vocal jazz. Although the essence of jazz is instrumental, one or two artists have shown that the human voice can express the spirit of the music. Apart from instrumentalists such as Armstrong and Teagarden, whose singing was an adjunct to instrumental expression, there have been two main groups of jazz singers, one rooted firmly in the folk-oriented communal past of the Southern U.S. Negro, the other committed to the world of commercial music and the fringes of show business. The male blues singers of the South, often men who earned their livelihood at some menial task, sang of life close to the bone, in terms whose graphic candour reflected the earthiness of the life they had known. Outstanding were Huddie Ledbetter, Big Bill Broonzy, Blind Lemon Jefferson, Sleepy John Estes, and Peetie Wheatstraw. Their female counterparts, much more closely linked to the professional world of vaudeville and cabaret, include Gertrude "Ma" Rainey, her young protégé Bessie Smith, Mamie Smith, and Bertha "Chippie" Hill. By far the greatest was Bessie Smith, whose vast recorded output has preserved a style outstanding for its integrity, honesty to life, and immense technical skill. Less traditional male singers have included Count Basie's robust blues shouter James Rushing and Joe Turner, whose 1938 recordings with pianist Pete Johnson coincided with Johnson's short-lived but freakishly popular boogie-woogie piano style, a variation of blues playing whose hypnotic reiterated rhythmic patterns won a world following and whose other notable exponents included Albert Ammons and Meade "Lux" Lewis. The most important female singers of this later period include Mildred Bailey, Ella Fitzgerald, and Sarah Vaughan, but by far the finest singer of modern times and, with the possible exception of Bessie Smith, the most gifted vocalist of either sex that jazz has so far produced is Billie Holiday. Whereas Bessie Smith was incomparable as an interpreter of the poetry of the blues, Billie Holiday achieved the same intensity with the far less substantial repertory of Tin Pan Alley. Many of her small-group recordings from 1935 to 1942, prized classics of the art of impromptu composition, reflect in musical terms the close personal relationship between the singer and saxophonist Lester Young. An interesting departure of the 1950s was tried by the Dave Lambert-Jon Hendricks–Annie Ross Trio, which sang lyrics composed to transcribed instrumental jazz solos.

JAZZ AS A SOCIAL FORCE

The question of the extent to which jazz reflects the society that has nurtured it has seldom been asked. The 1960s saw a belated acknowledgment of its powerful ability to evoke the urban ambience. Duke Ellington's music for *Anatomy of a Murder* (1959) was the first movie score ever composed by a jazz writer. Since then, the jazz language has overrun all spheres of popular musical expression. One of the most intriguing things about its career has been the way in which advancing technique has run concurrently with social improvement, so that, while the crude emergent music of early New Orleans was brothel music and its more polished descendant in the 1920s the music of the ginmill, the suave orchestral felicities of the swing age became the wholly respectable background music for the innocent romances of its college audiences. Finally, with the advance to chromaticism, jazz invaded the concert hall and installed itself at festivals all over the world.

For the most part, jazz has remained the province of the urban U.S. Negro, who has contributed almost every viable new idea that has helped jazz along its path to literacy and self-confidence. Although there have been astonishing advances by European musicians in the past 30 years, there remains only one non-U.S. figure in the entire history of jazz who had something original and also valid to contribute. This was the Basque guitarist Django Reinhardt, whose best work was achieved in the 1930s, before he succumbed to the blandishments of amplification.

The source of the musician's repertory has also changed radically over the years. While the blues has retained its primacy throughout jazz history, the players of the swing era, harmonically cultured, turned to the urbanities of the best musical-comedy writers, so that names such as George Gershwin and Jerome Kern occur repeatedly on recordings of all kinds. Indeed, Gershwin, with "I Got Rhythm," created a harmonic pattern whose popularity with improvisers stands second only to the blues. In recent years, however, there has been a tendency among the younger, more revolutionary players to write their own material, which has made it more difficult than ever for the onlooker to distinguish genuine inventiveness from mere charlatanism.

The influence of jazz on other music

Jazz, in watered-down form, has strongly influenced various other kinds of music, many of them commercially more viable, such as "pop" songs, rock 'n' roll, skiffle, rhythm and blues, Broadway musicals. Some critics include these in the history of jazz; others consider that anything other than original Dixieland, which had a revival in the 1950s and 1960s, cannot be considered as pure jazz. Another form, Afro-Cuban music, which has some affinities with jazz, in fact had different ethnic roots, but some jazz-musicians, such as Gillespie, incorporated its rhythms in their music making.

By and large, attempts to wed jazz with more formal methods of music making and composition have not been successful, although attempts to create a "third stream," involving musician-composers such as William Russo and Gunther Schuller, have not been without virtues to commend them. The oddest work in this direction remains Igor Stravinsky's *Ebony Concerto,* composed in 1945 for Woody Herman's orchestra. Although not in the specialist sense a jazz composition, it underlined the inherent contradictions in a marriage between the two forms of music. There appears to be a distinct possibility that jazz, faced at last with the challenge that its room to expand is finite, may eventually be merged into the world of music at large, to become an orchestral effect in a more general context. On the other hand, the tradition as represented by such artists as Armstrong, Ellington, Hawkins, Young, Tatum, Parker, and Holiday seems almost too fiery ever to be extinguished altogether.

BIBLIOGRAPHY. HUGUES PANASSIE, *Le Jazz hot* (1934; Eng. trans., *Hot Jazz,* 1936); WILDER HOBSON, *American Jazz Music* (1939); and FREDERIC RAMSEY, JR., and C.E. SMITH (eds.), *Jazzmen* (1939), although tainted by early naïveté, are indispensable pioneer attempts to formulate a critical method. ANDRE HODEIR, *Hommes et problèmes du jazz* (1954; Eng. trans., *Jazz: Its Evolution and Essence,* 1956), is an erudite attempt at close textual analysis. Among biographies, ALAN LOMAX, *Mister Jelly Roll* (1950), is outstanding for its graphic style and priceless sociological importance. BILLIE HOLIDAY with WILLIAM DUFTY, *Lady Sings the Blues* (1956); and WILLIE SMITH with GEORGE HOEFER, *Music on My Mind* (1964), successfully survive the ghosting process. STANLEY DANCE, *The World of Duke Ellington* (1970), presents a partial view of an extraordinary man. ARTIE SHAW, *The Trouble with Cinderella* (1952), is the only jazz autobiography with any real literary pretensions. NAT SHAPIRO and NAT HENTOFF (ed.), *Hear Me Talkin' to Ya* (1955), is a brilliant use of the

spoken word to build a picture of jazz history. The best attempts at more general critical analysis include FRANCIS NEWTON, *The Jazz Scene* (1959); BENNY GREEN, *The Reluctant Art* (1962); and HENRY PLEASANTS, *Serious Music, and All That Jazz* (1969). MARSHALL W. STEARNS, *The Story of Jazz* (1956), has the charm of modesty. WHITNEY BALLIETT, *The Sound of Surprise* (1959), is an interesting if impressionistic collection of short reviews, PAUL OLIVER, *Blues Fell This Morning* (1960), is an outstanding specialist work. LEONARD G. FEATHER, *Encyclopedia of Jazz,* rev. ed. (1960) and the *Encyclopedia of Jazz in the Sixties* (1967); and G.T. SIMON, *The Big Bands* (1967), are indispensable works of reference. PAUL OLIVER *et al., Jazz on Record* (1968), is useful but partisan. DONALD KENNINGTON, *The Literature of Jazz* (1970), is the first serious attempt to annotate all jazz literature.

(B.Gr.)

Jefferson, Thomas

Third president of the United States, principal author of the Declaration of Independence, and influential political philosopher, Thomas Jefferson was born on April 13, 1743, at Shadwell, in Albemarle County, Virginia, the son of Peter Jefferson, an early settler and leader in the county, and Jane Randolph Jefferson. Peter Jefferson was a surveyor and cartographer and was largely self-educated. Upon his death in 1757 he left his son considerable property, but the inheritance for which Thomas Jefferson expressed particular gratitude was his father's determination that he should have a sound classical education. After several years of study at local grammar and classical schools, Jefferson entered the College of William and Mary in 1760. In spite of his youth, he became a close friend of three leading residents of Williamsburg—William Small of the college faculty, George Wythe of the Virginia bar, and Francis Fauquier, lieutenant governor of the colony. These three older men gave Jefferson a taste for the pleasures of a society more urbane and sophisticated than that of rural Virginia, and Small and Wythe gave direction to his intellectual drive. Small introduced him to the natural sciences and to rational methods of inquiry; Wythe led him to see the study of law not as a narrow vocational preparation but as a means of understanding the history, culture, institutions, and morals of a people. After two years at the college, Jefferson studied law for five years under Wythe's direction and was admitted to the bar in 1767. In 1769 he entered the lower house of the colonial legislature, thus beginning a long career in politics that ended 40 years later with his retirement as president of the United States.

Jefferson, oil painting by Rembrandt Peale, 1800. In the White House Collection, Washington, D.C.

Author of the Declaration. When Jefferson entered the House of Burgesses. Virginia and the other colonies were already engaged in the long decade of opposition to British colonial policies that led eventually to revolution and independence. Jefferson joined with Patrick Henry and others who favoured strong resistance to George III and the British Parliament and soon became one of the leaders of this group. His political style was very different from that of Henry. He was assiduous in committee work, a skilled legal craftsman, a scholar who drew on his comprehensive knowledge of law and history to support the colonial case against Great Britain. He rarely made speeches, disliked oral dispute, whether in formal debate or informal conversation, and he recognized the necessity of consensus for effective political action; the pen was his natural means of expression, and he was a virtuoso in its use. His first major essay, "A Summary View of the Rights of British America" (1774), displayed an impressive array of learning and logic, demonstrated his capacity for intense passion and the ability to express it eloquently, and revealed an inclination to intellectual radicalism. The majority of his colleagues were not then prepared for his conclusion that the British Parliament had no authority at all to legislate for the colonies, but, as relations with Great Britain grew steadily worse, his arguments became increasingly acceptable and his language both persuasive and provocative. "The God who gave us life gave us liberty at the same time: the hand of force may destroy, but cannot disjoin them."

Delegate to the Second Continental Congress

In the spring of 1775 the Virginia legislature, sitting as a revolutionary convention in defiance of the royal governor, appointed Jefferson as a member of its delegation to the Second Continental Congress meeting in Philadelphia. There he joined with the more radical group in the Congress, and again his skills as a committeeman and stylist were recognized and used. In June of 1776, when the decision to break irrevocably with Great Britain seemed near, Jefferson was appointed to the committee assigned to draft a formal statement of the reasons for such a decision. Benjamin Franklin and John Adams were also on the committee, but they recognized the superior talent of the Virginian and gracefully bowed to it. Jefferson thus became the principal author of the Declaration of Independence. It was an official state paper, and in later life he stated that it was intended to be an expression of the American mind. That was no doubt true, but it is also true that his personal commitment to its principles was profound and intense. It was this commitment, not the mere fact of literal authorship, that rendered Jefferson uniquely symbolic of the ideals expressed in the Declaration.

Role in Virginia politics. Jefferson meant his revolutionary manifesto to be more than an eloquent justification of revolt against Great Britain. He intended to translate its principles into practice and to create in America a society in which the gap between aspiration and achievement would be narrowed. He had wanted to begin by taking part in framing the new constitution of Virginia, which was adopted in June of 1776, but his duties in Philadelphia made that impossible, and he did not enter the Virginia legislature until October. He then set in motion a plan for comprehensive reform of the laws and institutions of Virginia. Two parts of the plan show the thoroughness with which he had considered the nature of representative government and the conditions necessary to its successful operation. A third embodied his passionate commitment to intellectual freedom.

Jefferson sought and secured abolition of the laws of primogeniture and entail in Virginia in order to discourage concentration of property in the hands of a few great landowners. He believed that property was among the natural rights to which man was born and that it meant the right to a decent means of subsistence. After observing the economic conditions in France a few years later, he wrote:

> Whenever there is in any country, uncultivated lands and unemployed poor, it is clear that the laws of property have been so far extended as to violate natural right. The earth is given as a common stock for man to labour and live on. If for the encouragement of industry we allow it to be appropriated, we must take care that other employment be provided to those excluded from the appropriation. If we do not the fundamental right to labour the earth returns to the unemployed.

No society that denied this right could be just, nor was it likely to enjoy for long a republican government. Jefferson believed that the virtues required for that form of government could not flourish in conditions of extreme poverty or complete economic dependence.

The educational system proposed for Virginia was also a part of Jefferson's comprehensive plan for republican government. The lower schools would provide literacy for the entire population, which, combined with a free press, was necessary for an informed public opinion. The upper schools would develop a natural aristocracy to supply the leadership so essential to representative government, while scholarships awarded on the basis of merit would prevent identification of educational opportunity with economic privileges. Jefferson did not believe that an ignorant people could make rational and responsible decisions about public affairs, nor did he believe that men were equal in intelligence or that the operation of a government was a simple job easily mastered by the common man. He assumed that men of superior capabilities were those naturally suited for public office, and his scheme of education was intended to insure that such men, regardless of their economic circumstances, be given an opportunity to develop their talents. Jefferson's fellow Virginians were not prepared for so comprehensive a system of free public education, however, and the only part of it that he secured was the University of Virginia.

The statute of Virginia

The third and most famous reform, the statute of Virginia for religious freedom, met with bitter and persistent opposition and was not enacted until 1786, while Jefferson was in France. Although Americans had largely abandoned the gross forms of persecution common a few generations earlier, the toleration they practiced was limited and erratic. In some states, as in Virginia, a single church was established; others restricted public office to Protestants; some required belief in specific doctrines of the Christian religion, such as the divinity of Jesus, the Trinity, and immortality. The Virginia statute constituted a complete break with the traditional relationship between church and state. It prohibited support of any religion by public taxation and forbade all civil disabilities imposed on citizens because of religious belief or the lack of it. Jefferson regarded the statute as partial fulfillment of his celebrated vow: "I have sworn upon the altar of God eternal hostility against every form of tyranny over the mind of man."

After three years in the legislature, Jefferson was elected governor in 1779 and served for two years in a position characterized by much responsibility and very little power. When Virginia was invaded by British forces in the winter of 1780–81, Jefferson was unable to organize effective opposition and barely escaped capture when a detachment of troops raided Charlottesville and Monticello. His conduct during the emergency was criticized, and, although the legislature gave him a unanimous vote of confidence, he could not forget the slur cast upon his character as a public official. He refused to serve again either as governor or legislator and retired to Monticello determined to live out his life as a private citizen.

There was a reason other than wounded pride for this decision. He was worried about the health of his wife, Martha Wayles Skelton Jefferson. Since their marriage in 1772, she had borne him five children of whom only two survived, and in the fall of 1781 she was again pregnant. Jefferson's fears were justified, for she did not recover strength after the birth of the sixth child and died September 6, 1782. Jefferson's grief was incalculable.

"Notes on Virginia." After his retirement as governor and before he returned to public service in December of 1782, Jefferson wrote and revised the major portion of *Notes on Virginia*, his only book. It originated in a comprehensive but routine series of questions put to him by the secretary of the French legation in order to compile information about the new country. Jefferson's response was as revealing of himself as it was informative about the state of Virginia. In later years he learned to guard his pen carefully, especially after letters he considered to be purely private were printed in newspapers or elsewhere without his permission. The language of this book was frequently unrestrained. It was as if the *Notes*, written for the most part after his abrupt and unhappy withdrawal from Virginia politics and during the months of desperate fear for the life of his wife, provided a means for the release of otherwise restrained emotions.

Discussion of race and slavery in the *Notes*

The *Notes* include a discussion of slavery, its effects on both whites and blacks, and an attempt to delineate the racial characteristics of the latter. Although he was unalterably opposed to slavery and reiterated his reasons in this essay, he both expressed and reflected one of the principal obstacles to abolition—the belief that, because of inherent racial differences, blacks and whites could not live together in peace and harmony. Jefferson's summary of the supposed differences may now be seen as a classic example of the failure of an individual mind—and in this case one of exceptional independence and critical rigour—to transcend the cultural boundaries of its age. It is a curious blend of attempted objectivity flawed by the intrusion of unconscious prejudices and unexamined assumptions. He argued, among other points, that the blacks were inferior in physical beauty, that they might be lacking in foresight, that they were equal in memory but inferior in reason and imagination to the white race. He was aware of the influence of environment on behaviour and belief, accepted it as a general principle, and even cited it to explain the slave's alleged disposition to theft. Yet, he could not or did not apply it consistently and rigorously throughout his examination of the subject. It would appear that he clearly recognized the difficulties involved in applying the methods of scientific analysis to problems of racial 'characteristics, but they were difficulties beyond his power to resolve.

> The opinion that they are inferior in the faculties of reason and imagination, must be hazarded with great diffidence. To justify a general conclusion, requires many observations, even where the subject may be submitted to the anatomical knife, to optical glasses, to analysis by fire or by solvents. How much more then where it is a faculty, not a substance, we are examining; where it eludes the research of all the senses; where the conditions of its existence are various and variously combined; where the effects of those which are present or absent bid defiance to calculation; let me add too, as a circumstance of great tenderness, where our conclusion would degrade a whole race of men from the rank in the scale of beings which their Creator may perhaps have given them. To our reproach it must be said, that though for a century and half we have had under our eyes the races of black and of red men, they have never yet been viewed by us as subjects of natural history. I advance it, therefore, as a suspicion only, that the blacks, whether originally a distinct race, or made distinct by time and circumstances, are inferior to the whites in the endowments both of body and mind.

The *Notes* are otherwise interesting because they reveal the mind of a revolutionist in the midst of a revolution he regarded as unfinished. With some equanimity, he attributed the "very capital errors" in the Virginia constitution of 1776 to inexperience; it was with passionate outrage that he criticized proposals made twice in the Virginia legislature to follow Roman precedent and establish a temporary dictator in time of emergency:

> The very thought alone was treason against the people; was treason against mankind in general; as riveting forever the chains which bow down their necks, by giving to their oppresrors a proof which they would have trumpeted through the universe, of the imbecility of republican government, in times of pressing danger, to shield them from harm.

He urged revision of the constitution and enactment of his plans for universal education and full freedom of religion because he believed that the public virtue then prevalent among both the people and their leaders was impermanent, in part a function of the revolutionary situation, and destined to diminish. Rulers would become corrupt and abuse their power, and the people "will forget themselves, but in the sole faculty of making money, and will never think of uniting to effect a due respect for their rights." Jefferson's belief in republican government did not rest on naïve and unqualified faith in the people. Republican government would operate successfully only under certain conditions: a wide distribution of property or the availability of a substitute that provided men with a decent subsistence honestly earned; an educated and informed population; laws and institutions designed to compensate for the diminution of public virtue that Jefferson thought was sure to come when the crises of the revolutions were over.

Return to politics. In December 1782 he returned to public service and was for several months a member of the Virginia delegation to the Continental Congress. During this time Virginia ceded to the national government the area northwest of the Ohio River, which it claimed under grants made during the colonial period. In an ordinance drafted for the governance of this land, Jefferson set forth the principle that it should not be held by the original 13 states as colonial territory but should be divided into areas that, upon reaching a designated condition of population and organization, should enter the Union as states equal to the original 13. He also included a prohibition that would have forbidden slavery after 1800 in this territory and any others of which the United States might become possessed. The provision was defeated by one vote; a similar one had been incorporated in the Northwest Ordinance of 1787, but it applied only to that territory. Had Jefferson's original proposal been adopted. and had it remained in force, then slavery would have been outlawed in the whole area of the Louisiana Purchase. As he himself later commented,

> Thus we see the fate of millions of unborn hanging on the tongue of one man, and heaven was silent in that awful moment.

Visit to France

In 1784 Jefferson went to France to join Benjamin Franklin and John Adams in negotiating treaties with European powers. After a few months he succeeded Franklin as resident U.S. minister to the French government. His diplomatic duties were not onerous, and Paris offered him the intellectual and artistic society he had first glimpsed as a student at the College of William and Mary. There he could attend the theatre and opera, visit museums, keep up with science and inventions, associate freely with European scientists and intellectuals, share the politesse of French society, and indulge his passion for books. He loved France and the French, but not uncritically. His observations of economic and social conditions strengthened his aversion to absolute monarchy, and the contrast he saw between French and U.S. domestic morality led to a series of letters condemning the former and warning against the dangers of corruption should young men of his own country be sent to France for their education. (He did not want his daughters to marry abroad and so took them back to Virginia when the older was 17.) As author of the Declaration of Independence and of the Statute for Religious Freedom of Virginia, he had considerable influence with such moderate political leaders as the Marquis de Lafayette, and during the early stages of the French Revolution he was optimistic about the future of their efforts to effect gradual changes in the monarchy and its attendant laws and institutions. It was the greatest intellectual error of his life: France had almost none of the ingredients that had contributed to the success of the United States War of Independence, a fact Jefferson would surely have realized had he not allowed himself to indulge in wishful thinking. Jefferson observed only the opening stages of the Revolution, for he returned to the United States at the end of 1789.

Controversy with Hamilton. In the meantime, the Articles of Confederation had been replaced by the Constitution drafted in Philadelphia in 1787 and ratified the following year. Jefferson approved of most of that document but was critical of its lack of a bill of rights and its failure to impose limitations on the length of tenure for the presidency. Upon his return to Virginia in the fall of 1789, he was requested by George Washington to become secretary of state in the new government. With considerable reluctance, he accepted. Soon after he assumed the new office he became involved in controversy with Alexander Hamilton, who was secretary of the treasury. He opposed Hamilton's financial policies on the grounds that they exceeded the powers delegated to the central government by the Constitution, that they were contrary to the interests of the majority of the people, and that they represented a threat to republican institutions. Jefferson and Hamilton also disagreed on questions of foreign policy, with Jefferson at first leaning toward France and Hamilton toward Great Britain.

Role in the development of the two-party system

The issues between the two men were not purely personal; they extended to the country at large and led to the formation of national political parties based on policy and principle as well as personality. Thus was established the precedent and pattern of a national two-party system. Both Jefferson and Hamilton retired from the Cabinet near the end of Washington's first term, but each continued to be the symbol of the new parties, Jefferson of the Democratic-Republican, Hamilton of the Federalist. Both sides developed organizational skills among the electorate, the Congress, and the state legislatures, and both made effective use of the press. James Madison was, as usual, Jefferson's able collaborator and supplied active leadership of the party until the latter returned to the centre of national politics as vice president under John Adams in 1797. In 1798, when the United States was close to war with France, the Federalist-controlled Congress enacted the Alien and Sedition Acts. The latter, particularly as applied by Federalist judges, was used to stifle Democratic-Republican criticism of the government. Jefferson and Madison believed it to be contrary to the first amendment and therefore cons[illegible]al, a position th[illegible]d in the [illegible]inia [illegible]d Kentucky R[illegible]tions of 1798–99.

The decade ended with the defeat of the Federalists in the election of 1800. It was a critical period in the development of the new nation; politics were sharply divisive, conducted with extreme animosity, and permeated with fundamental cleavages over political principles. Jefferson regarded Hamilton as an enemy of republican government; Hamilton regarded Jefferson as a demagogic radical. Hamilton had a dream of national grandeur to which he was prepared to subordinate the immediate interests of the individual. Jefferson saw the purpose of government as the protection of the individual's right to life, liberty, and the pursuit of happiness. Jefferson's attitudes and behaviour during this period were revealing. He did not exercise an Olympian calm; his letters sometimes displayed anger and passion toward the policies of his opponents and toward some of them personally. Yet, the very bitterness of the controversy troubled him. He sensed and feared the divisive and destructive effects of unrestrained ideological conflict. Not only could the latter disrupt the social harmony that Jefferson valued so highly, but it could also conceivably rip the fabric of republican government altogether. A desire to forestall in America what had so frequently been the fate of such governments in the past seemed to influence Jefferson's conduct of the presidency during his first term.

Presidency. The Federalist candidates clearly lost the presidential election of 1800, but under the electoral system then prevailing neither of the Republican candidates, Jefferson and Aaron Burr, could claim victory. The Constitution had provided no means for electors to distinguish between their choices for president and vice president, and both candidates had received the same number of votes. The choice between them was therefore made in the House of Representatives. Partly because of the influence of Hamilton, who distrusted Burr even more than he disliked Jefferson, the latter was chosen president and inaugurated March 4, 1801.

The spirit and content of Jefferson's inaugural address were conciliatory, and so, to a considerable extent, were the policies of his first administration. There was no attempt at wholesale reversal of Federalist policies of the preceding 12 years, and in at least two instances—the Louisiana Purchase and the Embargo Act—he was said to be even more Federalist than the Federalists themselves. There was, however, an effort to nullify the Federalist attempt to fill the federal judiciary with partisan appointees holding office for life. and there was sufficient turnover in other federal offices to give some substance to the accusation that Jefferson introduced the spoils system.

But, in spite of the very bitter controversy of the preceding years, Jefferson's inauguration ushered in no drastic or radical changes. Had Jefferson been more doctrinaire or less aware of the danger of unrestrained political passion and of the delicate situation created by the first party change of administration in the new government's history, the future of U.S. politics might have been characterized by less stability than has been the case. The precedent he deliberately set must rank with the Louisiana Purchase as one of the major achievements of his presidency.

The Louisiana Purchase

The acquisition of the Louisiana Territory in 1803 was of incalculable importance, nearly doubling the size of the United States. Jefferson's original plan was to purchase merely a small area at the mouth of the Mississippi River. When Napoleon offered to sell the entire territory, Jefferson saw his chance and took it, even though, as he frankly admitted, he had no constitutional authority to do so. He believed that the purchase would contribute to the security of the United States by removing from the continent a major foreign power and that it would ensure the stability of republican government for generations to come by providing a vast reservoir of land for settlers.

Jefferson was re-elected in 1804; George Clinton replaced Burr as vice president. Jefferson's second administration was notable for his unsuccessful efforts to convict his former vice president, Burr, of treasonable acts in the southwestern territories, and for his efforts to pursue a policy of neutrality during the Napoleonic Wars and maintain the rights of neutrals on the high seas. His overwhelming desire to avoid war with either side led to charges of timidity and vacillation, and his Embargo Act (1807) was criticized as inconsistent with the principles of individual freedom and his former opposition to a strong national government. The act was securely based on the power given to the Congress to regulate commerce with foreign nations—a power of which Jefferson approved long before he became president—but the enforcement provisions of the act and its amendments can rightly be questioned as contravening the Fourth Amendment's prohibition of unreasonable search and seizure.

During Jefferson's presidency the power and prestige of the Supreme Court grew under the leadership of Chief Justice John Marshall. In the case *Marbury* v. *Madison* (1803), the court explicitly asserted the right and power of judicial review. Jefferson opposed the power of the court as the ultimate and exclusive interpreter of the Constitution and argued that such a power lodged in one department of the government whose members held office for life was irresponsible and therefore contrary to the principles of republican government.

Establishment of the University of Virginia

Jefferson might have been elected president for a third term but chose to follow Washington's example of withdrawing after two terms. On March 4, 1809, he turned the office over to his successor, James Madison, and went home to Monticello. There was one more official act he sought to accomplish, the establishment of the University of Virginia, to which he referred as "the last of my mortal cares, and the last service I can render my country." He designed the buildings and supervised their construction to the most minute detail; he gathered the faculty, planned the curriculum, and even selected the reading for some of the courses. He had never been able to persuade his fellow Virginians to support public education for elementary and secondary pupils, but the university was an appropriate conclusion to a political career remarkable for its-creativity as well as for its duration and success.

Jefferson's political career was undoubtedly impressive, but it was far from absorbing all of the energy, time, and talent of the man himself. He probably enjoyed politics more than he was willing to admit; it is also true that his often-expressed longing to retire to private life and pursue his other interests was very real. These interests were numerous and varied.

Personal and intellectual interests. He was an extraordinarily learned man, and the range of his knowledge and inquiry is scarcely credible in the modern age of specialization. He knew Latin, Greek, French, Spanish, Italian, and Anglo-Saxon and concerned himself with such questions as the difference between the ancient and modern pronunciation of Greek. At the age of 71 he tackled Plato's *Republic* in the original and found its author greatly overrated. He attempted an analysis of the New Testament in order to discover what Jesus really said as distinguished from what he was reported to have said. He enjoyed the study of mathematics and found its precision and certitude a welcome relief from the untidiness of politics and government. He was an ardent student of the natural sciences, carried on an extensive correspondence with such men as Joseph Priestley, and sometimes contributed time and money to progress in these fields. The discovery of fossil remains in various parts of the country fascinated him, and he tried to collect and classify as many as he could. He was much interested in the experiments with balloons and submarines then being made, and, while he was abroad, he sent back to his friends at home various mechanical and scientific gadgets produced in Europe, including a polygraph and phosphorus matches. His travel notes record impressions ranging from nearly ecstatic admiration of architectural monuments to sober economic analysis of the reasons for the differences in prosperity between regions producing white and red wine.

Interest in the natural sciences

He was an enthusiastic practitioner of scientific farming, conducted numerous experiments at Monticello, was always on the lookout for some new plant or seed that might contribute to the prosperity of the United States (once going so far as to smuggle a particular variety of rice across the Italian border), and kept meticulous meteorological records. His interest in architecture was intense and enduring, and his influence on the Neoclassical style in the United States was great.

The pursuit of these various interests concurrently with his political activities and the management of his estates (which included several thousand acres and at one time about 150 slaves) is remarkable. To this record of industry must be added the voluminous correspondence Jefferson maintained with extraordinary conscientiousness until very near his death. He could have accomplished so much only through rigorous self-discipline and an efficient organization of his time and activities. Yet, he was one of the most generous and approachable of men. Friends and strangers alike wrote to him for advice or came to Monticello when he was in residence. Relatives and guests filled Monticello to capacity—sometimes beds were made for as many as 50 people—and devoured his food as well as his time. For privacy he retreated several times a year to Poplar Forest, a second home built as a refuge in Bedford County.

Personal appearance and personality

Jefferson was 6 feet 2 inches in height, large boned, slim, erect, and sinewy. He had angular features, a ruddy complexion, sandy hair, and hazel-flecked gray eyes. His carriage was relaxed and somewhat awkward, and by 18th-century standards he seems to have been regarded as pleasant rather than handsome in appearance. He was sensitive and perceptive in personal relations, gracious and charming in manner (though sometimes cold upon first meeting strangers), and almost invariably even tempered. As a matter of both principle and inclination, he attempted to prevent political differences from creating personal ill will, and though he was subjected to malicious abuse during the political controversies in which he was involved, he endured it with relative equanimity and felt genuine animosity toward only a very few of his opponents and critics.

Because he was so central a figure, so widely known, so articulate, and so meticulous in preserving his letters and papers, it is possible to reconstruct a remarkably complete account of his career and his work. Yet, the man himself—the private man—remains elusive. There was a reserve of privacy that he kept inviolate. For example, no letters exchanged between him and his wife exist. Their marriage was, by contemporary accounts, an extraordinarily happy one, and it would therefore appear that Jefferson destroyed whatever letters once existed in order to keep their relationship forever private. Jefferson was, as his modern editor has suggested, ultimately a lonely man.

Ten days before his death, Jefferson replied to an invitation to join the residents of Washington, D.C., in celebrating the 50th anniversary of the proclamation of the Declaration of Independence. He could not attend because of illness, but he sent his best wishes, and, of the Declaration that was to be celebrated, he wrote:

> May it be to the world, what I believe it will be, (to some parts sooner, to others later, but finally to all,) the signal of arousing men to burst the chains under which monkish ignorance and superstition had persuaded them to bind themselves, and to assume the blessings and security of self government.

While Jefferson grew steadily weaker at Monticello, his old friend John Adams was nearing death in Massachusetts. It seems certain from the accounts of friends and relatives that both men wanted badly to live until the 50th anniversary of the day that symbolized the central endeavour and achievement of their lives. They succeeded. Jefferson died shortly before one o'clock on the afternoon of July 4, 1826; Adams died a few hours later, his last words said to have been, "Jefferson still survives." Jefferson was buried at Monticello. The epitaph that he had chosen was inscribed on his tombstone: "Here was buried Thomas Jefferson, author of the Declaration of American Independence, of the statute of Virginia for religious freedom, and father of the University of Virginia."

Deaths of Jefferson and Adams

BIBLIOGRAPHY. JULIAN P. BOYD (ed.), *The Papers of Thomas Jefferson,* 19 vol. to date (1950–74), covering the period up to March 10, 1791, is the definitive edition of Jefferson's papers. Its superlative editorial work includes extensive notes on the background, context, and significance of the documents printed, which include papers written to Jefferson as well as those written by him. Two other collections of Jefferson's writings can be used for the period not yet reached by the Boyd edition: ANDREW A. LIPSCOMB and ALBERT ELLERY BERGH, *The Writings of Thomas Jefferson,* 20 vol. (1905); PAUL LEICESTER FORD, *The Works of Thomas Jefferson,* 12 vol. (1904–05). The correspondence between Jefferson and John and Abigail Adams is conveniently reproduced in LESTER J. CAPPON, *The Adams-Jefferson Letters,* 2 vol. (1959). The letters are notable for their warmth and, especially those between the two men after 1812, for their discussions of the intellectual and political developments of the times. Much information about Jefferson's intellectual life may be found in E. MILLICENT SOWERBY (comp.), *Catalogue of the Library of Thomas Jefferson,* 5 vol. (1952), which contains a list of the books sold by Jefferson to the Congress in 1815, replacing the library burned by the British and forming the nucleus of the present Library of Congress. A convenient single-volume anthology of Jefferson's letters and papers is ADRIENNE KOCH and WILLIAM PEDEN (eds.), *The Life and Selected Writings of Jefferson*(1944).

The definitive biography for the present generation is that by DUMAS MALONE, *Jefferson and His Time* (1948–), of which five volumes had been completed by 1974, the last dealing with Jefferson's second term as president. A good popular biography is NATHAN SCHACHNER, *Thomas Jefferson: A Biography,* 2 vol. (1951). A comprehensive single-volume biography, unfortunately published without footnotes, is MERRILL D. PETERSON, *Thomas Jefferson and the New Nation* (1970). The 19th-century biography by HENRY S. RANDALL, *The Life of Thomas Jefferson,* 3 vol. (1858), is valuable because of Randall's extensive consultation with people then living who had known Jefferson personally. The influence of Jefferson in America is treated in MERRILL D. PETERSON, *The Jefferson Image in the American Mind* (1960). For more extended bibliographies, including treatments of topics in special fields, such as Jefferson's interest and achievements in architecture, education, language and literature, philosophy, science, agriculture, and civil liberties, consult the Peterson and Malone volumes.

Jehovah's Witnesses

Since 1931 the adherents of the apocalyptic sect organized by Charles Taze Russell in the early 1870s have been known as Jehovah's Witnesses. Before that they had been called Russellites, Millennial Dawnists, and International Bible Students. Worldwide, by the 1970s, their numbers exceeded 2,130,000, of whom approximately 550,000 lived in the United States.

Animated by an urgent need to warn mankind of the impending Battle of Armageddon, the Witnesses have brought their message to some 210 countries and territories. They believe that the Watch Tower Bible and Tract Society, their legal agency and publishing arm, exemplifies the will of God and proclaims the truths of the Bible against the evil triumvirate of organized religion, the business world, and the state.

Publishing

From the earliest days of the movement the Witnesses have relied on the printed word to win converts and indoctrinate members. The output of their several printing plants is enormous. One of their doctrinal texts, *The Truth That Leads to Eternal Life,* has become the fourth largest best seller of all times, with 74,000,000 copies in print. The *Watchtower,* the society magazine, by the late 1970s reported a circulation of more than 10,000,000 copies in 79 languages; its companion periodical *Awake!* claimed almost the same circulation.

Each Jehovah's Witness is expected to spend at least 10 hours a month in home Bible studies and door-to-door preaching or distribution .of Watch Tower literature. These methods, though they may annoy some householders, have brought remarkable growth; in 1942 the sect had only 106.000 members.

The Witnesses also stand apart from civil society, refusing to vote, run for public office, serve in any armed forces, salute the flag, stand for the national anthem, or recite the pledge of allegiance.

Their religious stands have brought clashes with various governments, resulting in lawsuits, mob violence, imprisonment, torture, and death. At one time more than 6,000 Witnesses were inmates of Nazi concentration camps. Communist and Fascist states usually forbid Watch Tower activities. In the U.S. the society has taken 45 cases to the Supreme Court and has won significant victories for freedom of religion and speech. The Witnesses have been less successful in claiming exemptions as ministers from military service and in seeking to withhold blood transfusions from their children.

Members outside the U.S.

Although the largest single contingent of Witnesses is American, most Witnesses live outside the U.S. Some of the larger groups are those in Nigeria (114,000 in the late 1970s), Brazil (106,000), West Germany (102,000), Mexico (84,000). the British Isles (80,000), and the Philippines (77,000).

History. *Pastor Russell.* By the time he was 20, Russell (1852–1916) had left both Presbyterianism and Congregationalism because he could not reconcile the idea of an eternal hell with God's mercy. He had drifted into agnosticism when a chance encounter with some Adventists introduced him to the idea that the Bible could be used to predict God's plan of salvation, especially as the plan related to the end of the world. Lacking much formal education, Russell managed to master the use of Hebrew and Greek dictionaries to study the Bible. The scriptures fascinated him far more than did his haberdashery in Pittsburgh, and he left the business world to form the first Bible classes in 1872. In 1879 he began publishing a magazine, *Zion's Watch Tower and Herald of Christ's Presence.* His major exegetical work was the seven-volume *Studies in the Scriptures.*

Basing his judgment on complex biblical calculations, Russell predicted that the end of the world would occur in 1914. His movement survived the embarrassment caused by the failure of this prediction, as well as the problems caused by his separation from his wife and numerous lawsuits.

Judge Rutherford. A Missouri lawyer, Joseph Franklin Rutherford (1869–1942), who had occasionally filled in as a circuit judge succeeded Pastor Russell as head of the Watch Tower Society. In 1918 Rutherford and seven other senior officials of the sect were sentenced to 20-year terms in federal prison for sedition. They were freed after nine months, and the government eventually dropped its prosecution.

Judge Rutherford discarded some of Russell's beliefs, such as the notion that the measurements of the Great Pyramid of Egypt verified biblical predictions of the Second Advent. The judge's voluminous output of books and tracts, almost 100, supplanted Russell's writings, which were allowed to go out of print. Rutherford coined the slogan "Millions now living will never die!" which drew attention to the movement's promise that the faithful would survive the imminent battle between Jehovah and Satan. He equipped members with portable phonographs to play his "sermonettes" on the front porches and in the living rooms of prospective converts. The democratic polity devised by Pastor Russell was replaced by a theocratic system directed from the society's headquarters in Brooklyn, N.Y. Rutherford intensified the Witnesses' attacks on organized religion, especially Roman Catholicism.

Theocratic polity

Aloof and somewhat mysterious, Judge Rutherford seldom appeared in public except for annual Watch Tower conventions. It was at one of these in 1931 that he announced the new name for the movement.

The Witnesses since Rutherford. Nathan H. Knorr (1905–77) left the Reformed Church and joined the Watch Tower while in high school. He joined the sect's Brooklyn staff shortly after graduation and worked his way up the hierarchy to become president in 1942 at the age of 35. Knorr established the Watch Tower Bible School of Gilead to train missionaries and leaders, decreed that all the society's books and articles be published anonymously, and set up adult education programs to train Witnesses to deliver their own apologetical talks. Under Knorr's direction a group of Witnesses produced a new translation of the Bible. The first of six volumes of the *New World Translation of the Hebrew and Christian Greek Scriptures* appeared in 1950.

Witnesses faced active persecution in Germany and other Axis countries during World War II as well as in several Allied countries where their work was banned. In the postcolonial era, they have encountered hostility in a number of new African nations whose nationalism conflicts with the Watch Tower idea of theocracy.

When President Knorr died in 1977, the directors elected Frederick W. Franz to be the fourth leader of the Watch Tower Bible and Tract Society. Long the sect's most important theologian, Franz was the first head of the society to have attended college; he completed two years at the University of Cincinnati.

Legal Corporations and Organization. Of the three corporations that direct the activities of Jehovah's Witnesses. the most powerful is the Watch Tower Bible and Tract Society of Pennsylvania; founded by Russell in 1884, it has several hundred members, mostly Americans. The other two corporations are the Watch Tower Bible and Tract Society, Inc., of New York and the International Bible Students Association.

Most members of a local congregation are kingdom publishers, who are expected to spend five hours a week at meetings in Kingdom Hall and spend as much time as circumstances permit in doorstep preaching. Pioneer publishers hold part-time secular jobs and try to devote 100 hours a month to religious service. Special pioneers are full-time, salaried employees of the society who should spend at least 150 hours a month in this work. Each Kingdom Hall has an assigned territory and each Witness a particular neighbourhood to canvass. The sect takes great pains to keep records of the number of visits, back calls, Bible classes, and books and magazines distributed.

Kingdom publishers

The elders of the congregation select a presiding minister to serve a one-year term. He is aided by an assistant presiding minister and ministerial assistants as well as by the elders. Only men are qualified to hold teaching or administrative positions.

About 3,000 Witnesses live in various Bethel residences around the world. Of these, some 700 live and work at the Brooklyn Bethel; they write the books, set the type, operate the presses, and conduct the business of the society. Others raise food on Watch Tower farms. All residents, from the president to the newest recruit, receive the same recompense: room, board, and $20 a month.

Doctrines. *Christology.* Jehovah's Witnesses believe in a God whose personal name is Jehovah. They reject the orthodox Christian doctrine of the Trinity as pagan idolatry and hold theological views similar to those of Arius, who was condemned as a heretic by the Council of Nicaea in AD 325.

Jehovah created his Son, who was known as Michael the Archangel before his incarnation. The Son took on human form and as Jesus Christ gave his life as ransom for mankind, which had lost the right to eternal life through Adam's sin. Jesus Christ, raised as a mighty spirit creature, now rules as Jehovah's executive officer in heaven. The Holy Spirit is understood not as a separate personage in the Trinity but as the name for the power of Jehovah as he intervenes in history.

The Second Coming. Rutherford explained that Russell had been correct about 1914; the Kingdom of God did begin then, but it was an invisible event. Witnesses believe that Armageddon may break out at any moment but certainly during the lifetime of the generation alive in 1914.

Armageddon

The Last Judgment. Since the time of Christ, a select band of 144,000 persons has been gathered and will reign with Jesus in heaven. About 10,000 of this number, all of whom are Jehovah's Witnesses, are still alive. Other Witnesses will be able to survive Armageddon and the experience of death and they, along with resurrected Witnesses, will thereafter populate a paradise on earth. After the victory of Jehovah, the world will no longer see sickness, old age, crime, war, or poverty. After 1,000 years, Satan will be loosed for one more chance to seduce mankind; a few weak persons will succumb to his temptations but most will remain faithful and continue an idyllic life on earth forever. The wicked will be annihilated.

The Bible. The Witnesses claim to base all their teachings on the Bible, which they accept as literally true, and their publications are laced with scriptural references. The Watch Tower cites the Bible to condemn Christmas trees, hypnosis, hunting and fishing for sport, military service, the pope, transcendental meditation, the United Nations, birthday celebrations, gambling, abortion, Protestantism, homosexuality, evolution, tobacco, communism, and lodges. Their refusal to accept blood transfusions is based on their interpretations of Gen. 9:4, Lev. 7:26, Acts 15:29, etc.

Church and sacraments. The weekly meetings in Kingdom Halls resemble Bible study classes more than a Protestant worship service. Rather than sermons and prayers, these meetings feature lectures, reports, and discussions of Watch Tower literature. Once a year, on Nisan 14 (the eve of Passover), the society sponsors a communion service called the Lord's Evening Meal (Memorial), to which all members and sympathizers are invited but at which only the living remnant of the 144,000 actually partake of the bread and wine. In 1976 nearly 5,000,000 persons attended, and 10,187 partook of the emblems.

Lord's Evening Meal

Jehovah's Witnesses rallies often feature mass Baptism. The society views Baptism by immersion as a symbol of dedication to Jehovah. Submission to Baptism not only initiates a convert into the sect but qualifies him or her to be a minister.

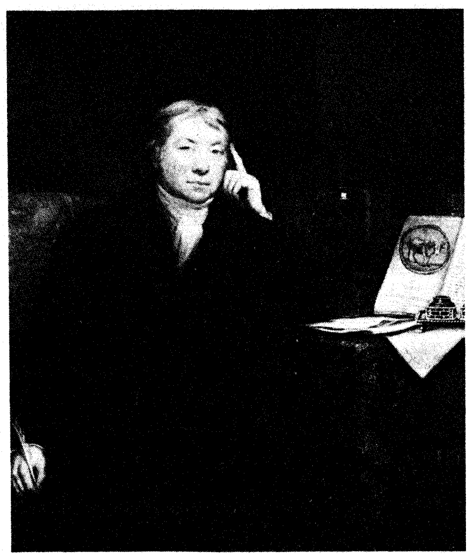
Jenner, Edward

Edward Jenner, in discovering the process of vaccination, did more than any other person to wipe out the menace of smallpox. In addition, his scientific acumen, personality,



Jenner, oil painting by J. Northcote, 1803. In the National Portrait Gallery, London.
By courtesy of the National Portrait Gallery, London

and his relations to society exemplified the best of his era.

Jenner was born on May 17, 1749, in Berkeley, Gloucestershire, at a time when the patterns of British medical practice and education were undergoing gradual change. Slowly the division between the Oxford- or Cambridge-trained physicians and the apothecaries or surgeons—who were much less educated and who acquired their medical knowledge through apprenticeship rather than through academic work—was becoming less sharp and hospital work was becoming much more important.

Jenner was a country youth, the son of a clergyman who died when the boy was only five. Brought up in a country environment, largely by an older brother who was also a clergyman, Edward acquired a love of nature that remained with him all his life. He attended grammar school and at the age of 13 was apprenticed to a nearby surgeon. In the following eight years Jenner acquired a sound knowledge of medical and surgical practice. On completing his apprenticeship at the age of 21, he went to London and became the house pupil of John Hunter, who was on the staff of St. George's Hospital and was soon to become one of the most prominent surgeons in London. Even more important, however, he was an anatomist, biologist, and experimentalist of the first rank; not only did he collect biological specimens but he also concerned himself with problems of physiology and function.

Influence of John Hunter

The firm friendship that grew between the two men lasted until the death of Hunter in 1793. From no one else could Jenner have received the stimuli that so confirmed his natural bent—a catholic interest in biological phenomena, disciplined powers of observation, sharpening of critical faculties, and a reliance on experimental investigation. From Hunter Jenner received the characteristic advice: "Why think, [*i.e.*, speculate]—why not try the experiment?"

In addition to his training and experience in biology, Jenner made progress in clinical surgery. At the end of two years in London, he returned, in 1773, to country practice in Berkeley and enjoyed substantial success. He was capable, skillful, and personally papular. In addition to practicing medicine, he joined two medical groups for the promotion of medical knowledge and wrote occasional medical papers. He played the violin in a musical club, wrote light verse, and, as a naturalist, made many observations, particularly on the nesting habits of the cuckoo and on bird migration. He also collected specimens for John Hunter; many of Hunter's letters to Jenner have been preserved, but Jenner's letters to Hunter have unfortunately been lost.

After one disappointment in love in 1778. Jenner married in 1788.

Smallpox was widespread in the 18th century, and occasional outbreaks of special intensity resulted in a very high death rate. The disease, a leading cause of death at the time, respected no social class. And disfigurement was not uncommon in patients who recovered. The only means of combatting the disease was the so-called inoculation—intentionally infecting a healthy person with the "matter" taken from a patient sick with a mild attack of smallpox. This practice, which originated in the East, depended on two distinct concepts: first, that one attack of smallpox effectively protected against any subsequent exposure; and second, that a person deliberately infected with a mild case of the disease would safely acquire such protection. It was, in present-day terminology, an "elective" infection—*i.e.*, one given to a person in good health. Unfortunately, the transmitted disease did not always remain mild, and significant mortality occurred. Furthermore, the inoculated person could disseminate the disease to others and thus act as a focus of infection.

Jenner, even as an apprentice, had been impressed by the fact that a person who had suffered an attack of cowpox—a relatively harmless disease that could be contracted from cattle--could not take the smallpox—*i.e.*, could not become infected whether by accidental or intentional exposure to the smallpox. Pondering this phenomenon Jenner concluded that cowpox not only protected against smallpox but could be transmitted from one person to another as a deliberate mechanism of protection.

Vaccination for smallpox

The story of the great breakthrough is well-known. In May 1796 Jenner found a young dairymaid, Sarah Nelmes, who had fresh cowpox lesions on her finger. On May 14, using matter from Sarah's lesions, he inoculated an eight-year-old boy, James Phipps, who promptly developed a slight fever and a low grade lesion. On July 1 Jenner inoculated the boy again, this time with smallpox matter. No disease developed; protection was complete. Jenner, in 1797, sent to the Royal Society a short paper describing his results, but the paper was refused. Then Jenner, in 1798, having added further cases, published privately a slender book entitled *An* Inquiry into the Causes and Effects of the Variolae Vaccinae, a Disease . . . Known by the Name of Cow Pox.

The reaction to the publication was not immediately favourable. Jenner went to London seeking volunteers for vaccination but, in a stay of three months, was not successful. In London inoculation became popularized through the activities of others, particularly the surgeon Henry Cline, to whom Jenner had given some of the inoculant, and doctors George Pearson and William Woodville. Difficulties arose, some of them quite unpleasant: Pearson tried to take credit away from Jenner; and Woodville, a physician in a smallpox hospital, contaminated the cowpox matter with smallpox virus.

But the procedure rapidly proved its value, and Jenner became intensely active, promoting the cause of vaccination. The procedure spread rapidly to the Continent, then to America, and soon was carried around the world.

Complications were many. Vaccination seemed simple, but the vast number of persons who practiced it did not necessarily follow the procedure that Jenner had recommended, and deliberate or unconscious innovations often impaired the effectiveness. Pure cowpox vaccine was not always easy to obtain, nor was it easy to preserve or transmit. Furthermore, the biological factors that produce immunity were not yet understood; much information had to be gathered, and a great many mistakes made before a fully effective procedure could be developed, even on an empirical basis.

Despite errors and occasional chicanery, the process of vaccination spread rapidly and the death rate from smallpox plunged. Jenner, although he received worldwide recognition and many honours, made no attempt to enrich himself through his discovery and actually devoted so much time to the cause of vaccination that his private practice and his personal affairs suffered severely. In 1802 Parliament voted him a sum of £10,000 and in 1806 a further sum of 520,000.

Jenner not only received honours but also aroused opposition and found himself subjected to attacks and calumnies. His calm, nevertheless, remained unruffled, and he continued his activities in behalf of vaccination.

His wife, ill with tuberculosis, died in 1815, and Jenner retired from public life. He died in Berkeley, January 26, 1823, one of the truly great benefactors of humanity.

Jeremiah

Jeremiah was a major prophet of ancient Judah who lived in the latter part of the 7th and the early years of the 6th centuries BCE (before the Common Era, or BC). Closely involved in the political and religious events of a crucial era in the history of the ancient Near East, he was able to help his fellow countrymen survive disasters that included the capture of Jerusalem by the Babylonians in 586 BCE, the exile of many Judaeans to Babylonia, and Judah's loss of political independence.

Alinari

Jeremiah, detail from a fresco by Michelangelo in the Sistine Chapel, Rome, *c.* 1512.

The man and his times. Jeremiah was born (probably after 650) and grew up in the village of Anathoth, two miles northeast of Jerusalem, in a priestly family. In his childhood he must have learned some of the traditions of his people, particularly the prophecies of Hosea, whose influence can be seen in his early messages.

The era in which Jeremiah lived was one of transition for the ancient Near East. The Assyrian Empire, which had been dominant for two centuries, declined and fell. Its capital, Nineveh, was captured in 612 by the Babylonians and Medes. Egypt had a brief period of resurgence under the 26th dynasty (664–525) but did not prove strong enough to establish an empire. The new world power was the Neo-Babylonian Empire, ruled by a Chaldean dynasty whose best known king was Nebuchadrezzar. The small and comparatively insignificant state of Judah had been a vassal of Assyria and, when Assyria declined, asserted its independence for a short time. Subsequently, Judah vacillated in its allegiance between Babylonia and Egypt and ultimately became a province of the Neo-Babylonian Empire.

Beginning of prophetic career

According to the biblical Book of Jeremiah, he began his prophetic career in 627/626—the 13th year of King Josiah's reign. It is told there that he responded to Yahweh's (God's) call to prophesy by protesting "I do not know how to speak, for I am only a youth," but he received Yahweh's assurance that he would put his own words into Jeremiah's mouth and make him a "prophet to the nations." A few scholars believe that after his call Jeremiah served as an official prophet in the Temple, but most believe that this is unlikely in view of his sharp criticism of priests, prophets, and the Temple cult.

Jeremiah's early messages to the people were condemnations of them for their false worship and social injustice, with summons to repentance. He proclaimed the coming of a foe from the north, symbolized by a boiling pot facing from the north in one of his visions, that would cause great destruction. This foe has often been identified with the Scythians, nomads from southern Russia who supposedly descended into western Asia in the 7th century and attacked Palestine. Some scholars have identified the northern foe with the Medes, the Assyrians, or the Chaldeans (Babylonians); others have interpreted his message as vague eschatological (last days and Judgment) predictions, not concerning a specific people.

In 621 King Josiah instituted far-reaching reforms based upon a book discovered in the Temple of Jerusalem in the course of building repairs, which was probably Deuteronomy or some part of it. Josiah's reforms included the purification of worship from pagan practices, the centralization of all sacrificial rites in the Temple of Jerusalem, and perhaps an effort to establish social justice following principles of earlier prophets (this program constituted what has been called "the Deuteronomic reforms"). Jeremiah's attitude toward these reforms is difficult to assess. Clearly, he would have found much in them with which to agree; a passage in chapter 11 of Jeremiah, in which he is called by Yahweh to urge adherence to the ancient Covenant upon "the men of Judah and the inhabitants of Jerusalem," is frequently interpreted as indicating that the prophet travelled around Jerusalem and the villages of Judah exhorting the people to follow the reforms. If this was the case, Jeremiah later became disillusioned with the reforms because they dealt too largely with the externals of religion and not with the inner spirit and ethical conduct of the people. He may have relapsed into a period of silence for several years because of the indifferent success of the reforms and the failure of his prophecies concerning the foe from the north to materialize.

Jeremiah and the Deuteronomic reforms

Some scholars doubt that Jeremiah's career actually began as early as 627/626 BC and question the accuracy of the dates in the biblical account. This view arises from the difficulty of identifying the foe from the north, which seems likely to have been the Babylonians of a later time, as well as the difficulty of determining the prophet's attitude toward the Deuteronomic reforms and of assigning messages of Jeremiah to the reign of Josiah. In the opinion of such scholars, Jeremiah began to prophesy toward the end of the reign of Josiah or at the beginning of the reign of Jehoiakim (609–598).

Early in the reign of Jehoiakim, Jeremiah delivered his famous "Temple sermon," of which there are two versions, one in Jeremiah, chapter 7, verses 1 to 15, the other in chapter 26, verses 1 to 24. He denounced the people for their dependence on the Temple for security and called on them to effect genuine ethical reform. He predicted that God would destroy the Temple of Jerusalem, as he had earlier destroyed that of Shiloh, if they continued in their present path. Jeremiah was immediately arrested and tried on a capital charge. He was acquitted but may have been forbidden to preach again in the Temple.

The reign of Jehoiakim was an active and difficult period in Jeremiah's life. That king was very different from his father, the reforming Josiah, whom Jeremiah commended for doing justice and righteousness. Jeremiah denounced Jehoiakim harshly for his selfishness, materialism, and practice of social injustice.

The scroll dictated to Baruch

Near the time of the Battle of Carchemish. in 605, when the Babylonians decisively defeated the Egyptians and the remnant of the Assyrians, Jeremiah delivered an oracle against Egypt. Realizing that this battle made a great difference in the world situation, Jeremiah soon dictated to his scribe, Baruch, a scroll containing all of the messages he had delivered to this time. The scroll was read by Baruch in the Temple. Subsequently it was read before King Jehoiakim, who cut it into pieces and burned it. Jeremiah went into hiding and dictated another scroll, with additions.

When Jehoiakim withheld tribute from the Babylonians (about 601), Jeremiah began to warn the Judaeans that they would be destroyed at the hands of those who had previously been their friends. When the King persisted in resisting Babylonia, Nebuchadrezzar sent an army to besiege Jerusalem. King Jehoiakim died before the siege began and was succeeded by his son, Jehoiachin, who surrendered the capital to the Babylonians on March 16, 597, and was taken to Babylonia with many of his subjects.

The Babylonians placed on the throne of Judah a king favourable to them, Zedekiah (597–586 BCE), who was more inclined to follow Jeremiah's counsel than Jehoiakim had been but was weak and vacillating and whose court was torn by conflict between pro-Babylonian and pro-Egyptian parties. After paying Babylonia tribute for nearly ten years, the King made an alliance with Egypt. A second time Nebuchadrezzar sent an army to Jerusalem, which he captured in August 586.

Jeremiah's advocacy of submission to Babylon

Early in Zedekiah's reign, Jeremiah wrote a letter to the exiles in Babylonia, advising them not to expect to return immediately to their homeland, as false prophets were encouraging them to believe, but to settle peaceably in their place of exile and seek the welfare of their captors. When emissaries from surrounding states came to Judah in 594 to enlist Judah's support in rebellion against Babylonia, Jeremiah put a yoke upon his neck and went around proclaiming that Judah and the surrounding states should submit to the yoke of Babylonia, for it was Yahweh who had given them into the hand of the King of Babylonia. Even to the time of the fall of Jerusalem, Jeremiah's message remained the same: submit to the yoke of Babylonia.

When the siege of Jerusalem was temporarily lifted at the approach of an Egyptian force, Jeremiah started to leave Jerusalem to go to the land of the tribe of Benjamin. He was arrested on a charge of desertion and placed in prison. Subsequently he was placed in an abandoned cistern, where he would have died had it not been for the prompt action of an Ethiopian eunuch, Ebed-melech, who rescued the prophet with the King's permission and put him in a less confining place. King Zedekiah summoned him from prison twice for secret interviews, and both times Jeremiah advised him to surrender to Babylonia.

When Jerusalem finally fell, Jeremiah was released from prison by the Babylonians and offered safe conduct to Babylonia, but he preferred to remain with his own people. So he was entrusted to Gedaliah, a Judaean from a prominent family whom the Babylonians appointed as governor of the province of Judah. The prophet continued to oppose those who wanted to rebel against Babylonia and promised the people a bright and joyful future.

After Gedaliah was assassinated, Jeremiah was taken against his will to Egypt by some of the Jews who feared reprisal from the Babylonians. Even in Egypt he continued to rebuke his fellow exiles. Jeremiah probably died in about 570 BCE. According to a tradition that is preserved in extrabiblical sources, he was stoned to death by his exasperated fellow countrymen in Egypt.

Personality

Prophetic vocation and message. This sketch of Jeremiah's life portrays him as a courageous and persistent prophet who often had to endure physical suffering for his fidelity to the prophetic call. He also suffered inner doubts and conflicts, as his own words reveal, especially those passages that are usually called his "confessions" (Jer. 11:18–12:6; 15:10–21; 17:9–10, 14–18; 18:18–23; 20:7–12, 14–18). They reveal a strong conflict between Jeremiah's natural inclinations and his deep sense of vocation to deliver Yahweh's message to the people. Jeremiah was by nature sensitive, introspective, and perhaps shy. He was denied participation in the ordinary joys and sorrows of his fellowmen and did not marry. He thus could say, "I sat alone," with God's hand upon him. Jeremiah had periods of despondency when he expressed the wish that he had never been born or that he might run away and live alone in the desert. He reached the point of calling God "a deceitful brook, . . . waters that fail" and even accused God of deceiving and overpowering him. Yet there were times of exaltation when he could say to God: "Thy words became to me a joy and the delight of my heart"; and he could speak of Yahweh as "a dread warrior" fighting by his side.

As a prophet Jeremiah pronounced God's judgment upon the people of his time for their wickedness. He was concerned especially with false and insincere worship and failure to trust Yahweh in national affairs. He denounced social injustices but not so much as some previous prophets, such as Amos and Micah. He found the source of sin to be in the weakness and corruption of the hearts of men —in what he often called "the stubbornness of the evil heart." He considered sin to be unnatural; he emphasized that some foreign nations were more loyal to their pagan (false) deities than Judah was to Yahweh (the real God), and he often contrasted nature's obedience to law with man's disobedience to God.

Jeremiah had more to say about repentance than any other prophet. He called upon men to turn away from their wicked ways and dependence upon idols and false gods and return to their early covenantal loyalty to Yahweh. Repentance thus had a strong ethical colouring, since it meant living in obedience to Yahweh's will for the individual and the nation.

In the latter part of his career Jeremiah had to struggle against the despair of his people and give them hope for the future. He expressed his own hope vividly by an action that he undertook when the Babylonians were besieging Jerusalem and he was in prison. He bought, from a cousin, a field in Anathoth, his native town. In the presence of witnesses he weighed out the money and made the contracts and said, "Thus says the Lord of hosts, the God of Israel: Houses and fields and vineyards shall again be bought in this land." In this and other ways he expressed his hope for a bright future for Israel in its own land.

The New Covenant

Jeremiah's most important prophecy concerning the future is one regarding the New Covenant (Jer. 31:31–34). While the present literary form of the passage is probably not Jeremiah's, the thought is essentially his. He prophesied of a time when Yahweh would make a covenant with Israel, superseding the old Mosaic Covenant; Yahweh would write his law upon the hearts of men (rather than on tables of stone), and all would know God directly and receive his forgiveness. This New Covenant prophecy was very influential in New Testament times. It is quoted in the Letter to the Hebrews and lies behind words attributed to Jesus at the Last Supper: "This cup is the new covenant in my blood."

Jeremiah is sometimes called "the father of personal religion." But this is true only in part, for there was religious individualism before his time, and Jeremiah himself did not abandon the view that Israel as a nation was chosen by God. Yet he did teach that genuine religion was not dependent upon worship at the Temple of Jerusalem or residence in the land of Palestine or a physical rite, such as circumcision, but rather upon sincere personal seeking of God. His own life encouraged the ideal of individual religion, and his encounter with God found him struggling with God in a very personal way.

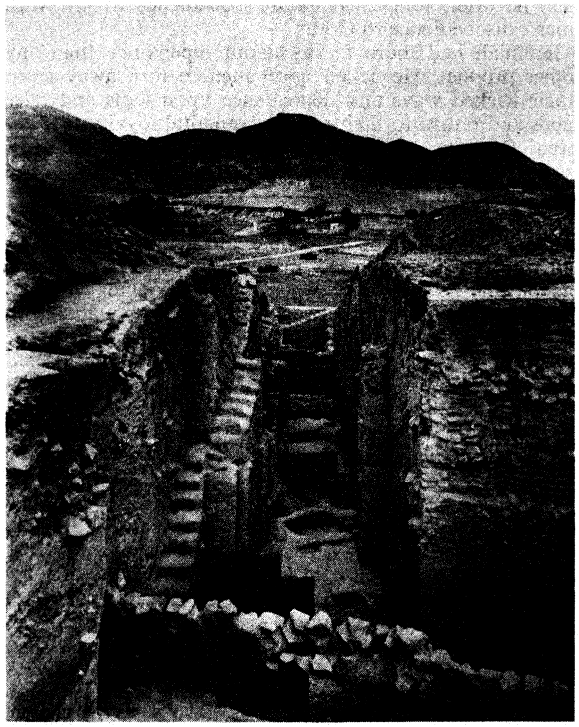
Jericho

Jericho (Arabic Arīḥā) is a town in Jordan situated 825 feet below sea level on the west side of the Jordan Valley, six miles north of the Dead Sea. In 1967 it had a population of about 6,829. Jericho's great importance is that it provides archaeological evidence of one of the earliest known continuous settlements in the world and therefore of the first steps toward civilization, dating perhaps to the 10th millennium BC. It is famous in biblical history as the first town attacked by the Israelites under Joshua after they crossed the Jordan (Josh. 6).

After its destruction by the Israelites it was, according to the biblical account, abandoned until Hiel the Bethelite established himself there in the 9th century BC (I Kings 16:34). Jericho is mentioned several other times in the Old and New testaments. Herod the Great established a winter residence there, and he died there in 4 BC. The site of the Roman and New Testament Jericho is about one mile south of that of the Old Testament town.

By courtesy of the Jericho Excavation Fund



A section of the mound of Jericho. Excavations have uncovered the last wall of the Middle Bronze Age, c. 1700 BC, down to the earliest remains of the Neolithic period, c. 7000 BC.

Old Testament Jericho has been identified in the mound known as Tall as-Sulṭān (at the source of the copious spring ʿAyn as-Sulṭān), which rises 70 feet above the surrounding plain. A number of major archaeological expeditions have worked at the site, the most recent in 1952–58 under Kathleen M. Kenyon, director of the British School of Archaeology in Jerusalem; one of the main objectives has been to establish the date of the destruction of the town by the Israelites—a matter of obvious importance for the chronology of the Israelite entry into Palestine. Evidence of this destruction was thought to have been found but proved to be an erroneous identification. Most of the town of the period, including the whole circuit of the town walls, has been removed by erosion; enough survives to show that there was a town of the period, but that is all. This may have been destroyed in the second half of the 14th century BC, but the evidence is too scanty for precision. The site was then abandoned until the Iron Age. Little trace has been found of the 9th-century-BC occupation attributed to Hiel, but there was a considerable settlement in the 7th century BC, ending perhaps at the time of the second Babylonian Exile in 586 BC. The site was then finally abandoned, and the later Jerichos grew up elsewhere.

Excavations have shown, however, that Jericho had a very long history before the biblical period, and the great importance of the site is that it provides evidence of the first ,development of permanent settlements and therefore of the first steps toward civilization.

Pre-biblical Jericho

Traces have been found of visits of Mesolithic hunters, dated by carbon-14 to c. 9000 BC, and of a long period of settlement by their descendants, in which flimsy huts were the only habitations. From these huts solid houses, still with the curvilinear plan of the huts, were developed, and the settlement spread to cover an area of about ten acres. By c. 8000 BC the inhabitants had developed into an organized community capable of building a massive stone wall around the settlement, strengthened at one point at least by a massive stone tower. The size of this walled settlement justifies the use of the term town and suggests a population of some 2,000–3,000 persons. Thus, in this 1,000 years there had been a development from a hunting way of life to full settlement. The development of agriculture can be inferred from this, and grains of cultivated types of wheat and barley have been found. Jericho is thus one of the places providing evidence of the development of agriculture, and it is in fact the earliest so far known. It is highly probable that, to provide enough land for cultivation, irrigation had been invented. This first Neolithic culture of Palestine was a purely indigenous development, traceable from the Mesolithic cave dwellers of Mt. Carmel to the town of Jericho. These indigenous Neolithic occupants were succeeded c. 7000 BC by a second group, bringing a culture that was still Neolithic and still not manufacturing pottery, though it was not indigenous. This occupation probably indicates the arrival of newcomers from one of the other centres, possibly in northern Syria, in which the Neolithic way of life based on agriculture had developed. Their domestic architecture was more elaborate, with many-roomed houses, rectilinear in plan. The most remarkable achievement associated with them is a number of portrait heads, modelled in plaster over human skulls.

The first pottery users

This second Neolithic stage ended c. 6000 BC. For the next 1,000 years there is little evidence of occupation at Jericho. Only about 5000 BC did Jericho show the influences of developments that had been taking place in the north, where an ever-increasing number of villages had appeared, still Neolithic but marked by the use of pottery. The first pottery users of Jericho were, however, primitive compared with their predecessors on the site, living in simple huts sunk in the ground. They were probably mainly pastoralists. Over the next 2,000 years, occupation was sparse and possibly intermittent.

At the end of the 4th millennium BC, an urban culture once more appeared in Jericho, as in the rest of Palestine. Jericho became a walled town again, with its walls many times rebuilt.

About 2300 BC there was once more a break in urban life. The nomadic newcomers, consisting of a number of different groups, were probably the Amorites. Their successors, c. 1900 BC, were the Canaanites, sharing a culture found the whole length of the Mediterranean littoral. The Canaanites reintroduced town life, and excavations have provided evidence both of their houses and of their domestic furniture, which was found in their tombs as equipment of the dead in the afterlife. These discoveries have indicated the nature of the culture the Israelites found when they infiltrated into Palestine, and which they largely adopted.

Excavations in 1950–51 revealed something of Herodian Jericho. A magnificent facade on Wādī al-Qilt, a mile south of Old Testament Jericho, is probably part of Herod's palace; and its style, completely Italian, illustrates Herod's devotion to Rome. Traces of other fine buildings can be seen in this area, which became the centre of Roman Jericho.

Jericho of the Crusader period was on yet a third site, a mile east of the Old Testament site, and here the modern town grew up. An insignificant village in Turkish times, it became a winter resort after the British Mandate (1922). Its major expansion, however, came after its incorporation into Jordan in 1949. The establishment in the neighbourhood of two enormous camps of Arab refugees from Israel brought great activity to the town, which was largely rebuilt; the area of the oasis was expanded by irrigation.

The Arab-Israeli War of June 1967 resulted in the dispersal of much of the population.

BIBLIOGRAPHY. JOHN and J.B.E. GARSTANG, *The Story of Jericho*, 2nd ed. (1948), gives a popular account of the excavations carried out in 1930–36. The ascription of the burned and collapsed walls of the so-called City IV to the period of Joshua has now been disproved. KATHLEEN M. KENYON, *Digging up Jericho* (1957), gives a popular account of the excavations begun in 1952 up to 1956; the finds of the 1957–58 season, including those of the earliest remains, are included in KATHLEEN M. KENYON, *Archaeology in the Holy Land*, 3rd ed. (1970). The same author's "Excavations at Jericho," *Palestine Exploration Quarterly* (1952–56, 1960), contains annual reports of the excavations; her *Excavations at Jericho*, 2 vol. (1960–65), forms part of the definitive report of the 1952–58 excavations and deals with all the tombs, ranging from the Proto-Urban to the Roman period. JAMES L. KELSO, "Excavations at New Testament Jericho . . . ," *Annual of the American Schools of Oriental Research*, vol. 29–30 (1955); and JAMES B. PRITCHARD, "The Excavation at Herodian Jericho, 1951," *ibid.*, vol. 32–33 (1958), are the reports of the excavations at the site of Herodian and Roman Jericho on the Wādī al-Qilt (Wadi Qelt).

(K.M.K.)

Jerome, Saint

One of the greatest teachers of the early Western Church, St. Jerome, also known as Eusebius Hieronymus, is regarded as the most learned of the Latin Church Fathers. He is known particularly for his translation of the Bible into Latin, the Vulgate, that could be understood by the people of his day.

Life. Jerome was born of well-to-do Christian parents *c.* 347 at Stridon, probably near the modern Ljubljana, Yugoslavia. His education, begun at home, was continued in Rome when he was about 12. There he studied grammar, rhetoric, and philosophy. A serious scholar, enamoured of Latin literature, he frequented the catacombs (subterranean burial places composed of galleries), and near the end of his Roman education was baptized (*c.* 366), probably by Pope Liberius.

Early monastic experiences

He spent the next 20 years in travel and impermanent residences. At Treveris (now Trier), he was profoundly attracted to monasticism. Possibly as early as 369 he was back in the vicinity of Stridon. In Aquileia (Italy) he was linked with an ascetic elite—including Rufinus, a writer and scholar, who translated the 3rd-century Alexandrian theologian Origen—grouped around Bishop Valerianus. When the group disbanded (*c.* 373), for reasons that are unknown to historians, Jerome decided to go on a trip through the East. Fatigued by travel and by inner conflict, on reaching Antioch (374) he rested as guest of the priest Evagrius of Antioch, and there may have composed his earliest known work, *De septies percussa* ("Concerning Seven Beatings"). There also, in mid-Lent 375, during a near-fatal illness, he had a celebrated dream. In that dream, in which he was dragged before a tribunal of the Lord, he was accused of being a Ciceronian—a follower of the 1st-century-BC Roman philosopher—rather than a Christian, and he was severely lashed; he vowed never again to read or possess pagan literature.

Long afterward, in controversy with Rufinus, he minimized the dream's importance, but for years it kept him from reading the classics for pleasure, and at the time it caused a genuine spiritual crisis. One result of the dream was his first exegetical (critical interpretive) work, an allegorical commentary on the biblical book Obadiah, disowned 21 years later as a youthful production of fervent ignorance.

In 375 Jerome began a two-year search for inner peace as a hermit in the desert of Chalcis. The experience was not altogether successful to him personally, A novice in spiritual life, he had no expert guide; speaking only Latin, he was confronted with Syriac and Greek; lonely, he begged for letters; a gourmet with a weak stomach, he found desert food a penance; desperate for peace, he was racked by passion. Yet, he claimed that he was genuinely happy. His response to various temptations was incessant prayer and fasting; he learned Hebrew from a Jewish convert, studied Greek with seriousness, had manuscripts copied for his library and his friends, and carried on a brisk correspondence.

The crisis came when Chalcis became involved with ecclesiastical and theological controversies centring on episcopal succession and Trinitarian (on the nature of the relationship of the Father, Son, and Holy Spirit) and christological (on the nature of Christ) disputes. Suspected of harbouring heretical views (*i.e.*, Sabellianism, which stressed God's unity at the expense of the distinct persons)?Jerome insisted that the answer to ecclesiastical and theological problems lay in oneness with the Roman bishop. Pope Damasus did not respond, and Jerome quit the desert for Antioch.

Education and work in Antioch, Constantinople, and Rome

In Antioch his host, Evagrius, won Jerome over to the party of Bishop Paulinus, who was opposed by Basil, the great orthodox bishop of Caesarea and one of the three influential Cappadocian Fathers—the other two being Gregory of Nazianzus and Gregory of Nyssa. Recognizing his importance—since Jerome was by now recognized as a scholar and a monastic figure of significance—Paulinus decided to ordain him. Jerome accepted (378) on two conditions: his monastic aspirations would not be prejudiced, and priestly functions would not be forced on him. He attended the exegetical lectures of Apollinaris of Laodicea and visited the Nazarenes (Jewish Christians) of Beroea to examine their copy of a Hebrew gospel purporting to be the original Gospel of Matthew.

Jerome spent almost three years (379–382) continuing his pursuit of scriptural studies. An enthusiastic disciple of Gregory of Nazianzus, Jerome also came to know Gregory of Nyssa and the theologian Amphilochius of Iconium at the Council of Constantinople (381). Under such influences he improved his knowledge of Greek and developed an admiration for Origen's exegesis. He translated 14 of Origen's homilies (sermons) on Old Testament books into Latin. Here too he translated the church historian Eusebius' *Chronicon (Chronicles)* and continued it to the year 378.

But the most decisive influence on Jerome's later life was his return to Rome (382–385) as secretary to Pope Damasus. There he pursued his scholarly work on the Bible and propagated the ascetic life. On Damasus' urging he wrote some short exegetical tracts and translated two sermons of Origen on the Song of Solomon. More importantly, he revised the Old Latin version of the Gospels on the basis of the best Greek manuscripts at his command, and made his first, somewhat unsuccessful, revision of the Old Latin Psalter based on a few Septuagint (Greek translation of the Old Testament) manuscripts. He held classes for a monastic-minded circle of noble Roman widows and virgins (*e.g.*, Marcella, Paula, and her daughters Blesilla and Eustochium). He taught them the Hebrew text of the Psalms, orally and in letters, he answered their biblical problems, and he was their master in spirituality as well. Under these conditions, he wrote a defense of the perpetual virginity of Mary, Jesus' mother (383), and attacked the view of those who espoused the equality of virginity and marriage. But his preaching in support of the monastic life and his relationship with the ascetic coterie, his castigation of Roman clergy, lax monks, and hypocritical virgins, and his correction of the gospel text provoked such a storm of criticism and calumny, especially after Damasus' death, in December 384, that in August 385 he left "Babylon" (Rome) in bitter indignation and made his way to the Holy Land.

Monastic work in Palestine

In company with virgins led by Paula, Jerome made a religious and archaeological pilgrimage through all of Palestine and to the monastic centres of Egypt; he spent almost a month with the famed exegete Didymus in Alexandria.

The summer of 386 found him settled in Bethlehem. There, by 389, Paula finished a monastery for men under Jerome's direction, three cloisters for women (forming one convent) under her own supervision, and a hostel for pilgrims.

Later literary works. The literary legacy of Jerome's last 34 years (in Palestine) is the outgrowth of contemporary controversies, Jerome's passion for Scripture, and his involvement in monastic life. The controversies were varied. An anti-Origen movement in the east, famed by the anti-heretical bishop Epiphanius, turned Jerome not only against the views of Origen—whose 39 sermons on Luke he had translated c. 389–392—but against his friends Bishop John of Jerusalem and Rufinus. His petulance in early correspondence with St. Augustine, stemming from the African's strictures on Jerome's biblical efforts, imperilled their mutual respect. His catalog of Christian authors, *De viris illustribus* ("Concerning Illustrious Men"), was written in 392/393 to counter pagan pride in pagan culture. Against the monk Jovinian, who asserted the equality of virginity and marriage, he wrote a polemical diatribe *Adversus Jovinianum* (393) that was frequently brilliant but needlessly crude, excessively influenced by the 2nd- and 3rd-century theologian Tertullian, whose writings were at times unnecessarily harsh toward marriage. Against the priest Vigilantius, Jerome dictated in one night a defense of monasticism, clerical celibacy, and certain practices connected with the cult of martyrs (*Contra Vigilantiurn*, 406). The Pelagian problem—named for the heretical English monk Pelagius, who minimized the role of divine grace in man's salvation—was transplanted to Palestine from Rome with the personal appearance of the author of this heresy, and called forth Jerome's finest controversial work, *Dialogi contra Pelagianos* (three books, 415), in which his use of fictitious interlocutors makes his arguments uncommonly impersonal.

Biblical commentaries, revisions, and translations

Jerome's biblical production in Bethlehem includes two introductory works helpful to biblical scholars: *Liber locorum* ("Book of Places"), a useful translation and adaptation of Eusebius' work on Palestinian place-names; and *Liber interpretationis Hebraicorum nominum* ("Book of Interpretation of Hebrew Names"), an alphabetical list, with quite fanciful etymologies or origins, of Hebrew proper names in the Bible. Continuing his revision of the Old Latin version of the Septuagint based on Origen's *Hexapla* (an edition with the Hebrew text in Hebrew and Greek characters, and four different Greek versions arranged in six parallel columns), he revised Ecclesiastes, Proverbs, the Song of Solomon, Chronicles, and Job, and to his Roman revision of the Psalms added Origen's diacritical notes. Between 391 and 406 he produced a Latin translation of the Old Testament on the basis of the original text, a remarkable effort considering the slender instruments at his disposal and the opposition his project provoked. Jerome's Bethlehem commentaries suffer at times from hasty composition, excessive dependence on his predecessors, and a predilection for allegorical interpretation. The *Liber Hebraicarum quaestionum in Genesim* ("Book of Hebrew Questions on Genesis") gives an important place to geography, etymology, and rabbinic tradition (post-biblical Jewish scholarly views). He wrote short glosses (interpretations) on the Psalter and more scientific explanations of Psalms 10–16. His commentary on Ecclesiastes (*c.* 387) is a milestone in exegesis, because it is the first original Latin commentary that takes advantage of the Hebrew text. Perhaps Jerome's best commentaries are on the minor and major prophets of the Old Testament. As for the New Testament, he explained Matthew, accenting the literal sense; he interpreted four of the Apostle Paul's letters (Philemon, Galatians, Ephesians, Titus), with the stress on the allegorical interpretation; he recast the chiliastic commentary (on the view that Christ would return again and his followers would reign for 1,000 years) of Bishop Victorinus of Pettau (Austria), a Latin exegete martyred *c.* 304, on the Revelation to John. Many of his letters are tracts on exegetical problems, and he wrote homilies to monks under his direction on texts of Scripture.

Jerome's ascetical interests at Bethlehem are mirrored not only in his controversies but in his life of Malchus, the monk captured by Bedouins; a biography of Hilarion, with its miracles and journeyings; a translation of Coptic ascetical works (*e.g.*, the Rule of Pachomius); homilies to monks; and a significant segment of his correspondence.

Influence

Jerome is remembered for his extensive erudition, especially his understanding of the classics, the Bible, and Christian tradition. He was a learned scholar rather than a deep thinker, a sound traditionalist and not a speculative theologian, more competent as editor than as exegete. His career was a turbulent combination of scholarship and asceticism, and his correspondence is an exciting source for the historian, Scripture student, and theologian. His influence has been far-reaching and profound, on the early Middle Ages in particular: primarily through the Vulgate (the Latin version that he had translated), but importantly also through his work as an exegete and humanist and because he transmitted much of Greek thought to the West.

Jerome lived at the monastery in Bethlehem, with brief exceptions, until his death in 419 or 420. St. Jerome's feast day is celebrated in the Roman Catholic Church on September 30.

Jerusalem

Jerusalem (Hebrew Yerushalayim; Arabic Bayt al-Muqaddas, or al-Quds), claimed by Israel as its capital, was, at the beginning of the 1970s, the home of almost 300,000 people, and a symbol and inspiration for the three great monotheistic religions of Judaism, Christianity, and Islām. For Jews throughout the world Jerusalem is the focus of age-old yearnings, a living proof of ancient grandeur and a centre of national renaissance; for Christians, it is the scene of their Saviour's agony and triumph; for Muslims, the goal of the Prophet's mystic night journey and the site of one of Islām's most sacred shrines. For all three faiths it is a centre of pilgrimage—the Holy City, the earthly prototype of the heavenly Jerusalem.

From 1948 until 1967, Jerusalem was divided into Israeli and Jordanian sectors, with the Israeli sector of the city forming the capital of Israel. During the Six-Day War of June 1967, however, Israel occupied the former Jordanian sector, over which it now claims jurisdiction as an integral part of the unified city. The claim is not recognized by either Jordan or the United Nations.

An outstanding characteristic of Jerusalem, which covers an area of 42 square miles (109 square kilometres), is the variety of its people and its buildings. The Old City has Muslim, Jewish, Christian, and Armenian quarters. The old Jewish neighbourhoods and some of the new preserve much of the atmosphere created by Jews from East and West who settled there at different periods. Jews from the Orient, Europe, and the Americas; Arabs in traditional and modern dress; clergy of all three faiths and many traditions; and hosts of tourists combine in colourful, kaleidoscopic patterns. Synagogues, churches, and mosques; governmental. educational, and other public institutions; shops, hotels, offices, and dwellings in various styles—almost all built or faced with the beautiful Jerusalem stone—make up the city's unique architectural mosaic. (Ed.)

HISTORY

Ancient origins. The earliest recorded masters of Jerusalem were the Egyptians. In the 14th century BC the city's ruler, Abdi-Kheba (Abdu-Heba), asked his overlord for help against the incursions of the Ḫapiru (Habiru, 'Apiru). Excavation has shown, moreover, that a settlement existed on the site south of the Temple platform, possibly in the Early Bronze Age and certainly by 1800 BG. A massive town wall still survives, just above the spring that determined the location of the ancient settlement.

The early Hebrew capital

About the year 1000 BG Jerusalem was captured by David, founder of the joint kingdom of Israel and Judah, and the city became the Jewish capital. His successor, King Solomon, extended the city and built his Temple on the threshing floor of Araunah (Ornan) the Jebusite. This foundation determined the sacred character of Jerusalem as a centre of monotheism.

On Solomon's death the northern tribes seceded. In 922 BC the Egyptian pharaoh Sheshonk I sacked the city, to be followed by the Philistines and Arabians in 850 and Joash of Israel in 786. In 701 Sennacherib of Assyria forced Hezekiah, then king of Judah, to pay tribute to him, and in 612 Assyria yielded its primacy to Babylon. Eight years later Jerusalem was despoiled, and its king was deported to Babylon. In the early 6th century BC, the city and Temple were completely destroyed, and the captivity began. It ended in 537 BC, when Cyrus II the Great of Persia had overcome Babylon. Little is known of the city's history during the next two centuries. Despite the opposition of the Samaritans (a religions community), the walls were rebuilt. and a restored Temple was dedicated.

The coming of Alexander the Great and his victory at Issus in 333 BC altered the political and cultural structure of the Middle East. Hitherto the region had been subject to one or the other of the two great "river civilizations" of the Euphrates and the Nile; now for almost a millennium, until the coming of the Arabs, it was to be within the orbit of Western power politics, a role it was to play again in the 19th and 20th centuries.

After Alexander's death, Palestine fell to the share of his marshal. Ptolemy I Soter, son of Lagus, who had occupied Egypt and bad made Alexandria his capital. In the year 198 BC Jerusalem was acquired by the northern dynasty, descended from Seleucus I Nicator, another of Alexander's marshals, which ruled from Antioch (contemporary Antakya, Turkey). The growth of Greek, or pagan, influence affronted the orthodox, whose hostility burst into armed rebellion in 167 BC after the Seleucid Antiochus IV Epiphanes had deliberately desecrated the Temple. The revolt was led by a pious countryman called Mattathias, son of Hasmoneus (Hasmon), and was carried on by his son Judas, known as the Maccabee. The Hasmoneans succeeded in expelling the Seleucids and established a state almost the size of Solomon's, which came to include "Galilee of the Gentiles," thus ensuring that all children born to Galilean parents would be brought up in a Jewish society.

The growth of Greek influence

Roman rule. Rome had for some time been expanding its authority in Asia, and in 63 BC Pompey captured Jerusalem. A clash with Jewish nationalism was averted for some time by the political skill of a remarkable family, whose most illustrious member was Herod the Great. Herod was of Edomite descent, though of Jewish faith, and was allied through his mother with the nobility of Nabataean Petra, the rich Arab state that lay to the east of the Jordan. In 40 BC Herod, who had already distinguished himself as governor of Galilee, was appointed "client" king of Judaea by the Roman Senate. He was the close friend first of Mark Antony and, after the defeat of Antony by Octavian at Actium in 31 BC, of Octavian (later Augustus) himself. He ruled for the next 36 years and largely rebuilt Jerusalem.

The kingdom of Herod

Jerusalem then profited from the offerings of Jewish communities dispersed throughout the Greco-Roman world, and thousands of pilgrims flocked to the Temple for the great feasts. Herod was succeeded by his son Archelaus, who proved utterly incompetent, and in AD 6 Judaea was absorbed into the Roman dominions as a province of the third rank under a procurator. It was under the fifth procurator, Pontius Pilate, that Jesus of Nazareth was put to death.

From AD 41 to 44 the kingdom of Herod was reconstituted for his grandson Herod Agrippa I, upon whose premature death the procurators returned. In 66 the Jews rebelled against Rome, and in 70 the city was besieged and almost wholly destroyed by the Roman forces under Titus. The Temple, Herod's greatest creation, was reduced to ashes. By 130 the city had been partially repopulated, and the Jews again revolted unsuccessfully against Rome from 132 to 135. Hadrian decided to plant a Roman city, Aelia Capitolina, on the site. The general layout of Hadrian's town has lasted into the 20th century.

Christian pilgrims early found their way to Jerusalem. It was, however, the establishment of Constantine as sole emperor of Rome in the year 324 and his conversion to Christianity that made possible the building of the famous shrines in Jerusalem including the Church of the Holy

Sepulchre and inaugurated one of the city's most splendid and prosperous epochs. In 614 this golden age was brought to an end by the Persian invasion in which the inhabitants of Jerusalem were massacred and the churches destroyed.

The Islāmic and British periods. In 638 the Muslim caliph ʿUmar I entered Jerusalem, and during the period from 688 to 691 the 10th caliph, 'Abd al-Malik ibn Marwān, built the Dome of the Rock. Both the Umayyads and their successors, the ʿAbbāsids, pursued a liberal policy toward Christians and Jews. In 969 control of Jerusalem passed to the Shi'ite Fāṭimid caliphs of Egypt, and in 1010 the caliph al-Hiikim ordered the destruction of Christian shrines. In 1071 the Seljuq Turks defeated the Byzantines, displaced the Egyptians as masters of the Holy Land, and cut the pilgrim routes, thus stimulating the movement known as the Crusades.

The Latin kingdom of Jerusalem lasted from 1099 to 1187, when it was overthrown by Saladin, whose successors ruled from Damascus. Jerusalem was again in Christian hands from 1229 to 1239 and from 1243 to 1244, when it was sacked by the Khwrirezm Turks. In 1247 the Holy City fell once more to Egypt and remained subject to the Mamlūks until 1517, when the Ottoman sultan Selim I took it and inaugurated a Turkish regime that was to last for exactly 400 years.

The Turkish era

During the next three centuries the city had almost no history. From 1832 to 1840 Palestine was governed by Muhammad 'Ali Pasha of Egypt and his son Ibrāhīm. In 1838 a British consulate (the first European representation) was opened, and in 1841 the Anglican bishopric was founded. Jewish immigration was stimulated, and archaeology began to reveal much of the city's past. In 1917 British troops entered Jerusalem, Ottoman rule came to an end, and the British administration under League mandate began.

Despite tensions between Arabs and Jews, which more than once led to open riots, improvements were made in both administration and the provision of amenities.

Post-World War II. British rule terminated in 1948; as the result of hostilities between Arabs and Zionists in that same year, the city of Jerusalem was divided. Israeli troops occupied the Old City in the Six-Day War of June 1967. Despite its annexation by Israel, negotiations continued as to the exact status of the city. (S.H.P.)

THE CONTEMPORARY CITY

The city site and traditional neighbourhoods. On the east, Jerusalem looks down on the Dead Sea and across the Jordan River to the arid mountains of Moab; on the west, it faces the coastal plain and the Mediterranean Sea. Just north of the Old City the main north–south road runs along the watershed between the Mediterranean plain and the rift valley of the Jordan and links Nābulus (ancient Shechem) with Bethlehem, Hebron, and Beersheba. The west–east road from Yafo crosses the Jordan north of the Dead Sea and runs to Amman (in Jordan; biblical Rabbah of the Ammonites) and the Arabian Desert.

The municipal boundaries, defined in 1967, enclose an area of 42 square miles that stretch from the Jerusalem airport in the north to a point about one mile from Bethlehem in the south and from the ridge of Mt. Scopus and the Mount of Olives in the east to Mt. Herzl, 'En Kerem, and the new Hadassah–Hebrew University Medical Centre in the west.

The Old City

The Old City, which is believed to have been continuously inhabited for more than 4,000 years, forms a quadrilateral about 3,000 feet (900 metres) long on each side at an altitude of from 2,370 to 2,580 feet (720 to 790 metres). It is dominated by the raised platform of the Herodian Temple Compound, the site of the First and Second Temples, known to Islām as al-Ḥaram ash-Sharif ("the Noble Holy Place"); the compound includes the Dome of the Rock and al-Aqṣā Mosque. Its Western Wall is the most sacred of Jewish shrines. The rest of the area within the walls—divided by the ancient street layout into Muslim, Christian, Jewish, and Armenian quarters—is a typical Oriental city, with its mosques and labyrinthine *suqs,* or bazaars. It is distinguished by its many churches and by the ancient synagogues and study houses of the Jewish Quarter. The first neighbourhoods outside the city walls, built from the 1860s onward, were scattered chiefly along the main roads leading into the city. The earliest, Mishkenot Sha'anannim, and Yemin Moshe have been renovated. Nahalat Shiv'a has been swallowed up by the commercial centre. Others include the Bukharan Quarter; Me'a Sheʿarim, founded by Orthodox Jews from eastern and central Europe, with its scores of small synagogues and Talmudic study houses; and Mahane Yehuda, with its fruit and vegetable market, inhabited mainly by Jews of Oriental origin. Residential quarters established between World War I and World War II include Rehavya in the centre, Talpiyyot in the south, and Qiryat Moshe and Bet ha-Kerem in the west. Some Arab districts, such as Talbieh (modern Qomemiyyut) and Katamon (Gonen), abandoned during the fighting of 1947–48, became Jewish neighbourhoods; and thousands of houses were built for new immigrants in districts to the west, newly incorporated in the city. Arab neighbourhoods outside the Old City include the American Colony, ash-Shaykh Jarrāḥ, Wādī al-Jōz, and Bayt Ḥanīnā in the north, and villages such as Silwiin and Bayt Ṣafāfā in the south.

Neighbourhoods outside the walls

The environment. *Climate.* Jerusalem has a mixed subtropical, semi-arid climate with warm, dry summers and cool, rainy winters. The average annual rainfall is about 20 inches (500 millimetres), and snow falls every two or three years. Average temperatures range from about 75° F (24° C) in August to about 50° F (10" *C)* in January. Hot spells, known as *sharavs,* or *sharqiyeh,* are fairly common in autumn and spring. Average daily humidity is about 62 percent in the daytime but may drop 30–40 percent under *sharav* conditions. Summer exposure to the sun's rays in Jerusalem is among the highest on the globe, attributable partly to the lack of clouds or humidity and partly to the angle of the sun (80") over the horizon at that season.

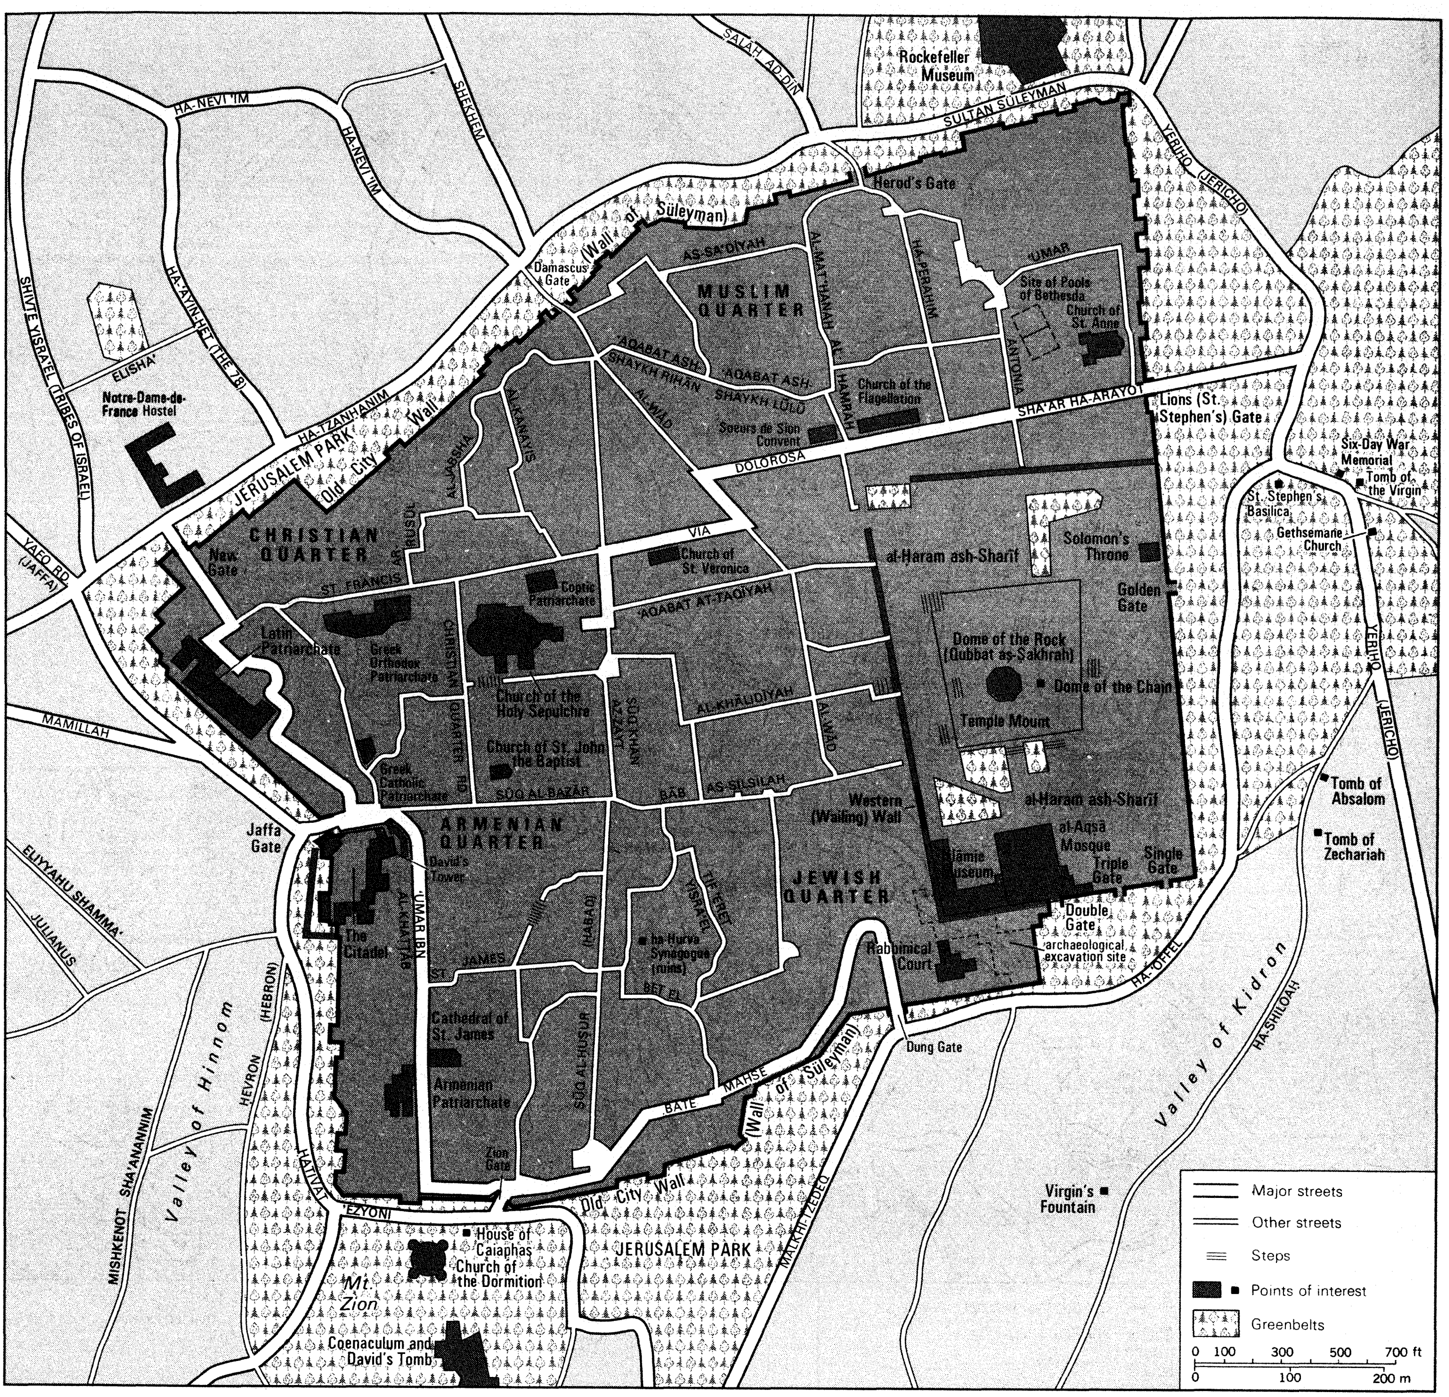
Jerusalem has no serious air pollution. Its altitude ensures the free mixing of surface air, and pollutant sources are few, for there is little heavy industry.

Vegetation and animal life. Lying on the watershed between the relatively rainy Judaean Hills and the dry Judaean Desert, Jerusalem has both Mediterranean and Irano-Turanian vegetation. The various red and brown Mediterranean soils, formed by the different types of limestone chalk covering the hills, support as many as 1,000 species of plants.

There is a great variety of birds, including 70 resident species and about 150 winter visitors. Those most commonly seen are the hooded crow, jay, swift—which nests in old walls and buildings—and bulbul. The only venomous snake is the Palestine viper; the smooth lizard and common chameleon frequent gardens.

The city plan. In 1968 a draft master plan was completed by the Jerusalem municipality for the municipal area and for the surrounding metropolitan area of about 260 square miles (675 square kilometres), which is defined as the commuting area from which the city centre can be reached within half an hour. Its aims were to establish an urban structure for the city as the capital of Israel and to ensure the preservation of historical sites and buildings. The long-term life-span of the plan was fixed at 40 years, and an operational plan was drafted to cover the period up to 1985.

The short-term plan envisages a growth of the population to 400,000 within the municipal boundaries and to 600,000 within the metropolitan area. It assumes free movement between Jerusalem and all parts of the area west of the Jordan, whatever political settlement is reached in the Middle East. There is to be a green belt around the city and a park around the Old City to be called Jerusalem Park. A central feature of the proposed road network is a wide boulevard from Mt. Herzl in the west, passing the university campus, the legislative and administrative centre, and the commercial and tourist centres, and culminating in Mt. Scopus and the Mount of Olives.



The Old City of Jerusalem.

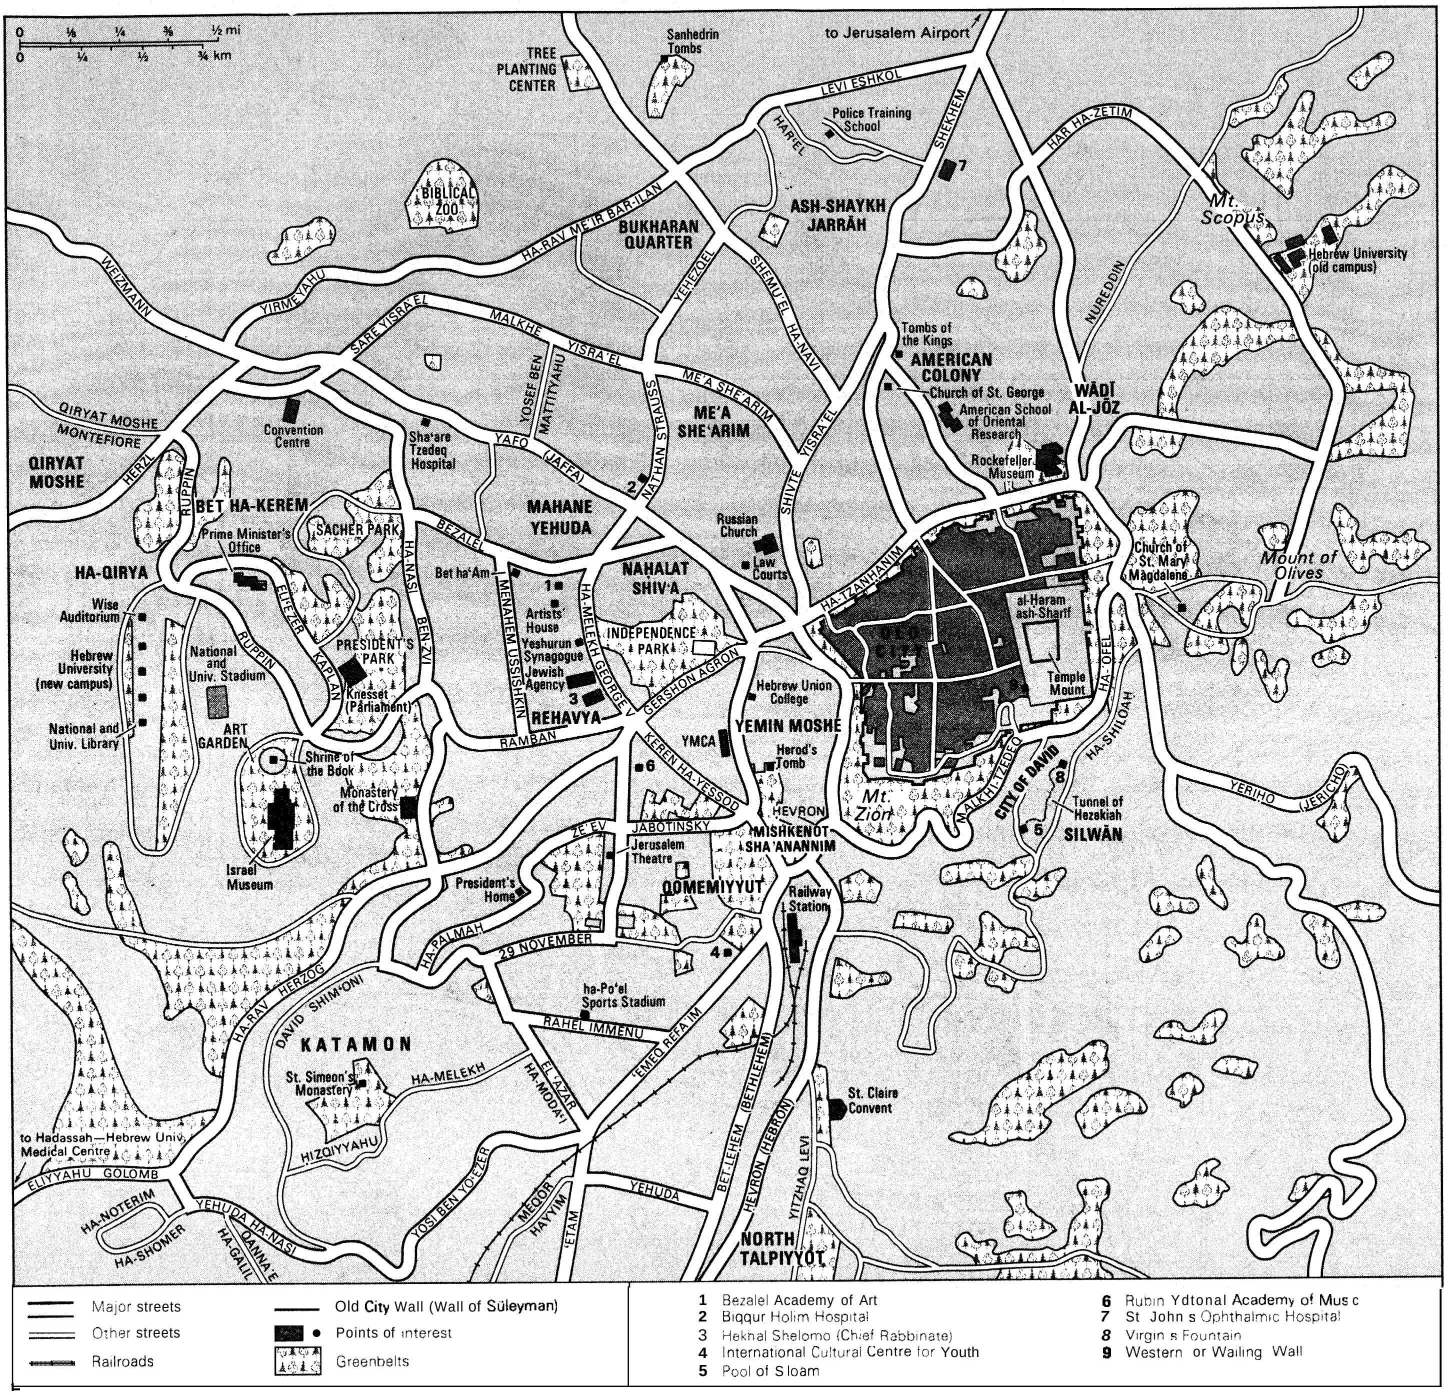
Composition of the population

Demography. In 1976 the population of Jerusalem was officially estimated at 366,300, of which about 73 percent were Jews. The Muslims were the most homogeneous of the communities, the Christians the most diversified. Among the Jews, the main divisions are between Ashkenazim and Sefardim and between religious and nonobservant; 54 percent were born in the country, 13 percent in other Asian countries, 11 percent in Africa, and 22 percent in Europe or the United States.

In 1967, 74 percent of the population lived in the former Israeli sector, 17 percent in the former Jordanian sector, and 9 percent in new extensions of the municipal area. The mean density of population was 8,721 per square mile (3,361 per square kilometre) in 1976.

Religious communities. The administration, protection, and care of holy places in Jerusalem are in the hands of the respective religious authorities. Penalties of up to seven years' imprisonment may be inflicted for desecration of these places. The rites and observances of all the faiths are publicly celebrated—the voice of the muezzin from al-Ḥaram ash-Sharif mingles with the sound of nearby church bells and of the Jewish prayer services at the Western Wall.

Jews. Jerusalem is the focus of Jewish religious reverence and aspiration. The most sacred spot is the Temple Mount, which Orthodox Jews refrain from setting foot on for fear of profaning its sanctity. In addition to the Western Wall—the most important centre of prayer and pilgrimage—other holy places are Mt. Zion, with the reputed tomb of King David, the Mount of Olives with its ancient Jewish cemetery, and the tombs of priestly and other historical figures. Ancient synagogues and study houses in the Old City are being restored; particularly worthy of mention is the group of four synagogues built in the 16th century by Jews exiled from Spain. There are scores of Jewish houses of prayer in the New City. Notable modern institutions include the Yeshurun Synagogue, where prayer is offered on state occasions, and



The modern city of Jerusalem.

the synagogue at Hekhal Shelomo, the seat of the Chief Rabbinate of Israel. Jerusalem is the world's foremost centre of rabbinic learning and contains scores of yeshivot, the Talmudic academies.

Muslims. Jerusalem is revered by Muslims as the third holiest place on earth, and the pilgrimage to Jerusalem (taqdis) completes the main pilgrimage (hajj). A Council of Waqf [religious endowment] and Muslim Affairs was created in 1967, with jurisdiction over shari'ah courts and waqf. The council assumed the responsibility for the administration of Muslim affairs that had previously rested with the Council of Waqf and Muslim Affairs in Amman.

Christians. Christians constitute the smallest but most highly diversified section of the population. The city is the seat of three resident patriarchs of the Eastern churches and many archbishops and bishops, and it has an ecclesiastical embassy for almost every sect in Christendom. The main groups, in order of size, are Orthodox, Monophysite, Latin, and Protestant. Major denominations share control over the Church of the Holy Sepulchre. Most of the church bodies in Jerusalem maintain scholarly research institutes with fine libraries.

The Greek Orthodox Church maintains a patriarchate with jurisdiction over the entire Holy Land. The Russian Orthodox churches (one governed from Moscow and one in exile) have considerable properties dating back to tsarist times. The Roman Catholic Church, first officially established in Jerusalem in 1099 during the First Crusade, controls numerous churches, hospices, monasteries and convents, schools, and hospitals. The Franciscan order appoints the father custodian of the Holy Land. Of the Monophysite churches, the Armenian is the largest, its patriarchate having been established in the 6th century. Most of the Armenians dwell in a compound around the seat of the patriarchate at the Cathedral of St. James, which constitutes the largest monastic centre in the country. The Protestant community is small

Armenian Church

but influential. The jurisdiction of the Anglican archbishop extends over the entire Middle East.

Housing. There is a great variety of housing in the city. In the Old City are antiquated buildings constructed of ancient stones; 19th-century Jewish neighbourhoods, some of which have declined into slums; modern quarters with tree-lined streets; and government-built housing projects, mainly for new immigrants. The commonest basic dwelling unit in the Old City consists of a complex of structures, often on different levels, built around an inner court that is entered through a narrow corridor. Steps are being taken to facilitate slum clearance, first in the Nahala'ot area, near Rehavya. In addition to extensive private building in many areas, large new housing projects are under construction or in the planning stage in previously undeveloped areas to the northeast and southeast.

The Wall of Süleyman

Architectural features. The outstanding characteristic of the architecture of Jerusalem is the harmonious coexistence of old and new, sacred and secular, in a variety of styles. The most conspicuous feature is the Old City Wall, erected in 1537–40 by Süleyman the Magnificent, largely on the foundations of earlier walls going back perhaps to the time of Solomon. On three sides of the Temple Compound, parts of the original supporting walls stand to this day. During the centuries when Jews were excluded from the Temple Compound, its Western Wall became Jewry's holiest shrine. Since 1967 the wall has been further exposed, and plans are being considered for the reconstruction of the present plaza and the whole area, once excavations are completed. The main buildings on the platform are the gold-capped Dome of the Rock, completed in 691, and the silver-domed al-Aqṣā Mosque, started in 710.

The Citadel (with David's Tower) beside the Jaffa Gate, which acquired its present form in the 16th century, was created over ruins from the Hasmonean and Herodian periods. Within the Old City, the religious buildings are of the walled, fortified type. Buildings of the crusader period are marked by the use of ribbed vaults. Some of them, such as the Church of the Holy Sepulchre and the church at the Tomb of the Virgin, incorporate older Byzantine remains. The best preserved are the Church of St. Anne, the Armenian Cathedral of St. James, and parts of the central bazaars. Mamlūk construction of the 13th to 15th century is easily identified by its "stalactite" ornamentation and painted brown stripes.

The rock-cut tombs east and north of the Old City exemplify architecture of the first half of the 1st millennium BC (Tomb of Pharaoh's Daughter) and the Second-Temple period (Tombs of the Kings, Tomb of Absalom, and Tomb of Zechariah). The Byzantine Monastery of the Cross, in the heart of modern Jerusalem, was rebuilt by the crusaders and restored in 1604 by the King of Georgia.

As Jerusalem spread outside the walls, the architecture came to be characterized chiefly by iron beams and red-tiled roofs. From 1930 onward there was a radical change, and flat roofs and reinforced concrete faced with naturally dressed stone predominated. There is little high-rise construction; residential buildings are seldom taller than four stories, and office buildings seldom taller than six. Tall buildings, especially hotels, rising as high as 16 stories, are under construction or being planned. Outstanding modern architectural features include the Rockefeller Museum, the Hebrew Union College, the YMCA, the Ecumenical Institute for Advanced Theological Studies, buildings on the university campuses on Mt. Scopus and Giv'at Ram, the Knesset (Parliament), the Israel Museum, and the Jerusalem Theatre.

Modern architecture

The economy. *Economic sectors.* The main source of livelihood in Jerusalem is government and public service (including academic and clerical professions). Since 1967 business activity and investment have been stimulated by the housing boom and the ever-increasing influx of pilgrims and tourists. Personal income rose steadily in the 1970s, and unemployment was marginal.

Industries include diamond cutting and polishing and the manufacture of home appliances, furniture, pharmaceuticals, chemicals, shoes, pencils, plastics, textiles, and clothing. There are also printing and publishing houses, as well as workshops for jewelry, giftware, curios, and printed fabrics.

The overall economy. In 1976 the civilian labour force numbered 108,500. According to a survey made in 1976, some 46 percent worked in public services; 19 percent in commerce, banking, finance, and insurance; 13 percent in industry; 8 percent in construction and public works; 6 percent in transportation and communications; 7 percent in personal services and entertainment; and a small percentage in public utilities and farming.

Political and governmental institutions. *National institutions.* Jerusalem is the seat of the president, the parliament, and the government of Israel. In 1947 the United Nations recommended that it be made an international city, but the proposal was opposed by both Israel and Jordan. Although a large number of countries do not recognize Jerusalem as the capital of Israel, a large proportion of the resident foreign embassies and legations in Israel are in Jerusalem. Diplomats living in the Tel Aviv area go to Jerusalem to present their credentials to the president and transact business at the Foreign Ministry. The main government offices are concentrated in ha-Qirya, the administrative centre. In addition to the Supreme Court and the Chief Rabbinate, the city also houses the head offices of many world Jewish bodies, such as the Jewish Agency and the World Zionist Organization. Yad va-Shem (official English name, Martyrs' and Heroes' Remembrance Authority), the central memorial for the Jews killed by Nazi Germany, contains extensive archives and is the major centre for research on the Nazi period.

Voting

Local government. The Municipal Council is composed of 31 members who are elected every four years by proportional representation. Permanent residents, even if not Israeli nationals, are entitled to vote. Although, for political reasons, no Arab candidates chose to stand, more than 11,000 Arabs out of 34,000 on the voter roll went to the polls in 1969. Of the administrative staff, about 20 percent are Arabs, most of whom served under Jordanian rule. Official correspondence is issued in both Hebrew and Arabic.

Services. *Public utilities.* Jerusalem has always depended on human ingenuity to bring its water from afar. The underground aqueduct built by King Hezekiah in the 8th century BC is still extant, and many reservoirs and rainwater cisterns date from ancient times. Since the 1950s the New City has enjoyed an unlimited supply from the Israeli national water grid; East Jerusalem was reconnected to the West Jerusalem system in 1967.

The construction of the city-wide sewerage system was almost complete in the mid-1970s. The six miles of ancient piping that run through the Old City, 40 feet underground, still present serious engineering problems.

Electricity is supplied by the national grid of an Israeli government corporation, as well as by a small diesel plant in East Jerusalem.

Health and safety. The Hadassah–Hebrew University Medical Centre at 'En Kerem is one of the most advanced institutions of its kind in the world. It treats patients from all over the country, as well as from the West Bank, the Gaza Strip, and Jordan. Other hospitals are Sha'are Tzedeq, which pays special attention to the requirements of orthodox Jews, Biqur Holim, St. John's Ophthalmic Hospital, Ezrat Nashim for mental patients, Alyn for crippled children, Spofford Children's Hospital, an Arab Muslim hospital named al-Maqāṣid al-Khayriyah, and an Arab Christian hospital named al-Muṭalla'.

Most families belong to one of the medical-insurance funds run by the labour federations and other nongovernmental bodies; and the municipal social-welfare department covers costs for needy nonmembers. There are municipal clinics for mothers and children. Health supervision, including dental inspection and treatment, is provided in all schools. All health services are subsidized by the government.

The police force, which is under the command of national headquarters, is composed of both Jews and Arabs. A major function of the force, in addition to keeping the peace and preventing crime, is to guarantee access to and maintain order in the holy places.

There are few fires because of the predominance of stone construction. The fire brigade is administered by the municipality.

Religious and secular education

Education. Because of the high birth rate and the strong religious convictions of many among the population, education has always involved complex problems. The language of instruction is Hebrew in Jewish schools and Arabic in Arab schools. While the great majority attend government schools, there are many private institutions maintained by Jewish, Muslim, and Christian religious organizations. State kindergartens were introduced in East Jerusalem after 1967, and 60 percent of the area's five-year-olds attended in 1971. In 1970 there were about 54,000 children in more than 280 state, municipal, and Jewish public schools and 12,000 in Arab public schools.

The Hebrew University in Jerusalem is the country's foremost institution of higher learning. It has two main campuses — at Mt. Scopus, and at Giv'at Ram in the west. The old buildings on Mt. Scopus have been renovated, and new buildings are under construction. The National Library and the University Library contain more than 2,000,000 volumes, as well as art treasures and manuscript collections on Jewish and general themes. In the mid-1970s there were about 13,000 students and more than 2,000 faculty members.

Other institutions of higher learning are the Bezalel Academy of Art, the Rubin National Academy of Music, the Hebrew Union College, several teachers' training colleges, and an Armenian seminary.

Cultural life. *Cultural institutions.* An important cultural institution is the Israel Museum, which, in addition to its general art collection, houses a comprehensive Near Eastern archaeological collection, several important Dead Sea Scrolls and other relics, a notable collection of Jewish ritual art, and Middle Eastern ethnological exhibits, a sculpture garden, and a youth wing. The Rockefeller Museum concentrates on the archaeology of the Holy Land, and there is an Islāmic Museum near al-Aqṣā Mosque.

Libraries

In addition to the National Library and the University Library, there are the Knesset Library and the State Archives (each of which receives a copy of every book printed in Israel), the Municipal Library (with branches), and libraries of various religious and public institutions.

Art exhibitions are held in the Israel Museum, the Artists' House, Hutzot ha-Yotzer (the craftsmen's centre), the International Cultural Centre for Youth, and private galleries. Concerts and theatre performances are given at Binyane ha-'Uma (the Convention Centre), Bet ha-'Am, the Khan (housed in a restored 18th-century building), and the Wise Auditorium of the Hebrew University. The Jerusalem Theatre was opened in October 1971.

The media. Newspapers published in Jerusalem include an English language daily, two Arabic dailies, and a Hebrew religious daily. The Government Press Office is located at Beit Agron, the headquarters of the Jerusalem Journalists' Association. The headquarters of the Israel Broadcasting Authority (television and radio) are also in Jerusalem. Radio broadcasts are mainly in Hebrew and Arabic, though short programs are also broadcast in a number of languages including English, French, Ladino, Romanian, Russian, and Yiddish.

Recreation. Jerusalem has about 2,000 acres (800 hectares) of parks, gardens, woodland, and newly planted forests. The largest, when completed, will be the 300-acre (120-hectare) Jerusalem Park, designed as a greenbelt to encircle the Old City walls. There are also 160 small gardens, playgrounds, and recreational areas dotted over the city. The Biblical Zoo houses specimens of all the animals that are mentioned in the Bible.

The municipality, the YMCA, and local clubs run comprehensive sports programs. The YMCA soccer field can accommodate 10,000 spectators, and the ha-Po'el (Workers' Sports Club) field 7,500. There are a number of open-air swimming pools. Community centres in the suburbs also provide sports facilities. A 100-acre sports area with a stadium for 30,000 is in the planning stage.

Archaeological excavations

Archaeology. Since 1968, extensive excavations have been carried out in the Old City on behalf of the Hebrew University Institute of Archaeology, the Israeli Department of Antiquities and Museums, and the Israel Exploration Society. The digs around the southern and western walls of the Temple Mount, going down to the Herodian pavements, have revealed the steps leading to the Temple, the priests' underground entrance to the Temple, and many religious objects. There are also impressive remains of public buildings alongside a main street. Remains found within the precincts of the First Wall in the Jewish Quarter bore the imprint of burning and destruction during the sack of the city by the Romans in AD 70. For the first time, walls were found of structures dating to the 8th and 7th centuries BC. One of these has been identified as the "Broad Wall" described by Nehemiah. A crucified body, from Roman times, with a nail still lodged in the ankle, was discovered in a Jewish tomb at Giv'at ha-Mivtar. (Ed.)

BIBLIOGRAPHY. Accounts of the city are given, by TEDDY KOLLEK and MAURICE PEARLMAN, in *Jerzisalem, Sacred City of Mankind (1968;* U.S. title, *Jerusalem: A History of Forty Centuries),*and, in the Israel Pocket Library series, *Jerusalem (1973). A* brief review, with emphasis on tourist aspects, is D. SHALEM and G SHAMIS, *Jerusalem (1970–71).*KATHLEEN M. KENYON, *Jerusalem: Excavating* 3000 *Years of History (1967)* and *Digging Up Jerusalem* (1974), describe the city from an archaeological point of view, as does *Encyclopedia of Archaeological Excavations in the Holy Land,* vol. *2* (1976), Eng. ed. MICHAEL AVI-YONAH. L. KESHISHIAN, *The Churches in Jerusalem* (1939), is still a good guide.

History: (Ancient): The Bible is the basic source, best consulted in the modern edition known as *The Jerusalem Bible* (1966), prepared in Jerusalem itself by scholars long conversant with the Holy City and its monuments. It may be supplemented by a good commentary such as JAMES HASTINGS, *Dictionary of the Bible,* 2nd ed. *(1963).* Next to the Bible, the main original source for ancient Jerusalem is JOSEPHUS, the Jewish historian who wrote under Roman patronage at the end of the 1st century AD; the Loeb edition is recommended. Of modern works, EMIL SCHURER, *Geschichte des jüdischen Volkes im Zeitalter Jesu Christi,* 2nd ed., *2* vol. *(1886–90;* Eng. trans., *A History of the Jewish People in the Time of Jesus Christ, 5* vol., *1897–98* and later eds.), is a work of such scope that it is hard to imagine its being superseded. See also the monumental *Jewish Encyclopedia, 12* vol. *(1901–05);* and the *Encyclopaedia Judaica, 16* vol. *(1972).* GEORGE ADAM SMITH, *Jerusalem: The Topography, Economics and History from the Earliest Times to A.D. 70, 2* vol. (1907–08), is a comprehensive survey by a great scholar. The works of the great Dominican scholars VINCENT and ABEL, especially *Jerusalem,* 2 vol. (1912–26), should also be read. *(Medieval)*: STEVEN RUNCIMAN, *A History of the Crusades,* 3 vol. (1951–54), provides essential background, and each volume contains an exhaustive bibliography. GUY LE STRANGE (trans.), *Palestine Under the Moslems (1890,* reprinted 1965), is the classic survey of the period. T.S.R. BOASE, *Castles and Churches of the Crusading Kingdom* (1967), is a finely illustratsd work by an outstanding scholar. *(Modern)*: The beginning of modern times was heralded by three books: EDWARD ROBINSON and ELI SMITH, *Biblical Researches in Palestine, Mount Sinai and Arabia Petraea,* 3 vol. (1841), by the founder of scientific biblical geography; JAMES FINN, *Stirring Times; or, Records from Jerusalem Consular Chronicles of 1853 to 1856,* compiled by his widow *(1878);* and CHARLES W. WILSON and C. WARREN, *The Recovery of Jerusalem* (1871), the record of the first underground survey of the ancient city. Since then, the output of books on every aspect of Jerusalem has been unceasing. For the period of the British mandate, A.M. HYAMSON, *Palestine Under the Mandate* (1950), is the standard work. STEWART PEROWNE, *The One Remains* (1954), is an eyewitness account of the succeeding period. Two general histories are JOHN GRAY, *A History of Jerusalem* (1969), an authoritative survey by a biblical scholar; and A.L. TIBAWI, *Jerusalem: Its Place in Islam and Arab History* (1969), based on original Arabic sources and on official Egyptian, Ottoman, and British records, and on UN publications and reports in *The* (London) *Times.* The latest archaeological excavations are reported in the *Israel Exploration Journal.*

(Ed./S.H.P.)

Jesus Christ

Jesus of Nazareth, the founder of Christianity, a religion that claims more than a third of the world's population in the 20th century, was born in Judaea about 6 BC and died by crucifixion about AD 30. Because of the theological motifs and presuppositions in the faith of the early church in respect to Jesus, it is difficult to write with certainty an authentic life of Jesus.

This article is divided into the following sections:

- Sources
  - Non-Christian sources
  - Christian sources
- Times and environment
  - Political conditions
  - Religious conditions
- The life and ministry of Jesus
  - The birth and family of Jesus
  - The ministry of Jesus
- The message of Jesus
  - The Kingdom of God
  - The will of God
- The sufferings and death of Jesus in Jerusalem
- The story of Jesus and faith in Jesus

SOURCES

The history of the life, work, and death of Jesus of Nazareth reveals nothing of the worldwide movement to which he gave rise. He lived and taught in a remote area (Palestine) on the periphery of the Roman Empire. His life was of short duration, and knowledge of it remained hidden from most of his contemporary world. None of the sources of his life and work can be traced to Jesus himself; he did not leave a single known written word. Also, there are no contemporary accounts written of his life and death. What can be established about the historical Jesus depends almost without exception on Christian traditions, especially on the oldest material used in the composition of the first three New Testament Gospels (Mark, Matthew, and Luke), which reflect the standpoint and outlook of the later church and its faith in Jesus.

References in Roman historical and administrative accounts

Non-Christian sources. Non-Christian sources are meagre and contribute nothing to the history of Jesus that is not already known from the Christian tradition. The mention of Jesus' execution in the Annals of the Roman historian Tacitus (XV, 44), written about AD 110, is, nevertheless, worthy of note. In his account of the persecution of Christians under the emperor Nero, which was occasioned by the burning of Rome (AD 64), the Emperor, in order to rid himself of suspicion, blamed the fire on the so-called Christians, who were already hated among the people. Tacitus writes in explanation: "The name is derived from Christ, whom the procurator Pontius Pilate had executed in the reign of Tiberius." The "temporarily suppressed pernicious superstition" to which Jesus had given rise in Judaea soon afterward had spread as far as Rome. Tacitus does not speak of Jesus but, rather, of Christ (originally the religious title "Messiah," but used very early among Christians outside Palestine as a proper name for Jesus). The passage only affords proof of the ignominious end (crucifixion) of Jesus as the founder of a religious movement and illustrates the common opinion of that movement in Rome. An enquiry of the governor of Asia Minor, Pliny the Younger, in his letter to the emperor Trajan (c. AD 111) about how he should act in regard to the Christians (*Epistle* 10, 96ff.) comes from the same period. Christians are again described as adherents of a crude superstition, who sang hymns to Christ "as to a god." Nothing is said of his earthly life, and the factual information in the letter undoubtedly stems from Christians.

Another Roman historian, Suetonius, remarked in his life of the emperor Claudius (Vita *Claudii* 25:4; after AD 100): "He [Claudius] expelled the Jews, who had on the instigation of Chrestus continually been causing disturbances, from Rome." This may refer to turmoils occasioned among the Jews of Rome by the intrusion of Christianity into their midst. But the information must have reached the author in a completely garbled form or was understood by him quite wrongly to mean that this "Chrestus" had at that time appeared in Rome as a Jewish agitator. Claudius' edict of expulsion (AD 49) is also mentioned in Acts 18:2.

References in Jewish sources

Josephus, the Jewish historian at the court of Domitian who has depicted the history of his people and the Jewish–Roman war (66–70), only incidentally remarks about the stoning in AD 62 of "James, the brother of Jesus, who was called Christ . . ." (Antiquities XX, 200). He understandably uses the proper name "Jesus" first (for as a Jew he knows that "Christ" is a translation of "Messiah"), but he adds, along with a derogatory "so-called," the second name that was familiar in Rome. A second passage in the same work, known as the "Testimony of Flavius" (XVIII, 63ff.), is without doubt a later Christian insertion, because it contains a complete summary of the Christian teaching about Jesus.

In the Talmud, a compendium of Jewish law, lore, and commentary, only a few statements of the rabbis (Jewish religious teachers) of the 1st and 2nd centuries come into consideration. Containing mostly polemics or Jewish apologetics, they reveal an acquaintance with the Christian tradition but include several divergent legendary motifs as well. The picture of Jesus offered in these writings may be summarized as follows: born as the illegitimate son of a Roman soldier called Panther, Jesus (Hebrew Yeshu) worked magic, ridiculed the wise, seduced and stirred up the people, gathered five disciples about him, and was hanged (crucified) on the eve of the Passover.

These independent accounts prove that in ancient times even the opponents of Christianity never doubted the historicity of Jesus, which was disputed for the first time and on inadequate grounds by several authors at the end of the 18th, during the 19th, and at the beginning of the 20th centuries.

Christian sources. Christian testimonies about Jesus were collected in the New Testament. Though they certainly represent only a selection from a much broader stream of tradition (Luke 1:1–4), these testimonies are a very valuable and representative selection. They are, however, of very different kinds. From many of them next to nothing can be learned about the historical Jesus.

***The* Pauline Letters.** The oldest New Testament writings, the genuine letters of Paul (written in the 50s of the 1st century), contain little information about the life of Jesus. Paul, the Apostle, who had not known Jesus personally (II Cor. 5:16), shows no interest in Jesus' biography. At the centre of Paul's thought and proclamation there stands only the theologically important significance of the death, Resurrection, exaltation, and Second Coming of Jesus Christ, contained in numerous short doctrinal and creedal formulas. These formulas the Apostle himself occasionally characterizes as being the tradition that he has received and handed on (I Cor. 11:23ff.; 15:3ff.) or they are in other ways indicated as a given tradition (Rom. 1:3ff.; Phil. 2:6–11).

The importance of the Synoptic Gospels

The Gospels. The most important sources for the life of Jesus are the Synoptic (parallel view of sources) Gospels: Mark, Matthew, and Luke. The Gospel According to John, the Fourth Gospel, assumes a special position. Though it offers some parallels to the other three, and though the independent traditions in it may in individual cases have historical kernels, the tradition in John shows that the gospel has reached an advanced theological state. Because a theological conception has been incorporated in the account to such an extent, this Gospel cannot be directly used as a historical source. It is also the latest of the Gospels, written about AD 100.

That the gospel literature was capable of developing in very different directions is also shown by the extracanonical tradition about Jesus, which is preserved in fragmentary form in quotations by the early Church Fathers and in other sources and which is marked almost without exception by legendary features and tendencies. The Coptic Gospel of Thomas (written in the 2nd century by Gnostic Christians; *i.e.*, heretical believers in esoteric, dualistic doctrines), which was found in 1945 in Naj' Ḥammādī (Egypt), is an example of such extracanonical literature. It contains 114 sayings of Jesus loosely strung together, which have some points of contact with the sayings of Jesus in the canonical Gospels. But this Gospel has no earthly, historical contours in its account of Jesus (*e.g.*, no accounts of the Passion and Easter). As a bearer of heavenly revelation in this Gospel, Jesus instructs the esoteric circle of his disciples about the foreign world of matter that they must renounce in order to participate in the imperishable, transcendent world of light from which they originate. The Gospel of Thomas, thus, is of no use as a source for the historical Jesus.

The Synoptic Gospels were originally anonymous. According to questionable 2nd-century tradition, they were written by the immediate disciples of Jesus or companions of the oldest Apostles. Most probably the Gospels were composed between AD 70 and 100. That they were written at such a relatively late time does not detract from their historical significance, however, because an older, oral tradition is collected in them and has left its traces everywhere. The character and structure of the individual traditions are incorporated into the Gospels, which definitely do not have a historical or biographical interest in facts, circumstances, and the course of events. They do not reproduce the story of Jesus as such but, instead, recount history interpreted from the viewpoint of the Christian faith. There never was a neutral reportage on Jesus in early Christianity; the Gospel accounts are therefore interlaced with theological motifs and styled accordingly. Thus, what Jesus says, does, and suffers is interpreted as the fulfillment of the Old Testament promises, and his story is slanted toward his end (the Passion and the Resurrection), his significance as the divine Saviour, and his Second Coming. In other words, the Gospel texts do not intend to describe the Jesus of the past but rather to proclaim who he is for all ages of time. These perspectives of the post-Easter church to which the writers belong and for which their reports are intended must continually be taken into consideration. To sum up, the Gospels can be characterized as follows: they are a combination, or a fusion, of history and faith, a story or report about Jesus, and a confession and testimony of faith.

A comparison of the first three canonical Gospels reveals a strange blending of agreements and differences. Mark, Matthew, and Luke contain, by and large, the same traditional material. Some parts, however, are to be found only in Matthew and Luke, and a considerable amount of material is peculiar only to Matthew or only to Luke (and a small amount to Mark, as well). According to almost all critical biblical scholars, Mark, the shortest Gospel, is viewed as the oldest—not Matthew, as was earlier assumed—and served as the main literary source for the other two. They also believe that the material common to Matthew and Luke comes from a second source (called Q, from the German *Quelle*, "source"). This second source (Q) consisted almost exclusively of sayings (logia) of Jesus and contained no Passion or Easter tradition and is therefore known among scholars as the logia, or sayings, source.

Significance of form criticism

Investigation of the Gospels by German biblical scholars such as Karl Ludwig Schmidt, Martin Dibelius, and Rudolf Bultmann—who developed what is known as form criticism, the study of the origin and development of the traditions in the Gospels—has shown that the basic stock of the tradition consisted of numerous small, self-contained units (single sayings, parables, debates, anecdotes, and miracle stories), originally without any relation to each other, and mostly without any interest in dates, places, or historical circumstances. It was the Gospel writers (or some earlier collectors) who first joined these individual pieces together editorially, forming a kind of "discourse" out of sayings and groups of sayings and, through linking individual scenes, creating the impression of a connected chain of events. They used a very modest set of tools for this; *e.g.*, short introductory and connecting phrases, stereotyped, generalizing indications of time ("next," "a few days later"), and frequently repeated, indefinite indications of place (mountain, field, road, house, lake). These editorial turns of phrase are, as a rule, easy to sever from their context and are employed very differently by the separate Gospel writers.

In methodically distinguishing and separating traditional and editorial features, form criticism of the Gospels has apparently dissolved the presuppositions for a historically sound, connected life of Jesus, which scholars have again and again attempted to write in the course of the last 200 years. But such an analysis was only a first step of research into the older material itself. Popular oral tradition, to which the Synoptic material belongs, makes use of fixed forms appropriate in each case to the contents, so as to be easily fixed in the memory. The tradition about Jesus offers many examples of this: prophetic sayings, the Beatitudes, pronouncements of woe, wisdom sayings similar to proverbs, legal sayings, church rules, dialogues, and others. In a corresponding way, many miracles of Jesus are narrated by means of motifs and other features also known from reports of other miracle workers. From this one perceives that this tradition is interested not so much in what was historically unique as in what was typical. Thus, with regard to the Gospels, it has to be considered that their tradition was formed and collected from the point of view of the faith of the post-Easter church, under the influence of its ideas and ways of thought and in close connection with its vital interests and the ways in which its life found expression. When interpreting the texts, scholars must therefore be concerned with the question of their setting in life (*Sitz im* Leben) in the church as well.

This critical survey of the sources shows that there are limits set on a portrayal of the historical Jesus. Many questions are still under debate or have to remain open.

TIMES AND ENVIRONMENT

Political conditions. Politically, the small Jewish nation in Jesus' time was rent and impotent. Always situated in an area of tension between the great empires of the ancient world (*e.g.*, Egypt, Assyria, Babylonia, Persia, and Syria) as they struggled with each other and succeeded one another, it had already lost its political independence since the time of the Babylonian Exile (586–538 BC) and had come under changing foreign domination: in the Hellenistic period, first under the Egyptian Ptolemaic dynasty (3rd century BC) and then under the Syrian Seleucid dynasty (2nd century BC), and, finally, until its ultimate overthrow (AD 70), under the Romans, who continued to rule the area. Only for a short interim was there a Jewish kingdom. The Maccabees, a priestly family, reigned after their revolt (168–165 BC) against Antiochus IV (Epiphanes), the Syrian king. Their rule, however, came to an end as a result of internal disintegration and violent struggles for the throne.

Judaea under Roman domination

Initially courted by the rival parties, the Roman general Pompey marched into Palestine, capturing Jerusalem in 63 BC, and reduced the Jewish territory to Judaea, without the coastal cities and the confederacy of towns of the Decapolis (central Transjordan). Several other smaller regions—*e.g.*, inland Galilee of the northern province around Lake Gennesaret and Peraea, east of the Dead Sea—were left to the Jews. By exploiting the threat to the Roman Empire from the Parthians and by adapting himself skillfully to the changing power situations after the murder of Julius Caesar (44 BC), the clever and adroit Herod I (reigned 37–4 BC) managed with the help of the Romans to become "king of the Jews" and to extend the Jewish state over almost all of Palestine again. His regime was decidedly progressive. He promoted Hellenization (*i.e.*, emphasizing Greek culture) by modern building projects, the founding of towns, and in other ways. But he also attempted to win the favour of the Jews, above all by rebuilding Solomon's Temple in ostentatious form and on an enormous scale. It was begun in 20 BC but was not finally completed until AD 64, a few years before its destruction in AD 70 by Titus, who became emperor of Rome nine years later.

Though the Jews demanded of the Romans the abolition of Herodian rule after his death, the Romans divided the land up among the sons of Herod the Great. The most important and largest part, Judaea, with Jerusalem, Samaria, southern Judaea, and Idumaea, was granted to Archelaus, who was deposed by AD 6. His area was integrated into the Roman administration under a governor (procurator), who controlled military, taxation, and judicial affairs. As was their custom, the Romans allowed the Jews to practice their religion and to exercise restricted powers of administration and jurisdiction. Some of the procurators, however, did not hold themselves strictly to these principles. Pontius Pilate, who is designated in an inscription found in 1961 as *praefectus Judaeae*, ruled (AD 26–36) ruthlessly and with bursts of cruelty. He was dismissed for this reason. The reigns of Herod's other two sons were of rather longer duration: Philip (4 BC–AD 34) ruled as tetrarch of the non-Jewish region northeast of Lake Gennesaret, and Herod Antipas (4 BC–AD 39) served as ruler of Galilee and the remote Peraea.

As far as Jesus' story is concerned, the conditions in Galilee, the land of his origin and his ministry, are of paramount importance. Thoroughly changed in character by the settlement of foreign colonists, although again in the process of being re-Judaized: Galilee was held in contempt by the Judaeans. Though the land's culture and civilization were in large measure Hellenistic, especially at the court of Herod Antipas, in individual towns and among the owners of large estates, the Jewish population, which spoke Aramaic, lived with its own, largely unaffected religious traditions. At the time of Jesus, Galilee was known as a seat of Jewish resistance to Rome.

According to Josephus (Antiquities XVIII, 18 ff.), Herod Antipas—whom Jesus called a "fox" (Luke 13:32)—held John the Baptist, the prophet who preached repentance, to be politically dangerous, had him put in prison, and had him executed for this reason. The Synoptic tradition, however, gives the Baptist's harsh criticism of Herod's unlawful second marriage as the reason (Mark 6:17–29).

Information about political conditions in Palestine at the time of Jesus is found mainly in non-biblical sources, especially in Josephus. Only a few details are mentioned in the Gospels. Such information is nevertheless significant as background for the story of Jesus, even if it does not contribute much to an understanding of his teaching. The attitude of the Jewish people to the foreign rule of the Romans was not uniform. There were conformists, especially among the priestly aristocracy in Jerusalem, and there were those who exhibited concealed and open resistance.

Various sectarian Jewish groups at the time of Jesus

Religious conditions. Judaism in the time of Jesus presents a disunited, fragmented picture, composed of widely different groups.

The Pharisees. In the reports of the Synoptic Gospels, the Pharisees serve almost entirely to exemplify his opponents. They are incensed by his preaching and behaviour, spy on him, press from the very beginning to have him done away with, and are, conversely, themselves attacked by him most fiercely as being self-righteous hypocrites. Debates with the Pharisees without doubt played an important role in Jesus' life. From the Gospels there has developed a crude popular view that "Pharisee" is synonymous with "self-righteous hypocrite." The New Testament sources, however, are to be used with discretion in this respect for the following reasons: (1) the later narrators were in large measure no longer conversant with the historical circumstances, especially because they were themselves outside the region of Palestine. As a rule, the Pharisees are introduced as a collective quantity in the Gospels but, in reality, were not a unified group. There are also sporadic references in the Synoptic tradition to the fact that Jesus maintained table fellowship with Pharisees (Luke 7:36; 11:37; 14:1). It is also worthy of note that they play no part in the Passion tradition (with the exception of the later legend in Matt. 27:62ff. about the Pharisees' requesting a guard at Jesus' tomb). (2) A Synoptic comparison reveals the tendency to give Jesus' opponents more concrete form, but in a schematic way. In the later texts, the Pharisees are frequently introduced as the constant foil for Jesus, whereas the older tradition speaks of Jesus' opponents in an indefinite way. (3) Matthew, especially, reflects the sharpened conflicts between Jews and Christians in the period after the destruction of Jerusalem (AD 70), when a theologically narrower brand of Pharisaism was finally asserting itself in the course of the religious reconstitution of Judaism. This later picture dominates the Talmudic tradition, but it may not be projected back into the time of Jesus.

Originating in the time of the Maccabees (or earlier, according to some scholars), the movement of the Pharisees (*i.e.*, the "separated ones") formed itself into a religious association composed chiefly of laymen from varied classes and callings. Its aim was strict adherence to the Torah (Law) in even the most remote areas of daily life, in order to realize the true Israel of God. This especially included the scrupulous observance of the individual ritual commandments for the practice of prayer and fasting, cultic purity, and the avoidance of all contact with the cultically unclean, whether that be lawless persons, sinners, corpses, animals, or unclean utensils. In the Pharisees' piety there was also to be found an eager longing for the future world of God, a doctrine of the resurrection of the dead, and a hope in the promised Davidic Messiah, who would establish his rule in Jerusalem and destroy the power of the heathen.

Jesus' relation to the Pharisees

In view of this religious situation, it is difficult to arrive at a uniform judgment on Jesus' relation to the Pharisees. Points of contact in matters of teaching definitely are present; *e.g.*, in the expectation of the resurrection of the dead, which they hold in common (Mark 12:25–27). Again, there are critical statements about formalized and hypocritical piety in Jewish Talmudic tradition, and not just in sayings of Jesus. It would therefore be unjust to judge all Pharisees to be alike. Obviously, many sayings of Jesus have parallels in Rabbinic tradition. Nevertheless, there is no question that Jesus rejected their claim to righteousness and their ideal of representing the true Israel, that he characterized their "tradition of the elders" as human tradition in contrast to the commandment of God, and that, through his attitude to tax collectors and sinners, he must have given them offense. Because of such opinions of Jesus, they probably would have influenced the people against Jesus. That certainly need not mean, however, that the Pharisees, who were politically anything but dominant, aimed at Jesus' crucifixion from the start (contrary to what is said; Mark 3:6).

The Sadducees. A party of quite another kind was that of the Sadducees, who belonged to the Jerusalem priestly caste. They carried much less authority among the people than the Pharisees. As a theologically conservative school, they differed from the latter also in their rejection of the additional "traditions" and the new doctrine of the resurrection of the dead. Because of the Sadducees' hierarchical tradition and their readiness to adapt themselves to the current political conditions, their influence in Jesus' time, before the destruction of the Temple, is not to be underestimated. Besides the Pharisees and the elders of the people, they had a decisive voice in the supreme religious and judicial authority, the Sanhedrin. A close relation probably existed between them and the Roman rulers. They did not, however, survive the catastrophic outcome of the war and the end of the Temple (AD 70).

The scribes. The scribes are frequently mentioned in the Gospels. In later Judaism, which, since the time of Ezra (5th century BC), was committed to the Mosaic Law, they formed a most respected class of the teachers. Corresponding to the normative significance of the Law for all religious, moral, social, and legal questions of Jewish life, the scribe was a combination of theologian and lawyer. Social origin and membership of a particular party played no role in this group. In Jesus' time, there were, apart from Pharisees and priests, also Sadducees and Zealots among the scribes. They were not paid as a professional class but, instead, had to find their own living. As scribes, they had to expound the Torah and give directives for daily life. Those who had undergone the long and careful training in their schools were accorded the status of scribe, wore the long robe of the scholar (Mark 12:38), were respectfully addressed as "rabbi" (Matt. 23:7), and were allowed to sit in a place of honour in the synagogue. Jesus, like the scribes, sat to teach (Matt. 5:1; Luke 4:20), engaged in debate, gave his opinion on the diverging doctrinal propositions of particular schools (Matt. 19:3ff.), and gathered disciples about him. The stereotyped way in which, particularly in Matthew, Pharisees and scribes are grouped together reflects the conditions obtaining at the time of the Gospel-writers, in which it was the Pharisees who controlled the instruction in the synagogues exclusively. But earlier, in the time of Jesus, the scribes were a more motley group. Also, it is not allowable to conclude from the fact that Jesus is frequently addressed as "rabbi" and "teacher" that he himself was a member of this profession.

Theocratic ideals and zeal for the Law among the Zealots

The Zealots. The involvement of the religiopolitical movement of the Zealots, a revolutionary group, in the historical development of Palestine was disastrous to the nation. No longer contented with the passive resistance of the Pharisees, out of whose ranks they certainly gained many adherents, the Zealots took the ideal of a theocracy and zeal for the Law extremely seriously. The first outbreak of their activities occurred in AD 6, when the Syrian legate Quirinius ordered the population in Judaea to register. This aroused indignation and was the signal for an insurrectionist movement, which confined itself initially to scattered individual acts of revolt but soon expanded, took military form, and finally instigated the Jewish–Roman war (AD 66–70). Biblical and nonbiblical sources name Judas, a Galilean scribe from Gamala, as founder of the Zealots. Like him, other fanatical messianic prophets also found significant followings. In Jesus' time, the conflict had not yet reached its zenith. The Zealots carried out sudden raids on the Roman occupation forces and conducted a guerrilla war from their hiding places in the wilderness. The Romans correspondingly held the land under strict control, reinforced their troops in Jerusalem at the times of the Jewish festivals, when great crowds of pilgrims gathered in the city, and took drastic and ruthless action if they anticipated sedition. This situation illuminates the events leading to Jesus' death. The Zealots' goals were political and, primarily, religious: the realization of a Jewish theocracy, the rule of the promised Messiah, and the destruction of the heathen regime.

The thesis that Jesus belonged to the Zealots or founded a related movement was first advanced in the 18th century and has repeatedly been supported in recent times. The most important point in its favour is Jesus' execution on the cross, a punishment that only the Roman authorities could inflict and did frequently against rebels. There were two others executed in the same manner with Jesus, and they, like Barabbas, who was granted amnesty in Jesus' place (Mark 15:15), are referred to as "robbers" (Mark 15:27), a customary term for rebels at this time. This could indicate that, at that Passover time, when many Jews were in the city, a Zealot revolt had been planned and was bloodily suppressed but also that Jesus had actually been willing to play a leading part in it.

Jesus' messianic entry into Jerusalem and the cleansing of the Temple (Mark 11) are also interpreted along these lines, the latter being understood as an attack on the dominant priestly class that sympathized with the Romans. Some also see a connection with the fact that one of the disciples was carrying a weapon when Jesus was arrested in Gethsemane (Mark 14:47). The later Christian tradition has, it is claimed, for apologetic and theological reasons, altered the true historical state of affairs until it has become unrecognizable. But isolated hints have nonetheless been preserved in it; *e.g.*, Jesus' critical sayings about that "fox" Herod (Luke 13:32) and the violent earthly rulers (Luke 22:25); similarly, the way he attracted Zealots, documented by the fact that among his disciples at least one, called Simon (Luke 6:15; Acts 1:13), was a Zealot.

There are, however, no sufficient reasons to support the hypothesis of Jesus belonging to the Zealots. The undeniable fact that he was crucified by the Romans as a political messianic pretender only proves that he was held to be a Zealot and was probably denounced as an enemy of the state, but not that he really was. The most important and decisive argument against the Zealotism assumption is found in Jesus' message of the dawning of the Kingdom of God, which belongs to the best established items in the tradition. It lacks any politico-nationalistic features and expressly says that God alone, and not any human activity, establishes his Kingdom (Mark 4:26–29) and offers his salvation to all without exception. If Jesus were directly or indirectly to be counted among the Zealots, this would mean at the same time that he must have fought to have the Law rigorously carried into effect and must have strictly avoided associating with sinners, especially with the tax collectors, who stood in the service of Rome. In the dialogue on paying tribute to Caesar (Mark 12:13–17), Jesus even expressly rejected rebellion against the Roman emperor, without thereby glorifying his regime.

Characteristics of the Qumrān community

The Essenes. Far removed from the above-mentioned religious groups were the sectarian, separatist Essenes, most probably identical with the sect of Qumrān (near the northwest bank of the Dead Sea). The sensational discovery in 1947 of many of their original writings (the Dead Sea Scrolls) and the later excavations of their settlement have extended knowledge of the Jewry of those times to an extraordinary degree and have occasioned the suggestion that both John the Baptist and Jesus came from this sect or were, at the least, heavily dependent on their teaching. Important arguments, however, speak against this assumption. This sect had arisen, like the Pharisees, in the 2nd century BC out of a conflict with the official priesthood in Jerusalem but had nevertheless preserved the priestly traditions and, at the same time, developed a strongly ritualistic practice of the Law. Characteristics of the Qumrān community are: its monastic seclusion from the outside world, including the rest of the Jews; the way it termed itself the "children of light" in contrast to the "children of darkness"; its rigid organization and discipline; and its apocalyptic expectations—centring on the intervention of God in history, along with dramatic and cataclysmic events—and other special features of its theology. Although the new texts found at the Dead Sea show numerous individual parallels to the Jesus tradition of the Gospels, there are already fundamental differences between the Qumrān sect and John the Baptist. His eschatological (last times) message of repentance addressed to the nation as a whole fits in with the sect as little as does his unique kind of Baptism—which one underwent once and for all—with the Essenes' regular ritual washings. Nor does John's temporal and geographic proximity to the strictly esoteric Qumrān sect justify asserting close relations between them. There also are diametrical differences between the views of the sect and the range of Jesus' ministry, his message of salvation, his understanding of God's will in a way free of all casuistry, and, especially, the radical character of his commandment of love and his fellowship with sinners and social outcasts.

THE LIFE AND MINISTRY OF JESUS

The birth and family of Jesus. The birth of Jesus. The life of Jesus will be dealt with in this section up to the beginning of his Passion. The course of his life and the geographical setting of his ministry can only be given in rough outline. The details are surrounded by many uncertainties. The period within which his ministry and death occurred may, however, be narrowed down with considerable accuracy on the basis of a synchronistic dating of the appearance of John the Baptist in the 15th year of Tiberius (Luke 3:1)—*i.e.,* AD 28/29—which is confirmed by nonbiblical sources. But the year and place of Jesus' birth are uncertain. Mark and John say nothing about them. The only sources for them are the widely divergent birth and childhood legends in Matthew 1 and 2, on the one hand, where Jesus' birth and early lot are set in the time of Herod I and the change of regime (4 BC), and, on the other hand, the narrative of Luke 2, which links Jesus' birth with the first registration in Judaea under the emperor Augustus (AD 6). (The use of BC [before Christ] and AD [Anno Domini, or "in the year of the Lord"] was not common until the Middle Ages.)

The tradition of Bethlehem as the place of Jesus' birth, which is found only in Matthew 2 and Luke 2, has its source in all probability in the Old Testament conception of the Messiah as a descendant of David. Early Christian-

Davidic descent of Jesus

ity took this view from the beginning. "Son of David" is found in many texts (*e.g.*, Mark 10:48) alongside other titles of Jesus. Its original political and national sense was abandoned. even though it is still recognizable in the acclamation of the people (Mark 11:10). The theological motif of Jesus' Davidic descent, however. did not necessarily involve the idea that he was born in Bethlehem, David's hometown. That is only the case in the opening stories in Matthew and Luke. They differ in that, in Matthew. Bethlehem is thought of as the parents' original place of residence, which they soon change to Nazareth because of the dangers threatening their child (*e.g.*, the flight to Egypt), whereas, in the Lucan story, Jesus' parents really live in Nazareth but stay in Bethlehem temporarily because they are obliged to register at the Davidic family's place of origin. Both traditions are to be judged as legendary variations of the theological theme of Jesus' messiahship, even though each in its own way assigns to his birth a place in history. The extent to which these texts are marked by theological motifs, above all by the thought that Jesus as Messiah fulfills the promises of the Old Testament and the hope of Israel and the world, is shown by the numerous quotations woven into the stories.

The widely differing genealogies in Matthew 1 and Luke 3 also belong in the context of the doctrine of the Davidic descent of the Messiah (Christ). They are the only New Testament evidences for genealogical reflection about Jesus' messiahship. The two texts, however, cannot be harmonized. They show that originally a unified tradition about Jesus' ancestors did not exist and that attempts to portray his messiahship genealogically were first undertaken in Jewish Christian circles with use of the Septuagint (Greek translation) text of the Old Testament. Both texts have to be eliminated as historical sources. They are nevertheless important for the development of Christology (doctrines on the nature of Christ), because they reveal the difficulty of reconciling the genealogical proof of Jesus' Davidic descent with the relatively late idea of his virgin birth.

This last tradition, too, is only recorded in two stories—in Luke 1 and Matthew 1—and was originally quite unconnected with the frequently found motif of Jesus' divine Sonship. Paul, John, and the rest of the New Testament writers are not acquainted with the idea. Also, it has left no traces in the rest of the Synoptic tradition, not even in the story of Jesus' birth (Luke 2:1–10), where Joseph and Mary appear as his natural parents. In Matthew 1, Jesus' miraculous birth is presupposed, and, in Luke, 1, it is explained more closely. This tradition is not to be traced back directly to the idea, widely held in classical antiquity, of heroes and great men who derived from the union of a deity with a human woman. In other words, Jesus is not characterized as a demigod here. What underlies this tradition is, rather, the concept of the creative power of God and his Spirit, which is known from Hellenistic Judaism. This theological, not biological, motif has been applied to Jesus and, with the greatest probability, only secondarily combined with the Greek version of the messianic promise of Isa. 7:14 (in the Septuagint, the Hebrew word *ʿalma—i.e.*, "young woman"—is translated as "virgin"), and in this way the Christian story came about. According to a very old, reliable tradition, the village of Nazareth, which lay in the Galilean hill country, had a Jewish population, and was untouched by the influence of the Hellenistic cities, was the hometown, and then certainly also the birthplace, of the "Nazarene" (Mark 1:24; 10:47; 14:67; 16:6).

The Jewish character of Jesus' parents, brothers, and sisters

The family of Jesus. Four of Jesus' brothers and several sisters are mentioned in Mark 6. (There is no basis in the text for making them into half brothers and half sisters or cousins, and to do so betrays a dogmatic motive.) All his relatives' names testify to the purely Jewish character of the family: his mother's name was Mary (Miriam), his father's, Joseph, and his brothers', James (Jacob), Joseph, Judas, and Simon (names of Old Testament patriarchs). The same is true of the name Jesus. In the Septuagint it is the customary Greek form for the common Hebrew name Joshua; *i.e.*, "Yahweh helps." It is also mentioned in Mark 6 that Jesus or his father (there are variant textual versions) was a carpenter. There are several not unimportant pieces of information preserved about the later history of the family. Of his father, who probably died early, little is mentioned. His mother, brothers, and sisters did not join his movement at first but, rather, disapproved of his behaviour (Mark 3:31–35). Mary is, however, mentioned as a member of the Christian Church after his death (Acts 1:14). The same is true of his brother James, whom Paul names among the witnesses of the Resurrection (I Cor. 15:7) and who was the leader of the Jerusalem Church after Peter (Galatians, Acts). The author of the Letter of James has taken a brother's name for himself, as did the author of the Letter of Jude in respect to another brother. According to a later nonbiblical account (in the *Ecclesiastical History* of Eusebius, a 4th-century historian of the church), grandchildren of Jude (who otherwise remains unknown), who were living in Galilee, were summoned by the emperor Domitian as "descendants of David," but then released as representing no political danger.

Jesus most likely grew up in the piety that was cultivated in the home and in the synagogue (including Bible study, obedience to the Law, prayer, and expectation of the final coming of the Messiah) and also took part in pilgrimages to Jerusalem. From these scattered reports it is possible to gain some information about Jesus' background and theological education. The latter also comes to light in his teaching and in the frequently attested honorific form of address "rabbi" (teacher), which, in the language of the time, was not yet confined to members of the trained and ordained profession of the scribes. Nothing is precisely known, however, about Jesus' youth and inner development. What is known is contained in the sole narrative in Luke 2:40–52 (the boy Jesus in the Temple) and the legendary apocryphal gospels, which, after the manner of legend, sought to illumine the obscurity of Jesus' childhood.

The Christian significance of John the Baptist

The ministry of Jesus. ***The role of John the Baptist.*** The Gospel accounts of the appearance and activity of John the Baptist and of Jesus' Baptism at his hands first establish a historically safe basis for knowledge of Jesus' life and work. Significantly, the oldest Gospel writer calls these events "the beginning of the gospel of Jesus Christ" (Mark 1:1), indicating that his would be a message about Christ, not a description of the contemporary background for Jesus' life. The Baptist is, therefore, represented exclusively from the Christian point of view. His place in the Christian history of salvation is that of a forerunner or pioneer; or he is a witness to Jesus, as in the Gospel According to John. But the tradition has nevertheless preserved unchallengeable information about John, especially in Q. Josephus characterizes him as a mere moral teacher and his Baptism as merely ritual washing. In reality, however, he made his appearance in the desert as a prophet of the imminent Last Judgment, calling all without exception to repentance in the eleventh hour, and baptized those who were ready to repent, in order to prepare them for the baptism of fire of the mightier one coming from heaven and to preserve them from his annihilating wrath (Matt. 3:7ff. and Luke 3:7ff.). His dress and diet as an ascetic nomad and, above all, the location of his ministry (the Judaean desert and the Jordan steppes) far away from the institutions and places of traditional religion and secularity illustrate the earnestness of his eschatological preaching and his attack on all conventional piety: but they also correspond to the old prophetic promise that God would encounter his people in the Last Days, as he did once before, in the desert. Historically, all these features may not be understood immediately in Christian perspective; *i.e.*, as pointing to Jesus as the Messiah. The tradition of the Gospels visibly and increasingly interpreted the history of the Baptist in retrospect, and not least for the reason that there still existed for a considerable time alongside the disciples of Jesus a rival body of disciples of the Baptist.

That Jesus was baptized by John, as all the Gospels record, indicates that in all probability Jesus initially be-

The significance of Jesus Baptism

longed to John's movement. The account of Jesus' Baptism is styled in the Gospels as an "epiphany (or manifestation) story" and deals with Jesus' installation at this time as Messiah (Mark 1:9–11). The announcement of the Kingdom of God by John and his call to repentance retained decisive significance for Jesus. His high estimate of the Baptist emerges unambiguously from the fact that he placed John above the prophets and called him the greatest among men (Matt. 11:7–11). He saw the signs of the approaching Kingdom of God in the work of the Baptist as in his own work, and he recognized the authority given John as being from heaven (Mark 11:27–33). These words carry all the more weight historically because the tendency of the context here is to proclaim Jesus as the Messiah and to place the Baptist, as the lesser, in Jesus' service. It is significant that John himself is nowhere attacked in the Synoptic texts, nor is he designated as a follower of Jesus. Wherever polemic can be recognized in the Gospels (especially in John), it is always directed against the false belief, doubtlessly held by the (later) Baptist disciples, that John was the promised Messiah. The extent to which the close connection between Jesus and John occupied the theological reflection, apologetics, and imagination of the Christian Church is shown by several passages and, above all, by the cycle of legends in the introduction to Luke (chapter 1). Regardless of the close relationship between Jesus and John the Baptist, especially in their prophetic announcement of the approaching Kingdom of God and their call to repentance (cf. Matt. 3:2; 4:17), there are also radical differences.

The *beginning* of Jesus' *ministry*. At the latest, after the Baptist's imprisonment (as the Synoptics state), possibly even earlier (according to John), Jesus began as a grown man (Luke 3:23) an independent public ministry, but in the villages of his Galilean homeland and—sporadically—in the neighbouring countryside, rather than in the wilderness, as did John. The real area of his ministry was the district on the northwest bank of the Lake of Gennesaret (or Sea of Galilee; the towns of Beth-saida, Chorazin, and Capernaum). The change of scene is significant in itself. Jesus did not call the people into the desert. He sought men in their settlements and took part in their ordinary life, and not as an ascetic, like John the Baptist (Matt. 11:18). He worked among them as a wandering preacher (Matt. 8:20) and charismatic miracle worker, without, however, baptizing like John. But the image he presents is nonetheless highly peculiar. He taught not only in the synagogues but likewise in the open air, on the shore of the lake, and on the road. There also were strange people in the group surrounding him: women, children, and many who were viewed as godless or unclean. Further, the manner of his teaching is surprising. He did not derive it from the Holy Scriptures, although he was familiar with them, esteemed them, and appealed to them here and there. Instead, he constantly presented the reality of God and the validity of his will in an immediate way and made them comprehensible to his hearers without using the established structure of sacred texts and traditions and without presupposing a conventional religious point of view. His metaphors, parables, and proverb-like utterances were not used to explain traditional teachings of biblical theology but, instead, appealed directly to the everyday experience and the understanding of his hearers, and they are therefore characterized by a unique self-evidence and a disarming simplicity.

Jesus' relationships to various people

This corresponds to the manner of his behaviour in his meetings with other people. The Gospels portray this in a large number of separate scenes. These persons vary considerably: pious and impious, rich and poor, respected and outcast, healthy and ill. In every encounter, Jesus' amazing sovereignty with which—free of all prejudices—he mastered the situation is made visible. He saw through his opponents' attempts to corner him in debate, disarmed their objections, saw the needs of the possessed and the sick who crowded around him, and associated with those who were avoided by others. Some of the scenes may only have been added or filled out in later popular tradition, but they clearly demonstrate the power with which Jesus helped people by word and deed, whether he grew passionately angry over the power of disease or over the pride and lovelessness of the "righteous" or whether he commanded the demons or blessed children and laid hands on the sick.

Origins of the disciples

The calling of Jesus' disciples. According to the unanimous witness of the Synoptic Gospels, Jesus gave rise to a movement in Galilee and found numerous followers, although not without provoking rejection as well. This movement cannot yet be called a "church." (This concept first appears in the later tradition.) To spread his message and movement, he called on his disciples, for the sake of the approaching Kingdom of God, to resolutely surrender all ties of family and work (Mark 8:34ff.; Matt. 10:37ff.; Luke 14:26ff.) and to follow him and to become "fishers of men" (Mark 1:17; Luke 5:10). Many of his words are of extreme sharpness and do not conceal how difficult the disciples' road will be (Luke 14:25–33). But, at the same time, the patent immediacy of Jesus' sovereign power comes to light in these texts. In the scenes mentioned, it is Jesus who makes the decision. He calls, appoints, and selects particular men, without regard to their origin and previous training. There are fishermen (Andrew, Peter, James, and John), a tax collector (Matthew), and Zealots (Simon and, perhaps, Judas Iscariot) among them, perhaps also a few craftsmen and peasants. Whether it was a circle of 12 disciples from the start is questionable and under debate. It is clear, however, that he commissioned and authorized his disciples to preach and to drive out demons (Mark 3:14). Some of these disciples are well noted in the Synoptic tradition (*e.g.*, Peter and Judas Iscariot). In the Gospel According to John, others come into the foreground, including some from among the followers of the Baptist. Of others, only their names are known (*e.g.*, Thaddaeus). A characteristic of these companions of Jesus is that their discipleship is not, as with the rabbis, a transitional stage that ends with their "training." None of them moves up after sufficient study to the status of "master" (Matt. 23:8). Even if accounts of the calling of disciples have, in general, been styled in the later tradition as examples of what it means to be a Christian and individual scenes have been added to the original stock of stories, the recollection of incidents that occurred during Jesus' ministry in Galilee is doubtlessly preserved in the texts.

The Galilean period. The loose and often differing order of the individual scenes only entitles scholars to speak of a rather ambiguous Galilean period of Jesus' activity: they cannot say with certainty how long it lasted. Because the Synoptic Gospels mention only one trip of Jesus to Judaea and Jerusalem, with the Passion following it, the impression is created that the period lasted no longer than one year. Editorial and theological considerations have, without question, also played a part in this presentation (*e.g.*, Jesus' activity in Galilee and his sufferings in Jerusalem). Scholars offer several good reasons, however, to support the assumption that the Synoptic outline still deserves to be preferred to the widely differing one in John. In the latter, Jesus is in Jerusalem for three celebrations of the Passover (John 2:13–23; 6:4; 11:55), as well as for one Sukkot (Feast of Tabernacles; John 7:2) and one Hanukka (Feast of Dedication; John 10:22). This involves a period of more than two full years. It is doubtful, however, that John is based on an independent tradition, because the indications of time referred to serve the Evangelist as a means of changing the scene of Jesus' ministry between Jerusalem and Galilee. (The centre here is Jerusalem.)

THE MESSAGE OF JESUS

***The* Kingdom of God.** Jesus announced the approaching Kingdom of God and therefore called people to repentance. The first two Gospels have set this at the beginning in a programmatic saying as a summary of his preaching and have thus characterized the central and dominant theme of his mission as a whole (Mark 1:15; Matt. 4:17). Thus, the Kingdom of God, or Kingdom of Heaven (a Jewish circumlocution for God preferred by

The central and dominant theme of Jesus' teaching

Matthew), does not just denote a final chapter of his "system of doctrine" (a concept that cannot be applied to Jesus, in any case). The underlying Jewish word (*malkhuta)* means God's kingship, and not primarily his domain. This meaning prevails in the New Testament texts. But Kingdom of God or Heaven is also used in a spatial sense ("Enter . . ."). The burning expectation of the Kingdom of God was widely spread in contemporary Judaism in manifold form, based on the Old Testament faith in the God of the fathers, the Creator and Lord of the world, who had chosen Israel to be his people. But with this faith there had united itself the contradictory experience that the present condition of the world was ungodly, that Satanic powers reigned in it, and that God's kingship would only manifest itself in the future. In wide circles, this expectation had the form of a national, political hope in the Davidic Messiah, though it had expanded this hope in apocalyptic speculation to a universal expectation. In each case it was directed toward the Last Days. Likewise, in Jesus' message, the expression Kingdom of God has a purely eschatological—*i.e.*, future—sense and means an event suddenly breaking into this world from the outside, through which the time of this present world is ended and overcome.

These traditional motifs of the end of the world, the Last Judgment, and the new world of God are not lacking in the sayings of Jesus preserved in the Gospel tradition. Thus, Jesus has not by any means changed the Kingdom of Heaven into a purely religious experience of the individual human soul or given the Jewish eschatological expectation the sense of an evolutionary process immanent in the world or of a goal attainable by human effort. Some of his parables have given rise to such misunderstanding (*e.g.*, the stories of the seed and harvest, the leaven, and the mustard seed). In such cases, the modern thought of an organic process has been wrongly introduced into the texts. People of classical and biblical times, however, heard in them connotations of the surprising and the miraculous. The Kingdom of God, thus, is not yet here. Hence the prayer, "Thy kingdom come!" (Matt. 6:10; Luke 11:2), and the tenses, for example, in Jesus' Beatitudes and predictions of woe (Luke 6:21–26). The poor, the hungry, and the weeping are not yet in heaven. The petitions of the Lord's Prayer presuppose the deeply distressing circumstance that God's name and will are abused, that his Kingdom is not yet come, and that men are threatened by the temptation to fall away.

Eschatological motifs

In regard to Jesus' preaching, one cannot, therefore, speak of a realized eschatology—*i.e.*, the Last Times are now here (according to the view of C. H. Dodd, a British biblical scholar)—but of an eschatology "in process of realizing itself" (according to the view of Joachim Jeremias, a German biblical scholar); for God's Kingdom is very close. It is on the threshold, already casts its light into the present world, and is seen in Jesus' own ministry through word and deed. In this, his message differs from the eschatology of his time and breaks through all of its conceptions. He neither shared nor encouraged the hope in a national messiah from the family of David, let alone proclaimed himself as such a messiah, nor did he support the efforts of the Zealots to accelerate the coming of the Kingdom of God. He also did not tolerate turning the Kingdom of God into the preserve of the pious adherents of the Law (Pharisees; Qumrān sect), and he did not participate in the fantastic attempts of the apocalyptic visionaries of his time to calculate and thus depict in detail the end of the present world and the dawn of the new "aeon," or age (Luke 12:56). Nor did he undertake a direct continuation of the Baptist's preaching.

All the ideas and images in Jesus' preaching converge with united force in the one thought, namely, that God himself as Lord is at hand and already making his appearance, in order to establish his rule. Jesus did not want to introduce a new idea of God and develop a new theory about the end of the world. It would therefore be incorrect to understand his preaching in the Jewish apocalyptic sense of immediate expectancy, coming, as it were, to a boiling point. The proximity of the Kingdom of God actually means that God himself is at hand in a liberating attack upon the world and in a saving approach to those in bondage in the world; he is coming and yet is already present in the midst of the still-existing world. In Jesus' message, God is no longer the prisoner of his own majesty in a sacral sphere into which pious tradition had exiled him. He breaks forth in sovereign power as Father, Helper, and Liberator and is already now at work, as is indicated by Jesus' proclaiming of his nearness and by Jesus' actions in entering the field of battle himself, to erect the signs of God's victory over Satan: "But if it is by the finger of God that I cast out demons, then the kingdom of God has come upon you" (Luke 11:20). For this reason, Jesus called out: the shift in the aeons is here; now is the hour of which the prophets' promises told (Matt. 11:5; Isa. 35:5). This "here and now" carries all the weight in Jesus' message: "Blessed are the eyes which see what you see! For I tell you that many prophets and kings desired to see what you see, and did not see it, and to hear what you hear, and did not hear it" (Luke 10:23–24). In answer to the Pharisees' question about when the Kingdom of God is coming, Jesus therefore said, "The Kingdom of God does not come in an observable way, nor will they say, 'Look, here it is!' or 'There!' For look, the Kingdom of God is within your reach" (Luke 17:20–21; another translation: "in the midst of you").

The dominant feature of Jesus' preaching is the Heavenly Father's turning in mercy and love to the suffering, guilty, outcast, and to those who, according to the prejudices of the "pious," have no right to receive a share in the final salvation. Numerous parables described how God behaves toward them and shows himself as Lord and King (*e.g.*, Luke 15; Matt. 18:23ff.; 20:1ff.). They all speak of God's action in images drawn from daily life, so that everyone can understand. They belong to the uncontestedly oldest stock of the Jesus tradition. But Jesus did not only teach this, he practiced and illustrated it himself by his own behaviour and thereby offended the pious, who claimed the Kingdom of Heaven for themselves.

The message of repentance

In this message of the approaching Kingdom of God, Jesus' call to repentance is grounded. He called on all not to miss the hour of salvation (Luke 14:16ff.; 13:6ff.), to sacrifice everything for the Kingdom of God (Matt. 13:44ff.), and to receive it like a child (Mark 10:15), without the presumptuous and desperate conceit that one might win it and realize it by one's own works (Mark 4:26ff.; Matt. 13:24ff.). Jesus' summons to be wise, to be on the watch (Luke 16:1ff.; 12:35ff.; Mark 13:33ff.; Matt. 24:45ff.), and to surrender the fiction of one's own righteousness (Luke 18:10ff.) belongs here, too. In Jesus' preaching, repentance does not mean a prerequisite or precondition or even a penitent contemplation of oneself but, rather, a consequence of the proximity of the Kingdom of God (Matt. 4:17) and an opening of oneself for his future, a movement not backward, but forward. Jesus in this way binds future and present insolubly together. The apocalyptic's question about how much time still has to elapse before the new world of God is here is thus rendered meaningless. He who asks this only proves that he understands neither the future nor the present properly; namely, God's future as the salvation that is already dawning and one's own present in the light of the coming Kingdom of God.

Jesus therefore rejected the demand that he produce "signs" as proof of the dawning of the time of salvation (Matt. 12:38ff.; Mark 8:11). He himself is to be viewed as the "sign," just as once Jonah, the prophet of repentance, was the only sign given to the people in Nineveh (Luke 11:29ff.). The sign is not identical with the thing signified, but it is a valid indication of it.

According to the Synoptics, Jesus never made his "messiahship" the subject of his teaching or used it as legitimation for his message. It is significant that the "I am" sayings of John, which bear the stamp of Christology throughout, are not found in the Synoptic tradition. That does not in any way affect the fact that Jesus in a decisive way included his own person as eschatological prophet and charismatic miracle worker in the event of the Kingdom of God: "And blessed is he who takes no offense at me" (Matt. 11:6).

Eschatology and ethics

The will of God. In Jesus' teaching, the nearness of God is itself viewed as a moving force. It creates, as it were, a field of force and challenges the whole person to obey the will of God unconditionally ("Let your loins be girded and your lamps burning"; Luke 12:35). As little as Jesus tolerated attempts at calculating the time when the Kingdom of God should come, so much the more did he demand that men reckon with its coming. The relation between eschatology and ethics in Jesus' teaching, however, needs to be further clarified. His commandments nowhere have the character of prophetic sayings, and their content is not given eschatological basis even where Jesus linked them with the promise of heavenly reward and, correspondingly, with the threat of damnation in the Last Judgment (*e.g.,* Matt. 24:24ff.; Luke 19:11ff.). God's will is valid in itself, always and everywhere. For this reason, it is incorrect to characterize Jesus' demands as "interim ethics"; *i.e.,* as exceptional emergency laws in the situation of the world that lies in the blaze of the cosmic catastrophes accompanying the shift of the aeons and the speedy dawn of the Kingdom of God (as did Albert Schweitzer, a great Alsatian theologian, medical missionary, and Nobel laureate). Jesus did not draw arguments for his ethical demands from the perishing order but, rather, from the existing world, the Old Testament commandments, the creation, and experiences known to everyone. Thus, he did not aim at forming a "holy remnant," which would escape the rejection awaiting others in the Last Judgment, on the basis of some kind of select monastic rule.

The certainty of God's nearness is, nevertheless, the open or concealed point of reference for Jesus' exposition of the will of God and explains his attitude to the Old Testament Law. Corresponding to the character of the Old Testament legal tradition, he refers to the will of God in single sayings and in comments in relation to individual commandments, and, it should be noted, he did not develop these into coherent "moral teaching." Rather, he took up quite different kinds of commandments as concrete examples, above all from the Decalogue and related texts, concerning one's behaviour toward one's fellow human beings (on murder and anger, adultery and divorce, oaths, retaliation, love for others; see Matt. 5: 21ff.) and also ceremonial commandments (concerning the Sabbath, prayer, fasting, and defilement) and other cultic duties. Jesus always went to the root of these commandments, and he did not content himself with the mere letter of the Law but disclosed within the Law—sometimes even against the letter of the Law (Mark 10:1ff.)—the genuine will of God. Though Jesus respected the Law, it was no longer for him the only source of knowledge of God's will and no longer the intermediate authority that exclusively mediates people's relation to God. From this basis are to be understood both Jesus' exposition of the Law and also his criticism of all formalistic casuistry, which is for him only "human tradition."

Jesus thus brings about a confrontation between the reality of God, which is no longer disguised by holy letter and tradition, and the similarly undisguised reality of humanity. People also can no longer delude themselves into believing that their pious works would represent them before God and thus keep on piling them up, as it were, like the Pharisee (Luke 18:11ff.). What God wants from humanity is not something but humanity itself, unconditionally and undividedly. The classic passages for these thoughts are the antitheses of the Sermon on the Mount (Matt. 5:21–48). They sharpen God's demands to the utmost extreme and leave no room for merely legalistic behaviour. Their leitmotiv is: "Not only, but even. . . ." Even anger, the lustful look, the "legal" divorce, retaliation that keeps within the limits prescribed, and love that excludes the enemy are against God's will.

These extreme demands are meant not so much to be paradoxically overdemanding as, rather, liberating. Firstly, they are formulated in a way that everyone can understand. They include numerous references to the natural, unperverted practices of people in their daily lives. Secondly, the demands do not describe an unattainable distant goal, which all human action must of necessity fail to meet. Rather, Jesus pointed again and again to what the heavenly Father has done, does, and will do with his children and to God's possibilities, which are unlimited, whereas a person might despair of his or her own limited possibilities and impotence (Mark 10:27). Jesus' sayings about faith (Mark 9:23ff.), prayer (Luke 11:1ff.; Matt. 6:1ff.), or worry (Matt. 6:25ff.) are examples of this. Wherever Jesus calls on people to decide for themselves for God, he bases the argument on the fact that God has already decided for humanity. The unlimited readiness to forgive that he calls for also has its motivation in the limitless mercy of God, which he demonstrates toward the guilty in unfathomable measure (Matt. 18:23ff.). Jesus draws his hearers into this relation to God and, therefore, does not engage in abstract reflections about whether his demands are capable of fulfillment. In this way, what a person loses is the characteristic of being able to attain meritorious achievements (Matt. 20:1ff.). On the other hand, Jesus certainly did not give up the thought of "reward." The reward, however, is not a material prize, although images of this kind are not lacking, but the confirmation and perfection of the relation to God (Matt. 25:14ff.). The idea that human beings could claim and charge payment from God is for Jesus completely excluded (Luke 17:10).

The nearness of God, the real God, also brings humanity, no longer graded and classified in traditional categories, into urgent and imperious proximity. How much Jesus was concerned with human beings is shown especially by his commandment of love, which he not only taught but also practiced to the point of offensiveness. In it is concentrated the "better righteousness" that he demands of his disciples (Matt. 5:20). Jesus has taken over the Old Testament dual commandment of love of God and one's neighbour (Deut. 6:5; Lev. 19:18), which is also in Judaism a summary of the whole Law. But it is characteristic of Jesus' preaching (1) that he consistently subordinated all other laws—*e.g.,* the Sabbath commandment—to this highest critical standard (*e.g.,* Mark 2:27; 3:4), and (2) that he extended and heightened love of one's neighbour to love of one's enemies (Luke 6:27ff.), and (3) that his commandment does not have the abstract ideal of a general philanthropy at its root. Rather, he directed his hearers into the situations—always eventful and concrete—where they encounter their enemy (Matt. 5:38ff.) and their fellowman in need (Luke 10:25ff.). Behaviour toward one's fellows is so important for Jesus that it is all that is spoken of in many of his utterances, without any mention of the first commandments of the Decalogue concerning behaviour toward God (*e.g.,* Matt. 5:25ff.; 7:12; 19:16ff.).

Individual and social ethics

The distinction that modern moral philosophy makes between individual and social ethics has, in respect to Jesus' teaching, only limited application. To be sure, Jesus did not draw up a program for a new order for the world and the nations, he did not demand a more just distribution of property, did not fight against the differences existing between masters, slaves, and hired workers, and did not give any directives for a better administration of justice. The world he had before his eyes was the world as it was, within the horizon of Palestinian Jewish rural conditions, and not the world as it ought to be. His sayings, parables, and illustrations show how keenly he assessed everyday life and how clearly he described it in his graphic, vigorous way—not glorifying this world as an eternally valid, divinely willed order, and also not getting morally indignant about it. Rather, he calls on people to behave in this given world in conformity to the original will of God and his dawning Kingdom; *e.g.,* to renounce the reign of mammon (Matt. 6:24; Luke 16:9ff.). Jesus did not, however, require a complete surrender of property from everyone. His followers were not to avail themselves of the legally regulated facilities for asserting one's own rights and were not to conform to the ways of customary behaviour in the world. The assertion that the world cannot be governed with the Sermon on the Mount is thus not to be denied. Jesus' sayings about retaliation and his commandment of love are not juristically practicable as they stand, because they can only serve as a guide for the one who has been wronged by someone else or who is required to divide his possessions with another person. Legislators and judges have to decide exclusively about the rights of others and must restrain evil for the sake of the general social order. But the truism about the impracticability of the Sermon on the Mount conceals the fact that Jesus' teaching contains strong impulses toward social criticism.

Jesus unmasks as hollow conventions many ostensibly valid standards, explaining the Law according to the norm of the commandment of love and applying it to concrete situations. For this reason he also resists egocentricity, not only of individuals but of entire religiously and socially privileged groups, and joins with discriminated-against people (*e.g.*, heathens, Samaritans, tax collectors, and harlots). Thus, Jesus calls on men to live a life that corresponds to the proximity of God's Kingdom, although the validity and urgency of his commandments require no apocalyptic basis. The act of their proclamation, however, stands nonetheless close to Jesus' own mission (Luke 11:32ff.). Whether, and in what way, he expressed the fact of his mission by the use of Christological titles is not thereby decided. Jesus knew that he had been sent to the "lost sheep of the house of Israel" (Matt. 15:24; 9:36). His ministry, seen as a whole, was confined to the sphere of his own people. Only a few significant words and scenes point forward to the inclusion of non-Jews, in a new, eschatological people of God (Matt. 8:11ff.). Jesus, however, did not organize a mission to the heathen (Matt. 10:5ff.) nor a worldwide "church." The only saying of this kind, spoken to Peter (Matt. 16:17ff.), has been placed in the mouth of the earthly Jesus by the later church and clearly reflects its situation, doctrine, and discipline. But Jesus certainly did call into existence a movement in Galilee and allowed at least the narrower circle of his disciples, if not all of his followers, to share in his wanderings and ministry. Later tradition first identified the latter group alone with the Apostles (authorized emissaries), the circle of whom was, however, not originally restricted to that group (*cf.* I Cor. 15:5ff.). The number 12 symbolizes the 12 tribes of Israel. If Jesus appointed these disciples himself, he thereby demonstrated his eschatological claim on the whole of Israel. According to the saying in Matt. 19:28 and Luke 22:30, which was probably not formulated until later, he conferred on them the office of ruling and judging the perfected Israel of the new aeon.

THE SUFFERINGS AND DEATH OF JESUS IN JERUSALEM

Jesus' decision to go to Jerusalem

Jesus' decision to go to Jerusalem is the turning point in his story. The events it set in motion soon came to have decisive significance for the faith of his followers. It is not coincidental that the Gospels narrate this period of his life in disproportionate breadth. Despite the many points of agreement among the Gospels, there also are considerable discrepancies within the tradition of the Passion. Thus, one cannot expect the tradition of the Passion to provide historically accurate reports, for it has been formed from the viewpoint of the church and its faith in Christ. The most important theological motifs in the narratives include the intention of presenting Jesus' sufferings and death as the fulfillment of God's will, the decision, in conformity with the words of the Old Testament Prophets and Psalms, to proclaim him as Messiah and Son of God, despite his brutal end. Nevertheless, important historical facts may be inferred from the texts.

Jesus probably went to Jerusalem with his disciples for the Passover in order to call the people of Israel gathered there to a final decision in view of the dawning Kingdom of God. He must have been aware of the heavy conflicts with the Jewish rulers that lay ahead of him. The story of the cleansing of the Temple, in particular, shows that Jesus did not avoid these conflicts. The later tradition, stylizing the story, gives as Jesus' sole motive for going to Jerusalem his desire to die there and to rise again in accordance with the will of God (Mark 8:31; 9:31; 10:32ff.). The best clue for a reconstruction of the outward course of Jesus' Passion is given by his Crucifixion. It proves that he was condemned and executed under Roman law as a political rebel. All reports agree that he died on Friday (Mark 15:42; Matt. 27:62; Luke 23:54; John 19:31). They differ, however, in that, according to the Synoptics, this was the 15th of Nisan (March/April); *i.e.*, the first day of the Passover. But, according to John, it was the previous day; *i.e.*, the one on which the Passover lambs were slaughtered and on which the festival was begun in the evening (in accordance with the Jewish division of days) with a common meal. Thus, according to John, Jesus' last meal with the disciples was not itself a Passover meal but took place earlier. Each of these datings may be theologically motivated, whether it be that the Eucharist is to be represented as the Passover meal (Synoptics) or whether Jesus himself is to be shown as the true Passover lamb, who died at the hour when the lambs were slaughtered (John). Historically, the Johannine dating is to be preferred, and the 14th Nisan (April 7) is to be regarded as the day of Jesus' death. The question of the occasion for Jesus' execution and the role that the Jews played is thereby more difficult and more important.

The date of Jesus' death

The way the Gospels present the facts of the case, Jesus was actually condemned to death by the supreme Jewish tribunal (Mark 14:55ff.). Pilate, on the other hand, was convinced of Jesus' innocence and made vain attempts to release him but finally yielded to the Jews' pressure against his better judgment (Mark 15:22ff.). The historical reliability of this account has rightly been questioned. First, the Synoptic reports differ among themselves. According to Mark and Matthew, the Jewish supreme court had already gathered in the home of the High Priest after Jesus' arrest in the night of Holy Thursday to Friday and condemned him to death as a blasphemer at that point (Mark 14:64). Thereafter, they resolved to hand Jesus over to Pilate in a new session in the early morning (Mark 15:1). Luke knows of only one session and has the interrogation take place in the morning (Luke 22:66), but he says nothing about Jesus' condemnation (Luke 22:71). John deviates even more; here, only the high priests Annas and Caiaphas are involved in the interrogation of Jesus (John 18:13ff.). Secondly, with regard to all the Gospel accounts, the question arises, what earwitness can be supposed later to have given the disciples an exact report? Thirdly, the jurisdictional competency of the Jewish Sanhedrin is disputed. In the opinion of some scholars, the Jewish authorities were permitted to pronounce sentence of death and to carry it out by stoning in the case of serious religious offenses (blasphemy). In the opinion of others, though, this required the confirmation of the Roman procurator. Also, trials of this kind were not to be conducted during the period of the festival.

The strongest argument against the Synoptic presentation is, however, that it is styled throughout in a Christian, and not in a Jewish, way; *i.e.*, on the basis of scriptural proof and the Christian confession to the messiahship and divine Sonship of Jesus. The High Priest's question, "Are you the Christ, the Son of the Blessed?" (Mark 14:61), is unthinkable from the viewpoint of Jewish premises, because Son of God was not a Jewish title for the Messiah. Thus, the account reflects the controversies of the later church with the Judaism of its day.

There also is in the Gospels a tendency to exonerate Pilate at the Jews' expense. His behaviour, however, does not match the picture that nonbiblical sources have handed down about him. But everything speaks for Jesus' having been arrested as a troublemaker, informally interrogated, and handed over to Pilate as the leader of a political revolt by the pro-Roman priestly and Sadducean members of the Sanhedrin, who were dominant in Jerusalem society in those days. The cleansing of the Temple and a prophetic, apocalyptic saying of Jesus (John 2:19; cf. Mark 14:58; Acts 6:14) about the destruction of the Temple may thereby have played a role. It can hardly be assumed that each and all of the Pharisees, who were without political influence at that time, were involved in the plot. Nor are they mentioned as a separate group in the Passion narratives alongside the priests, elders, and scribes.

The other scenes in the Passion story do not need to be listed here separately. They relate more to the theological meaning of Jesus' Passion and are, to a large measure, formed in a cultic manner, even though they refer to events that are certainly historical; *e.g.*, Judas' betrayal, Jesus' last meal with his disciples, and Peter's denial of Jesus. The traces of an eyewitness account are perhaps still recognizable at certain points (Mark 14:52; 15:21).

The last words of Jesus

The accounts differ in their presentation of Jesus' death, especially in their rendering of his last words. It is only in Mark and Matthew that Jesus dies crying out the prayer from Psalm 22: "My God, my God, why hast thou forsaken me?" The distinction between the repentant and the defiant thief is only found in Luke. Jesus' last words are given differently in Luke ("Father, into thy hands I commit my spirit!") and John ("It is finished"). Each of these accounts, as also the testimony of the Roman centurion ("Truly this man was the Son of God!"; Mark 15:39), gives expression to the significance of Jesus and his story.

THE STORY OF JESUS AND FAITH IN JESUS

Did Jesus' violent death render his mission and story meaningless? In other words, did he enter definitively into the past as a failure and thus in this sense become the "historical" Jesus? For Pilate and the Romans, as for Jesus' Jewish opponents, there was no longer any problem. The decision had been taken. But Jesus' disciples were faced with this pressing question all the more. Their hopes were bitterly disappointed (Luke 24:13ff.). According to the unanimous witness of the New Testament texts, they did not find the answer themselves but were given it soon after Jesus' death through the Easter (Resurrection) appearances of Jesus (I Cor. 15:3ff.; etc.) and the experience of his Presence in the Spirit. The faith of early Christianity, with all of its practical and theological manifestations, grew out of this. This faith was not the preserve of a few enthusiasts or the personal opinion of individual Apostles. Wherever there were early Christian witnesses and communities, they were all united in believing and acknowledging the risen Lord (I Cor. 15:11).

The forms and ideas in which this faith found expression were various. According to the oldest view, Jesus' Resurrection meant his exaltation to divine lordship and was not necessarily connected with the tradition of the finding of the empty tomb, as the Gospels variously relate it. The theory of the resurrected one's having walked on earth for 40 days and only subsequently ascending into heaven is only found in Acts (1:3). Thus, there exists an undeniable tension between the unequivocal nature of the Easter *message*, on the one hand, and the equivocal nature of the Easter *accounts* and the historical problems connected with them, on the other. But the phenomenon of the whole Gospel tradition, rightly understood, is an expression of the faith in the living Christ without which neither a single word or deed of Jesus nor his Passion would have been handed down at all. The New Testament tradition does not aim at preserving the memory of Jesus as a figure of the past and telling only who Jesus *was*, but it wants to proclaim who Jesus is.

It may seem surprising that the question of Jesus' awareness of being the Messiah has been scarcely discussed in this article, let alone been given a precise answer. Usually, decisive significance is assigned to this question. Many scholars believe that access to the historical Jesus is only to be gained through the fact that Jesus had such an awareness in association with particular titles, such as Son of God, Son of man, and Messiah. In just the same way, they believe that the rise of the early Christian faith can only be understood by the same means. In light of the fact that the Gospels portray Jesus as the Christ (Greek term for the Messiah) and that numerous other titles of a similar kind are also found in them, the importance of this question is not to be underestimated. But it must nevertheless be noted that the Gospels are interested in the fact that Jesus was and is the Messiah, but not in his "consciousness" and inner development in a modern sense. The stories of Jesus' Baptism, temptation, and Transfiguration, for example, are not reports of experiences. But the question of whether Jesus applied one or several of those titles to himself still needs to be examined carefully, for each of them implies thoughts and concepts that must be of considerable relevance for his preaching and ministry. On this question, the opinions of scholars diverge widely, but it is uncontested that Jesus related his mission and activity in a unique way to the dawn of the Kingdom of God. It is another—and doubtful—question, however, that he expressed this understanding of himself through any traditional title.

Jesus' use of messianic titles

Three observations are important for the discussion of these problems. Firstly, in the incontestably authentic texts in the Synoptics, Jesus never makes his own status a special topic of his teaching or the recognition of his rank a condition of salvation. Secondly, it is not only presumed but—by means of a comparison of the parallel texts and their modification from one Gospel to the next—often capable of proof and, in other cases, requiring to be assumed that the faith of the later church has had a major influence on the formation of the Christological texts. A third observation is also not without its importance. Wherever in such texts Jesus talks about the Messiah and the Son of David, the Son of man, the Son of God, and the Lord, there is never any indication that he is using these titles in a completely new sense. The meaning they have, however, is no longer congruent with the ideas that Jesus' contemporary hearers must have connected with the titles, to the extent that they were not completely unknown to them. Because the historical Jesus indubitably wanted to be understood, the critical question necessarily arises about texts of this kind reflecting the views of the later church and its environment.

Views about traditional messianic titles

Some of the traditional titles could not possibly have been used by Jesus with reference to himself. In those days his hearers could only have understood "Messiah" or "Son of David" in the political or national sense, which conflicted with Jesus' intentions. Also, the exclusive title "Son of God" must have been incomprehensible to the Jews of Palestine, although not to the later hearers of the Christian missionary preaching in the non-Jewish, Hellenistic world. The same applies to the expression "the (divine) Lord," which for Jews was reserved for God alone. Some scholars believe that Jesus understood himself to be the suffering servant of God, of whom Isaiah 53 speaks. But in the Gospels reference is hardly made to this important chapter. The sole passage (Mark 10:45) does not, at least in the form handed down, reproduce an authentic saying of the Lord but contains an interpretation of Jesus' death that goes back to the Greek-speaking Jewish Christian Church.

Thus, the problem is narrowed down to the question about Jesus' calling himself the "Son of man." This concept, which is frequently found in his statements about himself, is a title of sovereignty. It stems from Jewish apocalypticism and means not a normal human being but, rather, the mythical figure of the Judge of all the world, who will come on the clouds of heaven at the end of the days (Dan. 7:13ff.; etc.). An early group of Jesus' sayings (Mark 13:26; 14:62; Matt. 24:27) speaks of the Son of man in this eschatological, future sense and always in the third person, yet in some texts in such a way that Jesus does not explicitly identify himself with this Son of man (Mark 8:38; Luke 9:26; 12:8ff.). Two other groups of sayings speak of him quite differently. One speaks exclusively of his suffering, dying, and rising again in accordance with the will of God (Mark 8:31; 9:31; 10:33ff.); the other, of his authoritative work and wanderings on earth (Mark 2:10–28; Matt. 8:20; 11:19), both without a view of the Last Judgment. No Jewish hearer of Jesus could have recognized the apocalyptic Son of man in these sayings. Loosed from the ideas traditionally linked with it, the concept has here been given completely new contents in a retrospective view of Jesus' ministry and end. Thus, both of these groups of sayings are only to be understood from the point of view of the later church. Therefore, only some sayings of Jesus of the first group probably come into question as authentic ones. If Jesus spoke of the coming Son of man, those sayings prove he was speaking in the apocalyptic language and concepts of his day in order to express the promise that his disciples' loyalty to him will be recognized and confirmed in the Last Judgment. The relation of his earthly person to the figure of the coming Judge is not thereby made the subject of reflection. The Jesus tradition has gone through a process of modification, and the faith of the later church has made a major contribution to the formation of the tradition, whatever its precise extent may be.

The post-Easter message of salvation

In the post-Easter message of salvation, the eschatological here and now belongs inseparably to Jesus' message of the Kingdom of God and was being realized in him. In the face of unbelief and doubt, the Gospels do not just offer an account of the history of Jesus as it transpired, but they interpret it as God's history with the world, as the decisive, redemptive, and ultimate act and word of God for the world. All titles of sovereignty that faith has assigned to Jesus express the fact that in him the turning point of the ages, the inauguration of salvation. and the nearness and presence of God have arrived. The special character of the Gospel tradition should therefore be understood in this sense. This tradition has not replaced the historical Jesus with a mythical Christ but has made explicit the Christology that was secretly implicit in Jesus' words, works, and way, although without titles of sovereignty and supernatural traits. The question appropriate to the Gospel tradition would, therefore, not be about what has happened to Jesus of Nazareth in the course of the development but, rather, why the first Christians held fast to him. To ask in this way and to accept the answer of the Gospels are matters for faith. It goes beyond the limits of historical research. (G.Bor.)

BIBLIOGRAPHY

Times and environment: BO REICKE, *Neutestamentliche Zeitgeschichte* (1964; Eng. trans., *The New Testament Era*, 1968).

The life and ministry of Jesus: Valuable surveys of premodern material are provided by R.M. GRANT, *The Earliest Lives of Jesus* (1961), for the early patristic period; and HARVEY K. MCARTHUR, *The Quest Through the Centuries* (1966), especially for the 14th and 16th centuries. Modern historical study of the Gospels dates from the 18th century and was characterized in the 19th and early 20th centuries by the Life-of-Jesus movement. The literature is authoritatively surveyed in ALBERT SCHWEITZER, *Von Reimarus zu Wrede* (1906; 3rd ed., 1954; Eng. trans., *The Quest of the Historical Jesus*, 1910); and C.C. MCCOWN, *The Search for the Real Jesus* (1940). MAURICE GOGUEL, *La Vie de Jésus* (1932; Eng. trans., 1933), is a late biography especially valuable for the inclusion of detailed evidence frequently assumed in subsequent works. JOSEPH KLAUSNER, *Jesus of Nazareth* (1925; Eng. trans. from the first Hebrew ed., 1922), remains important for its collection of relevant rabbinic materials. S.J. CASE, *Jesus: A New Biography* (1927. reprinted 1968), in spite of its title, is a socio-historical treatment of the subject that had already moved away from the biographical format. More recent lives include VINCENT TAYLOR, *The Life and Ministry of Jesus* (1954); ETHELBERT STAUFFER. *Jesus: Gestalt und Geschichte* (1957; Eng. trans., *Jesus and His Story*, 1960); and DAVID FLUSSER, *Jesus* (1968; Eng. trans., 1969). The first half of the 20th century witnessed a marked decline in the appearance of biographies and studies of the historical Jesus. Several factors contributed to the decline, of which the most important was the rise of form criticism in the first quarter of the century as exemplified in MARTIN DIBELIUS, *Die Formgeschichte des Evangeliums*, 2nd ed. rev. (1933; Eng. trans., *From Tradition to Gospel*, 1934); and RUDOLF BULTMANN, *Die Geschichte der synoptischen Tradition*, 3rd ed. (1958; Eng. trans., *The History of the Synoptic Tradition*, 1963). RUDOLF BULTMANN, *Jesus* (1926; Eng. trans., *Jesus and the Word*, 1934), presents a so-called encounter with the message of Jesus, but without sharp differentiation of that message from the church's "earliest tradition." The period 1950–70 produced a resurgence of interest in the historical Jesus. Stimulus for the resurgence is often credited to a paper by ERNST KASEMANN, "The Problem of the Historical Jesus," in W.J. MONTAGUE (trans.), *Essays on New Testament Themes* (1964). The "new quest," as it came to be called after JAMES M. ROBINSON, *A New Quest of the Historical Jesus* (1959), arose as a question concerning continuity between Jesus and his message, on the one hand, and the early church's proclamation of Christ, on the other. Some of the alternative positions concerning the possibility of a biography of Jesus may be seen in CARL E. BRAATEN and ROY A. HARRISVILLE (eds.), *The Historical Jesus and the Kerygmatic Christ* (1964), a collection of essays by major figures. Distinctive positions are to be found in ERNST FUCHS, *Zur Frage nach dem historischen Jesus* (Eng. trans., *Studies of the Historical Jesus*, 1964); JOHN KNOX, *The Church and the Reality of Christ* (1962); HUGH ANDERSON, *Jesus and Christian Origins* (1964); and LEANDER E. KECK, *A Future for the Historical Jesus* (1971). Accurate popular presentations are in HEINZ ZAHRNT, *Es begann mit Jesus von Nazareth* (1960: Eng. trans.. *The Historical Jesus*, 1963); and in the moderately conservative JOACHIM JEREMIAS, *Das Problem des historischen Jesus* (1960; Eng. trans., *The Problem of the Historical Jesus*, 1964). The entire trend of Gospel study since the rise of form criticism is challenged by BIRGER GERHARDSSON in *Memory and Manuscript* (1961), who argues that Jesus himself taught his disciples, in the manner of a Jewish rabbi, to memorize and transmit traditions in a fixed form. J. ARTHUR BAIRD, *Audience Criticism and the Historical Jesus* (1969), explores the use of the computer in literary analysis but is somewhat ambiguous with respect to total historical methodology. The standard contemporary study is GUNTHER BORNKAMM, *Jesus von Nazareth* (1956; Eng. trans., 1960).

The message of Jesus: Many of the titles listed in the preceding section include discussions of the teachings of Jesus. NORMAN PERRIN, *Rediscovering the Teaching of Jesus* (1967), is the important technical introduction. T.W. MANSON, *The Sayings of Jesus* (1949), is a valuable commentary on the so-called Q material. Since JOHANNES WEISS, *Die Predigt Jesu vom Reiche Gottes* (1892; Eng. trans., *Jesus' Proclamation of the Kingdom of God*, 1971). it has been recognized that the eschatological Kingdom of God was the centre of Jesus' message. Whether the message implied a wholly futuristic expectation, a "realized" eschatology, or a future kingdom with present manifestations is still discussed. Convenient summaries of alternative interpretations are presented in NORMAN PERRIN, *The Kingdom of God in the Teaching of Jesus* (1963): and GOSTA LUNDSTROM, *The Kingdom of God in the Teaching of Jesus* (Eng. trans. 1963). Perrin's work also includes a survey of interpretations of the phrase Son of man and other titles related to Jesus' vocation. Representative recent studies include W.G. KUMMEL, *Verheissung und Erfüllung*, 2nd ed. (1953; Eng. trans., *Promise and Fulfillment*, 1957); RUDOLF SCHNACKENBURG, *Gottes Herrschaft und Reich* (1959; Eng. trans. *God's Rule and Kingdom*, 1963); GEORGE ELDON LADD, *Jesus and the Kingdom* (1964), written from a conservative perspective; and H.E. TODT, *Der Menschensohn in der synoptischen Überlieferung* (1959; Eng. trans.. *The Son of Man in the Synoptic Tradition*, 1965). Modern investigation of the parables derives from C.H. DODD, *The Parables of the Kingdom*, rev. ed. (1961). The definitive work is JOACHIM JEREMIAS, *Die Gleichnisse Jesu*, 6th ed. (1962; Eng. trans., *The Parables of Jesus*, rev. ed., 1963). DAN O. VIA, *The Parables* (1967), is one of several recent books in which literary critical insights are employed to advance interpretation beyond strictly historical critical study. ETA LINNEMANN, *Gleichnisse Jesu*, 3rd ed. (1964; Eng. trans.. *Jesus of the Parables*, 1967), advances views along the lines proposed by Ernst Fuchs. MARTIN DIBELIUS, *The Sermon on the Mount* (1940); HANS WINDISCH, *Der Sinn der Bergpredigt*, rev. ed. (1937: Eng. trans., *The Meaning of the Sermon on the Mount*, 1951); and W.D. DAVIES, *The Setting of the Sermon on the Mount* (1964). offer varying interpretations of the most familiar body of Jesus' teaching.

The sufferings and death of Jesus: EDUARD LOHSE, *Die Geschichte des Leidens und Sterbens Jesu Christi* (1964; Eng. trans., *History of the Suffering and Death of Jesus Christ*, 1967), provides a convenient overview of the problems. Of the massive recent literature on the trial and Crucifixion. JOSEPH BLINZLER, *Der Prozess Jesu*, 2nd rev. ed. (1955; Eng. trans., *The Trial of Jesus*, 1959); and PAUL WINTER, *On the Trial of Jesus* (1961), have been very influential. The range of scholarly opinion about the trial is well represented by eight responsible essays in *Judaism*, 20:6–74 (1971).

The story of Jesus and faith in Jesus: REGINALD H. FULLER. *The Mission and Achievement of Jesus* (1954) and *The Foundations of New Testament Christology* (1965), partly because of the author's shift in viewpoint, exhibit a range of opinion on the relation of Jesus' sense of vocation to the church's Christology. A more difficult study is that of FERDINAND HAHN, *Christologische Hoheitstitel* (1963; Eng. trans., *The Titles of Jesus in Christology*, 1969).

(M.J.Su.)

Jet Engine

A jet engine is a cigar-shaped propulsion device that draws in air from the atmosphere, compresses it, heats it by combustion with a fuel, and ejects the resulting gases with sufficient force that the reaction produces a substantial thrust in the opposite direction. While the same principle can be used with other fluids—for example, water ejection to propel a boat—the term jet engine normally refers to an air-breathing device. It is distinct from a rocket engine, which also produces thrust by ejecting gas, but all of whose fuel elements are stored within the fuel supply.

This article deals with the jet engine used in aircraft, whose introduction in the 1940s and '50s produced radical changes in military and civil aviation. Previously, aircraft propulsion had been by means of a piston engine whose reciprocating motion produced intermittent bursts of power that had to be converted by mechanical means to a rotating crankshaft and thence to a propeller. A jet engine reduces this cumbersome process to a much simpler one, resulting in a much smaller and lighter power plant. In addition, the jet engine eliminates the restriction on power output imposed by the propeller, opening the way to significant increases in aircraft speed, size, and operating altitudes.

Early developments

Like many other inventions, jet engines were envisaged long before they became a reality. The earliest proposals were based upon adaptations of piston engines and were usually heavy and complicated. The first to incorporate a turbine design was conceived as early as 1921, and the essentials of the modern turbojet (see below) were contained in a patent in 1930 by Flight Lieut. (later Sir) Frank Whittle in England. His design was first tested in 1937 and achieved its first flight in May 1941. In Germany, parallel but completely independent work followed issuance of a patent in 1935. It proceeded more rapidly, and the very first flight of a turbojet-powered aircraft, a Heinkel He 178, came in August 1939. By the end of World War II, these prototype aircraft had developed into a few operational turbojet squadrons in the German, British, and American air forces.

In the military area, jet fighter aircraft developed rapidly and were in use during the Korean War (1950–53), flying at speeds of 600 miles (1,000 kilometres) per hour. During the next decade they overcame the sound barrier and established normal operations up to more than twice the speed of sound (Mach 2). Bomber and transport jet aircraft were also able to reach and cruise at supersonic speeds—*i.e.*, speeds greater than the speed of sound.

The first civil jet transport, the British de Havilland Comet, flew in 1949 and regular transatlantic jet services were started in 1958 with the Comet 4 and the American Boeing 707. By 1974 more than 90 percent of hours flown throughout the world were flown by jets; the first supersonic airliner, the Anglo-French Concorde, flying at more than twice the speed of sound, entered regular service in January 1976.

The jet engine has developed along several different but clearly related lines, which can be classified broadly as turbojet, fan-jet, turboprop, and other types.

TYPES OF JET ENGINES

Turbojet. *Operating principles.* The turbojet is an internal combustion engine in which the fuel is burned inside the engine and the heat energy released is converted to mechanical energy. In the process, the working fluid undergoes a cycle of pressure and temperature changes, starting with compression of atmospheric air, followed by the addition of heat by combustion of the fuel at a nearly constant high pressure, the expansion of the products of combustion during which the heat energy is converted to mechanical or kinetic energy, and final exhaust at a fixed low pressure. The elements of an engine needed to achieve this cycle are shown in Figure 1, with typical changes in the temperature, pressure, and velocity of the working fluid as it passes through the engine.

The thrust developed derives from the momentum of the exhausted gas. Since momentum is the product of mass times velocity, it is significant that the gas is greater in mass and has substantially greater velocity than the air taken in. The net thrust achieved by a jet engine is the result of the difference between the mass times the velocity of the ejected combustion products and the mass times velocity of the incoming air.

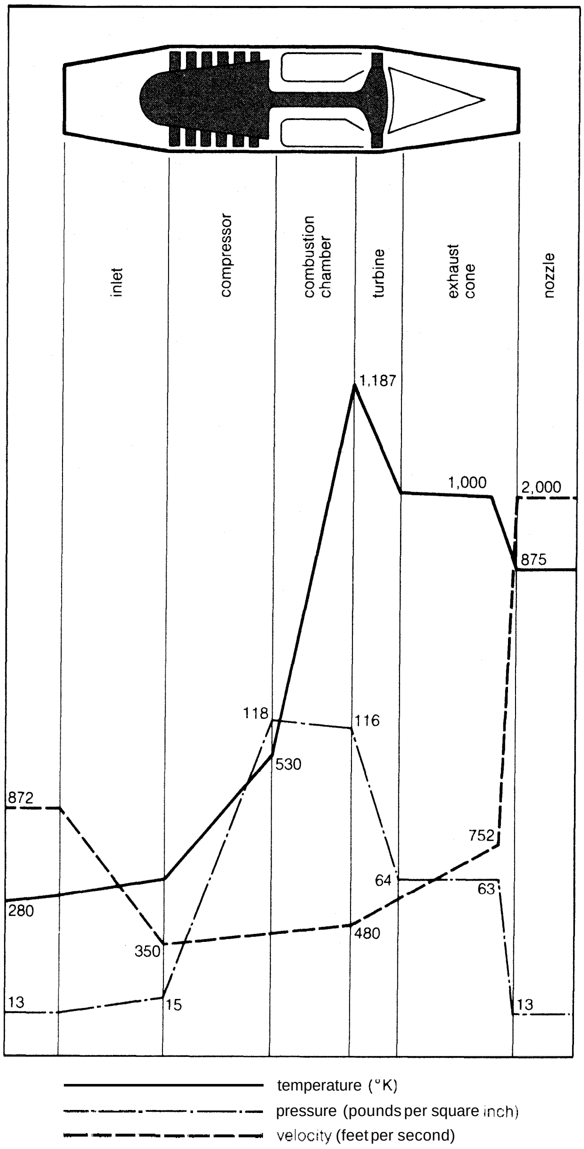


Figure 1: Cross section of a turbojet and (below) graph of typical operating conditions for its working fluid.

This is expressed in the equation

$$F=\frac{1}{g}\,(m_gV_j)-\frac{1}{g}\,(m_aV)$$

in which F is the engine net thrust in pounds; m_g is the flow rate of gas leaving the nozzle in pounds per second; m_a is the flow rate of air entering the inlet in pounds per second; V_j is the velocity of the exhaust jet in feet per second; V is the velocity of the air at inlet in feet per second; g is the gravitational constant of 32.2 feet per second per second.

Other things being equal, thrust will be increased by increases in either the mass of the ejected gas or its velocity or both; this is the basis of all changes to improve performance of the simple jet or its derived forms.

Principal components. Turbojet components and their functions, unlike those of the piston engine, are distinct and can be described and analyzed individually: (1) Inlet: The velocity of the incoming air relative to the engine depends on flight conditions, especially speed and altitude of the aircraft. It may vary from zero to much greater than the speed of sound. The air inlet is provided with control devices to adjust this velocity to values acceptable to the compressor. (2) Compressor: The early Whittle turbojets used centrifugal compressors, in which the air is forced radially outward by whirling blades, like the water in a centrifugal pump. Such an arrangement was found to suffer from low efficiency and required a compressor of awkwardly large diameter; it has since been superseded by the axial-flow compressor in which the air is forced through several rows of alternately fixed and moving blades. Each row of blades increases pressure moderately; the overall effect is a substantial increase in pressure and the configuration is well suited to engine design. Aerodynamic limitations in accelerating the engine arise when pressure ratios of the order of 7:1 are reached, but these can be overcome by such modifications as "blow-off" valves and variable settings for the stationary blades. Alternatively, and more usually, the restriction is avoided by using two independently driven compressors in series. They are referred to as low-pressure and high-pressure units and their combined pressure ratio may be 25:1 or more. (3) Combustion chamber: The combustion chamber ensures that the energy of the fuel is converted to heat energy and added to the compressed air to produce high-temperature gas. It is required to do this over a wide operating range, with maximum efficiency and minimum pressure drop, within a limited volume and without large temperature variations across the outlet. The temperature rise is generally of the order of 600"–700" C (1,100"–1,300" F) and the outlet gas temperature, depending upon engine design requirements, is in the range 927" to 1,177" C; (1,701" to 2,151° F). Because of the engine layout, an annular (ring) form of combustion chamber is most logical, but it was only extensively adopted in the 1960s because of earlier development, production, and assembly problems. (4) Turbine: The turbine, in its simplest form, consists of a rotating disk (rotor) with blades or "buckets" mounted on its rim and a ring of stator blades or nozzles upstream. Its purpose is to drive the compressor. The high-pressure gas from the combustion chamber flows through the nozzles and by impingement on the rotor blades imparts its energy to them. The energy may be transferred purely by a change of gas velocity and direction through the blades or by a change of both velocity and pressure. The former is known as an impulse effect and the latter as a reaction. In practice the rotor is designed to produce a combination of the two effects. In order to obtain greater power output, the gas may additionally pass through a second or third stage fixed to the same rotor or, when driving a separate compressor, through an independent stage. (5) Exhaust cone and propelling nozzle: The final element is the exhaust cone and propelling nozzle in which the residual gas energy is converted to kinetic energy and ejected in a high-velocity jet. This component may also contain silencing devices, a thrust-reversing mechanism, and variable-area nozzles.

Advantages of axial-flow compressor

The compressor, combustion chamber, and turbine are together referred to as the gas generator. They form the basis of all variations of turbojet engines. The gas generator pumps energy into the air by compression and combustion, but more than 60 percent of this is extracted again by the turbine driving the compressor. Only the remainder is available for external work.

Performance. The main criteria of turbojet performance are thrust F (in pounds or kilograms), fuel consumption Q_f (in pounds or kilograms per hour), and engine weight W (in pounds or kilograms). These are assessed as specific thrust—thrust divided by engine airflow rate (F/m_a pound per pound per second), specific consumption (Q_f/F pound per pound per hour), and specific weight (W/F pound per pound).

These performance characteristics depend on the maximum gas pressure and temperature developed in the engine, the separate efficiencies of the various engine components, the mechanical design and the external flight conditions of velocity, ambient temperature, and altitude. Increasing maximum temperature increases the specific thrust and increasing the pressure ratio improves specific consumption, but in combination they reach optima at different values. Design is, therefore, a compromise the direction of which depends on whether thrust or consumption is the major consideration. Improvements in pressure ratio were achieved, first by adding more stages to both compressor and turbine and later by using two independent rotor systems. Increases in temperature have relied upon the development of improved high-temperature materials, and recently, the introduction of turbine-blade cooling techniques. These have raised engine design temperatures from 750" to 1,177" C (1,400" to 2,151" F) and it is anticipated that future designs will reach higher than 1,377" C (2,511" F).

Reduction of specific weight

In parallel with these improvements specific weight has been reduced from more than 0.5 pound per pound of thrust in early engines to about 0.2 pound per pound in modern engines. In some special engines designed for vertical takeoff operations values lower than 0.1 pound per pound have been achieved.

The effect of altitude is to decrease thrust because of the lower density of the air entering the engine. This reduces the mass flow and hence the jet momentum. In the same way, forward speed increases the momentum of the air entering the engine and reduces the thrust. At the same time the greater kinetic energy of this air, converted to pressure energy, tends to increase thrust. The differential effect is first a fall and then an increase in thrust. This continues until the temperature rise, which accompanies the increase in pressure, reaches a point at which the fuel added in the combustion chamber must be reduced to avoid exceeding the maximum permissible gas temperature. At this stage thrust begins to drop again, but this only occurs at high supersonic flight speeds.

Though appreciable increases of thrust can be obtained by afterburning or reheating and by water-methanol injection, these procedures are unsuitable for continuous use because of the high additional consumption. Afterburning consists of injecting fuel into the hot gas–air mixture entering the exhaust system so that its temperature is raised still further. This accelerates the gas in the jet and so increases its momentum and the net thrust. It has the advantage that it does not affect the conditions upstream and can produce increase of 40 percent or more in static thrust. This thrust increase becomes proportionately greater with increasing forward speed. Its main disadvantage is the weight and complication of the variable-area nozzle necessary to deal with the greater volume of gas, and a small permanent loss in thrust caused by the combustion equipment.

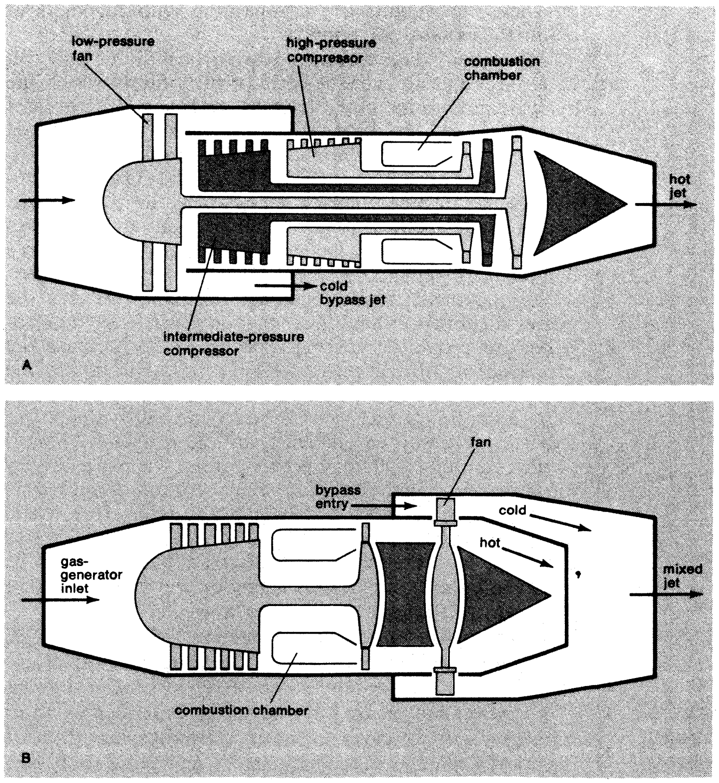

Figure 2: (A) Front fan-jet with separate jets and three independent rotors. (B) Aft fan-jet with mixed jet.

Water-methanol thrust boosting acts, in contrast, by injection at the inlet or immediately after compression. The liquid evaporates and reduces the air temperature, thus increasing density and mass flow. The thrust increase by this means is restricted to about 10 percent and is usually applied at takeoff only.

Fan-jet. In the turbojet, all of the air entering the intake passes through the gas generator, but in the fan-jet only a portion does so. The remainder passes through a fan or low-pressure compressor and is ejected directly as a "cold" jet or mixed with the gas-generator exhaust to produce a "hot" jet (Figure 2). The object of this "bypass" system is to increase thrust without increasing fuel consumption. It achieves its object by increasing the total air-mass flow and reducing its velocity within the same total energy supply.

Bypass ratio

Configuration. The fan-jet may be designed with a front or aft fan as indicated in Figure 2. The former is more usual and the size of fan or compressor depends upon the bypass ratio. For large ratios only one or two fan stages are necessary, but for smaller ratios a higher jet velocity and more compression are required. For a "hot" jet, the pressures of the two streams have to be designed to be the same at the mixing section.

The aft fan has an advantage in that it can be made mechanically independent of the gas generator and coupled only by ducting. It has problems of installation that are more difficult to overcome, and it has not been used extensively.

Performance. The main performance characteristic of the fan-jet is its low specific fuel consumption, which may be 25 percent less than comparable turbojets. Consumption at sea-level takeoff conditions for a 5:1 bypass ratio is of the order of 0.45 pound per pound-hour (pounds per hour for each pound of thrust), increasing for subsonic cruising at high altitude to 0.65 pound per pound-hour. Detracting from this, specific thrust is less than half that of modern turbojets and may be as low as 30 pounds per pound per second. This low figure is due to a large frontal area that can lead to high aerodynamic drag at forward speeds. The engine thrust also decreases rapidly with speed and is, in general, unsuitable for high supersonic flight conditions. The larger diameter and additional power delivered to the fan tend to raise the overall engine weight, but this is balanced by the extra thrust, and engine specific weights are comparable with turbojets at about 0.2 pound per pound.

Turboprop. The turboprop or turboshaft engine can be regarded as an extreme form of turbofan in which the bypass ratio has increased from the order of 5:1 to greater than 50:1, and the residual energy of the hot exhaust jet is reduced to a very minor value. The fan becomes a propeller and is no longer enclosed in a duct. It may be coupled to the turbine on the same shaft as the compressor, as in a single-spool turbojet, or independently, as in a two-spool engine. In the latter case it is described as a "free turbine" engine, and this form of drive permits more flexibility in control. In both cases the rotational speed of the power turbine is much higher than is suitable for the propeller and reduction gearing is necessary. This entails the provision of lubrication and oil cooling and adds to the design complication and weight.

There is a limit to the size of the engine, set by the power that can be absorbed efficiently by the propeller. This is of the order of 4,000 horsepower but may be increased by the use of counterrotating propellers. A more usual way is to couple two engines in tandem through a free wheel device to concentric propellers. In this way if the full power of both engines is not required, part load can be achieved by shutting down one engine and using the other nearer to full load and obtaining a greater efficiency.

Turboprops have a high efficiency at speeds below 500 miles (800 kilometres) per hour. In recent years their application has been chiefly as power units for helicopters.

Turboprop performance

The power output of a turboprop is expressed as shaft horsepower nr in cases in which a useful proportion of the energy remains in the exhaust jet, as equivalent horsepower. The latter is the sum of the shaft power and a theoretical power derived from the assumption that approximately three pounds of residual jet thrust (*F*) is equal to 1 shaft horsepower at takeoff.

The specific consumption of the actual engines is approximately 0.60 pound per hour for each equivalent horsepower at takeoff, but this is with relatively low pressure ratios. In general, designs with pressure ratios comparable to turbofans have not been developed, although these would give specific fuel consumption as low as 0.40 pound per hour for each shaft horsepower. The second characteristic of the turboprop is its high output at low forward speeds, and this may reach more than 160 shaft horsepower for each pound per second of air flowing through the gas generator. The third feature is specific weight, which may be 0.45 pound per equivalent horsepower. Except at low flight speeds this is heavier than the turbojet or turbofan, largely because of the weight of gearing required for the propeller. It is, however, only one-third of the weight of the piston engine it replaces.

When used in helicopters, all reduction gearing is regarded as part of the lifting rotor system and the turboshaft engine specific weight is reduced to the order of 0.25 pound per shaft horsepower.

Special types. ***Ramjet.*** This engine with no major moving parts is probably the lightest and simplest form of air-breathing jet engine. Its application is severely restricted by the fact that its compression ratio depends entirely on its forward speed. It develops no static thrust and very little thrust below sonic speeds. A ramjet aircraft must therefore be brought up to speed by some special launching means, such as another aircraft.

From Figure 3 it can be seen that it has a design similar to a turbojet in which the rotor system has been omitted. Because of this there is not the same limitation on maximum gas temperature, and temperatures beyond 1,930° C (3,510° F) are permissible. These boost the thrust output in the same way that afterburning augments the turbojet thrust, but they carry the same penalty of high specific consumption.

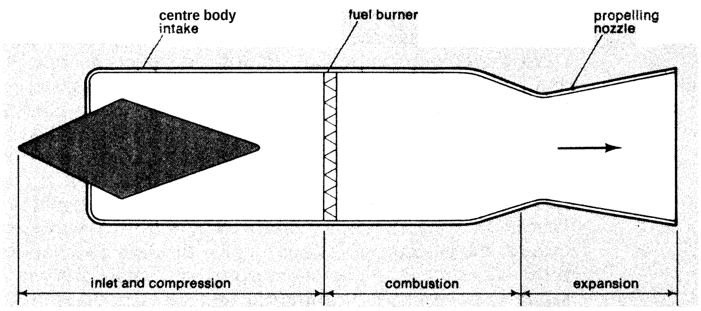

Figure 3: Arrangement of ramjet engine.

Consumption is sensitive to intake efficiency, and performance falls rapidly both above and below the designed speed unless the complications of variable geometry intakes and exhausts are accepted. The result is that the ramjet becomes competitive only at speeds approaching three times the speed of sound and above. Its main application has been in missiles where its low weight and simplicity have advantages.

Turboramjet. Because of the limitations of turbojet engines, primarily associated with speed and the maximum temperature of the rotating components, various forms of hybrid engine have been proposed. One such is the combination of turbojet and ramjet into a single power plant (Figure 4). The turbojet portion supplies static thrust and power for accelerating to supersonic speeds and is then closed off from the air flow, which bypasses it as in the fan-jet. A combustion system like a very large afterburner is operated for this bypass air and the whole engine becomes a ramjet.

This system requires air-flow shutoff mechanisms for the turbine, and a feathering arrangement for the fan blades so that they can be turned out of normal position to minimize drag. Even with these arrangements there are

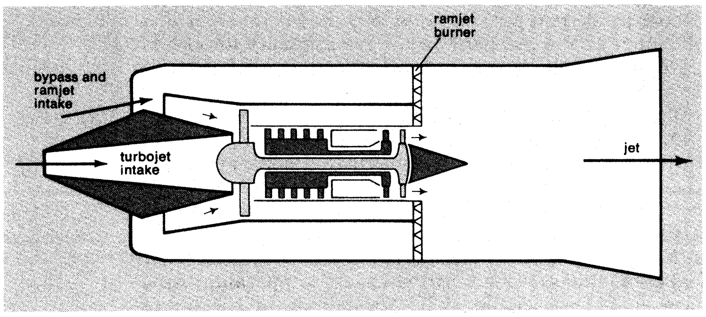

Figure 4: Internal organization of a turboramjet.

some aerodynamic losses in the ramjet operation, in addition to the extra weight. In the early 1970s aircraft speeds did not yet justify development of such an engine.

DESIGN PROBLEMS AND OTHER ASPECTS OF JET TECHNOLOGY

Jet aircraft engines operate under extreme conditions of temperature, pressure, and rotational speed in order to achieve the maximum output and minimum weight. These induce stresses and vibrations and other effects that must be taken into account in a successful design. This is done in two ways—first, by the inspection and maintenance system applied to engines to detect and remove any incipient component failures, and second, by design to limit the risks and consequences of a failure.

Past practice has been to fix the time between overhauls at a conservative figure and increase it in the light of experience. A well-established engine may now be expected to operate for more than 5,000 hours between overhauls. An alternative is to use continuous overhaul or "on-condition" maintenance. By means of built-in inspection equipment and continuous recording instrumentation it is possible to pinpoint any incipient troubles in the engine and take action to overcome them. This is facilitated in the latest designs by a form of module construction that enables major sections of the engine to be removed and replaced while the engine itself remains in its mountings on the aircraft.

The most serious sudden failure that may occur is the breaking of a turbine blade. Due to its weight and the speed of rotation, a turbine blade has great momentum when it breaks away from the rotor and could cause serious damage to anything in the plane of rotation. Design has been successful in reducing this risk by use of a containment shield that stops blades penetrating the engine casing and by ensuring that no vital fuel or oil pipes are in the plane of the blades.

Hazards from birds and icing

At the compressor end, there is a risk of foreign bodies being drawn into the intake and striking the compressor blades. The most likely object to be ingested is a bird, and all engine designs have to be strong enough to withstand the entry of a heavy bird at high speed without catastrophic effect on the compressor blading. A similar problem is created by icing conditions in which ice is deposited on the stationary parts of the intake and compressor guide vanes. In addition to reducing the air-flow area and thus reducing thrust, any ice that breaks off will enter the compressor. Protection is by anti-icing equipment, usually in the form of heat supplied to the sensitive area.

With the development of large engines, noise has become a serious nuisance and legislation to restrict it has been established in many places. There are two major noise sources in the jet engine—high-frequency noise from the compressor and low-frequency noise from the jet. The latter predominates at takeoff and the former during landings. Much of the compressor noise can be suppressed by lining the intake with sound-absorbing materials. Jet noise is largely a function of velocity and the most effective way to reduce it is by lowering the jet velocity. For pure turbojets this reduces the performance seriously but in fan-jets considerable noise reduction is possible without loss of performance.

Jet fuel. The fuel used in the earliest turbojets, domestic paraffin (kerosene), still remains the basis of all jet fuels. It is a liquid hydrocarbon similar to gasoline, but with some variations in physical properties. Gasoline is derived from crude petroleum by distillation within a limited temperature range (25°–150° C; 75°–300° F), but for kerosene this range is higher (150"–265" C; 300°–510" F). The effect of this is to endow kerosene with a higher flash point (temperature at which the fuel ignites), a higher freezing point, and higher specific gravity (weight per unit volume). The first of these ensures that kerosene will be much safer in accident conditions but presents slightly more difficult combustion problems, which are often manifested by smoke in the exhaust jet. The second produces difficulties when an aircraft is operating at low ambient temperatures for prolonged periods, and the third gives an advantage in the weight of fuel available from a fixed fuel-tank capacity. Since the calorific (heat) value of both fuels is almost the same, kerosene thus has almost 10 percent greater range or endurance.

Advantages of kerosene

Attempts have been made to develop higher calorific value fuels both chemically and by additives, but increases have usually been accompanied by uneconomical costs.

High-temperature materials. The continued improvement in turbojet performance over the years is, in large measure, due to operation at higher temperatures. This, in turn, has been made possible by the development of materials capable of withstanding stresses at the higher temperatures. The most highly stressed parts of the engine are the rotating components, and of these the turbine blades are subjected to the highest temperatures. They are required to resist oxidation, maintain strength, especially against fatigue. avoid embrittlement, and have reasonable hot-working and machining properties for manufacture. It was discovered early that nickel–chromium base alloys were better than steels and a series of alloys with approximately 80 percent nickel and 20 percent chromium were used. Improvements in these have permitted maximum gas temperatures to rise by an average of approximately 10" C (18" F) each year since the earliest days, but a limit to these alloys has now been reached. Cast, instead of forged, materials have extended the range up to over 1,025" C (about 1,880" F), but beyond that either cooling or refractory materials are necessary. Cooling has allowed the maximum gas temperature to be raised a further 200" C (360" F) without metal temperature rising. Molybdenum, tungsten, and niobium alloys could operate with higher surface temperatures, but all the associated problems have not yet been solved.

Turbine disks

Turbine disks, while not exposed to the direct impingement of hot gases, are subject to temperatures approaching 625" C (1,160" F) at their rims while their hubs may be some 450" C (800" F) lower. To overcome the resultant stresses the disks are always machined from forgings and the best materials are found to be steels with high nickel–chromium content.

Although compressors are at the air-entry end of the rotor system, blades are subject to increasing air temperature as flight speed increases and the compression ratio rises: temperatures of nearly 400" C (750" F) can be reached. Normally, aluminum alloy is used for the blades, but this begins to lose strength above 180" C (360" F), and it is necessary to change to steel in some high-pressure stages, resulting in an increase in weight. Efforts to reduce weight, particularly in the larger fan blades now being used, have led to the use of titanium and experiments with nonmetallic carbon-fibre material. Both of these are expensive but may be used increasingly in the future.

Future developments. Neither military nor civil aircraft designs appear to have reached their limits and turbojet engines can be expected to continue development along the lines followed steadily since their introduction. First, greater thrust without comparable increases in weight and size will be required together with operation at higher supersonic flight speeds and altitudes (at least for military aircraft), and second, greater economy and cheaper maintenance for airline operations.

In technical terms this will involve refinements of design rather than major changes, as performance approaches more closely to that of the ideal cycle. It is probable that pressure ratios will rise from the present 25:1 to 40:1, that bypass ratios will rise from 5:1 to 10:1, and that maximum gas temperature will rise from 1,450" to 1,800" K (1,180" to 1,525" C; 2,150" to 2,780" F) by the 1990s. There will also be significant but relatively small improvements in the efficiency of compressors, turbines, and combustion systems. Together, these will result in engines with specific fuel consumptions 15 percent less than the present best, with similar reductions in specific weight. Some of the weight reduction will arise from the introduction of new composite nonmetallic materials. It may be foreseen that engines having 50 percent more thrust than in the early 1970s will be built, and others designed, for operation at 3.5 times the speed of sound. In many cases the servicing and maintenance will be largely assessed by computer records, and a new concept of engine life will be established. Finally, assisted by the rise of higher bypass ratios and intensive research, a substantial reduction in noise levels will be achieved.

(A.D.B.)

Jet Streams

Atmospheric jet streams were discovered toward the end of World War II by U.S. bomber pilots over Japan and by German reconnaissance aircraft over the Mediterranean. The World Meteorological Organization defines a jet stream as a strong, narrow air current that is concentrated along a nearly horizontal axis in the upper troposphere or stratosphere (10 to 50 kilometres altitude), characterized by wind motions that produce strong vertical and lateral shearing action, and featuring one or more velocity maxima. Normally a jet stream is thousands of kilometres long, hundreds of kilometres wide, and several kilometres deep. The vertical wind shear is on the order of five to ten metres per second per kilometre, and the lateral shear is on the order of 5 m/sec per 100 km. An arbitrary lower limit of 30 m/sec is assigned to the speed of the wind along the axis of a jet stream.

With abundant radiosonde data now available over the Northern Hemisphere it is possible to map the jet streams in the upper troposphere (near 10 to 12 kilometres) in their daily occurrence and variation and to forecast them reasonably well with numerical prediction techniques. Upper-air information from the Southern Hemisphere is still sparse. Constant-level balloons (the so-called GHOST balloons) and satellite information on temperature structure and characteristic cloud formations in the atmosphere are serving to close the data gap on the global jet stream distribution.

The strongest winds known in jet streams have been encountered over Japan, where speeds up to 500 kilometres per hour (close to 300 knots) occur. A persistent band of strong winds occurs during the winter season over this region, flowing from the southwest and leading tropical air from northern India into juxtaposition with polar and Arctic air from Siberia. A similar region of confluence of air masses with vastly different temperatures exists over the central and eastern United States, leading to a maximum frequency of occurrence of jet streams during winter and spring (Figure 1).

The main impact on weather and climate (*q.v.*) comes from two distinct jet stream systems: the Polar-Front Jet Stream, which is associated with the air-mass contrasts (the fronts) of middle latitudes and which gives rise to the formation of squalls, storms, and cyclones in this latitude belt; and the Subtropical Jet Stream, which lies over the subtropical high-pressure belt, and which is characterized by predominant subsidence motions and, hence, by fair weather. During summer a belt of strong easterly winds is found over Southeast Asia, India, the Arabian Sea, and tropical Africa. This tropical, easterly jet stream is tied in with the weather disturbances of the Indian and African summer monsoons and their heavy rainfalls.

Because of their strong winds, jet streams play an important role in the economy of air traffic. Head winds must be outlasted by extra fuel, which takes up useful cargo space. Clear air turbulence (CAT) is often associated with the strong vertical wind shears found in the jet stream region. It is a hazard to passenger and crew safety, and, because of the increased stresses on the air frame, it decreases the useful life of the aircraft.

From Kao and Hurley, *Journal of Geophysical Research*, vol. 67, pp. 4235-36 (1962)

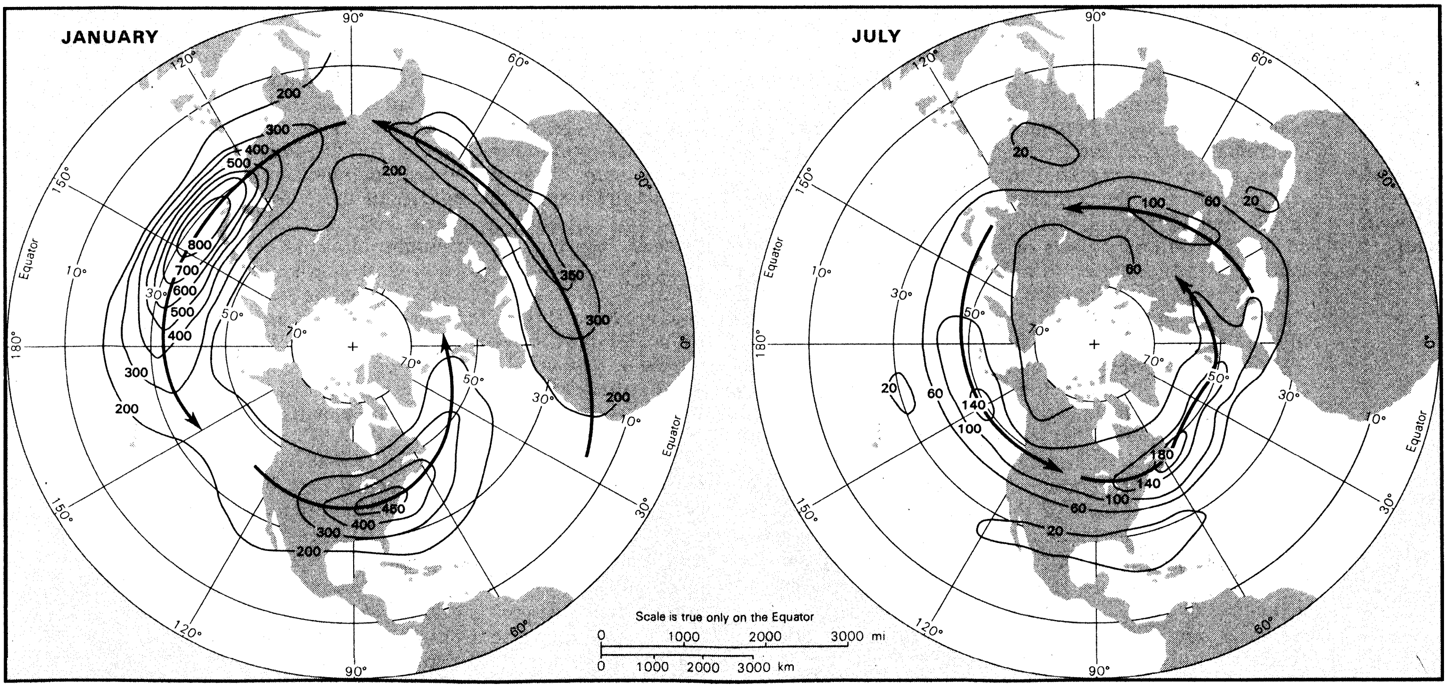

Figure 1: Mean kinetic energy in kilograms per metre per second at 300 millibars during January and July. Heavy lines and arrows indicate jet axes.

Jet streams are characteristic of a heat-driven circulation between Equator and pole that takes place in a rotating coordinate frame. Ocean currents, such as the Gulf Stream or the Kuroshio, bear a striking similarity to atmospheric jet streams, even though the wind-driven circulation in the trade-wind belt is of greater importance in their generation than the heat exchange between low and high latitudes.

This article treats the characteristics, properties, occurrence, and mode of formation of jet streams. For information on the general role of the jet stream in meteorology, see WINDS AND STORMS; CYCLONES AND ANTICYCLONES; CLIMATE; MONSOONS; and HURRICANES AND TYPHOONS. See also ATMOSPHERE and, for information on similar phenomena in water, OCEAN CURRENTS.

THE CAUSE AND FORMATION OF JET STREAMS

Relative motion of air parcels

The ultimate source of the kinetic energy that is concentrated in the jet streams is the positive radiation balance in the tropics and the negative balance in polar regions. For stable climatic conditions, heat transport from the Equator to the poles is required. On a non-rotating earth this would lead to a direct circulation between low and high latitudes, defined as a circulation that releases potential energy by the rising of warm air and the sinking of cold air and subsequently converts it to kinetic energy of air motions. In such a direct, or Hadley, circulation warm air would rise in the tropics, would move poleward near the top of the planetary layer in which strong convective mixing occurs, sink again at high latitudes, and then move equatorward near the earth's surface (Figure 2). This layer of convective mixing is called the troposphere. Its upper boundary is the tropopause. On a rotating earth the motions described above, forced by the necessity of heat transport between Equator and pole, must transport absolute angular momentum This quantity is defined as $M = \omega r^2$ in which ω is the angular velocity of a rotating point, r is the radial distance from its axis of rotation, and M is the angular momentum. An air parcel at the Equator that rotates together with the solid earth has a rate of rotation $\omega = 7.292116 \times 10^{-5}$ radians per second and a radial distance from the earth's axis equivalent to the earth's radius $R = 6{,}371$ km. If the air parcel rotates with the solid earth, there will be no wind because the parcel does not move relative to the earth.

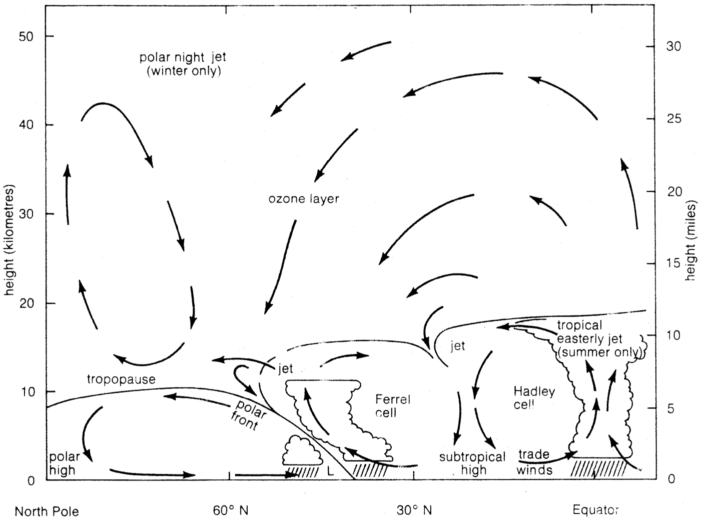

Figure 2: Positions of jet streams in the atmosphere. Arrows indicate directions of mean motions in a meridional plane.

If the air parcel under consideration is forced by heat convection to rise to the tropopause (16 to 18 km in height over the Equator), its radial distance from the earth's axis will increase slightly. In the absence of external forces such as pressure forces or frictional drag, the air parcel would conserve its absolute angular momentum as given by the above equation. For this reason, its angular velocity would have to decrease in order to compensate for the slight increase in radius. The parcel, in other words, would rotate more slowly from west to east than the solid earth underneath. The motion of the air parcel relative to the earth, therefore, would constitute a weak east wind.

During its poleward journey near the tropopause, the air parcel would be subject to shrinking radial distances from the earth's axis because of the spherical shape of the earth. Thus if M is to remain constant in the above equation, the decrease in r has to be compensated by an equivalent increase in ω. The parcel will rotate faster than the earth. and the difference will increase as the parcel moves farther poleward. Because the radial distance from the axis of rotation decreases with the cosine of latitude (φ), the expression for absolute angular momentum may be written as

$$M = (\omega_e + \omega)R^2 (\cos \varphi)^2,$$

in which ω_e is the angular velocity of the solid earth, ω is the angular velocity of the air motion relative to the earth's rotation, and R is the radius of the earth. It may be seen from this equation that a relatively short meridional displacement of an air parcel under conservation of absolute angular momentum will lead to strong westerly winds. An air parcel starting at 30° N latitude with zero westerly speed, for example, and traveling to 40° N under conservation of absolute angular momentum, will arrive at this new latitude with a west-wind component of 99 m/sec or 192 knots.

This example shows that the circulation ensuing from the poleward transport of heat and its associated transport of absolute angular momentum will generate a strong jet stream in subtropical latitudes. Because the air flowing northward near tropopause level, as it acquires strong westerly velocity components, converges with this jet stream band a high-pressure ridge will form. The northward flow of air, therefore, will have to overcome pressure forces. Absolute angular momentum will not strictly be conserved in this flow, but the tendency to such conservation, nevertheless, exists.

The Coriolis effect

The deflection of flow toward the right in the Northern Hemisphere, and toward the left in the Southern Hemisphere, results in strong west-wind belts in both hemispheres; it is caused by the earth's rotation. Such a deflection not only acts upon south winds but upon any arbitrary wind direction. The apparent force producing this deflection is called the Coriolis force, although in the

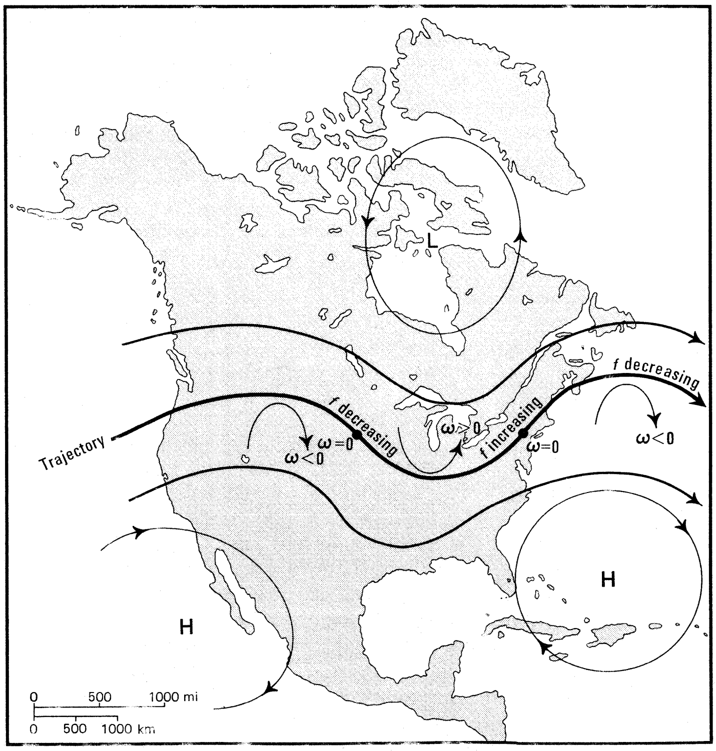

Figure 3: Changes in the Coriolis parameter, *f*, along the trajectory of an air parcel lead to changes in the rotation of the air mass (ω), thereby generating Rossby waves.

strict sense it is an effect. Its action upon a unit of mass is measured by the product of velocity times the Coriolis parameter,

$$f = 2\omega \sin \varphi,$$

in which φ is latitude. There is no deflecting effect at the Equator ($\varphi = 0$). The deflection reaches a maximum at the poles ($\varphi = 90°$, $\sin \varphi = 1$). This deflecting force prevents the air above the friction layer near the ground from flowing directly from a high-pressure region into the adjacent low-pressure region and causes it to adjust the flow direction until it parallels the isobars (lines of constant pressure). Because this deflection of flow prevents a rapid filling of cyclones and a rapid destruction of anticyclones, such pressure systems may remain active for many days as will the jet streams with which they are associated (Figure 3).

LABORATORY STUDIES OF JET STREAMS

The effects of meridional heat and absolute angular momentum transports on the formation of jet streams may be studied in so-called dishpan experiments. A flat pan (15 to 20 cm in diameter in some experiments) is filled with about 4 cm of water. Heat is applied through a heating coil at the bottom of the pan around the "equator" (*i.e.*, the outer rim of the pan) and is extracted at the pole (the centre of the pan) through a cooling cylinder, which is continuously flushed with cold water. The temperature gradient between equator and pole brings about a thermally driven circulation similar to the one described above. If the pan is rotated slowly, absolute angular momentum will be transported poleward in a manner described before, leading to the formation of a jet stream band that surrounds the polar cylinder symmetrically. Because of frictional forces acting in the vicinity of the polar cylinder, the jet stream will not touch the cylinder but will establish itself at some distance from it in high latitudes. If the rotation rate of the dishpan is increased slightly, the velocity of west winds in this jet stream will increase because of the transport of larger quantities of absolute angular momentum. At the same time, the jet stream band will move to slightly lower latitudes because the increased velocities will cause stronger frictional forces near the polar cylinder.

Thermal gradients and wave formation

A further increase of the rotation rate will require even higher transport rates of absolute angular momentum, enforced by the thermally driven circulation. Such increased transport rates, it turns out, can no longer be handled by a simple meridional circulation with rising motion at the equator, northward flow near the top of the water layer (equivalent to the tropopause), sinking near the pole, and southward flow near the bottom of the dishpan. The symmetric jet stream that surrounded the polar cylinder breaks down into regular and symmetric waves that progress slowly eastward. These waves, or eddies, support the meridional circulation described above in transporting heat and angular momentum: the southwesterly flow on the east side of a low-pressure trough brings warm water with high westerly angular momentum from the equator in rapid contact with the polar cold source. The northwesterly flow on the west side of these troughs carries cold water from the pole to the equator, thus also effecting the transport of heat toward the pole.

Rotation rate effects

Relatively slow rates of rotation generate one such symmetric wave. Higher rates of rotation cause two, three, four, or as many as six or seven symmetric waves to form, depending on the increased requirement for poleward angular momentum transport. If the rate of rotation is increased still further, the symmetric waves can no longer fulfill the requirements of such transports. They break down into strongly tilting and asymmetric troughs, whose axes extend in a direction from the southwest to the northeast. On the east sides of such tilting troughs, strong west winds are carried northward. On the west sides of the troughs, however, only weak westerlies, or even easterly winds, are carried southward. Thus, there will be vast net transport of westerly momentum poleward. The same consideration holds for the poleward transport of heat. These tilting troughs also reveal a tendency to break down into cutoff cyclones and anticyclones.

These vortices isolate themselves from the jet stream flow in middle latitudes. The cold cutoff lows become absorbed in warm subtropical regions, whereas the warm cutoff anticyclones merge with the cold water at high latitudes. This contributes significantly toward a net transport of heat and angular momentum poleward.

This stage of events, encountered in dishpan experiments at relatively high rates of rotation, closely resembles the weather patterns observed in the atmosphere in middle and high latitudes. The earth rotates too rapidly in these latitudes to permit the formation of a simple meridional circulation system. Eddy transport processes, brought about by low-pressure troughs, high-pressure ridges, cyclones, and anticyclones, play the dominant role in the transport of heat and absolute angular momentum. Only near the Equator, where the Coriolis force approaches zero, can a Hadley cell of meridional flow develop; but even there it is strongly influenced by the eddy transport processes of middle latitudes. Strong troughs, developing in the jet stream belt of middle latitudes, can sometimes reach far into the tropical and subtropical latitudes. Conversely, subtropical high-pressure cells occasionally may extend far into middle latitudes.

The necessity of eddy transport processes to maintain a climatic balance of temperature between Equator and pole, forced by the relatively high rate of rotation of the earth, exercises a strong effect upon the jet streams found in the atmosphere. It is because of these eddy processes that several jet stream systems exist in nature, rather than one simple jet stream band.

MEAN AND EDDY TRANSPORTS IN THE JET STREAM REGION

The Subtropical Jet Stream shown in Figure 2 may be considered an outgrowth of the northward transport of absolute angular momentum in a thermally driven Hadley circulation. It rests over the subtropical high-pressure belt, indicating the presence of convergence near tropopause level, if one averages flow conditions around the hemisphere, and of divergence near the earth's surface. The subsidence motion that dominates beneath the Subtropical Jet Stream gives rise to predominantly fair weather.

Jet streams and fronts

Farther to the north the Polar-Front Jet Stream occurs. It is associated with an indirect circulation cell, or Ferrel cell—that is, a circulation that consumes kinetic energy and generates potential energy. Such an indirect meridional circulation cannot maintain itself, together with a strong jet stream, against the forces of internal friction. The supply of energy maintaining the Polar-Front Jet Stream must originate in eddy processes. These are given in the form of migrating cyclones and anticyclones. The sinking of cold air behind a cold front and the rising of warm air along the warm-frontal surfaces in the cyclones of middle latitudes release the required amounts of potential energy to maintain the jet stream flow. The confluence of air masses from different latitudinal regions, which occurs near the earth's surface and which is shown in Figure 2, leads to the formation of strong fronts. This is in contrast to the flow regime found underneath the Subtropical Jet Stream, where diffluence tends to destroy and dissolve any fronts that may have been present.

The strong horizontal temperature gradients that occur in these frontal zones cause strong horizontal pressure gradients that increase in intensity up to the tropopause level. Hence, an increase of winds up to this level is required by a balance between pressure gradient force and the deflecting Coriolis force. Such strong temperature and pressure gradients are found throughout the troposphere beneath the Polar-Front Jet Stream; only in the upper troposphere do they occur beneath the Subtropical Jet Stream. There the lower troposphere is subject to frontolysis (the dissolution of fronts). Hence the jet streams are in balance with the horizontal temperature and pressure gradients in the layers underneath the maximum wind level. Because the formation of jet streams may be explained by a thermally driven circulation under conservation of absolute angular momentum, it may be argued that the jet streams generate their own frontal zones, and not vice versa.

Velocity and vorticity of flow

Polar-Front and Subtropical Jet Streams do not surround the hemispheres in bands of uniform wind speeds. Well-defined wind-speed maxima and minima are superimposed upon the jet stream belts. Thus, the air flowing in the jet stream region is subject to accelerations and decelerations, which, in turn, produce divergent and convergent flow patterns. These are shown schematically in Figure 4 in their relation to an individual jet- or wind-speed maximum. The curvature of flow that may be encountered in the jet stream region introduces a certain rotation in the flow pattern. So do horizontal wind shears. The latter may be realized by placing a hypothetical stick across one side of the jet stream shown in Figure 3. If the north side is used, the stick would rotate in a counterclockwise, or cyclonic, rotation because of the fast flow in the centre of the jet and the slower motion farther to the north. The rotation of flow is measured in terms of vorticity, defined as twice the angular velocity of the rotation. Vorticity is produced by the curvature of streamlines and by wind shears. The changes of vorticity, Q, and divergence of flow, D, are approximately related by $dQ/dt = -QD$ where dQ is the change of absolute vorticity (defined as the vorticity of the air motion plus the vorticity of the earth at the appropriate latitude, $2\omega \sin \varphi$) during the time interval dt. $D > 0$ measures divergence, $D < 0$ indicates convergence. Thus, if the absolute vorticity decreases along a given streamline ($dQ/dt < 0$), D has to be positive; divergent flow conditions must prevail because Q itself is positive everywhere. Such a divergence at jet stream level will cause a pumping out of vertical air columns in the locations indicated in Figure 4. This, in turn, will lead to falling surface pressure and to cyclogenesis. Under the regions of convergent flow at jet stream level anticyclones will build up. It therefore is apparent that jet maxima are instrumental in shaping cyclonic and anticyclonic weather conditions in temperate latitudes.

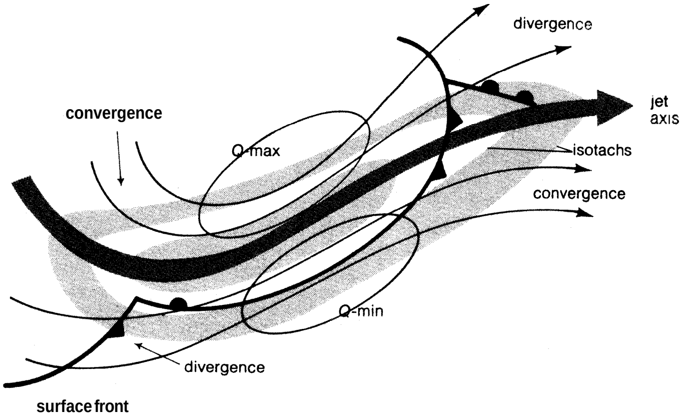

Figure 4: Vorticity and divergence distributions near a jet maximum. The streamlines (arrows) and convergence and divergence areas shown are characteristic of the jet stream in the upper troposphere (see text).

From the above equation it is clear that, if flow conditions are neither divergent nor convergent (that is, if $D = 0$), the absolute vorticity should not change with time but remain constant because $dQ/dt = 0$. This explains the reason for the formation of long planetary waves, the so-called Rossby waves, in the upper-tropospheric flow patterns: Q may be considered as the sum of the rotation of the air mass plus the earth's vorticity, given by the Coriolis parameter $2\omega \sin \varphi$. If an air mass moves southward, the Coriolis parameter decreases. If Q is to remain constant, the vorticity of the air-mass rotation must increase in proportion. This means that the air mass is acquiring more cyclonic rotation and therefore will return to higher latitudes. This reverses the process: because φ increases, the Coriolis parameter increases; consequently the rotation of the air mass will decrease and eventually become anticyclonic, thus repeating the whole process. The initial impulse, which forces the air mass to deviate from a purely westerly flow, may come from forced motion over or around large mountain ranges, such as the Rocky Mountains or the Himalayas. In the lee of these ranges are quasi-permanent low-pressure troughs in the upper flow patterns, which may be explained in the above manner and which greatly influence the climate in these regions.

Relation to topography and climate

The confluence of cold air, flowing down along the west side of these troughs, with warm tropical air moving from a southwesterly direction accounts for the strong horizontal temperature gradients prevailing there, as well as for the frequent occurrence of strong jet streams over the eastern United States and Japan (see Figure 1).

The divergence and convergence patterns near the jet stream, caused by the mass flow through the vorticity pattern, give rise to important vertical motions in the atmosphere. Upward motion leads to cloud formation and eventually to precipitation. Such motions occur beneath divergence regions at jet stream level.

Downward motions, on the other hand, lead to dissolution of clouds and fair weather. These occur beneath the convergent regions. Such downward motions may transport stratospheric air into the troposphere and toward the ground. During periods of nuclear testing, stratospheric air generally was contaminated by radioactive debris. Vertical transport through the jet stream was discovered to be an important factor in causing radioactive fallout at the ground.

OCCURRENCE AND DISTRIBUTION OF JET STREAMS

Polar Front and Subtropical Jet Streams, both occurring near the tropopause, have been described in detail above. In the Northern Hemisphere they are best developed during winter and early spring. The larger meanders, which both jet stream systems describe, fuse them into one single jet stream on monthly or seasonal mean maps or on hemispherically averaged cross sections through the atmosphere. On daily weather maps, however, two separate systems are distinctly present over wide regions of the Northern Hemisphere. The Subtropical Jet Stream during winter forms rather regularly three planetary waves with ridges over eastern China and Japan, over the United States, and over the eastern Mediterranean. In these three regions the Subtropical Jet frequently merges with the Polar-Front Jet Stream, giving rise to excessively strong jet maxima.

During summer in the Northern Hemisphere, the Subtropical Jet Stream loses its global identity and occurs only in sporadic velocity streaks.

In the Southern Hemisphere two distinct jet stream systems are present during winter, even on mean meridional cross sections through the atmosphere. This indicates that the meandering tendency of the two flow systems is not as strong there as in the Northern Hemisphere. During summer the Polar-Front Jet Stream system seems to dominate in middle latitudes, with stronger winds during this season than during winter.

Over the central United States a low-level wind maximum is frequently associated with an inversion near the 800- or 850-millibar (mb) level. This wind maximum is often referred to as the Low-Level Jet Stream. Because the flow in this wind system is usually from the south, it imports moist air from the Gulf of Mexico into the central United States. This rapid moisture transport plays an important role in the formation of severe thunderstorms and tornadoes. It is presently believed that this Low-Level Jet Stream is related to the diurnal variation of wind speed in the lower troposphere. This, in turn, is produced by frictional coupling and uncoupling of the atmospheric flow with the rough terrain during the day and night, and by the presence or absence of convective motions. The terrain slope from the Rocky Mountains into the Mississippi Valley also exercises an influence on the formation of the Low-Level Jet Stream.

The Tropical Easterly Jet Stream occurs near the tropopause over Southeast Asia, India, and Africa during the summer season. It is caused by southward flow under quasi-conservation of absolute angular momentum of air that travels out of the subtropical high-pressure cells (located over Tibet and the Sahara during summer), and moves Equatorward. Such motion will cause east winds. The Tropical Easterly Jet Stream is closely connected with the Indian and African summer monsoon.

During winter the polar stratosphere cools appreciably because of the lack of solar radiation. The ensuing strong horizontal temperature gradient in the stratosphere, directed from the Equator toward the pole, gives rise to a strong jet stream with a westerly wind direction that blows near the 50-kilometre level in high latitudes and meanders around the winter pole. It is called the Stratospheric Polar-Night Jet Stream.

Over the summer pole, where the stratosphere is exposed to continuous sunshine, temperatures are relatively warm. Thus the temperature gradient is directed from the pole toward the Equator, resulting in summer east winds in the stratosphere, which normally do not quite reach jet stream proportions.

The winter stratospheric circulation establishes itself gradually during autumn. It breaks down rather abruptly near the spring solstice in the Southern Hemisphere, and off and on during the middle and later winter in the Northern Hemisphere. The breakdown of the polar-night vortex leads to the abrupt warming of portions of the stratosphere at high latitudes in the winter hemisphere. The downward motions in midlatitudes, which predominate during this breakdown season, carry ozone to lower levels of the stratosphere. This leads to the observed spring maximum of ozone in middle latitudes.

Jet stream systems appear to be present in the upper mesosphere and in the thermosphere as well. In these regions of the high atmosphere, diurnal motions produced by tidal forces begin to dominate over the synoptic disturbances that characterize the weather in the troposphere and stratosphere. Because charged particles participate in these flow processes, at ionospheric levels, the name "electrojet" has been coined for some of these motion patterns. This term should be applied, however, only to motions in which the neutral gases of the high atmosphere participate in a significant proportion. Organized electron motions are more properly called currents.

Jewelry

Jewelry consists of objects of personal adornment prized for the craftsmanship that went into their creation and generally for the value of their components as well. In the prehistoric era and in modern primitive cultures, the materials considered rare and beautiful were shells, bones, pebbles, tusks, and wood; in more advanced civilizations, precious metals, precious and semiprecious stones, pearls, corals, enamels, vitreous pastes, and ceramics. Even in advanced civilizations where precious materials are available, in certain eras artist-craftsmen have sometimes placed less emphasis on the intrinsic value of materials than on their aesthetic function as components contributing to the effect of the whole. Thus, they might fashion a brooch out of steel rather than gold or platinum.

This article will cover the uses, forms, styles, materials, and techniques that have characterized jewelry throughout its 40,000-year history.

Materials and methods

MATERIALS

The first materials used to make objects for personal adornment were taken from the animal and vegetable world. The material taken from the animal world, in a natural or processed form, constituted the actual adornment, whereas vegetable fibres served as its support. A great variety of shells and pieces of shell were used during the prehistoric age and are still used by primitive tribes on the islands and coastal zones of nearly all the continents to make necklaces, bracelets, pendants, and headdresses. In the inland regions, the first materials used for personal adornment came from mammoths' tusks, the horns of reindeer and other animals, and, later on, amber and lignite.

Gold,
silver,
and
platinu

Metals. Of gold's properties, when it was first discovered (probably in Mesopotamia before 3000 BC), it was the metal's malleability that was a new phenomenon: only beeswax, when heated to a certain temperature, could be compared to it. Gold's molecules move and change position in accordance with the stresses to which it is submitted. so that when it is beaten it gains in surface area what it loses in thickness.

In modern jewelry, gold can take on a variety of hues when it is alloyed with other metals: water green, dead-leaf white, gray, and blue.

After gold, silver is the metal most widely used in jewelry and the most malleable. The discovery of some silver artifacts at Hisarlık in Asia Minor, which was also the location of the Homeric city of Troy, shows that this metal was known during the Copper Age. Before the classic age, however, silver made only rare appearances in jewelry. In general. silver was, and still is, used in jewelry for economic reasons or to obtain chromatic effects. It was often used in the 17th, 18th, and 19th centuries, however, as support in settings for diamonds and other transparent precious stones, in order to encourage the reflection of light.

Another rare metal, whose use in jewelry is fairly recent, is platinum. From the 19th century onward, this metal was used ever more frequently in jewelry because of its white brilliance and malleability, as well as its resistance to acids and high melting point.

Modern jewelry, like that designed by early-20th-century artists, introduced nonprecious metals such as steel.

Gems. In addition to gold, silver, and platinum, the precious materials most widely used in jewelry are gems—any precious or semiprecious stone. By definition this group also includes some animal and vegetable products with precious characteristics, such as amber, pearls, and coral. Conventionally, the following are classified as precious stones: diamonds, rubies (corundum), emeralds (beryl), and sapphires (corundum). To these, however, can be added chrysoberyl, topaz, and zircon because of their hardness and their refraction and transparency index.

Use of
diamonds,
rubies,
and
sapphires

Diamonds have the highest refraction index, and those used for jewels are very transparent. Diamonds from Indian deposits were known in ancient times; in the West the limited use of diamonds began in the late Middle Ages. Diamonds for jewelry are graded on the basis of colour from blue-white to yellow. Grading is also done on the basis of purity, which varies from perfectly clear, extremely pure stones to those with many impurities and flaws. Large demand provided an incentive for the production of false diamonds (as well as other stones) as early as 1675 in Paris.

Mogok rubies, from Burma, are the most highly prized because of their bright red colour (pigeon's blood). Those from Thailand are usually a more brownish colour, while those from Ceylon tend toward violet. Production of synthetic stones is far greater than the supply of natural rubies. The physical and optical properties of synthetic and natural rubies are so similar that it is difficult to distinguish between them.

The sapphire (blue variety of corundum) is considered one of the most valuable of precious stones. A sapphire's colouring usually indicates its origin. Those from Burma are deep blue. The Kashmir (Indian) sapphire is cornflower blue and is highly prized, being quite rare. Sapphires from Thailand are very similar in colour to those from Burma; those from Ceylon are of different shades but incline toward violet. Sapphires, like rubies, can be cut so that, in the light, a beautiful, luminous six-pointed star appears on the surface of the gem. Star sapphires and rubies are semiopalescent. Synthetic sapphires and rubies are produced by the same industries.

Use of emeralds

The green emerald is a precious stone used since very ancient times. There is documentation of its presence in Egypt during the life of Pharaoh Sesostris, in 1650 BC. At the end of the 16th century, emeralds from South America began to be brought into Europe. On the American continent, the first peoples to use emeralds were those belonging to the pre-Columbian civilizations, in particular the Incas. In 1935 in the U.S. (Chatham) and in Germany (Farbeindustrie), synthetic emerald crystals were made with characteristics similar to natural ones.

Among the beryls, mention must be made of morganite (pink beryl) found in various shades of peach-blossom pink. The main deposits are in California and Madagascar.

The two best known and most widely used varieties of chrysoberyl are alexandrite (transparent) and oriental cat's-eye (opaque). Because of its great power of absorption of certain colours, alexandrite looks green in daylight and reddish purple in artificial light. The cat's-eye is a yellowish-green colour and is characterized by a luminous line. The intensity of the light in this line varies according to the brightness of the rays of light that strike it.

One of the most important gems with pure crystals is the topaz, used a great deal in jewelry. The honey-yellow variety is the best known, but there are also pink, red, blue and the less used colourless stones. The oriental topaz (a corundum) and citrine quartz are also widely used. They are less rare than other kinds of topaz and, therefore, less expensive but create a similar effect.

Among the less important and less rare stones, the zircon is quite widely used in its three varieties: orange, blue, and colourless. The orange variety is called jacinth and was used to a great extent in classical antiquity. The blue variety is called starlite or Siam zircon, while the third type is called Ceylon or Matara diamond.

Among the semiprecious stones used in jewelry are amethyst, garnet, aquamarine, amber, jade, turquoise, opal, lapis lazuli, and malachite.

Varieties of pearls

The pearl is one of the oldest gems known to man. Its colour varies according to the waters from which it comes. Pearls from the Persian Gulf are usually cream coloured; those from Australia are white with greenish or bluish shades; golden-brown pearls come from the Gulf of Panama; those from Mexico are black or reddish brown; pink pearls are from Ceylon; and those from Japan are cream coloured or white with greenish tones. The main characteristic of the pearl is its iridescence. Baroque pearls are those with defects in their outer layer. In modern times, baroque pearls are rounded off artificially but, in the 16th and 17th centuries, their irregular form was exploited in jewelry by using them to make up parts of animals or other figures. After huge quantities of cultivated pearls invaded the world market, interest in real pearls underwent a considerable decrease.

Other materials. Some of the less highly prized materials used for jewelry are coral (corallium rubrum), glass, wood, and ceramic. The most recent material used in creative jewelry is plastic, which, when exposed to heat or cold in a mold, can take on and retain any shape desired. In addition, when unmolded and cooled, the material can be subjected to further working or can be combined with other similar or different materials.

The imagination shown by jewellers is often related to material of local origin. In Malaysia, for example, use is made of tigers' claws bound in gold, with inserts of precious stones, to create pins in the shape of a half-moon. The use of brightly coloured feathers from rare birds was also quite common, especially in pre-Columbian civilizations. Used traditionally only in Chinese jewelry are the breast feathers of a rare seabird similar to the fisher martin (Fei Ts'ui), which are mounted on a leather support and then on gold or silver.

PROCESSES AND TECHNIQUES

All materials that have been used over the centuries for the manufacture of jewelry have undergone to some extent mechanical, physical, or chemical treatment for the purpose of transforming their raw shapes into shapes which, in addition to being functional, also satisfy certain aesthetic concepts.

Metalwork. The basic components of jewelry have always consisted of metal sheet, metal cast in a mold, and wire (more or less heavy or fine). These components take on the desired shape by means of techniques carried out with the help of tools. Gold in its natural state was beaten while hot or cold and reduced to extremely thin sheets (this operation could be performed with stone hammers). The sheets were then cut into the desired sizes (with flint knives).

Metal sheet, embossing, openwork, and granulation

Examination of the most ancient pieces of jewelry shows that one of the techniques used most widely in decorating metal sheets for jewelry was embossing (relief work). Through the centuries embossing techniques have remained substantially unchanged, although in modern times mechanization has made possible mass production of decorative parts of jewelry, with great savings of time and labour but with a corresponding lack of art.

In repoussé, the relief is pressed (in a negative mold) or hammered out from the reverse side of the gold sheet and then finished off on the right side with a hammer or engraving tool. For half-modelled or completely round reliefs, the gold leaf was pressed onto wooden or bronze models. Completely round objects were made in two pieces and then welded together.

Another embossing, or relief, technique is engraving, which involves impressing designs into the metal with a sharp tool.

Decorative openwork designs can be created by piercing the gold leaf. In the Roman period this technique was called *opus interassile*.

Granulation is a decorative technique in which small or minute gold balls (with diameters ranging from $\frac{1}{60}$ to $\frac{1}{180}$ of an inch) are used to form silhouettes on smooth or embossed metal.

Casting from precious metals has always been rare. When the relief was to be visible only from one side, the metal was poured into the cast and, when hardened, touched up with a graver. When the relief was to be fully modelled, the cire perdue (lost-wax) process, involving casting from a wax mold, was used.

Metal wire and filigree

Gold and silver wire, according to its function, can be made into various sizes, shapes, sections, and weights. It can serve to join, to support pendants of varying importance, to make necklaces and bracelets, or to alternate with other decorative components.

From the 3rd millennium before Christ through the present day, chains—ranging from the simple type, consisting of a series of round or oval rings, to one of the oldest elaborations, the "loop in loop," or square, chain—have offered goldsmiths the widest field for decorative imagination.

Filigree is a form of decoration made exclusively from fine gold or silver wire welded onto the surface of an object made of the same metal or done in openwork (without a background). The decoration to be carried out is designed first on a model with a flat or curved surface identical to that on which the completed filigree is to be welded or to the unsupported shape that it must assume. It can be made from smooth wire or from a ropelike plait or from a series of small hemispheres. A more complicated type of filigree consists of metal wire made in the shape of beads called granulated filigree.

After having been prepared separately, the different parts that make up a piece of jewelry are put together. In primitive jewelry this was done mechanically, by inserting beaten pins, by bending and beating the parts to be fastened together, or by binding them with gold wire or tape. Welding is a technique belonging to a more highly developed stage of ancient goldworking, (end of the 3rd millennium BC).

Enamel work. In enamel work, powdered glass coloured with metal oxides diluted with water and adhesive is applied to certain parts of the piece of jewelry that have been cut lower or surrounded with a raised rim made of gold, silver, or copper. The object is then heated until the glass melts and adheres to the metal. As the enamel gradually cools, it crystallizes and, when smoothed, takes on greater lustre and colour. The enamel applied to jewelry can be opaque or translucent. By letting light through, transparent enamel catches reflections from the metal to which it is applied and makes visible any engraving done on the metal. Enamel is also distinguished according to the way it is applied, as in cloisonné, champlevé, basse taille, painted, and *plique à jour.*

Enamelling preceded the polychromy created by precious stones. In the beginning, in Egypt, Greece, and the Sāsānid period in Iran, unpolished enamelled parts of jewelry were often used to imitate lapis lazuli or malachite.

Niello technique

To a limited extent, jewelry was also decorated with the niello technique (from the Latin *nigellus*, adjective derived from *niger* = black). This consists of cutting grooves in gold or silver with a graver and then filling these with a powder made of red copper, silver, lead, sulfur, and borax. When heated, the powder melts and fills the grooves, adhering to the metal. After the piece has cooled, the surface is smoothed and polished, and the design shows up in black.

Gem engraving, setting, and cutting. The most ancient technique of stone engraving is intaglio-incised carving. This technique at a certain point gave rise to the idea of exploiting the different coloured layers of certain minerals to create contrasting figures (cameo): the background was cut down to the lower level, of a different colour or shade, in order to make the subject stand out chromatically. The stones that have properties suited for this purpose are sardonyx, agate, and onyx.

The cameo is usually one of the components for necklaces, bracelets, and rings or is included in medallions with a jewelled frame. The art of cameo in jewelry was most highly developed during three periods: the late Roman period, the Renaissance, and the neoclassic period in the 18th century.

Gem setting

The evolution of techniques of setting has followed that of stonecutting. The insertion of gems in jewelry can be done in various ways. The setting can have a round, square, oval, or rectangular collet (rim); in periods in which gems were mounted in their own irregular shapes, the collet followed this form. Usually, on the inside of the collet a short distance from the edge, there is a protrusion on which the stone rests. The edge is pounded down around the gem to ensure its stability. In coronet settings the form may be conical or pyramidal, solid or pierced. The edge is first shaped into a row of teeth, which are later hammered down onto the gem in order to hold it in place. Until fairly recently, nearly all gems were mounted on a metal base; and transparent stones, according to their colour, were placed on a gold or silver base to increase the amount of light reflected. As new cuts were developed for stones, setting techniques also progressed, especially for those jewels in which important stones like diamonds, emeralds, and rubies form the main theme. The tendency was to leave the stones as visible as possible (especially in rivière necklaces and bracelets made only of diamonds) by mounting them with a very small ring of white gold or platinum fitted closely against the back of the stone. Three claws, attached to this ring, hold the stone in place.

Pearls, like some coloured stones, in ancient classic times were pierced with a drill, the hole going half or all the way through according to whether the pearls were to be strung on a necklace or fastened onto a jewel.

Gem cutting

Until the 15th century, stones were only polished or the part to be left visible was rounded into a dome shape called cabochon. The cutting known as faceting gradually developed from the first attempts in the 15th century. During the 16th century the simple rose cut began to be used, after which there were no new developments until 1640 when, under the patronage of Cardinal Mazarin, the first brilliant cut was carried out (also called the Mazarin cut). Toward the end of this century, a Venetian succeeded in obtaining the triple brilliant cut, which is still used. The numerous cuts used for diamonds today are usually applied to other precious and semiprecious transparent stones as well. For emeralds, rubies, and other coloured stones the square or rectangular cut with a stepped bulb or the cabochon cut are usually used.

Historical development

During most of its history, jewelry has been worn as a sign of social rank—forbidden by sumptuary laws to all but the ruling classes—and as a talisman to avert evil and bring good luck. During the Middle Ages, for example, a ruby ring was thought to bring its owner lands and titles, to make him virtuous, to protect against seduction and to prevent effervescence in water—but only if worn on the left hand. Purely decorative jewelry has existed only since the period of the French Revolution. The possibility of tracing jewelry's historic itinerary derives primarily from the custom, beginning with the most remote civilizations, of burying the dead with their richest garments and ornaments. This source will last as long as archaeological diggings continue. The diggings have also brought to light occasional ancient "treasures"; that is, they have discovered hiding places where precious objects were secured for safekeeping during invasions and that were never recovered because of the death of those few who knew their location. Plastic and pictorial iconography—painting, sculpture, mosaic—offer abundant testimony to the jewelry worn in various eras and, most important, to the jewelry rich in precious components. Because such pieces were often disassembled and their components recast into new forms or sold, little has come down to us.

Prehistoric era

It is probable that man thought of decorating his body before he thought of making use of anything that could suggest clothing. Before precious metals were discovered, men who lived along the seashore decorated themselves with a great variety of shells, fishbones and fish teeth, and many-hued pebbles carried up onto the beach by the waves, exercising their aesthetic sense in making a selection and in the techniques for fastening and arranging these materials on their bodies. Men who lived inland used as ornaments materials from the animals they had killed for food: reindeer antlers, mammoth tusks, and all kinds of animal bones. After they had been transformed, with great patience, from their natural state into various elaborate forms, these materials, together with animal skins and bird feathers, provided sufficient decoration.

Most of the evidence that has survived from this period consists of cave paintings and carvings. Some of these represent women decorated with long necklaces, bracelets, and headdresses. This era was followed by one that saw a transition from a nomadic life to a settled social order and the subsequent birth of the most ancient civilizations. Most peoples settled along the banks of large rivers, which facilitated the development of agriculture and animal husbandry. Indirectly, this also led to the discovery of virginal alluvial deposits of minerals, first among which were gold and precious stones.

Over the years the limited jewelry forms of prehistoric times multiplied until they included ornaments for every part of the body. For the head there were crowns, diadems, tiaras, hairpins, combs, earrings, nose rings, lip rings, and earplugs. For the neck and torso there were necklaces, fibulae (the ancient safety pin), brooches, pectorals (breastplates), stomachers, belts, and watch fobs. For the arms and hands, armlets, bracelets, and rings were fashioned. For the thighs, legs, and feet craftsmen designed thigh bracelets, ankle bracelets, toe rings, and shoe buckles.

WESTERN CULTURE

Antiquity. *Sumerian.* The most ancient examples of jewelry are probably those found in Queen Pu-abi's tomb at Ur in Sumeria (now called Tall al-Muqayyar), dating from the 3rd millennium BC. In the crypt, the upper part of the queen's body was covered with a sort of robe made of gold, silver, lapis lazuli, cornelian, agate, and chalcedony beads, the lower edge decorated with a fringed border made of small gold, cornelian, and lapis-lazuli cylinders. Near her right arm were three long gold

pins with lapis-lazuli heads, three amulets in the shape of fish—two made of gold and one of lapis lazuli—and a fourth amulet of gold with the figures of two seated gazelles. On the Queen's head were three diadems, each smaller than the one next to it, fastened to a wide gold band: the first, which came down to cover the forehead, was formed of large interlocking rings, while the second and third were made of realistically designed ivy and willow leaves. Above the diadems were gold flowers, on drooping stems, the petals of which had blue and white decorations. On the back of the headdress was a Spanish-type comb, with teeth decorated with golden flowers. Huge golden earrings, in the shape of linked, tapered, semitubular circles, completed the decoration of the head. On the neck was a necklace with three rows of semiprecious stones interrupted in the middle by an openwork flower in a gold circle. Many rings were worn on the fingers. There were large quantities of other jewels—among them wrist and arm bracelets and pectorals—belonging to the handmaidens, dignitaries, and even the horses that formed part of the funeral train. As was the custom, the queen's attendants had killed themselves in the crypt after the burial ceremony.

Sumerian gold and faience diadems from Queen Pu-abi's tomb, Ur, c. 2500 BC. In the British Museum.

As this description suggests, Sumerian jewelry forms, much more numerous than those of modem jewelry, represent almost every kind developed during the course of history. Nearly all technical processes also were known: welding, alloys, filigree, stonecutting, and even enamelling. Sources of inspiration, aside from geometry (disks, circles, cylinders, spheres), were the animal and vegetable world; and expressive forms were based on an essential realism enriched by a moderate use of colour.

The Tutankhamen treasure

Egyptian. The sensational discovery of the tomb of the pharaoh Tutankhamen (18th dynasty: 1567–1320 BC) revealed the fabulous treasures that accompanied an Egyptian sovereign, both during his life and after death, as well as the high degree of mastery attained by Egyptian goldsmiths. This treasure, now in the Egyptian Museum, represents the biggest collection of gold and jewelry in the world. The Pharaoh's sarcophagus was made entirely of gold and the mummy was covered with a huge quantity of jewels. More jewels were found in cases and boxes in the other rooms of the tomb. The diadems, necklaces, pectorals, amulets, pendants, bracelets, earrings, and rings are of superb quality and of a high degree of refinement rarely surpassed or even equalled in the history of jewelry.

The ornaments in Tutankhamen's tomb are typical of all Egyptian jewelry. The perpetuation of iconographic and chromatic principles gave the jewelry of ancient Egypt—which long remained uncontaminated in spite of contact with other civilizations—a magnificent, solid homogeneity, infused and enriched by magical religious beliefs. Ornamentation is composed largely of symbols that have a precise name and meaning, with a form of expression that is closely linked to the symbology of hieroglyphic writing. The scarab, lotus flower, Isis knot, Horus eye, falcon, serpent, vulture, and sphinx are all motif symbols tied up with such religious cults as the cult of the pharaohs and the gods and the cult of the dead. In Egyptian jewelry the use of gold is predominant, and it is generally complemented by the use of the three colours of cornelian, turquoise, and lapis lazuli or of vitreous pastes imitating them. Although there was a set, fairly limited repertoire of decorative motifs in all Egyptian jewelry, the artist-craftsmen created a wide variety of compositions, based mainly on strict symmetry or, in the jewelry made of beads, on the rhythmic repetition of shapes and colours.

Forms of Egyptian jewelry

The concept of symmetry was utilized on the small pectoral or pendant (85 × 61 millimetres or 3.3 × 2.4 inches) that belonged to Sesostris III in the 12th dynasty (1991–1786 BC). Here the superbly rhythmic composition is framed by an architectonic design obtained by leaving open all of the nonfigurative part. The jewel is coloured with cornelian, turquoise, and lapis-lazuli inlays, while the function of the gold separating these materials is limited to creating the design. The victorious Pharaoh is represented by two lions with the plumed heads of falcons in a symmetric position in the act of trampling conquered Nubians and Libyans. Over the scene is the protective vulture of Upper Egypt with wings outspread, the only nonsymmetrical component in the ornament (Egyptian Museum, gen. cat. 52002). These memorial or dedicatory pendants, as well as other small jewels such as earrings, bracelets, and rings, consist exclusively of symbols.

Necklace beads—generally made of gold, stones, or glazed ceramic—are cylindrical, spherical, or in the shape of spindles or disks and are nearly always used in alternating colours and forms in many rows. The necklaces have two distinct main forms. One, called menat, was the exclusive attribute of divinity and was therefore worn only by the pharaohs. Tutankhamen's menat is a long necklace composed of many rows of beads in different shapes and colours, with a pendant and with a decorated fastening that hung down behind the shoulders (Cairo, Carter cat. No. 269K). The other, much more widely used throughout the whole period, was the *usekh,* which, like the vulture-shaped necklace from the tomb of Tutankhamen, also has many rows and a semicircular form (Cairo, Carter cat. No. 256MMM).

Of the many diadems made by Egyptian artist-craftsmen, one of the earliest was discovered in a tomb dating from the 4th dynasty (2613–2494 BC). It consists of a gold band supported by another band made of copper, to

which three decorative designs are applied. In the centre is a disk worked with embossing in the form of four lotus buds arranged radially. On the sides are two papyrus flowers linked horizontally at the base by a disk with a cornelian, while the upper line of the flowers comes together to create a kind of nest in which two long-beaked ibis crouch. The floral and animal symbology is carried out with a style that interprets and characterizes the theme.

Among the treasure discovered in the tomb of Queen Ashhotep (18th dynasty) is a typical Egyptian bracelet. It is rigid and can be opened by means of a hinge. The front part is decorated with a vulture, whose outspread wings cover the front half of the bracelet. The whole figure of the bird is inlaid with lapis lazuli, cornelian, and vitreous paste.

Foreign influence

A first sign of outside influence occurs in the 18th dynasty and consists of earrings, which are imported jewels, unknown in classical Egyptian production. Another evidence of the influence of foreign styles in some of the jewelry of the 18th dynasty is a headdress (reconstructed) that covered nearly all of the hair, made of a network of rosette-shaped gold disks forming a real fabric (New York, Metropolitan Museum of Art). Foreign influence increased to an ever greater extent during the last dynasties and with the arrival of the Greeks. Like all other forms of artistic expression, in spite of three centuries of Ptolemaic dynasty (up through 30 BC), the great artistic tradition of Egyptian jewelry slowly died out, and the introduction first of Hellenism and then of the Romans led to the definitive decline of the most monumental cultural and artistic structure known throughout all history.

Mycenaean. Because the Mediterranean island of Crete lay near the coasts of Asia, Africa, and the Greek continent and because it was the seat of prosperous ancient civilizations and a necessary point of passage along important sea-trading routes, it developed a level of wealth which, beginning about 2000 BC, stimulated intense goldworking activities of high aesthetic value. From Crete this art spread out to the Cyclades, Peloponnesus, Mycenae, and other Greek island and mainland centres. Stimulated by Cretan influence, Mycenaean art flourished from the 16th to the 14th century, gradually declining at the beginning of the 1st millennium BC.

Among the techniques used in goldworking were granulation and filigree, but the most widely used was the cutting and stamping of gold sheet into pieces to form necklaces and diadems, as well as to decorate clothing. The kings from Period I of Mycenaean civilization (c. 1580–1500 BC) discovered in their burial places, wore masks of gold sheet and scattered over their clothing were dozens of stamped gold disks. The disks reveal the rich variety of decorative motifs used by the Mycenaeans: round, rectangular, ribbon shaped—including combinations of volutes, flowers, stylized polyps and butterflies, rosettes, birds, and sphinxes.

A pendant from a Mycenaean tomb at Mállia, Crete, (Candia Museum) is one of the most perfect masterpieces of jewelry that has come down to us from the 17th

Dimitri

century BC. The sun's disk is covered with granulation and is held up by two bees, forming the central part of the composition. Ring bezels (tops of the rings), with relief engravings of highly animated pastoral scenes, cults, hunting, and war, are also fine. Like those of the other jewelry forms, the ornamental motifs of the necklaces are varied, including dates, pomegranates, half-moons facing each other, lotus flowers, and a hand squeezing a woman's breast. During the late Mycenaean period, earrings appeared in the shape of the head of a bull, an animal frequently represented in early gold plate.

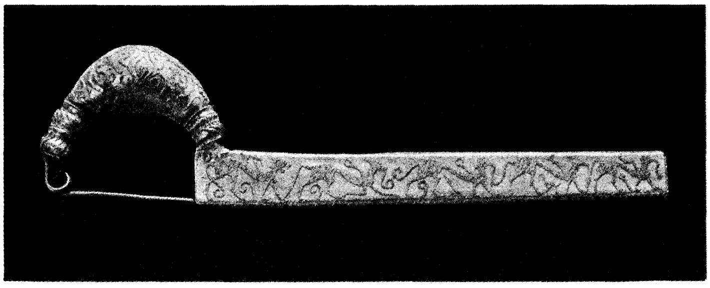
Orientalizing period

Phoenician. Phoenicia, a centre for both the production and exportation of jewelry, was not a source of great originality. It is to the trading done by this people throughout the Mediterranean, however. that we owe knowledge of the products of the most highly developed civilizations in the most remote lands—northern Africa, Sardinia, Spain, and Italy. The period in the 8th and 7th centuries BC, during which Scythian–Iranian oriental objects with their animalistic motifs were spread and consequently imitated throughout the Mediterranean countries, especially in Greece and Italy, is called the orientalizing period.

Etruscan. In Etruria, to a much greater extent than elsewhere, the stimulus provided by the jewelry imported by the Phoenicians led to emulation that soon had imposing results. Alongside imported objects and mechanically repeated oriental motifs, original forms, techniques, and styles developed that were the result of Etruscan taste. There was an entirely new concept, in which the goals of magnificence, impressive size, and a great wealth of decoration led to some of the most outstanding achievements in the history of jewelry. Technical virtuosity exploited all of the resources available to filigree and above all to granulation, carried out with gold alone without chromatic inlaying.

Fibulae began to be made in forms other than the single oriental leech shape: with a dragon bow, lozenge shaped, with a long foot. Like such ornaments as pendants and the heads of pins, fibulae were often decorated with gold dust, in which opaque granulated figures—ibexes, chimeras, sphinxes, winged lions, centaurs, horsemen, and warriors, nearly all of oriental derivation—stand out against the smooth surface of the gold (one notable example is the fibula from the Lictor's tomb in Vetulonia; Florence, Museo Archeologico).

SCALA, New York



Etruscan fibula of sheet gold decorated with animals made by the granulation technique, from the Lictor's tomb, Vetulonia, 7th century BC. In the Museo Archeologico, Florence.

The most elaborate, complicated examples of orientalizing Etruscan jewelry consist of very large brooches with fully sculptured decoration applied to a combined tubular and plate structure. The minutely designed granulated figures of sphinxes, winged lions, chimeras, winged griffons, and human heads—set in series in alternating rows—form a plastic fabric, the details of which are of astonishing technical ability, while at the same time they suggest the evocative, mysterious animalistic symbolism of near-Asian civilizations.

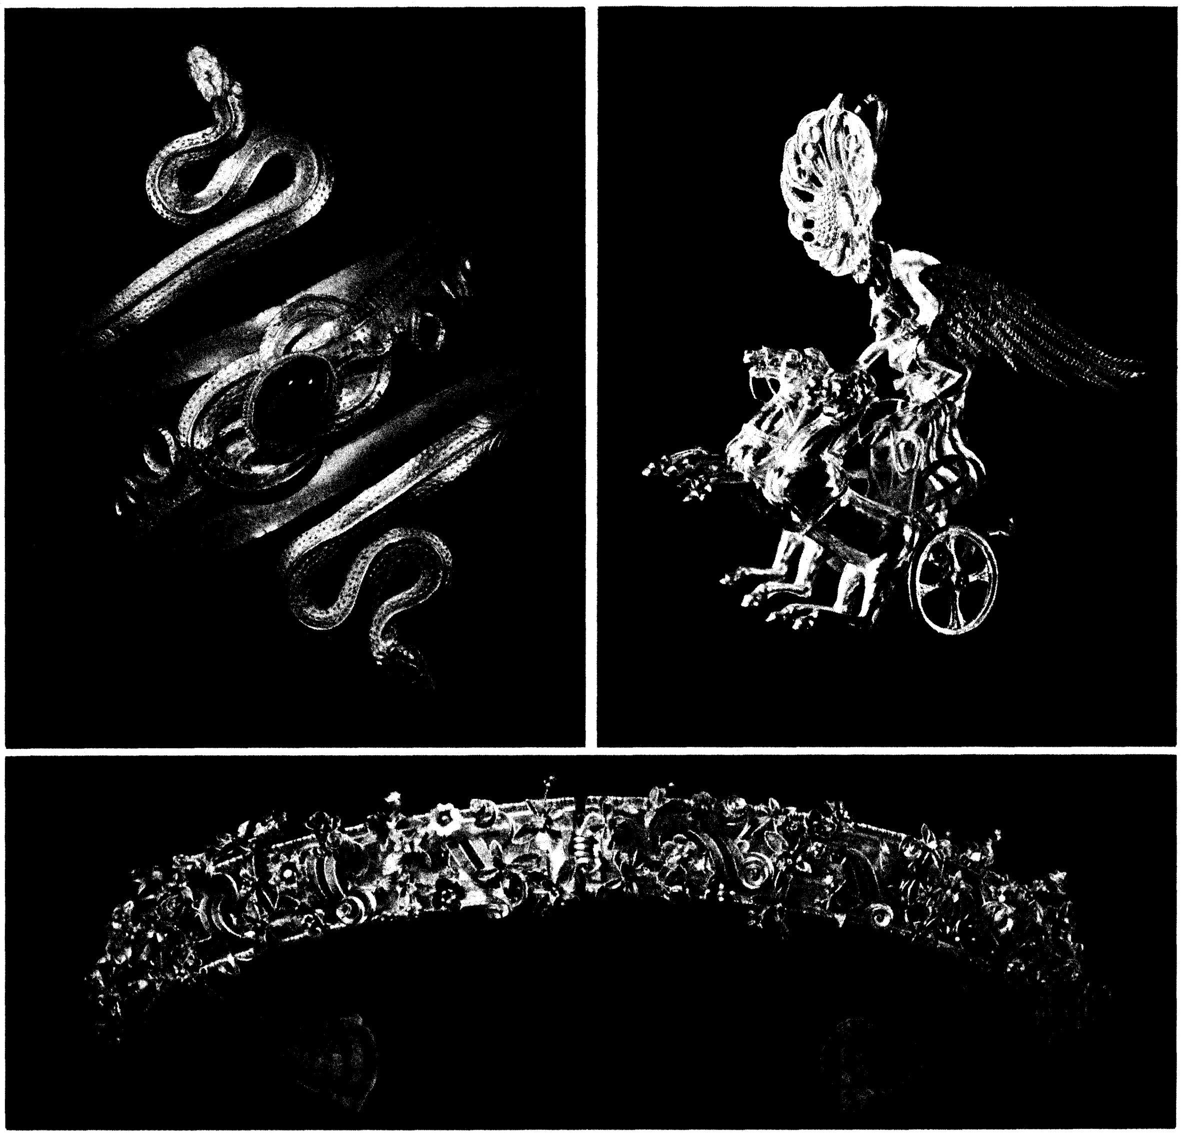
In the period that followed the orientalized one, Etruscan jewelry revealed Ionic influence (6th-5th centuries BC). The most beautiful examples are necklaces made of many flexible chains that cross each other and bear different rows of embossed pendants in the shape of harpies, mermaids, Gorgons, and Sileni, interspersed with others such as pomegranates, acorns, lotus flowers, and palms. These show the clear influence especially in the modelling of the pendant heads of the Greek severe period, an influence that spread throughout the entire Etruscan territory, from Spina on the Adriatic coast of Italy to southern Italy. Even clearer evidence of the acceptance of imported forms is provided by a new shape, the bulla, a pear-shaped sphere used to hold perfume. Its surface was decorated with embossed and engraved symbolic figures.

Greek In the 7th and 6th centuries BC the jewelry produced in Attica and the Peloponnese shows evidence of strong oriental stylistic influence the same influence which in Etruscan territory turned up in a much more magnificent form. In the 5th century BC the Ionic style became predominant, taking the place of the too showy oriental style. War scenes and animals of oriental origin disappeared for example. from the wide oval ring bezels and were replaced exclusively by the human figure: naked riders on galloping horses; seated and standing maidens, clothed or naked; deities and mythological figures. This extremely refined repertoire in reality was more closely related to sculpture and to classic ideals of beauty than to decoration. Indeed, in its long evolution, Greek jewelry has the predominant character of sculpture in miniature and represents isolated figures or religious, mythological. or heroic scenes.

Hellenistic jewelry

Greek expansion into Asia Minor to the east, southern Italy to the west, and the Balkan peninsula to the north resulted in the Hellenization of this entire area. Under the reign of Alexander the Great, a magnificent era for jewelry began. Hellenistic jewelry, much more so than painting and sculpture, underwent flourishing development in the art centres of the different regions under Greek rule. In the 3rd and 2nd centuries BC, the technical ability of Hellenistic goldsmiths reached the highest levels ever attained. A style both sumptuous and full of plastic vigour was created, in which meticulous arrangement of the decorative motifs resulted in the contrast and harmony, clarity and unity, rhythms and cadences that make some of these jewels complete works of art. The very fine technique and virtuosity in miniature is reflected in the creation of the first cameos and in disk earrings bearing pendants, often of minute proportions. A real masterpiece is an earring with a winged figure of a woman driving a two-horse chariot (Boston, Museum of Fine Arts). The precision of its tiny details, the severity of style with which it is modelled and the rhythmic dynamism of the figures make this earring a microscopic monument of sculpture.

Also worthy of high consideration are the magnificent diadems that came into wide use as a result of the Persian conquests made by Alexander the Great. One type is a rigid elliptical shape with a Hercules knot in the centre and pendants hanging down over the forehead (The Her-



Greek jewelry.

cules knot was the most famous one used in ancient times, as it was considered a magic knot and, in jewels, took on the significance of an amulet. It was also used on bracelets, belts, and rings during this period.) One of the most impressive of these diadems is the one from Kerch (James Loeb Collection, Murnau am Staffelsee). Above the Hercules knot is a sculptured figure of Nike flanked by two sea serpents.

One type of necklace during the Hellenistic period was made of gold pieces, often hollow or filled with resin, in the shape of acorns, amphorae and rosettes, sometimes alternated with stones or vitreous paste. In the 3rd century BC, the bracelet in the shape of a serpent originated and remained popular through the Roman period. The serpent motif was also used for rings.

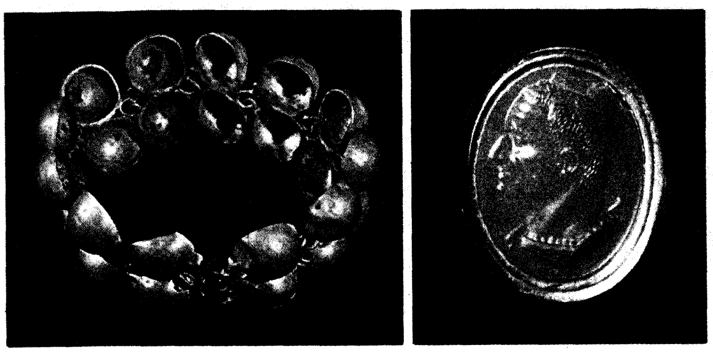
Roman. In ancient Rome, jewelry was used to an extent never seen before and not to be seen again until the Renaissance. Imperial Rome became a centre for goldsmiths' workshops. Together with the precious stones and metals that were brought to the city came lapidaries and goldsmiths from Greece and the oriental provinces. The gold ring, which under the republic had been a sign of distinction worn by ambassadors, noblemen, and senators, gradually began to appear on the fingers of persons of lower social rank until it became common even among soldiers. The great patrician families in Rome and the provinces possessed not only jewels but also magnificent gold and silver household furnishings, as shown by the objects found in Pompeii and Boscoreale (Louvre).

Stylistic characteristics of Roman jewelry

From the standpoint of style, Roman jewelry in its earlier phases derived from both Greek and Etruscan jewelry. Later it acquired distinctive features of its own, introducing new decorative themes and attaching greater importance to sheer volume (such as massive rings), in keeping with the rather pompous rhetorical spirit displayed at that point in cultural history.

The motif of a serpent coiled in a double spiral, copied from Hellenistic models, was frequently used for bracelets, rings, arm bands, and earrings. The Romans also used Greek geometric and botanical motifs, palmettos, fleeting dogs, acanthus leaves, spirals, ovoli, and bead sequences. From Etruscan gold jewelry the Romans took the strong plasticity of the bulla, which they transferred to necklace pendants sparely decorated with filigree or combined in completely smooth hemispheres in bracelets, headdresses, and earrings.

In Pompeii and Rome, jewelry began to take on Italian characteristics. New decorative motifs of a magical na-



Roman jewelry.

Arnoldo Mondadori Editore—C E A M

ture began to appear, such as the half-moon and the wheel with four spokes. In addition, as Roman jewelry freed itself of Hellenistic and Etruscan influences, greater use was made of coloured stones: topazes, emeralds, rubies, sapphires, and pearls. A strong preference was shown for engraved gems, so much so that they were considered collectors' items by wealthy people, including Caesar himself. The stones were set in bezels or supported by pins that passed through them, Another new technique also came into use called *opus interassile*, with which a flat or curved metal surface was decorated with tiny pierced motifs. Many pendants were used in the earrings: from a ring a series of pieces hung down with square bezels or bands of small bullas alternating with stones, which in turn supported pendants in different shapes.

There was an extremely varied production of gold mesh and chains, often containing inserted bezels set with stones or half pearls, while others had ivy or laurel leaves attached to them. Although pendants were not used on necklaces in the beginning, later examples have pendants in the form of embossed medallions like the one from Tortosa, Syria, with the head of Medusa (British Museum, No. 2730). Precious stones, vitreous pastes, and cameos with golden frames also served as pendants for necklaces. Toward the end of the 3rd century AD, necklaces often bore medallions or gold coins with portraits of the emperors.

Middle Ages. *Byzantine.* The fabulous phenomenon that was ancient Rome, the bearer of civilization throughout almost the entire known world, began to lose vitality and decline near the end of the 4th century AD though not without leaving indelible traces of its unique culture and civilization. The Roman Empire embraced Christianity, although in reality it was the papacy that embraced the Roman Empire, acquiring ever more ample powers. The intention of the Byzantine court (at Constantinople, the new seat of imperial power) to maintain Roman supremacy in the field of the arts was forced to give way to a style more closely related to that of the near Orient. Partly for religious reasons, this style soon developed a new spirit and its own distinctive characteristics. The wave of Iconoclasm—the controversy in the 8th and 9th centuries about the depiction of images in religious art—gave the decoration of jewelry, too, a basically ornamental nature, in which the techniques used to the greatest extent were filigree and enamelling, as well as the copious application of precious stones and pearls. Very complex decorations and arabesques were obtained with filigree, while enamelling was favoured for representations of flowers and birds. Typically Byzantine were the half-moon-shaped earrings that were in wide use up through the 12th century. There are examples with pierced decoration, with filigree basketwork, and with the figures of enamelled birds facing each other on a golden half-moon (such as the one in the British Museum). The court jewels, if credit can be given to the figures shown in the mosaics in S. Vitale at Ravenna, must have been of astonishing splendour. Although the mosaics give only a sketchy idea, on the figures of Justinian, Theodora, and their retinue, precious ornaments can be distinguished that were of ceremonial magnificence suited to their rank.

Iconoclasm

For all practical purposes, Constantinople's artistic activities came to an end when it was conquered and looted by the Crusaders in 1204.

Islāmic. After the Arab conquest of Iran brought it into the Islāmic community of peoples, rings, pendants, earrings, and necklaces of gold continued to be worn, and the Iranian tradition of animal art persisted, modified to some extent in order to conform to the canons of Islām, which forbade the making of images. A 12th-century gold pendant in the form of a lion is a highly schematic rendering of this animal; it is decorated with granulation. Other techniques were filigree, encrustation with precious and semiprecious stones, and the use of niello (a mat-black substance). From the 14th century onward, manuscript illustrations give some idea of the kind of jewelry worn by Persians. In Mongol and Timurid times, jewelled coiffures for women and diademed headdresses for men seem to have been fashionable in court circles. Under the Safavid rulers, jewelry became more sumptuous and elaborate. In the 19th century, native traditions were corrupted by European influence. Traditional designs, however, have persisted in Zinjaniib and among the Kurdish mountaineers of northwest Iran. Silver decorated with twisted wire arranged in scrolls is a feature of the former. The Kurdish goldsmiths also work in silver, which they decorate with chased or repoussé designs, sometimes reminiscent of motives found on Sāsānian metalwork.

Jewelry worn by men and women in Turkey during the Ottoman period was probably influenced by the fashions current in Iran. Objects of adornment were jewelled turban aigrettes, rings, earrings, necklaces, and armlets. A technique popular in Turkey from the 16th century onward was the encrusting of jade and other hard stones with jewels attached to the surface by delicate floral scrolls in gold. Unfortunately, not many surviving pieces are earlier than the 19th century, when native tradition had been stifled by a taste for Rococo jewelry.

In north Africa an independent tradition has been maintained by the Berber and Arab tribes. In design the jewelry of southern Morocco shows curious analogies to Byzantine jewelry—heavy silver plaques decorated with niello or cabochons, serving as diadems or headbands. In other parts of Morocco, in Algeria and Tunisia, popular forms are headbands, breast ornaments, brooches, pendants, and a characteristic triangular-shaped shawl pin.

Teutonic. While in the Byzantine area classic forms of expression were being wiped out by the development of a skillful class of artisans who impressed their entirely ornamental taste on jewelry produced solely for decorative purposes, in the rest of romanized Europe a huge, complex movement of peoples was taking place. Bringing their tradition of polychrome decoration with them, these peoples swarmed over the old declining Greek–Roman

artistic civilization. Goths, Vandals, Huns, Franks, and Lombards emigrated, extending their conquests into central, northern, and southern Europe beginning in the 4th century AD, and they remained there until the 9th century. In accordance with an ancient definition, they were called barbarians; that is, not Christians, foreigners. They were also considered barbarians because they were thought to have destroyed the classical art of the Roman world.

Throughout all the provinces of the Roman empire, these Teutonic tribes produced gold ware that shared a common, well-defined style moderated according to the tastes of the particular regions in which they settled. The blend of Teutonic and Iranian, Scythian, Sarmatian, or Celtic styles produced ornaments far from the great classic tradition. Precious ornamentation, which represented the main artistic ambition of these nomadic peoples, was achieved with faience (decoration made of opaque coloured glazes), jewels, and enamels. Dominant also is braiding, which was done with strips of embossing, with bands of stones or enamel set in bezels, and also with filigree.

Teutonic fibulae

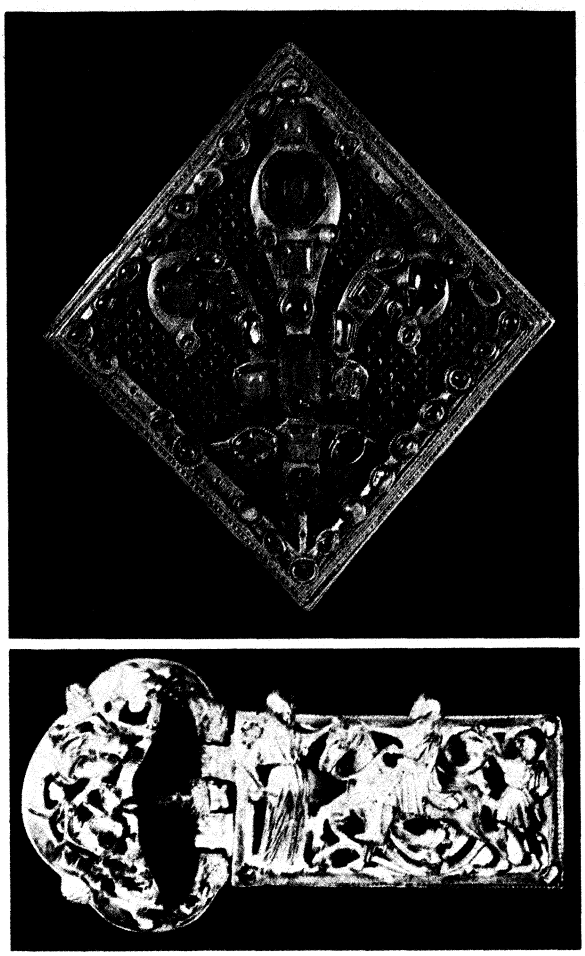
There was a highly varied production of fibulae. One of the most impressive for its size (35 centimetres or 14 inches) is the one in the shape of a bird found in Petroasa, Romania (Bucharest, National Museum), whose body is covered with sockets of different sizes and shapes in which stones and enamel were meant to be set (*c.* 4th century). The most widely used type of fibula was the so-called buckler variety, with a fan head arched bridge, and flat or molded foot, with pierced work in various shapes. Equally common were disk fibulae, either flat or with concentric embossing, while S-shaped fibulae and belt buckles were rarer.

Rigid necklaces, made up of several circles with much decoration, were typical. The most magnificent examples are those from the 6th century from Alleberg and Färjestaden, Sweden (Stockholm, Museum of National Antiquities). A ring with zoomorphic braiding (Milan, Museo Poldi Pezzoli) was found in the same region. This technique was most widely used in the Celtic and north Germanic regions of Europe, while in the British Isles, to judge from the magnificent jewels in the Sutton Hoo burial-ship treasure (London, British Museum), it was the technique of enamelling that reached extremely high levels. In northern Europe and Scandinavia the main goldworking techniques were filigree, embossing, and turning on a lathe.

As time passed, the different products of barbaric goldworking art took on a more definite stylistic identification according to the various races and locations.

Western European. The widespread adoption of Christian burial rites put an end to the custom of burying the dead with all of their jewelry. Thus, beginning with the 8th century, almost the only important gold products handed down to modern times were those preserved in abbey and cathedral treasures or by imperial and royal courts; among these gold products are very few pieces of jewelry. As the graphic and plastic arts gradually developed, however, they documented the jewelry in use at the time. According to these sources, little jewelry was worn in the Romanesque period (*c.* 950–*c.* 1150).

In the 11th century, monastic workshops for the service of the church began to decline, disappearing one after another to be replaced by secular workshops. Goldworking activities in western Europe gradually freed themselves from the centralizing patronage of the church in



Gothic jewelry.

order to serve the numerous courts and noble families, and in the 12th century the first goldsmiths' guilds were organized.

One of the most widely used ornaments in medieval Europe was the ring. To it was attributed ever more symbolic and religious value, as well as ever greater importance as a talisman, good omen, and sign of office; and, as always, it served as a seal.

Another widely used ornament was the brooch. Most popular was the medallion type, which might be round, star-shaped, or pentagonal, while the diamond shape was less common. A magnificent example of the diamond-shaped brooch is the fleur-de-lis brooch that was part of the French crown jewels and is now in the Louvre. Standing out in relief against a blue enamelled background is a large gold lily covered with important precious stones that create a rich chromatic effect.

Flamboyant Gothic style

A fine example that typifies the plastic decorative repertory of the flamboyant Gothic style is a silver belt buckle from Sweden (Stockholm, Historiska Museet). Modelled in high relief on the buckle plate is a gentleman on horseback approaching a lady and followed by his servant. The three-lobed buckle ring is modelled in a complex design that includes a seated person and a man kneeling in front of him (*c.* 1340).

Renaissance to modern. *15th and 16th centuries.* The "rebirth" of classicism, which combined all artistic expression in a single orderly, rational approach, found a fertile creative field in gold jewelry. During the Renaissance the jeweller's art reached truly high levels—particularly in Italy in the grand duchy of Tuscany. Eighteen centuries after the great flowering of Hellenistic jewelry, Italian Renaissance jewelry once again achieved an expressive form worthy of comparison with the figurative arts. There was, in fact, no sharp division between the two. Nearly all of the most famous names responsible for the Renaissance artistic revival—Ghiberti, Brunelleschi, Pollaiuolo, Botticelli—served apprenticeships in the goldsmiths' workshops, where gentlemen went to order medallions for their hats and where ladies went to have their jewels set.

Because of their elaborate workmanship, which meant that their artistic value was far greater than the intrinsic value of their materials, many pieces of jewelry have been handed down to modern times in public and private collections. Even more extensive evidence, however, is provided by paintings from this period which show the jewelry worn by both men and women. From portraits by Botticelli and Piero di Cosimo, it can be seen, for example, that as early as the second half of the 15th century the elaborate decoration of women's hair with precious materials had become a real art, in which goldsmiths and craftsmen carefully worked out every line of the often extremely complicated ornamental design that had to harmonize with the movement of braids or unbound hair,

Increase in the use of jewelry during th Renaissance

The Renaissance saw an enormous increase in the use of jewelry throughout Europe. The courts of England, France, and Spain, the French duchy of Burgundy, and the Italian duchy of Tuscany indulged in real contests, trying to outdo each other in the display of gold, gems, and pearls, a phenomenon that for centuries had not occurred on such a large scale. The nobility and the rich middle class followed this fashion, and even the youngest scions were covered with jewels, as shown in the portrait of the Medici princess by Il Bronzino (Florence, Uffizi), as well as many others. Francis I of France surrounded himself with famous artists such as Benvenuto Cellini and Leonardo da Vinci. In Paris, artists such as Jean Duvet, Étienne Delaune, and the Fleming Abraham de Bruyn were the outstanding creators of designs for jewelry. It was Hans Holbein the Younger who was mainly responsible for the introduction of Renaissance jewelry into England, where he found fertile ground, thanks to Henry VIII's great passion for jewels—a passion surpassed only by that of Elizabeth I. Henry possessed more than one magnificent parure, or set of matching jewelry, designed for him by Holbein, as well as several hundred rings.

As Holbein's portrait of Henry VIII suggests, the custom of wearing bejewelled clothing, which had begun gradually in the 14th century, flourished in the Renais-

Lauros—Giraudon

sance. Even hat brims were decorated, with designs in pearls as well as with pendants of great value.

In Holbein's portrait there is also a magnificent example of a popular necklace of the period. It consisted of wide gold bands decorated with embossing that formed medallions, in the center of which were large stones. From the necklace hung a pendant. Only rarely were women content to limit themselves to a single necklace, usually wearing a choker-type necklace made of pearls, with or without a pendant, together with a longer second necklace made of gold, with or without the inclusion of gems. A third necklace was often hooked to the clothing, on the shoulders, and formed a double loop, being lifted up in the centre and fastened to the bodice with a jewelled pin.

The precious ornament on which the artist-jewellers lavished all of their creativity and technical ability was the pendant. At first this consisted of a decorative medallion enclosing a cameo with figures and subjects of classic derivation, such as busts of women and pagan deities. These figures were later enriched with inserts of gold, enamel, and gems, which enhanced the polychrome effect. Still later, the figures were freely modelled in brilliant polychromy with a great variety of subjects—animals, Tritons, mermaids, ships, sea monsters, and symbolic figures—in complicated openwork compositions made of several linked pieces, in which the irregular shape of a large baroque pearl was often used for the body of an animal or a centaur's torso.

Throughout Europe the ring enjoyed wide popularity in an unlimited variety of types, including those with a bezel that could be opened and used as a container for relics, symbols, or—as romantic tradition has it—poison.

17th century. Toward the end of the 16th century, the Renaissance style blended gradually into the manifestations of the Baroque period, which arose at different times in different countries. This gradual change in the style of jewelry was conditioned mainly by two factors. The first was of a technical nature and concerned improvements in the cutting of precious stones, while the second consisted of a great vogue for the cultivation of flowers. Floral and vegetable decoration therefore became the most fashionable theme for jewelry designers, and its popularity spread throughout all Europe. The ornamental motifs of knots, ribbons, and Rococo scrolls also saw a considerable development. There was a corresponding decrease in the amount of figurative decoration, which finally completely disappeared. At first these ornamental forms were carried out in openwork gold jewelry, the majority of which was coloured with enamel; later diamonds and other precious stones became the real protagonists in the composition of jewelry.

Period of Louis XIV

During the 17th century, the number of pieces of jewelry worn decreased, as did the fashion for male adornment. The last monarch to make heavy use of jewels was Louis XIV, and the word heavy is used here in a literal sense, the great weight consisting mainly of gems with which the monarch covered himself for official ceremonies. He had his own personal jeweller, Gilles Légaré, who was a guest in the Louvre palace. He was not the only sovereign, however, who enjoyed showing off his jewels nor was Versailles the only court in Europe to follow the king's example. Those of London, Madrid, and Munich were not far behind. The precious ornaments worn by women started on the hat, on the side of which at least one striking aigrette (spray of gems) was fastened. Then came two or three heavy necklaces, each of which might have a pendant, then a belt that followed the pointed shape of the bodice. Other jewels were inserted along the armholes, shoulders, and wrists, and at least four rings were worn on the hands. Often the heavy fabrics used for the clothing were embroidered with gold thread. It was during this period that a spectacular form of jewelry was created in Spain, which in a more subdued form spread throughout Europe: the stomacher brooch, which covered a woman's entire bodice, from neckline to waist. With its heavily bejewelled composition of scrolls, leaves, and pendants on a gold framework that followed the curves of the body, even extending under the armpits, this jewel usually contained no less than 50 precious stones of different sizes. A famous example is the one in emeralds from the treasure of the Virgin of Pilar (Victoria and Albert Museum, London).

18th century. About 1725. Brazilian diamonds in large numbers began to be imported into Europe, and, during the course of the century, this stone became so popular that imitations began to be produced. The jewelry of this

Use of Brazilian diamonds

period seems to have been created to glorify and exploit the cutting of diamonds and other precious stones. The dense forms of Baroque jewelry were replaced by an entirely different conception, in which the design was to appear in gems alone, while the metal setting was concealed to the greatest extent possible. The greater lightness that resulted was increased by the large number of empty spaces in the composition as well as by its lack of symmetry in many cases. Wide choker necklaces with pendants were very popular, and the stomacher brooch remained in style but in a lighter, airier form (such as the one in Munich, Schatzkammer der Residenz). The jewelled stems of the aigrette were often made so that they could sway back and forth in order to show off the sparkle of the diamonds that covered them, The brooch in the shape of a bouquet of flowers began to become fashionable. As in the 17th century, both men and women wore jewelled buckles on their shoes.

A piece of jewelry that was widely used for daytime wear during this century was the chatelaine, on which, together with the watch case, goldsmiths lavished some of their most highly refined work. The chatelaine was a pendant made of jointed, embossed gold components of different shapes and sizes, with scenes and designs in elaborate frames. It was fastened by means of a hook to the belt or waistcoat pocket, and from its protruding points hung decorative chains of various lengths, on which men fastened their watches, the keys for winding them, and other accessories. Women, on the other hand, used the chatelaine to carry keys, scissors, and other more or less useful objects.

Classical ideals and Josiah Wedgwood

During the last 30 years of the 18th century, the great sensation caused by the archaeological discoveries in Pompeii and Herculaneum caused art forms to turn towards classical ideals of harmony and brought about a decisive change in European tastes and decorative forms. Curved lines no longer appealed in the ornamental repertoire, the new Neoclassical style being characterized by greater simplicity, together with severity of composition. Jewelry forms. too, were influenced by decorative motifs based on Greek and Roman models, and the cameo became fashionable once again.

An English pottery manufacturer, Josiah Wedgwood, made a big contribution to the popularization of the new jewelry forms. An expert technician, he produced reproductions of classic cameos, calling upon sculptors like John Flaxman to work with him on the execution of oval, round, and octagonal plaques with figures done in relief

in a white paste on a light blue, green, black, or pink background. These plaques, framed in gold, were used for all sorts of jewelry—medallions, pins, pieces of diadems, belts, bracelets, rings (a notable example is the ring with a Wedgwood medallion in the Musée des Arts Décoratifs, Paris).

*19th **century.*** The Industrial Revolution destroyed forever the ancient role of jewelry as a symbol of social rank. The social evolution created a market for a vast quantity of jewelry at prices the middle class could afford; and so jewelry, too, succumbed to the machine. Hundreds of different components for ornaments were produced by machines, an electric gold-plating technique was invented, and the production of imitation stones increased. Despite the growing dominance of the machine, however, the goldsmiths' technical ability remained at a high level.

The jewelry produced in the 19th century is characterized by a stylistic eclecticism that takes its inspiration from all past styles—Gothic, Renaissance, Greek, Etruscan and Roman, Rococo, Naturalistic, Moorish, and Indian, all tinged with the Sir Walter Scott–Lord Byron Romanticism of the period. The futility of transferring forms of artistic expression from an era in which they were the result of organic aesthetic development and of adopting them for objects that reflect only a gesture of romantic admiration is evident in the painting by Jacques-Louis David (Louvre, Paris) immortalizing Napoleon's coronation ceremony (1804). The painting provides documentation on the precious ornaments worn by the ladies who were present. In their jewelry, the conventional, rhetorical Empire style appears as a strict, uninspired interpretation of classic motifs, a far cry from the exquisite Neoclassicism of the 18th century.

Artistic commercial jewelry firms

Besides mass production, the 19th century saw the establishment of large artistic commercial firms that produced high quality jewelry suited to the requirements of the prosperous new bourgeois class. While always satisfying very high standards in regard to technique and materials, these firms tended, from the aesthetic point of view, to reflect the tastes of a bourgeois clientele, which are usually quite traditional.

The oldest of the firms was the one founded by Peter Carl FabergC in St. Petersburg (now Leningrad) in 1870, which took over from the firm his father had started in 1842. FabergC attained great renown at the Universal Exposition in Paris in 1900, where for the first time he put on display all the imperial Easter eggs that he had created, together with a selection of other "luxurious objects." On that occasion he was proclaimed "Master" and was awarded the Legion of Honour. FabergC used a

Marc Garanger

greater variety of precious and semiprecious stones than almost any other jeweller in history. He had a strong preference for the Louis XVI style but also made numerous objects in the Italian Renaissance, Rococo, and medieval styles, as well as in the "old Russian" style, which is a mixture of Byzantine and Baroque. Decoration with enamelling, too, was one of the main specialties of the Fabergé firm.

In Paris in 1898 Alfred Cartier and his son Louis founded a jewelry firm of great refinement. The firm was distinguished for a production characterized by very fine settings, largely of platinum, which were designed so that only the precious stones, always selected from the very purest, were visible.

At the beginning of the 20th century, Cartier was the most famous jeweller in the world, supplying jewels to the king of Portugal, the duke of Saxe-Coburg-Gotha, the grand dukes and princes of Russia, the prince of Wales, and other notables.

In the United States in about 1850, Charles Lewis Tiffany (father of Louis Comfort Tiffany, one of the most original of the Art Nouveau artist-craftsmen) produced silverware in New York. In 1886 he introduced the Tiffany setting, a special type of fork for the setting of diamonds. Among his clients were Sarah Bernhardt and President Lincoln.

Other high-quality jewelry firms founded in the 19th century were Van Cleef & Arpels in Paris, Bulgari in Rome, Asprey & Company in London, Black, Starr & Frost in New York, and Patek Philippe in Geneva.

Art Nouveau

The development of the movement called Art Nouveau at the end of the 19th century represented a reaction against the imitation of ancient styles and the emphasis given, in the creation of jewelry, to precious stones. The material used for Art Nouveau jewelry was prized not for its intrinsic value but for its ability to render a design or to carry out chromatic effects. The new jewelry was made from any material that would best express the new symbolic or decorative ideas. Vegetable and animal components, together with the feminine figure, formed the basis for compositions made of flowing lines of rich plastic and chromatic effect and antistructural, dynamic design on a high artistic level.

In Paris, through the works he presented at the Salon du Champ de Mars in 1895, René Lalique (1860–1945) achieved a position of European renown and importance. He personified the Art Nouveau jeweller-artist, his works providing evidence of such highly personal taste that they can be compared to Renaissance jewels. They lean toward a symbolism carried out by the use of milky or watery blue-green colours; of stones such as the opal; of disquieting animals such as the snake, the owl, the octopus, and the bat; and of feminine figures, usually enigmatic, mysterious, and dreamy. Enamel, ivory, vitreous paste, and engraved glass were often used by Lalique to obtain pictorial and plastic effects in his jewels.

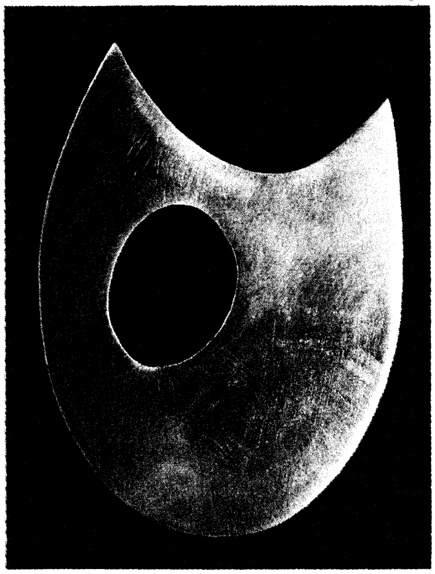
Unlike Lalique, the jewellers Georges Fouquet (1858–1929) and Henri Vever (1854–1942) expressed themselves through more synthetic geometric forms. The pendant representing a butterfly by Fouquet and the bracelet and ring for the actress Sarah Bernhardt (both in the Périnet Collection, Paris) show a very carefully thought-out stylization.

The Czechoslovak graphic designer Alphonse Mucha (1860–1939), who worked in Paris, created a number of jewelry designs, transferring his brilliant talent as an illustrator to precious stones and metals.

In the United States, the floral style in jewelry found one of its most highly personal interpreters in Louis Comfort Tiffany (1848–1933), one of the greatest of all American decorators. In the creation of jewelry he expressed himself at first by transferring to Art Nouveau forms the colourful Oriental and Byzantine style that so fascinated him. Later he adopted Lalique's French symbolism, on which he set his own stylistic mark.

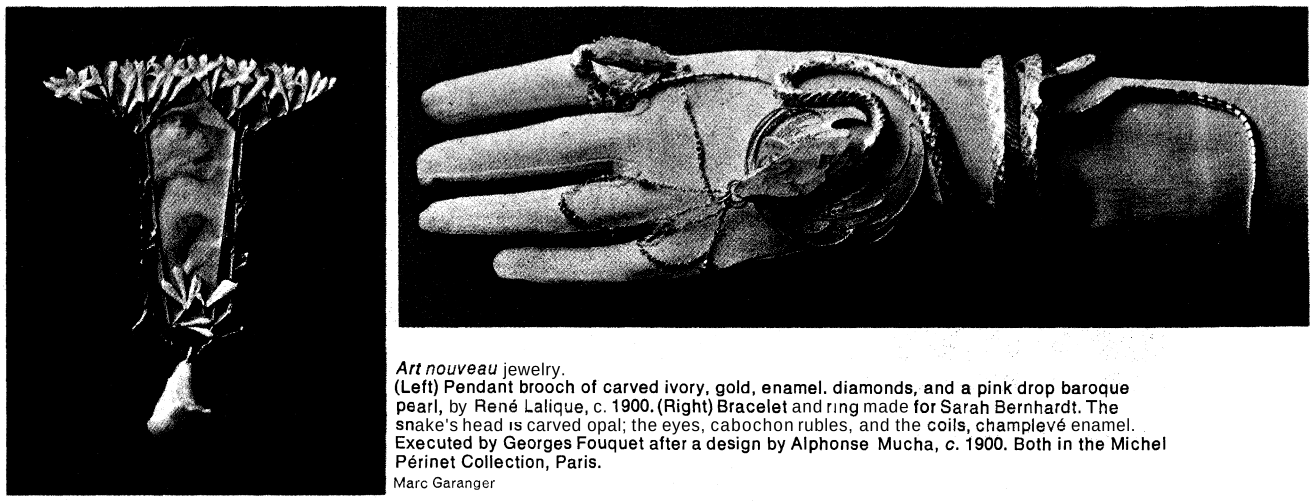
Modern. The Art Nouveau movement came to an end at the beginning of World War I. The years that followed the war's end seethed with new excitement. In this new phase, the stylistic trends—particularly the nonfigurative—that began to emerge in the most advanced jewelry creations were closely linked to those of painting and sculpture. Cubism, Futurism, the abstractionism of Piet Mondrian and other artists of the de Stijl group, Paul Klee's paintings, and above all the Bauhaus school (which aimed at integrating artistic disciplines with one another and with industrial techniques) provided a basis for the new forms used in avant-garde jewelry.

Marc Garanaer



"Cutout," made in gold by François Hugo after a design by Jean Arp, 1966–67. In the Galerie le Point Cardinal, Paris.

Compositions were based mainly on the interplay of geometric forms. Like Art Nouveau jewelry, creations of the Art Deco movement (named for the art displayed at the 1925 Paris exposition) used materials suitable for



Art nouveau jewelry.

Marc Garanger

expressing the new stylistic language. Preference was given to the smooth, polished, satined surfaces of precious metals or even of steel. Diamonds and other precious stones were used sparingly, functioning largely as chromatic accents. In the same piece of jewelry, coral could be combined with diamonds, regardless of the great difference in intrinsic value, because their sole purpose was to satisfy the aesthetic requirements of the nonfigurative styles.

During this period there were outstanding artist-jewellers such as Raymond Templier, Jean Fouquet, and René Robert in France, H.G. Murphy in England, and Wiwen Nilsson in Sweden.

Later, artists of great international renown devoted some of their creative efforts to the art of jewelry. Some—such as Georges Braque, Jean Cocteau, Max Ernst, Jean Arp, Man Ray, Salvador Dali, Yves Tanguy, and Jean Dubuffet—designed jewelry, while others—including Pablo Picasso, Alexander Calder, Alberto Giacometti, Gio Pomodoro—made jewels.

One of the most recent developments in modern mass-produced jewelry is the use of plastic. This material, as well as providing colour, can have mineral fragments or dust embedded in it or can be used in combination with more or less valuable metals, producing pieces of jewelry whose composition may call for considerable effort and which may be of much interest.

OTHER CULTURES

East Asian. *Chinese.* Much of Chinese jewelry, both of recent and early date, displays the familiar manipulative skill of the Chinese craftsmen; yet the work of the goldsmith or lapidary applied to personal ornament does not represent so distinct a branch of craft as it does in the west and is accorded no special attention by the native connoisseurs and writers on the arts. Most of the jewelry is designed to adorn the costume rather than the person, and much of it has a fulsome and insubstantial quality that is not immediately pleasing to Western eyes. Necklaces, bracelets, and earrings are comparatively rare, headdresses and elaborate hairpins being the more common forms attached to the person. In the traditional costume of recent times, ornate hooks and buckles were used to attach girdles, and women wore strings of beads, often multiple and variously spaced, with decorative plaques and other larger ornaments interspersed. The beads might be attached to the neck, head, or waist, and their purpose was to dignify the whole figure, rather than to display the fine quality of a curiously wrought gem. In any case, the splendour of the stuff of the costume, with richly woven or embroidered ornament, provided the distinctions of rank and wealth, and jewelry was often dispensed with altogether. The long sleeves and high collar of the garment left little of the person exposed for ornament set against the skin, in the manner favoured in the West.

Jewelry to adorn the costume rather than the body

In the time of the Shang dynasty, in the last centuries of the 2nd millennium BC, bone and ivory hairpins with ends carved as birds or abstract figures were a popular adornment. The many finely wrought, small jade plaques of the period, depicting animals in profile, are in many cases clearly intended for sewing to the costume. The earliest evidence of gold ornaments belongs to the time about 400 BC, though these are harness mounts, or weapon parts, rather than jewelry in the normal sense. The latter is better represented by the belt hooks (said to have been adopted from the nomads of inner Asia) that were probably worn by both men and women. They were mostly made of bronze, with fine cast ornaments usually of abstracted dragon and bird heads. These belt hooks were inlaid with gold or silver foil, polished fragments of turquoise, or more rarely with jade or glass; sometimes they were gilded.

Toward the end of the Han dynasty, probably not before the later 2nd century AD, the art of granulation was communicated to China from the Hellenized region of the Black Sea coast. Granulation can be traced in China until about the 10th century AD, its discontinuation in the East curiously coinciding with the loss of the technique in the West. Granulation was combined with filigree; and hairpins, combs, ear-rings, and costume plaques survive in some quantity, particularly from the richly furnished tombs of the T'ang dynasty (AD 618–907). There are plaques with birds and flowers delineated by soldered wire, inlaid with turquoise, on a ground of fine granulation that appears like a dust of gold.

The employment of the repoussé technique in gold and silver, particularly on the heads of combs, can be attributed to the T'ang period but became more common in the Sung dynasty (AD 960–1279). Meanwhile, hairpins of filigree, with heads shaped as butterflies or flowers, sometimes with pearls or small jade additions, continued the age-old fashion. A scented hairpin takes the place of the scarf or ring of European romance. They were called *pu yao* ("shaking while walking") and were loosely made so as to sway when the wearer moved. Gilded bronze and silver were the principal materials. There are accounts of elaborate headdresses, some no doubt of the kind representing a complete phoenix such as are to be seen on clay tomb statuettes of the T'ang period, but no surviving examples of these can be attributed with certainty to the Sung period. Jade ornaments were still attached to the costume.

Jewelry survives in greater quantity from the Ming dynasty (AD 1368–1644) and gives an impression of greater taste for elaborate figural and floral designs in high repoussé relief and for the effect of semiprecious stones. The latter were prized for their colour rather than their luminosity or rarity. They are never elaborately faceted, being merely ground flat and beveled at the edge for the most part and are set nearly always en *cabochon*, with barely a preliminary polishing, sometimes even retaining the irregularities of the pebble. The stones are invariably semiprecious or even commonplace: amethyst, agate, chalcedony, pink and other quartzes, and, of course, jade. Until modern times, this last has been the most admired

Ming dynasty jewelry

of the stones, especially the white variety, which was used for spacers and linking pieces in the silk and beaded hangings of elaborate costumes. The plaques of silver repoussé with flowers and scenes of people were probably used only by men as belt ornaments. Apart from the signet ring, the use of which may not go back beyond Ming times, the male could affect jewelry only in his accoutrement. An unusually splendid piece of personal jewelry is represented by the openwork gold plaque set with rough stones that is said to have come from the tomb of Emperor Hsiian-te (1425–35).

Magatama, inrō, and netsuke

Japanese. In the later prehistoric and early historical period of Japan (c. 2nd century BC–6th century AD), comma-shaped objects—not usually more than an inch in length, called *magatama*—were made of green jade and eventually even imitated in glass. They were sometimes pierced to be strung in a necklace. The symbolic meaning of the *magatama,* which were often placed in tombs, can only be guessed at.

In historical times, traditional Japanese costume, male and female, has never allowed the use of ornaments of precious metal or stone, so that nothing in the history of Japanese craft and taste corresponds to the jeweller's work of the West. Hairpins with elaborate heads were increasingly used in the Tokugawa (Edo) period (1603–1868) by women of the geisha and courtesan classes but not by women of other classes. In the same period men were permitted the ostentation of the *inrō,* a small tiered box for tobacco, medicines, confections, and the like, which might be beautifully painted in lacquer and inlaid with mother-of-pearl or precious metal. The ivory girdle toggle called netsuke, always delicately and often intriguingly carved, was the only other personal ornament which usage allowed. (Ed.)

Indian. Extensive documentation on ancient jewels is provided by Buddhist statues and the cycles of wall paintings in the Ajantā caves (4th–5th century). The great variety of types of jewelry represented and the dominance of polychromy indicates the high degree of development attained by the art of jewelry-making in one of the most magnificent of early civilizations, the Indus. The lavish use of polychrome jewelry was possible because of the ancient practice of pearl-diving and because of the wealth and variety of deposits of precious and semiprecious stones to be found in India and the neighbouring countries of Ceylon, Thailand, and Burma. Indian women were thus the first to decorate themselves with huge quantities of jewels—so many that they were almost fully clothed without wearing any real garments. The clothing of these lovely Indian girls often consisted of tiaras, necklaces, earrings, armlets, bracelets, belts, "cache-sex" (serving the same function as a loincloth), and toe rings, worn on their bare skin and complemented by nothing more than precious veils and scarves.

The important place given to polychromy in even such early jewelry, which contained only a negligible quantity of gold and other metal, is suggested by a woman's belt found in Harappā, one of the most ancient centres of Indus civilization, and dated from the end of the 3rd millennium BC. The belt was worn around the naked body of the woman, extending from the waist to the groin. The beads of which it is made are mainly red cornelian, green steatite, agate, jasper, amazonite from Gujarāt, jade from central Asia, lapis lazuli from Afghanistan, and a sort of faience.

In the Indus areas and in those under their influence, the setting, polishing, and piercing of precious and semiprecious stones underwent precocious evolution. Stone-cutting, however, was accepted very late in the Orient where, until only recently, it was considered preferable not to decrease the size of the stone. Over the centuries and the millennia, outside influence—Iranian, Greek, Buddhist, and Muslim—could not undermine the basic traditional characteristics of East Asian jewelry, which remained faithful to its preference for a many-hued rich effect that was less a form of artistic self-expression than a display of showy glitter aimed at astonishing the onlooker.

Kinds of Indi jewelry

If rich rajahs adorned themselves with jewels--on their turbans, on their ears, around their necks, inserted in their nostrils and even between their teeth—the precious objects worn by women were far more numerous, and each of them had its own specific name. For the head alone there were golden wreaths, large brooches, braids made from three bands of gold leaves with a star in the middle set with gems, braids to be placed along the part in the hair, lotus leaves made of gold sheet to be worn at the nape of the neck with bunches of gold flowers next to them, and tiaras in complicated shapes complete with many tinkling pendants. A variety of forms were used for the earrings, in which pearls, filigree, gems, and coral appeared in floral compositions based on the contrast between the different colours. Some Indian women embedded a jewel in the forehead or pierced the nose in order to wear a jewel in the left nostril. Necklaces were sometimes so long that they came below the navel, and different names were given to those made only of pearls and those of gold. The former were also distinguished according to the number of strings, of which there could be as many as several dozen. Some necklaces were made of a combination of precious stones and pearls, while others were made of amulets in various shapes. A very early type of Hindu amulet called a nauratan was made of a gold plaque with nine precious stones fastened above it. A series of *nauratans* could be used to form a necklace. Jewelled belts followed the shape of the body and often had extra pieces that reached up to the neck or down to the bracelets worn around the thigh. Ankle bracelets were often linked by tiny decorative chains running down the instep to the rings on the toes.

The magnificence of Indian jewelry is dominated by pearls, coloured stones, and enamel. Gaudy though small scale, the jewelry is made up of a combination of a series of linked components that break up the compositional unity. It depends mainly for its effect upon the chromatic play of the many different materials that have always abounded in the soil and sea of Indian territory and of nearby countries.

Southeast Asian. There is a long goldworking tradition among the peoples of Southeastern Asia, whose jewelry shows evidence of Tibetan, Chinese, and Indian stylistic influence. The areas in which personal ornamentation with precious objects underwent the greatest development were Burma, Cambodia, Laos, and Vietnam. Burmese jewels are outstanding for the beauty of their designs and for their technical artistry. Typical of them is the conical headdress, reflecting the traditional architectural form of the stupa (Buddhist shrine), and the bejewelled, rigid shoulder decorations with a raised line similar to that of pagoda roofs, worn by dancers in addition to arm and ankle bracelets, belts, and brooches made of gold and colored stones. Although it has its own distinct characteristics, Burmese jewelry was heavily influenced by Indian styles, especially in regard to a taste for great abundance; thus, each single jewel, rather than standing out, blends into the overall effect.

Burma, Cambodia, Laos, and Vietnam

In its jewelry forms Cambodia, Laos, and Vietnam were subject to greater Chinese influence because of their geographical position. In these territories, too, most documentation for the period when precious ornamentation had its most flourishing development is to be found in Buddhist sculpture. This means that the outstanding forms of expression in the art of jewelry were linked to religious rites, contributing to the glorification of the figures worshipped by the cult.

Scythian. It is to the Scythians, a seminomadic people from the Eurasian steppes who moved out from southern Russia into the territory between the Don and the Danube and then into Mesopotamia, that we owe a type of gold production, which, on the basis of its themes, is classified today as the animalistic style. During the early period (5th–4th century BC), this style appeared on shaped, pierced plaques made of gold and silver, which showed running or fighting animals (reindeer, lions, tigers, horses) alone or in pairs facing each other, embossed with powerful plasticity and free interpretation of the forms. The animalistic style had a strong influence in western Asia during the 7th century BC. Such ornaments as necklaces, bracelets, pectorals, diadems, and earrings making up the Ziwiye treasure (discovered in Iran near the border between Kurdistan and Azerbaijan) provide evidence of this Asiatic phase of Scythian goldworking art. The ornaments are characterized by highly developed expressive forms that are always based on animalistic themes. This Central Asian Scythian-Iranian style passed by way of Phoenician trading in the 8th century BC into the Mediterranean and into Western jewelry.

African. Personal decoration in African cultures usually consists of modest though showy material. The works with a relatively high degree of development come from those areas in which the influence of more advanced Mediterranean and Oriental cultures led to activities of some significance in the field of jewelry. Silver was the metal most commonly worked, especially in the northern coastal territories, and the forms used for ornaments were derived mainly from the art of Islām. Decoration that rarely surpassed the level of craftsmanship appears on objects such as bracelets, necklaces, rings, brooches, earrings, and belt buckles, and the techniques were usually limited to embossing, filigree, and the insertion of coins or semiprecious stones that had simply been polished.

Regions like Ethiopia, the Sudan, and the Bantu territory, partly because of their Egyptian–Nubian and Arabian origins and partly because they were the centres of a flourishing gold trade, developed a goldworking activity of fairly high quality, which was devoted mainly to the production of objects for the courts and for religious sites. These regions were also devoted to the production of personal ornaments such as embossed plaques, rings, necklaces, and tiaras.

Jewelry of the Ashanti culture of Ghana

The same observations hold true for the Ashanti culture in Ghana, from which there is a large collection of gold jewelry in the British Museum in London. The local chieftain of each Ashanti tribe had a private workshop for gold jewelry in his small court. In the 18th and 19th centuries the most magnificent court was that of King Asantehene in Kumasi, the ancient Ashanti capital on the Gold Coast. A very widely used object was the emblem of the "bearer of souls," a decorated disk that, together with other insignia, was borne by the king's pages. On the back of the disk was a little tube through which a gold wire or cord was run. The decoration of these disks consisted of a mixture of separate and varied radial or spiral motifs, derived in an unorthodox manner from classic art. The mysterious presence of these ornamental motifs

in Ashanti jewelry can be explained only by the sporadic appearance of European goldsmiths in that area, probably during medieval times. Rigid necklaces were also in use, as were rings, which instead of the bezel had fully sculptured figures of animals.

In the past the sandy dunes of Senegal provided alluvial soil from which the natives obtained much gold. There, as in other parts of Africa, the metal that was not exported was used to make ornaments for the tribal chieftains. These were very elaborate objects with complicated decorative motifs worked in embossing or punched freehand. The objects were characterized by the repetition of the designs used and by protruding hemispheres that were smooth or decorated, according to their size.

In these regions, where the making of jewelry was directly dependent upon what was obtained from local deposits, gold was the only material used. Usually the type of decoration, taken from imported models or introduced directly by European goldsmiths, persisted as a repertoire was acquired, with a tendency toward ever great repetition. In other words, rather than an art form dominated by genuine native expression, this production has no relation to the local culture.

American Indian. Central and South American: *pre-*Columbian. Although precious metals were worked in some areas before the beginning of the Christian Era, the greatest development in this field was reached during the second half of the 1st millennium AD. The ancient peoples who, with no proven contact with the cultures of other continents, attained the highest degree of artistic evolution in this part of the world were located in the region near the Andes (Peru, Colombia, Ecuador) and in Central America (Mexico, Guatemala, El Salvador, and part of Honduras), while Panama, Costa Rica, and Nicaragua are considered areas of cultural exchange between South and Central America.

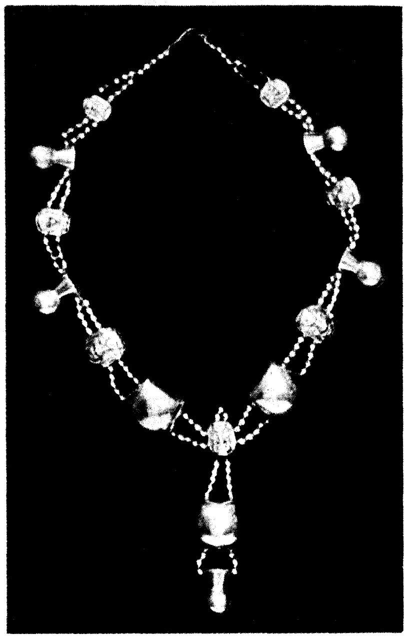
Andes region

In Peru the Chavin culture (c. 5th century AD) has supplied the oldest products, consisting of embossed gold sheets with ornamental motifs that suggest some Chinese influence, although this has not been proven. At the end of this period there was considerable development in techniques. This was followed by the Mochica culture (c. 3rd to 8th century), named for the Moche valley, where the discovery was made of objects decorated with filigree and set with gems. The Mochica culture produced large quantities of jewels in which animals were frequently represented, an example being a ring-shaped earring with a pendant in the form of a toucan (a tropical American bird). Contemporaneously, the Nazca culture flourished along the southern coast of Peru, producing gold ornaments of high technical quality in which anthropomorphic figures in high relief predominated. After centuries during which there was more or less a standstill because of a series of wars and political turmoil, the formation of the Inca empire in about 1300 encouraged the flourishing of local styles (Chimú, Chancay, Ica).

The richest gold and mineral deposits, which are still productive, were those in Colombia. It is not possible to establish definite dates for jewelry from Colombia and Ecuador, but an approximate chronology indicates the San Augustin zone as the oldest, followed by Chitcha. In the latter area, the "Quimbaya treasure" and objects from the upper Cauca River (Calima style) represent jewelry of the greatest importance and magnificence.

In the civilizations of the Andes, gold was lavishly used on clothes. About 13,000 pieces of gold were found sewn into a single Chimú poncho. On certain occasinos the priests wore tunics made entirely of braided gold sheet applied to the cloth. One of the commonest ornaments worn by important personages and warriors was the *nariguena*, a gold ornament that was hooked to the nostrils and might be in the shape of a simple ring, a laminated disk, or an upside-down fan decorated with pierced work. Anthropomorphic and zoomorphic figures appeared on pectorals which were embossed in high relief and decorated with overlapping cut and embossed pieces.

There are necklaces with a seashell motif in different shapes arranged one after the other and necklaces with other stylized zoomorphic forms that are all alike. One of the most outstanding of these necklaces is from Chimú (May 21, 1968, Christie sale). It is composed of a row of gold beads to which are attached eight similar figures of a deity in a ritual pose (1100–1200).



Gold necklace. Chimú, c. 1300. In the British Museum.

Among the advanced techniques known by the people of the Andes were repoussé gold beating, cire perdue casting, and the making of gold alloys. The most common alloy, *tumboaga* (consisting of gold and copper), was also known to the Mexicans.

Meso-American region

The most outstanding artistic development during the pre-Columbian era took place, together with that in the region of the Andes, in that part of Central America that is approximately bordered on the north by the Mexican state of Sinaloa and on the south by Honduras and Nicaragua. Probably because the area was poor in gold, objects made of this material date from about 1,000 years after those from the Andes (c. 14th century BC). Mixtec graves have yielded outstanding examples of objects such as gold pendants, jewels combined with turquoise mosaic, and quartz ear spools. The few examples that remain from the Aztec period suggest the stylistic influence of the Andes region. Of the decorative animal motifs, the most frequent is the serpent; of the ornamental motifs, the spheroid, disk, and sphere.

It is thought that ornamental objects in precious materials from the pre-Columbian civilizations, especially the older ones, had some religious function in addition to being used in burial rites. Stylistically, pre-Columbian objects show an unusual amount of charming expressiveness. Symbolic concepts were transferred from stone and pottery to gold through transfigurations that enhanced the plasticity of the forms, displaying at the same time an awareness of structure and of compositional rhythms that forms the main appeal of these objects. Although this was not done frequently, at times the pre-Columbian Indians encrusted their jewels sparingly with rock crystal, lapis lazuli, emeralds, turquoise, pearls, and coral, the purpose nearly always being to increase the expressiveness of the object represented.

North American. The diverse forms taken by personal ornamentation are related to the type of life led by the numerous ethnic and tribal groups scattered throughout the vast American territory. The most highly developed tribes were those whose social organization permitted them to settle in one place for long periods of time, with the consequent evolution of religious and artistic activities.

On the basis of archaeological finds, Indian territory was divided into the following broad areas: the eastern forests, which includes the Great Lakes region and Florida, east of the Mississippi; the Great Plains, including the central part of North America between the eastern forests and the Rocky Mountains; the Southwest, which corresponds to what are now the states of Arizona, New Mexico, southeastern Utah and southern Colorado; the northwestern coast, from the bay of Yakutat in Alaska to the mouth of the Columbia River; and California, in the area included between the northwestern coast and the southwestern cultures.

The Great Plains and California produced no jewelry, the former area because its slow artistic evolution involved only the decoration of clothing with leather, and the latter because its tribes were economically at the pre-agricultural level and therefore lacking in any impressive, long-lasting form of artistic expression. Judged on the basis of the archaeological data that has come to light so far, the highest artistry was achieved by the southwestern cultures, followed by those of the eastern forests and of the northwest.

Personal ornamentation in all of the native cultures of North America shows no connection with the pre-Columbian cultures of Central and South America. One of the most striking differences between the two is that in North America copper was much more frequently used than gold. In some parts of North America this metal may have been used before its use became known in the Western world and at that far-off time it was valued like gold.

As far back as the archaic period, the practice of decorating shells with carving or champlevé enamel work was very widespread. Feathers and turquoise (used for mosaic) complete the list of precious materials available to the American Indians for personal ornamentation until the arrival of the white man.

On the whole, in their limited diversity, forms of artistic expression became traditional for particular cultures and were perpetuated by them. Even today, attempts are still being made to keep them alive.

Indians of the Southwest

In the southwest cultural area the first objects used for personal ornamentation go back to the first half of the 1st millennium AD and consist of bracelets made from a shell carved in the shape of a frog, exquisitely sculptured in miniature; zoomorphic subjects on auricular disks; rings with bird and snake motifs in pierced work; and other shell jewelry covered with turquoise mosaics.

Shell etched in the horned toad motif, from the Snaketown excavations, Arizona; Hohokam. 900–1150 AD. In the Arizona State Museum, Tucson.

The Pueblo and Navajo tribes, which were part of the southwest cultural area, made beautiful necklaces and pendants from turquoise mosaics, shells, and coral. The Pueblo Bonito discoveries document this activity from pre-Columbian times. At the beginning of the second half of the 19th century, the Navajos learned to work silver from Mexican craftsmen and developed this skill with great ability, reworking motifs of Spanish American origin in their Indian traditional style.

In the Great Lakes region where the Forest culture was located, archaeological research has demonstrated the presence of copper ornaments as early as the 5th millennium BC. These consist of necklace beads formed of thin, narrow metal strips and of sheet metal in the shape of fish. The Hopewell finds include bobbin-shaped copper earrings and engraved sheets of silver, dated between 200 BC and AD 500, together with ornaments that were sewn into clothing or inserted in headdresses. From the Mississippi period there are pieces of embossed copper sheet and breastplates, disks, and plaques made of copper and shell with a wealth of engraved ornamental motifs, such as birds, sun symbols, isolated heads, human skulls, eagles, rattlesnakes, hands with outspread fingers and an eye designed on the palm, crosses, and figures of warriors.

Flying peregrine falcon, copper repoussé, Hopewell, 1st century BC–1st century AD. In the collection of the Ohio State Archaeological and Historical Society, Columbus.

Beginning in the 17th century, the Seneca, Cayuga, Onondaga, and Iroquois tribes in the New York State region hammered, shaped, and cut European silver coins to be used for jewelry of all kinds. Also worthy of note among the Iroquois are bone combs with handles carved in zoomorphic shapes.

Indians of the northwest coast

In the culture of the Indians on the northwest coast, the influence of Arctic and even of Asiatic peoples can be observed. Persons of very high rank wore a characteristic type of headdress, which was made of wood, in a conical shape with wide brim, surmounted by sculptured human and animal figures. Another type was shaped like a crown or diadem with a rectangular plaque worked in relief placed in the middle of a leather forehead band from which ermine tails and bunches of sea-lion bristles stuck out. The sculpturing on these plaques is highly refined, and the rich shell inlay with which they are decorated makes them look like jewels. The engraving on combs is also outstanding.

The sculptural style peculiar to this culture is characterized by a conventional, formal naturalism that is extremely vigorous and dynamic. Often the same object combines parts that are fully sculptured with parts in low relief, and the depth of the carving may vary greatly.

Objects called copper coins, symbols of maximum power and wealth, were in the form of a shield made of copper sheet in a standardized shape (trapezoidal above and rectangular below). The upper half was taken up by a design such as a head worked in engraving or embossing.

During the 16th century, European conquest and rule of the American continent interrupted development of the arts among the natives, who were forced to live under conditions that were far from favourable to the continuation of traditional artistic activities.

BIBLIOGRAPHY. W.T. BAXTER, Jewelry, Gem Cutting *and Metalcraft,* 3rd ed. rev. (1950), is a manual for students learning the art of the jeweller; many pieces of jewelry, several instruments, and various methods that are used in this extraordinary work are illustrated. JOAN EVANS in *A* History of *Jewellery, 1100–1870,* 2nd ed. (1970), as in the author's earlier works—English Jewellery from the Fifth Century *A.D.*

to 1800 (1921) and *Magical Jewels of the Middle Ages and the Renaissance* (1922)—documents and makes a profound aesthetic and critical study of the style of jewels in the periods considered, giving examples in pictures and in sculpture. E.D.S. BRADFORD, *Four Centuries of European Jewellery* (1953, reprinted 1967), treats jewelry from the Renaissance up to the 20th century, describing the manufacture of the precious material and the technique that must be learned to transform that material into a work of jewelry. R.A. HIGGINS, *Greek and Roman Jewellery* (1961), is divided into two parts: a description of the technical processes and their historical evolution and a chronological listing of the jewels themselves. This scholarly work makes it particularly clear that, except for rare exceptions, the history of ancient jewelry is not merely a history of stylistic revolution but a combination of technical and creative development. ERICH STEINGRABER, *Alter Schmuck: Die Kunst d. europ. Schrnuckes* (1956; Ital. trans., *L'arte del gioiello in Europa dal Medioevo al liberty,* 1965), deals with the historical evolution of gem setting as an art form; *Der Goldschmied* (1966), is an exhaustive study of the history of the techniques of working with gold and silver. HENRI VEVER, *La Bijouterie française au XIX^e siècle (1800–1900),* 3 vol. (1906–08), documents the grand lines of goldsmiths and jewelers during the 19th century, evaluating the most authoritative and impartial sources of the time: official reports on the various expositions and articles published in journals and reviews. GUIDO GREGORIETTI, *Il Gioiello nei secoli* (1969; Eng. trans., *Jewelry Through the Ages,* 1969), treats the history of personal precious ornaments of all civilizations from the 3rd millennium BC to the present (also contains descriptions of the most important beds of celebrated diamonds, pearls, and corals). MARIA ACCASCINA, *L'oreficeria italiana* (1934), reviews the most important works of the Italian jewellers from the Teutonic era to the beginning of the 20th century, concentrating on the significant events influencing the current means of production. ANTONIO MORASSI, *Antica oreficeria italiana* (1936), the catalog of Milan's sixth triennial exhibition of ancient Italian jewelry, documents with examples the historical evolution of jewelry. FILIPPO ROSSI, *Capolavori di oreficeria italiana dall' XI al XVIII secolo* (1956), is a study that illustrates the important moments in Italian jewelry, beginning with the 11th century. HEINZ BATTKE, *Geschichte des Ringes in Beschreibung und Bildern* (1953), describes the history of rings, beginning with the Egyptian seal of the 18th dynasty (*c.* 1400 BC) and continuing up to the rings of the 19th century. The book presents 160 examples that give a complete panorama of the history of rings through the centuries. Other recommended studies of particular countries and periods include: ETIENNE COCHE DE LA FERTE, *Les Bijoux antiques* (1956; Eng. trans., *Antique Jewellery from the Second to the Eighth Century,* 1962); MARGARET FLOWER, *Victorian Jewellery,* rev. ed. (1967); R.G. CHANDRA, *Studies in the Development of Ornaments and Jewellery in Proto-historic India* (1964); GABRIEL MOUREY and A. VALLANCE, *European Art Nouveau Jewelry* (1969); GRAHAM HUGHES, *Modern Jewelry: An International Survey, 1890–1967,* rev. ed. (1968); E.D.S. Jewish Mysticism

This article deals with the special nature and characteristics of Jewish mysticism, the main lines of its development, and its role in present-day religion and culture.

NATURE AND CHARACTERISTICS

The Judaic context. The term mysticism applies whenever a person is convinced that it is possible to establish *direct contact,* apart from sense perception and intellectual apprehension, with the divine—a reality undefinable by pure logic and believed to be the ultimate ground of being. Since mysticism springs from an aspiration to join and grasp that which falls outside ordinary experience, it is not easily restricted within precise limits. The boundary line that separates mysticism from metaphysics and cosmology (doctrines on the basic nature or structure of being and the world), from theosophies (systems of thought claiming special insights or revelation into the divine nature), and various forms of occultism (the study and control of supernatural powers), and from theurgy (the art of compelling or persuading divine powers) and even magic, often of the lowest kind, is not clear.

If mysticism is defined as the search for *direct* contact with the divine, however, it seems to be incompatible with Judaism. In its classical and normative form, Judaism appears as faith in a sole God who created the universe and who chose to reveal himself to a selected group by means of a rule of life he imposed on it—Torah ("Guidance" or "Teachings," incorrectly rendered as "Law"). The earthly destiny of the chosen nation, as well as the eternal salvation of the individual, in traditional Judaic beliefs, depends upon the observance of this rule of life, through which any relationship to God must take place. The fact is, however, that in the religious history of Judaism the quest for God goes beyond this relationship mediated by Torah, without ever dispensing with it (since that would take the seeker outside of Judaism) or pretending to reach the depths of the mystery of the divine, or still less to end in an ontological identification with it (where God and man are the same in nature and being).

Three types of Jewish mysticism. Three types of mysticism may be discerned in the history of Judaism: the ecstatic, the contemplative, and the esoteric. Though they are distinct types, in practice there are frequent overlappings and mixtures between them.

The first type is characterized by the quest for God—or, more precisely, for access to a supernatural realm, which is itself still infinitely remote from the inaccessible deity—by means of ecstatic experiences; this method is sometimes tainted by theurgy. The second follows the way of metaphysical meditation pushed to the limit, always bearing in its formulations the imprint of the cultural surroundings of the respective thinkers, who are exposed to influences from outside Judaism; this was the case with Philo of Alexandria (*c.* 15 BC–after *AD* 40) and a few of the Jewish thinkers of the Middle Ages, who drew their inspiration from Greco-Arabic Neoplatonism and sometimes also from Muslim mysticism.

Esoterism

The third type of mysticism claims an esoteric knowledge (hereafter called esoterism) that explores the divine life itself and its relationship to the extradivine level (the natural, finite realm) of being, a relationship that is subject to the "law of correspondences." From this perspective, the extradivine is a symbol of the divine; that is, a reality that reveals another, superior reality, whence reciprocal action of the one on the other (which corresponds to it) exists. This form of mysticism, akin to *gnosis*—the secret knowledge claimed by Gnosticism, a Hellenistic religiophilosophical movement—but purged, or almost purged, of the dualism that characterizes the latter, is what is commonly known as Kabbala (literally "tradition"). By extension, this term is also used to designate technical methods, used for highly diverse ends, ranging from the conditioning of the aspirant to ecstatic experiences to magical manipulations of a frankly superstitious character. If the concept of spiritual energy acting on matter and at a distance originally underlay these practices, it finally became unrecognizable and all that remained was a collection of "tricks of the trade."

The favour with which the doctrine of correspondences was regarded by ancient and medieval science, as well as the tendency in the three monotheistic religions (Judaism, Christianity, and Islām) to reconcile the results of rational reflection with the data of revelation, had the result of turning speculation on the origin and order of the universe toward mysticism.

Perennial human questions

It must also be noted that the quest for God implies the search for solutions to problems that go beyond those of religion in the narrow sense and that arise even when there is no interest in the relationship between man and supernatural powers. Man ponders the problems of his origins, his destiny, his happiness, his suffering—questions that arise outside of religion, as well as within nonmystical forms of religious life; the presence or absence of religious institutions or dogmas is of little importance when it comes to these questions. They were all formulated within nonmystical Judaism and served as the basis and framework for the setting and solution of problems in the various forms of Jewish mysticism. This mysticism, especially in its "Kabbalistic" form, brought about profound transformations in the concepts of the world, God and "last things" (resurrection, last judgment, messianic kingdom, etc.) set forth in biblical and rabbinical Judaism. Nevertheless, Jewish mysticism's own set of problems about the origins of the universe and of man, of evil and sin, of the meaning of history, of the afterlife and the end of time is rooted in the very ground of Judaism and cannot be conceived outside of an exegesis of revealed Scripture and rabbinical tradition.

MAIN LINES OF DEVELOPMENT

A study of the main lines of Jewish mysticism, following its actual historical development, reveals that during a very long period, from its origins in the 1st century-CE (Common Era, or AD) to the middle of the 12th century, only the first two of the three types outlined above existed. It was not until the second half of the 12th century that esoterism became clearly discernible; from then on it continued to develop in various forms up to very recent times.

Early stages to the 6th century CE. The centuries that followed the return from the Babylonian Exile in the 6th century BCE (Before the Common Era, or BC) witnessed the growth and intensification of reflection on the intermediary beings between man and God, of meditation on the divine appearances whose special place of occurrence had formerly been the most sacred part of the Jerusalem Temple, of speculation on the coming into being and organization of the universe and on the creation of man. None of these themes was absent from the Bible, which was held to be divinely revealed, but each had become the object of a constant ideological readjustment that also involved the infiltration of concepts from outside and reaction against them. The speculative taste of Jewish thinkers between the 2nd century BCE and the 1st century CE took them in many different directions: angelology (doctrine about angels) and its counterpart demonology (doctrine about devils); mythical geography and uranography, description of the heavens; speculation on the divine manifestations—which had as background the Jerusalem Temple worship and the visions of the moving "Throne" (the "Chariot," Merkava) in the prophecy of Ezekiel; on the double origin of man, a being formed of the earth but also the "image of God"; on the end of time; on resurrection (a concept that appeared only toward the end of the biblical period); and on rewards and punishments in the afterlife.

The literary crystallization of all this ferment was accomplished in writings, such as the book of Enoch, of which Pharisaic (rabbinical) Judaism—which became the normative Jewish [illegible] con[illegible] of Jerusalem [illegible]d the [illegible] of the [illegible] Temple (70 CE)—retained almost nothing and even the vestiges of which it tended to obliterate in its own writings; the Talmud and the Midrash (rabbinical legal and interpretative literature) touched these themes only with great reserve, often unwillingly and more often in a spirit of negative polemic.

As early as the 1st century CE, and probably even before the national calamity of 70, there were certainly sages or teachers recognized by the religious community for whom meditation on the Scriptures–especially the creation narrative, the public revelation of the Torah on Mount Sinai, the Merkava vision of Ezekiel, the Song of Solomon—and reflection on the end of time, resurrection, and the afterlife were not only a matter of exegesis and of attaching new ideas to texts recognized to be of divine origin but also a matter of inner experience. It was, however, probably in other circles that speculation on the invisible world was engaged in and where the search for the means of penetrating it was carried out. It is undeniable that there exists a certain continuity between the apocalyptic visions (*i.e.*, of the cataolysmic advent of God's Kingdom) and documents of certain sects (Dead Sea Scrolls) and the writings, preserved in Hebrew, of the "explorers of the supernatural world" (Yorde Merkava). The latter comprise ecstatic hymns, descriptions of the "dwellings" (hekhalot) located between the visible world and the ever-inaccessible divinity, whose transcendence is paradoxically expressed by anthropomorphic descriptions consisting of inordinate hyperboles (*Shiʿur qoma*, "Divine Dimensions"). In addition, a few documents have been preserved that attest to the existence of methods and practices having to do with the initiation of carefully chosen persons who were made to undergo tests and ordeals in accordance with psychosomatic criteria borrowed from physiognomy (art of determining character from physical, especially facial, traits). Some theurgic efficacy was attributed to these practices, and there was some contamination from Egyptian, Hellenistic, or Mesopotamian magic. (A curious document in this respect, rich in pagan material, is the Sefer ha-razim, the "Treatise on Mysteries," which was discovered in 1963.)

Two early sources of mystic writings

In this extrarational domain, there are many similarities between concepts reflected in unquestionably Jewish texts and the documents of contemporary non-Jewish esoterism, to the point that it becomes difficult, sometimes impossible, to distinguish the giver from the receiver. Two facts are certain however. On the one hand Gnosticism never ceases to exploit in its own way biblical themes (such as the tale of creation and speculation on angels and demons) that have passed through Judaism, whatever their original source may have been; on the other hand, though Jewish esoterism may borrow this or that motif fom ancient *gnosis* or syncretism (fusion of various faiths) and may even raise to a very high rank in the hierarchy of being a supernatural entity such as the angel Metatron, also known as "little Adonai" (*i.e.*, little Lord or God), it still remains inflexibly monotheistic and rejects the Gnostic concept of a bad or simply inferior demiurge who is responsible for the creation and governing of the visible world. Finally, it is noteworthy that during the centuries that separate the Talmudic period (2nd to 5th centuries AD) from the full resurgence of Jewish esoterism in the middle of the 12th century, the texts that have been preserved progressively lose their density and affective authenticity and become reduced to the level of literary exercises that are more grandiloquent than substantial.

Sejer yetzira. In the ancient esoteric literature of Judaism, a special place must be given to the Sefer yetzira ("Book of Creation"), which deals with cosmogony and cosmology (the origin and order of the universe). Creation, it affirms with a clearly anti-Gnostic insistence, is the work of the God of Israel and took place on two different levels: the ideal, immaterial level and the concrete level. This was done according to a complex process that brings in the ten numbers (sefirot, singular sefira) of decimal notation and the 22 letters of the Hebrew alphabet. The ten numbers are not to be taken merely as arithmetical symbols: they are cosmological factors, the first of which is the spirit of God—with all the ambiguities that this term ruah has in Hebrew—while the nine others seem to be the archetypes of the three elements (air, water, fire) and the spatial dimensions (up, down, and the four cardinal points). After having been manipulated either in their graphic representation or in combination, the letters of the alphabet, which are considered to be adequate transcriptions of the sounds of the language, are in turn instruments of creation.

The ontological value of speech

The basic idea of all this speculation is that speech (that is, language composed of words, which are in turn composed of letters/sounds) is not only a means of communication but also an operational agent destined to produce being—it has an ontological value. This value, however, does not extend to every form of language; it belongs to the Hebrew language alone.

The universe that is produced by means of the sefirot and the letters is constituted according to the law of correspondences between the astral world, the seasons that mark the rhythm of time, and man in his psychosomatic structure.

The "Book of Creation" certainly does not proceed entirely from biblical data and rabbinical reflection upon them; certain Greek influences are discernible, even in the vocabulary. What is important, however, is its influence on later Jewish thought, down to the present time: philosophers and esoterists have vied with one another in commentating it, pulling it in their own direction, and adjusting it to their respective ideologies. Even more important is the fact that Kabbala (see below The making of the Kabbala) borrowed a great part of its terminology from it (*sefira*, among others), naturally making semantic adaptations as required.

The speculation traced above developed during the first six centuries of the Common Era, both in Palestine and in Babylonia (later called Iraq); Babylonian Judaism had its own social and ideological characteristics, which put it in opposition to Palestinian Judaism in various aspects, including esoterism as well as other manifestations of the life of the spirit. The joint doctrinal influence of the two centres was to spread during the period from the mid-8th to 11th century among the Jews established in North Africa and Europe; mystical doctrines also filtered in, but very little is known about the circumstances and means of their penetration.

Greek philosophy and Islamic mysticism

The Arabic-Islāmic influence (7th–13th century). Arabic-Islāmic culture provided another important influence in Jewish mystical development. A considerable part of Jewry, which had fallen under Muslim domination in the 7th and 8th centuries, participated in the new Arabic-Islāmic civilization; the Jews of Asia, Africa. and Spain soon adopted Arabic, the prevailing language of culture and communication. By way of Arabic-language culture, elements of Greek philosophy and Islāmic mysticism penetrated Judaism and contributed to the deepening of certain theological concepts that were Jewish in origin but had become the common property of the three religions of the Book: affirming the divine unity, purging all anthropomorphism from the idea of God, and approaching the divine by progressing on a spiritual path that leads through an ascetic discipline (both physical and intellectual) to a detachment from this world and a freeing of the soul from all that distracts it from God. Greek philosophy and Islāmic mysticism, moreover, raised very serious questions that threatened many traditional beliefs, such as the creation of the world, the providential action of God, miracles, eschatology (doctrines about the resurrection of the body, rewards, and especially material punishments in the hereafter). Even in the Christian West, where cultural contacts between the majority society and the Jewish minority were far from reaching the breadth and intensity of the Judeo-Arab relations, Jewish intellectuals were unable to remain totally impervious to the incursions of the surrounding civilization. Moreover, at the beginning of the 12th century, if not earlier, European Judaism received part of the intellectual Arabic and Judeo-Arabic heritage through translations or adaptations into Hebrew, its only cultural language.

The making of the Kabbala (c. 1150–1250). It was in these circumstances that, starting around 1150, manifestations of markedly theosophic ideologies appeared in the south of present-day France (in the regions of Provence–Languedoc–Roussillon). Two types can be distinguished at the outset, which are very different as to their manner of appearance, their form, and their content.

Sefer *ha-bahir*. The first type is represented in fragmentary, poorly written, and badly assembled texts that began to circulate in Provence–Languedoc during the third quarter of the 12th century. Their inspiration, however, leaves no doubt as to the community of their origin. They were in the form of a Midrash; that is, an interpretation of Scripture with the help of a particular interpretative method, full of sayings attributed to ancient rabbinical authorities. This whole body of texts, probably imported from the Near East (Syria–PalestineIraq), is known as the "Midrash of Rabbi Nehunya ben Haqana" (from the name of a 2nd-century rabbi) or Sefer *ha-bahir*, "The Book of Brightness" (from a characteristic word of the first verse of Scripture to be elucidated in the work). The authorities cited are all inauthentic (as was often the case in late works), and the content of this Midrash, even its nonmystical content, is entirely Gnostic; a Gnosticism that tries nevertheless to escape any ontological dualism (and, as a matter of fact, succeeds).

Role of the divine powers

Its object is to present the origin of things and the course of history centred naturally on that of the chosen people, with the vicissitudes caused in turn by obedience to God and by sin, as bound and conditioned by the manifestation of divine powers. These "powers" are not "attributes" derived and defined by philosophical abstraction, although that is one of the terms used to designate it: they are hypostases (essences or substances). They are inseparable from God, but each one is clothed in its own personality, each operates in its own manner, in the leaning toward severity or mercy, in dynamic correspondence with the behaviour of man, especially of the Jew, in the visible world. They are ranked in a hierarchical order, which is not yet as fixed as it became starting with the second generation of Kabbalists in Languedoc and Catalonia (see below *The school of Gerona* [*Catalonia*]). The rich nomenclature used to designate the "powers" exploits the resources of both the Bible and rabbinical tradition, of the "Book of Creation," of some ritual observances, and also of the letters of the Hebrew alphabet and the signs that can be added to them to indicate the vowels. All of this combines to give a symbolical rendering of the myth, cosmology, sacred history, and eschatology through which an anonymous group of theosophists attempt to formulate their doctrine: a Gnostic myth, except for the adjustments that eliminate the radical depreciation of the visible world.

Thus, according to the Sefer *ha-bahir*, the universe is the manifestation of the hierarchically organized divine powers, and the one that is at the bottom of the hierarchical ladder has special charge of the visible world. This entity is highly complex. Undoubtedly there are survivals of Gnostic speculation on Sophia ("Wisdom"), who is involved, sometimes to her misfortune, in the material world. This power is also the divine "Presence" (*Shekhina*) of rabbinical theology but profoundly transformed: it has become a hypostasis; by a bold innovation, moreover, it is characterized as a feminine being and thus finds itself, while remaining an aspect of the divinity, in the position of a daughter or a wife, who owns nothing herself and receives all from the father or the husband. It is also identified with the "Community of Israel," another radical innovation. but facilitated by ancient speculation based on the allegorical interpretation of the Song of Solomon, which represents the relationship of God to the chosen nation in terms of the marriage bond. Thus a theosophical equality is established between the whole of the people chosen by God, constituted into a kind of mystical body, and an aspect of the divinity, whence the solidarity and linked destiny of the latter and the human group in question. As a matter of fact, a comparable relationship between the "Presence" and Israel was not totally foreign to ancient rabbinical theology. In this light, the obedience or disobedience of Israel to its particular vocation is a determining factor of cosmic harmony or disruption and extends to the inner life of the divinity. This is the essential and definitive contribution of the *Sefer* ha-bahir to Jewish theosophy. In the same document may be seen the resurgence of a notion fought against by the older theologians—that of *metensōmatōsis*, the reincarnation into several successive bodies of a soul that has not attained the required perfection in a previous existence.

School of Isaac the Blind. Parallel to the appearance of the Sefer *ha-bahir* but independent of it, another theosophic tendency unfolded in Languedoc, the second type referred to above. The two movements would take only about thirty years to converge, to constitute what may conveniently, though not quite precisely, be called classical Kabbala. The second school flourished in Languedoc during the last quarter of the 12th century and crossed the Pyrenees into Spain in the first years of the 13th century.

The most eminent spokesman of this school was Isaac ben Abraham, known as Isaac the Blind. For this theosophist, among whose extant works there is in particular a very obscure commentary of the "Book of Creation," the general vision of the universe proceeds, to use the words of Gershom G. Scholem (the eminent 20th-century Kabbala scholar), from the link he discovers between the hierarchical orders of the created world and the roots of all beings implanted in the world of the *sefirot.* One can already see a Neoplatonic influence in the reflections of Isaac: *e.g.*, the proceeding of things from the One and the corresponding return to the heart of the primordial undifferentiatedness, which is the fullness of being and at the same time every conceivable being. This return is not merely eschatological and cosmic but is in some way realized in the life of prayer of the contemplative mystic privileged to have supernatural inspirations, "appearances" of the prophet Elijah, by means of concentration, of orientation of action and thought (*kawwana*), and of "adhesion" (devequt), being-with-God, though not, indeed, a transforming union by which the human personality blends completely into the deity or becomes one with it.

Return to the undifferentiated One

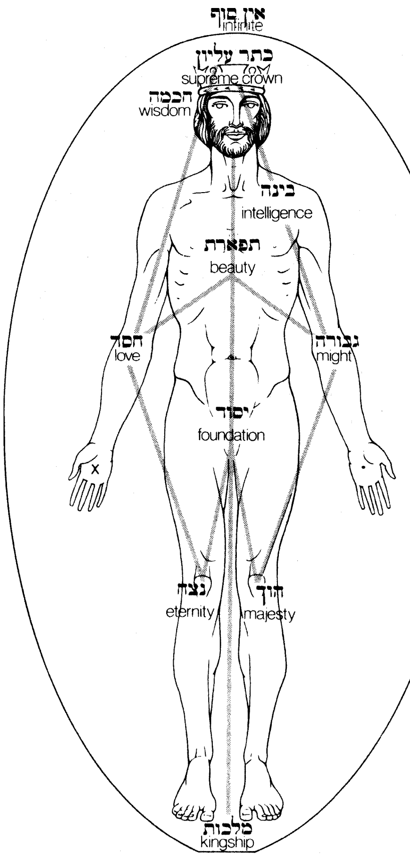
The synthesis of the themes of the bahir and the cosmology of the "Book of Creation," accomplished by Isaac or by others in the doctrinal environment inspired by his teachings, is and remains the foundation of Kabbala whatever enrichment, adjustments, even changes of orientation and sometimes radical modifications the composite may have undergone subsequently.

The ten sefirot. It is also in this environment that the nomenclature of the ten *sefirot* became more or less fixed; it is important to remember this, whatever variant terminologies and even divergent concepts as to the nature of these entities may exist elsewhere—*e.g.*, as internal powers of the divine organism (Gnostic point of view), as hierarchically ordered intermediaries between the infinite and the finite (Neoplatonic concept), or simply as instruments of the divine activity, neither partaking of the divine substance nor being outside it.

Here then is the classical list of the sefirot:

1. *keter ʿElyon*	The Supreme Crown (its identity or nonidentity with the Infinite, *En Sof*, the unknowable deity, remains problematical)
2. *ḥokhma*	Wisdom, the location of primordial ideas in God
3. *bina*	Intelligence, the organizing principle of the universe
4. *ḥesed*	Love, the attribute of goodness
5. *gevura*	Might, the attribute of severity
6. *tifʾeret*	Beauty, the mediating principle between the preceding two
7. *netzaḥ*	Eternity
8. hod	Majesty
9. yeson	Foundation of all the powers active in God
10. *malkhut*	Kingship, identified with the *Shekhina* ("Presence")

The School of Gerona (*Catalonia*). The double current of the gnosticizing theosophy of the *Sefer ha-bahir* and the contemplative mysticism of the masters of Languedoc became one in the elaborations it was subject to at the hands of the Kabbalists in Catalonia, where the Jewish community of Gerona was, during the first half of the 13th century, a veritable seat of esoterism. These elaborations followed the same overall lines, though they were at the same time highly diversified, depending on the personal inclinations of each writer. To the school of Gerona belong, among others, masters such as Ezra ben Solomon, Azriel of Gerona, Jacob ben Sheshet, Moses ben Naḥman (or Naḥmanides, *c.* 1195–1270, the famous Talmudist, biblical commentator, and mystical philosopher); their influence on the subsequent course of Jewish mysticism is of fundamental importance. None of them has left a complete synthesis of his theosophy; they expressed themselves, with more or less reserve, by means of commentaries, sermons, polemic or apologetic treatises or, at the most, brief summaries for the noninitiated. It is not impossible, however, to discover through these texts their vision of the world and compare it with the views of the Jewish thinkers who attempted to harmonize the biblical-rabbinical tradition with Greco-Arab philosophy, whether of Neoplatonic or Aristotelian inspiration.



Sefirot superimposed on the human body (see text).

From C D Ginsberg *Kabbalah, The Essenes;* Samuel Weiser Inc

At the base of the Kabbalistic view of the world there is an option of faith: it is by a voluntary decision that the unknowable deity—who is "nothing" or "nothingness" (nonfinite) because he is a fullness of being totally inaccessible to any human cogitation—set into motion the process that leads to the visible world. This concept radically separates Kabbala from the determinism from which the philosophy of the period could not, without internal contradictions, free the principle of being. In addition it offersa solution consistent with faith to the problem, highly embarassing for the philosophers, of creation ex *nihilo* (out of nothing): the paradoxical reinterpretation of the concept of the "nothing" eliminates the original matter coeternal with God and solves the opposition between divine transcendence (remoteness from the world) and immanence (presence in the world); issuing from the unfathomable depth of the deity and called to return to it, the world, visible as well as invisible, is radically separated from God, who is at the same time constantly present. The correspondence between the *sefirot*, which are modes of the divine manifestation, and all the degrees of being gives meaning to the structure of the world and to the history of humanity centred on the revelation especially given to the chosen people, a revelation that is a rule of life for this people and, consequently, the criterion of merit and sin, or good and evil. Thus, from the top to the bottom of the ladder, there are but corresponding realities that control one another; contrary to the opinion of the philosophers, evil is also a reality since it is the rupture of the universal harmony. It is also the consequence of this rupture, in the form of punishment, but it is repairable. From this perspective, scrupulous observance of the Torah, the revealed Law (both in the written text and the oral tradition), is the essential factor for the very maintenance of the universe. From that point on, the "rational" motivation of the commandments, which raises insurmountable difficulties for the theologians of philosophical orientation, is in the eyes of the Kabbalists but a false problem; the real problem is the fundamental nature of the Torah. Kabbala brings more than one solution to it, whereas philosophy is not even able to raise the question.

The divine "nothing"

It follows from this general concept that the Jewish faith, with its implications—the conviction of holding the undiluted truth, the faithful preservation of ritual practices, and the eschatological expectation—is safeguarded from all the doubts that either philosophical speculation or the rival religious doctrines of Christianity and Islām could evoke in the minds of Jewish believers. Considered from this point of view, Kabbala, already at the stage it had reached at Gerona, turns out to have been a significant factor in the survival of Judaism, which was exposed everywhere in medieval society to the perils that the history of the period reveals.

Besides the Gerona school and the doctrinal descendants of Isaac the Blind in Languedoc, there was another school of Jewish esoterism in southern Europe during the first half of the 13th century. This school—whose followers preferred to remain anonymous and therefore published their writings, such as the ***Sefer ha-Iyyum*** ("Book of Speculation"), either without giving any author's name or by attributing them to fictitious authorities—directed its speculation both to the highest levels of the divine world, where it discerned further aspects beyond the ten ***sefirot*** and attempted to give an idea of them by resorting to the symbolism of light, and to the primordial causes and the archetypes contained in the deity or directly issued from it. The sometimes striking similarity between these speculations and those of John Scotus Erigena a notable 9th-century Christian philosopher, seems to indicate not only a typological kinship of themes between this Kabbalistic current and Latin-language Christian Neoplatonism but also a concrete influence of the latter upon the former. The same may be true about Isaac the Blind and the school of Gerona, but certain knowledge is lacking.

The cycles of existence

Sefer ha-temuna. Still another current manifested itself at the same period; it found its literary expression in the *Sefer ha-temuna* ("The Book of the Image") of unknown authorship. This very obscure document claims to explain the figures of the letters of the Hebrew alphabet. In fact, the speculation of this treatise bears on two themes that were not foreign to the school of Gerona, but it develops them in a personal manner that decisively influenced the future of Jewish theosophy. On the one hand, it deals with a theory of different cycles through which the world must travel from the time of its emergence to its reabsorption into the primordial unity and, on the other hand, with various readings that correspond to these cycles in the divine manifestation that is constituted by the revealed Scriptures. In other words, the reading, thus the interpretation, and consequently the message of the Torah vary according to the cycles of existence; the passage to a cycle other than that under whose governance humanity is presently living could thus entail the modification, even the abrogation, of the rule of life to which the chosen people are presently subject, an explosive notion that opened the way to an overthrow of the traditional values of Judaism.

Medieval German (Ashkenazic) Hasidism. The period from *c.* 1150 to 1250, which witnessed the establishment of Kabbala in the south of France and in Spain, is no less important for the shaping of Jewish mysticism in the other branch of European Judaism, in northern France (and England) and in the Rhine and Danube regions of Germany. Unlike medieval Kabbala, which was to experience a broad and varied development starting in the second half of the 13th century, the movement designated somewhat summarily as German (or Ashkenazic, from a biblical place-name conventionally used to designate Germany) Ḥasidism (Pietism), would hardly survive as a living and independent current beyond the second quarter of the 13th century. There was undoubtedly within Franco-German Judaism a certain continuity of mystical tradition, based on the ***Sefer yetzira*** and the *hekhalot* (see above ***Sefer yetzira);*** certain elements of theurgy and magic of Babylonian origin had perhaps also reached it through Italy; and it would seem that the gnosticizing current crystallized in the ***Sefer** ha-bahir* did not pass without leaving traces in Germany. The intellectual atmosphere of Franco-German Judaism, however, differed greatly from that reigning in Spain or even Provence–Languedoc; it was characterized by an almost exclusively Talmudic culture, less intellectual contact with the non-Jewish environment than in the countries of Muslim civilization, and a very limited knowledge of the Jewish theology in Arabic of the Middle East, North Africa, and Spain. This situation would change only in the last third of the 12th century; until then, the "philosophical" equipment of the Franco-German Jewish scholar consisted essentially of a Hebrew paraphrase, dating perhaps from the 11th century, of the treatise ***Beliefs and Opinions*** by Sa'adia ben Joseph (the great 9th–10th-century Babylonian Jewish scholar and philosopher), and the commentary on the "Book of Creation," written directly in Hebrew (in 946) by the Italian Jew Shabbetai Donnolo. Even when the cultural influence of Spanish Judaism came to be felt more strongly in France–England and Germany, the speculative Kabbala noted above hardly penetrated there. Thinkers within Franco-German Judaism who inclined toward theological speculation had their own problems, which resulted in a mysticism strongly imbued with asceticism, a type of mysticism toward which the general situation of the Jews in those regions contributed, as, especially after the First Crusade, they were severely afflicted by bloody persecutions. The main speculative problem was that of the relationship between God in his pure transcendence and total unity and his manifestations in creation, as well as in revelation and communication with inspired men. Reflection on this problem led to the elaboration of various supernatural hierarchies between the inaccessible God and the created universe or the recipient of divine communication; data on angels taken from the Bible and rabbinical and mystical tradition, as well as speculation on the *Shekhina*, were used as material for these hierarchies and also gave a peculiar coloration to liturgical practice. The latter was marked, moreover, by a concern for spiritual concentration by means of fixing the attention on the words and even the letters of the synagogue prayers. Whatever the historical interest of these speculations, they had no great repercussions on the subsequent course of Jewish esoterism; the only exceptions are the mysticism of prayer and demonology, which was sometimes influenced by the beliefs of the Christian environment and fully developed in Hasidic circles. On the other hand, the ascetic morality of the movement, which found its literary expression in the work of Eleazar ben Judah of Worms (c. 1160–1238) and in the two recensions of the "Book of the Pious" ***(Sefer Ḥasidim)***, was to mark Jewish spirituality, esoteric or not, from then on.

Ashkenazic speculation and asceticism

The making of the Zohar *(c.* 1260–1492). Once the actually marginal episode of German Ḥasidism was finished, almost all of the creative activity in Jewish mysticism was to be situated or would originate in Spain, up to the expulsion of the Jews in 1492.

After the flowering of the schools described above came to an end, around the year 1260, two other currents appeared. The first, in its own manner, resumed relations with Gnosticism in that it placed the problem of evil at the centre of its reflection. The texts that reflect this tendency do not maintain evil in a state of dependence on the "attribute of judgement" within the structure of the ***sefirot*** set up by the previous Kabbalists but locate it outside the divinity, constructing a parallel system of "left-hand ***sefirot,"*** with a corresponding development of an exuberant demonology. The second movement, whose main representative was the 13th-century visionary-adventurer Abraham ben Samuel Abulafia, found its justification in inner experiences considered "prophetic" and encouraged by training methods akin to those of Yoga, the Byzantine Hesychasts (mystical, quietist monks), and the Muslim Ṣūfīs (mystics); moreover, an important place was given to speculations on the letters and vocalic signs of the Hebrew script. Unlike the protagonists of other mystical schools of Spain that until then had not sought to spread their ideas outside the circle of initiates, Abulafia applied himself in various places to propaganda and exhibitions that disaffected and worried the leaders of Judaism and caused their initiator to be pursued even by the non-Jewish authorities. The numerous writings that he left were later to stimulate a few minds among the Kabbalists.

The world of Moses de León

The work of Moses ben Shem Tov de León, in the last quarter of the 13th century, marked one of the most important turning points in the development of Jewish mysticism. Moses de León was born in the middle of the 13th century and died in 1305; he was the author of several esoteric works, which he signed with his own name. But at the same time, in order to better spread his ideas and to more effectively combat philosophy, which he considered a mortal danger to the Jewish faith, he turned to the composition of pseudepigrapha (writings ascribed to other authors, usually in past ages) in the form of Midrashim (plural of Midrash) on the Pentateuch, the Song of Solomon, Book of Ruth, and Lamentations, in which Talmudic authorities appeared, of whom only the names were even partially authentic, a procedure already used by the *Sefer. ha-bakir* (see above *Sefer ha-bahir);* in its most finished version (for there were several of them), the plot of the tales centred around Rabbi Simeon ben Yohai, a doctor of the 2nd century, about whom the Talmud already related some curious anecdotes, most of them semilegendary. Moses de León thus produced, over a period of about 30 years, first a work entitled *Midrash ha-ne'elam* ("The Mystical Midrash") whose method was largely allegorical and whose tongue was mainly Hebrew, and then a larger work, the *Sefer ha-zohar* ("The Book of Splendor"), or more briefly the *Zohar,* whose content is theosophic and which was written in artificial Aramaic. The book culminates in a long speech in which Simeon ben Yohai, on the day of his death, supposedly exposes the quintessence of his mystical doctrine. The literary hoax of Moses de León was not immediately accepted as authentic by all the esoterists and still less by scholars outside the theosophic movement; it took half a century or more for the *Zohar* and imitations of it to be recognized as authoritative ancient works, and even then it was not without some reluctance. The nearly contemporary imitations of the *Zohar* that were incorporated into it or appended to it were sometimes of a markedly different ideological orientation: the *Ra'ya Mehemana* ("Faithful Shepherd"—that is to say, Moses, who is the central figure of this composition, the particular subject of which is the interpretation and theosophic justification of the precepts of the Torah); and the *Tiqqune Zohar,* elaborations in the same vein bearing upon the first word of the book of Genesis (*Bereshit*, "In the beginning"). Although critics were never fully silenced and the authenticity of the *Zohar* was already questioned in the 15th century, the myth created by Moses de León and his imitators became a spiritual reality for the majority of believing Jews; it still retains this character among "Orthodox" Jews. The *Zohar,* believed to be based on supernatural revelations and reinterpreted in diverse ways, would serve as support and reference for all the Jewish theosophies in the centuries ahead.

Doctrine and symbolism of the *Zohar*

As to doctrine, the *Zohar* and its appendixes develop, amplify, and exaggerate speculation and tendencies that already existed, rather than offering any radical innovation. All of the ideas had already been accepted for a long time in Jewish theosophy: the springing forth of being from the depth of the divine "nothing"; the solidarity of the world of the *sefirot* (complicated by the introduction of four ontological levels at each one of which the schema of the ten *sefirot* is reproduced) with the visible world; the indispensable contribution of man (that is, of the Jew) who observes the biblical and rabbinical precepts in their slightest details, to universal harmony—these emphases remain the main lines of the *Zohar.* But all these themes (the speculations of the *Sefer ha-Temuna*, mentioned above, on the cosmic cycles and the "Prophetic Kabbala" of Abulafia being tacitly set aside) were largely organized and enhanced by the use, or rather the unscrupulous appropriation, of materials taken from rabbinical tradition and ancient esoterism as well as from more recent theological and philosophical currents of thought, despite the lack of esteem that the writers of the Zoharic corpus felt and sought to make others feel toward works created by gentiles.

The method of symbolic representation used by the writings of the Zoharic corpus was supported by a system of interpretation that made use of the originally Christian concept of the fourfold meaning of Scripture: literal, moral, allegorical (philosophical), and mystical. The symbolism thus set up boldly made use of an exuberant anthropomorphic and even erotic imagery whose function was to convey the manifestation of the levels of the sefirot to each other and to the extradivine world. The myth of the primordial man (Adam Qadmon), a virtually divine being, reappeared here under a new form, and it was to remain in the subsequent development of Kabbala.

The *Zohar* thus claims to provide a complete explanation of the world, man, history, and the situation of the Jew; on a higher level, to justify the biblical revelation and rabbinical tradition, down to the slightest detail, including the messianic expectation; and thereby to neutralize philosophy. But, while setting itself up as the defender of the traditional religion regulated by the Talmud and its commentaries, in a sense it places itself above tradition, by proclaiming boisterously the incomparable value of the theosophic teaching of "Rabbi Simeon ben Yohai" and the superiority of the esoteric doctrine over the Talmudic studies, which were open to all and which, along with the observance of the precepts, were, according to common opinion, supposed to constitute the basic justification of the life of the Jew. There is in this attitude —more accentuated in the *Ra'ya Mehernana* (see above) than in the *Zohar* proper—a revolutionary potentiality, a possible threat to the primacy of practice and study of Torah; the future would show that this danger was not completely unreal.

The Lurianic Kabbala. After the establishment of the Zoharic corpus, no major changes took place in Jewish esoterism until the middle of the 16th century, when in Safed (in Upper Galilee, Palestine; present-day Ẕefat, Israel) a religious centre of extreme importance for Judaism was established, which was mainly inspired by teachers coming from families expelled from Spain. Until the expulsion of the Jews from Spain (1492) and during the two generations that followed it, the Kabbalistic literary output had certainly been abundant, in Spain till the expulsion as well as in Italy and the Middle East; but it was primarily a matter of systematizing or even popularizing the *Zohar* or of extending the speculation already developed in the 13th century; there were also some attempts at reconciling philosophy and Kabbala. It should be noted that even the traditionalist theologians adopted a careful and rather reserved attitude toward Kabbala.

The teaching of Isaac Luria

The tragedy for Judaism of the expulsion from Spain and of the forced conversions to Christianity that preceded it by a century, and which would become even more extensive in Portugal shortly afterward, deeply marked the victims. These events, accentuating the already existing pessimism in response to the situation of the Jewish people dispersed among the nations, intensified the messianic expectation. This expectation does not seem to have been unrelated to the beginnings of the printed transmission of Kabbala—the first two printed editions of the *Zohar* date from 1558. All these factors, joined with certain internal developments of speculative Kabbala in the 15th century, prepared the ground for the new theosophy inaugurated by the teaching of Isaac ben Solomon Luria, who was born in Jerusalem in 1534, educated in Egypt, and died in Safed in 1572; although his teaching is traditionally associated with Safed, he spent only the last three years of his life there. Luria wrote very little; his doctrine has been transmitted, amplified, and probably somewhat distorted through the works of his disciples, of which the main one was Hayyim Vital (1543–1620), who wrote *'Etz Ḥayyim* ("Tree of Life"), the standard presentation of Lurianic Kabbala.

The theosophy of Luria, whose novelty was proclaimed by its creator and perfectly realized by the esoterists who held to the Zoharistic Kabbala (organized and codified precisely in Safed, during the lifetime of Luria, by Moses ben Jacob Cordovero, 1522–70), is of extreme complexity in its details, although basically it is but one more attempt to reconcile divine transcendence with immanence and to bring a solution to the problem of evil, which the believer in the divine unity can recognize neither as a power existing independently of God nor as an integral part of him.

The theosophic vision of Luria is expressed in a vast mythical construct, which is typologically akin to certain Gnostic and Manichaean (3rd-century dualistic) systems but which strives at all costs to avoid dualism. The essential elements of this myth are as follows: the withdrawal (*tzimtzum*) executed by the divine light, which originally filled all things, in order to make room for the extradivine; the sinking, as a result of a catastrophic event that occurred during this process, of luminous particles into matter (qelippof, "shells," a term already used in Kabbala to designate the evil powers); whence the necessity of saving these particles and returning them to their origin, by means of "repair" or "restoration" (*tiqqun*). This must be the work of the Jew who not only lives in complete conformity to the religious duties imposed on him by tradition but who also dedicates himself, in the framework of a strict asceticism, to a contemplative life founded on mystical prayer and the directed meditation (*kawwana*) of the liturgy, which is supposed to further the harmony (*yiḥud*, "unification") of the innumerable attributes within the divine life. The successive reincarnations of the soul, a constant theme of Kabbala that Lurianism developed and made more complex, are also invested with an important function in the work of "repair." In short, Lurianism proclaims the absolute requirement of an intense mystical life with, as its negative side, an unceasing struggle against the powers of evil. Thus it presents a myth that symbolizes the origin of the world, its fall, and its redemption; it gives meaning to the existence and to the hopes of the Jew, not merely exhorting him to a patient surrender to God but moving him to a redeeming activism, which is the measure of his sanctity. Obviously, such requirements make the ideal of Lurianism possible only for a small elite; ultimately, it is realizable only through the exceptional personage of the "just"-- the ideal holy Jew described above.

Shabbetai Tzevi, a 17th-century "messiah"

Shabbetaianism. During the 60 years that followed the death of the founder, the Kabbala linked to the name of Luria and overlaid with accretions from the other mysticisms of Safed spread through the Jewish Diaspora and deeply permeated its spiritual life, liturgy, and devotional practices. It emphasized the necessity of "repair" of a world in which the uneasiness of the Jew kept growing, for in spite of certain favourable factors—the relative tolerance of the Ottoman Empire and the peaceable establishment of an important Marrano (Iberian Jewish, or Sefardic) community in Amsterdam—there was no overall solution to the problem of the "conversos" (converts) who had remained in the Iberian Peninsula. The other half of the Jewish people, the Ashkenazim, also experienced a serious crisis: its most prosperous and dynamic section, the Jewish population of Poland, was sorely tried, almost totally ruined, and in large part forced to move back toward the west because of the massacres and the destruction that took place during the Cossack uprising of 1648. These ideological and historical data may provide the necessary context for understanding the astonishing though short-lived success of Rabbi Shabbetai Tzevi of Smyrna (1626–76), who proclaimed himself messiah in 1665. The "messiah" was forcibly converted to Islām in 1666 and ended his life in exile ten years later, but despite his failure he had faithful followers. A sect was thus born and survived largely thanks to the activity of Nathan of Gaza (*c.* 1644–90), an unwearying propagandist for the "messiah," who justified the actions of Shabbetai Tzevi, which were contrary to the Law, and his final apostasy by theories that were based on the Lurian theory of "repair": it had to be understood as the descent of the just into the abyss of the "shells" in order to liberate from it the captive particles of divine light. The Shabbetaian crisis lasted nearly a century, some of its aftereffects even longer. It led to the formation of sects whose members were externally converted to Islām—*e.g.*, the Dönme (Turkish, "apostates") of Salonika, whose descendants still live in Turkey—or to Roman Catholicism —*e.g.*, the Polish supporters of Jacob Frank (1726–91), the self-proclaimed messiah and Catholic convert. In Bohemia–Moravia, however, the Frankists outwardly remained Jews. This crisis did not discredit Kabbala, but it led the spiritual authorities of Judaism to watch over and severely curtail its spread and to exercise rigorous ideological control, by concrete acts of censorship and repression, over anyone, even a person of tested piety and recognized knowledge, who was suspected of Shabbetaian sympathies or of messianic pretensions.

Modern Ḥasidism. Though it is true that the messianic movement centred around Shabbetai Tzevi could only produce disillusionment and that if it had not been contained it could have led Judaism to its ruin, yet it answered not only the theosophic aspirations of a small number of visionary scholars but also an affective need of the Jewish masses that was left unsatisfied by the dry intellectualism of the Talmudists and the economic and social oppression of the ruling classes (both Jewish and non-Jewish). This was the case especially in Poland, which before the partition of the Polish kingdom (1772–95) included Lithuanian, Belorussian, and Ukrainian territories. It was there that the so-called Hasidic movement, in no way connected with medieval German Hasidism, originated around the middle of the 18th century—a movement in which the Lurian Kabbala, theoretically maintained as the basis of speculation, underwent adjustments and transformations that continue to the present day.

The Ba'al Shem Ṭov

If modern Ḥasidism may be regarded as a mass movement, having a minimum of organization, using the methods of propaganda and preaching, and forming groups of acknowledged members, then the legend is credible that traces it back to a single founder, Israel ben Eliezer. known as Ba'al Shem Tov (Master of the Good Name; that is, a possessor—he was not the only one of his kind--of the secret of the ineffable name of God, which bestows an infallible power to heal and perform other miraculous operations). This man was born around 1700 and died in 1760 in southern Poland. Though relatively untrained according to the norms of the rabbinical Judaism of his time, he was a spiritual personage of exceptional quality and was able to win to his ideas not only the common people but also many representatives of the intellectual elite. The mist of legend that surrounds him is too dense for it to be possible to reconstruct entirely his personal doctrine, which he probably never systematized. Drawing his inspiration from the methods of the itinerant preachers whose activity was becoming more intense in 18th-century eastern European Judaism, he delivered his teaching in the form of homiletic interpretations of sacred texts, having recourse to fables and parables borrowed from daily life and from folklore; this method remained constant in Hasidism, but it is undeniably an exaggeration and even an error in perspective to consider, as did Martin Buber (see below *Jewish mysticism* today), that the tale and the anecdote are the most authentic expression of the doctrine and the spirituality of Ḥasidism. It is indeed in the doctrinal works, most of them expressed in the form of sermons on the weekly sections of the Pentateuch and other liturgical lessons, that the thought of the Hasidic "rabbis" is expressed. It is very diversified thought, for there are as many bodies of doctrine in Ḥasidism as there were creative spirits during the first three generations of the movement. It is, nevertheless, possible to point to a few traits that are fundamental and common to Ḥasidism as a whole.

In theory, it remains rooted in the Lurianic Kabbala—and nothing essential separates it at this point from its most implacable adversaries in the traditional Judaism of eastern Europe. What is unique to it is to have made of devequt, "being-with-God," an object of aspiration and even a constant duty for all Jews and in all circumstances of life, even those seemingly most profane; in other words, it demands a total spiritualization of Jewish existence. This requirement entails a re-evaluation, less new in its principle than in its concrete application, of the speculative concepts of Kabbala: the emphasis is placed on the inner life of the believer, and it is at this level that the supercosmic drama is played (a drama whose stage was, according to bookish theosophy, in the universe of the *sefirot*); according to several teachers, the same emphasis on inwardness holds for messianic redemption. At the same time, Ḥasidism transforms into social reality a requirement that was also part of the Lurian doctrine of "repair," though it was unfortunately distorted by Shabbetaianism: Ḥasidism puts at the centre of the religious life and organization of the group, as an indispensible guide and unquestioned authority, the inspired leader, endowed with supernatural powers—the "just" ***(tzaddiq)***, the "miracle-working rabbi" ***(Wunder-rebbe)***. Ḥasidism thus produced, wherever it triumphed, an undeniable spiritual renewal; the reverse of the medal was the cult of personality, competition between "dynasties" of "rabbis," obstinacy in maintaining the Hasidic community apart from the surrounding society, with all the social and economic consequences that this will to isolation entailed and for which it would be false to lay all the blame on the environment, despite its definite hostility toward the Jews.

The *tzaddiq*

From its very beginnings, Ḥasidism was to encounter strong resistance on the part of the official Judaism of the period, which had been sensitized to the anarchism of the Shabbetaians and was at the same time solicitous for the prerogatives of the established community leaders and rabbis, the vigilant guardians over the traditional laws and their application, who were confined to the formal study of the Talmud and its commentaries. The behaviour of the followers of Hasidism, though irreproachable in its strict, even rigorous observance of ritual rules, displayed several traits that were distasteful to its adversaries (besides the unconditional submission to the *tzaddiq*, who often doubled as the rabbi of the official congregation): desertion of the general communal synagogues, meetings in small conventicles, modifications of the liturgy, casual dress during prayer, and preference given to mystical meditation rather than to the dialectical study of the Talmud, which requires instead serious intellectual concentration. Nevertheless, the conflict between the Ḥasidim and the "Opponents" (Mitnaggedim) did not finally degenerate into a schism; after three generations, a kind of tacit compromise was established between the two tendencies—Hasidic and Talmudic—without the consciousness of differences ever being erased. The compromise was rather to the advantage of Hasidism, but not without a few concessions on its part, notably on the question of education.

The strong organization of the Hasidic groups allowed them to survive the dislocation of eastern European Judaism as a result of the events of World War II, but its vital centres are today in the United States rather than in Palestine, in part because of economic reasons, in part because of the more or less reserved, and at sometimes frankly hostile, attitude of the Hasidic "rabbis" toward political Zionism and the State of Israel. The best known of the U.S.-based groups is the very active Lubavitchers (after Lyubavich, Russia, seat of a famous school of Ḥasidism), whose headquarters are in the Williamsburg district of Brooklyn, New York.

JEWISH MYSTICISM TODAY

The role played by Kabbala and Ḥasidism in the thought and spirituality of contemporary Judaism is far from being insignificant, though its importance is not as great as in former times. Of course, there is hardly any really living Kabbalistic and Hasidic literature, but the personal thought of religious writers such as Abraham Isaac Kook (*c.* 1865–1935), spiritual leader, mystic, and chief rabbi of Palestine, continues to exercise a marked influence. Furthermore, the renewal of religious thought in "westernized" Jewish circles between the two wars received a powerful impulse from the philosopher Martin Buber (1878–1965), whose work is in part devoted to the propagation of Hasidic ideology as he understood it. "Neo-Orthodoxy," founded in Germany by Samson Raphael Hirsch (1808–88), was quite indifferent to mysticism at the outset, but it too came to be influenced by it, especially after the rediscovery of living Judaism in Poland during World War I by Western Jewish thinkers. Also significant is the work of Abraham Joshua Heschel (1907–72), a Polish Jewish writer of distinguished Ḥasidic background and double culture—traditional and Western—who emigrated to the United States.

Christian and secular Kabbala

Jewish mysticism also has exercised some influence on thought outside the Jewish community. Kabbala, distorted and deflected from its own intentions, transcended the frontiers of Judaism and helped nourish and stimulate certain currents of thought in Christian society, from the Renaissance to the present: "Christian Kabbala," born in the 15th century under the impetus of Jewish converts from Spain and Italy, claimed to find in the Kabbalistic documents, touched up if necessary or even forged, arguments for the truths of the Christian faith. Thus a certain number of Christian humanist scholars became interested in Jewish mysticism, several of whom acquired a fairly extensive knowledge of it on the basis of authentic texts. Among them were Giovanni Pico della Mirandola (1463–94) and Gilles of Viterbo (Egidio da Viterbo; *c.* 1465–1532) in Italy, and Johannes Reuchlin (1455–1522), who was responsible for writing one of the principal expositions of Kabbala in a language accessible to the learned non-Jewish public ***(De arte Cabbalistica***, 1517), in Germany, while the visionary Guillaume Postel (1510–81) was attracting disciples in France. The occult philosophy of the 16th century, the "natural philosophy" of the 17th and 18th centuries, and the occult and theosophic theories cultivated even today and which have coloured the ideology of Freemasonry—all of these focus and continue to make borrowings from Kabbala, though they rarely grasp its spirit and meaning. The same is true of most of the books on Kabbala put out by publishers of occult and theosophic literature today.

The rigorous scholarly study of Jewish mysticism is a very recent phenomenon. The state of mind and the tendencies of the founders of the "science of Judaism" (the scholarly study of Jewish religion, literature, history, etc.) in Germany during the first half of the 19th century were too permeated with rationalism to be favourable to an investigation in depth of a movement judged to be obscurantist and retrograde. Granting some valuable earlier works, research on a large scale and application of the proved methods of philology and history of religions began only with the work of Gershom G. Scholem, professor of Kabbala at the Hebrew University, Jerusalem from 1923 to 1965, and has been continued by his disciples, both direct and indirect. This research touched all of the areas of Jewish mysticism that are briefly described in this article; however, the gaps in knowledge remain serious in every area. Critical editions of mystical texts are few in number; unpublished documents are cataloged in a very incomplete manner; and only a few monographs on writers and particular themes exist, though these are indispensible preliminaries to a detailed and thorough synthesis—the one outlined by Scholem in 1941, in his ***Major Trends in Jewish Mysticism***, though of exceptional value in its time, must be taken up again and completed.

BIBLIOGRAPHY

General works: G.G. SCHOLEM, ***Major Trends in Jewish Mysticism***, rev. ed. (1961), the standard survey of the subject, with a chapter-by-chapter bibliography, ***On the Kabbalah and its Symbolism*** (Eng. trans. 1965), several studies on some of the great themes of Jewish mysticism; A.E. WAITE, ***The Holy Kabbalah: A Study of Secret Tradition in Israel*** (1929), a theosophical view of Jewish mysticism.

Jewish Myth and Legend

Jewish myth and legend comprises a vast body of stories transmitted over the past 3,000 years in Hebrew and in vernacular dialects, such as Yiddish (Judeo-German) and Ladino (Judeo-Spanish), spoken by Jews in various parts of the world. These stories have played an important role in the history of Jewish religion and culture.

Significance and characteristics. Apart from their intrinsic appeal, Jewish myths and legends claim attention for three special reasons: (1) Those incorporated in the Old Testament now form part and parcel of the cultural heritage of the Western world and have exerted a profound influence on its literature and art. (2) During the Middle Ages Jews were among the principal transmitters of Oriental tales to the West, so that many familiar Eastern stories can be traced to Jewish compilations. (3) Since these stories have been accumulated through centuries of constant migration, they provide an unrivalled body of "clinical" material for studying the process by which popular tales in fact travel and are transformed.

Basic character and role

Not all of the stories are of Jewish origin; many can be readily paralleled elsewhere and are derived from tales the Jews picked up from their non-Jewish neighbours in the lands of their dispersion. Even what is borrowed, however, is usually impressed with a distinctive Jewish stamp, being adapted to point up some precept of the Jewish religion, to illustrate some facet of Jewish life, or to exemplify some trait of Jewish character and temperament. The dominant overall feature of the stories is, indeed, their religious and moral tone; most of them are, in fact, told specifically as part of the homiletic exposition of Scripture. Such stories are taught to Jews from early childhood as a regular part of their religious education. To the tradition-minded Jew, therefore, they are more than mere literary fancies and assume a kind of doctrinal complexion. Biblical characters and events present themselves to him more in the lineaments of later legend than in their original biblical form; while popular notions about heaven and hell, rewards and punishments, the coming of the Messiah, and the resurrection of the dead derive mainly from this source rather than from Scripture itself.

Virtually all the standard types of folktale are represented. Conspicuously absent, however, are pure fairy tales because fairies, elves, and the like are foreign to the Jewish imagination, which prefers to people the otherworld with angels and demons subservient to God.

A distinction must be made, of course, between myth and legend. In common parlance, a myth is a story about gods or otherworldly beings. Judaism, however, is a rigorously monotheistic religion; hence, in this narrower sense, there can be no original Jewish myths. Nevertheless, from the earliest times, Jews have not disdained to borrow those of their pagan neighbours and then adapt them to their own religious outlook. If, however, the term is interpreted in a larger sense, to mean the portrayal of continuous, transtemporal concerns in the context of particular and punctual events, myth is indeed one of the essential vehicles by which Judaism conveys its message; for it is only when historical happenings are translated into this wider dimension that they cease to be mere antiquarian data and acquire continuing relevance. In Judaism, for example, the Exodus from Egypt is projected mythically from something that happened at a particular time into something that is continually happening, and it thus comes to exemplify the situation and experience of all men everywhere—their emergence from the bondage of obscurantism, their individual revelations at their individual Sinais, their trek through a figurative wilderness, even their death in it so that their children or children's children may eventually reach the figurative "promised land." By the same token, the historical destruction of the Temple of Jerusalem is transformed by myth into a paradigm of the continuing mutual estrangement of God and man, their exile from one another.

Legend, on the other band, implies no more than a fanciful embroidering of purportedly historical fact. Unlike myth, it does not transcend the punctual and local.

Myth and legend in the Old Testament. The vast repertoire of Jewish myths and legends begins with the Old Testament. Their overall purpose in Scripture is to illustrate the ways of God with man, as exemplified both in historical events and in personal experience. The stories themselves are often derived from current popular lore and possess abundant parallels in other cultures, both ancient and modern. In each case, however, they are given a peculiar and distinctive twist.

Myths in Genesis

Myths. Old Testament myths are found mainly in the first 11 chapters of Genesis, the first book of the Bible. They are concerned with the creation of the world and of man, the origin of the continuing human condition, the primeval Deluge, the distribution of peoples, and the variation of languages.

The basic stories are derived from the popular lore of the ancient Near East and can be paralleled in the extant literature of the peoples of the area. The Mesopotamians, for instance, also knew of an earthly paradise such as Eden, and the figure of the cherubim—properly griffins rather than nightgowned angels—was known to the Canaanites. In the Bible, however, this mythical garden of the gods becomes the scene of man's fall and the background of a story designed to account for the natural limitations of human life. Similarly, the Babylonians, too, told of the formation of man from clay, but in the scriptural version his function is to bear rule over all other creatures, whereas in the pagan tale it is to serve as an earthly menial of the gods. Again, the story of the Deluge, including the elements of the ark and the dispatch of the raven and dove, appears already in the Babylonian myths of Gilgamesh and Atraḫasis. There, however, the hero is eventually made immortal, whereas in the Bible this detail is omitted because to the Israelite mind no child of woman could receive that status. Lastly, while the story of the Tower of Babel was told originally to account for the stepped temples (ziggurats) of Babylonia, to the Hebrew writer its purpose is simply to inculcate the moral lesson that man should not build beyond his assigned station.

Myths in the Prophets and Holy Writings

Scattered through the Prophets and Holy Writings (the two latter portions of the Hebrew Bible) are allusions to other ancient myths—*e.g.,* to that of a primordial combat between Yahweh and a monster variously named Leviathan (Wriggly), Rahab (Braggart), or simply Sir Sea or Dragon. The Babylonians told likewise of a fight between their god Marduk and the monster Tiamat; the Hittites told of a battle between the weather god and the dragon Illuyankas; while from Ras Shamra (ancient Ugarit), in north Syria, has come a Canaanite poem relating the discomfiture of Sir Sea by the deity Baal and the rout of an opponent named Leviathan. (Originally, this myth probably referred to the annual subjugation of the floods.)

Ancient myths are utilized also in the form of passing allusions or poetic "conceits," much as modern Westerners may speak of Cupid or the Muses. Thus, there are references in the prophetic books to a celestial upstart hurled to Earth on account of his brashness and to the imprisonment of certain rebellious constellations.

The prophets used such myths paradigmatically to illustrate the hand of God in contemporary events or to reinforce their forecasts. Thus, to Isaiah the primeval dragon becomes the symbol of that continuous force of chaos and evil that will again have to be vanquished before the Kingdom of God can be established on Earth. Similarly, for Ezekiel the celestial upstart serves as the prototype of the prince of Tyre, destined for an imminent fall; and Habakkuk sees in the impending rout of certain invaders a repetition on the stage of history of Yahweh's mythical sortie against the monster of the sea.

Legends and other tales. Old Testament legends often embellish the accounts of national heroes with standard motifs drawn from popular lore. Thus, the story (in Genesis) of Joseph and Potiphar's wife recurs substantially (with other characters) in an Egyptian papyrus of the 13th century BCE (before the Common Era, or BC). The depositing of the infant Moses in the bulrushes (in Exodus) has an earlier counterpart in a Babylonian tale about Sargon, king of Akkad (c. 2334–c. 2279 BCE), and is paralleled later in legends associated with the Persian Cyrus and with Tu-Kiieh, the fabled founder of the Turkish nation. Jephthah's rash vow (in Judges) whereby he is committed to sacrifice his daughter recalls the classical legend of Idomeneus of Crete, who had similarly to slay his own son. The motif of the letter whereby David engineers the death in battle of Bathsheba's husband recurs in Homer's story of Bellerophon and again in the episode of Rosencrantz and Guildenstern in *Hamlet*. The celebrated judgment of Solomon concerning the child claimed by two contending women is told, albeit with variations of detail, about Buddha, Confucius, and other Oriental sages; while the story of how Jonah was swallowed by a "great fish but subsequently disgorged intact finds a parallel in the Indian tale of the hero Saktideva, who experienced the same thing during his quest for the Golden City. On the other hand, it should be observed that many of the parallels commonly cited from the folklore of primitive peoples may be, in fact, mere playbacks of biblical material picked up from Christian missionaries.

Etiologic tales

Sometimes, worldwide folktales serve in the Old Testament to account for the names of places in Palestine or for the origins of traditional customs and institutions. Thus, the familiar story of the man who has to struggle with the personified current of a river before he can cross it is localized (in Genesis) at the ford of Jabbok simply because that name suggests the Hebrew word abk ("struggle"); and Samson's felling of 1,000 Philistines with the jawbone of an ass is placed at Ramath-lehi because *leḥi* is Hebrew for "jawbone." Similarly, a taboo against eating the sciatic nerve of an animal is validated (in Genesis) by the legend that Jacob was struck in the hip when he tussled with an otherworldly being at Penuel (Face of God); and the custom of annually bewailing the vanished spirit of fertility is rationalized (in Judges) as a lamentation for the hapless daughter of Jephthah.

Besides myths and legends the Old Testament also contains a few examples of fables (didactic tales in which animals or plants play human roles). Thus, the serpent in Eden talks to Eve, and Balaam's ass not only speaks but also "flairs" spirits; while in the celebrated parable of Jotham (in Judges) trees compete for kingship.

Finally, in the Book of Job (38:31) there are allusions to star myths concerning the binding of Orion (called the Fool) and the "chaining" of the Pleiades.

Present-day interpretations. The tendency to interpret biblical tales and legends as authentic historical records or as allegories, or as the relics of solar, lunar, and astral myths, is now a thing of the past. For the modern folklorist, their primary interest lies in the fact that they push back to remote antiquity several tales and motifs long known from later literature. For the theologian, however, they pose the deeper problem of distinguishing clearly between the permanent message of Scripture and the particular form in which it is conveyed. Such a process of "demythologization" is today one of the central concerns of religious thought. It involves recognition of the fact that the natural language of religious truth is myth so that the continuing relevance of ancient scriptures depends not on a total rejection of that vehicle but rather on a constant expansion and remodelling of it—*i.e.*, on remythologization rather than demythologization. In the final analysis, the traditional portrayal of God himself is simply a mythical representation of ultimate reality, but that reality transcends the particular images in which it happens to be expressed. At the same time, it must be clearly understood that expressions that can be reconciled with modern Western patterns of thought only if taken as metaphors were literal statements of fact to ancient and primitive peoples. Gods, for example, were not merely "personifications" of natural phenomena but rather the effective potencies of the phenomena themselves conceived from the start as personal beings, much as a modern child might conceive of a railroad engine as "Mr. Choochoo."

Angelology, demonology, and eschatology

Myth and legend in the Persian period. When, in 539 BCE, the Jews came under Persian domination, they absorbed a good deal of Iranian folklore about spirits and demons, the eventual dissolution of the world in a fiery ordeal, and its eventual renewal. This introduced a new element into Jewish myth and legend. Hierarchies of angels, archangels such as Michael, Gabriel, and Uriel (modelled loosely upon the Iranian *amesha spentas*), and the demonic figures of Satan, Belial, and Asmodeus (corresponding to the Iranian Angra Mainyu [Ahriman], Druj, and Aēshma daeva) now entered their popular mythology, and there was a preoccupation with apocalyptic visions of heaven and hell and of the Last Days. Unfortunately, no Jewish texts of this genre from the Persian period itself are extant so that these new elements can be recognized only inferentially from their survival in later times, notably in such products of the ensuing Hellenistic age as the Dead Sea Scrolls.

The principal monument of Jewish story in the Persian period is the biblical Book of Esther, and this is basically the Judaized version of a Persian novella about the shrewdness of harem queens. The story was adapted to account for a popular festival named Purim, but this is probably a transmogrification of the Persian New Year. Such leading elements of the tale as the parade of Mordecai through the streets dressed in royal robes, the fight between the Jews and their adversaries, and the hanging of Haman and his sons seem, indeed, to reflect customs associated with that occasion, viz., the ceremonial ride of a common citizen through the capital, the mock combat between two teams representing Old Year and New Year, and the execution of the Old Year in effigy.

Myth and legend in the Hellenistic period. Historiatett Bibles and legendary histories. When, in 330 BCE, Alexander the Great completed his conquest of the Near East, Judaism entered a new phase. The dominant features of the ensuing Hellenistic age were an increasing cosmopolitanism and a fusion of Oriental and Greek cultures. These found expression in Jewish myth and legend in the composition (in Greek) of stories designed to link the Bible with general history, to correlate biblical and Greek legends, and to claim for the Hebrew patriarchs a major role in the development of the arts and sciences. It was asserted, for instance, that Abraham had taught astrology to the king of Egypt; that his and Keturah's sons had aided Heracles against the giant Antaeus; and that Moses, blithely identified both with the semi-mythical Greek poet Musaeus and with the Egyptian Thoth, had been the teacher of Orpheus (putative founder of one of the then current "mystery cults") and the inventor of navigation, architecture, and the hieroglyphic script. Leading writers in this vein were Artapanus, Eupolemus, and Cleodemus (all c. 100 BCE), but their works are known to us only from stray quotations by Eusebius and Clement of Alexandria, early Church Fathers.

Novelistic versions of biblical figures

Furthermore, the Jews followed a current Greek literary fashion of retelling Homeric and other ancient legends in "modernized," novelistic versions, well seasoned with romantic elaborations. Among the Dead Sea Scrolls has been found a paraphrase of Genesis in which the biblical narrative is tricked out with several familiar folklore motifs. Thus, when Noah is born, the house is filled with light, just as it is said elsewhere to have been at the birth of the Roman king Servius Tullius, of Buddha, and (later) of several Christian saints. When Abraham's life is threatened he dreams of a cedar about to be felled—the same omen said to have presaged the deaths of Domitian and Severus Alexander. (True, the parallels are of later date, but they illustrate the persistence of age-old popular traditions.) The same trend toward fanciful elaboration of scriptural tales is manifested also in the *Testaments of the Twelve Patriarchs* ("testaments" meaning last wills), in which the virtues and weaknesses of the sons of Jacob are illustrated by moralistic legends. There is also a lengthy paraphrase of early biblical narratives, mistakenly attributed to Philo, the famous Alexandrian Jewish philosopher of the first century CE (Common Era, or AD).

Apocrypha and Pseudepigrapha. The principal monuments of Jewish literature during the Hellenistic period are the works known collectively as the Apocrypha and Pseudepigrapha. The former are certain later writings excluded by Jews from the canon of the Old Testament but found in the Greek Septuagint version. The latter are other late writings not included in any authorized version of the Scriptures and spuriously attributed to biblical personalities.

Judaized versions of foreign tales

The Apocrypha include several Judaized versions of tales well represented in other cultures. The book of Tobit, for instance, turns largely on the widespread motifs of "The Grateful Dead" and the "Demon in the Bridal Chamber." The former relates how a traveller who gives burial to a dishonoured corpse is subsequently aided by a chance companion who turns out to be the spirit of the deceased. The latter tells how a succession of bridegrooms die on the nuptial night through the presence of a demon beside the bridal bed. Similarly, in Bel and the Dragon (2nd century BCE) occurs the equally familiar motif that fraud (in this case perpetrated in a temple) is detected by the imprint of the culprit's foot on strewn ashes—a motif that reappears later in the French and Celtic romance of Tristan and Iseult. Again, *Susanna and the Elders* (also 2nd century BCE) revolves around the well-worn theme that a charge of unchastity levelled against a beautiful woman is refuted when a clever youngster ("Daniel come to judgment") points out discrepancies in the testimony of her accusers. The story has a close parallel in a Samaritan tale about the daughter of a high priest in the 1st century CE; while the motif of the clever youngster who surpasses seasoned judges recurs later in infancy gospels and in the tale of ʿAlī Khamājah in *The Thousand and One Nights.*

The most interesting folktale in the Pseudepigrapha is that contained in the *Martyrdom of Isaiah* (1st century CE?), which tells how the prophet, fleeing from King Manasseh, hid in a tree that opened miraculously and how he eventually perished when it was sawn asunder. A similar tale is related in the Talmud about a certain Isaac ben Joseph and (later) in the Persian epic *Shāh-nāmeh* (c. 1000 CE) about the hero Jamshid.

Myth and legend in Talmud and Midrash. *Midrash and Haggada.* Toward the end of the 1st century CE, through a process known as "canonization," certain traditional Hebrew writings came to be recognized as an authoritative corpus of divine revelation, later called the Hebrew Bible or Old Testament. The study of them became, henceforth, an essential element of the Jewish religion. This meant that the sacred text had to be subjected to a form of interpretation that would bring out its universal significance and permanent relevance. The process was known as Midrash (literally "searching the Scriptures"), and a leading constituent of it was the spicing of homiletic discourses with elaborative legends—a pedagogic device called Haggada ("storytelling"). Originally transmitted orally, the legends were eventually committed to writing in that vast sea of literature known as the Talmud (the authoritative compendium of early rabbinic law and lore), as well as in later compilations geared to particular books or sections of the Old Testament, to scriptural lessons read in the services of the synagogue, or to specific biblical characters or moral themes (see also TALMUD AND MIDRASH).

The range of Haggada is virtually inexhaustible; a few representative examples must suffice. In regard to biblical characters, both Moses and David were born circumcised; Cain had a twin sister; Abraham will sit at the gate of hell to reproach the damned on Judgment Day; Aaron once locked the angel of death in the tabernacle; Solomon understood the language of animals; King Hiram, who supplied materials for the Temple, entered paradise alive; the flesh of Leviathan will feed the righteous in the world to come.

Indebtedness of Haggada to non-Jewish sources

In such fanciful elaborations of Scriptures, Haggada does not disdain to draw on classical tales. The men of Sodom, it is said, subjected itinerant strangers to the ordeal of Procrustes' bed; the Earth opened to rescue newborn Hebrew males from the Pharaoh, as it did for Amphiaraus, the prophet of Argos, when he fled from Periclymenus after the attack on Thebes; Moses spoke at birth, as did Apollo; Solomon's ring, cast into the river, was retrieved from a fish that had swallowed it, as was that of Polycrates, the tyrant of Samos, in the story told by Herodotus; the Queen of Sheba had the feet of an ass, like the child-stealing witch (Onoskelis) of Greek folklore; no rain ever fell on the altar at Jerusalem, just as none was said to have fallen on Mt. Olympus.

Other familiar motifs also appear. Moses qualifies as a husband for Zipporah by alone being able to pluck a rod from Jethro's garden—a variant of the tale told later about the sword Excalibur in the Arthurian legend; David's harp is played at night by the wind, like that of Aeolus; Isaiah, like Achilles and Siegfried, has only one vulnerable spot in his body—his mouth; Job has a magic belt, which relieves his pains.

Legends are developed also from fanciful interpretations of scriptural verses. Thus, Adam is said to have fallen only a few hours after his creation because the Hebrew text of Ps. 49:12 can be literally rendered "Adam does not last the night in glory." Lamech slays the wandering Cain—a fanciful interpretation of his boast in Gen. 4:23–24. Melchizedek is immortal in view of Ps. 110:4: "You are a priest for ever after the order of Melchizedek." The first man is a hermaphrodite (this notion has analogues elsewhere) because Gen. 1:27 says of God's creation, "Male and female he created them."

Fables and animal stories. Midrash also uses fables paralleled in non-Jewish sources. Aesop's fable of the "Lion and the Crane" is quoted by a rabbi of the 1st century CE, and the tales of the "Fox in the Vineyard and of the "Camel Who Got Slit Ears for Wanting Horns" likewise make their appearance.

Sometimes, too, material is drawn from medieval bestiaries (manuals on animals, real or imaginary, with symbolic or moralistic interpretations). Bears, we are told, lack mother's milk; hares and hyenas can change sex; only one pair of unicorns exists at a time; there is a gigantic bird (*ziz*) that reaches from Earth to sky.

Contribution of Haggada to Christian and Islāmic legends. Several of the stories related in Haggadic literature were later adopted and adapted by Christian writers. Thus, the legend that Adam was created out of virgin soil was taken to prefigure the fact that the second Adam (*i.e.*, Jesus) was likewise born of a virgin; while the story that the soil in question was taken from the site of the future Temple was transformed into the claim that Adam had been molded out of the dust of Calvary. Similarly, the legend that, at the dedication of the Temple, the doors had swung open automatically to admit the ark of the Covenant was transferred to the consecration of a church by St. Basil; and the Talmudic tale that the bronze Nicanor gates of the Temple had floated to Jerusalem when cast overboard for ballast during their shipment from Alexandria was applied to the doors of a sacred edifice erected in honour of St. Giles.

Nor was it only the Christians who absorbed Haggadic legends. The Qur'ān, the sacred book of Islām, likewise incorporates a good deal of such material in its treatment of such biblical characters as Joseph, Moses, David, and Solomon.

Myth and legend in the medieval period. *Jewish contribution to diffusion of folktales.* The Middle Ages was a singularly productive period in the history of Jewish myth and legend. Jews now began to play a prominent role in the transmission of Oriental tales to the West and thereby enhanced their own repertoire with a goodly amount of secular material. Especially in Spain and Italy, Arabic versions of standard collections were translated into Hebrew and thence into Latin, thus spreading the stories to the Christian world. The Indic fables of Bidpai, for example, were rendered into Hebrew from the 8th-century Arabic version of 'Abd Allāh ibn al-Muqaffaʿ, and from this Hebrew rendering there subsequently developed, in the 12th century, John of Capua's *Directorium humanae vitae* ("Guide for Human Life"), one of the most celebrated repertoires of moralistic tales (*exempla*) used by Christian preachers. So, too, the famous *Senbād-nāmeh* ("Fables of Sinbad"; one of the sources, incidentally, of Boccaccio's *Decameron*) was rendered from Arabic into Hebrew and thence into Latin; while the renowned romance of *Barlaam and Josaphat*—itself a Christian adaptation of tales about the Buddha—found its Jewish counterpart in a compilation entitled *The Prince and the Dervish,* adapted, from an Arabic text, by Abraham ben Samuel ibn Hisdai, a leader of Spanish Jewry in the 13th century.

The *Alexander Romance,* Arthurian legend, and Aesop's fables

Hebrew versions of medieval romances. Here, too, however, the traffic moved in both directions: Hebrew translations were also made from Latin and other European languages. There are, for instance, several Hebrew adaptations of the *Alexander Romance,* based mainly (though not exclusively) on Leo of Naples' Latin rendering of the Greek original by Callisthenes. The central theme is, of course, the exploits of the great Macedonian conqueror, and the narrative is spiced with fanciful accounts of his adventures in foreign lands and of the outlandish peoples he encounters. There is likewise a Hebrew reworking of the Arthurian legend, in the form of a secular sermon in which Arthurian and biblical scenes are blithely mixed together. Finally, there is a Hebrew *Ysopet* (the common title for a medieval version of Aesop) that shares several of its fables with the famous collection made by Marie de France in the late 12th century.

Jewish contributions to Christian and Islāmic tales. Moreover, apart from these Hebrew translations of Oriental and European works, a good deal of earlier haggadic material is embodied in the *Disciplina clericalis* of Peter Alfonsi, a baptized Jew of Aragon originally known as Moses Sephardi. This book, composed in the 12th century, is the oldest European collection of novellas and served as a primary source for the celebrated *Gesta Romanorum* ("Deeds of the Romans") of the same period—a major quarry for European storytellers, poets, and dramatists for many centuries.

Haggadic material percolated also to Arabic writers during this period. Not only does the Qur'ān incorporate such material but also the Egyptian recension of *The Thousand and One Nights* seems to have drawn extensively on Jewish sources, as, for instance, in its tales of "The Sultan and His Three Sons," "The Angel of Death," "Alexander and the Pious Man," and the legend of Baliqiyah.

Major medieval Hebrew collections. Between the 11th and 13th century the tendency developed in Europe to compile, both for entertainment and edification, comprehensive collections of tales and fables; standard examples are the British *Gesta Romanorum,* the Spanish *El novellino,* and the aforementioned *Disciplina clericalis.* Among Jews similar collections were made, especially in Morocco as well as in Moorish Spain. Two of the most important are *The Book of Comfort* by Nissim ben Jacob ben Nissim of al-Qayrawān (11th century) and *The Book of Delight* by Joseph ben Meir ibn Zabara of Spain (end of the 12th century). The former, composed in Judeo-Arabic, is a collection of some 60 moralizing tales designed to comfort the author's father-in-law on the loss of a son. It belongs to a well-known genre of Arabic literature, derives mainly from Arabic sources, and is permeated by a preoccupation with divine justice, typical of the Mu'tazilite school of Islamic theology. It was later translated into Hebrew. *The Book of Delight* consists of 15 tales, largely about the wiles of women, exchanged between two travelling companions—a form of cadre, or "enclosing tale," adopted on a more extensive scale by Chaucer in his *Canterbury Tales,* which dates from the same period. Typical is the tale of the "Silversmith and His Wife," which relates how a craftsman, persuaded by his greedy wife to make a statue of a princess, gets his hands cut off by the king for violating the Islamic law against making images, while his wife reaps rich rewards from the flattered princess. Although most of the stories are taken from Arabic sources, some indeed find parallels in rabbinic literature. To the latter category belongs, for instance, the famous tale of the matron of Ephesus, who, while keeping vigil over her husband's tomb, at the same time engages in an intrigue with a guard posted nearby to watch over the corpses of certain crucified robbers. When, during one of their trysts, one of the corpses is stolen and her lover therefore faces punishment, the shrewd woman exhumes the body of her husband and substitutes it. This tale is found already in the *Satyricon* of Petronius and was later used by Voltaire in his *Zadig* and by the 20th-century English playwright Christopher Fry in his A *Phoenix Too Frequent.*

The story of the matron of Ephesus

Of the same genre but deriving mainly from west European rather than Arabic sources are the *Mishle shuʿalim* ("Fox Fables") of Berechiah ha-Nakdan (the Punctuator), who may have lived in England toward the end of the 12th century. About half of these tales recur in Marie de France's *Ysopet,* and only one of them is of specifically Jewish origin. Berechiah's work was translated into Latin and thence became a favourite repertoire of European storytellers.

Among anonymous compendiums of this type is *The Alphabet of Ben Sira,* extant in two recensions, probably of the 11th century. This is basically a collection of proverbs attributed to the famous sage of the apocryphal book Ecclesiasticus (Wisdom of Jesus the Son of Sirach). In one of the recensions they are illustrated by appropriate tales. The author is represented as an infant prodigy who performs much the same feats of sapience as are attributed to Jesus in some of the Infancy Gospels.

The *Josippon, Jashar,* and *Jerahmeel* collections

Medieval historiated Bibles and legendary histories. Two other developments mark the history of Jewish myth and legend during the Middle Ages. The first was a revival of the Hellenistic vogue of compiling large-scale compendiums in which the history of the Jews was "integrated," in legendary fashion, with that of the world in general and especially with classical traditions. Two major works of this kind, both composed (apparently) in Italy during the 9th century, are (1) *Josippon,* composed by a certain Ben Gorion, which presents a fanciful record from the creation onward and contains numerous references to foreign nations; and (2) the *Book of Jashar,* a colourful account from Adam to Joshua, named for the ancient book of heroic songs and sagas mentioned in the Bible (Josh. 10:13; II Sam. 1:18). There is also a voluminous *Chronicles of Jerahmeel,* written in the Rhineland in the 14th century. This draws largely on Pseudo-Philo's earlier compilation, mentioned above. and is of special interest because it includes Hebrew and Aramaic versions of certain books of the Apocrypha.

Medieval Haggadic compendiums. The other development was the gathering of Haggadic legends and tales into comprehensive, systematic compendiums. Works of this kind are (1) *Yalquṭ Shimeʿoni* ("The Collection of Simeon"), attributed to a certain Rabbi Simeon of Frankfurt am Main; (2) *Midrash ha-gad01* ("The Great Midrash"), composed after the death of Moses Maimonides (1204), whom it quotes; and (3) the *Midrash of David ha-Nagid,* grandson of Maimonides. About 100 years later appeared a similar work, *Yalquṭ ha-Makiri* ("The Collection of Makhir"), on the Prophets and Holy Writings, compiled by one Makhir ben Abba Mari in Spain (see TALMUD AND MIDRASH). It has been suggested that the compilation of such works was spurred by the necessity of providing "ammunition" for the public disputations with Christian ecclesiastics that the church forced upon Jewish scholars in this period.

Myth and legend in the modern period. *Kabbalistic tales.* In the 16th century, Jewish myth and legend took several new directions. The disappointment of messianic expectations through the dismal eclipse of the pretender Shabbetai Tzevi produced, by way of compensation, an Increased interest in occult speculation and in the mystical lore of the Kabbala (esoteric Jewish mysticism). Important schools of Kabbala arose in Italy and at Safed, in Palestine, and tales of the miraculous Faust-like powers of such masters as Isaac Luria and Hayyim Vital Calabrese began to circulate freely after their deaths.

The legend of Joseph della Reyna

Another reaction to the dashing of messianic hopes is represented by the beautiful story of the Kabbalist Joseph della Reyna and his five disciples, who go journeying through the world to oust Satan and prepare the way for the Deliverer. Warned by the spirits of such worthies as Rabbi Simeon ben Yohai and the prophet Elijah, they nevertheless succeed eventually in procuring their blessing and help and are sent on to the angel Metatron. The latter furnishes them with protective spells and spices and advises Joseph to inscribe the ineffable name of God on a metal plate. When, however, they reach the end of their journey Satan and his wife, Lilith, attack them in the form of huge dogs. When the dogs are subdued they beg for food. Moved to pity, Joseph gives them spices to revive them. At once they summon a host of devils. Two of the disciples die of terror; two go mad, and only Joseph and one disciple are left. The Messiah weeps in heaven, and Elijah hides the great horn of salvation. A voice rings out telling Joseph that it is vain to attempt to hasten the footsteps of the Redeemer.

The repertory of Jewish tales and legends was seasoned, however, by other elements. During the 16th century—the age of the great navigators—stories began to circulate about the discovery of the Ten Lost Tribes in remote parts of the world.

Judeo-German (Yiddish) tales. It was at the same period that Judeo-German (Yiddish) came increasingly to replace Hebrew as the language of Jewish tales and legends in Europe, a major factor in this development being the desire to render them accessible to women unschooled in the sacred tongue. Not only were the synagogal lessons from Scripture legendarily embellished in a so-called *Taitsh Humesh* ("Yiddish Pentateuch"), in the more fancifully titled *Tze'ena u-re'ena* ("Go Forth and See"; *cf.* S. of Sol. 3:11) by Jacob ben Isaac Ashkenazi, and in adaptations of the story of Esther designed for dramatic presentation on the feast of Purim, but the Hebrew *Chronicles of Josippon* also assumed Yiddish dress. More secular productions were a verse rendition of the Arthurian legend, entitled *Artus Hof* ("The Court of King Arthur"), based largely on Gravenberg's medieval *Wigaleis,* and the *Bove Buch* by Elijah Levita, which retold the romance of Sir Bevis of Southampton.

These "frivolous" productions were in time offset by collections of moral and ethical tales. The principal of these are (1) the *Brantspiegel,* attributed to a certain Moses Henoch (Prague 1572), and (2) the *Maʿaseh Buch* ("Story Book"), a compendium of 254 tales compiled by Jacob ben Abraham of Meseritz and first published at Basel in 1602. The latter was drawn mainly from the Talmud but was supplemented by later legends about medieval rabbis. Jewish legends also circulated in the form of ephemeral chapbooks, a large selection of which is preserved in the library of the Yiddish Scientific Institute in New York City.

Judeo-Persian and Judeo-Spanish (Ladino) tales. A similar development, though on a lesser scale, took place among Jews who spoke other vernacular dialects. Major monuments of Judeo-Persian literature are poetic embellishments of biblical narratives composed by a certain Shāhīn of Shīrāz in the 14th century and by Joseph ben Isaac Yahudi (*i.e.,* the Jew) some 300 years later. These. however, are exercises in virtuosity rather than in creative storytelling. In Judeo-Spanish (Ladino) there are versified elaborations of the story of Joseph, entitled *Coplas de Yoçef* ("Song of Joseph"), composed, in 1732, by Abraham de Toledo and embodying a certain amount of traditional haggadic material. From a revival of literary activity in the 18th century comes a comprehensive "legendary Bible" called Me-'am Lo'ez ("From a People of Strange Tongue"; *cf.* Ps. 114:1), begun by one Jacob Culi and continued by later writers, as well as several renderings of standard Hebrew collections and a number of Purim plays. Until the Nazi holocaust in the 1940s, Judeo-Spanish folktales were still current in Macedonia and Yugoslavia, but these leaned more on Balkan than on Jewish sources.

Hasidic tales. The rise of the Hasidic sect (a popular pietistic-mystical movement) in eastern Europe at the end of the 18th century begat a host of legends (circulated mainly through chapbooks) concerning the lives, wise sayings, and miracles of such *tzaddiqim,* or masters, as Israel ben Eliezer, "the Besht" (1700–60), and Dov Baer of Meseritz (died 1772) (see also JEWISH MYSTICISM). These, however, are anecdotes rather than formally structured stories and often borrow from non-Jewish sources.

Droll stories. To the popular creativity of the ghetto belong also the droll tales of the wise men of Chelm (in Poland)—Jewish counterparts of the German noodles (stupid people; hence "noodle stories") of Schildburg and of the more familiar English Wise Men of Gotham. These, too, were circulated mainly in Yiddish popular prints. Typical of them is the tale of the two "sages" who went for a walk, one carrying an umbrella and the other without one. Suddenly it began to rain. "Open your umbrella," said the one without one. "It won't help," answered the other, "it's full of holes." "Then why did you bring it?" rejoined his friend. "I didn't think it would rain," was the reply.

Modern Israeli folktales. The ingathering of Jews from many lands into the modern state of Israel has made that country a happy hunting ground for the student of Jewish folktales. Assiduous work in the collection of these has been undertaken by Dov Noy of Hebrew University in Jerusalem, aided by enthusiastic amateurs throughout the country. Mainly, however, the stories are mere retellings of traditional material.

BIBLIOGRAPHY. The following works provide a general coverage of the field for English-speaking readers.

Old Testament: T.H. GASTER, *Myth, Legend, and Custom in the Old Testament* (1969).

Apocrypha and Pseudepigrapha: R.H. CHARLES (ed.), *The Apocrypha and Pseudepigrapha of the Old Testament in English,* 2 vol. (1913, reprinted 1964); M.R. JAMES, *The Lost Apocrypha of the Old Testament, Their Titles and Fragments* (1920).

Judeo-Spanish (Ladino): IGNACIO GONZALEZ LLUBERA (ed.), *Coplas de Yocef* (1935); C. CREWS, "Judaeo-Spanish Folktales in Macedonia," *Folk-Lore,* 43:193–225 (1932).

Hasidic: MARTIN BUBER (ed.), *Tales of the Hasidim,* 2 vol. (1947–48).

Israeli: DOV NOY (ed.), *Folktales of Israel* (1963); ZEV VILNAY, *Legends of Palestine* (1932; orig. pub. in Hebrew, 1929).

Comparative Studies: MOSES GASTER, *The Exempla of the Rabbis* (1924, reprinted 1968). A useful motif index of Haggadic legends to accompany STITH THOMPSON'S standard *Motif Index of Folk-Literature,* 6 vol., rev. and enl. ed. (1955–58), has been compiled by DOV NOY, *Motif Index of the Talmudic-Midrashic Literature* (1954), and is available on microfilm. For a convenient bibliographical survey of the entire field, see ABRAHAM BERGER, "The Literature of Jewish Folklore," *Journal of Jewish Bibliography,* 1:12–20, 40–49 (1938–39).

(T.H.G.)

Jewish Peoples, Arts of

There is no agreement on the definition of a Jew, much less Jewish art. One would be hard put to define in terms of its "Jewishness" the art, for example, of Gustav Mahler, Marcel Proust, or Amedeo Modigliani; yet they were all Jews. Since Jewish art is not satisfactorily defined simply as art produced by people who happen to be Jewish, and since no definition can subsume the diverse works of such artists as Proust, who was an assimilated Jew, and Sholem Aleichem, who was not, the definition assumed by this article is a limited one: art that is indisputably part of Jewish tradition, reflecting Jewish religion and Jewish customs, and literature written in Hebrew and Yiddish. Jewish artists, such as Mahler, Proust, and Modigliani, who have made major contributions to and are difficult to extricate from non-Jewish traditions, are treated more fully in other articles.

Literature

Literature in the Hebrew language has been produced continuously from the early 12th century BC. If, as is believed, the Canaanite population living in Palestine at the time of the Israelite conquest spoke in part an earlier form of Hebrew, then there is evidence of a Hebrew literature existing as early as the 14th century BC. During part of this literary history (c. 1200 BC–AD 200), Hebrew was a spoken language in Palestine, first in the dialect called biblical Hebrew and later in the form of Mishnaic Hebrew. During a second period (AD 200–1880), Hebrew was a literary language only, the writers of which spoke, and sometimes also wrote concurrently, a variety of other languages. Hebrew literary centres existed throughout the Mediterranean area and consecutively in northwestern Europe, central and eastern Europe, and, since mid-19th century, in America. The last period (1880 onward) coincides with the revival of Hebrew as a spoken language and saw the gradual shift of its centre to Palestine.

Hebrew literature is not synonymous with Jewish literature. Some Hebrew writing was produced by the Samaritans and in the 17th century by Protestant enthusiasts. Jews also produced important literatures in Greek, Aramaic, Arabic, Judeo-Spanish, Yiddish, and modern European languages. (Ed.)

Because Hebrew literature has had a great impact on Western literary tradition as a whole, it cannot easily be isolated from that tradition and is therefore discussed in the article LITERATURE, WESTERN. Early Hebrew literature, inextricably bound up with religion, is most extensively covered in BIBLICAL LITERATURE; JEWISH MYSTICISM; TALMUD AND MIDRASH; EXEGESIS AND HERMENEUTICS, BIBLICAL; and JEWISH MYTH AND LEGEND.

Origins of Yiddish literature

Yiddish is the main colloquial language of the majority of Ashkenazic (central and east European) Jews and one of their two literary languages (the other is Hebrew). Literature written in the Yiddish language began with the need of the Jews living in the Germanic Frankish lands of western Europe during the Middle Ages for a literature in their own vernacular: most of them no longer had enough knowledge of Hebrew, which had become the language of prayer and scholarship, to understand fully new works written in it. (Popular literature in Hebrew, intertwined with Yiddish traditions, developed much later.) Living among people speaking Middle High German, the Jews had adopted that language, but they continued to need a religious usage terminology, which had to be Hebrew. Thus there evolved an amalgam of the two languages called Jiidisch-Deutsch (Judeo-German), soon corrupted to Yiddish-Teitch; and finally called simply Yiddish. For a time there was little difference between Yiddish-Teitch and Middle High German, except for the infusion of Hebrew words; but eventually (possibly as early as the 9th century) Yiddish-Teitch became a separate language. With the Jewish migrations to eastern Europe after the massacres during the Crusades, the language acquired a strong Slavonic element and, cut off from its German source, developed on independent lines, flowering into a rich literary language. An oral and manuscript Yiddish literature first appeared in the 12th and 13th centuries, a printed literature in the 16th century.

Part of the cultural and spiritual transition of many Jews from the 18th-century ghetto to the modern 19th-century Western world was the adoption of modern European languages as literary vehicles. It is questionable whether—and in what ways—such literature can be characterized as Jewish.

This section of the article discusses literature written by Jews in Yiddish and, more briefly, in modern European languages.

IN YIDDISH

Early history. Yiddish, like many other languages, was for a long time looked upon as a vulgar tongue, good enough for the spoken but not the written word. The language of the scholars was Hebrew. When the first Yiddish books were written in the 12th and 13th centuries, they were intended only for women and the ignorant. These works were of two types: religious and liturgical—translations from the Bible, prayer books, and religious poems and secular writing, consisting mainly of adaptations from the German and Italian—the literature of the so-called *Spielmann* period, named after the German minstrels of the medieval period. Jewish folk singers and jesters sang or performed these texts at various entertainments. Most of them were verse romances, tales of knights and their ladies. Some even had erotic connotations. One of the most famous of these works, the *Bove-Buch*, was written in 1507 (and printed in 1541) by Elijah Bachur, more popularly known as Elijah Levita, a German Jew who emigrated to Italy in 1496, a time of trouble for Jews in his native country. Written in ottava rima (an eight-line stanza with a rhyme scheme of ABABABCC), it is a heroic tale adapted from an Italian romance (*Buovo d'Antona*) for its Jewish public. Another work by the same author is *Paris un Viene,* published posthumously in 1595. Both books are rhymed romances, written in the spirit of the Renaissance. They are at the same time fantastic, realistic, and highly dramatic. Another, earlier work, the *Shmuel Buch* (1544; "Samuel Book"), by an unknown writer, is a retelling of the Book of Samuel, with King David possessing all the characteristics of a medieval knight. Rabbis and pious Jews con-

Literature of the *Spielmann* period

demned these works as frivolous; but they tolerated them because they recognized that the Jewish woman of the day, who was as often as not breadwinner as well as wife and mother, needed some diversion.

As a result of the catastrophes and expulsions that the German Jews experienced in the wake of the Thirty Years' War (1618–48) in Germany and their subsequent emigration in large numbers to Poland, secular Yiddish literature disappeared for a long time. It did not appear again until the second half of the 18th century. The writings of the interim period were almost all of a religious, didactic nature. The most famous of them is the *Tzeno Ureno,* written by Jacob ben Isaac Ashkenazi of Janov, Poland. It appeared in Prague in 1608. It was a paraphrase of the Pentateuch (first five books of the Old Testament), with the addition of legends and commentaries from the Talmud (authoritative body of Jewish law and tradition), exegeses of Rashi (11th-century scholar and commentator), the Midrash (mystical commentary on the Pentateuch), and other holy books. The language used is much closer to that of modern Yiddish than to that of the earlier, 16th-century works. As late as the beginning of the 20th century it was still customary for women to read this book on the sabbath.

By the second half of the 18th century, Yiddish had become exclusively the language of eastern European Jews. With the coming of the Hasidic movement (a revolt, based on mystical enthusiasm, against the aridity of rabbinic intellectualism), a number of Hasidic storybooks began to appear in Yiddish. The greatest of them are the stories of Rabbi Nahman of Bratslav (then Russian). He was born in the south of Russia and was a great-grandson of Ba'al Shem Tov, the founder of Ḥasidism. He did not write his stories himself but dictated them to his disciple Rabbi Nathan Nemeirover. These tales, which have achieved fame in the German translation, by Martin Buber, are masterworks of Jewish folklore.

At about the same time in Poland, the *Haskala,* or Enlightenment (a moderate tendency toward Westernization), began to influence both Jewish life and literature. Most of the writers of the Enlightenment wrote either in Hebrew or in Russian, but some condescended to write in Yiddish. For the first time, works of popular science began to appear, as well as pamphlets directed against the Hasidim, the parodies of Hasidic literature. One of the earliest writers of this period was Israel Axenfeld. His stories and plays satirized the superstitions and impracticality of the eastern European Jews and criticized their total denial of secular education. Shlomo Ettinger was less bitter than Axenfeld and a superior artist as well. His play *Serkele* and other dramatic works and his epigrammatic poems and fables appeared after his death in 1856.

Importance of Mendele in modern Yiddish literature

Beginnings of modern literature. Modern prose in Yiddish began in the 1850s with the stories of Eisik Meir Dik; the satiric novel *Dos poilische Yingel* (1869; *The Polish Boy)* by Isaac Joel Linetzky; and the novels of Sholem Yakov Abramovitsch, better known as Mendele Mokher Sforim (Mendele the Itinerent Bookseller), "the grandfather" of modern Yiddish literature. Mendele also wrote in Hebrew and is a classic in both languages. Among his best Yiddish works are *Dos Vinschfingerl* (1865; "The Wishing Ring"), *Die Klatsche* (1873; "The Mare"), and *Fishke der Krumer* (1869; "Fishke, the Lame"). Mendele, like all of these writers, deplored and mocked the unworldliness of the Russian and Polish Jews, their exaggerated piety, and their obsolete system of educating their children. He also castigated the community elders who, for their private gains, exploited the poor Jews. By Mendele's time, great numbers of Jews already lived in the large cities of Russia, western Europe, and the United States. Jewish professors held high positions in the universities of the world. The revolutionary movement had reached even the Jews in the small villages of Poland and the Ukraine. Young men and women left their homes to rebuild Palestine. There was also an increasing emigration to the United States, South America, and elsewhere. But Mendele chose to write about the poorest and the most backward citizens of Kabtzansk (Pauper Village) and Glupsk (Village of Fools). From a purely literary point of view, Mendele himself was rather backward. His achievement was social: his themes did much to modernize the Jewish masses of eastern Europe.

Sholem Yakov Rabinovitsch, or Sholem Aleichem, considered himself a disciple of Mendele and his spiritual grandson. His style resembles that of Mendele, but he was a God-inspired master of description and one of the greatest humorists in world literature, to be rated only a few steps below the Russian writer Nikolay Gogol. Sholem Aleichem described the same muddy villages as Mendele had and even gave them similar satiric names; but he saw in the Russian Jews, restricted to the Pale, a heroic group. Seemingly condemned to extinction, they used all of their intelligence, wisdom, and shrewdness in order simply to survive and to insure a better lot for their children. All of Sholem Aleichem's heroes were possessed by the passion for making a living. He is perhaps the only writer in world literature whose main theme is the struggle to make ends meet. Sholem Aleichem was often only one step from sentimentality, but his artistic instinct seldom let him take that step. His greatest works are *Tevya der Milchiger* ("Tevya, the Milkman"), *Motel Peisy dem Chasen's* ("The Cantor's Motel Peisy"), and *Funem Yarid* ("Back from the Fair"), the first volume of an unfinished autobiographical novel. His language is rich, his descriptions alive and funny. Sholem Aleichem spent the last year or so of his life in the United States; and his descriptions of the Russian Jewish immigrants in New York are genuine, pertinent, and highly humorous.

Isaac Leib Peretz, who also wrote in Hebrew, was a contemporary of Sholem Aleichem and the first important romantic writer in Yiddish literature. His best works are *Chassidish* ("Hasidic") and *Folkstimliche Geshichten* ("Folktales") and a mystical drama, *Bei Nacht oifn alten Mark* ("At Night in the Old Marketplace"). Both stylistically and thematically, he was closer to modern European literature than his predecessors. It was Peretz who first described love in the Yiddish villages and cities. He dared to take a positive position toward religion, Ḥasidism and the Kabbala (Jewish mystical and theosophical doctrine). He wrote poetry, plays, and short stories. In contrast to the garrulous writers before him, his style was taut and concise. Peretz believed that it was possible for the Jews of Russia and Poland to create their own secular culture. He may rightly be called the father of Yiddishism, the spiritual founder of the movement that demanded cultural autonomy for the Jews of Russia. In contrast to Sholem Aleichem, he was an opponent of political Zionism. What he had in common with Mendele and Sholem Aleichem was that he was never able to make a proper living out of writing. For many years he served as an employee of the same Jewish community in Warsaw that he criticized in his writings. His house was often filled with young writers, whom he encouraged and helped. Although Peretz was potentially a greater artist than his fellow classic writers, he lacked the time and perhaps the patience necessary to create large canvases. He was a short story writer, a poet, a dramatist, a journalist, a speaker, an editor, and a cultural leader. He distinguished himself in all of these capacities.

The father of Yiddishism

Among the foremost essayists and men of letters of this period was David Frischmann, who wrote in Yiddish and in Hebrew. Frischmann in his essays preached "Europeanism." He was hypnotized by the scientific and cultural achievements of central and western Europe and considered the Yiddish and Hebrew literature of his day utterly provincial. He admired and translated the German philosopher Friedrich Nietzsche and kept his readers informed about "the new winds of Europe." He died in 1922, a lonely and disillusioned man in the Germany that he had so admired before World War I and the horror that came with it.

World War I to the present. Another essayist and man of letters, Hillel Zeitlin, was the first modern Yiddish writer who, after considerable soul-searching, came to believe that the Jewish people could not endure without religion; he propounded this belief in all of his writings. He fought bitterly against the Enlightenment and its idolatrous worship of worldliness. Zeitlin was a mystic and a

Kabbalist, and he translated parts of the Zohar (mystical commentary on the Pentateuch). He was also a sharp-tongued literary critic. He attacked especially the pro-Soviet writers, with their "proletarian" literature. His analysis of the precarious Judaism of the modern Jew is still valid today and may prove even more valid in the future. He was the father of Aaron Zeitlin, perhaps the greatest of the modern Yiddish poets, who shared his father's interest in mysticism and wrote books on psychic research in both Hebrew and Yiddish.

Sholem Asch, although he looked upon himself as a disciple of Peretz, had neither Peretz' scholarship nor his sense of style. He wrote his fiction on a broad scale and was one of the first Yiddish writers to create historical novels and plays. His books were translated into many languages and his play Got *fun* Nekomeh (1907; The *God* of Vengeance, 1918) was first produced by Max Reinhardt in Berlin (1910) and enjoyed considerable success. Among his best known earlier works are: *Kiddush Hashem* (1919), Die *Kishefmacherin fun* Kastilic (1921; "The Witch of Castile"), A *Shtetl* (1904; "A Village"), Farn Mabul (A Tale of Three Cities, 1933), Motke Gonef (1917; "Motke the Thief," 1935), and Onkl Moses (1918; *Uncle* Moses, 1938), a description of Jewish immigrant life in New York. Written in his later years, a trilogy — Der Man fur *Nazares* (1939; The *Nazarene*), Der Apostol (1943; The *Apostle*), and Mary (1949) — which deals with the New Testament, was the target of much controversy among Yiddish critics and readers. With Sholem Asch, an epoch of so-called "primitivism" was introduced into Yiddish literature. The new generation of Yiddish writers was no longer steeped in Hebrew letters and Jewish lore. Among the most talented writers of this group were Abraham Reisen, Isaac Meir Weisenberg, Abraham Moshe Fuchs, Joshua Perle, Ozer Warshafsky, Moses Stavsky, Rachel Feigenberg, Ephraim Kagonovsky, Israel Rabon, Sh. Berlinsky, Fishel Bimko, Sh. Horontchik, and Hertz Bergner.

Coexisting with the "primitives" were some writers who were still nourished by the old wells of Jewish knowledge: Micah Joseph Berdichevsky, who excelled in descriptions of Hasidic life, though he spent most of his literary life in Germany; Zalman Shneur, who wrote both in Hebrew and in Yiddish and was a highly gifted follower of Mendele; Hersh David Nomberg and Onoychi (pen name of Zalman Yitzchok Aaronson), who wrote Hasidic stories; and the brothers I.J. and I.B. Singer (see below).

To the roster of the most gifted of the Yiddish poets in Europe belong Abraham Reisen, Shimon Shmuel Frug, Aaron Einhorn, Isaac Katzenelson, Uri Tzvi Grinberg, Moshe Broderzon, Samuel Jacob Imber, Aaron Zeitlin, Itzik Manger, Melech Ravitch, Israel Stern, Jechiel Lehrer, Zusman Segalovitch, Kadia Maladovsky, Miriam Ulinover, and Rachel Korn.

Yiddish literature in the United States

Yiddish literature in the United States began to blossom after World War I. The writers before that period were mostly Socialist propagandists, such as Morris Wintehevsky, David Edelstadt, and Joseph Bovshover. Among the foremost Yiddish novelists and storytellers in the United States are: Lamed Shapiro, Der *Tseilem* (The Cross); Joseph Opatoshu, who wrote In poilische *Velder* (1921; In the Forest of *Poland*); David Pinski; the brilliant short story writer Yona Rosenfeld; O.B. Berkowitch, Boruch Glassman; Leon Kobrin, M. Chaimovitch; Isaac Raboy; Shaye Miller, I. Metzger; Benjamin Ressler; Shmuel Izban. Beniamin Demblin, Yitzchok Perlov, and Chaim Grade.

A writer who achieved considerable fame outside the Yiddish literary world and who, in 1933, emigrated to the United States, was Israel Joshua Singer. His novel *The* Brothers Ashkenazi (1936), which describes the growth of the industrial city of Łódź as mirrored in the rise and fall of the Ashkenazi family, is considered a classic work. His other works are *Yoshe* Kalb (1932; The Sinner, 1933), a description of Hasidic life in Galicia, and The Family Carnovsky (1969), the story of refugees from Germany before and during World War II. He also wrote short stories and plays that were performed in Yiddish both in Europe and the United States. He was a realist without a trace of the sentimentality characteristic of most of the Yiddish writers. His younger brother Isaac Bashevis Singer, who has lived in the United States since 1935, is the author of Satan *in Goray* (1955), The Family Moskat (1950), The Slave (1962), and The Manor (1967); he has also written numerous short stories, including stories for children. His books have been translated into a number of languages. Yiddish literature in the United States has excelled in its poetry: among the outstanding American-Yiddish poets are Morris Rosenfeld, whose poems about the sweat shops and the life of the immigrants gained world fame; H. Leivick, author of *The* Golem and Yehoash, who translated the Bible into Yiddish. Such poets as Moshe Leib Halpern, Moshe Nadir, Zisha Landau, and A. Lutzky were first-rate by any measure.

The two foremost Yiddish critics were Bal Machshoves (1873–1924), who lived in Russia, and Shmuel Niger (the pen name of Samuel Charney), who lived in the United States. Both of them influenced Yiddish literature to a high degree and nurtured whole generations of Yiddish writers.

Yiddish literature in the Soviet Union

The Bolshevik Revolution (1917–22) attracted a number of Yiddish writers and later liquidated most of them. Some of them were native Russians, others emigrated there after the Revolution. The greatest of these was David Bergelson, a novelist and short story writer. His best novels are *Noch Alemen* (1913; "After Everyone") and *Arum Vogsal* (1909; "By the Depot"). His novel *Penek* was a desperate and unsuccessful attempt to adapt himself to the demands of Soviet criticism. The same fate befell a highly talented poet from Vilna, Moishe Kulbak, and A. Nister, a mystic who tried his hand at Socialist realism. Peretz Markish, Itzik Feffer, and Izzy Charik wrote numberless odes to Stalin and his regime. All of these poets and many others were shot by the Soviet authorities in the early 1950s. Of the Jewish-Soviet writers of that time, the talented Asher Schwarzman and Leyb Kvitko had the good fortune to die natural deaths.

In the 1970s in the Soviet Union, Yiddish literature is practically nonexistent. The few writers who remain form a nucleus around the magazine *Sovietisch Heimland* ("Soviet Homeland"). In the United States no young generation of readers or writers is growing up. The situation is not much better in Israel, where the new generation knows only Hebrew. There the few Yiddish writers, such as Yehiel Hoffer, Joseph Papiernikov, A. Shomri, Yakov Friedman, Abraham Karpinovitch, and F. Siegelbaum, are concentrated around the magazine Die goldene Keit ("The Golden Chain"), edited by Abraham Sutzkever, a refugee from the Nazi holocaust, who is one of the best Yiddish poets, a bard of the destruction of his people.

Small centres of Yiddish literature also existed in other countries. In Romania there was the fabulist Eliezer Steinbarg; the poets Yankev Sternberg and Moishe Altman, the essayist Biekel. In France there are M. Shlevin and Mendel Mann, whose trilogy about the Red Army has been translated into a number of languages. The most important Yiddish writers in Argentina are P. Yannsovitch, Kehos Kliger, and Josoph Okrutny.

The Yiddish theatre naturally had its playwrights. The first and perhaps the greatest of them was Abraham Goldfaden, who lived in the 19th century and was the father of the Yiddish theatre. Jacob Gordin, also in the 19th century, was for many years the foremost Yiddish dramatist in the United States. There was S. Ansky, who wrote the world-famous Dybbuk, David Pinski, Peretz Hirshbein, and Harry Sackler.

Memoirs in Yiddish literature

The treasure of Yiddish literature is its huge number of memoirs. A memoirist of talent was Yehiel Yeshaia Trunk. His eight-volume work, Poilen (1944), is a monument to Jewish life in Poland. The greatest part of the memoirs about the Hitler era have been and are being written by ordinary men and women. These works constitute an accusation against humanity that has no counterpart in the history of world literature. The present generation of readers is still too close to the enormity of the holocaust to face it. Perhaps the future will be able to appraise this overwhelming literature.

IN MODERN EUROPEAN LANGUAGES

To define what Jewish literature is in any language other than Yiddish or Hebrew is no easy matter. Are Saul Bellow and Bernard Malamud Jewish writers or American writers who happen to be Jews? Was Franz Kafka a Jewish, German, or Czech writer? Is it enough to write on Jewish themes to be called a Jewish writer? No one considered Edna Ferber or Harold Pinter a Jewish writer because they were Jews. Was Ludwig Lewisohn a Jewish writer because he wrote on Jewish themes and in his later years fervently expounded his faith in his writings? Was Abraham Cahan (1860–1951), who wrote both in English (*Yerkl* and *The Rise of David Levinsky*) and in Yiddish (*Bletter fun mein Leben* ["Pages from My Life"]) and preached Socialism and atheism, a Jewish writer, a Yiddish writer, an American writer?

It is a fact that in Russia Isaac Babel was thought of as a Jewish writer, while Osip Mandelstam, and Ilya Ehrenburg were looked upon as Russian writers of Jewish extraction. The French speak of Schwarz-Bart, Memi, Elie Wiesel, and Piotr Rawicz as Jewish writers; but no Frenchman would dream of calling Marcel Proust one. In Germany and Austria it was only with the beginning of Nazism that such writers as Heinrich Heine, Jakob Wassermann, Arthur Schnitzler, Stefan and Arnold Zweig, Franz Werfel, and Elsa Lasker Schiller were called Jewish writers, while Soma Morgenstern and Nelly Sachs were altogether ignored. Actually the writer belongs to the language in which he writes and to the land in which he lives and which he describes. In truth, the classification "Jewish" writer is an arbitrary one and can no more be clarified than "Catholic" or "Protestant" writer.

It is, however, a fact that Jewish themes and Jewish culture and folklore have been increasingly accepted in recent times. In the United States there are, in addition to those writers mentioned above, Henry Roth, Chaim Potok, Maurice Samuel, Meyer Levin, Hugh Nissenson, Philip Roth, Herman Wouk, Karl Shapiro, Alfred Kazin, Leslie Fiedler, Daniel Fuchs, Arthur Miller, Charles Angoff, and many others. In Canada, there are Abraham Moses Klein and Mordecai Richler. In England there was the famous Israel Zangwill; and there are today Wolf Mankowitz, Chaim Raphael, Chaim Bermant, and Gerda Charles. South Africa has Dan Jacobson, Italy the novelist Natalia Ginzburg.

There is no doubt that the interest in Jewish themes and in Jewishness in general was increased tremendously on the one hand as a result of the holocaust that destroyed a great part of the Jewish people and on the other by the birth of the State of Israel, which elicited the astonishment and admiration of both Jews and Gentiles.

Common characteristics

If there is any common characteristic among the writers who deal with Jewish life in languages other than Yiddish and Hebrew, it is that they thrive on thin soil and have short cultural roots. Often both the authors and their protagonists are children of immigrants who are not yet truly acclimated to the land their parents adopted. Their literature lacks the richness that is the result of a generation-long way of life. With few exceptions, writers who write in a language that is comparatively new to them are inclined to either exaggerated admiration for their own kind or an exaggerated self-hatred. Immigration and assimilation are not the healthiest soil for literature. Literature must have a factual and cultural address.

The literary masters were all too deeply bound to the culture of their own people. They knew well their history, their habits, their idiosyncrasies, their weaknesses and strengths. They emerged only when their people were ripe in maturity, saturated with tradition, stably and solidly rooted. It may take a long time before the Jewish milieu in the United States, in England, in France, becomes sufficiently independent spiritually to produce full-blooded Jewish artists. Jews who speak Yiddish in the United States, on the other hand, are generally an uprooted group. Their language has become impoverished rather than enriched. They have abandoned, whether willingly or not, too many of the customs and traditions that lend a group its own special colour. The Yiddish-speaking writes is in fact living in the past, both in his language and his themes. The soil for Yiddish in the United States is growing ever thinner, and the hope for the emergence of great writers in Yiddish ever more doubtful. (I.B.S.)

Dance and theatre

Although there is biblical evidence in the Song of Solomon and the Book of Job of Hebraic awareness of drama, Jewish religious traditions prohibited theatricals except for song, dance, and processionals. Until the emergence of the modern, professional Yiddish theatre in 1876, the ritual pageantry of song, dance, and processional of traditional holidays provided the only Jewish "theatrical" experiences.

DANCE

Antedating the birth of Jewish theatre art, the dance among Jews flowered in arbitrarily designated eras: Ancient (biblical), Diaspora (*c.* 300 BC–*c.* AD 500), Middle Ages, Hasidic (18th–19th century), and modern (20th century).

Social and religious dance. *Ancient.* Derived possibly from the customs of neighbouring pastoral and agricultural Semites and Greeks, the early songs and processionals, associated with taboo rites and sacrifices, celebrated fertility and harvest festivals.

Sukkot dances

On the first day of Sukkot, a seven- to nine-day religious festival of thanksgiving celebrated originally as an autumn harvest festival, there was a ritual dance procession around the altar, followed on the second day by a torch dance. In synagogues to this day, the waving of the *lulav*, or festive palm branch, and the *etrog*, the fruit of the citron (which are carried and waved during the festival of Sukkot), culminates in seven processions on Hoshana Rabba, or the seventh day of Sukkot.

There were also ancient Hebrew dances performed on other occasions: dances to celebrate the return of Jephtha; dances that were part of war ceremonials; dances before the ark (the sacred chest in which the two tablets of the Law were kept); the vineyard dance, wherein maidens danced to woo prospective grooms; and dances in praise of God:

> Let them praise his name with dancing, making melody to him with timbrel and lyre!
>
> (Psalms 149:3.)

Women were the principal performers in these dances, but men danced in praise of God.

To celebrate the Water-Drawing Festival of Sukkot, a part of the harvest celebration, dances and acrobatics continued through the night; at dawn, with trumpets blasting, water was poured from precious pitchers upon the altar. To proclaim nuptials, escorts of a bride and a groom sang and danced. At weddings, professional dancers performed, and the officiating rabbi sometimes danced to honour the bride. From antiquity to the Middle Ages a Jewish bride would dance as she brandished a sword to symbolically ward off suitors other than her beloved or to drive away evil spirits. In the medieval times this custom became prevalent in the Middle East. To honour a celebrity, there was a circle dance, with prescribed hand movements, which was accompanied by the juggling of knives, glasses, or eggs.

Diaspora and Middle **Ages.** To avoid antagonizing local rulers, the rabbinate often forbade dancing, a prohibition that was relaxed for the irrepressible holiday spirit during Purim (a festival to commemorate the deliverance of the Jews from the machinations of Haman, a minister of the Persian king Ahasuerus). Pantomime, song, and dance culminated in a fire dance, perhaps derived from primitive people who thus destroyed ever-threatening demons. Because of the possible danger of fires from the torches, the Eastern Roman emperor Theodosius II in AD 408 prohibited the fire dance by Jews throughout the Byzantine Empire.

Social and folk dancing at festivals and weddings, forbidden in the synagogues, found a home in the *tanzhaus.* There, the dances blended Jewish traditional with local native dance. Popular dances included *maien tanz* (like a Polish polonaise), *umgehender* (a courtly minuet), *schpring tanz* (a vigorous peasant dance), Judentanz, *Adam harishon tanz*, Doctor Foist *tanz,* and *fish tanz* (the forms of the last four are not known).

Wedding dances, combining ritual with gaiety, introduced a *tanz fuhrer* (dance leader), the forerunner of the *badchen* (a witty master of ceremonies), who led the dances and sang rhymed, often ribald verses at the expense of the wedding principals. Among the wedding dances were the *bettlertanz*, dances by local beggars culminating in a dance with the bride (this dance provides a climactic scene in the drama *The Dybbuk),* and the *Totentanz,* or dance of death, which originated in the time of a plague and symbolized death and resurrection.

Mixed dancing, by stringent custom, was restricted to close relatives. During the mid-17th century, ecstatic followers of the false messiahs abandoned themselves to indiscriminate and licentious dancing between the sexes; thereafter, more decorous mixed social dancing became popular, although limited among the strictly Orthodox.

Kabbalistic dances

During the Middle Ages, Kabbalists (adherents of the esoteric doctrine or mysticism) in Safed (now Zefat, Israel) welcomed the sabbath with song and dance. (This may have been the origins of later Hasidic dances.) Similar dances take place in the 20th century at the Western Wall in Jerusalem on the sabbath eve.

Hasidic. The Hasidic cult (devoted to mysticism and opposed to secular studies and Jewish rationalism), which became popular among the Ashkenazi (eastern European Yiddish-speaking) Jews in the early 18th century, was distinguished by the religious fervour and joy of its adherents. Their devotion and exaltation was expressed in a spontaneous dance wherein each individual sought *devegut* (a unity with God). The Ḥasid sways in prayer, or dances either alone or in a circle with his brethren as they hold each other's shoulders or waists; the rabbi often dances alone or leads the others. The height of Hasidic dancing occurs in their synagogues on Simhat Torah ("Rejoicing of the Law"), when the rabbi leads his followers in a dance while he embraces the Torah (first five books of the Old Testament) close to his heart.

Modern. The Palestinian hora, frequently performed outdoors, resembles early harvest dances imported from eastern European folk dances and blends peasant vigour with Hasidic ecstasy and abandon. It has become a popular dance among Jewish youth the world over.

Jewish wedding dances have taken on folkways from other groups and are no longer choreographed from religious mysticism such as the sword dance by the bride to ward off evil spirits. At an Orthodox wedding, or at the request of an Orthodox guest at a Reform wedding, the celebration will feature dances such as the *sher,* a form of square dance; the *mitzwa* or *kosher-tanz*, either a mixed dance with handkerchief as the only contact between the man and woman in observance of the Orthodox custom that prohibited mixed dancing, or a dance performed by the bride with a guest or with her groom; *machutanim-tanz,* a circle dance by relations of the couple; *broyges-tanz*, a dance game with mixed partners, expressing resentment followed by reconciliation, as well as others derived from local nationalities, such as the *quadrille* and *lancelot, kutzki, bulgar, pas d'Espagne*, and *vingerka.* The *redl, karahod,* and *hopke* are circle dances performed by men only. The *koilich-tanz*, a woman dancing with salt and halla or twisted white bread, to ensure prosperity for the newlyweds; the *besem-tanz*, a man manipulating a broom as sword, rifle, or horse; the *flasch-tanz*, a male dancer balancing a bottle on his head while he dances; and the *bube-tanz*, the grandmother's dance, are wedding dances that are still featured.

Professional dance. Since their slavery in the Diaspora, when some were employed as dancers and entertainers, the Jews have enriched the art and lore of world dance. In 1480, Jews and Moors were obliged to perform their national dances on Corpus Christi day (Roman Catholic festival in honour of the Eucharist); and, in the 17th century, the sultans Ibrahim I and Mehmed had their troupes of Jewish fiddlers and dancers. *Danza de la muerte* (dance of death), with Talmudic implications, attributed to Rabbi Santob de Carrion, appeared in Spain late in the 14th century. In the 16th and 17th centuries, Jewish *letzim* (itinerant jesters or mummers) toured Germany to appear at weddings, where their performances included walking on stilts, dancing, acrobatic tumbling, and pantomime. Early in the 19th century, the parents of the French tragedienne Rachel were wandering Jewish dancers.

Jews have also been dance teachers and choreographers. In 1313, Rabbi Hacen ben Salomo taught Christians a ritual choral dance at St. Bartholomew's in Saragossa, Spain. The grand Florentine Lorenzo de' Medici had a Jewish dancing master, Guglielmo da Pesaro, who wrote the book *Treatise on the Art of Dancing.* Other Jewish dance teachers and choreographers were Sieur Isaac d'Orléans in the French court (1700); Greccion Azziz and Emanuel de Rabbi Jalmoasis of Ancona, whom the Pope granted the privilege to teach dance; the great *danseur noble* Arthur Saint-Léon, the son of the ballet master at Stuttgart's Theatre Royal, who danced and produced ballets in Paris and St. Petersburg in the 19th century and whose *Coppélia* is still a popular favourite in the repertoire of leading ballet companies; Dame Marie Rambert (Miriam Rambach), who taught eurythmics (the art of harmonious bodily movements) to the Russian dancer Nijinsky; and Emil May, a Moscow choreographer.

Jewish ballet dancers

Prominent among Jewish ballet dancers were Adolph Bolm, Alexandre Sakharov, Alexis Dolinoff, Louis Chalif, David Lichine; Shulamith and Asaf Messerer, both stars of the Bolshoi Ballet; Ida Rubinstein, Dame Alicia Markova (Lillian Alicia Marks), Annabelle Lyon, Miriam Golden, Nora (Koreff) Kaye, Benjamin Zemach; in Israel there are Rina Nikova, Baruch Agudati, and Gertrud Kraus; and in Poland, Judith Berg, Bela Katzova, and Sam Hyor. In the mid-20th century, the outstanding Jewish dancer is Beatrice Abramowicz in Bucharest.

In the U.S., dancers identified with modern and avant-garde dance have been Dvora Lapson, Lillian Shapero, Lazar Galpern, Pauline Koner, Miriam Blecher, Belle Didjah, Sophie Maslow, Marie Marchowsky, Thelma Babitz, Nina Fonoroff, Helen Tamiris (Helen Becker), Anna Sokolow, Felicia Sorel, Gluck-Sandor (Samuel Gluck), Blanche Evans, Hans Wiener, and Jerome Robbins. Prominent modern dancers from other countries have been enthusiastically received when they have appeared for recitals in Israel. Folk dancing has attained great popularity. Yemenite folk dances, which revert to biblical sources, have developed out of Yemenite and biblical traditions and have become the specialty of a singing and dancing troupe, the Inbal Ensemble. Under the guidance of its founder and leading spirit, Sara Levi-Tonai, this trained, professional group performs at camps, kibbutzim, and villages as well as in concert halls in cities.

THEATRE

Excluded from theatrical activity by their religion, by harassment at the hands of hostile princes and states throughout the Diaspora, the Jewish people found the roots of their theatre in their traditional and religious rituals such as the impressiveness of the reading of the Torah and the protocol of the Passover feasts. Out of the religious festival of Purim came the earliest Jewish theatrical presentation.

Purim-shpil. The *Purim-shpil* (Yiddish "Purim play"; the term was in use by the mid-16th century) formalized the Purim merrymaking with a plot based on the Book of Esther. Growing in popularity, and thereby demonstrating an affinity for theatre among the Jews, the *Purim-shpil* became the main Jewish theatrical entertainment until the birth of the modern professional Yiddish theatre, in 1876. The first Purim play to be published (1708, and in Hebrew in 1710) was the anonymous *Beautiful New Ahasuerus Play,* followed by *Mekhirat Yosef* ("The Sale of Joseph"), by the writer Bermann

(Lemberg, 1710), which featured the merry-andrew, or buffoon (*letz*), stock comic Pickelherring, later to be known as Leckerlaufer. Among the popular scripts that soon followed were *The Sacrifice of Isaac* and *David and Goliath*. First performed by amateurs and later by travelling mimes and jesters, the Purim play was presented either in the courtyard of the synagogue, in large homes of wealthy Jews, in large storerooms, or in community halls.

Yiddish theatre. *19th century.* Deploring the jargon of Yiddish, Jewish scholars wrote dramas in Hebrew during the 17th, 18th, and early 19th centuries. But because they were dedicated to the 18th- and 19th-century Haskala spirit of elevating the uneducated Jewish masses, eastern European Jewish poets, short-story writers, and novelists turned to the lingua franca of the lowly Jews, Yiddish. The origins of the professional Yiddish theatre were in the mid-19th century among the folk singers—individuals and groups—who travelled among the eastern European Jewish settlements and performed in Yiddish during that part of the year when the ever popular Purim play was not performed. The lone minstrel, Velvel Zbarsher (Wolf Ehrenkrantz), sang and acted throughout the provinces of Romania, where he popularized his own lyrics. His dedication to uplifting the uneducated and impoverished Jews was typical of the many educated *maskilim* (participants in the Haskala movement) who sought to emancipate the Jews from their circumscribed ghetto life. The most prominent among the travelling troupes who entertained in the Jewish enclaves in Yiddish was the Broder Singers (from Brod in Galicia), who appeared in cafes, wine cellars, and assembly halls throughout eastern Europe. Their repertoire included songs by Michael Gordon, Zbarsher, Eliokhim Zunser, and Abraham Goldfaden. When, in 1876, Goldfaden provided them with a continuity of dialogue and plot for their presentation in a wine cellar in Iaşi, Romania, the professional Yiddish theatre was born.

After hiding from threatened impressment into the Romanian army during the Russo-Turkish War (1877–78), Goldfaden's troupe appeared in Bucharest. Here the talented actor Sigmund Mogulesco, joining the company as the first professional Yiddish actor, established what was to become the conventional and popular role of a versatile comic. With a repertoire of Goldfaden operettas that were filled with Jewish lore and evoked the human richness of Jewish life, the troupe made successful tours of Russian cities that had Jewish centres.

The assassination of Tsar Alexander II (1818–81) intensified anti-Semitism until on September 14, 1883, Yiddish stage presentations were forbidden in Russia. The Yiddish theatre briefly continued in Warsaw as a "German" theatre; a second edict ended that subterfuge.

Yiddish theatre in the United States

The lonely immigrant and the Yiddish theatre found and sustained each other in America, where the Jews had greater economic opportunities; where they were influenced by radicals, a free press, and the intelligentsia to free themselves from religiosity and to assume a greater degree of worldliness; and where they were not subject to police harassment and official repression. In 1882, the young Boris Thomashevsky brought a few Jewish actors from London to New York to present the first professional Yiddish play in America. Soon, under the monopoly of the playwright-managers Joseph Lateiner and Moses Hurwitz, who produced vulgar melodramas and shoddy operettas, sentimental representations of inexact Jewish history, and crude imitations of Goldfaden's folk epics, a burgeoning Yiddish theatre in New York provided entertainment for the hordes of uneducated Jewish immigrants.

In the Haskala tradition, journalists, critics, actors, and artists sought to uplift the masses and agitated for better theatre. In 1892 Jacob Gordin, a Tolstoyan reformer, ushered in the first "golden epoch" of the Yiddish theatre with his play *Siberia,* produced by Jacob P. Adler, the most notable actor of the early Yiddish theatre. Gordin's prolific pen provided the Yiddish theatre with adaptations from the world's classic repertoire, as well as original plays concerned with social problems and reflecting Gordin's penchant for realism. For the ensuing decade, Gordin and his imitators dominated the Yiddish theatre in New York and Europe. Gordin's influence and heritage gave the Yiddish theatre higher standards of literature, acting, and directing, as well as a respect for the dramatists' written words that put an end to vulgar interpolations and extraneous improvisations by the actors.

The actors attempted to better their lot, organizing, in 1899, a Yiddish actors' union, a forerunner and guide to American Actors' Equity Association, which was formed two decades later. The union helped the actors but imposed restrictions upon productions that interfered with artistic realization; for example, the rules of seniority frequently required that an ancient actress be given an ingenue role, and new talent encountered discouraging obstacles in rules that limited membership.

20th century. Around the beginning of the 20th century, Russian authorities relented, and the Yiddish theatre burst forth with new life. Perez Hirshbein, considered the greatest Jewish playwright, inspired by the artistry of the Moscow Art Theatre, toured Russia and Poland with his company from 1908 to 1910. When its most notable actor, Jacob Ben-Ami, came to New York on the eve of World War I, he introduced the concepts of Konstantin Stanislavsky, director of the Moscow Art Theatre, to the American theatre for the first time via the Yiddish stage. In Warsaw, the Kaminska family established a distinguished Yiddish theatre that, except for a hiatus during World War II, has continued as the Jewish State Theatre of Poland even though its actor-manager-star, Ida Kaminska (the daughter of the original founder) fled from Poland's resurgent anti-Semitism in 1968.

The Yiddish Art Theatre

Although Gordin's influence continued to prevail, and great folk and poetic dramas by such dramatists as David Pinski, Leon Kobrin, and Ossip Dymov were produced by such prominent stars as Jacob P. Adler and David Kessler, the Lateiner and Hurwitz type of shoddy melodrama and tawdry operetta persisted. During World War I, a plethora of sordid melodramas about fallen women infested the Yiddish stage. In 1918 Maurice Schwartz gathered aspiring members of the New York Yiddish theatre into a new venture that was to become, two years later, the Yiddish Art Theatre. of which he became director and star for three decades. Early in its first season, at the urging of Jacob Ben-Ami, Schwartz's troupe presented Hirshbein's *Farvorfen Vinkel* ("Forgotten Village"). With its enthusiastic reception, the Yiddish Art Theatre movement—and the second "golden epoch" of the Yiddish theatre—was launched. Schwartz's troupe endured, both in New York and on triumphant world tours, for over three decades.

The determination to bring worthwhile literary dramas to Jewish communities and to develop talent for the professional stage resulted in the creation of literary and dramatic clubs that flourished in many Jewish areas. From these clubs were born important Yiddish theatre troupes of high artistic merit. Warsaw had the I.L. Peretz Theatre Society (founded in 1911) and the contemporary VYKT (Varschaver Yiddische Kunst Teater, or Warsaw Yiddish Art Theatre); and Vilna (now Vilnius, Lithuanian Soviet Socialist Republic) had FADA (Farband fun Yiddishe Dramatische Actyorin, or Association of Yiddish Dramatic Actors). When, in 1915, the occupying German forces determined to undermine Russian power by encouraging nationalistic groups, the dramatist Arnold Zweig and fellow German officers helped FADA form what was to become the world-renowned Vilna Troupe, whose fragments—discords and misunderstandings created splits within the group—later toured the world and set standards of unsurpassed theatre art. Also in 1915, in New York, two dramatic clubs combined to form the Folksbuehne, which, in the latter half of the 20th century, is the most notable Yiddish theatre still operating in the United States. Various theatre clubs combined in 1923 into the Folks Farband far Kunst Teater. In 1926, with the aid of many Jewish workers' organizations, this active studio group became the Arbeiter Teater Farband. When in 1927 it presented its first public production, the left-wing Artef group started its memorable, albeit one-decade, existence, during which it presented politically provocative and stylistically challenging productions in New York.

To revive and stimulate interest in Hebrew as a living language, Habima (Hebrew: the Stage) was organized in Bialystok, Poland, in 1912, under the guidance of Nahum Zemach. Encouraged by Stanislavsky, it established itself in Moscow during the turbulence of the Russian Revolution of 1917. Despite the new government's edict against Hebrew as a secular language for the Jews, the high artistic merit of this troupe, which performed in Hebrew, made it a cult in Moscow. Its sensational production of the Russian playwright S. Ansky's Dybbuk electrified theatregoers on both sides of the Atlantic. During the company's tour of Europe and the United States in 1926, defections by and schisms among the members led the remnants to regroup in Palestine where, in 1931, the Habima permanently established itself in Tel Aviv and later became the official state theatre of Israel.

Between the two World Wars, the Soviet government encouraged and supported Yiddish theatres, the most successful of which was the Kamerny in Moscow. As one scholar puts it, this theatre "sneered at old-fashioned Jewish folkways, caricatured such life, and satirized it with political interpretations; it exaggerated in order to ridicule the Jewish past." Thus, this Moscow Yiddish folk theatre distorted Jewish heritage in attempting to combine it with the ideology of the October Revolution.

Caught in the crossfire of the savage Nazi scourge and Stalin's purge, almost all Yiddish theatres, actors, and directors were eliminated from the Russian scene; moreover, the *shtetl* (Jewish small town or small town community in eastern Europe), the milieu out of which were distilled the Yiddish theatre arts and Yiddish dramatic poetry, also disappeared.

In the 1970s, the best organized and most ongoing Jewish theatres are in Israel and Romania. The first attempt at Hebrew theatre in Palestine, in 1894, was followed periodically with attempts by sporadic groups to establish themselves in either Hebrew or Yiddish productions. With the birth of the State of Israel in 1948, the Hebrew theatre came of age; by mid-20th century, it was firmly established as a vigorous and important part of world theatre culture. In addition to the state-subsidized Habima, there are the Ohel and Cameri theatres in Tel Aviv; Hateatron Haironi (the Municipal Theatre, under the direction of the renowned Josef Millo) in Haifa; and the Histadrut's (General Federation of Labour's) Telem (Theatre for New Immigrants), which has functioned chiefly as a tool to teach uneducated Jews from Arab countries. As an educational tool, its mobile stage offers plays at various reception centres for new immigrants as well as at outposts where newcomers are settled. In addition to independent Hebrew professional theatre groups that appear from time to time in the leading cities, visiting troupes, such as the Bucharest State Yiddish Theatre, have appeared in Israel. There are about 300 amateur theatrical groups in this small country. Playing an important role in the nation's culture, the theatres avoid plays from the Yiddish traditional theatre or ghetto genre, because the highly sophisticated theatre audiences are aware of the avant-garde theatres of other lands and are receptive to this eclectic fare. European and American successes are popular. Seldom are their original plays concerned with biblical subjects, local problems, the fight for independence, or the pioneers who settled the land. Supported by the highest per capita theatregoing population in the world, the Israeli theatre is forging its own theatric-dramaturgic traditions of a high order.

Decline of Yiddish theatre

The decline of Yiddish as a spoken and written language has had a devastating effect upon the languishing Yiddish theatre. Other than intermittent productions in New York and Buenos Aires and rare productions in other world capitals, there remains only a waning State Yiddish Theatre in Warsaw and a flourishing, highly artistic State Yiddish Theatre in Bucharest. Supported by a benign government, the Yiddish theatre in Bucharest operates its own theatre and tours the provinces with both traditional and avant-garde productions. Thus, it is in Romania, where the modern Yiddish theatre was born, that it still flourishes.

In its brief lifetime, the theatre of the Jews has brought forth talented performing artists and important dramatic poets, served as a nationalizing fulcrum, provided a bridge over which new theatrical art forms came from Europe to America, and created theatrical art forms that have enriched the world stage. (D.S.L.)

Visual arts

The Jewish attitude toward art has been cautious at times, although contrary to the general assumption there was no prohibition of artistic expression in biblical times, nor in most periods of Jewish history. The Second Commandment defines itself as a law against making idols for the worship of "other gods." No fear of artistic representation as idolatry can be detected in the detailed instructions given by God to Moses on how to build the Tabernacle and its implements, which, indeed, includes the specification to adorn the ark with two winged cherubs. The prohibition against idol worship, and sometimes the destruction of idols, did not deter artistic representations throughout the Israelite (c. 1020–586 BC) and Hasmonean (142–63 BC) periods.

The traditional Jewish "way of life" in accordance with the Halakha—*i.e.*, the section of the Talmud dealing with religion and civil law—which was established during the 3rd to 6th centuries AD, stressed verbal rather than visual expression: the Talmud is the great rabbinic compendium of Oral Law, lore, and commentary. Artistic representation was not prohibited, since there was no longer any fear of idolatry. It was mainly encouraged for educational purposes, or for *hiddur mitzwa* (that is, adornment of the implements involved in performing rituals).

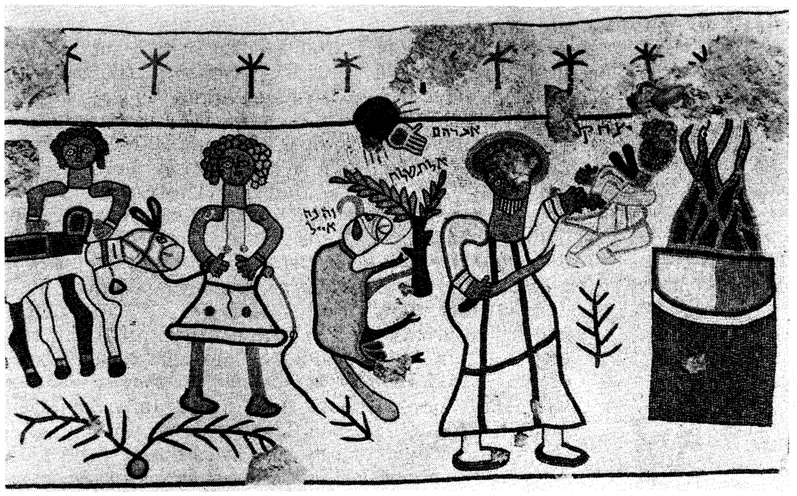
When Jewish antagonism to artistic expression did appear, it was limited to isolated areas and periods. Complete abstention from any adornment or from the use of decorated religious or secular objects pertained to small, ascetic Jewish sects called Hasidim, known from the Mishnaic period (450 BC to AD 200) and, later, from the 12th–13th centuries. Partial artistic abstention developed under the influence of external pressure prohibiting the depiction of the human form in sacred objects among the Jews living in Muslim countries and in the Byzantine Empire during the Christian Iconoclastic period, which prohibited the use of images in religious worship (725–843). During the 13th century, Jewish artists in the south of Germany introduced the human figure in distortion as a way to overcome this aversion.

Jewish art should be conceived as part of the arts of the Jewish people. There is no general Jewish style that can be traced throughout the 4,000 years of Jewish history. Because of the wide dispersion of the Jews, the style of Jewish art objects was usually similar to the contemporary style of their immediate environment. Nevertheless, some specific Jewish elements, motifs, forms, and styles were crystallized for limited periods in regional Jewish schools of artistic expression.

The arts of the Jews can be broadly divided into three major periods, each different in character from the other: the Israelite, the Jewish, and the modern periods.

ISRAELITE PERIOD

Very few art objects related directly to Israelite culture have survived from the Israelite period (see above). The Bible gives accounts of some major edifices, most of which were influenced by contemporary Egyptian, Canaanite, or Phoenician forms. These include the "Tent of Meeting" (Tabernacle) and its various appurtenances and Solomon's Temple in Jerusalem, built and decorated under the direction of the Zorite (Phoenician) artist Hiram. Solomonic public buildings were uncovered in Israel at Megiddo, Ḫaẕor and Gezer. Other royal buildings excavated are the palace of Ahab (*c.* 860 BC) at Samaria north of Nablus, and the palace of Jehoiakim (*c.* 608 BC) at Ramat Raḫel, south of Jerusalem; both were decorated with proto-Aeolian capitals that originated in



Sacrifice of Isaac, detail of a mosaic from the synagogue of Bet Alfa, Jezreel Valley, Israel, 6th century AD.

Archaic Greece. Ahab's palace was partly covered by surviving ivory panels that resemble the ivories found at Arslān Ṭāsh in northern Syria.

JEWISH PERIOD

Classical antiquity. The Jewish period begins with the classical phase, which spans the Hellenistic, Roman, and early Byzantine eras. Some elements introduced in Hellenistic times became characteristic throughout the Jewish period and lasted until the 19th century. The most important of these are the structure of the synagogue, the depiction of some biblical and legendary episodes, and the use of Temple symbols like the facade of the Temple, the ark of the Covenant, the *menora* (a seven-branched candelabrum), a shovel, the oil amphora, the shofar (ceremonial ram's horn), the *lulav* ("palm branch"), and the ***etrog*** ("citron"), all used in conjunction with the Sukkot festival.

Early development of the synagogue

Literature and archaeological finds of the period give evidence that synagogues existed both in Jerusalem and throughout the Diaspora (communities of Jews living outside Palestine), even before the destruction of the Temple in the year AD 70. The surviving synagogues from Roman times are of a basilican type of structure—*i.e.*, of an oblong construction ending in an apse, or a vaulted semicircular niche. Seats were built around the walls. The earliest example is the synagogue on Masada in the Judaean Desert, built by zealots during the revolt against Rome (AD 66–70). Most surviving synagogues of the late Roman and early Byzantine periods are located in the Galilee region of modern Israel and in Greece and Syria, and they are of two basic types. One type has its facade facing Jerusalem; the participants prayed within, facing the entrance. The 3rd-century synagogue at Kefar Nahum (Capernaum), in Israel, and the 4th-century synagogue in Ostia, near Rome, were of this type. The second type of synagogue had its back wall facing Jerusalem, and the Torah (scrolls of the Law) was kept permanently within a niche in the wall. Examples are the 6th-century-AD synagogue of Bet Alfa in the Jezreel Valley (Plain of Esdraelon) of Israel, and that in Dura Europos, on the Euphrates. Built in AD 245, it is now a part of the structure of the National Museum in Damascus, Syria.

Herod's Temple

The most important remaining building of this period of Jewish art is probably Herod's Temple, which was built on top of the Second Hasmonean Temple in Jerusalem. Although only the impressive supporting Western Wall (known as the Wailing Wall) and Southern Wall survive, they still give some indication of the magnificence of the building's scale. Herod's Temple was designed and decorated in the prevailing Roman style.

Synagogues were decorated by stone reliefs carved in the capitals of the columns and in friezes above them. The decorative motifs mainly consisted of acanthus leaves and floral ornamentation in addition to the traditional Temple symbols. The painted walls of Dura Europos bear witness to wall paintings mentioned in the Jerusalem Talmud (*c.* AD 400). They depict mostly biblical themes, with some Temple symbols. The style of the painting is Hellenistic in the Persian manner. Wall paintings, such as those of Dura, may have been modelled after illuminated biblical manuscripts, though no Hebrew manuscripts of the Classical period have been found.

During the 5th and 6th centuries, synagogues were decorated with floor mosaics in the Byzantine style. The motifs and themes used included Temple symbols, signs of the zodiac based on classical pagan models, and biblical scenes, of which the most famous are the sacrifice of Isaac in the synagogue of Bet Alfa in the Jezreel Valley, and the animals leaving Noah's ark in the Jarash synagogue in Jordan.

Jewish sepulchral art largely consisted of graffiti (crude drawings scratched onto a hard surface) and paintings of Temple symbols. These were executed on the interior walls of burial chambers and have been found at Jerusalem, at Bet She'arim in Israel, and in catacombs in Rome. Some burial caves in Israel had monuments built over them, such as the family tombs in the Qidron Valley and the public tombs around Jerusalem and in Bet She'arim.

Middle Ages and Renaissance. The Middle Ages introduced two distinct streams of culture into Jewish art, which were further developed during the Renaissance. These are the Sefardi tradition, originating in the East, and the Ashkenazi tradition of western Europe.

Sefardi art of the East

The Eastern stream was centred in the Muslim countries of the Near East and North Africa, as well as Yemen and Spain. After the expulsion of the Jews from Spain in 1492, a specific culture called Sefardi was created through the spread of Spanish Jews into Europe, the Americas, and the East.

Of the many large synagogues, schools, and other public buildings recorded in Jewish literature, only a few minor synagogues have survived in Egypt and Spain. These are mostly single halls with large Torah niches facing Jerusalem and a central bimah, an elevated platform from which the Torah is read. They were decorated with stucco sculpture and carved wood in the style of the Muslims, and the decorative motifs were Muslim as well, but Hebrew inscriptions were employed for ornamentation rather than Arabic ones. The 9th-century Ben-Ezra synagogue in Fusṭāṭ (Old Cairo) and the present church of El Transito (1357), Toledo, Spain, are examples of the single-hall synagogue. A more elaborate plan is that of the church of Santa Maria la Blanca in Toledo. Originally a synagogue built in 1205, it is divided into five aisles by four rows of horseshoe-shaped arcades.

The illumination of biblical manuscripts developed from the 9th century in the East, especially in Palestine, Egypt, and Persia. The carpet-like illumination of whole pages and sectional drawings followed motifs devised for illuminating the Qur'ān, the Muslim holy book. A special Jewish innovation was the outlining of drawings in micrography (tiny writing), using passages from the Masora (a collection of textual notes on the Hebrew Bible). Another typically Jewish element is the inclusion of a symbolic array of Temple implements as one of the carpet-like pages. This began in the East and developed mainly in Spain and the Provence region of France during the 14th century.

Carpet page with scrolls and leaves outlined by a micrographic inscription from the Masora. From the Damascus Keter, an illuminated Bible from Burgos, Spain, 1260. In the Jewish National and University Library, Jerusalem. 30.2 X 27 cm.

The 14th-century Spanish schools of illumination produced sumptuous Haggada manuscripts (book containing the text of the ritual service recited during the Passover *seder*). Full-page miniatures depicting biblical episodes, mainly from Genesis and Exodus, are found in manuscripts such as the "Golden Haggada" of Barcelona (*c.* 1320). The most important schools of Sefardi manuscript illumination in the 13th–14th centuries were those of northeastern Spain and southern France. In the 15th century, after the decline of the Castilian and Aragonese Jewish communities in central and northern Spain, the illumination schools of Galicia, in northwestern Spain and Portugal, became prominent.

Ashkenazi art of the West

The Ashkenazi Jewish culture of western Europe was centred in England (before the Jewish expulsion at the end of the 13th century), France (until the beginning of the 14th century when Jews were expelled), Italy, and Germany (where Jews were driven out during the 15th century).

The surviving Ashkenazi synagogues from the 12th century onward comprise mostly a single hall that is generally divided by one or two central pillars that support a vaulted ceiling. The Torah niche is in the east wall and the bimah in the centre. An example is the 14th-century Altneuschul (Old New Synagogue) in Prague, one of the very few medieval synagogues to survive Nazi destruction. Synagogue decorations were usually stone carvings, in the style of Gothic and Renaissance architectural ornamentation.

Ashkenazi illuminated manuscripts appear simultaneously in the 13th century in Germany, France, and Italy. To some extent the biblical manuscripts follow the oriental pattern of carpet pages, sectional divisions, and use of micrography. Ashkenazi manuscripts, however, tend to have more text illustrations, both on the text pages and as frontispieces. The Ashkenazi Haggadas, on the other hand, have illustrations within the text margins, rather than full-page miniatures. ***Mahzorim*** (festival prayer books) with marginal illustrations in text became fashionable in the Rhine region during the 13th–14th centuries. The Leipzig Mahzor (University Library, Leipzig, Germany) is one of the finest examples of illuminated *maḥzorim.* The existing works of Ashkenazi illumination produced in the 13th and 14th centuries in northeastern France, southern Germany, and central Italy were all directly related to the styles of Latin illumination in a given period or region. During the 15th century northern Italy became the most important centre of illuminated Hebrew manuscripts in the Renaissance style. Early printed books from Spain, Italy, and Germany also follow Christian Renaissance prototypes.

Some of the ritual objects introduced during the Middle Ages became established in the Renaissance for the subsequent generations of European Jews. The most common examples are the Torah ark, the Sefardi Torah case and the Ashkenazi Torah mantle, the crown and finials placed on top of the Torah, star-shaped, hanging sabbath lamps, tower-shaped spice containers for ceremonial use at the close of the sabbath, and lamps for Hanukka (Festival of Lights).

During the Middle Ages and the Renaissance, Jews excelled as artisans in many trades, some of which were known to be almost exclusively Jewish. Coin striking, silver engraving filled in with a black composition of metallic alloys called niello, sword production, and leather working were Jewish crafts. The making of astrolabes and drawing of maps were both considered Jewish arts in Majorca, Spain, Portugal, and North Africa.

Baroque age. The Jewish Baroque period of the 17th and 18th centuries was particularly important for introducing new decorative motifs, richer embellishment of ritual objects, and new design types for the building and arranging of synagogues.

In northern Italy, a "bipolar" arrangement developed inside the Sefardi synagogues, whereby a dramatically raised, stagelike bimah was placed along the wall opposite the ark of the Law. A lavish example is the 16th-century Sefardi synagogue in Venice, which was redesigned in the mid-17th century by the prominent Baroque architect Baldassare Longhena. In contrast, the Sefardi synagogues in The Netherlands, England, and the United States had the bimah in the centre, at varying distances from the Torah ark, as in the Touro Synagogue, designed in 1762 by the colonial American architect Peter Harrison for the Jewish community of Newport, Rhode Island.

During the Baroque period two special types of synagogues were developed in eastern Europe: the four-pillared stone synagogue and the wooden synagogue. Most of these were destroyed in the 20th century during the Nazi occupation.

Innovations in synagogue design

In Polish synagogues the four pillars were erected around a central raised bimah. They generally supported a heavy canopy. The earliest known four-pillared synagogue was built in 1553 at Cracow. Some of these synagogues had a castle-like exterior to protect the building and the congregation from the attacks of Cossacks and Tatars. Interior wall paintings were sometimes used as decoration.

The timber synagogues of Poland were built with elaborately decorated ceilings. The bimah was usually in the centre, and some were of the four-pillar type. Most of the walls and ceilings of the wooden synagogues were painted with biblical, floral, and symbolic motifs. The earliest known timber synagogue was at Chodorbw (modern Khodorov, Ukrainian Soviet Socialist Republic) in Poland (1651), but many must have been built earlier.

Objects of the Ashkenazi rite and the Italian rite (*rito italiano*) became more elaborately adorned with silver and gold during the Baroque period. New objects were introduced for the synagogue as for use in the home. The Torah ark, sometimes an entire structure of wood or

marble, was adorned with an embroidered curtain and a valance to hang over the curtain. The Torah scroll was adorned with a breastplate to hang over its mantle and with a pointer to help in reading the scroll. A laver and basin for washing the hands of the *cohen* (priest), a standing Hanukka lamp, and the lamp of the eternal light became fashionable synagogue accessories. Ritual objects for the home were the work of folk artists who used both traditional forms and their imaginations to shape and to adorn them. The most favoured objects were Hanukka lamps, spice boxes, special dishes for the festivals of Passover and Purim, sabbath candlesticks, wine cups, and metal bindings for prayer books. In the 18th–19th centuries, schools of manuscript illuminators developed in Moravia and Bohemia and spread to Germany, The Netherlands, and England. Professional adornment of tombstones began in The Netherlands with biblical scenes, and spread to other areas of western and eastern Europe, where Jewish folk artists depicted no human forms.

MODERN PERIOD

The emancipation of the Jews in the 19th century brought the art of the Jewish people out of its purely religious function and into the secular world, where it has remained. No Jewish national style has developed, and Jewish artists have integrated into the styles of the period. At the same time, art for ritual use has retained its traditional character.

Some Jewish 19th-century artists painted scenes of contemporary Jewish life. The most famous were Moritz Daniel Oppenheim in Germany, Solomon Alexander Hart in England, Mourycy Gottlieb in Poland, and Jozef Israels in The Netherlands. Of the Impressionistic school, the most famous Jewish painters were Camille Pissarro in France, Max Liebermann in Germany, and Isaak Ilich Levitan in Russia.

In the 20th century, several Jewish artists have become prominent, and although they may use Jewish subjects, the Jewishness of their style is debatable. Some of the best known are the painters Marc Chagall, Amedeo Modigliani, Chaim Soutine, and Jules Pascin; the sculptors Jacques Lipchitz, Bernard Reder, Naum Gabo, and Jacob Epstein; and the architects Erich Mendelsohn, Louis Kabn, and Moshe Safdie.

Jewish style of the 20th century

Attempts to create a Jewish national style occurred in 1906, when Boris Schatz founded the Bezalel School of Art in Jerusalem. His aim to combine Ashkenazi artistic forms with Yemenite style failed, and no distinctive Jewish national style has yet developed in Israel. Another attempt at the creation of a Jewish style was made in Russia immediately after the revolution of 1917, when a group of Jewish artists consciously studied Jewish folk art. Some of the late works of the painter Marc Chagall, such as his stained-glass windows installed at the Hadassah-Hebrew University Medical Center in Jerusalem, can be traced to this period when he worked on Jewish folk themes in the village of Vitebsk, in the Soviet Union. Twentieth-century synagogue architecture, sculpture, and ritual objects have been developed especially in the U.S., where they are characterized by formal monumentality and simplicity of decoration. (B.Ns.)

Music

History, geography, function, creators, and performers all contribute to the definition of Jewish music, a term that is most meaningful when applied to pure or stylized Hebrew musical tradition. In antiquity, when almost all Jews lived in one country, their music was largely vocal, instruments being used only for dance music and for the accompaniment of chant. Although there was non-Hebrew vocal music, most was in the Hebrew language, falling into the broad categories of religious and secular music. The religious stream included liturgical music, and, with the secular stream, it also contributed to popular music. The liturgical music of the Temple was performed by professional musicians, while synagogue music, originally performed by nonprofessionals, was influenced by both Temple liturgy and popular music.

MUSIC TRADITIONS

After the destruction of the Temple in Jerusalem (AD 70) by the Romans and the revolts against Rome (AD 135), the Jews were dispersed through North Africa and western Asia and migrated to Europe. Between AD 1 and 800, three main musical traditions emerged: the Mediterranean, or Sefardic, tradition, found at present in Spain, Italy, southern France, and the Balkan countries, northern Africa and the Near East, The Netherlands, the Caribbean, and in the former French colonies; the Ashkenazic musical tradition, its central European branch including German-speaking populations, its eastern branch encompassing Baltic and Slavic populations, both branches mingling in the Americas; and the Yemenite tradition, found in Yemen and Ethiopia. The three musical traditions and their subdivisions converge and can be heard in modern Israel.

Of the various properties of Jewish music, a few appear to be permanent and unaltered through the centuries: the preponderance of oral over written tradition; the importance of vocal rather than instrumental music; and the limitation to texts in Hebrew and its two most important derivatives, Yiddish, in the Ashkenazic orbit, and Ladino, or Judeo-Spanish, in the Spanish-Arabic. In all groups and all traditions, Hebrew chants stem from the oldest, possibly Hellenistic-Palestinian, origin. Because the earliest sources of written musical tradition come from the 12th century and are rare until the 18th century, the serious study of Jewish music must start with an examination of the problem of the continuity and authenticity of oral tradition.

Yemenite, Sefardic, and Ashkenazic traditions. Each of the three musical traditions differs from the others, so that they share only a few common elements. The Yemenite tradition is the oldest; although the Yemenites never came into contact with Christianity, they still sing tunes that have close parallels in the oldest strata of Gregorian chant. The Yemenites emigrated from Palestine during the rule of the last Hasmonean princes, and in Yemen, under later Islāmic rule, the Jews remained in strict isolation. Thus, their customs and melodies sometimes reach back into the pre-Christian epoch, from which also stem the oldest examples of Gregorian chant. The liturgical music has been preserved in a jealously guarded oral tradition.

Yemenite and ancient Christian chant

The continuity of the Sefardic tradition is better documented. Sefardic secular songs contain elements of medieval Spanish music and poetry, such as the ***Cantigas de Santa Maria,*** the ***El cantar de mío Cid,*** and the ***Ciclo de Roldán*** ("Cycle of Roland"), sung to old tunes in Ladino, which closely resembles Castilian Spanish. Many of these melodies are also used for liturgical chants.

The most recent of the traditions is that of Ashkenazic Jews. It begins in the Carolingian epoch, and it reflects best the historic transformations and the tragedies of European Jewry. Originating in northern Italy, the Ashkenazim settled in the German and French Rhineland, then branched off to Bavaria, Austria, Bohemia, and the other countries that constituted the Holy Roman Empire. After 1350, when the Jews were accused of spreading the plague and were massacred by the thousands, two or three waves of mass emigration reached Poland and Russia to the Ural Mountains and the Black Sea. Their tradition, called the east European, diverges from the central European only in those elements that originated after 1500. These show distinctly Slavic character.

Elements of musical style. There is some evidence that, in antiquity and in the Middle Ages, the various Jewish modes of chant corresponded to the expression of certain emotions, in accordance with the similar "doctrine of ethos" in ancient Greek music. Thus, laudatory prayers were differentiated from supplicatory ones by their musical modes. This approach later gave way to the belief in the harmony of the spheres and, in Ḥasidism (a pietistic movement arising in eastern Europe in the 18th century), to the doctrine of seven grades by which human chant may reach the throne of the Almighty.

After the destruction of the Second Temple, common law and oral tradition, rather than common language, linked the various groups. The differences between them are seen in elements of their chants. Their musical styles are represented in the criteria of mode versus scale; rhythm and metre; syllabic and melismatic tunes (see below); and monophonic and polyphonic music (see below). A scale is the result of the division of the octave, whereby the rising or descending steps fill the space of the octave. A mode, on the other hand, is in no way bound to an octave; it consists of a pattern of characteristic intervals. Thus, many individual melodies can be traced back to the same modal pattern. Modal patterns, such as the Dorian, Mixolydian, and others, continue to be used in Jewish tradition as well as in Christian Gregorian chant. The rhythm of the ancient chants was apparently free, although closely bound to textual accents. In the hymns that developed during the Middle Ages, melodies with regular metrical patterns also appear, although much more frequently in the Ashkenazic tradition than in the Sefardic. Most characteristic of the various rites of Jewish groups is the relationship of word and melody preferred by each group. Between the extremes of simple syllabic style (one note per syllable) and pure melismatic style (florid style with many notes per syllable), all shades and nuances occur. Thus, the east European Jews prefer a chant spiced with many melismatic passages, whereas the Yemenites use melismata only sparingly. The cantillation, or liturgical chanting, of Scripture also differs in the three main rites, although the so-called Masoretic accents, written signs regulating both cantillation and textual punctuation, are common to all groups. They date from the 9th century AD; the melodic motifs of cantillation, however, survive from antiquity. Jewish folk music does not make use of polyphony (music in several voice parts) but is monophonic (consisting of a single melodic line). In contrast, modern Israeli art music makes use of polyphony and all other techniques found in Western music. The works of 19th- and 20th-century Jewish composers do not represent Jewish music, except in compositions using traditional chants.

Word and melody

HISTORICAL DEVELOPMENT

Ancient and medieval music. The Old Testament contains many references to music. The practice of music permeates the wanderings of the Israelites through the desert, the dances of maidens, the outbursts of prophetic schools, the lyric prayers of young David, and the priestly praises in the First and Second Temples, recorded in Second Book of the Chronicles and in the book of Psalms. That most of these descriptions were exact has become apparent since the discovery of the Dead Sea Scrolls; for example, the scroll of ***The War of the Sons of Light Against the Sons of Darkness*** includes detailed description of the various trumpet signals. The accounts given by the Bible, the Jewish-Roman historian Josephus, and the Mishna (a section of the Talmud, the post-biblical legal code) stress the variety of the accompanying instruments: primitive clarinets, pipes, trumpets, lyres, harps, cymbals, hand drums, and even a rudimentary organ (or steam siren) were employed. Of these instruments, only the ritual and intentionally archaic ***shofar,*** or ram's horn, has remained for certain signals in the New Year's liturgy and the like. The ensemble must have sounded rather shrill because of the many high-pitched instruments.

Ancient instruments

Archaeological and literary evidence gives a rather clear picture of the Temple music; most of the instruments can be identified, and the unison singing of the Levites is established, as is the addition of boys' voices. But extant evidence yields no concrete idea of the Temple melodies and their nature.

The Talmudic and later rabbinic literature contains further descriptions of the Temple music, but these writings must be taken with considerable caution, for they all tend to exaggerate the number of participants and the quality of performance. In later history, only the European Jews had, by assimilation and acculturation, contact with Western music. The oldest notated documents of this musical symbiosis were written by Abdias the Proselyte (Obadya ha-Ger), an Italian monk of Norman extraction who had converted to Judaism after 1102. The three pieces notated by Abdias show resemblances both to Gregorian and to Sefardic-oriented chant, and similar phrases can be heard even today in Near Eastern synagogues.

The Ashkenazic musical tradition began in the Rhineland during the Carolingian period. Some ancient Ashkenazic psalmodies still form part of the daily morning prayers. The precentor (cantor, or ***hazzan)*** who carried the ancient, orally transmitted melodies emerged in Palestine and Babylonia in about the 7th or 8th century as an appointed official of the congregation. But his musical importance developed in Europe, where he was frequently singer, composer, and celebrant. The old Ashkenazic melodies, called Mi-Sinai tunes, especially those of the High Holidays, were composed by the cantors of the Rhineland and of southwest Germany during the period of the Crusades (1095–c. 1450). Their musical raw material blends ancient Jewish psalmodies with elements of the music of the trouvères and Minnesingers (medieval poet-composers of noble birth) and with street songs of the western German cities. There is some evidence that the transmitters from the Christian sphere were minstrels and vagrant singers.

Polyphonic compositions. During the Renaissance, the Italian Jews began to apply Western art music techniques to their synagogal music. Especially notable was Salomone Rossi, whose collection of Hebrew hymns, psalms, and other works for three to eight voices a cappella (Venice, 1622), contained a preface stating a revolutionary rabbinic decision that, in principle, allowed art music in the synagogue. Many French and Italian communities of the 17th and 18th centuries patronized minor Jewish and Gentile composers for festive cantatas. Among such works, the cantatas composed for the great Amsterdam Temple by the Sefardic composer Abraham Cáceres, with text by the Sefardic poet Moshe Hayyim Luzzatto, achieve a notable synthesis of Handel's aria style with liturgical chant. A much lower level of synthesis of operatic and traditional elements became typical for the general Ashkenazic development of cantorial songs, and by about 1820 the idiom of Haydn and Mozart had almost crowded out the traditional elements. Political emancipation and religious literalization saved the historical tradition of Ashkenazic music. The rejuvenator of this tradition was Salomon Sulzer, the chief cantor of Vienna. A friend of Schubert, and famous as a singer, organizer, and student of tradition, Sulzer set the example of style and performance for many European synagogues. His *Shir Zion* ("Song of Zion"; 1840, 1866) preserves traditional music, while making it accessible to organ accompaniment. The use of the organ became a controversy between the liberal and orthodox communities. Where the organ did not prevail, synagogue chant regressed to a rhapsodic popular style that has remained stagnant; where it did prevail, as in most Western and American communities, synagogue music began to rank with fine Protestant and Catholic church music. This was particularly evident in the United States, where, with the emerging Reform movement, the scientific study of Jewish musical traditions continued. Active 20th-century composers drawing on Jewish musical traditions include Abraham Binder, Leonard Bernstein, Lazar Weiner, Jacob Weinberg, Lazare Saminsky, Herbert Fromm, Isadore Treed, and Heinrich Schalit. The serious musical scholarship was initiated by the Hebrew Union College in Cincinnati and New York City.

Contributions of Salomon Sulzer

Israeli music

The rise of Jewish music had decidedly secular roots in Israel, to which the various waves of immigrants brought Yiddish and Ladino songs with them. But, from about 1910, immigrants also created working, dancing, and fighting songs in Hebrew. In the older dancing songs, some Hasidic elements are still noticeable, but they begin to vanish under the massive impact of Jewish immigrants from Arabic-speaking countries. Fine standards of European art music were set by Leo Kestenberg, an Israeli pianist and educator, in his work in musical education. The musicological departments of the universities of Jerusalem and Tel Aviv-Yafo have furthered the study of Jewish music, while the two music academies of these cities have specialized in the mass production of performing musicians. Meanwhile, there has emerged a generation of Israeli composers, among them Joseph Tal, Ödön Partos, Erich Walter Sternberg, and Paul Ben-Haim. The strongest stylistic trend blends the local colours of Israel with traditional elements of Jewish music within a Western framework that maintains close contact with European and American art music.

Research in Jewish music. The serious exploration of traditional Jewish music emerged about 1900. The first scientific studies were made by Eduard Birnbaum, a disciple of Sulzer. Abraham Zevi Idelsohn was the first to record thousands of songs in Palestine, between 1909 and 1920. His transcriptions are collected in the *Thesaurus of Hebrew Oriental Melodies* (10 vol., 1914–32). Curt Sachs, Eric Werner, and others who followed, specialized in historical or comparative studies. Jewish Philosophy

The term Jewish philosophy refers to various kinds of reflective thought engaged in by persons identified as being Jews, in one sense or another. At times, as in the Middle Ages, this meant any methodical and disciplined thought, whether on general philosophical subjects or on specifically Judaic themes, pursued by Jews. In other eras, as in modern times, concentration on the latter has been considered a decisive criterion, so that philosophers who are Jewish but unconcerned with Judaism or the Jewish heritage and destiny in their thought are not ordinarily classified as Jewish philosophers.

PRE-HELLENISTIC AND HELLENISTIC THOUGHT

The concept of Wisdom

Bible and Apocrypha. Philosophy arose in Judaism under Greek influence; however, a kind of philosophical approach may be discerned in early Jewish religious works apparently subject to little or no Greek influence. The books of Job and Qohelet (Ecclesiastes) were favourite works of medieval philosophers, who took them as philosophical discussions untinged by theological preconceptions. The book of Proverbs introduces, in an apparently theological context, the concept of Wisdom (Hokhma), which was to have a primordial significance for Jewish philosophical and theological thought, and presents it as the first and favourite of God's creations. It is also praised in the book of the Wisdom of Jesus the Son of Sirach (Ecclesiasticus) as instilled by God into all his works and granted in abundance to those he loves. It is sometimes equated with fearing God and keeping the Law; however, in other passages piety seems to be regarded as superior to Wisdom. The Wisdom of Solomon, probably originally written in Greek, praises Wisdom, which is held to be an image of God's goodness and a reflection of the eternal light. God is said to have given the author knowledge of the composition of the world, of the powers, the elements, the nature of animals, the divisions of time, and the positions of the stars. In its vocabulary and perhaps in some of its doctrines, the work shows the influence of Greek philosophical conceptions. It has had considerable influence on Christian theology.

Philo Judaeus. The first systematic attempt to apply Greek philosophical concepts to Jewish doctrines was made by Philo Judaeus (Philo of Alexandria) in the 1st century CE (Common Era, which corresponds to AD). Philo, a scholar who combined Greek and Jewish learning, was influenced by Platonic and Stoic writings, and probably also by certain postbiblical Jewish beliefs and speculations. He apparently had some knowledge of the Oral Law, which was being evolved in his time, and he also knew of the Essenes, a contemporary rigorous sect, whom he praised highly.

The concept of Logos

Philo's main contribution was interpretative. He provided Jewish conceptions with the hallmark of intellectual and cultural respectability by stating them in Greek philosophical terms; he also showed that many Greek notions were consonant with Jewish doctrine, as he conceived it, and with the allegorical sense of biblical texts, as he read them. He had two schemes of reference—Jewish religious tradition and Greek philosophy—and the fact that he took care to stress the primacy of the former may have been more than mere lip service. It may be argued with some plausibility that in central points of his thought, such as his conception of the Logos (the divine Reason or Word), Philo used philosophical notions as trappings for an originally religious belief. A main function of the Logos in his thought is to serve as an intermediary between the transcendent, unknowable God and the world, a view that probably has a close connection with the view of his Jewish contemporaries concerning the world of God, by means of which he accomplishes his designs. On basic philosophical or theological problems, such as the creation of the world or the freedom of will, Philo's writings provide either vague or contradictory answers. He placed mystic ecstasy, of which he may have had personal experience, above philosophical and theological speculations.

Philo's approach, his method of interpretation, and his way of thinking, as well as some of his conceptions—primarily that of the Logos—exerted a considerable influence on early Christian thought but not, to any comparable extent, upon Jewish thought in that period. Later, in the Middle Ages, knowledge of Philo among Jews was either very slight or nonexistent. Not until modern times was his role in Jewish religious thought recognized.

Other ancient sources. Some traces of a knowledge of popular, mainly Stoic philosophy may be found in the Mishna, a codification of the Oral Law composed in Palestine in the 2nd century CE, and in the subsequent Talmudic literature set down in writing in Palestine and Babylonia. On the whole these traces are rather slight. Some scholars believe that the influence of Greek philosophy on Palestinian Jewry was far-reaching, but the case, to say the least, is not proven. Jewish theological and cosmological speculations occur in the Midrashim (plural of Midrash,), which, under the guise of interpreting biblical verses, propound allegorical interpretations, legends, and myths, and in the ***Sefer yetzira*** ("Book of Creation"), a work that is a combination of a cosmogony and a grammar and that was fictitiously attributed to Abraham. There is no clear evidence of the period in which it was written; both the 3rd century and the 6th or 7th century have been suggested. The book became a key work in later Jewish mysticism.

MEDIEVAL PHILOSOPHY

Islāmic background

In the 9th and 10th centuries, after a long hiatus, systematic philosophy and ideology reappeared among Jews, a phenomenon indicative of their accession to Islāmic civilization. The evolution of Islam in the 9th and 10th centuries showed that Greek scientific and philosophic lore could be separated, at least to some extent, from its pagan associations and could be transformed into another language and another culture; it also tended to show that a culture in which the sciences and philosophy or the sciences and theology or both of these combinations were an indispensable part could be based upon a monotheistic prophetic religion that in all relevant essentials, including adherence to a basic religious law, was closely akin to Judaism. The question of whether philosophy is compatible with religious law (the answer being sometimes negative) constituted the main theme of the foremost medieval Jewish thinkers. From approximately the 9th to the 13th centuries Jewish philosophical and theological thought participated in the evolution of Islamic philosophy and theology and manifested only in a limited sense a specifically Jewish character. Jewish philosophers showed no particular preference for philosophic texts written by Jewish authors over those composed by Muslims, and in many cases the significant works of Jewish thinkers constitute a reply or a reaction to the ideas of Islāmic philosophic and scientific writings.

Jewish kalām. Although several Jewish intellectuals in 9th–10th-century Babylonia were steeped in Greek philosophy, the most productive and influential Jewish thinkers of this period represented a very different tendency, that of the Mu'tazilite *kaldm*. *Kalām* (literally, "speech") is an Arabic term used both in Islāmic and in Jewish vocabulary to designate several theological schools that were ostensibly opposed to Greek, particularly Aristotelian, philosophy. The Aristotelians, both Islāmic and Jewish, regarded *kalām* theologians (called the Mutukallimiin) with a certain contempt, holding them to be mere apologists, watchdogs of religion, and indifferent to truth. Herein they did not do justice to their adversaries, for many representatives of the Mu'tazilite school of *kaldm*, formed in the 8th century, displayed a genuine speculative impulse. Its theology, forged in disputes with Zoroastrians, Manichaeans, and Christians, claimed to be based on reason.

Sa'adia ben Joseph. This belief in reason, as well as some of the tenets of Mu'tazilite theology, were taken over by Sa'adia ben Joseph, who was also influenced, either directly or through the intermediary of an Arabic philosopher, by the arguments of a Christian 6th-century philosopher, John Philoponus, against certain Aristotelian and Neoplatonic positions. Sa'adia's main theological work, *Kitdb al-amānāt wa al-iʿtiqādāt (Beliefs and Opinions),* is modelled on similar Mu'tazilite treatises and on a Mu'tazilite classification of theological subject matter known as the Five Principles. Like many Muʿtazilite authors, Sa'adia starts out by setting forth in his introduction a list and theory of the various sources of knowledge.

Sa'adia's four sources of knowledge

Sa'adia distinguished four sources: (1) the five senses, (2) the intellect, or reason, (3) necessary inferences, and (4) reliable information given by trustworthy persons. In Sa'adia's sense of the word, intellect, or reason (*al-ʿaql*), means first and foremost an immediate, a priori cognition, independent of sense experience. In *Beliefs and Opinions* the intellect is characterized as having immediate ethical cognitions—that is, as discerning what is good and what is evil—in opposition to the medieval Aristotelians, who did not regard even the most general ethical rules as a priori cognitions. The third source of knowledge comprises inferences of the type "if there is smoke, there is fire," which are based on data furnished by the first two sources of knowledge. The fourth source of knowledge is meant to validate the teachings of Scripture and of the religious tradition. Teachings of Scripture must be held true because of the trustworthiness of the men who propounded them. One of the main purposes of the work is to show that the knowledge deriving from the fourth source concords with that discovered by means of the other three, or, in other words, that religion and human reason agree.

Sa'adia opposed Aristotle's view that the natural order was eternal. He held, with other partisans of the Mu'tazilite *kaldm*, that the demonstration of the temporal creation of the world must precede and pave the way for the proof of the existence of God the Creator. Given the demonstrated truth that the world has a beginning in time, it can be proved that it could have been produced only through the action of a creator. It can further be proved that there can have been only one Creator.

Divine justice and human ethical judgment

The theology of Sa'adia, like that of the Mu'tazilites, hinges on two principles: the unity of God and the principle of justice. The latter principle takes issue with the view (widespread in Islām and present also in Judaism) that the definition of what is just and what is good depends solely on God's will, to which none of the moral criteria found among men is applicable; according to this view, a revelation from God can convert an action now generally recognized as evil into a good action. Against this way of thinking, Sa'adia and the Mu'tazilites believed that being good and just or evil and unjust are intrinsic characteristics of human actions and cannot be changed by divine decree. The notions of justice and of good, as conceived by man, are binding on God himself. Since, according to Sa'adia, man has a priori knowledge of good and evil, just and unjust, the fact that human ethical judgments are valid for God means that man's ethical cognitions are also those of the Deity.

The function of religious law—of central importance in traditional Judaism and Islām—is to impose on man the accomplishment of good actions and to prohibit bad ones. Because Sa'adia believed that man has a priori knowledge of good and evil and that this knowledge coincides with the principles underlying the most important portions of the revealed law, he was forced to ask the question whether this law is not superfluous. He could, however, point out that, whereas the human intellect recognizes that certain actions—for instance, murder or theft—are evil, it cannot by itself discover the best possible definition of what constitutes a particular transgression, nor can it, on its own, determine the punishment appropriate for a transgression. On both points. Sa'adia asserted, the commandments of religious law give the best possible answers.

The commandments that accord with the behests of the human intellect were designated by Sa'adia as the intellectual, or rational, commandments. According to him, they include the duty of manifesting gratitude to the Creator for the benefits he has bestowed upon man. Sa'adia recognized that a considerable number of commandments—for instance, those dealing with the prohibition of work on the sabbath—do not belong to this category. He held, however, that the obligation to obey them may be derived from the rational commandment that makes it incumbent upon man to be grateful to God, for such gratitude entails obedience to his orders.

The Karaites. Sa'adia's adoption of the rational Mu'tazilite theology was a part of his overall activity, directed toward the consolidation of rabbinical Judaism (based on the Mishna and Talmud), which was being attacked by the Karaites. This Jewish sect, founded by Anan ben David in the 8th century, rejected the authority of the Oral Law—that is, of the Mishna and the Talmud. In the 10th century and afterward, the Karaites accepted as their guides the Bible (Old Testament) and human reason, in the Mu'tazilite sense of the word. Their professed freedom from any involvement with postbiblical Jewish religious tradition facilitated a rational approach to theological doctrine. This approach led the Karaite authors to criticize their opponents, the adherents of rabbinical Judaism, for holding anthropomorphic beliefs based, in part, on texts of the Talmudic period. Karaite authors propounded, in conceptual terms, a theology of Jewish history in exile ***(galut).*** Life in exile is a diminished existence; nevertheless, the good or bad actions of the Jewish people (rather than their material strength or weakness) affect the course of history. Redemption may come when all Jews are converted to Karaism.

Karaite rationalism and atomism

The Karaites adopted, wholesale, Mu'tazilite *kalām*, including its atomism. The Mu'tazilite atomists held that everything that exists consists of minute, discrete parts. This applies not only to bodies but also to space, to time, to motion, and to the "accidents"—that is, qualities, such as colour—which the Islāmic and Jewish atomists regarded as being joined to the corporeal atoms (but not determined by them, as had been believed by the Greek Atomists). An instant of time or a unit of motion does not continue the preceding instant or unit. All apparent processes are discontinuous, and there is causal connection between their successive units of change. The fact that cotton put into fire generally burns does not mean that fire is a cause of burning; rather, it may be explained as a "habit," signifying that this sequence of what is often wrongly held to be cause and effect has no character of necessity. God's free will is the only agent of everything that occurs, with the exception of one category—human actions. These are causes that produce effects; for instance, a man who throws a stone at another man, who is then killed, directly brings about the latter's death. This inconsistency on the part of the theologians was necessitated by the principle of justice, for it would be unjust to punish a man for a murder that was a result not of his action but of God's.

This grudging admission that causality exists in certain strictly defined and circumscribed cases was occasioned by moral, not physical, considerations.

Jewish Neoplatonism. ***Isaac Israeli.*** Outside Babylonia, philosophical studies were pursued by Jews in the 9th and 10th centuries in Egypt and in the Maghrib (northwest Africa). The outstanding figure was Isaac ben Solomon Israeli, an Egyptian-born North African who has been called "the first Jewish Neoplatonist." In his philosophical works, such as the "Book of Elements" and the "Book of Five Substances," he drew largely upon a 9th-century Muslim popularizer of Greek philosophy, Abii Yiisuf Yaʿqūb al-Kindi, and also, in all probability, upon a lost pseudo-Aristotelian text. The peculiar form of Neoplatonic doctrine that seems to have been set forth in this text had, directly and indirectly, a considerable influence on medieval Jewish philosophy.

According to Israeli, God creates through his will and power. The two things that were created first were form, identified with wisdom, and matter, which is designated as the genus of genera (the classes of things) and which is the substratum of everything, not only of bodies, but also of incorporeal substances. This conception of matter seems to derive from the Greek Neoplatonists Plotinus and Proclus, particularly from the latter. In Proclus' opinion generality was one of the main criteria for determining the ontological priority of an entity (relative place in the levels of reality). Matter, because of its indeterminacy, obviously has a high degree of generality; consequently, it figures among the entities having ontological priority. According to the Neoplatonic view, which Israeli seems to have adopted, the conjunction of matter and form gives rise to the intellect. A light sent forth from the intellect produces the rational soul, and in its turn it gives rise to the vegetative soul.

Israeli's doctrine of prophecy seems to be the earliest Jewish philosophical theory attributing prophecy to the influence of the intellect on the imaginative faculty. According to Israeli, this faculty receives from the intellect spiritual forms that are intermediate between corporeality and spirituality. This explanation implies that these forms, "with which the prophets armed themselves," are inferior to purely intellectual cognitions.

Solomon ibn Gabirol. In essentials the schema of creation and emanation propounded by Isaac Israeli and his Neoplatonic source or sources was taken over by Solomon ibn Gabirol, a celebrated 11th-century Hebrew liturgical poet, who seems to have been the earliest Jewish philosopher of Spain. His chief philosophical work, "Fountain of Life," written in Arabic, has been preserved in full only in a 12th-century Latin translation entitled ***Fons vitae.*** This work, which makes no reference to Judaism or to specifically Jewish doctrines, is a didactic dialogue between a disciple and a master who teaches him true philosophical knowledge. Despite its prolixity and many contradictions, it is an impressive work. Few medieval texts so effectively communicate the Neoplatonic conception of the existence of a number of planes of being that differ according to their ontological priority, the derivative and inferior ones constituting a reflection in a grosser mode of existence of those that are prior and superior.

Ibn Gabirol's doctrine of divine will

A central conception in Ibn Gabirol's philosophy is concerned with the divine will, which appears to be both part of and separate from the divine essence. Infinite according to its essence, the will is finite in its action. It is described as pervading everything that exists and as being the intermediary between the divine essence and matter and form. Will was one of a number of traditional appellations applied in various medieval theologies to the entity intermediate between the transcendent Deity and the world or to the aspect of the Deity involved in creation. According to a statement in ***Fons vitae,*** matter derives from the divine essence, whereas form derives from the divine will. This suggests that the difference between matter and form has some counterpart in the Godhead and also that universal matter is superior to universal form. Some of Ibn Gabirol's statements seem to bear out the impression of superiority of universal matter; other passages, however, appear to imply a superiority of universal form.

Form and matter, whether they be universal or particular, exist only in conjunction. All things, with the sole exception of God, are constituted through the union of the two, the intellect no less than the corporeal substance. In fact, the intellect is the first being in which universal matter and form are conjoined. The intellect contains and encompasses all things. It is through the grasp of the various planes of being, through ascending in knowledge to the world of the intellect and apprehending what is above it—the divine will and the world of the Deity—that man may "escape death and reach "the source of life."

Judah ha-Levi. Judah ben Samuel ha-Levi (c. 1075–c. 1141), also from Spain and a celebrated Hebrew poet, was the first medieval Jewish thinker who consciously and consistently based his thought upon arguments drawn from Jewish history. His views are set forth in an Arabic dialogue, ***al-Hazari*** (Hebrew ***Sefer ha-Kuzari),*** the full title of which is translated as "The Book of Proof and Argument in Defense of the Despised Faith." This work is usually called ***Kuzari, i.e.,*** "the Khazar."

The ***Kuzari***

Basing his narrative on the historical fact that the Khazars (a Turkic-speaking people in Central Eurasia) were converted to Judaism (c. 740), ha-Levi relates that their King, a pious man who did not belong to any of the great monotheistic religions, dreamed of an angel, who said to him, "Your intentions are pleasing to the Creator, but your works are not." To find the correct way of pleasing God, the King seeks the guidance of a philosopher, a Christian, a Muslim, then, finally, after hesitating to have recourse to a representative of a people degraded by its historical misfortune, of a Jewish scholar who converts him to Judaism. The words of the angel heard in a dream may, in accordance with both religious and philosophical doctrine, be regarded as a kind of revelation. The use of this element of the story enabled ha-Levi to suggest that it is not the spontaneous activity of human reason that impels man to undertake the quest for the true religion; for this, one needs the gift of prophecy, or, at least, a touch of the prophetic faculty (or a knowledge of the revelations of the past).

The argument of the philosopher whose advice is sought by the King brings this point home. This disquisition is a brilliant piece of writing, for it lays bare the essential differences between the Aristotelian God, who is totally ignorant of and consequently wholly indifferent to human individuals, and the God of religion. Within the framework of philosophical doctrine, the angel's words are quite meaningless. Not only is the God of the philosophers, who is a pure intellect, not concerned with man's works, but the (cultural) activities, involving both mind and body, to which the angel clearly referred, cannot, from the philosophical point of view, either help or hinder man in the pursuance of the philosophers' supreme goal—the attainment of union with the active intellect, a "light" of the divine nature. This union was supposed to confer knowledge of all intelligible things. Thus, man's supreme goal was here held to be of a purely intellectual nature.

In opposition to the philosopher's faith, the religion of ha-Levi's Jewish scholar is based upon the fact that God may have a close, direct relationship with man, who is not conceived primarily as a being endowed with intellect. The postulate that God can have intercourse with a creature made of the disgusting materials that go into the composition of the human body is scandalous to the King and prevents his acceptance of the doctrine concerning prophecy, expounded by the Muslim sage (just as the extraordinary nature of the Christological dogmas deters him from adopting Christianity).

Knowledge of God through the contemplation of Jewish history

The Jewish scholar's position is that it is contemplation not of the cosmos but of Jewish history that procures knowledge of God. Ha-Levi was aware of the odium attaching to the doctrine of the superiority of one particular nation; he held, however, that only this doctrine explains God's dealing with mankind, which, like many other things, reason is unable to grasp. The controversies of the philosophers serve as proof of the failure of human intelligence to find valid solutions to the most important problems.

Ha-Levi's dialogue was also directed against the Karaites. He shows the necessity and celebrates the efficacy of a blind, unquestioning adhesion to tradition, which the Karaites rejected. Yet, he expounds a theology of Jewish exile that seems to have been influenced by Karaite doctrine. According to ha-Levi, even in exile the course of Jewish history is not determined like that of other nations by natural causes, such as material strength or weakness; the decisive factors are the religious observance or disobedience of the Jews. The advent of Christianity and of Islām prepares the other nations for conversion to Judaism, an event that will occur in the eschatological period (at the end of history).

Other Jewish thinkers c. 1050–c. 1150. During the period comprising the second half of the 11th century and the first half of the 12th century, many other Jewish thinkers appeared in Spain. Bahya ben Joseph ibn Pakuda wrote one of the most popular books of Jewish spiritual literature, *Kitāb al-hidāyah ilā farā'iḍ al-qulūb* ("Guidance to the Duties of the Heart"), which combines a theology influenced by Sa'adia with a moderate mysticism inspired by the teachings of the Muslim Siifis (mystics). The commandments of the heart—that is, those relating to men's thoughts and sentiments—are contrasted with the commandments of the limbs—that is, the Mosaic commandments enjoining or prohibiting certain actions. Bahya maintained that both sets of commandments should be observed (thus rejecting the antinomian position), but made clear that first and foremost he was interested in the commandments of the heart.

Abraham bar Hiyya, an outstanding mathematician, an astrologer, and a philosopher, outlined in *Megillat* ha-Megalle ("Scroll of the Revealer") a view of Jewish history that is rather reminiscent of ha-Levi but does not emphasize to the same degree the uniqueness of that history; it is also set forth in much less impressive fashion. Living in Barcelona under Christian rule, Bar Hiyya wrote his scientific and philosophical treatises not in Arabic but in Hebrew. Hebrew was also used by Abraham ibn Ezra (died *c.* 1167), a native of Spain who travelled extensively in Christian Europe. His commentaries on the Bible contributed to the diffusion among the Jews of Greek philosophical thought, to which Ibn Ezra made many, although as a rule disjointed, references. His astrological doctrine had a significant influence on some philosophers.

A borderline case: Abii al-Barakiit

The last outstanding Jewish philosopher of the Islāmic East, Abii al-Barakāt al-Baghdādī (who died as a very old man sometime after 1164), also belongs to this period. As a borderline case he illustrates a certain indeterminacy in the definition of a Jewish thinker. An inhabitant of Iraq, he was converted to Islām in his old age (for reasons of expediency, according to his biographers). His philosophy appears to have had a strong impact on Islāmic thought, whereas its influence upon Jewish philosophy and theology is very hard to pin down and may be practically nonexistent. His chief philosophical work, *Kitāb al-Muʿtabar* ("The Book of That Which Has Been Established by Personal Reflection"), has very few references to Jewish texts or topics. Abū al-Barakiit rejects Aristotelian physics completely; according to him, time is the measure of being, and not, as Aristotle taught, the measure of motion, and he replaces Aristotle's bidimensional concept of place with the tridimensional notion of space, the existence of which is independent of the existence of bodies.

Jewish Aristotelianism. With regard to the adoption of Aristotelianism, including systems that in many essentials stem from but also profoundly modify the pure Aristotelian doctrine, there is a considerable time lag between the Islāmic East, on the one hand, and Muslim Spain and the Maghrib, on the other.

Abraham ibn Dd'iid. Abraham ibn Dā'ūd (12th century), who is regarded as the first Jewish Aristotelian of Spain, was primarily a disciple of Avicenna, the great 11th-century Islāmic philosopher. According to a not unlikely hypothesis, he may have translated or helped to translate some of Avicenna's works into Latin, for Ibn Dā'ūd lived under Christian rule in Toledo, a town that in the 12th century was a centre for translators. His historical treatises, written in Hebrew, manifest his desire to familiarize his coreligionists with the historical tradition of the Latin world, which at that time was alien to most of them. But his philosophical work, Sefer *ha-emuna ha-rama* ("Book of Sublime Faith"), written in 1161 in Arabic, shows few, if any, signs of Christian influence.

The doctrine of emanation, set forth in the "Book of Sublime Religion," describes in the manner of Avicenna the procession of the ten incorporeal intellects, the first of which derives from God. This intellect produces the second intellect, and so on. Ibn-Dā'ūd questioned in a fairly explicit manner Avicenna's views on the way the second intellect is produced; his discipleship did not by any means spell total adherence. Ibn-Dā'ūd's psychology was also, and more distinctively, derived from Avicenna. The argumentation leading to a proof that the rational faculty is not corporeal attempts to derive the nature of the soul from the fact of immediate self-awareness. Like Avicenna, Ibn-Dii'iid tended to found psychology on a theory of consciousness.

Ibn-Dā'ūd often referred to the accord that, in his view, existed between philosophy and religious tradition. As he remarked, the "Book of Sublime Faith" was not meant to be read either by readers who, in their simplicity, are satisfied with what they know of religious tradition or by those who have a thorough knowledge of philosophy. It was intended for readers of one type only, those who, being, on the one hand, acquainted with the religious tradition and having, on the other, some rudiments of philosophy, are "perplexed." It was for the same kind of people that Maimonides wrote his Guide of the Perplexed.

The greatest medieval Jewish philosopher

Maimonides. Maimonides (Moses ben Maimon, 1135–1204), a native of Spain, is incontestably the greatest name in Jewish medieval philosophy, but his reputation is not derived from any outstanding originality in philosophical thought. Rather, the distinction of Maimonides, who is also the most eminent codifier of Jewish religious law, is to be found in the vast scope of his attempt, in the *Dalālat al-ḥā'irīn* (Guide of the Perplexed), to safeguard both religious law and philosophy (the public communication of which would be destructive of the law) without suppressing the issues between them and without trying to impose, on the theoretical plane, a final, universally binding solution of the conflict.

As Maimonides made clear in his introduction to the Guide, he regarded his self-imposed task as perilous, and he therefore had recourse to a whole system of precautions destined to conceal his true meaning from the people who, lacking the necessary qualifications, might misread the book and abandon observance of the law. According to Maimonides' explicit statement, these precautions include deliberately contradictory statements meant to mislead the undiscerning reader. The apparent or real contradictions that may be encountered in the Guide are perhaps most flagrant in Maimonides' doctrine concerning God. There seems to be no plausible hypothesis capable of explaining away the differences between the following three views:

1. God has an eternal will that is not bound by natural laws. Through an act of his will, he created the world in time and imposed on it the order of nature. This creation is the greatest of miracles; only if it is admitted can other miracles, which interfere with the causally determined concatenations of events, be regarded as possible. The philosophers' God, who is not free to cut the wings of a fly, is to be rejected. This conception is in keeping with the traditional religious view of God and is avowedly adopted by Maimonides because failure to do so would undermine religion.

2. Man is incapable of having any positive knowledge concerning God. No positive attributes—*e.g.*, wisdom or life—can be ascribed to God. Contrary to the attributes predicated of created beings, the divine attributes are strictly negative; they state what God is not: for instance,

he is not not-wise, and such a statement is not a positive assertion. Hence, only a negative theology is possible—saying what God is not. The way God acts can, however, be known. This knowledge is to be found in natural science.

3. God is an intellect. The formula current among medieval philosophers that maintains that in God the knowing subject, the object known, and the act of intellectual knowledge are identical derives from Aristotle's thesis that God knows only himself. Maimonides, however, in adopting the formula, interpreted it in the light of human psychology and epistemology (theory of knowledge), pointing out that, according to a theory of Aristotle, the act of human (not only of divine) cognition brings about an identity of the cognizing subject and cognized object. The parallel drawn by Maimonides between the human and the divine intellect quite evidently implies a certain similarity between the two; in other words, it is incompatible with the negative theology of other passages of the *Guide*. Nor can it be reconciled with his theological doctrine that the structure of the world—created in time—came into being through the action of God's will.

Maimonides' doctrine of prophecy

The enigma of the *Guide* would be nonexistent if Maimonides could be held to have believed that truth can be discovered in a suprarational way, through revelations vouchsafed to the prophets. This, however, is not the case. Maimonides held that the prophets (with the exception of Moses) combine great intellectual abilities, which qualify them to be philosophers, with a powerful imagination. The intellectual faculty of the philosophers and the prophets receives an overflow from the active intellect. In the case of the prophets, this overflow not only brings about intellectual activity but also passes over into the imaginative faculty, giving rise to visions and dreams. The fact that prophets have a strong imagination gives them no superiority in knowledge over philosophers, who do not have it. Moses, who belonged to a higher category than did the other prophets, did not have recourse to imagination.

The laws and religion as instituted by Moses are intended not only to ensure the bodily welfare and safety of the members of the community but also to facilitate the attainment of intellectual truths by individuals gifted enough to uncover the various hints embodied in religious laws and practices. This does not mean that all the beliefs inculcated by Judaism are true. Some indeed express philosophical truths, although in an inaccurate way, in a language suited to the intellectual capacity of the common people, who in general cannot grasp the import of the dogmas they are required to profess. Other beliefs, however, are false but necessary for the preservation of a public order upholding justice—*e.g.*, the belief that God is angry with wrongdoers.

As far as the Law—that is, the religious commandments—is concerned, two aspects of Maimonides' position may be distinguished. First, he maintained that it is unique in its excellence and valid for all time. This profession of faith, at least with regard to its assumptions about the future, lacked philosophical justification; however, it could be regarded as necessary for the survival of Judaism. Second, he asserted that certain precepts of the Mosaic Law were related to specific historical situations and the need to avoid too sharp a break with popular customs and practices, for instance, the commandments concerning sacrifice.

Influence of the *Guide of the Perplexed*

For at least four or five centuries the *Guide of the Perplexed* exercised a very strong influence in the European centres of Jewish thought; in the 13th century, when the *Guide* was twice translated into Hebrew, these centres were Spain, the south of France, and Italy. Rather paradoxically, in view of the unsystematic character of Maimonides' exposition, it was used as a standard textbook of philosophy and condemned as such when the teaching of philosophy came under attack. The performance of this function by the *Guide* was rendered possible, or at least facilitated by, the fact that from the 13th century onward the history of Jewish philosophy in European countries acquired a continuity it had never had before. This development seems to have resulted from the substitution of Hebrew for Arabic as the language of philosophical exposition. Because of the existence of a common and relatively homogeneous philosophical background—the Hebrew texts were much less numerous and less diverse than Arabic philosophical works—and the fact that Jewish philosophers reading and writing in Hebrew read the works of their contemporaries and immediate predecessors, something like a dialogue can be discerned. In striking contrast to the immediately preceding period, European Jewish philosophers in the 13th century and after frequently devoted a very considerable part of their treatises to discussions of the opinions of other Jewish philosophers. That many of the Jewish philosophers in question wrote commentaries on the *Guide* undoubtedly furthered this tendency.

Influence of Averroës and Christian Scholastics on medieval Jewish philosophy

Averroists. The influence of Maimonides' great Islāmic contemporary Averroes, many of whose commentaries and treatises were translated into Hebrew, was second only to that of Maimonides on Jewish intellectual development. Indeed, it may be argued that for philosophers, as distinct from the general reading public, it often came first. In certain cases commentators on the *Guide* tend, in spite of the frequent divergences between the two philosophers, to quote Averroes' opinions in order to clarify those of Maimonides.

The apparently significant influence of Christian Scholastic thought on Jewish philosophy was often not openly acknowledged by Jewish thinkers in the period beginning with the 13th century. Samuel ibn Tibbon, one of the translators of the *Guide* into Hebrew and a philosopher in his own right, remarked on the fact that the philosophical sciences were more widely known among Christians than among Muslims. Somewhat later, at the end of the 13th century and after, Jewish scholars in Italy translated into Hebrew varied texts of Thomas Aquinas and other Christian Scholastics; not infrequently, some of them acknowledged the debt they owed their Christian masters. In Spain and in the south of France, a different convention seems to have prevailed up to the second half of the 15th century. Whereas Jewish philosophers of these countries felt no reluctance about referring to Greek, Arabic, and other Jewish philosophers, as a rule they refrained from citing Christian thinkers whose views had, in all probability, influenced them. In the case of certain Jewish thinkers, this absence of reference to the Christian Scholastics served to disguise the fact that in many essentials they were representative of the philosophical trends, such as Latin Averroism, that were current among the Christian Scholastics of their time.

Quite evident is the resemblance between certain views professed by the Latin Averroists and the parallel opinions of Isaac Albalag, a Jewish philosopher who lived in the second half of the 13th century, probably in Catalonia, Spain, and who wrote a commentary in Hebrew on the *Tahāfut al-falāsifah* ("The Inconsistencies of the Philosophers"), an exposition of Avicenna's doctrine written by the Muslim philosopher al-Ghazālī. Albalag's assertion that both the teachings of the Bible and the truths demonstrated by reason must be believed even if they are contradictory clearly poses the question whether some historical connections exist between this view and the Latin Averroist doctrine that there are two sets of truths—the religious and the philosophical—and that these are not necessarily in accord. In most other points Albalag was a follower of the system of Averroës himself. This philosophical position may be exemplified by his rejection of the view that the world was created in time. He professed, it is true, to believe in what he called "absolute creation in time." This expression, however, merely signifies that at any given moment the continued existence of the world depends on God's existence, an opinion that is essentially in harmony with Averroes.

Joseph Caspi, a prolific 14th-century philosopher and exegetical commentator, maintained a somewhat unsystematic philosophical position that seems to have been influenced by Averroes. He expressed the opinion that knowledge of the future, including that possessed by God himself, is of a probabilistic nature. The prescience of the prophets is of the same nature. It is more than likely that Caspi's interest in this problem had some connection with the debate about future contingencies in which Christian Scholastics were engaged at that time.

Moses Narboni

Moses of Narbonne, or Moses Narboni, who lived in the south of France in the 14th century, was, like many other Jewish writers of this period, mainly a writer of commentaries. He wrote commentaries on biblical books, on treatises of Averroes, and on Maimonides' *Guide*. In his commentary on the *Guide,* Narboni often interprets the earlier Jewish philosopher's opinions by recourse to Averroes' views. Narboni also expounded and gave radical interpretations to certain conceptions that he understood as implied in the *Guide*. According to Narboni, God participates in all things, because he is the measure of all substances. God's existence appears to be bound up with that of the world, to which he has a relation analogous to that existing between a soul and its body (a comparison already made in the *Guide).*

Gersonides. Gersonides (Levi ben Gerson), another 14th-century Jewish philosopher born in the south of France, wrote the systematic philosophical work *Milḥamot Adonai* ("The Wars of the Lord") as well as many philosophical commentaries. Gersonides apparently never explicitly mentioned Christian Scholastic philosophers; he cited Greek, Arabic, and Jewish thinkers only, and in many ways his system appears to have stemmed from the doctrines of Maimonides or Averroes, regardless of whether he agreed with them or not. For example, he explicitly rejected Maimonides' doctrine of negative theology. A comparison of his opinions and of the particular problems that engaged his attention, with the views and debates found in Scholastic writings of his period, however, suggests that he was also influenced by the Latins on certain points.

Gersonides disagreed both with the Aristotelian philosophers who maintained the eternity of the world and with the religious partisans who believed in the creation of the world in time out of nothing. He maintained that God created the world in time out of a pre-existent body lacking all form. As conceived by Gersonides, this body seems to be similar to primal matter.

The problem of human freedom of action and a particular version of the problem of God's knowledge of future contingencies form an important part of Gersonides' doctrine. Gersonides, who, unlike the great Jewish and Muslim Aristotelians, believed in astrology, held that all happenings in the world except human actions are governed by a strict determinism. God's knowledge does not extend to individual human acts but embraces the general order of things; it grasps the laws of universal determinism but is incapable of apprehending events resulting from man's freedom. Thus, the object of God's knowledge is an ideal world order, which differs from the real world insofar as the latter is in some measure formed according to man's free will.

In political and social doctrine there is a fundamental difference between Maimonides and Gersonides. Gersonides does not appear to have assigned to the prophets any political function; according to him, their role consists in the prediction of future events. The providence exercised by the heavenly bodies ensures the existence in a given political society of men having an aptitude for and exercising the handicrafts and professions necessary for the survival of the community. He remarked that in this way the various human activities are distributed in a manner superior to that outlined in Plato's *Republic*. Thus, he rejected explicitly Plato's political philosophy, which, having been adapted to a society ruled through the laws promulgated by a prophet (Muhammad), had been an important element of Jewish philosophy in the Arabic period.

Hasdai Crescas. Hasdai ben Abraham Crescas (1340–1410), a Spanish-Jewish thinker, like Gersonides had thorough knowledge of Jewish philosophy and partial knowledge of Islāmic philosophy, and both seem to have been influenced by Christian Scholastic thought; moreover, in certain important respects Crescas was influenced by Gersonides himself. In Crescas' main work, *Or Adonai* ("The Light of the Lord"), however, one of his objectives, quite contrary to Gersonides, was to expose the weakness and insufficiency of Aristotelian philosophy. This attitude may be placed in the wider context of the return to religion itself, as opposed to the Aristotelian rationalization of religion, and the vogue of Kabbala (Jewish theosophical mysticism), both of which were characteristic features of Spanish Jewry in Crescas' time. This change in attitude has been regarded as a reaction to the increasing precariousness of the position of the Jewish community in Spain.

Anti-Aristotelianism

The low estimation of the certainties and the rationalistic arrogance of the medieval Aristotelians coincided chronologically with a certain disintegration of and disaffection toward classical Aristotelian Scholasticism. Relevant to this decline were the so-called voluntarism of Duns Scotus, the Nominalism of William of Ockham and other 13th–14th century Christian Scholastics, and the development, in the 14th century and after, of anti-Aristotelian physics at the University of Paris and elsewhere. Significantly there is a pronounced resemblance between Crescas' views and two of these trends, Scotism and the "new" physics.

Crescas accepted Gersonides' view that divine attributes cannot be negative, but unlike his predecessor he centred his explanation of the difference between the attributes of God and those of created existents on the antithesis between an infinite being and finite beings. It is through infinitude that God's essential attributes—wisdom, for instance—differ from the corresponding and otherwise similar attributes found in created beings. In Crescas', as in Spinoza's, doctrine (see below), God's attributes are also infinite in number. The central place assigned to the thesis of God's infinity in Crescas' system suggests the influence of Duns Scotus' theology, which is similarly founded upon the concept of divine infinity.

The problem of the infinite approached from an altogether different angle was one of the main themes of Crescas' critique of Maimonides' 25 propositions; these propositions, concerned mainly with Aristotelian physical doctrines, had been set forth in the *Guide* as the basis of Maimonides' proof for the existence of God. Crescas' declared purpose in criticizing and rejecting several of these propositions was to show that the traditional Aristotelian proofs (founded in the first place on physical doctrines) were not valid. In the course of his critique, Crescas attempted to disprove the Aristotelian thesis that the existence of an actual infinite is impossible. He held that space is not a limit but a tridimensional extension, that it is infinite, and that, contrary to Aristotle, the existence of a vacuum and of more worlds than one is possible. He also criticized as being impossible the thesis of the Aristotelian philosophers that there exists an infinite number of causes and effects, which have order and gradation. This thesis refers not to a temporal succession of causes and effects that have a similar ontological status but to a vertical series, descending from God to the lowest rung in creation. His attacks were likewise directed against the Aristotelians' conceptions of time and of matter.

Crescas' fundamental opposition to Aristotelianism is perhaps most evident in his rejection of the conception of intellectual activity as the supreme state of being for man and for God. Crescas' God is not first and foremost an intellect, and the supreme goal to which man can aspire is to love God with a love corresponding as far as possible to the infinite greatness of its object and to rejoice in the observance of his commandments. God, too, loves man, and his love, in spite of the lowliness of its object, is proportionate to his infinity.

Crescas attacked the separation of the intellect from the soul as conceived by the Aristotelians and attempted, perhaps in part under the influence of Judah ha-Levi, to refute the Aristotelian doctrine that the actualized intellect, in contradistinction to the soul, survives the death of the body. According to Crescas, the soul is a substance in its own right and can be separated from the body; it continues to subsist after the body's death.

Joseph Albo. Whereas Crescas unmistakably regarded the Aristotelian philosophers as adversaries to be criti-

Albo's mixture of religious tradition and rational philosophy

cized or combatted, the attitude of Joseph Albo (*c.* 1380–c. 1444), who regarded Crescas as his teacher, is much less clearly defined. Albo did not eschew self-contradiction, apparently considering it a legitimate precaution on the part of a philosophical or theological author; indeed, he indulged in it in a much more obvious way than did Maimonides. But, whereas the latter's fundamental philosophical position is fairly clear, the problem being how far he was prepared to deviate from Aristotelian doctrine in the interests of religion, there may be valid doubt whether Crescas and the Jewish religious tradition or Maimonides and Averroës were Albo's true masters. Mainly because of this perhaps deliberate failure to explain to the reader where he really stood, Albo has often been dismissed as an eclectic. He was strongly influenced not only by the authors just mentioned but also by Sa'adia. He seems to have had a considerable knowledge of Christian theology, even adopting for his own purposes certain Scholastic doctrines. He differs from Crescas and to some extent resembles Maimonides in having a marked interest in political theory.

The proclaimed theme of Albo's magnum opus, ***Sefer ha-'iqqarim*** ("The Book of Principles"), is the investigation of the theory of Jewish religious dogmas, the number of which Maimonides, in a nonphilosophical work, had set at 13, whereas Albo, following a doctrine that in the last analysis seems to go back to Averroes, would limit the number to three: the existence of God, divine providence in reward and punishment, and the Torah as divine revelation. One section, usually including the philosophical and the traditional religious interpretations side by side, is devoted to each of these dogmas. Albo's principal and relatively novel contribution to Jewish doctrinal evolution is the classification, in his introduction, of natural, conventional, and divine law.

Natural law (the universal moral law inherent in human nature) is necessary, because man, being political by nature, must belong to a community, which may be restricted in size to one town or may extend over the whole earth. Natural law preserves society by promoting right and repressing injustice; thus, it restrains men from stealing, robbing, and murdering. The positive laws instituted by wise men take into account the particular nature of the people for whose benefit they are instituted, as well as other circumstances. This means that they differ from the natural law in not being universally applicable. Neither natural law nor the more elaborate conventional laws, however, lead men toward true spiritual happiness; this is the function of divine laws instituted by a prophet, which teach men true theoretical opinions. Whereas Maimonides maintained that Judaism was the only divine law promulgated by a true prophet, Albo considered that the commandments given to Noah for all mankind also constitute divine law, which ensures, although to a lesser degree than does Judaism, the happiness of its adherents. This position justifies a certain universalism; in accordance with a Talmudic saying, Albo believed that the pious among the non-Jews—that is, those who observe Noah's laws—have a share in the world to come. But he rejected the pretensions of Christianity and Islām to be divine laws.

MODERN PHILOSOPHY

The Iberian-Dutch Philosophers. The expulsion of the Jews from Spain and Portugal produced a new centre of Jewish thought, Holland, where many of the exiled Jews found a new and safer domicile; the tolerance of the regime seemed to provide guarantees against external persecution. This did not prevent, and indeed may have furthered, the establishment of an oppressive internal orthodoxy that was prepared to chastise rebellious members of the community. This was evident in the cases of Uriel Acosta, or da Costa, and Benedict de Spinoza, two 17-century philosophers who rebelled against Jewish orthodoxy and who were excommunicated for their views (Acosta twice).

The two excommunicados: Acosta and Spinoza

Uriel Acosta. Acosta came to Amsterdam from Portugal, where, belonging to a family of Marranos (Jews who had converted to escape religious persecution), he had been brought up in the Catholic faith; his philosophical position was to a great extent determined by his antagonism to the orthodox Judaism that he encountered in Amsterdam. His growing estrangement from generally accepted Jewish doctrine is attested by his Portuguese treatise ***Sobre a Mortalidade da Alma*** ("On the Mortality of the Soul"). He considered that the belief in the immortality of the soul has had many evil effects, for it impels men to choose an ascetic way of life and even to seek death. According to him, nothing has tormented men more than the belief in an inner, spiritual good and evil. At this stage Acosta affirmed the authority of the Bible from which, according to him, the mortality of the soul can be proved.

In his autobiography, written in Latin and entitled ***Exemplar Humanae Vitae*** ("Example of a Human Life"), he takes a more radical position. He proclaims the supreme excellency of the natural moral law (which, when arguing before Jews, he seems to identify with the divine commandments to Noah, thus suggesting a correspondence with the view of Albo). Accordingly, he denies the validity of the argument that natural law is inferior to Judaism and Christianity, because he believes that both these religions teach the love of one's enemies, a precept that is not a part of natural law and is a manifest impossibility.

Benedict de Spinoza. Although modem philosophers of Jewish origin are not considered as belonging to the history of Jewish philosophy unless they deal with Judaic themes, this restriction may not apply to Spinoza for the following reasons. (1) It was through the study of Jewish philosophical texts that Spinoza was first initiated into philosophy. (2) Spinoza's system is in part a radicalization of, or perhaps a logical corollary to, medieval Jewish doctrines; and the impact of Maimonides and of Crescas is evident. (3) A considerable portion of Spinoza's ***Tractatus Theologico-Politicus*** deals with problems related to Judaism (see SPINOZA, BENEDICT DE).

Spinoza's view of prophecy

The first chapters of the *Tractatus* show that the doctrine of prophecy is of central importance to Spinoza's explanation of Judaism and that, in dealing with this subject, he used Maimonides' categories, although he applied them to different people or groups of people. Maimonides held that the prophets combined intellectual perfection, which made them philosophers, with perfection of the imaginative faculty. He also referred to a category of persons endowed with a strong imagination but possessing no extraordinary intellectual gifts; this category includes, for example, lawgivers and statesmen. Spinoza took over this last category but applied it to the prophets, whom he described as possessing vivid imaginations but as not necessarily having outstanding intellectual capacities. He denied that the biblical prophets were philosophers and used a philosophical and historical approach to the Scriptures to show that the contrary assertion is not borne out by the texts.

Spinoza also denied Maimonides' assertion that the prophecy of Moses was essentially different from that of the other prophets and that this was largely because Moses, in prophesying, had no recourse to the imaginative faculty. According to Spinoza, the distinctive fact about Moses' prophecy was that he heard the voice of God in a prophetic vision—that is, in a state in which his imagination was active. In this assertion Spinoza employed one of Maimonides' categories of prophecy, differentiated in the ***Guide*** according to certain characteristics of prophetic dreams and visions; however, Maimonides thought it improbable that the voice of God was ever heard in prophetic vision, and he held that this category is purely hypothetical. It seems evident that in his classification of Moses, Spinoza was concerned not with what really happened in history but with pigeonholing the biblical evidence into Maimonides' theoretical framework so that it fit in with his own theologico-political purpose: to show that there could be a religion superior to Judaism.

This purpose made it imperative to propound in the *Tractatus* ***Theologico-Politicus*** a theory concerning Jesus, whom Spinoza designates as Christus. The category and the status assigned to Jesus are by and large similar to those that Maimonides attributed to Moses. Thus, Jesus is referred to in the *Tractatus* as a religious teacher who makes recourse not to the imaginative faculty but solely to the intellect. His authority may be used to institute and strengthen the religion Spinoza called *religio catholica* ("universal religion"), which has little or nothing in common with any of the major manifestations of historic Christianity.

The difference between Judaism and Spinoza's *religio catholica* corresponds to the difference between Moses and Jesus. After leaving Egypt the Jews found themselves, in Spinoza's view, in the position of people who had no allegiance to any positive law; they had, as it were, reverted to a state of nature and were faced with the need to enter into a social pact. They were also an ignorant people and very prone to superstition. Moses, a man of outstanding ability, made use of the situation and the characteristics of the people in order to make them accept a social pact and a state founded upon it that, contrary to Spinoza's scheme for his ideal communities, were not based first and foremost upon utilitarian—that is, reasonable—consideration of the advantages of life in society over the state of nature.

The social pact concluded by the children of Israel in the desert was based upon a superstitious view of God as "King" and "Judge," to whom the children of Israel owed whatever political and military successes they obtained. It was to God rather than to the representatives of the popular will that the children of Israel transferred political sovereignty. In due course political sovereignty was vested in Moses, God's representative, and in his successors. It should be added that, in spite of Spinoza's insistence on the superstitious foundations of the ancient Israelite state, his account of its regime was not wholly unsympathetic. He believed, however, that it contained the seeds of its own destruction and that, with the extinction of this state, the social pact devised by Moses had lapsed and all the political and religious obligations incumbent upon the Jews had become null and void.

The rational state and its religion

It could be argued that, because the state conceived by Spinoza is based not on superstitious faith but on a social contract originating in rational, utilitarian considerations, it does not necessarily need to have its authority safeguarded and stabilized by means of religion. Nevertheless, Spinoza appears to have held the view—perhaps derived from a purely empirical knowledge of the behaviour of the common run of men—that there is a need for religion. In order to fulfill the need for some religion and to obviate the danger of harmful religions, he devised his *religio catholica,* the universal religion, which has the following distinctive traits: (1) Its main purpose, a practical one (which is furthered by recourse to the authority of Jesus), is to impel men to act in accordance with justice and charity. Such conduct is tantamount to obedience to the laws of the state and to the orders of the magistrates, in whom sovereignty is vested; for disobedience—even if it springs from compassionate motives—weakens the social pact, which safeguards the welfare of all the members of the community; in consequence, its evil effects outweigh whatever good it may produce. (2) Although religion, according to Spinoza, is not concerned with theoretical truth, in order to be effective the *religio catholica* requires dogmas, which he set forth in the *Tractatus.* These dogmas are formulated there in terms that can be interpreted in accordance both with the philosophical conception of God that Spinoza regarded as true and also with the superstitious ideas of ordinary people. It follows that if they are accepted as constituting by themselves the only creed that everybody is obliged to profess, people cannot be persecuted on account of their beliefs; Spinoza held that such a persecution may lead to civil war and may thus destroy the state. Philosophers are free to engage in the pursuit of truth and to attain, if they can, the supreme goal of man, freedom grounded in knowledge. There can be little doubt that the furtherance of the cause of tolerance for philosophical opinions was one of Spinoza's main objects in writing the *Tractatus.*

The relation between Spinoza's *Ethics,* his major philosophical work, and Jewish medieval philosophy is much more ambiguous than in the case of Spinoza's *Tractatus* Theologico-Philouophicus. In a way, Spinoza's metaphysical system, contained in the *Ethics*, can be regarded as being, in part, a spelling out of some extreme consequences, which could perhaps be legitimately drawn from medieval Aristotelianism; but the facts of the case are no doubt much more complicated than this.

German philosophers. *Moses Mendelssohn.* Moses Mendelssohn opened what may be called the German period of Jewish philosophy *(c. 1750–c.* 1830). This period, in which a considerable number of works on Jewish philosophy were written in German and often under the influence of German philosophy, is also marked by the emancipation of the Jews—that is, by the abrogation of discriminatory laws directed against them—and by their partial or complete assimilation. In this period in particular, the term Jewish philosophy applies especially to works the main purpose of which, or one of the main purposes of which, consists in proposing a definition of Judaism and a justification of its existence. The second task is often conceived as necessitating a confrontation of Judaism with Christianity rather than with philosophy, which served as a critical point of comparison for many medieval philosophers. This change seems to have been a result of the demarcation of the sphere of religion in such a way that, at least in the opinion of the philosophers, possible points of collision no longer existed between it and philosophy. This demarcation was largely furthered by the doctrine of Spinoza, from whom Mendelssohn and others took over and adopted for their own purposes certain fundamental ideas concerning Judaism. Like Spinoza, Mendelssohn held that it is not the task of Judaism to teach rational truths, although they may be referred to in the Bible. Contrary to what he called Athanasian Christianity—that is, the doctrine set forth in the Athanasian Creed—Judaism has no binding dogmas; it is centred on inculcating belief in certain historical events and on action—that is, observance of religious law (including the ceremonial commandments). Such observance is supposed to lead to happiness in this world and in the afterlife. Mendelssohn did not reject this view offhand, as Spinoza would have done; indeed, he seems to have been prepared to accept it, God's mysteries being inscrutable, and the radicalism and what may be called the consistency of Spinoza being the complete antithesis of Mendelssohn's apologetics. Non-Jews were supposed by Mendelssohn to owe allegiance to the natural moral law.

Solomon Formstecher. Whereas Mendelssohn continued the medieval tradition, at least to some extent, or adopted Spinoza's doctrine for his purposes, the Jewish philosophers of the first half of the 19th century may generally be regarded as disciples of the philosophers of their own time. In *Die Religion des Geistes* ("The Religion of the Spirit"), Solomon Formstecher (1808–89) may have been influenced by F.W.J. Schelling, an eminent German philosopher, in his conception of nature and spirit as manifestations of the divine. There are, in Formstecher's view, two types of religions that correspond to these manifestations: (1) the religion of nature, in which God is conceived as the principle of nature or as the world soul, and (2) the religion of the spirit, which conceives of God as an ethical being. According to the religion of the spirit, God has produced the world as his manifestation in full freedom and not, as the religion of nature tends to profess, because the world was necessary for his own existence.

The religions of nature and of spirit

The religion of the spirit, which corresponds to absolute religious truth, was first manifested in the Jewish people. The religious history of the world may be understood as a process of universalization of the Jewish religion. Thus, Christianity propagated Jewish conceptions among the nations; however, it combined them with pagan ideas. The pagan element is gradually being eliminated—Protestantism, for instance, in this respect, marks considerable progress. When at long last the Jewish element in Christianity is victorious, the Jews will be right to give up their isolation. The progress that will bring about this final religious union is already under way.

Samuel Hirsch. The main philosophical work of Samuel Hirsch, entitled ***Die Religionsphilosophie der Juden*** ("The Philosophy of Religion of the Jews"), was decisively influenced by G.W.F. Hegel. This influence is most evident in Hirsch's method and in the task that he assigned to the philosophy of religion—the transformation of religious consciousness into conceptual truth. Contrary to Hegel, however, he did not consider religious truth to be inadequate as compared to philosophical truth.

God revealed himself in the first stages of Jewish history by means of miracles and of prophecy. At present, he manifests himself in the miracle that is constituted by the existence of the Jewish people. At its beginning in the time of Jesus, Christianity was identical with Judaism. The decisive break between the two religions was caused by Paul. When the Pauline elements are eliminated from Christianity, it will be in all essentials in agreement with Judaism, which, however, will preserve its separate existence.

Nachman Krochmal. Nachman Krochmal, a native of Galicia (at that time, part of Austria), was the author of ***More nebukhe** ha-zman* ("Guide for the Perplexed for Our Time"), a treatise in Hebrew on the philosophy of history and on Jewish history that had a considerable influence. Krochmal's philosophical thought was centred on the notion of "spirit," Krochmal being mainly concerned with the "national spirit," the particular spirit that is proper to each people and that accounts for the peculiar characteristics differentiating one people from another in every domain of human activity. The national spirits of all peoples except the Jewish are, according to Krochmal, essentially particular. Hence, the national spirit either becomes extinct with the extinction of the nation or, if it is a powerful spirit, is assimilated by some other nation. The Jewish people have a special relation to the Universal Spirit, who is the God of Israel. This relation accounts for the perpetuity of the Jewish people.

Solomon Steinheim. Solomon Ludwig Steinheim, the author of *Die **Offenbarung nach dem** Lehrbegriff der Synagoge* ("The Revelation According to the Doctrine of the Synagogue"), was apparently influenced by the antirationalism of Friedrich Heinrich Jacobi, a German philosopher. His criticism of science is based on Jacobi's criticism, but he did not agree with Jacobi in opposing discursive reason to the intuitive knowledge of God—Steinheim contrasted human reason to divine revelation. The main point on which the revelation, vouchsafed to the prophets of Israel, is opposed to reason is to be found in the fact that the God posited by reason is subject to necessity, that he can act only in accordance with laws. Moreover, reason affirms that nothing can come from nothing. Accordingly, God is free to create not a good world, but only the best possible world. Revealed religion, on the other hand, affirms the freedom of God and the creation of the world out of nothing.

The Neo-Kantian philosopher of Judaism

Hermann Cohen. There seems to be little connection between the Jewish philosophers of the first half or two-thirds of the 19th century and Hermann Cohen (1842–1918), the head of the Neo-Kantian school centred at the University of Marburg. In a certain sense Cohen may be regarded as a rather unusual case among the philosophers of Judaism of his and the preceding generations because of the two aspects of his philosophical thought—the general and the Jewish—and the uneasy equilibrium between them. Judaism was by no means the only important theme of his philosophical system; it was one of several and not even his point of departure. There is no doubt that, for most of his life, Cohen was wholly committed to his brand of Kantianism, in the elaboration of which he displayed considerable originality—it has been maintained with some justification that his doctrine manifests a certain (unintentional) kinship with Hegel's. Cohen's idea of God, however, derives from an analysis and a development of certain conceptions of Immanuel Kant. In Cohen's view reason requires that nature be conceived of as conforming to one rational plan and that harmony exist between the domains of natural and of moral teleology (ultimate purposes or ends). These two requirements, in turn, necessitate the adoption of the idea of God—the word idea being used in the Kantian sense, which means that no assertion is made about the metaphysical reality of God.

Cohen seems to have changed his attitude in the last years of his life; although he did not explicitly renounce his previous positions, a considerable shift of emphasis can be discerned in his doctrines. The notion of the human individual—an individual who is weak and full of sin—comes to the fore, as well as the conception of a correlation, a relationship, between God and the individual. This relationship is one of love, the love of God for man and the love of man for God. It is difficult to reconcile the conception of God expounded in Cohen's work of his last period with his Kantian or Neo-Kantian attitude toward metaphysics.

Franz Rosenzweig. Franz Rosenzweig published his main philosophical work, ***Der Stern der Erlösung** (**The Star of Redemption***, 1971), in 1921. This work begins with a rejection of the traditional philosophical attitude that denies the fear of death, maintaining, instead, that this fear is the beginning of the cognition of the All. Man should continue to fear death, despite the indifference of philosophy and its predilection for accepting death. Traditional philosophy is interested exclusively in the universal, and it is monistic—its aim is to discover one principle from which everything can be derived. This tendency of philosophy, however, denatures human experience, which knows not one but three separate domains (which Kant had referred to in a different context), namely, God, the world, and man.

According to Rosenzweig, God (like the world and like man) is known through experience (the experience of revelation). In Greek paganism, the most perfect manifestation of paganism, every one of these domains subsists by itself: the gods, the cosmos, and man as the tragic, solitary, silent hero. Biblical religion is concerned with the relation between the three: the relation between God and the world, which is creation; the relation between God and man, which is revelation; and the relation between man and the world, which leads to salvation. The philosophy that renounces the ambition to find one principle for everything that exists and that follows biblical religion in centring on the connections between the three domains and between the words and acts that bring about and develop these connections, Rosenzweig termed the narrative philosophy; the term and the concept were taken over from Schelling, whose influence Rosenzweig repeatedly emphasized.

The biblical faith brought forth two valid religions—Christianity and Judaism. The first is described by Rosenzweig as the eternal way; the Christian peoples seek in the vicissitudes of time and history the way to salvation. In contradistinction to them, the existence of the stateless Jewish people is not concerned with time and history; it is—notwithstanding the hope for final salvation—already an eternal life, renewed again and again according to the rhythm of the liturgical Jewish year.

"I and Thou"

Martin Buber. Since the early years of the 20th century, Martin Buber has exercised a powerful influence on both Jews and non-Jews. In his early period Buber was led, partly through empathy with Jewish and non-Jewish mysticism, to stress unitive experience and knowledge, in which the difference between one man and another and between man and God tend to disappear. But in his final period he taught, following, as he claimed, a suggestion of Ludwig Feuerbach, a 19th-century German philosopher, that man can only realize himself as a human being in a relation with another, who may be another man or God. This conception of the "I and Thou" relationship leads to the formulation of Buber's view of the dialogical life—the mutual, responsive relation between man and others—and accounts for the importance that he attaches to the category of "encounter." (S.Pi.)

BIBLIOGRAPHY

General introductions: JULIUS GUTTMANN, ***Die Philosophie des** Judentums (1933;* Eng. trans., ***Philosophies of Judaism,*** 1964), the best general treatment of Jewish philosophy from

the ancient to the modern period, ending with Franz Rosenzweig; NATHAN ROTENSTREICH, *Jewish Philosophy in Modern Times: From Mendelssohn to Rosenzweig* (1968), a good philosophical discussion of the major thinkers in modern Jewish philosophy, especially perceptive on Hermann Cohen.

Hellenistic philosophy: NAHUM GLATZER (ed.), *The Essential Philo* (1971), lengthy selections from the major works of Philo, with notes: HARRY A. WOLFSON, *Philo*, rev, ed., 2 vol. (1962), the most comprehensive study of Philo in any language, with special emphasis upon Philo's influence upon later philosophy.

Medieval philosophy: ISAAC HUSIK, *A History of Medieval Jewish Philosophy (1940,* reprinted 1969), a thorough examination of each of the major medieval Jewish philosophers from Isaac Israeli through Joseph Albo, with good bibliography; *Three Jewish Philosophers: Philo, Saadya Gaon, Jehuda Halevi,* trans. and ed. by HANS LEWY, ALEXANDER ALTMANN, and ISAAK HEINEMANN (1965), a good introductory anthology containing representative selections from these classical figures with perceptive introductions and explanatory notes; GEORGES VAJDA, *Introduction à la pensée juive du moyen âge* (1947), a good general survey organized around the major philosophical traditions in medieval Jewish philosophy, with extensive bibliography.

Jewish Kalām: SAʿADIA BEN JOSEPH, *The Book of Reliefs and Opinions,* trans. by SAMUEL ROSENBLATT (1948), Sa'adia's important philosophical work dealing with the major topics in Jewish theology such as faith and reason, creation, God, and reward and punishment; *A Karaite Anthology,* trans. and ed. by LEON NEMOY (1952), an excellent collection of the more accessible Karaite materials, covering a wide range of themes, writers, and periods; ISRAEL EFROS, "Medieval Jewish Philosophy" (1967), a collection of essays (in Hebrew) containing a full-length study of Sa'adia's philosophy, in addition to short essays on Judah ha-Levi and Maimonides.

Jewish Neo-Platonism: ISAAC ISRAELI, *Works,* ed. and trans. by ALEXANDER ALTMANN and S.M. STERN (1958), contains complete translations of three of Israeli's works and excerpts from another, together with a comprehensive essay on his philosophy; SOLOMON IBN GABIROL, "Fountain of Life," trans. from the Latin into Hebrew by J. BLUWSTEIN (1950), in addition to a complete vocalized translation of the text this edition contains the Hebrew summary made by Shem Tov ibn Falaquera in the 13th century.

Judah ha-Levi: The Kuzari, trans. by HARTWIG HIRSCHFELD (1964), a complete English translation of the text and notes, with an introductory essay by HENRY SLONIMSKY; LEO STRAUSS, "The Law of Reason in the Kuzari," in *Persecution and the Art of Writing* (1952), in addition to this perceptive and provocative essay on ha-Levi's attitude towards philosophy and rationalistic ethics, the book contains important essays on Maimonides and Spinoza; BAHYA IBN PAQUDA, *The Duties of the Heart* (Hebrew ed. by A. ZIFRONI, *1928;* Eng. trans. by EDWIN COLLINS, 1904), one of the more widely read medieval classics of Jewish philosophy, concentrating upon ethics and personal piety; ABRAHAM BAR HIYYA, *The Meditation of the Sad Soul,* trans. with introduction by G. WIGODER (1971), one of the more accessible philosophical works of this important medieval astronomer and mathematician, devoted primarily to ethical and religious themes.

Jewish Aristotelianism: ABRAHAM IBN DAUD, *Das Buch Emunah Ramah,* ed. and trans. into German by S. WEIL (1852), one of the first manifestations of the Jewish assimilation of Aristotelian philosophy, containing a critique of Gabirol's neo-Platonism.

Maimonides: The Guide of the Perplexed, trans. with introductory essay by SHLOMO PINES (1963), an accurate and clear translation, with an excellent essay by Pines and a valuable prefatory essay by LEO STRAUSS; *A Maimonides Reader,* ed. with introduction and notes by I. TWERSKY (1972), a fine anthology containing important material from Maimonides' *Mishne Torah* and other legal writings, as well as from his shorter philosophical-theological essays and the *Guide;* HARRY A. WOLFSON, "Maimonides on Negative Attributes," in the *Louis Ginzberg Jubilee Volume,* pp. *411–446* (1945), the best historical and analytical study of Maimonides' doctrine of divine attributes; and "Halevi and Maimonides on Prophecy," *Jewish Quarterly Review,* n.s., 32:345–370, 33:49–82 (1942), an excellent historical analysis of the sources of doctrines of both philosophers on prophecy and a clear analysis of the differences between them.

Averroists: (Isaac Albalag): GEORGES VAJDA, *Isaac Albalag, Averroïste juif, traducteur et annotateur d'Al-Ghazâlî* (1960), a translation of and commentary on Albalag's main philosophical work. al-Ghazālī's "Inconsistencies of the Philosophers," containing valuable citations from the classical Arabic philosophical texts. *(Levi ben Gerson):* "The Wars of the Lord" (1866), Gersonides' major philosophical work (in Hebrew) dealing with the most difficult and controversial topics in medieval philosophy and science; SEYMOUR FELDMAN, "Gersonides' Proofs for the Creation of the Universe," *Proceedings of the American Academy for Jewish Research, 35:113–137* (1967), an analytical study of Gersonides' theory of creation and of his criticism of Aristotle's theory of eternity of the universe. *(Ḥasdai Crescas):* "The Light of the Lord" (1861), Crescas' most original critique (in Hebrew) of Aristotelian philosophy and his vigorous defense of traditional Judaism; HARRY A WOLFSON, *Crescas' Critique of Aristotle* (1929), the most important study of medieval Jewish and Arabic philosophy so far written, containing a translation and critical Hebrew text of part 1 of the treatise with comprehensive, detailed, and most valuable notes and introductory essay; JOSEPH ALBO, *Book of Principles,* trans. with critical text by ISAAC HUSIK, 4 vol. (1946), a fine translation with helpful notes of Albo's treatise in Jewish dogmatics.

Modern Jewish philosophy: (Iberian-Dutch philosophers): I.S. REVAH, *Spinoza et le dr. Juan de Prado* (1959), a study of the cultural background of Spinoza's Amsterdam, especially of the heterodox elements in Sefardic Judaism, containing valuable material pertaining to the excommunication of Spinoza and the ideas of Uriel da Costa; BARUCH SPINOZA, *Theologico-Political Treatise,* trans. by R.H.M. ELWES *(1883,* reprinted 1951), Spinoza's critique of the Bible and the Jewish religion; LEO STRAUSS, *Spinoza's Critique of Religion (1965),* an excellent philosophical study of Spinoza's *Treatise,* its relation to Maimonides, Uriel da Costa, and other Sefardic heterodox thinkers; HARRY A. WOLFSON, *The Philosophy of Spinoza,* 2 vol. *(1934,* reprinted 1969), a most detailed commentary on Spinoza's *Ethics,* containing valuable references to Spinoza's medieval sources such as Maimonides, Gersonides, and Crescas.

German philosophers: (Moses Mendelssohn): Jerusalem and Other Jewish Writings, trans. and ed. by ALFRED JOSPE (1969), a complete translation of *Jerusalem* and other miscellaneous writings, pertaining to questions on the Jewish religion, with a brief, informative, acute introduction by the editor; JULIUS GUTTMANN, "Mendelssohn's Jerusalem and Spinoza's *Theologico-Politico Treatise*" (in Hebrew) in his *Religion and Knowledge* (1956), a collection of Guttmann's essays that also includes important essays on ha-Levi, Maimonides, Gersonides, and Crescas, as well as on themes in modern philosophy of Judaism; NACHMAN KROCHMAL, "Collected Works" *(1961,* in Hebrew), containing his "Guide for the Perplexed of Our Times," ed. by S. RAWIDOWICZ and Rawidowicz' comprehensive analytical study of Krochmal's philosophy of Jewish history and its relationship to Hegelian philosophy. *(Hermann Cohen): Die Religion der Vernunft aus den Quellen des Judentums (1919,* reprinted 1966), Cohen's major work dealing with his philosophy of Judaism, organized according to the main themes of the Jewish religion; *Reason and Hope: Selections from the Jewish Writings of Hermann Cohen,* trans. and ed. by EVA JOSPE (1971), a useful collection from Cohen's miscellaneous writings on Jewish themes. *(Franz Rosenzweig): The Star of Redemption,* trans. by WILLIAM HALLO (1971), Rosenzweig's early but impressive statement of his "re-conversion" to Judaism, which has been influential in contemporary Jewish and non-Jewish theology; NAHUM GLATZER, *Franz Rosenzweig: His Life and Thought,* 2nd ed. (1961), an excellent anthology of Rosenzweig's various writings, containing many letters that reveal the more important and intimate episodes in Rosenzweig's career. *(Martin Buber):* See bibliography to article BUBER, MARTIN.

(Se.F.)

Jewish Religious Year

The term Jewish religious year as used in this article encompasses the cycle of sabbaths and holidays that are commonly observed by the Jewish religious community —and officially in Israel by the Jewish secular community as well. Dates here are listed as BCE (Before the Common Era = BC) and CE (Common Era = AD).

NATURE AND SIGNIFICANCE

The sabbath and festivals are bound to the Jewish calendar, reoccur at fixed intervals, and are celebrated at home and in the synagogue according to ritual set forth in Jewish law and hallowed by Jewish custom. According to Jewish teaching, the sabbath and festivals are, in the first instance, commemorative. The sabbath, for example, commemorates the Creation, and Passover commemorates the Exodus from Egypt over 3,000 years ago. The past is not merely recalled; it is also relived through the sabbath and festival observances. Creative physical activity ceases on the sabbath as it did, according to Genesis, when the Creation was completed; Jews leave their homes and reside in booths during the Sukkot festival as did their biblical ancestors. Moreover, sabbath and festival themes are considered to be perpetually significant, recurring and renewed in every generation. Thus the revelation of the Torah (the divine teaching or law) at Sinai, commemorated on Shavuot, is considered an ongoing process which recurs whenever a commitment is made to Torah study.

An important aspect of sabbath and festival observance is sanctification. The sabbath and festivals sanctified the Jews more than the Jews sanctified the sabbath and festivals. Mundane meals became sacred meals; joy and relaxation became sacred obligations (*mitzwot*). No less significant is the contribution of the sabbath and festivals toward communal awareness. Thus, neither sabbath nor festival can be properly observed in the synagogue according to the ancient tradition if fewer than ten male Jews are present. Again, a Jew prays on Rosh Hashana and mourns on Tisha be-Av not only for his own fate but for the fate of all Jews. The sense of social cohesiveness fostered by the sabbath and festival observances has stood the Jews well throughout their long, often tortuous history.

Through Christianity and Islām, the sabbath and festivals have had considerable impact on much of the inhabited world. The seven-day week, the notion of a weekly day of rest, and many Christian and Islāmic holiday observances owe their origins to the Jewish calendar. sabbath, and festivals.

THE JEWISH CALENDAR

Lunisolar structure. The Jewish calendar is lunisolar —*i.e.*, regulated by the positions of both the moon and the sun. It consists usually of 12 alternating lunar months of 29 and 30 days each (except for Heshvan and Kislev, which sometimes have either 29 or 30 days), and totals 353, 354, or 355 days per year. The average lunar year (354 days) is adjusted to the solar year (365¼ days) by the periodic introduction of leap years in order to assure that the major festivals fall in their proper season. The leap year consists of an additional 30-day month called First Adar, which always precedes the month of (Second) Adar. A leap year consists of either 383, 384, or 385 days and occurs seven times during every 19-year period (the so-called Metonic cycle). Among the consequences of the lunisolar structure are these: (1) The number of days in a year may vary considerably, from 353 to 385 days. (2) The first day of a month can fall on any day of the week, that day varying from year to year. Consequently, the days of the week upon which an annual Jewish festival falls vary from year to year despite the festival's fixed position in the Jewish month.

Leap year: Second Adar

Months and notable days. The months of the Jewish religious year, their approximate equivalent in the Western Gregorian calendar, and their notable days, are as follows:

Tishri (September–October)
1,2 Rosh Hashana (New Year)
3 Tzom Gedaliahu (Fast of Gedaliah)
10 Yom Kippur (Day of Atonement)
15–21 Sukkot (Tabernacles)
22 Shemini Atzeret (Eighth Day of the Solemn Assembly)
23 Simhat Torah (Rejoicing of the Law)
Heshvan, or Marḥeshvan (October–November)
Kislev (November–December)
25 Hanukka (Feast of Dedication) begins
Ṭevet (December–January)
2–3 Hanukka ends
10 ʿAsara be-Tevet (Fast of Tevet 10)
Shevaṭ (January–February)
15 Tu bi-Shevaṭ (15th of Shevaṭ: New Year for Trees)
Adar (February–March)
13 Ta'anit Esther (Fast of Esther)
14, 15 Purim (Feast of Lots)
Nisan (March–April)
15–22 Pesah (Passover)
Iyyar (April–May)
18 Lag ba-Omer (33rd Day of the Omer Counting)
Sivan (May–June)
6,7 Shavuot (Feast of Weeks, or Pentecost)
Tammuz (June–July)
17 Shiva' 'Asar be-Tammuz (Fast of Tammuz 17)
Av (July–August)
9 Tisha be-Av (Fast of Av 9)
Elul (August–September)

During leap years, the Adar holidays are postponed to Second Adar.

Since 1948 many Jewish calendars list Iyyar 5—Israel Independence Day—among the Jewish holidays.

Origin and development. The origin of the Jewish calendar can no longer be accurately traced. Some scholars suggest that a solar year prevailed in ancient Israel, but no convincing proofs have been offered, and it is more likely that a lunisolar calendar similar to that of ancient Babylonia prevailed in ancient Israel. In late Second Temple times (*i.e.*, 1st century BCE to 70 CE), calendrical matters were regulated by the Sanhedrin, or council of elders, at Jerusalem. The testimony of two witnesses who had observed the New Moon was ordinarily required to proclaim a new month. Leap years were proclaimed by a council of three or more rabbis with the approval of the nasi, or president, of the Sanhedrin. With the decline of the Sanhedrin, calendrical matters were decided by the Palestinian patriarchate (the official heads of the Jewish community under Roman rule). Jewish persecution under Constantius II (reigned 337–361) and advances in astronomical science led to the gradual replacement of observation by calculation. According to Hai ben Sherira (died 1038)—the head of a leading Talmudic academy in Babylonia—Hillel II, a Palestinian patriarch, introduced a fixed and continuous calendar in 359 CE. A summary of the regulations governing the present calendar is provided by Maimonides, the great medieval philosopher and legist, in his Code: *Sanctification of the New Moon*, chapters 6–10.

Regulation by the Sanhedrin and patriarchate

Fragments of writings discovered in a geniza (depository for sacred writings withdrawn from circulation) have brought to light a calendrical dispute between Aaron ben Meir, a 10th-century Palestinian descendant of the patriarchal (Hillel) family, and the Babylonian Jewish authorities, including Sa'adia ben Joseph—an eminent 10th-century philosopher and *gaon* (head of a talmudic academy). Ben Meir's calculations provided that Passover in 922 be celebrated two days earlier than the date fixed by the normative calendar. After a bitter exchange of letters, the controversy subsided in favour of the Babylonian authorities, whose hegemony in calendrical matters was never again challenged.

Calendars of various sectarian Jewish communities deviated considerably from the normative calendar described above. The Dead Sea (or Qumrān) community (made famous by the Dead Sea Scrolls discoveries) adopted the calendrical system of the noncanonical books of Jubilees and Enoch, which was essentially a solar calendar. Elements of this same calendar reappear among the Mishawites, a sect founded in the 9th century.

The Karaites, a sect founded in the 8th century, refused, with some exceptions, to recognize the normative fixed calendar and reintroduced observation of the New Moon. Leap years were determined by observing the maturation of the barley crop in Palestine. Consequently, Karaites often celebrated the festivals on dates different from those fixed by the rabbis. Later in medieval times, the Karaites adopted some of the normative calendrical practices, while rejecting others.

THE SABBATH

The Jewish sabbath (from Hebrew shavat, "to rest") is observed throughout the year on the seventh day of the week—Saturday. According to biblical tradition, it commemorates the original seventh day on which God rested after completing the creation.

Scholars have not succeeded in tracing the origin of the seven-day week, nor can they account for the origin of the sabbath. A seven-day week does not accord well with either a solar or lunar calendar. Some scholars, pointing to the Akkadian term shapattu, suggest a Babylonian origin for the seven-day week and the sabbath. But *shapattu*, which refers to the day of the Full Moon and is nowhere described as a day of rest, has little in common with the Jewish sabbath. It appears that the notion of the sabbath as a holy day of rest, linking God to his people and recurring every seventh day, was unique to ancient Israel.

Importance. The central significance of the sabbath for Judaism is reflected in the traditional commentative and interpretative literature called Talmud and Midrash (*e.g.*, "if you wish to destroy the Jewish people, abolish their sabbath first") and in numerous legends and adages from more recent literature (*e.g.*, "more than Israel kept the sabbath, the sabbath kept Israel"). Some of the basic teachings of Judaism affirmed by the sabbath are God's acts of creation, God's role in history, and God's covenant with Israel. Moreover, the sabbath is the only Jewish holiday the observance of which is enjoined by the Ten Commandments. Jews are obligated to sanctify the sabbath at home and in the synagogue by observing the sabbath laws and engaging in worship and study. The leisure hours afforded by the ban against work on the sabbath were put to good use by the rabbis, who used them to promote intellectual activity and spiritual regeneration among Jews. Other days of rest, such as the Christian Sunday and the Islamic Friday, owe their origins to the Jewish sabbath.

Worship, study, and abstinence from work

Observances. The biblical ban against work on the sabbath, while never clearly defined, includes such activities as baking and cooking, travelling, kindling fire, gathering wood, buying and selling, and bearing burdens from one domain into another. The Talmudic rabbis listed 39 major categories of prohibited work, including agricultural activity (*e.g.*, plowing and reaping), work entailed in the manufacture of cloth (*e.g.*, spinning and weaving), work entailed in preparing documents (*e.g.*, writing), and other forms of constructive work.

At home, the sabbath begins Friday evening some 20 minutes before sunset, with the kindling of the sabbath candles by the wife, or in her absence by the husband. In the synagogue, the sabbath is ushered in at sunset with the recital of selected psalms and the "Lekha Dodi," a 16th-century Kabbalistic (mystical) poem. The refrain of the latter goes: "Come, my beloved, to meet the bride," the "bride" being the sabbath. After the evening service, each Jewish household begins the first of three festive sabbath meals by reciting the kiddush ("sanctification" of the sabbath) over a cup of wine. This is followed by a ritual washing of the hands and the breaking of bread; two loaves of bread (commemorating the double portions of manna described in Exodus) being placed before the breaker of bread at each sabbath meal. After the festive meal, the remainder of the evening is devoted to study or relaxation. The distinctive features of the sabbath morning synagogue service include the public reading of the Torah, or Five Books of Moses (the portion read varies from week to week) and, generally, the sermon, both of which serve to educate the listeners. Following the service, the second sabbath meal begins, again preceded by kiddush (of lesser significance), and conforming for the most part to the first sabbath meal. The afternoon synagogue service is followed by the third festive meal (without kiddush). After the evening service, the sabbath comes to a close with the havdala ("distinction") ceremony, which consists of a benediction noting the distinction between sabbath and weekday, usually recited over a cup of wine accompanied by a spice box and candle.

The *havdala* ceremony

THE JEWISH HOLIDAYS

The major Jewish holidays are the Pilgrim Festivals: Pesaḥ (Passover), Shavuot (Feast of Weeks, or Pentecost), and Sukkot (Tabernacles); and the High Holidays: Rosh Hashana (New Year) and Yom Kippur (Day of Atonement). In common, their observance is required by the Torah and work is prohibited for the duration of the holiday (except on the intermediary days of the Pesah and Sukkot festivals, when work the neglect of which entails monetary loss is permitted). Purim (Feast of Lots) and Hanukka (Feast of Dedication), while not mentioned in the Torah (and therefore of lesser solemnity), were instituted by Jewish authorities in the Persian and Greco-Roman periods. Lacking the work restrictions characteristic of the major festivals, they are sometimes regarded as minor festivals. In addition, there are the five fasts: 'Asara be-Tevet (Fast of 10 Tevet), Shiva' 'Asar be-Tammuz (Fast of Tammuz 17), Tisha be-Av (Fast of Av 9), Tzom Gedaliahu (Fast of Gedaliah), and Ta ʿanit Esther (Fast of Esther); and the lesser holidays—*i.e.*, holidays the observances of which are few and not always clearly defined—such as Rosh Hodesh (First Day of the Month), Tu bi-Shevaṭ (New Year for Trees), and Lag ba-Omer (33rd Day of Omer Counting). The fasts and the lesser holidays also lack the work restrictions characteristic of the major festivals. Some of the fasts and Rosh Hodesh are mentioned in Scripture. but most of the details concerning their proper observance, as well as those concerning the other lesser holidays, are provided by the Talmudic and medieval rabbis.

Pilgrim festivals. In Temple times. all males were required to appear at the Temple three'times annually and actively participate in the festal offerings and celebrations. These were the joyous pilgrim festivals of Pesah, Shavuot, and Sukkot. Originally, they marked the major agricultural seasons in ancient Israel and commemorated Israel's early history; but after the destruction of the Second Temple in 70 CE, emphasis was almost exclusively placed on the commemorative aspect.

In modern Israel, Pesah, Shavuot, and Sukkot are celebrated for the number of days prescribed by Scripture, namely, seven days, one day, and eight days, respectively (with Shemini Atzeret added to Sukkot). Due to calendrical uncertainties which arose in Second Temple times (6th century BCE to 1st century CE), each festival is celebrated for an additional day in the Diaspora.

Pesah (Passover). Pesaḥ commemorates the Exodus from Egypt and the servitude that preceded it. As such, it is the most significant of the commemorative holidays, for it celebrates the very inception of the Jewish people —*i.e.*, the event which provided the basis for the covenant between God and Israel. The term pesah refers originally to the paschal (Passover) lamb sacrificed on the eve of the Exodus, the blood of which marked the Jewish homes to be spared from God's plague; its etymological significance, however, remains uncertain. The Hebrew root is usually rendered "passed over"—*i.e.*, God passed over the homes of the Israelites when inflicting the last plague on the Egyptians—hence the term Passover. The festival is also called Hag ha-Matzot ("Festival of Unleavened Bread"), for unleavened bread is the only kind of bread consumed during Passover.

The Festival of Unleavened Bread (matza)

Leaven (se'or) and foods containing leaven (*ḥametz*) are neither to be owned nor consumed during Pesah. Aside from meats, fresh fruits, and vegetables, it is customary to consume only those foods prepared under rabbinic supervision and labelled "kosher for Passover," warranting that they are completely free of contact with leaven. In many homes, special sets of crockery, cutlery, and cooking utensils are acquired for Passover use. On the evening preceding the 14th day of Nisan, the home is thoroughly searched for any trace of leaven (*bediqat* hametz). The following morning the remaining particles of leaven are destroyed by fire (bi'ur hametz). From then until after Pesah, no leaven is consumed. Many Jews sell their more valuable leaven products to non-Jews before Passover (mekhirat hametz), repurchasing the foodstuffs immediately after the holiday.

The unleavened bread (matza) consists entirely of flour and water, great care being taken to prevent any fermentation before baking. Hand-baked matza is flat, rounded, and perforated. Since the 19th century, many Jews have preferred the square-shaped, machine-made *matza*.

Passover eve is ushered in at the synagogue service on

The seder ceremonies

the evening before Passover, after which each family partakes of the seder ("order of service); *i.e.*, an elaborate festival meal in which every ritual is regulated by the rabbis. (In the Diaspora, the seder is also celebrated on the second evening of Passover.) The table is bedecked with an assortment of foods symbolizing the passage from slavery (*e.g.*, bitter herbs) into freedom (*e.g.*, wine). The Haggada (literally "narration"), a printed manual comprised of appropriate passages culled from Scripture, Talmud, and Midrash, accompanied by medieval hymns, serves as a guide for the ensuing ceremonies and is recited as the evening proceeds. The seder opens with the cup of sanctification (kiddush), the first of four cups of wine drunk by the celebrants. An invitation is extended to the needy to join the seder ceremonies, after which the youngest son asks four prescribed questions expressing his surprise at the many departures from usual mealtime procedure. ("How different this night is from all other nights!") The father then explains that the Jews were once slaves in Egypt, were then liberated by God, and now commemorate the servitude and freedom by means of the seder ceremonies. Special blessings are recited over the unleavened bread and the bitter herbs (*maror*), after which the main courses are served. The meal closes with a serving of *matza* recalling the paschal lamb, consumption of which concluded the meal in Temple times. The seder concludes with the joyous recital of hymns praising God's glorious acts in history and anticipating a messianic redemption to come.

The Passover liturgy is considerably expanded and includes the daily recitation of Psalms 113–118 (Hallel, "praise"), public readings from the Torah, and an additional service (*musaf*). On the first day of Pesah, a prayer for dew in the Holy Land is recited; on the last day, the memorial service for the departed (yizkor) is added.

Shavuot (Feast of Weeks, or Pentecost). Originally an agricultural festival marking the wheat harvest, Shavuot commemorates the revelation of the Torah at Sinai. Shavuot ("weeks") takes its name from the seven weeks of grain harvest separating Passover and Shavuot. The festival is also called Hag ha-Qazir (Harvest Festival) and Yom ha-Bikkurim (Day of First Fruits). Greek-speaking Jews called it *pentēkostē*, meaning "the fiftieth" day after the sheaf offering. In rabbinic literature, Shavuot is called atzeret ("cessation, conclusion"), perhaps because the cessation of work is one of its distinctive features, or possibly because it was viewed as concluding the Passover season. In liturgical texts it is described as the "season of the giving of our Torah." The association of Shavuot with the revelation at Sinai, while not attested to in Scripture, is alluded to in the Pseudepigrapha (a collection of noncanonical writings). In rabbinic literature the association first appears in 2nd-century materials. The association, probably an ancient one, was derived in part from the book of Exodus, which dates the revelation at Sinai to the third month (counting from Nisan), *i.e.*, Sivan.

Dating Shavuot

Scripture does not provide an absolute date for Shavuot. Instead, 50 days (or seven weeks) are reckoned from the day the sheaf offering (Omer) of the harvest was brought to the Temple, the 50th day being Shavuot. According to the Talmudic rabbis, the sheaf offering was brought on the 16th of Nisan; hence Shavuot always fell on or about the 6th of Sivan. Jewish sectarians, such as the Sadducees, rejected the rabbinic tradition concerning the date of the sheaf ceremony, preferring a later date, and celebrated Shavuot accordingly.

In Temple times, aside from the daily offerings, festival offerings, and first-fruit gifts, a special cereal offering consisting of two breads prepared from the new wheat crop was offered at the Temple. Since the destruction of the Second Temple, Shavuot observances have been dominated by its commemorative aspect. Many Jews spend the entire Shavuot night studying Torah, a custom first mentioned in the Zohar ("Book of Splendour"), a Kabbalistic work edited and published in the 13th–14th centuries. Some prefer to recite the *tiqqun lel* Shavuot ("Shavuot night service"), an anthology of passages from Scripture and the Oral Law (Mishna) compiled in the late medieval period. An expanded liturgy includes Hallel, public readings from the Torah, yizkor (in many congregations), and musaf. The Book of Ruth is read at the synagogue service, possibly because of its harvest-season setting.

Sukkot (Tabernacles). Sukkot ("booths"), an ancient harvest festival that commemorates the booths the Israelites resided in after the Exodus, was the most prominent of the three pilgrim festivals in ancient Israel. Also called Hag ha-Asif (Festival of Ingathering), it has retained its joyous, festive character through the ages. It begins on Tishre 15 and is celebrated for seven days. The concluding eighth day (plus a ninth day in the Diaspora), Shemini Atzeret, is a separate holiday. In Temple times, each day of Sukkot had its own prescribed number of sacrificial offerings. Other observances, recorded in the Mishna tractate Sukka, include the daily recitation of Hallel, daily circumambulation of the Temple altar, a daily water libation ceremony, and the nightly bet ha-sho'eva or she'uvah ("place of water drawing") festivities starting on the evening preceding the second day. The last mentioned featured torch dancing, flute playing, and other forms of musical and choral entertainment.

Ideally, Jews are to reside in booths—walled structures covered with thatched roofs—for the duration of the festival; in practice, most observant Jews take their meals in the sukka ("booth) but reside at home. A palm-tree branch (lulav), bound up together with myrtle (*hadas*) and willow ('arava) branches, is held together with a citron (etrog) and waved. Medieval exegetes provided ample (if not always persuasive) justification for the Bible's choice of these particular branches and fruit as symbols of rejoicing. The numerous regulations governing the sukka, lulav, and etrog comprise the major portion of the treatment of Sukkot in the codes of Jewish law. The daily Sukkot liturgy includes the recitation of Hallel, public readings from the Torah, the musaf service, and the circumambulation of the synagogue dais. On the last day of Sukkot, called Hoshana Rabba (Great Hoshana) after the first words of a prayer (hoshana, "save us") recited then, seven such circumambulations take place. Kabbalistic (mystical) teaching has virtually transformed Hoshana Rabba into a solemn day of judgment.

Simhat Torah

Hoshana Rabba is followed by Shemini Atzeret (Eighth Day of Solemn Assembly), which is celebrated on Tishri 22 (in the Diaspora also Tishri 23). None of the more distinctive Sukkot observances apply to Shemini Atzeret; but Hallel, public reading from the Torah, yizkor (in many congregations), musaf, and a prayer for rain in the Holy Land are included in its liturgy. Simhat Torah (Rejoicing of the Law) marks the annual completion of the cycle of public readings from the Torah. The festival originated shortly before the gaonic period (*c.* 600–1050 CE) in Babylon, where it was customary to conclude the public readings annually. In Palestine, where the public readings were concluded approximately every three years, Simhat Torah was not celebrated annually until after the gaonic period. Israeli Jews celebrate Simhat Torah and Shemini Atzeret on the same day; in the Diaspora, Simhat Torah is celebrated on the second day of Shemini Atzeret. Its joyous celebrations bring the Sukkot season to an appropriate close.

Ten Days of Penitence. The Ten Days of Penitence begin on Rosh Hashana and close with Yom Kippur. Already in Talmudic times they were viewed as forming an especially appropriate period of introspection and repentance. Penitential prayers (selihot) are recited prior to the daily morning service and, in general, during the period scrupulous observance of the Law is expected.

Rosh Hashana (New Year). According to Mishnaic teaching, the New Year festival ushers in the Days of Judgment for all of mankind. Despite its solemnity, the festive character of Rosh Hashana is in no way diminished. In Scripture it is called "a day when the horn is sounded"; in the liturgy "a day of remembrance." In the land of Israel and in the Diaspora, Rosh Hashana is celebrated on the first two days of Tishri. Originally celebrated by all Jews on Tishri 1, calendrical uncertainty led to its being celebrated an additional day in the Diaspora and, depending upon the circumstances, one or two days in Palestine. After the calendar was fixed in 359, it was regularly celebrated in Palestine on Tishri 1 until the 12th century, when Provençal scholars introduced the two-day observance. Considerable speculation in recent literature concerning the origin of the Jewish New Year festival proves mostly that its early history can only be conjectured, not reconstructed.

The most distinctive Rosh Hashana observance is the sounding of the ram's horn (shofar) at the synagogue service. Medieval commentators suggest that the blasts acclaim God as Ruler of the universe, recall the divine revelation at Sinai, and are a call for spiritual reawakening and repentance. An expanded New Year liturgy stresses God's sovereignty, his concern for man, and his readiness to forgive those who repent. On the first day of Rosh Hashana (except when it falls on the sabbath) it is customary for many to recite penitential prayers at a river, symbolically casting their sins into the river; this ceremony is called tashlikh ("thou wilt cast"). Other symbolic ceremonies, such as eating bread and apples dipped in honey, accompanied with prayers for a "sweet" and propitious year, are performed at the festive meals.

Yom Kippur (Day of Atonement). The most solemn of the Jewish festivals, Yom Kippur is a day when sins are confessed and expiated and man and God are reconciled. It is also the last of the Days of Judgment and the holiest day of the Jewish year. Celebrated on Tishri 10, it is marked by fasting, penitence, and prayer. Work, eating, drinking, washing, anointing one's body, sexual intercourse, and donning leather shoes are all forbidden.

The kol *nidre* prayer

In Temple times, Yom Kippur provided the only occasion for the entry of the high priest into the Holy of Holies; details of the expiatory rites performed by the high priest and others are recorded in the Mishna and recounted in the liturgy. Present-day observances begin with a festive meal shortly before Yom Kippur eve. The *kol* nidre prayer (recited before the evening service) is a legal formula which absolves Jews from fulfilling solemn vows, thus safeguarding them from accidentally violating a vow's stipulations. The formula first appears in gaonic sources (derived from the Babylonian Talmudic academies, 6th–11th centuries) but may be older; the haunting melody that accompanies it is of medieval origin. Virtually the entire day is spent in prayer at the synagogue, the closing service (ne'ila) concluding with the sounding of the ram's horn.

Minor festivals: Hanukka and Purim. Hanukka and Purim are joyous festivals lacking the work restrictions characteristic of the major festivals.

Hanukka (Feast of Dedication). Hanukka commemorates the Maccabean (or Hasmonean) victories over the forces of the Seleucid king Antiochus IV Epiphanes (reigned 175–164 BCE), and the rededication of the Temple Kislev 25, 164 BCE. Led by Mattathias and his son Judah Maccabee, the Maccabees were the first Jews who fought to defend their religious beliefs rather than their lives. Hanukka is celebrated for eight days beginning on Kislev 25. The Hanukka lamp or candelabrum (*menora*), which recalls the Temple lampstand, is kindled each evening. One candle is lit the first evening; an additional candle is lit each subsequent evening until eight candles are lit on the last evening. According to the Talmud (Shabbat 21b), the ritually pure oil available at the rededication of the Temple was sufficient for only one day's light but miraculously lasted for eight days, hence the eight-day celebration of Hanukka. Evidence from the Apocrypha (writings excluded from the Jewish canon but included in the Roman Catholic and Eastern Orthodox canons) and rabbinic literature shows an association between Sukkot and Hanukka, possibly accounting for the latter's eight-day duration. Hanukka joy is expressed in festive meals, song, games, and gifts to children. The liturgy includes Hallel, public readings from the Torah, and the ʿ*al ha-nissim* ("for the miracles") prayer. The Scroll of Antiochus, an early medieval account of Hanukka, is read in some synagogues and homes.

Biblical background of Purim

Purim (Feast of Lots). As recorded in the biblical Book of Esther, Purim commemorates the delivery of the Persian Jewish community from the plottings of Haman, Ahasuerus' (perhaps Xerxes, king of Persia, 486–465 BCE) prime minister. Mordecai and his cousin Esther, the King's Jewish wife, interceded on behalf of the Jewish community, rescinded the royal edict authorizing a pogrom against the Jews, and instituted the Purim festival. The historicity of the biblical account is questioned by many modern scholars. It is now generally conceded that the Book of Esther was written in the Persian period (it contains Persian but not Greek words) and reflects Persian custom. Except for the Book of Esther, the earliest mention of the Purim festival is from the 2nd–1st centuries BCE. The name of the festival was derived from the Akkadian *pûru*, meaning "lot."

In most Jewish communities, Purim is celebrated on Adar 14 (some also celebrate it on the 15th, others only on the 15th). On the evening preceding Purim, men, women, and children gather in the synagogue to hear the Book of Esther read from a scroll (*megilla*). The reading is repeated Purim morning. A festive meal during the day is accompanied by much song, wine, and merriment. Masquerades, Purim plays, and other forms of parody are common. Friends exchange gifts of foodstuffs and also present gifts to the poor. Aside from the Esther readings, the liturgy includes public reading from the Torah and recital of the Purim version of the ʿ*al ha-nissim* prayer.

The five fasts. The commemorative aspects of the fasts are bound up with their penitential aspects, all of which find expression in the liturgy. Thus the Jew not only relives the tragic history of his people with each fast, but is also afforded an opportunity to search within himself and focus on his own (and his people's) present and future. Penitential prayers (selihot) are recited on all fasts, and the Torah is read at the morning and afternoon services.

'Asara be-Tevet (Fast of Tevet 10) commemorates the beginning of the siege of Jerusalem by Nebuchadnezzar, king of Babylonia, in 588 BCE.

Shiva' 'Asar be-Tammuz (Fast of Tammuz 17) commemorates the first breach in the wall of Jerusalem by the Romans in 70 CE. It initiates three weeks of semi-mourning that culminate with Tisha be-Av.

Tisha be-Av (Fast of Av 9) commemorates the destruction of the First and Second Temples in 586 BCE and 70 CE. The most solemn of the five fasts, its self-denials are more rigorous than those prescribed for the others, and, like Yom Kippur, the fast begins at sunset. The book of Lamentations is read at the evening service, followed by poetic laments that are also recited Tisha be-Av morning.

Tzom Gedaliahu (Fast of Gedaliah) commemorates the slaying of Gedaliah, governor of Judah after the destruction of the First Temple.

Ta'anit Esther (Fast of Esther), which commemorates Esther's fast (cf. Esther 4:16), is first mentioned in gaonic literature.

The lesser holidays. Rosh Hodesh (First Day of the Month). A major festival in the biblical period, this day gradually lost most of its festive character. Since Talmudic times, it has been customary to recite Hallel on Rosh Hodesh. In the medieval period, aside from the liturgical practices carried over from the Talmudic period, it was celebrated with a festive meal. Always more diligently observed in Palestine than in the Diaspora, attempts to revive its full festive character are being made in modern Israel.

Tu *bi-Shevat* (New Year for Trees). First mentioned in the Mishna, where it marks the New Year for tithing purposes, it assumed a festive character in the gaonic period, and later in the medieval period it became customary to eat assorted fruits on the holiday. In modern times it is associated with the planting of trees in Israel.

Lag *ba-Omer* (*33rd* Day of the Omer Counting). It is a joyous interlude in the otherwise somber period of Omer counting (*i.e.*, of the 49 days to Shavuot), which is traditionally observed as a time of semi-mourning.

Usually celebrated as a school holiday with outings, it is first mentioned in medieval sources, which attribute its origin to the cessation of a plague that was decimating the students of Akiba, an influential rabbinic sage in the 2nd century, and to the anniversary of the death of another great rabbi, Simeon ben Yoḥai (died *c.* 170 CE).

THE SITUATION TODAY

Modern attitudes toward the sabbath and festivals vary considerably. Acculturated Jews under the sway of Western secularism often are ignorant of, or choose to neglect, traditional observances. Attitudes of committed Jews in the Western world are patterned mostly along the lines of accepted Orthodox, Conservative, and Reform practice. Thus for example, driving to synagogue services on the sabbath is unthinkable in Orthodox circles, a matter of dispute among Conservative rabbis, and normative practice for Reform Jews. Among Orthodox Jews, who best preserve the traditional observances, contemporary discussion centres mostly on technological advances and their effect on Halakhic practice (the behaviour laid down in the written and oral Torah). Whether or not hearing aids may be worn on the sabbath, and how crossing the international dateline affects observance of sabbaths and festivals typify the sort of problem raised in Orthodox *responsa* ("replies" to questions on law and observance). Recent (and often heated) discussion in conservative literature raises the possibility of abolishing the obligatory character of the additional festival days in the Diaspora (except for the second day of Rosh Hashana), thus unifying Jewish practice throughout the world. Reform Jews, the most innovative of the three groups, observe neither the additional festival days (including the second day of Rosh Hashana) nor the fasts and have introduced numerous modifications in the liturgy as well as in the observances. In recent years more radical Reform congregations have experimented freely with "psychedelic" sound and light effects and other novel forms of synagogue service.

In Israel sabbath is the national day of rest, and Jewish holidays are vacation periods. Municipal ordinances govern public observance of the sabbath and festivals; their enactment and enforcement vary with the political influence of the local Orthodox Jewish community. Attempts to interpret festivals along nationalistic lines are common; some kibbutzim (communal farms) stress the agricultural significance of the festivals. Independence Day is a national holiday; the preceding day, Remembrance Day, commemorates Israel's war dead. Yom Hashoa (Holocaust Day)—marking the systematic destruction of European Jewry between 1933 and 1945 and recalling the short-lived Ghetto uprisings—is commemorated officially on Nisan 27; many religious Israelis prefer to commemorate it on Tebet 10 (a fast day) now called *yom ha-qaddish* (day upon which the mourner's prayer is recited). Since the June 1967 war, Iyyar 28—Liberation of Jerusalem Day—is celebrated unofficially by many Israelis. Appropriate services are conducted on all the aforementioned holidays by most segments of Israel's religious community.

In Israel and the Diaspora, Jewish theologians often stress the timelessness and contemporaneity of holiday observances. Nevertheless, "revised" Passover Haggadot (plural of Haggada) in which contemporary issues are accorded a central position, appear regularly.

Scholarly research into the origin of the festivals, if unabated, has not advanced significantly in recent years, nor is it likely to unless new evidence is forthcoming. Attempts to trace the development and spread of festival observances have fared better, and studies such as A. Yaari's ***History of the Simhat Torah Festival*** (in Hebrew) bode well for the future.

BIBLIOGRAPHY. ROLAND DE VAUX, ***Les Institutions de l'Ancien Testament, 2*** vol. (1958–60; Eng. trans., ***Ancient Israel: Its Life and Institutions,*** 1961), summarizes the present state of biblical scholarship regarding the origin and development of the Jewish calendar, sabbath, and festivals. Other relevant works include: THEODOR H. GASTER, ***Festivals of the Jewish Year*** (1953), an anthropological, comparative, and often speculative approach to the sabbath and festivals; SHLOMO YOSEF ZEVIN, ***ha-Mo'adim ba-halakhah*** (1944), a modern classic (in Hebrew) treating talmudic and post-talmudic developments in the festival observances; and MENAHEM M. KASHER, ***Torah Shelemah,*** vol. *13* (1949), a comprehensive history of the Jewish calendar, also in Hebrew.

(S.Z.L.)

JimCnez de Cisneros, Francisco, Cardinal

Cardinal Francisco Jiménez de Cisneros, Spanish cardinal, grand inquisitor, and statesman, was the first of the great series of 16th-century ecclesiastics, both Catholic and Protestant, who, through sheer power of intellect and force of personality, rose from humble beginnings to commanding positions in the religious and political life of their countries.

FUNDATOR. ✠. F. F. X. CARDINALIS HISP. ARCHIEPIS. TOL. COMPLVT. ACADEMIÆ

Jiménez de Cisneros, engraving after a bust by Felipe Vigarny (d. 1543).

Early life

Jiménez was born at Torrelaguna, in Castile, Spain, in 1436, the son of a poor hidalgo (lower nobility) tax collector, and was christened Gonzalo. He studied at the University of Salamanca and, after taking holy orders, spent a number of years in Rome (1459–66), where he disliked the Humanists at the papal court but was impressed by their learning. Pope Paul II gave him an "expective letter" for the first vacant benefice in the Archdiocese of Toledo. The archbishop, Alfonso de Carillo, refused to accept the letter and, in 1473, when Jiménez insisted on his rights, threw him into prison. Refusing release at the price of giving up his claims, Jiménez remained in prison until 1479, when Carillo gave way. In 1482 Cardinal Pedro González de Mendoza, impressed by Jiménez' ability and strength of character, made him vicar general of the Bishopric of Sigiienza. In 1484 Jiménez gave up this post and, apparently, a brilliant career and became a monk in the Franciscan monastery of San Juan de los Reyes at Toledo, taking the name of Fray (Brother) Francisco.

In 1492, on Mendoza's recommendation, Isabella I the Catholic, of Castile, appointed him her confessor. From then on his influence grew rapidly. In 1495 he succeeded Mendoza as archbishop of Toledo. This position gave JimCnez the opportunity to initiate the reform of the Spanish clergy. At synods of Alcalá (1497) and Talavera (1498) he promulgated a series of orders: the clergy had to give up the common practice of concubinage; they were required to reside in their parishes, to go to frequent confession, and to preach and explain the gospel to their parishioners every Sunday. A simple catechism was published with the decrees. The monks, first of Jiménez' own order of the Franciscans and then of the other orders, were required to observe their traditional rules. Aristocratic ecclesiastics resented this interference with their life style and appealed to Isabella and to Rome; 400 monks from Andalusia even fled to North Africa with their "wives" and became Muslims. But gradually the reforms became effective, at least in the monastic orders.

Against the advice of Hernando de Talavera, archbishop of Granada (who wanted to convert the Moors of Granada slowly by education), Jiménez introduced forced mass conversions. The Moriscos, although now nominally Christians, were neither willing to be assimilated to the Christian Spaniards nor were they accepted as equals by the latter. Jiménez' intervention was the direct cause of a Moorish revolt in 1499–1500, and he must be held largely responsible for making the Morisco problem insoluble. In 1609 the Moriscos were finally expelled from Spain.

Appointed grand inquisitor

Jiménez spent the last years of Isabella's reign mostly at her court as her principal religious and political adviser. Upon her death, in 1504, he supported the claims of Ferdinand II the Catholic, of Aragon, against his son-in-law, Philip of Burgundy, but helped to mediate the Agreement of Salamanca, which left Philip as king of Castile. On Philip's death (1506) Jiménez set up a regency government for Ferdinand, who was in Naples at the time, and stopped the intrigues of a group of high nobles who wanted to make over the regency lo the emperor Maximilian I. Ferdinand made him grand inquisitor and obtained for him the cardinal's hat in 1507. As grand inquisitor, Jiménez insisted that the inquisitors observe the inquisitorial rules strictly, but he also extended the authority of the Supreme Council of the Inquisition (the "Holy Office") over the local inquisitorial courts. It was said that he offered from his own resources to pay Ferdinand the sum of 600,000 ducats, which the *conversos* (converted Jews) had offered the King for the abolition of the Inquisition.

Jiménez was the guiding spirit behind the Spanish campaigns in North Africa (1505–10), which he helped finance from his archiepiscopal revenues. But, because of a greater interest in Italy, Ferdinand was content with the capture of Oran and other ports and refused to support Jiménez' plan for a crusade to conquer all North Africa.

Jimtnez knew that the reform of the morals and pastoral work of the clergy could not be effective without a parallel intellectual reform of the church. He thus began planning the foundation of a new university at Alcalá de Henares in 1498. It opened in 1508. Apart from the usual chairs in Thomist theology, Jiménez also established chairs in Scotist and Nominalist theology, as well as in Oriental languages. He attracted some of the finest contemporary scholars to Alcala (although Erasmus refused his invitation). These scholars cooperated in the production of the famous Complutensian Polyglot Bible (completed in 1517 and published *c.* 1522).

Regent of Castile

At the death of Ferdinand (1516) Jimknez once more became regent of Castile. 'The old antagonisms between the nobility and the cities and between the Castilians and the Aragonese broke out again. Some of Ferdinand's Castilian opponents had previously gone to the court in Brussels. They were now joined by Ferdinand's Aragonese ministers, who tried to secure their position with the prospective new ruler, Ferdinand's grandson, Charles of Burgundy (later Charles I of Spain and Emperor Charles V). They were bitterly resented by those who remained in Spain. A group of Castilian nobles plotted to place Charles' young brother Ferdinand on the throne, but Jiménez forestalled them and obtained the general recognition of Charles in Castile. It was due largely to the Cardinal's efforts that Charles could take over his new kingdom without open opposition (September 1517). But Jimknez died at Roa on November 8, 1517, without seeing the new king.

BIBLIOGRAPHY. In the absence of a fully satisfactory modern biography, the CONDE DE CEDILLO, *El Cardenal Cisneros, gobernador del reino* (1921); REGINALD MERTON, *Cardinal Ximenes and the Making of Spain* (1934); and WALTER F. STARKIE, *Grand Inquisitor* (1940), are all useful. There is an excellent short account of Jiménez' ecclesiastical reforms in MARCEL BATAILLON, *Érasme et l'Espagne*, ch. 1 (1937). Some of Jiménez' correspondence is published by DIEGO LOPEZ DE AYALA, *Cartas del Cardenal Don Fray Francisco Jiménez de Cisneros* (1867); and VINCENTE DE LA FUENTE, *Cartas de los secretarios del Cardenal D. Fr. Francisco Jiménez de Cisneros* (1876).

(H.G.K.)

Jinnah, Mohammed Ali

Mohammed Ali Jinnah, an Indian Muslim politician popularly known as Qāʾid-e A'zam, or the Great Leader, was the founder of the state of Pakistan.

Early years

He was born in Karāchi on December 25, 1876, the first of seven children of Jinnahbhai, a prosperous merchant. After being taught at home, Jinnah was sent to the Sind Madrasasah High School, in 1887. Later he attended the Mission High School, where, at the age of 16, he passed the matriculation examination of the University of Bombay. On the advice of an English friend, his father decided to send him to England to acquire business experience. Jinnah, however, had made up his mind to become a barrister. In keeping with the custom of the time. his parents arranged for an early marriage for him before he left for England.

BY courtesy of the Pakistan Embassy, Washington, D.C.

Jinnah.

In London he joined Lincoln's Inn, one of the legal societies that prepared students for the bar. In 1895, at the age of 19, he was called to the bar. While in London Jinnah suffered two severe bereavements—the deaths of his wife and his mother. Nevertheless, he completed his formal studies and also made a study of the British political system, frequently visiting the House of Commons. He was greatly influenced by the liberalism of William E. Gladstone, who had become prime minister for the fourth time in 1892, the year of Jinnah's arrival in London. Jinnah also took a keen interest in the affairs of India and in Indian students. When the Parsi leader Dadabhai Naoroji, a leading Indian nationalist, ran for the English Parliament, Jinnah and other Indian students worked day and night for him. Their efforts were crowned with success, and Naoroji became the first Indian to sit in the House of Commons.

When Jinnah returned to Karāchi in 1896, he found that his father's business had suffered losses and that he now had to depend on himself. He decided to start his legal practice in Bombay, but it took him years of work 'to establish himself as a lawyer.

It was nearly 10 years later that he turned toward active politics. A man without hobbies, his interest became divided between law and politics. Nor was he a religious zealot: he was a Muslim in a broad sense and had little to do with sects. His interest in women was also limited to Ruttenbai, the daughter of Sir Dinshaw Petit, a Bombay Parsi millionaire, whom he married over tremendous opposition from her parents and others. The marriage proved an unhappy one. It was his sister Fatima who gave him solace and company.

Jinnah first entered politics by participating in the 1906 Calcutta session of the Indian National Congress, the party that called for dominion status and later for independence for India. Four years later he was elected to the Imperial Legislative Council—the beginning of a long and distinguished parliamentary career. In Bombay he came to know, among other important Congress personalities, Gopal Krishna Gokhale, the eminent Marāthā leader. Greatly influenced by these nationalist politicians, Jinnah aspired during the early part of his political life to become "a Muslim Gokhale." Admiration for British political institutions and an eagerness to raise the status of India in the international community and to develop a sense of Indian nationhood among the peoples of India were the chief elements of his politics. At that time, he still looked upon Muslim interests in the context of Indian nationalism.

But by the beginning of the 20th century, the conviction had been growing among the Muslims that their interests demanded the preservation of their separate identity rather than amalgamation in the Indian nation that would for all practical purposes be Hindu. Largely to safeguard Muslim interests, the All-India Muslim League was founded in 1906. But Jinnah remained aloof from it. Only in 1913, when authoritatively assured that the league was as devoted as the Congress to the political emancipation of India, did Jinnah join the league. When the Indian Home Rule League was formed, he became its chief organizer in Bombay and was elected president of the Bombay branch.

"Ambassador of Hindu–Muslim unity"

Jinnah's endeavours to bring about the political union of Hindus and Muslims earned him the title of "the best ambassador of Hindu–Muslim unity," an epithet coined by Gokhale. It was largely through his efforts that the Congress and the Muslim League began to hold their annual sessions jointly, to facilitate mutual consultation and participation. In 1915 the two organizations held their meetings in Bombay and in 1916 in Lucknow, where the Lucknow Pact was concluded. Under the terms of the pact, the two organizations put their seal to a scheme of constitutional reform that became their joint demand vis-8-vis the British government. There was a good deal of give and take, but the Muslims obtained one important concession in the shape of separate electorates, already conceded to them by the government in 1909 but hitherto resisted by the Congress.

Meanwhile, a new force in Indian politics had appeared in the person of Gandhi. Both the Home Rule League and the Indian National Congress had come under his sway. Opposed to Gandhi's non-cooperation movement and his essentially Hindu approach to politics, Jinnah left both the Home Rule League and the Indian National Congress in 1920. For a few years he kept himself aloof from the main political movements. He continued to be a firm believer in Hindu–Muslim unity and constitutional methods for the achievement of political ends. After his withdrawal from the Congress, he used the Muslim League platform for the propagation of his views. But during the 1920s the Muslim League, and with it Jinnah, had been overshadowed by the Congress and the religiously oriented Muslim Khilāfat committee.

When the failure of the non-cooperation movement and the emergence of Hindu revivalist movements led to antagonism and riots between the Hindus and Muslims, the league gradually began to come into its own. Jinnah's problem during the following years was to convert the league into an enlightened political body prepared to cooperate with other organizations working for the good of India. In addition, he had to convince the Congress, as a prerequisite for political progress, of the necessity of settling the Hindu–Muslim conflict.

To bring about such a rapprochement was Jinnah's chief purpose during the late 1920s and early 1930s. He worked toward this end within the legislative assembly, at the Round Table Conferences in London (1930–32), and through his fourteen points, which included proposals for a federal form of government, greater rights for minorities, one-third representation for Muslims in the central legislature, separation of the predominantly Muslim Sind region from the rest of the Bombay province, and the introduction of reforms in the North-West Frontier Province. But he failed. His failure to bring about even minor amendments in the Nehru Committee proposals (1928) over the question of separate electorates and reservation of seats for Muslims in the legislatures frustrated him. He found himself in a peculiar position at this time; many Muslims thought that he was too nationalistic in his policy and that Muslim interests were not safe in his hands, while the Indian National Congress would not even meet the moderate Muslim demands halfway. Indeed, the Muslim League was a house divided against itself. The Punjab Muslim League repudiated Jinnah's leadership and organized itself separately. In disgust, Jinnah decided to settle in England. From 1930 to 1935 he remained in London, devoting himself to practice before the Privy Council. But when constitutional changes were in the offing, he was persuaded to return home.

Soon preparations started for the elections under the Government of India Act of 1935. Jinnah was still thinking in terms of cooperation between the Muslim League and the Hindu Congress and with coalition governments in the provinces. But the elections of 1937 proved to be a turning point in the relations between the two organizations. The Congress obtained an absolute majority in six provinces, and the league did not do particularly well. The Congress decided not to include the league in the formation of provincial governments and exclusive all-Congress governments were the result. Relations between Hindus and Muslims started to deteriorate, and soon Muslim discontent became boundless.

Creator of Pakistan

At this point, Jinnah emerged as the leader of a renascent Muslim nation. Events began to move fast. On December 22, 1939, soon after the resignation of the provincial Congress ministries, Jinnah called upon the Muslims to observe "the Day of Deliverance." Three months later, on March 22–23, 1940, in Lahore, the league adopted a resolution to form a separate Muslim state, Pakistan. The Pakistan idea was first ridiculed and then tenaciously opposed by the Congress. But it captured the imagination of the Muslims. Pitted against Jinnah were men of the stature of Gandhi and Nehru. And the British government seemed to be intent on maintaining the political unity of the Indian subcontinent. But Jinnah led his movement with such skill and tenacity that ultimately both the Congress and the British government had no option but to agree to the partitioning of India. Pakistan thus emerged as an independent state in 1947.

Jinnah became the first head of the new state. Faced with the serious problems of a young nation, he tackled Pakistan's problems with authority. He was regarded not as merely the governor general but was revered as the father of the nation. He worked hard until overpowered by age and disease, and he died in Karāchi, the place of his birth, on September 11, 1948.

BIBLIOGRAPHY. A definitive biography of Mohammed Ali Jinnah is yet to be written. But there are several readable accounts of his life and work both by Pakistani and foreign writers, the most recent of which is GULAM A. ALLANA, ***Quaid-e-Azam Jinnah: The Story of a Nation*** (1967). ***A*** more widely read book is HECTOR BOLITHO, ***Jinnah, Creator of Pakistan*** (1954). Among the older works MATLUBUL HASAN SAIYID, ***Mohammad Ali Jinnah: A Political Study*** (1945); and SAROJINI NAIDU, ***Mohamed Ali Jinnah, an Ambassador of Unity: His Speeches and Writings, 1912–1917*** (1920), are valuable. M.A.H. ISPAHANI, ***Qaid-e-Azam Jinnah As I Knew Him*** (1966), is written by one who worked with Jinnah in the Pakistan Movement and knew him well. JAMIL-UD-DIN AHMAD (ed.), ***Speeches and Writings of Mr. Jinnah, 2*** vol. (1960-64), ***Gandhi-Jinnah Talks*** (1944), and ***Letters of Iqbal to Jinnah*** (1963), throw light on important aspects of Jinnah's work. His role in the Pakistan Movement is dealt with in books dealing with the history of Pakistan, notably KEITH B. CALLARD, ***Pakistan*** (1957); and MOHAMMAD NOMAN, ***Muslim India*** (1942). The story of the events immediately preceding the creation of Pakistan is dealt with in CHAUDHRI MUHAMMED ALI, ***The Emergence of Pakistan*** (1967), which is an interpretation by a key figure among the Muslim officials; and V.P. MENON, ***The Transfer of Power in India*** (1957), by the most important Hindu official at the time. ALAN CAMPBELL-JOHNSON, ***Mission with Mountbatten*** (1951), is the version of one on the staff of Lord Mountbatten and is rather unsympathetic to Jinnah. A recent competent study of the events leading to Pakistan is H.V. HODSON, ***The Great Divide*** (1969).

Joachim of Fiore

Mystic, theologian, biblical commentator, philosopher of history, and founder of an order of monks, Joachim of Fiore (also Flora, or Floris) attained great renown in his lifetime, and his ideas continued to be deeply influential on spiritual movements and thought in later times.

The known facts about the life of Joachim (Italian Gioacchino) of Fiore are few. He was born at Celico, Calabria, in southern Italy, *c*. 113011135. Legends about his parentage and youth are of little historical significance, but from an autobiographical reference it seems certain that he went on a pilgrimage to the Holy Land that reputedly had an effect on his conversion to the religious life. He became a Cistercian monk at Sambucina and in 1177 abbot of Corazzo (Sicily). About 1191 he broke away from the distracting duties of administration and retired into the mountains to follow the contemplative life. Although claimed as a fugitive by the Cistercians, he was allowed by Pope Celestine III to form the disciples who gathered around him at San Giovanni in Fiore (a town in present-day Cosenza province in Calabria) into the Order of San Giovanni in Fiore in 1196. He died in 1201/1202.

Spiritual experience and prophecy

Far more significant is the evidence for the inner development of a man who came to believe that spiritual understanding would be given to one who wrestled with the "letter" of the Scriptures to get at the "spirit." Three moments of special illumination are indicated, but the first is only known in legendary form, connected with either his pilgrimage or his novitiate at Sambucina. The second, recorded by himself, took place one Easter eve, after a period of frustrated study of the biblical book of Revelation when he felt himself "imprisoned" by difficulties. In the midnight silence, suddenly his mind was flooded with clarity, and his understanding released from prison. The third was an experience at Pentecost, when, after a time of agonizing doubt on the doctrine of the Trinity, Joachim had a vision of a psaltery with ten strings, in a triangular form, that clarified the mystery through a visual symbol and called forth paeans of praise from him. He expresses this experience of illumination given after mental striving in terms of the city seen intermittently by the approaching pilgrim or of the spirit breaking through the hard rind of the letter.

He was summoned by Pope Lucius III in 1184 and urged to press on with the biblical exegesis he had begun. This probably refers to the ***Liber concordie Novi ac Veteris Testamenti,*** in which Joachim worked out his philosophy of history, primarily in a pattern of "twos"—the concords between the two great dispensations (or Testaments) of history, the Old and the New. But already Joachim's spiritual experience was creating in his mind his truly original "pattern of threes." If the ***spiritualis intellectus*** springs from the letter of the Old and New Testaments, then history itself must culminate in a final age of the spirit that proceeds from both the previous ages. Thus was born his trinitarian philosophy of history in which the three Persons are, as it were, built into the time structure in the three ages or ***status*** of the Father, Son, and Holy Spirit.

The third ***status*** was to be won by the church only after arduous pilgrimage and great tribulation, like the Israelites marching through the wilderness and crossing the Jordan River into the Promised Land. As guides through this crucial stage, Joachim prophesied the advent of two new orders of spiritual men, one of hermits to agonize for the world on the mountaintop and one a mediating order to lead men on to the new spiritual plane. Although the third age belongs ***par excellence*** to contemplatives, secular clergy and laymen are not shut out of it. In a strange diagram, a "ground plan" of the New Jerusalem, various categories of monks are grouped around the seat of God, but below, secular clergy and tertiaries (lay members) live according to their rule.

In the ***Expositio in Apocalypsim*** Joachim seeks to probe the imminent crisis of evil, as pictured in the apocalyptic symbols of Antichrist, and the life of the spirit to follow. His third main work, the ***Psalterium decem chordarum,*** expounds his doctrine of the Trinity through the symbol of his vision of the ten-stringed psaltery. Here and in a lost tract he attacked the doctrine of "quaternity" (an overemphasis on the "one essence" of the Godhead that seems to separate it from the three Persons of the Trinity and so create a fourth), which he attributed to Peter Lombard, a 12th-century theologian. Besides this trilogy, written concurrently, Joachim left minor tracts and one uncompleted major work, the ***Tractatus super quattuor Evangelia.***

Joachim was a poet and artist. His lyricism breaks through the biblical exegesis that he chose as his medium and the turgid Latin of his style. Above all, his visual imagination is expressed in the unique ***Liber figurarum*** (discovered in 1937), a book of drawings and figures thought to be a genuine work by most Joachim scholars today. Here his vision of the culminating age of history is embodied in trees that flower and bear fruit luxuriantly at the top; his doctrine of the Trinity is expressed in remarkable geometric figures; his kaleidoscopic vision fuses images in some strange shapes, such as the tree that becomes an eagle, which may have influenced Dante. Joachim's figures probably carried his ideas in exciting and popular form far more widely than his indigestible writings.

Posthumous reputation and influence

In his lifetime Joachim was acclaimed as a prophet, gifted with divine illumination, and this is how he was seen by the first chroniclers after his death. The condemnation of his tract against Peter Lombard by the fourth Lateran Council in 1215 dimmed his reputation for a time, but the appearance of the Franciscan and Dominican mendicant orders, hailed as Joachim's new spiritual men, re-established him as a prophet. The Spiritual Franciscans at mid-13th century and various other friars, monks, and sects down to the 16th century appropriated his prophecy of a third age. But Joachim has always had a double reputation, as saint and as heretic, for cautious Christian thinkers and leaders have seen his writings as highly dangerous. The debate as to whether he was orthodox or heretic continues today.

BIBLIOGRAPHY

Chief works of Joachim: ***Liber concordie Novi ac Veteris Testamenti; Expositio in Apocalypsim*** (1527); ***Psalterium decem chordarum*** (1527); ***Tractatus super quattuor Evangelia,*** ed. by E. BUONAIUTI (1930); ***Liber figurarum,*** ed. by L. TONDELLI, M. REEVES, and B. HIRSCH-REICH (1954).

Secondary works: E. BUONAIUTI, ***Gioacchino da Fiore, i tempi, la vita, il messaggio*** (1931), good for background, some disputed views; A. CROCCO, ***Gioacchino da Fiore*** (1960), excellent on some aspects of Joachim's theology; H. GRUNDMANN, ***Studien iiber Joachim von Floris*** (1927), a fundamental work from which all modern research starts; ***Neue Forschungen iiber Joachim von Fiore*** (1950), surveys recent work to date; M. REEVES, ***The Influence of Prophecy in the Later Middle Ages: A Study in Joachimism*** (1969), attempts to trace Joachim's influence after his death; M. REEVES and B. HIRSCH-REICH, ***The*** Figurae ***of Joachim of Fiore*** (1972); L. TONDELLI, ***Il Libro delle Figure dell'Abate Gioacchino da Fiore,*** vol. 1 (1953), states the case for the authenticity of the ***Liber figurarum*** and examines its influence, especially on Dante; F. RUSSO, ***Bibliografia gioachimita*** (1954), useful but full of errors; K. LOWITH, ***Meaning in History,*** ch. 8 (1949), a consideration of the effects of Joachim's prophecy on modern political developments and ideology.

Articles: M.W. BLOOMFIELD, "Joachim of Flora: **A** Critical Survey of His Canon, Teachings, Sources, Biography and Influence," ***Traditio,*** 13:249–311 (1957); M. REEVES, "The ***Liber figurarum*** of Joachim of Fiore," ***Mediaeval and Renaissance Studies,*** 2:57–81 (1950), a short study with some illustrations.

(M.E.R.)

Joan of Arc, Saint

St. Joan of Arc was a peasant girl who, believing that she was acting under divine guidance, led the French army in repulsing an English attempt to conquer their country during the Hundred Years' War in a momentous victory at Orléans and, captured a year afterward, was burned by the English as a heretic. She became the greatest national heroine of her compatriots. Her achievement was a decisive factor in the revival of French determination to oust the English from France and in the awakening of French national consciousness.

St. Joan, equestrian miniature from the manuscript La *Vie des femmes célèbres* by Antoine Dufour, c. 1505. In the Musée Archéologique Thomas Dobrée, Nantes, France.
Giraudon

Joan was born the daughter of a plowman, Jacques of Arc, and baptized c. 1412 at Domremy, a village in the French part of the Duchy of Bar, between Champagne and Lorraine. She had three brothers, Jacquemin, Pierre, and Jean, and one sister, Catherine, who died while young. Joan, a peasant girl without formal learning, acquired her faith and her prayers from her mother. She was later remembered by her friends and neighbours as a hardworking, good, simple, and exceptionally pious child. At 13 she began to hear a voice from God that taught her self-discipline; later, the voice told her to go to France, where she would raise the siege of Orleans. She declared that she frequently saw St. Michael, St. Catherine, and St. Margaret, the patron saints of her country. These "voices" were to guide Joan throughout her life.

JOAN'S MISSION

The crown of France at the time was in dispute between the dauphin Charles, the son and heir of Charles VI, and the English king Henry VI, whose armies, in alliance with the Burgundians, were occupying nearly all the northern part of the kingdom. The apparent hopelessness of the Dauphin's cause at the end of 1427 was increased by the fact that, five years after his father's death, he had still not been crowned at Reims, the traditional place for the investiture of French kings. Reims was well within the territory held by his enemies. As long as the Dauphin remained unconsecrated, the rightfulness of his claim to be king of France was open to grave question in the minds of the people.

Led by her "voices," Joan, in May 1428, travelled from Domremy to Vaucouleurs, the nearest stronghold still loyal to the Dauphin, where she asked a captain for permission to join the Dauphin. He did not take the 16-year-old girl and her visions seriously, and she returned to Domremy. Joan went to Vaucouleurs again in January 1429; this time her quiet firmness and piety gained her the respect of the people, and the captain, persuaded that she was neither a witch nor feeble-minded, allowed her to go to the Dauphin at Chinon. She left Vaucouleurs about February 13, 1429, dressed in men's clothes and accompanied by six men-at-arms. Crossing territory held by the enemy, and after travelling for 11 days, she reached Chinon.

Meeting with the Dauphin

Joan at once went to the castle occupied by the Dauphin. He was uncertain whether to receive her and took counsel, receiving conflicting advice; but two days later Joan was granted an audience. The Dauphin had hidden himself among his courtiers, but she made straight for him and told him that she wished to go and make war against the English and that she would have him crowned at Reims. On the Dauphin's orders she was immediately interrogated by ecclesiastical authorities in the presence of Jean, Duc d'Alençon, a relative of Charles, who showed himself well-disposed toward Joan. For three weeks she was further questioned by eminent theologians at Poitiers. These examinations were occasioned by the ever-present fear of heresy. Joan told the ecclesiastics that it was not at Poitiers but at Orleans that she would give proof of her mission; and forthwith she dictated letters of defiance to the English. In their report the churchmen suggested that in view of the desperate situation of Orléans, which had been besieged by the English for several months, the Dauphin would be well-advised to make use of her.

Joan returned to Chinon. At Tours, during April, the Dauphin provided her with a military household of several men; Jean d'Aulon became her squire. She was joined by her brothers Jean and Pierre. She had her standard painted and a banner made for her; when the question of a sword was brought up, she declared that it would be found in the church of Sainte-Catherine-de-Fierbois, and one was in fact discovered there.

The troops, numbering several hundreds of men, were mustered at Blois and on April 27, 1429, they set out for Orléans. The city, besieged since October 12, 1428, was almost totally surrounded by a series of English strongholds. When Joan and La Hire, one of the French commanders, entered with supplies on April 29, she was told that action must be deferred until further reinforcements could be brought in.

The relief of Orléans

On the evening of May 4, when she was resting, Joan suddenly sprang up, apparently inspired, and announced that she must go and attack the English. Having herself armed, she hurried out to the east of the city toward an English fort, where, indeed, an engagement of which she had not been told was taking place. Her arrival aroused the French, who took the fort. The next day Joan addressed another of her letters of defiance to the English. On the morning of May 6 she crossed to the south bank of the river and advanced toward another fort; the English immediately evacuated it in order to defend a stronger position nearby, but Joan and La Hire attacked them there and took it by storm. Very early on May 7 the French advanced against the fort of Les Tourelles. Joan was wounded but quickly returned to the fight and it was thanks to her tenacity that the French commanders maintained the attack until the English capitulated. Next day the English were seen to be retreating, but, because it was a Sunday, Joan refused to allow any pursuit.

Joan left Orleans on May 9, 1429, and met the Dauphin at Tours. She urged him to make haste to Reims for his coronation. Though he hesitated because some of his counsellors were advising him to undertake the conquest of Normandy, Joan's importunity ultimately carried the day. It was decided, however, first to clear the English out of the other towns along the Loire River. Having met her friend the Duc d'Alençon, whom the Dauphin had made lieutenant general of the French armies, they moved off together and took a town and an important bridge. They then attacked Beaugency, whereupon the English retreated into the castle. Despite the opposition of the Dauphin and Georges de La Trémoille, one of his favourites, and the reserve of Alençon, Joan received the Constable de Richemont, who was under suspicion at the French court. After making him swear fidelity she accepted his help.

Battle of Patay

The French and English armies came face to face at Patay on June 18, 1429. Joan promised success to the French, saying that Charles would that day win a greater victory than any he had won so far. The victory was, indeed, complete: the English army was routed and with it, finally, its reputation for invincibility. A contemporary chronicler, although a partisan of Burgundy, freely acknowledged that Joan had now won so much honour and renown that all felt that the king's enemies had no longer any power against her.

Instead of pressing home their advantage by a bold attack upon Paris, Joan and the French commanders turned back to rejoin the Dauphin, who was staying with La Trémoille at Sully-sur-Loire. Accompanying the vacillating Charles on his perambulations among the towns along the Loire, she argued all the time to overcome his hesitancy and the advice of hostile counsellors. She was not unaware of the danger and difficulties but declared them of no account, insisting on the necessity of going swiftly to Reims. Ultimately she won Charles to her view.

Coronation of the Dauphin

From June 25, 1429, the army began to assemble at Gien; it was from there that the Dauphin sent out the customary letters of summons to the coronation. Joan wrote two letters: one to the people of Tournai, always loyal to Charles, the other to Philip the Good, the duke of Burgundy. She and the Dauphin set out on the march to Reims on June 29. Before arriving at Troyes, Joan wrote to the inhabitants, promising them pardon if they would submit. They countered by sending a friar, the popular preacher Brother Richard, to take stock of her; but though he returned full of enthusiasm for the Maid and her mission, the townsfolk decided after all to remain loyal to the English. The Dauphin held a council and Joan proposed that the town should be attacked; the next morning she began the assault and the inhabitants at once asked for terms. The royal army then marched on to Chalons; despite an earlier decision to resist, the count-bishop handed its keys to Charles. On July 16 the royal army reached Reims, which opened its gates to Charles. His coronation took place on July 17. Joan was present at the consecration, standing with her banner not far from the altar. After the ceremony she knelt before Charles, calling him her king for the first time. That very day she wrote to the Duke of Burgundy, adjuring him to make his peace with the King and to withdraw his garrisons from the royal fortresses.

The King left Reims on July 20, 1429, and for a month the army paraded through Champagne and the Île-de-France. On August 2 Charles decided on a retreat to the Loire, which implied abandoning the plan to attack Paris. The loyal towns that would thus have been left to the enemy's mercy expressed some alarm; Joan, who was opposed to Charles's decision, wrote to reassure the citizens of Reims on August 5, saying that the Duke of Burgundy, now in possession of Paris, had made a fortnight's truce, after which it was hoped that he would yield Paris to the King. In fact, on August 6, English troops prevented the royal army from crossing the Seine at Bray, so that it fell back on Provins, much to the delight of Joan and the commanders. Everywhere acclaimed, Joan was now, according to a contemporary chronicler, the idol of the French. For her part, she was enchanted with the people and the land and expressed the wish that, if it pleased God, she might, when she had finished her days, be buried in that district. She confided to Renaud de Chartres, the archbishop of Reims, that she would now like to go back to tending her parents' flocks.

Near Senlis, on August 14, 1429, the French and English armies again came face to face as at Patay; but this time only skirmishes took place, neither side daring to start a battle, though Joan carried her standard up to the enemy's earthworks and openly challenged them. Meanwhile Compiègne, Beauvais—whence the bishop, Pierre Cauchon, who was later to be one of Joan's two judges, fled precipitately—Senlis, and other towns north of Paris surrendered to the King; soon afterward, on August 28, a four months' truce for all the territory north of the Seine was concluded with the Burgundians.

Attack on Paris

Joan, however, was becoming more and more impatient; she thought it essential to take Paris. She and Alençon were at Saint-Denis on the northern outskirts of Paris on August 26, and the Parisians began to organize their defenses: Charles arrived on September 7 and an attack was launched on September 8, directed between the gates of Saint Honoré and Saint-Denis. The Parisians could be in no doubt of Joan's presence among the besiegers: she stood forward on the earthworks, calling on them to surrender their city to the King of France. Wounded, she continued to encourage the soldiers until she had to abandon the attack. When next day she and Alençon sought to renew the assault, they were ordered to retreat. Charles VII retired to the Loire, Joan following him. At Gien, which they reached on September 22, 1429, the army was disbanded and Alençon and the other captains went home. Only Joan remained with the King. Later on, when Alençon was planning a campaign in Normandy, he asked the King to let Joan rejoin him, but La Trémoille and other courtiers dissuaded him, and Joan went with the King to Bourges, where many years later her goodness and her generosity to the poor were recalled. Nearby Joan met a clairvoyant, who told Joan that she wished to effect a reconciliation between the Duke of Burgundy and the King of France. Joan replied that in her view no peace could be found save at the lance's point; and she told Charles that the woman's pronouncements were foolish and empty. In October 1429 she was sent against Saint-Pierre-le-Moutier; it was through her courageous assault, with only a few men, that the town was taken. Laying siege to La Charité-sur-Loire, and short of munitions, they appealed to neighbouring towns for help. The supplies arrived too late and after a month they had to raise the siege.

Battle of Compiègne

Joan then rejoined the King, who was spending the winter in towns along the Loire. Late in December 1429, Charles issued letters patent ennobling Joan, her parents, and her brothers. Early in 1430 the Duke of Burgundy began to threaten Brie and Champagne; the citizens of Reims became alarmed and Joan wrote to them in March to assure them of the King's concern and that she would come to their defense. When the Duke of Burgundy moved up to attack Compikgne, the townsfolk determined to resist and, in late March or early April, Joan left the King and set out to their aid, accompanied only by her brother Pierre, her squire Jean d'Aulon, and a small troop of men-at-arms. She arrived at Melun in the middle of April, and it was no doubt her presence that stimulated the townsfolk to declare themselves for Charles VII.

Joan was at Compikgne by May 14, 1430. There she found Renaud de Chartres, the archbishop of Reims, and Louis I de Bourbon, comte de Vendôme, a relative of the King's. With them she went on to Soissons, where the townsfolk there refused them entry. Renaud and Vendôme therefore decided to return south of the Marne and Seine rivers; but Joan refused to accompany them, preferring to return to "her good friends" in Compiègne.

CAPTURE, TRIAL, AND EXECUTION

On her way back, Joan heard that John of Luxembourg, the leader of a Burgundian band, had laid siege to Compiègne. Hurrying on, she entered Compikgne under cover of darkness, and the next afternoon she led a sortie and twice repelled the Burgundians, but was eventually outflanked by English reinforcements and compelled to retreat. Remaining till the last in order to protect the rear guard while they crossed the Oise River, she was unhorsed and could not remount. She gave herself up and, with her brother Pierre and Jean d'Aulon, was taken to Margny, where the Duke of Burgundy came to see her. In telling the people of Reims of Joan's capture, Renaud de Chartres accused her of rejecting all counsel and having acted willfully.

Imprisonment by John of Luxembourg

John of Luxembourg sent Joan and Jean d'Aulon to his castle in Vermandois. When she tried to escape in order to return to Compikgne, he sent her to a more distant of his castles. There, though she was kindly treated, she became more and more distressed at the predicament of Compikgne; her desire to escape became so great that she jumped from the top of a tower, falling unconscious into the moat. She was not seriously hurt, and when she had recovered she was taken to Arras, a town belonging to the Duke of Burgundy.

News of Joan's capture had reached Paris on May 25, 1430. Next day, the University of Paris, which had taken the English side, requested the Duke of Burgundy to hand Joan over for judgment either to the chief inquisitor or to the bishop of Beauvais, Pierre Cauchon, in whose diocese she had been captured. The university wrote also, to the same effect, to John of Luxembourg; and on July 14 the Bishop of Beauvais presented himself before the Duke of

Burgundy asking, on his own behalf and in the name of the English king, that the Maid be handed over in return for a payment of 10,000 francs. The Duke passed on the demand to John of Luxembourg, and by January 3, 1431, Joan was in the Bishop's hands. The trial was fixed to take place at Rouen. Joan was then imprisoned in a tower of the castle of Bouvreuil, which was occupied by the Earl of Warwick, the English commander at Rouen. Joan's offenses against the English king were common knowledge. But she was brought to trial before a church court because it would not have served English interests to do away either by imprisonment or execution with so popular a figure unless they had first undermined the people's faith in her, and, through her, in the recently crowned king. The purpose of the trial was to show that Charles VII was a fool in the hands of a witch, or at least an unbeliever. Her judges were to be the Bishop of Beauvais and Jean Lemaitre, the vice inquisitor of France.

Interrogation

The trial. From Jan. 13, 1431, statements taken in Lorraine and elsewhere were read before the bishop and his assessors and would provide the framework for Joan's interrogation. Summoned to appear before her judges on February 21, Joan asked for permission to attend mass beforehand, but it was refused on account of the heinousness of the crimes with which she was charged. She was ordered to swear to tell the truth and did so swear; but she always refused to reveal the things she had said to Charles. Cauchon forbade her to leave her prison, but Joan insisted that she was morally free to attempt escape. Guards were then assigned to remain always inside the cell with her; and she was chained to a wooden block and sometimes put in irons. Between February 21 and March 24 she was interrogated nearly a dozen times; on every occasion she was required to swear anew to tell the truth, but she always made it clear that she would not necessarily divulge everything to her judges since they were the enemies of King Charles. The report of this preliminary interrogation was read to her on March 24; apart from two points she admitted its accuracy.

When the trial proper began a day or so later, it took two days for Joan to answer the 70 charges that had been drawn up against her. These were based mainly on the contention that her whole attitude and behaviour showed blasphemous presumption: in particular, that she claimed for her pronouncements the authority of divine revelation; prophesied the future; endorsed her letters with the names of Jesus and Mary; claimed to be assured of salvation; immodestly wore men's clothing; and dared to claim that her saint spoke in French and not in English. Perhaps the most serious charge was of preferring what she assumed to be the direct commands of God to those of the church.

On March 31 she was questioned again on several points about which she had been evasive, notably on the question of her submission to the church. In her position, obedience to the court that was trying her would inevitably be made the test of such submission. She did her best to avoid this trap, saying she knew well that the church could not err; but it was to God that she held herself answerable for her words and actions. The trial continued: the 70 charges were reduced to 12, which were sent for consideration to many eminent theologians in Paris as well as at Rouen.

Meanwhile, Joan fell ill in prison; she was attended by two doctors, since it did not suit the Earl of Warwick that she should die with the trial unresolved. She received a visit on April 18 from Cauchon and his assistants, who exhorted her to heed their advice. Joan, who was seriously ill and obviously thought she was dying, begged to be allowed to go to confession and receive Holy Communion and to be buried in consecrated ground. But they continued to badger her with their admonitions until May 2, receiving only her constant reply, "I am relying on our Lord," "I hold to what I have already said." They became more insistent on May 9, threatening her with torture if she did not clarify certain points. She answered that even if they tortured her to death she would not reply differently, and added that in any case she would afterward maintain that any statement had been extorted from her by force. In face of this common-sense fortitude her enemies, by a majority of ten to three, decided that torture would be useless. Joan was informed on May 23 of the decision of the University of Paris that if she persisted in her errors she would be handed over to the secular authorities for punishment (*i.e.*, execution). A young theologian attempted once more to change her mind, but she maintained the truth of what she had said at the trial.

Abjuration, relapse, and execution. Nothing further, therefore, could be done. She was taken out of prison for the first time in four months on May 24 and was taken to the cemetery of the Church of St. Ouen where the sentence was to be read out. First she had to listen to a sermon by one of the theologians, who, during his peroration, violently attacked Charles VII, provoking Joan to interrupt him, because she thought he had no right to attack the King, a "good Christian," and should confine his strictures to her. After the sermon was ended she asked that all the evidence on her words and deed should be sent to Rome. But her judges ignored her appeal to the pope, to whom, under God, she would be answerable, and began to read out the sentence abandoning her to the secular power. Hearing this dreadful pronouncement, Joan quailed, saying she would do all that the church required of her. She was, therefore, presented with a form of abjuration, which must already have been prepared. She hesitated in signing it, eventually doing so "on condition it was pleasing to Our Lord." She was then condemned to perpetual imprisonment or, as some maintain, to imprisonment in a place habitually used as a prison.

Revocation of abjuration

In any case, the English insisted on her returning to her former prison; she obeyed the order of the vice inquisitor that she should wear women's clothes. But two or three days later, when the judges and others visited her, and found her again in male attire, she said she had made the change of her own free will, preferring men's clothes. They then pressed other questions, to which she answered that St. Catherine and St. Margaret had censured her "treason" in making an abjuration. These admissions were taken to signify relapse, and on May 29 the judges and 39 assessors agreed unanimously that she must be handed over to the secular authorities. The next morning, May 30, 1431, Joan received from Cauchon permission, unprecedented for a relapsed heretic, to make her confession and receive Communion. Accompanied by two Dominicans she was then led to the Place du Vieux-Marché. There she endured one more sermon, and the sentence abandoning her to the secular arm, that is, to the English, was then read out in the presence of her judges and of a great crowd. The executioner seized her and led her to the stake, lighting the pyre. A Dominican consoled Joan, who asked him to hold high a crucifix for her to see and to shout out the assurances of salvation so loudly that she should hear him above the roar of the flames. To the last she maintained that her voices were sent of God and had not deceived her.

Few witnesses of her death seem to have doubted her salvation; and 26 years later, at the rehabilitation, all witnesses agreed that she died a faithful Christian. The executioner had never before found his task so fearful; he afterward declared that Joan's heart would not burn and that he found it intact amid the ashes. A few days later the English king and the University of Paris formally published the news of Joan's execution.

Rehabilitation

Almost 20 years afterward, on his entry into Rouen in 1450, Charles VII ordered an inquiry into the trial. Two years later the cardinal legate Gillaume d'Estoutville made a much more thorough investigation. Finally, on the order of Pope Calixtus III, proceedings were inaugurated that revoked and annulled the sentence of 1431. Joan was canonized by Pope Benedict XV on May 16, 1920, and the church celebrates her feast on May 30. The French parliament, on June 24, 1920, decreed a national festival in her honour; this is held on the second Sunday in May.

CHARACTER AND IMPORTANCE

Joan's place in history is assured. Her relief of Orléans undoubtedly proved a turning point in the Hundred

Years' War; and her achievement in reviving the courage of the French people and their faith in the Valois dynasty is in no way belittled by acknowledging that the reconciliation between Charles VII and the Duke of Burgundy in 1435 was yet to provide the practical basis for a French recovery that could in any case hardly have been averted once England in its turn began to be rent by civil war. Beyond this, the story of Joan's mission will probably be a source of controversy for historians and psychologists. Innumerable facts about her campaigns and about the motives and actions of her supporters and enemies are subject to dispute: for instance, the number and dates of her visits to Vaucouleurs; how she was able to convince the Dauphin at their first meeting at Chinon; whether Charles's perambulations after Reims represent triumphant progress or scandalous indecision; what Cauchon meant by "perpetual imprisonment"; whether Joan, after her recantation, resumed men's clothes really of her own free will and at the bidding of her voices, or, as one story has it, because they were forced upon her by her English jailers.

Assessment

Assessments of Joan's character and mission can be equally varied; some will agree with the church that she was a saint, others dub her a deluded hysteric. Joan liked gay clothes and undoubtedly enjoyed the acclamations of the crowds. Her sturdy piety must at times have been infuriating: she constantly ordered the entire royalist army to go to confession. and she lost valuable tactical advantage by refusing battle on Sundays or festivals, saying that God would make up to them and they would win other victories. Her answer to her judges, demonstrating the pointlessness of employing torture, shows her practicality; she could shrewdly turn off stupid questions, replying to a query as to whether St. Michael had long hair by asking why it should have been cut off.

But essentially Joan exhibits the basic characteristic and stamp of the genuine prophets and saints, utterly subordinated to a particular task that they believe has been inexorably laid upon them by divine command; Joan differs from many of them only in that she seems never, except for a few days near the end, to have swerved from her appointed path.

BIBLIOGRAPHY. There is an extremely large literature on Joan of Arc, but no truly definitive biography. Important works include: J. QUICHERAT, *Procès de condamnation et de rehabilitation du Jeanne d'Arc*, 5 vol. (1841-49); *Le Prods de condamnation de Jeanne d'Arc, 2* vol., trans. and annotated by P. TISSET (1960–70); *La Réhabilitation de Jeanne la Pucelle,* 3 vol., trans. and annotated by P. DONCOEUR and Y. LANHERS (1956–61), containing the recorded testimony from the trial of more than 100 witnesses who had known Joan of Arc; and LANERY D'ARC, *Les Mémoires et consultations en faveur de Jeanne d'Arc* (1889), dealing with the memoirs of jurists and theologians, intended to facilitate her rehabilitation. In English, W.P. BARRETT, *The Trial of Jeanne d'Arc* (1931); D.S. RANKIN and C. QUINTAL, *The First Biography of Joan of Arc with the Chronicle Record of a Contemporary Account* (1964); and R. PERNOUD, *The Retrial of Joan of Arc* (Eng. trans. 1955), are particularly recommended.

Johanan ben Zakkai

Of all the Palestinian Jewish sages of the 1st century AD, none apparently proved so fundamentally influential in his own time and for subsequent generations of scholars and spiritual leaders as Johanan ben Zakkai. Although this seems to have been true even before 70 CE (Common Era = AD), when the Jerusalem Temple—the principal cultic and religious institution of the Jews—was destroyed and the country was devastated, it was certainly the case in the last third of the 1st century.

Sources of knowledge about Johanan

As is the case with all the Talmudic teachers (the rabbis who interpreted and applied the Oral Law), little strictly biographical information about Johanan ben Zakkai has been preserved: Talmudic and Midrashic sources (commentative and interpretative writings) are principally devoted to the teachings of the sages and of what they came to represent. Thus, what can be reported essentially about Johanan is this: even before 70 he acted as a leading representative of the Pharisees in debate with priestly and Sadducean authorities. (The Pharisees stressed rigorous observance of the Law, inclusion of the oral tradition as normative, and an interpretative adaptation of traditional precepts to new situations; the Sadducees, an elitist conservative group, accepted only the Written Law as authoritative and were more literalist and static in their interpretation.) Johanan's school was apparently famous, and one in search of learning would go to extremes, if need be, to be admitted there. Furthermore, Johanan was opposed to the policy of those who were determined on war with Rome at all costs. By quitting beleaguered Jerusalem according to most accounts in 70 (though it is possible that he left as early as 68) and being brought to the Roman camp, he somehow succeeded in getting permission to set up an academy in Jamnia (Jabneh), near the Judaean coast, and there he was joined by a number of his favourite disciples. Two of them, Eliezer ben Hyrcanus and Joshua ben Hananiah, who are credited with having smuggled their master out of Jerusalem in a coffin, were to become, by the end of the century and the beginning of the following one, the leading teachers of their generation and had a profound influence on the greatest scholars of the next generation. It is therefore hardly excessive to say that Johanan's teachings are to be traced not merely to the relatively few statements specifically attributed to him but to many views that become articulate during the 2nd century: for example, that acts of loving-kindness atone no less effectively than the former Temple sacrificial ritual and are indeed at the core of the universe since its creation; that the study of Torah (the divine instruction or Law) is a central purpose of man and a paramount form of serving God; that a number of ceremonies and regulations once confined to the Temple were to be adopted even outside the Temple complex "to serve as memorials of the Sanctuary"; at the same time, despite the unique sanctity of Jerusalem, basic decisions regarding practice and instruction were now to be permitted to the authorized scholars wherever circumstances compelled them to sit in session. Such views, truly radical in origin, became normative rabbinical teaching and permanent components of Judaism.

Thus, it may be said that, by establishing in Jamnia a major academy and authoritative rabbinic body, Johanan fixed the conditions of continuity of basic traditions; and that, by his lively sense of the need for reinterpreting inherited concepts lest they become irrelevant in new circumstances, he laid the foundations on which Talmudic and rabbinic Judaism built their structure.

Work on the Law (Halakha)

The chief preoccupation of Johanan and his students was the study and continuing development of the Law (Halakha). He and they also engaged in the study of nonlegal subjects (Aggada), especially in connection with biblical exegesis (Midrash), explanation and interpretation of the biblical contents. In addition, he was interested in esoteric themes related to the subject of creation and the visions of the Merkavah (the divine chariot of Ezek. 1), discourses on which were even delivered by some of his disciples. And, at least before the destruction of the Temple, if not thereafter as well, he seems to have held occasional sessions when certain ethical–philosophical questions, typical of Hellenistic–Roman popular philosophical discussion, were raised and explored. His homiletical interpretations of scripture often unite the symbolic with the rationalistic in a remarkable way. Why were not hewn stones permitted in the building of the altar? Because iron is for weapons of destruction, and the altar of God is intended to bring peace, he answers. Why is the ear of one who prefers servitude to have a hole bored in it? Because we are God's servants, and man heard at Sinai with his own ears. Let the unlistening ear be bored. Such are typical comments by Johanan. Although he had discouraged what must have seemed to him unwarranted messianic proclamations, a saying attributed to him in his last illness suggests that messianic speculation was not alien to him.

In the history of Talmudic literature and thought, Johanan is rightly seen as continuing the Hillelite tradition, although this should not be interpreted to mean that he inherited only Hillel's teachings (see HILLEL).

BIBLIOGRAPHY. The most important modern study of Johanan ben Zakkai is that by G. ALON, *Studies in Jewish History,* vol. 1, pp. 219–273 (1957), in Hebrew. In addition to the summary description in the general Jewish histories such as H.H. GRAETZ, *Geschichte der Juden,* vol. 2 (1897; Eng. trans., *History of the Jews, from the Earliest Times to the Present Day,* vol. 2, pp. 321–359, 1891), see W. BACHER, *Die Agada der Tannaiten,* vol. 1, pp. 25–46 (1884); J. GOLDIN, "On the Academy of Johanan ben Zakkai," in AMERICAN ACADEMY FOR JEWISH RESEARCH, *Harry Austryn Wolfson: Jubilee Volume on the Occasion of His Seventy-Fifth Birthday,* vol. 3, pp. 69–92 (1965) in Hebrew; and J. NEUSNER, *A Life of Yohanan ben Zakkai, ca. 1–80 C.E.,* 2nd ed. rev. (1970).

(J.Gol.)

Johannesburg

Johannesburg, the largest city of the Republic of South Africa and the second largest city on the African continent, is South Africa's economic metropolis. It stands at an altitude of 5,750 feet (1,753 metres) on the southern slopes of the Witwatersrand—commonly called the Rand—a rocky watershed of east–west ridges surrounded by the Transvaal highveld. The greater metropolitan area has a total population of about 1,500,000; loosely known as "Greater Johannesburg," it consists of a municipal and a magisterial area.

Johannesburg grew at a remarkable speed after the discovery of gold on the Rand in 1856. Today it stands at the centre of the country's gold-mining industry. Johannesburg is the only city of its size that is not situated on a coast, a lakeshore, or on a river. (For historical aspects see SOUTHERN AFRICA, HISTORY OF.)

The discovery of gold

History. Johannesburg was founded as a result of the discovery of gold in the Witwatersrand area of the Transvaal in 1886. The farms from Driefontein in the east to Roodepoort in the west were proclaimed as public diggings, and gold-mining operations began. The centre of contemporary Johannesburg now stands on land that was then government ground and was known as Randjeslaagte or Rantjeslaagte. There has been much controversy about the origin of the name Johannesburg; the earliest known official statement about the Johannes, for whom the city was named, dated from 1896, when it was recorded that it was called after Johann Rissik, acting surveyor general, and Christian Johannes Joubert, head of the mines department of the Zuid-Afrikaansche Republiek (South African Republic), in whose territory the goldfields were located. The two men had been appointed as commissioners to investigate the mining situation. By November 1886, according to the provisions of the act known as the Gold Law, the first members of a Goldfield's Diggers Committee were elected and became the city's first local government authority. This body was later called the Sanitary Committee but by 1897 had become a Stadsraad, or Town Council. In 1887, the year after the discovery of gold, the mining syndicates—forerunners of the mining companies of today—had begun to operate in Johannesburg; and houses, offices, churches, and shops had begun to spring up.

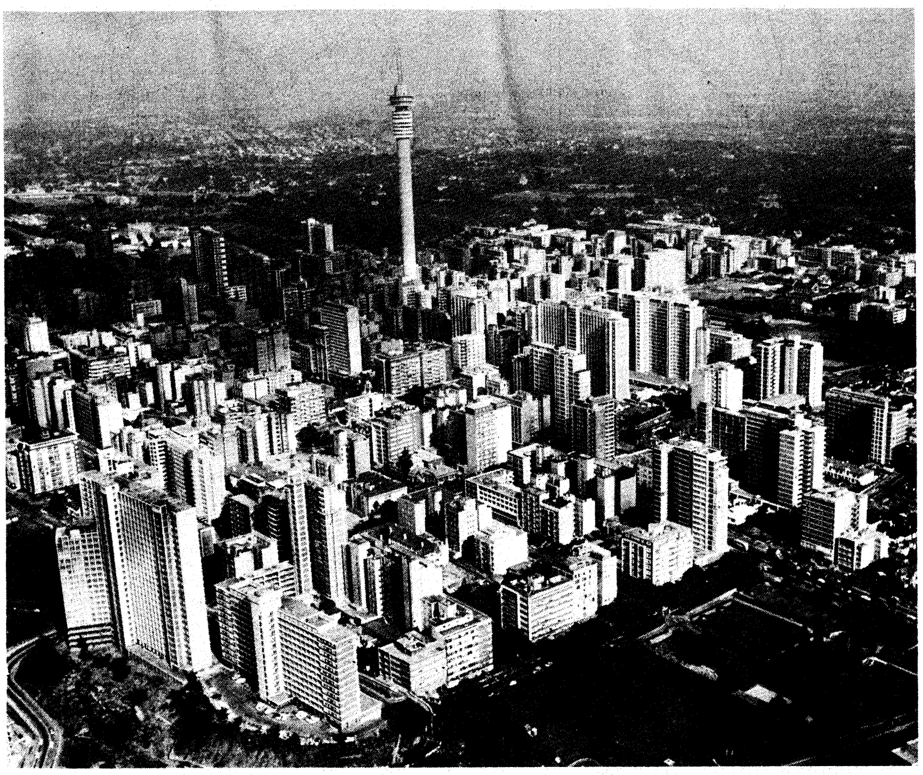
In 1889 the new city's expansion was halted when the miners reached a zone of pyrite (an ore of sulfur, associated with gold and sometimes called fool's gold) from which it was not known how to extract the gold. As a result, a number of mines closed down before three Scotsmen from Glasgow, the brothers R.W. Forrest and W. Forrest and J.S. MacArthur, discovered the cyanide method of gold extraction. This process saved the Rand, and Johannesburg's growth was resumed.

Although postal facilities of a sort were available from the outset and a telegraph office was opened in 1887, telephone service was not installed until 1894. Goods had to be carried in by ox wagon, and passengers were transported by coach and horses; the only railroad in the locality, from Johannesburg to nearby Boksburg, was primarily used for the transport of coal to the mines. In 1892, however, the city was linked by rail to the port of Cape Town. By 1896 the inhabitants of Johannesburg, most of whom were English-speaking and did not have the franchise, came to wish for representation in the government of the country. As a result, differences between the rulers of the country in Pretoria and the mining men in Johannesburg became acute. When the South African War between the United Kingdom and the Zuid-Afrikaansche Republiek broke out in 1899, many residents left Johannesburg. By agreement, the mines were handed over undamaged when the British took the city in 1900. At the conclusion of the war in 1902, by which time the city's population numbered 100,000, labour for the mines was so scarce that Chinese workers were imported. Due to political pressures, however, the Chinese were all repatriated by 1910, the year in which Johannesburg, together with the remainder of the Transvaal, became a part of the Union of South Africa. After World War I, labour unrest occasioned various strikes in the mines. In a strike of 1922, white miners opposed the use of Africans for semiskilled work. The strike was suppressed but at a cost of more than 200 lives. In 1928 Johannesburg was declared to be a city; it celebrated its 50th anniversary in 1936. World War II checked further development from 1939 to 1945, after which a building boom occurred, with urban expansion taking place to the north and northwest. By 1970 the city's municipal boundaries were extended to include an area of 104 square miles.

Expansion of the city after World War II

Physical description. Johannesburg is situated in the most thickly populated part of southern Africa. The mines, many of which were almost worked out in the early 1970s, lie to the south and southwest of the city. In September 1970 it was estimated that of the restricted municipal population about 483,000 were whites, about 804,000 were black Africans, 39,000 were Asians, and about 83,000 were Coloureds (of mixed white and nonwhite descent). The city's height above sea level, which as already mentioned is 5,750 feet, is measured at Joubert Park near the centre of the city; the highest point, however, is to be found near the suburb of Northcliff, which stands at an altitude of 5,928 feet. There are about 400 suburbs altogether; most of the city's workers live either in the suburbs or in the surrounding dormitory towns. The population is segregated by colour, in accordance with South Africa's official policy of apartheid (literally "apartness"), so that the nonwhite groups—black Africans, Coloureds, Asians—are each restricted to residence in certain areas, which are located particularly in the west and southwest. The major buildings in the city are grouped around Eloff Street, the main shopping area that leads south from the railway station, with Von Brandis, Joubert, and Rissik streets parallel to it. Other streets in the vicinity include Commissioner, Market, Fox, and Main streets (which constitute the commercial area) and Jeppe and Bree streets. Joubert Park, Milner Park, George Harrison Park (named for the Australian who first discovered gold-bearing quartz in the area in 1886), Turffontein Race Course, sports grounds, and mine dumps are all in the area. Johannesburg is the meeting place of roads from major towns in South Africa, such as Pretoria, Bloemfontein, Cape Town, and Durban. Not included in the municipal area, though administered by the municipality, is a group of towns inhabited by Africans (Bantu) that is known as Soweto (southwestern townships) and that covers an area of 26 square miles; it is linked with Johannesburg by road and rail. By 1961 the city council had provided subsidized housing in Soweto for 57,000 families and 26,000 single men—a total of about 370,000 persons. Water, sanitation, and lighting are supplied, and sports fields, schools, and other facilities are provided by the city council. All shopkeepers in the area are black Africans. Welfare and employment services are staffed by about 400 whites and about 3,000 black Africans. Other townships include Coronationville and Westbury, reserved for Coloured people, and—about 20 miles away—Lenasia, a township for Asians.

Climate. Johannesburg has an attractive climate; in July the mean temperature is about 50° F (10" C); in December it is 68" F (20" C). Rainfall averages about 30 inches a year. The sun shines for an average of nine hours a day in summer, and more than seven hours in winter.



Downtown Johannesburg skyline dominated by a television transmission tower.

Georg Gerster—Rapho Guillumette

Little remains of the original plant and animal life, except in the Melville Koppies Reserve to the northwest of the city. Suburban gardens flourish and are often elegant. The city's air and water are relatively pure in most parts; water shortages occur periodically, especially during the winter months.

City planning. The streets of the centre of the city, laid out on a grid plan established in 1886, are narrow, and city blocks are short. More imaginative street planning is in evidence in the suburbs, where many of the streets are tree lined.

Transport. Motorways are being built in many parts of the city to accommodate the large amount of traffic that enters and leaves the city each day. In the suburbs local public transport is provided by bus services, whereas the railroad, used by 160,000 passengers daily, serves commuters living outside municipal boundaries to the east, west, and south. Jan Smuts (international) Airport, from which scheduled domestic flights also leave, is situated 14 miles northeast of the city; charter planes fly from Rand Airport, nine miles to the east; and Baragwanath Aerodrome, seven miles to the southeast, has facilities for gliding and other aerial sports.

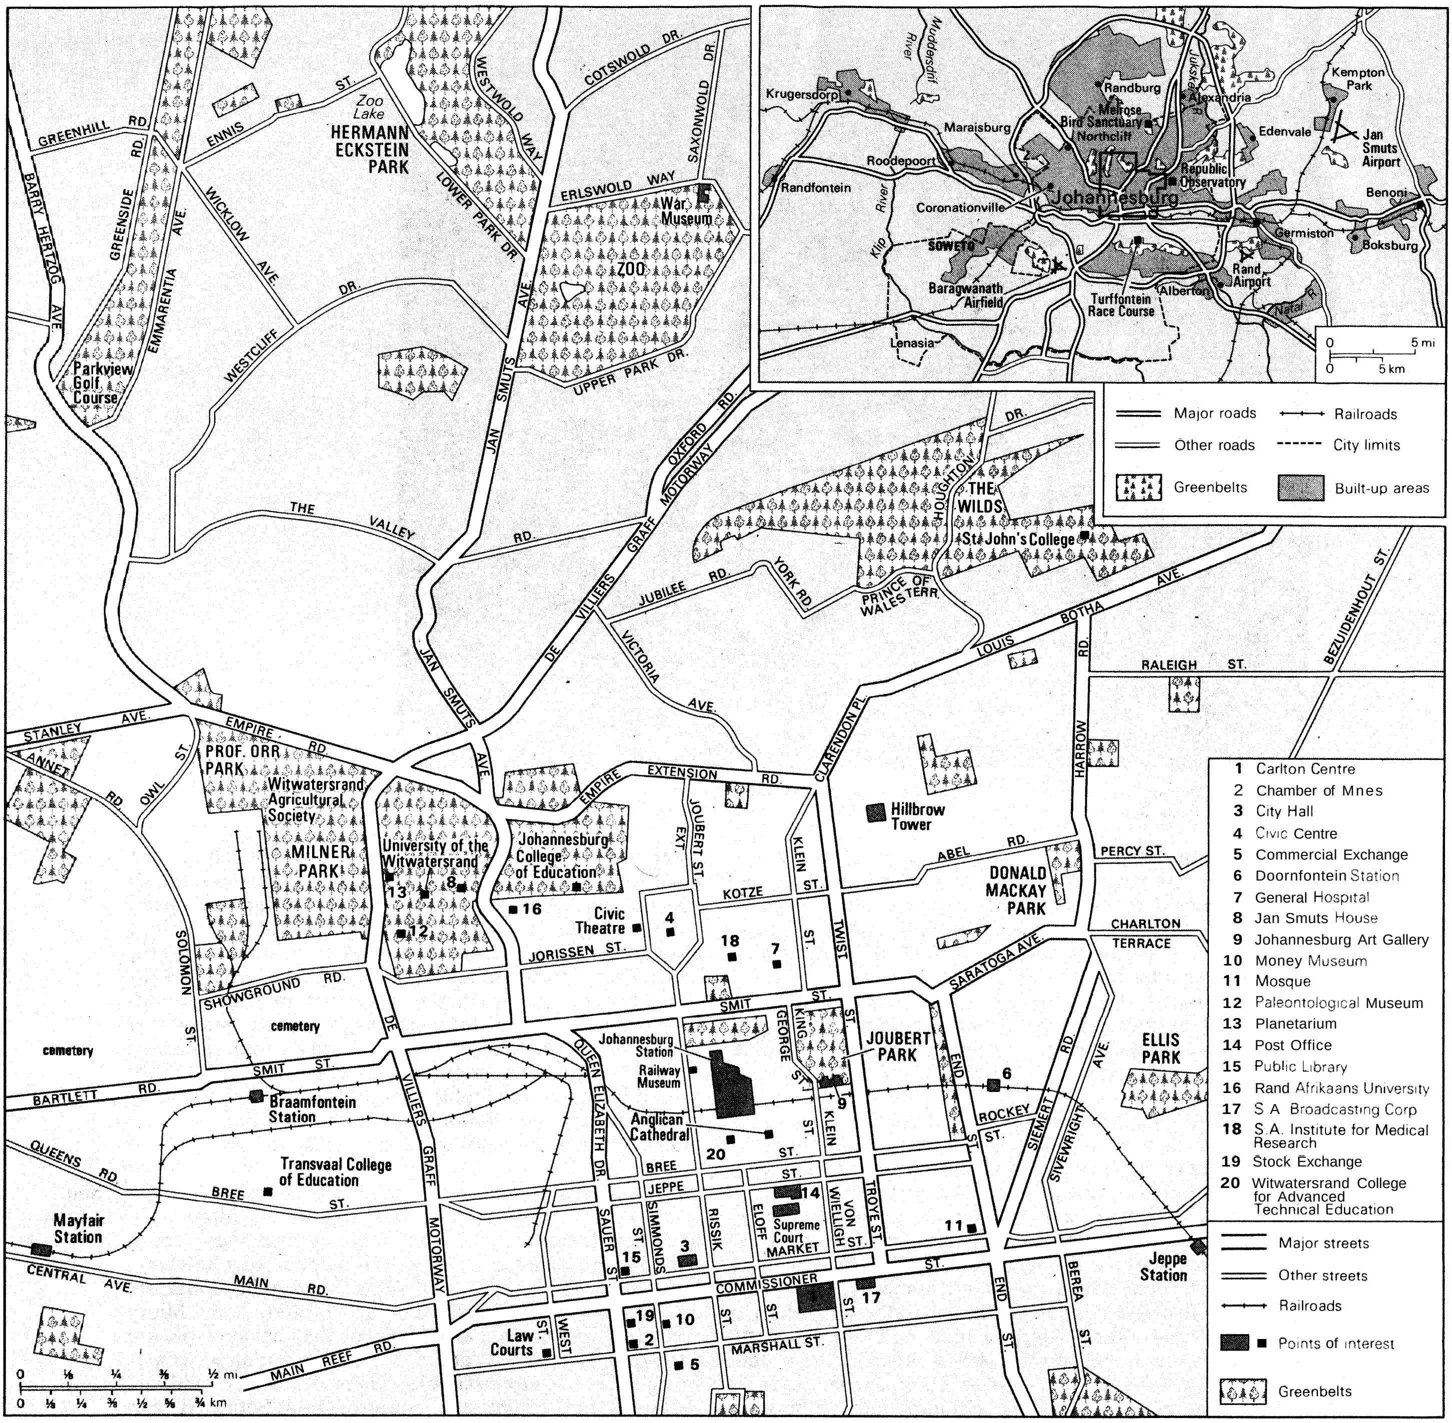
Demography. The city is cosmopolitan. Although English- and Afrikaans-speaking groups dominate the white section of the population, minority groups of Germans, Dutch, Hungarians, Italians, French, Scandinavians, Swiss, Poles, and others are also to be found, while Jews from all of these groups have also made Johannesburg their home. Africans speaking Zulu, Xhosa, Pedi, Venda, and Tswana also inhabit the city, while Asian groups include Japanese, Chinese, and Indians, speaking various languages and adhering to various faiths. The Coloured people of the city represent an intermixture of many groups, both white and nonwhite; they speak English or Afrikaans or both, and belong to Christian churches.

Housing. It is customary in Johannesburg to demolish and rebuild houses, rather than to follow the European practice of renovating or altering existing buildings. There are numerous blocks of flats or apartments for all types of income groups, and many South Africans have been able to maintain houses with gardens. Architectural styles of all kinds are in evidence. Buildings of the style developed from 18th-century Cape architecture are noticeable in residential areas, whereas business buildings and many houses are derived from modem European or United States models. Public buildings are modem adaptations of older European styles, particularly English, Dutch, and Renaissance Italian. By the early 1970s it had become the practice to construct apartment buildings (called flats in Johannesburg) so that residential density can be increased; it was still the custom, however, to build single-story homes for married nonwhites. Subsidized housing is available for eligible (*i.e.*, low-income) groups of the population, and large building projects are features of Soweto and other areas to the south of the city.

South Africa's business centre

Business and industry. Because Johannesburg is the centre of the South African business world, more well-to-do people are to be found in this city than elsewhere in the country. Gold mining is now conducted elsewhere, but most of the business and administrative headquarters of the gold-mining companies are located here. Many secondary industries, particularly of the heavier type, are to be found in the city, and opportunities for employment of many kinds are available. There are many banking, industrial, and commercial concerns, both South African and foreign; the city is also the home of the South African Stock Exchange, which was founded in 1887. Because of the city's importance, it has a number of branch offices of governmental institutions, as well as consular offices and other institutions (such as banks, building societies, and insurance companies) usually located only in capital cities.

Government utilities and services. Johannesburg is a municipally controlled city. It has a city council with 47 councillors (1971), elected by popular vote every five years; a mayor is chosen by the councillors from among themselves each year. The city council is the local government unit and is responsible to the Transvaal provincial council, which is in turn responsible to the central government. City councillors represent the same political parties that are represented in the national Parliament. Its local transport, electricity and gas utilities, fire-fighting services, and sanitation are run by the municipality. Water is provided by the municipality through the agency of the Rand Water Board. The rail-



Central Johannesburg and (inset) its metropolitan area.

ways are government owned, with the city's large railway station constituting the heart of the nation's rail system. Electricity for the mines and railways is provided by a public utility with headquarters in the city.

Police services are provided by the nationally administered South African Police Service, but traffic is regulated by the municipality's traffic officers. The city operates produce and livestock markets and the abattoir. The Witwatersrand Agricultural Society organizes a major show in Milner Park every year. It attracts agricultural and industrial exhibitors from throughout the country as well as from overseas. Trade is promoted by the Johannesburg Chamber of Commerce; the Commercial Exchange, a unique institution, owes its existence to commerce generated by the mining industry. Mining operations themselves are regulated by the South African Chamber of Mines, which also has its headquarters in the city.

Health and education. In addition to Johannesburg General Hospital, medical facilities for whites include many private nursing homes and institutions for sick children, maternity cases, and mine workers. Medical facilities for nonwhites are also extensive, and include clinical, curative, midwifery, and dental services; most mines also provide hospitalization for employees. Medical research is pursued at the South African Institute for Medical Research as well as at the medical school of the University of the Witwatersrand.

The University of the Witwatersrand itself, with an enrollment of about 8,000 students, is mainly intended for English-speaking students; higher education in Afrikaans is provided at the Rand Afrikaans University (founded in 1966). The Witwatersrand College for Advanced Technical Education specializes in technological training related to mining and other subjects. In addition, there are throughout the city **a** great number of schools,

Teacher-training colleges

both private and governmental, for pupils of all ages, from kindergarten to school-leaving age. Teacher-training courses are given at the Johannesburg College of Education (for English-speaking students), at the Goudstadse Onderwyskollege (for Afrikaans-speakers), at the Transvaal College of Education (for Asians), and at the Rand College of Education (for Coloured students).

Cultural institutions. Cultural institutions include the Johannesburg Public Library and a number of museums with collections relating to South African history, military history, medicine, archaeology, geology, costumes, transport, railroads, and Judaica. The Johannesburg Art Gallery exhibits modern European paintings as well as the work of South African artists. Commercial art galleries and antique shops are scattered throughout the city centre and in the northern districts. Branch library services are available in the suburbs and townships.

The media. Radio and press services are available for all sections of the population, but there is no television service. Domestic radio services are broadcast not only in the official languages, English and Afrikaans. but also in some African languages (such as Zulu, South Sotho, Tonga, and Venda). Overseas radio programs are broadcast from near Johannesburg in nine languages (including French, German, Portuguese, and Dutch, and such Bantu languages as Swahili, Chewa, and Tsonga). The commercial service of the South African Broadcasting Corporation has its main studios in the city. Daily newspapers are published in English and Afrikaans, in addition to which a number of publications for nonwhite readership are also produced. Newspapers for minority groups are also published in various languages, including Chinese. There are numerous learned and popular journals. Many book publishers are established in the city.

Recreation. There are a great number of sporting facilities, including golf courses, tennis courts, rugby and soccer grounds, swimming baths, and cricket grounds, as well as privately owned sports clubs of various kinds and commercial establishments providing facilities for ice hockey, horse racing, and ice skating. The Zoological Gardens have a large collection of wild animals, some fine gardens, and a lake. The larger parks constitute popular picnic areas, and there are numerous open areas in the suburbs. South African wild flowers are to be seen in the Wilds, which consists of 45 acres in the northern suburbs; wild birds may be seen at the Melrose Bird Sanctuary. The open space known as the Civic Centre has some fine examples of sculpture; the Civic Theatre is the home of opera, ballet, music, and drama. Throughout the city, many cinemas, halls, and theatres are to be found, as well as a number of recreation centres. There are also a planetarium and some observatories, including the Republic Observatory, which is of international importance. Kelvin House is the headquarters of many of South Africa's scientific and technical societies. A number of societies cater to the interests of photographers, philatelists, chess players, horticulturists, students of Jewish affairs, archaeologists, and other specialized groups.

John XXII, Pope

The second pope to rule from Avignon in southern France, John XXII (Jacques Duese) is remembered today for his conflicts with the Franciscan order and with the Holy Roman emperor Louis IV, as well as for his unorthodox theological views. He also greatly increased the wealth of the papacy and centralized church administration.

Leonard von Matt—EB Inc.

John XXII, contemporary silver coin. In the coin collection of the Vatican Library.

Born of a wealthy bourgeois family at Cahors in southwestern France, he studied canon and civil law at Paris and Orléans. In 1309 he became chancellor to Charles II of Naples and was made a cardinal three years later. On August 7, 1316, he was elected pope at Lyons, France, succeeding Clement V, and proceeded to establish the papal court at Avignon on a permanent basis.

Early in his pontificate, John intervened in a long-standing conflict between two factions in the Franciscan order —the Spirituals, who favoured strict adherence to St. Francis' rule of poverty, and the Conventuals, who held to a broader interpretation. He supported the Conventuals and persecuted Spirituals who resisted his decision. He later condemned the whole Franciscan theory of evangelical poverty in two decretals (letters): ***Ad Conditorem Canonum*** (1322) and ***Cum Inter** Nonnullos* (1323), asserting scriptural evidence to show that Christ and the Apostles had owned property.

Conflict with Louis the Bavarian

John also intervened in a quarrel over the crown of the Holy Roman Empire between Louis the Bavarian (Emperor Louis IV) and Frederick of Austria. Louis defeated Frederick in 1322, but John forbade him to exercise imperial authority until he, as pope, settled the dispute. Louis's answer was the Sachsenhausen Appellation (May 22, 1324), in which he denied papal authority over imperial elections and attacked John's condemnation of the Spiritual Franciscans. At the same time Louis received at his court the political philosophers Marsilius of Padua and John of Jandun, who, in their work ***Defensor** pacis* ("Defender of the Peace"), had declared the authority of an ecumenical council superior to that of the pope. John retaliated by excommunicating Louis, but, on April 18, 1328, the Emperor had John deposed at Rome. (His condemnation of the Spirituals was held to conflict with the pronouncement of Nicholas III.) The Franciscan Peter of Corbara (Pietro Rainalducci) was elected antipope as Nicholas V, and Michael of Cesena, general of the Franciscan order, appealed to the authority of a church council against John. John thereupon excommunicated Peter and deposed Michael. When Louis returned to Germany in 1329, Peter submitted to John and was subsequently imprisoned at Avignon. The Emperor attempted, without success, to effect a reconciliation with the Pope, and thereafter the Franciscans and their philosopher ally Marsilius continued to carry on a vigorous antipapal propaganda from the imperial court at Munich.

New accusations of heresy were provoked by John's ideas about the experience of God by the souls of the blessed in the afterlife (the Beatific Vision), which he expressed in four sermons delivered in the winter of 1331–32. Most theologians held that the saints in heaven were immediately admitted to a full vision of the Godhead. John disagreed, holding that the fullness of the Beatific Vision would be delayed until the Resurrection of the dead and the Last Judgment at the end of the world. Thomas Wallensis, an English Dominican, was imprisoned for publicly disputing the Pope's position, which was subsequently condemned by a committee of doctors of the University of Paris. A pro-imperial cardinal, Napoleone Orsini, began secret negotiations with the Emperor for the convocation of an ecumenical council to judge John. John tried to reconcile his views with those of his opponents before his death on December 4, 1334.

During his pontificate, John had promoted missionary activity in Asia, establishing Catholic bishoprics in Anatolia, Armenia, Iran, and India. At Avignon he founded a papal library; and at Cahors, a university. Like most of the Avignon popes, he showed favouritism to his relatives and fellow countrymen. Of 28 cardinals created by him, 20 were from southern France, and three were his nephews. In appearance he was small, thin, and pale; in character, impetuous, astute, obstinate, and autocratic, though simple and approachable.

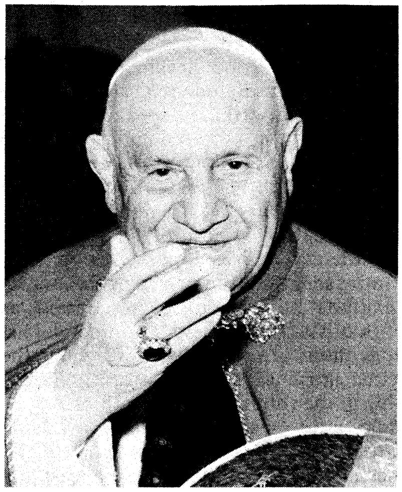
Assessment

His most lasting achievements were in the sphere of law and finance. He added to the body of church law the canons (decrees) of his predecessor, Clement V, and many of his own canons were later added. These were the last additions to canon law until the 16th century. The papal treasury, greatly depleted at the time of his accession, was greatly increased when he died. By the bulls (solemn documents) ***Execrabilis*** (1317) and ***Ex Debito*** (1319), he increased papal control over the distribution of church offices and over the fees paid by their recipients. He also compiled a new tax book, fixing fees for 145 documents issued by the papal chancery, which was not revised for the next two centuries.

BIBLIOGRAPHY. CUILLAUME MOLLAT, *Les Papes d'Avignon (1305–1378)*, 10th ed. (1964; Eng. trans., ***The Popes at Avignon, 1305–1378,*** 1963), is the standard and best general account of the Avignon papacy. YVES RENOUARD, ***La Papautf*** a *Avignon*, 3rd ed. (1954; Eng. trans., ***The Avigon Papacy, 1305–1403,*** 1970), is also very good, especially on the administrative side, and draws attention to the geographical importance of Avignon in the development of papal government. NOEL VALOIS, "Jacques Dubse, pape sous le nom de Jean XXII," ***Histoire littfraire de la France,*** 34:391–630 (1914), gives the best account of John's relations with the Franciscans and of his views on the Beatific Vision and his contributions to missionary activity and to the liturgy. See also S. BALUZE, ***Vitae Paparum Avenionensium,*** 2 vol. (1693), rev. by GUILLAUME MOLLAT (1917), contemporary lives with extensive notes by the chief modern authority; GUILLAUME MOLLAT, AUGUSTE COULON, and SUZANNE CLEMENCET, ***Les Registres de Jean XXII*** (issued in fascicles), papal letters with an invaluable introduction on papal administration; and DECIMA DOUIE, ***The Nature and the Effect of the Heresy of the Fraticelli*** (1932), somewhat out of date but still the fullest account in English of John XXII's relations with the Franciscans.

John XXIII, Pope

Although Pope John XXIII did not reach the papacy until he was almost 77 years old and held the office less than five years, he inaugurated changes in Roman Catholicism so far-reaching that his reign must be considered the beginning of a new era in the history of the Roman Catholic Church. There was nothing in the earlier life of Angelo Giuseppe Roncalli to suggest that his reign as pope would be anything other than the decorous, tradition-bound, static pontificate the Sacred College of Cardinals was counting on when they chose him as an "interim" pope—a papa di passaggio—in October 1958. His .brilliant, strong-willed predecessor, Eugenio Pacelli, as Pius XII, had shaped a defensive policy for dealing with the modern world that the cardinals thought would serve the needs of the church for another century, and they had every reason to believe, from his past behaviour, that the elderly Cardinal Roncalli would maintain the status quo for the few years he had to live. Then, according to the plan, the church would be turned over to a younger prelate who was cast in the Pacelli mold. As pope, however, Roncalli put into effect so many of the ideas he had entertained privately during a half century of obediently serving others that the church was never the same again.



John XXIII, 1963.
Keystone

Angelo Roncalli might have lived and died as an obscure parish priest had he been less of a conformist throughout all but the last few years of his life. The child of a peasant family, he began his career in the church with no connections of any significance and no powerful patron to guide him through the maze of ecclesiastical politics. His steady climb was due above all to his readiness to subdue his own preferences, follow orders, and adjust without complaint to the will of his superiors. Such was the clerical ideal proposed at his seminary in Bergamo, Italy, and it guided him throughout his life.

Early life and career. Angelo was born on November 25, 1881, one of 13 children born to Giovanni Roncalli, a tenant farmer of Sotto il Monte, a tiny village seven miles from the Lombard city of Bergamo. The Roncallis were poor but not anywhere as destitute as some of the later legends would have had it. "We had the necessities of life," the Pope used to say testily, "and we were strong and healthy." Though Angelo, the third child and oldest son of the family, went off to prepare for the priesthood as a child of 11, he continued to spend vacations with the family and remained close to them throughout his life.

Relations with his family

No matter how powerful he became, however, he never helped any of the other Roncallis to advance in the world. "The world is only interested in making money. . . ," he wrote to his brother Xaverio after he became pope. "A great honour has come to our family," he acknowledged, but he urged Xaverio and the others to remain humble, seek no honours or preferments, and take no material advantage of their relationship to the Pope. "At my own death," he concluded, "I shall not be denied the praise which did so much honour to the holiness of Pius X: born poor, he died poor." In his last will he bequeathed each of the living members of the family a legacy of less than $20—his total personal fortune.

Angelo, the churchman, however, was destined to spend most of his life among the powerful and cultivated. Inevitably, that set him apart from the other Roncallis almost from the beginning. While still a seminarian, he was already beginning to feel out of place in Sotto il Monte, where he was charged with priggishness and "putting on airs." "Only three days of the holidays have passed and already I am weary of them," he recorded in the diary that he allowed to be published after his death. He was eager, he wrote, to return to Bergamo, with its orderly life of study, prayer, and genteel fellowship, and to escape from the petty gossip, suspicion, and jealousies of the village.

Roncalli was not an especially brilliant student. He did well enough, however, to be sent to Rome for theological studies, in 1900. After only one year at the Seminario Romano, his education was interrupted when he was drafted into military service and assigned to an infantry company conveniently stationed at Bergamo. Later, as a priest, he returned to the army during World War I. Again he served in Bergamo, first as a hospital orderly and later as a military chaplain with the rank of lieutenant.

Even with the time out for military service, he was not yet 23 when he was ordained a priest, in Rome on August 10, 1904. The next day he said his first mass at St. Peter's Basilica. After a visit to the family in Sotto il Monte, he returned to the Seminario Romano for further study. Eventually he received a doctorate in canon law.

As a graduate student in Rome, Roncalli took the first step that was to lead to the papacy a half century later. Simply because he was a priest of Bergamo, he was asked by the reigning pope, Pius X, to assist in the ceremony of consecration for a new bishop, Giacomo Radini-Tedeschi, who had been appointed to take over the diocese of Bergamo. The new bishop, a member of the Italian nobility, was much taken by the young priest and asked him to serve as his secretary.

Back in Bergamo, Don Angelo, in addition to his secretarial duties, was assigned to the faculty of the diocesan seminary. For the next nine years he served as a professor of theology and spiritual director of the young men preparing for ordination. As the Bishop's right-hand man, he gained a wide range of pastoral experience.

Roncalli had great esteem for his superior, who was known as the most progressive prelate in Italy. After the Bishop's death, in 1914, he wrote an appreciative biography of the prelate and sent a copy to the pope, Benedict XV, who had been one of Radini-Tedeschi's personal friends.

Call to service under Pope Benedict XV

With the war behind him, Roncalli was summoned to wider service in the church. In 1920, Pope Benedict, recalling Radini-Tedeschi's biographer, named him a director of the Italian organization for the support of foreign missions. The position was not notably significant in a church top-heavy with dignitaries, but it brought him into personal contact with a number of important clerical figures throughout Europe, and his name became recognizable in ecclesiastical Rome. He also gained some attention because of his work as a part-time historian who specialized in some of the minor activities of Saint Charles Borromeo, a cardinal of Milan who played an important role in the 16th-century Counter-Reformation. It was Roncalli's researches for this project that first brought him into contact with Msgr. Achille Ratti, the Milanese librarian who would become Pius XI.

Service as a Vatican diplomat. Pius XI later remembered the Bergamo priest's gift for personal dealings and brought him into the Vatican's diplomatic service. Roncalli was appointed apostolic visitor to Bulgaria in March 1925. In keeping with custom, he was made an archbishop before he left Rome. He spent the next ten years in that obscure but delicate post, where he was expected to protect the interests of a small Roman Catholic community in a country overwhelmingly Eastern Orthodox. His diary reveals that he was often lonely and discouraged in Bulgaria, but he carried out the assignment with tact, patience, and notable good humour. Still, he was not deemed to be among the best qualified clerics in the papal diplomatic corps.

His next assignment was equally unpromising. He was appointed apostolic delegate to Greece, which was combined with naming him head of the Vatican diplomatic mission to Turkey. Again he was called upon to represent powerless Catholic minorities in an Eastern Orthodox nation, Greece, and a Muslim nation, Turkey. He made his home in Istanbul, where he was generally ignored by both the Turkish government and the Vatican but was warmly appreciated in the diplomatic colony as an amiable host and affable dinner companion.

None of these posts loomed large in the Western-oriented Vatican, and the Archbishop had good reason to believe that his career had reached a dead end. Later, he confessed that he was stunned by the announcement, at the end of 1944, that he had been named papal nuncio to Charles de Gaulle's newly liberated France; his first thought was that a clerical error must have been made in Rome.

Papal nuncio to France

The French post was particularly delicate at the time. Roncalli's predecessor, Msgr. Valerio Valeri, had been close to the collaborationist Gen. Philippe Pétain during the German occupation, and de Gaulle made it clear to the Vatican that, since Valeri had become ***persona non grata*** to the French people, he would have to be replaced immediately. France was still seething with a spirit of vengeance against former collaborators. It would be the new nuncio's obligation to deal with the ill will created by his predecessor and by the bishops who had cooperated with the hated Vichy government. Someone in the Vatican remembered the genial Archbishop languishing in the Near East, and it was decided that, though he was not noted for his political astuteness, perhaps he had precisely the qualifications needed under the circumstances. Roncalli was told that he would be expected to cool the atmosphere, re-establish the independence of the church, and gain the release of a number of German seminarians who were being held as prisoners of war. In addition, be had to deal with an outburst of radicalism among the younger French clergy, which the conservative forces in the Vatican Curia found highly disturbing.

His success in carrying out the assignment was acknowledged by the papacy when Archbishop Roncalli was named a cardinal by Pius XII. In January 1953 the red hat, the symbol of a cardinal, was conferred on him by the Socialist president of France, Vincent Auriol.

Reign as pope. As a cardinal, Roncalli immediately became eligible for one of the major Italian archbishoprics. Appointed patriarch of Venice at the age of 71, he had cause once more to believe that he had reached the end of the line. Thus, perhaps no one was more surprised than he when, after the death of Pius XII on October 9. 1958, he was elected pope on the 12th ballot—clearly a compromise candidate acceptable to all parties only because of his advanced years.

The second Vatican Council

Perhaps a younger pontiff would have been less daring and innovative than John XXIII turned out to be. Soon after his coronation, he announced almost casually that he was summoning an ecumenical council—a general meeting of the bishops of the church—the first in almost a century. He said the idea came to him in a sudden inspiration. His purpose was to "bring the church up to date" ***(aggiornamento)*** and to work for its spiritual regeneration. He was the first pope since the Reformation who acknowledged frankly that Catholicism stood in need of reinvigoration and reform.

It was long a truism among church historians that councils are followed by upheaval and disorder in the church. The Pope's decision, consequently, was received coolly by his conservative Curia, who were convinced that the church had prospered under Pius XII's leadership and who saw no good reason for the changes John envisioned. Some of the Vatican cardinals in fact did everything in their power to delay the council until the old man had passed from the scene and the project could be quietly dropped. But the Pope pushed on with his plan and lived long enough to preside over the first session of the second Vatican Council in the fall of 1962.

In keeping with his wishes, the council fathers pledged that they would be consistently positive. No condemnations or anathemas were to be made; political hostilities were to be ignored; and the church above all was to recognize that it was not the master but the servant of humanity. The Pope made it clear that the second Vatican Council was convened as a pastoral council. No new dogmas were to be pronounced, though old doctrines and disciplines were to be re-examined. What John sought, he said, was a "New Pentecost," a new outpouring of the Holy Spirit.

The council, according to John's design, would make a new start toward achieving Christian unity by putting aside the hostilities of the past and acknowledging the

Catholics' share of responsibility for the scandal of a divided Christianity. With his long experiences among the Eastern Orthodox, John's interest in Christian ecumenism seemed natural enough, but no one in Rome was quite prepared for the extent of his openness. He received Eastern Orthodox, Anglican, and Protestant religious leaders with extreme cordiality and made sure they were invited to send observers to the Vatican Council. He removed certain words offensive to Jews from the official liturgy of the church. On one notable occasion, he introduced himself to a group of Jewish visitors with the biblical words, "I am Joseph your brother," referring to the Old Testament story of the meeting of the sons of the patriarch Jacob at the court of Egypt.

He travelled around Rome freely, breaking with the tradition that the pope, deprived of his former temporal power, was a "prisoner of the Vatican." In an attempt to depoliticize the church, he played down his position as ruler of the Vatican and emphasized his role as "servant of the servants of God," a traditional title of the pope. In that spirit he called on the President of Italy and cordially received the son-in-law of the Soviet premier, Nikita Khrushchev, in private audience. Among his other visitors were the Archbishop of Canterbury — the first such meeting since the 14th century — the Moderator of the Scottish Kirk, and a Shintō (the religious cult of Japan) high priest — the first such official in history to be received at the Vatican.

The *Pacem in Terris* encyclical

During the Cuban missile crisis of 1962, the Pope publicly urged both the United States and the Soviet Union to exercise caution and restraint and won the appreciation of both Pres. John F. Kennedy and Premier Khrushchev. His major encyclical *Pacem in Terris* ("Peace on Earth"), addressed to all mankind, was received warmly throughout the world and praised by politicians as well as churchmen. Straightforward and frankly optimistic, it avoided the language of diplomacy and set forth the requirements for world peace in profoundly human terms. Distinguishing between the philosophy of Marxism and actual governments to which it gave birth, John suggested that peaceful coexistence between the West and the Communist East was not only desirable but was actually necessary if mankind was to survive. He thereby diluted the religious energy that had been poured into the Cold War as a result of the militant policies shaped by his predecessor.

John saw himself as a reconciler. In statement after statement he emphasized the church's significance as a suprapolitical spiritual force in the world. His greatest claim on the world's affection, however, rested on the warmth of his personality rather than on any of his formal statements. He remained simple and unaffected, in spite of the baroque setting in which he found himself, and instinctively appealed directly to human values that everyone could understand.

"Since you could not come to me, I came to you," he told the inmates of a Roman prison. When Mrs. John F. Kennedy, then wife of the President of the United States, came to call, he rehearsed "Mrs. Kennedy, Madame Kennedy" in his poor English. Then, when she appeared he spontaneously spread open his arms and cried out, "Jacqueline!" He once told a Communist diplomat, "I know you are an atheist, but won't you accept an old man's blessing?" When a shabby peasant woman reached up to touch him as he was being carried through St. Peter's, he stopped to clasp her hand. "There is no reason why you shouldn't get as close as the King of Jordan did," he said.

The roly-poly Pontiff — he was short of stature and never overcame a tendency toward corpulence — gradually became a kind of father figure for the world. When he died on June 3, 1963, it was generally recognized that he had become one of the best loved men on earth and one of the most popular popes of all time. His successor, Paul VI, instituted formal proceedings that could lead to his canonization as a saint. Had the ancient custom of popular canonization still been in effect in 1963, however, that honour would probably have been given to him immediately by the tearful crowd who were gathered in St. Peter's Square when his death was announced.

BIBLIOGRAPHY. Pope John's impact on the church, along with a biographical sketch, is dealt with in most of the books about the second Vatican Council and the new developments in contemporary Roman Catholicism. Among the best of these in English are XAVIER RYNNE, *Letters from Vatican City* (1963); GARY MACEOIN, *What Happened at Rome? The Council and Its Implications for the Modern World* (1966); and in translation, HANS KUNG, *Konzil und Wiedervereinigung* (1960; *The Council and Reunion,* 1961). Biographical works include E.Y. HALES, *Pope John and His Revolution* (1965); A LAZZARINI, *Giovanni XXIII* (1958; Eng. trans., *Pope John XXIII,* 1959); and MERIOL TREVOR, *Pope John* (1967). The Pontiff's diary, which he began writing as a seminarian and finished when he was pope, was published as *Il giornale dell' anima,* 4th ed. (1965; Eng. trans., *The Journal of a Soul,* 1965). His encyclicals and major public addresses may be found in *The Encyclicals and Other Messages of John XXIII* (1964).

(Jo.C.)

John of England

One of the most unpopular monarchs in his country's history, John, king of England from 1199 to 1216, aroused widespread hostility among barons, prelates, and commoners alike. His reign ended in a baronial rebellion that forced him to issue Magna Carta, the most important constitutional instrument in English history. Yet he was one of the most astute politicians and energetic administrators of the Plantagenet line of kings. A subject of controversy throughout his life, he was born at Oxford on December 24, 1167, the youngest son of Henry II and Eleanor of Aquitaine. Henry's plan (1173) to assign to his favourite son (whom he had nicknamed Lackland) extensive lands upon his marriage with the daughter of Humbert III, count of Maurienne (Savoy), was defeated by the rebellion the proposal provoked among John's elder brothers. Various provisions were made for him in England (1174–76), including the succession to the earldom of Gloucester. He was also granted the lordship of Ireland (1177), which he visited from April to late 1185, committing youthful political indiscretions from which he acquired a reputation for reckless irresponsibility. Henry's continued favour to him contributed to the rebellion of his eldest surviving son, Richard I (later called Coeur de Lion), in June 1189. For obscure reasons John deserted Henry for Richard.

First attempt to seize government

On Richard's accession in July 1189, John was made count of Mortain (a title that became his usual style), was confirmed as lord of Ireland, was granted lands and revenues in England worth £6,000 a year, and was married to Isabella, heiress to the earldom of Gloucester. He also had to promise (March 1190) not to enter England during Richard's absence on his crusade. But John's actions were now dominated by the problem of the succession, in which his nephew, the three-year-old Arthur I, duke of Brittany, the son of his deceased elder brother Geoffrey, was his only serious rival. When Richard recognized Arthur as his heir (October 1190), John immediately broke his oath and returned to England, where he led the opposition to Richard's dictatorial chancellor, William Longchamp. On receiving the news in January 1193 that Richard on his way back from the crusade had been imprisoned in Germany, John allied himself with King Philip 11 Augustus of France and attempted unsuccessfully to seize control of England. In April 1193 he was forced to accept a truce but made further arrangements with Philip for the division of Richard's possessions and for rebellion in England. On Richard's return, early in 1194, John was banished and deprived of all his lands. He was reconciled to Richard in May and recovered some of his estates, including Mortain and Ireland, in 1195, but his full rehabilitation came only after the Bretons had surrendered Arthur to Philip II in 1196. This led Richard to recognize John as his heir.

In 1199 the doctrine of representative succession, which would have given the throne to Arthur, was not yet generally accepted, and following Richard's death in April 1199 John was invested as duke of Normandy and crowned king of England in May. Arthur, backed by Philip II, was recognized as Richard's successor in Anjou and Maine, and it was only a year later, in the Treaty of

John, tomb effigy in Worcester Cathedral.

Le Goulet, that John was recognized as successor in all Richard's French possessions, in return for financial and territorial concessions to Philip. Meanwhile, John successfully resisted Scottish claims to the three northern counties and conducted a vigorous overhaul of local administration in England.

Second marriage

The renewal of war in France was triggered off by John's second marriage. His first wife, Isabella of Gloucester, was never crowned, and in 1199 the marriage was dissolved on grounds of consanguinity, both parties being great-grandchildren of Henry I. John then intervened in the stormy politics of his county of Poitou and, while trying to settle the differences between the rival families of Lusignan and Angoulême, himself married Isabella (August 1200), the heiress to Angoulême, who had been betrothed to Hugh IX de Lusignan. This politically conceived marriage provoked the Lusignans into rebellion the next year; they appealed to Philip II, who summoned John to appear before his court. In the general war that followed his failure to answer this summons, John had a temporary success at Mirebeau in August 1202, when Arthur of Brittany was captured, but Normandy was quickly lost (1204). By 1206, Anjou, Maine, and parts of Poitou had also gone over to King Philip.

These failures, foreshadowed under Henry II and Richard, were brought about by the superiority of French resources and the increasing strain on those of England and Normandy. Nevertheless. they were a damaging blow to John's prestige, and, equally important, they meant that John resided now almost permanently in England. This factor, coinciding with the death (1205) of the chancellor and Archbishop of Canterbury, Hubert Walter, gave his government a much more personal stamp, which was accentuated by the promotion of members of his household to important office. His determination to reverse the continental failure bore fruit in ruthlessly efficient financial administration, marked by taxation on revenues, investigations into the royal forests, taxation of the Jews, a great inquiry into feudal tenures, and the increasingly severe exploitation of his feudal prerogatives. These measures provided the material basis for the charges of tyranny later brought against him.

Quarrel with the church

John's attention was diverted and his prestige disastrously affected by relations with the papacy. In the disputed election to the see of Canterbury following the death of Hubert Walter, Pope Innocent III quashed the election of John's nominee in procuring the election of Stephen Langton (December 1206). John, taking his ground on the traditional rights of the English crown in episcopal elections, refused to accept Langton. In March 1208, Innocent laid an interdict on England and excommunicated John (November 1209). The quarrel continued until 1213, by which time John had amassed more than $100,000 from the revenues of vacant or appropriated sees and abbeys. But such a dispute was a dangerous hindrance to John's intention to recover his continental lands. In November 1212 he agreed to accept Langton and the pope's terms. Apparently at his own behest, he surrendered his kingdom to the papal nuncio at Ewell, near Dover, on May 15, 1213, receiving it back as a vassal rendering a tribute of 1,000 marks ($666 13s. 4d.) a year. He was absolved from excommunication by Langton in July 1213, and the interdict was finally relaxed a year later. John thus succeeded in his aim to secure the papacy as a firm ally in the fight with Philip and in the struggle already pending with his own baronage. But his treatment of the church during the interdict, although arousing little if any opposition among the laity at the time, angered monastic chroniclers, who henceforth loaded him with charges of tyranny, cruelty, and, with less reason, of sacrilege and irreligion.

Baronial rebellion and Magna Carta

In August 1212, recurrent baronial discontent had come to a head in an unsuccessful plot to murder or desert John during a campaign planned against the Welsh. Pope Innocent's terms had included the restoration of two of those involved, Eustace de Vesci and Robert Fitzwalter, and, although the barons soon lost papal support, they retained the protection of Stephen Langton. John, skillfully isolating the malcontents, was able to launch his long-planned campaign against the French, landing at La Rochelle in February 1214. He achieved nothing decisive and was forced to accept a truce lasting until 1220. Returning to England in October 1214, he now had to face much more widespread discontent, centred mainly on the northern, East Anglian, and home counties. After lengthy negotiations in which both sides appealed to the Pope, civil war broke out in May 1215. John was compelled to negotiate once more when London went over to the rebels in May, and on June 19 at Runnymede he accepted the baronial terms embodied in Magna Carta, which ensured feudal rights and restated English law. This settlement was soon rendered unworkable by the more intransigent barons and John's almost immediate appeal to Pope Innocent against it. Innocent took the King's side, and in the ensuing civil war John captured Rochester castle and laid waste the northern counties and the Scottish border. But his cause was weakened by the arrival of Prince Louis (later Louis VIII) of France, who invaded England at the barons' request. John continued to wage war vigorously but died at Newark on October 18–19, 1216, leaving the issues undecided. His death made possible a compromise peace, including the restoration of the rebels, the succession of his son Henry III, and the withdrawal of Louis.

John's reputation, bad at his death, was further depressed by writers of the next generation. Of all centuries prior to the present, only the 16th, mindful of his quarrel with Rome, recognized some of his quality. He was suspicious, vengeful, and treacherous; Arthur I of Brittany was probably murdered in captivity, and Matilda de Braose, the wife of a recalcitrant Marcher baron, was starved to death with her son in a royal prison. But John was cultured and literate. Conventional in his religion rather than devout, he was remembered for his benefactions to the church of Coventry, to Reading Abbey, and to Worcester, where he was buried and where his effigy still survives. He was extraordinarily active, with a great love of hunting and a readiness to travel that gave him a knowledge of England matched by few other monarchs. He took a personal interest in judicial and financial administration, and his reign saw important advances at the exchequer, in the administration of justice, in the importance of the privy seal and the royal household, in methods of taxation and military organization, and in the grant of chartered privileges to towns. If his character was unreliable, his political judgment was acute. In 1215 many barons, including some of the most distinguished, fought on his side.

John III Sobieski, of Poland

Of the ten elective kings who ruled Poland between 1573 and 1795, only three were Poles by birth. The most famous and perhaps the most important of them was John III Sobieski (reigned 1674–96), the last warrior on the Polish throne, the subduer of the Ottoman Turks, and a writer whose letters to his wife are famous. The kingdom of Poland-Lithuania, weakened by internal revolt and by wars with Russia, Sweden, Brandenburg, Transylvania, and the Ottoman Empire in the mid-17th century, was restored to greatness for the last time under Sobieski's leadership but proved unable to regain its previous preponderance in eastern Europe. Though a genuine patriot, Sobieski also knew how to further his own and his family's interests. His greatness as a king has been disputed, but he was certainly one of the greatest commanders in chief Poland has ever had.

John III Sobieski, engraving by Carel Allardt (1648–1709).

Sobieski's ancestors were of the lesser nobility, but one of his great-grandfathers was the famous grand-hetman (military commander) St. Żółkiewski, and when he was born in Olesko, August 17, 1629, his father, James (Jakób) (1588–1646), had already taken a step to the higher ranks, sharing an office on the royal court. At the end of his life, the father even became castellan of Cracow, an office that secured him the highest rank among the members of the Polish Senate, or first chamber of the parliament. John was well-educated and toured western Europe in his youth, as was usual for a Polish noble of his class. When the Swedes invaded Poland in 1655, he joined them in opposition to the Polish king John Casimir. The following year he changed sides again and became one of the leaders in the fight to expel the Swedes. In 1665, through the influence of his patroness, Queen Maria Louisa (Ludwika), he was appointed to the prestigious office of grand marshal. In 1666 he became field commander of the Polish army. In October 1667 he defeated the Tatars and the Cossacks near Podhajce (now in the U.S.S.R.), and in the spring of 1668, when he triumphantly returned to Warsaw, he was named commander in chief. In 1665 he had married an ambitious young French widow, Marie-Casmire de la Grange d'Arquien (Marysieńka). Marysienka planned to have John elected king after King John Casimir's resignation in 1668. When this plan failed—the nobility elected Michael Wilniowiecki in 1669—she began working to obtain support from Louis XIV of France for her husband's advancement. Since they were often separated—the husband on the front, his wife on journeys to France—Sobieski wrote long letters to Marysieńka, which are now a highly interesting and important historical source. Her letters have not been preserved. During the short reign of King Michael (1669–1673), Sobieski distinguished himself by further victories over the Cossacks, and simultaneously he tried to undermine Michael, whose policies favoured the Habsburgs against France. Michael died in November 1673, and almost on the same day Sobieski won a splendid victory over the Turks under Hussein Paşa near Chocim (Hoţin). Although this victory did not alter the disastrous conditions of the Peace of Buczacz concluded in 1672 (Poland had to cede territory to the Turks and to pay a considerable indemnity), Sobieski's reputation was so great that in May 1674 he was elected king in preference to the candidate backed by the Habsburgs. At first Sobieski followed a pro-French policy. He tried to end the Turkish war by French mediation and concluded the secret treaty of Jaworów with France (June 1675), in which he promised to fight the Holy Roman (Habsburg) Emperor after the conclusion of peace with the Turks. In fact, only an armistice with them was concluded at Żórawno (October 1676), and the conditions were only slightly more favourable than those of Buczacz.

Sobieski's marriage

Sobieski's hopes of compensating for losses to the Turks in the southeast by using French and Swedish support to make territorial gains from Prussia in the northwest were also disappointed. Furthermore, Louis XIV was neither ready to recognize Marysieńka's French relatives as members of a royal family nor willing to support the succession of Sobieski's son James (Jakób) to the Polish throne. The great nobles, especially those from Lithuania, were opposed to the French alliance because they feared that Sobieski was striving to attain absolute power with the help of France. It was becoming clear, moreover, that it was impossible to reconcile the interests of Poland and those of Louis, whose aim was to use Sobieski as an obedient vassal against the Habsburgs. Poland, for its part, had no differences with Habsburgs and, after a series of Turkish attacks, came to regard the Ottomans, the allies of France, as its deadliest enemies. Sobieski, therefore, though always an admirer of France, shifted away from the French alliance and concluded a treaty with the Holy Roman emperor Leopold I against the Turks (April 1, 1683). By the terms of the treaty, each ally had to support the other with all his might if the other's capital were to be besieged. Thus, when a great Turkish army approached Vienna late in the summer of 1683, Sobieski himself rushed there with about 25,000 men. Because he had the highest rank of all military leaders gathered to relieve Vienna, he took command of the entire relief force (about 75,000 men) and achieved a brilliant victory over the Turks at the Kahlenberg (September 12, 1683), in one of the decisive battles of European history.

The siege of Vienna

In the campaign that followed in Hungary (in the autumn of 1683), however, Sobieski was less successful, and his relations with the emperor Leopold deteriorated because of differences in temperament and conflicting political plans. Sobieski's idea was to liberate Moldavia and Walachia (present-day Romania) from Ottoman rule and to expand Poland's influence to the shores of the Black Sea. But his advances into Moldavia, undertaken between 1684 and 1691, were mostly failures, and during the last one he was even in danger of being captured. Despite his previous victories, he was thus not able to achieve his objective. Only after his death, in 1699, were the territories that had been lost in 1672 recovered.

In the last years of his life, from 1691 until his death in 1696 (June 17), Sobieski was often seriously ill and had to face quarrels with the nobles and within his own family. His eldest son, James, was bitterly opposed to the Queen and the younger princes. All of Sobieski's sons were interested in succeeding to the throne and tried to obtain help, either from the Emperor or from France. The marriage of Sobieski's daughter Kunegunda to Maximilian II Emanuel, elector of Bavaria (1694), was the only bright spot in these rather gloomy years.

Although the second half of the reign was much less brilliant than the first, the personal wealth of the royal couple continued to grow because they knew how to obtain money in exchange for offices and signs of royal favour. Thus, the King left a considerable fortune when he died.

Sobieski also spent large sums on his residences in Żółkiew and Jaworów and especially on the palace of Wilanów near Warsaw, a fine example of Baroque architecture. He was also a patron of poets and painters. Of all the Polish rulers of the 17th century, he was the best educated and took the greatest interest in literature and cultural life.

The struggle against Ottoman power in Europe was the keystone of Sobieski's foreign policy, with which all other foreign relations were closely connected. When the Russians, traditionally Poland's enemies, showed willingness to join the league against the Turks, Sobieski concluded with them the "Eternal" Peace of 1686 (the Grzymułtowski Peace). In this treaty, Kiev, which had been under temporary Russian rule since 1667, was permanently ceded by Poland. But despite all the failures and disappointments he experienced after 1683, Sobieski was able to deliver southeast Poland from the threat of Ottoman and Tatar attack.

His failures

In domestic policy Sobieski was least successful. All his endeavours to strengthen the position of the crown and stabilize the army failed completely, and his own sons opposed him. The nobles showed little interest in defending the country after the great victory of 1683 had been won, and the Lithuanian magnates fought each other rather than the Turks. Thus, John Sobieski, although a brilliant general and organizer, was unable to prevent rebellion in his family and the dissension among his subjects that finally led to Poland's downfall in the 18th century. This tends to make him, in the final reckoning, a somewhat tragic figure.

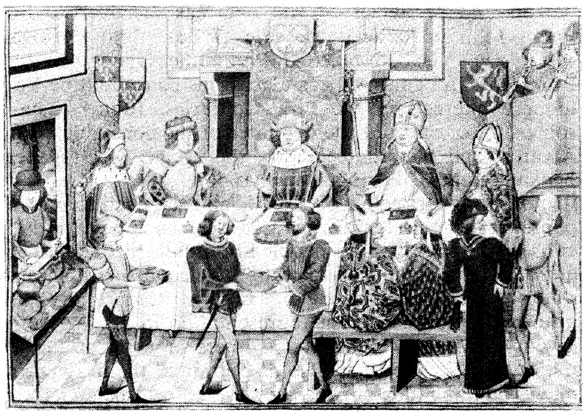
John I of Portugal

The first ruler of the House of Aviz, John I, king of Portugal from 1385 to 1433, consolidated his own position and preserved his country's independence from Castile by the great victory of Aljubarrota in 1385. His conquest of Ceuta in northwest Africa (1415) marked the beginning of the Portuguese and European age of overseas expansion and exploration, and his treaty with England (1386) raised the Anglo-Portuguese connection to the status of a firm and permanent alliance.

Born at Lisbon on April 11, 1357, John was the illegitimate son of King Pedro I and Teresa Lourenço. At age six he was made master of the military Order of Aviz; he received an ecclesiastical and military education, probably at Aviz in Alentejo. On his father's death, in 1367, his half brother Ferdinand became king and embarked on a calamitous rivalry with the new ruler of Castile, Henry II, who finally forced Ferdinand to accept a Castilian marriage for his infant heiress, Beatriz, thus compromising the future independence of Portugal.



John I of Portugal (centre) entertaining John of Gaunt (on his right), miniature from a late-15th-century manuscript by Jehan de Wavrin, published as Anchiennes Croniques *d'Engelterre* (3 vol., 1858–63). In the British Museum (Royal MS. 14 E.iv).

When Ferdinand died, in 1383, his widow, Queen Leonor, submitted to the demand of her Castilian son-in-law, John I, that he be recognized as king of Portugal. John of Aviz, who had hitherto remained carefully in the background, though he had been arrested for a time in 1382, was now persuaded by a group of young nationalists, led by Nuno Álvares Pereira, to murder Queen Leonor's favourite and adviser, the Galician João Fernandes Andeiro, conde de Ourém. Popular support was at once stirred up for John, and Queen Leonor fled from Lisbon, appealing to Castile for help. In May 1384 Castilian armies besieged John in Lisbon until the outbreak of plague forced them to withdraw (September).

John had been named defender of the realm; but in April 1385 representatives of the three estates met in the Cortes (assembly) of Coimbra, and, after it had been demonstrated that King Pedro's elder surviving sons had not been legitimized, John was elected king. The cities of Lisbon and Porto and the merchants and trade guilds enthusiastically backed him, but much of the older nobility still favoured the Castilian succession. John and Nuno Alvares, now his constable, marched northward and obtained the submission of the chief places but returned on hearing that the Castilians were preparing a major invasion. As Spanish forces entered central Portugal, John and Nuno Alvares advanced to bar the road to Lisbon and won the famous Battle of Aljubarrota (August 14, 1385). This victory assured Portugal's independence and made John a desirable ally. He had already received some English aid, and a small party of English archers had fought for him at Aljubarrota; and he now concluded the Treaty of Windsor (May 9, 1386), which became the cornerstone of the Anglo-Portuguese alliance. In consequence, John of Gaunt, duke of Lancaster, arrived in Galicia hoping, through his second marriage, with the daughter of King Pedro I of Castile, to realize his claim to the Castilian crown. John of Aviz sealed the alliance by marrying, in February 1387, Gaunt's daughter, Philippa of Lancaster. A joint invasion of León was unsuccessful, and Lancaster withdrew. John of Aviz made a ten-year truce with Castile in 1389, but frontier warfare with Castile was intermittent thereafter until peace was finally made in 1411.

Elected king

John's elder sons had now reached the age at which they could become knights, and it was ostensibly on their behalf that he organized an expedition against Ceuta, which fell in a day (August 24, 1415). He had probably hoped to advance into Morocco and tap the African caravan routes, but, instead, Ceuta became a beleaguered outpost supplied from the Portuguese Algarve. This stimulated the maritime explorations, beginning with the rediscovery and settlement of the Madeira Islands and the Azores.

The children of John and Philippa

John's court now became a centre of culture, influenced through Queen Philippa by English traditions. Of their sons, the *inclita geração* ("illustrious generation"), the eldest, Edward, administered the kingdom under his father and was later king; the second, Pedro, travelled through Europe and was regent after Edward's death; and the third, Henry, known as the Navigator, was the patron and organizer of the overseas discoveries. For them, John introduced the title of duke into Portugal. Their sister, Isabel, married Philip the Good, duke of Burgundy and count of Flanders, thus consolidating Portuguese interests in the Low Countries. John's bastard son, Afonso, married the daughter of the constable Nuno Álvares, and their descendants, the House of Braganca, became kings of Portugal from 1640.

John's long struggle with Castile and the need to recompense a new aristocracy caused serious financial difficulties, but he rallied his people around his throne and acquired a reputation as a cautious leader and shrewd statesman. He rewarded the faithful trade guilds by granting them permanent representation in the House of Twenty-four, in which two members of each of the 12 major guilds were to sit. He also granted them a special magistrate, the judge of the people. At Porto he ended the unpopular civil jurisdiction exercised over the city by the Bishop. He displayed his devotion by building near Leiria the great Abbey of Batalha to commemorate his victory and serve as a pantheon. He was the author of a work on hunting (*Livro da montaria*), his favourite pastime.

He died in Lisbon on August 14, 1433. There is a portrait of John in the Museum of Ancient Art, Lisbon, and recumbent statues of John and Philippa over their tomb at Batalha.

BIBLIOGRAPHY. John's reign, like those of his predecessors, D. Pedro and Fernando, was chronicled by FERNAO LOPES. There are several modern editions in Portuguese, but only a short excerpt has been translated by E. PRESTAGE in *The Chronicles of Fernão Lopes and Gomes Eannes de Zurara* (1928). The chronicle of Nuno Alvares Pereira is perhaps also by Lopes. GOMES EANNES DE ZURARA wrote the *Crónica da Tomada de Ceuta. A* modern biography in Portuguese is DAMIAO PERES, *D. João I* (1917). The events of the beginning of the reign are dealt with fully by S. DIAS ARNAUT, *A crise nacional dos fins do século XIV* (1960). *An* excellent account of the international politics and military enterprises of the period is in P.E. RUSSELL, *English Intervention in Spain and Portugal in the Time of Edward III and Richard II* (1955).

(H.V.L.)

John II of Portugal

King of Portugal from 1481 to 1495, John II is regarded as one of the greatest Portuguese rulers, chiefly because of his ruthless assertion of royal authority over the great nobles and of his resumption of the exploration of Africa and the quest for India.

John was the great-grandson of the founder of the House of Aviz, John I, and only surviving son of Afonso V by his queen and cousin, Isabella. Born in Lisbon in 1455, he was educated by the humanists of the court and was married to his cousin Leonor in 1471. He participated in his father's conquest of Arzila in Morocco, where he was knighted, and was given a separate household at Beja in southern Portugal. In 1474 his father entrusted him with the "trade of Guinea" and the African explorations. When Afonso V claimed the Castilian throne in opposition to Isabella I, plunging Portugal into war, he appointed John his regent (April 1475). The prince mobilized an army and marched to support his father, but the Battle of Toro (March 1476) checked the Portuguese intrusion into Castile. Afonso V departed for France in a fruitless search for an alliance while John defended the frontier and parried a Spanish counterattack. Afonso's lack of success caused him to announce his abdication. John was proclaimed king, but his father returned and resumed his reign, concluding the disadvantageous Treaty of Alcáçovas before his death in August 1481.

The oath of obedience

At John II's accession, this peace treaty had obliged him to place his young children under Spanish guardianship near the frontier as a pledge of their marriage to Castilians. Afonso had been limited in authority by the ambitious House of Braganca, the wealthiest family in Portugal. John summoned the Cortes (assembly) at Évora (November 1481) and imposed a drastic oath of obedience on his vassals. He also reasserted the *beneplacet*, requiring papal letters to be submitted to him before publication. He successfully negotiated a revision of the treaty with Spain, by which his children were restored to him. He then accused the Duke of Bragança of treason and had him tried and beheaded at Bvora (June 1483). Although evidence was produced that the Braganças had intrigued with Castile, it seems clear that John sought vengeance for their having caused the death of his maternal grandfather, the regent Dom Pedro. He confiscated the Braganças' vast estates and appointed royal judges in what had been private jurisdictions of the nobility. When a second conspiracy sought to remove him and bestow the crown on his wife's brother, the Duke of Viseu, John killed his rival with his own hand (August 1484).

In Africa, Afonso V had preferred crusading in Morocco to trade and discovery of the west coast. John II himself never returned to Africa after Arzila but supported the development of commerce and exploration.

Encouragement of African exploration

In December 1481 he sent Diogo de Azambuja to build the fortress of St. George at Mina (the "gold mine"), near Benin, a powerful native kingdom in the territory of modern Nigeria. Gold currency had been restored by his father, and the new -trade now doubled the royal revenues, and in 1485 John assumed the title of Lord of Guinea. He had already sent Diogo Cão to search for the seaway to India, and Cão had discovered the Congo. Christopher Columbus tried to interest him in his plan to reach India by a western route. John rejected this but licensed Fernão Dulmo to search for new islands, apparently without result. In 1485 he sent Cão on a second voyage that reached southwest Africa but failed to find the Cape. When in 1486 merchants in Benin heard news of a native potentate far to the east who was thought to be the legendary Christian ruler, Prester John, the King sent Pero da Covilhã and Afonso Paiva to visit India and Ethiopia by an overland route. He also sent Bartolomeu Dias to take over Cão's task of finding the southern extremity of Africa: Dias' return in December 1488 demonstrated that Africa could be rounded and India reached by sea, but it was only after John's death that Vasco da Gama's successful expedition to India was launched. In 1490 a mission was sent to consolidate relations with the kingdom of Congo. In 1493 Columbus arrived in Lisbon with tidings of, as he supposed, islands off Asia, and the Pope awarded these discoveries to the Spanish crown. But John II protested and began negotiations leading to the celebrated Treaty of Tordesillas (June 1494), which gave to Spain all lands west of a line 370 leagues to the west of the Cape Verde Islands. This line, however, reserved Brazil (still apparently unknown) for Portugal.

John had previously negotiated with the papacy, ceding the *beneplacet* but retaining the right to have ecclesiastical cases settled in Portugal and obtaining permission for a crusade against the Moors. He bent a minor expedition against Anafé and obtained tribute from Safi and Azemmour in Morocco, but in 1489 his attempt to build a fortress at the mouth of the Loukkos was prevented by the ruler of Fez.

Policy toward the Jews

When in May 1492 Ferdinand and Isabella of Spain decided to expel the Jewish population, John received a delegation of Spanish Jews who offered 60,000 cruzados for the permanent admission of 600 wealthy families to Portugal, together with a fee of eight cruzados a head for the temporary admission of others, who would be allowed to remain eight months, after which John would supply ships for them to leave. In fact, ships were provided only for Tangier and Arzila; some Jewish children were sent to settle the island of São Tomé.

John's son, Afonso, was married to the eldest daughter of the Spanish rulers, but soon after the Prince was thrown from a horse and killed (July 1491). John was deeply affected. He thought of legitimizing his other son Jorge but had already promised the succession to his wife's brother Manuel. He suffered a long illness and died in October 1495 at the small castle of Alvor in the province of Algarve. John's exercise of personal power, particularly against the nobles, explains the epithet, the "Perfect Prince," which owes its origin to Lope de Vega's play about him.

BIBLIOGRAPHY. Sources are the contemporary chronicler RUI DE PINA, *Croniqua Delrey Dom Joham II* (1792; modern edition by ALBERTO MARTINS DE CARVALHO, 1950), whose version is borrowed and amplified by GARCIA DE RESENDE. The only biography in English is that of ELAINE SANCEAU, *The* Perfect *Prince* (1959).

(H.V.L.)

John the Apostle, Saint

St. John has since ancient times been regarded as the author of three letters, the fourth Gospel, and Revelation in the New Testament.

Life with Jesus

The son of Zebedee, a Galilean fisherman, and Salome, John and his brother James were among the first disciples called by Jesus. In the Gospel of Mark he is always mentioned after James and was no doubt the younger brother. His mother, Salome, was among those women who ministered to the circle of disciples. James and John were called by Jesus "Boanerges," or "sons of thunder," perhaps because of some character trait such as the zeal exemplified in Mark 9:38 and Luke 9:54 when John and James wanted to call down fire from heaven to punish the Samaritan towns that did not accept Jesus. John and his brother, together with Simon Peter, formed an inner nucleus of intimate disciples. In the Fourth Gospel, ascribed by early tradition to John, the sons of Zebedee are mentioned only once, as being at the shores of the lake of Tiherias when the risen Lord appeared; whether the "disciple whom Jesus loved" (who is never named) mentioned in this Gospel is to be identified with John (also not named) is not clear from the text. After the Resurrection, John continued to play a leading role in the church at Jerusalem, together with Peter and James. His authoritative position is shown by his visit with Peter to Samaria to lay hands on the new converts there. It is to Peter, James (not the brother of John but a brother of Jesus), and John that Paul successfully submitted his Gospel for recognition. What position John held in the controversy concerning the admission of the Gentiles to the church is not known; the evidence is insufficient for a theory that the Johannine school was anti-Pauline—*i.e.*, opposed to granting Gentiles membership in the church. The authorship of the Gospel and letters of John and of the book of Revelation is discussed in BIBLICAL LITERATURE.

Obscurity of later life

John's subsequent history is obscure and passes into the uncertain mists of legend. At the end of the 2nd century, Polycrates, bishop of Ephesus, claims that John's tomb is at Ephesus, identifies him with the beloved disciple, and adds that he "was a priest, wearing the sacerdotal plate, both martyr and teacher." That John died in Ephesus is also stated by Irenaeus, bishop of Lyons c. AD 180, who says John wrote his Gospel and letters at Ephesus and Revelation at Patmos. During the 3rd century, two rival sites at Ephesus claimed the honour of being the Apostle's grave. One eventually achieved official recognition, becoming a shrine in the 4th century. In the 6th century, the healing power of dust from John's tomb was famous (it is mentioned by the Prankish historian Gregory of Tours); at this time also, the church of Ephesus claimed to possess the autograph of the Fourth Gospel.

St. John the Apostle, on Patmos, writing the book of Revelation. Painting by an unknown artist, 14th century. In the Städelsches Kunstinstitut, Frankfurt, West Germany.

Legend was also active in the West, being especially stimulated by the passage in Mark 10:39, with its hints of John's martyrdom. Tertullian, the 2nd-century North African theologian, reports that John was plunged into boiling oil from which he miraculously escaped unscathed. During the 7th century, this scene was portrayed in the Lateran basilica and located in Rome by the Latin Gate; it is still annually commemorated on May 6. John's feast day otherwise is December 27. This belief that John did not die is based on an early tradition. In the original form of the apocryphal Acts of John (second half of the 2nd century) the Apostle dies; but in later traditions he is assumed to have ascended to heaven like Enoch and Elijah. A popular tradition known to Augustine declared that the earth over his grave heaved as if the Apostle were still breathing.

The legends that contributed most to medieval iconography are mainly derived from the apocryphal Acts of John. These Acts are also the source of the notion that John became a disciple as a very young man. Iconographically, the young, beardless type is early (as in a 4th-century sarcophagus from Rome), and this type came to be preferred (though not exclusively) in the medieval West. In the Byzantine world, the evangelist is portrayed as old, with long, white beard and hair, usually carrying his Gospel. His symbol as an evangelist is an eagle. On account of the inspired visions of the book of Revelation the Byzantine churches entitled him "the Theologian"; and the title appears in Byzantine manuscripts of Revelation, but not in manuscripts of the Gospel.

BIBLIOGRAPHY. A scholarly study of St. John's life may be found in commentaries on the Gospel, Epistles, and Apocalypse; especially commentaries on the Gospel by R.E. BROWN (1966–70), J.N. SANDERS (1968), and R. SCHNACKENBURG (1968). See also the entry under December 27 in *Butler's* Lives of *the* Saints, vol. *4* (1956). For an appreciation of Johannine theology, see F.M. BRAUN, Jean *le théologien*, 3 vol. (1959–67).

John the Baptist, Saint

St. John the Baptist was a Jewish prophet of priestly origin, who, at the beginning of the Christian Era, preached the imminence of God's Final Judgment and baptized those who repented in self-preparation for it. In the Gospels of the New Testament, his baptism of Jesus of Nazareth marks the start of Jesus' public activity. John's principal importance for history lies not in any sect that he founded—though "Baptist" groups developed after his death—but in the fact that his message was taken up by the early Christian Church, in which his role as the forerunner of Christ was treasured, many of his disciples were later found, and many of his sayings were transmitted. His rite of baptism was adapted and adopted by the church and became one of its principal sacraments. Nevertheless, scholars differ widely in assessing John and determining the relationship that existed between him and Jesus.

Sources of information about John

The primary sources for information about John's life and activity are the four Gospels (Matthew, Mark, Luke, and John), the Acts of the Apostles, and the Jewish historian Josephus' Antiquities of the Jews. In using these works for historical reconstruction, allowances must be made for the known tendencies of each writer. All four Gospels recognize in John the start of the Christian Era, and each in its own way tries to reconcile John's precedence in time and Jesus' acceptance of his message and of a baptism of repentance from his hands (elements suggesting subordination to John), with the author's belief in Jesus as Messiah and Son of God. The Gospel According to Mark presents Jesus as the hidden Messiah, known only to a narrow circle, and John as the prophet Elijah returned and as the one who had to "come first to restore all things" but who also remained hidden and suffered death with little acknowledgment of his true status (Mark 9). An early collection of sayings of Jesus, known to biblical scholars simply as Q, similarly represents the Baptist as the herald of the Coming One and of the imminent Kingdom, yet tries to stress his preparatory character, and so his subordination to Jesus. Matthew and Luke develop these two sources. The Gospel According to Matthew emphatically identifies John as the returning Elijah, herald of the Kingdom of God (Matt. 3). For Matthew, John's death, like that of Jesus, illustrates the old Israel's hostility to God's offer of salvation. Luke, in his Gospel and in the Acts of the Apostles, neglects the identification with Elijah but describes John as Jesus' forerunner and as inaugurator of the time of fulfillment of prophecy. Luke's account of the infancy of John and of Jesus does not necessarily derive from an underlying document composed in a "Baptist" sect, although it uses material perhaps transmitted by former disciples of the Baptist. It depicts the birth of Jesus and John in two parallel series of scenes, each with an angelic annunciation, conception, marvellous birth, circumcision, hymns greeting the children and predicting their destiny, and infancy. Even in his mother's womb John recognizes Jesus—also still in his mother's womb—as his Lord. The Gospel According to John reduces the Baptist from an Elijah to a model Christian preacher, a mere voice; it omits any description of Jesus' baptism. Its tendency has often been labelled polemic against a continuing group of disciples of John, but it is more plausibly explained by the evangelist's desire that this ideal witness recognize the full character of the Christ as he is presented in the Gospel According to John and as a necessary consequence of the tension between the highly developed understanding of Christ in this Gospel and those details in early Christian tradition that suggested Jesus' subordination to John. The Gospels are thus primarily interested in the relations between John and Jesus.

Alinari

Josephus sought to present Jewish religious phenomena in Hellenistic categories and to de-emphasize any political elements unfavourable to Roman imperial control.

Life and work

After allowances are made for the tendencies of each of these sources, the following items about John appear relatively trustworthy. He was born somewhere in Judaea (localized at 'En Kerem from at least AD 530) to Zechariah, a priest of the order of Abijah, and his wife, Elizabeth, perhaps a relative of Mary, the mother of Jesus. His formative years were spent in the Judaean desert, where monastic communities, such as the Essenes (a strict Jewish sect that existed from about the 2nd century BC to the end of the 1st century AD), and individual hermits often educated the young in their own ideals.

In 27/28 or 28/29 John attained public notice, not as a priest but as a prophet. He was active in the region of the lower Jordan Valley, from "Aenon near Salim" (near-modern Nablus) to a point east of Jericho. His dress of an austere camel's hair garment was the traditional garb of the prophets, and his diet of locusts and wild honey represented either strict adherence to Jewish purity laws or the ascetic conduct of a Nazirite (a Jew especially vowed to God's service). His mission was addressed to all ranks and stations of Jewish society. His message was that God's wrathful judgment on the world was imminent and that, to prepare for this judgment, the people should repent their sins, be baptized, and produce appropriate fruits of repentance. Certain problems about, the meaning of John's message continue to be debated: In Matt. 3, John says, "he who is coming after me is mightier than I"; this might refer to God himself, a human messiah, or a transcendent divine being. He also says, "I baptize you with water . . . ; he will baptize you with the Holy Spirit and with fire"; this second baptism might symbolize the judgment the one coming would carry out. John's followers were characterized by penitent fasting, beyond the demands of Jewish Law, and special prayers. John's ethical call for justice and charity in Luke 3 requires righteousness from everyone in his own situation.

Although, like earlier prophets, John had an inner circle of disciples, baptism was not an admission rite into this group. It was a rite (immersion in running water) that symbolized repentance in preparation for the coming world judgment and was to be accompanied, before and afterward, by a righteous life. It was hardly conceived as a sacrament, in the Christian sense, conveying forgiveness, or as superseding Judaism and marking off a new people, including both Jews and Gentiles, prepared for God's final Kingdom; nor is a hypothesis that it symbolized a new Israel's crossing of the Red Sea toward a new national deliverance demonstrable. Equally unprovable is that it was a rite symbolizing man's reunion with divinity and return to his heavenly home—a sacrament of salvation and rebirth. The Jewish rite of baptism of converts differs fundamentally and is not its source. There were several other baptizing groups found about the same time and place, but none of these various and little-known baptisms can be shown to have inspired John's. It may have resembled in parts the initiatory baptism of the Essenes, though their other baptisms were more concerned with maintaining their community's ritual purity. John's baptism probably symbolized not so much anticipated entrance into the Kingdom of God as an anticipatory submission to the coming world judgment, which was represented as a coming second "baptism" by the Holy Spirit in a river of fire.

Possible relationship with the Essenes

The discovery of the Dead Sea Scrolls has drawn attention to the numerous parallels between John's mission and that of the Essenes, with whom John may have received some of his religious training. Both were priestly in origin, ascetic, and with intense and, in many respects, similar expectations about the end of the world. But John neither belonged to nor intended to found any organized community; he did not stress study of the Mosaic Law; and his message was more widely directed (to the poor, to sinners) than was that of the Essenes.

Jesus, who was baptized by John, saw in John the last and greatest of the prophets, the one who prepared for the coming of God's Kingdom (Mark 9, Matt. 11, Luke 7), and in many ways his ministry continued and developed John's. Whether John, who probably expected a divine Son of Man, recognized him in Jesus is not clear, but many of his disciples later followed Jesus.

Some time after baptizing Jesus, John was imprisoned by Herod Antipas, ruler of Galilee and central Transjordan. His crime was hardly the innocuous moral message Josephus presents, nor would his message, as found in the Gospels, have had much more immediate political bite. Herod had married (illegally, by Jewish Law) Herodias, the former wife of his half brother, after divorcing his first wife, the daughter of King Aretas IV of the Nabataeans, an adjacent Arab people. John's denunciation of this marriage doubtless presented Herod with the danger that his Jewish subjects would combine with his semi-Arab subjects in opposition to him. John's execution certainly preceded Aretas' victory over Herod in 35–36, a defeat popularly considered to have been divine vengeance on Herod for killing John. According to the Gospels, John's death preceded Jesus'; any greater chronological precision depends on the dates of Jesus' ministry and death. It is probable that John's followers recovered and buried his body and revered his tomb. The traditional burial site, at Sebaste (originally Samaria), near "Aenon by Salim," is attested from 360 onward. John's chief feast days are June 24 (nativity) and August 29 (beheading).

BIBLIOGRAPHY. On the ancient sources, see the standard commentaries on the Gospels, the Acts of the Apostles, and Josephus ("Loeb Classical Library"). Among recent monographs, CARL H. KRAELING, *John the Baptist* (1951), is primarily a historical investigation, while WALTER WINK, *John the Baptist in the Gospel Tradition* (1968), studies the Gospels' tendencies and their differing representations of John. For analogous contemporary baptizing groups, see J. THOMAS, *Le Mouvement baptiste en Palestine et Syrie . . .* (1935), and more recent literature on the community that produced the Dead Sea Scrolls. Most encyclopaedias of religion or biblical studies contain articles on John. Representative are: P. VIELHAUER in *Die Religion in Geschichte und Gegenwart*, 3rd ed., vol. 3, pp. 804–808 (1959), who offers the mainline view of critical New Testament scholarship; and W.R. FARMER in *The Interpreter's Dictionary of the Bible*, vol. 2, pp. 955–962 (1962), who stresses the political aspects of John's activity.

John the Fearless, Duke of Burgundy

Second of the four dukes of Burgundy of the French royal house of Valois, who ruled over a large part of the Netherlands as well as the duchy and county of Burgundy between 1384 and 1477, John the Fearless exercised a more decisive influence on the internal history of France than any other Burgundian duke. Although his reign as duke was relatively short, 1404–19, his role in maintaining Burgundian power in Europe and in improving the administration of the scattered Burgundian territories was of crucial significance for the future of the Burgundian state.

The son of Philip the Bold, duke of Burgundy, and Margaret of Flanders, John the Fearless was born on May 28, 1371, outside Dijon, Burgundy, in the ducal castle of Rouvres, where he spent the greater part of his childhood. In 1385 he married Margaret of Bavaria, and, in the following decade, his father initiated him into the arts of government and warfare, though he was not given any post of responsibility. Even in 1396, at the age of 24, when he became leader of the Burgundian crusade against the Ottoman Turks in defense of Hungary, his leadership was only nominal. The actual conduct of the expedition, which ended in the disastrous defeat of the crusaders on the battlefield of Nicopolis and the capture of John by the Turks (an adventure that earned him the epithet the Fearless), was entrusted to a group of councillors and military advisers appointed by Philip the Bold. John evidently benefitted from the blunders of these commanders, for his subsequent career showed that he was the only one of the Valois rulers of Burgundy who knew how to handle an army.

Succession

When John at last succeeded his father in 1404 as duke of Burgundy and count of Burgundy, Flanders, and Artois, he was 33 years old.

John the Fearless spent most of his time and his considerable political and military energies in France, Paris being his normal place of residence and seat of government. His only significant personal participation as duke of Burgundy in major events outside France took place in 1408, when he led a Burgundian army to aid his beleaguered brother-in-law, the Bishop of Liège, John of Bavaria, against the citizens of Liège, who were in open revolt. On the field of Othée, on September 23, 1408, the men of Liège were decisively defeated, and Burgundian influence was extended over the city and over the bishopric of Liège. From the start, then, John found himself involved in French affairs and was in part responsible for provoking a civil war in France with a rival house, headed by his first cousin, the King's younger brother, Louis, duc d'Orléans. Each man sought control of the mad king Charles VI and his queen and of the capital Paris. While the notorious murder by Duke John of his cousin by hired assassins in 1407 enabled John to subdue Paris and the crown, the opposition to the Burgundians by Louis's followers and heirs continued. Their faction was named after its main supporter, Bernard VII, comte d'Armagnac. During the five years between 1413 and 1418, in which the Armagnacs succeeded in driving the Burgundians out of Paris, the internal situation in France was further complicated by a new English invasion led by the ambitious king, Henry V. Duke John was one of those French princes who, while pretending to do his best to reach the battlefield of Agincourt to give battle to the English (1415), was unaccountably delayed on the way. His intermittent negotiations with King Henry V did not, however, lead to a firm Anglo-Burgundian alliance, and in the autumn of 1419 John turned instead to the Armagnacs, in the hopes of arranging a truce or even making a firm peace settlement with their youthful leader, the dauphin Charles (the future Charles VII), in an alliance against the English. The two princes, each with ten companions, met on the bridge of Montereau, some 50 miles southeast of Paris. On September 10, 1419, as the diplomatic parley began, John the Fearless was struck down and killed during a dispute started by the Armagnacs, a political assassination that contemporary evidence shows was almost certainly carefully premeditated.

Reputation

John the Fearless pursued aims similar to those of the other rulers of his day: the consolidation and extension of his own and his family's power. In spite of his lapses into violence, his love of intrigue, his hypocrisy, and his rashness, he was a successful diplomat and military leader; he was more dynamic and more of a reformer than his son Philip the Good and more cunning, though less scrupulous, than his father. Yet he has received less attention from historians than either of them. In the eye of history, especially French history, he has long been regarded as a traitor and assassin. There was, perhaps, a dark and sinister element in his character, but he lived in an age when vice, tyranny, and murder were the common properties of every ruler. If he wrought destruction in France, he also brought peace and prosperity to his own Burgundian lands.

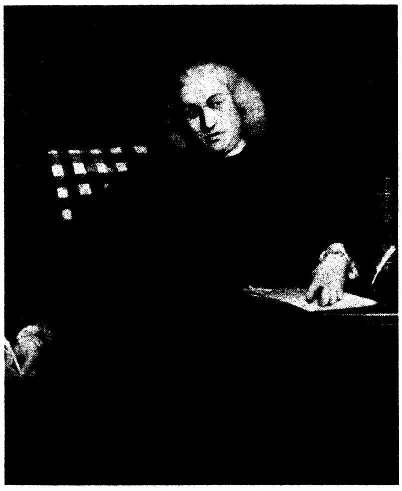
Johnson, Samuel

The English poet, critic, essayist, and lexicographer Samuel Johnson became famous not only for his writings but also for his forceful, witty conversation. After Shakespeare, Johnson is possibly the best known figure and the most frequently quoted in the whole range of English literature.

BY courtesy of the National Portrait Gallery, London



Dr. Johnson, oil painting by Sir Joshua Reynolds, 1765. In the National Portrait Gallery, London.

EARLY LIFE AND INFLUENCES

He was born at Lichfield, Staffordshire, on September 18 (new style; September 7, old style), 1709. His father, Michael Johnson, was a prominent citizen of Lichfield and was sheriff of the city at the time of Samuel's birth. As a bookseller, he conducted a substantial but not very profitable business. Samuel was not a healthy child. His eyes were weak and he was the victim of a tubercular infection in the glands of the neck, commonly known then as "the King's Evil." In the hope that the cure for this disease lay in the royal touch, Mrs. Johnson travelled to London with Samuel in March 1712, and the boy was duly touched by Queen Anne. His memories of the ceremony were naturally slight, but he retained "a sort of solemn recollection of a lady in diamonds and a long black hood." It is not recorded that he derived any physical benefit from the royal touch, but the gold amulet that the Queen hung round his neck remained there until his death.

Michael Johnson was a high churchman with Jacobite sympathies, favouring the Stuart rather than the Hanoverian succession. His wife, Sarah Ford, was a devout woman with leanings toward Calvinism. She taught her son to learn the collect for the day by heart and expounded to him the contrast between heaven and hell. In 1717 Johnson entered Lichfield grammar school and began the study of Latin. One of his schoolfellows, Edmund Hector, who was to become his lifelong friend, recalling in later years Johnson's "uncommon abilities for learning," wrote: "His ambition to excel was great, though his application to books . . . was very trifling . . . his dislike to business was so great that he would procrastinate his exercises to the last hour." It was a disposition that remained with Johnson throughout his long literary career.

Friends and influences at Oxford

When he was promoted to the upper school, Johnson came under the discipline of the headmaster, a scholar but a tyrant who beat his boys indiscriminately—"to save them from the gallows." As Johnson later said, "My master whipt me very well. Without that, Sir, I should have done nothing." After a brief period at the grammar school at Stourbridge, where he was a student and also took some part in the teaching of the younger boys, Johnson helped his father in the bookshop. Rambling along his father's shelves, he read widely and with the instinct of an incipient scholar—"not voyages and travels, but all literature, Sir, all ancient writers, all manly . . ." Thus, by the time that he entered Pembroke College, Oxford, in 1728, he was familiar with many works unknown at the universities; and when he was first introduced to William Jorden, tutor of the college, his own contribution to the conversation was a quotation from the Latin grammarian and philosopher Macrobius. Johnson thought little of Jorden's scholarship but praised his goodness of heart. William Adams, fellow and later master of Pembroke, meant more to Johnson and remained his friend through many years. He had some good friends, too, among the undergraduates of his own generation. He was near to his old schoolfellow, John Taylor of Ashbourne, at Christ Church, and among Pembroke men he had the reputation of being gay and frolicsome. But it was a forced gaiety. Frustrated and embittered by poverty, he defied authority and "thought to fight his way by his literature and his wit." One example of his scholastic facility survives from his undergraduate days—a Latin translation of Alexander Pope's "Messiah," which was included in a *Miscellany* published at Oxford in 1731.

How the impecunious Michael Johnson was enabled to send his son to college is not wholly clear. Possibly a small legacy received by Mrs. Johnson may have helped. But, in any event, Johnson was compelled to leave Oxford in December 1729 after a residence of 13 months. His prospects were poor. He had no degree or other qualification; his father's business was declining; an application for an ushership (assistant teacher) at Stourbridge was unsuccessful. His father died at the end of 1731, and in the following year Samuel accepted a post as undermaster in the grammar school at Market Bosworth. The work brought him neither health nor happiness, and he resented the arrogance with which he was treated by Sir Wolstan Dixie, in whose house he lived. Through the influence of his old friend Edmund Hector, who had become a surgeon in Birmingham, Johnson secured the task of translating into English the French version of ***A Voyage*** to ***Abyssinia*** by Father Jerome Lobo. Johnson's preface gives an early indication of his instinctive sympathy with the natives of an invaded country. The invaders of Abyssinia were missionaries who preached the gospel with swords in their hands. The preface also gives an authentic foretaste of Johnson's prose style:

> The Reader . . . will discover, what will always be discover'd by a diligent and impartial Enquirer, that wherever Human Nature is to be found, there is a mixture of Vice and Virtue, a contest of Passion and Reason, and that the Creator doth not appear Partial in his Distributions, but has balanced in most Countries their particular Inconveniences by particular Favours.

Marriage and early literary endeavours

Johnson's sojourn in Birmingham brought him something more than a fee of five guineas for his first book—it brought him a wife in the person of Elizabeth, widow of Harry Porter, a mercer. She was 20 years older than Johnson, and it is not easy to determine the grounds of mutual attachment. Johnson, in later years, used to speak of his wife's beautiful blonde hair; and whatever the lady thought of Johnson's looks ("lean and lank . . . the scars of the scrofula deeply visible") or of his "convulsive starts and odd gesticulations," she at least appreciated the vigour and good sense of his conversation. The marriage took place at Derby in 1735, and the bride brought with her a reputed dowry of £700. On the strength of this and with the encouragement of a friend who was registrar of the ecclesiastical court of Lichfield, Johnson decided to set up at Edial, near Lichfield, a school on his own at which young gentlemen could be boarded and taught the Latin and Greek languages. He prepared an elaborate curriculum, but only a few young gentlemen, among whom was David Garrick, came as pupils, and at the end of two years Johnson had to admit failure.

But in spite of ill health, of melancholia, of his lack of a degree, and of the collapse of his school, the desire to be known as a scholar and a writer remained clear in his mind. While still a schoolboy he had written of

> . . . the young Authour, panting after fame,
> And the long honours of a lasting name

and in the year before his marriage he had written to the founder of the *Gentleman's Magazine*, offering to fill a column, on reasonable terms, with poetry, dissertations, critical remarks on ancient and modern authors, and other material. Furthermore, with plenty of time on his hands at Edial, he embarked, again with the encouragement of friends, on the writing of a tragedy, based on the story of Sultan Mahomet (Mehmed) II and the beautiful Greek maiden Irene, as told by Richard Knolles in his *General History of the Turks*. But the work was not finished, and Johnson, facing the fact that he must write something for which an editor or a bookseller would pay, decided to seek his fortune in London. So, in company with David Garrick, he rode to London in March 1737. Arthur Murphy, in "An Essay on the Life and Genius of Samuel Johnson LL.D." (1792), wrote:

> Two such candidates for fame perhaps never, before that day, entered the metropolis together. . . . They brought with them genius, and powers of mind, peculiarly formed by nature for the different vocations to which each of them felt himself inclined. . . . In three or four years afterwards Garrick came forth with talents that astonished the publick. . . . Johnson was left to toil in the humble walks of literature.

Contributions to the *Gentleman's Magazine*

The *Gentleman's Magazine* offered him the first opportunity of humble toil. Edward Cave, the publisher, quickly recognized his journalistic ability, and Johnson contributed a number of pieces in prose and verse—odes, epigrams, reviews, as well as a series of concise biographies. In the later part of 1737 he returned to Lichfield, finished his tragedy *Irene*, and brought his wife to London. Meanwhile, his ambition to be a writer of something more than ephemeral pieces for periodicals remained, and in 1738 his first substantial poem, *London*, was published. It was written in imitation of the third *Satire* of Juvenal, and in it Johnson embodied his protest against political corruption:

> Here let those reign, whom pensions can incite
> To vote a patriot black, a courtier white;

against the dangers of the London streets:

> Their ambush here relentless ruffians lay,
> And here the fell attorney prowls for prey;
> Here falling houses thunder on your head,
> And here a female Atheist talks you dead.

and, with more acutely personal feeling, against the miseries of the unknown and impecunious author:

> This mournful truth is ev'ry where confess'd,
> SLOW RISES WORTH, BY POVERTY DEPRESS'D.

London, published anonymously, had an immediate success. It went quickly into three editions and won high praise from Alexander Pope. But Johnson's fee was only ten guineas, and again he thought of schoolmastering as an alternative to being "starved to death in translating for booksellers." The headmastership of Appleby School in Leicestershire was offered to him, subject to his obtaining the degree of M.A., but negotiations for its conferment broke down both at Oxford and at Dublin; similarly, his lack of a degree in law frustrated his application for permission to practice as an advocate. To this period of embittered disappointment belong his two most violent and satirical strictures upon the government of Walpole: the first was *Marmor Norfolciense* (1739), an essay upon a Latin rhyme supposed to have been discovered in Walpole's county, Norfolk; and the second *A Compleat Vindication of the Licensers of the Stage* (1739), an ironical defense of the suppression of Henry Brooke's play *Gustavus Vasa*. Both satires are the protests of an angry young man rebelling against authority and striving, as he had striven at Oxford, to fight his way out by his wit. Johnson was no sentimental Jacobite, but his scorn of the Hanoverian government was never more bitterly explicit than in *Marmor Norfolciense:*

> Then o'er the World shall Discord stretch her wings;
> Kings change their Laws, and Kingdoms change their Kings.

Satires against the Walpole ministry

The story that a warrant was issued for Johnson's arrest has never been verified, but, meanwhile, as a member of Cave's staff, he was required to treat contemporary politics in more sober style. Reports of parliamentary debates had been a feature of the *Gentleman's Magazine* since 1732, but shortly after Johnson's arrival in London the House of Commons forbade publication of its proceedings, Cave, however, contrived to continue the publication as "Debates in the Senate of Magna Lilliputia"; and in the first instance Johnson was employed to assist in editing and expanding the reports, but from 1740 to 1743 the "Debates" were entirely Johnson's own work. He was not a reporter in the modern sense and was only once inside the House of Commons. Sometimes he had a few notes supplied by other reporters, sometimes nothing more than the subject of debate and the names of the speakers; sometimes, he confessed, the "Debates" were the mere coinage of his own imagination, and in later years he had some prickings of conscience about his freedom of invention. As a journalistic feat, they were a remarkable tour de force. He would shut himself up in a room at Cave's headquarters in St. John's Gate and deliver three columns for the *Magazine* in an hour. His often-quoted remark that he took care that the Whig dogs—members of the political party opposed to the Tories—should not have the best of it gives a false impression of what he was doing. His reports have been well described as leading articles on both sides of the question, rather than records of the cut and thrust of debate. The short speech put into the mouth of Walpole at the end of the debate on the motion for his removal from office is a remarkably objective record of a minister speaking with dignity and restraint in his own defense.

Friendship with Richard Savage

One of Johnson's closest companions in his early years in London was Richard Savage. Savage had in his time been actor, playwright, and poet. He claimed to have been nobly born and had had many friends among the great whose hospitality he persistently abused. Two qualities at least he shared with Johnson—poverty and patriotic indignation against the Walpole administration. When their fortunes were at their lowest, they would spend whole nights in "a perambulation round the squares of Westminster . . . when all the money they could both raise was less than sufficient to purchase for them the shelter and sordid comforts of a night cellar." When Savage died, Johnson lost no time in commemorating his friend. Written con amore and at a white heat, the *Account of the Life of Mr Richard Savage*, published anonymously in 1744, was the first of Johnson's prose works to captivate the public. The novelist Henry Fielding, who would publish *Tom Jones* five years later, called it the best treatise in the language on the excellencies and defects of human nature; Joshua Reynolds, then only 21 but destined to become one of England's greatest painters, could not put the book down until he had finished it.

RECOGNITION AND MATURE CAREER

The theatre. In addition to a great variety of hack work, Johnson was now turning his attention to Shakespeare. In 1745 he published his *Miscellaneous Observations on the Tragedy of Macbeth,* coupled with preliminary proposals for his own edition of the plays, but he was deflected from further Shakespearean work by the suggestion that he should compile a dictionary of the English language. That a syndicate of booksellers should have chosen Johnson for so gigantic a task is a tribute to the position he had made for himself during his nine years in London.

In those same years David Garrick had made more rapid and more brilliant progress. Deserting the law for the theatre, he had made his mark as an actor in 1741 and by 1747 had become the manager of Drury Lane Theatre. For the first performances under Garrick's management Johnson wrote a prologue, and, although he commonly spoke with contempt of actors and their profession, he was willing, for friendship's sake, to plead their cause:

> Ah let not Censure term our Fate our Choice,
> The Stage but echoes back the publick Voice,
> The Drama's Laws the Drama's Patrons give,
> For we that live to please, must please to live.

At this time, moreover, Johnson had a personal interest in dramatic production. His tragedy *Irene* had long lacked a publisher or a producer. Garrick, when he came into power, agreed to do his best for his old master, and *Irene* was produced "with a display of Eastern magnificence" in 1749. It ran for nine nights. It was essentially a moralist's play, and although it was said to be universally admired, it has never been revived.

The Vanity of Human Wishes

More permanent was Johnson's second didactic poem, *The Vanity of Human Wishes* (1749), in which the careers of Galileo, Wolsey, Charles XII of Sweden, and others are shown to illustrate the hazards of political ambition, the futility of military conquest, and the miseries of authorship:

> There mark what ills the scholar's life assail,
> Toil, envy, want, the patron, and the jail.
> See nations, slowly wise and meanly just,
> To buried merit raise the tardy bust.
> If dreams yet flatter, once again attend,
> Hear Lydiat's life, and Galileo's end.

Though at the time of its publication *The Vanity of Human Wishes* had a much less rapid sale than *London,* it is Johnson's greatest poem. Its manner is that of its period. But Johnson's panorama of the rise and fall of scholars and philosophers, of statesmen and kings, in the modern as well as the ancient world, is inspired by that "high seriousness" that endows the poem with universality. But the record of disillusionment is not the end.

> Must helpless man, in ignorance sedate,
> Roll darkling down the torrent of his fate?

No, says Johnson, he must pray for the love and patience and faith of the Christian.

The "Rambler." The contract for A *Dictionary* of *the English Language* had been signed in 1746, and Johnson published his *Plan of a Dictionary of the English Language* the following year. He made no complaint of what the booksellers offered him, but it was not enough to keep the wolf from the door. So, in 1750, he embarked upon the *Rambler,* a twopenny sheet published twice a week and containing a single anonymous essay. The *Rambler* is of fundamental importance in any estimate of Johnson's approach to literature. Before he embarked on the work he prayed that he might promote the glory of God and the salvation of himself and others. The Rambler, in short, was not an entertainer but an instructor, and 19th-century critics tended to dismiss his essays as lay sermons.

Johnson had recently founded his first club (the Ivy Lane Club) and from his tavern chair would take a prominent part in contributing to what he called "colloquial entertainment." But a printed essay demanded "more accurate thought and more laboured beauties." Talking for victory was legitimate; with the printed word came the moralist's responsibility, and in Johnson's literary creed the basic article of belief was that it was always a writer's duty to make the world better. This sense of responsibility determined the style of the essays. He created no character comparable to that of Addison and Steele's Sir Roger de Coverley in the *Spectator,* and the essays bear little relation to current events or current literature. On the other hand, they frequently reflect the social and literary conditions of the time: there is scorn for the virtuoso and the overdomesticated hostess; an objective picture of the prostitute's life; a vigorous protest against the death sentence for robbery; and, inevitably, a grimly humorous presentation of the journalist's lot. Moreover, they show a remarkable understanding of human frustration and blocked wills. As has recently been pointed out, in the writings of Johnson there is the closest anticipation of the theories of Freud, if not his language, before the 20th century.

Mrs. Johnson's death

The *Rambler* appeared twice a week for two years (1750–52). A few days after the issue of the last number, Johnson's constitutional melancholy was deepened by the death of his wife. The full story of his married life must necessarily be conjectural. None of Johnson's friends in his early London period appears to have met Mrs. Johnson, and there are but few contemporary references to her. That the marriage was based on mutual admiration and affection is reasonably clear. From the beginning Mrs. Johnson had relished the quality of her husband's conversation, and she had a special admiration for the *Rambler;* Johnson, on his part, appreciated her intelligent reading of comedy. But, domestically, they were not well suited. Johnson was as insistent about the quality of his food as he was careless and untidy about the house. What was more serious was that in her later years Mrs. Johnson became addicted to strong liquor and to drugs and was unwilling to satisfy her husband's physical desires. Something of this may be read between the lines of Johnson's prayers and meditations about her death. Nevertheless, Johnson's affection, tinged with some remorse, remained sincere; and its sincerity is not impaired by the discovery that on April 22, 1753, he purposed "to try . . . to seek a new wife without any derogation from dear Tetty's memory." The precise direction of his search is not known, but it is interesting that he contemplated an adventure that he was later to describe as the triumph of hope over experience. "Formosae, cultae, ingeniosae, piae" ("a woman of beauty, elegance, ingenuity, and piety")—so Johnson described his Tetty on the gravestone that he placed in Bromley Parish Church more than 30 years later. In lapidary inscriptions, as he said, a man is not upon oath.

In 1752 Johnson was a lonely man, but he had made some good friends. At the Ivy Lane Club he was delighted "to pass those hours in a free and unrestricted interchange of sentiments, which otherwise had been spent at home in painful reflection." There were ten members, including Sir John Hawkins, who lived to be Johnson's executor and biographer; John Hawkesworth, editor of the *Adventurer,* to which Johnson himself contributed a number of essays; John Ryland, one of the few of Johnson's early friends who lived to attend his funeral; John Payne, publisher of the *Rambler;* and Richard Bathurst, the physician whom Johnson loved better than any other creature. It was at the Ivy Lane Club that Johnson celebrated the publication of the first book of his friend Mrs. Charlotte Lennox by "a whole night spent in festivity." About five in the morning, according to Hawkins, "Johnson's face shone with meridian splendour, though his drink had been only lemonade."

The dictionary. In 1747 Johnson published his *Plan of a Dictionary of the English Language.* At the suggestion of Robert Dodsley, the author and bookseller, it was dedicated to Lord Chesterfield. At first Chesterfield showed some interest and made some suggestions for revision, but when he paid no further attention to the work, Johnson would not be obsequious—and Johnson did not forget. In April 1753 he was beginning work upon the second volume of the *Dictionary,* and he had still to write the preface, the grammar, and the history.

Two years later the work was finished. It had occupied Johnson and his amanuenses for eight and one-half years, and its accomplishment was described by Sir James Mur-

Character and reputation of the *Dictionary*

ray, editor in chief of the *Oxford English Dictionary*, as a marvellous one. It surpassed earlier dictionaries not in bulk but in precision of definition and in literary illustration. Its 40,000 words were, in fact, rather less than those in the work of his predecessor, Nathaniel Bailey; but what distinguished Johnson's work was the range of reading by which he exemplified the different shades of the meaning of a particular word. "I applied myself," he wrote in his preface, "to the perusal of our writers. . . noting whatever might be of use to ascertain or illustrate any word or phrase." Certain books (Bacon's *Essays,* South's *Sermons,* and others) have survived with Johnson's underlinings and indications of the passages chosen for quotation. His assistants copied the quotations on separate slips, and these were pasted below Johnson's own definitions. At the beginning Johnson had looked forward to hours that he would revel away in feasts of literature and ransack the obscure recesses of northern learning. But he soon realized that these were "the dreams of a poet doomed at last to wake a lexicographer." To the weariness of copying was added the vexation of expunging, and Johnson, having set practical limits to his work, was acutely conscious of its imperfections. His orthography was admittedly controvertible and his etymology uncertain; and, even while the dictionary was hastening to publication, some words, as he said, were budding and some were falling away. Nevertheless, the claim made in the final paragraph of his preface—one of the finest examples of his prose style—was abundantly justified:

> In this work, when it shall be found that much is omitted, let it not be forgotten that much likewise is performed; and though no book was ever spared out of tenderness to the author, and the world is little solicitous to know whence proceeded the faults of that which it condemns; yet it may gratify curiosity to inform it, that the *English Dictionary* was written with Little assistance of the learned, and without any patronage of the great; not in the soft obscurities of retirement, or under the shelter of academick bowers, but amidst inconvenience and distraction, in sickness and in sorrow.

Today the ordinary reader may tend to remember the few "wild blunders"; the "risible absurdities"; and the frankly personal prejudices shown in the definitions of "oats" ("A grain, which in England is generally given to horses, but in Scotland supports the people"), "excise," "pension," and other well-known examples. But Johnson's enrichment of the wordbooks of his predecessors by judicious definition and by linguistic illustration from the whole range of English literature was an enduring monument in the history of lexicography.

On the title page of the *Dictionary,* Johnson had the satisfaction of describing himself as a Master of Arts of the University of Oxford, and it is significant that the award was made in consideration of the religious and moral value of his essays. The degree, in short, was conferred upon the Rambler.

The *Dictionary* was well received, and opposition came only from "the Criticks of the coffeehouse whose outcries are soon dispersed in the air and are thought on no more." But there had been one outcry of enthusiastic praise that Johnson did not allow to be dispersed. Shortly before the work appeared, in two papers in the *World,* Lord Chesterfield, seeking to make amends for his previous neglect, hailed Johnson as the supreme dictator of the English language and so provoked the most famous of all Johnson's letters:

> The notice which you have been pleased to take of my labours, had it been early, had been kind; but it has been delayed till I am indifferent, and cannot enjoy it; till I am solitary, and cannot impart it; till I am known, and do not want it. . . .

Journalism. Johnson was soon at work upon an abridged edition of the *Dictionary*, but fame as a lexicographer had not relieved him of pecuniary distress. In March 1756 he was under arrest for the sum of £5 18s. Normally he would have appealed to one of the printers for whom he worked, but they were not available, and it was the printer-novelist Samuel Richardson who sent him six guineas. So, of necessity, his activity as a journalist continued. He edited Sir Thomas Browne's *Christian Morals* (1756), wrote prefaces to William Payne's *Introduction to the Game of Draughts* (1756) and Richard Rolt's *New Dictionary of Trade and Commerce* (1756), and contributed many articles to journals. In the *Literary Magazine,* Jonas Hanway's "Essay on Tea" provoked Johnson's description of himself as a "hardened and shameless tea-drinker" who had drunk of it for 20 years without hurt and therefore believed it not to be poison.

A more important review was that of Soame Jenyns' *Free Inquiry into the Nature and Origin of Evil* (1757), in which, with massive irony, Johnson demolished the conjecture of a superior race of beings deceiving and tormenting men for their own pleasure:

> The only end of writing is to enable the readers better to enjoy life, or better to endure it: and how will either of those be put more in our power by him who tells us, that we are puppets, of which some creature not much wiser than ourselves manages the wires.

Nor could Johnson swallow the bland assertion that poverty was generally compensated by better health and a more exquisite relish of the smallest enjoyments. "Life," he retorted, "must be seen before it can be known." These were topics on which he wrote with peculiar depth of feeling, and, as always when he felt deeply, his style became more simple.

Political writings

Neither Johnson's interests nor his writings were confined to the problems of literature and ethics. To the *Literary Magazine* of 1756 he contributed two articles on the political situation—"An Introduction to the Political State of Great Britain" and "Observations on the present State of Affairs." In both he writes with scorn of the power politics inherent in both English and French colonialism. The dispute between the two countries in America was "the quarrel of two robbers for the spoil of a passenger," and even those who had settled in the New World on the fairest terms had no other merit than that of "a scrivener who ruins in silence over a plunderer that seizes by force." Nor was he afraid of asserting that the French sent out better governors and that they treated the natives better than did the English. It was ridiculous, he wrote, to imagine that the friendship of nations, whether civil or barbarous, could be gained or kept but by kind treatment; and it was this basic mistrust of the motives and methods of colonizers that provoked his later and better known outburst against colonial claims. Meanwhile, he had projects of his own in hand or in view. He issued his proposals for his edition of Shakespeare in 1756, emphasizing, not for the first time, that his motive was not desire of fame but want of money. In April 1757 he wrote to his old friend Edmund Hector, in Birmingham, that the subscriptions, if slightly disappointing, were satisfactory, but early in 1758 he was obliged to borrow £40 from a bookseller.

"The Idler" essays

About the same time he undertook to contribute a weekly essay, to be entitled "The Idler," to the *Universal Chronicle.* Of these essays it may be said that the reader who has been nurtured in the tradition that while Johnson's talk is magnificent, his writings (other than the *Lives of the English Poets)* are unreadable, would be well advised to turn his attention to "The Idler." Though the moralist and the social reformer (especially on such topics as debtors' prisons and vivisection) are still evident, he is willing to turn aside to the human comedy: for instance, to the female bargain hunter ("whatever she thinks cheap, she holds it the duty of an economist to buy") or to the publisher ("Some never dealt with authors; others had their hands full; some had never known such a dead time; others had lost by all that they had published for the last twelvemonth"). There are also some character sketches, of which the most memorable is that of "Mr. Sober":

> Mr. Sober's chief pleasure is conversation; there is no end of his talk or his attention; to speak or to hear is equally pleasing; for he still fancies that he is teaching or learning something and is free for the time from his own reproaches.
>
> But there is one time at night when he must go home, that his friends may sleep; and another time in the morning, when all the world agrees to shut out interruption. These are the moments of which poor Sober trembles at the thought.

It is a rare and convincing piece of self-portraiture. Every week for two years, with a few exceptions, Johnson delivered his "Idler" essay to the printer.

Rasselas. In the midst of his work and worry came news of his mother's illness. On January 13, 1759, he contrived to send her 12 guineas. But he knew that he would need more, and on the same day that he wrote his last tender tribute to his mother (January 20), he implored Strahan, the printer, to let him have £30 on account of "a thing he was preparing for the press." The thing was to be entitled *The Prince of Abissinia,* better known as *Rasselas.* Written in the evenings of a week with the impending expenses of his mother's funeral in mind, it explores and exposes the vanity of the human search for happiness. The setting was no doubt prompted by Johnson's recollection of Jerome Lobo's *Voyage to Abyssinia,* and the work is addressed to those who "listen with credulity to the whispers of fancy and pursue with eagerness the phantoms of hope." Impelled by such eagerness, Rasselas, with his sister, leaves his happy valley because its pleasure has ceased to please and because he is fired with a desire to do something. He meets with men of varied occupations and interests and earnestly explores their manner of life—scholars, astronomers, shepherds, hermits, poets. With Imlac, the poet, he ranges over many of the basic problems of art and life but gains little satisfaction from the answers he receives. At his first entry into city life, Rasselas meets everywhere with gaiety and happiness, but closer association reveals a picture of levity and intemperance. From the extravagance of youth he turns to an inspiring lecture on morality, only to find that the lecturer's philosophy collapses at the first stroke of personal misfortune. When he passes hopefully to scenes of pastoral simplicity, he finds the shepherds cankered with discontent, since they are condemned to labour for the luxury of the rich; when hc seeks advice from a hermit, he is disappointed to be told that "the life of a solitary man will be certainly miserable, but not certainly devout." So the journey of disillusionment continues, until Imlac protests: "While you are making the choice of life, you neglect to live"—which is, perhaps, the most important moral to be drawn from the tale.

The moral of *Rasselas*

Of all Johnson's writings, none is more intensely characteristic than *Rasselas.* It is a remarkable example of his fluent productivity when he had a definite object and a definite date before him, but speed did not debase either the solemnity of his subject or the dignity of its treatment. Johnson allowed his imagination to wander into Ethiopia and Egypt, but fundamentally *Rasselas* is a spiritual autobiography. Furthermore, it was the one prose work of Johnson's that obtained an immediate and wide popularity in his lifetime. It satisfied the taste of the 18th-century reader for "impressive truth in splendid fiction drest"—and not only of the English reader. In a variety of translations its fame spread over Europe and beyond.

Johnson's circle. In spite of his struggles and sorrows, Johnson was, by this time, no longer a lonely hack writer. His writings, though they did not make his fortune, had brought him many friends. Joshua Reynolds had been enthralled by Johnson's *Life of Savage* and was no less enthusiastic about his conversation and his counsel; Charles Burney, a leading English music historian of his time, warmly commended the *Dictionary* and encouraged the edition of Shakespeare; Bennet Langton, a Lincolnshire gentleman and scholar, came to London at an early age for the express purpose of meeting the author of the *Rambler.* Johnson also cherished his Oxford friendships. He spent some time there in 1754 and again in 1755 and 1759 and, after the conferment of his degree, took a keen pleasure in wearing his gown. It was at Trinity in 1759 that Bennet Langton introduced him to Topham Beauclerk, who was descended from Charles II and Nell Gwyn.

Introductions, reviews, and dedications

Even so, Johnson was still at the beck and call of authors, editors, and friends for the writing of introductions, reviews, and, especially, dedications. Of James Bennet's edition of Roger Ascham's works he was virtually the editor and contributed a life of Ascham, a famous scholar and Latin secretary to Elizabeth I; he wrote the loyal address presented to George III on his accession by the painters, sculptors, and architects; he revised a pamphlet on the proper route for the coronation procession; he reviewed a work on Mary, queen of Scots, and wrote a dedication for Giuseppe Baretti's *Italian Dictionary.* Meanwhile his edition of Shakespeare tarried. In 1762 the unexpected happened. He was informed of the gracious intention of his majesty the King to confer on him a pension of £300 a year. Could he in decency take it, after defining "pension" in his *Dictionary* as "pay given to a state hireling for treason to his country"? At least, he felt, he must consult his friends. But Reynolds reassured him, and Lord Bute, the prime minister, told him that the award was made not for anything he might do but for what he had already done. So, from a full heart, Johnson thanked his lordship for sparing him "the shame of solicitation, and the anxiety of suspense."

Meeting with James Boswell. The following year was to provide yet another landmark in Johnson's life, for on May 16, 1763, his accidental meeting with James Boswell in the back parlour of Thomas Davies' bookshop in Covent Garden inaugurated one of the most famous companionships in history. Boswell, the eldest son of Lord Auchinleck, a Scottish judge, had studied law at Edinburgh and Glasgow and had a passionate desire to taste the felicities of London life. His mind was dominated by two ambitions—to meet famous men and to be a famous author himself. Staying in a country house in the previous year, he had read aloud, with enthusiastic comment, some of the *Rambler* essays; and, in the list of celebrities whom he wished to meet, the author of the *Rambler* stood high. A little daunted by Johnson's brusque rejoinders at their first meeting, Boswell was nevertheless encouraged by Davies to persevere; and a week later he waited, with some apologies, upon Johnson. Johnson cut him short. "I am obliged," he said, "to any man who visits me." So Boswell stayed and listened in rapture. "His conversation," he wrote in his diary, "is as great as his writing." He could give no higher praise. To Johnson new friendships were always welcome, and especially with young people (Johnson was then 53 and Boswell only 22), for such friendships lasted longest. To the charm of Boswell's enthusiasm he quickly succumbed. Together they enjoyed suppers at the Mitre Tavern and excursions on the Thames, but the signal mark of Johnson's favour was his offer to accompany Boswell in the coach to Harwich, whence Boswell was to embark on his continental tour. Johnson gave him much sound advice. In particular, he urged him to keep a diary, and it is to Boswell's diary that the world owes its intimate knowledge of Johnson. Many others left valuable records of his life and character, but it was Boswell who Johnsonized the land.

Foundation of The Club

In 1764 Johnson was happy to concur with Joshua Reynolds' suggestion for the foundation of what is still the most famous of London dining clubs—The Club. Among the original members, besides Reynolds and Johnson, were Edmund Burke, Topharn Beauclerk, Bennet Langton, and Oliver Goldsmith, and nine years later it was one of the proudest moments of Boswell's life when he was admitted to membership.

Edition of Shakespeare. Meanwhile, Johnson had been working on his edition of Shakespeare. Adumbrated in 1745 and formally announced in 1756, it had occupied him for much more than the two years in which he had hoped to complete it, and the long delay had provoked some typical satire from the pen of the scurrilous poet Charles Churchill:

> He for subscribers baits his hook,
> And takes their cash—but where's the book?

The book, in eight volumes, appeared at length in 1765. Johnson had been a student of Shakespeare all his life. He was no idolater, and his basic criticism is that of the moralist:

> He is so much more careful to please than to instruct, that he seems to write without any moral purpose. . . . He carries his persons indifferently through right and wrong, and at the close dismisses them without further care, and leaves their examples to operate by chance. This fault the barbarity of his age cannot extenuate; for it is always a writer's duty to make the world better.

As an editor Johnson set out, first, to correct textual corruptions; second, to elucidate obscurities of language;

and, last, in treating of Shakespeare's sources, to examine the very books that Shakespeare consulted. Of the critics' complaint of Shakespeare's neglect of the unities of time and place he made short work. The demand for these unities arose from "the supposed necessity of making the drama credible," but in Johnson's view no drama was either credible or credited. "The truth is that the spectators are always in their senses, and know, from the first act to the last, that the stage is only a stage, and that the players are only players." Johnson recognized that Shakespeare wrote his plays not for the reader at his desk but for an audience in the theatre. But Johnson himself could never appreciate the contribution made by the actor to dramatic interpretation. For him the actor was a reciter who said his piece "with just gesture and elegant modulation," and it was not in the theatre but in his study that he was most deeply moved by "the perpetual tumult of indignation, pity and hope." "He that peruses Shakespeare," he wrote about *Macbeth*, "looks round alarmed and starts to find himself alone," and he was so deeply shocked by his first reading of Cordelia's death in *King Lear* that he could not bear to read it again until he revised the play as an editor. The romantic critics of the 19th century belittled Johnson's work on Shakespeare, but the prophecy by the English critic Sir Walter Raleigh (1861–1922) that Johnson would receive more respect in the 20th century has been abundantly fulfilled by modern editors. It was in the year of the publication of his Shakespeare that Johnson received the degree of LL.D. from Trinity College, Dublin; his own university did him a similar honour ten years later.

Johnson's household. In whatever literary work Johnson was engaged his greatest terror was solitude, and the composition of his household reflects his efforts to avoid it. He had many habitations in London of which the most famous is the house in Gough Square, just north of Fleet Street, in which he lived from 1749 to 1759. When Boswell first called upon him in 1763 he was at 1, Inner Temple Lane. From there he moved back to Johnson's Court (7, Fleet Street) in 1765 and in 1776 to Bolt Court, which was his home until his death. The house in Gough Square has been well preserved and is now a Johnson museum. There the *Dictionary* was compiled; there the *Rambler*, the *Idler*, possibly *Rasselas* and much else was written; there his wife died in 1752. Even before her death and long before the grant of his pension, he had begun to make his house a refuge for the poor and unfortunate.

The house in Gough Square

Anna Williams, daughter of Zachariah Williams, who had received Johnson's help in writing his *Longitude at Sea*, came to London in the hope of being cured of a cataract but later became totally blind. She was a constant visitor in Mrs. Johnson's lifetime and, after her death, came to live in the house. For the rest of her life she had either a room in Johnson's house or lodgings near at hand. Blindness made her peevish in manner, but Johnson's regard and affection for her remained constant. When she died in 1783, he mourned a companion to whom he had had recourse for domestic amusement for 30 years. Shortly after Mrs. Johnson's death, Johnson's beloved friend Richard Bathurst presented to him Francis Barber, a Negro slave who had been freed by Bathurst's father. Johnson made Francis his friend as well as his servant, sent him to school at Bishop's Stortford, and provided for him handsomely in his will. Another humble friend was Robert Levett, "an obscure practiser in physick amongst the lower people," who was given a room at the top of the house in Johnson's Court. Johnson insisted that Levett was indebted to him for nothing more than houseroom, a share of a penny loaf at breakfast, and an occasional Sunday dinner. His death provoked one of Johnson's most moving poems:

> Well try'd through many a varying year,
> See Levett to the grave descend;
> Officious, innocent, sincere,
> Of every friendless name the friend.

Yet another beneficiary was Mrs. Desmoulins, daughter of Dr. Swynfen, Johnson's godfather, who joined the household in the early London years. After Mrs. Johnson's death she appears to have been in charge of the cooking. But she quarrelled constantly with Anna Williams, and anarchy reigned in the kitchen.

Friendship with the Thrales

It was from this domestic background that in 1765 Johnson was introduced to a family that was to provide one of the most comforting friendships of his life. Henry Thrale, owner of a Southwark brewery, had been married to Hester Lynch Salusbury in 1763. Two years later he was elected member of Parliament for Southwark, and his wife became a famous hostess and, in particular, "the provider and conductress of Dr. Johnson." For the first time in his life Johnson, who was invited not only to dine but to spend weeks, or even months, at the Thrales's country house at Streatham, was free to enjoy the luxury of solid comfort. No man, as he said, is a hypocrite in his pleasures, and at Streatham he could enjoy them all—a good library, intelligent conversation, pretty women, late hours, tasteful cookery. Furthermore, he became the confidant and counsellor of both parents and children; a room was set apart for him at the Southwark house as well as at Streatham; he was one of the family.

Political pamphlets. Already Johnson's pension had made two important differences in his way of life: he was no longer obliged to write for a living, and he could afford the time and money for holidays. Not that he was entirely idle as a writer: Shakespeare and the *Dictionary* called for revision; friends called for dedications and prologues (he wrote one for Goldsmith's *Good-Natur'd Marl)*; and he was also moved to write a series of political pamphlets. Of these tracts, the general view was, for long, that they exhibited the sad spectacle of a great man giving vent, unworthily, to the abusive expression of his conservative prejudice against the rights of the people. Today, more trouble is taken to understand Johnson's point of view. The pamphlets of the 1770s are seen not as a sudden whim of his later years but as part of the expression of a lifelong concern with political morality, which in the 1730s and 1740s had produced pamphlets vigorously denouncing the alleged tyranny and corruption of the Walpole government and, in the 1750s, a large amount of acute journalistic analysis (and condemnation) of the commercial and imperialist motives underlying the Seven Years' War.

The False Alarm (1770) was written not so much to defend the right of the House of Commons to refuse readmittance to a member already expelled as to protest against the absurdity of raising the controversy to the level of a constitutional crisis. What the country was arguing about, he said, was whether Middlesex should be represented, or not, by a criminal from jail. To raise the cry that liberty was in danger was to raise a false alarm.

Thoughts on the Late Transactions respecting Falkland's Islands (1771) was a reply to the anonymous political controversialist Junius and others, who had been urging the British government to resist the Spanish claim to those islands by aggressive action, and who now reproached it for having avoided war by a diplomatic compromise that left Britain in possession of the islands, though without fully establishing its title to them as against Spain's. Johnson gives a thorough history of the rival claims and of the diplomatic manoeuvring and then, in vigorous rhetoric, denounces the jingoism of his opponents, charging them with warmongering for commercial gain.

> These are the men who, without virtue, labour, or hazard . . . rejoice when obstinacy or ambition adds another year to slaughter and devastation; and laugh from their desks at bravery and science, while they are adding figure to figure, and cipher to cipher, hoping for a new contract from a new armament, and computing the profits of a siege or tempest.

The Patriot (1774), a short piece written just before the election of that year, defines the qualities of the true patriot and contrasts them with the behaviour of those who had unjustifiably arrogated the title to themselves. As for the supposed defenders of liberty of conscience, had they not opposed the act of Parliament that gave the Catholics of Quebec the right to practice their own religion?

Taxation No Tyranny (1775) is *a* reply to the resolutions passed by the American Continental Congress of 1774, which assert a position similar to that contained in the

Declaration of Independence in the year 1776. Here it is important to remember that throughout his life Johnson had shown little sympathy toward European colonization and colonists in general and had published bitter denunciations of the exploitation (and worse) of native populations by the Portuguese in Africa, the Spanish in Central and South America, and the "English barbarians that cultivate the southern islands of America'— the West Indies. In an "Idler" essay (81; 1759) Johnson puts into the mouth of an Indian chief a fierce tirade against the American colonists' oppression of the Indians and Negroes. By comparison, the colonists' complaints of "oppression" by the British government (in the form of taxation) seem to Johnson trivial. For mercenary reasons, they had settled on the other side of the Atlantic under English protection and with the authority of English charters. That they had no representation at Westminster was their own fault. They had the protection of English arms. Why should they not pay for it? And, if there were 3,000,000 Whigs in America "fierce for liberty," why were the loudest yelps for liberty heard among the drivers of Negroes?

Johnson's pragmatic philosophy of politics

For Johnson, these tracts were an opportunity to expound his essentially pragmatic philosophy of politics. He ascribed divine right neither to kings nor to people. Talk about liberty in the abstract or about "natural" rights he dismissed as cant. What was essential for a civilized community was a stable government and respect for its laws. But he clearly recognized that there was an ultimate safeguard. If government abused its power, mankind would not bear it; against a tyrant the people would rise and cut off his head.

The politics of the 1770s did not deter Johnson from the enjoyment of his new-found liberties. With the Thrales he spent weeks at Brighton as well as at Streatham, and his "annual midland ramble" included long visits to Oxford, to Lichfield, and to his old friend John Taylor at Ashbourne.

Journey to the western islands of Scotland. In 1773 Boswell persuaded Johnson to accompany him on a more exciting expedition. Johnson had wanted to visit the Hebrides, the western islands of Scotland, for longer than he could remember and now felt that Boswell's "gaiety of conversation and civility of manners were sufficient to counteract the inconveniences of travel." The travellers left Edinburgh on August 18 and followed the coast road. At St. Andrews Johnson's sadness at the sight of archiepiscopal ruins was mitigated by the kindness of the professors; at Aberdeen he was made a freeman of the city; dining with the governor of Ft. George, he talked learnedly about gunpowder. After Inverness, horses were substituted for the post chaise, and by the shore of Loch Ness Johnson encountered an old woman, who could speak very little English, boiling goat's flesh in a kettle. They crossed to Skye from Glenelg. There they had rain for the first time and were warned that a succession of three dry days was not to be expected for many months. In the island of Raasay they found "nothing but civility, elegance and plenty," and Johnson was delighted with the patriarchal life that he had come to see. Similarly, at Dunvegan he "tasted lotus." On the voyage to the island of Mull in the Inner Hebrides they were driven by a stormy sea into Coll, where, to Boswell's delight, Johnson strutted about one night with a broadsword and target (shield). But they were weather-bound for a week, and Johnson began to long for the mainland—"to go on with existence." It was Boswell, not Johnson, who insisted on visiting Iona, a small island southwest of Mull, but Johnson's comment is one of the most famous paragraphs in all his writings: "That man is little to be envied, whose patriotism would not gain force upon the plain of Marathon, or whose piety would not grow warmer among the ruins on Iona." On the way back to Edinburgh a visit was paid to Boswell's father at Auchinleck, where, to Boswell's distress, Johnson did not succeed in avoiding controversial topics. After a fortnight's stay in Edinburgh, Johnson returned to London and declared that his tour was the most pleasant journey he had ever made.

From many points of view the tour was a triumph. Johnson had his 64th birthday at Dunvegan, and his endurance of the physical strain of riding his pony up the rough tracks of Mam Rattachan, of sleeping in Highland huts, and of being tossed in small boats on stormy seas was in itself remarkable. Socially, with rare exceptions, the tour was a complete success, both from Johnson's point of view and from that of his hosts. For Boswell, of course, it was a glorious opportunity for him to write what was, in effect, the first installment of his *Life* of Johnson. Johnson himself was moved, for once, to write a book for its own sake. It was at Anoch in Glenmoriston, on August 31, 1773, that the travellers "entered a narrow valley not very flowery, but sufficiently verdant." While the horses grazed, Johnson sat down on a bank "such as a writer of Romance might have delighted to feign" and conceived the thought not of a romance but of an account of his journey. Of course, he did not attempt to compete with Boswell, whose diary he read, and approved, at intervals. For an intimate personal record of the "minute particulars" of Johnson's behaviour and conversation, the reader naturally turns to Boswell's ***Journal of a Tour to the Hebrides,*** published after Johnson's death. Johnson, in his own ***Journey to the Western Islands of Scotland*** **(1775),** was concerned to describe the customs, religion, education, trade, and agriculture of a society that was new to him. His narrative is far from being impersonal, but it contains no gossip. It was in his many letters to Mrs. Thrale that he wrote more freely. In one letter he offered her a definition of travel highly characteristic of his general approach to life: "The use of travelling is to regulate imagination by reality, and instead of thinking how things may be, to see them as they are."

Boswell's diary

Not long after his return, Johnson was saddened by the death of Oliver Goldsmith. They had met perhaps as early as 1760, and Johnson had been one of the first to recognize the quality of Goldsmith's writings. He had contributed a famous couplet to ***The Traveller,*** and ***She Stoops to Conquer*** had been dedicated to him. He frequently crushed Goldsmith in argument at The Club and elsewhere, but his final judgment was sincere: "Let not his frailties be remembered," he wrote, "he was a very great man."

Tours of Wales and France with the Thrales

Johnson's intimacy with the Thrales at this time is clearly illustrated by his joining them in two long tours—to North Wales in 1774 and to France in the following year. On the way to Wales he was able to introduce them to his Lichfield friends, and some time was spent in the Vale of Clwyd, where Mrs. Thrale's ancestors had lived. On the return journey Johnson was interested to see Matthew Boulton's "enginery" at Birmingham, where Boulton built steam engines in partnership with James Watt, and at Oxford the party was entertained in the hall of University College. In France he was interested more in people than in places. He admired some of the cathedrals, but his most significant comments were on social conditions, particularly on the gulf between rich and poor. There was no provision for the maintenance of the poor, and there was no comfortable middle class.

"The Lives of the English Poets." In 1777 three booksellers waited upon Johnson and asked him to write a series of ***Lives*** for an "elegant and accurate" edition of the English poets that they and others had in preparation. Johnson agreed. The choice of the poets had already been made, and he strongly objected to the volume being described as "Johnson's Poets." Only five names (and some of them rather odd names) were added at his suggestion. Though he said that he wrote his pieces "dilatorily and hastily, unwilling to work, and working with vigour and haste," it was in this work that he came nearest to actual enjoyment of writing.

The ***Lives*** are not a series but a miscellany. They follow no plan; they have no uniformity of design. On certain major poets (Milton, Dryden, Pope, and others) Johnson wrote long essays that remain as part of the stock-in-trade of English criticism. He was led on, he said, by "the honest desire of giving useful pleasure." Thus, in writing of Abraham Cowley, he seized the opportunity of a lengthy examination of the characteristics of the Metaphysical Poets, those poets who were "more desirous of being admired than understood." On the other hand, in a laconic piece of **300** words on Richard Duke, he concluded that his poems "were not below mediocrity." When he came to James Thomson (one of his own additions) he praised his ***Seasons*** highly, but of the poem ***Liberty*** he wrote: "When it first appeared, I tried to read and soon desisted. I have never tried again . . . ."

Criticism of Milton and Gray

The biographical part of literature was what Johnson loved best, and he made no attempt to separate the poetry from the man who had written it. If he disapproved of the man, he found it difficult to be a detached critic of his work. The ***Lives*** of Milton and Gray might be cited as two instances. Milton's religion and politics are scornfully exposed—he was not a member of any church and politically he was an acrimonious and surly republican. And some of this prejudice comes through in the discussion of Milton's poetry. To be sure, Johnson had high praise for ***Comus*** and "L'Allegro" and "Il Penseroso," and thought Paradise Lost one of the great "productions of the human mind." But he did not wish it longer, and insisted on pointing out major faults. In his criticism of "Lycidas" (a judgment that was to irritate the Romantics, though even this has been persuasively defended by modern critics), Johnson made a firm break with the older pastoral tradition, which he found stale and appropriate only to descriptions of country life.

Personal dislike is also evident in the ***Life*** of Gray. To the ***Elegy*** Johnson paid a famous tribute of genuine admiration, but he approached his other poems with "the neutrality of a stranger and the coldness of a critick." In fact, he was far from neutral in his harsh unfavourable criticisms of Gray's linguistic inversions and antiquarian epithets. It was Gray's attitude to life and literature that irritated Johnson. One who had spent 30 years in Grub Street could have little patience with a fastidious scholar who asked for leisure to be good and wrote only when he was in the humour.

LAST YEARS

Publication of the ***Lives*** was completed in **1781,** and a storm of criticism broke out. But Johnson was too old a campaigner to be disturbed by criticism, and, in fact, the ***Lives*** remain the best loved, or the least neglected, of Johnson's works. What distressed him far more that year than unfavourable reviews was the death of Henry Thrale. No loss since that of his wife had so much oppressed him; he felt like a man beginning a new course of life. To some extent he was saved from brooding over his loss by his attention to his duties as executor. Always interested in trade and commerce, he had enjoyed discussing brewery policy with Thrale in his lifetime, and now he was dealing not with parcels of boilers and vats but with "the potentiality of growing rich beyond the dreams of avarice."

Death of Henry Thrale

To his disappointment, but to Mrs. Thrale's delight, the brewery was sold to "a knot of rich Quakers" for £135,000. For a time Johnson continued to regard Streatham as his home, but in August **1782** Mrs. Thrale told him of her decision to sell the house. On his last visit in October he humbly thanked God for the comforts he had enjoyed there. A room was allotted to him in the house that Mrs. Thrale took in Argyll Street, but the intimacy of the Streatham days was weakening. For long a victim of asthma and dropsy, Johnson had a paralytic stroke in June **1783,** from which he did not properly recover until the spring of the following year. Mrs. Thrale wrote to him with "the attention and tenderness of ancient time," but she dared not tell him that she had for long been trying to decide whether or not to marry Gabriel Piozzi, an Italian musician. When, at the end of June **1784,** Johnson heard of her decision to marry, he wrote a letter of angry condemnation; but a week later he recognized that Mrs. Thrale's marriage (which was, in fact, a happy one) was her own affair and thanked her for the kindness that had soothed **20** years of a life radically wretched.

Johnson was now bereft of many old friends. He was a sick man, but to the end he fought untiringly against his worst enemy—solitude—and the melancholy that it induced. In December **1783** he had formed yet another club in Essex Street, which was conveniently near his house in Bolt Court, and in the following July he set out upon his last Midland ramble. At Lichfield everyone was pleased to see him; he stayed for two months at Ashbourne, where he was comfortable but "hungry for conversation," for John Taylor, his friend from school days, went to bed at nine; at Birmingham he talked over old times with Edmund Hector; at Oxford he was welcomed to his old college by the master. On November 16 he returned to London. Though his mind remained alert, his bodily state grew worse, and he died on December **13, 1784. A** week later he was buried in Westminster Abbey. One journalist noted that there was only one man of hereditary title among the mourners; but he added, rightly, that he who was followed by Reynolds and Burke did not go unhonoured to the grave.

REPUTATION AND CHARACTER

The history of Johnson's fame is curious. In his own day he was acknowledged as an outstanding writer and thinker, and his fame still persists. Yet today his reputation rests on a dual tradition. There is the "folk image," based largely on Boswell's accounts, and perpetuated by Macaulay, which stresses Johnson the witty talker, who often takes the wrong side of an argument. This is the colourful eccentric, the bear with the heart of gold, whom everybody quotes but nobody reads, remembered chiefly as a character in a great book. Then there is Johnson the man of letters, so admired in his own day and now, after a long eclipse, once again dominating the scene. This second tradition does not rule out Johnson the talker, so admirably described by Boswell, but it concentrates on the Great Cham's own writings.

Johnson the moralist

In scores of recent books the emphasis is not on Johnson's amusing foibles and forceful remarks but rather on his vigorous reasoning intelligence, his keen understanding of human frailty, his detestation of hypocrisy, and his practice of applying ethical standards to nations as well as to individuals. Many of Johnson's so-called obtuse prejudices, when properly understood, derive from his insistence on making strict moral judgments. Johnson was not a sentimental Tory reactionary. He violently opposed war and pleaded for more humane treatment of prisoners of war. He attacked censorship in the **1737** licensing act; he argued for mitigation of laws against prostitutes and debtors and the death penalty for forgery. He was the consistent champion of the poor and oppressed and argued for the rights of blacks and other indigenous peoples. Yet at the same time he saw the necessity of a strong central government in order to withstand the pressures of wealthy mercantile interests.

Moreover, it is now evident that Johnson was not, as was formerly assumed, a strictly neoclassical literary critic; rather, his approach tended to be empirical. He rejected any slavish following of rules and insisted on judging each work separately, making his own decision as to its merits and defects. Johnson is now seen to be the father of 20th-century New Criticism.

Although he scorned those optimists who had a naïve faith in the perfectibility of human institutions, Johnson himself was not a complete pessimist. Along with his skeptical doubts, he had an enormous zest for living. Participation and struggle were always necessary, and while there were some areas where improvement might be possible, everything had to have a strong ethical base. Johnson was not only a moralist but a Christian moralist. The sinfulness of man and his need of redemption by the Passion of Jesus Christ were the basis of his personal faith. His constitutional melancholy deprived him of a feeling of joy in his religion, and the sin of which he was most deeply conscious was idleness. In his ***Prayers and Meditations*** **(1785),** published after his death, his repentance and his good resolutions, constantly repeated but seldom kept, show the sincerity of his heart-searching and his humility. But his faith prevailed, and in his last days he refused to take opiates because he had prayed that he might render his soul to God unclouded.

Born in a bookshop, Johnson had the qualities, and the conscience, of a scholar. By the writing of books he strove to earn his daily bread; by the reading of books he sought to enlarge the range of his ideas and of his scholarship. And what, he asked in later years, should books teach but the art of living? Few men have left finer examples of the art of living than Samuel Johnson.

MAJOR WORKS

VERSE: *London: A Poem* (1738); *The Vanity of Human Wishes* (1749); *Irerze: a Tragedy* (1749).

PROSE: *Marmor Norfolciense* (1739), satirical essay; *A Compleat Virtdication of the Licensers of the Stage* (1739), ironical defense of the suppression of Henry Brooke's play *Gustavus Vasa; An Account of the Life of Mr Richard Savage* (1744); *Miscellaneous Observations on the Tragedy of Macbeth* (1745); *The Plan of a Dictionary of the English Language* (1747); *The Rambler* (1750–52); *A Dictionary of the English Language*, 2 vol. (1755); *The Prince of Abissinia*, 2 vol. (1759), better known as *Rasselas*; *The Idler* (1758–60); *The Plays of William Shakespeare*, 8 vol. (1765); *The False Alarm* (1770); *Thoughts on the Late Transactions respecting Falkland's Islands* (1771); *The Patriot* (1774); and *Taxation No Tyranrzy* (1775), four political tracts; *A Journey to the Western Islands of Scotland* (1775); *Prefaces, Biographical and Critical, to the Works of the English Poets,* 10 vol. (1779–81, rev. as *The Lives of the most eminent English Poets, 4* vol., 1781); *Prayers and Meditations, composed by Samuel Johnson, LL.D.* (1785), published posthumously by George Strahan.

BIBLIOGRAPHY. The standard bibliography is that by W.P. COURTNEY and D. NICHOL SMITH (1915), reissued in 1925 and supplemented by R.W. CHAPMAN and A.T. HAZEN in the *Proceedings of the Oxford Bibliographial Society* (1939). *The R.B. Adam Library Relating to Dr. Samuel Johnson and His Era,* 4 vol. (1929–30), contains facsimiles of many manuscripts and letters. The most extensive Johnson collection is now in the Hyde Library, near Somerville, New Jersey, described in *Four Oaks Library,* 2 vol. (1967). J.L. CLIFFORD and D.J. GREENE in *Samuel Johnson: A Survey and Bibliography of Critical Studies* (1970), list the most important works on Johnson from his day through 1968.

Collected editions: The Oxford edition, 9 vol. (1825), with two supplementary volumes of *Debates,* has long been the most cited, but its text is deficient by modern standards. The new Yale edition under the editorship of A.T. HAZEN and J.H. MIDDENDORF (1958–) now undertakes to supply a more satisfactory text. *Diaries, Prayers, and Annals,* ed. by E.L. MCADAM, JR., with DONALD and MARY HYDE •(1958); *The Idler and The Adventurer*, ed. by W.J. BATE, J.M. BULLITT, and L.F. POWELL (1963); *Poems*, ed. by E.L. MCADAM, JR., with GFORGE MILNE (1964); *Johnson on Shakespeare*, ed. by ARTHUR SHERBO, 2 vol. (1968); *The Rambler,* ed. by W.J. BATE and A.B. STRAUSS, 3 vol. (1969); *A Journey to the Western Islands*, ed. by MARY LASCELLES (1971). Until superseded, the standard edition of *The Lives of the English Poets* is that by G.B. HILL, 3 vol. (1905, reprinted 1967); and of the correspondence, *The Letters of Samuel Johnson,* ed. by R.W. CHAPMAN, 3 vol. (1952). The most extensive anthology is *Johnson, Prose and Poetry,* selected by MONA WILSON (1950).

Biography and criticism: The number of biographical and critical studies of Johnson is enormous. Apart from Boswell's *Journal of a Tour to the Hebrides* (1785) and *Life of Johrzson* (1791), there are a number of contemporary authorities, including the official *Life* by SIR JOHN HAWKINS (1787; abridged ed. by B.H. DAVIS, 1961); HESTER LYNCH PIOZZI, *Anecdotes* (1786; ed. by S.C. ROBERTS, 1925); *Lives* by ARTHUR MURPHY (1792) and by ROBERT ANDERSON (1795; 3rd expanded ed., 1815). Portions of these and many other anecdotes are included in G.B. HILL (ed.), *Johnsonian Miscellanies,* 2 vol. (1897, reprinted 1966). Two of the most famous essays on Johnson were those of MACAULAY: one a review of J.W. Croker's edition of Boswell *(Edinburgh Review,* 1831), in which the depreciation of Johnson as a writer set the fashion for many years; the other, a more balanced account, in the *Encyclopædia Britannica,* 8th ed. (1856). Among shorter Victorian studies there are *Lives* by LESLIE STEPHEN (1878) and FRANCIS R. GRANT (1887).

In the 20th century much new biographical evidence has been assembled by A.L. READE in *Johnsonian Gleanings,* 11 vol. (1909–52); A.T. HAZEN, *Samuel Johnson's Prefaces and Dedications* (1937); E.L. MCADAM, JR., *Dr. Johnson and the English Law* (1951); B.B. HOOVER, *Samuel Johnson's Parliamentary Reporting* (1953); and in the various volumes of the *Boswell Papers* (ed. by F.A. POTTLE *et al.),* particularly *The Correspondence and Other Papers of James Boswell Relating to the Making of the Life of Johnson,* ed. by MARSHALL WAINGROW (1969). Much of this new evidence is used in J.W. KRUTCH, *Samuel Johnson* (1944); J.L. CLIFFORD, *Young Sam Johnson* (1955); PAUL FUSSELL, *Samuel Johnson and the Life of Writing* (1971); CHRISTOPHER HIBBERT, *The Personal History of Samuel Johnson* (1971); and other critical works.

Some special studies are: WALTER RALEIGH, *Six Essays on Johnson* (1910, reprinted 1965), an early revaluation correcting Macaulay's view; B.H. BRONSON, *Johnson Agonistes, and Other Essays* (1946); W.K. WIMSATT, JR., *The Prose Style of Samuel Johnson* (1941); J.H. HAGSTRUM, *Samuel Johnson's Literary Criticism* (1952); J.H. SLEDD and G.J. KOLB, *Dr. Johnson's Dictionary* (1955); ARTHUR SHERBO, *Samuel Johnson, Editor of Shakespeare* (1956); EDWARD A. BLOOM, *Samuel Johnson in Grub Street* (1957); D.J. GREENE, *The Politics of Samuel Johnson* (1960); M.J. QUINLAN, *Samuel Johnson: A Layman's Religion* (1964); C.F. CHAPIN, *The Religious Thought of Samuel Johnson* (1968); R.B. SCHWARTZ, *Samuel Johnson and the New Science* (1971). There have also been various collections of shorter articles: F.W. HILLES (ed.), *New Light on Dr. Johnson* (1959); *Johnson, Boswell and Their Circle: Essays Presented to L.F. Powell* (1965); D.J. GREENE (ed.), *Samuel Johnson: A Collection of Critical Essays* (1965); and J.L. CLIFFORD (ed.), *Twentieth Century Interpretations of Boswell's Life of Johnson* (1970).

General evaluations that stress Johnson the moralist, thinker, and critic are: W.J. BATE, *The Achievement of Samuel Johnson* (1955); R.B. VOITLE, JR., *Samuel Johnson the Moralist* (1961); P.K. ALKON, *Samuel Johnson and Moral Discipline* (1967); ARIEH SACHS, *Passionate Intelligence: Imagination attd Reason in the Works of Samuel Johnson* (1967). D.J. GREENE, *Samuel Johnson* (1970), is an excellent introduction and analysis embodying the new approach.

(S.Rs./J.L.Cl.)

Joint

In anatomy, a joint is a structure that separates two or more adjacent elements of the skeleton. Depending on the type of joint, such separated elements may or may not move on one another. Though this article is intended to deal with human joints, its content is applicable as well to those of vertebrates in general and mammals in particular.

The Latin stem word for joint is art— (as in articular, articulation); the Greek stem word is *arthro— (as* in arthritis, arthrology). The international vocabulary of arthrology (the science of joints) uses Latin and Greek terms, but the more important of these have well-known English equivalents that will be used here when possible.

Classification of joints

Joints can be classified in two ways: temporally and structurally. Each classification is associated with joint function.

Temporal classification. Joints are either transient or permanent. The bones of a transient joint fuse together sooner or later, but always after birth. All the joints of the skull, for example, are transient, excepting those of the middle ear and those between the lower jaw and the braincase. The bones of a permanent joint do not fuse except as the result of disease or surgery. Such pathological or surgical fusion is called arthrodesis.

All permanent and some transient joints permit movement. Movement of the latter may be temporary, as with the roofbones of an infant's skull during birth, or long-term, as with the joints of the base of the skull during postnatal development.

Structural classification. There are two basic structural types of joint: diarthrosis, in which fluid is present, and synarthrosis, in which there is no fluid. All the diarthroses (commonly called synovial joints) are permanent. Some of the synarthroses are transient; others are permanent.

Before proceeding further with joint classification, it is necessary to describe the types of motion made possible by mobile joints. These motions include spinning, swinging, gliding, rolling, and approximation; they can be briefly described as follows: Spin is a movement of a bone around its own long axis denoted by the term rotation in anatomy. Swing, or angular movement, brings about a change in the angle between the long axis of the moving bone and some reference line in the fixed bone. Approximation denotes the movement caused by pressing or pulling one bone directly toward another—*i.e.*, by a "translation" in the physical sense. The reverse of approximation is separation. Gliding and rolling movements occur only within synovial joints and cause a moving bone to swing.

Flexion (bending) and extension (straightening) of the elbow are examples of swing. A swing (to the right or left) of one bone away from another is called abduction; the reverse, adduction. An important example of spin is provided by the radius ("outer" bone) of the forearm; this bone can spin upon the lower end of the humerus (upper arm) in all positions of the elbow. When an individual presses the back of his hand against his mouth, his forearm is pronated, or twisted; when the palm of his hand is pressed against his mouth, his forearm is supinated, or untwisted. Pronation is caused by medial (inward) rotation of the radius, and supination by lateral (outward) rotation. Approximation and separation normally occur only at the symphyses and gomphoses, joints that will be discussed later.

All of the most common movements of bones involve some degree of spin. Pure swings, which are not accompanied by spin, are most often seen in military drill and gymnastic exercises. This topic is dealt with relative to conjunct rotation at synovial joints.

SYNARTHROSES

Classes of synarthroses

Synarthroses are divided into three classes: fibrous, cartilaginous, and fibrocartilaginous; the last class is called symphysis. The tissues that make up these joints are described in the article CONNECTIVE TISSUE, HUMAN; and the composition of bone, in the article BONE.

Fibrous joints. In fibrous joints the articulating parts are separated by white connective tissue (collagen) fibres, which pass from one part to the other. There are two types of fibrous joints: suture and gomphosis.

A suture is formed by the fibrous covering, or periosteum, of two bones passing between them. In the adult, sutures are found only in the roof and sides of the braincase and in the upper part of the face. In the infant, however, the two halves of the frontal bone are separated by a suture (the metopic suture), as are the two halves of the mandible at the chin. Excepting those of the fetus and newborn infant, all sutures are narrow. In the late fetus and newborn child, the sagittal suture, which separates the right and left halves of the roof of the skull, is quite wide and markedly so at its anterior and posterior ends. This enables one of the halves to glide over the other during the passage of the child through the mother's pelvis during birth, thus reducing the width of its skull, a process called molding. (The effects of molding usually disappear quickly.) After birth all sutures become immobile joints. The expanded anterior and posterior ends of the sagittal suture are called fontanels; they lie immediately above a large blood channel (superior sagittal sinus). The anterior fontanel provides an easy access for obtaining a blood sample from the very young infant.

From Cunningham's Textbook of Anatomy edited by G.J. Romanes and published by Oxford University Press, as an Oxford Medical Publication

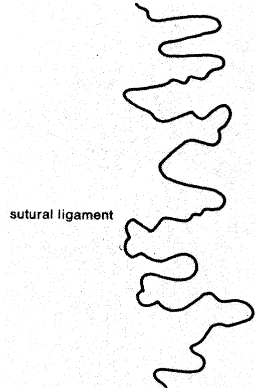


Figure 1: Surface view of portion of sagittal suture.

Sutures are transient, for they are unossified parts of the skeleton that become fused at various dates from childhood to old age. The fusion is effected by direct conversion of the sutures into bone. Until maturity the sutures are active sites of growth of the bones they separate.

A gomphosis is a fibrous, mobile peg-and-socket joint. The roots of the teeth (the pegs) fit into their sockets in the mandible and maxilla and are the only examples of this type of joint. Bundles of collagen fibres pass from the wall of the socket to the root; they are part of the circumdental, or periodontal, membrane. There is just enough space between the root and its socket to permit the root to be pressed a little further into the socket during biting or chewing. Comphoses are permanent joints, in the sense that they last as long as do the roots of the teeth involved in them, unless, of course, they are obliterated by disease.

The movement of the root within a gomphosis has a threefold effect. It lessens some of the impact between the upper and lower teeth in biting; it pumps blood and lymph from the periodontal membrane into the dental veins and lymph channels; and it stimulates sensory nerve terminals in that membrane to send signals to the brain centres controlling the muscles of mastication.

Fibrocartilaginous joints; symphysis. A symphysis is a joint in which the body (physis) of one bone meets the body of another. All but two of the symphyses lie in the vertebral (spinal) column, and all but one contain fibrocartilage as a constituent tissue. The short-lived suture between the two halves of the mandible is called the symphysis menti (mentum, meaning chin) and is the only symphysis devoid of fibrocartilage. All the other symphyses are permanent.

The symphysis pubis joins the bodies of the two pubic bones of the pelvis. The adjacent sides of these bodies are covered by cartilage through which collagen fibres run from one pubis to the other. On their way they traverse a plate of cartilage, which, in some instances (especially in the female), may contain a small cavity filled with fluid. Surrounding the joint and attached to the bones is a coat of fibrous tissue, particularly thick below (the subpubic ligament). The joint is flexible enough to act as a hinge that allows each of the two hipbones to swing a little upward and outward, as the ribs do during inspiration of air. This slight movement is increased in a woman during childbirth because of the infiltration of the joint and its fibrous coat by fluid toward the end of pregnancy, the fluid making the joint even more flexible. In both sexes the joint acts as a buffer against the shocks transmitted to the pelvic bones from the legs in running and jumping.

Intervertebral disks

The symphysis between the bodies of two adjacent vertebrae is called an intervertebral disk. It is composed of two parts: a soft centre (nucleus pulposus) and a tough, flexible ring (anulus fibrosus) around it. The centre is a jellylike (mucoid) material containing a few cells derived from the precursor of the spine (notochord) of the embryo. The ring consists of collagen fibres arranged in concentric layers like those of an onion bulb. These fibres reach the adjacent parts of the vertebral bodies and are attached firmly to them. The mass of fibres is embedded in chondrousia—the mixture of ground substances characteristic of cartilage—but yet the ring, although called fibrocartilaginous, is predominantly fibrous, and this fact determines its mechanical properties.

There are 23 intervertebral disks, one found between each pair of vertebrae below the first cervical, or neck (atlas), and above the second sacral (just above the tailbone). The lumbar (lower back) disks are thickest, the thoracic (chest or upper back) thinnest, and the cervical are of intermediate size. These differences are associated with the function of the disks.

In general these disks have two functions: to allow movement between pairs of vertebrae and to act as buffers against the shocks caused by running, jumping, and other stresses applied to the spine. Each of these functions merits separate consideration.

If an intervertebral disk were the only joint between a pair of vertebrae, then one of these could move on the other in any direction; but each pair of vertebrae with an intervertebral disk has also a pair of synovial joints, one on each side of the vertebral (neural) arch. These joints limit the kinds of independent movement possible so that the thoracic vertebrae move in only two directions, and the lumbar in only three; only the cervical vertebrae below the atlas have full freedom of movement.

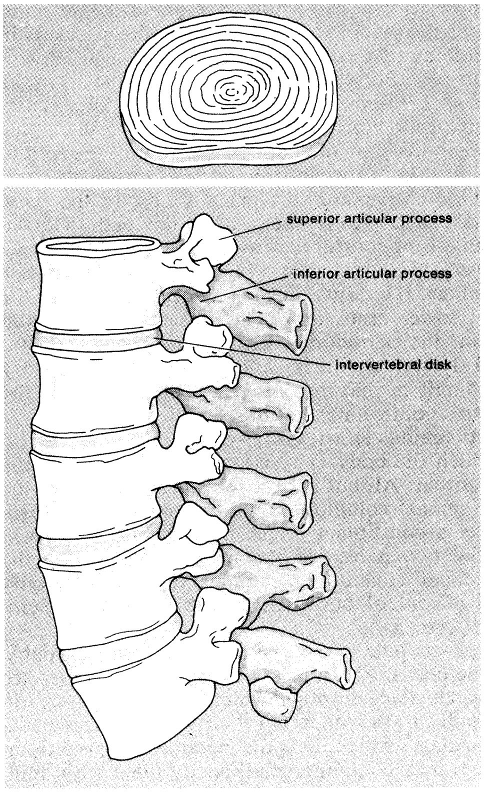

Figure 2: (Top) Cross section of an intervertebral disk. (Bottom) The lumbar vertebrae (left-side view).
Adapted, with permission, from *The CIBA Collection of Medical Illustrations* by Frank H. Netter, M.D.

All intervertebral disks allow approximation and separation of their adjacent vertebrae. This is caused partly by movement brought about by muscle action and partly by the weight of the head and the trunk transmitted to the pelvis when a person is upright. The effect of weight is of special importance. The mucoid substance in the centre of the disk behaves like a fluid. It is acted upon by the person's weight and any other pressure forces transmitted along the spine. Hence the disk flattens from above downward and expands in all other directions. After arising in the morning, and as the day progresses, a person decreases in height because of this compression of the disks. An average decrease of one millimetre in the height of each disk would mean an overall shortening of 2.3 centimetres, or about an inch. The spine lengthens again, of course, during sleep.

In the infant the greater part of the disk consists of the soft centre. Later the fibrous ring becomes relatively thicker in such a way that the soft part is nearer to the back of the disk. As middle age approaches, there is an increase in the fibrous element, the soft centre is reduced in size, and the amount of cartilage is increased. There is a tendency for the posterior part of the fibrous ring to degenerate, so that a sudden violent pressure may rupture the disk and allow the central part to protrude backward against the spinal cord. This condition is commonly referred to as slipped disk.

Cartilaginous joints. These joints, also called synchondroses, are really the unossified masses found between bones or parts of bones that pass through a cartilaginous stage before ossification. Examples are the synchondroses between the occipital and sphenoid bones and the sphenoid and ethmoid bones of the floor of the skull. As already stated, these permit growth of the adjacent bones and act as virtual hinges at which the ethmoid and occipital bones swing upward upon the sphenoid; this allows backward growth of the nose and jaws during postnatal life. The juxta-epiphyseal plates separating the ossifying parts of a bone are also an example. Growth of the whole bone takes place at these plates when they appear, usually after birth. All synchondroses are transient; and all normally have vanished by the age of 25.

DIARTHROSES: SYNOVIAL JOINTS

Structure and elements of synovial joints. A synovial joint is nothing but a bursa (a closed sac lined with a membrane and containing fluid; see BURSA) at which movement of one or more bones occurs on one or more others. Two or more parts of the bursal wall become cartilage (chondrify) during prenatal life. These are the parts of the bursa that are attached to the articulating bones, and they constitute the articular cartilage of the bones.

The bursal fluid is called synovia, whence the common name for this class of joints. Bursas are found between structures that glide upon each other, and all motion at diarthroses entails some gliding, the amount varying from one joint to another.

General structure of synovial joints

A synovial joint consists of a wall enclosing a joint cavity that is wholly filled with synovial fluid. The wall consists of two layers: an outer, complete, fibrous layer and an inner, incomplete, synovial layer (Figure 3). Parts of the outer layer are either chondrified as articular cartilages or partly ossified as sesamoid bones (small, flat bones developed in tendons that move over bony surfaces). Parts of the synovial layer project into the cavity to form fatty pads. In a few diarthroses the fibrous layer also projects inward to become intra-articular disks, or menisci. These various structures will be discussed in connection with the layer to which they belong.

The bones appertaining to a synovial joint are, strictly speaking, outside the joint because it is a complete bursa. Nevertheless, those parts of them that can be seen only after the bursal wall has been opened are usually said to be inside the joint. This custom will be followed here whenever it makes for clarity.

From *Cunningham's Textbook of Anatomy* edited by G.J. Romanes and published by Oxford University Press, as an Oxford Medical Publication

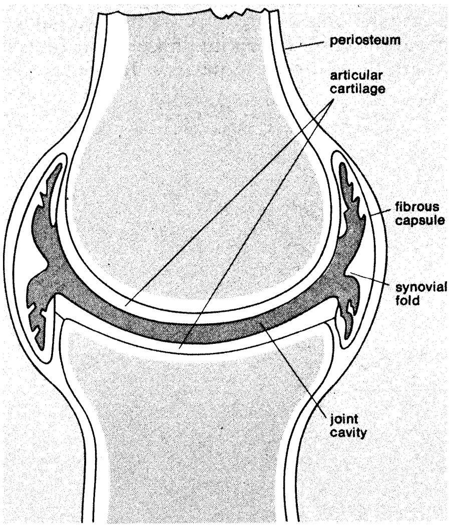

Figure 3: A synovial joint.

The fibrous layer. The fibrous layer is comprised of two continuous sections—one manifest and one hidden. The manifest part is that which is visible in an unopened joint cavity and is referred to as the investing ligament. At the point where it reaches the articulating bones, it covers their articulating ends as a complete periosteum. This is the hidden part. It is made of white fibrous tissue, composed of collagen fibres along with the cells that produce and maintain them.

Articular cartilage. Where the periosteal part of the fibrous layer covers the articulating part of a bone it becomes permeated with cartilaginous material, and the collagen fibres form a spongework in the meshes of which lie cartilage cells, thus forming articular cartilage. The continuity of the periosteal collagen with that of the articular cartilage can be seen by means of polarized light. Although the articular cartilages of a joint do complete the wall of the articular bursa, they are mechanically and visually distinguishable and merit the separate descriptions they usually receive.

Physical characteristics of articular cartilage

Articular cartilage is of the type called hyaline (glass-like) because thin sections of it are translucent, even transparent, to light. Unlike bone, it is easily cut by a sharp knife. It is deformable but elastic, so that it recovers its shape quickly when the deforming stress is removed. These properties are important for its function.

The surface of articular cartilage is smooth to the finger, like that of a billiard ball, and the cartilage's coefficient of friction is low indeed—0.02 or less. The electron scanning microscope has recently shown, however, that the surface is actually irregular, more like that of a golf ball. The part of the cartilage nearest to the bone is impregnated with calcium salts. This calcified layer appears to be a barrier to the passage of oxygen and nutrients to the cartilage from the bone, so that the cartilage is largely dependent upon the synovial fluid for its nourishment.

Every articular cartilage is divisible into two parts: a central, articulating part and a marginal, nonarticulating part. The marginal part is much smaller than the central and is covered by a synovial membrane. It will be described later in connection with that membrane.
